DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR 1965

WEDNESDAY, FEBRUARY 19, 1964

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met at 10 a.m., pursuant to call, in room 1223, New Senate Office Building, Hon. Carl Hayden (chairman) presiding.
Present: Chairman Hayden, Senators Bible, McGee, and Mansfield.

DEPARTMENT OF THE INTERIOR

STATEMENT OF THE CHAIRMAN

Chairman HAYDEN. The subcommittee will come to order.

We are here to consider the 1965 budget estimates for the Department of Interior and related agencies. This bill includes funds for all the bureaus and agencies of the Department of the Interior, except the Bureau of Reclamation, the Southeastern Power Administration, the Southwestern Power Administration, and the Bonneville Power Administration. All of these latter agency estimates are contained in the public works appropriations bill which will be considered later this year.

In addition, this bill will include funds for the U.S. Forest Service, the Federal Coal Mine Safety Board of Review, the Commission of Fine Arts, the Division of Indian Health in the Department of Health, Education, and Welfare, the Indian Claims Commission, the National Capital Planning Commission, the National Capital Transportation Agency, the Smithsonian Institution, the National Gallery of Art, the Civil War Centennial Commission, the Corregidor-Bataan Memorial Commission, and the Virgin Islands Corporation.

APPROPRIATIONS, 1964, AND 1965 ESTIMATES

For fiscal year 1964, $960,412,500 were appropriated for these agencies, which includes $6 million in borrowing authority and $13,486,000 in indefinite appropriations of receipts. The various bureaus and agencies now have pending supplemental 1964 estimates in the amount of $33,092,737.

For fiscal year 1965 there is requested a total appropriation of $1,020,613,000, an increase of $60,200,500 over fiscal year 1964. This sum includes $20 million in borrowing authority and $12,985,000 in indefinite appropriations of receipts.

COMPARATIVE STATEMENTS

I will place in the record a comparative statement of the appropriation for fiscal year 1964 and the budget estimates for fiscal year

1965, and a table comparing appropriations and receipts for the Department of the Interior for fiscal years 1964 and 1965.

(The statement follows:)

Comparative statement of the appropriations for fiscal year 1964, and the estimates for fiscal year 1965

Item	Appropriations, 1964	Budget estimates, 1965	Increase (+) or decrease (−), 1965 budget estimates compared with 1964
TITLE I—DEPARTMENT OF THE INTERIOR			
PUBLIC LAND MANAGEMENT			
Bureau of Land Management:			
Management of lands and resources	$44,152,500	$45,447,000	+$1,294,500

Net receipts	633,542,500	467,346,215	[2] 554,865,635

NET DIFFERENCE

Amount by which appropriations exceed net receipts	$123,145,500	$336,615,044	$288,856,865

[1] Receipts duplicated are as follows:

Item	1963 actual	1964 estimate	1965 estimate
Receipts from mineral leasing, public lands, collected by Bureau of Land Management included in "Oil, gas, and mining royalties and rents" and "Collections, reclamation fund"	$54,020,611	$54,866,000	$56,763,000

[2] Excludes estimated receipts of $125,000,000 based on proposed legislation for the new "land and water conservation fund."

JUSTIFICATION

Chairman HAYDEN. Also, I will include in the record the statements presented to the committee in justification of the permanent appropriations for the Department of the Interior.

(The justifications referred to follow:)

JUSTIFICATIONS FOR PERMANENT APPROPRIATIONS, FISCAL YEAR 1965

BUREAU OF LAND MANAGEMENT

Miscellaneous permanent appropriations

Appropriated, 1964 (estimate)	$65,553,135
Estimate, 1965	69,992,300
Increase	4,439,165

JUSTIFICATION

1. Expenses, sale of timber, etc., on reclamation lands, $2,000

The cost of making and administering timber sales by the Bureau of Land Management on reclamation withdrawn lands is refunded to the Bureau of Land Management from timber sale receipts (41 Stat. 202; 53 Stat. 1196).

2. Leasing of grazing lands, Bureau of Land Management (receipt limitation), $1,000

The act of June 23, 1938 (52 Stat. 1033), authorizes the Secretary of the Interior to enter into leases for the rental of grazing lands with States, counties, or private parties when the leasing of such lands will promote the orderly use of grazing district lands and aid in conserving the forage resources of the public lands therein. Under the act, rentals paid the lessors may not exceed the grazing fees paid the United States for grazing privileges on the land.

3. Payments to Oklahoma (royalties), Bureau of Land Management (receipt limitation), $10,000

The joint resolution of Congress approved June 12, 1926, provides for payment to the State of Oklahoma of 37½ percent of oil and gas royalties received from the south half of the Red River, Okla. The payment is in lieu of all State and local taxes upon Kiowa, Comanche, and Apache tribal funds received from such lands under the act of March 4, 1923 (42 Stat. 1448), and is to be used by the State for the construction and maintenance of public roads, or for the support of public schools, or other institutions of learning.

4. Payments to Coos and Douglas Counties, Oreg., from receipts, Coos Bay wagon road grant lands, $750,000

Not to exceed 75 percent of the receipts in any one year from the Coos Bay wagon road grant lands in Oregon are for payment annually, in lieu of taxes, to Coos and Douglas Counties, as provided in the act of February 26, 1919 (40 Stat. 1179), and the act of May 24, 1939 (53 Stat. 753–754).

The decrease of $225,000 reflects an anticipated decrease in receipts from these lands.

5. Payments to counties, Oregon and California grant lands, $18,000,000

In accordance with title II of the act of August 28, 1937 (50 Stat. 876), 75 percent of the moneys deposited in the Oregon and California land grant fund is paid to the counties in which the revested lands are situated.

However, the "Oregon and California grant lands" appropriation of the Bureau of Land Management provides that 25 percent of the receipts collected from sale of timber and other products on the O. & C. lands are available for management, protection, and development of resources, and for construction, operation, maintenance of access roads, reforestation, and other improvements on the O. & C. lands and other Federal lands in the Oregon and California land-grant counties of Oregon. The amount appropriated will be a reimbursable charge against the Oregon and California land-grant fund and be reimbursed to the general fund of

the Treasury. The estimate of $18 million to be paid to the counties in fiscal year 1965 is based on an estimated total receipts of $36 million collected from the sale of timber and other products on the O. & C. lands during fiscal year 1964. This is an increase of $2,968,730 over fiscal year 1964.

6. Payments to States (grazing fees), Bureau of Land Management, $1,000

Section 11 of the act of June 28, 1934 (43 U.S.C. 315j), provides that 33⅓ percent of all grazing fees received from each grazing district on Indian lands ceded to the United States for disposition under the public land laws, be paid to the State in which said lands are situated.

7. Payments to States (proceeds of sales), Bureau of Land Management (receipt limitation), $232,000

This appropriation is made to fulfill the Government's obligation to the States under various acts of Congress, which provide that 5 percent of the proceeds of sales of public lands and various materials therefrom, after deducting all the expenses incident to sale, shall be paid to the States for education or for making roads and improvements (31 U.S.C. 711).

8. Payments to States from grazing receipts, etc., public lands outside grazing districts, Bureau of Land Management, $350,000

Payments are made to States of 50 percent of moneys received as grazing fees from public lands outside grazing districts, under the provisions of section 15 of the act of June 28, 1934, as amended (43 U.S.C. 315i, 315m).

The increase of $15,200 reflects an anticipated increase in receipts.

9. Payments to States from grazing receipts, etc., public lands within grazing districts, Bureau of Land Management, $324,200

Under the provisions of section 3 of the act of June 28, 1934 (43 U.S.C. 315(b)), 12½ percent of receipts from grazing fees from public lands within grazing districts is paid to States in which the lands are situated.

The increase of $20,000 reflects an anticipated increase in receipts.

10. Payments to States from grazing receipts, etc., public lands within grazing districts, miscellaneous, Bureau of Land Management, $10,000

Under the provisions of the act of June 28, 1934, as amended, this appropriation is provided for payment to States of amounts received from grazing fees on miscellaneous lands within grazing districts which are not susceptible to a standardized and uniform distribution on a percentage basis (43 U.S.C. 315).

11. Payments to States from receipts under Mineral Leasing Act, $49,301,100

This is an appropriation for payment of 90 percent to Alaska and 37½ percent to Westerm States of receipts from bonuses, royalties, and rentals under the provision of the Mineral Leasing Act (30 U.S.C. 191), and 37½ percent of receipts from bonuses, royalties, and rentals from leases of potash deposits under the act of February 7, 1927 (30 U.S.C. 285).

The increase of $1,651,100 in 1965 is based on anticipated increase in the total receipts from these sources.

12. Payments to counties, national grasslands, $211,000

This account consists of amounts appropriated from revenues received during each calendar year from the use of submarginal lands transferred from the Department of Agriculture by Executive Order No. 10787, dated November 6, 1958. Twenty-five percent of the net revenues is used for school or road purposes or both (7 U.S.C. 1012).

13. Expenses, Public Land Administration Act, $800,000

Section 301 of Public Law 86-649, approved July 14, 1960, authorizes the appropriation of moneys received as a result of forfeitures by timber sale contractors for failure to restore areas damaged by cutting operations and other amounts received in settlement of damage to timberlands. Section 302 of the act authorizes the appropriation of moneys received from road users for road maintenance. The amounts appropriated are to remain available until expended. Any amounts in excess of the cost of doing the work authorized are required to be transferred to miscellaneous receipts (74 Stat. 507-508).

Bureau of Indian Affairs

CLAIMS AND TREATY OBLIGATIONS

Statement relating 1963, 1964, and 1965 programs

1963 program (obligations incurred)	$158,968
1964 program (obligations incurred)	161,000
1965 program (obligations incurred)	161,000

JUSTIFICATION

1. Fulfilling treaties with Senecas of New York, $6,000

This is a permanent annuity made pursuant to a provision in the act of February 19, 1831, which reads as follows:

"That the proceeds of the sum of $100,000 being the amount placed in the hand of the President of the United States in trust for the Seneca Tribe of Indians situated in the State of New York, be hereafter passed to the credit of the Indian appropriation fund, and that the Secretary of War be authorized to receive and pay over to the Seneca Tribe of Indians the sum of $6,000 annually in the way and manner as heretofore practiced, to be paid out of any money in the Treasury not otherwise appropriated."

This money is paid in equal share to about 4,880 members of the Seneca Nation, and any small balance is deposited to the credit of the tribe.

2. Fulfilling treaties with Six Nations of New York, $4,500

The Six Nations comprise the Senecas, Tonawanda Band of Senecas, Tuscarora, Onondago, Oneida, and Cayuga Tribes. This appropriation is made annually in fulfillment of treaty obligations for permanent annuity in accordance with the act of November 11, 1794, which reads in part as follows:

"In consideration of the peace and friendship hereby established * * * and with a view to promote the future welfare of the Six Nations and of their Indian friends aforesaid, the United States will add the sum of $3,000 to the $1,500 heretofore allowed them by an article ratified by the President on the 23rd day of April 1792, making in whole $4,500, which shall be expended yearly forever in purchasing clothing, domestic animals, implements of husbandry and other utensils suited to their circumstances, and in compensating useful artificers who shall reside with or near them and be employed for their benefit."

Approximately $2,700 is allocated annually to the New York Indians and is utilized for the purchase of dress goods; the remainder, approximately $1,800 is distributed per capita to the Oneida Indians under the jurisdiction of the Great Lakes Agency, Wis.

3. Fulfilling treaties with Pawnees, Oklahoma, $30,000

This sum is to pay the permanent annuity to the Pawnees, as required by article 2 as amended, of the treaty of September 24, 1857. As amended, this article provides:

"The United States agrees to pay to the Pawnees the sum of $30,000 per annum, as a perpetual annuity, to be distributed annually among them per capita, in coin, unless the President of the Uuited States shall from time to time otherwise direct. But it is further agreed that the President may, at any time in his discretion, discontinue said perpetuity by causing a value of a fair computation thereof to be paid to or expended for the benefit of said Indians in such manner as to him shall seem proper."

4. Payments to Indians of Sioux reservations, $120,500

This is an annual charge against the general fund of the Treasury, the amount being indefinite until applications are made and approved.

The act of March 2, 1889, provided for the issue of certain articles necessary to aid individual Sioux Indians in industrial pursuits, particularly on their own allotments. Later, by the act of June 10, 1896, authority was granted to compute the value of the articles named and to pay these Indians cash in lieu thereof. Payments made under this appropriation are commonly referred to as "Sioux benefits" and can be made only upon application of the individuals entitled thereto. When cash payments are made, funds are used for purposes of direct benefit to the individual involved, including the purchase of farm equipment or livestock, and home improvement.

The legal authority for these payments is found in the act of March 2, 1889, section 17 (25 Stat. 894); act of June 10, 1896 (29 Stat. 334); and the act of June 21, 1906 (34 Stat. 326).

MISCELLANEOUS PERMANENT APPROPRIATIONS

Statement relating to 1963, 1964, and 1965 programs

1963 obligations incurred	$5,731,514
1964 appropriation (estimate)	6,385,200
1965 appropriation (estimate)	6,539,200

JUSTIFICATION

1. Acquisition of lands and loans to Indians in Oklahoma, act of June 26, 1936, $10,000

It is estimated that $10,000 will be derived from mineral deposits underlying certain lands purchased in Oklahoma and will be used for the acquisition of lands and for loans to individual Indians, associations, or corporate groups of Indians residing in Oklahoma (25 U.S.C. 507).

2. Indians arts and crafts fund, $200

Fees charged for the use of Government trademarks attesting to genuineness and quality of Indian products and are used to stimulate sales of Indian arts and crafts (25 U.S.C. 305 a, c).

3. Operation and maintenance, Indian irrigation systems, $4,075,000

All funds requested under this appropriation are obtained from the collection of assessments against water users on the various projects and are deposited in the Treasury to the credit of the respective projects. By the expenditure of these funds, the various projects located on Indian reservations are maintained in good operating condition, thus permitting the facilities constructed by the Government to be utilized by the Indian and non-Indian landowners within the project who depend upon proper operation and maintenance of the projects for irrigation farming and subsistence.

The funds are used for operation of the irrigation systems to provide adequate water deliveries; for the annual cleaning of canals and laterals to remove silt, moss, and weed growth; for the repair and replacement of water control structures; for the operation and maintenance of reservoirs, dams, and pumping plants, including the purchase of electrical energy; for the purchase of materials and supplies and equipment used in operating and maintaining the irrigation system; for the maintenance, heating, and lighting of offices used for project administration and quarters occupied by project employees; for payment to the U.S. Geological Survey for stream gaging and water recording services; for payment to other Government agencies and irrigation districts for operation and maintenance of irrigation systems on Indian lands included and benefited; for the repair of flood damage and for all incidental and necessary expenses for the proper operation, maintenance, and administration of Indian irrigation projects. The policy in administration of Indian irrigation projects is to make the assessment rate for the various projects on a basis of actual costs.

4. Power systems, Indian irrigation projects, Bureau of Indian Affairs, $2,234,000

All funds under this permanent indefinite appropriation are from earned revenue deposited in the Treasury to the credit of the respective projects. This appropriation provides funds for the operation and maintenance of two hydrogenerating plants; a diesel power generating plant; transmission lines, distribution systems and pumping plants for use of the project irrigation systems; the purchase of power for resale and for all necessary expenses for operation of power systems. The project power systems not only serve their primary purpose of furnishing electrical energy to the projects for irrigation and drainage pumping, but also furnish energy to mining and milling properties, public utilities and domestic consumers on the project proper, in nearby towns and villages and in outlying farming areas. The energy supplied by these projects in many instances is the only source of electrical energy available to the customers. At present, there are approximately 9,600 domestic and commercial customers being served. A large number of potential customers have also applied for electrical service.

The activities under the appropriation consist of operation, maintenance, and improvement of power systems built in connection with irrigation projects on

the Gila River, Colorado River, and Flathead Indian Reservations. The facilities under these power projects consist in the aggregate of 4 generating plants of 17,620 kilowatt capacity; over 1,767 miles of transmission system; 113 project pumping plants and approximately 116 buildings used as quarters, powerhouses, and warehouses for both power and irrigation activities. Funds are used for payment of the salaries of power superintendents; power and pumping plant operators; line repair and maintenance crews; meter reading and reporting and a clerical force for billing and accounting for revenues; for the purchase of energy, and for the purchase and repair of equipment used on the power systems. An approximate of 115 million kilowatt-hours are transmitted over all project transmission and distributary systems annually.

5. Colorado River Indian Reservation benefits, southern and northern reserve, $220,000

All receipts from leasing of unassigned lands, Colorado River Indian Reservation, Ariz., southern and northern reserves, may be expended for the benefit of the Colorado River tribes and their members (69 Stat. 723).

NATIONAL PARK SERVICE

Miscellaneous permanent appropriations

Appropriated, 1964	$148,729
Estimate, 1965	133,000
Decrease	15,729

JUSTIFICATION

1. Educational expenses, children of employees, Yellowstone National Park, $108,000

The act approved June 4, 1948 (62 Stat. 338), authorizes the Secretary of the Interior to make payments in advance or otherwise from any revenues received from the collection of visitor fees to the park, for providing educational facilities to pupils who are dependents of persons engaged in the administration, operation, and maintenance of Yellowstone National Park.

The 1965 budget estimate is compared with the amount available for 1964, as follows:

	Available, 1964	Estimate, 1965	Change
Personnel compensation and benefits	$5,000	$5,000	
Contractual services	71,000	75,000	+$4,000
Construction	26,000	17,000	−9,000
Other expenses	16,000	11,000	−5,000
Total	118,000	108,000	−10,000

Personnel compensation and benefits.—The amount of $5,000 will provide for the part-time services of custodial and maintenance employees.

Contractual services.—The estimate of $75,000 is needed to cover the prorata costs to the Government for qualified pupils who attend various public schools. It includes estimated payments to the Yellowstone National Park School District for hire of teachers, substitute teachers' services, and school supplies for the elementary school at park headquarters, and for reimbursing school districts in communities immediately adjacent to the park for tuition, transportation, etc. It is estimated that there will be 102 elementary and 48 high school students in 1965 as compared to estimates of 104 and 38 respectively, in 1964.

Construction.—The amount of $17,000 is included in this estimate to complete the school facilities on which construction was commenced in 1963.

Other expenses.—It is estimated that $11,000 will be required for other expenses connected with the school at park headquarters, principally for supplies, fuel, and equipment.

2. Payment for tax losses on land acquired for Grand Teton National Park, $25,000

Pursuant to the act of September 14, 1950 (64 Stat. 851), the Secretary of the Interior is authorized to use visitor fees collected at Grand Teton and Yellowstone National Parks to compensate the State of Wyoming for tax losses on lands acquired for Grand Teton National Park.

It is estimated that the amount of $25,000 will be required for this purpose to cover the tax schedule on 1963 calendar year taxes.

Office of Territories

Internal revenue collections for Virgin Islands

Appropriated, 1964	$7,042,107
Estimate, 1965	8,000,000
Increase	957,893

JUSTIFICATION

Under the provisions of section 28(b) of the Revised Organic Act of the Virgin Islands, Public Law 517, 83d Congress, approved July 22, 1954, the Treasury Department is authorized to transfer customs duties and certain taxes into the treasury of the Virgin Islands, to be available for expenditure as prescribed therein.

The internal revenue collections available to the Virgin Islands for the fiscal year 1964 under the provisions of the revised organic act are $7,042,107. It is estimated that $8 million will be available in the fiscal year 1965. Any balance of internal revenue collections remaining after the amount equal to the revenue collected in the Virgin Islands has been transferred will be deposited into the Treasury as miscellaneous receipts.

Geological Survey

Permanent appropriation

Appropriated, 1964	$500
Estimate, 1965	1,000

JUSTIFICATION

Payment from proceeds, sale of water, Mineral Leasing Act of 1920, section 40(d), Geological Survey

When lessees or operators drilling for oil and gas on public lands strike water, water wells may be developed by the Department from proceeds from the sale of water from existing wells (30 U.S.C. 221–229). During 1965 proceeds totaling $1,000 are anticipated. No obligations are anticipated in 1964 or 1965.

Bureau of Commercial Fisheries

Promote and develop fishery products and research pertaining to American fisheries

1964 appropriation (receipts for calendar year 1962)	$5,373,096
1965 appropriation (estimated receipts for calendar year 1963)	5,200,000
Decrease	173,096

Pursuant to the provisions of the act of July 1, 1954 (68 Stat. 376), as amended by the Fish and Wildlife Act of 1956 (70 Stat. 1119), an amount equal to 30 percent of the gross receipts from customs receipts on fishery products is maintained in a separate fund and used by the Secretary of the Interior (1) to promote the free flow of domestically produced fishery products in commerce; (2) to develop and increase markets for fishery products of domestic origin; and (3) to conduct any biological, technological, or other research pertaining to American fisheries. The work under this appropriation falls under four activities: (1) Marketing and technology, which includes commercial fishery economics, exploratory fishing and gear development, fishery market news service, commercial fishery statistics, fishery technological studies, and fishery education and market development; (2) research, which consists of coastal and offshore and inland fishery research, and commercial shellfishery research; (3) research on fish migration over dams; and (4) general administrative services, which cover such expenses incident to this program, including expenses of the American Fisheries Advisory Committee.

BUREAU OF COMMERCIAL FISHERIES

Payment to Alaska from Pribilof Island receipts

Appropriated, 1964	$589,300
Estimate, 1965	1,606,000
Increase	1,016,700

Section 6(e) of the Alaska Statehood Act of July 7, 1958 (72 Stat. 339) provides that "Commencing with the year during which Alaska is admitted into the Union, the Secretary of the Treasury, at the close of each fiscal year, shall pay to the State of Alaska 70 per centum of the net proceeds, as determined by the Secretary of the Interior, derived during such fiscal year from all sales of sealskins or sea-otter skins made in accordance with the provisions of the Act of February 26, 1944 (58 Stat. 100; 16 U.S.C., secs. 631a–631q), as supplemented and amended * * *." Payment is to be made from the Pribilof Islands fund.

BUREAU OF SPORT FISHERIES AND WILDLIFE

Migratory bird conservation account

Appropriated, 1964 (indefinite) (estimate)	$4,000,000
Estimate, 1965 (indefinite)	4,000,000

JUSTIFICATION

Receipts from the sale of Federal migratory bird hunting stamps under the Hunting Stamp Tax Act of March 16, 1934 (16 U.S.C. 718), are available exclusively for payment of Post Office Department expenses of printing and selling migratory bird hunting stamps, and the location, ascertainment, and acquisition of suitable areas for migratory bird refuges under the provisions of the Migratory Bird Conservation Act. The 1965 receipts are estimated at $4 million to be derived from the sale of 1,333,333 migratory bird hunting stamps at $3 each.

In 1963 there was appropriated an advance to the migratory bird conservation account, pursuant to the act of October 4, 1961 (16 U.S.C. 715k–3–5), of $7 million. An additional amount of $10 million was appropriated and transferred to the account for 1964.

In 1965 the estimate for this account includes a transfer of $8 million from the annual definite appropriation advances to the migratory bird conservation account. This is a decrease of $2 million under 1964. The total program of $12 million for 1965 is as follows:

	Estimate, 1964	Increase or decrease	Estimate, 1965	Transfer from advances to migratory bird conservation account	Total estimate
1. Printing and sale of hunting stamps: Payment to Post Office Department for cost of printing, sale, and accounting for migratory bird hunting stamps	$115,000	----------	$115,000	----------	$115,000
2. Acquisition of refuges and other areas: Costs of location, ascertainment, and acquisition of migratory bird refuges and waterfowl production areas are as follows:					
(a) Realty costs, involving location, ascertainment, and appraisal of areas; presentation of proposals to the Migratory Bird Conservation Commission; and, following approval of the Commission, negotiation, title verification, title clearance, and other expenses incident to vesting title in the United States. Included in this category: Solicitor's Office costs for legal services ($30,000) and Migratory Bird Conservation Commission costs of travel of Commissioners and ex officio members to attend meetings and costs incident thereto ($7,500). The $37,500 increase is derived from a reduction of "(c) Biological work costs"	446,000	+$37,500	483,500	$999,500	1,483,000
(b) Engineering costs in connection with location and ascertainment of areas; drafting services and other costs incident to preparation of preliminary development plans, outline specifications, estimates, and topographic maps; engineering studies and water rights investigations and filings; and other costs incident to preparing cases for presentation to Migratory Bird Conservation Commission; and, following approval by Commission, cadastral surveys incident to vesting title in the United States	395,000	----------	395,000	240,000	635,000
(c) Biological work costs in the location and ascertainment of refuge areas, and waterfowl production areas in the prairie pothole region of the Midwest; and the preparation of preliminary management plans and estimates; and other costs incident to preparing cases for presentation to the Migratory Bird Conservation Commission. The $37,500 reduction is transferred to "(a) Realty costs"	307,500	−37,500	270,000	----------	270,000
(d) Administrative costs, including executive direction and general administrative services attributable to the program	57,000	----------	57,000	----------	57,000
(e) Costs of acquisition or rental of areas, including water rights, rights-of-way, easements, removal expenses of occupants, and other direct costs of acquiring the areas or rights therein	2,679,500	----------	2,679,500	6,760,500	9,440,000
Total program	4,000,000	----------	4,000,000	8,000,000	12,000,000

Federal aid in fish restoration and management

Appropriated, 1964	$6,358,099
Estimate, 1965	6,000,000
Decrease	358,099

JUSTIFICATION

The act of August 9, 1950, popularly known as the Dingell-Johnson Act (16 U.S.C. 777a–k) authorizes the Secretary of the Interior to cooperate with the States through their respective fish and game departments in fish restoration and management projects. The act authorizes appropriation of an amount equal to collections of the 10 percent manufacturers' excise tax on fishing rods, creels, reels, artificial lures, etc. There is authorized to be deducted from amounts so appropriated not to exceed 8 percent for expenses of administration of the act. The remainder is apportioned to the States on the basis of a formula which takes into account the land area and number of persons holding paid fishing licenses. The act provides for 1 percent minimum and 5 percent maximum apportionments to the States and fixed apportionments to the island possessions. The States and possessions have 2 years in which to obligate the apportionments. Any money not obligated reverts to the Bureau and is used for its sport fish research program. The 1965 program is a decrease of $400,000 as follows:

	Estimate, 1964	Increase or decrease	Estimate, 1965
1. Payments to States: States are reimbursed up to 75 percent of the cost of approved fish restoration and management projects, including research into fish culture; formulation of restocking plans; and acquisition and improvement of fish habitat. Island possessions are reimbursed 100 percent of the cost of such projects. The decrease is due to a reduction in receipts for 1964 to be apportioned in 1965	$5,937,900	−$406,700	$5,531,200
2. Administration: Administration of the act includes apportionment of funds; examination and approval of fish restoration and management plans; processing of project agreement after approval of State plans; inspection of projects; making payments to States and auditing State expenditures; and coordinating research effort of the various States. The increase of $7,200 is due to increased pay costs for fiscal year 1964 positions	436,600	7,200	443,800
3. Research: Funds not obligated by the States within a 2-year period revert and are used when available to supplement funds for fishery research in the "Management and investigations of resources" appropriation. The 1965 program is the same as 1964	25,500	−500	25,000
Total program	6,400,000	−400,000	6,000,000

Federal aid in wildlife restoration

Appropriated, 1964	$16,237,886
Estimate, 1965	16,000,000
Decrease	237,886

JUSTIFICATION

The act of September 2, 1937, popularly known as the Pittman-Robertson Act (16 U.S.C. 669–669j) authorizes the Secretary of the Interior to cooperate with the States through their respective fish and game departments in wildlife restoration projects. The act authorizes the setting aside in a special Federal aid to wildlife restoration fund an appropriation of amounts equal to revenues from the 11 percent manufacturers' excise tax on firearms, shells, and cartridges. There is authorized to be deducted from amounts so appropriated not to exceed 8 percent for expenses of administration of the act. The remainder is apportioned to the States on the basis of a formula which takes equally into account the land area and the number of persons holding paid hunting licenses. The act provides for one-half of 1 percent minimum and 5 percent maximum apportionments to the States and fixed apportionments to the island possessions. The States and possessions have 2 years in which to obligate the apportionments. Any money

not obligated reverts to the Bureau and is used for carrying out the purposes of the Migratory Bird Conservation Act. The 1965 program is estimated at the same level as 1964.

	Estimate, 1964	Increase or decrease	Estimate, 1965
1. Payments to States: States are reimbursed up to 75 percent of the cost of approved wildlife restoration projects including acquisition and development of land and water areas, and for wildlife management research and maintenance of completed projects not to exceed 25 percent of the total amount apportioned. Island possessions are reimbursed 100 percent of the cost of such projects. The decrease is due to a reduction in receipts for 1964 to be apportioned in 1965	$14,667,100	−$18,400	$14,648,700
2. Administration: Administration of the act includes apportionment of funds; examination and approval of wildlife restoration plans, specifications and estimates from the States; processing of project agreements after approval of State plans; inspection of projets; making payments to States and auditing State expenditures; and coordination of research effort of the various States. The increase of $16,600 is due to increased pay costs for fiscal year 1964 positions	1,043,700	+16,600	1,060,300
3. Carrying out Migratory Bird Conservation Act: Reverted funds are available for carrying out the purposes of the Migratory Bird Conservation Act. The 1965 program is at the same level as 1964	289,200	+1,800	291,000
Total program	16,000,000		16,000,000

Payments to counties, national grasslands

Estimate, 1964	$2,000
Estimate, 1965	2,000

JUSTIFICATION

Executive Order No. 10787 transferring certain submarginal lands to the Secretary of the Interior for administration by the Bureau of Sport Fisheries and Wildlife as refuges for migratory birds and other wildlife provides that the counties shall participate in the net revenues from the use of such lands in accordance with the Farm Tenant Act (7 U.S.C. 1012). This act specifically provides that 25 percent of the net revenues received from the use of submarginal lands shall be paid after the close of the calendar year to the county in which such lands are situated for the benefit of schools and roads. When the land is situated in more than one county, the net receipts are prorated to each county in proportion to the area of the land in the particular county. Revenues from the use of these lands consist of receipts from grazing, rights-of-way, concession operations, and from other privileges on refuges.

Permanent appropriations from national wildlife refuge receipts

Appropriated, 1964	$2,494,599
Estimate, 1965	2,416,000
Decrease	78,599

JUSTIFICATION

The Migratory Bird Conservation Act (16 U.S.C. 715s) authorizes the sale of products from the national wildlife refuge system. Revenues consist of receipts from the sale of surplus wildlife or of oil, timber, hay, grass or other spontaneous products of the soil, shell, sand or gravel and from other privileges on refuges.

Expenses for sales, etc., in refuges, Migratory Bird Conservation Act, $156,000

Section 401 of the act provides for deduction of the direct expenses of sales from refuge revenue prior to distribution of net revenues. Examples of such expenses are salaries of foresters to cruise and mark timber for sale, auctioneer's fees, transportation of furs to auction houses, and labor and supplies for butchering and shipping buffalo. The program for 1965 is estimated at the same level as 1964.

Management of national wildlife refuges, $1,918,000

A permanent appropriation (64 Stat. 693–694) of 75 percent of the net refuge revenues under the Migratory Bird Conservation Act is for management of national wildlife refuges and law enforcement. The 1965 program is as follows:

1. *Development and maintenance of wildlife refuges.*—To supplement funds provided for management of wildlife refuges in the appropriation management and investigations of resources. These funds are used for additional personnel, equipment, and general expenses needed for the management of the national wildlife refuge system. Included in the 1965 program is $50,000 for the establishment of a National Wildlife Refuge Training School at the Crab Orchard National Wildlife Refuge, Ill. The Bureau is in a critical period insofar as refuge personnel staffing is concerned, since 83 percent of the personnel in grades GS–11 and above will be eligible for retirement in the next 5 years, and because an expanded land acquisition program and intensified resource management will also demand the filling of 30 to 40 additional professionals annually. To properly train new personnel and especially to provide them with the broader knowledge of national resource management concepts and objectives, a central training school is a necessity. The Crab Orchard Refuge is well located geographically for this purpose, and has the facilities available that can be adapted to this program. The 1965 program totals $1,438,800, a decrease of $15,700 under 1964, because of decreased revenues.

2. *Enforcement activities.*—To supplement funds provided for enforcement of migratory bird laws in the management and investigations of resources appropriation. These funds are used for salaries and general expenses in support of the program of enforcement of the Migratory Bird Treaty and Lacey Acts. The 1965 program totals $479,200, a decrease of $17,800 under 1964, because of decreased revenues.

Payments to counties from receipts under Migratory Bird Conservation Act, $565,000

The Migratory Bird Conservation Act provides for participation of counties in revenues from refuges. After deduction of expenses from gross receipts on a refuge-by-refuge basis 25 percent of the remainder is paid to each county in which a refuge is located to be expended for the benefit of the public schools and roads. When a refuge is in more than one county the net receipts are prorated to each county in proportion to the area of the refuge in the particular county. The 1965 program is $565,000, a decrease of $23,000 under 1964, because of decreased revenues.

Chairman HAYDEN. The Secretary of the Interior is here to lead off the budget presentation for his Department this year.

Secretary Udall, you may introduce your staff members who accompany you, and then either read your statement or present it in highlight form.

DEPARTMENT OF THE INTERIOR

OFFICE OF THE SECRETARY

STATEMENTS OF HON. STEWART L. UDALL, SECRETARY OF THE INTERIOR; D. OTIS BEASLEY, ADMINISTRATIVE ASSISTANT SECRETARY; AND SIDNEY D. LARSON, DIRECTOR OF THE BUDGET

FISCAL YEAR 1965 BUDGET PRESENTATION

Secretary UDALL. I have with me Assistant Secretary Beasley, and Mr. Larson, our Director of Budget. It is always a pleasure to appear before the subcommittee. I should like to file my statement and have it appear in the record and then cover the highlights of it.

Chairman HAYDEN. That may be done.

(The statement referred to follows:)

I appreciate the opportunity to appear before you today and to present the Department of the Interior programs embraced in the fiscal year 1965 appropriation estimates under consideration in the bill before you.

It is always a pleasure to appear before the members of this committee who have done so much for the conservation of our resources and have given such strong support to those human resource development programs which so intimately concern our Indian people and those who live in the territories.

Conservation of Natural Resources

In this Nation our expanding economy and changing requirements of our citizens are imposing more and more demand on our natural resources. It is incumbent upon us today to carry out programs that insure the conservation of those resources, to assure that our actions today do not leave future generations with more serious problems of water supply and stream pollution, restricted areas of public use, and dwindling mineral resources that would put a drag on the future of our economy.

We cannot accomplish this all in 1 year, but we must continue our efforts, step by step, to achieve desirable objectives.

The budget estimates recommended for your consideration are based on economy and progress. They have been developed in accordance with the principles established by President Johnson in his program of frugal management in Government operations.

The President's theme of thrift and dollar value of benefits from dollar spent reinforces my own efforts in this direction in the administration of the Department of the Interior. There must be a continuing, all-out attack on avoidable costs in Government. I feel this is particularly true in my Department where needs and demands for new and expanded programs for natural resources conservation and development are so pressing. At least a substantial part of those needs and demands must be met by better utilization of existing resources.

Redirection or Expansion of Programs

When I took office as Secretary of the Interior, I found that in almost every direction that I turned—national parks, Indians, public land management, territorial affairs, fisheries, water research and development, minerals, and the other Interior resource programs—there was a need for redirection or expansion of programs.

With the wise guidance of this committee, that redirection and expansion took on significant proportions as we launched new efforts to meet the conservation requirements of tomorrow.

Even though these programs do, for the most part, represent investment in the future and frequently result in substantial economic benefits or increased revenues to the U.S. Treasury, they could not simply be saddled on top of older on-going programs. I found that manpower and appropriations had to be redirected to meet our priority goals and greater economy and efficiency had to be introduced into our regular operations. Fortunately, Interior officials and employees responded to meet the demands of our situation. Over the past 3 years numerous actions, large and small, have been taken in Washington and in the field; some of the more significant of these put into effect in the past year and those planned for the immediate future are outlined in a separate statement which I ask be made a part of the record of these hearings.

Steps to Reduce Employment

The committee will be interested in the steps taken to reduce employment in the Department. You will recall that last year the committee indicated the maximum number of positions the Department might fill under the amounts appropriated for 1964. Not only have we maintained our employment within the number desired by the committee, we have taken action to insure that employment will be below that number.

The Department's end-of-year employment for 1964 is now fixed at 72,342. For 1965 the Department will limit employment to 72,279, which is 63 less than employment for the current fiscal year.

The anticipated decrease below the 1964 level would be greater were it not for the compelling necessity of adding nearly 500 new positions to provide school teachers and supporting staff for urgently needed school facilities which will be completed for use in 1965 under the administration's high priority goal to provide educational opportunity for all Indian children of school age. Another unavoidable increase is for the trust territories where 63 school teacher positions must be added, as well as 12 doctors to man hospitals and provide medical services in areas where such services are now lacking.

Program for Managerial Improvement

In achieving control of employment, the Department will, in part, look to sources outside the Federal Government for work now performed by Government personnel in those instances where that will result in a lower cost. In addition, a program for managerial improvements will be instituted and pushed vigorously. We are determined that efforts for better manpower utilization be strengthened to insure that the Department holds employment within the limit established.

To achieve the economy and promote the progress called for by this budget, we simply must use our scientific and technical knowledge to the best of our ability to meet today's resource problems and to avoid passing on undesirable conditions to further generations. To that objective we are dedicated, and we welcome the challenge it presents.

While the budget estimates under consideration in this bill do not include the requirements for reclamation and the power marketing agencies, I do wish briefly to refer to the total 1965 budget estimates for the Department in order that your committee may understand what has been accomplished in limiting appropriation requests to a level that I believe to be as low as possible and still avoid a stagnation of programs relating to natural resources—one of the main factors contributing to this Nation's progress.

Budget Request for 1965

The budget request for 1965 is $1,027,667,000—this is $80,186,000 less than the amount included in the 1964 budget as it was first submitted to the Congress.

As to the estimates to be considered in this bill, the 1965 request is $643,617,000. While that amount is $42,650,935 more than the funds appropriated in fiscal year 1964, most of the increase is for what can fairly be described as unavoidable demands. Among the increases are $14 million for helium conservation, $10 million for Guam rehabilitation, $6,515,200 for Indian education, and $5,264,616 for pay cost increases legally effective January 5.

Fully to understand the impact of Interior's budget upon the finances of the Federal Government, it is necessary to take into account the substantial revenues produced in the Department's operations. In the period 1962–64, the Department's receipts have ranged from 50 to 80 percent of its expenditures. And in 1965, it is estimated the net receipts of the Department will be $784,728,424, equal to more than 76 percent of the expenditure. For these departmental activities covered by the estimates of $643,617,000 in this bill, receipts are estimated at $554,865,000, not including estimated receipts of $125 million from the land and water conservation fund now being considered in the Congress.

Public Land Management

The budget for the Bureau of Land Management provides for continued improvements in the management of forest and range lands. Additional funds are included for the rehabilitation of burned-over lands. Increases are provided to maintain roads, buildings, and other facilities of the Bureau including those constructed with accelerated public works funds.

Funds to initiate construction of the fire control station at Anchorage, Alaska, also are included. Of particular importance is the request to initiate construction of sanitation and protection facilities for public health and safety in areas of intensive public use of the public lands.

Bureau of Indian Affairs

The major increases requested for the Bureau of Indian Affairs are for education and economic development. If we are to be successful in decreasing the extreme poverty found on most Indian reservations, it is essential that we continue to press forward with these two basic programs. This is in keeping with President Johnson's recent statement on "Pockets of Poverty."

The only additional Federal employment being requested by the Bureau of Indian Affairs is for staffing new educational facilities that will open for the first time in fiscal year 1965, and to staff enlarged adult vocational training programs already authorized. It is proposed to acquire the additional manpower needed for economic development by making reductions in programs of a lesser priority.

National Park Service

The budget for the National Park Service includes minimum increases under the operating appropriations designed to meet the needs of more than 102 million visitors, about 8 million more than visited the parks in 1963.

Natural science and wildlife management studies are being initiated to provide needed facts and information upon which to base policy, program, and management decisions having to do with the preservation development, and use of the parks

The 1965 fiscal year fund requirement for acquisition of lands is not included in this estimate. It is to be included in the proposed 1965 supplemental estimate of the Bureau of Outdoor Recreation to be funded from the proposed land and water conservation fund.

Bureau of Outdoor Recreation

The budget request for the Bureau of Outdoor Recreation is increased to provide for the development of a national outdoor recreation plan and to coordinate the recreation programs of other Federal agencies. Definite overall plans are essential if there is to be adequate provision for open spaces and public-use areas without duplication of effort between Federal, State, and local governments. I cannot stress too strongly that a well conceived and recognized plan must be available for future planning of industrial and domestic program expansions if progress is to be made in an orderly manner and without impairing the natural value of our open spaces.

Office of Territories

The Office of Territories' program for improving conditions in American Samoa has reached its peak and requirements for 1965 are below those of fiscal year 1964. However, the program for improving health, education, and living conditions for people of the trust territories is increased to the full authorization in order that we can meet our trusteeship obligations.

The budget also includes increased funds for the rehabilitation of Guam which will be implemented by a supplemental estimate already submitted to the Congress for fiscal year 1964.

Mineral Resources

The budget for the Geological Survey provides continuing support for programs that are fundamental to the development and utilization of the Nation's land, water, and mineral resources.

An increase is requested for topographic mapping to resume work on the National Atlas, a composite of information that will be valuable for many uses including information, education, and nationwide planning.

The principal increase will provide for greater emphasis on the collection of basic water resources information during 1965 to meet the growing need for basic streamflow, ground water, and water quality data.

Upper Mantle Project

The Upper Mantle project will provide fundamental knowledge on the subsurface geologic conditions and processes that are necessary to the search for mineral resources and many other land-use activities.

The marine geology and hydrology program in the Geological Survey is part of a coordinated interdepartmental program. More and more we must expect to look to the sea for resources and the Survey's program are designed to obtain data to facilitate such utilization.

The continuing program of the Conservation Division safeguards the public interest in the production of minerals from Federal and Indian lands, and from the Outer Continental Shelf, and in doing so supervises operations that will produce royalties in excess of $190 million this year.

Bureau of Mines

Particular emphasis is placed in the budget for the Bureau of Mines for a continued effort to reduce the hazards of mining operations due to gas, dust, and other hazardous conditions.

An increase of $14 million is requested to continue the conservation of helium, the limited gas now being produced at five private plants and Government facilities.

The budget for the Office of Coal Research will provide to continue the research projects started in 1964 with limited increase to initiate a few additional research projects in fiscal year 1965. We feel that some benefit has already been received from the program carried on thus far from the effort to stimulate the use of coal abroad. This has resulted in increased demands for coal from the national supply as well as benefiting the Nation's balance of payments.

Fish and Wildlife

The one resource of the world to be called upon more and more in the future will be that of the sea. Greater knowledge of this habitat and its productivity is needed as well as the effects of pollution and pesticides in the estuaries, the reproductive areas of the creatures of the sea.

Equally important are the fish and wildlife resources of the Nation which not only supply important recreational opportunities but a food supply as well. The budget for the Bureau of Commercial Fisheries includes increases for expansion of oceanographic programs, as part of the national oceanographic program, conducted by the Bureau in cooperation with other Government agencies. Other research programs, important to the health of the American public as well as the future of our country's fishing industry, are the results from the studies of botulism and pesticides.

Pesticide Research

The more important and intriguing problems are not only the immediate effect of pesticides but the residual and carryover effect on future generations. A very interesting development is taking place in pesticide research. By adding Coturnix quail to the series of indicator (test) species, departmental biologists have scored a breakthrough in the rate of screening chemical pesticides for harmful effects on wildlife. The Coturnix, or Japanese quail as it is often called, reaches maturity in 35 to 50 days, produces eggs steadily for about 40 weeks, and has an incubation period of only 16 days. Accordingly, four generations can be raised and tested successively per year instead of only one as is the case with the more common animals such as bobwhite quail, pheasants, and mallards. The significance in terms of obtaining an early insight into the toxic long range effects, if any, of chemicals on body tissues and reproductive processes is self-evident. In fact, the encouraging results recorded thus far have prompted our scientists to recommend the Coturnix to contemporaries in the medical and paramedical fields.

A major program expansion for the Bureau of Sport Fisheries and Wildlife is in the field of research on the effects of pesticides. This expansion follows implementation by President Kennedy of the report of his Science Advisory Committee on use of pesticides. This report highlighted the increasing dangers from the widespread use of pesticides and the urgency of step-up in the Government's program to find solution to the myriad of problems stemming from this modern-day phenomenon.

In addition to pesticide research laboratories, the construction program includes work at the Leavenworth, Wash., fish hatchery, plans and specifications for the National Fisheries Center and Aquarium at Washington, D.C., and development on 12 wildlife refuges and advance planning for wildlife research facilities.

Saline Water Conversion

The increase in the request for research funds reflects the need to develop an accelerated program of basic and fundamental studies in the search for more effective and economical means of saline water conversion. The budget request for the Office of Saline Water for fiscal year 1965 will provide funds for the maintenance and operation of these five plants and for continuing studies to develop more efficient methods of operation and plant improvements.

In recognition of the need to carry out the functions of Government most efficiently and effectively, a great amount of effort was expended in reviewing the fund and manpower needs of the Department. Where increases in the program have been considered necessary, offsetting decreases have been made insofar as possible. The budget also reflects a relatively small increase in employment primarily to provide for the education programs for the Indians and the people of the Trust Territories of the Pacific Islands. Increased number of positions are also included in the budget for Geological Survey. I wish to assure the committee that you will be informed as soon as the studies currently underway are completed that further downward adjustments can be made in employment.

We are continuing our efforts of more productive effort in the manpower field. We believe that the Department has made real progress over the past years although many of the achievements are not of the nature that attract widespread attention.

I have more detailed statements regarding the programs of the Department which in the interest of saving time I would like to file for the record at this point.

Manpower Utilization and Management Improvement Achievements

REORGANIZATION AND CONSOLIDATION

Major adjustments were made in the staff divisions of the Administrative Assistant Secretary resulting in the strengthening of Departmentwide attention to financial management, accounting systems, contract administration, automatic data processing and other aspects of administrative management as well as providing more effective centralized administrative services. Two new offices, the Office of Survey and Review and the Office of Management Operations, were established. The first combined into one organization departmental audit, analysis and investigative functions. To that Office was transferred the functions formerly assigned to the Division of Inspection, the financial review and regulatory functions of the Division of Budget and Finance and the contract review responsibilities of the Division of Property Management. To the Office of Management Operations was assigned responsibilities formerly vested in the Division of Administrative Services and the Division of Property Management.

The resources program staff redefined the role of their regional representative to strengthen the coordination of departmental program management in the field.

The major bureau reorganization completed this past year involved the Bureau of Mines with emphasis upon the realinement for minerals research, mineral resource development, and administration; the abolition of five regional offices; the consolidation of seven field administrative offices into two large offices; and the consolidation of all statistics operations.

Other changes included the elimination of a separate regional office for Alaska in the Bureau of Sport Fisheries and Wildlife; the abandonment of plans for suboffices below the regional office in the Bureau of Outdoor Recreation; the reduction of four BLM field administrative offices to two; and numerous small organization adjustments in almost all of the other bureaus.

SIMPLIFICATION OF SYSTEMS AND PROCEDURES

Systems and procedures improvements were evident in nearly every bureau and office program involving major and minor economies. Bonneville Power Administration estimated annual savings resulting from system improvements of over $1 million and the Bureau of Reclamation reported over $7,800,000 in annual savings or revenue increases. The Bureau of Land Management reported on its use of new techniques for surveying in Alaska, Geological Survey on the use of new scribing techniques that have doubled the output of geologic maps between 1962 and 1963, the Bureau of Sport Fisheries and Wildlife on the preparation and distribution of hunting regulations, in the fish allocation and record system, and in the administration of migratory bird permits, and the National Park Service on its comprehensive paperwork management program.

CONVERSION TO HIGH-SPEED DATA HANDLING EQUIPMENT

The electric power activities of the Department have achieved total annual savings in excess of $2 million through use of automatic data processing techniques. There is increasing emphasis upon improving and expanding these techniques, and in resolving the major organizational changes resulting therefrom. For example, the Bureau of Indian Affairs will centralize many administrative functions. This can be implemented only through computer procedures, and will involve savings of over 35 positions and $150,000 annually. The Department has instituted and is enforcing interbureau utilization of major computer facilities. This is a major decision dictated by the costs associated with acquiring and/or leasing ADP equipment and is also necessary to assure the immeasurable benefits of such facilities to the bureaus who would not be able to afford these management tools for their sole use. Concomitant steps are being taken to insure the most effective utilization of computer facilities, systems, and programing effort, through appropriate departmental review and advice on the economic and other aspects of proposed computer applications.

An interbureau computer project is being installed in Anchorage, Alaska. A much more significant joint-use arrangement is taking shape in Denver, Colo., a location at which Interior has substantial installations featured by the Chief Engineer's Office of the Bureau of Reclamation. Additionally, a joint-use operation has been established at the Portland, Oreg., office of the Bonneville Power Administration.

MANAGEMENT SURVEYS

The Office of the Secretary has undertaken management surveys in the operations of the Office of the Science Adviser, the Office of Saline Water, Office of Coal Research, Office of the Solicitor, and of automatic data processing operations throughout the Department. Findings in each of these areas will result in significant program improvements and more effective utilization of manpower. Additional surveys are being planned to carry out the Secretary's cost and personnel reduction program.

Comprehensive bureauwide management surveys have been carried out in Bonneville Power Administration, Southwestern Power Administration, National Park Service, and the Bureau of Land Management during the past year. The survey of BLM by Dr. George Shipman and the Institute of Administrative Research at the University of Washington is of particular interest as a different approach for making an organizational and management appraisal.

IMPROVEMENTS IN FORWARD PLANNING

The need for a departmentwide approach to strengthen forward planning for Interior's program is becoming increasingly apparent. This is particularly true in water resources research and development, recreation, oceanography, and a number of other program areas involving a number of bureaus of the Department and other agencies of the Government that are now being reviewed by committees attached to the Executive Offices. More attention will be focused on these areas in the current year.

Bureau forward planning efforts were particularly significant in the Geological Survey, Bureau of Sport Fisheries and Wildlife, Bureau of Commercial Fisheries, National Park Service, and the Bureau of Mines. Bonneville Power Administration expects to complete its Pacific Northwest economic base study in 1964 and is also undertaking a number of cooperative studies involving power resource estimating and power scheduling methods.

USER CHARGES

One of the most sensitive areas of user charges receiving attention is that of grazing fees charged by the Bureau of Land Management. Thirty individual fee items have been increased during the last year, including a 58-percent increase in grazing fees on public lands which involves additional revenues to the United States of over $1 million annually. Other substantial increases in revenues are anticipated in Bonneville Power Administration and Southwestern Power Administration. If Congress takes favorable action on the land and water conservation fund proposed legislation, considerable attention will be focused on the problem of fees in relationship to the expanded recreation program.

EMPLOYEE INCENTIVES

The Department of the Interior continues to operate a vigorous incentive awards program with benefits associated with suggestions and other contributions amounting to more than $350,000 last year. The Bureau of Mines has related the incentive awards program effectively to an emphasis upon training of employees and supervisors in the simple techniques of work improvement. A similar program is now underway for management operations personnel in the Office of the Secretary and will be extended to other areas. It is planned to take full advantage of the stimulation of the incentive awards program in carrying out the President's current program of cost reduction, economy, and efficiency.

MANPOWER ECONOMIES INCLUDING PRODUCTIVITY STANDARDS

One of the most dramatic and effective examples of manpower economies in the Department of the Interior over the past year was the administration of a $63 million accelerated public works program with administrative costs by the bureaus

involved held to less than a hundredth of 1 percent of this amount. The Alaska Railroad increased its revenue-ton miles this past year with fewer employees. The Bureau of Reclamation is now managing an investment of $4.5 billion with 11,800 employees, or 7,500 less than the 19.260 employees needed to manage its $1.7 billion investment in 1950; and its professional engineering staff carried a contract workload of $144,000 per man-year in 1963, or 2½ times the $54,000 workload in 1959. The Bureau of Sport Fisheries and Wildlife's fishery research in 1962 maintained a production rate of 1.2 scientific publications per professional man-year at an average cost of $17,000 per publication; comparable industry-research averages, as reported by the National Science Foundation, were 0.8 publications at an average cost of $57,000—around three times higher.

The Bureau of Land Management participated in a Bureau of the Budget research project on productivity measurement and the National Park Service is developing performance standards for its uniform personnel. The Geological Survey and the Bureau of Mines also reports a number of significant projects in this area.

Additional emphasis will be devoted to this area in the next year by the Division of Management Research of the Office of the Administrative Assistant Secretary to adapt various measurement and quantification techniques to the requirements of individual programs and bureau operations.

PROCUREMENT AND PURCHASING METHODS

The Office of Management Operations in the Office of the Administrative Assistant Secretary was instrumental in developing a departmentwide program for the use of excess property having an original acquisition cost of over $17 million. Bonneville Power Administration has reduced payments for rights-of-way by $175,000; the Office of Saline Water has developed a program to produce savings of 40 percent on items acquired by contractors through GSA; and Southwestern Power Administration has reduced its administrative costs of contracting by 79 percent.

PROPERTY MANAGEMENT, INCLUDING ACQUISITION AND DISPOSAL

During the past year 50,000 cubic feet of records were disposed of, releasing space and filing equipment valued at $535,000. Bonneville Power Administration is saving $224,000 by using centralized procurement and warehousing facilities.

The details of the individual bureau programs are set forth in the attached reports. We have also included copies of the letters of responsible bureau management officials in transmitting these reports to the Secretary as evidence of the sincerity and importance given to the President's program of cost reduction and more efficient administration.

Analysis of Budget Estimates, 1965

Public Land Management

The public land management responsibilities of the Department of the Interior are carried out through the Bureau of Land Management, Bureau of Indian Affairs, National Park Service, Bureau of Outdoor Recreation, and the Office of Territories.

The estimate of $409,184,000 is an increase of $15,178,921 over the $394,005,079 available in 1964.

Proposed program increases will provide better management of public and Indian lands and forests, help meet the expanding demand for and use of outdoor recreation facilities, and advance the educational and economic development of the Indian people and those in territorial and trusteeship areas under U.S. jurisdiction.

Bureau of Land Management

The budget for the Bureau of Land Management for fiscal year 1965 is $48,847,000, compared with $45,126,500 for 1964. This includes $45,447,000 for management of lands and resources, $1,400,000 for construction of buildings and sanitation and protection facilities, and $2,000,000 for liquidation of obligations incurred under contract authorization contained in the Federal Highway Act of 1962. In addition, $8,250,000 is provided for the Oregon and California grant lands with the provision that this amount is reimbursable to the Treasury from ceipts from those lands.

The operating appropriation for the Bureau is increased in the budget by $1,380,500. The fiscal year 1965 program emphasizes additional funds for the management of forest and range resources of the public lands; prompt rehabilitation of burned-over public lands; and increased maintenance of roads, buildings, and other facilities.

In fiscal year 1965 an initial $1 million is provided for construction of sanitation and protection facilities on certain public lands under multiple-use management where public recreational use is heavy. These facilities will help to reduce hazards to public health in such areas as the Owens River in California and the Salmon River in Idaho where present intensive use without facilities is resulting in pollution and other health hazards. Construction of the first phase of the Anchorage, Alaska, fire control station is scheduled for $400,000. This facility, when completed, will permit more efficient fire protection and control for southwestern Alaska.

The Bureau of Land Management is a producer of substantial revenue to the U.S. Treasury and to States and counties. Receipts for 1965 are estimated at $445 million, of which $69 million will be paid to States and counties in which the public lands are located. Thus, receipts continue to be several times the amount of investment in the resource management and development programs conducted by the Bureau.

BUREAU OF INDIAN AFFAIRS

The budget estimate for the Bureau of Indian Affairs for the fiscal year 1965 is $210,293,000, a net increase of $3,766,250 over the adjusted appropriation for the fiscal year 1964 of $206,526,750. Of this increase, $1,264,450 is for increased pay costs and $2,501,800 is for increased program operations.

EDUCATION AND WELFARE

For education and welfare services the estimate is $96,970,000, a program increase of $6,971,800 over 1964. Program increases are included for additional costs to public schools educating Indian children under Johnson-O'Malley plans; increased enrollment in Federal facilities; increased child welfare caseloads; an expanded program of adult vocational training; and expansion of law and order programs where most urgently needed.

RESOURCES MANAGEMENT

For resources management the estimate is $40,728,000, a program increase of $2,636,000 over 1964. The program increases are for additional timber sales; additional credit staff to service the growing number of loan and financing transactions; improved road maintenance of school bus routes; additional real estate staff to handle the ever-increasing number of real property transactions; and the maintenance of newly constructed Federal facilities. Increases are also requested for economic development program.

CONSTRUCTION

The estimate for construction is $51,176,000 as compared with $58,238,000 for fiscal year 1964. The major portion of these funds will be used for the replacement, expansion, and improvement of obsolete school facilities; relief of some overcrowding; and for an increasing school population. Funds also are included for the continuation of construction of the Navajo Indian irrigation project.

ROAD CONSTRUCTION

The estimate for road construction is $17 million as compared to $15 million for the fiscal year 1964. These funds are needed to liquidate obligations incurred under contract authorization provided in the Federal Aid Highway Act.

MENOMINEE TRIBE SCHOOL COSTS

The estimates also include $88,000 for payment to the State of Wisconsin for joint school district costs for the county of Menominee. These funds are requested to lessen the impact of the termination of Federal services to the Menominee Tribe.

National Park Service

It is estimated that park visitation will reach 102 million in 1965 as compared to 94,093,000 in 1963 and an estimate of 96 million in 1964. In addition to the need to recognize and plan for serving the increasing number of visitors, the budget also makes provision for increased fund requirements for operating and maintaining the many new and reconstructed facilities that are being completed in the parks under the Mission 66 construction program.

The 1965 fiscal year budget provides $111,030,000 for the National Park Service. This is a net decrease of $1,421,829 under the amount available for 1964.

MANAGEMENT AND PROTECTION

The budget provides $29,712,000 for "Management and protection," an increase of $2,635,417 over the amount available for 1964; $23,500,000 for "Maintenance and rehabilitation of physical facilities," an increase of $1,958,504; $2,412,000 for "General administrative expenses," an increase of $275,250; $25,406,000 for "Construction," a decrease of $7,291,000; and $30 million for "Construction (liquidation of contract authorization)," an increase of $1 million.

The increase requested for the "Management and protection" and "Maintenance and Rehabilitation of physical facilities" appropriations, totaling $4,593,921, provides $3,658,321 for the benefit of park operating programs; $430,000 to cover wage rate increases in effect as of August 15, 1963, and $505,600 to meet increased costs incident to classified employee salary increases made pursuant to Public Law 87-793. These proposed increases include funds for operating and maintaining the following new areas for which funds are not now provided: Hamilton Grange National Memorial, N.Y., and the Frederick Douglass Home, District of Columbia. Also in the category of increases for the benefit of park operating programs is provision for strengthening the U.S. Park Police Force for the National Capital park areas; for continuing and expanding the program commenced in fiscal 1963 for converting existing park radio systems to narrow-band frequencies; for paying service connection charges incident to obtaining commercial electric and telephone service in some of the isolated park areas; for more adequate fire protection service in the parks; and for production of increased quantities of informational publications to meet heavy visitor demands. It is also proposed to initiate a coordinated program of natural science and wildlife management studies to provide needed facts and information upon which to base policy, program and management decisions having to do with the preservation, development, and use of the parks.

CONSTRUCTION ESTIMATES

The construction estimate provides for the following:

Buildings, utilities, and other facilities	$24,926,000
Acquisition of water rights	480,000
Total	25,406,000

The estimate for buildings, utilities, and other facilities provides $3,870,000 for the first stage of a supplemental water supply and rehabilitation of the sewer system project at Grand Canyon National Park, Ariz.; $1,826,900 for various developments including a day-use building at Mount Rainier National Park, Wash.; $799,500 for continuing work at Independence National Historical Park, Pa.; $1,291,300 for various developments at Glacier Bay and Sitka National Monuments in Alaska; and $1,031,000 for various developments at Yellowstone National Park, Wyo. The program provides $16,107,300 for various buildings, utilities, and related projects in other park areas.

The 1965 fiscal year fund requirement for acquisition of lands is not included in this estimate. It is to be included in the proposed 1965 supplemental estimate of the Bureau of Outdoor Recreation to be funded from the proposed land and water conservation fund. This action accounts for the major portion ($5,300,000) of the reduction ($7,291,000) indicated in the third paragraph of this statement under the "Construction" appropriation item.

CONSTRUCTION (LIQUIDATION OF CONTRACT AUTHORIZATION)

The budget request of $30 million under the item "Construction (liquidation of contract authorization)" is for partial liquidation of obligations to be incurred under the 1965 contract authorization and obligations incurred under the contract authorization for 1964 and prior years. The roads and trails and parkways construction programs are in the amounts of $21,600,000 and $12,400,000, respectively, for which contract authorization is provided in the Federal-Aid Highway Act of 1962. Some of the major projects included in these programs are as follows: $2,405,000 is included for completing the 11-mile gap around Asheville, N.C., on the Blue Ridge Parkway on which construction is now underway or has been financed (this 11-mile section and the 5.5 miles around Grandfather Mountain are the only stretches of the entire Blue Ridge Parkway remaining to be completed); $1,385,000 is included for starting construction on a 5.5 mile section of road from the eastern terminus of the Foothills Parkway in Tennessee, at the Pigeon River, to connect with proposed Interstate Route 40 near Brown Island, at the Pigeon River, where the State is constructing an interchange for the Foothills Parkway; $1,304,700 is included for continuing construction on the Natchez Trace Parkway in Mississippi, from U.S. Highway 61 at Port Gibson, to Mississippi Highway 552, for a distance of about 6 miles; and $1 million is included for construction of city streets in the city of Vicksburg, Miss., as a substitute for roads being removed from Vicksburg National Military Park, pursuant to the provisions of Public Law 88–37, approved June 4, 1963.

GENERAL ADMINISTRATIVE EXPENSES

The increase of $275,250 for "General administrative expenses" provides for strengthening the administrative staffs in the Washington and regional offices to meet the increase in administrative workload that has taken place since the commencement of Mission 66 and to intensify management analysis and statistical functions in the interest of full utilization of manpower and fund resources; and for increased salary costs as authorized by Public Law 87–793.

Bureau of Outdoor Recreation

The Bureau is requesting a total of $2,700,000 for 1965, an increase of $800,000 over the amount appropriated in fiscal year 1964. The increase is needed for work on the nationwide recreation plan, to assist the States in developing statewide plans, to investigate special areas being considered for recreation development, and to strengthen the Bureau's coordinating function, particularly in the review of programs, budgets, and legislation of other Federal agencies.

The Bureau's program for 1965 is based on the ultimate objective of providing adequate outdoor recreation opportunities to meet the needs of the public. It is essential that action be taken now toward providing for the future more and better outdoor opportunities so that the Nation's citizens may use their leisure hours in the pursuit of constructive and healthful outdoor activities. Increases in population, leisure time, personal income, and mobility have combined to greatly expand the demands for outdoor recreation. The Congress has recognized that action in this field is a public as well as private responsibility.

Most outdoor recreation areas now are overcrowded and inadequate to meet current demands, and these demands are increasing at a very rapid rate. With the Nation's population expected to reach 350 million by the year 2000, just 37 years from now, it is important that immediate action be taken.

NATIONWIDE RECREATION PLAN

One of the primary functions of the Bureau, and the one which has top priority, is to formulate and maintain a comprehensive nationwide recreation plan. The funds requested for 1965 will allow the Bureau to accelerate the preparation of such a plan so as to meet the deadline set by Congress for its completion. This plan will identify current and future demand for outdoor recreation throughout the country, the resources currently available and those potentially available for the future, and will include recommendations as to how the needs can be met most effectively. The nationwide recreation plan will be built, in a large part, on plans developed by States. For this reason, the Bureau will give increased assistance to the States in the development of their plans.

Heretofore, assistance has been furnished to States covering a wide range of service-type activities. The Bureau proposes to discontinue furnishing such service-type activities to State and local agencies, as well as Federal agencies, and

concentrate its efforts on the devlopment of the nationwide recreation plan and to strengthening its program of Federal coordination.

The Bureau will be faced with a heavy load in reviewing special areas that offer outstanding recreation potential. In addition to areas presently scheduled for study, it is expected that data developed under the nationwide recreation plan will pinpoint other areas that should be reviewed carefully. This phase of the Bureau's program has a special sense of urgency, because if action is not taken soon to preserve these areas for recreation, they will be lost forever for that purpose either by preemption for other use or by becoming prohibitively expensive.

Recreation Advisory Council

The Bureau will strengthen its Federal coordination function and will assist the Secretary in carrying out responsibilities assigned to him by the President under Executive Order 11017, issued April 28, 1962. That order directed the Secretary, in consultation with other members of the Recreation Advisory Council, to develop methods and procedures for improved interagency coordination in the development and carrying out of national outdoor recreation policies and programs.

The Bureau has initiated a comprehensive approach to Federal coordination. In accordance with the authority in the act of May 28, 1963, the Bureau will commence an intensive review of the authorities, functions, programs, budgets, operations, and proposed legislation of Fedral agencies engaged in outdoor recreation activities.

Report on Recreation Activities

The Bureau will prepare a comprehensive report encompassing the recreation activities of the entire Federal Government. This report will point out overlaps and gaps in the Federal effort, effectiveness of Federal expenditures, omissions and conflicts in Federal policy, and recommend any adjustments that are believed to be needed in administrative responsibility, budgets, policy clarification, Federal-State relations, and legislative needs. The new approach to Federal coordination will provide the Congress and the executive branch of the Government with data on which to make basic policy decisions.

Through its program of Federal coordination, the Bureau has a unique opportunity to contribute to the efficiency of Federal Government operations. For example, about $100 million are expended annually for acquisition of recreation lands or lands that have recreation capabilities. Large sums are spent for recreation research and for operation and maintenance of recreation facilities. The Bureau is the one agency in the Federal Government where all projected expenditures for outdoor recreation activities can be summarized and reviewed by specialists in this field. This has never been done before although the Bureau did accumulate and review proposed Federal expenditures for fiscal year 1965–66 for outdoor recreation land acquisition and for research.

It is estimated that all agencies of the Federal Government expend an estimated $300 million annually in programs directly related to outdoor recreation. The need for an impartial review of these programs is obvious. The Bureau's total request for funds is less than 1 percent of this figure.

River Basin Review

The Bureau will devote efforts to recreation planning in river basins and at water resource projects mainly on a reimbursable basis from other agencies. These areas offer tremendous potential for meeting the needs of the public for water-oriented recreation. These studies will be conducted in most instances as part of the comprehensive river basin review being conducted by various Federal agencies under coordinated direction and will contribute to the nationwide planning effort. The Bureau also will give attention to improving methods for determining and evaluating recreation benefits and cost allocations on Federal reservoir projects.

The Bureau will assist to a very limited degree, educational institutions and others in establishing education programs and activities and to encourage public use and benefits from outdoor recreation. To this end, planning has been initiated for holding a national conference on outdoor recreation education in July 1964 under the joint sponsorship of Syracuse University; State University of New York, College of Forestry; and the Bureau of Outdoor Recreation.

Provision is made in the budget for later transmission of a request for $40 million for fiscal year 1965 to provide funds for initial operation of the land and water conservation fund upon enactment of authorizing legislation.

Office of Territories

The estimate of $36,314,000 includes $10,108,000 for Guam, $8,037,000 for American Samoa and $17,500,000 for the Trust Territory of the Pacific Islands. These funds will provide that continued emphasis be placed on the economic, social, and political development of these areas. The budget also contemplates a supplemental estimate of $11,464,000 for fiscal year 1964 for Guam to begin a rehabilitation program authorized by Public Law 88–170 of November 4, 1963.

The $10,108,000 estimate for Guam provides $10 million to enable that territory to go forward with the second phase of the rehabilitation program, including $940,000 for the College of Guam, $850,000 for an air terminal, $6,973,000 for sewer, water and power facilities, $1,137,000 for village development, and $100,000 for harbor planning.

The estimate of $8,037,000 for American Samoa is a net decrease of $4,239,000 under the current year appropriation, due mainly to a sharp decrease in requirements for the construction program since most major projects included in the 3-year greatly expanded program begun in fiscal year 1962 are scheduled for completion by the end of fiscal 1964. The budget year program includes $7,748,811 in the form of grants which will permit continued emphasis on education, particularly the educational TV program, public health, communications, and public works.

Trust Territory of the Pacific Islands

The United States, through the Department of the Interior, administers the trust territory under a trusteeship agreement with the Security Council of the United Nations. As administering authority, the United States has obligated itself to promote political, economic, and educational development, and to improve the health and well-being of the Micronesians through improved public health measures. The trust territory covers a water area of 3 million square miles, with a total land area of 687 square miles. The population totals better than 80,000.

The estimate of $17,500,000 for the trust territory of the Pacific Islands is an increase of $2,500,000 over the amount available in the current fiscal year. It includes $4,920,000 for the construction program, $1,304,000 of which is for educational facilities, both elementary and secondary, $888,000 to complete a new hospital for the Truk district, and $2,728,000 for housing, airfield, power and water, road, communications, and other facilities. Other significant amounts are $3,900,000 for educational services, $2,120,000 for expanded medical services, $1,285,000 for resources management and development, and $3,575,000 for operations, maintenance, transportation, and communications services.

Mineral Resources

The program for the development and conservation of the mineral resources is carried out by the Geological Survey, Bureau of Mines, and the Offices of Coal Research, Minerals Exploration, and Oil and Gas.

The estimate for 1965 is $138,951,000, an increase of $23,219,500 over the $115,731,500 available for 1964.

Geological Survey

The 1965 budget estimate for the Geological Survey is $69,223,000. This represents an increase of $5,523,000 over 1964, of which $990,000 is for increased pay costs for fiscal year 1964 positions. The program increase of $4,533,000 will permit increased emphasis on investigations and data collection, which are vital to the proper development and management of the Nation's natural resources.

The principal elements of the topographic mapping program will continue during 1965 at very nearly the same rate as for 1964. There will be progress toward completion of standard quadrangle mapping of the Nation, remapping of areas where presently available maps, made many years ago, do not satisfy today's needs, and revising maps where cultural development has made the existing map obsolete. The distribution of the total effort among these major elements is largely determined by the priority requests by map-using agencies in Federal and State Governments. The mapping program is, therefore, a reflection of mapping needs, principally those in commerce, defense and natural resources. For 1965, the estimate of funds is $22,301,000, of which $315,000 is for increased pay costs and $346,000 will allow resumption of work on the National Atlas, a project which began in 1962.

A program increase of $500,000 is proposed for the oceanographic work of the Geological Survey. This will provide $998,000 to enable the Survey to maintain its role of providing geologic and hydrologic support to the Federal interagency oceanographic program.

An increase of $1,250,000 for geologic and mineral resource surveys and mapping includes $265,000 for increased pay costs and $985,000 for the Upper Mantle project, which seeks many types of basic information on the earth's crust, supporting other activities by the Geological Survey and other agencies.

For the conservation of lands and minerals, an increase of $90,000 for increased pay costs and $100,000 for program is budgeted. The program increase will cover the costs of supervising rapidly increasing oil production and prospecting in the Outer Continental Shelves and in Alaska, and the transfer of royalty accounting to an automatic data-processing system.

Denver Federal Center

Plans are virtually complete for a building at the Denver Federal Center to house activities involving nuclear materials. Funds to begin construction of the building in 1965 are requested in the amount of $1 million.

The budget estimate for data collection and research in the field of water resources, including work in the soil-moisture program, is $20,992,000 for 1965. This represents an increase of $2,092,000, of which $290,000 will be for increased pay costs. The program increase is primarily to accelerate the collection of basic streamflow, ground water and water-quality information to keep pace with the current surge in planning for water-resource development. Financial cooperation with States and municipalities is the traditional basis for most basic data collection. The budget estimate for 1965 includes $10,800,000 to match a like amount offered by the States, to continue at a slightly increased rate these cooperative programs.

Bureau of Mines

The budget estimate for the Bureau of Mines for fiscal year 1965 is $41,332,000, an increase of $1,841,000 over the adjusted appropriation for fiscal year 1964. After adjusting for increased pay costs, the estimate provides for a net increase of $898,000 for expansion of the Bureau's health and safety and conservation and development of mineral resources programs. In addition $20 million of borrowing authority, an increase of $14 million, is requested to enable the Bureau to carry out its helium conservation program.

CONSERVATION AND DEVELOPMENT

For conservation and development of mineral resources the estimate is $30,377,000. This estimate provides for a net program increase of $313,000 over fiscal year 1964. A program increase of $217,000 is requested to start a well-balanced program aimed at overcoming problems caused by the emission of methane gas during mining operations. An increase of $200,000 is requested for research on in situ retotring of oil shale; and $126,000 for new studies to determine the economic significance, methods of recovery, and utilization of marine mineral deposits. A program decrease of $235,000 is reflected in the anthracite program.

HEALTH AND SAFETY

For the health and safety appropriation the estimate is $9,530,000. A net program increase of $660,000 provides $140,000 for expansion of the safety education and training program to meet requirements of present-day mining industries and to keep abreast of rapidly changing mining conditions; $370,000 to extend research and development for controlling the float-coal dust hazard; particularly in mechanized coal mines; $150,000 for research to improve mine ventilation; and $100,000 to expedite development of methane-monitoring devices to combat the hazard of mine explosions. A decrease of $100,000 is reflected under this appropriation due to termination of the study to appraise health and safety conditions and practles in metal and nonmetal mines.

Helium Fund

The budget estimate for the helium fund is $20 million (borrowing authority), an increase of $14 million over the amount authorized for 1964. The $20 million borrowing authority is used, in addition to income received from the sale of helium

and related services, for the production, conservation, purchase, and sale of helium; location and development of helium properties and reserves; and research on the properties and uses of helium to promote its wise and effective use.

COAL, MINERALS, AND PETROLEUM OFFICES

Office of Coal Research	$6, 836, 000
Office of Minerals Exploration	900, 000
Office of Oil and Gas	660, 000
Total estimate, 1965	8, 396, 000

The total estimate of $8,396,000 for these Offices is an increase of $1,855,500 over the amount appropriated for fiscal year 1964, but is a decrease of $3,085,385 under the amount available due to carryover balances.

The major part of the increase ($1,761,000) will allow for additional contract coal research.

OFFICE OF COAL RESEARCH

In the relatively short period of its operation, the Office of Coal Research has been able to stimulate the interest of outstanding research organizations, some of whom have previously had no research activities in the field of coal research. As an outgrowth of such interest, proposals have been received from individuals and organizations throughout the Nation.

Within the limitations of prudent operations, the OCR has developed an overall research program which is represented by the projects currently underway and planned through fiscal year 1965. It is estimated that these contract research projects offer the best possibility to achieve technical and economic feasibility within the reasonably short-term future and thus meet the objectives of the Congress and the administration to provide substantive assistance to the coal industry, and all associated with it. At the same time, these projects will, if successful, assist in a very substantial degree the best conservation interests of the Department of the Interior and our country by seeking out the highest potential uses for coal as one of the most abundant and important natural resources with which our Nation has been blessed.

CONTRACT PROPOSAL EVALUATION

The Office of Coal Research, through its own staff, and through the use of the extremely qualified scientists, technicians, and engineers who comprise its various technical consultant panels, seeks to evaluate contract proposals in a manner that assures the selection of projects offering the greatest potential for success, projects that must closely tie into the designs for an integrated total research program, and which seek to avoid any duplication of past or present research. OCR is working in closer cooperation than ever with the Bureau of Mines to avoid any duplication or overlap from this source as well.

It is important to note in this regard that OCR has many more worthy and even urgent projects to do than it has money for. This has compelled a constant screening process in the selection of projects for contracts.

The screening has sought to eliminate any research that might be done elsewhere, whether by the Bureau of Mines or any other research organization; eliminate any research which might be delayed for the time being without serious detrimental effect on other aspects of the OCR program; and selection of projects for contracting where there is the greatest probability of significant impact if the research is successful, and the probability of success of the research itself.

The expanding interest in OCR's contract activities and in coal as a basic raw material resource, by some of the key industrial and educational research organizations has also acted to stimulate internal research within the coal industry.

The OCR program has been instrumental in stimulating expanded activities by the coal industry in seeking out additional export markets. These efforts in recent months have been markedly successful. As a consequence, in addition to the direct benefits that accrue to everyone associated with the coal industry, our country's balance-of-payments problem and gold outflow problem has been lessened. At least part of the credit must accrue to the export market study completed by the Nathan Co. under an OCR contract.

It shall be the continuing endeavor of the OCR and the Department of the Interior to act favorably upon those projects which offer the greatest potential of genuine benefits to the largest segment of the coal industry at the earliest practicable time.

Office of Minerals Exploration

There is an increase of $50,000 for the Office of Minerals Exploration for financial assistance to participants in the exploration program.

Under Public Law 85–701, the Office of Minerals Exploration stimulates exploration by private industry for domestic sources of minerals by contracting to pay a specified part of the cost of authorized exploration work. Federal funds provided under a contract are repaid with interest by a royalty on production from the property. The program is designed to encourage exploration for long-range mineral reserves rather than to bring new properties into immediate production. The OME also administers the projects with royalty obligations under the program of the former Defense Minerals Exploration Administration.

The level of interest in exploration assistance is expected to continue in 1965. assuring the obligation of the entire amount requested for financial assistance

Office of Oil and Gas

There is also an increase of $44,500 for the Office of Oil and Gas.

The Office of Oil and Gas is a staff organization primarily responsible for the coordination of Federal oil and gas policies and activities and performs the following functions:

Provides advice and assistance to Federal and State agencies, Members of Congress, congressional committees, industry, foreign governments, and private citizens on oil and gas matters or activities.

Collaborates with the Office of Emergency Planning and the Departments of State and Defense on petroleum problems involved in potential and actual crises in the Far East, the Middle East, and Western Europe.

Participates in the development of petroleum policies and special papers to be used by U.S. delegations at meetings of the Petroleum Planning Committee of NATO and other international organizations.

Conducts regular and special petroleum supply-demand studies, both domestic and worldwide, including data for U.S. and free world economic development and military support programs.

Serves as the principal channel of communication between the Federal Government and the Interstate Oil Compact Commission, State oil and gas regulatory bodies, and the petroleum and gas industries.

Fish and Wildlife Service

This Service is responsible for research and management programs to conserve fish and wildlife resources of the Nation for recreational and commercial use. The estimate of $74,234,000 is an increase of $2,708,539 over the $71,525,461 available in 1964.

Bureau of Commercial Fisheries

The estimates for the Bureau of Commercial Fisheries for 1965 total $26,445,000, an increase of $2,467,766 over the amount available for 1964. An additional $2,442,000, to be derived from the Pribilof Islands Fund, is being requested for "Administration of the Pribilof Islands." The increases proposed for fiscal year 1965 will not require any increase in overall Bureau employment over that authorized for fiscal year 1964.

The estimate for "Management and investigations of resources" totals $20,681,000. This represents an increase of $2,856,766 over the adjusted appropriation for 1964, and includes approximately $1.8 million for expansion of oceanographic research conducted by the Bureau as part of the national oceanographic program. The Departments of Navy and Commerce are responsible for the major portion of the national oceanographic program while responsibility for marine biological studies essential to the program are centered in the Bureau of Commercial Fisheries.

Other research programs, important to the health of the American public as well as the future of our country's fishing industry, for which an increase of $720,000 is budgeted are botulism and pesticides studies. Research on *Clostridium botulinum* type E will be conducted in cooperation with other Federal agencies to establish methods of eliminating the public health hazard of botulism poisoning from seafood products. Recent cases of smoked fish poisoning resulted in seven deaths and severe economic injury to the fishing industry.

Research

Biological research will be conducted to determine the effects of pesticides on aquatic life in its natural environment. Technological research will be conducted to establish when, and under what conditions, pesticides are taken up by fish and shellfish, and how to modify processing procedures to minimize harmful residues in fishery products offered for consumption. These studies will help to eliminate health hazards to the public and protect the economic position of the fishing industry.

Federal-State Columbia River Fishery Development Program

The Federal-State Columbia River fishery development program designed to offset losses to salmon and steelhead runs resulting from Federal water-use developments in the Columbia River Basin will be continued. The Columbia River salmon runs are a vital part of the highly important and valuable Pacific coast salmon industry. Damage to these runs have been mitigated through construction and operation of hatcheries, fish screens, fish ladders, and stream clearance. The budget includes $588,000 for construction and $2,260,000 for operation and maintenance of facilities for this program.

Special Foreign Currency Program

The estimate of $300,000 for the "Special foreign currency program" is the same as the 1964 appropriation. It provides for the use of foreign currencies to prosecute research which will benefit the United States.

These programs are investigating the fundamental, long-range aspects of biological and technological problems confronting domestic fisheries. The purpose is to increase the fund of basic knowledge upon which intelligent fishery management programs can be based.

Fishery Facilities

The estimate for "Construction of fishery facilities" is $4,200,000. This includes $1,000,000 for construction of a shellfish research center at Milford, Conn.; $1,500,000 for the construction of a biological research laboratory for the tropical Atlantic area; $350,000 for scientific equipment for the fishery research vessel for use in the North Pacific Ocean and Bering Sea which will be constructed out of funds appropriated in fiscal year 1964; and $1,350,000 for the construction of a replacement of the exploratory fishing vessel *Oregon* for use in the Gulf of Mexico, Caribbean and tropical Atlantic areas. These projects are essential to the orderly development of the national oceanographic program.

Administrative Expenses

The estimate of $676,000 for "General administrative expenses" represents an increase of $23,000 over 1964 to provide for increased pay costs for 1964 positions.

The 1965 budget does not include a request for funds under the appropriation "Construction of fishing vessels," resulting in a decrease of $750,000 compared to the fiscal year 1964 appropriation for that item. The program financed under the "Construction of fishing vessels" appropriation will terminate in fiscal year 1964 because of the deadline of June 12, 1963, for the filing of applications for assistance under the program provided in the authorizing legislation (74 Stat. 212).

Bureau of Sport Fisheries and Wildlife

The estimates for the annual definite appropriations total $47,396,000, an increase of $233,773 over 1964, as follows: "Management and investigations of resources," estimate $34,419,000, increase $3,859,273; "Construction," estimate $3,593,000, decrease $1,650,500; "Advances to migratory bird conservation account," estimate $8 million, decrease $2 million; and "General administrative expenses," estimate $1,384,000, increase $25,000.

The increase in the estimates and amounts becoming available from readjustment of priorities of continuing programs provide for the following urgent items in 1965: $593,781 for costs of the 1964 Pay Act and wage board and employees' compensation increases; $1,079,119 for operation of new fish hatchery, fishery research, wildlife refuge and wildlife research installations and facilities; $315,373 for more adequate management of refuges and replacement and overhaul of aircraft.

Pesticide Research

A major program expansion in the field of research on the effects of pesticides will be possible with an increase of $1,930,000 for new studies and $1,335,000 for construction of new laboratories at Columbia, Mo., and Denver, Colo. This expansion follows implementation by the President of the report of his Science Advisory Committee on use of pesticides. This report highlighted the increasing dangers from the widespread use of pesticides and the urgency of a step-up in the Government's program to find solution to the myriad of problems stemming from this modern-day phenomenon.

In addition to pesticide research laboratories, the construction program includes $150,000 for work at the Leavenworth, Wash., fish hatchery, $500,000 for plans and specifications for the National Fisheries Center and Aquarium at Washington, D.C., $1,468,000 for development on 12 wildlife refuges and advance planning and $140,000 for wildlife research facilities at Jamestown, N. Dak., and Laurel, Md.

Migratory Bird Conservation

The $8 million advance to the migratory bird conservation account and $4 million from the sale of duck stamps will support a balanced program of acquisition of 225,000 acres of land for migratory waterfowl of which 85,000 acres will be in refuges and 140,000 acres in waterfowl production areas.

Water Development

Office of Saline Water

The total budget estimate for the Office of Saline Water amounts to $12,950,000. This consists of $10,650,000 for the research and development program and $2,300,000 for the operation and maintenance of demonstration plants. The estimate for basic and applied research represents an increase of $650,000 over the appropriation for fiscal year 1964. The estimate for operation and maintenance of demonstration plants is $450,000 more than the appropriation for 1964.

The increase in the request for research funds reflects the desire of the President to develop an accelerated program of basic and fundamental studies in the search for more effective and economical means of saline water conversion as provided in Public Law 87–295, which authorizes $75 million for this work during fiscal years 1962 to 1967 inclusive. The general activities to be pursued include exploratory research, corrosion and equipment studies, extraction and use of byproducts, economic studies, small conversion units, pilot plant construction, and the operation of the research and development test station at Wrightsville Beach, N.C

construction funds

Construction funds for five saline water conversion demonstration plants authorized by Public Law 85–883 have already been appropriated. Four of these plants have been completed: a 1-million-gallon-per-day plant converting sea water to fresh at Freeport, Tex.; a 250,000-gallon-per-day plant desalting brackish water at Webster, S. Dak.; a 1-million-gallon-per-day sea water conversion plant at San Diego, Calif.; and a 1-million-gallon-per-day brackish underground water plant at Roswell, N. Mex. A fifth plant designed to produce 200,000 gallons of fresh water per day from sea water is under construction at Wrightsville Beach, N.C. The budget request for fiscal year 1965 will provide funds for the maintenance and operation of these plants and for continuous studies to develop more efficient methods of operation and plant improvements.

Legal Services

office of the solicitor

The estimate of $4,173,000 for the legal services of the Department is an increase of $174,000 over the amount available for 1964.

The function of the Solicitor is to provide legal services to the entire Department of the Interior, its bureaus and offices, its many field establishments and the secretariat.

The estimate will provide for increased pay costs, personnel benefits and a strengthening of the staff by filling some vacancies in established positions which is necessary in order to cope with the steadily increasing demand for legal services.

ADMINISTRATION

OFFICE OF THE SECRETARY

The estimate of $4,125,000 is an increase of $269,975 over the funds available in 1964.

The Secretary, the Under Secretary, the Assistant Secretaries, the resources program staff, and the Administrative Assistant Secretary, who provide for the general direction, guidance, and coordination of the bureaus and offices of the Department, are financed from this appropriation. The programs carried on are extremely diversified and have grown in size and importance during the past several years. New and expanded responsibilities and activities have been placed in the Department. It is important, therefore, that the Secretary and his supporting staffs be in a position to give strong direction and guidance, along with the necessary coordination of all programs.

The additional amount requested provides for increased pay costs under the Federal Employees Salary Act of 1962 and for general strengthening in certain areas.

BUDGET CARRIES ESSENTIALS

Secretary UDALL. First I should like to say that this is the fourth time I have appeared before this committee to present a budget. This is the tightest and leanest budget that I have presented by far, Mr. Chairman. It is, of course, in line with the directions of President Johnson that he wants us to tighten up the ship and to get maximum mileage out of each dollar. I want to assure you that this is a budget that has integrity, and nevertheless it is a very tight and lean budget.

I am sure the committee will scrutinize it carefully, but I think that you will find in looking at it that we have here really the bare essentials that we need in terms of funding for our programs.

This is a growing country. Out responsibilities are growing, and yet basically, I think you will find this to be a hold-the-line budget.

BUDGET HIGHLIGHTS

Just to give you the highlights, I am reading now on page 5 of my statement.

The budget request for 1965 is $1,027,667,000—this is $80,186,000 less than the amount included in the 1964 budget as it was first submitted to the Congress.

As to the estimates to be considered in this bill, the 1965 request is $643,617,000. While that amount is $42,650,935 more than the funds appropriated in fiscal year 1964, most of the increase is for what can fairly be described as unavoidable demands. Among the increases are $14 million for helium conservation, $10 million for Guam rehabilitation, $6,515,200 for Indian education, and $5,264,616 for pay cost increases legally effective January 5.

RECEIPTS OF DEPARTMENT

To understand fully the impact of Interior's budget upon the finances of the Federal Government, it is necessary to take into account the substantial revenues produced in the Department's operations. In the period 1962–64, the Department's receipts have ranged from 50 to 80 percent of its expenditures. And in 1965, it is estimated the net receipts of the Department will be $784,728,424, equal to more than 76 percent of the expenditure.

I submit there are few departments that can make that claim. For those departmental activities covered by the estimates of

$643,617,000 in this bill, receipts are estimated at $554,865,000—not including estimated receipts of $125 million from the land and water conservation fund now being considered in the Congress.

I want also to specifically discuss the employment levels, and I have mentioned this on pages 3 and 4 of my statement. I should like to read that to be precise about it. This is always a matter of concern to the committee and, of course, again I stress the fact that so many of our programs, Indians, and parks, and public lands, and with a growing country and growing problems, we do have a heavier load in these areas.

Attempt To Reduce Employment

The committee will be interested in the steps taken to reduce employment in the Department. You will recall that last year the committee indicated the maximum number of positions the Department might fill under the amounts appropriated for 1964. Not only have we maintained our employment within the number desired by the committee, we have taken action to insure that employment will be below that number.

The Department's end-of-year employment for 1964 is now fixed at 72,342. For 1965 the Department will limit employment to 72,279, which is 63 less than employment for the current fiscal year.

The anticipated decrease below the 1964 level would be greater were it not for the compelling necessity, and we feel we have no choice in this matter, of adding nearly 500 new positions to provide schoolteachers and supporting staff for urgently needed school facilities which will be completed for use in 1965 under the administration's high priority goal to provide educational opportunity for all Indian children of school age.

This will give you some idea again, Mr. Chairman, of the tightness in this area.

Trust Territories Funding, Pacific

I should like to cover two or three additional highlights with regard to new programs that are upcoming or a special problem.

We are proposing in this budget to fully fund the $17.5 million authorized for the Trust Territories of the Pacific Islands. This, of course, is a special responsibility under the Trusteeship Council of the United Nations. As a matter of fact, there is a mission from the United Nations, as they do regularly every few years, going out to inspect the trust territories now.

We have to move rapidly to prepare these people to make their own way, and to have an economy that is viable, and provide them with education, and we think full funding of this program is highly vital.

Saline Water Program

With regard to the saline water program, there are not any substantial increases in this program, but I should like to say that I think we are nearing the point where the faith of this committee over the past 12 years in this program, and the moneys that have been appropriated for this big research and experimental program that has been going forward—I think we are nearing the point of a big breakthrough where we can bring the price down, where we can move into large plants.

We are not going to do this by pulling a rabbit out of the hat, but I think technology is reaching the point where we know a lot more than we did know, and I think the big economies are going to come when you move to large plants.

ONE PLANT FOR PROCESSING WATER

And No. 2, we think the key now, one of the new things that we have decided in the last year and a half is to have one plant. You have to heat water for most of the processes that are involved. You have to have energy to do it.

If you can have one large plant which simultaneously produces electric power which needs high pressure steam to turn the turbines, and water, desalinate water, which needs low pressure steam, you just lead off the low pressure steam and use it, instead of wasting it. This combination will have one plant and will produce cheap power and cheap water simultaneously.

We don't have all the answers yet, but there is an interesting item, that may be a little bit premature, in the press this morning that gives you some idea of what we are thinking about.

Possible Use of Atomic Energy

Chairman Hayden. The use of atomic energy has been gone into very carefully, I assume.

Secretary Udall. Yes, this is the idea of wedding atomic energy to saline water. This is being considered and this may be very promising in some areas. Where you have other fuel that is available cheaper, you would use that other fuel. But with atomic energy I think these two programs, over the long haul, you are going to find them wedded together more and more.

Cost of Desalinating Water

Senator Bible. At that point, Mr. Secretary, what is the cheapest that you have been able to produce water from the sea, on a gallon measure or an acre-foot measure?

Secretary Udall. Well, we measure it by the 1,000 gallons, and I think the price now that variously is quoted is particularly for our San Diego plant, which is being moved to Guantanamo. We were very pleased that this could be done.

This plant has been in operation nearly 2 years, and as a matter of fact, this was a plant designed as a 1-million-gallon-a-day plant, Through experimenting with new methods and so on, they actually got the capacity of the plant up nearly to 1⅓ million gallons. If they could have had a larger pump they could have even increased it more. This is out of a plant designed for only 1 million gallons.

I think at maximum operation, the price in the neighborhood of $1 a thousand gallons is what they have been talking about. But we think if you had multiple units of this type of plant, and if you were to go to, say 10 million gallons a day, or 25 million gallons a day, the price is going to break down to 60, 50 and 40 cents as we move ahead, so that we think that we are ready to make the big break below $1.

ECONOMICALLY FEASIBLE COST

Senator BIBLE. At what figure does it become economically feasible for use as either industrial or for domestic consumption?

Secretary UDALL. Well, as far as an area like Key West, Fla., if you can produce 50- or 60-cent water, this is economical. It depends upon the area. In most municipalities in this country and areas where there are not water shortages, I suppose it is in the neighborhood of 15 or 20 cents. But there are other areas of the country where it is dry, and where the price of 30 or 35 cents is economical.

Senator BIBLE. How far are you away from 50 cents per thousand gallons?

Secretary UDALL. I think that we are very close, Senator.

Senator BIBLE. Water at San Diego costs $1 per thousand?

Secretary UDALL. That is right, but this is one small plant, and we think that with the economies of moving to very large plants and of moving to plants which will produce both water and power, that these are going to pull the price down sharply.

COST OF PLANT

Senator BIBLE. What would it cost to build a plant, say near San Diego, to supply that area?

Secretary UDALL. Well, roughly, Senator, with a 1-million-gallon-a-day plant, just sort of a rule of thumb to give you a rough idea, costs about $1 million, or in this neighborhood. This is what the San Diego plant costs, and I think it was something over $1 million.

Chairman HAYDEN. Is it a city or county plant?

Secretary UDALL. This actually is a plant which we built under this special authorization and this committee funded as one of these five experimental plants, and the Office of Saline Water operates it. We have a tie with the city of San Diego and they have been buying the water and paying for it, so that this is a type of combination we have.

MOVING PLANT TO GUANTANAMO

Senator BIBLE. You might comment briefly on the record, as I am sure some members of the committee would be interested, in the Guantanamo decision and the moving of the plant from San Diego to Guantanamo. It might be helpful for the record, Mr. Chairman, if this is all right with you.

Chairman HAYDEN. Certainly.

Secretary UDALL. Well, the Department of Defense and the President and others were confronted with this problem a few days ago. They began looking at a solution, which would be a sound solution. You can barge water in for hundreds of miles, which is what they are doing temporarily, to take care of the situation, but if you want a permanent solution, it was decided that the best solution was to set up desalination right there at the site which would provide the needs of the base.

You know the efficiency of the Seabees, they are still in operation, and it was felt the quickest and best solution was to just bodily pick up the San Diego plant and move it there, and this is underway right now. It is going to be done very rapidly, and this was the first step.

QUESTION OF PLANT CAPACITY

I think probably this plant will not provide the entire amount of water that is needed. They may end up building one or two other units just like the San Diego plant, also at Guantanamo, but I don't think the decision has been made. Nevertheless, the saline water process has reached the point where we moved in and solved a problem of this kind.

Senator BIBLE. This resulted in a complete close down of the San Diego plant?

Secretary UDALL. Yes, it does, except our present plan, we haven't reached the point of final decision on this, is to rebuild and replace it with a new plant.

Senator BIBLE. As I recall, the authorizing law provided for one on the east coast, and one on the west coast, and one on the inland brackish area, and one on the gulf.

Secretary UDALL. Two inland brackish plants, one in South Dakota and one in New Mexico.

PLANT FOR PACIFIC COAST

Senator BIBLE. This means that there will be none along the Pacific coast when this moving is completed?

Secretary UDALL. That is right.

Senator BIBLE. And it is contemplated that you will put another in operation there?

Secretary UDALL. That is right, so we can continue our experimental work there. But we are hopeful that we will move out of this 1 million gallon and less experimental plant stage this year, and move into these large plants.

Senator BIBLE. Does the law permit you to do that? I recall some discussion at the time the amendment was offered to the law, and I thought that they were keeping it pretty much on an experimental pilot plant basis, rather than a full-scale operation.

AUTHORITY FOR LARGER PLANT

Do you have the authority to build a larger plant?

Secretary UDALL. Well, we will have to come to the committees for clearance on anything that we do, but under the latest act, the act authorizing these five demonstration plants, under the Anderson-Aspinall Act of 1951, we do have authority and in fact, we were directed to look toward moving into these larger plants.

If larger appropriations are necessary, and if we can't finance them by having a local municipality or someone else who needs water, provide the main financing, we would have to come back for special authorization by the committee and special funding by this committee.

SOURCE OF FUNDS FOR SAN DIEGO PLANT

Senator BIBLE. Now, in the replacement of the saline water plant at San Diego, would that be a DOD function? Do they provide the money for that?

Secretary UDALL. This is what we are working out, and it is a question of whether Defense, in effect, replaces that plant. I can't give you the details on it at the moment, because we are still working on it.

Senator BIBLE. Thank you, Mr. Chairman.

Land and Water Conservation Fund Bill

Secretary Udall. One very important new bill that has a bearing, a strong bearing, Mr. Chairman, on this appropriation bill is the land and water conservation fund bill. I want to explain this to the committee, and to be sure that you understand how it will function, if the Congress passes it.

Incidentally, both the House and Senate committees have had hearings on the bill, and the House committee has marked up the bill and it is in the Rules Committee. I understand that Congressman Aspinall has requested clearance by the Rules Committee and this should be granted shortly.

Normally, we would have in this bill money to provide for acquisition of lands for the new park areas, like Cape Cod, and Point Reyes, and so on, and also we would have money in for purchase of inholdings and so on. There is not money in this bill to do that. This money would come out of the moneys that would accrue in the land and water conservation fund bill, as contemplated by the bill that we recommended to the Congress.

The House committee went along with all of these provisions in the bill it wrote up, and this fund would operate in a different way than the reclamation fund, but nevertheless it is an earmarking of funds for conservation purposes. This is one of the few and honorable exceptions in terms of earmarking.

Revenues Accruing to Conservation Fund

I think conservation does deserve this experimental treatment, but it would provide that all of the receipts and revenues from national parks and from other public lands would go into the fund and would provide that $30 million. That is the 4-cent gas tax that boaters pay into the highway fund, and which is a windfall to the highway fund.

This is about $30 million a year that would go into the fund, and it provides also that the revenues the Government realizes annually from the sale of real property, since this fund is a purchase of real property, would also go into the fund.

However, this is not any kind of "back door" or irregular financing. We will present this to the committee and we will estimate the revenues that will go into this fund, and more than half, or 60 percent of this money will go to the States on a matching fund program for new outdoor recreation effort.

We will present this to the committee and the committee will fully scrutinize it as it does any regular appropriations. In other words, we have designed this to accord with the regular process. The committees have been working on this legislation really for 3 years. This is the third year. We are confident we can get a bill.

Supplemental Request Necessary

There is still some disagreement on details, but we think these things can be compromised out and we think the experience of the House committee, with them writing a bill, has already indicated we are going to have a bill.

If this legislation passes, we may have to come back in one of the last supplementals in order to carry out the missing elements in this bill which concern the appropriations for acquisition of new park land and of parks.

Senator BIBLE. I happen to wear a second hat in this field, that is as chairman of the Public Lands Subcommittee legislativewise, and we receive many requests from various interested people as to the creation of parks. The price tag, if we were to create all of the parks that are now before us, which have the approval of yourself and your Department, would be in the hundreds of millions of dollars.

FINANCING IN EVENT OF LEGISLATIVE FAILURE

Now, how are we going to finance those if this land and water conservation fund bill doesn't pass?

Secretary UDALL. Well, the answer, I think, Mr. Chairman, is this: As you well know, because you have been in the thick of this whole fight and you are more familiar than anyone I think in the Congress, except your counterpart on the House side, with all of the new park and national seashore and other proposals that are pending, many of them are costly, just as Point Reyes and Cape Cod were costly proposals.

If this fund bill passes, then it is designed to, and we think will, provide and be a funding mechanism to fund the acquisition of these areas that the country needs, and also to help the States get in this with both feet.

Therefore, we have sort of felt that this bill is needed to run interference and to provide the assurance of financing for this major outdoor recreation effort which has been recommended by the Outdoor Recreation Commission, and which we feel is necessary.

Therefore, I think that you are quite right that unless this bill passes, it does run up a red flag in terms of financing this whole big new program.

DEFERMENT OF PARK PROPOSALS AND REQUESTS

Senator BIBLE. At that point, I am wondering if we wouldn't be well advised to just put all of the park proposals and all of the requests on the shelf until we see what happens to this. What if this doesn't pass? Will you still ask for the seashores and the recreation areas?

Secretary UDALL. As I conceive it, as I am sure you know, Senator, this is all part of one program, and I think that the fund bill is necessary for us to, in effect, shift gears and to pass a lot of these measures that are needed. In a sense, maybe the Congress should wait and see what happens to the fund bill before it moves on other bills.

I would say this, however: Of course this is exactly what the House committee has done. Last year it spent so much time on this bill that it has passed, I think, very few of the park proposals that the Senate committee has sent over. If the fund bill passes the House soon, I think that they then will begin to move and the Senate at that time can take it up.

I think with the fund bill moving on ahead, you then have the assured financing for all of the proposals that have been submitted and that your committee is considering.

Canyon Lands Bill

Senator Bible. We have also passed Sleeping Bear Dunes, and we have Oregon Dunes before us, just to mention two that readily come to mind. But you wouldn't advise that we put a rider on the Canyon Lands bill, because they are not acquisitional bills. They are straight-up creations of national parks and seashores.

Secretary Udall. No, I wouldn't Senator. Partly out of my optimism, I think we are going to get some kind of a fund bill and it will have the money in it, but also take a bill like Canyon Land or your Great Basin bill, and some of these created out of the public lands, and there is no land acquisition cost in some of these bills. Some of them are very expensive and some are not.

I personally think that the work that your committee has done up to this point has been very judicious in terms of what has been done.

Federal-State Action in Water Research

There are just two or three other matters I would like to bring before the committee, Mr. Chairman. One concerns Senator Anderson's bill which passed last year, and this is patterned after, in a sense, the Department of Agriculture program for agricultural experiment stations, which is one of the oldest and most honorable research programs that the Government has.

This is designed to get State action and to coordinate Federal-State action in the whole field of water research. All of the scientists tell us, and all of the people in my Department tell us, and in fact, all of the papers that come across my desk tell me, that we are going to have more and more water problems.

These are water quality problems, as well as water conservation problems of all kinds. We are shorthanded today in terms of hydrologists and water scientists, and with the problems piling up, unless we can get a big effort going in our State universities and our universities to produce water scientists, we are not going to be able to do the job that is necessary.

As to Senator Anderson's bill, the Senate has passed it and the House committee has completed action on it and we think it is going to pass this year. This would provide funds for each of the States to designate either their land-grant university or some other university it they want to, it will be up to the States, to set up water research institutions and each State will get grants and there will also be a general grant program under this act to other institutions for research purposes.

Possible Supplemental Request on Water Research

This will get the type of effort that we feel is necessary and the the Senate committee felt was necessary, to really get or develop a corps of water research scientists and people so that we can take care of our water problems as they come up.

We think this is very soundly conceived legislation, and the administration has supported it and we think it is going to pass. This is another one that we may be coming back to you on before the session is over to get funds for.

Chairman HAYDEN. This would be a supplemental appropriation?

Secretary UDALL. Yes. I just want to say one other thing generally speaking, and I am sure this committee needs no missionary work on this front.

ATTACK ON POVERTY FOR INDIAN AREAS

The administration is still working on the attack-on-poverty program that the President has laid out. The details will be coming up soon to the Congress. There is one point that we have stressed in our Department. The President himself met with the Indian leaders and put them in the forefront of this attack-on-poverty program.

If we are really going to make an attack on the pockets of poverty in this country, whether you measure it by unemployment rates, education deficiencies, per capita income—you name the standards you want to use—the Indian people in this country will be right at the top of almost any list.

The overall unemployment rate on Indian reservations today in this country is 40 percent. In some instances, it is as high as 70 and 80 percent. This, of course, underscores the need not only for our on-going programs, but for including our Indian people in any poverty program that is presented.

The members of this committee who are from the States where there are Indian people, I want to alert you to this so that we can see that our Indian people and our Indian programs are strengthened to help us do something about this problem.

These are the only matters that I wished to highlight for the committee, Mr. Chairman, and I am happy to discuss any of these matters with you.

SOUTHWEST PACIFIC WATER PLAN

Senator BIBLE. I want to ask the Secretary several questions.

I think early this week you released the revised Pacific Southwest water plan. That included, among other things, the plan for the construction of the southern Nevada water project. Now, when do you anticipate that that proposal will clear the Bureau of the Budget and be transmitted to Congress for appropriate action?

Secretary UDALL. Well, as to the plan which was in the press over the weekend, we were under obligation to file it before the Federal Power Commission, because the Marble Canyon Dam has an application for license pending there, and the Commission had asked us to file a plan and we had to file it.

AMOUNT FOR LARGEST PROJECT

It has been at the Bureau of the Budget and the Bureau of the Budget has been considering it for the past 3 or 4 weeks. This is the largest single water project, I think, in the history of the Bureau of Reclamation.

Senator BIBLE. What is the total?

Secretary UDALL. Therefore, it does deserve close scrutiny.

Well, the first phase of the plan is $1,700 million. This is, of course, patterned after the regional approach, and basin account funding, and based on the upper Colorado project which I am sure all of the members of this committee are familiar with. I would say this, that I think that we are getting very close to clearance and I think it is

just a matter of a few days, and I think probably as soon as the committee schedules a hearing on the water problem in the Pacific Southwest, we should be ready to present the plan to the Congress.

Inclusion of Southern Nevada Water Plan

Senator Bible. Now, do you consider that the inclusion of the southern Nevada water plan within the broad Pacific Southwest water plan is an approval of that plan within the overall package?

Let me word it the other way. Do you approve the southern Nevada water plan?

Secretary Udall. I think that you will find, and of course we work very closely with the people in your State, that the southern Nevada water plan and the Moapa Valley project are both approved as to their financial feasibility as part of this plan, yes.

Senator Bible. Do you approve it as a separate project?

Secretary Udall. Well, Senator, happily the southern Nevada water supply project, which is a municipal water project which does not need subsidy from electric power revenues, is a project that does not need and does not hinge on the construction of new additional major power dams on the Colorado. This is one which can proceed as part of the overall plan.

If it is necessary at some time in the future to proceed separately on it, it can proceed separately. The Moapa Valley project is in the other category, however. It has to be keyed to a regional plan.

Urgency of Nevada Plan

Senator Bible. Well, you certainly know of the urgency of the southern Nevada water plan. They are in almost a critical water shortage in southern Nevada, and they have a timetable of 3 or 4 years. I think that each of us who has lived with the Colorado River so many years, as has the distinguished Chairman of this committee, knows that there are still many, many problems in working out not only the Central Arizona project, but also many of the other projects that are envisioned in your long-time project.

The State of Nevada simply can't wait that long to supply water, domestically and industrially, to the users in southern Nevada. I think we just must insist that this project move forward on its own and without delay and at the earliest possible date.

Regional Approach To Speed Action

Secretary Udall. Senator, the purpose of our devising a regional plan has not been to delay action. It has been to provide a vehicle for action, because this is a region of the country, as you are very familiar with, where you have had the biggest water fight in the West, and it has been going on for many years.

We think that we have put something together, and we have worked very closely with the Governors and water experts in all of the States, and that this is an action plan and it can move forward this year if everyone will get behind it. I am aware of the special problem that you have, and we think that the regional approach is the best approach, and it will be the most successful approach in the lower Colorado just as it was in the upper Colorado area.

RENEGOTIATION OF HOOVER POWER CONTRACTS

Senator BIBLE. Now, is there any attempt being made to renegotiate the present Hoover power contracts?

Secretary UDALL. No; not at the present time.

Senator BIBLE. There is none at the present time?

Secretary UDALL. No, sir.

Senator BIBLE. Necessary contracts are effective until 1987?

Secretary UDALL. They are 25-year contracts.

Senator BIBLE. There is no attempt to renegotiate those in order to pick up some extra revenue to subsidize part of this overall project?

Secretary UDALL. No. It is, however, an essential part of our plan that after the payout of Hoover Dam and Parker-Davis, that these dams would then go to work for a basin fund. This is an essential part of our plan.

Senator BIBLE. Well—but if I understand you correctly, there is no attempt to do that; and I doubt, as a lawyer, that you could do it prior to 1987.

Secretary UDALL. This is a contractual matter, and we couldn't, and we are not talking about it and this isn't involved in the plan in any way.

Senator BIBLE. And there is no attempt being made by the Interior Department to attempt to renegotiate these contracts prior to 1987?

Secretary UDALL. That is correct.

Senator BIBLE. Thank you.

MANPOWER CUTS

Senator MCGEE. I am sorry to be a little late. It is another case of one of these overlapping meetings this morning, but I have been disturbed, or at least apprehensive, about the manpower cuts that you are effectively working out in the Department of the Interior.

The reason I am disturbed about it is that I see your Department, Mr. Secretary, as the most potentially significant one in our whole economic base expansion in this country. I would think that at a time like this, when we are seeking to strengthen our economic roots, and to bring in greater resources so that we have a stronger economy, that you ought to be expanding.

I understand that you have spelled out a little bit how you are still able to continue to do that with the cuts that have been required of you. I wondered if you could address yourself to that for just a moment.

THREE-YEAR INCREASE IN EMPLOYMENT

Secretary UDALL. I did discuss this, Senator, before you came in, and I would like to say, generally speaking, we have gone through an expansion and a growth period during the last 3 years. I think that our employment is up from about 55,000 to 72,000 during the past 3 years.

Our responsibilities are growing, and the country is growing, and Congress builds new schools or opens new parks or gives us additional responsibilities in administering public land or authorizes additional reclamation projects, and of course, there has to be an expansion.

TIGHT POLICY THIS YEAR

What we are basically doing this year, however, is having a year when we deliberately set out to run a taut ship, and to do our very best in terms of trying to get better utilization of our manpower and greater efficiency. We think we can do it.

I wouldn't want to say to this committee that I think we can do it 2 or 3 years running, but I think at least up to this point this has been an exercise in efficiency that has been well received in the Department. I think we are getting good cooperation from our bureau chiefs, and I think that we can get more efficiency out of existing manpower.

But I think that you are quite right, and I made the point in the beginning, that if our responsibilities are going to grow, if the country is going to grow, inevitably we would have to have some increases. But I think that we can do this job this year. We certainly had a very good response from the field and from all of our people up to this point.

Senator McGee. I fully appreciate the fact that you are going to be able to meet your obligations this year with this kind of a conservation of manpower and this tightening of the screws. I think we ought to have every ounce of efficiency that we can command.

DANGER OF PENALIZING GROWTH RATE

What disturbs me is the momentum. Momentum becomes a long-range thing, and I know of no department of our Government in which the momentum that has begun under your leadership is more critical. I am a little disturbed at the prospect that in an attempt to tighten the screws, in an attempt to make sure that it is ultraefficient, we may penalize our growth rate economically.

NEED TO KEEP UP WITH NATIONAL EXPANSION

I don't know of any section of the country that holds a greater promise for the future of the whole Nation than the West with our resource potential, which is specifically under your jurisdiction. That is why I am very cautious about anything that will slow it down.

We are exploding so fast in our other responsibilities as a nation, and internationally, that unless we can at least keep even with that, and even ahead of it would be better, we are going to penalize our national effort, and our security effort, and our economic growth effort, and our prosperity effort, and our standard of living, and everything rides on our being able to move fast enough in the West.

As you know best of all, we can't bring in more water or new water conservation projects just by an act of Congress. We can't do it in 1 year, and we can't do it in 5 years, and we can't bring in a new breakthrough in new uses for coal, even though we are pecking away at that. It is on a pitifully small scale in my judgment. We can't prove out a lot of these things for tomorrow. We must take the long view—10 years or 15 years.

I appreciate the fact that your point of view is difficult to sell to the Congress when they are looking at a budget for 1 year, until they can get past an election. But I would hope we would not let that narrow our base so much that we are going to penalize ourselves the year after the election. I think the Nation's future depends too much on a long view.

EFFECTIVENESS NOT JEOPARDIZED

Secretary UDALL. Well, my feeling up to this point, Senator, because this is an attempt to get maximum efficiency, is that we can do this without impairing our effectiveness and our ability to discharge our responsibilities. I point out to you, the Bureau that had the largest number of employees in our Department, and this isn't all due to things like automation, is the Bureau of Reclamation.

What they submitted to me initially, and from the beginning before we entered into the economy drive, actually involved a very small cut of personnel. As a matter of fact, the Bureau of Reclamation, and this will interest you, which I think has something in the order of 11,400 employees, has about 8,000 less than it did in 1950. Yet it is carrying a heavier workload.

This is due, I think, to overall increase in efficiency, and again, once you have a bureau or agency that is running on a tight basis, it is hard to squeeze it any further. But at the same time, this does show you how by better utilization of manpower, and by more efficiency, that you can do a bigger job with fewer people in some areas.

Senator MCGEE. Thank you.

RECREATION FACILITIES NOT UNDER DEPARTMENT

Senator BIBLE. I had only one further question, Mr. Secretary, and maybe this is better developed through Mr. Crafts or Mr. Hartzog, but I have been intrigued for some time by the effort of the Bureau of Land Management, and maybe this is developed by Mr. Stoddard, for increased recreational facilities within the public domain that is not under the control of either the Park Service or the Department of Agriculture or the Forest Service.

Do you have a program outlined in that area, and how costly will it be? You made some effort to obtain some money for it a year ago, and I don't know what effort you are making in this present budget.

Secretary UDALL. This is one of the areas that has been a little distressing to me in some of our States, particularly in Nevada, as a prime example, where 87 percent of the land is in public ownership. Oregon and California are also areas where this problem is acute and Arizona has some problems, with this explosive growth of population.

In many of these public land areas which have very fine outdoor recreation potentials, the development of at least some minimal facilities or having at least some management becomes extremely important. I think that I discussed this matter, and I think the record will show it, with this committee 2 years ago, and I am not sure I didn't discuss it 3 years ago.

EARLIER REQUESTS FOR FUNDS

We had requests and the budget approved modest requests, I think, on the order of $700,000 for a beginning program in this field.

Senator BIBLE. At that point, do you have the legislative authority to proceed on these public domains in this manner?

Secretary UDALL. This is where the dispute arose, because our people, or my people, my solicitors, have been of the view all along that as far as the management of the public lands, we have just as much authority as, for example, the Forest Service has.

REASON FOR DENIAL OF FUNDS

The Forest Service has had outdoor recreation programs for years, and fine ones and good ones. They have no special bill that authorized them to do this. They have a general authorization in the management of lands for overall purposes. Yet there were some members of the other body, your counterpart committee and others, who took the view that we had no authority, and therefore, we were denied the appropriations on that basis.

That was true in the past. Yet, it is still our view that this is necessary. I am sure that you are familiar with some of the specific situations where we should be doing something, and I foresee that in the future exploiting the outdoor recreation potential of public domain lands is one of the big opportunities we have to do this outdoor recreation job.

The Forest Service can't do it all, and the Park Service can't do it all, and many of these areas are located closer to communities and large cities. Either we leave it there with no development, with no management, and a mess develops, which it is already, or we have a program.

It is our view, and I would be very happy to have my people go into it with the committee staff, we believe we do have authority.

FUNDS FOR SANITATION AND PROTECTIVE FACILITIES

Senator BIBLE. Do you request money for that in this budget?

Secretary UDALL. We have $1 million for construction of sanitation and protection facilities in the public lands.

Senator BIBLE. Is that the same thing?

Secretary UDALL. Well——

Senator BIBLE. Or is that just disguised a bit?

Secretary UDALL. Well, it isn't expressed in terms of outdoor recreation. It is expressed in terms of taking care of public health problems of people who use the public domain, and maybe the committees will see it in this light, where we couldn't get them to see it when we are talking about outdoor recreation.

Senator BIBLE. You are asking for the same thing, but you are asking for it under a different name? This is going to be the end result, and this is what you asked for last year, in general. I am not saying whether you are right or wrong, but there has been a point raised that you don't have authority to do it and I think that the committee should go into this.

I don't want to labor the point, because I am advised that this will be brought up or will be opened up when the Director of the Bureau of Land Management appears before us, as he does tomorrow morning.

DEPARTMENTAL POWER IN PUBLIC LANDS

Secretary UDALL. We have very broad powers to manage the public lands, and we manage them, particularly these grazing lands, for many purposes, as this committee well knows. I can simply say to you that there is a problem. These lands are being used, and

they are owned by the public, and the public can use them, but the question is in terms of public health, and in terms of protecting scenic values, and in terms of access, and everything else.

Are we going to let this thing continue helter-skelter on an unmanaged, unplanned basis, or are we going to do something about it and protect the public rights and the public health and so on?

So I think that you are correct in saying that this is roughly the same idea we are expressing, and we are talking a little bit more in terms of public health than in terms of outdoor recreation, but I must say in terms of reality it is the same thing.

I want to be honest with the committee.

Senator BIBLE. Thank you.

U.S. GEOLOGICAL SURVEY UNITIZATION SECTION, TRANSFER TO CASPER, WYO.

Senator MCGEE. Mr. Secretary, as you well know, the U.S. Geological Survey centers a great deal of its activities in the public lands States, particularly in my State of Wyoming where nearly 50 percent of the land area is a part of the public domain.

Casper, Wyo., in particular, is a focal point of activity since this area is recognized as the oil center for the Rocky Mountain region. Many persons and groups in the Casper area who are directly and indirectly involved with the public lands have advised me that present USGS forces there are inadequate. A particular grievance seems to be the location of the USGS Unitization Section far away from the public lands in Washington, D.C.

How many personnel are utilized in this Unitization Section?

Secretary UDALL. At the present time there are four full-time employees and two part-time employees in the Washington headquarters Unitization Section.

Senator MCGEE. Is it true that while they are located in Washington, D.C., the functions and work performed involves most immediately the public-land States?

Secretary UDALL. The work of the headquarters Unitization Section involves public lands, Indian lands, acquired lands, and offshore lands. The leases in these lands are located in 43 States including Alaska, and are predominantly on the public domain.

Senator MCGEE. Would not the services of this section be far more useful and beneficial to the people involved if it were centered in the area it serves?

Secretary UDALL. Action on unit plans is initiated in the regional offices, such as the office located in Casper, and work in the Washington office is limited to review for coordination and final processing. Due to the present organizational structure of the Department, and due to the widespread location of the leased lands, and the diversity of procedures involved in servicing the different types of land, we believe that Washington possesses the beneficial aspects of a centralized location, even though its geographical location would seem to negate this.

Senator MCGEE. What would be the cost of transferring this section to Casper, Wyo.?

Secretary UDALL. The cost of transferring the Unitization Section to Casper must be measured not only in the cost of transferring personnel and records and space costs but also indirect costs of training replacement personnel, the awkwardness of operating a coordinated

program at a location remote from headquarters, and the inconvenience to the public in traveling between Casper and distant parts of the country.

Senator McGEE. What, if any, major problems would be raised by such a relocation?

Secretary UDALL. The relocation of the Unitization Section to Casper would present several major problems. Perhaps the most serious of these would be the disruption of prompt and ready communication with the Director, the Solicitor of the Department, and my Office not only on the part of Survey representatives but of industry representatives as well.

Senator McGEE. Would this transfer, then, in your opinion, be feasible in view of the benefits to be derived by the persons affected in Wyoming and other Western States?

Secretary UDALL. Such a transfer is not considered to be feasible, for we doubt that there would be benefits derived from such a move except perhaps for a few operators located in or near Casper.

Chairman HAYDEN. If there is no further business, the committee will stand in recess until 10 a.m. tomorrow morning, when we will hear the Bureau of Land Management.

(Whereupon, at 11 a.m., Wednesday, February 19, 1964, the committee recessed, to reconvene at 10 a.m., Thursday, February 20, 1964.)

DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR 1965

THURSDAY, FEBRUARY 20, 1964

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met at 10 a.m., pursuant to recess, in room 1223 of the New Senate Office Building, Hon. Carl Hayden (chairman) presiding.

Present: Chairman Hayden, Senators Bible, McGee, Bartlett, and Mundt.

DEPARTMENT OF THE INTERIOR

BUREAU OF LAND MANAGEMENT

STATEMENTS OF CHARLES M. STODDARD, DIRECTOR OF THE BUREAU OF LAND MANAGEMENT; ROBERT E. WOLF, ASSISTANT TO THE DIRECTOR; JAMES P. BEIRNE, ASSISTANT DIRECTOR, ADMINISTRATION; MARK B. WELT, BUDGET AND FINANCE OFFICER; EUGENE V. ZUMWALT, ASSISTANT DIRECTOR, RANGE AND FOREST MANAGEMENT; IRVING SENZEL, CHIEF, DIVISION OF LANDS AND RECREATION; CHARLES E. REMINGTON, CHIEF, DIVISION OF ENGINEERING; JOHN E. DAWSON, BUDGET OFFICER

RECEIPTS OF BUREAU OF LAND MANAGEMENT

Chairman HAYDEN. The subcommittee will come to order.

This morning the committee will study the budget estimate of the Bureau of Land Management for fiscal year 1965. As usual, I wish first to place in the record a table showing receipts to the Bureau of Land Management, by sources, and another table showing the distribution of these receipts to the various States during fiscal year 1963.

(The tables referred to follow:)

RECEIPTS BY SOURCES

The following table shows actual receipts of the Bureau of Land Management for fiscal years 1961, 1962, and 1963, and the estimated receipts for 1964 and 1965.

	1961	1962	1963	1964	1965
Sales, public lands and materials	$4,250,000	$3,581,482	$3,382,561	$3,400,000	$3,400,000
Fees and commissions	2,476,549	2,849,944	3,004,406	3,000,000	3,000,000
Mineral leasing	109,677,284	117,062,197	118,562,815	120,000,000	124,130,000
Mineral leasing, Outer Continental Shelf	7,304,687	11,612,151	366,814,447	183,000,000	272,000,000
Grazing fees	2,982,188	2,780,252	4,027,587	4,890,000	5,170,000
Right-of-way leases	209,724	203,575	256,598	250,000	250,000
O. & C. and Coos Bay timber sales	29,866,075	32,070,557	31,261,912	37,300,000	34,000,000
Other timber sales	2,259,682	2,664,923	2,367,012	2,400,000	2,400,000
Miscellaneous receipts	219,968	692,421	1,015,322	951,000	951,000
Total	159,246,157	173,517,502	530,692,660	355,191,000	445,301,000

Allocation of Bureau of Land Management receipts to States, fiscal year 1963

State	Sales of public lands and timber	Mineral leases and permits	Taylor grazing leases	Taylor grazing districts	Other	Total
Alabama	$310	$3,069				$3,379
Alaska	11,510	8,446,127				8,457,637
Arizona	8,345	206,659	$25,008	$14,584		254,596
Arkansas	(27)	93,709				93,682
California	56,958	2,649,677	44,139	6,755		2,757,529
Colorado	8,893	3,321,165	8,437	16,389		3,354,884
Florida	59	110				169
Idaho	18,164	203,727	7,234	30,087		259,212
Illinois	2					2
Kansas		157,675	19			157,694
Louisiana	93	114,909				115,002
Michigan	98	3,627				3,725
Minnesota	5,881					5,881
Mississippi		11,397				11,397
Missouri	4					4
Montana	9,769	2,111,577	24,006	21,661	[1] $57,888	2,224,901
Nebraska		8,064	97			8,161
Nevada	38,622	146,676	7,764	58,218		251,280
New Mexico	12,708	9,499,757	6,111	40,667	[1] 2,465	9,561,708
North Dakota	40	399,284	2,205			401,529
Oklahoma	43	83,811	318			84,172
Oregon	47,047	2,163	12,283	25,331	[2] 15,259,969	15,346,793
South Dakota	645	105,460	11,030			117,135
Utah	4,611	3,772,121		31,776		3,808,508
Washington	657	1,243	4,681			6,581
Wisconsin	60					60
Wyoming	5,490	14,066,013	55,618	39,574		14,166,695
Total	229,982	45,408,020	208,950	285,042	15,320,322	61,452,316

[1] Executive Order 10787 of Nov. 6, 1958, from grazing.
[2] From O. & C. lands, $15,031,270; Coos Bay wagon road lands, $228,699.

Chairman HAYDEN. Also, I will place in the record the highlight statement furnished to the committee by the Bureau.

(The statement referred to follows:)

HIGHLIGHT STATEMENT

Selective expansion in programs to conserve the public lands characterizes the budget for fiscal year 1965 for the Bureau of Land Management. Areas of special emphasis are:

1. An adequate program for immediate rehabilitation of burned over areas;
2. Completion of forest inventories so that all forest resources of the public lands can be managed on a sustained-yield basis;
3. Construction of sanitation and protection facilities on certain public lands where public use is intensive;
4. Construction of fire control facilities at Anchorage, Alaska, to increase the efficiency of firefighting operations. Construction will be completed in 3 years.
5. A major revitalization of road and facilities maintenance programs so that existing roads and facilities can be used safely and investments made in them will be protected.

These developments along with adjustments in going programs are aimed at further improvement in public land management consistent with the increasing value and importance of the resources of these lands. One further element characterizes this budget: The program of improved resource management it incorporates will be performed although total Bureau employment will be reduced slightly below the fiscal year 1964 level as revised downward during the preparation of these estimates. Greater effectiveness by each employee will be necessary and will be achieved.

PUBLIC LAND MANAGEMENT

The past fiscal year has produced considerable progress in public land management:

1. The moratorium on the filing of certain types of applications for public lands was ended on September 1, 1962. The number of pending "land" cases in the land offices has been reduced from 40,000 to 15,000, and a distressing backlog

condition of 15 years standing was eliminated. Personnel previously required to service this backlog have been shifted to other work, including reassignments to district offices where they can contribute directly to the on-the-ground performance of multiple-use resource management.

2. Grazing fees were increased by 50 percent, providing a more reasonable return to the U.S. Treasury and funds for the development and maintenance of range improvements. The range adjudication program was emphasized and reached the 80 percent completed stage by the end of the year.

3. The Bureau joined with other land management agencies in prompt reaction to the Columbus Day forest blowdown of 1962 in the State of Oregon which involved over 1 billion board feet of timber under its administration. Special crews were assembled, emergency regulations issued, and other forest needs deferred in order to offer the timber for sale before it lost value and became the breeding ground for insects and endangered remaining stands to fire.

4. Efforts to halt deterioration of public lands were accelerated, as the conservation of soil and moisture remains of prime importance to the management and use of western natural resources. For example, over 200,000 acres were seeded, bringing the total seeded area to almost 3 million acres since 1935. However, 12 million acres remain in need of such treatment.

5. Extensive projects were conducted in 37 eligible areas under the accelerated public works program. In addition to advancing the conservation programs for these areas, 359 man-years of employment were provided in fiscal year 1963 to unemployed individuals in those localities.

The current fiscal year already has been marked by significant developments. The prodigious task of offering the windblown timber in Oregon has been completed. While administration of the cutting contracts remains, the forestry program now can begin to rebalance efforts as it recovers from the disruptions caused by the emergency sales program.

A new program of designating resource conservation areas has been initiated. Road construction projects have been started under the new program, public land development roads and trails, authorized by the Federal Aid Highway Act, 1962. This program is expected to provide more adequate road systems which are a basic essential to all resource management programs for the public lands.

Management of Lands and Resources Budget

The budget for fiscal year 1965 under the operating appropriation, "Management of lands and resources," is summarized below:

Appropriation, 1964	$44, 152, 500
Transfer to General Services Administration	−86, 000
Total amount available 1964	44, 066, 500
Net program increases	931, 500
Pay raise requirements	449, 000
Total program 1965	45, 447, 000

The amounts shown above for 1964 and 1965 are exclusive of supplemental appropriations for fire suppression costs which will be proposed during each year as required.

This Bureau strives for economy in all its operations. With the increases in conservation programs, some increases in personnel have been necessary. However, personal services has become a decreasing portion of the estimates, even including pay raise costs, as shown in the following table:

Comparison of personal services and total program management of lands and resources (exclusive of fire suppression)

Year	Total program	Personal services	Percent of total program
1960	$24, 095, 000	$15, 271, 000	63.4
1961	27, 709, 000	17, 235, 000	62.2
1962	32, 704, 000	19, 236, 000	58.8
1963 [1]	40, 775, 000	23, 537, 000	57.7
1964 estimate [1]	43, 666, 000	24, 960, 000	57.2
1965 estimate [1]	45, 047, 000	25, 735, 000	57.1

[1] Includes costs of pay raises authorized by Public Law 87-793.

Utilization of Manpower

New methods are explored and adopted when found to be practical. For example, hoversight techniques have been adopted in surveying in Alaska which permits the Bureau to double its survey accomplishments with the same manpower.

The Bureau currently is undergoing an organizational analysis with the assistance of the director of the Institute of Administrative Research, University of Washington. A major purpose of this study is to obtain more effective utilization of manpower. This report is expected shortly. In the meantime the Bureau has consolidated the division of lands and minerals and the land offices in several States, and in one instance consolidated the land office with a district office. Land examiners and mining engineers have been moved from State office headquarters to field locations in order to get higher production at less travel costs. Four field administrative offices have been consolidated into two in order to perform larger workloads with essentially the same total staffs.

The conservation work that is needed on the public lands serves as a constant challenge to the personnel of the Bureau to make the most of the financial and manpower resources that are available. Further economies that do not sacrifice sound accomplishments are sought continuously.

Revenues from public lands have exceeded the costs of administration by a ratio of 8 to 1 during the past 150 years. Gross receipts for all years through 1961 totaled more than $2.5 billion; of that total, the receipts of the last 15 years accounted for $1.5 billion. The cost of managing the public domain during the same 15-year period was $185 million.

Background of Director

Chairman Hayden. Mr. Charles Stoddard is the Director of the Bureau of Land Management, having assumed that position since the committee considered the budget estimates for the last fiscal year. Mr. Stoddard, will you please tell the committee something about yourself and then proceed with your presentation, either by highlighting your written statement or by reading it, as you prefer.

Mr. Stoddard. Do you want me to give you a brief statement of my background, Senator Hayden?

Chairman Hayden. Yes.

Mr. Stoddard. Well, I am trained in forestry. My home is in Wisconsin. I worked for some years before the war with the Forest Service. Since the war, I was in consulting forestry work and land management work and I own and operate a tree farm in northern Wisconsin, which I have had now for 28 years.

I have worked for Resources for the Future, a research foundation in this field as a member of the staff for 5 years. During the past 3 years, until last June 1, I headed the Secretary's Resources Program Staff in the Department of the Interior.

I have a brief statement which I will place in full in the record and highlight it, if that is your pleasure.

Chairman Hayden. Very well.

(The statement referred to follows:)

Statement of Charles H. Stoddard, Director, Bureau of Land Management

Mr. Chairman and members of the committee, we are here today to discuss the budget request for fiscal year 1965 needed to administer essential programs on over 465 million acres of public lands. This request involves no increases in manpower for the Bureau.

These lands are of increasing importance both for the renewable and nonrenewable natural resources which they supply to the economy and for their public use role essential to present and future western land needs.

This Bureau performs several land management functions, some of them exclusively on the lands administered by the Bureau, others on lands also administered by other agencies.

The Bureau acts upon private and public efforts to secure needed public lands for development.

The Bureau performs essential services for other agencies through programs such as the cadastral survey operations.

The Bureau, in cooperation with Geological Survey, is responsible for leasing of mineral resources.

The resources of these BLM lands contribute significantly to the economy of the Nation.

Approximately 1.35 billion board feet of timber and other forest products will be made available in 1965, resulting in receipts estimated at $36.4 million. Forage for over 10 million head of livestock is furnished for part of their annual requirements, generating grazing fees estimated at $5.2 million in 1965. Mineral leasing, especially of oil and gas, will bring in $124 million exclusive of the Outer Continental Shelf.

As a result of these revenue producing operations, payments to State and counties in 1965 are expected to exceed all operating appropriations for the Bureau by about $10 million. In addition, deposits to the reclamation fund will exceed Bureau appropriations by more than $3 million.

The operations of this Bureau contribute significantly to the economy, to the support of local and State government in the West, to resource development, and to the maintenance of lands available for future use and development which is of increasing importance in view of the rapid growth of our population.

BASIS FOR 1965 BUDGET

This 1965 budget is based on:

1. Sustaining programs for sound resource management with emphasis upon economy in all operations;
2. Initiating a program of constructing sanitation and protection facilities essential to protect public health and safety in the use of the public lands;
3. Adequate funds for the prompt rehabilitation of burned over lands;
4. Increased funds to maintain roads, buildings, and other facilities on a businesslike basis.

MANAGEMENT OF LANDS AND RESOURCES

The estimate for 1965 for the appropriation "Management of lands and resources" is $45,447,000, an increase of $1,380,500 over the amount available for 1964. A third of this increase provides for the increased pay costs for 1964 positions as authorized by Public Law 87-793.

The moratorium on certain types of land cases permitted the Bureau to reduce a longstanding problem and last year a reduction in funds for land office operations was proposed and effected. We are actively engaged in developing further streamlined procedures, simplified regulations, and operating economies and we now propose a further reduction in this budget for anticipated savings in 1965. Part of these savings is planned to aid with land classification work essential for orderly disposal and management and for records improvement projects. However, the overall program reduction in lands and minerals activities is $109,500 in these estimates. Improved public land disposal procedures, only possible if basic acts are revised or repealed, would provide over a period of years for further real economy.

GRAZING LANDS

A program increase of $70,000 for management of grazing lands is proposed to continue intensive efforts to complete privilege adjudication by July 1, 1967, and to improve the management of wildlife habitat. Over 10 million head of livestock owned by 29,000 ranching operations and close to 1½ million deer, antelope, and elk which attract millions of hunters depend partially upon the public lands for forage. Steady progress is being made in the cooperative use and conservation of the rangelands.

FORESTRY ACTIVITY

A program reduction of $326,000 is proposed for the forestry activity. This is the net result of several factors:

1. Financing the entire cost of forest management in western Oregon from this appropriation;
2. Financing all requirements of forest development and protection in western Oregon from the O. & C. grant lands appropriation;

3. An increase of $75,000 in the program for forestry work on public domain lands.

On this basis funds for management, development, and protection of forests in western Oregon approximate the 1964 level. However, the cost to this appropriation on a program basis is reduced by $401,000.

Public domain forestry outside of western Oregon is increased by $75,000 to provide for completion of forest inventories and reforestation surveys and to reduce the existing large reforestation backlog. These requirements will be met partially by economies in forest protection in Alaska. The completion of forest inventories for these lands outside of western Oregon is the first essential step to sound forest management and the development of optimum revenues.

CADASTRAL SURVEY

The cadastral survey program is at the same financial level as in fiscal year 1964 although a large backlog of needed work exists. This program also has benefited in recent years from the application of advanced techniques to permit a performance of greater volume of work per dollar appropriated. For example, through the application of Hoversite techniques it is now possible to survey almost twice the area as with electronic equipment and five to six times the amount possible with customary ground methods. While these techniques are particularly useful in Alaska in the State selection program, their applicability to surveying problems in the Western States is being investigated to insure that latest technical advances are used wherever applicable. Again this is a program where savings are translated into the accomplishment of larger workloads.

REHABILITATION OF BURNED-OVER AREAS

An increase of $600,000 is requested to provide more adequately for the prompt rehabilitation of burned-over areas. The soil and moisture program otherwise will be continued at the 1964 level. The appropriation for 1964 included $250,000 for rehabilitation of burned-over lands. Due to several major fires, especially in Idaho, this amount proved inadequate. Consequently the 1965 budget proposes a total of $850,000 for this purpose which should meet rehabilitation needs of a normal fire year.

Resource Conservation Areas

The Bureau has initiated a program of resource conservation areas to identify areas of special need where much can be accomplished with strengthened local cooperation.

ROADS AND BUILDINGS

Increases proposed for the maintenance of access roads and physical facilities are needed to enable the Bureau to protect these assets on a businesslike basis. Until recently roads and buildings have deteriorated for lack of maintenance. With the 1965 program over 1,100 miles of Bureau roads will be restored to useful condition. Sanitation and protection facilities constructed over the last 2 years under the accelerated public works program will be maintained and the maintenance needs of Bureau offices, warehouses, fire lookouts, and other structures will be more adequately met.

Construction Appropriations

The estimate for the construction program is $1,400,000 which will provide a $1 million program for the installation of minimum-type sanitation and protection facilities in carefully selected areas and $400,000 to initiate construction of the Anchorage fire control facilities. Public use of Federal lands for fishing, hunting, camping, and similar activities is widespread and growing. It presents the Bureau with a host of complex problems. The land is there—the people go to it and use it. In certain areas use is so extensive that health, pollution, and safety hazards to the public and resources now exist. The Bureau will continue to stress all other means available to it, including the Recreation and Public Purposes Act, to encourage local authorities to provide facilities and to channel public use and prevent misuse.

ANCHORAGE FIRE CONTROL FACILITIES

The first phase of the Anchorage fire control facilities is scheduled for construction in 1965 at a cost of $400,000. Present plans are to complete these

facilities in 3 years at a total cost of $1,100,000. These facilities will replace a collection of former CCC buildings and quonset huts, which are exorbitant to heat and maintain, with an efficient and modern station from which fire control operations can be conducted on an economical and effective basis.

ACCESS ROAD PROGRAM

An amount of $2 million is requested as liquidating cash for the access road program, public lands development roads and trails. The budget contemplates use of only half of the new obligational authority provided by the Congress for fiscal year 1965 in the Federal Aid Highway Act of 1962. Liquidating cash provided in 1964, the first year of this program, is sufficient to meet little more than one-third of the obligations to be incurred in that year. This request for $2 million should meet the balance of the obligations to be incurred in 1964 as well as those obligations in 1965 which will require expenditure in that year. Normal lags in expenditures are rather limited because most of the Bureau's projects are small and contractors frequently can initiate and complete projects in the same fiscal year.

RECEIPTS UNDER O. & C. GRANT LANDS APPROPRIATION

The estimate of receipts to be available in 1965 under the O. & C. grant lands appropriation is $8,250,000 including $1 million for transfer to the Forest Service. This appropriation will continue to provide for access road and recreation facility construction and maintenance. It also will provide for all forest development and protection work in the O. & C. area as explained previously. Last year $540,000 of the cost of forest management was paid from the O. & C. grant lands appropriation. This budget substitutes all of one item, forest protection $700,000, and $150,000 of reforestation in the O. & C. grant lands appropriation while handling all of forest management in management of lands and resources. The net result is that each element is financed completely from one of the appropriations. These shifts of items require an additional $310,000 in 1965. This factor, together with an overall reduction in estimated receipts, reduces the available funds for road construction in 1965.

Manpower and Fund Utilization

The Bureau is intensifying efforts to achieve maximum performance of its responsibilities with the manpower and fund resources made available to it. The moratorium on land applications allowed the Bureau to reduce a longstanding problem, streamline its land operations, and make actual reductions in funds and manpower used to run the land offices.

Technical advances are permitting us to improve the performance of cadastral survey workloads especially in connection with the State selection program in Alaska.

SALES OF BLOWN-DOWN TIMBER

The Bureau handled the salvage sales program for blown-down timber in western Oregon by reprograming its work. This was disruptive to normal forest management during the emergency and the task remains of establishing management plans, inventories, and other measures to restore forest management to a sound and balance program.

The increases in maintenance funds will restore Bureau roads and facilities to useful condition, thereby contributing to the efficiency of day-to-day operations. Range survey techniques are being carefully reviewed to see if ways can be found to achieve more significant results for the same or even less cost. Field examiners, mining engineers, and cadastral surveyors are being moved from State offices to field stations to save travel costs and reduce time in reaching assignments.

CONSOLIDATION AND AUTOMATION

Consolidation of field administrative offices and automation of payroll and other selected administrative tasks have helped to meet the rapidly expanding load of general administrative work in support of the enlarged resource management program of the Bureau. However, workloads in this area appear to be outrunning available internal remedies.

In summary, all aspects of the Bureau's operations are being examined and reexamined for ways to gain more efficient and economical performance that

more effectively fulfills the Bureau's mission and the President's economy directives.

ORGANIZATIONAL ANALYSIS

In this regard the director of the Institute of Administrative Research, University of Washington, was engaged in June to work with the Bureau to provide a thoroughgoing organizational analysis of its operations and determine whether organizational adjustments can be made that are consistent with the Bureau's responsibilities and with its objective of constantly obtaining better use of manpower and funds. Present indications are that it may be possible for the Bureau to substantially increase its effectiveness by a further decentralization of effort in the field and a realinement of the central office staff.

In the last decade the Bureau has been reorganized in the traditional sense of the word three times. We will not be attempting a reorganization in the traditional sense in this operation, but instead we will be realining the structure of the Bureau and clarifying the roles of its principal people and offices so as to achieve greater efficiency and economy while at the same time maximizing the program output. The goal will be for operating functions to implement more effectively defined programs essential to carrying out the Bureau's mission.

In our efforts to insure optimum utilization of funds particular attention has been paid to payroll requirements. Personal services are a decreasing portion of the estimates despite the additional pay raise costs authorized by Public Law 87-793. Personal services which were 63.4 percent of the operating appropriation in 1960 were reduced to 58.8 percent in 1962 and are estimated to be down to 57.1 percent in 1965. Operating experience will continue to be analyzed and the committee is assured that further savings will be effected whenever proposed changes are supported by the facts. However, due to the nature of the Bureau's operation and the widely scattered lands, we believe we now are near the lowest ratio that can be achieved.

REVENUES AND INVESTMENTS

Receipts for 1965 are estimated at $445 million of which $69 million will be paid to States and counties in which the lands are located. Receipts continue to be many times the amount of the investment in the resource management and development programs conducted by the Bureau. As the preponderance of these receipts is generated through the leasing of nonrenewable resources, such as oil and gas, it is important that investment in the management and development of the renewable resources of the public lands be made on an orderly and adequate basis so that the public lands can continue to contribute significantly to the national economy and substantially to the economies of many western regions and localities.

The estimates presented for 1965 represent modest and orderly steps toward conserving and sustaining the resources of the public lands and assuring their appropriate disposal as in recent years.

FORESIGHT OF COMMITTEE ON LAND PROBLEMS

Mr. STODDARD. This committee has been very farsighted in its handling of the public land problem, in the making available to us of funds for special rehabilitation work in Wyoming and South Dakota last year, and in previous years in Idaho, Nevada, New Mexico, and Oregon, which has made possible the acceleration of rehabilitation of ranges and application of soil conservation measures on specific areas of severe need.

Since this is my first appearance before your committee as Director, I would like your permission to give a few more of these facts before we go into the basic details.

WORK UNDER BUREAU JURISDICTION

We have, as you know, over 400 million acres under our jurisdiction in the 12 Western States and Alaska. We have a dedicated group of professional people, forestry, range, soil conservation, engineering,

and many other professions. As an example of their dedication, last year when the timber salvage job took place, or was required as a result of the blowdowns in Oregon, all hands came to the rescue and put in long and arduous hours of work in order to expedite the program of timber salvage.

This program is moving along very, very well and it is well on its way to completion before we will have possible serious outbreaks as a result of insect damage in the residual stands.

Outmoded Land Laws

One of our problems is that we do have a number of old and outmoded land laws, and complicated procedures which do add heavily to our costs of doing business. We are required to follow the law, but we have been actively exploring every feasible opportunity to eliminate unnecessary work.

The changes that should be made can occur only after the Congress has dealt with these laws specifically, and we have a number of studies which are going to be helpful, I think, to the Congress in resolving policy questions with respect to the management and disposal of public lands.

Administration of Rangeland

One of the major problems that we have is in the administration of 180 million acres of rangeland, and I can assure you that too much of it is in a low condition of productivity. This land is not only important to the economy of the western ranchers and the communities in which they live, but it is also vital for the watershed values that are present on these lands that are needed as a basis for the water supplies of the growing population in the West.

Improved Watershed Conditions

Through the assistance of the committee, again we have been able to apply many conservation measures which have resulted in improvement of the watershed conditions, reduction of silt, and increase of water yields, as for example, in the elimination of juniper and replacing it with grass. We accomplish two things there. There is a greater water yield and a greater yield of forage.

A few personnel have done a great deal to obtain the maximum of conservation benefits for the dollars that have been appropriated.

Size of Public Domain Areas

One of the problems we have in the administration of the public domain lands is the sizes of the areas that have to be served out of our district office. The average district has 2.8 million acres of public domain which is interspersed with about 4 million acres of other private and Federal lands.

Consequently, our employees must travel or cover around 600,000 acres per field employee. It is a very thin administrative allocation. It is 600,000 acres, about equivalent to Connecticut and Rhode Island combined, so this is a big job for each fieldman.

RANGELAND ADMINISTRATION

In the field of rangeland administration, a tremendous body of regulations has been developed which I believe can be simplified, but because of past history and experience it is quite evident that simplification will require close effort and cooperation with the users of the land.

We are trying to develop a program which does work with the users, in defining some of the problems that they have with us, and we with them to try to eliminate some of these obstacles in order to have a better working relationship.

One regulation, for example, gets off into the area of petrified wood. We propose a limitation of the taking of petrified wood so there will be some in the future. We did set up a proposed regulation last year which wasn't quite precise. It was fitted to what some of the people thought would be a way of regulating their activities.

CORRESPONDENCE REACHING BUREAU

We got about 3,000 letters in the Bureau with suggestions and protests and so on, and perhaps you got some of them also, Senator. This gave us an indication of the interest that there is by another group in the public land.

We receive nearly 300,000 pieces of correspondence in a year, and this, of course, ties down tremendous numbers of man-hours, and it is a very expensive thing. Some of this, I think, through careful analysis can be reduced as we improve our ways of giving service to the public, so that the people will know what their opportunities are and what their rights are, and what they are not. So there will be some changes to cut down this influx of correspondence.

These are just a few items which I wanted to mention in terms of background of our problems and what we are trying to do about them, Senator.

BUDGET ESTIMATES OF 1965

Chairman HAYDEN. It is very proper that you should, because you have problems, there is no doubt about that at all.

I shall place in the record statements in justification of the budget estimate for "Management of lands and resources," in the amount of $45,447,000. This is $1,294,500 more than the appropriation provided in fiscal year 1964.

(The statements referred to follow:)

Bureau of Land Management

Management of lands and resources

Appropriation, 1963	$41, 510, 200	
Supplemental appropriation, 1963	2, 900, 000	
Total appropriation, 1963		$44, 410, 200
Transferred to "Operating expenses, Public Buildings Service," General Services Administration		−348, 335
Total available, 1963		44, 061, 865
Appropriation, 1964		44, 152, 500
Transferred to "Operating expenses, Public Buildings Service," General Services Administration		−86, 000
Total available		44, 066, 500

Summary of Increases and Decreases, 1965

Lease and disposal of land and mineral resources:		
To provide for increased pay costs for fiscal year 1964 positions	+151, 600	
Decrease in title, lease, and records program	−230, 000	
To continue inventory and evaluation of land and mineral resources and records improvement programs	+120, 500	
		+42, 100
Management of grazing lands:		
To provide for increased pay costs for fiscal year 1964 positions	+68, 000	
Increase will provide for continuation of resource inventories, adjudication of grazing privileges, and resource inventories on public grazing lands	+76, 000	
Decrease in fire presuppression program	−6, 000	
		+138, 000
Forestry:		
To provide for increased pay costs for fiscal year 1964 positions	+85, 000	
Increase in forest management and development programs on public domain and western Oregon lands	+680, 000	
Decrease in forest protection program, Alaska	−82, 000	
Transfer of O. & C. forest protection and development programs to Oregon and California grant-lands appropriation	−924, 000	
		−241, 000
Cadastral surveys: To provide for increased pay costs for fiscal year 1964 positions		+45, 100
Soil and moisture conservation:		
To provide for increased pay costs for fiscal year 1964 positions	+70, 300	
To provide increased funds for rehabilitation of burned-over lands	+600, 000	
		+670, 300
Maintenance of physical facilities: To provide for increased maintenance costs, including sanitation and protection facilities		+222, 000
Maintenance of access roads: To provide for increase in maintenance of roads on the public domain		+475, 000
General administration: To provide for increased pay costs for fiscal year 1964 positions		+29, 000
Net increase, 1965		1, 380, 500
Budget estimate, 1965		45, 447, 000

MANAGEMENT OF LANDS AND RESOURCES

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964		
		Total appropriation	Transfers [1]	Amount available
1. Lease and disposal of land and mineral resources	$9,775,106	$10,403,900	−$46,000	$10,357,900
2. Management of grazing lands	5,547,273	6,052,000	−18,000	6,034,000
3. Forestry	8,303,326	8,938,500	−12,500	8,926,000
4. Cadastral surveys	4,387,430	4,904,900		4,904,900
5. Soil and moisture conservation	10,842,309	11,265,200	−9,500	11,255,700
6. Fire suppression	2,370,247	400,000		400,000
7. Maintenance of physical facilities	153,767	178,000		178,000
8. Maintenance of access roads	25,210	225,000		225,000
9. General administration	1,741,006	1,785,000		1,785,000
Unobligated balance lapsing	916,191			
Total	44,061,865	44,152,500	−86,000	44,066,500

BUREAU OF LAND MANAGEMENT

1. Lease and disposal of lands and minerals resources

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Title, lease, and records service	$5,646,220	$5,785,700	$5,650,000	−$135,700	+$94,300	−$230,000
(b) Field examination and classification	3,500,645	3,871,000	4,000,000	+129,000	+45,500	+83,500
(c) Records improvement	628,241	701,200	750,000	+48,800	+11,800	+37,000
Total	9,775,106	10,357,900	10,400,000	+42,100	+151,600	−109,500

[1] To provide for increased pay costs for fiscal year 1964 positions.

(a) *Title, lease, and records service*

The estimate of $5,650,000 is a decrease of $135,700 consisting of:

(1) A decrease of $230,000 as a result of improved operations;

(2) An increase of $94,300 to provide for increased costs in fiscal year 1965 of the pay raise authorized by Public Law 87-793.

Plan of work.—During fiscal year 1963 lands and minerals case backlogs were further reduced due largely to increased efficiency of operations and continued emphasis upon case processing as top priority work. The table which appears below shows that there was less than a 1-percent increase in total filings during fiscal year 1963 (as compared with an increase of over 13 percent during fiscal year 1962). Certain regulatory changes and more clearly established criteria for classification action are chiefly responsible. It is expected that the total number of new mineral filings will increase substantially through fiscal year 1965 while the total number of new lands filings will decrease slightly over the same period. Backlog reductions should continue with the greatest percentage decrease being reflected in lands cases. The accomplishment by both this Bureau and the Forest Service of Public Law 167 proceedings is expected to result in a decrease in minerals casework in certain areas.

	1962 actual	1963 actual	1964 estimate	1965 estimate
Cases pending, start of year	94,252	[1] 57,770	53,510	46,517
New and reactivated cases	[1] 357,862	360,365	379,007	368,483
Cases closed	[1] 394,344	364,625	386,000	374,000
Cases pending, end of year	[1] 57,770	53,510	46,517	41,000

[1] Amended by reinventory of Arizona, July 1, 1963.

NOTE.—The above table includes both lands and minerals filings.

Simultaneous oil and gas filings account for the preponderance of the totals. In lands, for example, pending caseloads were reduced from nearly 18,000 to 14,500 cases during fiscal year 1963.

Casework is current in most States. Where case backlogs remain, plans are to get on a current basis for all but a few areas by December 31, 1964. New regulations and instructions have simplified the filing, classification, and protest procedures under the public land laws. To more effectively manage classification activities, this authority has been delegated to district managers. Priority attention will be given to all applications filed under the Recreation and Public Purposes Act and State selections. Reductions are due to improved techniques in handling the necessary records and other service requirements attendant to Government-motion activity, and in meeting demands by the public and other governmental agencies for lands, general services, and information.

Improved office procedures have made it possible to process the increasing volume of simultaneous oil and gas lease offers, now being received at an average rate of 20,000 filings per month. Resulting filing fees average some $200,000 each month. With the prospective opening to simultaneous filing of new areas in Alaska (approximately 16 million acres), the 1964 and 1965 rate is expected to increase. Continued vigilance in the detection of irregularities in filings will be stressed. Programs are being developed to focus attack upon continued abuses such as dummy filings, and disregard of acreage limitations. With the funds requested for fiscal year 1965, the Bureau will step up the training of personnel to detect and investigate suspected abuses in those States where simultaneous filing activity is heaviest.

Public requests for land title and status data, information regarding land use and acquisition, and information on the processing of pending petition applications constitute a significant workload. In addition, decentralization of certain lands and minerals operations to the district offices requires increased technical assistance to the districts. The growing interest in the public lands and their resources is reflected in the increasing number of personal and written inquiries from individuals, groups, and governmental entities. A general increased interest is being expressed in the States of California, Idaho, and Nevada in outdoor recreation opportunities on BLM lands. This has become a large factor in increased Bureau's public service activities in both the land and district offices. The funds requested would permit maintenance of the necessary records and public service activities in the appropriate offices.

Continued emphasis is being given to satisfaction of nearly all State selection grants outside of Alaska by the end of fiscal year 1965. In Alaska, unless the State changes its plans, all State selection applications on hand will be brought to a current basis by that time, and field examination and adjudication will be completed on 15 million acres filed through fiscal year 1964. Emphasis will also be placed upon making available land possessing agricultural potential outside of Alaska under present State water policies. The exchange program will be directed toward meeting urgent Federal and State needs. Selected small tracts and townsites will be offered in areas of highest demand when suitable land is available. To improve efficiency, the Bureau will initiate more land classification, sale, lease, and exchange actions on its own motion in order to meet public and private demands and to make tenure adjustments consistent with sound land management.

(b) *Field examination and classification*

The estimate of $4 million is an increase of $129,000 over 1964 consisting of:

(1) An increase of $83,500 to continue efforts to inventory and evaluate the land and mineral resources of the public lands;

(2) An increase of $45,500 to provide for increased costs in fiscal year 1965 of the pay raise authorized by Public Law 87–793.

Need for increase.—An increase of $83,500 is needed to continue efforts to inventory and evaluate the land and mineral resources of the public lands. Completion of detailed land use and planning studies as a distinct phase of the general inventory and initial evaluation of the public lands and resources is targeted for the end of fiscal year 1966. An inventory of all suspected occupancy and agricultural trespass will be maintained. Continued stress will be placed upon a thorough outdoor recreation inventory and evaluation of all BLM land, and upon making suitable sites available to State and local governments under the Recreation and Public Purposes Act. Special efforts will be made in the identification, preservation, and management of recreation, scenic, wildlife, archeological and historical values, and petrified wood deposits. The additional funds requested would help the Bureau to meet these goals.

The initial analysis phase of the minerals inventory program is nearly completed, and fiscal year 1965 will provide the base for refinement of data in the detailed or continuing analysis phase of the inventory. At that time analyses will be required for proper evaluation of data collected during the course of the inventory and field examinations.

The Bureau anticipates that land trespass abatement programs established in fiscal year 1964 will be fully operative during fiscal year 1965. These programs will be designed to eliminate existing cases and to move rapidly against any new cases of unauthorized use or occupancy. Emphasis will be placed upon completing use arrangements for all remaining occupants of mining claims in accordance with the Mining Claims Occupancy Act. Suspected minerals trespass investigations will continue to receive high priority attention during fiscal year 1965. Sales of mineral materials will increase steadily, with concurrent increased attention to surface use and rehabilitation, contract management, and appraisal.

Plan of work.—Field investigations needed for casework processing will be conducted on a current basis. The lands and minerals activity is geared for prompt response to public demand requirements with the investigation of all such cases given top priority.

Initial analyses are identifying areas requiring intensified land tenure adjustments and lands available to meet the needs of heavy population and economic pressures. In this connection the Bureau expects to develop action programs of sale, lease, and tenure adjustment where priority needs have been identified, complete identification of public lands that are suitable for exchange, and encourage exchanges with other governmental agencies. Approximately 200,000 acres will be reviewed under the withdrawal review program which is an integral part of the master unit system. This work must be done in close cooperation with States and legal governmental units and other Federal agencies.

By the end of fiscal year 1965 the Bureau expects to have completed approximately 70 percent of the inventory of recreation and related wildlife values. Initial site plans will be prepared for lands in need of high priority Federal recreational development. The needs for related wildlife habitat improvement will be identified. Cooperation, coordination, and negotiation with Federal, State, and private agencies and organizations concerned with the recreational use of BLM lands will be stressed. Appropriate cooperative arrangements will be worked out with State recreation and fish and game agencies, and BLM will continue to make land available under the Recreation and Public Purposes Act. Action programs leading to necessary tenure adjustments will be consistent with multiple-

use management of recreation and wildlife recoursces and with other resource management programs. BLM land will be managed so as to protect the identified scenic, scientific, recreational, archeological, and historical values from vandalism, deterioration, damage, or destruction. Bureau construction programs will be harmonized with the management, protection, and development of ourtdoor recreation resources. Efforts will be increased to carry out responsibilities for providing public access to public lands.

(c) *Records improvement*

The estimate of $750,000 is an increase of $48,800 consisting of:

(1) An increase of $37,000 to maintain a program level sufficient to complete this program by fiscal year 1968;

(2) An increase of $11,800 to provide for increased costs in fiscal year 1965 of the pay raise authorized by Public Law 87–793.

Need for increase.—The increase requested will provide $750,000 for this program in fiscal year 1965. It is presently estimated that at this level of operations the records improvement program can be completed by 1968.

Plan of work.—The Bureau has now located records improvement personnel at Littleton, Colo. The construction of new records for Wyoming has been initiated in fiscal year 1964 and will be completed in fiscal year 1965. Preparatory work for the Oregon records will be initiated in fiscal year 1964 and the records completed by the end of fiscal year 1965. Preparatory work will be initiated for Colorado records in fiscal year 1965.

2. Management of grazing lands

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Administration of grazing lands	$4,471,340	$4,933,500	$5,072,000	$138,500	+$62,500	$76,000
(b) Fire presuppression	1,075,933	1,100,500	1,100,000	−500	+5,500	−6,000
Total	5,547,273	6,034,000	6,172,000	138,000	68,000	70,000

[1] To provide for increased pay costs for 1964 positions.

(a) *Administration of grazing lands*

The estimate of $5,072,000 is an increase of $138,500 consisting of:

(1) An increase of $46,000 to provide acceleration of range resource inventories, dependent ranch property surveys, and range use adjustments to meet the longstanding goal of completing grazing privilege adjudication by July 1, 1967;

(2) An increase of $30,000 to intensify and improve the management of wildlife habitat;

(3) An increase of $62,500 to provide for increased costs in fiscal year 1965 of the pay raise authorized by Public Law 87–793.

Need for increase.—The grazing administration program and the increases planned for it, are designed to bring about more intensive management of the 178 million acres of publicly owned rangelands administered by BLM. Sound management provides the basis for conservation and improvement of the land, for orderly multiple use, and for a sustained yield of forage for use by wildlife and domestic livestock.

Scientific range management is essential to the prevention of range deterioration, and the conservation of soil, water, plant, and animal resources. Much of the depletion in the past has been due primarily to a lack of management. Proper management is an absolute necessity if public and private investments on soil and water rehabilitation treatments are to accomplish their purposes. It also will encourage private effort and investments toward the improvement of range and associated private resources. The public ranges are an important source of forage for many big game herds and for nearly 29,000 livestock ranches. Ranches using the public range supply large numbers of feeder animals to the Nation's feedlots and meat markets. They also are the basis of an important segment of many local and regional economies.

At present the public ranges are depleted and are producing less than their potential capacity. Over 84 percent has been found to be in only fair or bad

condition. Recent studies show that 64 percent is not improving while 18 percent is deteriorating. Only 18 percent is improving.

Considerable progress has been made in recent years, but a great deal remains to be done. The increases requested will permit accomplishment of the following goals during 1965:

(1) Range resource inventories on about 26 million acres of Federal lands. As of the beginning of fiscal year 1965 there will be about 33.5 million acres still needing such inventories. These inventories provide data and information on present and potential forage production, and they are an important basis for both the adjudication of grazing privileges and long-term management. Also included is a modest expansion of range resource evaluations in Alaska to form a basis for management of critical reindeer and wildlife habitats as well as land usable by domestic livestock.

(2) Dependent property surveys necessary to determine the base property qualifications of 1,050 ranching operations for grazing licenses and for permits on the public lands. This work is prerequisite to the adjudication of grazing privileges.

(3) Completion of adjudication of grazing privileges for 2,100 ranch operations of the 3,400 for which such work will remain to be done after the close of fiscal year 1964. Adjudication, the apportioning of present and potential public land grazing capacity among dependent ranch units, is an essential step toward effective management. Completion of this step makes possible sound range management and rehabilitation and encourages cooperative investments in the public land.

(4) Intensified supervision of range use. Effective management of the public ranges requires that the range be used by the best suited class of animal (domestic or wild), in the proper season, and in proper numbers. Use by too many animals and in the wrong seasons have been the basic causes of range abuse and depletion. Use supervision assures the public and the permitted users that the resource is not being abused or overgrazed. It also helps provide for greater beneficial use through attention to effective grazing systems, animal distribution, and production practices. Good range management coupled with needed investments will enable the public range, for example, to eventually carry double the present number of livestock.

The increase requested will be used largely to insure that investments in resource rehabilitation are not wasted through improper use, and to curb overuse of ranges already deteriorating.

(5) Intensify and improve BLM management of wildlife habitat. Recently it has been estimated that 1,330,000 deer, 130,000 antelope, 22,000 elk, and various other wildlife species derive a substantial portion of their annual forage from the public lands. The importance of wildlife use is increasing; for example, deer on the public lands have increased about 15 percent per year for the last two decades. Even more significant is the fact that with an increasing population more and more people are turning to hunting and fishing as a form of outdoor recreation. Growing wildlife population and public use needs increase the requirement for improved management and rehabilitation of wildlife habitat on public lands. The States regulate hunting, but the Bureau is responsible for the public land game habitat.

Plan of work.—Long-range objectives of grazing administration are to provide for maximum sustained multiple use of the range resources. This entails the application of sound range management techniques, practices, and methods that will provide for the proper use, protection, and improvement of the range and will also provide for the maximum sustained yield of forage for use by livestock and wildlife in balance with the other needs and uses of the land.

Range resource inventories and dependent property surveys must be completed by the end of fiscal year 1966 as they furnish basic data required for range adjudication. Adjudication, scheduled for completion by July 1, 1967, will provide a base for accelerated range management. Intensified management practices, based upon adequate studies and investigations, will provide for maximum use, and will shorten the time required to restore production of depleted areas. Following the completion of each range adjudication, more intensified range management should be coupled with cooperative investments for resource rehabilitation and development.

Range condition and trend studies will be continued. They provide part of the basic data needed to guide yearly and long-term range management decisions.

Range resources in Alaska will be studied, appraised, and managed with the objective of providing the greatest sustained contribution to the wildlife resource and livestock economy of the area.

Range management activities will be expanded and intensified within established resource conservation areas and special project areas. This will provide a basis for improving methods and techniques of application, cooperation, and coordination of range management activities with other programs involved in a concerted effort of total resource management and rehabilitation.

(b) *Fire presuppression*

The estimate of $1,100,000 is a decrease of $500 consisting of:

(1) A decrease in program of $6,000 due to pay raise costs of $5,500 and $500 reduction of estimate;

(2) An increase of $5,500 to provide for increased costs in fiscal year 1965 for pay raise costs authorized by Public Law 87-793.

Plan of work—Hazard reduction consisting principally of snag felling and flash fuel disposal will be accomplished on 3,000 acres. Some 2,000 miles of firebreaks and truck trails will be developed and maintained to alleviate fire hazards along roadways and in areas of heavily concentrated public use. Increased incidences of man-caused fires require fast access for men and equipment to take prompt and effective control measures.

Special emphasis will be placed on training regular fire control personnel and fire suppression crews in the modern techniques of fighting forest and range fires. The Bureau has played and will continue to play a leading role in the development and operation of departmentwide fire training schools and in participation with other agencies in training schools covering fire weather, supervision, and air suppression methods. An intensified program of public fire information and education, investigation, and enforcement is contemplated also.

In addition, we plan the orderly replacement of obsolete fire conyrol communication equipment and all other types of fire equipment and tools, extension of detection and reporting systems for faster action on fires, and the development of more comprehensive fire plans.

3. Forestry

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Western Oregon lands	$4,358,981	$4,550,900	$4,200,000	−$350,900	+$50,100	−$401,000
(b) Public domain	3,944,345	4,375,100	4,485,000	+109,900	+34,900	+75,000
Total	8,303,326	8,926,000	8,685,000	−241,000	+85,000	−326,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

(a) *Western Oregon lands*

The estimate of $4,200,000 is a decrease of $350,900 from the amount available for fiscal year 1964 consisting of:

(1) An increase of $523,000 to return the financing of forest management work entirely to this appropriation;

(2) A decrease of $774,000 to eliminate financing of protection work from this appropriation;

(3) A decrease of $150,000 to eliminate partial financing of reforestation work from this appropriation;

(4) An increase of $50,100 to provide for increased costs in fiscal year 1965 of the pay raise authorized by Public Law 87-793.

Need for increase.—The increase requested for forest management is more than offset by the decreases related to forest protection and development work in western Oregon. The result will be to finance all of forest management out of this appropriation while protection and reforestation will be financed entirely from the appropriation, Oregon and California grant lands. The forest management program will be reduced slightly below the fiscal year 1964 program level. Receipts deposited to the general fund of the Treasury will be approximately twice the amount requested for management.

The appropriation, "O. & C. grant lands," provides an amount equivalent to 25 percent of gross receipts to be reimbursed from receipts. That appropriation has been used to invest in the development of these lands through the construction and maintenance of roads and recreation facilities, and reforestation. It is proposed that all nonmanagement requirements of western Oregon forestry in fiscal

year 1965 be paid from that appropriation. Consequently, forest development and protection programs are eliminated from this estimate. Reductions total $924,000, or $401,000 more than the program increase of $523,000 required to entirely finance forest management from this appropriation.

Plan of work.—The salvage operation in western Oregon resulting from the October 12, 1962, and the subsequent March 27, 1963, windstorms caused major curtailment in all forest management activities in favor of timber sales. The change in emphasis was necessitated to quickly sell damaged timber before its value dropped as well as to reduce the imminent danger of disastrous insect and fire outbreak. These activities need to be brought back into balance with the sales program. Although final determinations have not been made, it appears certain that at least 6 of the 22 forest management areas will require complete reinventorying and recomputation of a new allowable cut. The stability of local industries and communities partly depends upon the availability of Bureau of Land Management timber. The fiscal year 1965 program is directed at the restoration of all phases of the forestry program which have been disrupted by the emergency salvage program and the continued offering of the full allowable cut.

Orderly management suffered a serious setback as a result of the windstorms. For example, the carefully analyzed and delineated pattern of cutting, developed over a period of years, encompassing entire forest drainages, must be redone. The remnants of residual green stands left in the more seriously damaged areas of the storm path pose a major technical challenge in fitting them into an orderly management-disposal plan. These isolated blocks represent the only natural seed source in many areas and their perpetuation and preservation inject greater complexity into the orderly development of the forest property.

Another significant problem is the necessity to integrate mainline systems of roads constructed prior to the windstorms with portions of the roads constructed to extract the salvage material and redetermine future road construction needs. The large number of salvage roads and firebreaks made necessary has opened up more country to a recreation-minded public, increasing the burden of providing for their needs and protection as a facet of the multiple-use program.

During fiscal years 1963 and 1964 inventory work was at a standstill. Many of the sample plots established for the July 1962 inventory have been destroyed or lost and will require reestablishment. A full reinventory program must be undertaken on those severely overcut forest-management areas. If substantial reductions in cutting levels are required by sustained-yield policies special efforts are needed to prorate remedial adjustments over an optimum period so as to minimize local economic dislocation. It is estimated that the overcut will be approximately one-half billion board feet, which represents almost 50 percent of the timber cut from these lands in a normal year.

Access needs for fiscal year 1965 are anticipated to be 270 easements and agreements involving approximately 230 miles of road. While the number of easements and agreements will be less, the negotiations will be more time consuming and difficult because of the loss of prenegotiation time, as well as the reluctance of private landowners to grant necessary access for timber that does not carry the compulsion for extraction as did the salvage timber. The pressure of public opinion materially aided in acquiring access during the emergency program.

Granting of access is the furnishing of rights to cross lands or use roads of the Federal Government. As the Federal road program expands, adjacent landowners are stimulated to develop and harvest the resources of their own lands. The granting of access not only is time consuming but, by its nature as a service to the public, it often takes precedence over other programed work. It is expected that cooperators will require 290 new access permits over more than 530 miles of road. The anticipated increase is due to the inability of the many small intermingled landowners to salvage their material as rapidly and expeditiously as the large landowners and Federal agencies. In many instances the principal roads had to be developed before smaller operators could reach their holdings.

During fiscal year 1963, 114 confirmed trespass cases were closed, but 87 new confirmed cases were brought to light resulting in a net reduction of only 27 cases. The penetration of new and remote areas for the salvage timber has uncovered additional trespasses. To meet the 1967 deadline for elimination of the backlog of trespass cases will require processing of an estimated 122 confirmed cases in fiscal year 1965, valued at approximately $128,000, and an additional 202 suspected cases on which an undetermined value will be received. Although cases closed show an increase in revenue, old cases are more difficult

to successfully prosecute and there is a commensurate increase in the cost of processing as a result of having delayed action because of the salvage program.

Timber sale offerings will be 1.1 billion board feet, chargeable against the allowable cut of 1,127 million, and 100 million board feet of salvage and thinning material not chargeable to the inventory, giving a total estimated sales program of 1.2 billion board feet. It is necessary to reduce sales of chargeable timber to adjust for the overcutting in fiscal years 1963 and 1964 caused by the windstorms.

The volume, sales price, and receipts for O. & C. and CBWR timber sold during fiscal years 1961–62, for O. & C., CBWR, and PD during fiscal year 1963, and estimated sales price and receipts for O. & C., CBWR, and PD timber for fiscal years 1964 and 1965 are as follows:

Fiscal year	Bureau of Land Management sales		Receipts	
	Volume sold (thousand board feet)	Sales price	Bureau of Land Management	Forest Service
1961 [1]	991,842	$26,261,765	$26,424,830	$3,441,245
1962 [1]	917,706	22,691,695	27,995,977	4,074,580
1963 [2]	1,567,267	35,979,838	28,141,849	4,051,005
1964 [2]	1,400,000	32,200,000	34,200,000	4,000,000
1965 [2]	1,200,000	30,000,000	30,800,000	4,000,000

[1] O. & C. and CBWR only.
[2] O. & C., CBWR, and PD west of R. 8 E. Willamette meridian.

The estimated increase in receipts in fiscal years 1964 and 1965 results from the increased volume being sold in fiscal years 1963–64 under the salvage program.

BLM forest activities in western Oregon are of major national significance. While the BLM administers 8.5 percent of the total commercial forest land in the Douglas-fir region (2,176,538 acres), in fiscal year 1963 it offered 21.8 percent of the total lumber production from all ownerships in that area (1.7 billion board feet). The volume of timber harvested from BLM lands in western Oregon provides about 63,000 man-years of employment every year. Contribution to the gross national product is estimated to approximate $750 million.

Forest development and protection

The plan of work for forest development and protection in western Oregon, which previously has been included under "Management of lands and resources," is shown under the "Forest development and protection" activity of the "Oregon and California grant lands" appropriation for fiscal year 1965. All funds for this work have been eliminated from the 1965 budget request for this appropriation.

(*b*) *Public domain (excluding western Oregon)*

The estimate of $4,485,000 is an increase of $109,900 over the amount available for fiscal year 1964. The additional funds are programed as follows:

(1) An increase of $106,000 to provide adequate progress on inventory and maintain timber sales at the 1964 level;

(2) An increase of $51,000 to reduce a large reforestation backlog;

(3) A decrease of $82,000 in forest protection in Alaska;

(4) An increase of $34,900 to provide for increased costs in fiscal year 1965 of the pay raise authorized by Public Law 87–793.

Need for increase.—Increases are requested in order to continue progress on the program begun in fiscal year 1962 to bring the public domain lands under sound forest management. In accordance with this program completion of both the forest inventory and reforestation surveys is scheduled for fiscal year 1965. Once completed these elements of the forestry program can be placed on a maintenance basis while the information gained from them is used to determine the full allowable cut and make it available to industry in accordance with sustained yield management principles. Similarly, the information gained through the completion of the reforestation surveys will make it possible for the Bureau to develop sound schedules for the reforestation of cut over and damaged areas to restore these lands to productivity.

Plan of work.—Forestry activities conducted on public domain lands, exclusive of western Oregon, include the three major functions of forest management, forest development, and forest protection as described below:

(1) Forest management: The estimate includes $2,098,000 for this function which is an increase of $106,000 over the amount available for fiscal year 1964.

Increasing public use of the Federal lands requires greater detail in planning than in past years. The rapidly growing recreational demand alone has caused agencies administering public lands to review plans previously developed. With the completion of the forest inventory in fiscal year 1965, the Bureau will, for the first time, be in a position to develop on the public domain detailed forest management plans based on sound factual data.

The increase will help provide for the completion of the forest inventory that was initiated in fiscal year 1962. Completion of the inventory is imperative in order to develop sound management plans. Lacking detailed inventory data, previous reconnaissance studies show that some forest areas are not being cut to full potential, while other areas are being overcut. In either instance both the Federal Government and private industry suffer because of the inadequacies of available forest resource data. There is a growing reliance on the part of the timber industry and local communities for timber sales from the public lands. This dependency requires the regular and predictable offering of timber volumes annually to provide industry and local economies reasonable stability. It therefore is incumbent upon the Bureau to determine the full allowable cut and to make it available to the installed capacity of industry.

Access needs for fiscal year 1965 are anticipated to be 320 permits and easements involving approximately 430 miles of road. Granting rights to use existing roads or to construct roads across lands administered by the Bureau of Land Management is expected to involve 150 permits and 230 miles of road. Good trespass control and prompt trespass action are essential to proper forest management. The requested funds will provide for processing 183 cases during fiscal year 1965. This level of trespass closure will have to be increased substantially in subsequent years in order to meet the 1967 deadline for elimination of the backlog of trespass cases.

Timber sales are being held at the same level as fiscal year 1964 pending completion of the forest inventory and computation of allowable cuts. Plans are to offer 155 million board feet. Actual and estimated volumes and receipts for timber sold from public domain lands for fiscal years 1961 through 1965 are as follows:

Fiscal year	Volume sold (thousand board feet)	Sales price	Receipts
1961 [1]	141,288	$2,305,100	$2,259,682
1962 [1]	147,484	2,037,695	2,664,923
1963 [2]	100,260	1,083,564	1,436,070
1964 (estimate) [2]	155,000	1,700,000	1,500,000
1965	155,000	1,700,000	1,600,000

[1] Includes western Oregon public domain.
[2] Excludes western Oregon public domain.

The 155 million board feet to be offered in fiscal year 1965 will contribute an estimated $42,625,000 to the gross national product and provide for over 8,100 man-years of work.

(2) Forest development: The estimate includes $450,000 which is an increase of $51,000 over the amount available for fiscal year 1964, exclusive of increased pay costs.

The most critical phase of managing forests at a productive level and under the sustained yield principle lies in prompt reestablishment of tree reproduction on denuded forest land. Experience has shown that under the most favorable circumstances only about one-half of the area deforested by fire, logging, insects, or disease, will show adequate natural regeneration from adjacent seed sources 10 years after denudation. With approximately 200,000 acres of public domain forest lands cut over or damaged by various causes since 1950, it is estimated that about 100,000 acres are in need of treatment to assure a continuing source of wood fiber.

The loss of timber growth from public domain lands needing treatment is estimated to be at least 20 million board feet per year, having at today's stumpage

prices an annual value of $220,000. The loss of such production reduces the gross national product by an estimated $5½ million annually.

Annual timber oriented employment resulting from the 1965 fiscal year reforestation program is estimated at 50 man-years. In 1965 forest planting alone will provide for approximately 20 man-years of field labor in areas often remote, where the labor force is dependent on forestry related work. It is estimated that in 1965 the direct private payroll resulting from only the planting effort will be $120,000.

The program as presented contemplates treatment of only those sites having highest productive capacity. In addition to actual planting and seeding of 3,150 acres, the program also involves the necessary preparation of brushed-over and grassed-in sites to provide for a proper planting or seedbed, as well as the purchase of seed and planting stock.

The 1965 reforestation program is as follows:

	Acres	Amount
Reforestation plans and surveys	173,000	$103,000
Site improvement	3,150	128,000
Reforestation	3,400	[1] 219,000
Total		450,000

[1] Includes purchases of approximately 2,300,000 seedlings and 230 pounds of seed.

(3) Forest protection, Western States: The estimates include $837,000 for this function which is the same amount as is available in fiscal year 1964.

Contracts for fire protection are negotiated on a rate per acre that is based on the average of 5 prior years' experience. The negotiations of some contracts may involve amounts in excess of the average due to the severity of the fire season immediately prior to the contract year. Hazard reduction work, including snag felling and removal and construction of firebreaks, will be continued at a modest level.

The acreage and estimated costs for fiscal year 1965 are:

State	Acres	Cost
California	2,055,900	$535,000
Idaho	542,270	107,000
Minnesota	40,700	3,000
Montana	245,000	25,000
New Mexico	94,000	5,000
Oregon	386,800	45,000
Washington	150,200	25,000
Subtotal	3,514,870	745,000
Supervision		55,000
Hazard reduction		37,000
Total		837,000

(4) Forest protection, Alaska: The estimate includes $1,100,000 for this function which is a decrease of $82,000 from fiscal year 1964, exclusive of pay costs.

Significant progress has been made in the program since calendar year 1957. The annual acreage burned has been reduced from 1 million to about 200,000 acres. During the first 9 months of calendar year 1963, 13,285 acres have burned. Rapidly expanding population and recreational use places the lands and resources in greater jeopardy from fires and creates a need for higher protection standards. Higher values are being placed on Alaska's forest resources as a result of increased interest in wood fiber.

Increasing State and national interest requires more intense protection of wildlife and their habitats. Alaska is one of the major nesting grounds of North America and contributes migratory waterfowl to all major flyways.

The program complement has reached about 80 percent of the normal year operation needs. Acceleration of the program has been deferred in favor of priority work in other activities for fiscal year 1965.

4. Cadastral surveys

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Public land States except Alaska	$2,533,043	$2,961,100	$2,990,000	+$28,900	+$28,900	0
(b) Alaska	1,854,387	1,943,800	1,960,000	+16,200	+16,200	0
Total	4,387,430	4,904,900	4,950,000	+45,100	+45,100	0

[1] To provide for increased pay costs for fiscal year 1964 positions.

(a) *Public land States, except Alaska*

The estimate of $2,990,000 is an increase of $28,900 to provide for increased costs in fiscal year 1965 of the pay raise authorized by Public Law 87–793.

Plan of work.—It is necessary to maintain the essential cadastral surveys in support of the major resources inventory and multiple use programs of the Bureau. The 1965 program will emphasize surveys, resurveys, special surveys, small tract surveys, and remonumentation of Forest Service boundaries needed for: (1) development of mineral resources, particularly through oil and gas leasing; (2) management of timberlands and settlement of timber trespass cases, the identification of tracts for timber sales, timber salvage operations and reforestation; (3) population and industrial expansion of western towns and cities; (4) reestablishment of selected corners marking the boundaries of the public lands.

A summary of the 1965 program follows:

Purpose of survey	Approximate area in acres	Field party days [1]
1. Bureau of Land Management land:		
(a) Forest management	320,000	1,330
(b) Range management	1,005,000	2,085
(c) Minerals program	80,000	1,160
(d) Lands program	600,000	1,990
2. Work mainly for other agencies:		
(a) Miscellaneous surveys for other Federal agencies (and financed from BLM funds)	200,000	1,010
(b) Reestablishment of boundary monuments	[2]	500
Total	2,205,000	8,075

[1] For purpose of definition, a field party normally consists of a chief of party and 5 subordinate survey aids.

[2] Not measurable in acres.

The majority of the surveys will be accomplished by established ground methods. Electronic measuring devices, photogrammetric methods, radioisotope corner markings, Hoversight techniques, and other new developments in the cadastral surveying spectrum will be adopted and used wherever feasible. Protraction surveys are being extended over areas where their use for all management purposes short of title transfer is feasible.

(b) *Alaska*

The estimate of $1,960,000 is an increase of $16,200, entirely for increased pay costs, leaving the program at the 1964 level.

Plan of work.—A summary of the 1965 program follows:

1965 cadastral survey program, Alaska

Purpose of surveys	Approximate area in acres	Approximate miles of survey line	Field party days
1. State selections	2,800,000	2,400	5,920
2. Smaller areas	50,000	[1]	295

[1] Not measurable in miles.

By the close of fiscal year 1964, cadastral surveys for State selections will approximate 60 percent of the acreage selected to date. Most of these surveys have required additional work in 1964 and some activity on this acreage may extend into 1965 to comply with July 1963 instructions on details of field marking of State selections. The total program for 1965 contemplates a survey of 2,800,000 or about 20 percent of the total acreage selected to date. At the end of the 1956 program, about 80 percent of the total area presently selected will be surveyed. The extent of further selections that may be made in the meantime is not known but will reduce the ratio of the area surveyed.

The cadastral survey program in Alaska must also provide adequately for the survey of smaller areas. Approximately 50,000 acres of land for smaller tracts is to be surveyed in 1965. The rapidly expanding economy of Alaska requires prompt action on applications for survey of homesites, homesteads, mineral claims, and trade and manufacturing sites. In many cases, smaller areas already covered by valid rights are found within the boundaries of State selections. These lands cannot be selected by the State and must be surveyed and the area eliminated from the selected list.

The Bureau employs the most advanced methods, including tellurometer and Hoversight techniques. The latter is coupled with radio communication to Anchorage where computations are processed on ADP and the results radioed back to the field party. In this manner it is possible to survey almost twice the area as with electronic equipment and five to six times the amount possible with customary ground methods.

5. Soil and moisture conservation

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
Soil and moisture conservation	$10,842,309	$11,255,700	$11,926,000	$670,300	$70,300	$600,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

The estimate of $11,926,000 is an increase of $670,300 over 1964, consisting of:

(1) An increase of $600,000 to provide for rehabilitation of burned over areas;

(2) An increase of $70,300 to provide for increased costs in fiscal year 1965 of the pay raise authorized by Public Law 87–793.

NOTE.—The weed control activity has been merged with this activity and the amounts shown for 1963, 1964, and 1965 include weed control funds. Weed control activities will be continued at present levels in the following States: Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, and Wyoming.

Need for increase.—The fiscal year 1965 program includes an increase of $600,000 for rehabilitation of areas damaged by wildfires. This has been a most useful program because it has permitted immediate action to revegetate burned areas, at the lowest possible cost, because seeding can be done without expensive land preparation costs. This increase, together with the $250,000 provided in fiscal year 1964, will total $850,000 for treatment of public lands damaged by wildfires. Without conservation treatment, public lands suffer as a result of wildfires, which not only destroy the vegetative cover, but also render the soil vulnerable to accelerated erosion and serious watershed damage. The treatments will be applied immediately after wildfires occur, while the surface soil conducive to plant growth is still in place, and before invasion of undesirable plants that would require additional treatment. This increase is directly related to experience and should provide an adequate program for a typical year; however, more extensive damage in a critical fire year might require supplemental funds.

In 1965, $30,000 is to repay the Bureau of Employee Compensations for increased benefit payments which already have been made to injured BLM employees. Billings to the Bureau reflect actual costs paid; however, this amount will be absorbed.

No increase in the regular soil and moisture conservation program is included in these estimates. However, one situation may require extensive reprograming

or supplemental funds. Recent outbreaks in epidemic proportions of a defoliator moth (Aroga websteri) have defoliated approximately 12 million acres of sagebrush, primarily in Oregon, Idaho, Nevada, and northeastern California. Where the insect attack results in wholesale destruction of sagebrush there are dangers to the range resource similar to those resulting from wildfire. In many cases the understory of native perennial grasses and forbs is absent, and in others it is so suppressed that it cannot respond rapidly to dominate the land and protect it from accelerated erosion or invasion of undesirable species such as Medusahead, cheatgrass and halogeton. Halogeton is poisonous; Medusahead and cheatgrass create extreme fire hazards and are of low forage value. As with fire rehabilitation, early application of conservation treatment will yield the best results at the lowest costs. These outbreaks are relatively recent, thus it is premature to estimate the extent to which seeding or other treatments may be required, and the degree to which requirements can be met by reprograming. However, the situation appears to be serious and may require substantial funds. It should be viewed as a contingency upon these estimates at this time.

Plan of work.—The 1965 program contemplates the application of several major conservation practices which are compared in the following table with major accomplishments in 1963 and planned for accomplishments for 1964:

Soil and moisture conservation program by major practices

Conservation practice	Units	Fiscal year 1963 accomplishments	Fiscal year 1964 planned program	Fiscal year 1965 program
Brush control	Acres	328,900	262,700	270,500
Range seeding	do	208,000	283,800	205,500
Fencing	Miles	1,679	1,841	1,456
Water development	Number	875	1,136	995
Water control structures	do	1,619	1,397	2,394

In addition to those practices listed in the preceding table, the 1965 program will include contouring, pitting, furrowing, waterspreading, dune control, deep tillage, checks, fertilization, tree and shrub planting, weed control or other practices which aid in reducing erosion, rebuilding soil, improving soil fertility and structure, and reducing loss of water.

Funds for soil and moisture conservation and weed control are provided for those areas most urgently requiring treatment. The following table illustrates proposed allocations by States for the fiscal year 1965 program:

Soil and moisture conservation program by States for fiscal year 1965

State:	*Total program*
Arizona	$567,000
California	557,000
Colorado	835,000
Idaho	1,063,000
Montana	920,000
Nevada	1,353,000
New Mexico	1,277,000
Oregon	1,786,000
Utah	955,000
Wyoming	1,050,000
Program direction, employee compensation, and other expenses	713,000
Fire rehabilitation	850,000
Total	11,926,000

Previously identified projects will continue at the 1964 rate. Emphasis will be placed on developing the 85 designated resource conservation areas established in 1964.

6. Fire suppression

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost	Program
Fire suppression	$2,370,247	$400,000	$400,000	0	0	0

This estimate is for the same amount as in 1964 and represents a continuation of the practice of requesting a token appropriation to be followed with a supplemental request to cover the actual cost of fire suppression.

Plan of work.—Under this activity the Bureau will continue to suppress fires on or threatening lands under its jurisdiction except those protected under contract with States or other Federal agencies (see items "Forest protection, western Oregon" and "Forest protection, Western States" under the activity "Forestry"). The Bureau cooperates closely with States and other Federal agencies in its effort to reduce heavy losses from fires. Modern firefighting techniques, equipment and materials are used wherever possible. The fire danger rating system, airdrop chemical fire retardants, improved radio communications, and smokejumpers are among measures developed to improve firefighting effectiveness. Regular salaries of permanent employees used on an emergency basis during regular duty hours for fire suppression are not included in this estimate.

7. Maintenance of physical facilities

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost	Program
Maintenance of physical facilities	$153,767	$178,000	$400,000	+$222,000	0	+$222,000

The estimate of $400,000 is an increase of $222,000 over the amount available for fiscal year 1964, consisting of—

(*1*) An increase of $150,000 to maintain and operate the sanitation and protection facilities constructed under the accelerated public works program;

(*2*) An increase of $72,000 to more adequately meet annual maintenance requirement of Bureau structures.

Need for increase.—The increase is needed to maintain and operate sanitation and protection facilities constructed in fiscal years 1963 and 1964 and to meet regular maintenance requirements which are especially heavy on the Bureau's older structures of light construction. The sanitation and protection facilities which have been constructed must be maintained to protect the investment made in them and to permit them to continue to serve their purpose of avoiding fire and pollution danger to the natural resources and to the public. The buildings which are used by the Bureau for offices, warehouses, and fire control purposes in many instances were not constructed for enduring use. Until such time as the Bureau can replace them, heavy annual maintenance must be performed to keep the buildings in use without unnecessarily endangering the safety and welfare of BLM employees. As new buildings are constructed, regular annual maintenance must be performed to protect the investment made.

Plan of work.—Structures will be repaired and renovated so that they can contribute their maximum potential to the Bureau's expanding resource management programs.

Maintenance of sanitation and protection facilities will consist of disposing of garbage, maintaining equipment, testing water supplies, and servicing the sanitation facilities. This work will be performed for the most part under contract with local residents.

8. Maintenance of access roads

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
Maintenance of access roads	$25,210	$225,000	$700,000	+$475,000	0	+$475,000

This estimate of $700,000 is an increase of $475,000 over the amount available for fiscal year 1964.

Need for increase.—Through neglect caused by lack of funds over many years the Bureau's roads have seriously deteriorated and extensive deferred maintenance work must be performed before roads can be placed on a regular maintenance basis. The most economical approach is to accomplish the deferred maintenance as quickly as possible. A start is being made with the funds available in the current year. A substantial increase is needed in the budget year so that significant progress can be made toward performing approximately $3 million worth of deferred maintenance on some 18,000 miles of main access roads. The work done will protect existing roads and the investments in them and the adjacent public lands. Adequate maintenance will avoid more expensive replacement costs in the long run. With increasing public use of public lands, maintenance of roads in a safe condition for general use is essential.

Plan of work.—Primary emphasis will be given to providing adequate road drainage through ditching and repair and replacement of culverts. This type of maintenance will greatly reduce future water damage to the road and help prevent soil erosion. Over 15,000 feet of drainage pipe will be laid in 1965. Emphasis will be given also to major maintenance required to reopen roads closed by slides and washouts. It is planned that over 1,100 miles of roads can be reopened following maintenance work in 1965. The total program of maintenance involves grading over 6,000 miles in 1965. Heavily used routes will receive continuing normal maintenance to prevent deterioration. A relatively small amount will be expended on the normal maintenance program because of the substantial need in the deferred maintenance areas.

9. General administration

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
General administration	$1,741,006	$1,785,000	$1,814,000	$29,000	+$29,000	0

[1] To provide for increased pay costs for fiscal year 1964 positions.

The estimate of $1,814,000 is an increase of $29,000 to provide for increased costs in fiscal year 1965 of the pay raise authorized by Public Law 87–793.

Plan of work.—Over the past 6 years the programs of the Bureau have expanded sharply, while practically no additional administrative support has been provided. Consequently, the internal audit staff has been reduced, adequate staffing for procurement management and for analysis of management problems has been deferred in order to meet day-to-day operating requirements. These measures will be continued in 1965.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+)
Program and financing:				
Total obligations	$43,145,674	$44,066,500	$45,447,000	+$1,380,500
Transferred to "Operating expenses, Public Buildings Service" (76 Stat. 716)	348,335	86,000		−86,000
Unobligated balance lapsing	916,191			
Appropriation	44,410,200	44,152,500	45,447,000	+1,294,500
Obligations by objects:				
11 Personnel compensation	24,388,975	25,209,880	25,805,000	+595,120
12 Personnel benefits	1,671,494	1,770,200	1,810,000	+39,800
21 Travel and transportation of persons	2,614,866	2,480,000	2,650,000	+170,000
22 Transportation of things	984,011	900,000	952,000	+52,000
23 Rent, communications, and utilities	630,539	638,000	650,000	+12,000
24 Printing and reproduction	398,053	400,000	400,000	
25 Other services	6,729,620	6,892,000	7,950,000	+1,058,000
Services of other agencies	87,000	114,000	140,000	+26,000
26 Supplies and materials	3,698,496	3,920,000	3,500,000	−420,000
31 Equipment	1,689,779	1,800,000	1,650,000	−150,000
32 Lands and structures	300,000			
42 Insurance claims and indemnities	160			
44 Refunds	548			
Subtotal	43,193,541	44,124,080	45,507,000	+1,382,920
Deduct quarters and subsistence charges	47,867	57,580	60,000	−2,420
Total obligations	43,145,674	44,066,500	45,447,000	+1,380,500

Decrease in Title, Lease, and Records Service

Chairman Hayden. I notice that in your estimate for "Title, lease, and records service" there is a gross decrease of $230,000 which you attribute to improved operations. Would you describe these improved operations briefly?

Mr. Stoddard. Yes. The moratorium which we had on new filings for land entries enabled us to get our workloads current, so we are not just servicing backlogs and just answering letters. I would like to have Irving Senzel, Senator Hayden, our man in charge of our Lands Division, give you a little more background on the specifics of this, if he will.

Current on-Hand-Cases Backlog

Mr. Senzel. Mr. Chairman, the land moratorium resulted in a reduction of our pending backlog from 43,000 to 16,000 cases. That brought us down to a current position for the first time in about 15 years.

Chairman Hayden. You are actually current?

Mr. Senzel. We are practically current in all respects. Some States are a little behind, but we are making every effort to bring them current. That saves a good deal of money in handling just the correspondence about a backlog. We are able now to handle cases.

New Legislation in Application System

We have also introduced new regulations in the way we conduct our operations with applicants. We now have a petition-application system and we avoid, by more direct and informative relationships with the applicant, a great deal of appeals which are also very expensive and time consuming.

We have revised the small tract regulations in order to put most of our work on a Government motion business, so that we can make tracts available much more quickly and satisfactorily consistent with local planning standards.

Modernized Fee System

We have modernized our fee system so that we have a more realistic overall fee system.

We have decentralized activities so far as possible to the district levels, so that the district manager, who knows the land best, has technicians right there where the people who are really interested in the land can come and speak to somebody who has real knowledge of the capabilities of the land and of the opportunities to secure lands.

Land Listing

We are listing lands now so that people know what is available, and this is the first time in our history really that we have been able, under the classification system, to show what lands are available. And there are other steps.

Chairman Hayden. From your description, conditions are greatly improved.

Mr. Senzel. Thank you.

Field Examination and Classification

Chairman Hayden. In your item "Field examination and classification" for which you propose $4 million in fiscal year 1965, I observe that stress will be placed upon a thorough outdoor recreation inventory and evaluation of all Bureau of Land Management lands. How is this activity coordinated with the functions of the Bureau of Outdoor Recreation? Is there any overlapping or duplication of work?

Mr. Stoddard. No, sir. We are using their standards in inventorying areas which have recreational attractiveness and for determining the suitability and usefulness of particular areas, and for identifying areas which are suitable under the Recreation and Public Purposes Act for transfer to local, State, or county governments, or which are available for future use as public areas.

We are using their people to work with us in defining the standards. They don't have a very large field staff, and this does help us in getting the fieldwork carried out.

Homestead Applications Classified, 1962

Chairman Hayden. In 1962, I understand that the Bureau of Land Management classified only 7 homestead applications totaling 720 acres as suitable for disposition while it classified 2,419 applications covering 377,000 acres as unsuitable for disposition under the Homestead Act. A review of the other public land laws such as the desert land law and the public sale laws shows much the same situation.

REASON FOR LOW RATIO IN CLASSIFIED LAND

Could you advise this committee why there is such a low ratio between lands classified as suitable compared to those found unsuitable?

Mr. STODDARD. Yes, sir. The problem is that the existing land laws do not require that in advance of an application that there be a determination of the suitability of the land for disposal under a particular law. The result is that people make applications when there hasn't been any real advance determination of the suitability of the land for the particular purpose indicated by the law under which they make their filing.

Because so little of the public land now administered by the Bureau is suitable for agriculture, as much of it has been gone over, there are very few cases which do not result in a positive classification. We made a study of agricultural land law effectiveness which showed that during the last decade only 230 out of the 4,000 homestead applications went all the way to patent.

In addition, our study showed that of the few that went to patent, only half of them were being presently used for agriculture.

Chairman HAYDEN. Isn't this procedure wasteful of the time and energy of your people as well as that of those who seek to acquire public land?

COST OF PROCESSING APPLICATIONS

Mr. STODDARD. We estimate the cost of processing these applications, based upon those that are successful, to equal about $50 an acre. On this basis, it costs us more than the land is worth, and it ties down a lot of people.

Chairman HAYDEN. I can understand, of course, that the land has been picked over and picked over and picked over, and a man thinks he would like to get it and then he can't qualify.

Will you submit for the record a statement regarding the effectiveness of the various public land laws at the present time?

STUDIES ON LAND LAWS

Mr. STODDARD. Yes, sir, we have made some studies which we will be glad to provide to the committee.

Chairman HAYDEN. I think it would be of benefit to the legislative committees.

Mr. STODDARD. Yes, sir.

(The information referred to follows:)

LAND LAW EFFECTIVENESS STUDY

During the fiscal year of 1963, the field considered a total of almost 1,000 applications for public sale under sec. 2455 R.S. Of these, 60 percent were rejected, and 40 percent were approved. About one-half of the rejections were for reasons that did not involve the exercise of discretion, i.e., the law or procedural defects [1] prevented the field officers from approving the applications. Where the field officers had discretion as to the disposition of the application, approvals amounted to nearly 60 percent of the total considered.[2]

[1] By procedural defects is meant the steps the applicant must and does not take to have a valid application before the Department. These defects are remedial, and the application is rejected only if the applicant chooses not to correct them.

[2] These data must be considered approximations. In assigning the reasons for rejection from the data on hand, field reporters necessarily are subject to a degree of judgment error. Likewise, summarizing the field reports involves both this type of subjective error and also a certain degree of error in the tabulation of those applications rejected for multiple reasons.

The major reasons given for rejection where discretion was required involved inconsistency with public management programs. The data reported were not in sufficient detail to identify the programs involved in every case, but reference was often made to various Federal agencies and to State and local governmental agencies also. They suggest that about one-half of the discretionary rejections involved findings of inconsistency with BLM programs and about one-third inconsistency with other governmental management programs. The remainder involved conflicts with other types of disposition or with other criteria.

Under existing procedures, the public sale applicant is required to publish legal notice of the authorized sale. During fiscal year 1963, about 25 percent of the applicants failed to publish after being authorized to do so.

None of the authorized sales were canceled prior to bidding. However, in about 5 percent of the cases, no bids were received. Failures to publish and failures to bid resulted in reducing the total possible sales by 30 percent.

During the year, four transactions were vacated after bidding was completed. In two cases, the appraisals were found to be defective. In one case, the bidders failed to comply with the postbidding regulations. In the fourth case, a public need for the land (outdoor recreation and wildlife purposes) became apparent after the bidding.

Agricultural Land Law Effectiveness Study

INTERIM ANALYSIS

By almost any measure, except to the individuals involved, homesteading in the Western States during the decade of the fifties was a minor matter. A little more than 4,000 applications were filed, of which some 560 were approved to the extent of permitting the applicants to go upon the land to try their luck as homesteaders. By the end of 1962, a total of 230 homesteaders received patents while some 190 had given up. The remainder still had time to prove up.

From experience to date with the applications, the expected record for the period when it is finally closed looks as follows: About 14 percent of the applications will have been allowed and 86 percent rejected; of the allowed entries, 50 to 60 percent will be patented.

By States, about 60 percent of the allowances were in two States, Nevada and Utah, where 28 percent and 19 percent of the applications, respectively, were allowed. So far in Nevada, only 29 percent of the allowed entries have gone to patent with the outlook being that the final figure may be about 40 percent. Comparable Utah figures are 40 percent allowed and perhaps 65 percent patented.

Homesteading in Alaska, often referred to as the "last frontier," never did reach beyond minor proportions, considering the length of time and the great area of lands involved. Sixty-five years of homesteading in that State so far has led to about 10,000 claims. Of these, 3,250 have gone to patent, with some claims still pending. This indicates that eventually the total patented will amount to about 40 percent of the claims. This figure is highly influenced by the period 1944–54 during which many World War II veterans could earn title simply by residence on the land for 7 months. The averages before and immediately after this period both amounted to about 20 percent.

DESERT LAND ACT APPLICATIONS

Applications under the Desert Land Act, applicable only in 13 Western States, totaled about 20,000 in the 10-year period. Of these applicants, some 3,300 were permitted to go upon the land to develop it. By the end of 1962, a total of 1,250 had received patents while 1,100 had given up. Almost 1,000 still had time to reclaim the lands.

Experience to date indicates that eventually about 20 percent of the applications will have been allowed. Patents will probably issue for 50 to 60 percent of the allowed entries.

About two-thirds of the desert land allowances were in the two States, Idaho and Nevada. In Idaho, a little more than 40 percent of the applicants were allowed compared to about 20 percent for Nevada.

Patenting in Idaho is expected to run to about 60 percent of the allowances. The figures for Nevada are more uncertain and could run between 40 and 60 percent.

The Pittman Act, operable only in Nevada, was almost a complete failure. Out of 1,700 applications, 172 were allowed, and 2 went to patent by the end of 1962. Only a few remained uncanceled.

Activities initiated under these agricultural land laws during the 1950's resulted in passing about 300,000 acres in the Western States into private ownership by late 1962. Better than one-third of this acreage was in Idaho (134,000 acres). Nevada was next with 46,000 acres and Arizona third with 27,000 acres. These laws did not prove to be a very significant means of getting lands into private ownership. Public sales during the same period transferred 1,200,000 acres out of public ownership.

In Alaska, homesteading has also not proved to be a means to get large areas into private ownership. Sixty-five years of homesteading resulted in the transfer of about 400,000 acres, about one-tenth of 1 percent of the land area of the State.

CULTIVATIONS OF LANDS

In terms of actual cultivation of lands, the objective of these laws, the results are even smaller. Studies in the summer of 1962 of the lands patented by 1961 showed a total of about 125,000 acres cultivated in the Western States. About 60 percent of the cultivated lands were in Idaho. Most of the farming appears to be oriented to the livestock industry—alfalfa, grass, and small grains being the principal crops. Outside of these groups were potatoes (some 11,000 acres, mostly in Idaho), beans (some 5,000 acres, again chiefly in Idaho), safflower (about 5,000 acres, practically all in Arizona), and very small acreages of other crops.

Data on cultivation in Alaska are not yet tabulated. However, only about 25,000 acres are under cultivation in all of Alaska. In terms of acreage patented within the scope of these studies, cultivation amounted to almost 60 percent of the lands patented under the Desert Land Act, about 30 percent of the lands in the Western States patented under the homestead acts, about 2 percent of the lands patented in Alaska under the homestead acts, and none of the lands patented under the Pittman Act.

By States, the percentage of patented land cultivated included about 70 percent for Idaho, 45 percent for Arizona, 40 percent for Nevada and Utah, 30 percent for California, and 2 percent for Alaska, listing only the States having patents for more than 15,000 acres.

In the Western States, the percentage of entries in 1962 which were entirely devoted to nonfarm uses or entirely out of economic production or use varied from one-third to one-half in five States, one-fifth in three States, and less than one-tenth in three States, including Idaho. By 1962, 40 percent of the entries had changed ownership in their entirety and another 5 percent partly. In Alaska, 84 percent of the entries were estimated to be unoccupied or devoted entirely to nonfarm uses.

No attempt has yet been made to analyze the social costs of getting lands into private ownership during the 1950's via the agricultural land laws. For the purposes of getting an idea of what the magnitudes could be, in the preliminary analyses, an assumption was made of social costs of $300 per application. This appears to be low, considering the costs involved in examination of the lands and analyses of the situation by the applicants and by the Government, the flim-flams by bunco artists and the costs of the investigations and prosecutions, the costs of processing appeals and protests and holding hearings involving the Government, the applicants, grazing users, and other interested parties, the costs of supplying information to the public aware of the fact that there are homestead laws still on the books, water and other investigations and actions by States and local governments, actions by the better business bureau, newspapers, etc.

If the social costs are only $300, then the total costs for handling the applications filed in the Western States during the 1950's was about $8 million, or perhaps about $20 per acre transferred to private ownership. These would be merely the costs of transfer—costs of development would be additional and in individual cases can amount to as much as $150 per acre.

If the nondevelopment social costs amount to $1,000 per application, which is not unreasonable, then the costs of transfer could be close to $75 per acre. During the 1950's, sales of small tracts averaged between $40 and $50 per acre while lands sold under the public sale act averaged close to $10 per acre.

Especially if Idaho is eliminated from consideration, it seems altogether reasonable to conclude that quite often, if not generally, social costs of transfer of lands under the agricultural lands laws in the 1950's exceeded the raw land value of the transferred land.

Title Transfers Under the Public Land Laws in Alaska

To date, approximately 3,200 entries and 420,000 acres have been patented under the homestead laws. Currently, there are about 25,000 acres under cultivation on which crops have been harvested. Approximately one-half of this acreage in cultivation was brought about directly or indirectly by the Matanuska Colony project.

From the standpoint of achieving agricultural settlement and development, the homestead laws operating over a period of 60 years have been a failure. In addition, homesteading has demanded the expenditures of thousands of dollars of public funds for roads and other public services. An untold amount of individual effort and money has also been spent on homesteading endeavors which failed to produce an economic return.

For the period of 1953 through 1962, 1,462 homestead patents were issued for 165,954 acres; 4,478 small tract patents for 11,930 acres, and a total of 879 patents for 4,106 acres were issued under the homesite, headquarters, and trade and manufacturing site acts.

For the same period 572 townlot patents were issued. Figures are not available as to the number of townsite deeds issued by townsite trustees. It is estimated that close to 1,000 were issued during the 10-year period.

As can be seen, the Small Tract Act has been the most successful of these laws on the basis of number of persons accommodated. The results of the act are particularly noteworthy in light of the fact that fair market value is required for the lands which is not true of the settlement laws. This act has also had significant success when measured in terms of use and development. Examples of intense use brought about under the act include the recreation sites on Big Lake and Harding Lake, and hundreds of homesites in the Anchorage and Fairbanks areas. Classification encouraged concentrations which would justify roads and power supplies. In addition, it allowed systematic and planned openings to meet genuine needs.

State selection applications have concentrated on areas in proximity to settlement and along transportation routes. Its applications now cover practically all lands having reasonable potential in the foreseeable future for agricultural, urban, commercial, and industrial purposes. Yet, applications now total only about 14 million acres or about 13.5 percent of the grants. The State is expected to file promptly for any lands that appear to have economic potential, whether surface or subsurface, and therefore is expected to be in constant competition with private individuals and companies for Federal land. The State will have the edge in such competition owing to the ease of selection and the segregative effect of its applications.

Lowest Cost on Administration Desired

Chairman Hayden. This committee is interested in achieving the lowest possible cost in the administration of the public lands, while helping to develop the most effective ways to put land in private or in State ownership.

What suggestions do you have for reducing nonproductive work and improving procedures for getting public lands into private or State ownership?

Mr. Stoddard. There are proposals, as you know, for reviewing the public land laws. The House has one proposal which is coming up very shortly. A thorough review of the operation of the public land laws in relation to the management and administration and disposal of public lands is almost essential for us to reduce the costs to the maximum extent.

Advanced Classification of Lands

One of the things that we are engaged in now is an effort to try to classify the public lands in advance; that is, to try to use some objective classifications, not on the basis of the various laws, but on what are they likely to be used for, based on appraisal of their resources, their location, and economic and physical factors. Are they in blocks

or are they scattered or are they near cities and towns, and so on, so that we can determine where the long-term management commitments should be made and the conservation measures applied and where the disposal programs should be concentrated.

Chairman HAYDEN. To the extent that you can do that you are saving time of the department and you are saving the time of the prospective owners of the land.

Mr. STODDARD. We look forward to this as being a means of coming to grips with the problem.

OUTDOOR RECREATION INVENTORY AND EVALUATION COST

Chairman HAYDEN. What is the cost to you of your outdoor recreation inventory and evaluation activities?

Mr. STODDARD. You mean what is the present cost of it?

Chairman HAYDEN. Yes.

Mr. STODDARD. Actually, it is carried on as the inventory work is carried on, as a very minor part of the lands activity. Do you have any of the precise figures?

Mr. BEIRNE. We can supply that.

Mr. STODDARD. It is carried on as a sideline activity. We will supply an estimate.

(The information referred to follows:)

During fiscal year 1964 the Bureau of Land Management will expend not more than $150,000 on outdoor recreation inventory and evaluation.

RANGE RESOURCES INVENTORIES BUDGET

Chairman HAYDEN. How much is in this budget for your range resource inventories and how does the work which you have accomplished so far, and which you propose to accomplish in fiscal year 1965, compare with the trial program of public land range appraisal prepared at the request of this committee and published as Senate Document 119 in calendar year 1962?

Mr. BEIRNE. Senator, the figures that we supplied the committee are essentially the same as we are working on now, around $1 million a year for this purpose.

Chairman HAYDEN. Could you supply the figures?

Mr. STODDARD. We will supply the details for the record.

(The information referred to follows:)

PUBLIC LAND RANGE APPRAISAL PROGRAM

The public land range appraisal program contemplated by Senate Document 119 would involve a total cost of $11.9 million for the Bureau of Land Management, of which approximately $5.8 million is for the completion of the regular range inventories of the Bureau. Appropriations have provided a portion of this amount during fiscal years 1963 and 1964 and it is expected that sufficient regular funds will be available to complete the initial range inventories by the end of fiscal year 1966. The additional work required by the public land range appraisal program would cost an estimated $6.1 million over a 5-year period.

ESTIMATE LOWER FOR "WESTERN OREGON LANDS"

Chairman HAYDEN. I observe that your forestry estimate for western Oregon lands is less than the amount made available to you last year. Would you explain to the committee what changes in your program are responsible for this decrease?

Mr. STODDARD. There are some shifts in the account classifications here, as well as others. Mr. Beirne has some of those figures right handy.

Mr. BEIRNE. Senator, last year the House committee proposed that the additional costs because of timber sales be paid from the receipt limitation appropriation. This year it is proposed that all of the management costs be paid from this appropriation, and that in lieu of that, that the cost of reforestation and fire protection be paid from the timber sales.

AMOUNT OF REDUCTION

This effects a net reduction of $401,000 in the appropriation for those lands. The total amount for direct operations will still be the same but a greater amount will be paid out of the receipts rather than out of direct appropriations.

Chairman HAYDEN. You actually save no money as a whole?

Mr. BEIRNE. That is right.

REDUCTION IN "FOREST PROTECTION, ALASKA"

Chairman HAYDEN. You are asking $82,000 less in fiscal year 1965 for forest protection in Alaska than the amount available to you in fiscal year 1964. In your justification you say that the rapidly expanding population and recreational use creates a need for higher protection standards. How do you reconcile the reduction in your financial needs with this statement?

TRANSFER TO STATE ADMINISTRATION

Mr. BEIRNE. As the lands are being transferred to the State, the State generally assumes the cost of protecting those lands, and so, therefore, there are fewer acres to be protected by the Federal Government

Chairman HAYDEN. That is how you make the savings?

Mr. BEIRNE. Yes, sir.

SENATE LANGUAGE ON ALASKAN LAND SELECTION

Chairman HAYDEN. Last year, the report of the Senate committee contained language with regard to land selections made by the State of Alaska under the statute admitting Alaska into the Union. The conference report took note of this language and indicated that the directive included in it would be satisfied by surveys of the exterior boundaries of full townships with monumentation at an average of 2 miles around the perimeter of the townships.

Would you please tell the committee how this procedure has worked out, and indicate whether selections are being disposed of at a satisfactory rate of progress?

Mr. STODDARD. Mr. Remington, our chief engineer, has been handling this program, and I would like to have him present this.

METHOD OF HANDLING LAND SELECTION

Mr. REMINGTON. This method of monumenting the surveys and grouping them into surveyable sections and townships has for the first time given us a charter and we have progressed very rapidly on

that. We are very satisfied with the procedure now. We have an understanding with the State of Alaska, and before the surveys are started, we agree on a monumentation pattern, and then proceed with the work.

We have about 175 townships that we have been able to complete during that past summer, and complete the monumentation and get them ready for transfer to the State, because of the committee action last year.

TRANSFERS OF ACREAGE SURVEYED

Senator BARTLETT. I have a question or two there. What actual transfers have there been of the acreage surveyed?

Mr. REMINGTON. The actual transfers have not been completed, because the plats themselves have not come in to us from Alaska, but we understand that all of the Susitna Valley, and the Delta Tok Junction area, have been completed and are about ready to come in to us for approval. The actual transfer will be completed at that time.

Senator BARTLETT. Probably during this calendar year?

Mr. REMINGTON. Oh, yes, we feel sure.

Senator BARTLETT. You say the Bureau of Land Management is satisfied with this arrangement made by the committee last year?

Mr. REMINGTON. Yes, sir.

Senator BARTLETT. And you have asked for the same amount of money this year as the committee gave last year?

IMPROVEMENTS IN ALASKA SURVEYING

Mr. REMINGTON. That is right. We have improved our process and procedures for surveying in Alaska, and we think that this will enable us to carry on the program at a satisfactory rate.

Senator BARTLETT. And that amount was $300,000 for the current fiscal year more than the budget had originally requested?

Mr. REMINGTON. That is right.

REHABILITATION OF CERTAIN LAND IN SOUTH DAKOTA

Chairman HAYDEN. Last year Congress added unbudgeted funds for rehabilitation of public land in Butte and Lawrence Counties, S. Dak., and in the Big Horn Basin of Wyoming. Will you please indicate briefly the accomplishments attained with this money?

Mr. STODDARD. In South Dakota we have set up an office at Belle Fourche for the Makotapi project. This area is an area where there are three principal blocks of public lands and we are completing all of the basic project planning work during the winter and we are ready to move in the spring now.

In tree planting, we have 60,000 acres ready to go for spring tree planting, and we have scheduled 900,000 board feet of timber sales, much of which, or the majority of which is salvage of bug-killed timber.

In addition we have seven contracts for treating of infested areas and then we are setting up what we are calling a resource conservation area there, which will be a demonstration area of the kinds of practices which are appropriate. That is, the gully plugs, the contouring and the reseeding and various kinds of practices which are applicable to

the particular piece of land or the soil, and so on. So that we will have a small start on what will be the larger job ahead.

AMOUNT REQUESTED FOR PROJECT

Chairman HAYDEN. What sums do you have for each of these projects in the fiscal year 1965 budget?

Mr. STODDARD. $146,000.

Senator MUNDT. I have a question there. How much is that?

Mr. STODDARD. $146,000.

Senator MUNDT. That is yet to spend?

Mr. STODDARD. No.

ANTICIPATED EXPENDITURES, 1965

Senator MUNDT. What do you anticipate spending in the fiscal year now under consideration?

Mr. STODDARD. We have the same amount as last year, $146,000.

Senator MUNDT. Is that adequate to make the job proceed at a maximum or optimum rate?

Mr. STODDARD. As far as we can see we will be able to work consistently at a longer term conservation program in carrying on this work area by area, as we get to it.

POSSIBLE FUTURE NEED FOR LARGER FUNDS

Senator MUNDT. Do you anticipate that the best procedure is to use about that much money each year, or does it lead up to a time when you will have to have larger funds.

Mr. STODDARD. Well, the big part of this is going to essentially be capital investment and once it is made, it will be more on a maintenance basis. We really haven't gone into an analysis of when do we taper off of capital investment and go on maintenance.

But the rehabilitation of the resource, such as the tree planting, and getting of the land into more forage production is going to be scheduled out probably over a 10- or 15-year period.

Senator MUNDT. As I understand it, your actual work in the field will begin for the first time next spring.

Mr. STODDARD. Yes, in the spring. Most of the work was preparatory work last fall.

ESTIMATE FOR ACTIVITY IN BIG HORN BASIN

Chairman HAYDEN. Senator McGee, with regard to the action taken by the committee last year respecting the Big Horn Basin in Wyoming, do you have any questions?

Senator MCGEE. Yes, I have, Mr. Chairman. During these hearings last year, Mr. Stoddard, Mr. Landstrom indicated that the total estimated cost for the Big Horn Basin rehabilitation project was about $21 million. He also indicated that the project would require approximately 10 years to complete.

Now, an initial small appropriation was made last year, between $300,000 and $400,000, to begin work on it. The Bureau is asking for that same amount, $385,000, this year. I wonder if for the record you could advise the committee as to how the initial funds were spent and what is contemplated with that amount of money for this year.

EXPENDITURES OF INITIAL FUNDS

Mr. STODDARD. On these kinds of large projects, you have to go into a particular area. For 1965 we chose two small watersheds, No Water Creek and Bud Kimbell Creek, where we would apply all of the kinds of measures that were appropriate for the area. That is, the range improvement through elimination of sagebrush and the replacing with range grasses, and the soil conservation and other watershed measures that are supporting practices.

As you know, Senator McGee, there have been some misunderstandings in the area with respect to some of these techniques and so on, and why they were needed, and we felt by concentrating on a couple of watershed areas and getting the local people who were affected involved in this, that we could carry on a demonstration of why these projects would eventually increase the total number of AUM's and improve the water supplies in the area in a way that they would have a clear understanding of what was involved over a much larger area.

NEED FOR LARGER ANNUAL EXPENDITURES

Senator MCGEE. The amount that you are asking for this year, $385,000 isn't moving us very systematically toward $21 million in 10 years. That leaves us short. You ought to be spending a couple of million dollars a year if you were going to stay on any schedule.

COMPLETION DATE

Do you still estimate a 10-year completion date for this project?

Mr. STODDARD. No, sir; we don't. We are having to revise the length of time in which we feel that we can carry this project out. As I indicated, we are going to be learning quite a little bit from the experience in the particular areas that we are working in right now, so that we will have a better idea of whether our initial estimates have been accurate or not.

Senator MCGEE. In other words, you hope with this smaller allocation, concentrated in smaller sample areas, to not only educate the Bureau but to educate the ranchers involved.

Mr. STODDARD. That is right; we are going to have a real showplace, to show them what is involved.

Senator MCGEE. Would you anticipate that if this showing is an effective one, that you would then be prepared to step up the tempo considerably, let us say beyond this $385,000?

Mr. STODDARD. Yes, sir, we would be able to. We would be able to do this in the future. We would like to be assured that the people in the area are cooperating in this thing, and we hope that in the process of trying it out on a small scale, we get the people at the local level behind us on this. But this year we are concentrating at this level that we are proposing to continue.

COOPERATION WITH RANCHERS

Senator MCGEE. What kind of cooperation has the Bureau encountered so far with the ranchers in the area?

Mr. STODDARD. Well, we called a meeting on November 26 in which we asked all of the ranchers to come in who were our users in the Big

Horn Basin, at which the project was discussed in some detail and the response was generally for it and what the results would be as a result of the work that would be done.

In the local area now that the work is going on, we are going to have a local meeting of the local users, so that they can watch this operation all the way along. We did previously work this project through the advisory boards of the districts and with the soil conservation district people.

This project has a long history of technical work and some local work, but it was put on the shelf for a long time. I think a lot of people forgot it because the initial work was started in 1950 and since then it has been revived and revised.

Importance of Information Regarding Cooperation

Senator McGee. This is a point I think exceedingly important, and the Big Horn Basin is a place in which the Bureau or somebody has failed to get the full story told. There are those who, for whatever reasons, are coming out of the basin with the impression that this rehabilitation project was something that was invented in Washington, that was being rolled back in reverse order into the basin. As a matter of fact, as you very correctly stated, this project has a very long history, its origin and the original concept of it coming up through the local boards as far back as 12 or 13 years ago.

It is now possible to bring it into fruition, but it is going to take cooperation and understanding by the ranchers and the others who are using the grazing areas in the basin. This is the only reason that I am willing to go along with the Bureau's budget request this year of $385,000. This project is not a steamroller operation.

Selection of Small Areas for Discussion

In view of the need of correcting and narrowing this gap of misunderstanding, I think that the Bureau is very wise in selecting and working on the two small areas in order to demonstrate locally what the capabilities of the entire project area are. I think then you will have an easy task of winning understanding in the other areas of the Big Horn Basin.

Mr. Stoddard. I might say where we have done this in other places, it has worked out this way. They have got to see. The report doesn't do it, but where they can see the results on the ground, they will get behind this.

Senator McGee. This project goes back before your time, of course. However, it certainly shows a blindspot in the Bureau in terms of public relations and public information. I am glad to learn you are taking steps to correct these particular failings.

Technicians Fail To Inform Local People

Mr. Stoddard. Basically, one of our problems is that we are technical fellows, and our technical fellows will see what needs to be done and they will develop a plan for working with the resource. Sometimes we forget that there are people involved, and I think that this in one of the things that happened.

Senator McGEE. You put it very well. I know the BLM is under fire in many parts of Wyoming for many wrong reasons, but this matter does reflect a lack of either patience or concentrated effort to try to acquaint the local groups with precisely the work that is underway.

I think the Bureau would admit it has made some mistakes as well. We all make mistakes. But once in a while there is a lack of candor in admitting some of those mistakes of the past, and this fires the imagination of a community and enables the troublemakers to whip up much wider opposition than even the mistakes themselves would ordinarily have invited.

FIELD HEARINGS CONTEMPLATED

Again, I think that you are going at this the right way. We hope to have some field hearings out there whenever the circumstances of the Congress will permit, so that some of these people can sound off and get it out of their systems and lay their cards on the table. I think with you at the helm now we will have a chance to call everybody's cards and see where we stand. We are looking forward to that opportunity.

I want to thank you for the initiative you have shown in approaching the public relations problem in this realistic manner.

DEMONSTRATION PROJECT AREA

Senator MUNDT. May I continue along that same line, or not exactly along the same line, but something he said stimulated this.

We have no criticism of your Bureau in South Dakota, but you said something in response to my earlier question. I think you said you set up some of these projectlike demonstration areas for private people who may go out and do likewise on their land.

Mr. STODDARD. That is right.

LIAISON WITH STATION AT NEWELL

Senator MUNDT. In that connection, I wonder whether you have any liaison or any partnership programs or any coordination with the Federal station out at Newell, that the Department of Agriculture has in soil and water utilization. It would seem to me that there should be some connection between the two programs in some way.

Mr. STODDARD. If I am not mistaken, Senator, I believe that our people have been over there to go over the kinds of techniques that have been developed at that station that can be applicable in the western South Dakota project. We hope to apply known techniques so far as it is possible rather than pioneering.

Senator MUNDT. It is something that you could supply for the record, because it is something that you wouldn't have on top of your mind, but tell us what coordination there has been between you and the Newell station, and what might be done to a greater extent in that area.

It seems to me what you get out of public lands somebody else has to pick up. This is a job of the Department of Agriculture, of the specialists in the Newell Station, and there should be a sort of a cross-fertilization of the programs and planning and publicity.

RECORD OF APPLICABLE TECHNIQUES

So if you will prepare that for the record I would appreciate it.

Mr. STODDARD. One of the things that we are in the process of doing, and this applies to public lands all over, is work much more closely with the soil conservation districts. They have agreements with the private owners whose lands intermingle our land, and this enables us to make more unified planning of a total piece of land, and this will apply in the future.

Senator MUNDT. Will you supply that for the record?

Mr. STODDARD. I will.

(The information referred to follows:)

NEWELL EXPERIMENT STATION

Direct contacts were made with the Newell Experiment Station in 1963 when the Makotapi project was in the initial stage of development. Applicable information obtained from the station was used in the preliminary planning. The station was contacted again on February 12, 1964, for the specific purpose of obtaining assistance on methods and techniques for range studies. An agreement as to the design and extent of the studies will be made in the near future.

Because of the unique soils in the project area, it is anticipated that additional research projects on contour furrowing, seeding, and other conservation and development work will be undertaken cooperatively.

PETRIFIED FOREST REMAINS

Senator MUNDT. You mentioned earlier something about archeological antiquities. I believe that you are going to find some of the greatest petrified forest deposits which we have in this country, and certainly the greatest we have in this area.

What do you do to protect those or how do you operate now? I know they are there, but I don't know what your relationship is there.

Mr. STODDARD. We are in the process of developing a program for protective withdrawals of these lands. This is one step. The first one, of course, is identifying where they are. Then, the next is to determine what are likely to be the kinds of uses or abuses that may be made and how they may be preserved.

Having the protective withdrawals, we will then consider the lands in a special classification for administration and management. In some cases, we are building cyclone fences around very, very valuable deposits of huge petrified logs. This is only in two or three instances, but we found that in Senator Bible's State, the people have come in and dynamited some of this just invaluable material.

Until we know what we want to do with it in the future and how do we want to preserve it for posterity, we are having to select out some of the most valuable of these deposits and give them protection.

SMALL MANUFACTURING INDUSTRY USING PETRIFIED WOOD

Senator MUNDT. That is good, because I have no idea what you should do, but I know we have some out there that are 100 and 150 feet long, and pretty large diameter and width, and I just wondered what your connection with them was. I think that there is an industry, a small industry, a jewelry industry at Lemmon, S. Dak., which is in Perkins County, where they get from private deposits these little pieces of this petrified wood to make jewelry, that is, pin-on jewelry.

Mr. STODDARD. We will see what there is in this area, as a result of our inventory, and we will make a report.

TIMETABLE ON PETRIFIED FOREST PRESERVATION

Senator BIBLE. Might I interrupt at that point? On this question of the preservation of our petrified forests, and some disposition of them, could you give me the timetable on your surveys and inventories?

I know some fine geologists at our University of Nevada, and Mackey School of Mines, who made suggestions to our people that certain areas should be preserved pretty much in frozen status, so that the generations to come could see evidence of these petrified forests. We have a number of rather interesting ones in the State of Nevada. They have been dynamited and they have been removed by a lot of so-called rock hounds.

How far along are you on your study as to the possibility of designating certain areas as areas in which petrified forests could not be removed?

Mr. STODDARD. We have a few of them that we know already and we are moving on those. During this summer we are asking the district managers to identify any additional ones that would be candidates. We are going to set up some standards with respect to what would fit in and what would not fit in to an area that is worthy of being set aside.

We will get all of this information together. Then we will move on that with respect to which ones should have some very special treatment of the kind that I have mentioned.

Senator BIBLE. And you are to be commended for that.

Mr. STODDARD. In the fall sometime, I think we would have that.

Senator BIBLE. I would hope that you move along rather diligently, because if you take too long in making these so-called set-asides, they will be dynamited and completely removed and they will be gone. This is a position of many of our geologists in Nevada—that is, if the set-asides are not made pretty soon, there will be no more petrified forests left.

Senator MUNDT. What happens after you set them aside? Are they made a national park, and do you administer them? Suppose you decide that here is 10 acres that ought to be kept as it is, and then what do you do?

ADMINISTRATION OF WITHDRAWN AREAS

Mr. STODDARD. This is one of the questions that relate to the general question of how do we manage the public lands. For some time, I think that we are going to have to work cooperatively with the States, to help us in administering some of these areas, or the National Park Service where it is nearby, but essentially the basic job of administration is going to be ours.

One of the things that we are working toward, and I think that you gentlemen would be interested to know, is that by having rangers out for part of this 600,000 acres in a district that I indicated, rather than concentrated in a district office, so they can work with the local people and the local people know who they are, it will have some better control over these kinds of uses.

We are having to resolve this kind of administration for these special areas. Some of them are so small that they wouldn't warrant being national parks.

Senator BIBLE. Thank you.

Mr. STODDARD. We will cooperate with the Nevada geologists and I will check on this with our State director this afternoon.

AMOUNT FOR REHABILITATION OF BURNED-OUT AREAS

Chairman HAYDEN. I note that you are requesting $600,000 more this year than the $250,000 provided in fiscal year 1964 for rehabilitation of burned over areas. Your budget request last year was very much greater than the amount which was approved. How did the amount appropriated work out insofar as your needs were concerned?

Mr. STODDARD. We had some rather substantial fire losses, Senator Hayden, which exceeded the amount we had available.

Mr. BEIRNE. Most of our bad fires were in Idaho. We rehabilitated some of these areas, and then we had proposed a supplemental which unfortunately the timing was late and we couldn't get the work done. So the supplemental did not appear before the Congress.

However, the Bureau of the Budget did allow an additional $600,000 for next year so we have funds available to rehabilitate these areas immediately following the fire.

DEFOLIATOR MOTH EPIDEMIC

Chairman HAYDEN. With regard to the defoliator moth epidemic, would you describe for the committee just what is the problem which confronts you? When did the epidemic first become large enough to be so described?

Mr. STODDARD. It was known to exist for several years, but last year it became, in 1963, in epidemic proportions, and it looks as though the sagebrush is going to be not only defoliated but killed as a result. In some areas, this will have the effect of releasing grasses to grow, and in other areas where there is no cover, this means that we are going to have to do a job of range seeding.

We are watching it very carefully, and there are approximately 12 million acres of sagebrush that have been defoliated, and next spring will be the test of just how much has been able to survive through this epidemic of defoliator moth.

Chairman HAYDEN. This defoliates sagebrush and nothing else?

Mr. STODDARD. No; it is a specific insect.

Chairman HAYDEN. I thought sagebrush was tough enough to withstand anything.

Mr. STODDARD. That is what we all thought.

COST OF MOTH ELIMINATION AND RESEEDING

Chairman HAYDEN. What is the estimated cost of eradication of the moth?

Mr. STODDARD. Whether we eradicate the moth or whether we replace the sagebrush with grass is a question. I think the latter is more likely to be our course of action, because some species of sagebrush are valuable forage for the big game animals, and it will affect them more than it would affect livestock.

The cost of reseeding 12 million acres roughly is $9 an acre, and that would run us to a fairly substantial figure, $108 million if we tried to do it all at once, but we are not coming in with any kind of a program or estimate on this, because we don't know what is going to happen.

Maintenance of Physical Facilities

Chairman Hayden. I note that in your budget for maintenance of physical facilities there is an increase of $150,000 over the amount available in fiscal year 1964, for maintaining and operating sanitation and protection facilities constructed under the accelerated public works program. Would you please supply for the record a tabulation of the accelerated public works projects constructed on Bureau of Land Management lands, indicating the type and the location of each project, the total cost of each project; and if they were not constructed entirely with Federal funds, please indicate the source and amount of non-Federal funds.

Accelerated Public Works Construction

Mr. Stoddard. Yes, sir; we built 64 sites with 854 family units. We will supply this.

(The information referred to follows:)

Accelerated Public Works Program

Sanitation and protection facilities

The Bureau of Land Management utilized $2,110,000 in accelerated public works funds to construct sanitation and protection facilities on 64 sites involving 854 family units. No contributed or matching funds were involved in this construction. A detailed listing of the sites follows:

State	County	Construction cost	Remarks
Alaska	Anchorage Election District 10.	$47,000	20 family units at Eklutna Lake.
	Fort Yukon-Fairbanks Election District 16.	17,000	10 family units, 1-mile access road at Eagle.
	Cordova-Valdez Election District 6.	33,000	10 family units, 2 boat docks, 2-mile access road at Mankomen Lake; 20 family units at Miles Lake.
	Palmer-Wasilla-Talkeetna Election District 7.	18,000	10 family units at Bayer Lake.
California	Humboldt	157,000	30 family units, 12 miles of foot trails and related facilities in Kings Range area.
	Lassen	58,000	30 family units and boat dock at Eagle Lake; 20 family units at Post Camp-Painter Flat.
	Trinity	78,000	20 family units at Douglas City campground.
	Tulare	140,000	50 family units at Long Valley and Kennedy meadows.
	Mendocino	5,000	10 family units on Red Mountain.
Idaho	Kootenai	39,000	4 family units and 2½ miles of trail at Killarney Creek and Mineral Ridge; 20 family units at Mirror and Crystal Lakes.
	Washington	83,000	20 family units, boat dock, and 5 miles of trail at Brownlee Reservoir.
	Benewah	9,000	5 family units at Tingley Spring.
	Bonner	12,000	9 family units and ½ mile of trail at Pack River Viewpoint.
	Idaho	15,000	10 family units and 700 feet of trail at Skoockumchuck Creek.
Nevada	Lincoln	6,000	4 family units at Meadow Valley Wash.
	Mineral	107,000	17 family units and boat launching facilities at Walker Lake; 20 family units and boat launching facilities at Tamarack Point.

State	County	Construction cost	Remarks
New Mexico	San Juan	$45,000	5 family units at Angel Peak.
	Taos	279,000	34 family units at 6 recreation sites, with 4 parking areas and 16 miles of foot trails in the Rio Grande Gorge.
Oregon	Curry	10,000	7 family units at Sixes River.
	Josephine	189,000	32 family units at Deer Creek and 10 miles of construction on the Rogue River Trail.
	Klamath	77,000	30 family units and boat launching facilities at Gerber Reservoir; 10 family units at Chase Mountain; 10 family units and boat launching facilities at Topsy.
	Coos	38,000	10 family units at each of the following sites: Burnt Mountain Cabin, Park Creek, Bear Creek, and Cherry Creek.
	Douglas	45,000	10 family units at each of the following sites: Darby Creek, Cavitt Falls, Lone Rock, and Susan Creek Falls. 5 family units at Little River and 15 family units at Wolf Creek Trail.
	Marion and Polk	264,000	70 family units on Santiam River at Fishermens Bend; 20 family units at Elk Horn Valley; 20 family units at Canyon Creek; 14 family units at Mill Creek; 25 family units at Salmon Falls.
	Columbia	22,000	10 family units at Scaponia site.
Utah	Carbon	64,000	50 family units at Price Canyon.
	Emery	20,000	12 family units, foot trails, and parking area at Buckhorn Wedge.
	Garfield	80,000	9 family units at Relishing Seep-Calf Springs; 10 family units at Sawmill Basin; 10 family units at McMillan Springs.
	St. George	53,000	12 family units at Red Cliffs.
	San Juan	75,000	15 family units at Hatch Point; parking area, 4 picnic areas, and 3 overlooks at Needles Viewpoint; 4 overlooks, 2 picnic areas, foot trails, and parking area at Anticline Overlook.
Wyoming	Sweetwater	25,000	10 family units at 14-Mile Reservoir.
Grand total		2,110,000	

NOTE.—Includes projected items pending completion of projects.

MAINTENANCE OF ACCESS ROADS

Chairman HAYDEN. Your budget estimate for fiscal year 1965 for "Maintenance of access roads" is $700,000 compared to the fiscal year 1964 appropriation of $225,000, which was a reduction of $79,000 in your last year's estimate. Would you please explain to the committee why more than three times as much money as was made available last year is to be required in the coming year?

Mr. REMINGTON. This is a program we are just getting underway, the maintaining and bringing up to the original standard a lot of the old roads that are servicing our areas. This, I believe, will allow us to open up to the public some 1,100 miles of these roads that are presently closed. It is a program to further open up the public lands by improving the existing roads to a standard that the public can travel on.

Chairman HAYDEN. Of course, the roads serve many purposes.

Mr. REMINGTON. Oh, yes.

1965 BUDGET ESTIMATE FOR CONSTRUCTION

Chairman HAYDEN. There will be included the budget estimate for "Construction" for fiscal year 1965. The Bureau requests an appropriation of $1,400,000, which is $1,100,000 more than was appropriated in fiscal year 1964.

(The document referred to follows:)

BUREAU OF LAND MANAGEMENT

Construction

Appropriation, 1964	$300,000
Unobligated balance from prior years	465,986
Total available for obligation	765,986
Decreases:	
Access roads on public domain lands	372,256
Buildings	393,730
Subtotal	765,986
Increases:	
Buildings	400,000
Sanitation and protection facilities on public domain lands	1,000,000
Total, budget estimate, 1965	1,400,000

Analysis by activities

Activity	Amount available, 1964	Fiscal year 1965			Total available, 1965 compared to total available, 1964
		Unobligated balance from prior years	Budget estimate	Estimated total available	
1. Access roads	$372,256				−$372,256
2. Buildings	393,730		$400,000	$400,000	+6,270
3. Sanitation and protection facilities			1,000,000	1,000,000	+1,000,000
Total	765,986		1,400,000	1,400,000	+634,014

1. Access roads, 0

No estimate is furnished for access roads in fiscal year 1965 under this title in view of the authorization by the 87th Congress of a new section of the Federal Aid Highway Act entitled "Public Land Development, Roads and Trails." Amounts that are unobligated and unexpended as of June 30, 1963, will remain available and will be utilized under this appropriation to complete authorized projects.

2. Buildings, $400,000

The estimate of $400,000 is an increase of $100,000 over funds appropriated in 1964, exclusive of $93,730 in carryover funds which also are available in that year.

The only project included in this estimate is the fire control facilities to be constructed at Anchorage, Alaska. In fiscal year 1962 the Congress authorized funds for the preparation of architectural plans for fire control facilities in Anchorage, estimated to cost approximately $1.1 million. Present facilities are located on Elmendorf Air Force Base and are composed of prefabricated buildings constructed under the CCC program in 1941. Facilities are covered by a revokable permit from the Air Force, first issued in 1948 and renewed periodically since that time. The last permit was issued in December of 1959 for 5 years.

In 1953 the Air Force indicated in writing that the Bureau of Land Management should move. Subsequent expressions by the Air Force as to their desires to have the Bureau vacate have been expressed verbally. Location on the base is not advantageous to the Air Force, the Bureau of Land Management, or the public. It presents some inconvenience for the Air Force and is not good in terms of military security control of the base. Maintenance costs for the present buildings are excessive and the buildings are exorbitantly expensive to heat. Necessary major improvements cannot be justified under current revokable permit conditions. Proposed construction site on Bureau of Land Management land is more suitable for requirements of transportation, delivery of supplies, etc. The contemplated facilities will provide for more efficient operation of the fire control station.

The request of $400,000 is to initiate construction of these facilities in fiscal year 1965. Completion of the entire fire station is scheduled within 3 years.

3. Sanitation and protection facilities, $1,000,000

Use of the public land for recreation is increasing and cannot be stopped with reversal of public policies of long duration. Much of the public land has a potential for recreation. The land is there; the people go to it and use it. Public health and safety is endangered and unsightly eyesores develop. Public lands can be left unmanaged only when their resources are not in demand by people. When recreation use is made of these lands without even minimum facilities, fire, pollution, erosion, and other hazards are created which endanger the using public.

While thousands of people depend at least partially upon the public lands for grazing, timber products, oil and gas, and other mineral resources as a means of earning their living, millions of people look to the public lands as a place to relax rather than work. It is estimated there will be 18 million visits to BLM lands for fishing, hunting, sightseeing, picknicking, and other recreation purposes during 1965. This use is occurring despite very few access roads. Recreation is a valuable land use and an inescapable component of multiple use resource management.

The Bureau is engaged in a varied preventive program to diminish abuse of public lands resulting from improper recreation use. Special steps have been taken to have field personnel properly utilize the various acts of Congress so as to better control trespass and protect archeological and other antiquities; steps are being taken to stop flagrant violations of the Antiquities Act in the Four Corners country of Utah and Colorado. Petrified wood deposits will be given orderly management under proposed regulations implementing Public Law 87–713. Rules of conduct governing use of the Rogue River Trail in Oregon were issued following public hearings. New signs are being installed to direct people to established facilities and to encourage respect for resource values. Brochures and maps to assist sportsmen to enjoy the public lands in an orderly fashion are in preparation. Operation Cleanup in Arizona and a similar program in Nevada are examples of efforts by BLM officials, in cooperation with State and local authorities, to encourage recreation users of the public lands voluntarily to maintain clean campgrounds and otherwise practice good outdoor manners.

A conspicuous example of the urgent need to install sanitation and protection facilities is the Owens Valley of California. Heavy year-long use is ruining outstanding scenic areas. Human waste pollutes streams serving as part of the Los Angeles domestic water supply; visitors wash their clothes, dishes, and pets in the streams which are used by others for drinking water; garbage and refuse is scattered in piles about the area; fires are located in places of high fire hazard due to lack of proper facilities. The act of March 2, 1931 (46 Stat. 1530), withdrew most of the public land in the valley to protect this water supply and states: "That nothing herein contained shall be construed as affecting the use or occupancy of any of said withdrawn lands for *recreational* or grazing purposes under such rules and regulations as the Secretary of the Interior may deem necessary to conserve the natural forage of the area." [*Italic* supplied.] The Department of the Interior Regulation of April 18, 1931, further provides for recreation that "due care in the use of campfires and the extinguishment of same must be exercised by all persons using the lands, camp refuse or debris of any kind must not be left in an exposed or unsanitary condition or deposited in or near any stream, lake or other body of water in a manner which may directly or indirectly cause pollution of said water." This law and regulation were effective when use was low, but today it is not the answer to the heavy public use that exists.

Another instance of severe pollution is the condition of the Salmon River in Custer County, Idaho, particularly between Ellis and the Challis National Forest boundary. Many people come from Utah, Montana, Colorado, California, and other States to try their luck in this famous fishing stream, and the public lands bordering it receive intensive use throughout the summer. Pollution of the water, due to lack of any sanitation facilities to serve fishermen camped beside the river, reached such a point that in 1958 the State health department was considering closing the river. Temporary relief was afforded in 1960 with cooperation of the State and of local interests. However, increasing use without any further steps to protect it are aggravating the situation. Cases of severe dysentery and at least one case of typhoid have been attributed to using this impure water for drinking purposes.

An example where facilities are needed to protect human life is the Canyon Rims country of Utah. Here visitors are flocking to accessible overlooks providing spectacular views of the canyons of the Green and Colorado Rivers.

These places are dangerous due to vertical drops of over 1,000 feet, overhanging ledges, and strong wind currents. Fatalities of children, pets, and the more venturesome adults will be inevitable unless protective fences are built.

Similar conditions could be cited on many other portions of the public domains. Where feasible, the Bureau has taken steps to correct them by encouraging lease or sale of the property to State and local authorities. The imperial Hot Spa in California has been used for years by people seeking benefit from its hot waters but without effective control and without necessary sanitation or other public services. In 1963 the Bureau issued an R. & P.P. Act patent for this site to Imperial County. Local interest, especially in the recreation potential of reservoirs near centers of population, has enabled the Bureau to convey some such sites under this act for local development. This program is being intensified but it will not meet all needs.

In the Owens Valley, Salmon River, Canyon Rims, and other selected areas, basic and simple facilities such as toilets, a safe water supply, garbage and litter disposal, and guard fences will be built. One million dollars is requested for this program in 1965. Details of the construction program are set forth in the following table:

State and location	*Cost*
Arizona:	
Hualpai Mountains	$36,000
Cerbat Mountain	18,000
California: Owens Valley	207,000
Colorado:	
Five Points Placer	15,000
Drowsy Waters	10,000
Gypsum	33,000
Idaho: Salmon River	62,000
Montana:	
Madison River	80,000
Locate Creek	40,000
Nevada:	
Red Rock Canyon	80,000
Wildhorse Reservoir	97,000
New Mexico:	
Three Rivers Pictograph	14,000
Santa Cruz Reservoir	30,000
Oregon:	
Deschutes River	100,000
Steens Mountains	20,000
Utah: Canyon Rims	30,000
Wyoming: Five Springs	78,000
Survey and design of facilities	50,000
Total	1,000,000

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) decrease (−)
Program and financing:				
Total obligations	$1,185,632	$765,986	$1,400,000	+$634,014

FIRE CONTROL BUILDINGS, ANCHORAGE, ALASKA

Chairman HAYDEN. $400,000 of this amount is for buildings and all of it is to be expended for fire control facilities at Anchorage, Alaska. What is the total cost of these facilities in Alaska which, I understand, will require 3 years for completion?

Mr. STODDARD. The total cost, Mr. Chairman, is $1.1 million which, if spent once, will be over 1 fiscal year. We propose to spread it out over 2.

Senator BARTLETT. May I ask a question?

Chairman HAYDEN. Certainly.

Senator BARTLETT. How many buildings are to be constructed, Mr. Stoddard?

Mr. STODDARD. Let Mr. Remington talk on these specifics.

Mr. REMINGTON. In the Anchorage setup, it is a part of the main building. It is the training section of the building which will house the warehouse and the training section.

METHOD OF LETTING CONTRACTS

Senator BARTLETT. Then let me ask this question, because I would assume this is to be done over a 3-year period that three separate contracts will have to be let: Can you do this as cheaply in that matter as to complete the job in 1 year under one contract?

Mr. REMINGTON. No. The architect who designed the building has given us an estimate that it will cost us $80,000 more to build it in three sections than to build it all at once as one job. There are actually two buildings involved. The training center and the warehouse will be one, and the equipment repair shop is another building.

Senator BARTLETT. Then the three-step program will involve an additional cost to the taxpayer of about $80,000?

Mr. REMINGTON. $80,000 is the architect's estimate.

Senator BARTLETT. Thank you. That is all.

Chairman HAYDEN. Are there any other building projects planned for fiscal year 1965?

Mr. STODDARD. Actual buildings? No sir. It is mostly maintenance on existing buildings.

SANITATION AND PROTECTION FACILITIES

Chairman HAYDEN. With regard to the $1 million asked for "Sanitation and protection facilities" I find a very strong similarity to the description of the project for which you requested $700,000 in the fiscal year 1964 budget and which you called "Recreation facilities." Are the projects which are included in the fiscal year 1965 budget essentially the same recreation facilities which were denied by Congress last year?

Mr. STODDARD. The locations are the same, the problem is the same, that is, use by recreationists, by people using public lands. But our proposal here is essentially this: To provide the basic essentials; fireplaces to keep fires from getting away on the public lands; disposal of waste; toilet facilities and water wells so that we don't get pollution of the streams, and so that we do not have litter around, we have dumpsites. These are the basic elements. We have deleted boat ramps and other such improvements.

We do not consider this recreation. We consider this protection of the resource and the public.

RELATION TO RECREATION

Now, the people who come there are recreationists, but they have to go and find their activity interests in other things. These are the basic elements for providing clean use of the public lands.

We have some pictures here, Senator, showing the present problems that we are faced with and showing the way in which public lands are used and abused, because people do not have any kind of campgrounds.

USE OF ACCELERATED PUBLIC WORKS FUNDS

Now we did, with accelerated public works money, take care of some of the difficult situations, but the ones we have left are not in the depressed areas that qualify under the accelerated public works. These are in other areas, and these are the things that exist that we are trying to take care of.

We did do it with accelerated public works money. We have a good record of areas that are in good shape.

Senator BIBLE. May I pursue that a little further, Mr. Chairman?

Chairman HAYDEN. Yes.

PRESENT FACILITY SIMILAR TO FACILITY DENIED, 1964

Senator BIBLE. Notwithstanding what Mr. Stoddard says, and I questioned Secretary Udall on this, this is pretty much the same type of facility that was denied by Congress in the last session. You may be calling it a little differently, but actually what you are doing is the same thing you attempted to do a year or two ago. I think there is some merit for this type of program and I would hope, because the question has been raised as to whether you have the authority to do it or not, that you would supply for the record the opinion of your Solicitor indicating, as I understand it, that you do have the authority to go into these health and sanitation facilities.

(The information referred to follows:)

U.S. DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SOLICITOR,
Washington D.C., June 1, 1962.

Memorandum to: Director, Bureau of Land Management.
Through: Assistant Secretary, Public Land Management.
From: Solicitor.
Subject: Construction of recreational facilities.

You have inquired as to the legal authority under which you can construct recreational facilities on the public lands under the jurisdiction of this Department. More broadly stated, you wish to know whether this Department has authority to administer or manage the public domain for recreation uses. The answer is in the affirmative.

There is no law that directly confers such authority. However, the authority is necessarily implied from other legislation as well as from the general responsibility of the Secretary of the Interior to administer and regulate the use of the lands under his jurisdiction. (Eg., 34 Ops. Atty. Gen. 320, 326–327.)

It is firmly established that the general public may make legitimate use of the public domain though there is no law specifically authorizing it. Eg., *Buford* v. *Houtz* (133 U.S. 320 (1890)). And such use or uses may continue under a sort of implied license until or unless Congress legislates to the contrary. This does not mean that Congress has bestowed a right on the users; it merely suffers the lands to be so used. Eg., *Omaechevarria* v. *Idaho* (246 U.S. 343 (1918)). Nor does it mean that the Secretary of the Interior may not administer and regulate such uses. Quite the contrary, Congress has bestowed upon him the authority

"to prescribe regulations, not inconsistent with law * * * for the Government of his department * * * and the * * * use * * * of the * * * property appertaining to it" (R.S. sec. 161, 5 U.S.C. 22), and has charged him with the duty, among others, of supervising the public business relating to the public lands (R.S. sec. 441, as amended, 5 U.S.C. 485), and of performing all executive duties in anywise respecting such lands. (R.S. sec. 453, 43 U.S.C. 2; 1950 Reorg. Plan No. 3, secs. 1 and 2, eff. May 24, 1950, 15 F.R. 3174, 64 Stat. 1262.)

The use of public lands for recreational purposes is legitimate. It is clearly in the public interest unless it conflicts with some other higher use to which the lands have been devoted. It is not an unauthorized disposition of the lands or their resources. It is not a use that has been specifically or impliedly prescribed by Congress. On the contrary, Congress has for years recognized and protected the right of hunting and fishing (a recreational use) on the public lands. Sections 1, 2, and 9, Taylor Grazing Act, 43 U.S.C. 315, 315a, 315h; section 1, Coordination Act, 16 U.S.C. 660. More recently, it established a nonpartisan Outdoor Recreation Resources Review Commission. (Public Law 85–47, June 28, 1958, 72 Stat. 238, as amended by Public Law 86–6, Mar. 25, 1959, 73 Stat. 14). The salient purpose of this Commission was stated in the preamble as follows:

"That in order to preserve, develop, and assure accessibility to all American people of present and future generations such quality and quantity of outdoor recreation resources as will be necessary and desirable for individual enjoyment, and to assure the spiritual, cultural, and physical benefits that such outdoor recreation provides, in order to inventory and evaluate the outdoor recreation resources and opportunities of the Nation, to determine the types and location of such resources and opportunities which will be required by present and future generations; and in order to make comprehensive information and recommendations leading to these goals available to the President, the Congress, and the individual States and territories, there is hereby authorized and created a bipartisan Outdoor Recreation Resources Review Commission."

In the circumstance, therefore, it can hardly be said that Congress has not given at least its tacit consent to the use of the public domain for recreational purposes. This being the case, it is a legitimate public use of these lands which the Secretary of the Interior is authorized to administer, manage, and regulate.

FRANK J. BARRY, *Solicitor.*

Senator BIBLE. Now I hope that you will develop for the record what you expect to get for the $1 million in facilities and how much more manpower it takes and where they will be located.

Mr. STODDARD. Yes, sir; we will have all of that for you.

BREAKDOWN OF LOCATIONS

Senator BIBLE. Do you have a breakdown available now?

Mr. BEIRNE. Of the locations?

Senator BIBLE. Where will they be located?

Mr. BEIRNE. In Arizona, in the Hualpai Mountains and Cerbat Mountain; in California, Owens Valley; in Colorado, Five Points Placer, Drowsy Waters, Gypsum; in Idaho, Salmon River; in Montana, Madison River and at Locate Creek; in Nevada, Red Rock Canyon and Wildhorse Reservoir; in New Mexico, Three River Pictograph and Santa Cruz Reservoir; in Oregon, Deschutes River and Steens Mountains; in Utah at Canyon Rims; and in Wyoming, Five Springs.

This is ready to be inserted in the record.

(The information referred to follows:)

SANITATION AND PROTECTION FACILITIES

The sanitation and protection facilities included in the program are the simplest and most economical possible that will serve the intended purpose. The average cost per family unit is slightly in excess of $1,000. In all cases, State and local governmental agencies have been unwilling or financially unable to construct the necessary facilities. In some cases, however, where the sites are near established communities, local government has agreed to share the costs of operation and

maintenance. The types of facilities proposed are limited to the following:

(*a*) *Sanitation.*—Toilet facilities are of the pit (with concrete base) or chemical type. We do not plan flush toilets. Convenient cans for garbage and trash are provided and a sanitary fill disposal pit frequently provided some distance away.

(*b*) *Water supply.*—Health authorities have determined that much of the water from streams and seeps on the puolic lands is not safe for human consumption. It has become contaminated by domestic livestock, wildlife, or humans. We, therefore, frequently drill wells and install hand operated self-priming pumps or construct a concrete head box at a spring having potable water and install a gravity water system.

(*c*) *Public protection.*—In some instances it is also necessary to construct service roads and trails, bridges, parking areas, provide tables for picnicking and camping and informational and directional signs to concentrate the users of the public lands in safe places. It is also necessary to remove safety hazards from the site or install protective devices. Examples are dead limbs or trees, jagged metal objects under water where children can be expected to wade or swim, and precipitous cliffs.

(*d*) *Fire protection.*—This includes removing inflammatory material from sites, constructing and maintaining fire breaks, and the construction of a safe fireplace for each family unit. This fireplace ordinarily consists of a concrete base firebox with a grid or a sheet metal cover.

Overall, we propose the construction of facilities at 18 sites in 10 States. A brief explanation of these proposed developments follows:

Name	Description	Cost
Arizona:		
Hualpai Mountains	23 family picnicking and camping units, hunters' camps, sanitation facilities, drinking water supplies, and parking areas at 4 sites in mountainous section of northwestern Arizona used extensively by hunters and summer campers.	$36,000
Cerbat Mountain	9 family units and sanitation facilities at 3 sites along the Chloride-Tipton Road used by hunters, picnickers, and campers.	18,000
California: Owens Valley	154 family units, camping and trailer sites, water and sanitation facilities and roads and parking areas for this major recreation area used by an estimated 200,000 people annually, primarily from southern California. Uncontrolled use is causing serious public health hazards.	207,000
Colorado:		
Five Points Placer	10 family units for camping and picnicking with sanitation and water facilities on the Arkansas River, 15 miles west of Canon City, where present fishing use is resulting in litter and unsanitary conditions.	15,000
Drowsy Waters	10 family units for camping and picnicking with sanitation and water facilities on the Colorado River, 5 miles west of Granby, where easy access from U.S. 40 is resulting in acute sanitary problems.	10,000
Gypsum	20 family units for camping and picnicking, with sanitation and water facilities on the Eagle River, where fishermen and campers are creating an extreme litter and sanitation problem.	33,000
Idaho: Salmon River	60 family and picnicking units with sanitary and water facilities, access roads, parking areas at 3 sites on the Salmon River, needed to alleviate the existing serious health and safety problems.	62,000
Montana:		
Madison River	40 camping and picnicking units with adequate sanitation and water facilities with necessary spur and access roads. Because of good fishing and easy accessibility, the area is receiving heavy public use which results in health hazards and increased fire danger.	80,000
Locate Creek	20 family units with water and sanitation facilities adjacent to major highway between Baker and Miles City will help alleviate present heavy demand for overnight camping facilities.	40,000
Nevada:		
Red Rock Canyon	40 camping and picnicking units with appurtenant water and sanitation facilities on an archeological site, 15 miles west of Las Vegas, to facilitate present heavy local and regional use which has resulted in unsanitary conditions and destruction of historically valuable petroglyphs.	80,000
Wildhorse Reservoir	50 family units with appurtenant water and sanitation facilities for this major water sport recreation center for northern Nevada. Present unsanitary conditions caused by indiscriminate use of this site by anglers, hunters, boaters, and water skiers caused closure of a portion of the lake by the State health department.	97,000

Name	Description	Cost
New Mexico:		
Three River Pictograph	3 family picnicking units, sanitary facilities and a mile of chain link fence to protect Indian pictographs. Present use by visitors is causing serious vandalism and sanitation problems.	$14,000
Santa Cruz Reservoir	27 family units with appurtenant water and sanitation facilities on 1 of the few lakes available for water sports in northern New Mexico, serving the Santa Fe and Los Alamos area. The intensive uncontrolled use is now causing health and sanitation problems.	30,000
Oregon:		
Deschutes River	35 family units at Cedar Island and 20 camping and 20 picnicking units in Mack Canyon with adequate sanitary, water, and parking facilities. 2 sites are located between Sherars Bridge and State Highway 216 and Mack Canyon and were recommended by a joint Federal-State study which recognized the dangers of high fire hazards and sanitary problems adjacent to one of the finest streams in the Northwest.	100,000
Steens Mountains	15 family units with adequate sanitation facilities in 2 sites along the Steens Mountains loop road, to accommodate present heavy use by hunters and campers using areas adjacent to Malheur National Game Refuge.	20,000
Utah: Canyon Rims	3 overlooks, parking areas, camping and picnicking areas with appurtenant sanitary and water facilities along the Colorado River Canyon rim, 20 miles south of Moab. Complete project started under accelerated public works program.	30,000
Wyoming: Five Springs	28 new family units, sanitation facilities, repair of old CCC campsite, spring development, and improved access. Site located near Lovell on a main access road to Yellowstone National Park. Present facilities require improvement and expansion to accommodate users and to alleviate existing unsightly and unsanitary conditions.	78,000

Outdoor Recreation Resources Review Commission

Chairman Hayden. Is the money requested in fiscal year 1965 made "to implement the recommendations of the Outdoor Recreation Resources Review Commission" as was the case with the funds requested in fiscal year 1964?

Mr. Stoddard. Consistent with the recommendations of the Commission, but based on the inventory. We used their people to help us identify this, or they are being used right now. We have worked it up in cooperation with their standards. Howard Ball of Mr. Crafts' staff has worked with our Mr. Peterson on this.

The actual facilities will be just the basic facilities. We have trimmed back any proposals for boat ramps, or tennis courts, or volleyball courts, down to the basic essentials.

Family Recreation Units Planned

Chairman Hayden. How many family recreation units are planned for construction with this budget, and where would they be placed?

Mr. Beirne. That has been inserted in the record.

Maintenance and Servicing of Areas

Senator Mundt. Would you also include in this insertion your plan for maintaining and servicing these areas? It seems to me just to construct something and go away and leave it then you are right back where you were before, because some who use them are pretty careless.

Mr. Stoddard. We have a clue to it on the basis of other construction. We spent $2 million. We have $150,000 in the budget for annual caretaking responsibilities of these sites.

(The information referred to follows:)

FACILITIES PROVIDED

The maintenance program for sanitation and protection facilities in fiscal year 1965 is estimated to require $150,000 and 25 man-years of labor. This labor will be furnished by contractors in areas where they are available and by Bureau temporary employees in more remote areas.

If the $1 million for construction of sanitation and protection facilities is allowed in fiscal year 1965, it is estimated that increases for maintenance in fiscal year 1966 will include $75,000 and 12 man-years of labor for these facilities.

Senator BIBLE. I think there is considerable merit in this, Mr. Chairman, but I think we ought to know exactly what we are doing as we get into it; what the costs are for construction. If I might repeat, you are going to be in four areas; in the area of water, you are going to provide fireplaces, you are going to provide toilet facilities and what else?

Mr. STODDARD. Garbage dumps. Probably there would have to be some roads and trails to provide access.

MAINTENANCE PERSONNEL AND OPERATIONAL COST

Senator BIBLE. And might I ask one further question, following up what Senator Mundt said. I think you have a cost of maintenance. How many men does it take and how much will it cost to keep these operational?

Mr. STODDARD. We will have this in the figures. Now, in some cases we are working with the local governments or the State park people to do this for us. In some cases, the National Park Service may be able to help us. But the cost will be there.

Senator BIBLE. May I ask one further item to be supplied, Mr. Chairman, with your permission.

Chairman HAYDEN. Certainly.

NEW FACET OF PUBLIC DOMAIN MAINTENANCE

Senator BIBLE. Assume we embark on this which is, apparently, a new facet of management of the public domain. Where does it lead us? How many of these do we build around the public domain States? Because you have many, many hundreds of thousands of acres of public domain under your control. How many facilities do we build?

INVENTORY INDICATES AREAS CONCERNED

Mr. STODDARD. The inventory shows where we have indicated areas. We have asked for funds for sites where there are concentrated uses, where people will probably be concentrating their recreational use, hunting, fishing, camping, and so on.

From the inventory, we will know at least the number of sites and probably the capacity that could reasonably be taken care of based on the geography of the particular spots. We can lay this before your committee to indicate what has been the increase in visitor load as this builds up. Then it will be up to Congress to determine how much of this should be provided for, if any, each year.

(The information referred to follows:)

CONSTRUCTION OF SANITATION AND PROTECTION FACILITIES

The facilities to be constructed with the $1 million requested for fiscal year 1965 are all located in areas of intensive public use. This heavy use of areas lacking in basic sanitation and protection facilities has resulted in hazards to the using public and the natural resources through pollution and uncontrolled fires.

On the basis of the present state of our inventory and present knowledge of actual use of the public lands, continuation of this program on the same basis will require the expenditure of $6 million to provide facilities on some 300 sites. Future additional needs for facilities will depend on future trends in use of the public lands.

Public Domain Lands

Senator Bible. If I understand you correctly, you are attempting to do something with the public domain lands under your jurisdiction and your control similar to what the Forest Service under the Department of Agriculture has done to the forest lands, something similar to that.

Mr. Stoddard. Similar in the fact that people are using them now and we have to provide some means of controlling this use so that the lands and the waters are not harmed.

Now we are not going into the, shall we say, manicuring of the camp spots that would be involved, all the refinements that would be involved in the Forest Service sites. If these people want to rough it, we will have the essential facilities and leave it at that.

Questions of Charging Fees

Senator Bible. Do you propose to charge a fee?

Mr. Stoddard. This is going to have to be a part of this whole land and water fund consideration, and I think as the policy is developed for the Department and the Government on this, we will have to face up to it.

Senator Bible. A bill has been reported out of the House committee now on a recreational fund. Does that provide for a payment of a fee for use of these facilities you have described?

Mr. Stoddard. There is nothing to prevent it.

Senator Bible. I think that is going to be tightened up, because I can tell you people in my State are going to holler to the high heaven if they are going to be asked to pay a fee.

Senator McGee. And if Nevada does not kill it, Wyoming will.

Senator Bible. Very good. I have an ally. This is a different type of concept than a national park, or lakeshore, or seashore tract, and so I think this should be examined very carefully when it comes before us. But it still has to come from the House to the Senate and then to the Interior Legislative Committee. I am glad you forewarned us by saying there is nothing to prevent it.

Mr. Stoddard. That is up to you.

Senator Bible. We understand. But I appreciate your holding up the flag to warn us.

Mr. Stoddard. I do not mean to pass the buck.

Senator McGee. You are trying to get a buck, not pass it. I think that in regard to the public domain people rightfully expect to have access to it and they are not going to want to pay for such access. Even if they know they are going to have to pay for it as a taxpayer, they do not want to pay for it as recreation users and I think there is a distinction there.

Senator Bible. Thank you, Mr. Chairman.

Relationship to Bureau of Outdoor Recreation

Senator Mundt. Mr. Chairman, some mention was made of the Bureau of Outdoor Recreation in connection with this discussion.

Just where do they figure in this discussion and what are they doing for you or what are you doing for them? I am not sure of the relationship.

Mr. STODDARD. They were set up, as you know, Senator Mundt, with a series of specific responsibilities, one of which is to coordinate all of the recreational programs within the Federal Government and then develop a correlative program with the States and so on. And the first step has been to make this inventory with which we are cooperating and, are supposed to cooperate with in the field. Then, presumably, what they will do—and the guidelines are still evolving for this—is to give some idea of what is the projection in increase in visitor use of the lands and where will this impact be made; in what areas.

That is so that there is some basis for making decisions with respect to use before the fact rather than after the fact such as where we have use being made and clutter problems developing, pollution problems, and so on.

And they have this coordinating group which then provides this basic information to us and will indicate that so many visitors are in certain areas and that such-and-such an impact will take place on the public lands.

ORIGIN OF FEE CONCEPT

Senator BIBLE. Were they the originators of this concept to charge the public for entrance into the public domain?

Mr. STODDARD. No, I think that in the national parks is the only place where this has been done, and some of the State parks. This charge involves buying a sticker. Other kinds of charges are not provided for specifically in the act, other than the sticker that goes on your car window, if you go into a public area, This would presumably be there, and many of the States are using this in their parks and forest systems for people actually using them.

Senator MUNDT. Let it appear in the record that the public is invited to use the State parks of the great State of South Dakota for free and we commend that to you as an example.

FUNDS GENERATED ON PUBLIC DOMAIN

Senator BIBLE. I think that is very important, because it is part of the Secretary's statement and Mr. Stoddard's statement that the public domain, itself, generates something in the neighborhood of $445 million, less a payment of some $70 million to the States, and that $370 million finds its way into the U.S. Treasury. So your agency is showing a profit, because your budget is approximately $49 million. Is that right?

Mr. STODDARD. Yes.

Senator MCGEE. They do not get credit for the profit. It goes into the general treasury.

Senator BIBLE. As an appropriation, I think this is all right; but I think the proposal to charge fees for the use of public domain lands, which do generate revenue, has to be examined very carefully.

Chairman HAYDEN. I will ask you to submit for the record tables showing the accelerated public works in which the Bureau of Land Management has participated in fiscal years 1963 and 1964.

(The information referred to follows:)

Accelerated Public Works Program, Fiscal Year 1963 (First Appropriation)

Consolidated list of accelerated public works projects for fiscal year 1963, authorized by the Secretary of the Interior from $38 million allocated to the Department of the Interior by the President under authority of Public Law 87-658, approved September 14, 1962.

Bureau of Land Management

State and project	Eligible area and county	Eligibility category	Man-years	Cost (thousand dollars)	Work description
Alaska	Upper Yukon Election District No. 20.	5b	1	17	For construction of 10 family recreation units and 1 mile of road construction at Eagle Lake.
	Valdez-Chitina-Whittier Election District No. 8.	5b	1	18	For construction of 10 family recreation units, 2 boat docks, and 2 miles of access road at Mankomen Lake.
California	Eureka	SU	15	215	For construction of camp-ground picnic facilities and foot trails in the Kings Range Recreation Area and survey, design, and construction of 5 miles of access road into Kings Range.
	Lassen	5b	24	247	For construction of 10 family recreation units at Eagle Lake and 20 family units at Post Camp and Painter Flat, and forest stand improvement on 4,300 acres.
	Trinity	5b	9	132	For the construction of 15 family units at Douglas City, timber stand improvement on 400 acres, and site improvement on 1,000 acres.
	Ukiah (Mendocino)	5a	8	112	For construction of the Red Mountain access road and forest development on 400 acres.
Colorado	Alamosa	5b	3	46	Features to be completed are: 7.5 miles of fence, 3 wells, 3 detention dams, 200 check dams, 1,200 acres of chaining and seeding, and 1,000 acres plowing and seeding.
	Conejos	5b	5	80	For seeding 1,000 acres, 750 acres of brush control, 5 miles of fence, 6 water developments, 2 detention dams, and 300 gully plugs.
	Huerfano	5b	4	37	Features to be completed are: 7 spring developments, 12 miles of fence, 5 detention dams, 1 well, and 1,000 acres of chaining and seeding.
Idaho	Kootenai	5b	12	81	Construction of 5 miles of the Latour Creek access road, Killarney Creek Campground, Beauty Bay trails, and acceleration of forest stand and site improvement on 500 acres.
	Ontario, Oregon (Payette and Washington Counties, Idaho).	Substantial unemployment.	9	100	Construction of 15 family units and 5 miles of foot trail at Brownlee Reservoir and acceleration of conservation measures.
Montana	Butte (Silver Bow)	do	8	159	For the fabrication of 318 cattleguards and 318 wooden gates. These items will be used throughout the State in the regular conservation program.
	Carbon	5b	2	43	For drilling 5 wells, constructing 10 reservoirs and realinement of 10 miles of access roads.
Nevada	Lincoln	5b	10	105	For the construction of 4 family units at Meadow Valley Wash, road maintenance of Bunker Peak Road, drilling 6 stock wells, and constructing 12 miles of fence.
	Mineral	5b	9	155	For the construction of 17 family units at 16-Mile Point, 20 family units at Tamrack Point, and the construction of 47 miles of fence.

New Mexico	Grant	5b	23	122	For the construction of 450 erosion-control structures, 13,000 acres of mesquite eradication, and 120,000 acres of rodent control.
	McKinley	5b	8	139	For the construction of 20 livestock wells and storage facilities.
	Rio Arriba	5b	3	50	For 12 cattleguards, 20 miles of fence, and 5,000 acres of brush control and seeding.
	San Juan	5b	25	400	For the construction of the Farmington district office and facilities, 5 family units in the Angel Peak Recreation Site, and 20 livestock wells and storage facilities.
	Taos	5b	50	349	For the development of 6 recreation sites, 4 parking areas and 16 miles of foot trails, realinement of 15 miles of access road in the Rio Grande Recreation Area, construction of 42 miles of fence, and 4,200 acres of brush control and seeding.
Oregon	Albany (Linn)	Substantial unemployment.	7	133	For surfacing 7 miles of the Yellowbottom segment of the Quartzville Road system and acceleration of site improvement measures on 175 acres.
	do	do	9	150	For surfacing 2 miles of Yellowbottom Road, 2.5 miles of the Yellowstone Road, and 3 miles of the Boulder Creek Road.
	Gold Beach (Curry)	do	2	23	For construction of recreation facilities at Sixes River and 185 acres of stand improvement at Bosley and Edson Buttes.
	Josephine	5b	26	206	For construction of 10 family units at Deer Creek, improving the Rogue River trail, 400 acres of site improvement, 1,000 acres thinning and pruning, and 1,000 acres snag felling.
	Klamath Falls (Klamath)	Substantial unemployment.	24	370	For construction of 30 family units at Gerber Reservoir, surfacing 30 miles of Bonanza Road system, construction of 10 family units at Chase Mountain and Topsy, and site improvement on 3,000 acres and 10 miles of stream clearance.
	Lakeview (Lake)	do	9	164	For construction of 55 miles of fence, 10 livestock reservoirs, 9,000 acres of seeding, and drilling 5 wells.
	North Bend-Coos Bay (Coos)	do	15	268	For grading 4.6 miles on North Fork Coquille Ridge timber access road.
	do	do	22	156	For the construction of 10 family units at each of the following areas: Burnt Mountain Cabin, Park Creek, Bear Creek, and Cherry Creek; pruning and thinning 1,700 acres, and site improvement on 1,050 acres.
	Roseburg (Douglas)	do	11	175	For the grading of 2.4 miles on the West Fork Cow Creek access road.
	do	do	5	95	For grading 2.2 miles of the Little Camp Creek access road.
	do	do	18	225	For grading 3.5 miles of the Union Creek access road.
	do	do	5	38	For the construction of 10 family units at each of the following areas: Darby Creek, Cavitt Falls, Lone Rock, Wolf Creek Trail, and Susan Creek Falls.
	Salem (Marion and Polk)	do	19	289	For construction of recreation sites at Santiam River, Elk Horn Valley, Canyon Creek, and Mill Creek; surfacing 5 miles of Gooseneck Road, 7 miles of Mount Horeb Road; snag felling on 100 acres, precommercial thinning on 300 acres, and construction of 25 family units at Salmon Falls.
Utah	Yamhill	5b	10	140	For grading 4 miles on the B section of Bald Mountain access road.
	Carbon	5b	14	176	For replacement of Price office, 14 family units and 2 miles of road in Price Canyon, and cutting 8,000 posts.
	Emery	5b	5	36	For construction of sanitation and protection facilities at Buckhorn Wedge (2 units), cutting 8,000 juniper posts, and constructing 12 miles of fence.

Bureau of Land Management—Continued

State and project	Eligible area and county	Eligibility category	Man-years	Cost (thousand dollars)	Work description
Utah	Garfield	5b	24	225	For construction of 9 family units at Relishing Seep and Calf Springs, 10 family units at Saw Mill Basin, 7 family units at McMillan Springs, grading 7 miles of Escalante Canyon access road, site improvement on 5,000 acres, pruning and thinning on 1,500 acres, construction of 20 miles of stock trails, 7 miles of horse trails, and 6 miles of fence, and cutting 15,000 juniper posts.
	Juab	5b	8	115	For constructing 38 miles of fence, fabricating and installing 6 cattle guards, and 2,700 acres of seeding.
	Provo-Orem (Utah)	Substantial unemployment.	16	105	For the cutting of 25,000 juniper posts, constructing 20 miles of fence, fabrication and installing cattleguards, 300 check dams, and 6 spring developments.
	St. George (Washington)	do	24	268	For the construction of 105 miles of fence, 4,000 acres of brush control, 2 stock wells, 15 spring developments, and acceleration of other conservation measures.
	San Juan	5b	6	75	For the construction of recreation facilities at Anticline Overlook, Canyonlands Panorama, Needles View Point, and Hatch Point. These recreation sites lie along the east rim of the Colorado River within the buffer zone surrounding the proposed Canyonlands National Park.
	do	5b	18	350	For construction and/or realinement of 47 miles of access road.
	Sanpete	5b	4	32	For constructing 20 miles of fence and installing 5 cattleguards.
Wyoming	Rock Springs (Sweetwater)	Substantial unemployment.	7	116	For construction of 50 miles of fence on W-3–W-4 boundary, 10 miles of Antelope Study fence, 8 family recreation units at 14-Mile Reservoir, 10 miles of Vermillion Division fence and 8 miles of Dobie Town boundary fence.
Total, Bureau of Land Management			537	6,537	

Accelerated Public Works Program—Supplemental Appropriation Act, 1963

Consolidated list of accelerated public works projects authorized by the Secretary of the Interior from $25 million allocated to the Department by the President under the Supplementary Appropriation Act, passed May 28, 1963, under authority of Public Law 87-658, approved September 14, 1962.

Bureau of Land Management

State and project	Eligible area and county	Eligibility category	Man-years	Cost (thousand dollars)	Work description
Alaska	Anchorage Election District No. 8	5a	3	50	For construction of protection and sanitation facilities at Eklutna Lake.
	Cordova-Valdez Election District No. 6.	5b	2	18	For construction of protection and sanitation facilities at Miles Lake.
	Palmer-Wasilla-Talkeetna Election District No. 7.	5b	2	18	For construction of protection and sanitation facilities at Bayer Lake.
	Fairbanks-Fort Yukon Election District No. 16.	5b	3	35	For construction of office, fire warehouse, and garage at Fort Yukon.
	Yukon-Kuskokwim Election District No. 15.	5b	3	42	For the construction of the Galena fire control station.
	Bethel Election District No. 14	5b	3	35	For the construction of fire office, garage, and warehouse at Bethel.
	Fairbanks-Fort Yukon Election District No. 16.	5b	1	17	For the construction of fire warehouse and garage at Central.
California	Lassen	5b	3	58	For reforestation of 1,545 acres.
	Siskiyou	5b	2	17	For timber stand improvement on 500 acres. Hazard reduction on 60 acres.
	Trinity	5b	11	171	For grading 6 miles of Brock Gulch access road. For 5 family units at Douglas City campground. Timber stand improvement on 400 acres. Reforestation, 250 acres. Hazard reduction, 40 acres. Road realinement, 10 miles.
	Plumas	5b	1	16	Forest site preparation, 315 acres.
	Visalia (Tulare County)	Substantial unemployment.	21	322	Grading 11 miles of Long Valley Road. Construction of 50 family units at Long Valley and Kennedy Meadows.
	do	do	16	255	For construction of 6 miles of Lamont Meadows and 3 miles of the Rockhouse road.
	Redding (Shasta County)	do	4	54	For surfacing 7 miles of Cinder Cone access road, 1,200 acres of reforestation, road realinement and grading, 10 miles.
	Sonora (Tuolumne County)	do	7	110	For grading 5 miles of Big Jackass Creek Road.
	Ukiah (Mendocino County)	do	1	5	For 30 acres of site improvement. Firebreaks 2 miles. Forest pest control on 260 acres.

Bureau of Land Management—Continued

State and project	Eligible area and county	Eligibility category	Man-years	Cost (thousand dollars)	Work description
California	Eureka (Humboldt County)	Substantial unemployment.	23	293	For construction of foot trails and additional protection and sanitation facilities in Kings Range. Road construction 5 miles. Hazard reduction on 1,500 acres. Firebreaks 4 miles. Forest pest control on 500 acres.
Colorado	Conejos	5b	1	8	Site preparation and tree planting 40 acres. Mistletoe control and seed collection of 50 pounds of forest tree seed.
	Creede (Mineral County)	Substantial unemployment.	1	3	For the collection of 200 pounds of forest tree seed.
	Dove Creek (Dolores County)	do	2	19	Site improvement, 60 acres. Collecting 250 pounds of forest tree seed. Reforestation, 50 acres.
	Huerfano	5b	1	6	For 120 acres of site improvement.
	Montezuma	5b	2	16	For gathering 250 pounds of forest tree seed. Reforestation, 50 acres. Hazard reduction, 100 acres. Firebreaks, 10 miles.
	Pagosa Springs (Archuleta County)	Substantial unemployment.	4	42	For 150 acres of site improvement. Reforestation, 150 acres. Protective fence for protection of new forest planting projects, 3 miles. Forest road realinement. Hazard reduction, 120 acres. Firebreaks, 10 miles.
Idaho	Benewah	5b	6	77	For grading 9 miles of the St. Joe forest access road. Protection and sanitation facilities at Tingley Spring. 5 family units. Timber stand improvement, 25 acres.
	Bonner	5b	1	17	Protection and sanitation facilities, Pack River View Point, 10 family units. Timber stand improvement, 100 acres. Hazard reduction, 50 acres. Collecting 100 pounds of forest seed.
	Boundary	5b	1	13	For timber stand improvement on 50 acres. Collecting 100 pounds of forest tree seed.
	Idaho	5b	1	15	For the construction of protection and sanitation facilities at Skoockum-chuck Creek.
	Kootenai	5b	6	94	For the construction of 12 miles of forest access roads. Protection and sanitation facilities at Mirror and Crystal Lakes, 20 family units.

	Mountain Home (Elmore County)	Substantial unemployment.	4	41	For the construction of Bennett Mountain lookout. Grading 9.5 miles of forest spur roads. Timber stand improvement on 500 acres.
Montana	Butte (Silver Bow County)	5a	1	6	For the location and construction of 7 miles of firebreaks and trails.
	Carbon	5b	1	15	Hazard reduction, 100 acres. Firebreaks, 4 miles.
Nevada	Mineral	5b	8	93	For the construction of the Corey Peak repeater station. Grading 5 miles of timber access roads. Realinement and surfacing of 20 miles of forest access roads.
	Lincoln	5b	24	213	For the construction of fire office and warehouse to contain firefighting equipment at Caliente. Construction of the Caliente lookout. Timber stand improvement, 2,000 acres. Reforestation, 500 acres. Realinement and surfacing of timber access road, 75 miles.
	Goldfield (Esmeralda County)	Substantial unemployment.	5	35	Realinement and surfacing of 30 miles of forest access roads.
New Mexico	Catron	5b	4	25	For 2,500 acres of hazard reduction and mistletoe control.
	Taos	5b	3	52	Timber stand improvement on 1,500 acres. Reforestation, 200 acres. Hazard reduction, 4,100 acres.
	Valencia	5b	4	25	Site improvement, 640 acres. Hazard reduction, 1,280 acres.
Oregon	Josephine	5b	16	190	For construction of protection and sanitation facilities and improvement of the Rogue River trail. Collection of 4,000 pounds of forest tree seed. Hazard reduction, 2,800 acres.
	do	5b	15	355	For grading 6 miles of D section of Galice forest access road.
	Wasco	5b	2	25	Reforestation, 60 acres. Hazard reduction, 15 acres. Realinement and surfacing of 10 miles of forest access road.
	Lakeview (Lake County)	Substantial unemployment.	1	10	For construction of the Green Mountain Lookout.
	North Bend-Coos Bay (Coos County)	do	9	104	For site improvement on 150 acres. Reforestation, 150 acres. Hazard reduction, 1,350 acres. Firebreaks, 80 miles. Fence, 20 miles for protection of forest seedling. Forest road realinement and surfacing, 34 miles.
	North Bend-Coos Bay	do	15	245	For grading 7 miles of the Elk Creek access road.
	Rosebury (Douglas County)	do	32	300	For construction of protection and sanitation facilities at Wolf Creek and Little River, clearing down timber from Loon Lake recreation site. Site improvement on 300 acres. Timber stand improvement, 280 acres. Reforestation on 3,800 acres. Hazard reduction on 1,500 acres. Firebreaks, 100 miles. Fence to protect forest seedlings, 61 miles. Realinement and surfacing of forest roads 41, miles.
	Bend (Deschutes County)	do	8	87	For grading 21 miles of timber access roads in La Pine area. Timber stand improvement on 800 acres. Protective fence, 1 mile.
	Columbia	5b	2	22	For the construction of 10 family units at Scaponia recreation area.

Bureau of Land Management—Continued

State and project	Eligible area and county	Eligibility category	Man-years	Cost (thousand dollars)	Work description
Oregon	Yamhill	5b	6	48	Site improvement on 1,000 acres. Timber stand improvement on 160 acres. Reforestation on 440 acres. Gathering 1,000 pounds of forest tree seed.
	Albany (Linn County)	Substantial unemployment.	5	40	Site improvement on 120 acres. Timber stand improvement on 160 acres. Reforestation on 710 acres. Gathering 700 pounds of forest tree seed. Forest pest control on 160 acres. Realinement and surfacing 5 miles of timber access road.
	Klamath Falls (Klamath County)	do	4	51	For the construction of the Brian Mountain Lookout. Reforestation on 200 acres. Hazard reduction on 1,640 acres. Forest pest control, 3,000 acres.
	Salem (Marion County)	do	12	122	For expansion of protection and sanitation facilities at Fisherman's Bend. Timber stand improvement, 160 acres. Reforestation on 490 acres. Gathering 500 lb. of forest tree seed. Hazard reduction on 2,000 acres.
	North Bend-Coos Bay (Douglas County.	do	12	175	For construction of 3 miles of the Union Creek timber access road.
Utah	Beaver	5b	3	50	Realinement and grading of 30 miles of access roads.
	Carbon	5b	2	18	Site improvement on 515 acres. Forest pest control on 40 acres.
	Emery	5b	4	62	Fire control access road, 15 miles.
	Roosevelt (Duchesne County)	Substantial unemployment.	3	43	For construction of 5 miles of timber access road. Timber stand improvement on 460 acres.
Wyoming	Big Horn	5b	4	35	Site improvement 1,000 acres.
	Lincoln	5b	2	30	For construction of the Kemmerer warehouse.
	Buffalo (Johnson County)	Substantial unemployment.	3	47	For construction of 5 miles of the Billy Creek forest access road.
	Evanston (Unita County)	do	14	110	For grading 30 miles of road to provide access to an area for control of forest insects. Forest pest control on 10,000 acres. Timber stand improvement on 500 acres.
Total, Bureau of Land Management			360	4,500	

ESTIMATES FOR OREGON AND CALIFORNIA GRANT LANDS

Chairman HAYDEN. At this point in the record I will include your justification of appropriations of funds for Oregon and California grant lands in the amount of $8,250,000; for funds for range improvements in the amount of $1,523,000; and your statement with regard to administrative provisions, specifically the purchase of seven passenger motor vehicles for replacement, and one additional aircraft.

(The information referred to follows):

JUSTIFICATION

BUREAU OF LAND MANAGEMENT

Oregon and California grant lands

Appropriation 1964		$9,000,000
Unobligated balance from prior years		2,546,524
Total available for obligation		11,546,524
Decreases:		
Construction and acquisition of access roads	$9,611,783	
Forest development and protection	1,240,000	
Operation and maintenance	694,741	
		11,546,524
Subtotal		0
Increases:		
Construction and acquisition of access roads	$5,750,000	
Forest development and protection	1,800,000	
Operation and maintenance	700,000	
		8,250,000
Budget estimate, 1965		8,250,000

OREGON AND CALIFORNIA GRANT LANDS

Analysis by activities

Activity	Amount available, 1964	Fiscal year 1965			Total available, 1965, compared to total available, 1964
		Unobligated balance from prior years	Budget estimate	Estimated total available	
1. Construction and acquisition	$9,611,783		$5,750,000	$5,750,000	−$3,861,783
2. Forest development and protection	1,240,000		1,800,000	1,800,000	+560,000
3. Operation and maintenance	694,741		700,000	700,000	+5,259
Total	11,546,524		8,250,000	8,250,000	−3,296,524

Under this title an amount equivalent to 25 percent of the gross receipts from sales of timber and other products on the revested Oregon and California railroad grant lands is appropriated as a reimbursable charge against the Oregon and California land grant fund.

It provides for the construction, acquisition, operation and maintenance of access roads and improvements and for forest protection and development on the revested Oregon and California railroad grant lands and on other Federal lands in the Oregon and California land grant counties of Oregon.

Existing legislation provides that the O. & C. counties shall receive, in lieu of tax payments, up to 75 percent of the gross revenues from these lands. The Association of O. & C. Counties has recommended that one-third of the amount due from receipts, or 25 percent of the total gross receipts, be appropriated for the development of these lands and be reimbursed to the Treasury from funds otherwise payable to the counties.

1. Construction and acquisition, $5,750,000

This activity provides for construction and acquisition of access roads and recreation facilities. The construction of recreation facilities previously has been included in the second activity. Details of the estimates follow:

(*a*) *Access roads.*—This estimate of $5,076,000 is a decrease of $1,410,000 from the amount available in 1964, exclusive of carryover funds in the amount of $2,415,888. The program is for the construction of access roads in the valuable timberlands in western Oregon. In addition to the actual construction and improvement of roads, the estimate provides for the determination of future access routes to tap timber resources as well as the acquisition of easements, rights-of-way and privately owned roads either by agreement or condemnation. At the end of fiscal year 1963, 403 miles of mainline access roads have been completed and 101 miles were under construction. Specific accomplishments under the program in fiscal year 1965 will be the grading of 14 miles; surfacing 48 miles; bridge construction; and rock production for road surfacing. In addition, 74 miles of road will be purchased. Acquisition of 200 easements will be accomplished for planned road construction.

Basic to the realization of the full allowable cut on lands in western Oregon, with attendant benefit locally and nationally, is the development of an access system on a planned and orderly basis. Lack of ability to provide such access in a timely manner results in the disruption of finely balanced schedules for cutting. It is imperative that mature, overmature, decadent, and salvage timber be removed according to plan in order to convert the valuable timberlands of western Oregon to well managed and regulated stands producing maximum wood fiber. This can be accomplished only if the timber can be reached by proper road systems.

In addition to their value for providing transportation routes for the proper harvest of Federal timber, they also serve as a means of ingress and egress for fire protection, recreation, transport of privately owned timber, and other purposes.

Details of the program are given in the following tables:

Status of appropriations for access roads, fiscal years 1951 through 1963

Amount appropriated		$50,247,150
Available to Bureau of Public Roads	$41,927,569	
Available to Bureau of Land Management	7,022,165	
Available to Forest Service	1,297,416	
Obligations 1951–63		47,831,262
Bureau of Public Roads	$40,367,755	
Bureau of Land Management	6,837,021	
Forest Service	626,486	
Unobligated balance, June 30, 1963		2,415,888
Bureau of Public Roads	$1,559,814	
Bureau of Land Management	185,144	
Forest Service	670,930	
Amount appropriated		50,247,150

Fiscal year 1964 program

Availability:		
Unobligated balance as of June 30, 1963, brought forward		$2,415,888
4th quarter 1963 receipts warranted in July 1963		2,062,500
Estimated authorization, fiscal year 1964		6,486,000
Less estimated 4th quarter 1964 receipts warranted in July 1964		2,062,500
Available for 1964 program		8,901,888
Utilization:		
Bureau of Land Management:		
Planning, reconnaissance	$460,000	
Acquisition	500,144	
		960,144
Bureau of Public Roads:		
Surveys	491,805	
Construction	6,203,009	
		6,694,814
Forest Service		1,246,930
Total 1964 program		8,901,888

Details of construction program, BLM lands, fiscal year 1964

Continued work on going projects	$871,352
Rock Creek B and C, grading 10 miles	1,120,000
Keno A and B, surfacing 28 miles	1,030,000
Keno C, grading 3 miles	110,000
Nestucca River, reconstruction and bridge, 6 miles	550,000
Agency Creek, surfacing 9 miles	290,000
Clark Creek, surfacing 9 miles	320,000
Big River-Elk Meadows, surfacing 18 miles	450,000
Canton Creek B and C, surfacing 18 miles	520,000
Cow Creek C, grading 3 miles	305,000
Miscellaneous rock production	576,657
Miscellaneous small bridges	60,000
Total, 1964 construction program, BLM lands	6,203,009

Fiscal year 1965 program

Availability:		
Estimated 4th quarter receipts warranted in July 1964		$2,062,500
Estimated authorization, fiscal year 1965		5,076,000
Less estimated 4th quarter 1965 receipts warranted in July 1965		2,062,500
Available for 1965 program		5,076,000
Utilization:		
Bureau of Land Management:		
Planning, reconnaissance	$485,000	
Acquisition	936,000	
		1,421,000
Bureau of Public Roads:		
Surveys	250,000	
Construction	2,829,000	
		3,079,000
Forest Service		576,000
Total, 1965 program		5,076,000

Details of construction program, BLM lands, fiscal year 1965

Bald Mountain B, surfacing, 7 miles	$274,000
Bald Mountain A, grading, 8 miles	300,000
Cow Creek A and B, surfacing, 19 miles	430,000
South Fork Alsea B, grading, 6 miles	415,000
Burnt Mountain C, surfacing, 9 miles	370,000
Burnt Mountain B, surfacing, 13 miles	445,000
Miscellaneous rock production	525,000
Miscellaneous small bridges	70,000
Total, 1965 construction program, BLM Lands	2,829,000

(*b*) *Recreation facilities.*—The estimate of $674,000 is an increase of $25,000 over the amount available in fiscal year 1964 exclusive of carryover funds. Of the total amount $424,000 is programed for facilities to be developed by the Forest Service on lands in the O. & C. counties that are administered by that agency—$250,000 is programed for development of the south jetty road project by this Bureau. This 5-mile road, south of Florence, Oreg., will provide general access for the public to nearly 5 miles of excellent sandy ocean beach near the south jetty of the Siuslaw River. This project is scheduled in fiscal year 1965 as a recreation development.

2. Forest development and protection, $1,800,000

(*a*) *Forest development.*—The estimate includes $1,100,000 which is an increase of $400,000 over the amount provided from this appropriation for this purpose in fiscal year 1964. As $150,000 was provided from the appropriation, "Management of lands and resources," in 1964, the net program increase proposed is $250,000.

It is estimated that this program will provide for the reforestation of 34,500 acres. Timber growth to be obtained by this effort is estimated to be 17 million board feet annually, valued by current market prices at $425,000. At best, only one-half of the area scheduled for reforestation could be expected to regenerate naturally in about 10 years, and that only where natural seed source is available. Thus, if the reforestation schedules are not met, a total growth loss valued at over $2 million could result over the next decade. Total employment in the lumbering industry resulting from the 1965 reforestation effort in western Oregon is estimated to be 900 man-years annually and will contribute nearly $11 million yearly to the gross national product. The direct contribution of the actual 1965 reforestation projects to the western Oregon labor force is an estimated 78 man-years, with a payroll of more than $400,000. Overshadowing these economic considerations is the critical topsoil loss through erosion and the siltation of streams and reservoirs which will result unless reforestation holds the soil in place.

Programing at this level will eliminate the backlog acreage needing reforestation on O. & C. lands, will complete reforestation plans and surveys on PD and CBWR lands, and will result in the reduction of the reforestation backlog on PD and CBWR lands by approximately 45 percent. By the end of 1967 all reforestation backlog in western Oregon will be eliminated and the 1968 fiscal year will see the forest development program on a maintenance basis if present schedules are met.

This program includes site improvement work (primarily brush clearing) necessitated by previous delays in reforestation work. Such delays result in added site improvement requirements and increased total costs of reforestation. Failure to place the depleted acreage back into timber production within the prescribed period incorporated in the calculation of the allowable cut can result only in a commensurate future reduction in the allowable cut. Adherence to the principles of sustained yield management precludes the cutting of mature growing stock at a faster rate than cutover areas are restored to productivity. The reforestation program for western Oregon is as follows:

	Acres	Amount
Plans and surveys	123,000	$100,000
Site improvement	9,000	189,000
Reforestation	34,500	811,000
Total		1,100,000

(*b*) *Forest protection*

The estimate includes $700,000 for this program which is proposed under this appropriation in fiscal year 1965. As $774,000 was provided from the appropriation, "Management of lands and resources," in 1964, a program decrease of $74,000 is proposed.

Contracts for fire protection are negotiated with the State of Oregon and the Forest Service on a rate per acre that is based on their costs for fire suppression, maintenance, replacement, and addition to facilities and equipment, and the prevention program. The Bureau contributes to presuppression and control measures by removing snags, slash disposal, and development of fire trails and fuel breaks.

Through accelerated public works projects a large portion of the snag felling has been accomplished. Continuance of snag felling will be done wherever appropriate through sales and development work. However, outside of planned development and sales areas, snag felling will be necessary as a hazard reduction measure. The program for fiscal year 1965 assumes that salvage timber sales will be sufficiently completed by June 1964 to preclude the existence of serious fire hazard areas in 1965 due to windthrown timber. The program estimate is as follows:

Contract protection	$626,000
Snag felling, slash disposal, fire trails, and fuel breaks	48,000
Supervision and inspection	26,000
Total	700,000

(c) *Forest management.*—No estimate is provided for this purpose in fiscal year 1965 under this appropriation. During fiscal year 1964, $540,000 was provided from this appropriation toward the financing of forest management activity normally financed from the appropriation, "Management of lands and resources." Details of this program are discussed in the western Oregon section of the "Forestry" activity under that appropriation.

(d) *Recreation facilities.*—Construction of recreation facilities, formerly included in this activity, appears in the first activity, "Construction and acquisition," in the fiscal year 1965 estimates.

3. Operation and maintenance, $700,000

This estimate provides for maintenance of constructed and acquired access roads and recreation facilities. The increase of $75,000 over the amount available in fiscal year 1964, exclusive of carryover funds, is necessary to adequately protect existing and newly constructed roads which in turn assure the efficient use and management of the lands and resources.

Effectual road maintenance is essential in western Oregon to negate the need for extensive repairs to protect existing capital investments. Roads receive heavy logging use during the rainy season. If these roads are inadequately maintained, they are highly susceptible to rapid deterioration, slides, and washouts. Repair costs can be materially greater than initial construction. Washouts alone can entail considerable relocation of adjacent undamaged segments of the affected road, and require additional easement acquisition. Both purchasers of Government timber and private timber owners are dependent upon the network of roads constructed by the Bureau. Temporary road closure due to improper maintenance can prevent replenishing depleted mill log inventories during the critical winter and spring months, resulting in hardship to loggers and mill operators.

In addition to maintenance performed with appropriated funds, fees for road maintenance are paid by purchasers of Government timber as a condition of timber sale contracts and by timber haulers using the roads under permits.

An amount of $50,000 is included in this estimate for maintenance of recreation facilities and includes disposing of garbage, maintaining firewood supplies, servicing sanitary facilities, repairing and maintaining equipment, and testing water supplies.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$7,897,382	$11,546,524	$8,250,000	−$3,296,524

Bureau of Land Management

Range improvements (receipt limitation)

Appropriation, 1963	$696,525
Estimate, 1964	1,247,730
Estimate, 1965	1,523,000
Increase	+275,270

Need for increase.—This estimate is an increase of $275,000 over 1964 which reflects an anticipated increase in grazing fee receipts. This is an annual indefinite appropriation derived from grazing fee receipts in accordance with sections 4 and 10 of the Taylor Grazing Act (48 Stat. 1269), as amended. Included also, are receipts from Bankhead-Jones Farm Tenant Act lands transferred from the Department of Agriculture by Executive Order 10787, dated November 6, 1958.

Plan of work.—Approximately 178 million acres of public grazing lands which includes over 2 million acres of Bankhead-Jones lands will require range improvements to preserve the forage resources. Twenty-five percent of grazing fee receipts from public lands outside grazing districts and Bankhead-Jones lands and 33⅓ percent of receipts from grazing lands inside grazing districts are designated as a range improvement fund which is applied to improvements on the range. Receipts in fiscal year 1965 are estimated at $5,170,000 which includes the sum of $570,000 from Bankhead-Jones lands.

Status of program.—This is a continuing program for maintenance, construction, and purchase of range improvements as an aid in obtaining conservation and use of the forage resource on the public lands, by such measures as drift and boundary fences, development of stock watering places, reseeding, etc.

The appropriation is distributed as follows:

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Public lands	$646,974	$1,187,377	$1,383,000	$195,623
Farm Tenant Act lands	49,551	60,353	140,000	79,647
Total	696,525	1,247,730	1,523,000	275,270

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase(+) or decrease(−)
Program and financing:				
Total obligations	$820,300	$1,265,000	$1,550,000	+$285,000

Administrative Provisions

Passenger motor vehicles

Authorization is requested for purchase of seven passenger vehicles for replacement only. All of the vehicles to be replaced will have met the standards as to age or mileage.

These vehicles are for use by field personnel in the administration of public grazing lands, forest management, and fire suppression in widely scattered areas, by field examiners and surveyors in the performance of investigations and surveys, and by supervisory personnel.

One station wagon is included in the request. It will be used principally by cadastral engineers where the job requirements involve extensive driving and the hauling of personnel, scientific instruments, and field equipment.

Vehicles to be purchased:

Number	7
Gross cost	$11,350

Old vehicles to be exchanged:

Number	7
Allowance	$1,300
Net cost	$10,050

Aircraft

Authorization also is requested for the purchase of one additional aircraft.

Aircraft purchased by the Bureau are used only in Alaska. They are necessary for photogrammetric surveys, fire patrol, and for transporting smokejumpers, firefighters, and equipment and for transportation of forest management, cadastral survey and field examiner personnel.

Aircraft to be purchased:

Number	1
Gross cost	$80,000

Chairman HAYDEN. If you have any comments on any of these matters, the committee will be glad to hear them now.

Mr. STODDARD. We have no comment other than the explanation.

ESTIMATE FOR PUBLIC LANDS, ROADS, AND TRAILS

Chairman HAYDEN. There will be printed in the record your estimate of $2 million for fiscal year 1965 for public lands, development roads, and trails. This is an increase of $1,240,000 over the amount appropriated in fiscal year 1964.

(The information referred to follows:)

BUREAU OF LAND MANAGEMENT—PUBLIC LANDS DEVELOPMENT ROADS AND TRAILS (liquidation of contract authorization)

Statement relating 1963 and 1964 appropriation to 1965 estimate

1964 appropriation in annual act	$760,000
Decrease in construction of roads and trails	760,000
Subtotal	
Increase in construction of roads and trails	2,000,000
Total estimate for 1965	2,000,000

Analysis by activities

Activities	1963	1964	Decreases	Increases	1965
Public lands development roads and trails		$760,000	$760,000	$2,000,000	$2,000,000

Contract authorization and liquidation program

	Contract authority available	Obligations	Unliquidated obligations, prior year	Total obligations	Expenditures	Unliquidated obligations carried forward
Fiscal year 1963: Public lands development, roads and trails (total)	$2,000,000	----------	----------	----------	----------	----------
Fiscal year 1964: Public lands development, roads and trails (total)	6,000,000	$2,000,000	----------	$2,000,000	$760,000	$1,240,000
Fiscal year 1965: Public lands development, roads and trails (total)	6,000,000	2,000,000	$1,240,000	3,240,000	2,000,000	1,240,000

Status of cash authorization for liquidation of contract authorization

	1963	1964	1965
Appropriation	----------	$760,000	$2,000,000
Unexpended balance brought forward	----------	----------	----------
Total available	----------	760,000	2,000,000
Less: Expenditures	----------	760,000	2,000,000
Unexpended balance	----------	----------	----------

Need for funds.—The Federal Aid Highway Act, 1962, authorizes a $4 million program for "Public lands development, roads and trails." However, only $2 million of this authorization is scheduled for use in fiscal year 1965. During fiscal years 1964 and 1965, the first 2 years of this program, $4 million will be available for obligation. Requests for liquidating cash for these 2 years total $2,760,000, or two-thirds of obligations to be incurred. As many of the road projects of this Bureau are relatively small, progress is rapid once work is initiated. Adequate liquidating cash must be available so that scheduled projects can be undertaken.

The public land roads and trails program reflects the needs of the resource management programs for better access to public land areas. Road systems are essential to the proper conduct of forestry, range, watershed, wildlife, outdoor recreation, and resource protection programs.

Timber sales of commercial stands of timber are dependent upon access. Range management and watershed conservation programs can be conducted much more efficiently with permanent roads. Fire protection will be improved. The elapsed time between detection and arrival of firefighting crews quite frequently determines the final size of the fire, the extent of suppression effort and cost, and the degree of damage that results to the land base and its resource potential. Access roads also permit increased recreational use of public lands by hunters, fishermen, and the general public.

This estimate provides for grading 160 miles, surfacing 24 miles, and advanced survey and design work on 139 miles to be scheduled for construction in subsequent years.

A summary of the road program by State follows:

Arizona	$118,000
California	401,000
Colorado	150,000
Idaho	152,000
Montana	88,000
Nevada	68,000
New Mexico	67,000
Oregon	319,000
Utah	253,000
Wyoming	127,000
Acquisition of roads and easements	80,000
Location, survey, design	177,000
Total	2,000,000

PLANS FOR FISCAL YEAR 1965

Chairman HAYDEN. Please comment to the committee on your program for fiscal year 1964 and the plans of your Bureau for fiscal year 1965.

Mr. BEIRNE. Mr. Chairman, we had contractual authority for $2 million during the current fiscal year. The basic legislation provides contractual authority for $4 million for 1965; however, we are limited to $2 million, and since most of our construction is fairly small in nature, it does not extend over a period of years.

Now, we anticipate we will have to pay $2 million of that.

WORK IN SOUTH DAKOTA

Senator MUNDT. Mr. Chairman, I have a couple of questions.

It is my understanding, Mr. Stoddard, the budget now before us includes the total of about $146,000 for work in South Dakota. Of this, $14,000 is for lease and disposal of lands and mineral resources, $6,000 for management grazing lands, $43,000 for forestry 1964 surveys, and $18,000 for soil and moisture conservation which together with $12,000 for public land development of roads and trails makes up the expenditure package.

I wonder if you could briefly outline just what type of work will be done under each of these activities. For example, what land will be leased and what land is to be disposed in what manner, what type of forestry and water conservation will be done and where?

Now, if you would rather prepare a statement on that and send it to my office that will be all right.

Mr. STODDARD. I think we could do a more complete job for you, Senator Mundt, if we could lay it out with technical background and maps.

EXEMPTION LAND SURVEYS, SOUTH DAKOTA

Senator MUNDT. I want this primarily for my own information. And on page 43 of your justification you mentioned the exemption land surveys in South Dakota. Could you give us, for the record, a few words on that and the history and plans for the future. I am not too familiar with that operation.

Mr. STODDARD. I will ask our surveyor.

Mr. REMINGTON. I am not familiar with the detail on it.

Senator MUNDT. If you would rather supply that to the record that is all right.

Mr. REMINGTON. Yes, sir.

(The information referred to follows:)

BLACK HILLS

To achieve full resource utilization in the project area resurveys must be accomplished to delineate the lines between public and private lands. The public lands in the Black Hills exemption area consist of numerous irregular tracts, bounded by the lines of patented mineral claims. The tracts range in size from 0.02 to over 1,200 acres. This area was "exempted" from inclusion in the Black Hills National Forest because of heavy mining claim activity.

The badly deteriorating monumentation completed almost 80 years ago consists of materials such as native rocks, posts, pits, and mounds. These, coupled with the maze of claim stakes and monuments of every conceivable material, pose a real challenge during remonumentation.

REVISION OF LAND RECORD SYSTEM

Senator MUNDT. In your justification, on pages 18 and 19 you discuss the land record system which is being revised and brought up to date. According to page 18 of your justification, the system has been completed for South Dakota as well as for seven other States. Just exactly what is this program and what is the function of it? I am just not clear on that.

Mr. STODDARD. Mr. Senzel will talk on that.

Mr. SENZEL. Yes, sir; I will be glad to. Our land records that we have been using go back almost to the beginning of the public land laws. About 10 years or so ago we started a program to modernize those records. Many of them were being lost through deterioration. They were in the form of entries in a ledger and were very difficult to use, both for the public and for our own employees. They were a very inefficient way to try to operate the public domain.

METHOD OF CHECKING SURVEYS

The system now involves the checking of the basic records to correct any errors that appear in the books, and a great many of them have accumulated over the years, and putting the record in a more usable system, this is largely in the form of a summary record, typewritten, instead of handwritten, and in the form of plats so that you can visually see the status of the lands and their availability.

Senator MUNDT. Is this sort of a cataloging of all of the public lands that you have in each State? Is that what we are talking about?

Mr. SENZEL. The public domain. Actual cataloging of what has been patented and the status of what remains.

Senator MUNDT. Then you also indicate under whose jurisdiction they are being operated, whether under the Park Service or whether it is under the Department of Agriculture or whether under your Department? Do you show that, too?

Mr. SENZEL. Yes, sir; through the nature of the withdrawal that may be on the land. It is in terms of the withdrawal.

Senator MUNDT. Am I correct in that you have completed that reclassification or recodification for South Dakota?

SOUTH DAKOTA RECORD

Mr. SENZEL. I understand for that portion of South Dakota which is still active as public domain, Senator. Much of the eastern part of the State has been patented for many, many years.

Senator MUNDT. Could you send to my office a complete record of what we have in this cataloging of yours in South Dakota?

Mr. SENZEL. Yes, sir.

Senator MUNDT. Thank you. That is all.

Senator MCGEE. Mr. Chairman.

Chairman HAYDEN. Yes, sir.

REDUCTION OF ANIMAL GRAZING UNITS

Senator MCGEE. I wanted to pursue a point or two in regard to the grazing lands. Of course, that is where we are getting a lot of static right now, particularly with the proposals to reduce the animal units. I wonder if we could get some information on the record to help in getting at the problem.

How many acres of grazing land do you manage?

Mr. STODDARD. We have about 180 million acres. All but about 2 million are in the "lower 48" States.

Senator MCGEE. How many animal unit months of grazing does this provide?

Mr. STODDARD. About 17 million animal units or AUM's for domestic livestock and 2.2 million AUM's for wildlife use. This is, again, in the Western States, except for Alaska. In Alaska they also have reindeer AUM's.

RANGE ADJUDICATION, TAYLOR ACT

Senator MCGEE. Can you explain briefly the purpose of the so-called range adjudication program under the Taylor Act?

Mr. STODDARD. When the act was passed in 1934 individual ranchers indicated that they had certain claims to certain amounts of forage. These all added up to more than the available supply and this whole effort is to determine the applicants' qualifications for forage and to distribute it among the ranchers in equitable proportions.

In many cases this has been a reduction. Where the management has not been as active as it should be, and the deterioration has been great, this means a greater cut than where there is a very healthy range condition.

ANIMAL UNIT CUTS CREATE POVERTY AREAS

Senator MCGEE. In some of the areas, particularly out in our part of the world, the size of sum reductions, at least those proposed, have

been so substantial it occurs to me that we are creating our own original poverty areas. Some areas have been cut back very severely. Would that not be the result?

Mr. STODDARD. That is right.

Senator MCGEE. What do we gain by this?

Mr. STODDARD. The problem, of course, is if an economic unit of a rancher to make a decent living is 300 head of cattle is cut down to 200, his whole economic base is shot down from under him. In the long run, the range can come back and can support 350 or 400 head if range improved practices are followed.

Senator MCGEE. After he has gone broke.

Mr. STODDARD. This is the problem. This is why we are interested in doing as much as we can in range improvements in the areas where the bite takes place.

Senator MCGEE. You are saying then, that you think the ranges could be improved moderately and with less severe cuts over a long period of time, thus keeping the ranchers in business and achieving your goal of effective range conservation?

FUNDS TO IMPROVE RANGE CONCURRENTLY WITH CUTS

Mr. STODDARD. If we had the funds to do range improvement concurrently with the cuts, we could show the ranchers that they would have to take up their belts for a short time, but in the long run they would be better off. We are trying to work out a package program whereby they would be able to get some assistance from the Department of Agriculture agencies, ACP, to build up their own lands to help carry them through this period of drought which is necessary, if we are going to get the range in a better longrun condition.

Senator MCGEE. Do you mean that in your judgment you lack the funds to go at it that way?

Mr. STODDARD. To be able to allocate it as the adjudications are taking place.

AMOUNT FOR SOIL AND MOISTURE CONSERVATION

Senator MCGEE. How much are you getting now for your soil and moisture conservation?

Mr. STODDARD. About $12 million a year.

Senator MCGEE. How much per acre is that? Maybe you could supply it for the record.

Mr. STODDARD. It is about 7 cents, I think, spread over the whole grazing area. But in terms of the application to the specific units in which the work is going on, it is somewhere around, I think, $5 or $6 an acre. But it is limited.

FUNDS ALLOWANCE PRECLUDES REHABILITATION PROBLEM

Senator MCGEE. What you said, then, in your response to the previous question is that this just enables you to hang on by the fingernails. It does not enable you to move ahead with the kind of rehabilitation program whereby simultaneously with the range improvement you take a more moderate position in regard to the reductions that had been proposed?

Mr. STODDARD. That is right. We have to rely on nature if we do not have a chance to go in and establish a stand of grass, by pulling off the pressure and waiting until the grasses come in as a result of lower grazing pressure.

LONG-RANGE DANGER OF OVERGRAZING

Senator MCGEE. The other side of the coin, of course, is that if you do not make the cutbacks you deem necessary, you can put the range permanently out of business.

Mr. STODDARD. This is the long run danger.

Senator MCGEE. So we can go at this problem in one of two ways. As it stands now with the pending appropriation, we can allow reductions and permanently ruin the range by little or no management of it. Or we can handle it in the way that its severe condition requires, that is, provide additional funds to practice conservation in areas where cuts are proposed and keep the rancher in business. Is that what you are saying?

GRADUAL PROCESS OF CHANGING UNIT RULE

Mr. STODDARD. Yes. We could make this a gradual process of shifting from present condition to a better future condition rather than a more or less drastic change.

Senator MCGEE. Could you elaborate on this a little bit, for the record? This concept is important and should be clearly understood.

Mr. STODDARD. Here is a ranching unit. Here is the base ranch and here is the public land along side of it. Say the condition is poor. Say it is low productivity. It takes 40 acres to take care of a head, or maybe it takes a section, but it is low productivity depending on the location.

RESULTS OF REDUCING GRAZING PRESSURE

Now, by reducing the grazing pressure there will be an increase in the amount of forage available. But, shall we say, elimination of sagebrush in some areas will increase the forage considerably and reseeding will increase it even more.

So that we have the problem of a short-term pulling up of the belt, but we are going to have to have a new seeding and then a rest so that we can get into a rotation type of pasture management so that the new seeding can get established for a year of two before grazing takes place on it.

But we have not the money in most cases to do the work on the ground. We are trying to make a tie-in, but it is just not enough.

Senator MCGEE. You could not undertake this type of program on a 1-year, quick-shot basis?

Mr. STODDARD. Not 1 year. Over several years. We would stage our adjudications to fit the investment funds that are available.

REDUCTIONS IN AREAS OF EXCESSIVE GRAZING DEMANDS

Senator MCGEE. I still have questions about this. But to be practical, it would be helpful if you could prepare for the committee a list of the areas where grazing demand exceeds the present capacity and the extent of the reductions that the BLM recommends or is

projecting for those areas. Then show the present animal units on those tracts, the grazing demands on them, the potentials of all sorts and types of improvements, that, in your judgment, would be required to do both of these things, to develop those ranges over the long pull and at the same time protect the ranchers who are already using them, at least at a level at which they could stay in business.

I think if you could put this information in table form for those areas it would give us, at a glance, a very useful profile of the concepts of the program and what it would cost.

Mr. STODDARD. We will be able to supply all of the first and much of the second, but it will have to be estimates. We have the data on where they are scheduled to take place and how much is involved.

Senator MCGEE. This information should also include the number of ranches involved in each of those areas.

Mr. STODDARD. These we will be able to give you.

RELATION OF NUMBER OF ANIMAL UNITS TO SURPLUS

Senator MCGEE. This discussion raises another question about increasing the animal units or holding them level at the same time we are talking about our concern over beef imports. This is a question raised with me by the ranchers in Wyoming who want to stay in business with as many units as they can.

As we project an increase in the per capita consumption of beef, which is growing at a rather steady pace—3.7 percent—we are going to have an increased demand for animal units, rather than less, and this is the reason why you ought to be thinking seriously about increasing those units rather than cutting them back as severely as you have. That is why I would be interested in seeing this spelled out on the figures you will supply.

It sounds good if it can be supported by the evidence that your technicians can supply for us.

Mr. STODDARD. We will be glad to supply that information for you.

(The information referred to follows:)

ANALYSIS OF NEEDED ADJUSTMENTS IN GRAZING USE ON BLM LANDS

The attached tabulation indicates the funds which would be required to restore grazing use, in the areas listed, to either the qualified demand or treatment potential, whichever is less.

The tabulation includes only those areas which are under immediate consideration for adjustments in grazing use and does not include the areas in which adjustments have previously been imposed. Approximately 80 percent of the operators who have grazing use on lands administered by BLM have previously been adjusted to the grazing capacity of the range and are not included in this report. In general, the areas previously adjusted have incurred larger reductions in grazing use than those remaining because the more critical areas were given priority.

In many instances the forage potential for the area is greater than that required to satisfy the qualified demand for grazing use in the area. It may be possible in some instances to shift operations from areas with limited potential to areas where extensive land treatment practices can be applied.

Normally, soil stabilization, water control, and proper water use results in increased forage production and it is through the integration of the Bureau's soil and moisture conservation program with the grazing administration phase that these forage increases can be planned and used to advantage. Thus, many soil and moisture conservation projects will serve both their intended purpose of controlling erosion while also increasing the forage resource.

Following is an explanation of the various column headings appearing on the attached tabulation:

Number of operators.—The number of individuals who will be affected by the anticipated adjustment in grazing use on the areas involved.

Acres Federal range.—Acreage of lands administered by the Bureau of Land Management within the specified area.

Estimated grazing capacity (animal unit months).—The number of animal unit months of forage that are presently available for livestock within the specified area on lands administered by the Bureau of Land Management.

Qualified demand (animal unit months).—The maximum animal unit months of forage that the operators within the area are qualified to utilize from the lands administered by the Bureau of Land Management.

Adjustment (reduced animal unit months).—This is the difference between the present grazing capacity of the Federal range and the qualified demand of the operators within the area.

Potential for increase by treatment (animal unit months).—The estimated animal unit months of forage that can be obtained through rehabilitation of the range; i.e., range seeding, brush spraying, water spreading, contouring, etc. This figure is in addition to the present grazing capacity.

Additional increase by management following treatment (animal unit months).—The estimated animal unit months of forage that can be obtained by intensive management practices. This does not include any land treatment work, but would include water developments, fencing, etc. This figure is also in addition to the present grazing capacity and would not be fully available for a considerable period of time.

Estimated cost of treatment.—The estimated funds required to restore, through range treatment, the animal unit months of forage indicated by either the adjustment (reduced animal unit months) column or the potential for increase by treatment (animal unit months) column, whichever is the least.

Rehabilitation measures required.—This is a list of the major improvement practices applicable in the area and for which the funds would be expended.

PUBLIC HEARINGS IN THE WEST

Senator MCGEE. I think we should take this kind of proposal out to Wyoming in field hearings of the Public Lands Subcommittee and ask some questions out there, inasmuch as we do want some public hearings in the West. It would be useful if we had your information when we go to Wyoming for hearings.

COST OF RANGE REHABILITATION

Senator BIBLE. One problem that worries me, and I appreciate your suggestions and as I have indicated we will have field hearings in both Wyoming and Utah, is the terrific price tag of rehabilitating the ranges to the point where you think they can carry a full load.

I think your predecessor testified on that question, either last year or the year before, and we were getting into a figure of hundreds of millions of dollars to rehabilitate the range where it could carry the full allotment, and this gives me great concern because I do not know if it is good economics. And I am interested in the line of questioning developed by the Senator from Wyoming. It is very appropriate, it is helpful in attempting to work out one of the real touchy areas that you wrestle with in the Bureau of Land Management; but if I recall in one of our field hearings I think it was said that there has not been a single rehabilitation program under the direction of the Bureau of Land Management that has resulted in the restoration of a single grazing cut.

Now, I wish you would either verify that, correct it, or put the record straight, because if we are spending these millions and millions of dollars on rehabilitation programs and it does not restore any of the carrying capacity or any of the allotment cut, then I wonder why we should have it.

But I wish you would supply that information.

Mr. STODDARD. We will be glad to do so, and I think it is on the contradictory side.

Senator BIBLE. It may be and I want you to analyze it and if I am wrong or if my information is wrong indicate where it is wrong and where you have spent $10 or $20 million and it has resulted in an increase in the allotted carrying capacity, because this is a real tough program.

(The information referred to follows:)

RESTORATIONS IN GRAZING USE RESULTING FROM REHABILITATION MEASURES

The attached tabulation contains examples of the restorations effected through rehabilitation measures.

The instances where restorations have been made after an adjustment was imposed, though significant, are not as numerous as instances where larger adjustments would have been required had the rehabilitation measures not been in effect prior to the adjudication. Some examples are evident in the tabulation.

The Burley district in Idaho provides an outstanding example of where tremendous potentials exist in rehabilitation practices. Special funds provided to control the beet leafhopper through the eradication of host plants by planting perennial grass species, resulted in secondary benefits of increased forage available for livestock and wildlife.

Listed are some examples of the increased grazing use made available by range rehabilitation practices on BLM land.

Restorations resulting from rehabilitation measures

		McNich No. 1	None		[1] 18
		McNich No. 2	None		[1] 25
		Green River	48	1959	100

[1] These units did not have a downward adjustment in grazing use and the precent figure shown in the restoration column indicates the percentage of the qualified demand by which the operations were increased. The rehabilitation measures averted a reduction and resulted in the availability of forage in excess of the original demand.

[2] The Nevada tabulations include both restoration of use following a reduction and the reduction averted due to the rehabilitation of areas prior to adjudication. All adjustments listed during 1962 and 1963 show the present adjustment averted in the restoration column.

Senator McGEE. That is all the questions I have. Thank you.

Chairman HAYDEN. Any further questions?

PERSONNEL STRENGTH OF BUREAU

Senator BIBLE. Before we adjourn I have one more question to ask. What is your present personnel strength in the Bureau of Land Management? How many employees do you have?

Mr. STODDARD. I know we have 1,705 temporary in the summer season and it is something over 3,000 permanent.

Mr. BEIRNE. We have a proposal for 3,461 permanent employees.

Senator BIBLE. Is that what you are carrying now?

Mr. BEIRNE. Possibly there are 200 vacancies out of that.

Senator BIBLE. How many are in Washington and how many are in the field?

Mr. BEIRNE. In Washington there are a little over 300.

Senator BIBLE. The balance are in the field?

Mr. BEIRNE. Yes, sir.

Senator BIBLE. How many States are actually under your jurisdiction? Do I understand the figure is 12?

STATE OFFICES OF BUREAU

Mr. STODDARD. Where we have State offices and in addition we have other States, mostly in the Great Plains area, where we do have more scattered lands. We have some in Minnesota, some in Michigan, some in Florida. But basically they are in the 12 Western States.

Senator BIBLE. Your State directors and main offices are in 12 of the Western States, but you actually have a Bureau of Land Management office in how many other additional States?

Mr. BEIRNE. Two other States. We have an office in Washington which handles most of the fieldwork east of the Rockies, and we have an office in New Orleans which handles the Outer Continental Shelf.

Senator BIBLE. You are talking about 14 BLM offices in the United States?

Mr. STODDARD. Central offices. Then there are district offices.

Senator BIBLE. How many of those?

Mr. STODDARD. Seventy-one.

Senator BIBLE. Located in how many different States?

Mr. BEIRNE. We have 71 district offices in the Western States, and 2 in Alaska.

Senator BIBLE. I have just one further question.

Senator MCGEE. May I add that of the 3,000 that must be out in the field, I have a letter from one unhappy rancher who thinks they are all in one county in Wyoming.

TEMPORARY SUMMER JOBS

Senator MUNDT. How many temporary summer jobs?

Mr. BEIRNE. There are about 1,700.

Senator MUNDT. What kind of jobs are those? What kind of people do you employ? Where do you get them?

Mr. BEIRNE. They are survey aids, some work with range crews in the soil and moisture field and in the forestry field.

Senator MUNDT. Would these be in the main, college boys?

Mr. BEIRNE. Generally, yes.

Senator MUNDT. How do they get jobs there? How do they qualify? How do you pick them?

Mr. BEIRNE. They just apply, generally. For these short-term appointments, there is no general examination.

Senator MUNDT. They just list their qualifications?

Mr. STODDARD. And we are interested in them, if they are studying agriculture or forestry.

Senator MUNDT. What do you pay?

Mr. BEIRNE. About the equivalent of a GS–3.

Senator MUNDT. Is that around $350 a month?

Mr. BEIRNE. A little less than that, I think. About $300.

Senator MCGEE. Would you be receptive to Senators recruiting for that program?

BACKLOG OF WORK IN NEVADA

Senator BIBLE. Mr. Chairman, may I ask just one further additional question of Mr. Senzel. I understood him to say his workload is about current and I would like a reading on Nevada, because the director there is in the process of requesting a moratorium on the grounds that he cannot get up on his caseload.

Mr. SENZEL. I believe I said it was generally current but that we have a backlog in some States. You are quite right. One of our bad areas is in the desertland law area in Nevada. So far as management of our funds and making lands available to people economically, we have problems there.

Senator BIBLE. I have mixed emotions about the Nevada problem. The moratorium may very well be a good thing not only for the purpose of catching up with the backlog but for the purpose of having

land and water run together with some degree of continuity and semblance of reason. I wanted that clear.

Mr. SENZEL. Yes, sir.

Chairman HAYDEN. We will stand recessed until 10 a.m., Friday, February 21, and take up the Bureau of Indian Affairs at that time.

Thank you, gentlemen.

(Whereupon, the committee adjourned at 11:50, Thursday, February 20, 1964, to reconvene at 10 a.m., Friday, February 21, 1964.)

DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR 1965

FRIDAY, FEBRUARY 21, 1964

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met at 10 a.m., pursuant to recess, in room 1223 of the New Senate Office Building, Hon. Carl Hayden (chairman presiding.)

Present: Chairman Hayden, Senators Bible, McGee, and Bartlett.

DEPARTMENT OF THE INTERIOR

BUREAU OF INDIAN AFFAIRS

STATEMENT OF PHILLEO NASH, COMMISSIONER OF INDIAN AFFAIRS, ACCOMPANIED BY JOHN O. CROW, DEPUTY COMMISSIONER; JAMES E. OFFICER, ASSOCIATE COMMISSIONER; RODERICK H. RILEY, ASSISTANT TO THE COMMISSIONER; FRED H. MASSEY, ASSISTANT COMMISSIONER, ADMINISTRATION; MISS SELENE GIFFORD, ASSISTANT COMMISSIONER, COMMUNITY SERVICES; R. REESEMAN FRYER, ASSISTANT COMMISSIONER, ECONOMIC DEVELOPMENT; A. O. ALLEN, ENGINEERING ADVISER; MRS. HILDEGARD THOMPSON, CHIEF, BRANCH OF EDUCATION; J. LEONARD NORWOOD, CHIEF, BRANCH OF BUDGET AND FINANCE; FRANCIS WILES, CHIEF, BUDGET SECTION, BRANCH OF BUDGET AND FINANCE; WALTER J. KNODEL, CHIEF, BRANCH EMPLOYMENT ASSISTANCE; AND GEORGE KEPHART, CHIEF, BRANCH OF FORESTRY

COMPARATIVE STATEMENT

Chairman HAYDEN. The subcommittee will be in order.

There will be placed in the record a comparative statement of fiscal year 1964 appropriations and the budget estimate for fiscal year 1965 for the Bureau of Indian Affairs. This statement shows an increase of $3,669,450 over the appropriation for fiscal year 1964.

(The statement referred to follows:)

Comparative statement of 1964 appropriations and 1965 budget estimate

	1964			1965 estimate	Increase or decrease (−) 1965 compared with 1964		
	Appropriation	Transfers [1] (−)	Amount available		Total	Pay cost [2]	Programs
Education and welfare services:							
1. Educational assistance, facilities, and services	$66,118,250	$9,200	$66,109,050	$70,652,000	$4,542,950	$631,750	$3,911,200
2. Welfare and guidance services	11,264,000	6,600	11,257,400	11,646,000	388,600	52,000	336,600
3. Relocation and adult vocational training	9,420,000	1,000	9,419,000	12,092,000	2,673,000	69,000	2,604,000
4. Maintaining law and order	2,433,000		2,433,000	2,580,000	147,000	27,000	120,000
Total	89,235,250	16,800	89,218,450	96,970,000	7,751,550	779,750	6,971,800
Resources management:							
1. Forestry and rangelands	4,804,100	1,000	4,803,100	4,924,200	121,100	70,100	51,000

PREPARED STATEMENT

Chairman HAYDEN. Mr. Commissioner, if you have a statement for the record you may file it and summarize it, or if you prefer you may read it.

Mr. NASH. Thank you, Mr. Chairman. I have a statement which I would like to file for the record and summarize briefly, if I may, sir.

(The statement referred to follows:)

STATEMENT OF PHILLEO NASH, COMMISSIONER OF INDIAN AFFAIRS

Mr. Chairman and members of the committee, I appreciate the opportunity to appear before this committee to present the request of the Bureau of Indian Affairs for appropriations for fiscal year 1965.

The fiscal year 1965 budget estimate for the Bureau of Indian Affairs is $210,293,000, an increase of $3,766,250 over the adjusted appropriation for fiscal year 1964. This increase represents $1,264,450 for increased pay costs and $2,501,800 for program increases. These estimates adhere to the President's hold-the-line budget policy. We have included only built-in increases for the operation of previously approved school construction and for resource-based programs that will aid in the reduction of Indian poverty by increasing Indian employment and income.

The Bureau's staff will increase only because of our operation of schools and the adult vocational and training programs. These increases represent personnel to staff new facilities and for increased activity in the adult vocational training program. In keeping with the instructions of this committee and with our own desire to achieve the most effective utilization of personnel, we have made some adjustments in our personnel assignments within the overall ceilings to provide additional staff assistance in certain of the economic development programs. This has been accomplished through reductions of personnel in programs where the needs are less acute.

For education and welfare services we are asking the sum of $96,970,000. This is a program increase of $6,971,800 over fiscal year 1964. It includes funds for additional schoolchildren who are entering the Bureau's school system for the first time, and for increased aids to public schools educating Indian children under the Johnson-O'Malley program; for the vocational training of increased numbers of adult Indians authorized by recent amendments to Public Law 84–959, and for care of neglected, handicapped, or dependent Indian children.

The Bureau is requesting $40,728,000 for resources management, a program increase of $2,636,000 over 1964. Increases under this appropriation item are for the benefit of reservation areas through increased timber sales; improved real property and appraisal services; expansion of the reindeer industry in Alaska; improved credit services to Indians and Indian tribes; and further industrial development. Bureau responsibilities arising from claims awarded to Indian tribes by the Indian Claims Commission and the U.S. Court of Claims are increasing and funds to handle these added responsibilities are included in this request. Increased funds are also requested for assistance to tribal housing authorities in the construction of Indian dwellings, and for improved road maintenance, particularly schoolbus routes.

We request $4,331,000 for general administrative expenses, unchanged from the fiscal year 1964 level.

Our estimate for construction is $51,176,000. This is $7,062,000 less than the amount available for fiscal year 1964. The 1965 construction item will provide additional school facilities for Indian children entering the school system and the replacement of some of the most hazardous, unsafe, and substandard buildings in the present Bureau system.

The estimate for road construction is $17 million, an increase of $2 million in cash over the funds available in 1964 to liquidate the obligations incurred under the authority contained in the Federal Aid Highway Act.

You have justifications for each program request before you. I shall be happy to discuss these programs in detail with you and to answer any questions you may have.

Statement of the Commissioner

Mr. Nash. For the record, my name is Philleo Nash. I am Commissioner of Indian Affairs and I have with me a number of my associates in the Bureau of Indian Affairs this morning.

Mr. Chairman, the 1965 budget estimate for the Bureau of Indian Affairs is $210,293,000, a net increase of $3,766,250 over the adjusted appropriation for fiscal year 1964. This increase represents $1,264,450 for increased pay costs and about $2.5 million for program increases.

Mr. Chairman, this budget is a hold-the-line budget in accordance with the desires of this committee and at the instruction of the President. The increases that we have asked are merely built-in increases that are necessary because of school construction programs that the Congress has funded in past years and which are coming into use this year and where we have to have, of course, teachers and maintenance and operating personnel as the buildings come into service.

Adult Vocational Training Program

We are also asking for an increase, pursuant to the authorization of Congress to add to our adult vocational training program, a program which has been very successful and popular with the Indian people and which has a high rate of success in leading to employment for Indians following vocational training.

We think this is a real antipoverty program, one of proven effectiveness, which is not only helping Indian people, but will, perhaps, serve as a model for other groups.

Chairman Hayden. You mean acquired skills in order to be able to make a living?

Mr. Nash. Yes, and a good living, the kind of job skills that are marketable in today's labor market.

Resources Program Increases

On the resources side, we are asking for some program increases, but only where the expenditure of a small amount of money will bring in a good many times that in Indian income. For example, by putting on a few additional foresters, it will be possible to increase timber sales of both tribal and allotted timber that will bring in receipts several times what it costs to put on those few additional people.

We have also, following instructions of the Congress, looked over our activities very carefully in order to see whether we can transfer people from programs of a lower priority to programs of a higher priority so as to do a more effective job within the dollar and personnel limitations that we are under.

General Administrative Expenses

In the field of general administrative expenses, we are holding the same level as we have for several years. We are not asking for an increase and I would like to say that my associates have been very faithful and diligent in taking on additional programs, such as the accelerated public works program, without adding to the numbers of employees. This has been very difficult and there was a lot of overtime. I am not sure, in every case, that this is the most effective

way to get things done over a long period of time, but on a crash basis, we have been able to handle added amounts of work without adding employees.

Housing on Reservations

This year, for the first time, we will begin to see some effective results in our program to bring the benefits of public housing to the Indian reservations. The Public Housing Administration has set aside 3,200 units, 1,700 of low-rent public housing, and 1,500 of a new program that was developed on the reservations, mutual help housing, and we are asking for people to supervise the construction of these dwellings.

Chairman Hayden. Are these all individual dwellings?

Mr. Nash. They are all individual dwellings. This is not group housing, sir. The program is very popular with the Indian people, and the first 10 units of the mutual help housing are actually under construction at the San Carlos Reservation right now, sir.

We are asking for construction, $51,176,000. This is $7,062,000 less than the amount available for fiscal year 1964. This will permit us to continue our program of school construction for Indian children primarily in the Four Corners area and Alaska and enable us to keep up with the rapid increase in the size of the school-age population. These funds will also enable us to continue our program of replacing the most hazardous, the most unsafe, and the most substandard buildings in the present Bureau system.

We are still operating with a substantially obsolete educational plant.

Indian Population

Chairman Hayden. You mentioned a substantial increase in school population. How about the total population of all Indians? Are health conditions such that their number is actually increasing?

Mr. Nash. Yes, sir. The Indian population is the fastest increasing segment of the American population. And this is reflected, of course, in the demands for school services. The success of the Division of Indian Health in reducing some of the great killers, so far as Indian people are concerned, is having very significant results.

Now, the health conditions are still substandard, and an Indian baby born today has about nine-tenths the life expectancy of the non-Indian baby born next door. This is lower than it ought to be, but it is a great improvement over the years.

The health of the older people, going back to childhood diseases which were not under control in their youth, results in an average age at death of about two-thirds that of the general population.

Now, there is a difference between that average age of death and life expectancy that is a measure of the improvement in Indian health. I can brag about this, sir, because this is not our work, but the work of the Indian Health Division of the Public Health Service.

Roads Construction

For road construction, Mr. Chairman, we are asking, in liquidating cash, $17 million. This will enable us to get caught up with the rate at which we are picking up obligations in roads construction.

In roads construction, we are emphasizing school bus routes, because as we open new schools it is important that the road nets be improved as much as possible in order to increase the attendance.

That completes my summary and if there are any questions I will be happy to answer them.

Chairman HAYDEN. There will also be included in the record the justifications for the 1965 estimate for education and welfare. This estimate amounts to $96,970,000, an increase of $7,734,750 over the appropriation for fiscal year 1964.

(The justifications referred to follow:)

EDUCATION AND WELFARE SERVICES

HIGHLIGHT STATEMENT

The Bureau provides services and assists the States in furnishing services to Indians in the United States including the natives of Alaska in the fields of education, welfare, relocation, and law and order. Progress in education is basic to successful achievement of overall Bureau programs.

Education provides the base of understanding and skills that facilitates Indian acceptance of ideas and programs leading them to full assumption of citizenship responsibilities. In the last few years the education program has been broadened to include adults as well as children of school age. Indian children attend public, Federal, private, and mission schools. In 1963 there were 121,236 Indian pupils, age 6 to 18 inclusive, enrolled in school, an increase of 3 percent over the year before. In addition, 10,563 Indian pupils, under 6 and over 81, were enrolled in school. Funds are requested for fiscal year 1965 to provide educational services for 2,253 additional pupils in boarding schools, approximately 240 additional pupils in 8 additional day school units, and for the Federal Government's share of the increased costs and increased pupil load in public schools enrolling Indian children.

ENROLLMENT IN PUBLIC SCHOOLS

Wherever facilities are available to meet their needs Indians are enrolled in local public schools. The Bureau assists in financing some districts enrolling Indian pupils eligible for payment under the Johnson-O'Malley Act. When school districts educating Indian children are eligible for Federal aid under Public Law 874, 81st Congress (64 Stat. 1100), as amended, supplemental aid under the Johnson-O'Malley program is limited to meeting educational problems under extraordinary or exceptional circumstances.

When public school opportunities are not available, the Bureau operates schools for Indian children. In 1963 the Bureau operated 264 schools, enrolling 43,435 pupils and 20 dormitories housing 4,082 pupils attending public schools. The primary objective of the schools operated for Indian children is to prepare them for successful living. In Federal schools the children develop basic academic skills, acquire an understanding of the social and economic world, learn improved standards of living, follow practices which assure optimum health, acquire vocational training to qualify for gainful employment, and obtain sufficient education to enter special schools and institutions of higher learning. The schools provided by the Federal Government for Indian children meet the instructional standards required by the States in which they operate and all secondary schools are accredited so that graduates may enter college on the same basis as public school graduates. In addition to the operation of Federal schools for eligible Indian children, the Bureau conducts a limited educational program for adult reservation Indians. In 1963, 140 communities were served by this program. Courses are planned to meet specific needs of individuals and community groups and range from the most elementary reading and writing to community problems, business skills, and citizenship training.

The Bureau provides general assistance, child welfare, and miscellaneous services to Indians who do not qualify for similar services offered under Federal, State, or county welfare programs. An average monthly caseload of 17,000, no increase over 1964 for general assistance is contemplated in 1965; and child welfare care for 2,820 children, an increase of 200 over 1964.

The relocation program assists Indians from reservations to settle and secure permanent employment in non-Indian communities, and assists in a program of industrial development on or near reservations to provide local job opportunities.

The act of August 3, 1956 (70 Stat. 986) as amended, authorizes a program of adult vocational training and education in the amount of $12 million annually. This program was initiated in 1958 on a limited basis. For 1965, we are requesting $9,300,000, which will provide for approximately 3,297 institutional trainees and 1,370 on-the-job trainees.

Police services and tribal court operations are financed on Indian reservations, and special officers direct enforcement of Federal law. Failure or lack of a program to maintain order on the reservations jeopardizes or renders impossible the accomplishment of other Bureau programs.

[1] To provide for increased pay costs for fiscal year 1964 positions.

A. Assistance to pupils in non-Federal schools

The estimate of $9,054,000 is an increase of $500,000 over 1964.

Need for increase.—The increase of $500,000 covers the Bureau's share under State Johnson-O'Malley plans for the increased enrollment and additional costs in public schools.

Plan of work.—This item covers subactivities as follows:

(1) Public schools: This item provides funds for the Johnson-O'Malley program which permits the Bureau to cooperate with States and local school districts in the education of Indian children. Local public schools are assisted with Johnson-O'Malley funds when the tax-free status of Indian lands within the boundaries of the school district create unmanageable financial problems after all other financial resources to the district have been exhausted. Assistance is provided in accordance with formal State or district plans and at contracting time funds are adjusted to meet the exact amounts needed to finance each plan.

Prior to 1959 local public schools were ineligible for entitlement for Indian pupils under Public Law 874, 81st Congress (64 Stat. 1100) administered by the Health, Education, and Welfare Department. The act of August 12, 1958, amended Public Law 874 so that school districts educating Indian children may now receive payments for Indian children on the same basis as for other federally affected children. Bureau efforts are carefully coordinated with the Office of Education in the Department of Health, Education, and Welfare to insure no duplication of assistance for the same service. Public Law 874 requires a 3-percent impact and a minimum average daily attendance of 10 federally connected children to qualify. Some public schools enrolling Indian children do not qualify because of this provision. Johnson-O'Malley funds are used in these instances. Other public schools located on Indian reservations with little or no local tax resources are not able to operate at acceptable State standards without additional assistance over and above the funds they receive from State aids and their Public Law 874 entitlements. Johnson-O'Malley assistance is used to supplement these other available funds to permit operation at adequate State standards. Johnson-O'Malley aids are limited to financing needs under these and other extraordinary and exceptional circumstances, after all other aids to the district have been fully used.

Increased enrollment and increased education costs account for increased need of assistance from the Bureau under the Johnson-O'Malley program. The Bureau must be in a position to meet justifiable assistance to public schools enrolling Indian children to insure their continued enrollment in terms of today's numbers and increasing costs.

The Bureau meets the full per capita cost for the education of Navajo pupils domiciled in Federal dormitories who are attending public schools outside their districts.

The following tables list the Johnson-O'Malley education contracts:

(2) Special aids: This item provides lunches for Seminole children in Florida.

(3) Higher education: Bureau scholarship funds provide assistance for students who cannot qualify for other types of scholarship aid and supplement partial aids students receive from other sources. This item provides grants to 1,300 college students. In 1965 the average grant will be $885 per student. The Bureau funds, together with funds provided by private and public organizations, various schools, some States, tribal groups, and Federal and tribal loans, assist Indian young people to attend schools of higher learning who would be unable to attend without assistance. In 1963, 39 tribes provided over $800,000, and other non-Federal sources provided $220,000 for scholarships. The number of Indian high school graduates is increasing each year as is the percentage of Indian high school graduates who want to go to college.

B. Federal facilities

The estimate of $60,522,374 is an increase of $4,030,310 over 1964.

Need for increase.—The increase of $4,030,310 consists of:

(1) $3,545,200 in boarding schools representing $2,787,200 for increased enrollment of 2,253 pupils, and $284,000 to meet increased costs of plant operations and $474,000 increased pay cost.

(2) $454,692 in day schools representing $157,390 for increased enrollment in eight additional day school units; and $182,610 to meet increased costs of plant operations and $114,692 increased pay cost.

Increased costs of plant operations in boarding schools and day schools: This increase is requested to cover Educations' share of increased costs of plant operation required to meet minimum standards of student and employee health and safety and to protect the educational plant. Plant operations include heating and lighting; water and sewage treatment, and disposal; garbage and refuse disposal; grounds maintenance; custodial services; and fire protection.

(3) $30,418 in special services represents an increase in pay costs for program direction and museums.

Plan of work.—An analysis of the item by subactivity follows:

	1963		1964		1965		Increase		
	Pupils	Amount	Pupils	Amount	Pupils	Amount	Pay cost	Pupils	Program amount
(1) Boarding schools	31,933	$40,058,135	35,427	$41,296,022	37,680	$44,841,222	$474,000	2,253	$3,071,200
(2) Day schools	15,584	10,648,529	[1] 18,030	12,145,427	[1] 18,270	12,600,119	114,692	[1] 240	340,000

Total	47,517	53,376,391	53,457	56,492,064	55,950	60,522,374	619,110	2,493	3,411,200

[1] Represents full enrollment of capacity of added facilities.

(1) Boarding schools: This subactivity is analyzed as follows:

Type of operation	Number of pupils			Increase
	1963	1964	1965	
Boarding schools	27,851	31,569	33,694	2,125
Dormitory only operations	4,082	3,858	3,986	128
Total	31,933	35,427	37,680	2,253

(2) Day schools:

	1963		1964		1965, number of units	Increase, number of units
	Number of units	Number of pupils	Number of units	Number of pupils		
(2) Day schools	585	15,584	601	18,030	609	8

(3) Special services:

(*a*) Program direction: This item provides for the salaries and expenses of the education employees rendering field supervisory service as well as the education personnel in the central office. These education specialists plan the overall academic and vocational program for Federal Indian schools and in cooperation with State and local officials develop plans for increased enrollment of Indian pupils in the public school system.

(*b*) Museum: This item provides for the operation of the Blackfeet Museum at Browning, Mont.

(*c*) Transportation of boarding school students: This item provides for plane, bus, and rail fares and incidental expenses of transporting pupils from their homes to and from boarding schools.

C. Adult education

This program offers general education instruction to adults where the need is especially acute because the Indians have missed the advantage of education in their youth. It provides a type of training which meets the needs and abilities of the individual Indians as citizens. The program ranges in nature from instruction in basic arithmetic and language skills to continuation of elementary and high school education, instruction, and assistance to increase participation in local community organizations; informing Indian parents of their role and responsibilities in the education of their children and strengthening their participation in parent-teacher activities.

Federal education programs.—Federal education programs help to bridge a cultural and educational gap, and thus they prepare Indian youth and adults to take advantages of further education and employment opportunities.

1. Federal elementary programs. The instructional program in Federal elementary schools is designed to meet the special English language needs of Indian children, in addition to teaching the basic skill subjects ordinarily taught in elementary grades. The Bureau attempts to provide schooling, especially in the elementary grades, within the home environment to permit the two-way communication between Indian homes and the school, and to preserve the strength of home ties in the overall development of Indian children. To carry out this objective the Bureau operates day schools wherever feasible, and when boarding schools are necessary, they are located as near the homes as reasonably possible. Seventy-one percent of Indian children in Federal schools are enrolled in grades beginners through eight.

2. Federal high schools. Federal high school programs are also designed to meet the special education and English language needs of Indian pupils. The programs are those of basic education needed by all citizens for full participation in American life plus emphasis on prevocational programs leading to more advanced technical, vocational, and subprofessional training. Practical arts such as home economics for girls and general shop for boys are required of all students as part of the regular high school course.

Special instructional programs at elementary and high school levels are offered for approximately 3,500 overage pupils. Each student is permitted to progress at his individual rate toward high school graduation.

In 1963 the Bureau offered basic high school instruction in 27 schools, and special curriculums for overage students in 10 schools. All Federal high schools meet the accreditation standards of the States in which the schools are located. Six Federal high schools have achieved the higher education standards required by and are now accredited by the North Central Association of Colleges & Secondary Schools and the Northwest Association of Secondary & Higher Schools. To meet the special needs of Indian students Federal high schools provide, in addition to the above, guidance and counseling programs, programs to increase English language capability, and programs to broaden the experiences of the students.

Post high school vocational and technical courses are offered at Haskell Institute, Chilocco Indian School, and the Institute of American Indian Arts in modern office work, accounting machines, and business practices, electronics, auto mechanics, auto body work, heavy equipment operation, commercial cooking, cosmetology, vocations related to fine and applied arts, and numerous other trades. In addition, high school graduates take advantage of institutional vocational training available under Public Law 959. In 1963, 1,007 students were enrolled in post high school technical courses at Haskell, Chilocco, and the Institute of American Indian Arts. This is exclusive of the 2,911 other Indians who were enrolled in 626 courses in 248 approved vocational training institutes under the adult vocational training program.

3. Summer programs. The summer programs carried on by tribal groups in cooperation with the Bureau and many other interested groups have been successful in expanding the background experience of Indian youth and reducing the incidence of juvenile delinquency among Indian boys and girls. These programs are locally planned and assisted, where necessary, by the Bureau. In the summer of 1963, 20,447 Indian youths participated in varying degrees in such programs as student work projects (plant maintenance and repair, building improvements, and forestry); academic classes to earn extra credit or make up credit; special instruction in science, mathematics, English, and typing; supervised recreation; educational field trips; preschool preparation; and special English instruction for elementary and high school students. Many tribes participated either by contributing money or personnel to the programs. Local non-Indian citizens and nontribal groups in some communities have cooperated with Indian tribes and the Bureau in summer program activities.

College education. The number of students enrolled in college is increasing but more students could and should pursue higher education courses. Also the number who fail to complete their full college course is of concern. The financial struggle resulting from inadequate financial help has prompted too many potential college students to take marginal jobs, or enroll in better financed programs of assistance in trade training. With increased financial help for college bound students it is expected that the number of students enrolling in degree courses will increase.

Indian participation in school affairs is greater than is generally recognized. A survey in 1962 revealed Indian participation on 284 local school boards and 414 parent-teachers' associations.

The dropout rate of Indian students in Federal schools in calendar year 1959 was 50 percent higher than the national average at that time. The number of dropouts in Federal schools is now decreasing. Between 1960 and 1963 the dropout rate in Bureau schools changed from 4.6 percent of total enrollment to 3.8 percent of total enrollment. The Bureau of Indian Affairs believes that this improvement is related to additional funds for guidance and instruction, increased parental interest in education and participation in school affairs, summer program activities, and improved plant facilities.

Average daily attendance in Bureau schools has increased over the years. In 1963 average daily attendance in Federal schools was 88.9 percent as compared to a national average daily attendance of 89.3 percent. A few schools experience irregular and poor attendance.

BASIC PROBLEMS ENCOUNTERED BY THE BUREAU IN CARRYING OUT ITS EDUCATION RESPONSIBILITY

1. By comparison with the increase of school-age children in the general population, the Indian school population is increasing at a higher rate. This high rate of population increase adds to the nationwide problem of providing

adequate school spaces and places an unusually heavy burden on existing Federal facilities. Where public schools are not available, the Bureau must provide additional space in Federal facilities.

2. Geographic and cultural isolation and lack of roads make continued Federal operations necessary. Many of these Federal operations because of isolation are boarding schools. As roads and bus routes can be developed, additional numbers of Indian children can attend on a day basis. This is one of the Bureau's educational objectives. A major obstacle at present is the lack of development of the road net; consequently the development and maintenance of additional school bus routes is necessary to make day schools possible.

3. Federal schools must be concerned with developing quality instruction to give Indian youths background and high level skills so they may take advantage of all employment opportunities including but not limited to the professions, service occupations and trades.

4. Indian education must face the educational and cultural gap that exists between Indians and non-Indians. The median educational level of the non-Indian population is approximately the 11th grade while the education of Indian groups is approximately half that level.

5. How to bring about the rapid changes necessary to bridge the educational gap and at the same time avoid creating a disturbing cultural breach between parents and children is a major problem. However, the educational handicap of the Indian people must be overcome quickly if they are to manage their own affairs successfully in a modern world.

2. Welfare and guidance services

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) General assistance	$4,601,834	$5,514,817	$5,514,817			
(Caseload)	(15,660)	(17,000)	(17,000)			
(b) Other welfare assistance	$1,811,943	$2,222,490	$2,559,090	+$336,600		+$336,600
(1) Child welfare	($1,736,194)	($2,139,690)	($2,476,290)	+($336,600)		+($336,600)
(Caseload)	(2,420)	(2,620)	(2,820)	+(200)		+(200)
(2) Miscellaneous assistance	($75,749)	$(82,800)	($82,800)			
(c) Housing		$500,000	$500,000			
(d) Social services	$2,563,149	$3,020,093	$3,072,093	+$52,000	+$52,000	
Total	$8,976,926	$11,257,400	$11,646,000	+$388,600	+$52,000	+$336,600

[1] To provide for increased pay costs for fiscal year 1964 positions.

NOTE.—The estimate for 1965 is $11,646,000, an increase of $388,600 over 1964. The increase includes $52,000 for increased pay costs and $336,600 for the welfare and guidance program.

(a) General assistance

No increase in funds is requested. The development of employment opportunities through such activities as public works projects, intensive use of force account labor, industrial development, and an accelerated employment assistance program is having an impact upon the need for general assistance. These activities are providing employment opportunities for many Indians who otherwise would be on the general assistance rolls. The continuation of these economic activities in fiscal year 1965 will make it possible to provide general assistance within the funds available without increase.

Plan of work.—General assistance will be provided to needy Indians on reservations who are not eligible for public assistance under the Social Security Act (old-age assistance, aid to families with dependent children, aid to the blind, aid to the permanently and totally disabled), and for whom such assistance is not available from established welfare agencies or through tribal resources.

(b) Other welfare assistance

The estimate of $2,559,090 is an increase of $336,600 over 1964.

(1) Child welfare: The estimate of $2,476,290 is an increase of $336,600 over 1964.

Need for increase.—The increase will provide for foster care or necessary institutional care for approximately 200 additional Indian children and for increased costs of institutional and foster care for children for whom the Bureau is already providing such care. There is a gradual increase in the child population on reser-

vations, and with improved case finding by social workers and greater awareness of children's needs by tribal courts, an increased number of neglected, handicapped, and dependent children come to the attention of the Bureau for whom care away from their homes must be provided.

Plan of work.—Necessary foster care and appropriate institutional care will be provided for Indian children on reservations for whom such care is not available through established welfare agencies.

(2) Miscellaneous assistance: No increase in funds is requested.

(c) *Housing*

No increase in funds is requested. The program will continue on a pilot basis.

Plan of work.—These funds will be used as a contribution by the Bureau for housing improvement in cases where existing housing is far below the standards compatible with decency and health, and where improved housing cannot be secured through other available housing programs.

Full utilization will be made of existing services in the Bureau for family selection, social welfare guidance, credit problems, assistance and supervision during design and construction phases.

(d) *Social services*

The increase includes $52,000 for pay costs.

3. Relocation and adult vocational training

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
1. Relocation services	$2,748,401	$2,747,000	$2,792,000	+$45,000	+$45,000	
2. Adult vocational training	5,341,742	6,672,000	9,300,000	+2,628,000	+24,000	+$2,604,000
Total	8,090,143	9,419,000	12,092,000	+2,673,000	+69,000	+2,604,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

The estimate of $2,792,000 for relocation services is an increase of $45,000 over 1964. The $45,000 increase is for increased pay costs.

The estimate of $9,300,000 for adult vocational training is an increase of $2,628,000 over 1964. The increase includes $24,000 for increased pay costs and $2,604,000 for program operations.

Need for increase.—The increase will provide the full range of services both through entering employment direct from places of origin on the reservation, and through adult vocational training, including employment following training, for the present backlog of approximately 800 applicants awaiting this service.

Plan of work.—These two programs provide financial assistance to Indians to enable them to become self-sufficient through adequate employment. The relocation services phase of the program provides services and financial assistance to Indians who are prepared to accept immediate employment. The adult vocational training program (Public Law 959) provides training which will lead to self-support.

Relocation services will provide service and financial assistance to 1,800 units (4,140 persons). The funds requested for adult vocational training services will provide services and financial assistance to 3,297 units (7,050 persons) in training. Financial assistance and services will also be available for 1,370 units (4,520 persons) in on-the-job training.

4. Maintaining law and order

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
Maintaining law and order	$1,961,410	$2,433,000	$2,580,000	+$147,000	+$27,000	+$120,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

The estimate of $2,580,000 for "Maintaining law and order" is an increase of $147,000 over 1964. The increase includes $27,000 for increased pay costs and a program increase of $120,000.

Need for increase.—Tribes which have in the past borne the entire cost of law enforcement are finding themselves financially unable to continue this practice. The increase of $120,000 requested will be used to render some assistance to those tribes who are in the most dire need of financial assistance.

Plan of work.—Maintenance of law and order on Indian reservations is a Federal and tribal responsibility except in those areas where the States have assumed jurisdiction pursuant to congressional authorization.

Tribes have been encouraged to assume financial responsibility for law and order, and some of them are now spending more than the Bureau. The resources of other tribes, however, are running low and their inability to carry the financial burden affects the quality of their law and order programs.

The Bureau will direct and supervise reservation programs where necessary, leaving tribal financial arrangements in force and effect where the tribes are able to assume them. Where funds permit, however, both full financial responsibility and program direction will be assumed by the Bureau in the interest of more effective law and order.

In addition, the Bureau will increase its efforts to persuade tribal enactment of modern, effective codes of law to replace outmoded tribal codes or departmental codes of Indian offenses.

Expansion of services to emphasize preventive programs will be continued.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$81,020,794	$89,346,412	$96,970,000	+$7,623,588

INDIAN SCHOOL CHILDREN

Chairman HAYDEN. How many Indian children are in school under the auspices of the Bureau of Indian Affairs?

Mr. NASH. The total school-age population, 6- to 18-year-olds, Mr. Chairman, was 137,031, last year. Some of these children go to school in Federal schools, some go to religious schools, mission schools and others, and some, of course, go to public schools.

Chairman HAYDEN. Break this down to show the number of pupils in Bureau of Indian Affairs schools and the number in public schools.

Mr. NASH. Yes, sir. In the Federal system, both boarding and day, our school year 1963–64 estimated enrollments are 53,500 children; there are about 9,200 children in mission schools, and in the public schools there are in excess of 72,000.

Chairman HAYDEN. That is a remarkable increase compared to a few years ago.

Mr. NASH. Yes, sir; that is.

ASSISTANCE TO PUPILS IN NON-FEDERAL SCHOOLS

Chairman HAYDEN. You indicate that the cost of the Johnson-O'Malley contracts will be $500,000 more this year than in 1964. Are there to be more such contracts or are the contracts to be more costly?

Mr. NASH. Mr. Chairman, the increase of $500,000 in the Johnson-O'Malley program is required to meet both increased costs and increased enrollment, particularly in Arizona and New Mexico. For example, New Mexico has had an 8 percent annual increase in the number of reservation Indian children for the past 3 years.

Arizona costs are increasing approximately 10 percent annually and, also, it has an annual increase in the numbers of its children.

So the answer to your question, sir, is that there are not more contracts, because the States remain the same, but there are more children that we are contracting for.

Chairman HAYDEN. There are more Indians?

Mr. NASH. And more costs.

TRANSPORTATION OF BOARDING SCHOOL CHILDREN

Chairman HAYDEN. In what areas do you experience most of your transportation of boarding school students?

Mr. NASH. The Four Corners area, Mr. Chairman, and Alaska are the particular sources of our transportation.

STATUS OF SUMMER PROGRAM

Chairman HAYDEN. What is the status of your summer program? Last year you did not get what you asked for, did you?

Mrs. THOMPSON. Although last year we did not get all of the funds requested in our total education budget, we were able through some reduction of other programs to budget funds for the summer programs.

Our summer programs started 4 years ago in a few locations. They were limited the first summer primarily to recreational activities and trips to give Indian children new experiences. Approximately 2,000 children were served in the summer of 1961. The summer program activities have since been expanded both in scope of activities and numbers of children served. Last summer, the summer of 1963, 20,447 participated in a variety of activities.

The programs are planned at the local community level. Most of the programs are cooperatively planned and carried out involving in addition to the Bureau, tribal groups, Indian health, local organizations, church groups, and interested non-Indian citizens. Seventeen to twenty tribal groups participated each summer, some of them with

substantial contributions of funds and time of individuals, which greatly expands the number of children who can be served.

Chairman HAYDEN. Can you illustrate some actual cases where pupils benefited from the program?

Mrs. THOMPSON. The great variety of programs fall into these major categories: work programs, work-study programs, academic programs, recreational and camping programs, and kindergarten programs. In the summer of 1963, 25 boys and 24 girls at Sherman Institute earned $21,078.33 in jobs on the school campus, in the surrounding cities and national parks.

A total of 1,127 students participated in summer work programs of some kind at several locations in 1963. The opportunity to earn their own spending money and clothing takes these teenagers back to school in greater numbers. At one school every boy who was employed in a maintenance work program on the campus returned to school in the fall.

Chairman HAYDEN. Does the program consist of just projects of the nonacademic kind, or is attention paid to academic subject matter?

Mrs. THOMPSON. There is a growing interest on the part of students to attend regular classes during the summer. Attendance is voluntary and opportunities are provided to improve basic education skills at the elementary level such as spoken and written English, and reading; to earn extra credits or to make up credits at the high school level. In 1962, the number attending academic programs was 1,838, which increased to 4,177 in the summer of 1963. One elementary school on the Navajo Reservation had three times the number of children enroll the first day of last summer's session than were expected.

SPECIAL PROGRAMS

A special academic program was offered at Haskell last summer for 11th and 12th graders interested in preparing for college. Courses in science, mathematics, and English were given, with special training in college level study habits, and special instruction in the use of the library. Many more applications were received than the 77 who could be accommodated. In 1964 courses will be given at Haskell to accommodate 200 college bound high school students.

Two years ago summer kindergarten programs were started on some reservations where English is not spoken in the homes. These, too, are popular programs which will upgrade the educational attainment of these children when they enter primary schools since they will have acquired some English and an interest in school.

Trips and recreational programs which provide new experiences and worthwhile leisure activities are paying good dividends in lessening juvenile behavior problems on Indian reservations during summer months. In addition to keeping them out of trouble, Indian children are seeing and doing new and exciting things which give greater meaning to their schoolwork when they return to school in the fall.

The summer programs are, in fact, extending the school year without making it mandatory, motivating teenagers toward more education, bringing new experiences and the outside world into reservation life, reducing behavior problems, and increasing parental responsibility through their involvement in the summer activities for their

children. Aside from the direct social and educational value of these programs, Indian children are meeting the public and creating good will toward Indians. This, in turn, increases Indian pride and gives them a feeling of worth. These results may well be the most lasting and most valued.

POVERTY PROGRAM

Chairman HAYDEN. Does your division get in on the attack on poverty program? How?

Mrs. THOMPSON. Much of what is being said and planned as an attack on poverty, the Bureau is doing within the funds appropriated for education and other programs. Regular education programs prepare youth for employment. Indians who are well educated do get good paying jobs. For example, all of the 1963 graduates of Haskell's business and trade courses were placed in employment upon graduation in jobs with beginning salaries that averaged $4,165. The highest beginning salary was $9,588 for Abel Akipik, an Eskimo who is employed at Anchorage, Alaska.

In a followup study in 1963 of a 1951 Sherman Institute graduating class of 101 students of a special 5-year program, 83 were located. Eighty of the eighty-three were employed earning wages ranging from $2 to $4.75 per hour, and salaries reaching a maximum of $6,240 per annum. Thirty-nine of the sixty-nine boys in the class served in the armed services and two made the supreme sacrifice in the Korean conflict.

The work programs, work-study programs, special educational and training programs, and the like being discussed as methods to attack poverty have been tried in the Bureau and they do get results.

The most valuable lasting results may not be directly related to either education or jobs. Expanding the experiences and opportunities of Indian youth from deprived environments gives them new inspiration and hope, and brings them in contact with others under favorable circumstances. These youth are good ambassadors for their people, and they are building public good will for themselves and their parents. This, in turn, gives these youth a personal feeling of worth and a new sense of pride in their Indian heritage which might be the basic element that activates a variety of other elements in any successful attack on poverty.

Since most Indian reservations are pockets of extreme poverty, we anticipate consideration will be given to expanding present programs as well as the initiation of new programs on Indian reservations.

INSTITUTE OF INDIAN ARTS

Chairman HAYDEN. How is the Institute of Indian Arts progressing?

Mrs. THOMPSON. The enrollment at the Institute of American Indian Arts has increased to approximately 270 this school year. The program provides a high school education of high quality, with electives in the arts and vocations related to the arts. Students may remain for 2 years beyond the high school if they wish to continue in some selected field of art.

The art productions of these students in painting, ceramics, sculpture, jewelry design, fabric design, weaving, music, and creative writing, have won for the school recognition and praise from many

quarters. Students from the institute during this first year of operation took six of the seven awards in the 1963 Contemporary Indian Arts Annual Exhibition held at the Museum of New Mexico. In the summer of 1963 the students in a summer work project produced materials and objects for the architectural embellishments of the school, offices, and business places to be constructed at the Miccosukee Reservation in Florida. Their work was of high quality, winning the praise of the Indian leaders and the architects. The quality of creative writing has earned for the school an annual poetry award to be given to a student in the creative writing class.

These students have never before had this kind of opportunity to express themselves creatively, or to give their creative potential an opportunity to be developed. There is growing evidence that this opportunity to grow creatively is easing many of the emotional and behavior problems some of the students came with. Their creative production is individual, for the most part outstanding, and with a distinct Indian quality. Along with their growth in creative expression there is growth in self-respect and pride in their Indian background.

Chairman HAYDEN. Would you furnish for the record a table showing the number of students whom you have to transport and the cost—breaking it down to show the number of students in the United States, and the number in Alaska?

Mr. NASH. Yes, sir; we will do that for the record.

(The information referred to follows:)

Approximately 7,000 students were transported to boarding schools in the fall and back to their homes in the spring in school year 1962-63. Of this number, 5,660 were from the States other than Alaska; and 1,340 were Alaskan natives, 300 of whom were students overage for their grades who enrolled in special programs at the Chemawa boarding school in Oregon, 110 were students who enrolled in technical, business, and trade courses at Haskell Institute, Lawrence, Kans., and 930 who were transported from their villages to Wrangell and Mount Edgecumbe in Alaska. In fiscal year 1963 the total cost for student transportation was $623,907; for fiscal years 1964 and 1965 it is estimated that this cost will be $775,000.

HOUSING REPAIRS AND HOME REHABILITATION

Chairman HAYDEN. Last year you initiated a program for housing repairs and home rehabilitation for which $500,000 was appropriated. Your justifications indicate that the program will continue with the same amount of funds in fiscal year 1965 on a pilot basis. Do you have any comment on the adequacy and value of that program?

Mr. NASH. Yes, sir. We feel that this program is very essential, because when you take the programs of the Housing and Home Finance Agency and adapt them to the reservations, whether you take the low rent public housing program of PHA or the mutual help program that we are starting, you find some people that cannot repay a loan, cannot pay rent, and may not be able to do any work on their own homes. And it is for these people that this housing improvement program of ours, is intended.

Now, $500,000 is a very small amount compared to the need. We are gaining experience with it and we are just beginning to get the experience.

HOUSING SURVEYS

For example, at Fort Hall in Idaho, we surveyed 57 houses of the most needy people on the welfare program whom we knew could not be helped by the public housing programs. Twenty houses are under repair or construction at the present time.

In Montana we have surveyed 47 houses. Construction or rehabilitation of those that can be rehabilitated will start in the spring.

At Fort Totten 48 houses have been surveyed. We will start construction or rehabilitation again in the spring.

In Minnesota, in a very depressed community, 67 houses have been surveyed and we will start construction in the spring.

So our experience is not complete. We have made a beginning and we are finding that our hopes that most of these houses could be repaired and would not have to be constructed from scratch are not being borne out by our surveys.

When we get into many of these homes, we find they are in such poor condition it would be a waste of money to make repairs. So that this has developed into partly a repair and partly a new construction program.

TYPE OF HOUSE TO BUILD

Chairman HAYDEN. That comes to the question of what type of house you can build for a modest amount of money.

Mr. NASH. Yes, sir. We feel we should build or remodel houses that are modern in the sense that there will be separate sleeping places for the parents and children, that will have plumbing and light, and modern heat, that are adequate and substantial, but are not luxurious by any means.

MAINTAINING LAW AND ORDER

Chairman HAYDEN. Would you please comment on your item for maintaining law and order? It would be well, I believe, to include in the record information as to the tribes for which the Federal Government pays the expenses of maintaining law and order, and the amounts expended for this purpose. I would like to have it for both fiscal years 1964 and 1965.

Mr. NASH. We will provide that for the record, Mr. Chairman.

(The information referred to follows:)

Reservations where Federal Government finances law and order

Area and reservation	Amount programed fiscal year 1964	Amount proposed fiscal year 1965
Aberdeen:		
Cheyenne River	$18,190	$18,190

Senator McGEE. Will you please include in the record a statement or table showing both the Federal and tribal contributions to law and order on the Wind River Reservation during the current fiscal year?

How much is included in your estimates for this purpose for next year?

Would you say that to the best of your knowledge present arrangements with the two tribes for this purpose are now satisfactory?

Mr. NASH. To the best of our knowledge the situation at Wind River is satisfactory to both tribes. We have no knowledge that either tribe plans on a change.

(The table referred to follows:)

Law and order costs on Wind River Reservation, fiscal year 1964

	Federal funds	Shoshone tribal funds	Arapaho tribal funds
Fiscal year 1964	$52,438	----------	$38,350
Fiscal year 1965	52,438	----------	38,350

Survey of Indian Education

Chairman Hayden. Last year the conferees directed that the proposed survey of Indian education be conducted within the amount of funds appropriated. Would you please advise the status of this survey?

Mr. Nash. Yes, Mr. Chairman; we have begun it, but we are not very far along with it. I brought back into the service one of our most experienced Bureau people, the former superintendent of the United Pueblo Agency, Dr. Sophie Aberle, to design this study for us. Some things we have concluded that we could get for ourselves within the Bureau of Indian Affairs more efficiently than we could get the information from outside.

Updating educational statistics

For example, we are updating our educational statistics and improving the method of correcting them. We are also in the process of evaluating the achievement scores in tests of the children in our schools and trying to determine the adequacy of our own testing program.

Dropout Research

We have been contemplating, but have not executed, contracts for some special research in the field of dropout, of English language capability, the teaching of English to bilingual students. We have drawn up the proposals, but we have not executed the contract.

Senator Bartlett. Mr. Chairman, may I ask one question?

Chairman Hayden. Yes.

Senator Bartlett. Commissioner Nash, will you continue the surveys in the coming year with available funds? I do not note anything in the budget for it in 1965.

Mr. Nash. Yes, sir. We did not put a special item in the budget, because we were directed by the Congress to carry the study forward, but to pay for it out of regular appropriations.

In other words, a special amount was not set to one side and we will continue the survey. We did not put a special amount in it, because we concluded the Congress meant us to pay for it within the regular educational program.

Senator Bartlett. You will be able to fund it?

Mr. Nash. We will be able to fund it. Possibly it will not be within the scope of the study that we contemplated last year, but we will have the money and we will have enough to do a feasible research job.

Senator Bartlett. Thank you.

RESOURCES MANAGEMENT

Chairman HAYDEN. There will be printed in the record the justifications for the 1965 budget estimate for "Resources management" amounting to $40,728,000. This is an increase of $3,054,700 over the appropriation for fiscal year 1964.

(The justifications referred to follow:)

HIGHLIGHT STATEMENT

The purpose of this appropriation is to promote the economic advancement of the Indians in the continental United States including natives of Alaska through the utilization of their resources.

To carry out this purpose the Bureau of Indian Affairs is responsible for the management, development, improvement, and protection of resources and appurtenant facilities of Indians under the jurisdiction of the Bureau.

The long-range program objective is to improve the economic and social conditions among Indians to the point where Federal financing will no longer be required to develop and utilize their resources.

During the last fiscal year the Bureau carried out this objective through active management programs which were aimed toward increased Indian participation in the management of Indian-owned resources.

For fiscal year 1965 emphasis is being placed on the development phase of Indian resources while at the same time carrying on the custodial-type activities necessary for the protection and preservation of such resources.

Resources management

Appropriation, 1963	$34,300,000
Supplemental appropriation, 1963	1,290,000
Total appropriation, 1963	35,590,000
Comparative transfer to other accounts	−93,000
Transferred to "Operating expenses, Public Buildings Service," General Services Administration	−57,000
Total available, 1963	35,440,000
Appropriation, 1964	37,691,300
Transferred to "Operating expenses, Public Buildings Service," General Services Administration	−18,000
Total available, 1964	37,673,300

SUMMARY OF INCREASES AND DECREASES, 1965

Forest and range lands:	
To provide for increased pay costs for fiscal year 1964 positions	70,100
To provide funds for timber sales program	51,000
Total	121,100
Agricultural and industrial assistance:	
To provide for increased pay costs for fiscal year 1964 positions	84,100
To provide funds for additional personnel to service the growing number of loan and financing transactions, for increased protection and management of reindeer herds in western Alaska, additional personnel necessary for establishment and operation of industrial and resource-based enterprises on Indian reservations, additional staff to keep abreast of the flow of accelerated tribal activity and employment of staff required in the planning, development, and execution of the mutual help housing program	739,000
Total	823,100

Soil and moisture conservation:	
To provide for increased pay costs for fiscal year 1964 positions	$90,400
Decrease in program base	−600,000
Total	−509,600
Maintenance of roads:	
To provide for increased pay costs for fiscal year 1964 positions	10,800
To provide funds for increased regular maintenance on school bus routes	450,000
Total	460,800
Development of Indian arts and crafts: To provide for increased pay costs for fiscal year 1964 positions	5,300
Management of Indian trust property:	
To provide for increased pay costs for fiscal year 1964 positions	99,400
To provide funds for additional real property management and real estate staff	455,000
Total	554,400
Repair and maintenance of buildings and utilities:	
To provide for increased pay costs for fiscal year 1964 positions	54,000
To provide funds for repair and maintenance of new buildings	1,550,000
Total	1,604,000
Operation, repair, and maintenance of Indian irrigation systems:	
To provide for increased pay costs for fiscal year 1964 positions	4,600
Decrease in program	−9,000
Total	−4,400
Net increase, 1965	3,054,700
Budget estimate, 1965	40,728,000

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964		
		Appropriation	Transfers [1]	Amount available
1. Forest and range lands	$4,349,445	$4,804,100	−$1,000	$4,803,100
2. Fire suppression	604,435	140,000		140,000
3. Agricultural and industrial assistance	5,009,424	5,499,400	−9,000	5,490,400
4. Soil and moisture conservation	5,722,676	5,917,600		5,917,600
5. Maintenance of roads	2,849,872	3,134,800		3,134,800
6. Development of Indian arts and crafts	293,153	312,700		312,700
7. Management of Indian trust property	5,290,523	5,921,600	−8,000	5,913,600
8. Repair and maintenance of buildings and utilities	9,525,317	10,642,700		10,642,700
9. Operation, repair, and maintenance of Indian irrigation systems	1,152,547	1,318,400		1,318,400
Unobligated balance lapsing and comparative transfers to other accounts	[2] 735,868			
Total	35,533,260	37,691,300	−18,000	37,673,300

[1] Represents transfers to General Services Administration.
[2] Represents $643,312 unobligated balance and $92,556 comparative transfer to other accounts.

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
1. Forest and range lands	$4,349,445	$4,803,100	$4,924,200	$121,100	$70,100	$51,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

1. Forest and range lands—Analysis by subactivities

Subactivity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Forestry	$2,761,310	$3,155,100	$3,252,300	$97,200	$46,200	$51,000
(b) Range lands	1,588,135	1,648,000	1,671,900	23,900	23,900	
Total	4,349,445	4,803,100	4,924,200	121,100	70,100	51,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

(a) *Forestry*

The estimate for 1965 is $3,252,300, an increase of $97,200 over 1964. The increase includes $46,200 for increased pay costs, and a program increase of $51,000 which is distributed to forestry program features as follows:

Activity	1964 program	1965 program	Increase
Forest management	$1,212,100	$1,212,100	
Timber sales	1,943,000	1,994,000	$51,000
Total	3,155,100	3,206,100	51,000

Need for increase.—Timber sales: The increase of $51,000 will permit an estimated increase of 16 million board feet in the volume of timber to be cut under contract during the year, and will increase the estimated receipts from timber sales by about $200,000.

Plan for work.—The objectives of the timber management program are: (1) Development of the full timber growing potential of the Indian-owned forest lands; (2) protection of the growing stock from destructive agencies, primarily fire, insects, windthrow, and trespass; and (3) improvement of the economic status of the Indian owners, and communities on and near the reservations, through full use of the sustained yield allowable cut of all commercial forest products. It is a function of the branch of forestry to relate these objectives of

timber management to other uses of the forest under the multiple-use concept, such as grazing, recreation, and watershed protection.

Importance to the Indian economy.—At some reservations, receipts from timber sales are the principal source of income to the tribes. It is estimated that every million board feet of timber sold creates from 6 to 12 man-years of employment on or near the reservations in the logging operations and manufacture of lumber. This employment tends to decrease with the trend toward greater mechanization, but employment can be increased through the establishment of integrated wood product plants and remanufacturing facilities. One objective, therefore, is to plan the timber sales so as to encourage the establishment of fully integrated manufacturing facilities on the reservations.

(*b*) *Range lands*

The estimate for 1965 is $1,671,900, an increase of $23,900 over 1964. This increase is for pay increase costs.

Plan of work.—The range management program provides for proper conservation and use of 40 million acres of Indian grazing land; the development of management plans for the grazing land of each reservation; the development of range water supplies; the granting of grazing privileges looking toward the highest return consistent with undiminished future use; and the encouragement of Indian use of the Indian range resource.

Management plans provide for the division of the range into practical use units, determination of proper stocking and season of use, and for range improvement and betterment programs to obtain full use of the forage balanced with sustained production. Annual range condition and trend studies and utilization checks are made as the basis for adjustments in stocking rates, season of use, unit boundaries, and for the location of range water developments and other facilities. Provision is made for uniform distribution of livestock on the range to insure proper utilization and to prevent its destruction through localized overgrazing. Range water is increased through the development of deep wells, paved catchment basins and pipelines in the arid southwest in support of the range management program.

Most Indian reservations are located in principal watershed areas of the Western United States. Proper use of the Indian range is essential in the multiple-use concept of watersheds. Well-managed ranges provide excellent habitat for wildlife, encourage recreation development, and stabilize streamflows. In addition, a material contribution is made to a stabilized livestock industry by furnishing grazing for 467,297 cattle, 37,276 horses, and 711,605 sheep. Range inventories and other technical data indicate an average potential grazing capacity 50 percent greater than the current estimated capacity. This potential can be reached through an understanding and application of the basic principles of range management by the range users over a period of time, and after development of necessary physical range improvements.

Assistance is furnished to the Indian tribes in the allocation of grazing privileges to their members. Grazing privileges not needed for these allocations are advertised and permitted after competitive bidding.

2. Fire suppression

Activity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost	Program
Fire suppression	$604,435	$140,000	$140,000	----------	----------	----------

Plan of work.—The estimate for 1965 is $140,000, the same as 1964. Funds under this activity, together with available tribal funds, are used to pay the cost of suppression and emergency prevention of fires on or threatening forest and range lands of Indian reservations.

Status of program

	Calendar years					5-year average
	1958	1959	1960	1961	1962	
Number of fires	1,424	1,309	1,467	1,629	1,130	1,392
Average acres per fire	125	80	94	76	59	88
Area burned (acres):						
Timberlands	12,995	22,401	25,577	15,379	23,952	20,061
Brush and grasslands	165,060	82,623	113,033	108,679	42,463	102,372
Total area burned	178,055	105,024	138,610	124,058	66,415	122,433
Estimated damage	$364,276	$2,172,803	$552,325	$1,179,050	$329,451	$919,581

A reasonable estimate of fiscal year 1965 costs for fire suppression is not possible. Such variable factors as weather conditions, tourism, and recreation, the effectiveness of previous hazard reduction programs, and the effectiveness of prevention, presuppression, and suppression programs, etc., have a marked effect on the number, location, and size of fires that occur and the eventual cost of suppression. Multiple use of the woods has increased tremendously in recent years and when coupled with the buildup of flash fuels the resultant risk of disaster fires is compounded.

[In percent]

Causes of fires	Calendar years				
	1958	1959	1960	1961	1962
(*a*) Man	47	50	51	38	44
(*b*) Lightning	53	50	49	62	56

The obligations for each of the last 5 fiscal years were:

1959	$520,306
1960	432,109
1961	1,221,228
1962	942,574
1963	604,435

In fiscal year 1959 there were several large fires on the Colville Reservation, Wash., and a large fire in California. During fiscal year 1960 there was one serious fire on the Klamath Reservation in Oregon accounting for about one-fifth of total expenditures. In fiscal year 1961, the high suppression costs were due largely to serious fires on the Flathead Reservation, Mont. Heavy obligations were incurred in fiscal year 1962 on the Crow and Umatilla Reservations in Montana and Oregon, and on southern California Indian lands. In fiscal year 1963, a large portion of the costs resulted from large and numerous timberland fires on the Colville Reservation, Wash.

3. Agricultural and industrial assistance

Subactivity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
(*a*) Agricultural extension	$1,368,090	$1,399,700	$1,479,700	$80,000	$10,000	$70,000
(*b*) Credit operations	1,152,060	1,321,100	1,455,700	134,600	24,600	110,000
(*c*) Economic development	2,489,274	2,769,600	3,378,100	608,500	49,500	559,000
Total	5,009,424	5,490,400	6,313,500	823,100	84,100	739,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

(a) *Agricultural extension*

The estimate of $1,479,700 is an increase of $80,000 over 1964. The increase provides an additional $70,000 for program and $10,000 for increased pay costs.

Need for increase.—The increase of $70,000 will lead to economic betterment of the western Alaska Eskimos by a training program in the herding and management of reindeer and assistance in marketing reindeer products. The Nunivak Island reindeer herd has exceeded the carrying capacity of the island about 33 percent. The present deer population has been estimated at 16,000 head before this season's kill, and the overall capacity of Nunivak has been placed at 10,000 head.

For the past several years the project on Nunivak has been operated in a successful manner and it is proposed to conduct the same type of project on a reduced scale at various locations on the mainland.

It is proposed to develop this program in gradual stages wherein concentrated training programs will be carried out to teach management principles to the Eskimos in order that they might ultimately own or operate under corporate ownership the translocated reindeer herds.

Plan of work.—State extension contracts: The estimate of $769,100 will allow continuance of Johnson-O'Malley contracts with 15 State extension organizations of the land grant colleges. Extension agents counsel with individuals and families and also develop organized educational programs with Indians, through which they demonstrate and influence acceptable practices in all types of agriculture, home management, and youth training through 4–H Clubs. Approximately 90 professionally trained extension agents are employed by the 15 States in which special emphasis is given to including Indians in community, county, and statewide extension programs and services. The extension program is carried on through farm and home visitations, meetings, short courses, demonstrations, farm tours to show improved practices, bulletins, 4–H Clubs, achievement days, and exhibits.

The following table shows how the funds are programed to the States under contract:

	Actual 1963 contract amount	1964 contract amount	1965 contract amount
Colorado	$18,100	$19,100	$19,100
Florida	24,200	24,200	24,200
Idaho	35,000	35,000	35,000
Minnesota	19,500	19,500	19,500
Montana	102,440	102,440	102,440
Nevada	46,885	46,885	46,885
New Mexico	71,350	69,950	69,950
North Carolina	18,780	19,200	19,200
North Dakota	50,000	50,000	50,000
Oklahoma	133,565	133,565	133,565
Oregon	23,960	23,960	23,960
South Dakota	127,000	127,000	127,000
Utah	18,300	18,300	18,300
Washington	54,000	54,000	54,000
Wyoming	26,000	26,000	26,000
Total, State contracts	769,080	769,100	769,100

Noncontractual work.—In the States of Alaska, Arizona, and Mississippi, extension personnel work directly with Indian people and help them to use the services of the county agents and the State extension service. Examples are joint demonstrations held by Bureau and State extension personnel on topics such as wool grading, livestock marketing, and livestock parasite control. Bureau extension personnel will plan continuation of educational assistance to Indian families in community improvement, home economics, management of farm and home enterprises, and training of youth through 4-H Club activities.

(b) *Credit operations*

The estimate of $1,455,700 is an increase of $134,600 over 1964. The increase includes $24,600 for increased pay costs and $110,000 for services required by the enlarged credit program.

Need for increase.—At June 30, 1963, $128,706,202 was involved in the program, of which private lenders supplied about 66 percent. Indian organizations supplied about 20 percent, and loans through the Bureau accounted for about 14 percent. The program is increasingly dependent upon lending from established private

sources and requires arrangements for private financing of Indian enterprises by investment firms, insurance companies and banks. The development of sound operating plans is necessary to maximize private financing. Qualified accounting and audits are needed. Credit investigations are required of firms and individuals with whom tribes may plan to operate enterprises jointly. These needs cannot be met by the present staff. An increase of 11 positions is requested.

Plan of work.—Financing is basic in the program for the development and utilization of Indian resources. Operations are patterned to meet the requirements of expanding Indian participation and self-reliance in business ventures. The objective is to utilize Indian resources and enterprises in a manner that will insure maximum Indian employment, income, and training, through management participation.

Activation of the Indian economic development program requires that financing be approached in many different ways. Every industrial, commercial, or business development requires planned financing, whether it is to be operated on an individual, tribal, or cooperative basis, or as a joint venture in association with non-Indian interests. Assistance is required: (1) To seek and obtain financing from private sources; (2) to determine the economic soundness of new ventures; (3) to insure the most businesslike operations, and (4) to minimize dependence upon Federal financing.

The Bureau's credit program requires Indians to exhaust all possible sources of private financing, and to utilize their own funds to finance developments, before loans by the United States are considered. This is in accordance with the recommendations in the "Report of the Committee on Federal Credit Programs" of February 11, 1963.

(c) *Economic development*

The estimate of $3,378,100 is an increase of $608,500 over 1964. The increase includes $49,500 for increased pay costs and $559,000 for program increases.

Need for increase.—The increase of $559,000 will provide industrial and technical assistance associated with the establishment and operation of industrial and commercial enterprises on Indian reservations; additional staff to handle the greatly increased workload because of increased claims awards and the need to identify and locate beneficiaries and develop claim rolls, and for basic information necessary to develop criteria for special legislation. There is also an increased need for thorough and extensive plans to be developed in consultation with tribes for the use of judgment funds arising from successful claims. The amount requested will also provide for the engineering and project supervision required in the planning, development and execution of the mutual aid housing program. Under this program, the family contributes its labor in the construction of the home, the Public Housing Administration provides funds for the materials and the minimum of essential skilled labor, and the Bureau provides organizing and supervision services, utilizing existing services in the Bureau for family selection, social welfare guidance, credit problems, and assistance and supervision during design and construction phases. The Housing and Home Finance Agency customarily relies upon local housing authorities for engineering services. Few tribal housing authorities are able to provide the same services as municipalities. Consequently, the Bureau must assist the tribal housing authorities to provide these services if they are to qualify for this program.

Plan of Work.—Initial stages in the development of economic growth includes the preparation of individual reservation-wide economic improvement programs. These programs are designed to inventory and evaluate the resources and assets of the reservation and to emphasize and familiarize the Indians with their resources, known needs, development potentials and barriers to development. The programs are to be enlarged and extended periodically to provide continuing guidelines and solution of all significant economic problems.

In scope, the initial programs include descriptions and interpretations of the reservation economies, physical resources, the bases for economic growth, problems, needed adjustments, analysis of labor force as to numbers, skills, training potentials and needs, and proposed projects.

The second stage in economic development is determination of the economic feasibilities of selected projects. Feasibility determination is based on financial analyses of costs, and returns, cost-benefit ratios, payout, sources of investment funds, operating capital and credit, adequacy of raw materials, transportation facilities and costs, markets and marketing, manpower requirements and availability, management and operating plans. Reports recommend specific actions to be taken in initiating development projects.

The final stage is the construction of the reservation-based projects and the beginning of operations. Project organization is designed to maximize the involvement of the Indians through employment, management, and financing. These projects provide for developing industrial and commercial enterprises of types most likely to furnish maximum permanent employment to Indians by utilizing their skills, and to make use of the natural resources owned by them or at their disposal. Projects cover primarily commercial and industrial enterprises, supporting facilities and services, and commercial and tourism improvements.

The Bureau of Indian Affairs is encouraging Indian groups to undertake the establishment of commercial, industrial, and tourism projects, and to seek out and negotiate with private corporations to establish plants on reservations. This is accomplished by location, design, and preparation of sites, construction of public facilities, location and measurement of raw materials, labor and management training, housing development, transportation, technical and engineering guidance, project promotion, organization, advertising and publication of brochures, and financial assistance.

The Bureau will continue to be responsible for assisting tribes with developing and amending constitutions and charters in order to enable them better to take advantage of programs of economic development and housing. Staff assistance is provided to the Department in interpreting the intent of constitution and charter provisions. The Bureau assists Indian tribes to develop their annual budgets, institute administrative procedures safeguarding the expenditure of funds and helps them develop "family plans" for the use of tribal funds, and processes ordinances and resolutions which require review or approval by the Commissioner or the Secretary.

The Bureau staff will continue to process contracts of claims attorneys; organize tribal meetings for the purpose of considering compromises in claims litigation; assist the Indian Claims Commission with auditing attorney expense vouchers; keep tribes informed as to the progress of their cases; undertake the research necessary to prepare legislation defining beneficiaries of claims awards; develop payment rolls, to assist tribes with planning for the use of their judgment funds, and to process the application of Indian tribes for loans with which to finance their litigation.

The self-help housing program has aroused great interest among the Indians. To improve Indian housing, full use will be made of existing staff at the reservation level. If loans for housing improvement are involved, credit officers will assist. Plant management personnel will be utilized during construction and inspection phases; social welfare, home demonstration, and education personnel will participate in orientation, family selection, and guidance in social and welfare problems.

Mutual help housing is a program designed to meet the housing needs of low-income Indian families on reservations. To meet the needs of these Indian families, the Housing and Home Finance Agency (under the United States Housing Act of 1937) provides financial aid for housing. The Bureau of Indian Affairs proposes to provide technical services and supervisory assistance. Through the establishment of local tribal housing authorities, Indian tribes are to provide the organization and mutual Indian help contributions. Under the program, individual Indian participants through their efforts can construct and own their own homes. An agreement between the HHFA and BIA was established on May 29, 1963, to define the extent of participation by both agencies.

4. Soil and moisture conservation

Activity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
Soil and moisture conservation	$5,722,676	$5,917,600	$5,408,000	−$509,600	$90,400	−$600,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

The estimate for 1965 is $5,408,000, a decrease of $509,600 under 1964.

Plan of work.—The soil and moisture conservation technicians work directly with Indian people in an effort to teach them the advantages of conserving their soil, forage, and water resources. This close working relationship makes it possible to do a better job of planning for the use and development of these

resources. A high percentage of these technicians are members of the local tribe who understand local customs and the need for conservation. These persons are a part of work units which are located away from agency and area headquarters, so that they are accessible to the Indian, the lessee, and close to the land with which they are concerned. These technicians have the closest possible direct contact with Indians in the area they serve. Conservation measures are designed to fit each set of soil, slope, and erosion condition and are needed to (1) correct ravages of erosion and depletion; (2) protect still productive land against erosion and depletion; and (3) improve productive and resulting economic gains from all Indian lands.

The estimate of $5,408,000 will provide funds for the following major program features:

1. Land use investigations and planning	$1,600,000
2. Application of measures	2,908,000
(a) Soil stabilization and improvement	1,400,000
(b) Water management	1,508,000
3. Operation and maintenance	900,000
Total	5,408,000

During 1965, the program will continue to provide farm, ranch, watershed, and reservation plans for the utilization and development of soil, water, and forage resources. These plans will be based on information provided by soil and range inventories being made as a part of this program.

Emphasis will be placed on continuing the close working relationship with Indian people with specific guidance toward increasing the productive capacity of Indian resources and greater Indian participation in the watershed protection and flood prevention program as authorized by Public Law 566, 83d Congress (68 Stat. 666). The value of many Indian farms can be increased by being included in these projects.

The operation and maintenance program will provide for compliance checks to assure continued application of planned conservation measures resulting from the expenditure of soil and moisture conservation funds. Each year the cost of operation and maintenance increases because there are more applied practices to maintain.

5. Maintenance of roads

Activity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
Maintenance of roads	$2,849,872	$3,134,800	$3,595,600	$460,800	$10,800	$450,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

The estimate for 1965 is $3,595,600, an increase of $460,800 over 1964. The increase includes $10,800 for increased pay costs and $450,000 for increased regular maintenance on schoolbus routes.

Need for increase.—The program increase of $450,000 will provide regular maintenance on 1,265 additional miles of schoolbus routes that had previously received only occasional maintenance and also provide occasional maintenance on 1,177 miles of reservation roads and trails serving Indian land which had previously received no road maintenance.

An additional load has been placed upon the programs by the exceptionally large school construction program and education's goal of full school attendance, including the semi-isolated areas. This means increased road maintenance on the access roads and the schoolbus routes over which the schools must transport supplies, personnel, and schoolchildren. Dependable transportation over reservation roads is essential to the maximum utilization of school facilities To contribute to the success of the educational program, road maintenance must, therefore, be increased to adequately serve the new schools and also the existing schools. Experience has shown that schoolbus routes require regular and complete maintenance for continued mechanical operation of the buses, to remove road hazards and also assure good daily school attendance.

If regular attendance and efficient operation of the school system are to be maintained, a better and expanded program must be carried out. Many miles of roads necessary to the school system alone are hazardous for schoolbus operation and are frequently impassable, making attendance and the servicing of schools irregular and difficult. This inadequacy is having a harmful effect on economic as well as educational programs, quite aside from the serious safety factors involved.

Plan of work: An area budget classification breakdown of the plan of work for 1965 follows:

Area	1965 estimate	Miles of heavy traffic	Amount of regular maintenance	Miles of light traffic	Occasional maintenance	Amount of heavy maintenance	Amount of special maintenance	Amount of airstrip maintenance
Aberdeen	$550,000	1,420	$457,000	578	$58,000	$20,000	$15,000	----------
Anadarko	110,000	112	36,000	404	54,000	10,000	10,000	----------
Billings	395,000	666	240,100	1,123	114,400	20,500	20,000	----------
Gallup	950,000	3,412	760,800	1,646	126,350	23,600	20,000	$19,250
Minneapolis	200,000	334	147,200	230	25,200	17,600	10,000	----------
Muskogee	100,000	310	80,000	----------	----------	10,000	10,000	----------
Phoenix	590,000	1,651	392,000	2,033	148,000	30,000	19,000	1,000
Portland	460,000	911	314,000	1,649	126,000	10,000	10,000	----------
Sacramento	118,000	173	74,000	155	18,000	16,000	10,000	----------
Washington	122,600	73	53,000	78	27,000	35,200	7,400	----------
Total	3,595,600	9,062	2,554,100	7,896	696,950	192,900	131,400	20,250

(*a*) Regular maintenance: 9,062 miles of heavy traffic roads, $2,554,100; this sum provides for surface repair, blading, snow removal, ditch cleaning; removing rock, trees, weeds, and maintaining bridges and culverts. Average cost of $282 per mile.

(*b*) Occasional maintenance: 7,896 miles of light traffic roads, $696,950; this sum provides for work required to keep secondary roads and trails open to travel, such as blading, removing slides, filling washouts, removing trees, and occasional shaping. Average cost of $88 per mile.

(*c*) Heavy maintenance (major restoration): $192,900; this sum provides for reshaping roadbed, spot resurfacing, and major repairs to bridges and culverts.

(*d*) Special maintenance: $131,400; this sum provides for the repair of major damage caused by storms, fires, floods, etc.

(*e*) Flight strip maintenance: $20,250; this sum provides for surface blading of 20 flight strips which have been constructed in areas for emergency air transportation.

6. Development of Indian arts and crafts

Activity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
Development of Indian arts and crafts	$293,153	$312,700	$318,000	$5,300	$5,300	----------

[1] To provide for increased pay costs for fiscal year 1964 positions.

The estimate of $318,000 is an increase of $5,300 over 1964. This increase is for increased pay costs.

Plan of work.—The program of the Indian Arts and Crafts Board stimulates, encourages, and promotes the development of the widely recognized skills of Indian artists and craftsmen, not only to preserve a valuable American heritage, but to make this activity a larger factor in the self-support and economic development of the Indian people.

Arts and crafts specialists are located in strategic areas throughout the United States. They work with individuals and groups in developing high standards of workmanship, developing new ideas which have good market potential, assisting in the development of production-marketing centers, and preparing exhibits to stimulate public interest in Indian craftsmanship. In addition, two museums and craft centers are under the jurisdiction of the Indian Arts and Crafts Board, the Southern Plains Museum and Craft Center, Anadarko, Okla., and the Sioux

Indian Museum and Craft Center, Rapid City, S. Dak. These museums have developed an international reputation and are in the unique position of reaching a public interested in not only the finest of contemporary Indian arts and crafts, but also in the so-called souvenir items which can be mass produced.

Several workshop programs for Indian craftspeople have been held within the past year and these have proven to be so successful that it is planned to expand the program and conduct workshops in more areas.

7. Management of Indian trust property

Subactivity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Land management	$4,282,875	$4,779,500	$5,261,400	$481,900	$84,900	$397,000
(b) General trust service	989,197	1,054,100	1,068,600	14,500	14,500	----------
(c) Employee compensation payments	18,451	80,000	138,000	58,000	----------	58,000
Total	5,290,523	5,913,600	6,468,000	554,400	99,400	455,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

(a) Land management

The estimate of $5,261,400 is an increase of $481,900 over 1964. The increase includes $397,000 for program and $84,900 for increased pay costs.

1. Real property management: The estimate of $4,022,400 is an increase of $414,400 over 1964. The increase includes $352,000 for program increases and $62,400 for increased pay costs.

Need for increase.—There were 50,483,517 acres of Indian-owned land (plus 4,712,749 acres of federally owned land) under Bureau jurisdiction at the end of fiscal year 1963. During the year Bureau staff processed nearly 40,000 real estate actions and additionally some 52,500 items of clerical work associated with the determination of the heirs of deceased Indians. These statistics do not reflect the total workload of this activity which is now being called upon increasingly to supply technical real estate advice and assistance to other growing resource development programs of the Bureau (housing, credit, industrial development, and others).

Because the basic wealth of the Indian people is in their land, sound and effective real estate management practices are fundamental to the success of all our resources based programs. Our experience demonstrates that significant economic gains may be brought about through the introduction of industry and other income producing activity on and near the reservations. Indian trust lands extend across some of the most attractive areas of the United States, yet, to a large extent, they include relatively undeveloped areas, and their potential is far from maximum realization. Together with the Indian people, therefore, we are engaged as a Bureau, in a major developmental effort to improve economic conditions in their reservations and communities. The requested increase will be utilized in the development of the more effective real property management services required to meet the rapidly expanding demands of trusteeship for the Indian land estate.

Plan of work.—To the extent possible with available resources, the Bureau will continue to meet the needs of individual Indians and Indian tribes as landowners for requested real estate transactions, such as, surface and subsurface leases, acquisitions, exchanges, partitions, sales, and consolidation of fractionated interests into less complex title patterns. In addition, the Bureau needs to take the initiative in planning jointly with the Indian people for the establishment of comprehensive, long-range plans for development of their real property resources. Land surveys are in some instances a prerequisite to such planning. On certain reservations (Navajo and Southern Ute for example), the public land surveys have not been completed. On these and other reservations boundary disputes have occurred. Where surveys have not been made or where survey markers have been lost, surveying work is required.

It is anticipated that the demands for Indian lands for all purposes (recreational, industrial, residential, commercial as well as farming and grazing) will continue to increase, and will result in an increased demand for specialized land use planning services not available from staff.

The decentralization of title plants from Washington to the area offices is a continuing program, but to meet the demand for early automation of title services there must be increased use of contract automatic data processing services.

2. Real estate appraisal: The estimate of $1,239,000 is an increase of $67,500 over 1964. The increase includes $45,000 for program increases and $22,500 for increased pay costs.

Need for increase.—The $45,000 program increase requested for 1965 will provide additional professional appraisal services where such services will render immediate economic benefits. Appraisal advice relating to the leasing of agriculture and grazing lands, residential, commercial and industrial sites, and mining and mineral interests will provide immediate and continuing monetary gains. Important advantages of a continuing nature can be gained through real estate economic analysis for land use planning.

Plan of work.—The appraisal branch supplies technical real estate evaluation services to assure that fair and reasonable value is realized in real estate transactions. These reports are valuable tools used in the preparation of sound and practical economic programs for Indian people. This requires a comprehensive economic analysis of the income potential of Indian property. The appraisal reports provide guidelines for management to achieve its objectives of conservation, highest and best use, and maximum income from the land. Long-term leasing authorities now provide for committing Indian lands to lease contracts which will carry into the next century. Fair rent in return for the use of Indian land is, therefore, of major significance in shaping the present and future economic status of the Indian people. The Bureau trustee responsibility encompasses approximately 52 million acres of trust land. Each of the 45,000 real estate transactions annually should be supported by appraisals. Immediate attention is necessary to obtain fair annual rental for approximately 41 million acres of range land used under the permit system.

(*b*) *General trustee services*

The estimate of $1,068,600 is an increase of $14,500 over 1964. This increase is for increased pay costs.

Plan of work.—The Bureau is charged by various laws and regulations with the trust responsibility of accounting for and disbursing individual Indian moneys which come into the custody of Bureau officials as a result of administering trust or restricted properties of individual Indians, through per capita payments, judgments, awards, and claims. Indian service special disbursing agents are designated to carry out these responsibilities.

In addition, trustee management is required for minors and those Indians who are unable to manage their affairs because of the lack of training in business affairs and the difficulties of communication due to inability to speak English. Such management includes the disbursement of funds under a planned program for the care of minors, with portions set aside for investment purposes for future use.

This subactivity also finances positions of field representatives who serve as contact representatives with the Indians at the reservation level and who perform work connected with the activities concerned with administration of trust properties.

The realty, forestry, irrigation, credit, welfare, and other activities of the Bureau and the Geological Survey and the Bureau of Land Management are directly affected by the management and operation of Indian money banks.

(*c*) *Employee compensation payments*

The estimate for 1965 is $138,000, an increase of $58,000 over 1964. The increase will provide funds to reimburse the employees' compensation fund for payments made on account of the injury or death of employees under the jurisdiction of this agency as required in section 209 of Public Law 86–767.

8. Repair and maintenance of buildings and utilities

Activity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
Repair and maintenance of buildings and utilities	$9,525,317	$10,642,700	$12,246,700	$1,604,000	$54,000	$1,550,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

Need for increase.—The program increase of $1,550,000 is required to fund the repair and maintenance of buildings and utilities available for use in fiscal year 1965 for which funds have not been previously appropriated. Accomplishments of the construction program in 1963–64 will result in a net increase of the Bureau's plant facilities amounting to approximately 2,620,000 square feet of buildings and 970 individual utility systems. Most of the Bureau's plants and facilities are located in the arctic and desert regions and must be maintained in continuous operation under difficult conditions.

Plan of work.—The repair and maintenance of buildings and utilities is a continuing program. Funds requested are used to provide normal maintenance and repairs to Bureau physical plant facilities located throughout the conterminous United States and Alaska. These facilities include 10,355 individual buildings having a total floor area of 31,700,000 square feet and approximately 10,190 separate utility systems. These include (1) 506 water systems comprising 540 storage tanks having a capacity of over 11,800,000 gallons, 490 wells with pneumatic systems, chlorinators, filters, clarifiers, water softeners, sump and settling tanks, sprinkler irrigation systems, fire hydrants and mains, and more than 4,290,000 lineal feet of water distribution systems; (2) 510 sewage systems comprising 505 septic and Imhoff tanks having a capacity of 3½ million gallons; 452 individual sewage ponds and disposal fields with a capacity of 400 million gallons, storm sewers, filter beds, lift stations, sumps and pumps, cesspools and 1,790,000 lineal feet of sewer systems, 90,000 plumbing fixtures including water closets, urinals, tubs, lavatories, sinks, fountains, etc.; (3) 2,975 fuel systems comprising 1,310 liquefied petroleum gas systems, with a capacity of 800,000 gallons and 570,000 lineal feet of distribution lines; approximately 1,800 oil storage tanks with a capacity of 3,400,000 gallons and 68,000 lineal feet of distribution lines; 250 coal storage bunkers with a capacity of over 150,000 tons; (4) 386 electric systems with 515 electric generators (diesel, gas, steam) with a capacity of 21,000 kilowatt, distribution systems approximately 375 miles in length; (5) 290 communication systems, comprised of 18 telephone systems having 18 switchboards and 2,600 telephones and 3,000 miles of telephone lines and 272 radio systems with some 1,800 receiver/transmitters; (6) 3,389 heating systems, including 722 heating plants (oil fired, gas fired, high pressure) having a capacity of 40,000 horsepower; and some 2,540 individual low pressure heating systems; (7) miscellaneous systems including 250 "walk-in" refrigeration units—230,000 cubic feet capacity, 400 air-conditioning systems totaling 1,850-ton capacity; more than 400 individual locations having in excess of 50,000 acres of ground, 11,000 acres of lawns, 2 million lineal feet of sidewalks, curbs, and gutters, 3 million lineal feet of fencing and items such as garbage dumps, land fills, air compressors, gasoline storage tanks, railroad sidings, docks, windmills, fire lookout towers, etc.

Commercial facilities are not available to serve the Bureau's isolated locations, therefore complete services including heat, light, power, water, sewer, garbage, etc. required to operate schools, dormitories, kitchens, dining halls, quarters, office buildings, shops, garages, and other educational and recreational facilities, etc. must be operated and maintained by the Bureau.

Utilities maintained at most locations are equivalent to those of an average community and in many locations are much more extensive due to central plants which provide electrical power, hot water, steam, etc. In addition to normal operating requirements these systems must be maintained on an uninterrupted 24-hour basis to insure the health and safety of Indian school children and Bureau personnel. Occupancy of most Bureau facilities on a 24-hour basis places increased loads on plants which accelerates deterioration and requires more than the usual time and expenditures to keep Bureau buildings and utilities in operating condition.

9. Operation, repair, and maintenance of Indian irrigation systems

Activity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
Operation, repair, and maintenance of Indian irrigation systems	$1,152,547	$1,318,400	$1,314,000	−$4,400	$4,600	−$9,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

The estimate of $1,314,000 is a net decrease of $4,400 under the amount made available for this activity in 1964. The decrease includes an increase of $4,600 for pay cost and a program decrease of $9,000.

The total request is to cover annual operation and maintenance charges assessed against Indian-owned lands included within various private and public irrigation districts and water user associations, annual contract payments authorized by the Congress; and annual operation and maintenance costs for those projects not included within private or public irrigation districts and water user associations.

There are approximately 300 irrigation systems on various Indian reservations west of the Mississippi River, ranging in size from tracts of a few acres such as subsistence garden tracts to major projects of over 100,000 acres.

All collections are deposited in the operation and maintenance receipt account and are available for operating and maintaining the respective projects pursuant to the provisions of the act of August 7, 1946 (60 Stat. 895). These collections include payments by Indian and non-Indian water users and payments made on behalf of Indian water users who are financially unable to pay their assessment for current annual operation and maintenance. Collections from Indian water users for prior year assessments which have previously been paid from reimbursable appropriated funds are deposited directly into the Treasury to the miscellaneous receipt account as a repayment of reimbursable indebtedness. Where non-Indians receive water services from Indian irrigation systems they are required to pay the full per acre cost. The above referred to irrigation systems and projects fall in the following categories:

1. Projects which are economically feasible on the basis that there is a sufficient quantity of water to supply the assessable area. The lands have characteristics which will produce crops under sustained irrigation and have repayment capabilities which will permit landowners and water users as a whole to pay the full annual cost of operating and maintaining the system. The assessment rates on these projects are fixed to return the full operation and maintenance cost. Any unpaid assessment becomes a lien against the land for which the assessment is not paid.

Funds requested for payment of assessments under this category will be used when necessary to pay into the collection account that part of the uncollectible current annual per acre assessment against Indian-owned lands. Funds so paid into the collection account to cover such unpaid assessments become reimbursable debts due the United States.

2. Projects where the repayment capabilities of the land will not permit payment to the full annual operation and maintenance costs. Assessment rates for Indian water users on these projects are based on the ability of the Indian to pay and therefore do not cover the full cost of operation and maintenance. All or any portion of any unpaid assessment becomes a lien against the land for which such assessment is not paid.

Funds requested for payment of costs under this category will be used when necessary to pay into the collection account that part of the annual operation and maintenance cost on Indian-owned lands in excess of the annual assessment and any part of the uncollectible annual per acre assessment against Indian-owned lands. Funds so paid into the collection account to cover these costs become reimbursable debts due the United States when used to pay all or any part of the annual costs included in the assessment rate. Costs in excess of the assessment rate are nonreimbursable.

3. Irrigated areas, such as subsistence garden tracts and tracts of a few acres which do not represent economical units but do provide Indian landowners with a means of supplementing their livelihood. Because of the low income of the Indian landowners and water users on these irrigated areas and tracts, it is not feasible from an economic standpoint to assess these lands. Accordingly the operation and maintenance costs are nonreimbursable and do not become a lien against the lands benefited.

Funds requested for payment of costs under this category will be used when necessary to pay into the collection account the total cost for operation and maintenance of these subsistence garden tracts and irrigated areas, or if no collection account has been established and it is not desirable or proper to establish such an account, the funds will be expended when necessary directly from the appropriation account.

4. Irrigation systems and reservoirs serving Indian-owned lands located within and operated by various private and public irrigation districts and water user associations. Assessments for operation and maintenance of the irrigation systems

and reservoirs serving these Indian-owned lands are made by the irrigation district or water users association embracing and serving such Indian-owned lands.

Funds requested for payment of assessments under this category will be used when necessary to pay into the collection account for payment to private and public irrigation districts and water users associations for operation and maintenance costs assessed for Indian-owned lands included within such irrigation districts and water users associations. Funds used for payment of assessments covering these costs are reimbursable and become debts due the United States except for those payments that are nonreimbursable by legislation.

5. Projects that are operated by this Bureau at no cost to the Indian landowners and water users as provided for under legislation.

Funds requested for payment of assessments under this category will be used when necessary to pay into the collection account appropriated funds for irrigation projects operated by this Bureau at no cost to the Indian water users as required by legislation.

Summary by subactivity

Subactivity	Appropriated, 1963	Appropriated, 1964	Estimate, 1965	Increase (+) or decrease (−)
(*a*) Annual assessment payment	$113,262	$125,189	$128,420	+$3,231
(*b*) Annual water payments	40,000	40,000	40,000	
(*c*) Operation and maintenance of irrigation systems	1,094,464	1,153,211	1,145,580	−7,631
Total	1,247,726	1,318,400	1,314,000	−4,400

Forest Management

Chairman Hayden. Would you please comment on the forestry program, indicating how much of the forest management expenditures are returned from the timber sale receipts?

Mr. Nash. Yes, sir. We returned about 10 percent to the miscellaneous receipts of the Treasury. There is a substantial portion

of the cost of the forestry program that is funded by this means, but it is not 100 percent.

Chairman HAYDEN. How much is contributed by the various Indian tribes to the overall forest management costs?

OVERALL COST

Mr. NASH. By and large, the overall cost of the forest management program is paid for by the 10 percent deduction.

Mr. Kephart, what are the contributions of the tribes in addition to that?

Mr. KEPHART. The tribes are now contributing about $400,000 a year to the forestry program.

Chairman HAYDEN. Out of tribal funds?

Mr. NASH. Yes, sir; out of tribal funds.

FIRE SUPPRESSION

Chairman HAYDEN. How much is your 1964 fire suppression cost going to run?

Mr. NASH. Our 1964 fire-suppression costs will be a little under $900,000, $889,611. We, of course, have our regular $140,000 item, and we are asking for $500,000 supplemental. We anticipate the second 6-month cost at about $175,000 so we will have to absorb about $250,000 of the fire-suppression costs.

CREDIT OPERATIONS

Chairman HAYDEN. With regard to credit operations, I notice that you are requesting 11 more positions. Would you please comment on the need for these?

Mr. NASH. Yes, sir. With these 11 positions we will be able to increase the amount of financing that the tribes will get from commercial lenders. There was a time when the only source of credit that was available to Indian tribes and individuals was the revolving program; Federal moneys. There has been a marked change in this in the past few years.

The Bureau of Indian Affairs is now the smallest source of Indian credit. Next are the tribes themselves. But nearly two-thirds of the outstanding credit to Indian tribes and individuals comes from commercial lenders.

Now, the need for these 11 people is to increase the amount of borrowing that is available from these standard sources. Credit, of course, is necessary to economic development. The law permits loans of this kind, but many bankers are either not aware of it, or they are apprehensive about making it.

Chairman HAYDEN. Is this lending confined to bankers?

Mr. NASH. No, it is all sources; investment firms, savings and loans, and so on. But these 11 people are to be the go-betweens between the tribes and individuals and regular private lenders.

ECONOMIC DEVELOPMENT

Chairman HAYDEN. You have requested $559,000 additional for your economic development activity. Would you please describe for

the committee the industrial and technical assistance to which this sum will be applied?

Mr. NASH. Yes, sir. In the field of economic development, we include four activities, all of which are very important to the present and future well-being of the tribes. For example, housing development is included in economic development. These 3,200 dwellings that the Public Housing Administration is providing will be handled by 58 tribal housing authorities. So the branch of housing development that helps the tribes set up these housing authorities in order to take advantage of the programs of the Public Housing Administration is one activity.

Under the mutual help program, we supervise construction and there are 25 positions provided for in the increase to help in the supervising of the construction of the self-help.

In the same way, our Office of Tribal Operations is working with the tribes to help plan the use of judgment funds. The number of awards by the Claims Commission is increasing and the dollar value is very great. And we have all sorts of enrollment problems and planning problems in connection with the disbursement of these funds so that they will not be dissipated, but will be for constructive tribal or individual purposes.

In the field of industrial development, our people in that branch have been enabled in the past 3 years to bring 25 new light manufacturing industries to the reservations which are right now providing 750 jobs for Indian people that were not there 3 years ago.

This increase will provide 15 people to be added to our industrial development branch.

Chairman HAYDEN. You think they earn their way?

Mr. NASH. Yes, sir.

SOIL AND MOISTURE CONSERVATION

Chairman HAYDEN. Where do you propose to apply the $509,000 decrease in your soil and moisture conservation activity?

Mr. NASH. We will divide this between personal services and programing. There are about $300,000 that will be absorbed by the normal process of attrition between now and the beginning of the year. That would amount to about 40 positions. In addition to that, in the field of supplies and materials and contracts, we will pick up about another $200,000.

Chairman HAYDEN. I have been handed a number of questions regarding your soil and moisture conservation program. I will appreciate your providing answers for these questions which can be placed in the record.

Mr. NASH. We will do that, sir.

(The material referred to follows:)

SOIL AND MOISTURE CONSERVATION

Question. Will the anticipated cut allow cooperating Indians to continue applying conservation measures at the same rate as in the past year?

Answer. The anticipated cut will not enable cooperating Indians to continue applying conservation measures to their lands at the same rate as they did during the past year because the reduced program will bring about a reduction in technical staff and funds available to match Indian funds which might be used for carrying out SMC practices. Both technical guidance and encouragement, and

matching funds are a necessary part of getting Indians to properly develop and use their soil and water resources.

Question. Will the budget estimate appropriations for soil and moisture conservation allow the Bureau of Indian Affairs to participate in watershed protection and flood prevention projects (Public Law 566)?

Answer. The reduced SMC budget would not enable the Bureau to participate in the small watershed program (Public Law 566) because participation by the Bureau in the past in these small watershed projects has been limited to application of practices at about the same rate as was being accomplished on lands outside of these special projects. The reduced program would not provide for accelerating the application of practices in presently approved projects or provide any funds for new projects which might be authorized.

Question. Will the budget estimate for fiscal year 1965 permit participation in the resource conservation and development projects (sec. 102, title 1, Food and Agriculture Act of 1961)?

Answer. The reduced SMC program would not enable the Bureau to participate in this type of project because we have not participated in this program in the past and participation at this time would cut into the reduced funds which are available for our going programs.

Question. Would the reduced SMC budget enable the Bureau to participate in development of resource conservation areas as proposed by the Department of the Interior and other resource improvement projects?

Answer. The reduced budget would not enable the Bureau to participate in development of new resource conservation areas or other resource improvement projects because the participation in additional projects of this type would seriously jeopardize the going program being carried out on Indian lands as a whole.

Question. How much additional money is necessary to allow the Bureau of Indian Affairs to do their part in these programs?

Answer. It is estimated that $1,500,000 of additional funds would be needed for fiscal year 1965 to enable the Bureau to participate in the above programs at the rate anticipated as being necessary for the Bureau to carry on the work on Indian lands at a rate comparable to that on non-Indian lands.

Maintenance of Roads

Chairman Hayden. In your Maintenance of Roads item you indicate an increase of $450,000 to provide regular maintenance on schoolbus routes and occasional maintenance on other reservation roads. Would you please furnish for the committee the total amount which you propose to expend on the schoolbus routes?

Mr. Nash. Yes, sir. The estimated amount to be spent on the maintenance of roads carrying schoolbus traffic is $2,850,000. The $450,000 increase will enable us to provide major maintenance on 1,265 miles of schoolbus routes and to do occasional maintenance on 1,127 miles of trails that at present do not receive any maintenance.

Repair and Maintenance of Buildings and Utilities

Chairman Hayden. I note about a 15-percent increase requested for repair and maintenance of buildings and utilities. Is there any particular condition which is causing this large increase?

Mr. Nash. Yes, sir. The principal cause of the large increase, Mr. Chairman, is our school building program, which is adding about 2½ million square feet of school space each year. In addition to that, there are 970 individual utility systems, that is, heating plants, water, sewerage, and electrical plants, and other utility systems which have to be maintained. That is the principal cause of this increase.

REVOLVING FUND FOR LOANS

Chairman HAYDEN. The old authorization for revolving fund for loans has been completely appropriated. However, last November, Congress enacted Public Law 168 authorizing the appropriation of $900,000 to establish another revolving fund from which the Secretary may make loans to finance procurement of expert assistance in cases before the Indian Claims Commission.

Congress is requested to appropriate this $900,000 as a supplement to the fiscal year 1964 appropriation. The justification will be printed in the record.

(The justification referred to follows:)

Revolving fund for loans

Request (for availability until expended)	[1] $900, 000
Appropriation to date	2, 000, 000
Obligations to Dec. 31, 1963	2, 939, 404
Expenditures to Dec. 31, 1963	1, 874, 845
Budget estimate next fiscal year	

[1] This is the first time an appropriation has been requested for this purpose. The $2,000,000 appropriated in the Interior and Related Agencies Appropriation Act, 1964, was appropriated for loans to Indian tribes and individual Indians for economic improvement.

PURPOSE AND NEED FOR SUPPLEMENTAL FUNDS

These funds will be used for making loans to tribes for hiring expert assistance in connection with claims presented to the Indian Claims Commission as authorized by Public Law 88-168 approved November 4, 1963.

REVOLVING FUND FOR LOANS

JUSTIFICATION

The $900,000 appropriation requested by this estimate is urgently needed to make loans to needy tribes to finance the procurement of expert assistance in cases before the Indian Claims Commission. Services of experts are necessary for preparation and trial of the claims. Because of the high cost of expert services many tribes have not been able to bear the financial burden. The lack of expert services has caused delay in settling claims.

More than 850 claims were presented to the Commission on or before August 12, 1951, the deadline for filing such claims. Yet, only one-fourth has been finally determined. The pending claims are in about 600 dockets. Of these, about 150 have been finally determined; about 20 are on appeal to the Court of Claims; about 20 await only determination of gratuitous offsets; and about 400 are pending in early stages of prosecution. The funds requested are needed primarily to provide assistance in connection with reaching determinations on the 400 claims that are pending in early stages.

Most of these 400 dockets are based on taking of Indian lands and title has been found in 40 of them. The others are less advanced and are the ones in which historians, anthropologists, ethnologists, appraisers of land, timber, and minerals and similar experts are needed in order to get the claims moving and keep them under active prosecution through the valuation phase.

In the past, some experts were engaged by claims attorneys under contractual arrangements which provided for payment of compensation and expenses contingent upon recovery. The Indian Claims Commission has declared such contracts to be against public policy and void. The alternate is to engage experts under fixed fee contracts providing for payment for the services regardless of the outcome of the cases. The legislation authorizing the revolving fund provides that, after enactment, no contingent expert witness fee contract shall be approved.

Loans will be made to those tribes which do not have sufficient tribal funds available for engagement of expert assistance. Determination of the eligibility of a tribe will be made when processing the application for a loan.

In view of the many pending dockets, it is likely that $900,000 will be completely obligated in a short time. However, loans are to be reimbursed from awards granted in the respective tribal claims. It is estimated that loans will be outstanding for an average period of at least 5 years before being reimbursed. A minimum of 2 years usually passes after title is found in a case until the value of the land is determined. The case then continues until gratuitous offsets and other allowable reductions are determined. Also, decisions on liability and final determinations are subject to appeal within 3 calendar months. Several cases have been appealed to the Court of Claims which also needs time to make its review.

LOAN DISBURSEMENT

Chairman HAYDEN. Would you please explain the immediate need for this appropriation; and describe machinery which may have been established to disburse the loans?

Mr. NASH. Yes, Mr. Chairman, I will be glad to do that. May I also offer for the record a letter from the Chief Commissioner of the Indian Claims Commission, explaining the need for $900,000 and supporting the program. Our plans will be to handle this through our regular credit operation staff. We have some applications pending and we will treat these loans exactly as we treat any others, bearing in mind that the purpose for which they are appropriated was very specifically spelled out in the authorizing legislation.

(The letter referred to follows:)

INDIAN CLAIMS COMMISSION,
Washington, D.C., January 13, 1964.

Hon. STEWART L. UDALL,
Secretary, Department of Interior,
Washington, D.C.

DEAR MR. SECRETARY: I want to express my appreciation for your very friendly cooperation in getting before the Congress a request for funds to implement the act authorizing a revolving fund to be loaned to impecunious Indian litigants for the preparation and presentation of their cases.

We are seriously handicapped now in processing these claims by the fact that the Indians are not prepared for trial, largely because they do not have funds with which to employ expert witnesses to do research for them and to present expert evidence to the Commission in support of their claims.

Your request for this appropriation will go a long way in securing an appropriation at an early date. Our information is that there will be no request in the regular budget for fiscal 1965, so if any money is appropriated it will have to be done through a supplemental request for this fund.

We have learned through Indian sources that there probably will be more requests for loans than the total amount authorized by the Congress. These applications are all ready to be filed as soon as there is hope of having the money available.

Again, many thanks.

Sincerely,

ARTHUR V. WATKINS, *Chief Commissioner.*

CONSTRUCTION

Chairman HAYDEN. There will be placed in the record the justification for the budget estimate for "Construction" which amounts to $51,176,000, a decrease of $7,124,000 from the amount appropriated in fiscal year 1964.

(The justification referred to follows:)

Construction

Appropriation 1964		$58,300,000
Transferred to General Services Administration (75 Stat. 353 and 76 Stat. 728)		−62,257
Appropriation (adjusted)		58,237,743
Unobligated balance from prior years		1,232,068
Total available for obligation		59,469,811
Decreases:		
Buildings and utilities	$53,096,936	
Irrigation systems	6,360,822	
Land acquisition	12,053	59,469,811

		Unobligated balance from prior year	Budget estimate	Estimated total available	
1. Buildings and utilities	$53,096,936		$42,776,000	$42,776,000	−$10,320,936
2. Irrigation systems	6,360,822		8,400,000	8,400,000	+2,039,178
3. Land acquisition	12,053				−12,053
Total	59,469,811		51,176,000	51,176,000	−8,293,811

CONSTRUCTION OF FACILITIES

1. Buildings and utilities, $42,776,000

This estimate places emphasis on the replacement, expansion, and improvement of obsolete school facilities, relief of some overcrowding and for an increasing school population. The Bureau also is facing the need to provide facilities for high school students in rapidly increasing numbers.

Considerable progress has been made in recent years in the school facility construction program to provide facilities for the increasing school populations. This is a continuing need and future budgets must provide for the annual increase in school populations. Planning for the replacement of obsolete facilities must include the expansion necessary to provide space for increasing populations related to the geographic location to be served by each school. It also must include a 5-year growth factor in relationship to each project where the known preschool population indicates growth.

The Bureau is cooperating with State and local agencies to provide school facilities for Indian children. Where it is in the best interest of the Indian children, they are placed in public schools. Where public schools are not available, the Bureau must continue to provide facilities. The State of Alaska is developing with the Bureau of Indian Affairs, a joint policy for education of all Alaska children. This will require the construction of facilities in the native villages by the Bureau. These facilities will eventually be turned over to the State for operation.

In addition to the need for school facilities, this estimate includes funds for the construction of employee housing, for urgently needed water and sanitary sewer facilities, and for some jail facilities. It also includes funds for advanced planning of future projects. The appropriation of funds for advanced planning of new projects has enabled the Bureau to step up the construction program. This has resulted in getting more children into school and some relief of overcrowding, and replacement of obsolete facilities. A list of projects in this estimate and their justifications follow:

BUILDINGS AND UTILITIES CONSTRUCTION PROGRAM, FISCAL YEAR 1965

Summary of projects by State —New construction

	Estimated cost
Alaska:	
Barrow kitchen multipurpose building	$725,000
Goodnews Bay Day School	319,000
Koliganek Day School	358,000
Koyuk Day School	354,000
Mekoryuk Day School	552,000
Mountain Village Day School	300,000
Nome School facilities	2,921,000
Tuluksak Day School	361,000
Total, Alaska	5,890,000
Arizona:	
Phoenix Indian School dormitories	1,122,000
Beshbito Boarding School	6,665,000
Red Rock Boarding School	2,202,000
Rough Rock Boarding School	2,645,000
Total, Arizona	12,634,000
California: Sherman Institute dormitories	3,700,000
Kansas: Haskell Institute vocational shops	798,000
Montana: Fort Belknap Agency water	50,000
New Mexico:	
Huerfano Boarding School	2,465,000
Kimbeto Day School	865,000
Ojo Encino Day School	520,000
Sanostee Boarding School	2,654,000
Total, New Mexico	6,504,000
North Dakota:	
Turtle Mountain Agency, Fort Totten jail	150,000
Standing Rock Agency jail	250,000
Total, North Dakota	400,000
Oklahoma:	
Chilocco Indian School dormitories	1,280,000
Sequoyah School	2,128,000
Total, Oklahoma	3,408,000
Oregon: Tongue Point School	2,042,000
South Dakota: Rosebud Boarding School completion	600,000
Washington:	
Colville Agency water system	64,000
Colville jail, Wellpinit	125,000
Total, Washington	189,000
Wyoming: Wind River Agency sewer	71,000
Bureau-wide:	
Quarters, various	700,000
Water exploration and development	390,000
Advance plannings	400,000
Total, new construction	37,776,000
Major alterations and improvements	5,000,000
Grand total	42,776,000

2. Irrigation systems, $8,400,000

This activity provides funds for the continuation of irrigation development work on existing and approved irrigation projects on Indian reservations located in the arid and semiarid West where the conservation and development of lands

and water for agricultural irrigation are of fundamental importance to enable the Indian to become self-supporting and to make proper use of his land and water resources. Funds are also provided for the newly authorized Navajo Indian irrigation project, located on the Navajo Indian Reservation in New Mexico. The development and extension of irrigation projects on Indian reservations are primarily for the benefit of resident reservation Indian families. The facilities, however, also directly benefit the surrounding community, as well as non-Indian owned lands included within the projects. Most Indian-owned land is devoted to growing supplemental feed for the 41 million acres of range lands. The success of stock raising is largely dependent on an adequate supply of winter feed which can be produced on irrigated land. The early completion of new and existing continuing projects will make possible the determination of final per acre construction costs for reimbursement purposes and will greatly facilitate the program and policy of the Bureau in transferring the responsibility for operation and maintenance of the systems to the water users.

The type of work proposed is the construction, extension, rehabilitation, and betterment of irrigation systems; land clearing and leveling; and surveys and investigations.

The major structures and canal systems are completed, or nearing completion, on many of the existing projects. The work now proposed on these projects will consist primarily of extending canals and laterals, land clearing and leveling, extension of drainage systems and the rehabilitation and betterment of existing irrigation projects.

The newly authorized Navajo Indian irrigation project embraces 110,630 acres of land. The complete development of this project includes additional studies, preparation of a definite plan report, and construction of canal, laterals, and structures.

There was initiated during the fiscal year 1961 a program for the preparation of rehabilitation and completion reports for all existing and authorized projects and feasibility reports for new and unauthorized projects. When completed these reports will provide a complete and up-to-date inventory of project acreages, irrigation facilities and needs and requirements for long-range planning. It is anticipated that the completion and rehabilitation reports will be completed by 1966.

Irrigation Construction

Summary of projects

	Total estimated cost	1965 estimate
(a) Annual contract payments	$610,750	$16,000
Fort Belknap	250,000	6,250
Tongue River	360,750	9,750

CONVERSION OF TONGUE POINT NAVAL INSTALLATIONS

Chairman HAYDEN. The committee has before it a departmental letter which will be included in the record, requesting authorization to reprogram $2,921,000 for conversion of the Tongue Point naval installation in Oregon to a boarding high school for Indian children. This amount is needed for initiation of required renovation work.

(The letter referred to follows:)

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D.C., December 20, 1963.

Hon. CARL HAYDEN,
Committee on Appropriations,
U.S. Senate, Washington, D.C.

DEAR SENATOR HAYDEN: In fiscal year 1964, the construction program approved by the Congress for the Bureau of Indian Affairs, amounted to an estimated $55,867,000; however, the appropriation bill provided $3,067,000 less than this amount, or $52,800,000 to accomplish the total construction program. In addition, several emergency situations and other considerations have developed during the past few months, making it necessary for the Bureau to adjust the project list previously submitted and approved by the Congress. The following narrative information and attached comparative report, which shows the program as approved by the Congress and the Bureau's revised programing, is submitted for committee approval.

Recently it became known to the Bureau that the facilities of the Tongue Point Naval Installation, Astoria, Oreg., could be made available to the Bureau. A team of Bureau educators and technical personnel conducted a survey of the facilities to determine the feasibility of converting the base to a boarding high school for Indian children. This survey indicated such a plan would be economically and functionally feasible. It is estimated that a savings of approximately $3 million in construction costs could be made over the construction of a completely new high school plant. The Bureau will convert the base into a 1,000-pupil school to meet the increasing need for high school facilities for Indian children from all areas. As phase 1 of the program, a new academic classroom building with an auditorium-gymnasium will be constructed, as well as a new girls' dormitory for approximately 250. Utilities will be renovated and extended to the new buildings. Funds amounting to $2,921,000 are being reprogramed for this work. Additional funds to complete the conversion of the plant, which will consist of remodeling and renovation of existing buildings and the purchase of furnishings and equipment, will be requested at the earliest possible date.

For some time the Bureau has been acutely aware of the need for improving the working and living conditions of employees stationed at the Bethel field office in Alaska. When the Air Force SAGE facility at Bethel became available, the Bureau determined the buildings could be converted to office and quarters use for approximately one-half the cost of new construction, and therefore acquired the plant. It is proposed in fiscal year 1964 to remodel a portion of the main building for some of the needed quarters, and in a future year, complete the conversion. Funds from the Bureau's appropriation for "Quarters, various," have been programed for this work.

In order to provide safe and sanitary school facilities for the children in Florida now attending an old dilapidated school at Big Cypress, and those children presently housed in a temporary portable wooden school on the Tamiami Trail, the Bureau plans to construct at each location, a two-classroom school and the necessary adjunct facilities. This construction, which is included in the reprograming, will provide classroom space for the present enrollments and an anticipated increase in enrollment of 60 children.

During the past school year, two boys' dormitories at the Sequoyah School, Oklahoma, were determined to be unsafe for occupancy by Bureau structural engineers and have been demolished. Emergency living accommodations were provided for the boys in various rooms throughout the plant. Considerable overcrowding is present in the remaining dormitories. To provide safe living conditions for the boys in the shortest period of time, the Bureau is constructing

13 standard two- and three-bedroom houses at Sequoyah. The children will be housed in these units until funds can be obtained for construction of new dormitories. The 13 houses will be used for school employees when they are no longer needed for the children. Also, there has been an inadequate supply of water at the school plant during the peak periods of use. The city of Tahlequah has an ample supply of water which can be made available to the school by the extension of the necessary waterlines. The city will guarantee the school an adequate and constant supply of water at a cost which will not exceed the cost of operating a Bureau waterplant. The Bureau proposes to obtain its water supply for the school from the city and will enter into an agreement with the city of Tahlequah which will cost $50,000.

The Corps of Engineers is constructing a new school on the Lower Brule Reservation to replace the existing school, because of the inundation of the present school facility by waters from the Big Bend Dam.

The Senate Appropriation Committee, in its report on the Interior Department and related agencies appropriation bill for fiscal year 1964, approved the reprograming of the Bureau's fiscal year 1964 construction appropriation to provide for the Bureau's share of the cost of this school. Because the Corps of Engineers entered into a contract for the construction of the school in fiscal year 1963, the Bureau reprogramed fiscal year 1963 funds for the school. The $30,000 reprogramed in fiscal year 1964 is for the required equipment and furnishings for the school.

To fund the additional projects and to adjust the program to meet the amount appropriated, it is necessary to defer construction of the Goodnews Bay Day School and Koliganek Day School in Alaska; and the Rough Rock Boarding School, White Cone Boarding School, and the Kimbeto Day School on the Navajo Reservation.

In view of the urgent need for these new facilities, it will be very much appreciated if the committee will give early approval to the reprograming requested.

This request is also being sent to the Honorable Michael J. Kirwan, chairman of the Subcommittee on Appropriations for the Department of the Interior and Related Agencies, House of Representatives.

Sincerely yours,

D. Otis Beasley,
Assistant Secretary of the Interior.

Chairman HAYDEN. Will you advise the committee of the total cost of this conversion?

Mr. NASH. Yes, sir. The total cost of the conversion for 1,000 children is, in our proposals, to spread across 2 fiscal years. The $2,920.000 you just referred to is in fiscal 1964, and an additional $2 million in fiscal 1965 which will be a total cost of $4,963,000.

Chairman HAYDEN. What do you plan to do with the money for which you request reprograming?

HIGH SCHOOL FOR INDIAN CHILDREN

Mr. NASH. In the $2,900,000 that we are asking for out of the 1964 money, we would build a new dormitory facility for girls, build new academic classroom facilities, a new auditorium-gymnasium complex, provide for the demolition of some buildings that are not suitable for school purposes and which stand in the way of new construction, $250,000 for utilities and site work and $231,000 for engineering plans and surveys, which will come to a total of $2,921,000.

Chairman HAYDEN. What plans do you have for the funds requested in fiscal year 1965?

Mr. NASH. For fiscal year 1965, we are asking for $2,042,000 to renovate the old bachelor officer's quarters to a girls' dormitory, to renovate employee quarters, to renovate a barracks to a dormitory and dining hall-kitchen complex, to renovate the administration building, to renovate the public health clinic, to remodel one of the school shops, money for furnishings and equipment and, again, money for engineering plans and surveys.

NEW CONSTRUCTION COMPARED WITH CONVERSION

Chairman HAYDEN. How much would this high school cost if you were to build it as a new facility?

Mr. NASH. Building costs vary a good deal, Mr. Chairman, according to the locality. This works out to about $5,000 per student, that is, per seat-bed. The cheapest comparable facility would be Fort Wingate, which is largely a renovation job. For example, the utilities are already in at Fort Wingate and that is going to run $6,600 per seat-bed. We have a good many facilities that run as high as $7,500 and when you get into Alaska, where construction costs run about 2½ times as high, you have to go up as high as $20,000 a seat-bed. But I think a minimum of $7,500 would be your most comparable figure for new construction in the Southwest.

Senator BARTLETT. Commissioner Nash, how much more would it cost to build new facilities than it will cost to convert the naval facilities?

Mr. NASH. In that particular location?

Senator BARTLETT. Right there.

Mr. NASH. I would say you could not expect to build there new for less than $7500 per seat-bed. In other words, for a thousand-child school $7.5 million instead of $5 million.

Senator BARTLETT. $2.5 million more?

Mr. NASH. Yes, sir.

Senator BARTLETT. And will the reconverted establishment be as satisfactory in every way as the new?

Mr. NASH. If we can have our druthers, Senator Bartlett, we always prefer to design and build from scratch. But we are successfully using Mount Edgecumbe, which was a Coast Guard station, for

a school, although we know we are going to have to come back and ask for rehabilitation and remodeling money for Mount Edgecumbe.

We are using at Brigham City, Utah, the Intermountain School. That was not designed or built for a school, but we have 2,200 students there, and are using it successfully.

ESTIMATED COST OF OPERATION AND MAINTENANCE

Chairman HAYDEN. Is there a difference in the estimated cost of operation and maintenance between the proposed Tongue Point facility and a new school?

Mr. NASH. Yes, sir. When we took over these facilities that were not designed for school purposes, we saved a lot of money on construction costs, but the operation and maintenance cost has been somewhat higher. We estimate that the operation and maintenance at Tongue Point will run about $500,000 a year. In a school of 1,000 children, we would normally expect between $250,000 to $300,000 operation and maintenance cost.

INCREASED SCHOOL FACILITIES

I might add, sir, that the full facilities will not be exhausted when a thousand children are enrolled at Tongue Point. We believe that it may be possible in the course of time to develop this for another thousand children without adding greatly to the costs. The reason for that is that the Navy Heights housing development has 368 dwellings and they will not all be used for a school of 1,000 children. If we can solve the problem of supervision, it may eventually be possible to put in a thousand older students in cottages, which we like very much. They are among our most successful schools, where we are able to do that. If that is the case, the $5,000 a child would probably drop another $1,000 which would mean we are getting a school here for almost 50 percent the cost of construction. Our operating costs would be somewhat higher.

Chairman HAYDEN. You would still have a higher operating cost?

Mr. NASH. We would still have a higher operating cost; yes, sir.

Chairman HAYDEN. Why can not the Indian children for whom this school is intended be sent to public high schools near their homes?

USE OF PUBLIC HIGH SCHOOLS

Mr. NASH. The Indian children who will be sent to the school come from remote locations where there are either no public school districts or where the existing public school districts are already overcrowded. For example, we have in the Navajo school system, not necessarily at the Navajo Reservation but in off-reservation high schools, nearly 3,000 Navajo young men and women. They are not children; they are over the age of 18. They are in our special remedial education program. They are people for whom no educational facilities were provided in their youth, who reached the age of 14 or over, without the ability to speak English, without ever having been to school or having been to school very slightly. This is also true in Alaska. Now while we have had this classroom building program and we are getting caught up with the backlog of out-of-school children, we still have for several years, the need to remedy the educational deficiency.

Our policy is to educate children as close to home as possible. Ideally, every Indian child ought to be the same as everybody else; live at home and go to day school.

Learning English and American Ways

Chairman Hayden. As a practical matter, they learn English and American ways off the reservation in these boarding schools much better than they do on the reservation?

Mr. Nash. Yes, sir. There is no getting around the fact that if the home does not have values of education, is overcrowded and does not have light and heat and a place to study, they are not going to get very good results with home living. If there has to be travel to distant boarding schools, we think it ought to be the older children, and, therefore, our expectation would be to send the older children to Tongue Point, if the committee gives its approval. And this would open up spaces in existing boarding schools closer to home for the younger children. And this is the way in which the Tongue Point would serve the total Bureau system.

Chairman Hayden. Senator Bartlett.

Senator Bartlett. Commissioner Nash, from what you have said here this morning, I gather that the saving to be affected by conversion of Tongue Point would be lost in less than 10 years by the added costs of operation and maintenance?

Mr. Nash. Yes, sir.

Attending Children From New Mexico and Arizona

Senator Bartlett. Now I am told, and this is thirdhand—the testimony was given before the House counterpart of this subcommittee—that most of the children to be placed at Tongue Point would come from the Southwest. Is that right?

Mr. Nash. We are asking for Tongue Point as an addition to our total system, because our policy is to ask the older children to do the traveling and so go to distant locations far from home. Because the Southwest is the place where the largest number of young people over the age of 18 are now in our school system, this is probably the place from which the majority of them would be drawn. I would not, however, close out any other area. For example, we are not planning this primarily to service the Northwestern States. On the other hand, it is a fact that our other boarding schools are getting an increasing number of referrals from dropouts and other educational failures from public schools all over the country, including the Pacific Northwest. So if some young people, who are now being accepted in our boarding schools because they are not being successful in the public schools, should find Tongue Point closer to home, we would want to be able, of course, to send them there. We are not thinking of this as a substitute for any other school and we are not thinking of it primarily as the place for Alaskan children, for example. But, again, I would not close out the possibility that there might be facilities available at Tongue Point that children from any State of the Union, including Alaska, might take advantage.

Senator Bartlett. The majority would be from New Mexico and Arizona?

Mr. Nash. I assume so, yes.

CONSTRUCTION PROJECTS DEFERRED

Senator BARTLETT. When Assistant Secretary Beasley wrote Chairman Hayden on December 20 last in regard to the reprograming which you requested, the letter contained this paragraph:

To fund the additional projects and to adjust the program to meet the amount appropriated, it is necessary to defer construction of the Goodnews Bay Day School and the Koliganek Day School, in Alaska, and the Rough Rock Boarding School, the White Cone Boarding School, and the Kimbeto Day School on the Navajo Reservation.

Where is Rough Rock?

Mr. NASH. On the Navajo Reservation.

Senator BARTLETT. And White Cone?

Mr. NASH. White Cone is on the Navajo Reservation.

Senator BARTLETT. But when the presentation was made for the 1964 budget it was thought these facilities should be constructed during the current fiscal year, obviously.

Mr. NASH. Yes, sir.

TONGUE POINT ABANDONED BY NAVY

Senator BARTLETT. Now that leads me to this question and I quote again from Secretary Beasley's letter:

Recently it became known to the Bureau that the facilities at the Tongue Point Naval Base at Astoria, Oreg., could be made available to the Bureau.

Tongue Point had been abandoned some years ago by the Navy, as I understand it.

Mr. NASH. In 1961.

Senator BARTLETT. Was it only after the 1964 Appropriation Act became law that it was called to your attention that these facilities would be available?

Mr. NASH. Yes, sir.

Senator BARTLETT. Was it the judgment of the Department, then, that this project had a priority over the projects that had been approved by the Congress already?

Mr. NASH. Yes, sir.

PROGRAM OF PROJECTS DEFERRED

Senator BARTLETT. Now, let me ask you this question: What if one of the committees, either the Appropriations Committee of the House or the Senate, was not to approve all of the reprograming requests? Would that mean, for example, that insofar as funds are concerned, that these projects that were deferred would go into immediate construction?

STATUS OF ALASKAN SCHOOLS

Mr. NASH. Of the two Alaskan schools, Goodnews Bay and Koligane, if I have them correct, we have put them in our 1965 schedule so that the effect of the reprograming letter, if it should be approved, was merely to defer construction of these two schools for 1 year. The same is true with Rough Rock and Kimbeto. Both are in our 1965 justification. White Cone we have not put in our 1956 justification for a different reason. It is located in what is now the joint Navajo-Hopi Reservation, which was declared to be a joint reservation by court order, and there is so much confusion and tension over the ad-

ministration of this joint reservation area that we deemed it advisable not to construct White Cone at this time.

Senator BARTLETT. May I inquire just a bit further to try to date the situation. Secretary Beasley said, as I have already related:

> Recently it became known to the Bureau that the facilities at the Tongue Point Naval Base at Astoria, Oreg., could be made available to the Bureau.

Can you give us a more exact date as to when that information reached you?

Mr. NASH. Yes, sir. I became aware of Tongue Point by a call from the Bureau of the Budget, Executive Office of the President, in the early summer of 1963. It would be hard to pinpoint it by month. Mr. Massey, when did we send our first team up to look at it?

Senator BARTLETT. That is close enough. Your answer is completely explanatory. I have no further questions.

WHITE CONE SCHOOL

Chairman HAYDEN. You spoke about the White Cone School. Just where is that located; in the Hopi part of the reservation?

Mr. NASH. No, sir. White Cone is just outside of district 6, Mr. Chairman, but within the so-called formerly disputed area.

Chairman HAYDEN. About how far is it from Toreva?

Mrs. THOMPSON. It is north of Holbrook. It is in that area, south of the Hopi Reservation.

Mr. NASH. It is about 6 miles from district 6 on a line north of Holbrook.

SCHOOL CONSTRUCTION IN FLORIDA

Chairman HAYDEN. You have also asked authority to reprogram fiscal year 1964 funds to construct two 2-classroom day schools in Florida. Would you please comment on this request, indicating the total amount of funds which you will need?

Mr. NASH. Yes, sir. The total amount needed is $470,000. That would be two 2-classroom day schools each, with a lunchroom-kitchen, a multipurpose room, clinics, office space; quarters at each for employees would also be provided in addition to a utility building, and site work such as filling, grading, streets, and sidewalks.

SAGE FACILITY AT BETHEL ALASKA

Chairman HAYDEN. The third request in that letter is for authority to reprogram some of the appropriation for quarters to convert the Air Force SAGE facility at Bethel, Alaska, into office and quarters. How much do you propose to expend for this purpose out of fiscal year 1964 funds? Is there an estimate for the remainder of the funds in the fiscal year 1965 budget?

Mr. NASH. Yes, sir. The cost for 1964 is estimated at $400,000 and the total estimated cost is $677,500. We do not have a request for this additional amount in 1965. We would expect to put that in the 1966 budget.

CONSTRUCTION AT SEQUOYAH SCHOOL, OKLAHOMA

Chairman HAYDEN. Also included in that letter is a proposal to construct 13 houses at the Sequoyah School, Okla., to be used temporarily as dormitories until permanent dormitories can be constructed.

The funds needed for the permanent construction are requested in the fiscal year 1965 budget. How much do you propose to expend for the houses?

Mr. NASH. We propose to spend $168,000 for those buildings.

EQUIPMENT FOR LOWER BRULE SCHOOL

Chairman HAYDEN. The last of your reprograming requests is for $30,000 for equipment, such as desks, in the Lower Brule School about which you may want to say something.

Mr. NASH. Yes, sir. The amount for the construction of the building and all equipment that is connected to the building was in the original request. The amount we are asking for now is to cover desks, chairs, tables, bookcases, pots, pans, dishes, wastebaskets, and other miscellaneous items that are not part of the permanent fixtures. And this is a once-only item in the sense that we would not come back for a like amount in the next year.

APPROVAL OF REPROGRAMING REQUEST, EXCEPT TONGUE POINT

Chairman HAYDEN. If there is no objection, your requests regarding the Bethel field office, school facilities in Florida, housing facilities at Sequoyah School, Okla., and equipment for the Lower Brule School will be approved. The matter of the Tongue Point School will be retained for further consideration.

Mr. NASH. Yes, sir.

SCHOOL CONSTRUCTION

Chairman HAYDEN. Would you please supply for the record a table showing by years, beginning with fiscal year 1961, the school construction for which Congress has appropriated funds; the construction items which have been completed; the construction items for which funds are still available; and the construction items for which funds are no longer available; indicating the disposition of the funds, whether the items are still considered to be necessary, and if so, when additional funds will be proposed?

Mr. NASH. Mr. Chairman, we will do that for the record; yes, sir.

(The information referred to follows:)

Buildings and utilities program

FISCAL YEAR 1961

Project name	Approved program estimate	Project started	Funds still available	Funds not available	Comments
Alaska:					
Barrow Elementary School	$186,000	Yes			(1).
Chequils Lake School	58,000	Yes			(1).
Chevak School	175,000	Yes			(1).
Galena School	169,000	Yes			(1).
Koliganek School	198,000	No		X	Project in fiscal year 1965 budget.[2]
Kotlek School	322,000	Yes			
Kevigak School	170,000	Yes			(1).
Minto School	97,000	Yes			
Newktak School	261,000	Yes			
Sheldon Point School	147,000	No		X	Project proposed for fiscal year 1966.[2]
Arizona:					
Phoenix School Dormitory	389,000	Yes			
Sacaton Municipal Center	135,000	Yes

[1] Project added through reprograming.
[2] Project deleted through reprograming and funds transferred to projects which were added and to other approved projects when costs exceeded estimated amounts.
[3] School destroyed by fire after being 60 percent complete.

Chairman HAYDEN. Which of the school construction items for which funds were made available in fiscal year 1964 have not been contracted? Indicate whether there are any of these on which contracts will not be sought, and give the reason why it is no longer thought necessary to perform the building.

Mr. NASH. May we include that as a part of the information just requested?

Chairman HAYDEN. Yes. Are there any proposed construction items in the fiscal year 1965 bill which the Bureau feels will not be obligated during fiscal year 1965? If so, please indicate the particular items.

Mr. NASH. Mr. Chairman, not at this time. As far as we can see from the stage of our design and reports from the architectural engineering unit, we will obligate fully.

Chairman HAYDEN. You could not indicate any particular item?

Mr. NASH. No, sir. I think we will obligate everything.

KOLIGANEK DAY SCHOOL—ALASKA

Chairman HAYDEN. For Koliganek Day School in Alaska you are asking $358,000. Last year you asked $258,000 but have not spent it because the town has not moved as was intended and the funds have been reprogramed to another project. Is there any assurance that the village will be moved during the coming fiscal year?

Mr. NASH. The residents of Koliganek, which is located 60 miles north of Dillingham, are moving the village to a new site and the move was precipitated by the annual flooding of the Nuskagak River and the school is still urgently needed. We have reprogramed it for 1965. The only reason the villages did not move was because we were unable to construct the building.

Chairman HAYDEN. Are the buildings underway now?

Mr. NASH. No, sir. We set that to one side and deferred it because of the greater priority of other items, but the villagers are still anxious to move and they are simply waiting on us to provide the school building.

KIMBETO DAY SCHOOL—NEW MEXICO

Chairman HAYDEN. For the Kimbeto Day School in New Mexico, for which $865,000 was appropriated in fiscal year 1964 but which funds have been reprogramed, do you believe that the land title can be cleared during the coming fiscal year so that it will be possible for you to obligate the $865,000 which you are again requesting?

Mr. NASH. Yes, sir. We believe that question will be cleared up and we can go ahead.

TONGUE POINT SCHOOL—OREGON

Chairman HAYDEN. In the event the Congress does not approve a reprograming of over $2,900,000 of fiscal year 1964 funds for the Tongue Point School in Oregon, will you need the $2,042,000 requested in the fiscal year 1965 budget?

Mr. NASH. If the committee does not approve the reprograming of the 1964 funds for Tongue Point, we would take it that they did not wish us to convert the facility to school purposes and we would, therefore, not ask for the $2,042,000 in fiscal year 1965. However, we need the thousand spaces and we would take this to be a direction of the committee to continue with the type of boarding school building program that we have been going ahead with before the Tongue Point matter came up. That is, our existing boarding high schools need to be enlarged and improved and we know that as we are now

getting on top of the backlog of out-of-school elementary children, there will be a demand for high school services in the near future. And we would, therefore, wish to go ahead with a high school building program. If the committee approves Tongue Point, then this will provide us with 1,000 high school spaces. If not, we ought to go ahead with some other high school for a like number of children on the order of 1,000. It would, as I say, cost, depending on where we are building, anywhere from $7.5 million up to $8 million, $8.5 million, or $9 million, depending on the site.

Location of Employee Quarters

Chairman Hayden. Where do you propose to place the 30 quarters for which you have budgeted $700,000, and how many of these 30 quarters are to replace existing ones?

Mr. Nash. Mr. Chairman, we would put 10 quarters at Fort Yates, N. Dak.; 10 quarters at the Northern Cheyenne Agency in Montana; and 10 quarters at the Navajo Reservation. These are all new.

Construction Funds Added by Congress

Chairman Hayden. Last year the Congress added funds for schools at the Rosebud School Mission; Ignacio, Colo.; Newtown, N. Dak.; and Grants, N. Mex., and for a jail on the Fort Peck Indian Reservation. What is the status of these projects at this time?

Mr. Nash. Mr. Allen, would you answer this question for the Chairman?

Mr. Allen. The Rosebud School is under design. We hope to get it out for bids, in March 1964. The money for the three schools that were to assist the public school districts have all been made available to those districts. I do not know anything about their status of construction.

On the jail at Fort Peck, we are working with the tribe in designing a facility. You will remember, the tribe is to put up $20,000 in matching funds.

Water Shortage at Mill Creek School

Senator McGee. A serious situation concerning the water shortage at the Mill Creek School has just recently been brought to my attention.

By way of background, Mill Creek School is in School District No. 14 at Ethete. It is on the Lander Route and is on the Wind River Reservation. Since most of the land is held in trust by the Federal Government for the Indians it does not appear on the tax rolls and is one of the poorest in valuation per child of any district in the State. It has nearly exhausted its bonded indebtedness limitation for expansion of its classroom facilities.

The enrollment in the Mill Creek School on January 10, 1964, was 327 for purposes of a Public Law 815 survey. Most of these children are Indians and over 90 percent are federally connected for Public Law 815 and Public Law 874 funds.

The present source of water for the school is from wells and the amount of water recovered has dropped off drastically. Addition of pumps and extra storage facilities has not alleviated the situation;

consequently, the number of showers the children can take and the laundering by kitchen personnel, and so forth, has been cut back. By February 8, 1964, the water supply was so low that it became necessary to start hauling water from Lander—a 26-mile round trip—at a cost of 1 cent per gallon. This expense over a period of years would, of course, be prohibitive.

The most promising solution considered by the council is bringing in water from the Little Wind River at an estimated cost of $60,000.

I would very much appreciate having the Bureau look into this matter to see if some assistance can be provided by the Bureau since this problem is very critical. Please submit a statement for the record.

Mr. NASH. We will do that, Senator.

(The statement referred to follows:)

The Bureau of Indian Affairs is familiar with the serious water shortage at the Mill Creek School in Wyoming. Since this is a public school, we have discussed the problem with local school officials and with personnel of the Office of Education in efforts to find a solution.

The Bureau of Indian Affairs does not have funds in its budget for the construction of such systems for public schools. According to personnel in the Office of Education, application for supplemental assistance under Public Law 815 to construct water supply facilities for public schools cannot be approved unless the construction is on the school site. Since two wells have already been drilled on the school grounds with unsatisfactory results, it would appear unreasonable to drill another well on the school site.

Based on this information it seems evident that the most promising solution is the proposal considered by the tribal council; namely, construction of a pipeline system from the Little Wind River at an estimated cost of $60,000.

Chairman HAYDEN. Will you please submit for the record tables indicating your accelerated public works projects during the past 2 fiscal years?

Mr. NASH. Yes, sir.

(The material referred to follows:)

ACCELERATED PUBLIC WORKS PROGRAM

FIRST APPROPRIATION, FISCAL YEAR 1963

Consolidated list of accelerated public works projects for fiscal year 1963, authorized by the Secretary of the Interior from $38 million allocated to the Department of the Interior by the President under authority of Public Law 87–658, approved September 14, 1962:

Bureau of Indian Affairs

State and project	Eligible area and county	Eligibility category	Man-years	Cost	Work description
				Thousands	
Alaska:					
Cook Inlet Reservation	Election District No. 2	5b Indian	3	$50.0	Construction and improvement of community center at 1 village.
Norton Sound Reservation	Election District No. 23	do	6	95.0	Construction and improvement of community centers at 2 villages.
Southeast Reservation	Election District Nos. 1, 2, 3, and 4	do	22	400.0	Construction and improvement of community centers at 6 villages.
Total, Alaska			31	545.0	
Arizona:					
Colorado River Reservation	Yuma	5b Indian	3	21.3	Erosion control and improvement of soil productivity.
Fort Apache Reservation	Apache, Gila, and Navajo	do	22	130.0	Erosion control and improvement of soil productivity, timber stand improvement.
Gila River Reservation	Maricopa and Pinal	do	11	82.0	Road construction, erosion control, and soil improvement.
Hopi Reservation	Apache and Coconino	do	59	400.0	Erosion control and improvement of soil productivity, road construction.
Hualapai Reservation	Coconino, Mojave, and Yavapai	do	4	25.0	Erosion control and improvement of soil productivity.
Navajo Reservation:					
Project No. 1	Apache, Navajo, and Coconino	do	36	400.0	Grading and surfacing 12 miles of reservation roads.
Project No. 2	Apache	do	40	400.0	Construction 9 miles primary highway; Ganado south.
Project No. 3	Apache, Navajo, and Coconino	do	56	282.2	Erosion control and improvement of soil productivity.
Project No. 4	Apache	do	45	200.0	Timber stand improvement.
Project No. 5	Apache, Navajo, and Coconino	do	30	203.4	Forest stand improvement, soil and moisture conservation.
Papago Reservation	Pima	do	63	400.0	Forest fire control.
Salt River Reservation	Maricopa	do	6	37.8	Erosion control and improvement of soil productivity, road improvement, and community center.
San Carlos Reservation	Gila, Graham, and Pinal	do	63	390.0	Timber stand improvement, erosion control and improvement of soil productivity, road construction.

Wind River Reservation Construction Charges

Senator McGee. During these hearings last year I was advised that a report was being completed by the Bureau regarding certain assessments against non-Indian owners for construction charges of the irrigation project on the Wind River Reservation. I was advised that this report was received by the Bureau on November 13, 1962, that it was being tabulated and analyzed, that the findings would have a bearing on the Bureau's report on Senate Joint Resolution 6, and that these findings were to be completed in the very near future.

Will you advise me of the present status of this report?

Mr. Nash. The Department's proposed report on Senate Joint Resolution 6 was sent to Bureau of the Budget February 24, 1964, for clearance. It will be submitted to the committee as soon as Budget clearance is received.

Road Construction

Chairman Hayden. There is a request for an appropriation of $17 million in fiscal year 1965 for liquidation of contract authorizations in connection with the Federal-aid highway contracts. The justification statement will be included in the record.

(The justification statement referred to follows:)

Road construction—Contract authorization and liquidation program

FISCAL YEAR 1963

	Contract authority available	Obligations	Unliquidated obligations prior year	Obligations	Expenditures	Unliquidated obligations carried forward
Federal-aid highway roads	$13,155,936	$12,180,799	$7,041,315	$19,222,114	$14,024,654	$5,197,460

JUSTIFICATION

Road construction (liquidation of contract authorization), $17 million

LIQUIDATION PROGRAM (CASH)

Liquidation of contract authorization (cash program).—1963, $18,261,490; 1964, $16,274,173; 1965, $17 million

The estimate for the road construction cash program for fiscal year 1965 is $17 million. This amount is required to liquidate $8,585,071 of unfinanced prior year obligations which come due for payment during fiscal year 1965, as well as the 1965 obligations that will come due for payment during the 1965 fiscal year. This leaves $7,585,071 of unpaid obligations at the end of fiscal year 1965.

The balance of unpaid obligations at the close of the fiscal year has been declining as follows: 1961, $13,316,517; 1962, $9,951,767; 1963, $6,772,886; 1964, $8,585,071 (unfunded); and 1965, $7,585,071 (estimate). This decline is caused by the fact that engineering preparation surveys and plans are catching up with the program. These completed plans permit contract awards and project starts earlier in the fiscal year. Work on force account projects requires cash before and while the work is going on rather than after completion of contracts.

CONTRACT AUTHORIZATION PROGRAM (OBLIGATIONS)

1. Federal-Aid Highway Act (obligational program).—1963, $15,082,609; 1964, $18,086,358; 1965, $16 million

The estimate for the road construction obligational program for fiscal year 1965 is $16 million. This justification proposes that $2 million of the $18 million contract authorization for fiscal year 1965 shall be reserved.

The Federal-Aid Highway Act of 1962 authorized in section 2, "for the purpose of carrying out the provisions of title 23 of the United States Code, the appropriations for Indian reservation roads and bridges, $16,000,000 for the fiscal year ending June 30, 1964, and $18,000,000 for the fiscal year ending June 30, 1965."

Title 23 of the United States Code provides, in section 101, the definition of Indian reservation roads; and in section 203, that funds authorized for Indian reservation roads shall be available for contract on a date not earlier than 1 year preceding the beginning of the fiscal year for which authorized; and that the Secretary of the department charged with the administration of such funds is granted authority to incur obligations, approve projects, and enter into contracts under such authorizations, and his action in doing so shall be deemed a contractual obligation of the United States for the payment of costs thereof.

Tax-free Indian lands are not served adequately by State or country roads. There are reservations where county governments do not exist, and many instances where the counties are not financially or administratively able to carry on the road function. As a result, Congress has recognized that the improvement and construction of roads and bridges serving Indian lands is a Federal responsibility, and it has authorized the above-cited program of road construction for fiscal years 1964 and 1965.

This proposed $16 million obligation is required to provide adequate roads on the reservations to serve the increased school building, education, economic development, and health programs. These increased programs will generate a greater volume of traffic on the reservations and need dependable transportation facilities. The Bureau's 1964 program includes $66,118,250 for education and $52,800,000 for new buildings and utilities on the reservations. Better school attendance is a very important goal of the education and building program.

Improved all-weather roads to both the old and the new schools are essential to that goal; they are needed to assure daily safe operation of schoolbuses and the transportation of supplies and equipment. The Bureau's road system is a defined system of local roads to serve the people which in turn services the schools and health centers of the reservations. The improvement of this system must keep pace with the growing communities, increasing school facilities, and the trend toward the use of day schools rather than boarding schools.

The following is a detailed description of the 1965 fiscal year program based on the total estimated obligations to be incurred during 1965 fiscal year:

	Miles	Amount
(*a*) Grading and draining	482.0	$7,348,000
(*b*) Surfacing	556.1	6,914,000
(*c*) Bridge construction	[1] 1,130.0	522,000
(*d*) Future surveys and plans	605.5	1,216,000
Total		16,000,000

[1] Feet.

(*a*) *Grading and draining, $7,348,000.*—This feature covers clearing rights-of-way, installing drainage structures, and constructing a roadbed by excavating high ground and filling low ground. This results in a well-drained earth embankment with easy grades and flat curves, built so that the roadbed will provide a firm foundation for the surface course. The estimate covers 482 miles of grading and draining.

(*b*) *Surfacing, $6,914,000.*—This estimate covers the surfacing of 556.1 miles of roads; 228.1 miles will have a base course and surface course of local materials such as gravel. The remaining 328 miles are on the heavier traffic roads and will have the gravel surface stabilized with bituminous material.

(*c*) *Bridge construction, $522,000.*—This covers the construction of 1,130 running feet of bridges. Most of this will replace wornout spans now in a dangerous condition.

(*d*) *Future surveys and plans, $1,216,000.*—This covers preliminary engineering, surveys, and preparation of plans and specifications for the construction of roads and bridges. The estimate covers surveys and plans for 605.5 miles of roads.

The average estimated cost for grading and draining is $15,244 per mile; for gravel surfacing $8,346; for bituminous surfacing, including base course, $15,255 per mile; for bridge construction $462 per running foot; and for future surveys and plans $2,008 per mile.

The 1965 program is distributed as follows:

(1) *Aberdeen area, $2,100,000.*—This area program totals 67.7 miles of grading and draining, 80.9 miles of surfacing of which 46.8 miles are bituminous surfaced, and 294 feet of bridge construction. This construction is located as follows: Nebraska—Winnebago Reservation; North Dakota—Turtle Mountain Reservation, Fort Totten Reservation, Fort Berthold Reservation, and Standing Rock Reservation; and South Dakota—Cheyenne River Reservation, Crow Creek Reservation, Lower Brule Reservation, Pine Ridge Reservation, Rosebud Reservation, and Sisseton Reservation.

(2) *Anadarko area, $500,000.*—This area program totals 8 miles of grading and draining, 17 miles of surfacing. This construction is located as follows: Oklahoma—Cheyenne and Arapaho Reservation, Kiowa Reservation, Pawnee Reservation, and Shawnee Reservation.

(3) *Billings area, $1,250,000.*—This area program totals 51.9 miles of grading and draining, 61.1 miles of surfacing of which 35.1 miles are bituminous surfaced. This construction is located as follows: Montana—Blackfeet Reservation, Crow Reservation, Flathead Reservation, Fort Belknap Reservation, Rocky Boys Reservation, Northern Cheyenne Reservation, and Fort Peck Reservation; Wyoming—Wind River Reservation.

(4) *Gallup area, $4,900,000.*—This area program totals 165.3 miles of grading and draining, 166.0 miles of surfacing of which 85 miles are bituminous surfaced, and 490 feet of bridge construction. This construction is located as follows: Arizona—Navajo Reservation; New Mexico—Navajo Reservation, Zuni Reservation, Jicarilla Reservation, Mescalero Reservation and United Pueblos Reservation; Colorado—Consolidated Ute Reservation.

(5) *Juneau area, $650,000.*—This area program totals 10 miles of street and road. This construction is located in Alaska and includes streets at Barrow.

(6) *Minneapolis area, $600,000.*—This area program totals 31 miles of grading and draining, 25.5 miles of bituminous surfacing, and 20 feet of bridge construction. This construction is located as follows: Minnesota—Red Lake Reservation and White Earth Reservation; Wisconsin—Lac du Flambeau Reservation, Lac Courte Orielles, St. Croix, and Bad River Reservation.

(7) *Muskogee area, $500,000.*—This area program totals 19.8 miles of grading and draining, 19.5 miles of surfacing of which 10 miles are bituminous surfaced and 150 feet of bridge construction. This construction is located as follows: Mississippi—Choctaw Reservation; Oklahoma—Five Civilized Tribes Reservation.

(8) *Phoenix area, $2,800,000.*—This area program totals 76 miles of grading and draining, 55.2 miles of surfacing of which 24 miles are bituminous surfaced and 118 feet of bridge construction. This construction is located as follows: Arizona—Colorado River Reservation, Fort Apache Reservation, Hopi Reservation, Papago Reservation, Pima Reservation, San Carlos Reservation, and Salt River Reservation; Nevada—Duck Valley Reservation and Walker River Reservation; Utah—Uintah and Ouray Reservations.

(9) *Portland area, $1,800,000.*—This area program totals 42.1 miles of grading and draining, 103.1 miles of surfacing of which 71 miles are bituminous surfaced, and 58 feet of bridge construction. This construction is located as follows: Idaho—Fort Hall Reservation and Coeur d'Alene Reservation; Oregon—Umatilla Reservation and Warm Springs Reservation; Washington—Colville Reservation, Quinault Reservation, and Yakima Reservation.

(10) *Sacramento area, $600,000.*—This area program totals 7.8 miles of grading, draining, and 7.8 miles of surfacing of which 3.6 miles are bituminous surfaced. This construction is located as follows: California—Sulphur Bank Rancheria, Round Valley Reservation, Hoopa Valley Reservation, Big Sandy Rancheria, and Santa Rosa Rancheria.

(11) *Washington area, $300,000.*—This area program totals 2.4 miles of grading and draining, 10 miles of bituminous surfacing, and central office supervision of the road construction program. This program is located as follows: Florida—Brighton Reservation; North Carolina—Cherokee Reservation; Washington, D.C.

Chairman HAYDEN. Do you have any particular comment with regard to this program?

Mr. NASH. Yes, sir. It is a very badly needed program, the improvement of economic conditions, living conditions, and the education programs on the reservations are all dependent upon the road-building program. The $17 million is needed to liquidate obligations that we have already undertaken and we must either have the full amount or slowdown in our new obligations for road construction. And I would hope that would not happen.

ROAD CONSTRUCTION BY CONTRACT

Chairman HAYDEN. Last year the conferees urged that the Bureau of Indian Affairs return to road construction through contracts with private firms with the requirement that the successful bidder employ primarily Indian labor from the reservation on which the road

construction is to be accomplished. What success have you had with this type of operation?

Mr. NASH. Pursuant to the committee's instructions, we made a study of the contract method of building roads versus the force account method of building roads, and that study has been completed and we have sent it over to the committee.

In summary, what it shows, Mr. Chairman, is that the force account method of roadbuilding or construction generally is not more expensive than the contract method and is eight times as helpful when it comes to Indian income and employment. The Indian share of the construction dollar is about 4 cents when construction is done by a contractor and is almost 32 cents under force account. Now there are many reasons for this, but I think perhaps, the principal one is that any established contractor moving around from one construction site to another likes to take his experienced crew with him and, therefore, we can write in all the preferences for Indian employment that the law allows in our contract and we can talk to the contractor and we can help him find people, but the Indian just does not get the jobs. When we do it ourselves, we are able to find the Indians. We are able to find the help. We get our construction done on schedule and, as the study will show, there is a small percentage in savings to the Government. I do not claim it is a significant amount, Mr. Chairman.

Chairman HAYDEN. Do you have that report?

Mr. NASH. Yes, sir.

Chairman HAYDEN. I will include that report in the record.

(The report referred to follows:)

PRELIMINARY REPORT ON 1963 BUREAU ROAD CONSTRUCTION COSTS

Report No. 181 of the Senate Appropriations Committee of the 88th Congress, 1st session, states on page 7 the following:

"The committee agrees with the objective of the Bureau of Indian Affairs to create greater employment for Indian people. However, it is the committee's view that this objective can and should be obtained at no greater cost than accomplishment of road construction through the prior method of contracting for necessary work.

"The committee believes that the Bureau of Indian Affairs should explore very carefully the return to road construction through contracts with firms in that business; * * *".

The Bureau has conducted a study of 1963 construction projects covering a total of 148 projects on 61 Indian reservations located in 21 States. Of these projects, 73 were accomplished by contract and 75 by the force account method. Each of 10 areas submitted reports on total expenditures for contract and force account projects, also listing overhead and engineering expense. Overhead was prorated to the categories of engineering, contract and force account expenditures on a dollar valuation, except that overhead was charged to contract expenditures on a 50-percent ratio only. All of the appropriation which was authorized for Indian Bureau road construction was charged into these costs. The engineering costs are the same as those incurred by a State highway department in making surveys and designs awarding contracts and performing the construction engineering and inspection on State highway projects, most of which are by contract.

Individual project reports were made on completed force account projects. These reports contained a detailed breakdown of items of work such as would be shown on a contract bid schedule. The actual quantities of work performed on each item was shown and these quantities were multiplied by the unit cost which successful contractors had bid on this item. The total of these costs was considered to be the amount that the job would have cost by contract.

These reports also showed the total actual obligations incurred against the project, including a share of the overhead expense. This was the total actual cost to the Bureau except for a use charge on equipment purchased by the Bureau.

The equipment used on this work was from three sources: 1. Rental equipment on which the rent was included in the project cost directly. 2. Bureau purchased equipment on which the use was charged as an extra depreciation item. 3. Equipment acquired from Federal surplus on which there was no cost to the Bureau. However, even though there was no direct cost, the same equipment use charge was made as for equipment purchased by the Bureau.

FORCE ACCOUNT PROJECTS

The force account projects reported on were of two general types, the first of which selected the labor producing items of the project for force account operations, and left the heavy mechanical equipment items for contract, these force account projects were mostly clearing right-of-way and fencing, and the heavy grading and paving on these projects was contracted. The second type consisted of projects on which the Bureau performed all of the work.

Finished projects in the second category tended to be small, because the Bureau started to tool up for this work in 1962 and did not have sufficient equipment for larger projects. A list of some of the projects in the second category is attached. It will be noted from this list that there was considerable variation in the contract force account relationship. The projects vary from force account costs, which are 30 percent over estimated contract costs, to force account costs which are 27 percent under estimated contract costs.

When all of the completed force account projects on which reports were made were considered, we derived the following:

1.	Total estimated contract cost	$2, 564, 303
2.	Direct obligations including overhead	$2, 196, 524
3.	Depreciation charge on Bureau purchased equipment	$150, 224
4.	Sum of lines 2 and 3	$2, 346, 748
5.	Use charge on free surplus	$138, 300
6.	Sum of lines 4 and 5	$2, 485, 048
7.	Estimated contract cost (line 1), less Bureau cost (line 4)	$217, 555
8.	Estimated contract cost (line 1), less Bureau cost (line 6)	$79, 255
9.	Bureau cost (line 4) is 8.45 percent less than estimated contract cost: $217,555 divided by $2,564,303	*Percent* 8. 45
10.	Bureau cost plus surplus equipment use charge (line 6) is 3.1 percent less than estimated contract cost: $79,255 divided by $2,564,303	3. 1

The variations in the individual projects so far as comparison of force account and contract costs are concerned makes it clear that the percentages developed above are simply the results obtained from a particular study. They do appear to support the Bureau contention that Bureau roads force account work can produce work by force account at costs comparable to contract prices.

Advantages to the force account method in road work accrue from the amount of heavy construction equipment used. The fact that surplus equipment and new equipment purchased at wholesale prices, as compared to the retail prices contractors pay, is an advantage that would not extend to other construction fields such as housing.

Partial list of individual force account projects

1963 Employment Study of Bureau of Indian Affairs Construction Projects, November 1963

This report is based on information from 224 Bureau of Indian Affairs construction projects totaling (58 million and located on Indian reservations in 15 States. It includes construction projects from the Branches of Land Operations, Plant Management, Plant Design and Construction, and Roads.

Summary

	Contract projects (percent)	Force account projects (percent)
Percent of contract or project amount paid to on-site labor	26.5	42.3
Percent of on-site labor paid to Indians	14.0	73.8
Percent of contract or project amount paid to Indians	3.7	31.2

The contractors' certified payrolls showed the following ratios of mounts paid to various groups:

	Percent of payroll amount
Unskilled labor	19.6
Skilled labor	80.4
Indian unskilled	6.7
Indian skilled	7.3
All Indian labor	14.0

The BIA construction dollar, that is available for either contract or force account construction, will pay less than 4 cents to Indians under a contract or 31 cents to Indians if programed to a force account project.

Chairman HAYDEN. What percentage of your road construction work is accomplished through force account and what percentage is through contracts with private road-construction firms?

Mr. NASH. Approximately half, 50 percent contract and 50 percent force account, give or take a few percentage points.

WINSLOW–TOREVA ROAD, ARIZONA

Chairman HAYDEN. What is the status of the Winslow-Toreva Road in Arizona?

Mr. NASH. I think we have a good report on the Winslow-Toreva Road, Mr. Chairman. It will all be put under contract this year.

Chairman HAYDEN. It takes quite a little time to get around there.

Mr. NASH. Yes, sir.

Chairman HAYDEN. I know that the Hopis will be very, very happy, because it will cut off many miles for them to get from their reservation to market.

Mr. NASH. Without getting into the exact mileage, the remaining portion of the bituminous surfacing will be completed shortly. Specifically, the grade construction is expected to be completed in April and the remaining work will consist of 22 miles of base course, 44 miles of bituminous surfacing and 44 miles of bituminous seal coat. A contract award is scheduled for May of 1964 to include all of the remaining work.

WIND RIVER RESERVATION ACCESS ROADS

Senator MCGEE. In April 1963 the Joint Tribal Council of the Wind River Reservation in Wyoming brought to my attention a serious situation existing on the reservation concerning the lack of short access roads to the main roads of the approved system.

The report of the council, which I made available to the Bureau, indicated that while the approved system appeared adequate, there is an urgent need for completion of short feeder roads—you might term these "farm to market" roads—for use as schoolbus routes and for other purposes. As the situation now stands, many children must walk a considerable distance to the bus stop, for instance.

In addition to about 10 of these needed access roads, there is the Maverick Springs Road, about 15 miles long, which was paved with asphalt over 10 years ago and is now in need of extensive repair. This road is on the approved system and serves several oil-producing companies and several ranches. The tribal council estimated the cost of repairing this road at about $175,000. The cost of developing the needed access roads ranges from $1,000 to $5,000 per road.

I wrote the Bureau last April about this and sent a copy of this report. In the reply of May 29, 1963, I was advised that a field report had been requested on the possibility of scheduling these projects under either the Bureau road construction program or the accelerated public works program.

Will you advise the committee on the status of the field report concerning the feeder roads requested by the Joint Business Council of Wind River Indian Reservation?

Mr. NASH. The report was completed by a letter from the Billings area office, dated June 11, 1963. Additional details were furnished verbally by Billings area office officials.

Senator MCGEE. If the report is completed, will you include it in the record?

Mr. NASH. Yes, sir.

(The report referred to follows:)

U.S. DEPARTMENT OF THE INTERIOR,
BUREAU OF INDIAN AFFAIRS,
BILLINGS AREA OFFICE,
Billings, Mont., June 11, 1963.

COMMISSIONER, BUREAU OF INDIAN AFFAIRS,
Washington, D.C.
(Attention Mr. Robert J. Trier).

DEAR SIR: Concerning your communication of May 8, 1963, with reference to a letter from Senator McGee regarding a list of projects proposed by the Joint

Business Council of the Wind River Reservation for some work, we wish to submit the following information pertaining to the projects as listed. This information has been reviewed by Superintendent Clyde W. Hobbs of the Wind River Reservation and by the superintendents of the Mill Creek School and the Fort Washakie School, and their suggestions have been incorporated into this letter.

SHOSHONE AREA

Brown's Lane.—This could be designed as a feeder loop road approximately 2 miles long. It would start from State Highway No. 64 and extend 1 mile east and along the Little Wind River bottom and then 1 mile south to connect with the Fort Washakie-Arapahoe Road.

This project would cost approximately $15,000 and would serve five families. The project could be constructed under our construction program as a feeder road. It would be necessary to secure right-of-way and to fence the entire length of the road.

We are asking for a resolution from the tribe as to whether or not they wish to include this project in their long range program.

Tillman Lane.—This project is 0.035 mile long and is a road serving five families that live in one family group. The project could not be classified as anything but a private road to this family group. The present lane is fenced and to grade and surface the road would cost approximately $1,200.

Track Lane.—This is a dirt road 1 mile long wandering across the flats. It serves one family; therefore, it would be impossible to get the Bureau of Public Roads to approve this as a construction project. There are also two abandoned houses along the road.

Noseep Lane.—This project is one-half mile long and serves a family group consisting of two families. One lives in a frame house and the other in a trailer house. The road would require right-of-way. Since this project is very much of a private nature it would be impossible to get Bureau of Public Roads' approval on the route.

South Fork Spur and Bridge.—This project could be put on the Wind River Road system. A new bridge across the South Fork of the Little Wind River would be required. The project would provide a loop road for schoolbus purposes and would serve a total of eight families. About 1½ miles of new road would have to be built. A right-of-way will have to be secured, some of which will be through an allotment where we may have some objections as it would split an irrigated field. The road would cost approximately $15,000 and the bridge $20,000.

ARAPAHOE AREA

Blackburn Lane.—This is a graded, gravel-surfaced county road 1½ miles long. It has never been maintained by the Indian Service and is a county obligation.

Jenkins Lane.—This is a private road 0.025 mile long to one house which has been deserted. There are no other houses or individuals living along this road.

Yellow-Calf Lane.—This road is approximately one-half mile long and leads from the Fort Washakie-Arapahoe Road to a cemetery. There are no families living along the road. The road could be graded and surfaced with pit run gravel for about $2,600. A right-of-way would have to be secured and three culvert pipes installed.

Extension of Thunder Lane.—This road is approximately one-half mile long and leads to a private family cemetery. Thunder Lane Road could be extended to this cemetery at an approximate cost of $1,000. Right-of-way would have to be secured and the lane fenced. The work could possibly be done under a heavy maintenance program.

Sage Cemetery Lane.—This road is 1$\frac{3}{10}$ miles long and wanders through the sagebrush. There are no families living along the route. It serves a private cemetery for three families. There is no evidence of any recent burial. The road would cost about $3,000. It would be necessary to secure a right-of-way.

Maverick Springs Road.—This project is on the Indian Service road system and was oil surfaced about 15 years ago. The road has been maintained by the Indian Service; however, the maintenance has not kept up with the deterioration of the roadbed. The project should be half-soled with a new mat and the estimate of $175,000 is about the approximate cost of this work.

Of the projects listed above, the only ones that might be eligible for public works funds would be the Brown's Lane loop road and the South Fork spur and bridge project, both located in the Shoshone area, and the Maverick Springs road

in the Arapahoe area. This later project serves an oil field which provides most of the oil royalty for the tribe.

Sincerely yours,

FRED O. THOMPSON,
Acting Area Director.

Mr. NASH. Later, the Bureau was informed that the list of projects proposed by the Joint Business Council, and this report, were reviewed with the council. It was jointly agreed that two of the roads were public roads and eligible for addition to the Bureau road system; Brown's Lane Road and South Fork spur road were added to the road system. The other projects listed in the report were considered not qualified for improvement with Federal funds as they were projects serving private interests.

Senator MCGEE. Have you scheduled any of the feeder roads, listed in the Joint Business Council's request, for construction in your program this year? If not, how much would be required to get started on these roads?

Mr. NASH. No. Only two of the roads included in the Joint Business Council's request qualify under the Bureau's road system. These two roads are Brown's Lane Road and South Fork spur road. These two roads would cost $50,000 and $185,000 respectfully.

GENERAL ADMINISTRATIVE EXPENSES

Chairman HAYDEN. For general administrative expenses the Bureau of Indian Affairs requests $4,331,000 in fiscal year 1965. This is an increase of $66,000 over the appropriation for last year, all of which is accounted for by pay costs.

(The document referred to follows:)

BUREAU OF INDIAN AFFAIRS

General administrative expenses

Appropriation, 1963	$4,000,000
Pay cost supplemental	190,950
Total appropriation, 1963	4,190,950
Transferred to "Operating expenses, Public Buildings Service," General Services Administration	−3,342
Total available, 1963	4,187,608
Total appropriation, 1964	4,265,000

SUMMARY OF INCREASES AND DECREASES, 1965

To provide for increased pay costs for fiscal year 1964 positions	+66,000
Total estimate, 1965	4,331,000

General administrative expenses

Activity	Fiscal year 1963, amount available	Fiscal year 1964, amount available	Estimate, fiscal year 1965	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
1. Departmental office	$1,190,178	$1,233,000	$1,258,000	$25,000	$25,000	----------
2. Field offices	2,936,567	3,032,000	3,073,000	41,000	41,000	----------
Unobligated balance lapsing	60,863	----------	----------	----------	----------	----------
Total	4,187,608	4,265,000	4,331,000	+66,000	+66,000	----------

[1] To provide for increased pay costs for fiscal year 1964 positions.

Plan of work.—The programs of the Bureau are administered from two organizational levels—the Washington office and area offices. In the Washington office, basic policy determinations are made, programs are evaluated, and operating procedures are developed; with the area offices carrying out the various programs and functions.

In the interest of efficiency and economy, the area offices perform the housekeeping functions for services common to all program activities. The benefiting program activities share part of the cost of these services based on the amount of administrative workload each program may create and the funds available to that program. The Bureau's proposed 1965 administration program totals $5,841,000, of which $4,331,000 is requested under the "General administrative expenses" appropriation and $1,510,000 allocable to program activities. A comparison of the program follows:

	1963	1964	1965	Change
Share of participating program activities	$1,325,000	$1,375,000	$1,510,000	+$135,000
General administrative expense appropriation	4,187,608	4,265,000	4,331,000	+66,000
Total administration program	5,512,608	5,640,000	5,841,000	+201,000

NOTE.—The total amount requested for administration, $5,841,000 is approximately 2.8 percent of the total funds requested for the entire Bureau in 1965.

STATUS OF PROGRAM

This program provides for carrying out administrative functions which support Bureau program activities. These functions include budgeting, accounting, property management, personnel management, and management planning.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$4,126,745	$4,265,000	$4,331,000	+$66,000
Transferred to "Operating Expenses, Public Building Service" General Services Administration	3,342			
Unobligated balance lapsing	60,863			
Appropriation	4,190,950	4,265,000	4,331,000	+66,000
Obligations by objects:				
11 Personnel compensation	3,113,794	3,363,138	3,411,838	+48,700
12 Personnel benefits	230,166	256,090	261,090	5,000
21 Travel and transportation of persons	213,920	230,176	230,176

26 Supplies and materials	75,354	81,642	85,000	+3,358
31 Equipment	126,189	50,259	50,259	
Total obligations	4,126,745	4,265,000	4,331,000	+66,000

Chairman HAYDEN. What comment do you care to make with regard to this budget item?

Mr. NASH. Mr. Chairman, we have held our administrative costs constant over quite a number of years, in spite of the additional workloads that have come about through the accelerated public works program and the many other economic development activities that we are now carrying on. We administer this very large program from Barrow, Alaska to the Everglades in Florida, in 500 different locations, with an overall administrative expense of 2.8 percent. We are determined to hold our administrative costs down, but I think we have reason to be proud of the fact that we can do it for 2.8 percent.

MENOMINEE EDUCATIONAL GRANTS

Chairman HAYDEN. In accordance with the requirements of Public Law 87–432, the Bureau requests $88,000 to be used as a grant to the State of Wisconsin in behalf of the Menominee Indian Tribe as a contribution to school costs. The justification will be included in the record.

(The justification referred to follows:)

MENOMINEE EDUCATIONAL GRANTS

Appropriation, 1963 (transfer from "Education and Welfare Services," Public Law 88–25)	$176,000
Appropriation, 1964	132,000
Decrease: School district costs	132,000
Increase: School district costs	88,000
Budget estimate, 1965	88,000

Analysis by activities

Activity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Decrease (−)
School district costs	$176,000	$132,000	$88,000	−$44,000

Need for estimate.—The $88,000 requested for 1965 will be used as a grant to the State of Wisconsin in behalf of the Menominee Indian Tribe as a contribution to school costs, as provided by Public Law 87–432.

Plan of work.—This program provides for grants to lessen the impact of the termination of Federal services to the Menominee Indian Tribe of Wisconsin. These grants will be made to the State of Wisconsin for contribution to joint school district costs. Legislation authorizing this action is contained in Public Law 87–432, approved April 4, 1962.

STATUS OF PROGRAM

Public Law 87–432, approved April 4, 1962, authorizes grants to the State of Wisconsin or the county or town of Menominee for contribution to joint school district costs. A total of $220,000 was authorized for 1962. This amount is decreased 20 percent each year for the next 4 succeeding years through 1966. The $88,000 requested in this estimate will be used to make the fourth of five total payments authorized under the legislation.

Chairman HAYDEN. This is the fourth of the five payments required by law. Other than that do you have any comment to make?

Mr. NASH. No, sir. This is a grant-in-aid to the county for which we have, at the direction of the Congress, requested appropriations although Federal supervision over the Menominees has been terminated by an act of Congress. I know, from my own knowledge and correspondence from the State, that there are serious health and welfare and county cost problems in the county. And most of these, I may say, were anticipated at the time that the aid bill was up which resulted in the check for the State in the assistance to the school district. We do not have either the authority or the responsibility for looking into this situation, but there is a serious condition there which somebody ought to do something about.

LANGUAGE CHANGE FOR PASSENGER CARRYING MOTOR VEHICLES

Chairman HAYDEN. I will include in the record your statement regarding language changes which will permit purchase of 66 additional motor vehicles.

(The statement referred to follows:)

ADMINISTRATIVE PROVISIONS

EXPLANATION OF LANGUAGE CHANGE

The language provides for the purchase of 241 vehicles of which 175 shall be for replacement only. Included in the 66 additional vehicles are 41 police-type vehicles needed to carry out the Bureau's responsibility in the area of law and order, and 25 buses to meet the additional needs in transporting pupils to and from schools.

Of the 175 passenger-carrying vehicles which the Bureau proposes to replace, 90 meet both the age and mileage standards; 55 meet the mileage standard; 25 meet the age standard; and 5 will be replaced because of excessive maintenance cost due to reservation road conditions.

Chairman HAYDEN. Would you indicate, by insertion in the record, where each of the 41 police-type vehicles and the 25 buses are to go?

Mr. NASH. Yes, sir. We will supply that for the record.

TRIBAL FUNDS

Chairman HAYDEN. The statement which you have supplied in connection with tribal funds will be printed in the record.

(The statement referred to follows:)

TRIBAL FUNDS

HIGHLIGHT STATEMENT

Funds have been deposited into the Treasury pursuant to various statutory acts of the Congress to be made available for expenditure for the use and benefit of the respective groups. The source of these funds is largely from income derived from Federal management of tribal real properties, the title of which is held in trust by the United States for the tribes. Another significant source is judgments or awards made pursuant to either general or specific statutory authorities enacted by the Congress.

In certain cases, the Congress has enacted legislation which provides the Secretary of the Interior with continuing authority to carry out the provisions of the specific acts. Such authorities are referred to as permanent authorizations. Examples of such legislation are: Fort Peck Indians, Montana (68 Stat. 329), Minnesota Chippewa Tribe of Indians (58 Stat. 271), and the Navajo Indians

(64 Stat. 44). Funds covered by permanent authorizations, however, are included in annual budget presentations to give the Congress an opportunity to review the activity conducted under the authorities extended to the Secretary of the Interior.

In the absence of permanent expenditure authorization, annual appropriation by the Congress is required to permit the use of the funds. Such authority is provided annually in the Department of the Interior Appropriation Act and covers two categories: (1) annual definite; and (2) annual indefinite.

Annual definite encompasses the use of funds, primarily, of those tribes who are not sufficiently organized to be represented by a recognized governing body. Funds programed under this type of authorization are not otherwise available for expenditure without congressional action and the $3 million requested for fiscal year 1964 is to provide the Secretary of the Interior with expenditure authority for the execution of programs, including such items as education of Indian children attending public or private schools, purchase of land and improvement thereon, compensation and expenses of tribal officers, councils, committees, and for various other purposes benefiting the particular Indian tribes. Expenditures made under this authority are individually made through Treasury regional disbursing offices, subject to the same regulations and procedures as appropriations from the general fund of the Treasury.

The annual indefinite authorization in the appropriation act provides the necessary authority, on an annual basis for the Secretary of the Interior, for such purposes as are designated by a particular tribe, to withdraw from the tribal accounts in the Treasury amounts which are to be advanced to bonded tribal treasurers of orgaized tribes to carry out out programs approved by the Secretary and the conduct of tribal operations, including, but not limited to, management of tribal resources and other programs designed to improve the situation of the general membership.

Approximately 300 Indian tribes, bands, or identifiable groups have approximately 600 accounts in the U.S. Treasury which are used for the conduct of tribal financial programs, enterprises, businesses, and other tribal affairs. These funds are available for various purposes, under various acts of Congress and are also subject to the provisions of tribal constitutions, by laws, charters, and resolutions of the various tribes, bands, and groups.

Tribes who need their own funds which are on deposit in the U.S. Treasury are required to prepare budgets for approval. Tribal funds are programed under three categories; namely, permanent authorization, annual authorization, and indefinite authorization.

Funds programed under the permanent authorization are made available under various acts of Congress and can be disbursed either through the Treasury disbursing offices or advanced to a tribe for disbursement through the Indian Service disbursing agent's accounts or advanced to a tribe for disbursement by a bonded tribal treasurer under an approved plan of operation. These funds do not require annual approval by Congress but are reported annually in the budget schedules. Funds programed under the annual authorization are disbursed through the Treasury disbursing offices, subject to the same procedures and limitations as appropriated gratuity funds and require annual approval by Congress. Funds programed under the indefinite authorization are made available under the annual Interior Department Appropriation Act under heading tribal funds. These funds are advanced to tribes for disbursement by Indian disbursing agents or by bonded tribal treasurers under a plan of operation. Some Indian tribes employ more than one of the above methods in conducting their affairs. The following proviso makes these funds available: "* * * *Provided*, That, in addition to the amount appropriated herein, tribal funds may be advanced to Ind an tribes during the current fiscal year for such purposes as may be designated by the governing body of the particular tribe involved and approved by the Secretary, except that tribal funds derived from appropriations in satisfaction of awards of the Indian Claims Commission and the Court of Claims shall not be further appropriated until a report of the purposes for which the funds are to be used has been submitted to the Senate and House Committees on Interior and Insular Affairs and those purposes either have been approved by resolution of either of said committees within 60 calendar days from the date the report is submitted, not counting days on which either House is not in session because of an adjournment of more than 3 calendar days to a day certain: * * *."

In the last 10 to 15 years, many tribes have progressed to the point that they have taken over the management of their affairs and the disbursement of their funds under a plan of operation previously approved by the Secretary and it is the policy of the Bureau to encourage tribes in this respect. Annual audits made of tribal funds by certified accountants of commercial auditing firms are submitted to the Bureau for review and information.

EXPLANATION OF LANGUAGE CHANGE

The proposed change in language will provide for payment of litigation expenses incurred in connection with the wards of judgments or claims immediately upon appropriation of the funds into the Treasury, and receipt and approval of the billings for such services; makes available a limited amount of funds to the tribes to cover the cost of preparing the plans for the use of the awards, and outlines reporting procedures stating the purposes for which such funds will be used.

Tribal funds

Appropriation 1963	$3,000,000
Appropriation 1964	3,000,000

Tribal officers and council expenses	14,000	
Miscellaneous tribes	217,015	293,877
Total estimate for 1965 (annual authorization)		3,000,000

Analysis by activities

Activity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−)
1. Education and welfare services	$94,505	$116,113	$88,202	−$27,911
2. Resources management	708,477	747,727	741,461	−6,266
3. Construction and land acquisition	252,258	529,038	382,550	−146,488
4. General tribal affairs	531,436	1,607,122	1,787,787	+180,665
Total	1,586,676	3,000,000	3,000,000	

Analysis of annual authorizations by activities

Activities	1964	Deductions	Additions	1965
1. Education and welfare services	$116,113	$27,911	----------	$88,202
2. Resources management	747,727	6,266	----------	741,461
3. Construction and land acquisition	529,038	146,488	----------	382,550
4. General tribal affairs	1,607,122	----------	$180,665	1,787,787
Total	3,000,000	180,665	180,665	3,000,000

Indian tribal funds

	1963	1964	1965
1. Permanent authorization	$60,050,506	$61,760,523	$46,932,168
2. Annual authorization	1,586,676	3,000,000	3,000,000
3. Indefinite authorization	4,894,661	4,391,221	4,090,411
Total	66,531,843	69,151,744	54,022,579

Comparative statement of annual authorization activities

	1963	1964	1965
1. Education and welfare services	$94,505	$116,113	$88,202
2. Resources management	708,477	747,727	741,461
3. Construction and land acquisition	252,258	529,038	382,550
4. General tribal affairs	531,436	1,607,122	1,787,787
Total	1,586,676	3,000,000	3,000,000

Plan of work.—No part of the funds contained in this estimate represents a charge upon the Federal Treasury. This item reflects the disbursement of funds to the credit of Indian tribes or bands under numerous special acts of Congress in compliance with the terms of the various trusts and for carrying out tribal programs recommended by the tribal governing bodies with the approval of the Commissioner of Indian Affairs.

The budget schedule reflects under the permanent authorization, disbursements from the tribal trust funds authorized by permanent legislation, and under the annual and indefinite authorizations, amounts requested annually by the various tribes for carrying out various tribal activities.

The estimate, therefore, is restricted to the funds requested annually as required by section 27 ot the act of May 18, 1916 (39 Stat. 158).

LANGUAGE CHANGE—TRIBAL FUNDS

Chairman HAYDEN. In the budget submission there is a change proposed in the tribal funds language which would authorize payments for attorneys' fees, litigation and program planning, and require plans to lay before the legislative committees for 60 days before becoming effective. Recently, though, I have received proposed language, which I will place in the record and which would authorize these payments but would prohibit other uses until after enactment of legislation setting forth the purposes for which the funds are to be used.

(The language referred to follows:)

After the word "Secretary" in the first proviso under the heading "Tribal Funds" strike out the comma and all words through "certain" preceding the colon and insert a colon and the following:

"*Provided further*, That funds derived from appropriations in satisfaction of awards of the Indians Claims Commission and the Court of Claims shall not be available for advances, except for such amounts as may be necessary to pay attorney fees, expenses of litigation, and expenses of program planning, until after legislation has been enacted that sets forth the purposes for which said funds will be used."

Chairman HAYDEN. Are you familiar with this latter language?

Mr. NASH. Yes, sir. I am. Mr. Chairman, we need a change in the present language. To operate under the authority we now have, we would have to present a proposal to the two substantive committees and either get action or have it lie there for 60 days, after which we would have to get an appropriation or wait until the next year's appropriation bill comes up.

CLAIMS

We are getting more and more of these claims as the Claims Commission accelerates its decisions and we would like to be able to pay litigation costs currently and to be able to allot a small amount to some of the tribes for planning purposes, looking toward the development of a long-range program for the total amount. And, at that time, we would then go to the Congress and get specific legislation authorizing the program. And the new language which has been proposed to this committee, would accomplish these purposes.

Chairman HAYDEN. Has anybody made an estimate as to when Congress will quit paying the Indians for the United States and how much that cost will be?

Mr. NASH. No, sir. But about 20 percent of the claims filed with the Indian Claims Commission have now been adjudicated and the total of the awards is in the vicinity of $95 million.

Senator BARTLETT. Alaska is to be heard from yet, Mr. Chairman.

Chairman HAYDEN. Do you recommend its incorporation in the appropriation bill?

Mr. NASH. Yes, sir.

Chairman HAYDEN. I have received a letter from Senator Jackson, Chairman of the Senate Committee on Interior and Insular Affairs, in which he endorses the amendatory language pertaining to tribal funds which you have just stated that you approve. His letter will be included in the record.

(The letter referred to follows:)

U.S. SENATE,
COMMITTEE ON INTERIOR AND INSULAR AFFAIRS,
February 20, 1964.

Hon. CARL HAYDEN,
Chairman, Appropriations Committee,
U.S. Senate, Washington, D.C.

DEAR CARL: For the past 2 or 3 years, there has been written into the "Tribal Funds" section of the annual Interior Department Appropriation Act, restrictions against the use of judgment funds arising from Indian claims. Indians in my State have written to me requesting there be some modification of the appropriation language that would give more flexibility in using judgment funds. I understand the Department of the Interior is recommending new language that reads as follows:

"*Provided further*, That funds derived from appropriations in satisfaction of awards of the Indian Claims Commission and the Court of Claims shall not be available for advances, except for such amounts as may be necessary to pay

attorney fees, expenses of litigation, and expenses of program planning, until after legislation has been enacted that sets forth the purposes for which said funds will be used."

This recommendation appears to resolve the existing problems and still reserves to the Committee on Interior and Insular Affairs jurisdiction over legislation providing for the use of the principal fund. I would like to express the hope that your committee would adopt it in the fiscal year 1965 Interior appropriation bill.

Sincerely yours,

HENRY M. JACKSON, *Chairman.*

Chairman HAYDEN. Senator Bible.

BUREAU OF INDIAN AFFAIRS EMPLOYMENT

Senator BIBLE. Mr. Commissioner, might I ask you what the strength of your Indian Bureau is now? How many people do you employ?

Mr. NASH. In permanent positions it is 12,399 as of December 31. We also hire temporaries.

Senator BIBLE. How many temporaries do you have?

Mr. NASH. The temporaries on December 31, the same date, 2,662.

Senator BIBLE. Now what is a temporary employee?

Mr. NASH. A temporary employee is hired for less than 12 months; he does not get a lot of the fringe benefits that the career civil servant gets. We use such individuals in the summer for firefighting, in our operations of buildings, and utilities. Many of these are Indian people, some of them are not qualified as teachers, but are used as instructional aids in our schools or in our dormitories.

Senator BIBLE. What would be their average length of employment during a year?

Mr. NASH. The average length of service of a temporary or part-time employee is approximately 4½ months.

INDIAN POPULATION

Senator BIBLE. How many Indians do you have under your jurisdiction?

Mr. NASH. 380,000.

Senator BIBLE. How many nonreservation Indians do you have? Are those just reservation Indians?

Mr. NASH. These are on or near. This would not include, for example, Indians living in Los Angeles, San Francisco, Chicago, Denver, Minneapolis, unless they were brought there as part of our vocational training or relocation programs.

Senator BIBLE. What is the total Indian population in the United States?

Mr. NASH. The 1960 census counted 552,000 Indians, Eskimos, and Aleuts.

Chairman HAYDEN. Are these full-bloods or halfs?

Mr. NASH. The census does not make an inquiry as to full or half. They merely say, "Are you an Indian?" "Are you known as an Eskimo?"

Senator BIBLE. Following the Chairman's question, where does your jurisdiction rest in that regard? Do you have a measuring stick?

Mr. NASH. No, sir. Our basis for providing services to an Indian is primarily on real estate. That is, we service those individuals who

reside on trust or restricted land, or so close to it that the program of the reservation would be affected by services not performed for that person.

Senator BIBLE. How does an Indian tribe determine its membership? Does it have a measuring stick of an eighth or a fourth?

Mr. NASH. Sometimes they do and sometimes they do not. The Cherokees in North Carolina have a quantum membership and it happens to be one-sixteenth at the present time. One-quarter is more common, but some tribes do not have any.

AVERAGE EARNINGS OF INDIANS

Senator BIBLE. Do you have any specifics that would indicate the average earnings of the male and the female adults of the 380,000 Indians that are under your jurisdiction? How much do they earn annually?

Mr. NASH. We are beginning to accumulate such statistics. The best way to answer, Senator, I think, is to say that the average income of an Indian family is between one-fourth and one-third the national average.

Senator BIBLE. You are referring now to the jurisdictional Indians?

Mr. NASH. Yes, sir.

Senator BIBLE. Those under your jurisdiction?

Mr. NASH. Those under our jurisdiction.

ECONOMIC STATUS OF INDIANS

Senator BIBLE. Do you have any figures that indicate the economic status of the Indians not under your jurisdiction?

Mr. NASH. No, sir. Those would be included in other figures gathered by the Bureau of Labor Statistics for the cities in which those people are living. When we take one of these people from the depressed reservations and provide them with vocational training, we know that they get into very good paying jobs and become stable and self-sufficient citizens of the communities in which they live.

Senator BIBLE. The purpose of my question is to try to determine just exactly that very thing, to see if the Indians who do leave the reservations actually are bettering themselves and are holding responsible jobs or do they revert back to reservation status?

Mr. NASH. The graduates of our own vocational boarding school we follow to some extent, and Mr. Knodel, Chief of our Employment Assistance Branch, follows as best he can those who have taken part in our adult vocational training program.

Might I ask him to comment on his experience? Mr. Knodel.

Mr. KNODEL. We are certain that they do materially better incomewise.

Senator BIBLE. You mean when they are away from the reservation?

Mr. KNODEL. That is right, sir. We notice a marked degree of activity in home purchase, for example, purchase of appliances, improving living in general, as a result of increased earnings.

Mr. NASH. I might state, Senator, that I would like to draw a distinction between the success that individual Indians have if they get the vocational training that we are providing them under Public Law 84–959 as amended and those who are merely assisted to relocate

without the vocational training. The relocation without vocational training is not very successful. They are likely to move from one pocket of poverty to another, from a rural pocket of poverty to an urban pocket of poverty and just maybe come back and give up. But when we spend the money necessary to equip the single person or head of a family with a marketable skill, then you have stabilized the members of a complete family and made them an important part of the community in which they live. We are very strongly for this program.

ECONOMIC STATUS OF INDIANS IN NEVADA

Senator BIBLE. I am frank to say that I have attempted, practically all of my life, to follow the economic welfare of the Indians in my own State of Nevada. I have gone to school with them during grammar school days and high school days, and a few probably drifted into college, but very few. I am frank to say, I cannot see very much improvement. It looks to me as though they are in the same position now as they were 30 years ago. There are exceptions, but they do seem to revert to the reservation time after time. I see Mr. Fryer here today. He was very helpful in our earlier days as superintendent of the Stewart Indian School. I am not trying to be critical and it is a very difficult job, but I am convinced hat we are not making much progress, at least in Nevada. I am told more emphasis should be put on this vocational education and from some of my firsthand experience with Indians I know that they do become fairly good craftsmen and fairly good on machines. In my State, we have Piute Tribes. Some work on the railroads and some do work with their hands, and do a fairly good job. But I do not know a very easy answer to this problem and if there is any way that the vocational education for the Nevada Indians could be accelerated, I would think it would be helpful.

NEVADA INDIAN COLONIES

I would like to develop another line. One of the most alarming problems we have in Nevada are these clusters of Indian colonies where the title is held for the particular tribe by the U.S. Government in trust. They are eyesores in about three of our cities that readily come to mind.

Elko is one and the person who handles it in your department is well aware of that. This is a little holding for the Indians held in trust. We have managed to secure money to give them some sanitation and we get the sanitation in and it immediately reverts to very little better than a jungle with the subdivisions moving completely around it. I have constantly talked to your people on this problem. We have the same thing in Winnemucca and Las Vegas and we have managed to secure a few thousands of dollars to finally give them some sanitation and to give them some water.

But, again, it reverts directly back to rather primitive status completely surrounded by a city. There must be some solution to that type of a problem. I do not know what it is and I wish you would have whoever is in charge of it take a look at those areas and see if there is some way you can move the reservations out beyond the city limits or improve the property, because the Indians simply will

not improve it. There are nothing except shacks. I am frank to say the Reno colony is much better. Rev. Clyde Matthews has taken an interest in that and has built it up quite a bit. I would like to have someone in your organization with authority take a look at it and come up with a solution. That is, I would like someone in Government who is better able than I am to find a solution. I have been wrestling with this for 5 or 6 years and it is worse now than when I started out. This is no reflection on you, Commissioner. But I would like to get the answer.

Mr. NASH. Senator, we wrestled with it, too.

I wish I could tell you that we are confident of finding the answer. It is a very, very difficult problem. I am sure that when the war on poverty is launched we are going to discover that this question is not an easy one to answer.

Senator BIBLE. Very few of your Indian people want to live in these areas. They come in and out. They are known to come in for a Saturday evening and stay over the weekend and leave. It leads to a deplorable condition from the standpoint of health and sanitation and actually gives the police some problems.

So I wish you would have some of your people look into it.

PYRAMID LAKE

One further question and I direct this possibly to Mr. Fryer. We are losing a golden opportunity in the State of Nevada by not doing something about Pyramid Lake. It is one of the most beautiful lakes in the world. It is completely under Indian jurisdiction and, again, this seems to be an area where we are not doing everything we should. And I would like to see Mr. Fryer, or whoever is responsible for it, get with me at some early date and see if we cannot do something to improve this status. They have a great natural resource there and very little is being done with it.

Mr. NASH. We have just finished a feasibility study for a recreation development at Pyramid Lake and Mr. Fryer will be delighted to tell you about it or come and call on you.

Senator BIBLE. I do not want to trespass on the other committee members' time. Senator Bartlett is here and I am sure he has questions.

I think it needs more impetus, because this could be very helpful to the Pyramid Lake and to the Piute Indian Tribe. They have a great natural resource there. I want to see them get the benefit of it. I do not want to see it stolen away from them. I hope Mr. Fryer or whoever has the responsibility, contacts me and I would suggest they might do it next week.

Thank you, Mr. Chairman.

Chairman HAYDEN. Senator Bartlett, do you have any questions?

Senator BARTLETT. Yes, sir. A few.

INDIAN CENSUS AND BUREAU EMPLOYEES

Pursuing Senator Bible's line of inquiry, I wonder if you would be good enough to supply for the record for the years 1930, 1940, 1950, and 1960, the Indian population for each of those census periods, the number of BIA employees for each of those years, and the amount of

BIA appropriations for each of those years, plus a similar statement for the current year.

Mr. NASH. Yes, sir.

Year	Indian population (based on census)	Appropriations	Bureau of Indian Affairs employees
1930	362,400	$19,879,035.91	7,295
1940	393,000	42,619,116.00	12,185
1950	455,500	[1] 67,469,746.00	[1] 12,588
1960	552,000	[2] 115,777,000.00	[2] 11,667
1964	[3]	206,623,500.00	[4] 15,061

[1] Includes Indian health activities which were transferred to Department of Health, Education, and Welfare, July 1, 1955 (68 Stat. 674–675).
[2] Excludes Indian health activities which were transferred to Department of Health, Education, and Welfare, July 1, 1955 (68 Stat. 674–675).
[3] Not available.
[4] Dec. 31, 1963, employment.

NOTE.—The service population of the Bureau of Indian Affairs in 1962 was 380,000.

REVOLVING FUND FOR LOANS

Senator BARTLETT. What is the ceiling on your Wheeler-Howard fund?

Mr. NASH. The revolving fund?

It is $20 million.

Senator BARTLETT. Has that all been appropriated?

Mr. NASH. That has all been appropriated and we have in the legislative process, in the very early stages of preparation, proposals to augment funds in several different ways. We have proposed a loan insurance and guarantee fund, we have proposed additional authorizations for the standard revolving loan fund, and, then, the heirship bill which has already passed the Senate, carries with it a $35 million land-purchase program.

Senator BARTLETT. Broadly speaking, how has this program worked out?

Mr. NASH. Very well. There is a tremendous unmet need for Indian credit. With the exception of the canneries in southeast Alaska, the repayment record is considerably more favorable than that of most commercial lenders. And the program in southeastern Alaska is absolutely essential to the life of those villages.

Senator BARTLETT. You wounded me vitally, but you withdrew the knife. Thank you.

LOAN REPAYMENT

Mr. NASH. I could not let the record show that there was a good repayment record of those villages, but I would also like the record to show that it has been a very important economic mainstay.

Senator BARTLETT. The record ought to show, also, that it is not only the Indian canneries that have suffered severe economic reversals in the last several years. Canneries owned by others have been in difficulties because there just have not been enough salmon to pack. That has been the trouble; has it not?

Mr. NASH. Yes, sir.

Senator BARTLETT. You say that the repayment rate has been excellent?

Mr. NASH. It has been at the rate of four-tenths of 1 percent.

Senator BARTLETT. That is better than commercial banks; is it not?

Mr. NASH. Yes, sir.

Reindeer Project in Alaska

Senator Bartlett. Did you mention a reindeer project in Alaska?

Mr. Nash. Yes, sir.

Senator Bartlett. You said on Nunivak Island there are too many reindeer. What is the proposal? Is it to remove the reindeer from that island to the mainland?

Mr. Nash. Yes, sir.

Our proposal is to add five people to our staff, all of whom will work on the reindeer program to bring in some Eskimos and train them in the practice of reindeer herding and management on Nunivak Island and then reduce the herd to the carrying capacity of the island by actually removing some of the animals to a location where there is feed. And we hope to have a more successful program than we have had in the past, by teaching herding and management.

Senator Bartlett. The reindeer program has not been successful in the past, has it?

Mr. Nash. No, sir. They have provided the Eskimos with the animals and have not given them the training in herd management that was necessary, and, in addition, work that ought to have been done in processing the meat and byproducts and the problems of marketing have not been studied. We have been engaged in all of these things and now we would like to get started on them.

Senator Bartlett. Is it difficult to sell the reindeer meat that is placed on the market?

Mr. Nash. We have none in storage at the present time. I do not know whether I can say it is sold without difficulty. It is sold every year and the *North Star* brings back the meat from the freezer on Nunivak.

Senator Bartlett. Now the law says that the reindeer can be owned only by Eskimos; is that right?

Mr. Nash. That is right.

Senator Bartlett. Do you believe there is any reason to amend the law and restore it to what it was and to have no racial difference as to ownership?

Mr. Nash. This is one of the few forms of economic development which is open to the Eskimos of western Alaska and in the Nome and Bethel area. I would hope that it would remain this way for a while.

Vocational High School, Nome, Alaska

Senator Bartlett. You have, Mr. Commissioner, an item in the 1965 request to construct a dormitory for a vocational high school at Nome, Alaska, which is certainly in western Alaska. Is this a cooperative project with the State?

Mr. Nash. Yes, sir; this is proposed as a three-phase program. The State has already completed a $1.5 million vocational school and we are proposing to put in just under $3 million for a kitchen-dining room complex, and a 150-student dormitory, plus associated quarters, and this is phase II. And in phase III the State proposes, again, to come along with another $1.5 million enlargement so that we would wind up with a complete complex of vocational instructional facilities for 300 with dormitory facilities, for 300, jointly with the State, on a 50–50 basis.

Senator BARTLETT. And this will give the Eskimo kids from the surrounding areas, who have never had an opportunity to go to high school, a chance to enter this vocational high school and to learn trades?

Mr. NASH. Yes, sir; and others, too.

Senator BARTLETT. It is contemplated that probably a good majority of the students will be Eskimos?

Mr. NASH. I assume so and in the dormitory, I assume they all will be Eskimos, because this is our primary responsibility and for this purpose our funds were appropriated. We do not contemplate a segregated facility.

Senator BARTLETT. The State's construction will be completed, as I understand it, in time for the opening of the school next fall?

Mr. NASH. Yes, sir.

Senator BARTLETT. Obviously, the dormitory will not be ready because the appropriation request is just before us. Let me ask you this, Commissioner Nash, and I have had this information rather thirdhand: Was there an intention to request reprograming with respect to the dormitories so that construction could have started this spring so that both the Federal and the State facilities would have been ready at the same time?

Mr. NASH. Yes, sir; that was our intention and we made that request.

Senator BARTLETT. And that request was stopped where?

Mr. NASH. The request was denied, sir, by the Bureau of the Budget which felt that the need for the thousand-child facility elsewhere was of more pressing importance than the provision of a dormitory for 150 at Nome.

Senator BARTLETT. In addition to the other projects which have been named here earlier in the morning as having been deferred out of deference to Tongue Point, the Nome dormitory must be added?

Mr. NASH. That is correct.

Senator BARTLETT. Thank you.

Senator BIBLE. Mr. Chairman, may I ask one or two more questions of Mr. Nash?

Chairman HAYDEN. Yes.

EMPLOYEES IN WASHINGTON, D.C.

Senator BIBLE. When I asked you about your employees and you told me that you had so many permanent employees and so many temporary employees, how many employees are employed in Washington?

Mr. NASH. In Washington there are 380.

INDIAN CENSUS AND BUREAU EMPLOYEES

Senator BIBLE. Would you supply for the record the total Indian population of Nevada from the last census, or if you have it estimated up to 1964, as well as the reservation and nonreservation Indians; and furnish for the record the total number of Government employees that you have in Nevada and where they are located?

Mr. NASH. Yes, sir.

(The information referred to follows:)

Funds appropriated, fiscal year 1964 for the State of Navada

Appropriation and activity	Appropriated, 1964	Nevada agency, permanent positions, 1964
Education and welfare services:		
Educational assistance, facilities and services	$987,805	110
Welfare and guidance services	235,331	6
Relocation and adult vocational training	19,647	2
Maintaining law and order	67,644	8
Total	1,310,427	126
Resources management:		
Forest and range lands	29,984	3
Agricultural and industrial assistance	135,553	11
Soil and moisture conservation	88,000	10
Maintenance of roads	65,000	7
Management of Indian trust property	40,526	5
Repair and maintenance of buildings and utilities	234,100	13
Operation, repair, and maintenance of Indian irrigation systems	105,000	
Total	698,163	49
Construction:		
Buildings and utilities	20,000	
Irrigation systems	221,522	4
Total	241,522	4
Road construction (liquidation of contract authorization): Federal-aid highway roads	240,000	5
Grand total	2,490,112	184

NOTE.—Based on 1960 census there were 6,681 Indians in the State of Nevada. The 1962 estimate of the number of Indians living on reservations in Nevada is 4,168.

Chairman HAYDEN. I would suggest to the Senator from Alaska that he ask for the same information from Alaska, that is, the number of Indians, the number of Eskimos, and employees, and so on.

Senator BARTLETT. I have right now. Thank you for suggesting, that, Mr. Chairman. I do make that request.

(The information referred to follows:)

Based on the 1960 census there were 43,500 Indians, Eskimos, and Aleuts in the State of Alaska. The Bureau of Indian Affairs service population in Alaska in 1962 was estimated at 38,300.

Senator BARTLETT. And I would like to know the number of Government employees in Alaska and their responsibilities and your total budget.

(The information referred to follows:)

Funds appropriated, fiscal year 1964, for the State of Alaska, and permanent positions by districts

Appropriation and activity	Appropriated, 1964	Permanent positions, total	Permanent positions, 1964					
			Juneau district	Anchorage district	Bethel district	Fairbanks district	Nome district	Southeast district
Education and welfare services:								
Educational assistance, facilities and services	$7,513,063	462	198	15	98	54	93	4
Welfare and guidance services	1,726,087	33	15	7	3	5	3	
Relocation and adult vocational training	445,653	27	13	6	2	4	2

Total	2,164,542	118	51	19	19	11	18	
Construction: Buildings and utilities	6,736,700	12	12					
Road construction (liquidation of contract authorization): Federal-aid highway roads	570,000	2	2					
General administrative expenses	297,782	36	36					
Grand total	19,453,827	690	327	47	122	74	116	4

Senator BIBLE. Thank you very much, Mr. Commissioner. Thank you, Mr. Chairman.

NAVAJO SCHOOL ATTENDANCE

Chairman HAYDEN. It has been interesting for me to conduct these hearings over the years. We can recollect, as far as the Navajo is concerned, when it was most difficult to get them into school at all. The child was born and was supposed to help herd the sheep. He would not go to school at all. A change came over the situation in that reservation, which is larger than the State of West Virginia, and the Navajos are the largest tribe in the United States, when a number of young Navajos went into service during the war. A rather peculiar service that they performed, in Germany and as far as the Japanese were concerned, was they could go to the front and telephone back information in their own language and the Germans and Japanese had no way of finding out the information that they were conveying. They rendered an excellent service that way.

When they came back, having seen the world, they said that this goat meat diet is over with and we want to be like other people. That was the impetus that came from these veterans who had been in the war, to get the children into schools; they changed again at that point.

Chairman HAYDEN. The clerk will hand you a series of questions posed by Senator Mundt. Will you please prepare answers to them and place them in the record?

Mr. NASH. We will, sir.

(The information referred to follows:)

RESPONSES TO SENATOR MUNDT'S QUESTIONS

1. Would you bring us up to date on the status of the Rosebud Boarding School? Is the money included in the fiscal year 1965 budget sufficient to complete the job? I understand you intend to get the project out for bids sometime within the next few months. When is construction expected to get underway and what about completion?

Answer. The fiscal year 1964 appropriations provided $4 million for constructing the Rosebud School. The $600,000 included in the fiscal year 1965 budget is for furnishings, equipment, construction contingencies, and design costs, and is considered sufficient to complete the project. Bids for constructing the project are scheduled to be opened on March 26, 1964. It is estimated that construction work will start about April 15, and that the project will be completed about September 1, 1965.

2. At the time the Big Bend settlement for Lower Brule was made, the Senate deleted several items that were included by the House. The tribe still feels that they are entitled to a municipal center, a road from the new town of Lower Brule to the dam via Counsellor Creek and access roads. It is my understanding that the cost of the above facilities would total about $1 million. The tribe feels that the municipal center could double as a community meeting room, surplus commodity warehouse and facilities, space for post office, tribal courtroom, jail, and office space for tribal and Federal officials. These figures are included in Senate Report 1636 of the second session, 87th Congress. Do you have any plans for helping out here?

Answer. There is available from the Corps of Engineers $33,000 for the construction of a municipal center at Lower Brule. It is estimated that a building with a large meeting room, toilets, small kitchen, and an office could be constructed with these funds. A new building with courtroom and jail facilities has recently been completed at Fort Thompson and is adequate in size for both the Crow Creek Reservation and the Lower Brule Reservation for incarceration of prisoners. Regarding the road from Lower Brule to the dam, Indian Bureau Route 5 leads south from Lower Brule Village to the new State highway which crosses the dam.

The northern section of the road will be flooded by the reservoir, and we have requested that the Corps of Engineers should provide a 4.6 mile relocation from the village to Counsellor Creek. The Bureau will extend this improvement to the State highway.

While the Secretary of the Interior has determined, as provided in Public Law 87–734, that the Corps of Engineers should replace the flooded section of the road between Lower Brule Village and Counsellor Creek, the Corps of Engineers has refused to do so on the grounds that this is part of the road from the village to the dam which Senate committee report No. 1636 removed from H.R. 5144. The Bureau maintains that the road removed from H.R. 5144 was a road from Counsellor Creek to the dam and not the Lower Brule Village to Counsellor Creek Road. This matter has not been settled.

Report No. 1636 also removed the request for access roads. Inasmuch as there is no other way to provide these access roads, they will have to be constructed as part of the Bureau's regular road program.

3. It is my understanding that the Corps of Engineers has told the Bureau of Indian Affairs and the tribe that they won't construct the new town of Fort Thompson unless the tribe or someone comes up with $70,000 for a water tower. Do you know anything about this and can you give us some background? Isn't there some way that the Bureau could absorb the $70,000? Why was this decision made?

Answer. The Corps of Engineers estimates that the cost of constructing the water system for the Fort Thompson townsite will exceed the funds available for this work by $70,000. The Corps has offered to proceed with the work as far as available funds will permit and it is our understanding that the tribe has agreed to pass a resolution confirming this position. The Bureau does not have funds for this project and cannot absorb the $70,000 cost without reducing its program somewhere else.

4. I understand that the first phase of your building program at the Pierre Indian School has been completed and that your new dormitories are now in operation. It is also my understanding that you plan as phase 2 a classroom addition, remodeling of existing classrooms, renovation of the gymnasium, remodeling of a warehouse, and construction of quarters for employees. I have been informed that preliminary drawings for these facilities have been completed and that the total cost would be around $700,000. This is a high priority project and I am wondering what you have in this budget for it. Please give us a complete rundown on this project.

Answer. While the second phase of construction at Pierre School has received a high priority in the Bureau's construction program, funds have not been included for the construction in the fiscal year 1965 budget estimates now before the Congress.

Phase one, consisting of two 168-capacity dormitories, was completed in August 1963. The construction contemplated in phase 2 consists of the following, with the estimated cost indicated:

(1) A new five-classroom school addition with administrative office, school library, a home economics classroom, and one industrial arts shop. Estimated cost of $250,000.

(2) Remodel the existing classroom building to provide a new music room and for the conversion of the 10 existing 600-square-foot classrooms to 5 standard 900-square-foot rooms. Estimated cost of $50,000.

(3) Renovate the existing gymnasium by installing a new floor and repairing exterior and interior walls. Estimated cost of $40,000.

(4) Remodel one existing brick building into a maintenance shop, and a property and supply warehouse. Estimated to cost $30,000.

(5) Construction of 16 quarters for employees as replacement for obsolete quarters at an estimated cost of $320,000.

5. I have just received another letter enclosing petitions signed by a large number of citizens of Washabaugh County concerning a road being built on the Pine Ridge Reservation. Your engineer, Mr. Walker, is apparently surveying for the road which would run 8 miles east from where the Bureau's road junctions with State No. 73 east of Wanblee. I will give you these copies of the petition I have received and wonder if you would have someone look into the objections raised by these citizens and would furnish a report to my office.

Answer. The road extending 8 miles east from State Highway 73 near Wanblee on the Pine Ridge Reservation has not been scheduled for construction. We have asked our field office for a complete report on this matter, and Senator Mundt will be furnished with full details on this matter as soon as the report is received.

6. Our facility at Flandreau has been improved greatly over the recent years, but there still remains quite a bit to be done. I understand that you estimate an expenditure of just over $1 million there in 1965; $58,000 of this is construction work of one type or another. What is contemplated there and what is contemplated as far as repair and maintenance of existing buildings?

Answer. While considerable construction work has been completed at the Flandreau School, approximately $1,150,000 is still needed to complete the remaining items. The items yet to be done, with their estimated cost, are:

Fire station building	$50,000
Water treatment plant	125,000
Kitchen-dining building	275,000
Utility improvements	250,000
Employee housing	450,000
Total	1,150,000

None of the above is included in the fiscal year 1965 budget now before the Congress.

In fiscal year 1965 routine repair and preventative maintenance work to the existing buildings and utilities system will be accomplished as well as the construction of some new streets and sidewalks and landscaping of the school grounds. The construction mentioned is estimated to cost $58,000.

Question. Could you provide a report to my office on exactly what the extension agents are accomplishing in South Dakota for the $127,000 we provide each year as outlined on page 43 of your justifications?

Answer A maximum workload for an extension technician on an individual or family basis is about 200 families or a minimum staff would be about 1 technician per 1,000 population. In South Dakota there are 26,000 Indians living on or adjacent to the reservations. For $127,000 the South Dakota State College furnishes 15 technicians, who work on Pine Ridge, Rosebud, Standing Rock, Cheyenne River, Crow Creek, Lower Brule, and Sisseton Reservations. The major activities carried on by the extension agents, seven men and eight women are:

Individual home and ranch visits	3,700
Organized homemaker clubs	40
Membership in homemaker clubs	350
Number of 4–H clubs	134
Membership in 4–H clubs	1,700

Chairman HAYDEN. Also I have a number of questions which Senator Young wanted to ask. However, he is detained at another hearing. Will you also place responses to his queries in the record?

Mr. NASH. Yes, sir.

(The material referred to follows:)

RESPONSES TO SENATOR YOUNG'S QUESTIONS

Question. I note that your budget contains $688,000 for the construction of buildings and utilities in North Dakota during 1965. What would be the nature of these buildings, their cost, and where would they be located?

Answer. The fiscal year 1965 budget contains $688,000 for the construction of buildings and utilities in the State of North Dakota. Following is the information regarding the type of work proposed, their estimated cost and location.

Location	Type of work	Estimated cost
Fort Totten	Jail construction	$150,000
Fort Yates	do	250,000
Do	Quarters construction	228,000
Mandaree	Well and pumphouse	39,000
Fort Yates	Kitchen remodel	14,600
Great Walker	Fire escapes	6,400
Total		688,000

Question. I understand the Bureau of Indian Affairs proposes to raze one of the two old dormitories at the Wahpeton Indian School and later to construct an additional new one.

When do you expect you will need the new dormitory?

Answer. It is planned to raze one of the two existing old dormitories at Wahpeton. A new dormitory to replace the other old dormitory is in the Bureau's long-range construction program, but the time schedule for replacement has not been determined.

Question. What is the estimated cost of this dormitory, and how many children would it accommodate?

Answer. The proposed new dormitory is estimated to cost $540,000, and it will provide accommodations for 160 students.

Question. Were funds for this dormitory requested of the Bureau of the Budget?

Answer. A request for construction funds for the proposed dormitory was not made.

Question. The Turtle Mountain Chippewa are most anxious to have a tribal enrollment program undertaken. As I understand it, such a program will have to be undertaken in connection with the pending settlement of the Red Lake and Pembina claims?

Answer. A Turtle Mountain tribal roll was approved by the Secretary of the Interior in 1943, but this roll has not been properly maintained in the intervening period. Consequently, it is now out-of-date. The Bureau does not at present have sufficient enrollment staff to undertake this large responsibility without neglecting its efforts to compile rolls of claims beneficiaries, which must be regarded as having higher priority.

At the present time it is not clear whether updating the Turtle Mountain roll will be necessary in connection with the pending settlement of the Red La e and Pembina claims. While it appears quite probable that certain of the Indians affiliated with the Turtle Mountain Tribe may be eligible to share as beneficiaries in these claims, it is far from certain that this sharing will be based on their membership in the Turtle Mountain Tribe.

We have instructed the superintendent of the Turtle Mountain Reservation to assign work on this roll to members of his staff who will, of course, also have to perform other duties. This approach does not offer much possibility for completion of the roll in the near future.

Question. When do you anticipate starting this enrollment program, and how much do you anticipate it would cost?

Answer. As indicated previously, we are in a limited way undertaking work on the roll at present. To make a real start on the problem, we would have to employ at least one enrollment officer and one clerk at Turtle Mountain at an annual cost of $12,000. We believe that completion of the task would take more than 1 year.

Question. If funds were provided to initiate this program, how much would be required for fiscal 1965?

Answer. $12,000.

Question. From all reports the building housing the jail at Fort Totten is extremely old and very inadequate. What plans do you have for replacing this jail; and when do you anticipate you will be able to seek construction funds for this? How much will it cost?

Answer. At Fort Totten the old laundry building which was converted to a jail is in very poor condition and is inadequate for the prisoner load. Funds amounting to $150,000 for the replacement of this jail are in the fiscal year 1965 budget request.

Chairman HAYDEN. If there is no further business, this committee will recess until February 24 when we will take up the Bureau of Outdoor Recreation and the National Park Service.

Thank you for appearance.

(Whereupon, at 11:25 a.m., Friday, February 21, 1964, the committee recessed, to reconvene at 10 a.m., February 24, 1964.)

29-120—64——16

DEPARTMENT OF INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR 1965

MONDAY, FEBRUARY 24, 1964

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met at 10 a.m., pursuant to recess, in room 1223 of the New Senate Office Building, Hon. Carl Hayden (chairman) presiding.

Present: Chairman Hayden, Senators Bible, McGee, Bartlett, and Mundt.

DEPARTMENT OF THE INTERIOR

BUREAU OF OUTDOOR RECREATION

STATEMENT OF EDWARD C. CRAFTS, DIRECTOR, BUREAU OF OUTDOOR RECREATION; ACCOMPANIED BY LAWRENCE N. STEVENS, ASSOCIATE DIRECTOR; AND HARRY W. RICE, CHIEF, DIVISION OF ADMINISTRATION

FISCAL YEAR 1965 BUDGET PRESENTATION

Chairman HAYDEN. The committee will be in order. For fiscal year 1965, the Bureau of Outdoor Recreation proposes a budget of $2,700,000, an increase of $800,000 over the appropriation for fiscal year 1964. The justification for this estimate will be included in the record.

(The statement referred to follows:)

SALARIES AND EXPENSES HIGHLIGHT STATEMENT

In order to promote the coordination and development of effective programs relating to outdoor recreation, the Secretary of the Interior in April 1962, established the Bureau of Outdoor Recreation. The Bureau has since been given a charter by the Congress in the passage of the act of May 28, 1963 (77 Stat. 49), which states in part:

"* * * That the Congress finds and declares it to be desirable that all American people of present and future generations be assured outdoor recreation resources, and that it is desirable for all levels of government and private interests to take prompt and coordinated action to the extent practicable * * * to conserve, develop, and utilize such resources for the benefit and enjoyment of the American people."

This statement of congressional policy is the foundation on which the Bureau builds its programs.

The Bureau is requesting a total of $2,700,000 for 1965, an increase of $800,000 over the amount appropriated in fiscal year 1964. The increase is needed for work on the nationwide recreation plan, to assist the States in developing statewide plans, to investigate special areas being considered for recreation development, and to strengthen the Bureau's coordinating function, particularly in the review of programs, budgets, and legislation of other Federal agencies.

The Bureau's program for 1965 is based on the ultimate objective of providing adequate outdoor recreation opportunities to meet the needs of the public. It is essential that action be taken now toward providing for the future more and better outdoor opportunities so that the Nation's citizens may use their leisure hours in the pursuit of constructive and healthful outdoor activities. Increases in population, leisure time, personal income, and mobility have combined to greatly expand the demands for outdoor recreation. The Congress has recognized that action in this field is a public as well as private responsibility.

Most outdoor recreation areas now are overcrowded and inadequate to meet current demands, and these demands are increasing at a very rapid rate. With the Nation's population expected to reach 350 million by the year 2000, just 37 years from now, it is important that immediate action be taken. The increase in demand is illustrated in the following tabulation which compares visitations to certain areas in 1952 and in 1962:

[In millions]

Areas	Number of visitations		
	1952	1962	Percent increase
Corps of Engineers water projects	30.0	126.7	322
Forest Service areas	33.0	112.8	242
National Park Service areas	47.4	97.0	105
National wildlife refuges	4.3	10.9	153
Tennessee Valley Authority projects	19.8	45.0	127
Bureau of Reclamation projects	7.7	27.0	251
State parks	149.3	284.8	91

The population of the United States stood at 184,970,000 in 1962, an increase of 28,577,000 or 18 percent over 1952. The above table illustrates that participation in outdoor recreation activities by the public is increasing at a far greater rate than the population growth. This fact adds emphasis to the need for concerted action in increasing outdoor recreation opportunities.

Current annual expenditures by participants in all phases of outdoor recreation total about $20 billion. Such a sum has a definite impact on the economy of the Nation. As an indication of its magnitude, the $20 billion annual expenditures for outdoor recreation participants approximate the annual expenditures for education in all of the Nation's elementary and secondary schools.

One of the primary functions of the Bureau, and the one which has top priority, is to formulate and maintain a comprehensive nationwide recreation plan. The funds requested for 1965 will allow the Bureau to accelerate the preparation of such a plan so as to meet the deadline set by Congress for its completion. This plan will identify current and future demand for outdoor recreation throughout the country, the resources currently available and those potentially available for the future, and will include recommendations as to how the needs can be met most effectively. The nationwide recreation plan will be built, in a large part, on plans developed by States. For this reason, the Bureau will give increased assistance to the States in the development of their plans.

Heretofore, assistance has been furnished to States covering a wide range of service-type activities. The Bureau proposes to discontinue furnishing such service-type activities to State and local agencies, as well as Federal agencies, and concentrate its efforts on the development of the nationwide recreation plan and to strengthening its program of Federal coordination.

The Bureau will be faced with a heavy load in reviewing special areas that offer outstanding recreation potential. In addition to areas presently scheduled for study, it is expected that data developed under the nationwide recreation plan will pinpoint other areas that should be reviewed carefully. This phase of the Bureau's program has a special sense of urgency, because if action is not taken soon to preserve these areas for recreation, they will be lost forever for that purpose either by preemption for other use or by becoming prohibitively expensive.

The Bureau will strengthen its Federal coordination function and will assist the Secretary in carrying out responsibilities assigned to him by the President under Executive Order 11017, issued April 28, 1962. That order directed the Secretary, in consultation with other members of the Recreation Advisory Council, to develop methods and procedures for improved interagency coordination in the

development and carrying out of national outdoor recreation policies and programs.

The Bureau has initiated a comprehensive approach to Federal coordination. In accordance with the authority in the act of May 28, 1963, the Bureau will commence an intensive review of the authorities, functions, programs, budgets, operations, and proposed legislation of Federal agencies engaged in outdoor recreation activities.

The Bureau will prepare a comprehensive report encompassing the recreation activities of the entire Federal Government. This report will point out overlaps and gaps in the Federal effort, effectiveness of Federal expenditures, omissions and conflicts in Federal policy, and recommend any adjustments that are believed to be needed in administrative responsibility, budgets, policy clarification, Federal-State relations, and legislative needs. The new approach to Federal coordination will provide the Congress and the executive branch of the Government with data on which to make basic policy decisions.

Through its program of Federal coordination, the Bureau has a unique opportunity to contribute to the efficiency of Federal Government operations. For example, about $100 million are expended annually for acquisition of recreation lands or lands that have recreaction capabilities. Large sums are spent for recreation research and for operation and maintenance of recreation facilities. The Bureau is the one agency in the Federal Government where all projected expenditures for outdoor recreation activities can be summarized and reviewed by specialists in this field. This has never been done before although the Bureau did accumulate and review proposed Federal expenditures for fiscal year 1965–66 for outdoor recreation land acquisition and for research.

It is estimated that all agencies of the Federal Government expend an estimated $300 million annually in programs directly related to outdoor recreation. The need for an impartial review of these programs is obvious. The Bureau's total request for funds is less than 1 percent of this figure.

The Bureau will devote efforts to recreation planning in river basins and at water resource projects mainly on a reimbursable basis from other agencies. These areas offer tremendous potential for meeting the needs of the public for water-oriented recreation. These studies will be conducted in most instances as part of the comprehensive river basin review being conducted by various Federal agencies under coordinated direction and will contribute to the nationwide planning effort. The Bureau also will give attention to improving methods for determining and evaluating recreation benefits and cost allocations on Federal reservoir projects.

The Bureau will assist to a very limited degree, educational institutions and others in establishing education programs and activities and to encourage public use and benefits from outdoor recreation. To this end, planning has been initiated for holding a national conference on outdoor recreation education in July 1964 under the joint sponsorship of Syracuse University; State University of New York, College of Forestry; and the Bureau of Outdoor Recreation.

The increase requested for fiscal year 1965 is needed if the Bureau is to meet the deadline imposed by Congress on the submission of the nationwide recreation plan and if it is to carry out an effective Federal coordination program. The Bureau has lacked adequate manpower to handle its work. A recent recapitulation shows that over 27,000 hours of uncompensated overtime have been worked by the Bureau's small staff since January 1, 1963, yet over 400 requests for technical assistance have been rejected; and $75,000 worth of needed travel has not been made. We firmly believe that through its planning and coordinating role the Bureau can save the Government the amount of the Bureau's budget request many times over.

Salaries and expenses

Appropriation, 1963:	
Transferred from "Management and protection, National Park Service" pursuant to Reorganization Plan No. 3 of 1950	$1,101,096
Supplemental appropriation	100,000
Total available, 1963	1,201,096
Appropriation, 1964	1,900,000

SUMMARY OF INCREASES AND DECREASES, 1965

Planning and cooperative services:	
To provide for increased pay costs for fiscal year 1964 positions	30,000
To provide for salaries and other expenses for expansion of work on the nationwide recreation plan; assisting States in developing statewide plans; and conducting or coordinating studies of specific areas to determine their recreation potential	340,000
Coordination, education, and research:	
To provide for increased pay costs for fiscal year 1964 positions	14,000
To strengthen the Federal coordination function by making comprehensive studies of proposed outdoor recreation programs and expenditures of other Federal agencies so as to minimize duplication, clarify policies, recommend where dollars can be saved, and where legislation may be needed	416,000
Net increase, 1965	800,000
Budget estimate, 1965	2,700,000

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
1. Planning and cooperative services	$848,601	$1,230,000	$1,600,000	$370,000	$30,000	$340,000
2. Coordination, education, and research	350,732	670,000	1,100,000	430,000	14,000	416,000
Unobligated balance lapsing	1,763					
Total	1,201,096	1,900,000	2,700,000	800,000	44,000	756,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

1. Planning and cooperative services

Subactivity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Planning and surveys	$548,601	$735,000	$1,093,000	$358,000	$18,000	$340,000
(b) Cooperative services	300,000	495,000	507,000	12,000	12,000	
Total	848,601	1,230,000	1,600,000	370,000	30,000	340,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

(a) *Planning and surveys*

The estimate for 1965 is $1,093,000, an increase of $358,000 over 1964. The increase includes $18,000 for pay costs and $340,000 for program responsibilities.

Need for increase.—The increase requested is to provide for salaries and other expenses for expansion of work on the nationwide recreation plan, mainly at the

regional level and for conducting or coordinating studies of specific areas to determine their recreation potential.

Plan of work.—Under the act of May 28, 1963 (77 Stat. 49), the Bureau has responsibility for formulating and maintaining a nationwide outdoor recreation plan, taking into consideration the plans of the various Federal agencies, the States, and their political subdivisions. The nationwide recreation plan will evolve in large part from the planning programs of Federal agencies, of States and their political subdivisions, and of private groups. The Bureau will maintain contact with these groups and obtain from them all data that are usable rather than duplicate that which is available.

The plan will set forth the needs of the American people for outdoor recreation of all kinds and the current and foreseeable availability of resources to meet these needs. It will recommend the actions that should be taken at each level of government and by private interests to provide adequate outdoor recreation opportunities.

The act of May 28, 1963, which was enacted to promote the coordination and development of effective programs relating to outdoor recreation, provides that the nationwide plan shall be prepared as soon as possible for submission to Congress but no later than 5 years from the date of the act. The Bureau's goal is to have a complete plan ready by January 1967 for submission to the President and to the Congress.

The inventory and classification phases of the nationwide plan, aside from other phases, will involve the collection, tabulation, and organization of at least 25 items of information concerning many thousands of existing and potential urban and nonurban outdoor recreation areas. Also involved will be the collection of data on recreation "demand" broken down into approximately 5,000 units, and on administrative agencies broken down into some 2,000 units. Studies made in prior years will be updated and new studies undertaken to provide current and meaningful information for inclusion in the plan. In order to handle this volume of material in the most efficient and effective manner, and to interplay these major components in determining means to meet growing recreation needs, the use of automatic data processing techniques and equipment becomes essential.

Since its creation, the Bureau has been engaged in conducting or coordinating studies of specific areas to determine whether the areas should be managed for public outdoor recreation purposes and, if so, to recommend the suitable types of development, and the proper agency and level of Government to administer the areas. Desirable outdoor recreation areas are fast disappearing for other purposes, and the Bureau realizes the urgency of moving ahead in this program. The Bureau has made studies or participated in studies of a significant number of areas in the past years to review their recreation potential. Some of the more important ones include Assateague Island off the coast of Maryland; Fire Island, N.Y., Allagash River, Maine, Northern Cascades in Washington, and Whiskeytown-Shasta-Trinity area, California. There are at least 30 areas proposed by one group or another for establishment as national parks, national lakeshores, national seashores, national rivers, or national recreation areas. Reports have been submitted to Congress on about one-third of these areas recommending that they be established.

During fiscal year 1965, it is estimated that about a dozen studies of special areas will be made. In the past, these studies have been based on requests from the Secretary of the Interior, the Recreation Advisory Council, the Secretaries of the Interior and Agriculture jointly, and sometimes from Members of Congress. The studies vary in scope and complexity. Some are handled by the Bureau staff alone, others are joint projects with other agencies, both Federal and State.

Status of planning and surveys program.—A comprehensive manual of instructions has been prepared setting forth the procedures for developing the nationwide recreation plan, and a systems analysis is being undertaken in cooperation with the Bureau of Standards for assimilating the necessary information by means of automatic data processing techniques and equipment. Preliminary work has commenced to implement the plan. Maps are being accumulated and existing areas are being plotted. Data available from ORRRC, from Federal agencies, and from States are being screened with the view toward using all that is meaningful. The development of the nationwide recreation plan ranks among the first in order of priority over other Bureau responsibilities.

To illustrate the types of studies in which the Bureau concerns itself, comments follow on two joint projects recently undertaken:

1. The Departments of the Interior and Agriculture have cooperated in a study of over 60 of the Nation's free-flowing rivers to define the need to protect and

conserve a share of these rivers, or portions thereof, in their natural, free-flowing condition. A study team has selected sections of 12 rivers with outstanding recreation potential for additional detailed study. These studies could lead to designation of a nationwide system of free-flowing portions of rivers.

The segments of rivers selected for detailed study include the three forks of the Flathead in Montana, the Skagit and its Sauk and Suiattle tributaries in Washington, the Rogue in Oregon, and the Klamath in California, the Rio Grande in New Mexico, the Upper Green in Wyoming, and the Niobrara in Nebraska.

Also selected are the St. Croix and Namekagon in Minnesota and Wisconsin, the North Branch of the Susquehanna in New York and Pennsylvania, the upper Hudson in New York, the Big South Fork of the Cumberland in Kentucky and Tennessee, and the headwaters of the Savannah in North Carolina, South Carolina, and Georgia.

2. Another joint project of considerable scope and complexity has been undertaken by the Bureau. This is the Lewis and Clark Trail plan. It involves the conservation, recreation, historic, and fish and wildlife values in 10 States along the route of the famous expedition from St. Louis to the Pacific. The Bureau is conducting this study in cooperation with the Departments of Agriculture, Army, Commerce, other Interior bureaus, the 10 States along the trail, and with local and private interests.

The purpose of the project is to formulate a plan by which the resources of the trail can best be identified, developed, and made accessible for public use. This project has received strong encouragement from Congress through passage of a joint resolution. Planning activities are underway, and field studies are scheduled to commence in early 1964. A final report will be available in 1965.

(b) Cooperative services

The estimate for 1965 is $507,000, an increase of $12,000 over 1964, which is for pay costs.

Plan of work.—The Bureau has changed the emphasis on its assistance to States. Until recently, attempts were made to comply with all requests for assistance from States, counties, and cities. Assistance ranged from broad-scale planning of potential areas to providing advice on financing and operation problems. The Bureau could not meet these demands with available staff and further concluded that such detailed service-type of assistance was not its proper role. Accordingly, it has restricted its services to States to the development of statewide plans. Special attention will be given to the efforts of States in developing State plans and the Bureau will provide technical assistance to the extent of available manpower in helping the States with their plans. Benefits from State plans are twofold: (1) State plans will be of substantial benefit in the development of the nationwide recreation plan; and (2) an approved State plan will be a prerequisite to a State obtaining financial assistance under the land and water conservation fund legislation now pending in the Congress.

The statewide plans will, in effect, be the building blocks for the development of the nationwide plan, and both the Federal Government and the States will benefit from a coordinated approach to this matter. The Bureau also will encourage States to provide personnel to work with local and private agencies in developing the statewide outdoor recreation plans. The development of statewide plans will involve all State and local agencies providing outdoor recreation as well as the private sector. This coverage will include about 500 State recreation and resource agencies concerned with forestry, land use, water, and fish and game.

Most States are giving increased attention to meeting the demands for outdoor recreation areas. A growing number of State legislative bodes are appropriating more funds, authorizing bond issues, and taking other actions to meet these demands. The increase in interest and activity at the State and local levels should be of material assistance in meeting the long-range objective or providing adequate outdoor recreation areas to meet demands.

The work to be performed under this subactivity also involves the provision of technical assistance to Federal agencies which is required by law. For example:

1. Title VII of the Housing Act of 1961 has as its purpose the curbing of urban sprawl, the preservation of more open space, and the aiding of States and local governments in providing recreation, conservation, and scenic areas within urban complexes. This act authorizes the Administrator of HHFA to make grants to assist in carrying out the purpose of the act. The act provides that the Administrator shall consult with the Secretary of the Interior on the general policies to be followed in reviewing applications for grants, and that the Secretary of the Interior shall furnish him appropriate information on the status of recreation

planning for the areas to be served by the open-space land acquired with the grants.

The Secretary's responsibilities have been delegated to the Bureau of Outdoor Recreation. Funds requested for fiscal year 1965 will be used in part to meet the requests of HHFA for assistance.

2. For a period of 20 years, the Bureau is by law responsible for enforcing compliance with the terms and conditions in the deeds of transfer of Federal surplus real property acquired for park and recreation use. This is accomplished for all properties (255 in August 1963) by review of the grantees' biennial reports and periodic inspections. Additionally, on occasion a grantee requests permission to grant an easement or right-of-way or authorization to enter into a lease with a concessionaire for the operation of certain facilities. In some instances, the grantee requests abrogation of the conditions of the deed upon payment of the unamortized balance. Such a request must be carefully reviewed to determine the desirability of the proposal and whether the granting of the request would be in conformance with the requirements of law. These requests require a great amount of time and expense to determine whether the grantee is meeting the requirements of law. An increased number of transfers is creating a heavy workload in field inspections, contacting local officials (both past and present to secure a complete analysis) and in reporting facts.

3. Other Federal agencies seeking technical assistance of substantial magnitude will be asked to reimburse the Bureau for such assistance.

Status of cooperative services program.—Contacts have been made with the Governors of all States, pointing out the functions and objectives of the Bureau, and all but one State have designated an individual State official to serve as liaison with the Bureau. Many States already have funds available or are taking action to obtain financing for outdoor recreation purposes. Also, the States have been informed that technical assistance will be limited to the development of statewide plans. Guidelines have been developed by the Bureau for use of States in preparing statewide plans.

During prior years, technical assistance on various aspects of outdoor recreation programs has been given to States and local agencies on an average of about 500 occasions annually. While substantial manpower will continue to be devoted to State assistance in 1965, it will be directed primarily to the development of the statewide plans.

The latest available reports indicate that about 165 compliance reviews will be made to determine that the property is being used for park or recreation purposes.

2. Coordination, education, and research

Subactivity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Federal coordination	$295,732	$595,000	$1,022,000	$427,000	$11,000	$416,000
(b) Research and education	55,000	75,000	78,000	3,000	3,000	
Total	350,732	670,000	1,100,000	430,000	14,000	416,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

(a) *Federal coordination*

The estimate for 1965 is $1,022,000, an increase of $427,000 over 1964. The increase includes $11,000 for increased pay costs and $416,000 for program expansion.

Need for increase.—The increase requested is needed to enable the Bureau to strengthen its coordination function of reviewing programs, including specific projects, information services, budgets, operations, and legislative proposals, of some 20 Federal agencies with the objective of achieving coordination on a national basis with respect to outdoor recreation programs. These program reviews will seek effective methods of obtaining the greatest recreation value for each dollar expended.

Plan of work.—Reviews will be made of the programs, budgets, proposed legislation, authorities, functions, and operations of some 20 Federal agencies (natural resources and other) engaged in outdoor recreation activities. Agencies which are directly concerned with Federal outdoor recreation resources programs and

with which the Bureau will be working in correlating the planning for the development of the full recreation potential of their projects include, among others, the Corps of Engineers, the Tennessee Valley Authority, several agencies of the Department of Agriculture, and agencies of the Department of the Interior, such as the National Park Service, the Bureau of Reclamation, and the Bureau of Sport Fisheries and Wildlife. This correlation will also apply to programs of Federal agencies not involved directly in the management of natural resources but which have programs of significant importance to recreation—such as Public Health Service, Bureau of Public Roads, Area Redevelopment Administration, General Services Administration, and Small Business Administration.

The Bureau is making a definite change in emphasis in carrying out its coordinating responsibilities. Heretofore the Bureau has generally limited its coordinating functions to drafting policy statements for consideration by the Recreation Advisory Council by developing memorandums of agreement between Federal agencies, by joint task force reviews with other Federal agencies (Northern Cascades, as an example), and by analyzing the proposed outdoor recreation expenditures of Federal agencies for fiscal year 1965 for land acquisition and for research. It has also carried out part of its coordinating function by providing service-type recreation planning assistance to many Federal agencies.

The Bureau has initiated and will carry forward into fiscal year 1965 a comprehensive approach to Federal coordination. In accordance with the authority in the act of May 28, 1963, the Bureau will commence an intensive review of the authorities, functions, programs, budgets, operations, and proposed legislation of Federal agencies engaged in outdoor recreation activities.

Attention will be given to the question of whether Federal recreation programs are providing the quantity and type of outdoor recreation resources in the localities where the need exists. The review of Federal agencies' activities will be related to the data that is being compiled for the nationwide recreation plan.

The Bureau expects to prepare as a major effort within a year or two a comprehensive report encompassing the recreation activities of the entire Federal Government. This report will point out overlaps and gaps in the Federal effort, effectiveness of Federal expenditures, omissions and conflicts in Federal policy, and recommend adjustments that are believed to be needed in administrative responsibility, budgets, policy clarification, Federal-State relations, and legislative needs.

During 1965 an effective program of review of Federal agencies' publications dealing with outdoor recreation will be in operation to minimize duplication and overlap and to bring into being more effective publications which will serve to inform the public on pertinent outdoor recreation matters. It is hoped that by combining the efforts of the several agencies with respect to informational materials, that the information needed by the public on locations and types of recreation areas and facilities may be made available more effectively.

During fiscal year 1965, the Bureau will be involved, on a reimbursable basis, in conducting studies of and coordinating the recreation aspects of some of the Nation's major river basins. The increased attention devoted to this matter and the need to reduce overlapping activities result in part from the interest expressed by the Senate Appropriations Subcommittee on Public Works.

Another function performed under this subactivity is the provision of the necessary staff assistance to the Recreation Advisory Council. This Council was established by Executive Order 11017, issued April 28, 1962. The order states in part as follows:

"The Secretary of the Interior, in consultation with the other members of the Council, shall be responsible for developing methods and procedures for improved interagency coordination in the development and carrying out of national outdoor recreation policies and programs."

The principal responsibility for supplying staffwork on Recreation Advisory Council assignments rests with the Bureau of Outdoor Recreation. Depending on the nature of the assignment undertaken at the request of the Council, professional assistance is quite frequently obtained from other departments or agencies. For example, assignments in the fields of public health, water pollution, and scenic highways during fiscal year 1964 required the assignment of competent personnel from the Departments of Health, Education, and Welfare, and Commerce.

Utilizing the guidelines set forth in the Recreation Advisory Council's national recreation policy paper which should be approved in the next few months, and the information gained from budget and program review and interagency coordination activities, work is expected to be undertaken at the Council's request

in developing procedures and guidelines on the several areas of policy consideration including—

1. Development of regulations for charging fees for the recreational use of Federal land and waters;

2. Development of standardized methods for measuring recreational use of Federal areas.

Status of Federal coordination program.—The Bureau completed a review of the budgets of Federal agencies for fiscal year 1965 and submitted to the Bureau of the Budget an analysis of its findings.

The review for 1965 was limited to proposed expenditures for Federal land acquisition and research. The analysis related acquisitions of lands by regions for the period under review (1963–66) to demands for outdoor recreation areas in the same regions. The analysis revealed that proposed land acquisitions in some regions would more than meet the demands for outdoor recreation areas in those regions in the foreseeable future.

The Bureau is presently involved in studies of several major river basins for the Corps of Engineers, Bureau of Reclamation, and Public Health Service dealing with aspects of outdoor recreation directly related to programs of those agencies. Most of this work will be financed from funds made available by these agencies.

The Bureau has commenced the preparation of working procedures to be used in carrying out the new comprehensive approach to Federal coordination. This plan will provide the Washington and field employees with specific guidelines for accomplishing this mission.

(*b*) *Research and education*

The estimate for 1965 is $78,000, an increase of $3,000 over 1964, all of which is for pay costs.

Plan of work.—The small staff assigned to research functions will devote their efforts to supporting the development of the nationwide recreation plan and to assisting in the review of programs, budgets, and operations of Federal agencies engaged in outdoor recreation, with particular emphasis on Federal agencies' research programs.

There is a real need for the advice and assistance of research-oriented personnel in developing the nationwide recreation plan. Attention must be given to trends in population, income, mobility, and other factors affecting the present and future demands of the public for outdoor recreation, and to devising the best means of relating the demand to the present and potential supply of outdoor recreation opportunities.

The small research staff also will be of valuable assistance in carrying out the new approach to Federal coordination. Millions of dollars are expended by Federal agencies in research programs related directly or indirectly to outdoor recreation activities. These programs need to be reviewed under the same criteria that will be followed in reviewing other outdoor recreation programs.

Because the Bureau has decided to concentrate its efforts in developing the nationwide recreation plan and in conducting a comprehensive Federal coordination program, its staff will not engage in the conduct of specific research projects not related directly to these two functions.

Also, the Bureau will not be able to assist in establishing outdoor recreation education programs and activities in educational institutions other than on a very limited basis. Its educational activities will be limited mainly to co-sponsoring with Syracuse University and the State University of New York College of Forestry a national conference on outdoor recreation education in July 1964.

Status of research and education program.—The Bureau, in cooperation with the University of Michigan, held the First National Conference on Outdoor Recreation Research at Ann Arbor, Mich., in May 1963. The proceedings of the Conference, which dealt with important facets of outdoor recreation research, have been printed by the university and distributed to agencies and individuals concerned.

Information on outdoor recreation research programs of other Federal agencies and their proposed expenditures for fiscal year 1965 was obtained, analyzed, and included in a report to the Bureau of the Budget. Also, statistics on State activities in outdoor recreation were compiled and are being printed. These data include information covering acreage used for recreation, types of usage, expenditures, and other pertinent material.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Program and financing:				
Total obligations	$1,199,333	$1,900,000	$2,700,000	$800,000
Unobligated balance lapsing	1,763			
Appropriation	100,000	1,900,000	2,700,000	800,000
Transferred from "Management and protection, National Park Service"	1,101,096			
Obligations by objects:				
11 Personnel compensation	868,092	1,460,000	1,818,000	358,000
12 Personnel benefits	59,030	110,000	138,000	28,000
21 Travel and transportation of persons	77,243	130,000	195,000	65,000
22 Transportation of things	11,455	15,000	20,000	5,000
23 Rents, communications, and utilities	27,342	55,000	79,000	24,000
24 Printing and reproduction	27,330	45,000	65,000	20,000
25 Other services	35,908	15,000	287,000	272,000
Services of other agencies	29,400	25,000	35,000	10,000
26 Supplies and materials	14,410	15,000	25,000	10,000
31 Equipment	49,123	30,000	38,000	8,000
Total obligations	1,199,333	1,900,000	2,700,000	800,000

Chairman HAYDEN. Mr. Crafts, you may present your statement to the committee as you desire.

Mr. CRAFTS. Thank you, Senator Hayden. It is a pleasure to appear before you again this year. On my right is Mr. Stevens, the Associate Director of the Bureau, and on my left is Mr. Rice, Chief, Division of Administration of the Bureau.

I would like to brief my statement, Senator Hayden.

Chairman HAYDEN. Do that and let it appear in full in the record.

(The statement referred to follows:)

HIGHLIGHTS STATEMENT OF EDWARD C. CRAFTS, DIRECTOR, BUREAU OF OUTDOOR RECREATION

Mr. Chairman and members of the committee, this is only the second time that this Bureau has come before your committee to request funds for its operations. The Bureau of Outdoor Recreation, as you know, is a small, new Federal office created in April 1962, by President Kennedy in accord with one of the major recommendations of the Outdoor Recreation Resources Review Commission.

That Commission was a bipartisan one created by Congress. It was made up of four Members of the House, four Members of the Senate, and seven Presidential appointees. One of its recommendations was for a small Federal bureau to coordinate Federal activities in outdoor recreation, to serve as a focal point between the Federal Government and the States, and to provide assistance to other levels of government and the private sector. It was thus that we came into being.

ORGANIC ACT

Since we appeared before you a year ago, Congress has enacted a significant statute, Public Law 88–29, commonly referred to as the organic act for the Bureau of Outdoor Recreation. This act established a congressional policy that it is desirable for all levels of government and private interests to take prompt and coordinated action to develop and use outdoor recreation resources for the benefit of the American people. Thus this activity has been recognized by the Congress as a public responsibility.

That act likewise authorized a number of specific functions.

It directed the Secretary of the Interior to prepare within 5 years for transmittal to the Congress a comprehensive nationwide outdoor recreation plan.

It authorized technical assistance to States and to the private sector. It authorized research and the sponsorship of research. It authorized cooperation with educational institutions in establishing their programs and curriculums. It authorized cooperation with Federal agencies and promotion of coordination of Federal recreation plans and activities in all departments and agencies.

It further included a directive that the Federal departments and agencies carry out their activities in outdoor recreation in conformance with the nationwide plan when it is completed.

The question now remains as to what extent Congress wishes to implement the policies, directives, and authorities above referred to by making funds available to carry them out.

Realinement of Activities

During the first year of our operations, we had $1.1 million made available to us from funds previously appropriated to the National Park Service. We also received a supplemental appropriation of $100,000. In the current fiscal year, Congress appropriated $1.9 million. We are requesting $2,700,000 for fiscal year 1965.

During the present year, particularly since the passage of the organic act last May, we have started to initiate the activities authorized, develop programs of work, and establish priorities.

Difficulties have been encountered in many respects. Perhaps the foremost is that we have found that there was a great demand by other Federal agencies, the States and their political subdivisions, and by private groups of all sorts for service-type consultation and advice on a nonreimbursable basis. We have received hundreds of requests for choreboy service-type activities, the results of which the recipient can elect to accept or ignore as he sees fit.

At first we tried to be responsive. But this Bureau was created as a policy-making, planning, and coordinating office, not as a service agency. So, within recent months, there has been a major realinement of our thinking. We have decided that within the fund limitations presently imposed, as well as within those that may be reasonably expected next year, we should cut out the multitude of nickel and dime activities that we could undertake and that would dissipate our meager strength. Instead, we believe that we should concentrate on two and only two major undertakings authorized in the act. We think such concentration would result in consequential progress and better service to the American public.

We have decided, therefore, to limit our activities largely to (1) aggressive preparation of a nationwide outdoor recreation plan, including assistance to States in the preparation of statewide plans that will fit into the national plan, and (2) coordination of outdoor recreation activities among the numerous Federal agencies involved.

This means that we have decided for the time being to deemphasize certain activities specifically authorized by the Congress in our organic act. These include, for example, research and the sponsorship thereof, informational activities, cooperation with educational institutions, technical assistance to the States other than statewide planning, technical assistance to the private sector, and service-type activities to the other Federal agencies.

I cannot underscore too strongly that this drawing in and concentrating on two primary activities has been a major, and I might add, a painful program decision. The activities that we are deemphasizing temporarily are extremely important. I hope in time our facilities will be sufficient to undertake these other responsibilities authorized by the Congress, but at present they are not.

Requested Increase for Fiscal Year 1965

We are requesting a total appropriation for fiscal year 1965 of $2.7 million. This is an increase of $800,000. It can be interpreted as a 42-percent increase. On the other hand, it is substantially less than the level where I have said all along this Bureau should ultimately stabilize. It is only $200,000 more than was requested by the administration a year ago.

This request has been held firm by the administration throughout the rigid budget reconsiderations that occurred in December when the budget was being finally formulated.

The question simply is: Does this committee and the Congress wish to implement the authorities of the act of May 28, 1963, to the extent of $2.7 million and thus permit at least a partial program?

Under such a level of financing, we would conduct two principal activities as follows:

NATIONWIDE PLANNING

There would be placed in this activity $370,000 of the requested $800,000 increase. We would carry out the first year of developing the nationwide outdoor

recreation plan. This will include a detailed appraisal of total recreation demands, an inventory of recreation resources and the measurement of recreation needs that can be reasonably met, along with indicated responsibilities between Federal, State, and local governments and the private sector. Here, also, we will render such assistance as we can to States and encourage the development of statewide plans with State funds.

We have about completed guideline manuals for both the nationwide and State plans.

Certain specific projects are included as phases of the nationwide plan. These include the Lewis and Clark Trailway or Sailway study underway in cooperation with 10 States to commemorate the Lewis and Clark Expedition. This study should be completed during the coming year and will result in a recommended program of coordinated State and local action with a minimum expenditure of Federal funds and possibly recommendations for legislation to establish a voluntary coordinating commission.

Another project is a study which, when completed, may recommend that certain segments of the Nation's rivers be preserved in their free-flowing and relatively undeveloped status. Segments of about 15 rivers are now undergoing intensive investigation. This phase, likewise, should be completed next year.

A few specific areas will be studied and some perhaps recommended to the Congress for establishment as national recreation areas or seashores, such as Fire Island on the coast of Long Island, Assateague on the Maryland-Virginia coast, and the Allagash area in northern Maine. There are others that can be named, but these are illustrative.

You may ask why the country needs a nationwide outdoor recreation plan. One answer is that the Congress directed that it be prepared. A more substantive answer is that the Federal Government is currently spending over $300 million a year on recreation and the States and private sector are spending much more. The consumer is spending $20 billion a year, or more than is spent for primary and secondary school education. Recreation is a major element in the economy of many States. With this amount of money involved, some consistent and systematic approach to the activity is obviously needed. Furthermore, looking 30 years ahead, population is expected to double; recreation experiences will at least triple; the 30-hour week may be common, resulting in more leisure time; income will be higher; and highways will be spread all over the land. Outdoor recreation is extremely popular and will be a major way in which the growing population will use its increased income and its expanding leisure time. The country needs to start planning for this now.

FEDERAL COORDINATION

It is proposed to place $430,000 of the requested $800,000 in the Federal coordination activity. Here, too, this work will include several aspects as described below.

The major undertaking will be the initiation of a comprehensive overall analysis of the outdoor recreation programs and activities of the some 20 Federal agencies now active in this field. This will include both the land and water managing agencies, as well as those having a less direct but nontheless very significant role in the overall picture. Our concept is that, in order to effectively promote Federal coordination, a study should be made of the program activities of those agencies, the expenditures of funds in this field, the areas where policies conflict and where policies have not been formed. There should be prepared for the consideration of the Executive Office of the President, the Recreation Advisory Council, and the Congress an overall review of Federal work in outdoor recreation with recommendations as to resolution of policy conflicts, formulation of policies where none exist but are needed, suggestions as to legislative action that may be needed and where savings may be made or additional expenditures are needed. This is a major undertaking and cannot be completed in 1 year.

We believe there is a need for a program of scenic roads and highways to supplement the Interstate Highway System now under construction. This study should be made primarily in collaboration with the Departments of Commerce and Agriculture. It is proposed to investigate need and to make recommendations as to the scope of such a road program, its standards, costs, methods of financing, and legislative needs.

A study has been underway during the past year by the Departments of Agriculture and Interior to explore and recommend the management and administration of Federal lands and resources in the North Cascade Mountains in the State of Washington. This is an area of vast resources, extreme beauty, rugged

wilderness, and much controversy. The study is about half completed and should be concluded with recommendations to the two Secretaries and through them to the President in 1965.

As part of the Federal coordination program, the Bureau of Outdoor Recreation serves as staff agency to the Cabinet-level Recreation Advisory Council. Among the activities which it is expected that the Advisory Council will ask the Bureau to investigate during the coming year are development of regulations for charging fees for the recreational use of Federal land and waters. This will become particularly significant when the land and water conservation fund bill is enacted.

Other items are the development of standardized methods for measuring recreation use of Federal areas, a clearer delineation of the role of the private sector in providing outdoor recreation, and the identification of public measures needed to assure that private groups provide most of the services and facilities needed.

A continuing Federal coordination responsibility is to assess against the standards established for national recreation areas the various proposals as they approach the point of consideration by the Recreation Advisory Council, by the Bureau of the Budget, or by the Congress. A large number of such areas are proposed each year. Most of them are not suitable. This serves as an effective screening process.

Major Problems of the Bureau

There are two major "ifs" in connection with the Bureau of Outdoor Recreation. We are still in our infancy. The answer to these two questions will determine whether the country and the Congress believe such an organization as this Bureau is desirable and should be continued, or whether there is either no need for it or it is ahead of its time. I have my own personal strong convictions. However, these policy decisions rest not with me, but with the Congress.

The two "ifs" are—

(1) Whether the Congress will finance the authorizations provided in Public Law 88-29 to the extent necessary to permit a reasonably effective carrying out of the policy adopted by the Congress and the authorities granted therein.

You should know that each Governor has designated an official State liaison officer with this Bureau and that the States are well aware of the authorities which we have now to render technical assistance to them. We have had to advise every State that even with next year's budget we shall have to limit our technical assistance only to statewide recreation planning. We have a backlog of nearly 400 requests for assistance which we cannot handle, and which we have rejected.

It may also interest you to know that this small Bureau of about 180 people put in about $160,000 worth of uncompensated overtime during last year and that we have had to forgo about $75,000 worth of needed travel.

We are especially concerned that we have insufficient funds to render technical assistance to the private sector or conduct or sponsor needed research.

(2) The second "if" is whether the land and water conservation fund bill is enacted and subsequent thereto to what extent the fund created thereby may be appropriated by the Congress. This is the bill that will encourage States to take the leadership in planning, acquiring, and developing outdoor recreation resources and programs through a series of Federal matching grants. Unless such a program of Federal stimulation to the States can be gotten off the ground, there will be an increasing tendency to propose areas for total Federal administration and for the Federal Government to move into the vacuum created by the inaction of numerous States. This would be against the philosophy of the Outdoor Recreation Resources Review Commission report, against my personal philosophy, and against the desire of nearly all States.

Both the House and the Senate have completed hearings on this legislation, and on November 14, the House Committee on Interior and Insular Affairs reported out the bill with accompanying Report No. 900.

It is my feeling that unless the two big "ifs"; namely, implementation of the organic act and the passage of the land and water conservation fund bill are answered in the affirmative, it would unwise for the Bureau of Outdoor Recreation to continue in existence. There is no reason to continue this new office unless after a reasonable time and trial Congress is willing to make it a truly effective instrumentality of the Federal Government.

COORDINATING ACTIVITIES IN OUTDOOR RECREATION

Mr. CRAFTS. This is the second time we have appeared before your committee to request funds for its operations. We are a small Federal bureau, as you know, created about 2 years ago for the purpose of coordinating Federal activities in outdoor recreation, to serve as a focal point between the Federal Government and the States, and to provide assistance to other levels of Government and the private sector.

ORGANIC ACT (PUBLIC LAW 88-29)

Since we were here a year ago, the Congress has passed a new statute, Public Law 88-29, commonly referred to as the organic act for the Bureau of Outdoor Recreation. This act authorized a number of specific functions, including a directive to the Secretary of Interior to prepare a 5-year nationwide outdoor recreation plan to be sent to the Congress and to the President.

It authorized technical assistance to the States and to private parties. It authorized research and cooperation with educational institutions. It further included a directive for the Federal departments to carry out their recreation activities in conformance with the national plan, when it is completed.

IMPLEMENTING THE ORGANIC ACT

The question now is the extent to which the Congress deems it wise to implement the authorizations contained in the statute passed last May.

Our request this year is for $2.7 million in contrast to an appropriation last year of $1.9 million. In the past year and a half, particularly, we have encountered many difficulties. We have been asked to carry on many chore-boy, nickel and dime service type of activities which the requesting agency can accept or ignore, as it sees fit.

Recently, as a result of this, we have had a realinement of our priorities and we have decided to concentrate on three things. The first is the preparation of the nationwide recreation plan. The second is assistance to the States in helping the States prepare a statewide recreation plan.

And, third, is the coordination of activities among the Federal agencies. This means that we have decided, for the time being, to deemphasize research activities, educational activities, technical assistance to the States, other than in their statewide plans.

NATIONAL RECREATION PLANNING AND STUDIES

The request of $2.7 million held firm last December during the budget reexamination by the administration. Under the level of financing proposed for next fiscal year, we would place $370,000 of the requested $800,000 increase in this national planning effort which would include an appraisal of the total recreation demands, an inventory of recreation resources, measurement of recreation needs, and so on.

It would also include certain specific studies such as the Lewis and Clark Trailway or Sailway study, a study of certain of the Nation's wild rivers, with a view to making recommendations to the Congress

as to which segments of which rivers should be perpetuated in their wild status, studies of special areas proposed for national recreation areas or seashores, such as Fire Island on the coast of Long Island, Assateague on the Maryland-Virginia coast, and the Allagash area in northern Maine.

The need for a national recreation plan, I think, is rather obvious. In the first place, Congress has directed that it be prepared.

In the second place, the Federal Government is spending $300 million a year in outdoor recreation activities and the States and private sector are spending much more.

Recreation has a major impact on our economy today. It is expected that the utilization of outdoor recreation resources will more than triple in the next 30 years. And there is a problem, a growing problem, recognized by political scientists and sociologists as to the effective use of leisure time.

Federal Coordination

We would place $430,000 of the proposed increase in Federal coordination. A concept here is that there should be an overall study of the Federal Government's activities in this field with a view to resolving differences of policy, determining areas where there are policy overlaps or gaps, considering the financial level of various recreation programs, and making recommendations in this field to the Congress and to the executive branch.

I might say, Mr. Chairman, that since we appeared last week before the House, the Secretary, carrying out one of the authorities given to him in the act of last May, has just sent to some of his fellow Cabinet officers and to the heads of a number of independent agencies, as well as the heads of the agencies in the Department of the Interior, a copy of a memorandum to me directing that this overall study be initiated.

I will be glad to make these available to you, for your committee files, if you would like to have them.

Mr. Hayden. A copy of the memorandum may be inserted in the record.

Coordination in Outdoor Recreation

February 20, 1964.

To: Director, Bureau of Outdoor Recreation.
From: Secretary of the Interior.
Subject: Coordination in outdoor recreation.

Under Public Law 88–29, the Secretary of the Interior, in connection with activities dealing with interdepartmental cooperation is authorized—

"To promote coordination of Federal plans and activities generally relating to outdoor recreation, . . ." (sec. 2(g)).

In that same act, the Congress declared as a statement of policy (sec. 1)—

"That it is desirable for all levels of government and private interests to take prompt and coordinated action to the extent practicable * * * to conserve, develop, and utilize [outdoor recreation] resources for the benefit and enjoyment of the American people."

Section 3 of Public Law 88–29 states:

"In order further to carry out the policy declared in section 1 of this Act, the heads of Federal departments and independent agencies having administrative responsibility over activities or resources the conduct or use of which is pertinent to fulfillment of that policy shall, either individually or as a group, (a) consult with and be consulted by the Secretary from time to time both with respect to their conduct of those activities and their use of those resources and with respect to the activities which the Secretary of the Interior carries on under

authority of this Act which are pertinent to their work, and (b) carry out such responsibilities in general conformance with the nationwide plan authorized under section 2 (c) of this Act."

The authorities granted to the Secretary of the Interior in this act have been delegated to you as Director of the Bureau of Outdoor Recreation in accord with departmental Manual 248.1.1.

In Executive Order 11017 of April 27, 1962, which provided for coordination with respect to outdoor recreation resources and establishing the Recreation Advisory Council, the President of the United States ordered in section 1(b) that:

"The Secretary of the Interior, in consultation with the other members of the Council, shall be responsible for developing methods and procedures for improved interagency coordination in the development and carrying out of national outdoor recreation policies and programs."

Section 2(a) of the Executive order states:

"The Council shall provide broad policy advice to the heads of Federal agencies on all important matters affecting outdoor recreation resources and shall facilitate coordinated efforts among the various Federal agencies."

In the light of the above referred to statute, the delegation of authority thereunder to the Bureau of Outdoor Recreation, and the Executive order, I am requesting that you initiate a broad, overall review of Federal outdoor recreation resource programs and policies.

In this connection you are referred to the letter of August 2, 1963, to me from the Deputy Director of the Bureau of the Budget which requests the assistance of the Bureau of Outdoor Recreation to concerned Federal agencies and to the Bureau of the Budget in an overall analysis of Federal recreation programs and budget estimates.

In furtherance of the authorities and directives of Public Law 88–29 and Executive Order 11017, and in cooperation with the concerned Federal agencies, you are directed to examine present and proposed programs, budgets, and operations of the Federal agencies concerned with outdoor recreation including fish and wildlife resources. You should include in such examinations not only the land and water managing agencies, but also those other Federal agencies whose programs have an impact on outdoor recreation.

In connection with such examinations, you should pay particular attention to questions of policy including gaps, overlaps, and conflicts, as well as long-range programs and financial needs. Your study should point out areas where policy clarifications are needed, recommend policies which your examinations indicate to be desirable, suggest activities that may be curtailed or where expansion is needed, recommend appropriate sharing of responsibility between Federal, State, and local governments and the private sector, and include recommendations for such legislation as you believe may be needed.

The overall objective would be to provide the Executive Office of the President, the concerned Federal agencies, the Recreation Advisory Council, and the Congress a coordinated look at Federal outdoor recreation programs, policies, and expenditures along with recommendations which, if implemented, would result in a coordinated Federal approach, with proper attention to outdoor recreation in relation to other resources and financial needs. Your report should clarify the role of the Federal Government in proper perspective to that of the States and local governments and the private sector.

This is no small undertaking. It can be accomplished only with the full cooperation of the concerned Federal agencies. It is my intention to send copies of this letter with an appropriate request for cooperation to the Bureau of the Budget, to my fellow members of the Recreation Advisory Council, as well as to other Federal agencies not represented on the Advisory Council that have a significant concern with outdoor recreation.

Adequate performance of the task assigned herein may take several years. You are instructed to prepare interim reports on specific policy issues or agencies in accord with a program of priorities which you should develop. For example, certain policy issues worthy of early attention may be coordination of management of recreation lands and facilities at Federal reservoirs, development of coordinated fee policies for recreational use of Federal land and waters, standardized measurement of recreational use of Federal areas, and needed Federal services to encourage private enterprise in providing outdoor recreation opportunities.

Within a reasonable time, an overall coordination report with appropriate recommendations should be completed. This document which would provide the base for effective coordination of recreation activities within the executive branch would be an appropriate companion piece to the nationwide plan for outdoor

recreation likewise authorized by Public Law 88–29 and which is to be submitted to the President for transmittal to the Congress not later than May 28, 1968.

You are instructed to proceed forthwith to carry out this undertaking.

STEWART L. UDALL,
Secretary of the Interior.

FEBRUARY 20, 1964.

To: Under Secretary, Assistant Secretaries, the Solicitor, heads of all bureaus and offices.
From: Secretary of the Interior.
Subject: Coordination in outdoor recreation.

Attached for your information is a copy of a memorandum of instructions which I have issued to the Director of the Bureau of Outdoor Recreation, as well as a letter of transmittal to department and agency heads outside of the Interior Department, informing them of this action and requesting their cooperation.

The heads of agencies of this Department which have responsibilities in outdoor recreation, particularly the National Park Service, Bureau of Land Management, Bureau of Reclamation, Bureau of Sport Fisheries and Wildlife, and the Bureau of Indian Affairs are directed to cooperate fully with the Bureau of Outdoor Recreation in the coordinating function which it has been asked to undertake by my memorandum.

In due course, you will be contacted by officials of the Bureau of Outdoor Recreation.

STEWART L. UDALL,
Secretary of the Interior.

FEBRUARY 20, 1964.

Hon. ANTHONY J. CELEBREZZE,
Secretary of Health, Education, and Welfare,
Washington, D.C.

DEAR MR. SECRETARY: Enclosed for your information is a memorandum of instructions which I have issued to the Director of the Bureau of Outdoor Recreation directing him to initiate an overall analysis of outdoor recreation programs in the Federal Government.

This memorandum of instructions is in accord with the authorities granted in Public Law 88–29, an act to promote coordination and development of effective programs relating to outdoor recreation, and for other purposes.

In due course, you will be contacted by Director Crafts and his associates in the Bureau of Outdoor Recreation in connection with this assignment and the work of your Department dealing with outdoor recreation. The purpose of this is to carry out the intent of Congress and to be helpful to you.

All agencies of this Department having a responsibility in outdoor recreation are being instructed to cooperate fully.

I trust that I may have your personal assurance of cooperation in carrying out this undertaking. In turn, I can assure you that before any report may be finalized which bears on the activities for which you are responsible, ample opportunity will be provided for review and discussion with you.

Sincerely yours,

STEWART L. UDALL,
Secretary of the Interior.

Identical letter sent to the nine individuals listed below:
Hon. Douglas Dillon, Secretary of the Treasury, Washington, D.C. (for the Coast Guard)
Hon. Robert S. McNamara, Secretary of Defense, Washington, D.C.
Hon. Luther H. Hodges, Secretary of Commerce, Washington, D.C.
Hon. Orville L. Freeman, Secretary of Agriculture, Washington, D.C.
Hon. Joseph C. Swidler, Chairman, Federal Power Commission, Washington, D.C.
Hon. Robert C. Weaver, Administrator, Housing and Home Finance Agency, Washington, D.C.
Hon. Bernard L. Boutin, Administrator, General Services Administration, Washington, D.C.
Hon. John E. Horne, Administrator, Small Business Administration, Washington, D.C.
Hon. Aubrey J. Wagner, Chairman, Tennessee Valley Authority, Knoxville, Tenn.

FEBRUARY 20, 1964.

Hon. KERMIT GORDON,
Director, Bureau of the Budget,
Washington, D.C.

DEAR KERMIT: Attached for your information is a copy of my memorandum of instructions to the Director of the Bureau of Outdoor Recreation asking him to initiate an overall analysis of the present and proposed programs, policies, budgets and operations of Federal agencies concerned with outdoor recreation. This is in furtherance of section 2(g) of Public Law 88–29 which authorizes the Secretary of the Interior to promote coordination of Federal plans and activities generally relating to outdoor recreation.

Also enclosed is a copy of a letter which I have sent to the indicated department and agency heads as well as a copy of an internal memorandum of instruction to other officials of the Department of the Interior.

I trust that this approach may have the full support and cooperation of all concerned department and agency heads. This is essential if the coordination functions of the Bureau of Outdoor Recreation are to be pursued to a successful conclusion.

Sincerely yours,

STEWART L. UDALL,
Secretary of the Interior.

SCENIC ROADS AND HIGHWAYS

Mr. CRAFTS. We are engaged in a study of a proposed system of scenic roads and highways for the Nation. We also are engaged in a study of a very controversial problem in the North Cascade Mountains of Washington which involves the best use of the multiple resources in that area, problems of charging fees on Federal lands for the utilization of recreation purposes of Federal lands and waters and numerous other activities.

I would say there are two major problems confronting this Bureau. We are small, as we are intended to be. The first one I have already mentioned and that is the extent to which Congress decides to implement the authorizations that it has granted.

You might be interested to know that one reason for our concentrating on these three jobs which we have decided to concentrate on is that we have had about 1,000 requests from the States and private parties for this minor type of specific, technical assistance which we have had to refuse.

TRAVEL AND OVERTIME

We have had to forgo about $75,000 worth of travel that we thought was needed. We have put in, in this small Bureau of about 160

people, about $160,000 of uncompensated overtime in the past year.

So the problem of the level to which we can be financed is a major one to us.

LAND AND WATER CONSERVATION FUND BILL

The other major "if" is whether Congress enacts the land and water conservation fund bill which is pending and on which hearings have been completed in the Senate. The bill has been reported out by the House Committee on Interior and Insular Affairs, and is pending now before the Rules Committee in the House.

That bill would enable us to implement another of the major recommendations of the report of the Outdoor Recreation Resources Review Commission; namely, the initiation of a program to enable the States to obtain Federal funds to match State funds which will enable the States to carry on an effective program of recreation planning, acquisition, and development of recreation areas by the States.

Unless these two things, within a reasonable time, come to pass through the policy decisions that Congress will make, I must say to you, in all honesty, I think that the Bureau, without these arms, or these methods of implementation, would be an ineffective agency of the Government. And I would see, in due length of time, no point for us to continue.

Chairman HAYDEN. What is the difference in cost?

FUND BILL IS SELF-FINANCING

Mr. CRAFTS. The funds that we are asking for to perform the functions which we are presently authorized is an increase of about $800,000 this year. The land and water conservation bill is largely a self-financing bill with the moneys coming from user fees, from the sale of Federal surplus lands, from possibly an automobile sticker, and from advance appropriations which would be paid back.

These moneys would go into a fund, but the fund would have to be appropriated by the Congress in the normal procedure. This is a large program, relatively speaking, and when fully operating could yield about $200 million of Federal funds annually.

It is a terminal program. It is for a period of about 25 years.

That concludes my statement, Mr. Chairman. I would be glad to try to answer any questions.

REPORT ON RECREATION ACTIVITIES

Chairman HAYDEN. I note in the highlight statement accompanying your budget justification that the Bureau of Outdoor Recreation will prepare a comprehensive report encompassing the recreation activities of the entire Federal Government. How do you propose to go about this, and when do you expect that such a report will be available for use?

Mr. CRAFTS. I think we will do this on a piecemeal basis. This goes to the materials, which have been inserted in the record. We will do this partly through the Recreation Advisory Council, which was established by President Kennedy under Executive Order 11017 and is comprised of six Cabinet Officers and the Administrator of Housing and Home Finance Agency.

We would pick particular policy issues, a number of which are problems right now, such as the question of charging fees, such as the local administration of federally owned areas, the question of the extent of Federal land acquisition, the amount of Federal research in this field. We would make individual reports on these.

We would try to wrap the whole thing up in 2 to 3 years, and meantime, there would be progress reports.

Planning in River Basins and Water Resource Projects

Chairman Hayden. I note also that your Bureau will do recreation planning in river basins and at water resource projects, and that these studies will be conducted as a part of the comprehensive river basin review being conducted by various Federal agencies. What percentage of the total comprehensive river basin review is devoted to recreation planning?

Mr. Crafts. I think a relatively small proportion of the total river basin review. It varies by basins. We will carry on, with our own funds, only that portion of river basin work which has a direct relationship to the nationwide plan. We will carry on, for the other agencies, such as the Corps of Engineers, the Bureau of Reclamation, and some others which have primary responsibility for river basin studies, such aspects of the recreation planning on river basins as they wish us to do.

Chairman Hayden. Is that by transfer of funds?

Mr. Crafts. The latter would be by transfer of funds, and, according to the budget, it is estimated we will receive about $206,000 during fiscal year 1964, and in 1965 the probability is about $260,000. Most, but not all, of this would be for basin studies.

Nationwide Recreation Plan

Chairman Hayden. In your justification you refer to a nationwide recreation plan. Would you please describe this plan briefly to the committee, indicating when it is proposed that the plan will be available for use?

Mr. Crafts. The overall nationwide plan has to be submitted to the Congress by May 1968. We are shooting for about a year ahead of that. We have just completed our manual of instructions to carry out this plan, which I shall also make available for your committee records, and, along with it, a comparable plan, "Guidelines for State Outdoor Recreation Plans."

These two things mesh completely. Basically, what they do, is they appraise the recreation resources, they evaluate the recreation demand, they relate the demand to the resources, and they cannot consider recreation in a vacuum, particularly on land which has other uses.

We must take cognizance in our recreation planning of the other uses needed for these same lands. We are instructed in our act, and we would do so anyway, to consider not only the Federal recreation resources but the State resources and those in the county and local governments, as well as those of the private sector. We must relate the relative responsibility of these to each other.

Chairman Hayden. That is a wide area.

RECOMMENDED PROPOSALS

In connection with your studies of specific areas, do you make specific proposals for construction or other action? If so, briefly what have you recommended with regard to the five areas mentioned on page 9 of your justification—that is, Assateague Island; Fire Island; Allagash River, Maine; Northern Cascades, Wash.; and Whiskeytown-Shasta-Trinity?

NATIONAL SEASHORE ON FIRE ISLAND

Mr. CRAFTS. We have recommended the establishment of a national seashore on a portion of Fire Island. It is to be administered by the National Park Service.

This would require an act of Congress and legislation is pending and a favorable administration position has been taken on this bill.

NATIONAL SEASHORE ON ASSATEAGUE ISLAND

On Assateague Island, we have a report in which we have, likewise, recommended the establishment of a national seashore. Legislation has been endorsed by the administration.

NATIONAL WILDERNESS WATERWAY ON ALLAGASH RIVER, MAINE

On the Allagash River in Maine, we have recommended the establishment of a national wilderness waterway. This, likewise, is in a status of a Department of Interior proposal, and there is no legislation pending on this at the present time.

I might say that the State of Maine has established an Allagash River Authority which is making a study due by the end of this year. We have been in close contact with that authority.

The various points on the proposal that we recommended are controversial and the Secretary has made it clear that his position is fluid on all of these points, except for one.

He believes some sort of control, Federal or State, is necessary along the narrow stretch bordering the waters.

STUDY ON NORTHERN CASCADES, WASHINGTON

The Northern Cascades in Washington is an administrative study by the Departments of Agriculture and Interior. We have made a series of resource background studies that are about completed. We have held extensive hearings in the State of Washington, and we are about to the point of sitting down and trying to come up with some recommendations to the two Secretaries. But this will probably be toward the end of the year before we complete this study.

NATIONAL RECREATION AREA, WHISKEYTOWN-SHASTA-TRINITY

The Whiskeytown-Shasta-Trinity is a proposal for a national recreation area. Most of the land proposed is already in the national forests. This is a three-unit proposal, two of which are to be administered by the Forest Service, one by the National Park Service.

The latter borders the Whiskeytown Reservoir. There is legislation pending on this proposal, and there is a favorable administration position on this proposal.

I believe that completes the list.

FIELD OFFICES TO PERFORM STUDIES

Chairman HAYDEN. Where do you propose to perform such studies in fiscal year 1965?

Mr. CRAFTS. We really do it by a combination. We have set up 6 very small field offices with about 10 to 12 people per office in different parts of the country to carry out some of the studies. It is really cheaper for us to do this rather than concentrate everything here, because it reduces our travel.

So the basic work, now that the field offices have been established, would be carried out, initially, by the field offices and would be reviewed by this office.

Chairman HAYDEN. Last year the Senate committee directed that the amount to be available for research be no greater than $20,000 more than you had in fiscal year 1963. How much did this give you and how does it compare with your proposed research budget for fiscal year 1965?

Mr. CRAFTS. It gave us about $75,000 in fiscal year 1964 and our proposal for 1965 is for no increase in research activities. Because, as I said earlier, we have decided to concentrate on these three areas, the national plan, the statewide plans, and Federal coordination, and to deemphasize, for the time being, our research program.

PROPOSED RESEARCH PROGRAM

The research program we would carry on in the coming year would be the service type of research, methodology research, this type of thing.

Chairman HAYDEN. How large a research staff do you have, and how many personnel did you add to it in fiscal 1964? And, how many do you propose to add in fiscal 1965?

Mr. CRAFTS. We have seven people, including our clerical and secretarial force, and we propose no increase. It is very, very small.

Chairman HAYDEN. Your budget shows $287,000 programed for contract work in fiscal year 1965 compared to only $15,000 in fiscal year 1964. Is this the result of personnel ceilings imposed on you or do you believe that your work can be done more effectively by contract?

PERSONNEL CEILINGS

Mr. CRAFTS. Senator Hayden, I would say it is something of both. We have had personnel ceilings imposed on us, to be very frank with you. And I think if we were not in that situation, we would probably go above the ceilings that we are now faced with.

However, these were adopted by the administration, and I am in a position of supporting the administration's ceilings. The contract work is largely for our activities related to the nationwide plan, such as the tabulation of the data, determining the physical carrying capacity of the lands in relation to utilization of these lands by people, and a number of other items which I could enumerate to you.

We can do this by contract work. I think, if we had complete freedom that, rather than do it by contract, we would prefer to do it ourselves.

MANPOWER AND FUNDS REQUIRED TO ACCOMPLISH PROGRAMS

Chairman HAYDEN. The Bureau is less than 2 years old and probably has not reached the level of staffing and financing needed to accomplish its objectives. Could you give the committee your estimate of what this level will be in manpower and funds, excluding the land and water conservation fund?

Mr. CRAFTS. Excluding the land and water conservation fund, which is quite a different program, I would not like to be held to this because I can only conjecture for you now and I might, with more experience, come lower or higher, but I would think that we would level off permanently, probably in the neighborhood of 400 people or less.

That is about twice our present level, with the funds that would be necessary to carry that staff.

SUPPORT FOR LAND AND WATER CONSERVATION FUND LEGISLATION

Chairman HAYDEN. I assume that the land and water conservation fund legislation will be considered by the Senate this session. I would be interested in knowing how the States and conservation groups feel about this proposed legislation.

Have you any idea what support it has?

Mr. CRAFTS. Yes, we have a very good idea of that, Senator. This land and water conservation fund bill has been in the forefront of attention by conservation and recreation groups around the country, and particularly, by the State governments.

We have a compilation here which is too long to put in the record, but I would like to make it available to the committee, if you would like to have it, which summarizes organizations that are for it.

I can tell you, briefly, that there are 47 States on record for this legislation; not necessarily all the specifics, but the legislation in general. Thirty-two Governors have gone on record for it. These are Governors of both parties. It is not political. There is bipartisan support.

Both President Kennedy and President Johnson have issued statements in support of this bill. We must have about 20 to 25 conservation and recreation organizations, maybe more than that, who are strongly in support of this and I know of only a few isolated cases of opposition. Usually this is opposition to one particular aspect of the bill, rather than to the bill as a whole.

So I would say this bill has the strongest support that I have known of, with respect to a major piece of conservation legislation of this sort in a long, long time.

Chairman HAYDEN. Senator Bible.

Senator BIBLE. Just a few questions, Mr. Chairman. Thank you.

STATUS OF CONSERVATION FUND BILL

What is the status of the land and water conservation fund bill at the present time? Is it before the Rules Committee of the House?

Mr. CRAFTS. That is correct, sir. It was reported before Christmas by the Committee on Interior and Insular Affairs and it is pending before the Rules Committee and Chairman Aspinall has written for a ruling.

Senator BIBLE. Do you anticipate it will get a rule in the reasonably near future?

Mr. CRAFTS. I certainly hope so. And I know this is very high on Mr. Aspinall's list of bills that have come out of his committee. He sent this bill, with a copy of the committee's report, to every Member of the House with a special letter urging that they read it and saying, in his judgment, that it was one of the most important pieces of legislation to come out of his committee in a long, long time.

He further said that those on the Federal level, who were trying to get this recreation program underway and also trying to get the States to carry the bulk of the load—which is part of the philosophy of this Bureau—that this bill provided the vehicle by which the Federal Government could help the States achieve this objective.

Senator BIBLE. Now, you have testified, in response to some questions asked by the chairman, as to your endorsement of Whiskeytown-Shasta-Trinity, which I think is a very fine project. Does that project depend on the passage of this land and water conservation fund bill?

CONSERVATION FUND BILL AUTHORIZATIONS

Mr. CRAFTS. The land and water conservation fund bill authorizes no project. It authorizes no land acquisition. It establishes a method of financing, of raising money, into a fund which, if appropriated by the Congress, can then be available to Forest Service and Park Service, and the Bureau of Sport Fisheries and Wildlife, for certain acquisitions that are authorized under other action of Congress.

WHISKEYTOWN-SHASTA-TRINITY RECREATION AREA

In other words, the fund, itself, does not authorize any acquisitions. Therefore, the Whiskeytown-Shasta-Trinity would take an act of Congress coming out of your Public Lands Subcommittee to authorize the establishment of the Whiskeytown-Shasta-Trinity Recreation Area.

Then, if that bill were to pass, moneys from the land and water conservation fund bill would be available for the establishment of that area; the purchase of lands within that area.

Senator BIBLE. I understand that, but does the administration support the Whiskeytown-Shasta-Trinity bill, if the conservation fund bill does not pass?

Mr. CRAFTS. I think the administration supports the Whiskeytown-Shasta-Trinity area on its own merits. And if the conservation fund bill does not pass, then the funds for the establishment of that area would come the way they have historically come in the past in the normal appropriation process from the general fund of the Treasury.

PUBLIC DEVELOPMENT FUNDS

Senator BIBLE. The reason I asked the question, which I do purposely and with design, is that we now have pending before us the public development of the Indiana Dunes, Fort Larned, Graft House, Tock's Island, Fire Island, Agate Fossile, Big Horn National Monument, Assateague, Guadalupe Mountains, and the Ice Age Park.

And if you and Mr. Hartzog and the Secretary of the Interior are to take a position of holding the line on expenditures, how can you

do that in the face of the requests for this number of parks and seashores, and river systems, and lakeshores? How does it work out economically?

Mr. CRAFTS. Under the terms of the conservation fund bill, if the bill is activated to the extent estimated, there would be available quite a few dollars; roughly $80 million a year for acquisition of areas such as you mentioned plus the areas the Forest Service and others would require.

RECOMMENDED APPORTIONMENT

Now, this would have to be spread out over time. There would be, in the submission of the budget under the conservation fund bill, an indication to the Appropriations Committee each year as to how the moneys would be recommended for apportionment between the eligible Federal agencies and within the agencies as to how they would be recommended among the projects that had been authorized by the Congress.

So, some of these that you mentioned, would have high priority and some of them would not.

Senator BIBLE. You premise your answer on the optimistic note that the conservation fund bill passes, and I think it does have merit, but I think it probably needs some tightening up and some changes. If it does not pass, however, I am wondering what the departmental position is on these various parks, and national monuments, and lakes, and seashore bills.

Maybe it is the same. Maybe you would want to withhold comment on it.

Mr. CRAFTS. I think, because the administration is so strongly behind the conservation fund bill, it has to be premised on the assumption that it will pass. If it does not pass, then I think from a new Congress there would have to be a reassessment as to which of these areas have the higher priority.

FIRE ISLAND AND TOCKS ISLAND

Senator BIBLE. Would you hold back on Fire Island until the fund bill passed?

Mr. CRAFTS. No, sir; I would not.

Senator BIBLE. How about Tock's Island?

Mr. CRAFTS. Both Tocks Island and Fire Island have high priority, particularly because they are close to very large centers of population, and on areas such as Fire Island and Tocks Island, they are expensive, but if you hold back, they become more expensive with the passage of time.

Senator BIBLE. I am frank to say, Mr. Chairman, the Fire Island presentation is one of the best I have ever heard in the time I have been privileged to serve as chairman of the Public Lands Subcommittee, and the great appeal was that it served something in the neighborhood of 16 millions of people.

Mr. CRAFTS. Tocks Island is almost the same.

Senator BIBLE. Yes; and I think they are entitled to high priority, but I was trying to get your thinking in how we balance this out in the face of a strong mandate from a former colleague of ours on Pennsylvania Avenue. But I think you have put my thinking straight.

Chairman HAYDEN. Senator Mundt.

CONSERVATION FUND BILL

Senator MUNDT. I just got back from spending a weekend out in South Dakota and a lot of questions were raised about the land and water conservation fund bill, because people back home do not understand exactly what is involved and to be very frank about it, I want to clear up some questions I have in my own mind.

I want to ask you a couple of questions about that. What would you envision as the kind of establishment on the chain of Missouri River reservoirs out in the Midwest in connection with this program of charging user fees as admission, under the act? I have had a lot of questions about that, and I have had no answers to give.

HOUSE MODIFIED BILL

Mr. CRAFTS. Senator Mundt, under the terms of the bill, as reported by the House committee—and this, I think, is the draft of the bill that I should speak to, because the House committee substantially modified the bill from the way it was originally set up—under the terms of the bill as reported by the committee, the admission fees or entrace fees can be assessed only if certain conditions prevail.

FEE ASSESSMENT

I think they need to be listed and there are four of them.

Areas that are federally administered directly, not under lease to the State or private concessionaires. They need to be areas that are administered primarily for recreation. And this is a very key point, the word "primary." They need to be areas of which Federal facilities are provided at Federal expense, and the areas need to be posted.

Now, most of the reservoirs in the Missouri River, and I am speaking in general here—I think the same would apply to reservoirs on most of the rivers—are built either by the Bureau of Reclamation or the Corps of Engineers.

Senator MUNDT. May I interrupt. The Missouri River chain of projects were authorized under special legislation. Criteria that apply there might not apply to others, so maybe we had better stick to the Missouri River.

Mr. CRAFTS. As far as I know, with respect to the Missouri River, the purpose of the reservoirs was primarily not recreation.

Senator MUNDT. That is correct.

EXCLUSION OF FEES

Mr. CRAFTS. Therefore, we have gone on record in this in response to similar questions from other Members of Congress that on the reservoirs which are not administered primarily for recreation, it would not be possible, under the terms of the House bill, to impose a general admission or entrance fee.

It would be possible to charge a specific user fee for launching facilities, for camping facilities, for this sort of thing, but not a general entrance or admission fee.

LICENSE TO FISH

Senator MUNDT. Would you consider a Federal license to fish on the lake a user fee? Would that be possible?

Mr. CRAFTS. No. There is a specific section in this bill that says that there is nothing in this bill that should be interpreted as a fishing or hunting fee. It is prohibited in the bill.

Senator MUNDT. So unless you made it a general admission, you could not charge the fisherman for the right to fish?

Mr. CRAFTS. Oh, that is right. We could not do that. No; that is specifically prohibited.

Senator MUNDT. I would like to follow up a couple of questions the Chairman asked about your picture of the Bureau in the years to come. It is new. There have been a lot of inquiries from conservation groups that are interested in the Bureau.

FUTURE PLANS OF BUREAU

We have had a lot of widespread support and we still have from people who are curious about its plans in the future. Could you give me any idea of your planning 5 years, let's say, on what would be the optimum number of employees and the size of the budget increase?

Mr. CRAFTS. Yes. I would say that we have three things in mind. One is the carrying out of the planning and coordinating activities under the organic act which has been passed and the assistance to the States in their statewide plans. This, I think, would, as I said, reach an optimum level of about twice our present level to about 400 people and a budget of something in the neighborhood of $5 million.

I specified this before.

The second major activity that we would have would be the administration of the Land and Water Conservation Fund Act, if it were to pass. This is largely a passage of moneys to the States and to the other Federal agencies, and we would have only a relatively small administrative staff to supervise the administration of this program.

I have made no estimates as to the number of people and the amount of dollars it would take, but it would be small.

The third thing that I have had in the back of my mind, which we have not endeavored to implement yet, is another program of State aid which might be somewhat comparable to the farm forestry program which has been so successful over the past years.

This would require authorization by the Congress, but this would be the Federal matching of State funds for paying State employees on State payrolls, who would be recreation experts and who could perform services for the local governments and the private sector.

This would also require a minimum of staff to us and a minimum of Federal dollars spent by the Federal staff.

GRANT-IN-AID PROGRAMS

These are two major grant-in-aid programs that the States are thinking about. One is the Land and Water Conservation Fund Act and the other one is the one I have just mentioned to you. Back of it all is this major philosophy which we are trying to get implemented, and that is that the States and the private sector should carry

the bulk of the responsibility, as far as the public goes, in this recreation field.

Senator MUNDT. When you use the words "private sector," in your description, how do you define that? Give us some examples.

Mr. CRAFTS. The people who are in business.

Senator MUNDT. Do you mean concessionaires?

Mr. CRAFTS. Concessionaires, people who run dude ranches, ski outfits, the people who would run the lodges, or build motels around some of the State or Federal areas. I mean those in the commercial business of supplying recreation.

PRESIDENT'S WATER BILL

Senator MUNDT. If the President's water bill is passed, how much of the $40 million would you ask for?

Mr. CRAFTS. This has not been decided, Senator. We would have to have an appraisal of how much moneys the States would be in a position to match immediately. This, we would need to know, because, you see, one of the prerequisites is that the States must complete a statewide recreation plan before they are eligible for moneys.

BILL REQUIREMENTS

So we would need to know how much they would be in a position to match. We would also need to know how this fits within the framework of the Federal-State distribution of moneys because there is a requirement in the bill that it must be 60 percent State and 40 percent Federal Government. But there may be some variation of these percentages in the first 5 years of the program.

And then, I hope I am not confusing you, there is another requirement in the bill that the moneys may be distributed to the Federal agencies only in relation to the paid visitor days.

Now, if this stays in the bill as it is finally passed, this would place most of the money in the National Park Service, because the Forest Service and some of the other agencies are not charging in many of their areas. And there are a number of uncertainties of this sort that would have to be resolved when we see the final pattern of the bill.

There is another one which I am not clear on which says that only moneys can be appropriated after they go into the fund. Well, suppose the bill passes the 1st of July. There would only be in the fund about $3 million and these are moneys that would accumulate from the transfer of the boat tax moneys.

MONEY DISTRIBUTED ACCORDING TO VISITOR FEES

Now, if this language could be changed to permit moneys to be expended as they go into the fund up to a certain amount——

Senator MUNDT. Do I understand that these funds are earmarked for expenditure on the basis of the type of activities which generated the fund? That is, if you have funds for boat ramps, you use them for boat ramps?

Mr. CRAFTS. No, sir.

Senator MUNDT. You mentioned the Forest Service which leads me to believe that money generated from people visiting national forest preserves would be used for more forest preserves. And then you

would have something like the Robinson-Patman Act where you tax shotguns, and that tax goes to produce more birds to be shot at.

SOURCES OF FEES

Mr. CRAFTS. No, that is not it. This is a transfer of a presently imposed tax on gasoline usage of motorboats to the fund. This is one source.

Another source is user fees on developed Federal areas. Another source is a general entrance or admission fee. Another source is advance appropriations which must be paid back. These all go into the fund.

Senator MUNDT. Into one pool?

GUIDELINE FOR DISTRIBUTION OF MONEY

Mr. CRAFTS. Into one pool. Then, the distribution of the money has a guideline that first of all 60 percent of that fund goes to the States on a 50–50 matching basis.

Senator MUNDT. It stays in the State in which it was raised, do you mean?

Mr. CRAFTS. No, sir. There is a guideline as to how it is to be distributed in the States; 40 percent goes to the Federal agencies, and there is a certain latitude for varying that.

Within the Federal agencies, the money would be distributed among the eligible agencies which are specified in the bill in proportion to the paid visitor day attendance at designated recreation areas, you see.

Senator MUNDT. That is my question. Some kind of earmarking devices are implied by what you say.

Mr. CRAFTS. It is for the executive branch to recommend the distribution of moneys, following this formula. It also has a clause in there, "Except as otherwise indicated by the Appropriations Committee."

Senator MUNDT. We will live and learn as we go along with that.

Mr. CRAFTS. This is a complex bill, and I would be happy to come up to see you and talk with you about it.

Senator MUNDT. I am very much interested in it, and we will pick it up as we go along. I appreciate it.

Mr. CRAFTS. It has very strong support.

Senator BIBLE. Might I ask one question, following what Senator Mundt has asked, Mr. Chairman?

Chairman HAYDEN. Yes.

SANITATION REQUEST

Senator BIBLE. Last week we had before us Mr. Stoddard of the Bureau of Land Management. He asked for a certain sum for helping sanitation and he said the request was limited to four lines—water, forage, garbage, and sanitation.

I asked him the question as to whether or not a visitor to one of these areas would be charged a fee—would have to pay for a stamp to go into this facility.

He mentioned a couple of these that were going into my own State of Nevada, and I think they are badly needed. I understood him to

say that they could issue a regulation to make a visitor's fee applicable to this public domain area.

Do you have any thinking on that, because I think it is very important? I do not think it should be left to the regulation of a bureaucracy. I think the Congress should be in one way or the other on it.

PUBLIC DOMAIN LANDS ENTRANCE FEE

Mr. CRAFTS. There would be no entrance fee to the public domain lands, just as there would be no general admission or entrance fee to forest lands. This has been widely misunderstood. There could be, on certain specific developed camp grounds, that is, on a piece of public domain, or on a specific developed camp ground in a national forest, a user fee for the use of that particular area.

The instruction from the House committee says that the administrator must consider whether it is economically feasible to charge such a fee at this place, the types of facilities that are provided and this sort of thing. There would be no general admission or entrance fee on public domain lands.

Senator BIBLE. I certainly would hope not; because this is a red flag, and I am sure it is the cause of a lot of controversy and objection to the bill.

Mr. CRAFTS. Here, I would go back to the four criteria I named for Senator Mundt. One is that the areas must be administered primarily for recreation, and public domain lands are not administered primarily for public recreation.

Only small areas of them are public campgrounds.

Chairman HAYDEN. Senator McGee.

Senator MCGEE. On pages 9 and 10 of the Bureau's justifications, Mr. Crafts, you have alluded to the plans within your Bureau to develop 30 areas as national parks, national lakeshores, national seashores, national rivers, or national recreation areas.

BIG HORN CANYON NATIONAL RECREATION AREA

Reports have been submitted to Congress on about one-third of these areas, as you say. As far as I know, we still do not have a report to the Congress on one of the other areas that we are very much interested in; namely, the Big Horn Canyon National Recreation Area connected with the development of Yellow Tail Dam and Reservoir.

The Senators from Montana and Wyoming stand as one, as we are all equally concerned in that development. I wonder if you could relate for the record, the status of the report on our legislation?

Mr. CRAFTS. Yes, I would be happy to respond to that question, Senator. I was involved in that just last week. The Department of the Interior submitted a report, a proposed report, on this bill last fall to the Bureau of the Budget. I do not remember the precise time. It was sometime during the fall.

PRIORITY OF DEVELOPMENT

Recently the Bureau of the Budget has raised the question as to the priority of this area in relation to the priority of some other areas. They asked this Bureau to express its independent views on this question of priority of the proposed Big Horn area.

Now this is done, occasionally, in our role of Federal coordination, and we are permitted to act on legislative matters to express our independent views from time to time. And we were, just last week, requested to do this with respect to the Big Horn.

We are in the process now—I worked over the weekend—on preparing our views on this, which will go to the Chairman of the Recreation Advisory Council and, in turn, to the Bureau of the Budget.

And, I presume, upon receipt of those, the Bureau of the Budget will send its report to Congress.

Senator McGEE. You do not then feel at liberty to disclose the criteria for assigning the priority of the project at this time?

Mr. CRAFTS. I would not say I do not feel at liberty to do that. The criteria for the establishment of these areas were adopted by the Recreation Advisory Council. They are printed and are available to you. The Big Horn meet those criteria and there is no question about this.

The question raised by the Bureau of the Budget goes to not whether it meets the criteria of a national recreation area, but as to how it ranks along with all of the others.

BASIS FOR PRIORITY EVALUATION

Senator McGEE. That is my question. What is the basis for assigning this value among other proposals?

Mr. CRAFTS. I will tell you the position that we are taking on this, since you asked me and want to know. It is my feeling that the priority for the creation of recreation areas to be created primarily from private land should be considered in a different category from those that are to be created from lands that are already almost all in Federal ownership.

And, therefore, I think evaluating the priority of Fire Island and Tocks Island, for example, as against Big Horn and Glen Canyon and Flaming Gorge does not make too much sense, because the Big Horn, the Glen Canyon, and Flaming Gorge can be created by an act of Congress with relatively little or no cost for the acquisition of the lands and the establishment of the areas.

It is true that there will be development costs, but it will permit the dedication of these areas for national recreation areas. And the administration of these lands would then know what the ultimate disposition would be, the planning could proceed knowing what the end result would be.

And, therefore, the position which I propose to recommend is that these areas—those three that I have named to you—are primarily in Federal ownership at the present time and should be considered in a class by themselves and not in competition with Fire Island and Tocks Island.

And, therefore, I would recommend that Big Horn be given a high priority.

Senator McGEE. Big Horn, Flaming Gorge, and Glen Canyon, you say?

Mr. CRAFTS. I used those others as illustrations, but the question addressed to us last week related only to the Big Horn.

PRIORITY IN LARGE POPULATION AREAS

Senator MCGEE. I had understood that a higher priority was to be assigned to proposals that are proximate to areas of large population.

Mr. CRAFTS. This does not go so much to the question of priority under the criteria established other than that they have to have access to them of certain numbers of people within a certain radius. I do not remember just what the figure is.

But, with the U.S. highways that are going fairly close to the Big Horn area and with the completion of Interstate 90 which is now under construction, and with our knowledge of the people that visit Yellowstone and Glacier, we know that large numbers of people will get to the Big Horn area.

Senator MCGEE. So that in terms of area population, this is only a factor in determining whether the proposed project met the criteria for development as a national recreation area. Population would have no part to play in this priority of getting down to the business of bringing the projects into being?

STANDARDS OF PRIORITY

Mr. CRAFTS. We have no written standards as to the weighing of a priority. I would not say this had no part to play, but I think the fact that the land is already in Federal ownership is of much significance.

Senator MCGEE. I would not like to see low population States with fewer votes penalized.

Mr. CRAFTS. I do not follow you.

Chairman HAYDEN. These are matters, it seems to me, for legislative decision, not for decision by my committee.

Senator MCGEE. I am interested, Mr. Chairman, in making a record here to determine whether the development of a recreation area out in the West where we have high altitudes and low multitudes would be inhibited by that consideration: the sparse population factor.

Mr. CRAFTS. Well, I would say, Senator, on that question of votes, it is not a factor in my consideration. I am a career employee and have worked in the Government for 30 years, and I attempt to evaluate these things as I see them.

Senator MCGEE. I am not talking about partisan votes, I am talking about totals and surmising as to their correlation with the interest in getting close to large population areas for priority allocation.

FEDERAL OWNERSHIP AND PRIORITIES

Mr. CRAFTS. I think, in general, this is right, but also you have outstanding areas in Federal ownership and the people do travel and they will travel more. And so I think the fact they are already in Federal ownership is paramount in this particular case.

Now, I do not question at all the fact that Fire Island is of high priority since it is so close to New York City as are Tocks Island and as Assateague. These east coast areas are very high priority, but they cost many more millions of dollars to establish than would Big Horn or Glen Canyon.

Senator MCGEE. I would hope that each project would get balanced consideration and that no penalties would attach because of the accident of geography or sparsity of settlement.

WILD RIVERS STUDY

I have one other question while Mr. Crafts is here, Mr. Chairman. On page 10 of the justifications, you also discuss other types of planning and surveys that you anticipate including the "Wild rivers proposal." Among the wild rivers, you allude to the Upper Green River. What kind of controls on egress and ingress and use and so forth do you anticipate would be imposed on the Upper Green River if it were included in such a system?

Mr. CRAFTS. In the first place, we are feeling our way on this wild rivers study. The Upper Green, to a considerable extent, is already in national forest land. Such rivers as we might recommend or such segments of rivers as we might recommend for wild river status would be recommended to the Congress and would require congressional endorsement.

There is no executive authority to designate these with any impact or any significance. We would expect a wild river to maintain its free flowing status, to maintain a reasonable degree of water, water quality, a reasonable degree of stability or continuity of flow, and the preservation of a very narrow strip along the river to preserve its scenic aspects.

This would mean that in those sections that were so designated by the Congress, they could be above or below a major dam development, but in the particular section of the river, if designated by the Congress, it would be dedicated for this purpose rather than for development for hydroelectric power or utilization for water irrigation; this sort of thing.

As I said, we are feeling our way pretty carefully on this.

Senator MCGEE. And this system would ultimately be subject to the action of the Congress? We would not expect to read about it first in the Federal Register?

Mr. CRAFTS. No, sir. All of this would come before the Congress.

Senator MCGEE. I mention that, because we have had some recent experiences that suggest that the Federal Register is good daily reading.

Mr. CRAFTS. No; not as far as this is concerned.

Senator MCGEE. Thank you very much, Mr. Crafts.

Thank you, Mr. Chairman.

Chairman HAYDEN. Are there any further questions?

Senator MUNDT. I have one question, Mr. Chairman.

Chairman HAYDEN. Yes.

LOCATION OF FIELD OFFICES

Senator MUNDT. In connection with the establishment of your six field offices, have you determined where you think they might be located, or the general areas?

Mr. CRAFTS. These offices are now established, Senator. This map shows where they are located and the area that they cover. There is one in Philadelphia, one in Atlanta, one in Ann Arbor, one in Denver, Seattle, and San Francisco. These are very small offices.

Senator MUNDT. There is only one of them in a city where the National Park Service has its regional office, and that is in Philadelphia I believe you are locating these in different communities?

Mr. CRAFTS. The Park Service also has a regional office in San Francisco. We located these from the standpoint of relative ease in transportation to the States, and the concentration of other Federal offices in the particular city. Those were the two primary factors. Our relations with the National Park Service are very fine.

Senator MUNDT. I understand they have about 10 or 12 people in them?

Mr. CRAFTS. That is right.

Senator MUNDT. That is all, Mr. Chairman.

CORRESPONDENCE FAVORING APPROPRIATION

Chairman HAYDEN. Thank you very much.

A number of letters urging appropriation of the full amount requested for the Bureau of Outdoor Recreation have been received. They will be printed at this place in the record.

(The letters referred to follow:)

U.S. SENATE,
COMMITTEE ON INTERIOR AND INSULAR AFFAIRS,
February 17, 1964.

Hon. CARL HAYDEN,
Chairman, Appropriations Committee,
U.S. Senate, Washington, D.C.

DEAR CARL: You will shortly be considering the appropriation of the Bureau of Outdoor Recreation in the Department of the Interior. This new Bureau spent $1,201,000 in 1963, is budgeted at $1,900,000 for fiscal year 1964, and has asked $2.7 million for fiscal year 1965.

This letter is to urge you to appropriate the full amount requested by the executive branch.

The Bureau, headed by Edward C. Crafts, formerly of the Forest Service, has been doing an excellent job of "tooling up" and stimulating State, county, and local entities to get to work on the provision of outdoor recreation facilities to meet burgeoning needs.

We have pending in both the House and Senate the land and water conservation bill which will undoubtedly pass. It will provide $150 million annually, or more, for expansion of outdoor recreation facilities in the Nation over the following 10 years. It would be mighty poor economy not to have an agency prepared to make the most effective use of such a large sum. Bureau of Outdoor Recreation is responsible for the development of plans, consultation with the administering agencies and general supervisory operations which will, in a large degree, determine how efficiently far larger sums are to be spent.

I hope your subcommittee will recommend the full budget request.

Sincerely,

CLINTON P. ANDERSON.

NORTH CAROLINA RECREATION COMMISSION,
Raleigh, N.C., February 21, 1964.

Hon. CARL HAYDEN,
Chairman, Subcommittee on Interior Appropriations,
U.S. Senate, Washington, D.C.

DEAR SENATOR HAYDEN: The North Carolina Recreation Commission has long felt the need for the coordination-advisory assistance of a Federal recreation agency. The record will show that we gave active support to the development of the organic act of the Bureau, some guidance to the shape of its final form and to its passage. We believe, sincerely, in the great need for the excellent services which it, already, is rendering.

For these reasons we send this letter to you in support of the Bureau of Outdoor Recreation's current request for operational funds, in the amount of $2,700,000, for the fiscal year of 1965. We ask that this letter be made a part of the budget hearings record.

The work of the North Carolina Recreation Commission is with public, private nonprofit and private commercial recreation. Thus, with the vastly increased

Federal concern and operational involvement in many new aspects of recreation we know that the Bureau's work assumes new importance, and a much greater amount and depth of responsibilities. Its budget is not only a direct investment, therefor, in societal benefits but is, also, one in the economic future of this country.

Sincerely yours,

RALPH J. ANDREWS, *Director.*

STATE PARK & RECREATION COMMISSION,
Augusta, Maine, February 5, 1964.

Hon. CARL HAYDEN,
Chairman, Subcommittee on Department of Interior and Related Agencies Appropriations, U.S. Senate, Washington, D.C.

DEAR SENATOR HAYDEN: I understand that the budget request for the Bureau of Outdoor Recreation will be coming before your committee for consideration in the near future and the Maine State Park & Recreation Commission would like to go on record as supporting the budget as recommended on pages 498 and 499 of the appendix to the budget document for the fiscal year 1965.

Because of the rapidly growing emphasis on the importance of outdoor recreation facilities, both public and private, we feel that it is most important that comprehensive long-range plans be developed for the orderly development of recreational facilities. We subscribe to the principle that it is the State's responsibility in the first instance to develop its own recreational plans but it is also important that the Federal Government produce a nationwide recreation plan encompassing all aspects of outdoor recreation—Federal, State, local, and private. As we understand it, this is one of the basic reasons why the BOR was established and I think those of us who are currently working on our State plans will need all of the assistance we can get from a Federal agency such as the BOR.

Another reason for our supporting the establishment of the BOR has been the fact that we feel there is a great need of coordinating at the Federal level the activities of the many different Federal agencies that are getting into the field of providing outdoor recreation facilities. The fact that the BOR has as one of its objectives the coordination of these efforts is one of the principal reasons we have taken such an interest in the welfare of this new bureau.

It is not convenient for us to be represented at the hearing on this budget but I would like to put this department on record as favoring the proposed operational budget for the Bureau of Outdoor Recreation.

Sincerely yours,

LAWRENCE STUART, *Director.*

NATIONAL ASSOCIATION OF STATE FORESTERS,
Augusta, Maine, February 10, 1964.

Hon. CARL HAYDEN,
Chairman, Committee on Appropriations,
U.S. Senate, Washington, D.C.

DEAR MR. HAYDEN: The National Association of State Foresters, representing the 50 States, supports and urges acceptance of appropriation figures for the Bureau of Outdoor Recreation, U.S. Department of Interior, as shown on page 498 of President Johnson's printed budget for fiscal year 1965. These operating, departmental funds will greatly assist the States in the preparation of statewide plans as part of an overall nationwide recreation plan.

Our association submits this statement as part of the hearings record.

Sincerely yours,

AUSTIN H. WILKINS,
Chairman, Legislative Committee and Forest Commissioner of Maine.

AMERICAN RECREATION SOCIETY, INC.,
Washington, D.C., Feburary 21, 1964.

Hon. CARL HAYDEN,
Chairman, Committee on Appropriations,
U.S. Senate, Washington, D.C.

DEAR SENATOR HAYDEN: The American Recreation Society wishes to record its approval and support of the budget request as made by the Bureau of Outdoor Recreation, U.S. Department of Interior, for the fiscal year 1965.

We and other responsible elected officials, representing the fields of municipal, county, and State public recreation, as well as those with whom we work in the industrial, hospital, military, private, voluntary and college recreation areas have carefully analyzed the Bureau of Outdoor Recreation's budget request, contained on page 498–499 of the appendix of the budget for fiscal year 1965 and which is listed under the Department of the Interior.

In representing a goodly portion, thus, of those receiving the services of this Federal agency established in April 1962, the American Recreation Society speaks with direct knowledge as to the importance of these services.

The Bureau of Outdoor Recreation has been rendering important services, insofar as their existing personnel resources permit. We know that this Bureau is in need of the additional, requested, personnel to carry out the duties and responsibilites as identified in the organic act which created this agency.

We, therefore, urge your committee to act favorable upon the budget request as made by the Bureau of Outdoor Recreation. This is in the amount of $2,700,000 for fiscal year 1965.

We ask that this letter be made a part of the budget hearings record.

Sincerely yours,

JAMES S. STEVENS, Jr.,
Chairman, Legislative Committee, American Recreation Society.

NATIONAL PARK SERVICE

STATEMENTS OF GEORGE B. HARTZOG, JR., DIRECTOR; A. CLARK STRATTON, ASSOCIATE DIRECTOR; C. P. MONTGOMERY, ACTING ASSISTANT DIRECTOR, ADMINISTRATION; HOWARD W. BAKER, ASSISTANT DIRECTOR, OPERATIONS; J. E. N. JENSEN, ASSISTANT DIRECTOR, DESIGN AND CONSTRUCTION; JACKSON E. PRICE, ASSISTANT DIRECTOR, SPECIALIZED SERVICES; BEN H. THOMPSON, ASSISTANT DIRECTOR, RESOURCE STUDIES; HOWARD STAGNER, DEPUTY ASSISTANT DIRECTOR, RESOURCE STUDIES; THEODOR R. SWEM, ASSISTANT DIRECTOR, COOPERATIVE ACTIVITIES; T. SUTTON JETT, REGIONAL DIRECTOR, NATIONAL CAPITAL REGION; LAWRENCE F. COOK, FIELD ASSISTANT TO THE DIRECTOR; HAROLD G. SMITH, CHIEF OF PROGRAM COORDINATION; CARL O. WALKER, ACTING CHIEF OF BUDGET AND FINANCE

SUMMARY TABLES

Chairman HAYDEN. As we begin consideration of the proposed budget for the National Park Service for fiscal year 1965, I shall place in the record a summary table of appropriations, revenues, and visitors to the national park facilities for the years 1933 through 1965; a table showing general fund receipts by sources deposited to the credit of the U.S. Treasury during fiscal years 1963 through 1965; and a comparative summary of the 1964 appropriations with the 1965 estimates.

(The tables referred to follow:)

Summary of appropriations, revenues, and visitors

Year	Appropriations			Revenues	Visitors (calendar years)
	Operating funds	Capital improvements	Total		
1933	$2,816,620	$8,004,000	$10,820,620	$628,182	3,481,590
1934	2,518,190	2,567,600	5,085,790	729,153	6,337,206
1935	6,799,540	5,000,000	11,799,540	905,935	7,676,490
1936	9,110,780	7,585,500	16,696,280	1,136,026	11,989,793
1937	11,198,395	6,635,000	17,833,395	1,398,692	15,133,432
1938	11,052,834	10,618,546	21,671,380	1,508,127	16,331,467
1939	12,202,047	13,832,650	26,034,697	1,567,334	15,530,636
1940	12,954,267	8,144,015	21,098,282	1,928,078	16,755,251
1941	4,622,649	4,747,381	9,370,030	2,179,119	21,236,957
1942	5,715,005	8,894,770	14,609,775	2,080,702	9,370,969
1943	5,079,342	408,023	5,487,365	1,061,992	6,828,420
1944	4,563,560		4,563,560	807,601	8,339,775
1945	4,736,810	4,000	4,740,810	824,078	11,713,852
1946	5,457,125	30,250	5,487,375	1,592,947	21,752,315
1947	11,032,334	14,995,621	26,027,955	2,923,587	25,534,188
1948	9,660,055	968,000	10,628,055	3,303,328	29,858,828
1949	11,542,299	2,505,350	14,047,649	3,467,606	31,726,402
1950	15,150,982	14,953,868	30,104,850	3,527,607	33,252,589
1951	16,288,200	17,687,500	[1] 33,975,700	3,534,372	37,106,440
1952	16,878,564	11,370,000	28,248,564	3,568,094	42,299,836
1953	18,131,920	15,030,410	[1] 33,162,330	4,190,643	46,224,794
1954	18,437,550	15,416,300	33,853,850	4,037,551	47,833,913
1955	18,494,095	14,199,895	[2] 32,693,990	4,914,239	50,007,838
1956	20,787,000	28,079,300	48,866,300	5,065,784	54,923,443
1957	22,970,000	45,050,000	68,020,000	5,658,040	59,284,869
1958	[3] 27,581,530	48,400,000	75,981,530	5,744,920	58,676,953
1959	29,962,600	50,000,000	79,962,600	5,688,138	62,812,000
1960	32,682,000	46,735,000	79,417,000	5,685,176	[4] 72,287,800
1961	37,890,000	51,528,000	89,418,000	5,660,349	79,039,800
1962	[5] 42,223,851	[6] 67,976,000	110,199,851	5,841,761	88,457,100
1963	[7] 48,017,054	[8] 72,775,500	120,792,554	6,450,559	94,093,000
1964	[9] 50,754,829	61,697,000	112,451,829	[10] 6,873,000	[10] 96,000,000
1965 (estimated)	55,624,000	55,406,000	111,030,000	7,093,000	102,000,000

[1] Net appropriations after reductions pursuant to law.
[2] Excludes $131,600 transferred to Office of Solicitor, and includes $600,000 included in "Second Supplemental Appropriation Act, 1955" for the Jones Point Bridge.
[3] Includes $390,094 appropriated plus $134,436 transferred from other agencies for pay increases; and excludes $23,000 transferred to Office of Territories.
[4] New basis for counting visitors was implemented at beginning of 1960. Comparable figure on old basis of counting is 65,827,000.
[5] Includes $1,025,000 supplemental appropriations and excludes $28,000 transferred to Bureau of Outdoor Recreation and $9,649 to General Services Administration.
[6] Includes $3,500,000 supplemental appropriations.
[7] Includes $1,629,750 supplemental appropriations, and excludes $1,101,096 transferred to Bureau of Outdoor Recreation, and $600 to General Services Administration.
[8] Includes $5,000,000 supplemental appropriations, and excludes $2,000,000 withdrawn for Bureau of Indian Affairs.
[9] Excludes $72,671 transferred to General Services Administration for operation and maintenance of Franklin Delano Roosevelt Library.
[10] Estimated.

General fund receipts deposited to the credit of the U.S. Treasury during the fiscal year 1963 and estimated for the fiscal years 1964 and 1965

	Actual 1963	Estimated	
		1964	1965
Automobile, admission, guide, and elevator fees	$5,470,564	$5,800,000	$6,000,000
Business concessions	658,954	702,500	722,500
Rents and royalties	122,372	188,300	188,300
Permits, privileges, and licenses	28,077	30,000	30,000
Sale of power and other utilities	62,389	65,000	65,000
Sale of Government property and products	69,467	71,200	71,200
Sale of services	5,011	4,500	4,500
Other fees and forfeitures	1,732	2,500	2,500
Reimbursements	30,586	8,000	8,000
Gifts and contributions	1,407	1,000	1,000
Total	6,450,559	6,873,000	7,093,000

Comparative summary of the 1964 appropriations with the 1965 estimates

Appropriation and activity	Net appropriations, 1964	Estimate, 1965	Increase (+) or decrease (−)
Management and protection:			
Management of park and other areas	[1] $22,117,783	$24,598,300	+$2,480,517
Forestry and fire control	1,423,000	1,514,700	+91,700
Soil and moisture conservation	203,900	205,000	+1,100
Park and recreation progarms	2,826,300	2,877,000	+50,700
Concessions management	505,600	517,000	+11,400
Subtotal	27,076,583	29,712,000	+2,635,417
Maintenance and rehabilitation of physical facilities:			
Roads and trails	8,784,000	9,500,000	+716,000
Buildings, utilities, and other facilities	[2] 12,757,496	14,000,000	+1,242,504
Subtotal	21,541,496	23,500,000	+1,958,504
Construction:			
Buildings, utilities, and other facilities	26,532,000	924,926,000	−1,606,000
Acquisition of—			
Lands	5,300,000		−5,300,000
Water rights	365,000	480,000	+ 115,000
Roads and trails	500,000		−500,000
Subtotal	32,697,000	25,406,000	−7,291,000
Construction (liquidation of contract authorization):			
Parkways	11,000,000	12,000,000	+1,000,000
Roads and trails	18,000,000	18,000,000	
Subtotal	29,000,000	30,000,000	+1,000,000
General adminstrative expenses:			
Departmental expenses	1,304,350	1,457,000	+152,650
Regional office expenses	832,400	955,000	+122,600
Subtotal	2,136,750	2,412,000	+275,250
Grand total	112,451,829	111,030,000	−1,421,829

[1] Excludes $47,417 transferred to General Services Administration for operation of Franklin D. Roosevelt Library.
[2] Excludes $25,254 transferred to General Services Administration for maintenance of Franklin D. Roosevelt Library.

National Park Service Budget

Chairman Hayden. Mr. Hartzog, the committee welcomes you here today, presenting the National Park Service budget for your first time as Director of the National Park Service. Perhaps before you begin you would like to tell the committee a little bit about yourself. We realize that you have been with the Park Service and that you appeared before us last year as Mr. Wirth's assistant. After your self-introduction, I am sure that the committee would like to hear whatever statement you have with regard to your 1965 budget. You may either read something which you have prepared or you may file a written statement and highlight it.

Mr. Hartzog. Thank you very much. It is a great honor to have the opportunity to appear before this committee today. I was born and raised in South Carolina. My home is now in St. Louis, Mo. Mrs. Hartzog is a Bostonian. I came to work in the National Park Service in 1946 as an attorney. The office was then located in Chicago. After a year's service at Lake Texoma Recreation Area, which the Service administered at that time in cooperation with the Corps of Engineers, I returned to Washington as an attorney and saw service as Assistant Chief of the Concessions Management Division of the Service.

I transferred to Rocky Mountain National Park in 1955 as Assistant Superintendent and later to Great Smoky Mountains National Park in the same capacity. I next spent more than 3 years as Superintendent of the Jefferson National Expansion Memorial in St. Louis. I left the Park Service in 1962 to become executive director of a private organization in St. Louis concerned with encouraging the development of downtown St. Louis. I returned to the National Park Service in February of last year as Associate Director, assuming the directorship in January of this year when Mr. Wirth retired.

I have with me at the table this morning our new Assistant Directors and our Associate Director. With your permission, Mr. Chairman, I would like to show you some cards as I go through my general statement.

Chairman HAYDEN. Very well.

Mr. HARTZOG. Thank you, sir.

NATIONAL PARK SERVICE REORGANIZATION

Mr. Chairman, the National Park Service has recently undergone a reorganization, as the committee may know. Primarily, what we have tried to accomplish is to group the functions of the National Park Service, each of which is headed by an Assistant Director. Administration is headed by Clarence P. Montgomery; Operations is headed by Howard Baker, formerly our midwest regional director in Omaha; Design and Construction is headed by J. E. N. Jensen; Specialized Services in charge of Jackson E. Price; Resources Studies is headed by Ben Thompson; and cooperative activities is headed by Ted Swem. Also, I am privileged to have with me Associate Director Clark Stratton.

FIELD MANAGEMENT

Our field management is divided into six regions: The National Capital region, headed by T. Sutton Jett, who is also here today; the northeast region with headquarters in Philadelphia, Pa.; the southeast region with headquarters in Richmond, Va.; the midwest region with headquarters in Omaha, Nebr.; the southwest region with headquarters in Santa Fe, N. Mex.; and the western region with headquarters in San Francisco, Calif.

Also, we have three field design and construction offices responsible for the construction programs of the more than 200 areas of the national park system.

MISSION OF THE PARK SERVICE

The Congress has assigned to the National Park Service what in my opinion is the single most satisfying, rewarding, and fulfilling mission assigned any bureau. This mission is to manage park resources for the continuing benefit and enjoyment of all of the people. The National Park Service, therefore, is a people-serving agency. It is also a resource-managing agency. The scope of the national park system has been outlined in six landmark pieces of legislation:

PUBLIC LAND POLICY

The act of 1872, establishing Yellowstone National Park—the first of its kind in the world—in which the Congress laid down a new public

land policy, namely: That portions of the public lands were to be dedicated and set apart in perpetuity, not for material gain or riches, but rather for the benefit and enjoyment of the people as "* * * a public park or pleasuring-ground.* * *"

The original national park concept was concerned with natural features and scenic resources. But in the years after 1900, vandalism and indiscriminate looting of prehistoric Indian sites in the Southwest resulted in the passage of the Antiquities Act of 1906. This act extended the public land policy to provide authority for the President by proclamation to set aside as national monuments, "* * * historic landmarks, historic and prehistoric structures, and other objects of historic or scientific interest that are situated upon the lands owned or controlled by the Government of the United States * * *."

Establishment and Responsibility of Park Service

In 1916, the Congress established the National Park Service and assigned to it responsibility for administration of all of the national parks and most of the national monuments theretofore established.

Further consolidation of the administration of the Nation's parks was accomplished pursuant to law in 1933 when numerous military parks, memorials, and national monuments were transferred from other Government agencies to the Department of the Interior.

Historic Sites Act of 1935

The Historic Sites Act of 1935 established a national policy of preserving historic sites and buildings. It also directed the Secretary to carry out wide ranging programs in the field of history and placed with the Secretary responsibility for national leadership in the field of historic preservation.

Park, Parkway, and Recreation Area Study Act of 1936

The Park, Parkway, and Recreation Area Study Act of 1936 authorized the Secretary to cooperate with other Federal agencies, and with the States and their political subdivisions, in carrying out a comprehensive study of the public park, parkway, and recreation area resources of the United States.

Bureau of Outdoor Recreation

With the establishment of the Bureau of Outdoor Recreation in the Department of the Interior in 1962, the nationwide recreation planning functions were transferred to the new Bureau. The National Park Service, however, continues to make available its professional skills and experience in such activities as land use planning, design and construction, interpretation and management to Federal and State agencies, and we are working very closely with the new Bureau in furthering the mission assigned to it by the Congress.

New Concept in Park System Development

The act of 1961 authorizing Cape Cod National Seashore marked a new concept in the development of the national park system, namely: the use of appropriated funds at the outset to purchase a natural

area in its entirety for public enjoyment as a park. Prior to this enactment, areas, for the most part, were established either by setting aside portions of the public lands or from lands donated to the Federal Government initially by the States and private parties.

Visitations to Park System Areas

Of course, the visitation to the areas of the national park system has continued to rise and has placed great pressure upon the facilities in these areas. This is a chart which shows that in 1963 more than 94 million visits were made to the national park system. By 1980 these visits will more than double.

It may be of interest to you and the committee to note the dotted line which is a projection. This heavy black line is what has actually been happening during the period of Mission 66 in the past 8 years.

Traditionally, the Service has followed a policy of protection allowing plant and animal life to freely adapt. But as the pressures and influence of a constantly increased visitation descend upon us, coupled with an urban society in many instances in close proximity to the national parks, protection alone is not enough.

It was pointed out by Dr. A. Starker Leopold and his committee in a report which states in effect that it is going to be necessary in the years ahead for the National Park Service to take some definite steps to preserve these priceless heritages set aside by the Congress in the areas of the national park system.

Specifically, Dr. Leopold and his board recommend that the biotic associations within each park be maintained and where necessary re-created as nearly as possible in the condition which prevailed when the area was first visited.

Report of National Academy of Sciences

The National Academy of Sciences in its report has underscored the need for additional natural history research as a basis upon which to improve our overall management. These reports influenced our decision to coordinate all our resource studies in connection with our reorganization under the supervision of a single assistant director.

The Secretary's Advisory Board on Wildlife Management, independent researchers, conservationists, and others have pointed out the factor of human use and the physical development therefor and the resultant impact of both upon the areas of the national park system.

Coordination on Planning Land Use

To approach this complex task of land use planning, we have begun working very closely with the U.S. Forest Service on those lands administered by the National Park Service and those administered by the U.S. Forest Service. On March 5 of this year, we and the U.S. Forest Service are going to have a joint meeting of our regional directors and regional foresters to discuss this. We expect also to undertake a pilot project of planning land use in the southern portion of Mount Rainier and the adjacent national forests. We hope from these pilot projects to develop a system which will provide for better land planning and likewise increase the protection of the essential values inside the national park system.

SURVEY OF HISTORIC SITES

Additionally, at Glen Canyon and Whiskeytown National Recreation Areas we are developing joint visitor center and interpretative facilities with the Bureau of Reclamation. These will present a unified story covering the development of natural resources and outdoor recreational opportunities and they will save the taxpayers money.

To encourage other agencies, States, local governments, and private individuals to recognize and preserve important sites, representative of our Nation's historic heritage, the Service has undertaken a national survey of historic sites. Such sites are identified and, upon agreement of the owner, are marked with the national landmark plaque. The Federal Government, in this program, can officially recognize and encourage support for the preservation of these important historic sites, although it does not provide the funds necessary for their preservation.

Our parks make a priceless contribution to the innerstrength of our Nation. The American people are now far removed from the old frontiers when everyone lived close to the earth on ranches, farms, and in small communities. In those days, not more than a generation or two removed, there was unlimited space and the outdoors was always within easy reach.

But today when most people have cut their roots and moved off the land, they find less and less opportunity to enjoy what was once taken for granted. With a swiftly burgeoning population, an industrial and urban expansion without parallel, life has changed and areas that once provided recreational opportunity are now gone.

Spiritually, our people need reminders of their past. Without them they lose the sense of being a part of old America. Without them, they are without roots and without ties to our great national heritage. Without roots, we cannot understand the past, we cannot enjoy the present, and we cannot build for the future.

Mr. Chairman, we appreciate very much the support which you and this committee have given to the programs of the National Park Service over the years. We have additional information in our general statement and with your permission we will file it for the record. It is a great privilege to be here. We will be pleased to try to answer your questions. Thank you, sir.

(The statement referred to follows:)

STATEMENT OF DIRECTOR GEORGE B. HARTZOG, JR., OF THE NATIONAL PARK SERVICE

Mr. Chairman and members of the committee, it is with pleasure and a deep sense of gratitude that I am privileged to appear before you for the first time as Director of the National Park Service. I am keenly aware of the important part this committee has played over the years in advancing the Service's programs and in helping us attain our objectives, particularly during the 8-year period since Mission 66 was launched. I feel that it is with a sense of mutual interest in the programs of the Service and the part they play, and will play, in the general welfare of both present and future generations that we meet with you today to discuss our plans and fund requirements for the coming year.

Recently the National Park Service has been reorganized to reflect our several functions and to insure their closer coordination and supervision. The functions of the Service fall into six broad categories. Each of these functions is headed by an Assistant Director who is with me here today. They are Mr. Clarence P. Montgomery, Acting Assistant Director for Administration; Mr. Lawrence F.

Cook, Acting Assistant Director for Operations; Mr. Jackson E. Price, Assistant Director for Specialized Services; Mr. J. E. N. Jensen, Assistant Director for Design and Construction; Mr. Ben H. Thompson, Assistant Director for Resource Studies; and Mr. Theodor R. Swem, Assistant Director for Cooperative Activities. I am pleased to have here with me also my colleague, Mr. A. Clark Stratton, who serves as Associate Director.

Our field management is divided into six regions. The National Capital region, headed by Mr. T. Sutton Jett, who is also here today; the northeast region with headquarters in Philadelphia, Pa.; the southeast region with headquarters in Richmond, Va.; the midwest region with headquarters in Omaha, Nebr.; the southwest region with headquarters in Santa Fe, N. Mex., and the western region with headquarters in San Francisco, Calif.

Also, we have three field design and construction offices responsible for the construction programs of the more than 200 areas of the national park system.

The Congress has assigned to the National Park Service what in my opinion is the single most satisfying, rewarding, and fulfilling mission assigned any bureau.

This mission is to manage park resources for the continuing benefit and enjoyment of all of the people.

The National Park Service, therefore, is a people-serving agency.

It is also a resource-managing agency.

The scope of the national park system has been outlined in six landmark pieces of legislation:

The act of 1872, establishing Yellowstone National Park—the first of its kind in the world—in which the Congress laid down a new public land policy; namely, that portions of the public lands were to be dedicated and set apart in perpetuity, not for material gain or riches, but rather for the benefit and enjoyment of the people as "* * * a public park or pleasuring-ground * * *."

The original national park concept was concerned with natural features and scenic resources. But in the years after 1900, vandalism and indiscriminate looting of prehistoric Indian sites in the Southwest resulted in the passage of the Antiquities Act of 1906. This act extended the public land policy to provide authority for the President by proclamation to set aside as national monuments, "* * * historic landmarks, historic and prehistoric structures, and other objects of historic or scientific interest that are situated upon the lands owned or controlled by the Government of the United States * * *."

In 1916, the Congress established the National Park Service and assigned to it responsibility for administration of all of the national parks and most of the national monuments theretofore established.

Further consolidation of the administration of the Nation's parks was accomplished pursuant to law in 1933 when numerous military parks, memorials, and national monuments were transferred from other Government agencies to the Department of the Interior.

The Historic Sites Act of 1935 established a national policy of preserving historic sites and buildings. It also directed the Secretary to carry out wide-ranging programs in the field of history and placed with the Secretary responsibility for national leadership in the field of historic preservation.

The Park, Parkway, and Recreation Area Study Act of 1936, authorized the Secretary to cooperate with other Federal agencies, and with the States and their political subdivisions, in carrying out a comprehensive study of the public park, parkway, and recreation area resources of the United States.

With the establishment of the Bureau of Outdoor Recreation in the Department of the Interior in 1962, the nationwide recreation planning functions were transferred to the new bureau. The National Park Service, however, continues to make available its professional skills and experience in such activities as land-use planning, design, and construction, interpretation and management to Federal and State agencies, and we are working very closely with the new Bureau in furthering the mission assigned to it by the Congress.

The act of 1961 authorizing Cape Cod National Seashore marked a new concept in the development of the national park system; namely, the use of appropriated funds at the outset to purchase a natural area in its entirety for public enjoyment as a park. Prior to this enactment, areas, for the most part, were established either by setting aside portions of the public lands or from lands donated to the Federal Government initially by the States and private parties.

As will be observed, the national park system has not been a static institution. It has continued to evolve for almost a century. With each new congressional enactment it has taken on a new vitality and meaning. Even so, our original mission remains unchanged; namely, to manage park resources for the continuing benefit and enjoyment of all the people.

We stand at the threshhold of a new era. An era in which leisure is rapidly moving from the fringe to the core of life.

Our population continues to grow. For the most part, this growing population is concentrated in urban areas and this trend is continuing.

These factors continue to place pressure upon us to provide healthful outdoor recreational opportunities for all the people. For example, visitation to the areas of the national park system amounted to more than 94 million in 1963. We predict that this visitation will double by 1980.

Traditionally the Service has followed a policy of protection, allowing plant and animal life an opportunity to freely adapt to changing natural conditions. But the pressures and influences of a constantly increased visitation, coupled with an expanding urban society—in many instances in close proximity to the national parks—interfere with this freedom and make protection alone insufficient for proper management.

This problem was studied last year by the Secretary's Advisory Board on Wildlife Management and placed in clear focus in its brilliant report, a copy of which has been given to the committee. In brief, the Board recommended:

"That the biotic associations within each park be maintained, and where necessary re-created, as nearly as possible in the condition that prevailed when the areas were first visited by the white man. A national park should represent a vignette of primitive America."

The National Academy of Sciences, in its report, has underscored the need for additional natural history research as a basis upon which to improve our overall management. These reports influenced our decision to coordinate all resources studies within the Service under the supervision of an Assistant Director.

The Secretary's Advisory Board on Wildlife Management, independent researchers, conservationists, and many others have called attention to the factor of human use and the physical developments therefor, and the resultant impact of both upon the preservation of park values.

To approach the complex task of providing for increased park use and reducing its impact upon park resources on the broadest possible front, we need to undertake programs of comprehensive land planning with other agencies which will provide for the optimum man-land ratio and result in the highest and best use of the land.

On March 5 of this year, we and the Forest Service will hold a joint meeting of our regional directors and regional foresters. It shall be our purpose to discuss areas where such joint planning possibilities exist. We expect to undertake joint planning for public use with the Forest Service on at least one pilot area this year; probably, the southern portion of Mount Rainier National Park and the adjacent national forest. We are hopeful that this pilot project will lay a successful foundation upon which this effort may be extended in the future.

Additionally, at Glen Canyon and at Whiskeytown National Recreation Areas we are developing joint visitor center and interpretive facilities with the Bureau of Reclamation. These joint facilities will present a unified story covering development of our natural resources and of outdoor recreational opportunities. And, they will save the taxpayer's money.

To encourage other agencies, States, local governments, and private parties to recognize and preserve important sites, representative of our Nation's historic heritage, the Service has undertaken a national survey of historic sites. Such sites are identified and, upon agreement of the owner, are marked with a national landmark plaque. The Federal Government, in this program, can officially recognize and encourage support for the preservation of these important historic sites, although it does not provide the funds necessary for the preservation.

Our parks make a priceless contribution to the inner strength of our Nation. The American people are now far removed from the old frontiers when everyone lived close to the earth on farms, ranches, and in small communities. In those days not more than a generation or two removed, there was unlimited space and the out of doors was always within easy reach. But today when most people have cut their roots and moved off the land, they find less and less opportunity to enjoy what once was taken for granted. With a swiftly burgeoning population, an industrial, and urban expansion without parallel, life has changed and areas that once provided recreational opportunity are gone.

Spiritually, our people need reminders of their past. Without them, they lose the sense of being part of the old America. Without them, they are without roots or ties to our great national heritage. Without roots we cannot understand the past, enjoy the present, or build for the future.

In the 1965 budget proposals before you, we have given energetic attention to the objectives outlined by President Johnson a few weeks ago with regard to improvement in manpower utilization, effecting economies, improving service and increasing productivity. We are wholeheartedly in accord with this endeavor and are actively engaged in programs aimed at reducing costs and increasing efficiency of operations.

Since the commencement of Mission 66 it has been our practice to report to the committee annually on donations of cash, lands, and other objects received by the Service. Last year, Mr. Wirth reported that cash donations totaling $5,519,210 and donations of lands and other objects (exclusive of White House furnishings) valued at approximately $6,800,000 had been received during the period from July 1, 1955, the beginning of the fiscal year in which Mission 66 was announced, through December 31, 1962. I am pleased to report that during the 1963 calendar year additional cash donations totaling $648,771 and additional donations of lands and other objects (exclusive of White House furnishings) valued at approximately $175,000 have been received. This brings the total of such donations for the 8½-year period to more than $13 million. We anticipate that further contributions will be received as time goes on. We will continue our efforts to stimulate assistance from outside sources to help carry out our programs wherever possible. We should like to point out in this connection that the 1965 budget provides for a new position of trust fund officer, the incumbent of which will have primary responsibility for encouraging and promoting such patriotic participation.

I feel that this report on donations would not be complete if I did not state that the Service's achievements in obtaining contributions are attributable almost entirely to the unceasing efforts of former Director Wirth. This, of course, is only one of the innumerable achievements to Mr. Wirth's credit. During his long career he has given unstintingly of himself. He has walked—and at times, he has run with great strides—in the forefront of those who are working to preserve the great scenic and historic heritage of our land. The imprint of his life will always be upon this Service and upon the parks which he loves. His example of dedicated and distinguished service at one and the same time inspires me and, likewise, humbles me when I ponder the enormous task which has just been passed to me.

1965 ESTIMATES

The estimates under consideration total $111,030,000. This is a net decrease of $1,421,829 under the amount available for 1964. The budget provides a total of $55,624,000 for the Service's various operating programs and $55,406,000 for its capital programs. The amounts represent an increase of $4,869,171 over the amount presently available for 1964 for operating programs and a decrease of $6,291,000 for capital programs.

OPERATING PROGRAMS

The appropriation items which finance the operating programs, the amounts requested for 1965, and the increases provided for in the estimates are as follows:

Appropriation item	1965 request	Increase
Management and protection	$29,712,000	$2,635,417
Maintenance and rehabilitation of physical facilities	23,500,000	1,958,504
General administrative expenses	2,412,000	275,250
Total	55,624,000	4,869,171

The increase requested in the "Management and protection" and "Maintenance and rehabilitation of physical facilities" appropriation items, totaling $4,593,921, provides $3,606,321 for the benefit of park operating programs, and $987,600 to meet increased costs incident to classified employee salary increases pursuant to Public Law 87–793, wage rate increases and employee compensation fund payments.

Park visitation will reach an estimated 102 million in 1965 as compared to 94.1 million in 1963 and an estimate of 96 million in 1964. Increases in visitor use generate increases in fund requirements in all facets of park operations and maintenance. The budget recognizes this change in workload and provides appropriation increases for the purpose. It also recognizes, as it has for the past several

years, the fund requirements for operating and maintaining the new facilities that are being completed in the parks under the Mission 66 construction program. Of the total increases under the "Management and protection" and "maintenance and rehabilitation of physical facilities" appropriation items for the benefit of park operations, more than $2.7 million is for placing the Service in a better position to handle the increase in visitor workload in the parks, including extension of the visitor season in some of them, and for operating and maintaining new buildings, grounds, utility systems, roads, trails, parkways, and other Mission 66 facilities.

The budget includes increases for the park programs totaling $84,000 for operating and maintaining two new areas for which funds are not now provided: Hamilton Grange National Memorial, New York; and Frederick Douglass Home, District of Columbia. The amounts requested represent minimum first-year operation and maintenance requirements.

Also in the category of increases for the benefit of park operating programs, $97,000 is requested for 10 additional park police for the National Capital parks areas; $68,000 for continuing and expanding the program commenced in 1963 for converting existing radio systems in the parks to narrow-band frequencies; $400,000 for paying service-connection charges incident to obtaining commercial electric power and telephone service in some of the isolated park areas; $82,000 for for more adequate fire protection service in the parks; and $150,000 for natural science and wildlife management studies.

Provision of the additional U.S. Park Police postions will bring the park police force to the level proposed in the 1964 budget. This request is a further step toward attainment of the staffing level that previously has been determined by competent authority to be necessary.

The program for converting existing radio systems in the parks to narrow-band frequencies has been undertaken to meet requirements of a regulatory agency. The program, undertaken in fiscal 1963, is to be completed by November 1, 1966.

In order to obtain commercial electric power and telephone service in some of the isolated park areas, payments must be made to the utility companies to cover all or portions of the cost of extending their electric and telephone lines and other facilities to the parks. These paynents are made in lump sums when the services are commenced. Negotiations are underway for otaining commercial power and telephone service on this basis in fiscal year 1965 for which the amount of $400,000 requested will be required to meet service connection charges.

The placing of new Mission 66 facilities into operation, the enlargement of public use areas, the increased visitor use of the parks, and the addition of new areas to the system, all bring about added fire protection service requirements. The increase requested for this purpose will provide mainly for employment of additional temporary fire control aids in the parks and for the purchase of required supplies, materials, and equipment.

The natural science and wildlife management studies must be undertaken at the earliest possible date if the Service is to have needed facts and information upon which to base policy, program, and management decisions having to do with the preservation, development, and use of the parks. My earlier remarks in which I referred to the report of the Secretary's Advisory Board on Wildlife Management and the report made by the National Academy of Sciences dealt with this situation.

The pay increases for classified positions, as well as the wage rate increases, for which additional funds are needed are already in effect and these costs can be met only through an appropriation increase or through program retrenchments.

The increase of $275,250 for "General administrative expenses" provides for strengthening the administrative staffs in the Washington and regional offices to meet the increase in administrative workload that has taken place since the commencement of Mission 66 and to intensify management analysis and statistical functions in the interest of full utilization of manpower and fund resources; and for increased salary costs as authorized by Public Law 87–793.

CAPITAL PROGRAMS

Our capital program estimates include $25,406,000 for "Construction" and $30 million for "Construction (liquidation of contract authorization)."

The "Construction" estimate provides for the following:

Buildings, utilities and other facilities	$24,926,000
Acquisition of water rights [1]	480,000
Total	$25,406,000

[1] The 1965 fiscal year fund requirement for the acquisition of lands is not included in this estimate. It is proposed that it be included in a 1965 supplemental estimate of the Bureau of Outdoor Recreation after the pending land and water conservation fund legislation is enacted.

The "Construction (liquidation of contract authorization)" estimate provides expenditure authority for liquidation of obligations incurred and to be incurred under the contract authorization for parkways and roads and trails construction.

The contract authorization programs for the parkways and roads and trails construction programs for 1965 are in the amounts of $12,400,000 and $21,600,000 respectively, a total of $34 million.

The estimate for buildings, utilities, and other facilities includes $3,870,000 for the first stage of a supplemental water supply and rehabilitation of the sewer system at Grand Canyon National Park, Ariz.; $1,826,900 for various developments, including a day-use building at Mount Rainier National Park, Wash.; $799,500 for for continuing work at Independence National Historical Park, Pa.; $1,291,300 for various developments at Glacier Bay and Sitka National Monuments in Alaska; and $1,031,000 for various developments at Yellowstone National Park, Wyo.

Some of the major projects included in the 1965 construction program for roads and trails and parkways are: $2,405,000 for eliminating a 6-mile gap in the Blue Ridge Parkway near Asheville, N.C.; $1,385,000 for starting construction on a 5½-mile section of road from the eastern terminus of the Foothills Parkway in Tennessee, at Pigeon River, to connect with proposed Interstate Route 40 near Brown Island, at Pigeon River, where the State is constructing an interchange for the Foothills Parkway; and $1,304,700 for continuing construction on the Natchez Trace Parkway in Mississippi, from U.S. Highway 61 at Port Gibson, to Mississippi Highway 552, a distance of about 6 miles.

Mr. Chairman, in closing, I should like to thank the committee for the consideration it has given to our budget requests through the years. We renew our pledge to strive for obtaining the maximum benefit from every dollar that is made available to the National Park Service.

Landmark Program

Senator Bible. Mr. Chairman, might I ask him what that picture was that said the landmark program? What was that?

Mr. Hartzog. That was the barracks, I believe, at Carlisle.

Senator Bible. I just wanted to know what it was.

Mr. Hartzog. That is the Carlisle barracks in Pennsylvania, of which the Indian school has been selected for a historic landmark.

Senator Bible. Thank you very much. Thank you, Mr. Chairman.

Senator Mundt. What are the criteria, Mr. Hartzog? I understand it is private property but it is to identify the property with some historic background. You must have some criteria.

Mr. Hartzog. Indeed we do. We have a printed brochure on it: If we may, Mr. Thompson will pass it over to you. We might say also, Senator, that the "Soldier and Brave" book which you have before you is a theme study which represents the basic research from which these historic sites are then selected.

In other words, we take the major themes in American history and with the funds that you have provided our staff researches that theme and identifies the sites in this country that are representative in that theme and these, then, become not only national historic sites that were included in the national park system but landmark sites and others identified with State and local administration.

Chairman Hayden. There will be entered into the record the justification statement for the estimate of requirements for "Man-

agement and protection," for which $29,712,000 is asked in fiscal year 1965, an increase of $2,588,000 over the amount appropriated in fiscal year 1964.

(The justification referred to follows:)

MANAGEMENT AND PROTECTION

HIGHLIGHT STATEMENT

Broad purpose and long-range objective of program

The programs financed under this appropriation are those concerned with the management, protection, and interpretation of the areas administered by the National Park Service, including soil and moisture conservation, land use and water resources studies, and the management and audit of concessions operations; and those aimed at fulfilling the responsibilities placed upon the Service by provisions of the Park, Parkway, and Recreation Area Study Act, approved June 23, 1936 (49 Stat. 1894), the Colorado River Storage Project Act, approved April 11, 1956 (70 Stat. 105), and the Historic Sites Act, approved August 21, 1935 (49 Stat. 666).

The broad purpose and long-range objectives of the programs concerned with park operations are as stated in the act of August 25, 1916, establishing the Service, which provides that "the Service thus established shall promote and regulate the use of the Federal areas known as national parks, monuments, and reservations hereinafter specified by such means and measures as conform to the fundamental purpose of the said parks, monuments, and reservations, which purpose is to conserve the scenery and the natural and historic objects and the wildlife therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations." An objective of Mission 66 is to place the Service in a position to handle 108 million visitors in carrying out this mandate by 1966; the last year of the 10-year period.

The Park, Parkway, and Recreation Area Study Act of 1936 authorizes and directs the Secretary of the Interior "to cause the National Park Service to make a comprehensive study, other than on lands under the jurisdiction of the Department of Agriculture, of the public park, parkway, and recreation area programs of the United States, and of the several States and political subdivisions thereof, and of the lands throughout the United States which are or may be chiefly valuable as such areas."

The responsibilities as set forth in this act, originally delegated in full to the National Park Service, are now delegated in part to the Bureau of Outdoor Recreation and in part to the Service. The Service is now responsible for two broad program functions—National park and recreation area planning and recreation planning service to other Federal agencies.

Under the national park and recreation area planning program studies are conducted to determine the significance, suitability, and feasibility of areas proposed for inclusion in the National Park System. The program also includes the assembly and dissemination of material and data required for consideration prior to the authorization of a park area; development of information to assure that park boundaries are adequate to permit the accomplishment of the purpose for which a park was established; and the formulation of a long-range national park system plan, including the identification of areas of national significance for park, parkway, and recreation area status.

Under the planning service program, the Service participates in recreation site planning for the Bureau of Reclamation, Corps of Engineers, Bureau of Indian Affairs, Fish and Wildlife Service, Federal Power Commission, and other Federal agencies as requested; assists those Federal agencies in negotiating agreements with State and local agencies for administration of recreation lands and facilities provided with Federal funds; makes periodic inspections of operations covered by such agreements aimed at insuring compliance with terms of the agreements; and provides assistance to States and other political subdivisions in park and recreation planning, development, operations, and management matters.

The Colorado River Storage Project Act of 1956 provides under section 8 that "in connection with the development of the Colorado River storage project and of the participating projects, the Secretary is authorized and directed to investigate, plan, construct, operate, and maintain (1) public recreational facilities on lands withdrawn or acquired for the development of said project, or of said participating projects, to conserve the scenery, the natural, historic, and archeologic

objects, and the wildlife on said lands, and to provide for public use and enjoyment of the same and of the water areas created by these projects by such means as are consistent with the primary purposes of said projects: * * *." The National Park Service has been designated as the agency responsible for carrying out the obligation of the Department under this statutory provision. The Service is currently conducting archeological investigations and salvage and recreation site planning programs in connection with the Colorado River storage project in fulfillment of this responsibility. It has also commenced management, protection, interpretation and maintenance operations in the Glen Canyon area, Arizona and Utah, and the Flaming Gorge area, Utah and Wyoming; areas that have been determined to be of national significance. Funds are being provided in Bureau of Reclamation appropriations for transfer to the National Park Service for constructing recreational facilities in the upper Colorado River areas as authorized by the above-cited statute.

The Historic Sites Act of 1936 provides that "* * * it is a national policy to preserve for public use historic sites, buildings, and objects of national significance for the inspiration and benefit of the people of the United States * * *." The act further provides that the Secretary of the Interior through the National Park Service, for the purpose of effectuating this policy, shall:

"(*a*) Secure, collate, and preserve drawings, plans, photographs, and other data of historic and archeologic sites, buildings, and objects.

"(*b*) Make a survey of historic and archeologic sites, buildings, and objects for the purpose of determining which possess exceptional value as commemorating or illustrating the history of the United States.

"(*c*) Make necessary investigations and researches in the United States relating to particular sites, buildings, or objects to obtain true and accurate historical and archeological facts and information concerning the same."

In fulfilling the foregoing responsibilities, the Service has in progress an archeological investigations and salvage program, a historic sites survey, and a historic American buildings survey. The archeological investigations and salvage program is aimed at recovering irreplaceable historic and archeological resources from water control projects in the major river basins of the United States prior to flooding or other destruction. The historic American buildings survey comprises a national plan for making and preserving records of existing monuments of the builder's art in the United States and its possessions. Its first aim is the conservation of our national cultural resources in historic architecture and its secondary aim is service to the public by making available and preserving exact records of this cultural background of American history. The historic sites survey has as its objective a systematic nationwide inventory, investigation, and recording of significant historic and archeological sites; the formulation of clearly defined standards for determining which historic and archeological sites possess national importance within the scope of the Historic Sites Act; the preparation of a classified list of recorded historic and archeological sites, indicating which possess national importance and which do not; definition of the nature and extent of Federal responsibilities for the preservation and use of sites of national importance; and the formulation of policies and practices to carry out those responsibilities.

Accomplishments during the past year

Continued progress was made in fiscal 1963 in the prosecution of all the programs discussed in the foregoing. Some of the specific accomplishments of 1963 were:

1. The Service was host to 94,093,000 visitors to the park areas administered in 1963.

2. Operations were commenced at Bent's Old Fort (Colorado), Fort Smith (Arkansas), and Fort Davis (Texas) National Historic Sites; Lincoln Boyhood National Memorial (Indiana), and Whiskeytown Reservoir Area (California).

3. About 17,484,000 copies of free informational publications for use of park visitors were printed for distribution.

4. Visitor fee revenues deposited into the U.S. Treasury as miscellaneous receipts totaled $5,470,564.

5. Six new areas were authorized for addition to the national park system during the year: Fort Saint Marks (Florida); Sagamore Hill (New York), and Theodore Roosevelt Birthplace (New York) National Historic Sites; Padre Island (Texas) and Point Reyes (California) National Seashores; and Frederick Douglass Home, District of Columbia.

6. Field investigations were made of 48 areas throughout the country for possible national park, national historic site, or national recreation area status; com-

prehensive planning studies were made of 16 areas to determine their national significance and their suitability and feasibility for inclusion in the system.

7. Boundary adjustments were authorized affecting Bandelier (New Mexico), Capulin Mountain (New Mexico), Craters of the Moon (Idaho), and Natural Bridges (Utah) National Monuments; Big Hole (Montana) and Petersburg (Virginia) National Battlefields; Vicksburg National Military Park (Mississippi); and the Virgin Islands National Park. Also name changes were authorized to identify certain areas with a more appropriate park category, resulting in the following revised area identifications: Big Hole (Montana) and Petersburg (Virginia) National Battlefields; Edison National Historic Site (New Jersey); and Harpers Ferry National Historical Park (West Virginia).

8. Seventeen comprehensive geological and ground water investigations and 12 continuing measurements of streamflow and ground water level were accomplished in or for the parks.

9. Archeological surveys were accomplished in 31 project areas and major salvage in 42 project areas in 30 States. Small archeological investigations were made in 29 Service areas. Approximately 80 percent of the work was accomplished by cooperative agreements and contracts with 31 State and local institutions. In turn, the cooperating agencies expended approximately $274,000 of their own funds in cash or equivalent services on these projects.

10. Progress on the survey of historic American buildings continued with 334 sheets of measured drawings and 1,599 photographs, covering approximately 576 structures being completed and deposited in the Library of Congress.

11. The historic sites survey carried forward studies of 5 themes, or periods of American history, 5 special studies, and over 400 inventories. Special studies were completed in response to congressional requests; and a number of requests for investigations from other sources were received.

12. Six major concession contracts were executed, which included construction programs totaling approximately $2,850,000. At the end of the fiscal year, there were approximately 81 major concession contracts and 113 miscellaneous ones in effect. Capital investments by concessioners under existing contracts in new and improved facilities totaled approximately $3,500,000. The franchise fees of six concessioners were reconsidered, of which one was increased, three were unchanged and two are pending.

13. During the year audits were completed and reports rendered on 39 concessioners covering an aggregate of 143 years' operations. This represents an increase over the 1962 fiscal year of six audits. Periods covered in audits of individual concessioner's operations varied from 1 to 9 years.

Objectives and program for budget year

The objectives for the budget year are to achieve maximum progress toward the Mission 66 goal in all programs financed under this appropriation and to keep Mission 66 as nearly on schedule as possible.

The increases requested totaling $2,635,417 provide $2,186,817 for the benefit of park operating programs, and $448,600 to meet increased costs incident to classified employee salary increases pursuant to Public Law 87-793.

The budget contemplates that park visitation will reach 102 million in 1965 as compared to 94,093,000 in 1963 and an estimate of 96 million in 1964. It also recognizes, as it has for the past several years, the increased fund requirement for operating the many new and reconstructed facilities that are being completed in the parks under the Mission 66 construction program. Of the total increases under this appropriation item for the benefit of park operations, more than $1,500,000 is for placing the Service in a better position to handle the increase in visitor workload in the parks, including extension of the visitor season in some of them, and for operating new visitor centers, campgrounds, amphitheaters, and other new Mission 66 facilities.

The budget includes increases in the park programs for operating and maintaining two new areas for which funds are not now provided; namely, Hamilton Grange National Memorial, New York; and Frederick Douglass Home, District of Columbia. Also, in the category of increases for the benefit of park operating programs is provision for 10 additional U.S. Park Police positions; for continuing and expanding the program commenced in fiscal 1963 for converting existing radio systems in the parks to narrow-band frequencies; for paying service-connection charges incident to obtaining commercial electric and telephone services in some of the isolated parks; and for more adequate fire protection service in the parks.

An increase of $150,000 is also included to initiate a coordinated program of natural science and wildlife management studies to provide needed facts and

information upon which to base policy program, and management decisions having to do with the preservation, development, and use of the parks.

Management and protection

Appropriation, 1963	$25,525,000
Supplemental appropriation, 1963	960,000
Total appropriation, 1963	26,485,000
Transferred to "Operating expenses, Public Buildings Service," General Services Administration	−600
Transferred to "Salaries and expenses," Bureau of Outdoor Recreation, Interior	−1,101,096
Total available, 1963	25,383,304
Appropriation, 1964	27,124,000
Transferred to "Operating expenses, Public Buildings Services," General Services Administration	−47,417
Total available, 1964	27,076,583

SUMMARY OF INCREASES, 1965

To provide for increased pay costs for fiscal year 1964 positions	448,600
New park areas for which funds are not not provided	46,000
New park areas activated since beginning of Mission 66 now partially financed	401,000
To operate newly constructed facilities and to meet requirements generated by increased visitor use and general park program expansion in pre-Mission 66 areas	1,015,817
Conversion of park radio systems to narrow-band frequencies	68,000
Commercial power and telephone service connection charges	200,000
Natural science and wildlife management studies	150,000
10 additional U.S. Park Police, salaries and expenses	97,000
Production of additional park informational publications	75,000
To provide for more adequate fire protection service	82,000
Employees compensation fund payments	52,000
Net increase, 1965	2,635,417
Budget estimate, 1965	29,712,000

Analysis by activity

1. Management of park and other areas—Analysis by subactivities

Subactivity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase		
				Total	Pay cost [1]	Program
(*a*) National parks, monuments, etc.	$17,278,169	$18,787,083	$20,924,300	$2,237,217	$353,400	$1,783,817
(*b*) National Capital parks	2,446,210	2,833,000	3,045,000	212,000	18,000	194,000
(*c*) Informational publications	440,929	441,700	521,000	79,300	4,300	75,000
(*d*) Employees compensation fund payments	10,414	56,000	108,000	52,000	----------	52,000
Total	20,175,722	22,117,783	24,598,300	2,480,517	375,700	2,104,817

[1] To provide for increased pay costs for fiscal year 1964 positions.

(*a*) *National parks, monuments, etc.*

The estimate of $20,924,300 is an increase of $2,137,217 over 1964, and includes $353,400 for increased pay costs.

The programs financed under this subactivity are those concerned with management, protection, and interpretation of the areas administered by the National Park Service other than those comprising the National Capital region. The estimate contemplates that 207 park areas with a total of about 26 million acres in Government ownership will be administered during the 1965 fiscal year. The estimate also contemplates that visitation of those areas will exceed 102 million in calendar 1965 as compared to 94.1 million in 1963, the last completed calendar year, and an estimate of 96 million for 1964. Fulfillment of the Service's responsibility incident to this visitor use requires adequate staffs of uniformed personnel—rangers, naturalists, historians, guides, etc.—as well as adequate numbers of management and administrative employees.

While much progress has been made in overcoming staffing and other program component deficiencies that obtained at the commencement of Mission 66 and in meeting the heavy increase in workload that has taken place; i.e., the increase in visitor use, the addition of new areas to the system, and the provision of new visitor facilities in the areas the operation of which requires additional staffing and general expense funds, adequate staffing and funding levels have not been reached. It is essential that the full amount requested in the estimate be provided if minimum requirements for the management, protection, and interpretation of the park areas are to be met in the budget year.

The increases requested are for the following purposes:

Increased pay costs	$353,400
One new park area for which funds are not now provided	33,000
New park areas activated since beginning of Mission 66 now partially financed	401,000
To operate newly constructed facilities and to meet requirements generated by increased visitor use and general park program expansion in pre-Mission 66 areas	931,817
Conversion of park radio systems to narrow-band frequencies	68,000
Commercial power and telephone service connection charges	200,000
Natural science and wildlife management studies	150,000
Total	2,137,217

Need for increase.—Fund requirements under this subactivity continue to increase from year to year. Principal factors bringing about the increased requirements are (1) constantly increasing visitor use of the parks; (2) completion and placing into operation of new Mission 66 facilities requiring additional management, protection, and interpretive personnel and supporting general expense funds; (3) establishment of new park areas; and (4) increases in the cost of doing business. All of the increases requested are for going programs, except $33,000 for one new park not yet activated and $150,000 for natural science and wildlife management studies. Justification for the increase under each of the major program categories is set forth below:

New park area for which funds are not now provided, $33,000

Hamilton Grange National Memorial, N.Y.—This area was authorized for establishment by Public Law 87–438, approved April 27, 1962. "The Grange," built in 1801, was the only house ever owned by Alexander Hamilton, but it no longer stands on its original site. It is to be moved again and set aside as a public national memorial to commemorate the historic role played by Alexander Hamilton in the establishment of this Nation. Land is being donated to the Federal Government on which to relocate "The Grange." The act authorized an appropriation of $460,000 to cover the costs of moving and restoring the house and developing the new site for visitor use. Funds for this purpose were provided in the 1964 fiscal year "Construction" appropriation.

The lands which are being donated will be in Federal ownership within a short time and it is expected that "The Grange" will be moved to its new location on the donated land by or shortly after the beginning of the 1965 fiscal year, at which time the Service's responsibility for management, protection, and interpretation will commence. The increase requested will provide for the following:

Historian-curator, GS–9	$7,030
Park guide, GS–4 (2)	8,444
Guard, GS–3 (2)	7,780
Total salaries (5 positions)	23,254
Less estimated lapse	1,150
Net salaries	22,104
General expenses, including personnel benefits, uniform allowances, supplies, equipment, etc	10,896
Grand total	33,000

New park areas activated since beginning of Mission 66 now partially financed, $401,000

Since the beginning of Mission 66 in 1957, 24 new areas have been, or soon will be, activated for which management, protection, and interpretation funds totaling $1,275,700 are provided under this subactivity in the 1964 appropriation. The initial amounts and any subsequent increases provided have been requested and allocated to meet minimum needs in activating the new areas and their increased requirements to date. Requirements for new areas increase from year to years as progress is made in getting the operations underway and in providing services and facilities as visitor use increases. This estimate provides a program increase of $401,000 for 23 of the newly activated areas to meet operating requirements during the 1965 fiscal year. The areas activated during the Mission 66 period or soon to be activated and pertinent fund and staffing data with respect to each follow:

Area	1964 appropriation		1965 estimate		Increases requested	
	Fund allocation	Permanent positions	Fund allocation	Permanent positions	Funds	Permanent positions
Arkansas Post, Ark	$18,700	2	$25,300	3	$6,600	1
Bent's Old Fort, Colo	30,000	3	32,000	3	2,000	
Booker T. Washington, Va	24,900	2	27,100	2	2,200	
Cape Cod, Mass	155,000	10	211,300	14	56,300	4
City of Refuge, Hawaii	37,100	3	53,500	4	16,400	1
Flaming Gorge, Utah and Wyo	85,700	8	129,900	11	44,200	3
Fort Clapsop, Oreg	32,900	3	36,100	3	3,200	
Fort Davis, Tex	46,300	4	52,800	5	6,500	1
Fort Smith, Ark	42,900	6	48,600	6	5,700	
General Grant, N.Y	21,700	3	22,400	3	700	
Glen Canyon, Ariz. and Utah	184,200	18	203,400	19	19,200	1
Grand Portage, Minn	45,800	5	48,900	5	3,100	
Horseshoe Bend, Ala	37,600	4	45,600	5	8,000	1
Lincoln Boyhood, Ind	28,200	3	41,100	4	12,900	1
Minute Man, Mass	70,300	7	93,600	9	23,300	2
Padre Island, Tex	31,000	4	73,700	8	42,700	4
Pea Ridge, Ark	41,700	5	45,200	5	3,500	
Point Reyes, Calif	28,000	5	104,300	8	76,300	3
Russell Cave, Ala	24,700	3	25,800	3	1,100	
Sagamore Hill, N.Y	30,400	6	55,900	6	25,500	
Theodore Roosevelt Birthplace, N.Y	13,100	3	20,100	3	7,000	
Virgin Islands, V.I	163,800	17	174,800	18	11,000	1
Whiskeytown, Calif	52,000	5	100,400	7	48,400	2
Wilson's Creek Battlefield, Mo	29,700	3	30,200	3	500	
Total	1,275,700	132	1,702,000	157	426,300	25
Less pay increase costs for fiscal year 1964 positions					25,300	
Program increase requested					401,000	

The increases requested, as indicated in the foregoing, are needed to bring visitor services and protection staffing more nearly in line with that of other comparable areas and to meet the workload anticipated to obtain in the 1965 fiscal year, including the operation of new facilities that will be completed under the Mission 66 construction program. The increases in permanent positions shown in the above tabulation will be met through reductions in permanent positions in pre-Mission 66 areas where the work currently being performed by incumbents of such positions will be accomplished by contract or by temporary employees.

To operate newly constructed facilities and to meet requirements generated by increased visitor use and general park program expansion in pre-Mission 66 areas, $931,817

Since the beginning of Mission 66, the two major purposes for which increases have been requested under this subactivity for park areas existing at the commencement of Mission 66 have been (1) for operating newly constructed facilities, and (2) for requirements generated by increased visitor use and general park program expansion. While these items have been presented separately in prior year estimates, they have always been considered as companion ones. With the passing of time, it has become progressively difficult to break out the total requirement into the two categories. This is due principally to the fact that amounts appropriated for the purposes have in many instances been less than the amounts requested, thereby making it necessary to operate new facilities with amounts provided to meet the increased visitor workload and vice versa. In so doing, continuity of the requests from year to year has been disrupted. For this reason the two items are combined in this estimate.

Increases have been provided for these purposes each year since the beginning of Mission 66. However, the Mission 66 objective of providing adequate staffing and supporting general expense funds for management, protection, and interpretation of the park areas has not geen realized and the requirement increases from year to year as visitor use of the parks increases, as new facilities are placed into operation and, with respect to management requirements, as the overall park operating and development programs expand in the progress of Mission 66.

By the beginning of the 1965 fiscal year, it is estimated that there will have been completed and placed into operation in all service areas during the 8-year period since the commencement of Mission 66, along with a wide variety of other facilities, 1,750 miles of new or reconstructed roads, 260 of which serve new or reconstructed campgrounds; 80 new visitor centers; 14,600 new campsites; 178 new picnic areas with a capacity of 4,200 sites; and 60 new amphitheaters and campfire circles with seating capacity of 15,000. The construction appropriation estimates contemplate that programs for completing and placing into operation additional units in all of these categories will continue at a reasonably high level in 1965.

The completion and placing into operation of new units in each of these categories bring requirements for additional funds and staffing under this appropriation activity. New visitor centers require additional uniformed interpretive personnel. The new campgrounds and campfire circles require additional protective and interpretive personnel (rangers, naturalists, historians, etc.), plus supporting general expense funds, including uniform allowances. New miles of roads and parkways, and, in some instances, reconstructed and reconditioned roads require additional ranger personnel for patrol functions, plus supporting general expense funds, including such expensive items as the acquisition, operation, maintenance, and replacement of motor vehicles.

The steady increase in visitation to the pre-Mission 66 parks, which will exceed 100 million in 1965, intensifies existing workload requirements. This is for comparison with the workload generated by annual visitation of 60.3 million at the beginning of Mission 66. Only through the provision of adequate uniformed personnel and supporting program assistance can minimum visitor services and park protection requirements be met, to say nothing of improving the service to the public and providing more adequate protection of park values.

Aside from the increased visitor use of the parks during the previously recognized travel season, use patterns are changing and extending to the degree that in some heretofore seasonal parks, public use is steadily approaching a year-round basis. New public use areas and improvements of roads tend to spread public use within the parks. Water use and back-country use are steadily increasing. Campground use increased approximately 86 percent from 1956 to 1963. In 1956, camper days totaled 3,628,600 while in 1963 they totaled 6,741,000. All of these factors bring about progressively increasing fund requirements for management, protection, and interpretive staffing and general expenses.

The total increase requested under this heading is for application to requirements in 131 parks. The increase does not provide for any new permanent positions. It does provide, however, for about 64 man-years of temporary employment, plus supporting general expense funds for items such as uniform allowances and acquisition, operation, maintenance, and repair of motor vehicles. Additionally, it provides for contract work, communications, supplies, materials, and equipment required in the operation of the new facilities.

Conversion of park radio systems to narrow-band frequencies, $68,000

On January 14, 1959, the Executive Office of the President, Office of Civil Defense Mobilization, issued a directive requiring the narrow banding of all Federal radio systems. Pursuant to that directive, the Interdepartment Radio Advisory Committee issued a memorandum to the National Park Service on March 5, 1959, requiring conversion of the radio systems in the parks to narrow-band frequencies by November 1, 1963. In view of the number and diversity of radio installations throughout the Service, the various types of equipment now in use in the parks, and the various technical problems expected to be encountered, it appeared most unlikely that all of the conversions throughout the Service could be completed by the date set. Accordingly, the Service appealed for an extension of time and was given a new deadline date of November 1, 1966.

It is estimated that the total cost of the conversion to narrow-band frequencies will exceed $400,000. The sum of $67,500 was provided in each of the 1963 and 1964 appropriations to commence the program. The increase of $68,000 requested under this item brings the total request for the purpose to $135,500 in 1965 and represents fund requirements for conversions proposed to be accomplished in that year.

A significant increase in the use of the very high frequencies (VHF) for military, aeronautical, and "space" services emphasizes the need for the Government to use the available spectrum as efficiently as is practical. Use of narrow-band or "split" channels is a major factor in obtaining more efficient use and will provide increased availability of existing transmission and receiving radio chan-

nels. The National Park Service must convert its systems or the total schedule will not be met. This could cause serious interference with radio assignments to other agencies.

Commercial power and telephone service connection charges, $200,000

The Service arranges for obtaining electric power in the parks from commercial sources unless it is determined not to be in the interest of the Government to do so. Mission 66 plans call for the commencement of commercial electric power service in 22 areas in the budget year. Negotiations with the power companies to extend service to isolated park areas must be on the basis of paying a service connection charge to cover all or a part of the extension costs or, when possible to do so, the paying of increased rates over a specified period until the power company's extension investment is recovered. On the basis of experience to date, more satisfactory and more economical arrangements can be made on the basis of paying a lump-sum charge at the time the service is commenced. In many instances it is not possible to negotiate on any other basis.

To obtain telephone service in some of the isolated areas or to isolated sections of some areas, it is necessary to construct lines at Government expense from points where the telephone service is required to connect with telephone company lines or to arrange with the telephone companies for extension of their lines. Such arrangements with a telephone company, as is the case with respect to extension of electric lines by the power companies, must likewise be on the basis of paying a service connection charge or paying a higher monthly rate for telephone service over an extended period of time. In most cases, it has been determined to be in the interest of the Government to negotiate with the telephone companies on the basis of making a lump-sum payment at the time the service is connected.

Such lump-sum payments for both electric and telephone connections are proper for financing under the same appropriation items that finance the electric and telephone service. Negotiations underway for services to be commenced in 1965 carry a connection charge fund requirement of $450,000 of which $250,000 will be chargeable to this appropriation activity and $200,000 to activity 2 of the maintenance and rehabilitation appropriation item. A small increase of $50,000 was provided for the purpose in the 1964 management and protection appropriation but no specific provision for it was made in the maintenance and rehabilitation item. The increase requested for the purpose must be made available if the program for providing adequate electric power and telephone services for the parks is to go forward as planned.

Natural science and wildlife management studies, $150,000

It is of extreme urgency that the Service undertake a carefully planned and coordinated program of natural science and wildlife management studies at the earliest possible date. Some such work has been done from year to year in the past with funds that could be made available from area allotments and with the small amount that has been available specifically for the purposes, but such work has only scratched the surface and has not been accomplished as a part of a coordinated plan to insure timely production of adequate data on a servicewide priority of need basis. The increase requested under this heading is to provide for commencement of such a planned program.

It is essential that these studies be undertaken in 1965 to provide seriously needed data that is now lacking. Without this needed data, sound and timely management, policy, planning, and programing decisions required to protect and maintain the integrity of the park and to protect the interests of present and future generations in them cannot be assured.

The need for management oriented studies of wildlife, vegetation, and geologic conditions is stressed in a report dated March 4, 1963, by the Secretary's Advisory Board, on wildlife management entitled "Wildlife Management in the National Parks" and by the report of the National Academy of Sciences which was rendered by the Academy on August 1, 1963. It is urged that both of these reports be given careful review in considering this budget request.

The following statement is quoted from the National Academy of Sciences report:

"Unless drastic steps are taken to restore the deteriorated environments within this generation, several if not all of the national parks will be degraded to a state totally different from that for which they are preserved and for which they were to be enjoyed."

This is the sobering conclusion reached by a National Academy of Sciences committee appointed, at the request of Secretary Udall, to study and to advise

the National Park Service regarding its needs for scientific information as a basis for effective park management, use, and preservation.

The report asserts further that—

The national parks are among the most valuable heritages of this country.

The Government demonstrated particular wisdom in setting them apart for the people.

The role of national parks in the lives of our citizens is dramatically enlarging.

Each national park should be regarded as a system of interrelated plants, animals and habitat.

Each park should be dealth with individually on the basis of objectives defined in the light of the purposes and phenomena (biological, geological, archeological) which instigated its establishment.

The Service should conserve the national parks with due consideration for enjoyment by their owners.

Knowledge about the parks and their problems is prerequisite to the discharge of this responsibility.

Past research by the Service, the accomplishment of which should be a matter of pride to the Service, has nevertheless been seriously inadequate to the discharge of these responsibilities.

The report cites specific examples of where degradation or deterioration has occurred because scientific data was not developed and was not brought to bear upon problems of management, development, public use, or preservation.

The committee made 20 recommendations to the Service regarding the nature, scope, and methods of organizing and conducting a program to meet the problems of today and the future.

Park natural resources include scenery, geologic features and phenomena, forest and plant cover, wildlife and all other elements of the natural environments of the areas. These are real resources for they are the raw materials under the Service's management from which visitor benefit and enjoyment are obtained. These resources cannot be exploited consumptively if they are to yield a maximum of visitor benefit and enjoyment. They are to be used but not used up.

The results of forest fires are obvious at once. But other adverse influences such as erosion, trampling and pulverization of forest understory and flower-carpeted meadows, and the ravages of tree pests and blight, do not reveal their presence until irreversible harm has been done. The situation explodes with sudden violence and disastrous effects, like the failure of mechanical devices because of metal fatigue.

The wise course, and the economical one, is to nip in the bud, to apply remedial measures while the problem is small, before the damage becomes irreversible.

To do so the Service must take steps to obtain comprehensive knowledge about the resources it is protecting, and of the dangers it must protect against. The task is by no means simple, because the interrelations, interdependence, and interactions among natural environments, and the forces at work within them are exceedingly complex, frequently obscure, and incompletely understood. As in medicine, adequate knowledge is required for the diagnosis, and scientific competence is essential in applying the remedy.

The scientific program has an additional bonus value, providing data and concepts necessary for public information and interpretation.

The following cases illustrate the importance of competent scientific service and knowledge in the solution of practical park problems:

(1) About a decade ago an abnormal number of giant sequoia trees in Sequoia, Kings Canyon, and Yosemite National Parks, began to lean, and to fall. Where visitors were endangered, some of the trees had to be felled. Limited studies revealed that the root systems were injured by heavy visitor traffic and by being sealed off by blacktop. The cause was very complex, involving soil compaction, availability of air, water, and plant food, and root fungus. This small study is already pointing the way for protection of the sequoias through better development plans and better public use practices. But much more is needed immediately. The initial study also brought to light facts indicating that the species as a whole may be endangered through a widespread failure of the species to reproduce itself during the last 75 years. The full details by all odds must be obtained It is in the public interest that a program of scientific investigations be continued in the interest of preservation of these trees.

(2) Special emphasis must be placed on wildlife studies urgently needed by management. Overpopulation of ungulate wildlife species in several national parks has already resulted in severe damage to range environments and forest resources. Wildlife management control programs are continually required for

conserving the integrity of park wildlife and associated vegetation. To be effective and economical, these must be based upon scientific study and recommendations; guesswork is no longer good enough; elk, buffalo, and pronghorn antelope herds of Yellowstone National Park have so damaged the range as to have drastically altered the availability and quantity of food for themselves and for other species. Consequently, the whitetail deer and beaver have either been completely eliminated or severely reduced from these ranges, and the bighorn is threatened. Such ecological changes pyramid, so that soil erosion, reduction or elimination of plant species, reduction of suitable food and cover for smaller wildlife species, disruption of normal life patterns, establishment of conditions of starvation, pestilence, or disease follow. The solution is not found by only counting elk, but by conducting complete studies of the total environment, and basing corrective management plans thereon. Similar problems exist, requiring similar lines of attack in Zion, Bryce, Rocky Mountain, Glacier, Sequoia and other western national parks.

(3) In several parks, introduced nonnative wildlife species are in direct competition with native species for food, cover, and water. Competition for food and water is particularly severe in the desert areas. Studies need to be conducted to give guidance to control and management programs directed toward restoration of native habitats and native populations of wildlife species. Burros, goats, pigs, wild boars, and mongooses are presently in serious conflict with native wildlife in 15 areas administered by this Service, including Great Smoky Mountains, Hawaii Volcanoes, and Virgin Islands National Parks, and Death Valley National Monument.

(4) Both grizzly and black bear management and associated studies continue to be a critical need. Black bears were responsible for more than 60 personal injuries, 740 incidents and $10,800 in property damage during 1962. A single tort claim against the Federal Government, due to injuries caused by a grizzly bear, resulted in an award of approximately $130,000 to the plaintiff.

A servicewide management plan, that will insure maximum visitor enjoyment of the natural park scene with a minimum infringement on natural activities of bears, requires an understanding of the habitat requirements of bears, their way of life, and their reaction to man. The objective is to effect a maximum compatibility of man and bear within the natural situations that occur in the 38 parks involved. Studies toward this end should be continued and extended.

(5) Mosquitoes prevent full enjoyment of several parks, particularly in the eastern seashore recreational areas. The usual type of control programs which involve manipulations of water impoundments, use of insecticides, and biological deterrents, and other means can have extremely adverse effects upon other animals and plants, including the spectacular bird populations and fish life that the areas were established to perpetuate. Therefore, controls must be applied, first as carefully tested small-scale pilot projects, and the results subjected to a full analysis by professional ecologists.

The program makes provisions for:

1. Basic planning, in its initial stages, for the administration of, and for the technical aspects of the overall program. This has been undertaken by the existing professional staff, which will continue to consult with scientists of other bureaus and universities, in planning, setting up, and directing the programs.

2. Field investigations and consultative service: A small nucleus of scientists is proposed for immediate assignment to those national parks having the most severe deterioration and presently in greatest need of scientific data and service for remedial action. These men will provide immediate on-site advice and service on management problems while improving the present status of knowledge, and developing programs to remedy existing conditions of severe deterioration in the environment. The latter functions are essential to the development of management programs for each park, as recommended by the Academy Committee and the Committee on Wildlife Management in National Parks. The program contemplates temporary and w.a.e. employment of qualified specialists where appropriate to accomplish studies for which the assignment of permanent employees would not be economically feasible or necessary.

3. Project studies: Contracts and cooperative arrangements with State universities and Government research agencies for project studies offer an outstanding advantage. The cooperating institutions make substantial contributions of their own manpower and funds because of their own established interests and commitments in these fields. In this way, the Service usually receives much more than a dollar in return for every dollar spent.

It is proposed, through contracts with universities in the various States, and by cooperative arrangements with the Fish and Wildlife Service and the U.S. Geological Survey, to undertake specific projects directed toward the solution of recognized severe conservation problems in several park areas, such as Glacier, Hawaii, Rocky Mountain, Sequoia and Kings Canyon, Wind Cave, Yellowstone, and Yosemite National Parks, and Channel Islands, Badlands, Organ Pipe Cactus, and Saguaro National Monuments. Additional support and continuity will be provided for certain projects now in progress, such as elk environmental and improvement studies in Grand Teton, Glacier, Yellowstone, and Rocky Mountain National Parks, grizzly and black bear investigations, and studies and experimentation of techniques relative to the preservation and management of the bighorn, protection of moose range on Isle Royale National Park, and the "Balds" of Great Smoky Mountains National Park.

The total increase requested is as follows:

Personnel compensation:	
Permanent positions (5) (4.7 man-years)	$55,000
Temporary and/or w.a.e. employment (3 man-years)	35,000
Subtotal (7.7 man-years)	90,000
Contract studies	36,000
General expenses, including personnel benefits, printing, travel, etc	24,000
Total	150,000

Plan of work.—The program contemplates a continuing effort to manage, protect, and interpret the parks and facilities administered to accommodate an estimated 102 million visitors in 1965 and, at the same time, preserve park values.

Of the increase requested, about 16 percent is for increased pay costs; about 44 percent has been applied to the operation of newly constructed facilities and to cover requirements generated by increased visitor use and general park program expansion in pre-Mission 66 areas; about 21 percent is for the operation of 1 new park area for which funds are not now provided and for additional operating requirements in 23 park areas that have been activated since the beginning of Mission 66; about 12 percent to continue the program for converting park radio systems to narrow-band frequencies and to provide for service connection charges incident to obtaining commercial electric power in various parks; and the balance, about 7 percent is for the initiation of a coordinated program of natural science and wildlife management studies.

(*b*) *National Capital parks*

The estimate of $3,045,000 is an increase of $212,000 over 1964. The increase includes (1) $18,000 for increased pay costs; (2) $13,000 for operation of a newly authorized area (Frederick Douglass Home); (3) $97,000 for 10 additional U.S. Park Police positions, salaries, and expenses; and (4) $84,000 for additional staffing and general expense funds for management, protective, and interpretive functions.

Need for increase.—The increases are needed to (1) manage, protect, and interpret the newly authorized Frederick Douglass Home in the District of Columbia; (2) strengthen the park police force as a further step toward achievement of the required staffing level as discussed in previous estimates; and (3) provide other necessary management, protective, and interpretive staffing to meet the increased workload generated by increased visitor use and overall program expansion.

The following statement reflects increases in the volume of individuals using park facilities in the National Capital region and/or comprising vehicular and pedestrian traffic handled by the U.S. Park Police for certain calendar years from 1937 to 1963:

	1937	1959	1961	1962	1963
Out-of-town visitors	3,500,000	11,000,000	14,960,000	16,270,000	18,550,000
Active and inactive recreation participants	15,000,000	24,300,000	26,000,000	29,000,000	33,000,000
Business motorists and pedestrians	30,000,000	105,400,000	108,000,000	124,200,000	136,000,000
Total	48,500,000	140,700,000	148,960,000	169,470,000	187,550,000

This increase in visitation and in all types of park use, together with expanded facilities and increasing crime rate, makes it essential that the management, interpretative, and protective functions be strengthened. Justification for each major category of increase requested follows:

Frederick Douglass Home, District of Columbia, $13,000

This area was authorized to be designated and preserved as a part of the park system of the National Capital by Public Law 87–633, approved September 5, 1962. The act provides that the area so designated shall not exceed 14 acres, and that when the land, the home, and certain objects therein of historical significance have been donated to the United States, the Secretary of the Interior may designate it as a part of the park system by publication of a notice in the Federal Register. The act also authorizes the appropriation of $25,000 for repairing and refurnishing the home. Funds for this purpose were provided in the 1964 fiscal year construction appropriation.

It is anticipated that the area will be in Federal ownership prior to the beginning of the 1965 fiscal year, at which time the Service will be responsible for its management, protection, and interpretation. The increase requested herein for this purpose will provide for the following:

Historian, GS–7	$5,800
Temporary employment, 1 man-year	4,700
General expenses, including personnel benefits, supplies, materials, etc.	2,500
Total	13,000

Ten Additional U.S. Park Police, salaries and expenses, $97,000

The 1963 fiscal year estimate requested an increase of 62 additional park police as a step toward providing a Park Police force adequate to meet the protection needs of the park system in the Washington metropolitan area in the face of increasing crime rate and increasing visitor use. Funds were appropriated in 1963 for 31 additional officers. The 1964 estimate requested an increase of 31 police positions, the remainder of the full 1963 request, of which provision for 21 additional positions was made in the 1964 appropriation. This request for 10 additional officers is the balance of the number originally sought in 1963.

The 1963 fiscal year estimate justification stated that the Park Police force was the only one in the metropolitan area operating one-man cruisers. This type of operation has been necessary to give as much geographic coverage as possible with the limited manpower but it is not accepted as satisfactory policing in certain metropolitan areas. In programing the increases provided in 1963 and 1964, it was necessary to place emphasis on increasing the coverage in depth in certain localities as much as possible in view of the increasing crime rate. The frequency of patrol coverage by both foot and motor police has been increased but only in certain critical assignments has the use of two-man cruisers been inaugurated.

After excluding officers necessary for supervision; operating communications; performing equipment care, investigation, and training functions; handling crowds of approximately 400 special events per year and furnishing necessary escorts, only about one-half of the force is available for regular patrol duty. As it takes five men to man a patrol post, only 26 such posts can be manned regularly, of a total of 45 that should be manned, to protect life and property in approximately 40,000 acres of park land and regulate traffic over 215 miles of roads and parkways.

The 10 additional positions requested in this estimate, along with 10 that are being requested in the District of Coumbia budget, will bring the total force to 282 officers and 7 civilians. This number is 125 short of the 1965 staffing level recommended in the 1957 report on the survey of the Park Police operation.

Additional staffing and general expense funds for management, protection, and interpretation functions, $84,000

Visitor services requirements, $55,000.—The workload brought about by increased visitation and the construction of new public use facilities has created the need for additional protection and visitor services as follows:

1. Prince William Forest Park: Additional ranger services are needed to provide minimum protection in this park. Only one permanent and two seasonal rangers are provided at present for this park of 12,215 acres. The operation of new campground, picnic, and trailer camp facilities and increased activities during the hunting season, have brought about this requirement for additional ranger service. The estimate provides for 1 additional man-year of temporary ranger employment.

2. Catoctin Mountain Park: Additional ranger services, to be employed on the same basis as at Prince William Forest Park discussed above, are requested for this park. New public use facilities being constructed and increased use of the area make it essential that better protection be provided. Only one permanent ranger is available at this area. This leaves no protective personnel on active duty in the park when his tour of duty is over or when he is on leave. The estimate provides for 1.6 additional man-years of temporary ranger services.

3. Metropolitan area operations: Additional park guide services are needed to help handle the increased visitation workload at the various memorials. In the present overall operation of the memorials, there is a shortage of guide service at Custis-Lee Mansion and the combined forces at the Lincoln Museum and House Where Lincoln Died. The demands for interpretive services are such that an additional park guide is urgently needed at each location to provide essential services during required periods. There are presently eight guides and one guard assigned to Custis-Lee Mansion and six guides and three guards assigned to the Lincoln Museum and House Where Lincoln Died to provide interpretive and protective services to these areas on a three-shift, 7-day-a-week basis. The employment of additional guides on a temporary, part-time, or when-actually-employed basis to supplement the existing permanent personnel will make it possible to meet the minimum needs at the memorials. The estimate provides for 1 additional man-year of temporary guide services.

The services of a temporary clerk-typist are needed in the Branch of Information to assist in handling the increased demands for park information during the heavy-visitor-use season. The workload is such that there is more work than the one employee presently available can accomplish. This work involves answering numerous pieces of correspondence and telephone inquiries, clipping newspapers, typing press releases, etc. From January 1 to June 30, 1963, there were 180,000 pieces of literature distributed by the Information Branch; nearly 3,000 photographs were sold or lent for publication; approximately 7,000 written requests for information were processed. Many of these required written replies, either by a special letter, note, or designated form reply. By actual count, more than 100 incoming telephone calls have been answered in 1 day.

The services of a temporary park naturalist are needed to provide minimum interpretive services to visitors at Greenbelt Park which is being developed to include picnic areas and other facilities which will be opened for general public use by 1965. There is no interpretive staff presently available at this area.

Additional guard service, $29,000.—Additional part-time, when actually employed, and temporary guard services, supplemented where feasible and economical with automatic detection devices, are needed to provide necessary after work hours protection to the maintenance area in East Potomac Park and the warehouse buildings used to house historic objects when not on display. The East Potomac area is now used for the storage and issue of large quantities of supplies, materials, and equipment, and security should be provided during the night to protect the Government's investment. Also many items of historic value from the White House and other historic houses are stored in the warehouses which require protection. No guards have been provided for in appropriation increases for any of these facilities. With the proposed increase, needed protection can be provided at these two areas from 4 p.m. to 8 a.m. daily. The estimate provides for 3.1 additional man-years of temporary guard services.

Plan of work.—The program under this activity contemplates the management, interpretation, and protection of the Federal Park System of the Nation's Capital and the adjacent metropolitan areas in Maryland and Virginia. The System comprises over 39,000 acres representing capital investments of approximately $227 million, including improvements. The functions will be performed principally by employees of the National Capital region.

The increase will provide a more adequate police force and overall staffing to meet the needs of the management, interpretation, and protection programs.

(*c*) *Informational publications*

The estimate of $521,000 is an increase of $79,300 over 1964, which includes $4,300 for pay costs. The program increase will provide for (1) the production of increased quantities of free informational publications for distribution to park visitors and to meet a heavy demand for park informational material in the way of both personal and mail requests to the Washington and regional offices and (2) for production of additional sales publications dealing with the parks.

Need for increase.—Informational publications have played a vital part in the National Park Service's educational program from the earliest days of the agency.

The informational publications program over the years has been one of continued expansion. The reason, of course, is that printed information is essential to every operating area and the number of areas is increasing from year to year. With the continued and projected heavy increase in park visitation, the demand for additional publications and informational services cannot but follow the trend. Aside from this, the organizational unit handling this function finds itself closely allied with Department of Commerce activities promoting tourism from abroad and at home. This program, in fact, may well be one of the more influential programs allied with the Department of Commerce program for improving the dollar balance by way of tourism.

It is the Service's objective to ultimately be in a position to provide a park folder for every three park visitors. This long-held objective becomes less and less a reality from year to year. The ratio for 1964 will approximate 1 for every 7 visitors. The amount requested in this estimate for 1965 will still provide only 1 folder for about every 7 visitors because of the projected sharp rise in visitation.

The history and natural history handbook (sales publications) program is far behind demand. A genuine effort should be made to accelerate this program with a significant increase in output over that of recent years. Only 3 of these handbooks were produced in 1963; the backlog of handbook manuscripts has increased to nearly 30. This difference in the timelag between initial effort and the ultimate publishing step has too great a gap for continued confidence on the part of participating authors.

In keeping with the President's "See America Now" program, the National Park Service has this year opened a public reception room on the first floor of the Interior Building. The increase in demand at the Washington office level for informational material concerning the park areas is anticipated to be as much as 50 times greater than was experienced with the earlier informal arrangement in the Washington office for this same activity.

The publications program is by no means static. Booklets must be constantly revised because additional facilities and services are provided in parks through the Mission 66 program, boundaries are changed, and new knowledge of history, archeology, and natural history is obtained. Informational publications must be accurate and current if they are to serve the public.

Plan of work.—By and through this program it is planned to continue the production of general informational publications and their important adjuncts, the historical and natural history handbooks. Service personnel in the parks, the regional offices, and the Washington office, prepare and edit the publications and the Government Printing Office does the printing. The publications program for the current and budget years is as follows:

1964 fiscal year

	Copies	Estimated cost
Free informational publications:		
27 booklets	3,815,000	$96,800
129 folders	9,016,000	110,600
1 sheet	30,000	700
5 general information publications	95,000	2,900
Subtotal (162)	12,956,000	211,000
Sales publications:		
5 historical handbooks (new)		
4 natural history handbooks (3 new, 1 revised)		
Subtotal (9)		18,000
Total		229,000

1965 fiscal year

	Copies	Estimated cost
Free informational publications:		
30 booklets	4,600,000	$119,600
135 folders	10,000,000	130,000
2 sheets	50,000	1,200
8 general information publications	150,000	4,500
Subtotal (175)	14,800,000	255,300
Sales publications:		
6 historical handbooks		
6 natural history handbooks		
Subtotal (12)		24,000
Total		279,300

(*d*) *Employees' compensation fund payments*

The estimate of $108,000 is an increase of $52,000 over 1964. The estimate is the amount required for payment to the Bureau of Employees' Compensation, Department of Labor, as required by Public Law 86–767, approved September 13, 1960.

2. Forestry and fire control

Subactivity	Amount available, 1963	Amount available, 1964	Estimate, 1965,	Increase, 1965 compared with 1964		
				Total	Pay cost [1]	Program
(*a*) Forest management	$189,309	$234,000	$239,000	$5,000	$5,000	
(*b*) Fire protection service	864,430	984,000	1,069,600	85,600	3,600	$82,000
(*c*) Tree preservation	100,517	105,000	106,100	1,100	1,100	
(*d*) Forest fire suppression	405,096	100,000	100,000			
Total	1,559,352	1,423,000	1,514,700	91,700	9,700	82,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

Vegetation, whether forest, brush, or grass, is an extremely important component in the internationally known national park scenery. It is the outstanding feature in many of the parks; in others, it is an essential element of the total park environment.

Forestry and fire protection activities financed from these funds protect this vegetation totaling over 11 million acres from fire, insects, disease, and other preventable damage and preserve it unspoiled for the inspiration and enjoyment of the people. Thousands of structures for visitors and administrative use must be protected from fire.

In addition, serious insect or disease epidemics must be appraised and controls undertaken where feasible to protect the park vegetation. Continuing emphasis is placed upon the prevention of man-caused or influenced damage to the irreplaceable forest resources of the parks. Protection organizations and facilities need to be strengthened and new and improved methods and equipment adopted to keep abreast of protection requirements resulting from increasing numbers of visitors, the changing patterns of visitor use and the Mission 66 development program in the parks. Funds to accomplish these objectives are requested in these estimates, as discussed below.

(*a*) *Forest management*

The estimate of $239,000 is an increase of $5,000 over 1964. This increase is for increased pay costs.

Plan of work.—Technical staff direction including investigation and planning and the development of procedures and standards for the protection of vegetation and control of forest and structural fires, is provided under this program by the Washington and regional offices. The forest management staffs in the divisions of ranger services in the Washington office and five of the regional offices give staff direction to activities involving protection of park features (lands, waters, and vegetative cover) and facilities from impairment by fire, human misuse,

unnatural erosional forces, encroachment by nonnative plants, epidemics of plant diseases, and insect infestations. They maintain close liaison with park operations and give technical assistance to park rangers and other fire protection personnel, foresters, tree preservation crews, white pine blister rust control, and forest pest control personnel. They cooperate directly with other Federal and State conservation agencies to privide efficiency and uniformity on joint operations, mutual aid during fires or other emergencies, interagency training, and development of new techniques and equipment.

They are responsible for staff direction and coordination of programs involving protection of approximately 26 million acres of Federal land, which contain about 11 million acres requiring intensive protection from fire. The preservation of these park forests, natural features, and wildlife is a major responsibility of the National Park Service. Facilities and structures of great value, irreplaceable historical buildings and objects and the millions of people who use the parks must also be protected from fire. The values at stake require the highest standards of performance at all levels.

Under provision of the Lea Act of April 26, 1946, (54 Stat. 168), and the Forest Pest Control Act of June 25, 1947 (61 Stat. 177), the Department of Agriculture transfers funds to the Department of the Interior and it in turn to the National Park Service for the control of white pine blister rust and epidemics of forest insects and tree diseases within the parks. The forest management staffs are responsible for coordination and direction of these programs. They also maintain liaison with departmental and U.S. Forest Service officials, formulate policies and procedures, issue instructions to the parks, approve projects and methods of control, and give on-the-ground assistance in fire detection and suppression operations.

(b) *Fire protection service*

The estimate of $1,069,600 is an increase of $85,600 over 1964, which includes $3,600 for increased pay costs and $82,000 for operating requirements generated by increased visitor use and general program expansion.

Need for increase.—Additional fire protection and control facilities and services are needed as new or enlarged public use areas are developed under the Mission 66 program. Increased visitor use and expansion of facilities result in changing use patterns and require revision and strengthening of protection programs. An increase of $82,000 is needed to provide additional aircraft services, specialized equipment, training, and for the expansion of existing forest and building fire control organizations. The increase will provide for 4 man-years of temporary services in the parks.

Some of the things that should be done and will be done insofar as possible with the increase requested include:

1. Selected modern techniques of fire control which are ideally suited for park operations will be adopted.

2. The steadily increasing visitor use of the parks has intensified the responsibility and workload of park staffs, especially in connection with forest and structural fire control program functions. This public use is not only increasing during normal periods, but use patterns are changing and expanding to the degree that in some parks such use is approaching, or has already reached, a year-round basis. There is an increasing tendency to spread visitor use within the parks, including back-country and water use areas. Irreplaceable historical buildings and their contents must be given the best protection possible. Fire prevention and presuppression activities must be modernized and broadened accordingly.

3. The typically rough terrain and roadless expanses of the parks present special problems in detecting fires and reaching them with suppression crews while they are still small. The increasing use of aircraft is paying off in this respect. Aircraft will be used to a greater extent to supplement fire lookout stations and fire patrols to locate fires. Presuppression costs in the use of aircraft and for training and equipping air attack personnel are high, but they pay off in the prevention or early suppression of many large and costly fires. Provision must be made in advance of forest fires for fire retardant chemicals to be dropped as a "holding action" before crews arrive or to knock down "hot spots" on large fires, and for helicopters to be used for scouting and to transport men and equipment to isolated areas.

4. To engage in an effective air operation, the Service must provide better ground-to-air communications; special equipment such as helipumpers, firehose trays, and retardant mixing equipment; and strategically located helispots.

5. The Service will cooperate to a greater extent with other agencies in planning for emergency operations through mutual training and assistance agreements

and continue participation in the development and testing of new fire equipment and methods.

6. In addition to regular fire suppression training, the Service will conduct specialized training in fire behavior, fire weather, air operations, large fire generalship, etc.; participate to a greater degree in interdepartmental and interbureau fire training programs; and assign more trainees to actual going fires.

Plan of work.—The fire protection services program provides services and facilities within the parks to carry out preventive measures on the ground and to organize and train Service employees and others to combat fires when they do occur by the most economical means and with the least possible damage to park features.

(c) *Tree preservation*

The estimate of $106,100 is an increase of $1,100 over 1964. This increase is for increased pay costs.

There are two mobile tree crews—an eastern crew which serves the northeast and southeast regions, and a western crew which serves the midwest, southwest, and western regions. The purpose of this program is to provide special care and protection for individual or significant trees such as those in historical and military park areas; and to those trees in developed public use portions of various areas. The cultural treatment afforded under this program is not applied to trees in the undeveloped segments of the scenic or scientific parks. The program is designed to establish and maintain the trees and associated vegetation in permanence where required.

Many individual trees or groups of trees in the parks have scenic, scientific, or historic significance. Examples of historically significant trees are those at Shiloh National Military Park and Vanderbilt Mansion National Historic Site. The General Sherman Tree in Sequoia National Park and the General Grant Tree in Kings Canyon National Park both giant sequoias, are examples of scenic and scientific trees. The trees and forests in cemeteries, battlefields, campgrounds, overlooks, parkways, and landscaped areas are significant because of their aesthetic value as well as for shade and shelter to the park visitor.

Trees such as those mentioned in the foregoing are subject to injury, damage, and depletion from the elements, human use, insects, diseases, and wildlife. Regulated use does not afford sufficient protection. Constant surveillance by specialists to identify deterioration of the trees and to take timely prevention and maintenance measures is essential in achieving the objectives and purposes of this program.

Plan of work.—The eastern tree crew consisting of eight men will continue to carry out tree preservation activities in the northeast and southeast regions under the supervision of the northeast regional office. The western tree crew consisting of four men will accomplish similar work throughout the west with staff direction from the southwest regional office.

(d) *Forest fire suppression*

The estimate of $100,000 is the same as that for 1964.

Plan of work.—These funds are used solely to cover forest fire suppression and emergency presuppression costs when and as they occur. They are funds which may be required in addition to the regular fire protection service and onsite management activities for fire suppression and emergency presuppression actions. Suppression involves actual on-the-ground firefighting to control fires with dispatch and at least cost. Presuppression activities include stepping up protection forces during periods of critical fire danger as a preparedness measure in the event of fire emergency.

3. Soil and moisture conservation

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase 1965 compared with 1964		
				Total	Pay cost	Program
Soil and moisture conservation	$195,438	$203,900	$205,000	$1,100	$1,100	----------

The estimate of $205,000 is an increase of $1,100 over 1964. This increase is for increased pay costs.

The Service's soil and moisture conservation program is directed toward preventing and correcting accelerated erosion, restoration of certain historical scenes and stabilization of areas receiving heavy recreational use. Of the approximately 26 million acres of Federal lands administered by the Service, more than 2 million acres require intensive conservation treatments.

Some of the major soil and moisture problems in the areas administered by the National Park Service have developed through prior misuse of lands in farming, lumbering and grazing. In some cases, immediate corrective action is needed on and adjacent to sites being developed for public use. Other problems have developed because of unnatural concentrations of wildlife, trespass, grazing, and overuse of fragile high mountain meadows in some of the Western parks. These conditions must be corrected through a continuous long-range soil and moisture conservation program.

Plan of work.—Other Service programs, such as forestry and fire control, maintenance of grounds and facilities, and certain construction and wildlife management activities are directly related to the soil and moisture conservation program. It is intended that the program be a diminishing one with rehabilitation treatments accomplished as early as practicable and maintenance requirements undertaken as a part of routine maintenance operations. The 1965 program will consist of conservation measures in 43 parks. Approximately 63 percent of the estimate will be directed toward reestablishment of vegetative cover, fencing, brush control, and other soil stabilization measures.

About 13 percent of the estimate involves water management—primarily bank protection and small developments. The remaining 24 percent of the proposed work will involve land-use planning, studies and investigations which are coordinated with programs of adjacent jurisdictions and soil and water conservation districts.

This program is directed by the Washington and regional offices and accomplished by park forces and/or by contract.

4. Park and recreation programs

Subactivity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Resource planning	$699,528	$674,400	$692,000	$17,600	$17,600	----------
(b) Visitor services	648,671	664,900	680,000	15,100	15,100	----------
(c) Lands and water resources studies	391,164	430,600	440,000	9,400	9,400	----------
(d) Archeological investigations and salvage	789,305	761,700	765,000	3,300	3,300	----------
(e) Historic American buildings survey	146,048	142,200	145,000	2,800	2,800	----------
(f) Historic sites survey	137,253	152,500	155,000	2,500	2,500	----------
Total	2,811,969	2,826,300	2,877,000	50,700	50,700	----------

[1] To provide for increased pay costs for fiscal year 1964 positions.

(a) Resource planning

The estimate of $692,000 is an increase of $17,600 over 1964, which is for increased pay costs.

This continuing program is comprised of two main functions: National Park and Recreation Area Planning and Planning Service. Under the national park and recreation area planning function, studies are conducted to determine the significance, suitability, and feasibility of areas proposed for inclusion in the national park system. It also includes the assembly and dissemination of material and data necessary to assist in the authorization of a project; development of information to assure that park boundaries are adequate to permit accomplishment of the purpose for which a park was established; and the formulation of a long-range national park system plan, including identification of areas of national significance which are suitable for national park system status.

The Planning Service function consists of the Service's participation in recreation site planning for the Bureau of Reclamation, Corps of Engineers, Bureau of

Indian Affairs, Fish and Wildlife Service, Federal Power Commission, and other Federal agencies as requested; rendering cooperative assistance to States and other political subdivisions in park development and operation matters; assisting administering Federal agencies in negotiating agreements with State and local agencies for operating recreation lands and facilities developed with Federal funds; and making periodic inspections of transferred recreation areas to determine compliance with conditions of agreement.

Plan of work.—The major portion of the work is performed by basic staffs located in the Washington office and five regional offices. The staffs are composed mainly of specialists in park and recreation planning. Certain specialized phases of the program may be accomplished through contracts with private and public organizations, such as universities and research foundations.

With respect to the planning service function, the estimate provides for little more than basic minimum staffing for the direction and coordination of site planning for other agencies. It therefore contemplates that most of the site planning work for other agencies will be accomplished on a reimbursable basis except for coordination and direction costs.

(*b*) *Visitor services*

The estimate of $680,000 is an increase of $15,100 over 1964. This increase is for increased pay costs.

This subactivity finances the continuing functions in the Washington and regional offices that are primarily concerned with the park interpretive programs—history, natural history, photographic, and audiovisual functions. Staff members engaged in these functions also collaborate in the evaluation of areas proposed for addition to the national park system and in the formulation of master plans for existing ones.

In compliance with the basic congressional directives to formulate a program to conserve the Nation's heritage of scenic, historic, and scientific objects, including wildlife, in the national park system and to provide for keeping it "unimpaired for the enjoyment of future generations," the history, natural history, and audiovisual programs are dedicated to using and preserving park areas and through various media making them meaningful to the visitor today, tomorrow, and for years to come. These programs are such that it has been necessary to center the coordination, leadership, and servicewide direction of them in the Washington and regional offices.

The long-range objectives, which are dependent upon the development and use of complete and accurate data, are summarized as follows: (1) To safeguard scenic, historic, and scientific values and resources, (2) to maintain a high standard of integrity, (3) to provide the best interpretive service to the visitor, and (4) to make effective use of available manpower and funds.

The approximately 100 historical areas administered by the National Park Service are mute witnesses of the Nation's past. Their message cannot be understood or appreciated unless effectively presented to the park visitor. A comparable task must be met with respect to an equal number of scenic and scientific areas the Service administers. Visits to areas administered by the National Park Service were approximately 3,500,000 in 1933 and rose to 94,093,000 in 1963. The forecast indicates 108 million visits by 1966. The astronomical rise in visitation correspondingly complicates the conflict of both promoting and regulating visitor use of these priceless areas in the display of their variety while preserving their integrity.

Methods of interpretation to park visitors include literature, signs, markers, museums, exhibits in place, self-guiding trails, audiovisual orientation programs, message repeaters at strategic places, etc. These mechanical aids save manpower, keep the programs vibrant with life, and answer countless questions that the visitors frequently ask. Mechanical methods, however, are not total substitutes for manpower. The scripts for audiovisual orientation, for literature, signs, markers, etc., have to be written by trained historians and naturalists. The work of the field historians and naturalists must be supervised and aided by the regional office staffs and their work in turn coordinated for adherence to standards, policies, and procedures by corresponding staffs in the Washington office.

To accomplish the objective of providing for the enjoyment of the parks, the Service's interpretive programs are designed to enhance visitors' enjoyment by helping them to better understand and appreciate the fundamental values of the parks which lie to a large extent in a scenic, historic, scientific, and wildlife heritage which they preserve. An increasingly important method of serving park visitors is the use of automatic and semiautomatic audiovisual devices which can provide

increased, effective interpretation without park interpretive staffs always having to be present. Through the development and use of tape recorded messages, automatic sound/slide film presentations, automatic motion picture installations, automatic electric maps with tape recorded sound, and other similar audiovisual devices, the historic and scientific stories of the parks can be made to "come alive" for park visitors. Many installations are activated by visitors themselves on a "demand" basis by pressing a button; others are operated by visitor center personnel on a scheduled basis. The Washington and regional office staffs are jointly and continually striving to improve the methods and devices, using the experience gained in one park to benefit another, so as to make the best use of the manpower and other resources available.

Plan of work.—The visitor services program, which is carried out by Service employees in the Washington and regional offices, provides technical and scientific services and guidance in the fields of history, geology, biology, botany, etc., essential to the interpretation and public use of the historic and natural parks of the national park system. Most of the audiovisual work connected with the utilization of tape recorded sound, still photographs, filmstrips, color slides, and related printed commentaries will be accomplished by Service personnel.

(c) *Lands and water resources studies*

The estimate of $440,000 is an increase of $9,400 over 1964. This increase is for increased pay costs.

The land use program is a continuing one, the objective of which is to provide technical assistance in solving a variety of problems relating to uses made of park lands, such as highway and utility rights-of-way and easements, agricultural permits, private accesses, and continued use and occupancy reserved by owners in deeds of conveyance. Also involved are adverse uses, such as those covered by grazing permits, some of which were inherited from other Federal agencies, mining claims and trespass, and assistance in the acquisition of the non-Federal lands within the boundaries of the park areas and those authorized for establishment. The water resources studies program is also a continuing one. Its primary objectives are to (1) locate adequate sources of water supply, (2) determine the annual and seasonal water needs for the parks, and (3) determine the extent to which the water is already appropriated and the best methods by which to establish Federal rights to its use in compliance with the water laws of the several States.

The following tabulation shows the amount programed for each function:

Function	Amount available, 1963	Appropriation, 1964	Estimate, 1965	Increase
Land use studies	$190,515	$205,300	$211,600	6,300
Water resource studies	200,649	225,300	228,400	3,100
Total	391,164	430,600	440,000	9,400

Plan of work.—Land use studies: The work plan contemplates providing technical services and guidance to the park superintendents and their staffs concerning various land use and land acquisition matters as discussed in the foregoing. The functions are performed by employees of the Service at the regional and Washington office levels.

Water resource studies: This program calls for a continuing effort to locate sources of water supply necessary for operating the parks and for use of visitors, and the determination of methods for establishment or acquisition of rights to the use of such sources in compliance with the water laws of the several States. The work is performed primarily under the technical guidance and supervision of the staffs in the regional and Washington offices, with some technical assistance provided by the Geological Survey on a reimbursable basis. Where feasible and practicable, contracts with local consulting engineers, geologists, ecologists, and other professional specialists are utilized in making these technical studies.

(*d*) *Archeological investigations and salvage*

The estimate of $765,000 is an increase of $3,300 over 1964. This increase is for increased pay costs.

This is a continuing program the objectives of which are (1) to recover a minimum of 10 percent of the scientific archeological data threatened with destruction by multipurpose water control and other construction activities; (2) to disseminate information available, through publication to professionals, interested laymen, etc., concerning material objects recovered, the implications of their special relationships to one another, and scientific relationship to similar classes of data, and (3) to inventory basic archeological values in areas administered by the National Park Service and make them available for display, comparison, and further study.

Plan of work.—This program deals with archeological surveys, investigations, and/or excavations in reservoir areas under construction by Federal agencies and in the parks of the national park system. The major portion of the work (70 to 80 percent) is accomplished through contracts with qualified State and local educational and research institutions.

(*e*) *Historic American buildings survey*

The estimate of $145,000 is an increase of $2,800 over 1964. This increase is for increased pay costs.

This is a continuing program for making and preserving records of existing structures of historic and architectural significance in the United States and its possessions. The first aim is the conservation of national cultural resources in historic architecture and its secondary aim is service to the public by making available and preserving exact records of this cultural background of American history.

The backbone of current field operations is the work of architectural students. Academic progress stimulated by the survey has proved successful to the point that the survey is recognized as a special and important instrument in the training of future architects. As of now 11 colleges conduct an active participation program and the list grows. The cooperative relationships which the survey encourages grow steadily more far reaching in cumulative results and promise. It is noteworthy that the Urban Renewal Administration has been an ally in a great many preservation and recording efforts in which survey experience has helped.

The historic American buildings survey effort is being coordinated with the historic sites survey so that designated landmarks and buildings of just less than landmark status will be recorded and survey data deposited in the Library of Congress—and herein lies the essence of reciprocity embodied in the Historic Sites Act. Whereas the historic American buildings survey contributes indispensible source material to the historic sites survey in its theme study on architecture, the latter returns the compliment in its providing firm and unimpeachable criteria as a basis for rational decisions on what should be saved and/or recorded and by whom.

It is altogether obvious that the Federal Government cannot bear the enormous burden unaided. The program is designed to achieve the goal of helping States and local groups to help themselves and to assume their just proportion of responsibility. As the survey grows in depth and quality, it becomes increasingly important as a working tool for historians, architects, scholars, and students. The survey activities have been effective in actually saving a number of significant buildings which might otherwise have disappeared unrecognized; however, the progress to date has only scratched the surface.

Plan of work.—Preliminary and advance surveys to evaluate structures will be continued. Field measuring and photographic programs will be used to take full advantage of the outstanding work accomplished by national and local historical societies as well as various other surveys conducted by the Government. The material produced will be integrated in the work of the Historic American buildings survey. Teams composed of architectural students under the direction of specially qualified and selected professors of architecture, perform the greater part of all field measuring and execution of drawings. The program will foster close cooperation with the many smaller historical societies by instruction and guidance in preservation and recording projects. Photographic material, available for loan to these and other organizations will be made available with commentary on architectural values of the particular localities to assist in recognition of buildings worthy of recording, preservation, or restoration. This material will also be available to colleges and universities. A movement to increase recording and preservation by State, county, and city will be encouraged. It has been recognized

that mutual benefits would be derived from the introduction of the recording work into the collegiate routine of architectural education. The Service proposes to cooperate with schools of architecture that include recording projects and historical documentation for the Survey in their program and to purchase for nominal amounts, often at less than their real value, reproductions of students' drawings meeting the requirements set forth by the Service. Students whose work is sufficiently outstanding will also be offered summer employment. Emphasis will be placed on the recording of buildings receiving "Landmark" and "Exceptional Value" status under the various themes of the historic sites survey now being conducted by the Service as a separate program.

(f) Historic sites survey

The estimate of $155,000 is an increase of $2,500 over 1964. This increase is for increased pay costs.

This is a continuing program, the purpose of which is to discharge the Secretary of the Interior's responsibilities as set forth in the Historic Sites Act of August 21, 1935; namely, to make surveys that will lead to the preservation for public use of historic sites, buildings, and objects of national significance for the inspiration and benefit of the people of the United States. The basic data developed by the program aid the Federal Government in determining its role in historic and prehistoric preservation. In like manner, State and local preservation groups are encouraged to take a more active part in saving the historical heritage. These data are also necessary in preparing Presidential proclamations, national historic site designation orders, departmental reports on proposed legislation, replies to congressional inquiries, and to private and semipublic requests regarding the preservation of important sites. They are also essential in assisting the Department of the Army, Bureau of Reclamation, Corps of Engineers, and the Office of Territories with their historic sites problems.

Plan of work.—The work of the survey is performed by technical employees of the National Park Service assigned to the three phases of the program, and by contracts with qualified professional historians and archeologists outside the Service.

The survey is conducted by dividing the story of American history and prehistory into 22 themes or periods. Each theme is given intensive study with emphasis on the sites associated with the particular period under survey. Indian history (prehistory) is covered by 5 themes which present the development of aboriginal life from the earliest prehistoric hunters and gatherers through the development of Indian farming, village farming, and contact with the first European explorers, to indigenous groups surviving today. Themes of history begin with exploration and settlement, and trace U.S. history through colonial times, the major wars, expansion to the Pacific, development of natural resources, and development of the United States as a world power. Through this approach, all important sites within a theme are compared and evaluated. All studies are then submitted to the Advisory Board on National Parks, Historic Sites, Buildings, and Monuments for consideration. After reviewing the survey's findings, the Board makes recommendations to the Secretary of the Interior as to sites which should be classified as having exceptional value (national significance).

5. Concessions management

Subactivity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase, 1965 compared with 1964		
				Total	Pay cost[1]	Program
(a) Management	$203,435	$216,500	$222,000	$5,500	$5,500	----------
(b) Audit	279,119	289,100	295,000	5,900	5,900	----------
Total	482,554	505,600	517,000	11,400	11,400	----------

[1] To provide for increased pay costs for fiscal year 1964 positions.

(a) Management

The estimate of $222,000 is an increase of $5,500 over 1964. This increase is for increased pay costs.

The purpose of the program is to supervise, coordinate, and regulate the establishment, operation, and maintenance of facilities and services being furnished, or

to be furnished, by concessioners to the public in parks administered by the National Park Service. The objective is to have developed by private capital within such parks sufficient, clean, modern, and efficiently operated facilities and services to insure the visiting public a comfortable and enjoyable visit within the parks at prices they can afford to pay. In addition, the important function of furnishing guidance and assistance to municipalities, other Government agencies, State, and foreign governments, which is increasing steadily, will be continued.

Plan of work.—The program contemplates general and technical supervision over the establishment, operation, and maintenance of facilities and services being, and to be, furnished by concessioners to the public, and the providing of technical assistance to the superintendents and their staffs relating to all phases of the program, including contract compliance, business procedures, corrective measures when appropriate, and contract terms and conditions. Since visitor housing costs are of major importance, the Service will continue its program of exploring new developments in low-cost accommodations. In addition, the program of exploring and developing new sources of concessioner financing will be continued, as well as giving assistance, when requested, to municipal authorities, other Government agencies, both domestic and foreign, in handling matters of similar nature.

(*b*) *Audit*

The estimate of $295,000 is an increase of $5,900 over 1964. This increase is for increased pay costs. The purpose of the program is to audit the accounts and records of the concessioners and to examine their operating and financial statements to insure that the Government is paid the full amounts of franchise fees due; that rates charged for goods and services are in accordance with contractual stipulations; that financial data are reliable; and that the internal financial controls are adequate to protect the Government's interest.

As visitation to the parks continues to increase, and as new parks come under the jurisdiction of the Service, it is necessary to expand concession operations accordingly. Future plans for the program provide for continuing audits and reports thereon covering these operations on a 3-year cycle which is considered the minimum period for achieving maximum administrative usefulness from the audit reports.

Plan of work.—The program entails the audit, by Service personnel, of the accounts and records of concessioners who provide food, lodging, transportation, and various other services and facilities to park visitors, to insure that provisions of the concession contracts have been and are being complied with. It also entails financial surveys, by Service personnel, of the financial ability of prospective concessioners prior to the negotiation of contracts. The plan provides for an audit of each concession operation requiring audit once every 3 years with provision for more frequent audits in particular instances when determined to be necessary.

Itemization of estimate

	Actual, 1963	Available, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$25,225,035	$27,076,583	$29,712,000	+$2,635,417

HAMILTON GRANGE NATIONAL MEMORIAL

Chairman HAYDEN. In last year's presentation it was stated that the lands to be donated for the Hamilton Grange National Memorial would be in Federal ownership prior to the end of the 1963 fiscal year, after which the responsibility of the National Park Service for management, protection, and interpretation would commence.

This year's presentation indicates that the title to the lands has not yet been transferred, but that you expect the donation will be made within a "short time." What happened to delay transfer of title for at least a year, and what assurances do you have that you will acquire title so that you can begin your work within a reasonably short time?

Mr. HARTZOG. May I ask Mr. Price to answer that question?

Mr. PRICE. Mr. Chairman, I might say that the title papers for the transfer of this land are now being studied by the Department of Justice as required by law. We expect completion of the title review and transfers of the title in the very near future.

NEW PARK AREAS ACTIVATED SINCE BEGINNING OF MISSION 66

Chairman HAYDEN. For new parks activated since the beginning of Mission 66, and now but partially financed, you are asking an increase of $401,000 over the appropriation of $1,275,700 for fiscal year 1964. With this increase you will fill 25 new permanent positions. Would you please comment on the need for these positions?

Mr. MONTGOMERY. Mr. Chairman, these are areas that have come into the system since Mission 66 was commenced back in 1956. These areas have been activated on a skelton staffing basis. In other words, we have put the minimum of employees in them as operations have commenced.

As visitation increases, as facilities are provided, as the workload increases, we ask for additional staffing. We had a similar item last year which was provided for. This is a further step to staff these areas in a manner commensurate with the staffing of other comparable areas.

ADJUSTMENT IN POSITIONS BETWEEN NEW AND PRE-MISSION 66 AREAS

Chairman HAYDEN. You state that these positions will be met through reductions in permanent positions in pre-Mission 66 areas. Do you anticipate that this action will result in a reduction in the budget estimate for those areas?

Mr. MONTGOMERY. No, sir. Actually, we are not asking for any additional permanent positions in our overall budget. We are realining some of our functions and making positions available for some new functions that have been provided in the past for old functions. What we are doing, we are taking a hard look at the staffing that is provided for each operation. We propose to make adjustments between organizational entities when we determine it is feasible and appropriate to do so to provide for a need such as this. We know that some of our work heretofore performed with our own forces can be done by contract. We are proposing to do that where it would be economical to do so.

We feel that some of the functions that have heretofore been performed by permanent personnel can be performed by seasonal

personnel. Where that can be done, we propose to implement it and to make these adjustments.

Converting Park Radio Systems to Narrow Band Frequencies

Chairman Hayden. At the present rate of converting park radio systems, do you believe that it will be possible for the Park Service to make all conversions by the November 1, 1966, deadline proposed?

Mr. Montgomery. We think so, Mr. Chairman, with the increase that we have proposed here. We have had $67,500 available for this purpose during each of the past 2 fiscal years. This would add $68,000 in 1965 and at that rate we feel that we can meet the deadline of November 1966.

Natural Science and Wildlife Management Studies

Chairman Hayden. I find in your budget a proposed increase of $150,000 for natural science and wildlife management studies. If this amount is approved, how much will you have for this purpose in fiscal year 1965?

Mr. Hartzog. We would have $178,000. There is $28,000 now in the base for 1964. This would provide additional money to staff a minimum organization.

Chairman Hayden. Would you explain to the committee just what you plan to accomplish with such money and explain why it is considered by the National Park Service to be "of extreme urgency" to undertake these studies?

Mr. Hartzog. Sir, if we may, we will file for the record a list of the studies which we would propose to undertake if the Congress makes available this additional money. We feel this need is urgent. As I mentioned in the earlier statement, the national park system has evolved for almost a hundred years now. At the time that many of the national parks, particularly in the West, were established, protection and protection alone was adequate to preserve the values that were there. As Dr. Starker Leopold and his board have pointed out, with this constant policy of protection followed over long periods of time, the very character of the area is being changed. Unless we are to lose the significance of the area it is going to be necessary that we adopt certain management practices to restore the area and keep it like it was. In order to do this, we need the fundamental information on which we can make intelligent management decisions.

Chairman Hayden. Would you also please break down the amount requested between wildlife management studies and natural science studies?

Mr. Hartzog. Mr. Chairman, this list we have here breaks it down for you.

(The document referred to follows:)

Studies To Be Made With Requested $150,000 Increase

Full-time studies

Dinosaur.—The wildlife balance has been distorted by earlier range depletion, lack of full recovery and by overlapping range of deer and cattle.

The biologist will study the overall situation, with special reference to range conditions, status of deer, bighorn and beaver, degree of competition between cattle and deer or other wildlife.

Glacier National Park.—Elk and deer ranges are overcrowded; browse species have been severely reduced. Bighorn have declined for reasons unknown.

A full-time biologist is needed to develop a management plan for restoring forest and browse reproduction to normal levels, to determine elk and deer population levels that will permit range recover, and to determine the cause of bighorn decline and methods of restoring the animals.

Southwest areas.—Deterioraition of the original range is evident at Carlsbad, Petrified Forest, Chiricahua and neighboring Southwest Monuments. As a result, deer have been reduced considerably from original numbers and bighorn have vanished from areas where they previously occurred. Associated wildlife species likewise have been reduced. Soil erosion has occurred where the original natural cover has been stripped away.

The need is for a full-time worker to determine the causes and extent of this deterioriation for each of the Southwest areas affected, and to determine what measures can be effectively applied by management to restore these areas to a healthy condition.

Wind Cave-Badlands.—Biologist will make range studies at Wind Cave to develop a formula to govern the management of the bison, antelope, and elk, in coordination with State programs. At Badlands, range studies are also required to manage reintroduction of bison and bighorn, and to keep close watch on the situation until the species become well established.

Zion and Bryce National Parks.—Bighorn have become extinct. The deer natural habitat is deteriorating.

The reasons for the disappearance of the bighorn are not yet known. Full-time work is needed to determine how to improve the habitat and to determine when and if bighorn can be reintroduced.

Contract studies

Grand Canyon—Kiabab squirrel.—Minimum help is planned for continuation of a study by an independent scientist who is giving special attention to the food and environmental requirements of this unique species. Support by the National Park Service is largely for logistic support, and anticipates data that will assist in the continued preservation of this species.

Great Smoky Mountains—Montane Meadows (the balds) conservation.—Mountain meadows, called balds, have been in various stages of disappearance for at least 30 years due to the encroachment of forest tree species. It is believed by some that the balds are of natural occurrence; others believe they are of Indian or early white man origin. There are probably some of each. The balds contain species and combinations of species that are unique. The problem is multiple-fold: which balds are naturally occurring, why are they disappearing (which is to say, why are trees invading them), and how may these unique areas be preserved.

The Department of Botany of the University of Tennessee has conducted research in the balds to the extent that finances would allow. A beginning has been made in establishing study plots in the balds. The proposed studies will supplement the earlier ones, but will not duplicate them. No other Government agency is, or has been, engaged in research on these balds.

Hawaii.—Massive invasions and severe competition by exotic plants and animals threaten the existence of native Hawaiian plants and animals that are found nowhere else in the world. It is essential that we determine the extent of the impact of exotic species and ways in which this impact can be lessened or eliminated; determine the extent of impact of developments outside of park and development of ways which this impact can be lessened; and develop methods by which park management can restore and maintain the original natural ecological conditions, including the rescue of several species of plants and birds on the verge of extinction.

These studies will include a survey of the vegetation through ground observations and aerial photography; the preparation of maps of vegetation on which occurrences of rare species are plotted in addition to the general vegetation types; the establishment of study plots in various vegetation types to determine extent that original vegetation has been altered by exotic animals and humans, and to determine extent to which exotia plants have invaded the areas.

Isle Royale.—One of the most complete studies in detail encompassing the complete picture of animal life and its relation to the natural environment has been underway for some 6 to 8 years at Isle Royale under the leadership of Dr. Durward Allen of Purdue. Already this has provided invaluable data re the status and management of wolf, moose, and has resulted in a technical publication (in press) and an article in the National Geographic, on the wolf.

This is largely financed through the university. National Park Service support helps to maintain the continuity and influences the orientation in a direction most useful to the Service.

Mesa Verde—Wildlife restoration.—Numerous wildlife protection and restoration measures have been carried out at Mesa Verde, but without the information necessary to insure their effectiveness. Bighorn were reintroduced but left the park for a number of years, and have only recently begun to reestablish themselves in some areas. Information is needed as to the basic requirements of bighorn at Mesa Verde in terms of range and water supplies so that introductions can be made at the most suitable places and times.

Wild turkeys have gone through a comparable history of relatively unsuccessful restoration, and are barely maintaining themselves. Information is needed on their requirements in order to insure success.

Deer have damaged the range in localized certain key areas. Habitat studies indicated above for bighorn and turkeys should be coordinated with deer habitat studies to provide management with the information needed in working out a joint management program with the State.

Saguaro-Organ Pipe Cactus—Conservation of the Saguaro Cactus.—Since the turn of the century the Saguaro and Organ Pipe Cactus have steadily declined. Reproduction is failing to maintain the specimens and future survival is in question. Causes may be due to increased rodent population, cattle grazing, loss of cover and shade over seedlings, erosion and loss of soil nutrients, seed infertility, or other factors. It is necessary to determine the factors involved so that corrective measures and management methods can be applied so as to restore the natural process and strengthen the position of these species.

Sequoia-Kings Canyon and Yosemite—Sequoia reproduction.—Sequoia groves in Sequoia, Kings Canyon, and Yosemite National Parks have been involved by dense stands of fire, cedar, and a dense understory of underbrush and forest litter. Sequoias appear to reproduce only in semi-open forest, and on mineral soil. There is concern that this condition will result in the extinction of the species in these groves. The basic question remains unanswered—is this in fact a danger, or is the present situation a stage in a cyclic pattern, involving the sequoias and its understory, that has occurred repeatedly during the many thousand years history at these groves—and is this condition requisite to the perpetuation of the species? Until this question is answered, it would be unwise to interfere in any major way with this situation.

The studies must be done in the national parks where the problem exists. The big tree is not a commercially valuable tree and the necessary studies therefore, will not be done except in the parks.

Studies have been done under contract for the Service during the past few years by Dr. Richard J. Hartesveldt, of San Jose State College, California; Dr. James D. Blick and Mr. Thomas Aley, of the University of California. These researchers have studied and utilized all of the research done previous to their own studies; there has been no duplication of effort.

There are no current studies, germane to the problem at hand being carried out by any other Government agency or private institution. The National Park Service proposes to continue to support the excellent work begun by Dr. Richard J. Hartesveldt for the solutions to sequoia management problems.

Yellowstone—Grizzly bear.—Extensive studies through the Montana Wildlife Unit, have been in progress for several years focused upon all aspects of the life, requirements, and status of the grizzly bear. This is largely financed through the cooperative unit, several agencies participating. The National Park Service is concerned with the continuation of this study since Yellowstone Park is perhaps the most important sanctuary for this animal. These studies are expected to result in the most complete knowledge of the grizzly, and serve as the base for any management measures that may be needed for protection of people and preservation of the bears.

This is a major cooperative research project enlisting the skills, contributions, and know-how of many agencies. The National Park Service will be a major beneficiary of this project although it is being asked to contribute only a minor proportion of the total cost.

The studies must be done in Yellowstone National Park because this is one of the few areas in the United States, other than Alaska, where grizzlies exist in significant numbers.

Some preliminary publications by Dr. Craighead and associates have been issued, particularly the article "Radiotracking of Grizzly Bears," Bio-Telemetry, Pergamon Press, 1963, pp. 133–148.

Yosemite Valley—Vanishing meadows.—The floor of Yosemite Valley is undergoing a massive invasion of forest trees. Old-time photographs compared with those taken today show that the meadows are disappearing. We believe that this may not be wholly due to natural factors.

What is now needed is a study leading to methods and a management plan for restoring the primitive more open forest and the vanishing meadows. The longer the solution is postponed, the more difficult and costly is the remedy. Solutions arrived at in Yosemite may be applicable to comparable situations at Lassen, Sequoia-Kings Canyon, as well.

Studies and services with WAE personnel

1. Studies in Big Bend, Dinosaur, Grand Canyon, Grand Teton, Olympic, Rocky Mountain, Sequoia-Kings Canyon, Yosemite, and other areas as needed—temporary employment of field assistants and clerical personnel in support of full-time studies by the permanent staff.

2. Consultive and advisory service in support of the total program, primarily to secure expert guidance in carrying forward the recommendations of the Leopold and Academy committees.

3. Death Valley-Joshua Tree—Bighorn study. Continuation of this study by a WAE professional employee.

Frederick Douglass Home

Chairman Hayden. Has title to the Frederick Douglass Home been transferred to the United States yet?

Mr. Hartzog. No, sir; it has not. But Mr. Jett has an explanation on that for you.

Chairman Hayden. I note that in last year's presentation you stated that it was expected that title would be transferred by the beginning of the 1964 fiscal year, and in the current presentation you believe that it will be in Federal ownership prior to the beginning of the 1965 fiscal year.

Mr. Jett. Mr. Chairman, we found that two organizations were involved in the ownership and management of the Frederick Douglass Home, one of whom the attorneys indicated did not have the authority to transfer it. Through the year our attorneys and the Justice Department have been working with the two organizations. Now, the necessary authority has been established to transfer this property to the United States. The deed is being reviewed by the Justice Department and we expect fully that within a month, certainly by July 1, we will have it in Government ownership.

Additional Park Police

Chairman Hayden. Again, you are requesting funds to add 10 additional U.S. Park Police to your force. Would you care to comment upon the continued need for this personnel?

Mr. Jett. Mr. Chairman, the present strength of the U.S. Park Police is 262 uniformed men, 86 of whom are financed in the District of Columbia budget and 176 of whom are financed in the U.S. budget. We are asking for a 10-man increase under each of these appropriations which would bring the total strength of the force to 282 uniformed employees and 7 civilian employees. Mr. Chairman, we feel that these added police officers are necessary in order to afford adequate protection to visitors in the park areas of the Nation's Capital. We find in some of our in-town areas we are unable to have a footman, for example, in Lafayette Park, Meridian Hill Park, Franklin Park. We do not have a man on duty in these parks between the hours of

11 and 7 a.m. We feel very strongly that this protection and coverage is necessary.

We have also added responsibilities, for example, the burial of the late President Kennedy in Arlington National Cemetery requires 21 additional man-days of policing a week to handle the traffic on Memorial Drive and along the approaches to Arlington National Cemetery.

Also, there are new areas that have been added to the park system or will be. There is the zoo bypass which we anticipate will be put into use during this year. I think it would be of interest to the committee to know that we carried over 14,981 hours of compensatory time worked by the U.S. Park Police last year, that is in 1962, and an additional 14,168 hours of compensatory time in 1963.

Fire Protection Program

Chairman Hayden. In connection with your fire protection service, how much, if any, do you use of facilities of the Forest Service in your fire training?

Mr. Hartzog. We try to work very closely with them. We have Mr. Cook here who has been primarily involved in our training program. I would like to ask him to make a statement on that.

Mr. Cook. Ordinarily, for the basic training we train our own men like the States and all other Federal agencies. This week, we are cooperating with the Forest Service, the Bureau of Land Management, Indian Service, and the State of California in a training program at Redding, Calif.

Chairman Hayden. What kind of a fire year have you had during the past 12 months?

Mr. Cook. One of the worst we have had in a good many years. It was the longest and driest practically all over the country and we had more ligntning fires than we have ever had.

Chairman Hayden. And how much supplemental appropriation has it been necessary for you to seek.?

Mr. Cook. $275,000.

Recreation Resource Planning Program

Chairman Hayden. For resource planning in your park and recreation program you are seeking $692,000. Specifically, what kind of planning do you accomplish?

Mr. Hartzog. This, Mr. Chairman, covers a range of activities which we have organized in national park system planning. This involves the planning for new areas for the national park system which may arise from the theme studies made under the National Historic Sites Act; the national recreation areas identified by the Bureau of Outdoor Recreation for Administration by the National Park Service; and other national park or monument proposals originated by private individuals, Members of the Congress, States, and others. We, likewise, use this to study the boundaries of the existing areas and to determine those which should be revised to include or exclude additional land. Also, we do planning work for the Bureau of Reclamation and other Federal agencies such as for recreational facilities on reservoir areas, site planning, land-use planning, and so forth.

LAND AND WATER RESOURCE STUDIES

Chairman HAYDEN. In the section of your justifications entitled Land and Water Resources Study, I note that during 1963 you performed comprehensive geological and ground water investigations as well as measurements of stream flow and ground water level. Do you do this work with your own personnel, or do you arrange for Geological Survey personnel to do it?

Mr. PRICE. To a large extent, we arrange to have this work done by the Geological Survey on a reimbursable basis. This is particularly true, for instance, in connection with work in the Everglades National Park in Florida.

ARCHEOLOGICAL INVESTIGATIONS AND SALVAGE

Chairman HAYDEN. I think that would be a better way to do it. Will you please prepare for the record a table showing the locations of the archeological investigations and salvage which you have carried on in the past year, showing the costs of each of the investigations, and whether or not they are being accomplished by your own personnel or by contract or cooperative agreement with a state or local institution? It will be well, also, for you to prepare a similar sort of table to cover planned work in 1965.

Mr. HARTZOG. Thank you very much. We are working on it and will put it in the record.

(The table referred to follows:)

[1] It is contemplated that these projects will be done by National Park Service personnel. The others will be accomplished by contracts with appropriate State and local institutions in which case it is estimated those institutions will contribute approximately the same amount ($274,000) of their own funds and equivalent services as they did in fiscal year 1963.
[2] Report and analysis prior studies.
[3] Unknown.
[4] May be ahead of schedule and finished fiscal year 1963.

Historic American Building Survey

Chairman Hayden. Do you have any particular comment with regard to your historic American buildings survey?

Mr. Stratton. Mr. Chairman, the historic American buildings survey is a long-range program for assembling a national archives of historic American architecture. It was started in 1933 and has had the combined support and efforts of the American Institute of Architecture Executives as well as the Library of Congress.

At the present time a great number of drawings and photographs have been assembled and deposited in the Library of Congress and is available for the public. During the war years, this was stopped because of lack of funds and manpower but the survey was renewed in 1957 and today the collection is one of the largest in the Library of Congress for this particular type of thing. I understand there was some interest about what we are doing in the District of Columbia in this regard.

Chairman Hayden. I have received a specific inquiry relative to a survey of historic buildings and sites in the District of Columbia. How much work are you doing in this area?

Mr. Stratton. In the 1965 budget there is planned a measuring team of four architectural students under the professional direction of an architect. During the 1965 program the team should be able to record by photographs historic data and measured drawings of at least three or four significant historic buildings. We have, of course, already in the past several years, done this in relation to the Hayes Manor, the Rockledge, Jones Point Lighthouse, Christ Church, and several others in the District of Columbia. We will continue this.

Blue Ridge Parkway Extension Study

Chairman Hayden. In fiscal year 1963 the Senate report on this bill indicated that a survey should be made of the proposed national parkway from the Blue Ridge Parkway into the State of Georgia. What is the status of this survey?

Mr. Hartzog. Mr. Chairman, this survey has been completed. We have a statement on that study if you would like to have it.

(The statement referred to follows:)

Status of Study of Blue Ridge Parkway Extension into Georgia

On June 27, 1963, a report on the feasibility and desirability of developing a national parkway extending from the Blue Ridge Parkway near Beech Gap, N.C., southwest into Georgia, was submitted to Congress by the Secretaries of Interior and Commerce. The report was prepared in accordance with the act approved August 10, 1961 (Public Law 87–135, 87th Cong.), which instructed the National Park Service and the Bureau of Public Roads to make a survey of such a parkway running by Cashiers and Highlands, N.C., into Georgia in the direction of Atlanta.

The report recommends congressional approval of an extension of the parkway generally following the Blue Ridge Mountains for approximately 190 miles from Beech Gap to an intersection with U.S. 41 and Interstate Route 75, north of Marietta, Ga. Nearly half of the total distance of the recommended extension lies within two national forests. Location and planning within the forest boundaries would be coordinated with the Forest Service. Secretary of Agriculture Orville L. Freeman's endorsement of the parkway proposal is included in the report.

The report recommends that the principle of cooperative development of the parkway follow the pattern of the Blue Ridge Parkway and other national park-

ways with land acquisition by the States; construction and maintenance by the Federal Government; and the construction of motorists' facilities by private concessioners. The estimated cost would be approxiately $72,778,000 for all road construction and related costs of developed areas for visitor use, except for concessioner buildings, such as lodges, restaurants, and motor service buildings. Land acquisition costs are not included.

Of the estimated cost $17,301,000 would be required for construction of 43 miles in North Carolina and $55,477,000 for 147 miles in Georgia.

The following bills have been introduced in the 88th Congress to authorize the acceptance of donations of land and the construction, administration, maintenance of the extension by the Secretary of the Interior: H.R. 7956 (Davis of Georgia); H.R. 7704 (Taylor of North Carolina); and H.R. 7703 (Landrum of Georgia). No action has been taken on these bills.

Chairman HAYDEN. Do you have any idea when funds will be requested to initiate construction?

Mr. HARTZOG. The extension has not been authorized by legislation. We have programed all that the existing legislation covers. This extension will need new substantive legislation.

Senator BIBLE. May I interrupt Mr. Chairman to ask one question?

Chairman HAYDEN. Yes.

NATIONAL PARKWAY POLICY

Senator BIBLE. Have you developed a parkway policy within the National Park Service of the Department of Interior? What is your policy on parkways? We are receiving a tremendous number of requests for them in all areas of the United States. I would like to have you develop, and do it under a separate memorandum, a statement of your policy on national parkways—how you meet the criteria, how many parkways we actually have now, what they cost, how many surveys have been authorized, and what you are undertaking? I would like to have that supplied.

Mr. HARTZOG. Thank you, sir, we will be happy to prepare that and send it to you by letter.

ELK MANAGEMENT IN YELLOWSTONE NATIONAL PARK

Mr. MCGEE. In view of the additional elk traps purchased last year, do you anticipate that the entire elk reduction this year can be carried out by the live-trapping method?

Mr. HARTZOG. Yes, sir; except for a small number of elk which are collected periodically throughout the year for cooperative study purposes with the Montana Fish and Game Department's Wildlife Laboratory at Montana State College. The biological data obtained from these studies will furnish comprehensive information on the wildlife population. Construction of additional traps, through the use of operational funds, has been of considerable added assistance in furnishing live elk to the recipients.

Mr. MCGEE. How many elk must be removed from the herd this year?

Mr. HARTZOG. It is our plan to remove approximately 1,100 animals from this herd.

Mr. MCGEE. Have the herd reductions yet reached the point where there will be just a minimal thinning out each year as compared with the very large reductions of the past few years?

Mr. HARTZOG. Yes; through a reduction of the annual estimated increment to the northern Yellowstone elk herd.

Mr. McGEE. Do you anticipate any problems with this program this year or in the future?

Mr. HARTZOG. No sir, in fact the reduction for this year is nearly complete without any problems. We are uncertain as to the future at this time, but are hopeful no problems will develop.

FISH STUDY IN YELLOWSTONE NATIONAL PARK

Mr. McGEE. I am advised that in the past few years, the Park Service has been allocating funds to the Fish and Wildlife Service to conduct the fishery study on Yellowstone Lake.

This work being carried on is most important for fishing in that lake is very big business. The summary report of the fishery management program on Yellowstone Lake for 1963 indicates that there were 192,332 anglers on the lake in 1963 who spent 419,310 hours to catch 321,523 cutthroat trout.

As I understand it, this project involves the inventory of all waters of the lake and its drainage area for their fishery potential and a continued study of the fishing pressure for future management and increased use by the public. In view of the ever-increasing number of visitors to this great national park, I feet it is essential that an adequate fishing study be continued since fishing in the lake is one of the most popular attractions of the park.

Do you intend to allocate funds again this year to continue this study?

Mr. HARTZOG. We do plan to continue our temporary support of the study in fiscal year 1965. The Fish and Wildlife Service made studies of the Yellowstone Lake fishery for a number of years, developing information of much use to this Service in its fish management program. Two years ago the Fish and Wildlife Service found that it was unable to continue to support these studies within its management program. In order that we would not lose the benefit of previous studies in the year-to-year management of the fishery, we temporarily reprogramed park operating funds that has been provided for other purposes, so that studies by the Fish and Wildlife Service could continue at a maintenance level and on a reimbursable basis. We have continued to benefit from this year-to-year appraisal of the fishery.

Mr. McGEE. If such funds are not avaiable, how much would be needed to adequately carry forward this study?

Mr. HARTZOG. It is our understanding that an annual appropriation of $50,000 would be required. This would put the study on a secure and permanent basis, and broaden it to cover some of the other important fishery waters of the park, as well as Yellowstone Lake and its drainages.

Chairman HAYDEN. There will be included in the record the statments in justification of the budget estimate for "Maintenance and rehabilitation of physical facilities" in the amount of $23,500,000, which is $1,933,250 more than was appropriated in fiscal year 1964. Of this estimate $9,500,000 is for roads and trails, and the other $14 million is for buildings, utilities, and other facilities.

(The justification referred to follows:)

Maintenance and Rehabilitation of Physical Facilities

HIGHLIGHT STATEMENT

Broad purpose and long-range objectives of program

The maintenance and rehabilitation of physical facilities program is directed toward keeping, as nearly as possible, all park physical facilities—roads, trails, buildings, utilities, etc., in their original condition, as constructed or as subsequently improved, and providing sanitation, utility, grounds maintenance, and other services required by the visiting public.

A primary objective of Mission 66 is to be in a position to accomplish satisfactorily the foregoing when adequate facilities of all types have been provided and the visitor use reaches an estimated 108 million in 1966, the last year of the 10-year period.

Accomplishments during the past year

The significant accomplishments during 1963, stated briefly, were the maintenance and operation of facilities which were utilized by 94.1 million visitors with only a few complaints by the visiting public of a general nature and the successful assumption of the maintenance and operation of newly constructed facilities and those in new areas activated during the year.

Objectives and program for budget year

Objectives for the budget year are to keep this segment of the Mission 66 program on schedule to the fullest extent possible.

The program for 1965 contemplates a continuation of the rise in visitor use and expanded maintenance and operating requirements due to the completion and placing into operation of new or reconstructed facilities.

Maintenance and rehabilitation of physical facilities

Appropriation, 1963	$20,000,000
Supplemental appropriation, 1963	578,550
Total appropriation, 1963	20,578,550
Appropriation, 1964	21,566,750
Transferred to General Services Administration pursuant to Reorganization Plan No. 1 of 1963	−25,254
Total available, 1964	21,541,496

SUMMARY OF INCREASES, 1965

Increased pay costs	57,000
Wage rate increases	430,000
New park areas for which funds are not now provided	38,000
New park areas activated since commencement of Mission 66 now partially financed	298,000
Maintenance and operation of new and reconstructed facilities in pre-Mission 66 areas and more adequate maintenance and operation of facilities existing at commencement of Mission 66	935,504
Commercial power and telephone service connection charges	200,000
Net change, 1965	1,958,504
Budget estimate, 1965	23,500,000

Analysis by activity

	Fiscal year 1963 amount available	Fiscal year 1964

[1] To provide for increased pay costs for fiscal year 1964 positions.

1. Roads and trails

The estimate for 1965 is $9,500,000, an increase of $716,000 over 1964. The increase includes $24,000 for increased pay costs for fiscal year 1964 positions; $164,000 for wage rate increases already in effect; $3,000 for one new park for which roads and trails maintenance funds have not been provided; $175,000 for new park areas activated since commencement of Mission 66 now partially financed; $350,000 for maintenance and operation of new and reconstructed facilities in pre-Mission 66 areas and more adequate maintenance and operation of facilities existing at commencement of Mission 66, including provision for increased visitor use workload.

2. Buildings and utilities

The estimate for 1965 is $14 million, an increase of $1,242,504 over 1964. The increase includes $33,000 for increased pay costs for fiscal year 1964 positions; $266,000 for wage rate increases already in effect; $35,000 for two new parks for which buildings and utilities maintenance funds have not been provided; $123,000 for new park areas activated since commencement of Mission 66 now partially financed; $585,504 for maintenance and operation of new and reconstructed facilities in pre-Mission 66 areas and more adequate maintenance and operation of facilities existing at commencement of Mission 66, including provision for increased visitor use workload; and $200,000 for commercial power and telephone service connection charges.

Need for increase.—Fund requirements for maintenance and operation of physical facilities in the parks are governed principally by the size, number, and complexity of physical plants (roads, trails, buildings, utilities, campgrounds, sanitation systems, etc.), the number of visitors accommodated, and cost levels obtaining when the work is accomplished. Large-scale construction and reconstruction programs have been underway since 1957 and are planned through the budget year, resulting in the addition of many new and improved facilities. In addition, the maintenance and operation of such facilities in new parks are commenced from year to year, all of which require additional funds. The continued heavy park visitation exerts additional burden on maintenance and operating funds, and maintenance cost levels have increased steadily since, and even before, the start of Mission 66.

All of the increases requested, except the small amounts for new parks ($3,000 under "Roads and trails" and $35,000 under "Buildings, utilities, and other facilities"), are for going programs. Justification for each of the increases summarized in the foregoing follows:

Wage rate increases

Roads and trails	$164,000
Buildings, utilities, and other facilities	266,000
Total	430,000

The funds requested under this item are to cover wage increases in effect as of August 15, 1963, and do not take into consideration such increases that may become effective during the balance of 1964 or during 1965. It is essential that the increase be granted in order that the maintenance and operating program level, heretofore provided for, will not have to be lowered due to the increased personal services costs.

Increases included for National Capital region areas under this item are $12,600 for roads and trails, and $78,500 for buildings, utilities, and other facilities.

New park areas for which funds are not now provided

Area	Roads and trails	Buildings, utilities, etc.	Total
Hamilton Grange National Memorial, N.Y.	$3,000	$17,000	$20,000
Frederick Douglass Home, D.C.		18,000	18,000
Total	3,000	35,000	38,000

Information concerning the foregoing newly authorized areas is furnished in the management and protection justification. The amounts requested under this appropriation will be required to operate and maintain the physical facilities in the new parks during the estimate year.

The following is a component of cost breakdown of the amount requested for each of the areas:

Hamilton Grange National Memorial, $20,000

Laborer, ungraded	$4,909
Janitor, ungraded	4,784
Charwoman, ungraded	4,784
Temporary employment (0.4 man-years)	2,023
Total salaries	16,500
General expenses, including personnel benefits, supplies, equipment, etc.	3,500
Grand total	20,000

Frederick Douglass Home, $18,000

Laborer, ungraded	$4,618
Charwoman, ungraded	4,369
Temporary employment (1 man-year)	5,613
Total salaries	14,600
General expenses, including personnel benefits, supplies, equipment, etc.	3,400
Grand total	18,000

New park areas activated since the beginning of Mission 66 now partially financed

Roads and trails	$175,000
Buildings, utilities, and other facilities	123,000
Total	298,000

This item is a companion to the one for which an increase is requested under subactivity 1(a) of the management and protection appropriation item. The amount included in the 1964 maintenance and rehabilitation of physical facilities appropriation for each of the 24 new areas activated since the beginning of Mission 66, or soon to be activated, the number of permanent positions provided for, the amounts and positions proposed for 1965 and the increases in funds and permanent positions requested are as follows:

Area	1964 appropriation		1965 estimate		Increases requested	
	Fund allocation	Permanent positions	Fund allocation	Permanent positions	Funds	Permanent positions
Arkansas Post, Ark	$6,000	1	$6,000	1		
Bent's Old Fort, Colo	10,400		10,700		$300	
Booker T. Washington, Va	21,600	1	21,700	1	100	
Cape Cod, Mass	78,400	7	130,000	9	51,600	2
City of Refuge, Hawaii	21,700	2	23,100	2	1,400	
Flaming Gorge, Utah, and Wyo	67,100	4	122,500	5	55,400	1
Fort Clatsop, Oreg	12,800	1	13,100	1	300	
Fort Davis, Tex	36,100	1	38,600	1	2,500

Virgin Islands, V.I	85,400	15	94,500	17	9,100	2
Whiskeytown, Calif	19,900	2	46,000	5	26,100	3
Wilson's Creek Battlefield, Mo	12,500		14,300		1,800	
Total	805,500	76	1,123,700	92	318,200	16
Less increase for these areas included under heading under heading "Wage rate increases"					18,700	
Less increased pay costs for fiscal year 1964 positions					1,500	
Program increase requested under this heading					298,000	

The amounts currently provided, as indicated in the foregoing, have been requested and allocated to meet minimum needs in activating the new areas and their minimum increased requirements to date. Requirements for new areas increase from year to year as progress is made in getting operations underway and in providing services and facilities to meet visitor needs. The increases requested are needed to bring maintenance and operations program levels of the areas involved more nearly in line with those of other comparable areas and to meet the workload anticipated to obtain in the 1965 fiscal year. The increases in permanent positions shown in the above tabulation will be met through reductions in permanent positions in pre-Mission 66 areas where the work currently being performed by incumbents of such positions will be accomplished by contract or by temporary employees.

Maintenance and operation of new and reconstructed facilities in pre-Mission 66 areas and more adequate maintenance and operation of facilities existing at commencement of Mission 66

Roads and trails	$350,000
Buildings, utilities, and other facilities	585,504
Total	935,504

Since the beginning of Mission 66, the two major purposes for which increases have been requested in the maintenance and rehabilitation appropriation for areas existing at the commencement of Mission 66 have been: (1) Operating and maintaining newly constructed and reconstructed facilities; and (2) more adequate maintenance and operation of facilities existing at the commencement of Mission 66, including additional requirements brought about by increases in visitor use of those facilities. While they have been presented separately in prior year estimates, the two items have been considered as companion ones in the budget requests. With the passing of time, it has become progressively

difficult to break down the total requirement into the two categories. This is due principally to the fact that amounts appropriated for the purposes have, in many instances, been less than the amounts requested, thereby making it necessary to apply amounts provided for operating facilities existing upon commencement of Mission 66 to the cost of maintaining and operating new facilities, and vice versa. In so doing, continuity of the requests from year to year has been disrupted. For this reason, the two items are combined in this estimate.

While substantial headway has been made through appropriation increases in providing for more adequate maintenance and operation of facilities existing when Mission 66 was commenced and for maintenance and operation of new facilities, the standard of maintenance as contemplated in the Mission 66 program has not yet been attained. Also, as long as the visitor-use workload continues to increase and new facilities continue to be placed into operation, it will be necessary to request additional funds under this heading.

The maintenance and operation of new buildings, such as visitor centers, administration buildings, utility buildings, comfort stations, entrance stations, etc., new and improved campgrounds, new and improved utility systems, and other varied types of facilities provided in the parks under the Mission 66 construction program, bring about heavy increases in annual fund requirements. While some of these new facilities replace old ones for which maintenance and operating funds have previously been provided, most of them represent plant expansion, the maintenance and operation of which can be accomplished only through the provision of appropriation increases, or on a substandard basis through lowering the standard of maintenance of other facilities.

Experience of all agencies points up the fact that for the first 3 or 4 years after a road has been constructed or reconstructed, maintenance costs for drainage and shoulder and slope stabilization work are particularly high. Reconstructed roads are built to a higher standard with lesser grades, wider roadway, shoulders, ditches, and flatter slopes to safely handle increased visitor use. Accordingly, for reconstructed roads, maintenance costs are higher than for the old roads due to need for more frequent mowing, roadside cleanup, and the increased surface to be maintained on the improved road.

Many facets of the workload comprising the maintenance and operation of buildings, utilities, and other facilities are obvious and immediately recognized. However, it might not be fully understood that the placing into operation of a new campground requires, in addition to funds for maintaining guardrails, fireplaces, picnic tables, etc., substantial amounts for sanitation and other cleanup service, including the replacement of garbage and trash containers as they become unserviceable. Also, in placing a new comfort station in operation, in addition to requirements for painting, plumbing repairs, structural repair, etc., the much more costly sanitation service must be performed several times daily while the facility is receiving visitor use. Many other similar operating costs, including janitor services and utilities for new visitor centers and administration buildings, which have a bearing on the Service's maintenance and operating fund requirements, could be cited.

Aside from the increased visitor use of the parks during previously recognized travel seasons, use patterns are changing and extending to the degree that in some heretofore seasonal parks, public use is steadily approaching a year-round basis. New public use areas and improvements of roads tend to spread public use within the parks. Water use and back-country use are steadily increasing. Campground use increased approximately 86 percent from 1956 to 1963. In 1956 camper days totaled 3,628,600 while in 1963 they totaled 6,741,000. All of these factors bring about progressively increasing maintenance and operation fund requirements.

The increases requested in this estimate must be provided if the many facilities are to be operated and maintained at standards that will protect the Government investment and adequately serve the visiting public during the estimate year.

Increases included for National Capital region areas under this item are $42,500 for roads and trails, and $198,600 for buildings, utilities, and other facilities.

Commercial power and telephone service connection charges, $200,000

The need for this increase is explained in the justifications under the "Management and protection" appropriation item and, for ready reference, is quoted as follows:

"The Service arranges for obtaining electric power in the parks from commercial sources unless it is determined not to be in the interest of the Government to do so. Mission 66 plans call for the commencement of commerical electric power service in 15 areas in the budget year. Negotiations with the power companies to extend

service to isolated park areas must be on the basis of paying a service connection charge to cover all or a part of the extension costs or, when possible to do so, the paying of increased rates over a specified period until the power company's extension investment is recovered. On the basis of experience to date, more satisfactory and more economical arrangements can be made on the basis of paying a lump-sum charge at the time the service is commenced. In many instances it is not possible to negotiate on any other basis.

"To obtain telephone service in some of the isolated areas or to isolated sections of some areas, it is necessary to construct lines at Government expense from points where the telephone service is required to connect with telephone company lines or to arrange with the telephone companies for extension of their lines. Such arrangements with a telephone company, as is the case with respect to extension of electric lines by the power companies, must likewise be on the basis of paying a service connection charge or paying a higher monthly rate for telephone service over an extended period of time. In most cases, it has been determined to be in the interest of the Government to negotiate with the telephone companies on the basis of making a lump-sum payment at the time the service is connected.

"Such lump-sum payments for both electric and telephone connections are proper for financing under the same appropriation items that finance the electric and telephone service. Negotiations underway for services to be commenced in 1965 carry a connection charge fund requirement of $450,000 of which $250,000 will be chargeable to this appropriation activity and $200,000 to activity 2 of the "Maintenance and rehabilitation" appropriation item. A small increase of $50,000 was provided for the purpose in the 1964 "Management and protection" appropriation but no specific provision for it was made in the "Maintenance and rehabilitation" item. The increase requested for the purpose must be made available if the program for providing adequate electric power and telephone services for the parks is to go forward as planned."

Plan of work.—The roads and trails program contemplates maintenance and operation of primary and secondary roads, parkways, airport landing strips, and trails in such a manner as to prevent deterioration in the maintenance of existing mileage, and to provide adequately for new and reconstructed mileage. Maintenance plans and estimates are prepared by engineers based upon field inspections of existing conditions. The proposed increases will be allocated for the purpose mentioned above under the "Need for increase." Where it is possible and economical to do so, the work will be performed under contracts with private concerns; otherwise, the functions under the roads and trails maintenance program are performed by technical, skilled and unskilled employees of the Service assigned to these activities.

The buildings, utilities, and other facilities program contemplates the maintenance, preservation and operation of all physical facilities in the parks other than roads and trails. These facilities include buildings, structures, utilities, campsites, campgrounds, picnic facilities, prehistoric ruins, memorials, historic structures, scientific and historical and archeological artifacts, grounds, etc. As construction projects are completed, many diverse facilities must be maintained and operated to either directly or indirectly serve the visiting public Many of the tasks required to be performed are routine housekeeping functions, such as cleaning and picking up litter, but there are also facilities which involve highly technical work, such as the operation of water, sewer, and sanitation systems, audiovisual installations, and the preservation of priceless historic structures, paintings, and furnishings. While most of the buildings, utilities, and other facilities maintenance and operating functions are carried out by employees of the Service assigned specifically to those tasks, it will be possible and economical in many instances to enter into contracts with private concerns to have the work accomplished.

Itemization of estimate

	Actual, 1963	Available, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$20,457,157	$21,541,496	$23,500,000	+$1,958,504

MAINTENANCE AND REHABILITATION PROGRAM

Chairman HAYDEN. The committee will be glad to receive whatever comments you have with regard to this activity.

Mr. MONTGOMERY. Yes, sir; Mr. Chairman. It is under this appropriation item that we maintain all of the physical facilities in the parks. We maintain the roads, trails, buildings, utility systems, sanitation systems, etc. We also operate the buildings and utilities and the sanitation systems with these funds. This fund requirement increases from year to year as public use of the parks increases and as we provide new facilities that have to be operated and maintained. We have been requesting increases in this appropriation item over the years, particulary since the commencement of Mission 66, and this committee has been very generous in granting those increases. We are again requesting similar increases this year for the same purposes as those requested in prior years to meet the increased workload.

U.S. 20 AND U.S. 287 IN YELLOWSTONE NATIONAL PARK

Mr. MCGEE. A great deal of interest has been shown in the revival of the proposal to maintain U.S. Highway 20 in Yellowstone Park on a year-round basis. Many people are also interested in keeping U.S. Highway 287 through the Grand Teton National Park and the south entrance of Yellowstone Park connecting U.S. 287 and Montana State Highway 287 open on a year-round basis.

As you know, I recently introduced Senate Resolution 248 which calls upon the Senate Interior and Insular Affairs Committee to study the desirability of keeping these roads open all year. Each year finds more people traveling during the winter months and it is good sense to provide these people with the best possible look at our scenic attractions. It is also good sense to do everything possible to put our western tourist industry on a year-round basis.

Would you include in the record your estimates of what it would cost—additionally—to maintain these park roads all year around?

I understand that improvement of some of the roads would be required in addition to winterizing some facilities. But it would be helpful to have a breakdown of these costs at this time.

Mr. HARTZOG. Thank you, Senator, I appreciate the opportunity to explain the situation at this time.

During the past 15 years we have had two factual engineering surveys of the problems surrounding winter use and travel within the park. Both survey groups included professionally competent individuals having experience with the Bureau of Public Roads and State highway departments as well as National Park Service personnel.

Our latest study was made by the Snow Survey Committee in May 1958. The committee estimated the cost of snow removal and protection operations required to keep Yellowstone National Park roads and entrances (excluding the northeast approach) open on a year-round basis to be $380,000. Furthermore the Committee recommended that we add the indirect costs accruing in capital investments, in additional equipment, improvement in road standards, employee housing and servicing that this winter use would require. Costs which would be incurred by park concessionaires (private capital) to provide services—food, housing, service stations—which would be a necessity, and would be added to the total.

We have not updated our studies made 6 years ago; hence we are not in a position to provide meaningful estimates at this time.

CONSTRUCTION APPROPRIATION

Chairman HAYDEN. For construction in fiscal year 1965 the National Park Service requests an appropriation of $25,406,000, the justifications for which will be placed in the record. This amount does not include any request for acquisition of lands inasmuch as it is expected that the estimate for that purpose will be included in the request for appropriations to the proposed land and water conservation fund, the authorizing legislation for which is now pending in Congress. With allowances made for land acquisition funds, the 1965 request is $1,991,000 less than the appropriation made in 1964.

(The justification referred to follows:)

CONSTRUCTION

HIGHLIGHT STATEMENT

Broad purpose and long-range objective of program

This program provides for the construction of buildings, utilities, and other facilities in the parks and the acquisition of water rights to serve the parks. The objective of the program is to equip adequately the areas administered with structures and facilities needed for the safety and enjoyment of park visitors and for efficient administration, maintenance, and conservation, and to acquire and establish such water rights as are needed to meet visitor and park operating requirements. An objective of Mission 66 is to prosecute these programs on the basis of providing adequate structures, facilities, and water rights for the proper administration, maintenance, and conservation of the parks, and to meet the needs of more than 108 million visitors by 1966, the last year of the 10-year period. The Service's land acquisition program, heretofore included in this appropriation item, has been withdrawn and is projected in the budget as a 1965 fiscal year supplemental fund requirement to be appropriated from the proposed land and water conservation fund for which authorizing legislation is pending in the Congress.

Accomplishments during the past year

During 1963, nearly $27 million was obligated for the construction of camping and picnicking facilities, public service and administrative units, utilities, employee housing, and miscellaneous items. Among accomplishments during 1963 were the completion of 6 new visitor centers with 16 others under contract at the close of the year; the provision of 3,700 new campsites; the provision of 84 additional comfort stations; the completion of 196 utility systems, including additions to existing systems; the completion of 80 housing units for permanent and seasonal employees; and the completion of 9 new campfire circles or amphitheaters.

In addition, about $6,173,000 of appropriated and $191,000 of donated funds were obligated for land acquisition. Some 53,900 acres of lands were acquired by purchase, donation, and exchange (exclusive of boundary adjustments) for addition to 45 areas of the national park system. About $306,000 of appropriated funds were obligated for water rights acquisition functions carried on in 75 parks with major activities in 17. Accomplishments included drilling and testing of 66 wells, 45 of which are successful production wells, installation and operation of about 75 water and tidal measuring gages, receipt of 11 water right licenses, and extensive surveys and analyses of water resources and water use in several parks.

Objective and program for budget year

The 1965 budget provides for constructing facilities for park purposes and visitor use and the acquisition and establishment of water rights which are of the highest priority throughout the Service. The program for the budget year totals $24,926,000 for the construction of 425 projects affecting 107 parks located in 36 States, the territories, and the District of Columbia; and $480,000 for acquisition of water rights.

As is indicated above, the program requirement for acquisition of lands for fiscal year 1965 is not included in this estimate, but is projected in the budget as a supplemental estimate of the Bureau of Outdoor Recreation to be appropriated from the proposed land and water conservation fund.

Construction

Appropriation 1964	$32, 697, 000
Unobligated balance from prior years	22, 756, 664
Total available for obligation	55, 453, 664
Decreases:	
Buildings, utilities, and other facilities	35, 337, 438
Acquisition of lands and water rights	18, 941, 232
Executive Mansion and Grounds	194, 161
Parkways	3, 974
Roads and trails	976, 859
Subtotal	55, 453, 664
Increases:	
Buildings, utilities, and other facilities	24, 926, 000
Acquisition of lands and water rights	480, 000
Total available for obligation	25, 406, 000
Budget estimate, 1965	25, 406, 000

Analysis by activities

Activity	Amount available, 1964	Estimate, 1965	Total available, 1965, compared to total available, 1964
1. Buildings, utilities, and other facilities	$35, 337, 438	$24, 926, 000	−$10, 411, 438
2. Acquisition of lands and water rights	18, 941, 232	480, 000	−18, 461, 232
3. Executive Mansion and grounds	194, 161		−194, 161
4. Parkways	3, 974		−3, 974
5. Roads and trails	976, 859		−976, 859
Total	55, 453, 664	25, 406, 000	−30, 047, 664

1. Buildings, utilities, and other facilities

The estimate of $24,926,000 is a decrease of $1,606,000 under 1964.

Need for funds.—1965 will be the ninth year of Mission 66. Execution of the program provided for in the estimate will be another step forward in achieving the objective of completing sufficient developments to accommodate visitors to the parks as contemplated in Mission 66. The estimate again provides for important developments in areas commemorating the historic events of the Civil War in preparation for their centennial observances, and for continuing work in the Independence National Historial Park, Pa. It also includes a substantial amount to commence vital replacement and expansion of the water supply and sewer systems at Grand Canyon National Park, Ariz. The numbers of visitors to the parks are continuing at a very high level, with increases expected each succeeding year of the foreseeable future. Accommodations and services for these people are a prerequisite to preserving the parks for future generations. The types of facilities proposed for construction within the amount of the estimate for this activity are as follows:

Camping and picnicking facilities	$2, 202, 500
Public service and administrative units	8, 971, 000
Utilities	8, 889, 400
Employee housing	2, 266, 300
Miscellaneous	2, 596, 800
Total	24, 926, 000

By the end of 1964, it is expected that the Service will have increased the number of camping spaces to 26,600. The Mission 66 goal is 30,000 camping spaces, but if the campground use trend continues to increase, this goal must also be increased. The amount of $2,202,500 programed for camping and picnicking facilities under this activity is in addition to the $1,824,600 programed for the related roads and trails items under the appropriation "Construction (liquidation of contract authorization)," making a total of $4,027,100 for campgrounds and picnic areas. The estimate includes such items as site development; water, sewer, and power systems; tables; fireplaces; garbage receptacles; comfort stations; shelters, amphitheaters, campfire circles, and camp-tender residences.

The $8,971,000 programed for public service and administrative units will provide facilities which give direct service to the visitor and all units essential to proper administration, such as visitor centers, museums, wayside exhibits, contact stations, comfort stations (except those located in campgrounds), administration buildings, entrance stations, fire lookouts, utility buildings, and observation stations, among other things. Construction of these facilities will increase efficiency in park operations by replacing, enlarging, or modernizing facilities constructed 20 or more years ago, when visitors numbered less than a quarter of what they do today, and by providing new facilities in parks in which there have been no developments.

The $8,889,400 scheduled for utilities is to serve the above-mentioned public service and administrative units and such units currently existing, and will provide the necessary services for new concessioner developments or expansions. Utilities are programed only for those parks where commercial facilities are not available or economically feasible. Included in this item is the amount of $3,870,000 for the first stage of the vitally needed replacement and expansion of water, sewerage, and sewage treatment facilities at both the north and south rim development areas in Grand Canyon National Park. In contravention to recommended public health practices, a dual (potable and reclaimed) water supply has been in use at Grand Canyon Village for many years. At first, the reclaimed water system was constructed because of the high cost of potable water, but more recently, due to increasing demands, the potable water supply at Indian Garden Springs has become increasingly inadequate so that supplementation by the reclaimed water has been a necessity. During three of the past four summer seasons it has been necessary to supplement the supply with water hauled by railroad tank car at a cost of more than $5 per thousand gallons. The Indian Gardens pumping plant has been in service for about 30 years and must be rehabilitated.

The first stage of the project will provide a new source of supply in the form of a cross-canyon line from Roaring Spring to Indian Gardens, and rehabilitation of the Indian Gardens pumping plant and terminal storage with chlorinating facilities at Grand Canyon Village. This supply will eliminate the use of reclaimed water. Subsequent stages, with an estimated additional cost of

$5,834,000, will provide for (1) rehabilitation of sewerage and sewage treatment facilities at Grand Canyon Village; (2) water supply line with distribution system and also sewerage and sewage treatment facilities for Desert View; and (3) rehabilitation and extension of water, sewerage, and sewage treatment facilities at the north rim development.

The $2,266,300 included for employee housing will enable the Service to continue its high priority program of providing satisfactory living quarters for park personnel which has been lagging considerably behind the goal set by the Mission 66 program. The title "Employee housing" refers to facilities for housing permanent and seasonal employees, such as detached residences, duplex residences, apartments, motel-type multiple quarters, dormitories, and bunkhouses. Initially the Mission 66 goal envisioned the provision of 1,000 single-family employee housing units and a total of 400 multiple units over the number existing at the beginning of Mission 66 in the then existing park areas. It was planned to construct 200 houses per year and complete the single-family unit phase by the end of the 1961 fiscal year. Single family units constructed and/or programed for construction through the 1964 fiscal year in parks existing at the commencement of Mission 66 will total 553 or 447 less than the goal of 1,000 units all of which were anticipated to be provided by the end of 1961.

The "Miscellaneous" item of $2,596,800 includes items such as park entrance facilities, fences, signs, seats, memorials, and grading, seeding, and planting for public service and administrative units.

Plan of work.—The program contemplates continuing with construction of physical facilities in the parks to meet current administrative and visitor needs and to provide for handling the 108 million anticipated visitors during 1966. For the most part, the plans, estimates, and supervision for the construction work are carried out by professional employees of the Service, although in some cases it is desirable and possible to procure the services by contract with outside professional firms. The major portion of the construction will be performed under contract with some minor projects being accomplished with day-labor forces employed by the Service.

The 1965 program includes projects estimated to cost $100,000 or more, as follows:

NORTHEAST REGION

Acadia National Park, Maine: Visitor center, exhibits, and interpretive facilities	$305, 900
Cape Cod National Seashore, Mass.:	
Demolition and grounds improvement	200, 000
Construction and rehabilitation of buildings for administration, information, and employee housing including utilities	150, 000
Construction of miscellaneous beach facilities	175, 000
Campground and picnic area development	125, 000
Fort Necessity National Battlefield, Pa: Visitor center and exhibits	183, 600
Harpers Ferry National Historical Park, W. Va.: Alteration and rehabilitation of Storer College and grounds	100, 000
Independence National Historical Park, Pa.:	
Rehabilitation of old city hall including portion of historic furnishings	250, 000
Landscape construction, area A, center section, south portion	138, 300
Landscape construction, second bank of the United States	184, 300
Rehabilitation of second bank of the United States	176, 900
Lincoln Boyhood National Memorial, Ind.: Visitor center, exhibits, furnishings, and audiovisual facilities	256, 400

SOUTHEAST REGION

Booker T. Washington National Monument, Va.: Visitor center, furnishings, exhibits, and audiovisual facilities	100, 000
Cape Hatteras National Seashore, N.C.:	
Administrative headquarters building	241, 000
Beach erosion control and stabilization	500, 000

MIDWEST REGION

Big Hole National Battlefield, Mont.: Utility system	$161,900
Glacier National Park, Mont.: Visitor center including audiovisual	257,400
Grand Teton National Park, Wyo.: Water supply, south campground	107,100
Rocky Mountain National Park, Colo.: Visitor center and administration building, including fallout shelter	506,700
Wind Cave National Park, S. Dak.: Employee apartments, 12 units	133,100
Yellowstone National Park, Wyo.:	
Boat docks and miscellaneous related facilities	350,000
Employee apartments, 12 units	141,000
Employee residences (5) Mammoth	105,000

SOUTHWEST REGION

Big Bend National Park, Tex.: Castolon water supply, storage, and distribution system	102,400
Fort Davis National Historic Site, Tex.: Rehabilitation, stabilization of historic structures	162,600
Gila Cliff Dwellings National Monument, N. Mex.: Headquarters area, utilities	103,900
Grand Canyon National Park, Ariz.:	
Supplemental water supply and rehabilitation of sewer system	3,870,000
Employee residences (6)	102,300
Lake Mead National Recreation Area, Nev.: Visitor center; exhibits, audiovisual installation, furnishings, etc	227,200
Mesa Verde National Park, Colo.: Water supply and distribution lines and 300,000-gallon storage reservoir	411,700
Zion National Park, Utah: Water and sewer extensions, south campground	160,200

WESTERN REGION

Glacier Bay National Monument, Alaska:	
Lodge building	447,800
Cruise (50 passenger)	176,500
Water system	240,000
Mount Ranier National Park, Wash.:	
Water system (headquarters)	225,000
Sewer system (headquarters)	133,000
Day-use building (Paradise)	1,020,000
Water system (Paradise)	170,000
Sequoia and Kings Canyon National Parks, Calif.:	
Comfort stations (11)	121,000
Utilities	180,000
Replace radio system	175,200
Ash Mountain, employee residences (8)	160,000
Sitka National Monument, Alaska: Visitor center including arts and crafts center	124,500
Yosemite National Park, Calif.: Reconstruct sewer system (Valley)	300,000

NATIONAL CAPITAL REGION

District of Columbia:	
System general:	
Submaintenance unit	250,000
Improvements to small parks and reservations	239,900
West Potomac Park:	
Correction of settlement and structural repairs (Jefferson Memorial)	120,000
Floodlighting of memorial	132,600
Virginia:	
George Washington Memorial Parkway: Expandable visitor contact station including police facilities (Great Falls)	115,000

2. Acquisition of lands and water rights

Subactivity	Amount available, 1964	Estimate, 1965	Total available, 1965, compared to total available, 1964
(*a*) Acquisition of lands	$18,334,367		−$18,334,367
(*b*) Acquisition of water rights	606,865	$480,000	−126,865
Total	18,941,232	480,000	−18,461,232

(*a*) *Acquisition of lands*

The fund requirement for fiscal year 1965 is not included in this estimate; it is projected in the budget as a proposed supplemental estimate of the Bureau of Outdoor Recreation to be appropriated from the proposed land and water conservation fund.

(*b*) *Acquisition of water rights*

The estimate of $480,000 is an increase of $115,000 over the amount of $365,000 appropriated for 1964, but a decrease of $126,865 under the amount available for that year due to carryover balances. The increase is needed to permit the acceleration of this program to bring it more in line with requirements resulting from increased visitor use, additional developments, and the establishment of new areas.

Need for funds.—More than 1,500 water systems in the parks administered are being supplemented or enlarged under the Mission 66 development program to provide more water for which water rights must be acquired or established. Increasing numbers of the Eastern States are adopting regulatory or appropriative water laws which will not conflict with the basic riparian doctrines. These laws and related regulations are particularly applicable to the use of underground water and the drilling, development, and use of wells. As a result, the Service must establish increasing numbers of State permits and appropriative water rights for increasing water use from systems which have formerly been operated under the riparian water laws.

With the increased public use of the parks, more water must be obtained than is available from surface water sources. This can only be accomplished by preliminary geological investigations and subsequent exploratory test well drilling. The increasing need for such wells has been brought about by the increase in prior appropriations of the national water resources in many areas where the parks are located. Florida and Mississippi, among other States, have adopted laws which define riparian rights as those to the average 5-year minimum surface flow or ground water level during the past 20 or more years. These minimums now have to be estimated and revised as more data are obtained. One of the most vital projects involves the acquisition of an assured right to sufficient continued natural flow of water in Everglades National Park from the tributary drainage of southern Florida. The normal southward pattern of flow into the park has been radically reduced as a result of the Corps of Engineers construction of levees and canals north of the park as a part of the central and southern Florida flood control project. Sufficient flow from the project area is essential to the preservation of the ecology for which the park was established. Florida water laws require such water rights to be obtained through allocation by mutual agreement of the ultimate water users, including the United States and the Central and Southern Florida Flood Control District. The Chief of Engineers was directed, by Senate resolution of May 4, 1962, to review and revise the basic flood control plan, incorporated in House Document 643, 80th Congress, 2d session, with a view to determining whether the existing project should be modified in order to insure the supply, distribution, and conservation of water for or in the park. This Service must have sufficient funds for its required participation with the Corps of Engineers to accomplish these objectives. In many of the other Eastern States, it is necessary to drill and pump test several wells to define the extent of small ground water basins and determine the safe withdrawals which will not affect the yield of other wells deriving water from the same sources.

The estimate of $480,000 is needed to finance a more realistic program to carry out surveys to obtain needed data which are not provided in plans of existing water systems; preparation of maps to support applications for the appropriation

of water in compliance with State water laws; purchase of water rights; drilling and observation of necessary test wells; and for preparation and filing of applications with supporting maps for new systems being constructed under the Service's development program.

Plan of work.—A large portion of the studies, supervision, and analysis of ground water is accomplished by the U.S. Geological Survey on a reimbursable basis, particularly with respect to geological investigations and exploratory test well drilling. Most test wells are drilled under contracts with private firms. Temporary survey crews are employed by the Service in gathering data on existing water systems and for mapping in support of applications. The acquisition phases of the program are performed by professional employees of the Service.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)

CONSTRUCTION IN CIVIL WAR AREAS

Chairman HAYDEN. In the outline of your need for funds you indicate that your request will provide for commemorating historic events of the Civil War in preparation for their centennial observances. Would you please indicate to the committee just what construction you will accomplish for this purpose?

Mr. MONTGOMERY. Mr. Chairman, I am embarrassed to tell you that that statement in our justification is in error. We do not have projects in the construction program to commemorate the Civil War observances. Most of those dates have already passed. We do have projects in the construction program to develop the Civil War areas in the manner in which we are developing other areas, to provide facilities such as roads, trails, utility systems, employee quarters, and that type of thing. But they are not for meeting requirements for observances as has been the case for the past several years.

RESTORATION OF FORD'S THEATRE

Chairman HAYDEN. In last year's budget submission there was an item of $2,073,600 for restoration of Ford's Theatre. I fail to find that item included in this year's budget. Would you care to comment on the reason for this?

Mr. HARTZOG. Sir, it just is not in the budget.

Senator BIBLE. Did you ask for it?

Mr. HARTZOG. Yes, sir; we asked the Bureau of the Budget.

Senator BIBLE. It was lost along the way.

Mr. HARTZOG. Yes, sir.

Senator MUNDT. Do you think Senator Young is going to let you get by with that?

Mr. HARTZOG. Sir, as I understand the history of this item and I looked into this when the budget was going through, we had the item in last year's budget and the Congress took it out. We promised then that we would reinsert it in our program which, as Senator Bible asked me, we did. It is now not in the budget.

Senator MUNDT. I believe this committee approved it and the House took it out, is that not right?

Mr. HARTZOG. I believe that is correct.

PROPOSED LAND ACQUISITION PROGRAM FOR 1965

Chairman HAYDEN. Although there is, of course, no budget submission for acquisition of lands, I wonder if you would supply for the record an estimate of how much you believe will be included for the National Park Service in the supplemental estimate which will be submitted for the Bureau of Outdoor Recreation to be appropriated from the proposed land and water conservation fund? Please include in your submission an indication of where the lands are located which you will wish to purchase.

Mr. HARTZOG. We will be pleased to do that, sir.

(The information referred to follows:)

Proposed land acquisition program, 1965 fiscal year

Area	*Amount*
Cape Cod National Seashore, Mass	$3, 000, 000
Padre Island National Seashore, Tex	3, 500, 000
National Capital parks (Piscataway), Md	544, 493
Inholdings:	
Badlands National Monument, S. Dak	46, 000
Blue Ridge Parkway, Va. and NC	15, 000
Cape Hatteras National Seashore, N.C	162, 000
Capitol Reef National Monument, Utah	45, 000
Castillo de San Marcos National Monument, Fla	10, 000
Chalmette National Historical Park, La	80, 000
Chiricahua National Monument, Ariz	95, 000
Colonial National Historical Park, Va	100, 000

Yosemite National Park, Calif	192, 000
Zion National Park, Utah	180, 000
Total, inholdings	3, 355, 507
Total	10, 400, 000

Status of Lands in Civil War Areas

Chairman Hayden. With regard to acquisition of lands for Civil War areas, will you submit for the record a table showing the acreage authorized. The acres now in Federal ownership, the amount appropriated for land acquisition to date, the amount obligated for land acquisition to date, the amount to be requested for 1965 land acquisitions, and the amount needed to complete the planned land acquisition program?

Mr. Hartzog. We will be pleased to.

(The information referred to follows:)

Statement showing data on acreages and costs involving Civil War areas

Area	Acreage authorized	Acres in Federal ownership Jan. 1, 1964	Total appropriation for land acquisition, 1957-64	Amount obligated for land acquisition, 1957 to date	Additional amount needed to complete land acquisition program
Abraham Lincoln Birthplace National Historic Site	116.50	116.50			
Andrew Johnson National Monument	16.68	16.33		[1] $49,150	
Antietam National Battlefield Site [2]	783.63	355.32	$455,000	233,975	$350,000
Appomattox Court House National Historical Park	972.01	937.34			70,000
Brices Cross Roads National Battlefield Site	1.00	1.00			
Chickamauga-Chattanooga National Military Park	8,190.39	8,189.64			2,000
Fort Donelson National Military Park	600.00	196.24	225,000	225,000	[3] 120,000
Fort Jefferson National Monument	47,125.00	47,125.00			
Fort Pulaski National Monument	5,516.62	5,364.12			2,000
Fort Sumter National Monument	2.40	2.40			
Fredericksburg-Spotsylvania National Military Park	3,672.15	2,527.13	164,100	4,300	850,000
General Grant National Memorial	.76	.76			
Gettysburg National Military Park	3,408.64	2,868.40	584,740	351,106	3,000,000
Harpers Ferry National Historical Park	1,500.00	469.23	300,000	240,872	
Kennesaw Mountain National Battlefield Park	3,682.62	2,882.62			[4] 250,000
Lincoln Boyhood National Memorial	200.00	114.49	75,000	4,631	
Manassas National Battlefield Park	3,108.87	2,242.31	713,450	657,196	500,000
Pea Ridge National Military Park	4,283.40	4,217.75			10,000
Petersburg National Battlefield and Poplar Grove National Cemetery	2,739.72	1,512.65			150,000
Richmond National Battlefield Park	756.49	744.96			10,000
Shiloh National Military Park	3,564.46	3,557.97	29,500	34,260	
Stones River National Battlefield	330.86	323.86	6,200	2,100	
Tupelo National Battlefield	1.50	1.00			1,000
Vicksburg National Military Park	1,648.34	1,377.93			600,000
Wilson's Creek Battlefield National Park	1,730.00				20,000
Total	93,952.04	85,144.95	2,552,990	1,802,590	5,935,000

[1] The cost of acquiring lands at Andrew Johnson National Monument was financed from general land acquisition funds.

[2] The Service is authorized to purchase scenic easements on not to exceed 1,116.37 acres of additional lands.

[3] The appropriation authorization will have to be increased by $119,000 before the full amount of funds included above can be requested.

[4] The appropriation authorization will have to be increased by $247,710 before the full amount of funds included above can be requested.

Note.—No land acquisition money is being requested in the 1965 fiscal year budget.

Facilities at Rainbow Bridge National Monument

Chairman Hayden. What is the status of the construction of facilities for access to the Rainbow Natural Bridge?

Mr. Stratton. Mr. Chairman, most of the contracts have been let. We must still do some trail work and provide some picnic facilities, but with the exception of the walks, docks, and platforms to serve the floating facilities, the projects are essentially completed.

I checked yesterday and found that we are now waiting for the water in the lake to rise so that these facilities can be put into place. At the present time the elevation is 3,414 feet and it will have to rise to about 3,500 feet in order that we may put the facilities into operation.

Chairman HAYDEN. That depends on how much snow is on the watershed?

Mr. STRATTON. That is correct. The facilities are ready to go into place but due to the water situation it is quite doubtful that they will be available to the visitors this coming summer.

THEODORE ROOSEVELT NATIONAL MEMORIAL

Senator MUNDT. Mr. Chairman, I have some questions here for Senator Young.

How much would it cost the National Park Service to acquire the Noyes property?

Mr. HARTZOG. We have Mr. Lee, our Chief of Lands here, if I may ask him to supply that detail.

Mr. LEE. We have had negotiations with Mr. Noyes in an effort to purchase the property. I regret to say that it has not been possible for our people to get together with the Noyes owners for the reason that our appraisals do not justify the price being asked for the property. I may say for the record that Mr. Noyes also is asking for a sum of money in excess of our appraisal tax free, which presents another complication to us.

Senator MUNDT. As a matter of policy have you run into that kind of situation when it gets completely impossible to solve by voluntary arrangements that you ever resort to condemnation?

Mr. LEE. Yes; we do on occasion. I would say with some pride that in excess of 80 percent of the property that we have acquired in the park system has been accomplished by voluntary purchase.

AVAILABILITY OF FUNDS FOR ACQUISITION

Senator MUNDT. Are there funds for acquisition in this budget in the event there is a falling out of this resistance?

Mr. LEE. We plan to use available land acquisition funds for this acquisition. In fact, we are planning on moving forward on that before the 1965 budget is approved.

Senator MUNDT. How much is the acquisition road cost that you propose to build at Theodore Roosevelt National Memorial?

Mr. HARTZOG. We believe that a price in the neighborhood of $75,000 for the Noyes property would be reasonable. If you would like some background on this, sir, the property is located at an interchange of the interstate highway which would give visitors access to this area. The property we are talking about is property that lies inside the area which we would acquire for a public overlook in connection with this Interstate System.

GREEN RIVER COMPLEX

Mr. MCGEE. I am pleased to see that there is a budget request for $65,000 to begin construction of the Park Service complex at Green River, Wyo. As you know, these facilities will serve as a focal point

of visitor contact for the Flaming Gorge Recreation Area presently under construction.

The reservoir began to fill in November 1962 and will reach capacity in July of this year. The boat launching ramps at Buckboard Crossing, Fire Hole Canyon, Brinegar Ranch, and Holmes Ferry are also under construction. The rapid development of the recreation sites will result in heavy visitor flows starting this summer. The Green River complex will be located at the extreme northern end of the recreation area and is strategically located with respect to tourist availability.

Do you expect to complete this project in 1965?

Mr. HARTZOG. Our 1965 program for developments at Flaming Gorge, which is pending in the public works appropriation bill, includes $65,100 for the district ranger-visitor contact station you mention. If funds are appropriated we see no reason why this work cannot be accomplished during the 1965 fiscal year. We have given it high priority, as the visitors will be stopping there for information as you have indicated.

Mr. MCGEE. According to my information, we need not only the visitor contact station, but a utility building, two residences, a water and sewer system, and roads and trails. Although we are getting started on it this year, it is a small start at best and many people in that area of Wyoming are concerned lest the recreation areas be fully completed and the Park Service complex to service the visitors be incomplete.

Would you include in the record your proposed construction schedule for the entire project?

Mr. HARTZOG. Our long-range schedules show that we plan to continue with other developments at Green River without letup if this meets with the fiscal policies of the administration in effect at the time the budget estimates are considered. The only possible exception to our master planning proposals would be in connection with employee housing. As you know, we do not construct employee housing where rental housing is available. We tentatively plan on constructing the remaining facilities in 1966, or if fiscal policies require, during 1966 and 1967.

REPROGRAMING FOR PISCATAWAY PARK LAND ACQUISITION

Chairman HAYDEN. There are several requests before the committee for reprograming of construction funds now available.

One of these is your request to reprogram $180,107 to purchase tracts on Mockley Point across the Potomac from Mount Vernon. In fiscal year 1963, Congress appropriated $213,000 for the purchase of 133 acres, the amount estimated as necessary by the National Park Service. Subsequent surveys and appraisals, however, have shown the acreage to be about 97½ and the estimated cost to be $382,200. Your letter will be reproduced in the record.

(The letter referred to follows:)

FEBRUARY 14, 1964.

Hon. CARL HAYDEN,
Chairman, Committee on Appropriations
U.S. Senate, Washington, D.C.

DEAR MR. CHAIRMAN: The act of Congress approved October 4, 1961 (75 Stat. 780), authorized the acquisition of certain lands in Prince George's and Charles Counties, Md., to preserve the scenic view and principal overview from Mount Vernon.

The Department of the Interior and Related Agencies Appropriation Act, 1963, approved August 9, 1962 (76 Stat. 335), authorized funds for the acquisition of these lands, and Conference Report No. 2049 thereon specified at $213,000 figure for the acquisition of the Henry H. Clagett tract at Mockley Point, situated on the Potomac River opposite Mount Vernon, containing 133 acres.

Efforts to negotiate a mutually satisfactory agreement with the owners for the purchase of the Mockley Point tract within the amount authorized have been unsuccessful. Therefore, condemnation proceedings entitled "*United States of America* v. *97.56 acres of land, more or less, situated in Prince Georges County, State of Maryland, and Henry H. Clagett, et al.* (Civil No. 15010)," were filed on September 19, 1963, in the U.S. District Court for the District of Maryland to acquire the property. Upon survey, it was found that the Clagett lands to be acquired aggregated 97.56 acres instead of 133 acres.

By letter dated January 2 the Department of Justice advised that offers of settlement of $331,500 and $50,700 for tracts 1 and 2, containing 84.184 and 12.7449 acres, respectively, had been secured from the counsel for the owners of Mockley Point. These offers are based on a value of $3,900 per acre. Our appraisals list some comparable sales in excess of that figure.

The Department of Justice advises that the Governmet appraisals and testimony in the event of trial range between $256,380 and $424,092 as to tract 1 and $38,235 and $63,724.50 as to tract 2.

In the foregoing circumstances, it appears that the $213,000 estimate of value of the Clagett tract on Mockley Point has turned out, by the advent of time and growing interest in purchase of Potomac riverfront property, to be too low.

We believe that acceptance of the offers of settlement should be approved, as it appears unlikely that the lands can be acquired for a lower figure. To permit judgment to be entered at the proposed settlement figures, we propose to reprogram other funds in the amount of $180,107. The sum of $10,907 has been expended for necessary appraisals and surveys.

Your early consideration and approval of this reprogaming of land acquisition funds are respectfully requested.

Sincerely yours,

STEWART L. UDALL,
Secretary of the Interior.

Chairman HAYDEN. What do you have to tell the committee about this?

Mr. HARTZOG. I brought Mr. Jett to tell you about this.

Mr. JETT. That is correct; I have a statement here on the land situation at Mockley Point if you would like me to submit it for the record.

Chairman HAYDEN. Yes.

(The statement referred to follows:)

STATUS REPORT ON LAND ACQUISITION AND SCENIC EASEMENT PROGRAM FOR PISCATAWAY PARK AUTHORIZED BY PUBLIC LAW 87-362

The act of October 4, 1961, authorized the park along the Potomac River and across from Mount Vernon, which we refer to as Piscataway Park. The act authorized the Secretary of the Interior to acquire in fee or otherwise approximately 1,152 acres of property. The act also authorized the Secretary to accept donations of scenic easements on approximately 2,596 acres of additional park property adjoining the area to be established as a park.

The 1963 fiscal year appropriations bill contained an item of $213,000 specifically designated for the acquisition of Mockley Point, the property of Henry Claggett and his sons. Condemnation proceedings against the Claggett property are underway with the Department of Justice. Of the $213,000, $10,907 has been spent for necessary appraisals and surveys, leaving a balance of $202,093. The Claggett property to be acquired is 97.56 acres. The Department of Justice advises that offers of settlement have been obtained as follows:

Tract 1, containing 84.184 acres	$331, 500
Tract 2, containing 12.7449 acres	50, 700
Total	382, 200

These figures are based on a value of $3,900 per acre. Both Government appraisals list comparable sales in excess of $3,900. Since the offers of settlement are within the Government's appraisal range, it seems logical to accept the offers. This total cost, however, is $180,107 in excess of funds available and, of course, is over the ceiling set by the House Appropriations Committee. If authorized, funds are available for reprograming to accept this offer.

To date, scenic easements have been acquired through donations from 47 property owners conveying 70 tracts of land of which 49 are in Prince Georges County and 21 in Charles County. These easements have been recorded, and they constitute approximately 25 percent of the areas over which scenic easements are desirable. A program is underway to acquire additional scenic easements, and we expect in the next few months to be in a position to record a significant number of additional easements.

The statutory limitation of $937,000 indicated for the acquisition of land in this park to be acquired in fee will be inadequate on the basis of today's cost and recent appraisals based on the Mockley Point property. At the time the legislation was enacted, cost estimates were based on a judgment estimate by knowledgeable people in the land acquisition field. However, since appraisals have been acquired and the figure of at least $3,900 per acre seems to be appropriate and fair, a reevaluation of the remaining land acquisition in fee for the Piscataway Park project would be approximately $2,030,000 for approximately 520 acres of private property.

AGREEMENT ON PURCHASE PRICE

Mr. JETT. It shows that we now have donated to us about 25 percent of the land suggested in the scenic easement area. One of the foundations has turned over 151 acres in fee simple. It is true that at Mockley Point the appraisals on the property amounted to $3,900 an acre, which is more than we had anticipated. The Justice Department did institute condemnation proceedings but now the Justice Department officials have met with the owners and I understand they are agreeable to sell at $3,900 an acre which does put us $180,000 short of what we need to complete this acquisition. We have asked permission of this committee and the House committee to reprogram funds to make it possible to acquire the 97 acres in question.

Chairman HAYDEN. You will take the money from some other source?

Mr. JETT. Yes, sir.

Chairman HAYDEN. From what other source?

Mr. JETT. It will be reprogramed from other land acquisition moneys, I understand.

Mr. LEE. We have several projects which have been authorized in the past and moneys programed for them that have not materialized for one reason or another. We plan to use some of the funds presently available for these items until such time as they can be replaced through the regular budgetary process.

Senator MUNDT. Are you abandoning these projects from which you are taking the money?

Mr. LEE. We will have to replace those funds at a later date out of subsequent appropriations.

Chairman HAYDEN. Without objection, the request is approved.

REPROGRAMING FOR MESA VERDE NATIONAL PARK FACILITIES

Also, you have requested committee approval to reprogram $400,000 of funds for construction of buildings in order to change the location of the visitor use and concession facilities in Mesa Verde National Park in Colorado. These funds will be taken from money provided for four other park service facilities. This request and a supplemental memorandum will be included in the record.

(The information referred to follows:)

JANUARY 31, 1964.

Hon. CARL HAYDEN,
Chairman, Committee on Appropriations,
U.S. Senate, Washington, D.C.

DEAR MR. CHAIRMAN: During the past several years the National Park Service has undertaken exhaustive studies relating to the future development and public use of Mesa Verde National Park, Colo. Decisions reached recently will result in major changes in existing park operating plans and will call for park developments in new locations.

The focal point of visitor use, including overnight and day use facilities of the concessioner (the Mesa Verde Co.), are all located in a small congested area known as Spruce Tree Point on Chapin Mesa. This dangerously overcrowded area presents safety hazards to the more than 260,000 annual visitors because of precipitous cliffs and unsafe terrain. Also, the irreplaceable ruins which represent the primary park values are subjected to possible damage or loss. As part of the program to relieve congestion and confusion at Chapin Mesa, it is planned to relocate the overnight cabins and related facilities from Spruce Tree Point to Navajo, which is strategically located and conveniently accessible to visitors. This action will require considerable additional investment of private capital on the part of the Mesa Verde Co. In order to discontinue the Spruce Tree Point activities, it will be necessary for the Federal Government to purchase the concession properties and require them to be rebuilt in the new location. The company has agreed to this proposal recently, and it would provide them with part of the necessary capital with which to begin construction activities in the new location. The Service is desirous of accomplishing these development objectives at the earliest practicable date in the interests of public use, and it is hoped that the purchase of the factilities can be consummated soon so that the Mesa Verde Co. can start construction activities during the coming spring and summer.

Although funds for acquiring the concession facilities are not included in the programs of the National Park Service, there are funds which can be applied to the purpose without detriment to their overall programs. It is recommended that $400,000 of funds included in the 1964 fiscal year "Construction" appropriation of the Service be approved for purchasing the Mesa Verde Co. properties as follows:

El Morro National Monument, N. Mex.: 3 residences, utility extensions, visitor center, utility building, and seasonal employee quarters	$193,250
Gila cliff dwellings, New Mexico: Visitor center and utilities (portion)	58,520
Natural Bridges National Monument, Utah: Visitor center, fencing, entrance sign, utilities, and comfort stations	105,360
Zion National Park, Utah: Water and power systems	42,870
Grand total	400,000

It is contemplated that the foregoing projects will be reinstated in future year programs, or accomplished with savings accrued on other projects. Therefore, the deferments will be of a temporary nature.

Your approval of the foregoing program adjustments is respectfully recommended. A similar letter is being sent to Hon. Michael J. Kirwan, chairman, Subcommittee on Interior and Related Agencies Appropriations Committee, House of Representatives.

Sincerely yours,

JOHN A. CARVER, Jr.,
Assistant Secretary of the Interior.

FEBRUARY 11, 1964.

MESA VERDE NATIONAL PARK, COLO.

By letter of January 31 from Assistant Secretary Carver to Representative Kirwan and Senator Hayden, it was proposed to transfer $400,000 of funds programed during the 1964 fiscal year for buildings and utilities construction, to Mesa Verde National Park for purposes of acquiring the properties of the Mesa Verde Co., a concessioner in that park.

The entire 1964 fiscal year construction programs for El Morro and Gila Cliff Dwellings National Monuments, N. Mex., would be deferred temporarily. All of the program for Natural Bridges National Monument in Utah, except $51,300 for utilities, would be deferred temporarily.

Three projects would remain in the 1964 fiscal year program for Zion National Park, Utah, including $31,300 for boundary fencing on the north and east sides of the park, $8,000 for signs and markers, and $10,200 for fencing in the Hop Valley areas.

None of the projects deferred was included in the 1965 construction program, as the proposal to use the $400,000 for the Mesa Verde project had not yet received the attention and approval of the Appropriations Committees.

The projects temporarily deferred are all needed, and it is planned to proceed with them later in the same manner as if they had not been proposed for temporary deferment. It is proposed that if plans are completed, and other conditions permit, the projects would be placed under contract and financed by deferring other lower priority projects. ("Low priority" as applied to these projects means that unforseen situations stand in the way of their accomplishment as originally scheduled.)

In the case of the El Morro projects, the plans are not completed. At Gila Cliff Dwellings, major changes in master planning are required because an anticipated exchange of lands with the State game and fish commission did not materialize, and the facilities cannot be located as originally proposed. At Natural Bridges, the construction of the visitor center and other facilities was contingent upon completion of an approach road. Unanticipated delay in establishing the approach road has delayed the entire development in this location and bids have just been opened for the approach road construction. At Zion National Park the utilities were intended to serve an expanded development on the east side of the park. The entrance station and one set of quarters in this locality are now served through hauling water and by an electric generator. Utilities should be installed prior to development of other facilities such as additional quarters and a utility building. It is not known in which future year it will be possible to program funds for the expansion of these facilities in this locality.

If the proposed program adjustment is approved, and the projects temporarily deferred are not ready for accomplishment prior to the 1966 fiscal year, funds for these purposes will be scheduled in the 1966 program.

REPROGRAMING, DELAYS, AND ACQUISITION OF FUNDS

Chairman HAYDEN. Please discuss the need for this reprograming and indicate what planned facilities will be delayed at other parks, when they will be constructed, and specifically where you will acquire the funds to do that work.

Mr. STRATTON. Mr. Chairman, during the past several years the National Park Service has undertaken exhaustive studies relating to the future development of Mesa Verde. It is one of the few areas that has not had the touch of development resulting from Mission 66 due to the fact that we were actually not able to reach the full agreement on the development of the park. At the present time accommodations for visitor use, which include overnight accommodations, food facilities, and that sort of thing, are in a congested area known as Spruce Tree Point. Actually, years ago the Park Service felt that at such time as Spruce Tree Point area had a visitation of some 30,000 it would reach its maximum use. Last year visitation was 325,000, or almost 11 times. Therefore, it has become necessary to actually move some of these facilities back from Spruce Tree Point

because they are ruining by overrunning and overuse the Indian ruins that the park was actually set up to view.

Meanwhile, the National Geographic Society has given something in excess of a quarter of a million dollars to the Park Service to do archeological studies and excavation in another area of the park called Weatherill Mesa. This work has now been completed so that we are now in a position to go forward with the development of Mesa Verde National Park.

Navajo Hill Area Development

One of the problems involved was reaching an agreement with the concessioner who has facilities down on Spruce Tree Point. After considerable negotiations a price was arrived at to pay the concessioner for his holdings, or possessory interest as we call it, and agreed to by both the Government and the concessioner. That is what this $400,000 is to be used for in order that we can begin the development of Mesa Verde in an area called Navajo Hill, where we will not only be able to disperse the visitors but we will be able to protect the ruins of the park.

Now, then, the $400,000 is to be made available by reprograming certain buildings and utilities projects in four areas as related in the Department's letter to the committee. One area is El Morro National Monument, which involves the construction of three residences, utility extensions, and a visitor center. We would propose to go right ahead with the planning on these facilities at El Morro and at such time as the plans are complete, which we believe will be prior to the end of the fiscal year, we would hope to award those contracts.

This could be done with what we term "slippage" from other projects that have been advertised and have been bid in too high or from projects where we would not be able to get the planning completed in time to advertise them this year. In other words, we would just tend to drop the priority down on those projects that cannot be gotten underway. But we do feel on all four of these areas that are involved in this $400,000 reprograming that we can get the work under contract by the end of this fiscal year or shortly thereafter.

Chairman Hayden. If there is no objection we will approve it.

Reprograming for Fredericksburg Land Acquisition

A third programing request is for use of funds appropriated for acquisition of lands within the Fredericksburg battlefield for purchase of realty within the city limits of Fredericksburg. In fiscal year 1962, the committee approved your request to reprogram $75,000 to purchase 16 tracts within the city limits; and in fiscal year 1963, $85,000 was appropriated, making a total of $160,000. This letter request also will be printed in the record.

(The letter referred to follows:)

December 4, 1963.

Hon. Carl Hayden,
Chairman, Committee on Appropriations,
U.S. Senate, Washington, D.C.

Dear Mr. Chairman: In carrying out the National Park Service's Civil War area land acquisition program within the four battlefields administered as the Fredericksburg and Spotsylvania County Battlefields Memorial National Military

Park, Va., the approval of your committee is requested to utilize all funds programed for acquisition of lands within the Fredericksburg Battlefield for purchasing the available realty in the portion of the battlefield within the city limits of Fredericksburg.

In our letter of January 26, 1962, apprising you of the National Park Service's land acquisition plans for the battlefield, it was stated that the $75,000 made available in the 1962 Interior Department Appropriation Act would be used in the purchase of the 16 tracts within the city limits. It is now realized that your committee believed that the $75,000 would be sufficient to purchase the 16 tracts. This was not intended. Actually, the 16 tracts have a total estimated value of about $450,000.

We are informed that private development of some of the tracts is imminent and that, in fact, one tract has been sold for apartment house development. Accordingly, we would appreciate modification of your approval to (1) permit the expenditure of the $75,000 for the acquisition of as many as possible of the 16 tracts and (2) grant permission also to expend the $85,000 made available by the 1963 Interior Department Appropriation Act for lands within the city limits of Fredericksburg. The 1963 fiscal year funds were programed for purchase of lands in the Fredericksburg Battlefield—$45,000 within the city limits of Fredericksburg and $40,000 outside these limits.

An identical letter is being sent to the chairman of the House Subcommittee on Appropriations, seeking modification of his earlier approval to permit the National Park Service to expend the available $160,000 within the city limits of Fredericksburg for the purchase of as many of the needed 16 tracts as can be acquired with this sum.

Your favorable consideration of this request will be appreciated.

Sincerely yours,

D. OTIS BEASLEY,
Assistant Secretary of the Interior.

CIVIL WAR AREA LAND ACQUISITION PROGRAM

Chairman HAYDEN. Would you please comment on this, indicating whether $160,000 will be sufficient to purchase all the land? If it is not, will you estimate the additional sum necessary?

Mr. HARTZOG. Mr. Chairman, we have about $600,000 left out of a previous appropriation for purchase of land in Civil War areas. This money has been earmarked for each individual Civil War area. We are going to reexamine the whole Civil War land acquisition program and make up one master priority list for all of the Civil War areas, so that we will get the most pressing properties instead of proceeding area by area as we are now doing.

Chairman HAYDEN. Will you advise the committee whether all of the tracts originally planned for purchase may still reasonably be sought? Are they so developed either residentially or commercially that it is not practical to buy them?

Mr. HARTZOG. We don't think it is practical to proceed with that proposal now. This is why we are going to take a broad look at the whole program of all of this Civil War land acquisition and come back to you with a more complete proposal.

Chairman HAYDEN. I understand that the House committee has declined to approve this request and therefore there is no need for this committee to act.

Mr. HARTZOG. I had not heard that until just now.

REPROGRAMING FOR MOUNT RAINIER DAY USE FACILITY

Chairman HAYDEN. The committee still has before it a letter from the Secretary asking committee approval of a National Park Service proposal to divert $164,500 programed for residential construction at Ohanapecosh in Mount Rainier National Park to a proposed visitor

center and concession facilities at Paradise. The sum would be added to the amount appropriated for this purpose in last year's act to make available a total of $630,400. The letter will be printed in the record.

(The letter referred to follows:)

OCTOBER 11, 1963.

Hon. CARL HAYDEN,
Chairman, Committee on Appropriations,
U.S. Senate, Washington, D.C.

DEAR MR. CHAIRMAN: Report No. 181 of the Senate Appropriations Committee on the "Interior Department and Related Agencies Appropriation Bill, 1964" is quoted in part as follows:

"The construction program proposed by the Department includes a visitor center with utilities and concessioner facilities costing $465,900 which is proposed to be located in Sunrise Park in Mount Rainier National Park. Present outmoded accommodations at a location in the park known as Paradise are scheduled to be discontinued and in their place a summer-winter day ski use facility, which will include a visitor center with exhibits, a ski warming room, and concession facilities, will be provided at an estimated cost of $750,000. The committee concurs in a determination which has been made that the budgeted project should be transferred to Paradise; and is agreeable to use of the budgeted funds to construct the first phase of the new facilities needed there. It is expected that the new facility will care for as many as 5,000 visitors per day."

The report of the conferees (No. 551) did not contain any reference to the foregoing.

At one time it was thought that a usable unit of the day use facility could be constructed during the extremely short construction season, and the remainder during the succeeding season. Since then a preliminary architectural and engineering study has been made by a private firm, and their report discloses that this approach would be impracticable and more expensive, and it is proposed to construct the entire building at one time. It is estimated that 10 percent in costs would be saved by entering into a single stage contract. The report discloses also that the facility is estimated to cost in the neighborhood of $1,500,000. Details of the report are being studied to determine if the preliminary estimates might be curtailed. It is planned to include the remainder of the costs in the 1965 fiscal year estimates of the Service. In order to keep additional appropriation requirements to the minimum, it is proposed to apply certain funds included in the 1964 appropriation act to the day use facility, and to accomplish their originally intended purposes with accelerated public works funds.

The Interior Department and Related Agencies Appropriation Act, 1964, as approved, includes funds for projects for Mount Rainier National Park, Wash., as follows:

Mount Rainier National Park

Ohanapecosh:	
Seasonal apartments (12) with utility connections, B–152–4	$144,500
Residence (3-bedroom), B–137–4	20,000
Total	164,500

It is proposed to transfer the $164,500 included in the program for the Ohanapecosh developments to the Paradise location. Based upon anticipated approval of this request, an allocation of $165,000 of accelerated public works funds has been secured to replace the Ohanapecosh facilities. Therefore, determination as to source of financing these projects will await action upon this request for program adjustment.

Your approval of this program adjustment is respectfully requested.

Sincerely yours,

STEWART L. UDALL,
Secretary of the Interior.

COST OF FACILITY

Chairman HAYDEN. When Congress acted last year it was expected that the total cost of the facility would be $750,000, and would be constructed in two phases. Now it seems that the Department desires to program the construction as a single unit, and that the total

cost will be $1,500,000. Has the Ohanapecosh construction definitely been provided for by use of accelerated public works funds, as was planned?

Mr. HARTZOG. Mr. Stratton has been following this project.

Mr. STRATTON. Mr. Chairman, you have given me a whole mouthful to answer. Let me start by referring to Report No. 181 of this committee on the appropriation bill for 1964 which indicated that consideration be given to providing facilities at Paradise, the money to come partially from reprograming in another area in Mount Rainier called Sunrise Park. This was in an amount of $465,900. Also in the 1964 program there was an item for Ohanapecosh for seasonal apartments and a residence for a total of approximately $165,000. We were able to secure accelerated public works money for Mount Rainier and it was determined that it could be used for this same purpose.

So we used the APW money for that purpose with the idea of requesting approval for the money that had been put in the regular program to be added to the day use facility at Paradise. Now, sir, at the time we were asked what a facility at Paradise would cost—this is a summer-winter day use facility, it would be a visitor center, comfort station, ski room, a restaurant facility, souvenirs, and so forth—we gave an estimated cost of $750,000. At the time, we said it was hardly more than a "guesstimate" because we were not in a position then to take into consideration things like the heavy snowpack, the short building season, and that sort of thing. In other words, we had no experience with this kind of project. We did know that the cost of some of our visitor centers, including, for example, the one at Gettysburg, was in this category of price and that was the basis of our tentative estimate. Now, subsequent to that, because of the fact that our design people are not too familiar with construction at altitudes such as this one at Paradise and because it involves a number of different kinds of activities, we felt we should get professional help from the outside. We employed an architectural firm from the State of Washington to assist us in this matter.

They have completed a study of this proposed building. They have told us that to build it in two sections would cost at least 10 percent more than if it were included as one building. One of the things that they pointed out which presented problems of design was the fact that the length of the building season at the altitude that prevails at Paradise is very short. Consequently the cost would be extremely high. The average snow pack is something like 30 feet per year and 192 inches of precipitation, so as I say, it presents terrific problems from the standpoint of depth. The isolation factor enters into the picture in that it is approximately 65 miles from Tacoma over winding roads. Also, the contractors must pay premium pay in the Northwest. There is also the fact that a facility of this kind must have its own complete fire protection system. So when you add all those facts and costs together that were brought out by the study that was made by this private architectural firm, the price increased, in fact doubled our original "guesstimate."

THE 1965 APPROPRIATION ESTIMATE

Chairman HAYDEN. The amounts in the fiscal year 1964 appropriation add to $630,400 for construction and utilities, which would leave a balance required of $869,600. Yet in your 1965 estimate you propose an appropriation of $1,020,000. Please explain the additional $150,400.

Mr. STRATTON. May I go back to my first statement about the $465,900 that was in the 1964 program for Ohanapecosh which we propose to use at Paradise. This plus the $1,020,000 that is in the 1965 buildings and utilities and roads and trails programs add up to $1,485,900, or approximately the $1.5 million figure in question. The use of the $165,000 APW money there in 1964 will leave about $150,000 which will help us in meeting some of the other pending reprograming proposals.

Chairman HAYDEN. Under the circumstances I believe the committee would be justified in approving this proposal that you have made.

Mr. STRATTON. We appreciate it, sir.

DEPARTMENTAL POLICY ON REPROGRAMING

Senator MUNDT. Mr. Chairman, I would like to ask a general question on reprograming. It seems to me we are getting an uncommonly large number of reprograming requests. I regret I was not able to be here at the hearing the other day when the Secretary of the Interior appeared before the committee but I would like to raise this question. I don't know whether anybody here is competent to answer it but I would like to get an answer.

Does the Secretary plan to follow the recommendations of this committee or does he just plan to send the requests to us and then act as he sees fit regardless of what action we take? I have in mind the request on the reprograming of funds for the Merrywood estate easements. I would suggest that perhaps the Chairman might want to write him a letter and get it over the Secretary's signature rather than ask any of the gentlemen present to comment on it. I think if we are going to have a deluge of reprograming requests we ought to find out whether we are engaging in fighting windmills or whether this committee is still retaining some responsibility and authority in this area.

Chairman HAYDEN. I will write a letter of that kind if you wish.

Senator MUNDT. Thank you.

ACCELERATED PUBLIC WORKS PROJECTS

Chairman HAYDEN. For the record submit information showing accelerated public works projects constructed in fiscal year 1964. Show this by type, location, and cost. If the cost was not completely Federal, include the name of the contributor and the amount of the contribution.

Mr. HARTZOG. Thank you, sir. We will be happy to.

(The information follows:)

Accelerated Public Works Program

The public works acceleration program afforded the Service an opportunity to assist in shoring up the economy of depressed areas and at the same time to provide additional new facilities and the improvement and rehabilitation of many existing facilities essential to accommodate the unprecedented visitor use which the national parks are now receiving. During the 1963 and 1964 fiscal years, funds in the total amount of $11,136,000 were allotted to provide these much needed public use and related facilities which were not provided for through regular appropriations. Approximately 1,405 man-years of employment was generated in accomplishing the projects included on the attached lists.

Accelerated public works program (1964, $3,200,000), National Park Service

State and project	Eligible area and county	Eligibility category	Man-years	Cost (thousands)	Work description
Alabama: Russell Cave National Monument.	Jackson	5B	4.0	$34	Construct fire trails, roadside cleanup, and reforestation.

Point Reyes Land Acquisition

Chairman Hayden. There is also pending in Congress a fiscal year 1964 supplemental budget estimate in the amount of $3,700,000 for land acquisition at the Point Reyes National Seashore, Calif. The proposed language increases the existing $5,300,000 limitation on land acquisition. Included in the estimate is a proposal that an additional $1 million be transferred for this purpose from Minute Man National Historical Park, Mass., and $2,300,000 be transferred from the "Buildings, utilities, and other facilities" activity of this appropriation item. The justification statement will be placed in the record.

(The justification statement follows:)

Justification

Construction, National Park Service

Appropriation to date	[1] $55, 453, 664
Obligations to Dec. 31, 1963	23, 071, 055
Expenditures to Dec. 31, 1963	28, 858, 251
Budget estimate next fiscal year	25, 406, 000
Request (to remain available until expended)	3, 700, 000
Employment:	
Average number, current appropriation	666
Number involved, this estimate	3
Actual employment, Dec. 31, 1963	445

[1] Includes a carryover balance of $22,756,664.

PURPOSE AND NEED FOR SUPPLEMENTAL FUNDS

This estimate requests an additional appropriation of $3,700,000 to enable the Service to continue its land acquisition program in the newly authorized Point Reyes National Seashore, Calif. It is essential that the program go forward at the rate proposed in the estimate to obviate increases in land values which would result should there be a delay in completing the acquisitions. The estimate also contemplates the transfer to the Point Reyes land acquisition program of $1 million currently available for land acquisition at Minute Man National Historical Park, Mass., and $2,300,000 from the "Buildings, utilities, and other facilities" activity of this appropriation item, making a total supplemental program of $7 million.

ACQUISITION OF LANDS AND WATER RIGHTS

Acquisition of lands, Point Reyes National Seashore, $3,700,000

This estimate requests an additional appropriation of $3,700,000 and an increase of $6 million in the land acquisition limitation stipulated in the 1964 appropriation act to continue the land acquisition program at Point Reyes National Seashore, Calif.

The Supplemental Appropriation Act 1963, Public Law 88–25, approved May 17, 1963, provided $5 million to commence the Point Reyes land acquisition program. The 1964 Interior Department Appropriation Act, Public Law 88–79, approved July 26, 1963, provided an additional $2 million to continue the program. It is imperative that the remainder of the authorization, $7 million, be made available at the earliest date possible to avoid stalling the land acquisition program. The amounts provided to date are fully obligated or committed, and it is in the public interest to have supplemental funds appropriated to facilitate the going program.

It has been determined that the remaining $7 million of the appropriation authorization for acquisition of lands at Point Reyes National Seashore can be funded without having to propose an appropriation for the entire amount. To supplement the $3,700,000 requested herein, the amount of $3,300,000 would be provided through reprograming. This contemplates the transfer to the Point Reyes land acquisition program of $1 million currently available for land acquisition at Minute Man National Historical Park, Mass., and the transfer of

$2,300,000 from the "Buildings, utilities, and other facilities" activity of this appropriation item. Most of the projects representing the $2,300,000 proposed for transfer are being rescheduled in the 1965 fiscal year program. The postponement of construction projects that would be affected by the transfer until the 1965 fiscal year can be done without serious consequences in carrying out the authorized development program.

The following purchases or commitments to purchase have been made: Heims Ranch purchase contract for 1,115 acres, $850,000; Drakes Beach Estates and Seashore Lands, Ltd., of more than 1,000 acres of subdivided land, $2,050,000; Bear Valley Ranch of 7,714 acres, $5,725,000, of which $1,660,000 is to be paid from funds currently available, with the remaining $4,065,000 payable either in one subsequent payment or two subsequent payments at the option of the Government; and the Palomarin Ranch of about 3,100 acres, $2,028,000, of which $1,028,000 is to be paid from funds currently available, with the remaining $1 million payable from funds appropriated subsequent to the regular 1964 departmental appropriation but prior to September 30, 1964. The sum of $300,000 has been paid into court for the acquisition through judicial action of timber rights on some 3,700 acres of land on which timber cutting had been started. In addition, the United States faces possible liability in an indeterminate amount for the Limantour Spit, the title and the value of which have, as requested by Drakes Beach Estates, Inc., been submitted to the court for determination through the filing of a condemnation action with a declaration of taking. Several additional properties, such as the Lake Ranch of 2,524 acres, more or less; the Stewart Ranch of 543 acres; Bolema Club of 1,104 acres; and some 1,540 acres owned by the Point Reyes Land & Development Co., et al., are being or have been appraised and negotiations are currently underway or will be started shortly. Some additional but smaller parcels, or parts of parcels, needed for immediate development purposes are under negotiation and will probably be purchased. These, too, will be paid for from funds now on hand.

The cost of these additional properties, and the sum needed to complete the Bear Valley Ranch and the Palomarin Ranch purchases will exceed the remaining balance of the $7 million heretofore made available. Notwithstanding the absence of complete appraisal data, it is clearly apparent that the properties mentioned above, plus other acquisitions now being approached, will require, within a short time, more than the remaining $7 million presently authorized to be appropriated. It is apparent, too, that there is no substitute for money in hand, as an inducement to landowners to sign sales contracts. In the circumstances, it is critically important that the additional $7 million authorized be made available immediately so as to permit the land acquisition program to continue to follow the rapid and satisfying course it is now on. It is timely now to seek funds to take advantage of a favorable situation that may not always exist in seashore area. As indicated above, approval of this estimate will exhaust the $14 million authorization for the seashore.

The $3,700,000 requested in this supplemental estimate, together with the $3,300,000 proposed for reprograming, is considered essential to the project at this time. A delay in obtaining the additional sum until action is taken on the next regular appropriation will adversely affect the rate of progress on the going land acquisition program which has gathered real momentum; stagnate the land acquisition force at Point Reyes; arouse criticism by landowners who have been making plans to sell and acquire property elsewhere; and result in higher prices if delays in consummating additional purchases occur. There is also the prime probability that currently threatened development will be pushed in some cases if purchases are not made promptly.

STATUS OF EXPENDED FUNDS

Chairman HAYDEN. A total of $7 million has already been appropriated for this purpose. Approval of this supplemental estimate will utilize the full amount authorized for land acquisition at Point Reyes. Have you obligated all of the $7 million previously appro-

priated? That is, have you entered into arrangements whereby you must pay out the whole amount?

Mr. HARTZOG. Mr. Chairman, we have either obligated or committed the whole appropriation of $7 million, and we have a statement which we will be pleased to put in the record showing the status of the amounts expended under this initial $7 million. Now, the authorizing legislation for Point Reyes permitted us to negotiate contracts providing for several payments contingent upon annual appropriations of the Congress. With this authority we have negotiated some of these contracts that call for payments in subsequent years. Now more than $5 million is needed to pick up the options under these existing contracts.

I want it to be clear, so that I don't mislead you. These are not obligations but are commitments against this money. In other words, the Government is not bound to accept the options but the owner is bound to.

Chairman HAYDEN. If it is found to be an advantage, you can do it.

STATUS OF LAND ACQUISITION PROGRAM

Mr. HARTZOG. That is correct. This is why we did it, because the value of this land is going up out there at the rate of 10 to 15 percent a year. When we negotiate a contract, we freeze the price on it, then it permits us to pay off without the economic increment that attaches to the property. The other money requested in this $7 million supplemental estimate would enable us to continue the land acquisition program at Point Reyes.

Senator BIBLE. Might I ask a question at that point, Mr. Chairman?

Chairman HAYDEN. Yes.

Senator BIBLE. I handled the Point Reyes bill in the legislative committee. What was the total amount authorized for acquisition of land?

Mr. HARTZOG. $14 million, sir.

Senator BIBLE. How much have you spent to date?

Mr. HARTZOG. There has been $7 million appropriated, which has essentially all been obligated. In other words, not all of it has been expended, but it is committed to be spent. For all practical purposes the $7 million is exhausted.

Senator BIBLE. Will you be able to acquire the balance of the land that you intend acquiring for $7 million?

Mr. HARTZOG. No, sir, we will not.

ESTIMATE OF ACQUISITION COST

Senator BIBLE. What is your revised estimate of acquisition cost?

Mr. HARTZOG. Sir, we don't have a revised estimate for the whole area yet. We are in the process of getting that. Offhand it appears that the $14 million will get about half of it.

Senator BIBLE. Do you mean you underestimated by 50 percent?

Mr. HARTZOG. This arises from a combination of things.

Senator BIBLE. You may submit this for the record. This is one of the problems we constantly get into in the building of parks. They give us an estimate, and we find out about 3 years later that

the estimate is inaccurate. I would like to have a full explanation of it.

Chairman HAYDEN. You may include that in the record.

(The information referred to follows:)

EXPLANATION OF VALUATION OF POINT REYES NATIONAL SEASHORE LANDS

Between the first approach to an estimate of cost of the Point Reyes lands and improvements in 1956 and the enactment of the Point Reyes Act of September 13, 1962 (76 Stat. 538), three main factors have led to an upswing in the original estimate of value. These are (1) the time factor—3 to 4 years; (2) growing interest in development in the Point Reyes area; and (3) preparation of detailed appraisals translating prior estimates into realistic valuation concepts. An explanation follows.

The original 1956 estimate of cost of land for Point Reyes was derived from assessed county valuations. The assessed valuations represented 23 percent of the fair market value in relation to 1956 market levels. The then (1956) proposed area of approximately 35,000 acres was assessed at approximately $1,291,000 for land and approximately $435,000 for improvements. According to Marin County tax assessors, adjustment to market value to reflect current conditions would result in a maximum figure somewhat in excess of $10,300,000. Land in or near the San Francisco Bay area had been reflecting an annual 10-percent general increase during this same period.

While the proposed legislation was being studied and considered, attention was focused on the Point Reyes area. Subdivision interest grew, evidently in the hope that subdivisional values would be augmented if people believed they could purchase a lot and live within a seashore area administered by the Federal Government. In any event, subdivision plans for several new developments were filed with the county supervisors reflecting increased interest in use of parts of Point Reyes for such purpose. Increased prices were being paid in some of these subdivision areas, but the full effect of this could not be gaged accurately by simple estimation while the legislation was pending.

However, in 1961, one or two specific appraisals of individual tracts were made for exchange and other purposes. These pinpointed the substantial rise in value that was taking place in the Point Reyes area and, to some extent, nearby. They reflected that the acreage rate theretofore assigned to the area generally would be too low. The $14 million legislative ceiling applying to the 53,000 acres included in the finally enacted Point Reyes measure reflects to some extent the increased real estate activity in the area, and would, additionally, require several large-scale exchanges of public domain land for privately owned land within the area. The extent to which exchanges can be perfected still continues to be a major factor in determining the ultimate cost of the land for the seashore project. Two large exchanges, involving over $2 million, are in the negotiating state now. More exchanges, it appears, will be open for negotiation soon.

It is, however, clearly evident now that the original acreage estimates were too low and that the $20 million cost estimate mentioned to the Senate Committee on Interior and Insular Affairs by former Director Wirth early in 1961 was sounder. In his appearances before the House Subcommittee on National Parks on August 11, 1961, and February 5, 1962, former Director Wirth again alluded to increasing costs by advising that the total acquisition cost would be more nearly $25 million. This was attributed to land speculation and subdivision activities, property sales, appraisals, and current information. From this it is evident that the original legislative ceiling of $14 million is certain to be too low, unless a large-scale exchange program of an immense size can be consummated.

Automatically, as public use tracts are purchased by the Government in the Point Reyes area, higher values immediately attach to any of the unacquired lands within the pastoral zone that offer reasonable prospects of subdivision development, even though they may not be as ideal for the purpose as is the case with respect to much of the land purchased by the Government for the project. In other words, lands formerly considered inferior for subdivisional purposes are now becoming more valuable for such purposes due to scarcity of lands for subdivision development.

LAND ACQUISITION AT MINUTE MAN

Chairman HAYDEN. What is the unobligated balance of land acquisition funds for the Minute Man National Historical Park?

Mr. HARTZOG. $2,140,000.

Chairman HAYDEN. What effect will the transfer of a million dollars have on the land acquisition there?

Mr. HARTZOG. None, Mr. Chairman. In other words, the program would continue as we are not obligating the money at the rate we thought we would.

Chairman HAYDEN. Do you foresee a later request to reprogram funds to Minute Man?

Mr. HARTZOG. Yes, sir; we would have to ask for it to be replaced.

Senator MUNDT. Is that land going up in price the same way or not?

Mr. HARTZOG. Yes; but not as much, Senator.

Chairman HAYDEN. Not as much as in California?

Mr. HARTZOG. No, sir.

Chairman HAYDEN. Inasmuch as the full amount authorized to be appropriated for Minute Man has been made available, do you have legal authority to ask for more funds for land acquisition there?

Mr. HARTZOG. Sir, we would like to look into this. I have placed this question before our attorneys. If I may, I will place that in the record. This is a matter that is of concern to us, too. We are looking into it.

Chairman HAYDEN. You are going to look into that?

Mr. HARTZOG. Yes, sir; if we may. We will be happy to place it in the record.

Chairman HAYDEN. You can't answer the question as to how you will acquire the necessary funds for Minute Man until later?

REPROGRAMING LAND ACQUISITION FUNDS

Mr. HARTZOG. No, sir. I would rather wait for the opinion which we will include in the record.

(The information referred to follows:)

MEMORANDUM

To: Director, National Park Service.
From: Assistant Solicitor, National Parks.
Subject: Effect of reprograming of land acquisition funds, Minute Man National Historical Park.

The establishment of Minute Man National Historical Park was authorized by the act of September 21, 1959 (73 Stat. 590; 16 U.S.C. 410s (1958 Ed. Supp. IV)). Section 2 of that act provides for the acquisition of lands by donation, with donated funds, or with appropriated funds, and section 6 of the act, which authorizes appropriations for the park of not more than $8 million, provides that "* * * not more than $5,000,000 shall be used for acquisition purposes * * *."

It is my understanding that in connection with the appropriation of funds for fiscal years 1961 through 1964, the detailed estimates contained items for land acquisition for Minute Man in the total sum of $5 million; that of appropriations made during those years that amount was allocated to the park but, of this amount $1 million is proposed to be reprogramed for use in another park. You have asked to be advised if this reprograming would preclude requesting an appropriation of $1 million for Minute Man subsequently in view of the limitation in the authorizing legislation.

The appropriation acts in recent years have carried a lump-sum appropriation for the "* * * acquisition of lands, interest therein, improvements, and related personal property * * *." Funds so appropriated are available, in the absence

of other language in the appropriation act, for allocation with respect to certain areas and for reallocation or reprograming administratively among the various National Park Service areas in accordance with regularly established procedures.

Such reprograming may be legally accomplished without action by the Congress for the reason that budget estimates do not have status of legally fixing the use to which an appropriation shall be put. (See 26 C.G. 545, 547.) Furthermore, the limitation in the Minute Man National Historical Park legislation is on the amount of appropriated funds which "* * * shall be *used* for acquisition purposes * * *." [Italic supplied.]

In my view it is clear that the Congress intended the National Park Service to have authority to use up to $5 million of appropriated funds for the acquisition of lands and interests therein for Minute Man. Accordingly, I am of the opinion that, under the circumstances outlined above, there would be no legal inhibition to requesting an appropriation of funds for land acquisition at the park to replace the funds proposed for reprograming. In addition, I am of the opinion that an item in an appropriation bill including such an amount would not be subject to a point of order.

BERNARD R. MEYER,
Assistant Solicitor, National Parks.

(At the direction of the chairman the following letter from Senator Saltonstall is included at this point in the record:)

U.S. SENATE,
COMMITTEE ON ARMED SERVICES,
February 26, 1964.

Hon. CARL HAYDEN,
Chairman, Appropriations Committee,
Senate Office Building, Washington, D.C.

MY DEAR MR. CHAIRMAN: It has been brought to my attention that the Department of the Interior, National Park Service, is requesting a reprograming of $1 million currently available for land acquisition at Minute Man National Historical Park, Mass., to purchase land for the Point Reyes National Seashore, Calif.

I am opposed to this reprograming because although Minute Man Park will probably not use the funds in the immediate future, I understand that it might require a new authorization to continue land acquisitions at the Minute Man Park should additional lands become available.

The Cape Cod National Seashore will probably have used up all its land acquisition funds before the end of the fiscal year. In view of this, I do not feel that funds should be transferred to California when they could be put to equally good use in Massachusetts.

Sincerely,

LEVERETT SALTONSTALL, *U.S. Senator.*

REPROGRAMING UNDER BUILDINGS AND UTILITIES CONSTRUCTION PROGRAM

Chairman HAYDEN. What is your present unobligated balance available for "Buildings, utilities, and other activities"?

Mr. HARTZOG. $24,530,655 as of January 31.

Chairman HAYDEN. In what specific areas will buildings and utilities projects amounting to $2,300,000 be deferred?

Can you tell us how much of this amount will come from which park areas?

Mr. HARTZOG. Yes, sir; we have a list of those by projects and by parks and by amounts. We will insert it in the record, if we may.

(The list follows:)

LIST OF 1964 FISCAL YEAR PROJECTS RESCHEDULED IN THE 1965 FISCAL YEAR, BUILDINGS AND UTILITIES CONSTRUCTION PROGRAM

NORTHEAST REGION

	Amount
Cape Cod National Seashore:	
Construction of miscellaneous beach facilities (portion)	$60,200
Construction and rehabilitation of buildings for administration, information and employee housing, including utilities (portion)	31,000
Chesapeake & Ohio Canal National Monument:	
Rehabilitation, restoration and stabilization of canal beds and banks	20,000
Rehabilitation, restoration, and stabilization of revetments and riprap	10,000
Independence National Historical Park: Rehabilitation of second bank of the United States	60,400
Harpers Ferry National Historical Park: Alterations and rehabilitation of Storer College and grounds (portion)	88,600
Minute Man National Historical Park: Rehabilitation and restoration of historic structures (portion)	26,600

SOUTHEAST REGION

Arkansas Post National Memorial:	
Interpretive signs and markers, M–2	2,300
Visitor center, maintenance building, including exhibits, furniture, and connections to utilities, B–2	22,000
Blue Ridge Parkway—North Carolina:	
Mount Pisgah concession area water system, U–194	26,900
Sewerage system	16,100
Cape Hatteras National Seashore—Cape Point: Audiovisual room and amphitheater, M–31	9,000
Castillo de San Marcos National Monument: Gun carriages	5,700
Everglades National Park—Parachute Key: Install lawn sprinkler system, visitor center, headquarters building area, M–142	12,800
Fort Raleigh National Historic Site:	
Utility building, B–3–2	28,200
Oil and paint building, B–52	2,500
Grounds improvements, visitor center, M–4–1	8,700
Horseshoe Bend National Military Park:	
Procurement and mounting of 2 cannons, M–6	4,300
Boat landing (administration use only for small boat) M–14	4,800
Vista clearing, M–10	9,400
Kennesaw Mountain National Battlefield Park: Employee residences (2) (3-bedroom) including grounds improvement, B–27	38,000
Mammoth Cave National Park: Entrance station, Sloans Crossing, B–105–2	4,500
Pea Ridge National Military Park:	
Restoration of Elkhorn Tavern, 2d stage, B–7	35,800
Restoration of grounds and reconstruction of fence, Elkhorn Tavern, M–12	5,900
Interpretive shelters, interpretive devices for 6 stops, and 17 signs and markers, M–10–1	6,600
Shenandoah National Park—Big Meadows: Planting grounds improvements, selective clearing, visitor center, M–108	5,100
Shiloh National Military Park—Utility area:	
Shop and firehouse, B–11–5	63,300
Extend water system, U–2–3	3,200
Extend sewer system, U–13	5,100
Fencing, M–24–4	4,100
Vicksburg National Military Park:	
Restore Shirley House, B–2–3	46,100
Equipment storage shelters (2) and paint shop, utility area, B–7–3	30,100

SOUTHWEST REGION

	Amount
Big Bend National Park—Castolon:	
Water supply, storage and distribution system, U–57–1	$102, 400
Sewage disposal, U–59	46, 600
Gila Cliff Dwellings National Monument:	
Utilities for visitor center	24, 100
T.J. Ruins:	
Water system	24, 100
Sewer system	10, 200
Power system, diesel plant with standby unit	15, 400
Grand Canyon National Park—South rim: Grounds improvement, trailer village and Yavapai expansion, M–89	15, 400
Lake Mead National Recreation Area—Arizona: Willow Beach employee residence, duplex (portion)	20, 000
Mesa Verde National Park—North entrance: Water supply and distribution system, U–41–1, sewage collection and disposal system for 5 residences, U–48	77, 900
Natural Bridges National Monument: Utilities, water, sewer, and power, U–1–5, U–2–4, U–4	34, 300
Navajo National Monument: Seasonal employee quarters (3-unit apartment), including furnishings and equipment, B–13–1	40, 000
Saguaro National Monument: Water system, U–1–5	72, 300
Tonto National Monument:	
Extension of utilities, U–3–9, U–4–1, U–11–1	1, 800
Employee housing (2), B–10–5, M–9–1	40, 000

WESTERN REGION

Muir Woods National Monument: Employee residences (3 3-bedrooms), B–2–7, B–13–1	60, 000
Mount Rainier National Park—Paradise: Water system, U–98	37, 400
Sequoia and Kings Canyon National Parks—Ash Mountain: Employee residences (8), B–165	160, 000
Whiskeytown RA—Headquarters:	
Rehabilitate administration building	14, 500
Move and locate 7 transa houses	8, 200
Entrance signs and grounds improvements	5, 000

MIDWEST REGION

Badlands National Monument:	
Pinnacles entrance: Ranger station and fire cache, B–59	36, 400
Cedar Pass: Incinerator, U–41	20, 500
Dinosaur National Monument—Colorado: Artesia headquarters: Entrance development and signs, M–67	7, 400
Rocky Mountain National Park:	
Headquarters area: Utility extensions	8, 100
Moraine Park Campground: Campground development (complete), tables, fireplaces, etc. (150 sites) (portion)	30, 700
Theodore Roosevelt National Memorial Park—Headquarters:	
Employee residences (2), B–31–1	41, 400
Employee apartments (8 units) B–21–3	92, 200
Wilson's Creek Battlefield National Park:	
Employee residences (2)	40, 000
Utility building and pumphouse	30, 200
Water system	19, 700
Sewage disposal system	5 100
Interpretive and informational signs	5, 000
Wind Cave National Park: Employee apartments (12 units) B–24	133, 100
Yellowstone National Park—Mammoth: Employee residences, (5) 3-bedrooms	103, 500

NATIONAL CAPITAL REGION

Park system, general:	
Improvements to small parks and reservations (portion)	194, 800
Fort Washington: Continuation of historical restoration and stabilization	25, 000
Grand total	2, 300, 000

Chairman HAYDEN. Are replacement funds for these construction projects included in the fiscal year 1965 budget estimate?

Mr. HARTZOG. Yes, sir, they are.

Senator MUNDT. Are these lands owned by people who have held them for some time or have some speculators moved in and purchased them just to take advantage of the Government? I notice you have a $2 million item here for a thousand acres owned by the Drakes Beach Estates & Seashores Land, Ltd. That looks like an outside group which has moved in to purchase the land to highjack Uncle Sam. How about it?

Mr. HARTZOG. Senator, Mr. Lee has been out there on that project. Don, can you answer that question?

POINT REYES LAND ACQUISITION

Mr. LEE. The Drakes Beach Estates, Senator, was a budding subdivision with streets laid out, utilities in there and sewage facilities. In the Drakes Beach Estate, there already were 8 or 10 houses built. There was a campaign on to sell those lots which were commanding very high prices. Those were selling at the rate of about $7,000 or $8,000 per lot. In order to stop further development there it was determined that we would have to buy those lots out in the developed area so we made an early deal with the Drakes Beach Estates and their subsidiary corporation, Seashore Lands, Ltd. For a total of slightly over $2 million we purchased approximately 1,100 acres of the developed division area. That means that we have bought up all of the undeveloped land that has not been sold us by the corporation. That purchase has been consummated and the title has been transferred to us.

Mr. HARTZOG. Senator, we will put a list of the Point Reyes property acquired and the cost of its acquisition in the record, if we may.

(The list referred to follows:)

Purchases made with first $7,000,000 appropriated for Point Reyes land acquisition

Property	Acreage	Purchase price	Paid	Deferred payment
1. Heims Ranch	1,115	$850,000	$850,000	
2. Drakes Beach Estates, Inc.	1,000	1,925,000	1,925,000	
3. Seashore Lands, Ltd.	190	125,000	125,000	
4. Palmorain Ranch	3,100	2,028,000	1,028,000	$1,000,000 (1,500 acres) by Sept. 30, 1964.
5. Bear Valley Ranch	7,714	5,725,000	1,660,000	$2,032,500 (3,314 acres) by June 30, 1965 $2,032,500 (2,973 acres) by June 30, 1966, or sooner.
6. Limantour Spit	100±	(1)	(2)	
7. Alamea Development Co.	14.7	50,000	50,000	
8. 7 lots	3.08	60,400	(3)	
9. Timber rights	3,700	(1)	(4)	
10. Point Ryes Land & Development Co. (Option)	428	310,000	(5)	

[1] Not determined.
[2] $1 paid into court. To be determined in judicial proceedings.
[3] 60,400 title being examined.
[4] $300,000 paid into court under declaration of taking.
[5] $100,000 to be paid in 1964 fiscal year, $210,000 (2.89 acres) to be paid Oct. 31, 1964.

NOTE.—Total expended or under commitment for land purchases (exclusive of expenses) to date, $6,308,401 plus undetermined liability for Limantour Spit and timber rights.

CONSTRUCTION (LIQUIDATION OF CONTRACT AUTHORIZATION)

Chairman HAYDEN. The justification for an appropriation of $30 million for construction (liquidation of contract authorization) will be included in the record. This is $1 million greater than the appropriation for this purpose in fiscal year 1964 and is $12 million for parkways and $18 million for roads and trails.

(The justification referred to follows:)

Construction (liquidation of contract authorization)

Appropriation, 1964	$29,000,000
Decreases:	
Parkways	11,000,000
Roads and trails	18,000,000
Subtotal	29,000,000
Increases:	
Parkways	12,000,000
Roads and trails	18,000,000
Budget estimate, 1965	30,000,000

Analysis by activities

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
1. Parkways	$14,003,713	$15,533,690	$16,531,600	$997,910
2. Roads and trails	17,927,225	18,190,640	19,468,400	1,277,760
Total expenditures	31,930,938	33,724,330	36,000,000	2,275,670
Less balance available from prior years	15,655,268	10,724,330	6,000,000	4,724,330
Total expenditures from current appropriation	16,275,670	23,000,000	30,000,000	7,000,000

Contract authorization and liquidation program

	Contract authority available	Obligations	Unliquidated obligations, prior years	Total obligations	Expenditures	Unliquidated obligations carried forward
FISCAL YEAR 1963						
Parkways	$21,897,288	$15,940,708	$20,593,249	$36,533,957	$14,003,713	$22,530,244
Roads and trails	19,458,581	18,390,117	12,758,651	31,148,768	17,927,225	13,221,543
Total	41,355,869	34,330,825	33,351,900	67,682,725	31,930,938	[1] 35,751,787
FISCAL YEAR 1964						
Parkways	$22,506,580	$19,956,580	$22,530,244	$42,486,824	$15,533,690	$26,953,134
Roads and trails	23,068,464	22,668,464	13,221,543	35,890,007	18,190,640	17,699,367
Total	45,575,044	42,625,044	35,751,787	78,376,831	33,724,330	[2] 44,652,501
FISCAL YEAR 1965						
Parkways	$18,550,000	$12,400,000	$26,953,134	$39,353,134	$16,531,600	$22,821,534
Roads and trails	25,400,000	21,600,000	17,699,367	39,299,367	19,468,400	19,830,967
Total	43,950,000	34,000,000	44,652,501	78,652,501	36,000,000	42,652,501

[1] Available cash for liquidation is $10,724,330; balance of $25,027,457 is unfunded obligations.
[2] Available cash for liquidation is $6,000,000; balance of $38,652,501 is unfunded obligations.

Construction (liquidation of contract authorization)—Status of cash appropriation for liquidation of contract authorization

	1963	1964	Estimate, 1965
Appropriation	[1] $27,000,000	$29,000,000	$30,000,000
Unexpended balance brought forward	15,655,268	10,724,330	6,000,000
Total available	42,655,268	39,724,330	36,000,000
Less expenditures	31,930,938	33,724,330	36,000,000
Unexpended balance	10,724,330	6,000,000	

[1] Excludes $2,000,000 withdrawn for Bureau of Indian Affairs.

Need for funds.—The estimate of $30 million is for liquidating contractual obligations scheduled for the 1964 and prior year programs and for making partial payments against obligations to be incurred during 1965. Section 2, subsections (5) and (6) of the Federal-Aid Highway Act of 1962, provides contract authorization of $16,550,000 for 1964 and $16 million for 1965 for parkways, and $22 million for 1964 and $25 million for 1965 for park roads and trails. Programs provided for in this estimate to be carried out during 1965 under this contract authorization are in the amounts of $12,400,000 and $21,600,000 for parkways, and roads and trails, respectively, a total of $34 million.

1. PARKWAYS, $12 MILLION

The estimate will provide $12 million to meet expenditure requirements estimated to accrue through the 1965 fiscal year for liquidation of obligations incurred and to be incurred under the contract authorization.

The proposed program for 1965 of $12,400,000 will permit work on seven of the nine authorized parkways. Of the 18 major road projects on the parkways, 8 involve amounts in excess of $500,000 each, of which 3 exceed $1 million each. The acquisition of parkways lands and their donation to the Federal Government are being pursued by the various States so that construction can move forward without delay.

The parkways continue to receive enormous public use and each new stretch of mileage calls for complementary facilities, such as access roads, campgrounds, picnic areas, utility systems, and comfort stations. Other associated facilities, such as utility buildings, must also be provided. The 1965 program provides $1,317,800 for these purposes.

Major projects

Blue Ridge Parkway, $2,919,900 (North Carolina, $2,605,000; Virginia, $314,900).—This parkway was started in 1933 under authority of the National Industrial Recovery Act of June 16, 1933. When completed, it will extend along the crest of the Blue Ridge Mountains for a distance of 469 miles from Shenandoah National Park in Virginia to Great Smoky Mountains National Park in North Carolina.

In North Carolina, the program proposes the completion of the remaining 6 miles of the parkway around Asheville between U.S. Highways Nos. 25 and 70 at Oteen. Construction is now underway on a 5-mile section between Highway 191 and the crossing of U.S. Route 25. This 6-mile section and the 5.5 miles around Grandfather Mountain, are the only stretches of the entire parkway remaining to be completed. The program also proposes the continuation of work to stablilize tunnel portals on five existing tunnels where scaling rocks and dripping water are a potential hazard to the parkway motorist.

In Virginia, funds are included for the construction of the Yellow Mountain Area Road and completion of the Mill Mountain Spur Road to connect the parkway with a proposed campground development and other recreational facilities on Chestnut Ridge and Mill Mountain. All of this work is a part of the Yellow Mountain developed area in the vicinity of Roanoke. Funds for a portion of the Mill Mountain Spur Road were provided in the 1964 program.

Colonial Parkway, $485,000 (Virginia).—The Colonial Parkway had its inception in the act of July 3, 1930, which was the basic act for establishing Colonial National Historical Park. Subsequently, the parkway was more specifically authorized by the act of June 5, 1936 (16 U.S.C. 81c). It connects Yorktown, Williamsburg, and Jamestown Island by a 22-mile scenic roadway, portions of which parallel the York and James Rivers.

The program provides for two grade separation projects which will make possible the elimination of two dangerous crossings east and south of Williamsburg in the vicinity of a rapidly developing suburban area.

Foothills Parkway, $1,791,200 (Tennessee).—The Foothills Parkway was authorized by the act of February 22, 1945 (16 U.S.C. 403h–11). When completed it will extend approximately 68 miles generally parallel to the northern boundary of the Great Smoky Mountains National Park between the Pigeon River near Hartford and the Little Tennessee River at Chilhowee. An additional 4 miles, known as the Gatlinburg Spur, are complete and parallel the West Fork of the Little Pigeon River between Gatlinburg and Caney Creek.

The 1965 program provides for commencement of construction on a 5½-mile section from the eastern terminus of the parkway at the Pigeon River to extend along Green Mountain to Cosby. The section will connect with proposed Interstate Route 40 near Brown Island, at the Pigeon River, where the State is constructing an interchange for the Foothills Parkway. A slope stabilization project on the Gatlinburg Spur will eliminate danger of failure on cut slopes and prevent damage to the existing road.

George Washington Memorial Parkway, $875,700 (District of Columbia and Virginia).—This parkway is authorized to extend from Mount Vernon to Great Falls on the Virginia side of the Potomac River and from Great Falls to Fort Washington on the Maryland side, a total length of about 49 miles, not including the distance through Alexandria, Va., and the District of Columbia. The program proposes the continuation of work necessary to relocate and construct portions of the parkway road network on Columbia Island as a result of the construction of the Theodore Roosevelt Memorial Bridge and Virginia approaches to the bridge. This work will also alleviate to a great extent the existing traffic congestion by giving continuity to the parkway through Columbia Island. The program also includes funds for the reconstruction of the entrance road to the Fort Hunt developed area including road improvements on the parkway motor road. This reconstruction work will enable safe and convenient access to a recreation area now receiving heavy public use.

Natchez Trace Parkway, $3,831,300 (Alabama, $576,600; Mississippi, $2,604,700; Tennessee, $650,000).—A survey to determine the route of this parkway was authorized by the act of May 21, 1934, and construction was started with funds allocated from the Emergency Relief Appropriation Act of 1935. When completed the parkway will extend for a distance of about 450 miles from Nashville, Tenn., to Natchez, Miss.

In Alabama the program proposes the completion of structures located on the 7-mile section extending from the south side of the Tennessee River bridge to U.S. Highway No. 72 near Cherokee. Funds for the grading and other bridge work were provided in the 1962 and 1964 fiscal year appropriations. Upon completion of this work a usuable unit of 20 miles will be provided in northwest Alabama.

In southwest Mississippi, the program provides for continuing the parkway construction from U.S. Highway No. 61 at Port Gibson to Mississippi Highway 552 for a distance of about 6 miles. This new work is adjacent to a 35-mile unit in various stages of construction. Twenty-five miles of this unit are currently being paved between Oakley-Edwards Road and the Big Bayou Pierre. The 1965 program also includes funds for the completion of structures located on a 15-mile unit extending north from the Oakley-Edwards Road to U.S. Highway 80 and Interstate Route 20 in the vicinity of Clinton. Funds for the grading of this section were provided in the 1964 program. Upon completion of all this work, a usable unit of some 56 miles will be provided in southwest Mississippi. The program also provides for the completion of the parkway relocation for the Pearl River Valley Reservoir development north of Jackson. The first contract for the relocation and reconstruction of 8.5 miles of the parkway is currenlty underway.

In Tennessee the program provides for continuing parkway construction in Lewis County on a section extending north from Tennessee Highway No. 99 to a county road near the Hickman County line. This new work is adjacent to a 5-mile unit on which construction is underway between Meriwether Lewis National Monument and Highway 99. Upon completion of these two sections some 57 miles of continuous parkway will be provided in Tennessee.

Rock Creek and Potomac Parkway, $979,100 (District of Columbia).—The Rock Creek and Potomac Parkway was authorized by the act of March 4, 1913 (37 Stat. 885) to be under the jurisdiction of the Corps of Engineers, U.S. Army, as a part of the park system of the District of Columbia. Jurisdiction of the park-

way was placed under the Director, Public Buildings and Public Parks, by the act of February 26, 1925 (43 Stat. 983), and consolidated into the National Park Service by Executive Order No. 6166 issued pursuant to the act of March 3, 1933 (47 Stat. 1517).

The 1965 program will complete the zoo bypass project now under construction in the vicinity of the Zoological Park. When completed the two-lane roadway will provide the motorist with a continuous 24-hour scenic park road in the Rock Creek Valley, and the separation of the through north-south traffic from the secondary roads within the zoo area. Funds were provided in the 1963 program for the grading, vehicle tunnel, and structures. The 1965 program provides for the final paving, fencing, signs, and miscellaneous work. The program also provides for reconstruction of the existing parkway between Shoreham Hill and Massachusetts Avenue and P Street to Pennsylvania Avenue. The project will provide median strips, the widening of the Shoreham Hill Bridge and other road improvements.

Minor projects

Minor roads and trails, buildings, utilities, etc., $1,317,800.—This program provides for some 42 minor projects which include campground and picnic area roads, trails, parking areas, campground developments, picnic facilities, comfort stations, utility systems, and other visitor facilities required to make the parkways usable recreation units.

Funds are included for completing the Julian Price campground and picnic area roads in North Carolina; a new campground development at Yellow Mountain and maintenance facilities near Roanoke, Va., completing the Great Neck picnic area on the Colonial Parkway near Williamsburg; the completion of picnic area roads and other facilities at Dancy in Mississippi and the completion of a picnic area and campground development at Little Swan in Tennessee on the Natchez Trace Parkway; and other visitor facilities at Greenbelt Park on the Baltimore-Washington Parkway in Maryland and various locations along the George Washington Memorial Parkway in Virginia and Maryland.

Advance planning ($200,000).—This item provides for planning work, including master planning, that must be accomplished prior to project funding.

2. ROADS AND TRAILS, $18 MILLION

The estimate provides $18 million to meet expenditure requirements estimated to accrue through the 1965 fiscal year for liquidation of obligations incurred and to be incurred under the contract authorization.

The roads and trails construction program, in the amount of $21,600,000, is $3,400,000 less than the $25 million authorized in the Federal-Aid Highway Act of 1962. The program is broken down into the following broad categories.

Major roads:	
Reconstruction	$5, 020, 600
Paving	1, 700, 800
New work	4, 771, 500
Miscellaneous minor roads and trails projects	9, 607, 100
Advance Planning	500, 000
Total	21, 600, 000

Many of the existing park roads are antiquated and the standards do not come up to present day requirements. Many of them have been in use longer than the normal life expectancy. Road bases and surfaces have deteriorated and some structures are outdated. In some instances, relocation is the only means of meeting minimum traffic requirements and of eliminating steep, narrow, and winding sections of road which are unsafe for present day vehicular traffic. The estimate provides for work on 128 miles of major roads, including reconstruction of 69 miles; 29 miles of paving; and construction of 30 miles of new roads. The remainder of the program provides for numerous minor roads and trails projects; parking areas, campground roads, drainage structures, etc.; and for advance planning, reconnaissance surveys, topographic surveys, etc. Provision must also be made for turnouts, parking spaces, and overlooks for the safety and enjoyment of motorists.

Although the Service holds construction of new roads to a minimum, some are necessary to disperse the concentrated public use and alleviate the resulting abuse of some areas of the national park system. The Service's policy on providing roads is to make a number of sites and objects available to the visitor and to supplement the roads with trails to accommodate those people who wish a

closer look at park features. The roads and trails also serve as accesses for protection and management purposes.

Based upon estimates compiled in April 1963, it would require $252,403,000 after the 1965 fiscal year to complete construction and reconstruction of roads and trails in areas authorized for administration by the Service.

It is pertinent to point out that of the total request of $21,600,000 for roads and trails construction in 1965, $1,690,300 or 7.8 percent is for work in seven new areas that have been activated since the commencement of Mission 66 and $1 million or 4.6 percent is for work in Vicksburg National Military Park, for which additional authorizing legislation was enacted in the 88th Congress.

Projects estimated to require $100,000 or more are shown as follows:

Project and Location	*Amount*
Northeast region:	
Antietam National Battle Site (Maryland): Bypass road to Hagerstown Road, 2.32 miles	$336,300
Cape Cod National Seashore (Massachusetts): Reconstruction of portion of existing roads, trails, walks, paths, and parking areas	600,000
Lincoln Boyhood National Memorial (Indiana): Relocation of State Highway 345	125,000
Saratoga National Historical Park (New York): Entrance road, intersection to town road	173,400
Southeast region:	
Castillo de San Marcos National Monument (Florida): Castillo Dr. and parking area	207,200
Fort Raleigh National Historic Site (North Carolina): Entrance road and parking area	266,500
Great Smoky Mountains National Park (North Carolina):	
Reconstruct Newfound Gap parking area	625,000
Reconstruct Cataloochee to East Park boundary, 5 miles	558,500
Bryson-Monteith Rd. section, 9A3, tunnel and approaches, 1 mile	425,000
Horseshoe Bend National Military Park (Alabama): Visitor tour road and 7 10-car parking areas	206,200
Vicksburg National Military Park (Mississippi):	
Highway 80, 0.53 mile, underpass and Baldwin Ferry Rd., 0.35 mile and relocate arch	347,500
Construct streets to replace those closed by reconstruction	1,000,000
Midwest region:	
Dinosaur National Monument (Colorado and Utah):	
Reconstruct Echo Park Rd., Route 8 (portion) grade, base, bituminous stabilize, 4.5 miles (Colorado)	980,000
Quarry-Blue Mountain Rd., quarry to Cub Creek campground, including bridge (complete) 2.7 miles (Utah)	794,000
Fort Laramie National Historic Site (Wyoming): entrance, utility, and residential roads and parking, includes archeological salvage	283,600
Glacier National Park (Montana):	
Camas Creek cutoff, Route 8B, 5 miles, base, grade, and bituminous stabilize (portion)	700,000
Reconstruct roads and walks, Logan Pass visitor center	125,000
Roads and parking, additional camping loops and extend existing loops, Apgar campground	103,000
Grand Teton National Park (Wyoming): Reconstruct north approach road to Yellowstone, 1.5 miles	250,000
Theodore Roosevelt National Memorial Park (North Dakota): Scenic loop road, 12.5 miles, grade, base, and bituminous stabilize	665,000
Yellowstone National Park:	
Wyoming:	
Norris bypass and parking area and relocate Norris Junction, 3.5 miles; and reconstruct road from Norris bypass to Gibbon River Bridge, 2.5 miles, Route 1B and Route 12	795,000
Reconstruct road and parking areas, Chittenden Bridge to Artist Point, Route 160, 1.6 miles, base and bituminous surface	325,000
Montana: Reconstruct Red Lodge-Cooke City approach road (portion)	200,000

Project and Location	*Amount*
Southwest region:	
Arches National Monument (Utah): Surface treatment, 9.2 miles	$125,000
Big Bend National Park (Texas): Route 5 from Route 3 to Castolon and Interpretive spur roads, 17 miles, 10 parking areas (100 cars)	922,000
Capulin Mountain National Monument (New Mexico): Improve crater ascent road, construct retaining wall	186,000
Great Sand Dunes National Monument (Colorado): Reconstruct entrance road, turnouts, and parking area at Mosca Creek picnic area (55 cars) 4.5 miles	122,500
Natural Bridges National Monument (Utah):	
Kachina Bridge spur road, 1.3 miles and terminal parking area (40 cars) grade, base, drainage, surface	112,100
Owachomo Bridge spur road, 1.3 miles and terminal parking area (40 cars) grade, base, drainage, surface	112,100
Mesa Verde National Park (Colorado): Wetherill Mesa Rd., Navajo Hill to Wetherill Mesa including loop and parking areas at Rock Springs, 6 miles	840,000
Petrified Forest National Park (Arizona): Reconstruct park roads south of U.S. 66, enlarge 16 parking areas to viewpoints, 30 miles (portion)	476,000
Wupatki-Sunset Crater National Monuments (Arizona): Road, portion of section D, 6.27 miles	282,500
Western region:	
Hawaii Volcanoes National Park (Hawaii): Kalapana Rd., final paving, 18.3 miles	813,000
Lava Beds National Monument (California): Reconstruct, grade, and base course north boundary road, 8 miles (including archeological salvage)	410,000
Mount Rainier National Park (Washington):	
Stevens Canyon Road, rehabilitation of structures and drainage, Route 4, 18.6 miles	475,000
Recondition and pave Nisqually entrance road, 1.5 miles (portion)	336,100
Paradise, parking area, grounds improvement, and picnic area (portion)	107,400
Headquarters, clear, grade, drain, base, and oil (1.3 miles road, parking areas, snow plazas, etc.)	100,000
Point Reyes National Seashore (California): Roads (0.7 miles) and parking area (300 cars) (portion)	109,500
Sequoia and Kings Canyon National Parks (California): Access campground roads, Clover Creek	300,000
Whiskeytown Recreation Area (California): Road, Brandy Creek to Dry Creek (1.5 miles)	255,000
Yosemite National Park (California): Big Oak Flat Road, Crane Flat to Carl Inn, surface and pave (8.3 miles)	426,500
National Capital regon:	
Anacostia Park (District of Columbia): Access road and walks and parking (200 cars) for visitor center, Kenilworth	112,000
West Potomac Park (District of Columbia): Reflecting Pool drives, Lincoln Memorial to 14th Street (portion)	300,000

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)

ROAD CONSTRUCTION PROGRAM

Chairman HAYDEN. Will you comment on the road program?

Mr. HARTZOG. Mr. Jensen, Mr. Chairman, has a statement on this.

Mr. JENSEN. I have no comment to make other than have the record show——

Mr. HARTZOG. Mr. Chairman, what is the question again?

Chairman HAYDEN. I was trying to ask what kind of road program you have.

Mr. MONTGOMERY. It would be a continuation of our long-range program for providing the necessary roads in the parks, for rehabilitating roads that have worn down and are not up to standard to meet the traffic that is brought on by the heavy visitor use. It would also provide for roads in new park areas that are now coming into the system. It is a continuation of a program which has been underway for a long time.

LAKE MEAD NORTH SHORE ROAD

Chairman HAYDEN. What is the status of the construction of North Shore Road in the Lake Mead National Recreational Area for which $2,020,000 was appropriated in fiscal year 1964?

Mr. JENSEN. The proposed North Shore Road, extending from the boundary near Overton, Nev., to its intersection with Route 93 near the headquarters area in Boulder, Nev., is approximately 78.6 miles in length. Sections 1A and 1B, from Overton to Echo Bay, a distance of about 26.6 miles, have been completed as has section 1F from headquarters to Las Vegas Wash, a distance of about 13.3 miles. Section 1E, about 9 miles in length, is under contract. The $2,020,000 provided in the 1964 fiscal year is to finance construction of the re-

maining sections, totaling approximately 29 miles. We expect to contract for this work before June 30, 1964.

Senator BIBLE. May I ask one question at that point because it does involve my State. When this is put to contract will this complete the road?

Mr. JENSEN. Yes, this will complete the road from the park headquarters up to Overton.

Senator BIBLE. Will this be a hard-surfaced road?

Mr. JENSEN. Yes, sir.

Senator BIBLE. Thank you.

ROAD BETWEEN WUPATKI AND SUNSET CRATER

Chairman HAYDEN. There is a budget estimate of $282,500 for the road between Wupatki and Sunset Crater National Monuments. How much will you be able to accomplish with this fund? And how much will be needed to complete the necessary work?

Mr. HARTZOG. Mr. Chairman, we have a statement on this which we will put in the record if we may, in the interest of time.

(The statement referred to follows:)

WUPATKI-SUNSET CRATER NATIONAL MONUMENTS

Prior year projects have placed the entrance roads to the two areas in good shape and have also reconstructed part of "back country" road between the monuments. The $282,500 project in the 1965 fiscal year program is for continuation of the work on the latter road. This project will complete grading, base course, and surface treatment in all Government portions of the road. It is estimated that about $622,000 will be required for completion, most of which is for final paving.

The 5.2-mile portion of the county-owned road is not included. The total mileage of the loop road is 34.5 miles, including the 5.2 miles, of county roads.

The visitor center for Wupatki in the 1963 program was advertised but bids were so far over the estimated and programed amounts that they were rejected. Plans and specifications have been revised and the project will be readvertised shortly.

Utility systems for Sunset Crater are scheduled for advertisement in May with the buildings to follow shortly. Buildings at Wupatki in the 1964 fiscal year will probably be advertised at the same time as those for Sunset Crater.

GENERAL ADMINISTRATIVE EXPENSES

Chairman HAYDEN. There will be included in the record your justification for a budget estimate of $2,412,000 for general administrative expenses. This is $275,250 more than was appropriated in fiscal year 1964.

(The justification referred to follows:)

GENERAL ADMINISTRATION EXPENSES

HIGHLIGHT STATEMENT

Broad purpose and long-range objective of program

This appropriation finances certain administrative functions in the Washington office and five regional offices incident to the fulfillment of the Service's many responsibilities. The administrative functions are general in nature and include the formulation of the Service's policies; prescribing of procedures; information, program coordination, management analysis, and financial, personnel, property, and records management functions; and overall executive direction and coordination of the Service programs and functions. The long-range objective is to have the Washington and regional offices discharge these administrative and executive

direction functions in a manner that will facilitate fulfillment of the Service's multiple responsibilities to the maximum extent at the least possible cost.

Accomplishments during the past year

The accomplishments under the Service's various programs during the past year, as discussed under the other appropriation headings, can be credited largely to the administrative functions financed under this appropriation. None of the programs could be carried forward without the administrative functions. Some specific accomplishments are: A new financial management system to serve the three field design and construction office operations was developed and installed on a pilot basis in the Western Office of Design and Construction in San Francisco, Calif., and plans were made for installing it in the Eastern Office of Design and Construction in Philadelphia, Pa., during the 1964 fiscal year. The Service continued to install permit-validating machines (in lieu of preprinted accountable stock permits) for the collection of visitor fees where entrance station operations would be facilitated thereby and additional machines will be placed in operation during the 1964 fiscal year. Plans were made for closing the field finance offices at Mount Rainier and Olympic National Parks, Wash., and transferring their functions to the western regional office at San Francisco, Calif., during the 1964 fiscal year, with an estimated net annual saving of $32,000 and five permanent positions.

In the area of property and records management, a formal agreement was executed between the Service and the Federal Housing Administration under which by mutual arrangement, certain quarters rental rates will be established based on FHA appraisals, in lieu of appraisals being made by Service personnel, further improving manpower utilization and providing rates supported by action of an organization recognized in the field. The continuation of the records disposal programs resulted in a net decrease of 1,501 cubic feet of files.

In the field of personnel management, continued emphasis was given to the recruiting circulars and brochures for career and seasonal employment. Emphasis also continued on the use of management and development seminars and formal training programs for selected service officials showing promise in the executive field.

The reorganization and modernization of the directive's system resulted in the completion of seven additional hand books and two complete rewrites.

Objectives and program for current and budget years

The objectives for the current and budget years, as well as the long-range objectives, are to continue to discharge the administrative and executive direction functions in the most effective, efficient, and economical manner, and to facilitate the prosecution of all the Service's diversified programs to the maximum extent possible.

The budget includes an increase to provide for 20 additional positions in the Washington and regional offices that are essential to meet the increased administrative workload, to strengthen training and trust fund activities, and to provide for intensification of management analysis and statistical functions. The administrative workload in the Washington and regional offices has increased constantly since the commencement of Mission 66 during which period increases in this appropriation have provided for only six additional positions for the Washington office and for no additional positions in the regional offices. This request is in the interest of full utilization of manpower and fund resources.

General administrative expenses

Appropriation, 1963	$1,964,000
Pay cost supplemental	91,200
Total appropriation, 1963	2,055,200
Appropriation, 1964	2,136,750

SUMMARY OF INCREASES, 1965

To provide for increased pay costs for fiscal year 1964 positions	68,600
To strengthen financial management functions in the Washington office	17,000
To strengthen training functions in the Washington office	15,000
To intensify management analysis and statistical functions in the Washington office	54,650
To provide management analysis staffs in the regional offices	100,000
To increase the effectiveness of the Service's trust fund program	20,000
Net change, 1965	275,250
Budget estimate, 1965	2,412,000

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964

[1] To provide for increased pay costs for fiscal year 1964 positions.

1. Departmental expenses

Subactivity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Personnel compensation and benefits	$1,035,238	$1,112,000	$1,250,000	$138,000	$46,000	$92,000
(b) General expenses	180,026	167,350	182,000	14,650		14,650
(c) Administrative printing	46,144	25,000	25,000			
Total	1,261,408	1,304,350	1,457,000	152,650	46,000	106,650

[1] To provide for increased pay costs for fiscal year 1964 positions.

1. *Departmental expenses.*—The estimate of $1,457,000 is an increase of $152,650 over 1964, of which $46,000 is for increased pay costs.

Executive direction and certain administrative functions of the Washington office are financed under this activity. The functions are general in nature and include formulation of policy; prescribing of systems and procedures; public affairs and management analysis activities; financial, personnel, property and records management functions; and the overall executive direction and coordination of the various programs of the Service. The objective is to have the Washington office in a position to discharge these administrative functions in a manner that will facilitate fulfillment of the multiple responsibilities of the Service to the maximum extent at the least possible cost.

Since the commencement of Mission 66, there has been a constant increase in the administrative workload of the Washington office. This is evidenced by the increase in the Service's new obligational authority from $52,899,374 in 1956, the last year before the beginning of Mission 66, to $124,600,558 in 1964. Provision for meeting a small amount of the increased workload was made in the 1960 appropriation through an increase for 6 positions and a small amount for general expenses. No other provision has been made for additional staffing since Mission 66 started. While an increase of $383,000 was granted in the 1963 appropriation, it provided only for financing the salaries and expenses of certain positions formerly financed from construction funds.

New obligational authority has increased over 135 percent during the Mission 66 period while the "General Administrative Expenses" appropriation has increased only 40 percent, exclusive of the increase in the 1963 appropriation to cover salaries and expenses of certain positions formerly financed from construction funds. During that period, the "General Administrative Expenses" funds progressively diminished in comparison with the total program through 1962. While the percentage of the total for 1963 and 1964 shows a slight improvement over 1962, no increase in staffing was provided for as explained in the foregoing. A table setting forth these comparisons follows:

Fiscal year	New obligational authority (nearest hundreds)	Appropriated for general administrative expenses	Percentage of total
1956	$52,899,400	$1,250,000	0.0236
1957	70,454,800	1,250,000	.0177
1958	77,162,400	1,390,650	.0180
1959	84,072,800	1,429,300	.0170
1960	85,551,100	1,475,000	.0172
1961	93,602,500	1,581,000	.0169
1962	114,376,500	1,581,000	.0138
1963	132,609,700	2,055,200	.0155
1964	124,600,600	2,136,750	.0171

Need for increase.—The financial management workload; complexity of operations incident to present program levels; training needs for the increased number of Service employees; the need to intensify management appraisal, increase efficiency, and improve manpower utilization; and the Government interest served in promoting to the fullest extent possible the Service's trust fund programs require increased staffing and supporting general expense funds for the Washington office as follows:

Division of Budget and Finance, $17,000: Chief accountant, GS–14.
Division of Personnel, $15,000: Assistant training officer, GS–13.
Division of Management Analysis, $54,650:
- Statistician, GS–13.
- Economist, GS–13.
- Management analyst, GS–12.
- Clerk-stenographer, GS–5 (2).
- Clerk-DMT, GS–4.

Office of the Director, $20,000:
- Trust-fund officer, GS–13.
- Clerk-stenographer, GS–5.

Division of Budget and Finance, $17,000

The Division of Budget and Finance is responsible for the formulation, staff supervision, and direction of the servicewide financial management program, other than internal audit, and for staff functions incident to management of the visitor fee system.

The financial management functions include design, development, installation, field review, and central coordination and control of an integrated budgeting, accounting, and financial reporting system; analysis, compilation, and final preparation of all budget estimates including justifications and staff assistance in oral presentations; allotment of funds for the purposes for which appropriated or otherwise made available, and maintenance of control over such allotments; accounting, payrolling, claims settlement, and collection functions for Washington office activities, and maintenance of central control accounts; followup action on audit findings on a servicewide basis; and maintenance of continuing liaison with other agencies and offices concerned with financial management functions.

The visitor fee system management function includes the formulation of policy recommendations within broad policies promulgated by higher authority; continuing studies to determine changes that should be made in the fee structure to insure conformance with the governing policy, including the establishment of new fees when warranted; the handling of correspondence with respect to the fees charged; and the formulation of procedures, requirements, and practices for collecting, accounting for, and safeguarding the visitor fees.

The Division now consists of an office of the Chief and Assistant Chief and three branches—Budget, Accounting Systems, and Accounting Operations. This organizational structure was established in the early days of the Service's participation in the Government-wide financial management improvement program when its operations were much smaller in scope and much less complex than they are today.

With today's higher program levels and the attendant day-to-day budget and accounting matters requiring top level attention, the interests of the Government cannot be best served by the present organization under which the Chief of the Accounting Systems Branch and the Chief of the Accounting Operations Branch report directly to the Chief of the Division. It is essential that the Chief of the Division be relieved to the fullest extent possible of day-to-day accounting systems and operations workload in order that his time to the maximum degree possible may be devoted to the constantly increasing demands for top level attention to budget, accounting, and visitor fee matters. As the situation now stands, the workload is such that the accounting systems and accounting operations functions are not receiving adequate direction, supervision, and coordination. To correct this condition, the estimate requests an increase for a position of chief accountant, GS–14, to head up the accounting systems and operations functions.

Division of Personnel, $15,000

The additional training officer, GS–13, position requested for the Division of Personnel is vitally needed to assist the training officer, GS–14. The passage of the Government Employees Training Act of 1958 (Public Law 85–507) has generated considerable additional workload for the training officer and this increase in volume unquestionably will continue to mount. The training officer, unassisted, has not been able to set up guidelines for a formal program under the Government Employees Training Act or to do other things which would make use of the provisions of the Training Act more effective. These things include an intensive and continuing study of training needs which could be met through use of outside facilities, reports on these needs, and establishing criteria for the selection of employees to receive the benefits of training in outside facilities. The additional position will provide more nearly adequate leadership and assistance in management development, supervisory training, instructor training, orientation, safety training, etc., which are vital for the improvement of the career service of the Bureau and for more effective use of the Bureau's manpower. It is impossible for the training officer, unassisted, to plan and execute an adequate training program for a bureau of the size and complexity of the National Park Service. The pressures on the single training officer are mounting steadily and there are many demands on his time which he simply cannot meet.

The additional staff member requested would be able to do the following which now cannot be done:

1. Work up formal orientation programs for the Washington office and pattern programs and guidelines for field offices.
2. Develop manuals for supervisors to use in orientation training and in developing their staff members.

3. Prepare and edit a monthly management publication.
4. Plan and conduct supervisory training sessions. (Considerable progress has been made on executive training and management training, but only a start has been made on supervisory training and this is one of the greatest needs.)
5. Make field visits to advise on and assist in and evaluate park training programs.
6. Assist the training officer in conducting management seminars. (Hitherto this has of necessity been a one-man job. Management seminars, properly conducted, involve a tremendous amount of planning and detail. It is too much to expect one man to handle, along with the other work a training officer necessarily must do.)
7. Provide coverage and continuity in the Washington office when the training officer is in the field, as he should be a considerable portion of the time.

To intensify management analysis and statistical functions, $54,650

In the reorganization of January 12, 1962, a Division of Management Analysis was established in the Washington office. Basic staffing for the division was provided principally through transfer of personnel and functions from other organizational units existing prior to the reorganization. One important function of the new division for which no staffing is specifically available is the coordination and administration of a servicewide management appraisal program. These appraisals are for the purpose of measuring the sufficiency of administration, management, technical excellence, adherence to policy, manpower utilization, control of expenditures, and workload distribution throughout the Service. The estimate makes provision for new positions of management analyst, GS–12, and a clerk-stenographer, GS–5, to meet this need. The incumbent of the management analyst position would be immediately responsible for administering and coordinating the management appraisal program.

Included in the January 12, 1962, reorganization was the establishment, in the Division of Management Analysis, of a Branch of Statistics Analysis. The functions performed by this branch include those formerlly assigned to the Activities Analysis Section of the Division of Ranger Services and a nucleus staff for the new branch was provided by transfer to it of three positions formerly comprising the Activities Analysis Section.

The Branch of Statistics Analysis is the Service's sole vehicle for conducting rigorous quantitative analyses of the patterns of visitor use and visitor services in the 207 areas administered. As such it is the primary source of sifted, analyzed, and interpreted statistics for the guidance of development programs and current management of the parks. Some indication of the dimensions of the need for such guidance is seen in the estimated 96 million public visits the parks are expected to experience in 1964—a 46-percent increase over the 65 million experienced only 6 years earlier.

This organizational unit is responsible for exercising close technical controls over the kinds and quality of data generated regularly in the parks, for designing and executing special statistical investigations to meet problems not covered by data produced by standard statistical series, and for supplying appropriate officials of the Service, other Federal agencies, and the public with the kinds and amounts of statistical information requisite to their needs. Of particularly critical importance, the Branch is charged with the recurrent production of anticipatory data—information which alerts responsible officials of the Service of the imminence, dimensions, and character of problems foreshadowing the need for action—or change in predetermined line of action.

The present staff comprises three professional positions. Activities are severely hampered by the total absence of secretarial and clerical assistance. A clerk-stenographer, GS–5, is direly needed to provide assistance to the existing staff.

The past few years have witnessed a rapidly augmented volume of requests and demands for the technical services of the Branch. These have been responsive to needs for consultative services (both inside and outside the National Park Service), for the designing of special studies in the parks, and for processing and interpreting aggregations of data. The consequence is that demands vastly exceed the resources of the staff to meet them. There are large accumulations of data to be analyzed, investigations to be provided with technical designs, and basic management problems to be studied for reduction to statistical attack. To pick up the backlog and to meet the ever-increasing flow of new demands, three additional positions are needed: two professional and one clerical.

A statistician (operations and administration), GS–13, will direct and conduct the formal analyses of the existing and incoming aggregates of data. An economist (statistician, mathematician, or engineer), GS–13, versed in methodology,

is needed to apply and contrive modern economical techniques to a wide variety of Service management problems (entrance station queuing, internal information flow, comparative park workloads, etc.). Many of these problems can be attacked only cumbersomely by traditional methods—others cannot be tackled at all. A clerk-dictating machine transcriber, GS–4, will supply the necessary clerical support for these positions.

Office of the Director, $20,000

The proposed positions of trust fund officer, GS–13, and clerk-stenographer, GS–5, are needed to implement and carry forward the trust fund activity.

Two primary trust funds have been authorized by the Congress for the benefit of the national parks. The first, the act of June 5, 1920 (41 Stat. 917), grants broad authority to the National Park Service to accept donations including land, property, and money "* * * for the purposes of the national park and monument system." To date donations of money have amounted to nearly $12 million. Donations of land, if figured at an average value of $30 per acre, come to over $75 million The second, the act of July 10, 1935 (49 Stat. 477), created the National Park Trust Fund Board and authorizes the acceptance of gifts to be invested as in a foundation or endowment fund. Some $633,000 has been received under this program to date.

While the accomplishments have been substantial, there is ample opportunity to enlarge the scope and effectiveness of the trust fund program if full-time attention can be devoted to it. Heretofore, no individual has had this function as a primary responsibility with the result that the program has lacked continuity and has succeeded only to the extent that the Director and others have taken time from their other responsibilities to devote to it.

Substantial financial benefit accruing to the parks will be achieved by establishing the positions of trust fund officer and a clerk-stenographer. Through the trust fund officer, the Service will be in a position to develop and program a comprehensive portfolio of necessary and suitable projects having appeal to various kinds of donors. Such would range from small cash donations to a general fund by large numbers of givers, to special projects of considerable cost which would appeal to the class of sophisticated donors known to be in sympathy with park and conservation objectives. The trust fund officer would follow through and give leadership, continuity, and full-time thought and energy to the routine aspects of such an enterprise. He will also work closely with the Director and the Secretary of the Interior in enlarging the scope of trust fund programs and activities for national park purposes.

Plan of work.—The program contemplates provision of executive direction and the performance of certain administrative functions in the Washington office in support of all Service programs.

2. Regional office expenses—Analysis by subactivities

Subactivity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Northeast office	$160,958	$164,100	$188,600	$24,500	$4,500	$20,000
(b) Southeast office	155,471	168,100	192,600	24,500	4,500	20,000
(c) Midwest office	159,224	166,100	190,600	24,500	4,500	20,000
(d) Southwest office	148,846	163,100	187,600	24,500	4,500	20,000
(e) Western office	161,900	171,000	195,600	24,600	4,600	20,000
Total	786,399	832,400	955,000	122,600	22,600	100,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

2. *Regional office expenses.*—The estimate of $955,000 is an increase of $122,600 over 1964 of which $22,600 is for increased pay costs.

Executive direction, public affairs, management analysis, and program coordination functions in five of the regional offices are financed under this activity.

What was said under activity 1 concerning the increased administrative workload in the Washington office since the beginning of Mission 66 is equally true with respect to the regional offices. No additional staffing has been provided under the appropriation for the regional offices since the commencement of Mission 66.

Need for increase.—The program increase requested is for a small management analysis staff in each of the five regional offices. This additional staffing is needed

to carry out on a servicewide basis the management analysis and appraisal program discussed under activity 1. The need for the increase is discussed more specifically as follows:

To provide for management analysis staffs, $100,000

During the past decade the Service has experienced considerable expansion in the number of parks administered, size of staff, visitor use workload, and the levels of all programs for which it is responsible. There has been broad delegation of authority. To the fullest extent possible, authority and responsibility rest with those who actually perform the operations. The management analysis program is intended to help assure top management of effective and proper use of delegated authority and the efficiency and coordination of all activities. Management analysis is an important function of the Service and one which must receive increased emphasis in the interest of efficiency and economy and good manpower utilization.

The reorganization of January 12, 1962, provided for a Division of Management Analysis in the Washington office and anticipated eventual staffing for management analysis in each of the regional offices. The regional management analysis officer, GS–13, provided for in the estimate is to be responsible for planning and directing the management analysis functions throughout the region and for initiating programs and devising methods for improving the conduct of all activities of the region. This consists of reviewing and suggesting improved methods for conducting regional operations; making organizational, functional, and procedural studies; planning and directing regional forms and reports management programs; assisting in installing new organization and procedural plans; supervising and coordinating regional directives, correspondence, and records scheduling and disposition programs, and most importantly, formulating, programing, advising, assisting, and conducting broad management surveys of all functions performed by field offices within the respective regions in participation with technical specialists responsible for these functions. The management analysis officer would be responsible for the coordination and administration of the regional management appraisal program. These appraisals are for the purpose of measuring the sufficiency of administration, management, and technical excellence; adherence to policy; manpower utilization, control of expenditures, and workload distribution throughout the region. These functions are now the responsibility of the Assistant Regional Director for Administration but no staff has been provided to implement the management analysis program.

Each of the five regional management Analysis officers should have a GS–5 stenographer to assist in clerical duties as required.

Plan of work.—The program contemplates provision of executive direction and the performance of certain administrative functions in the regional offices in support of all Service programs.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase
Program and financing:				
Total obligations	$2,047,807	$2,136,750	$2,412,000	$275,250
Unobligated balance	7,393			
Appropriation	2,055,200	2,136,750	2,412,000	275,250
Obligations by objects:				
11 Personnel compensation	1,606,287	1,707,000	1,922,000	215,000
12 Personnel benefits	119,370	124,000	150,000	26,000
21 Travel and transportation of persons	115,541	103,000	125,000	22,000
22 Transportation of things	5,880	6,000	6,000	
23 Rent, communications, and utilities	43,948	46,000	48,000	2,000
24 Printing and reproduction	84,071	85,000	86,000	1,000
25 Other services	31,227	30,750	33,000	2,250
26 Supplies and materials	14,055	14,000	16,000	2,000
31 Equipment	27,478	21,000	26,000	5,000
32 Lands and structures	−50			
Total obligations	2,047,807	2,136,750	2,412,000	275,250

Chairman HAYDEN. Would you please comment on the proposed program increase of over $106,000 for departmental expenses?

ADDITIONAL STAFFING IN WASHINGTON OFFICE

Mr. HARTZOG. One of these jobs is a trust fund officer position. Every year we report to the committee the amount of donations received by the National Park Service. In the period of Mission 66 these have now amounted to something in excess of $13 million. This program has been carried on almost entirely by former Director Wirth. One of the positions we would propose would be to provide a trust fund officer to continue to promote contributions from foundations and others. Another one is that of chief accountant in our Division of Budget and Finance.

Most of the positions involved would be in the Division of Management Analysis. This is a division in which we analyze our operations and evaluate our workload and manpower utilization program. We believe that these are particularly critical if we are to improve the operations of the Service as a whole.

Chairman HAYDEN. The $100,000 increase for regional office expenses is to provide management analysis staffs. Would you describe the work proposed for such staff and indicate who is now doing this work?

ADDITIONAL STAFFING IN REGIONAL OFFICES

Mr. HARTZOG. Sir, this work is largely not now being done. This ties back in with the management analysis staff of the Washington office. What we think is needed is a systematic program of analysis of our operations not only at the Washington office level which we now have in this reorganization but at the regional levels and at the field level to make sure that we continue to get our money's worth out of the programs of the Service. As we have mentioned to the committee before, we are likewise attempting to develop workload standards and this is one of the activities of this division.

PASSENGER MOTOR VEHICLES

Chairman HAYDEN. There will be included in the record your statement with regard to administrative provisions, which indicates a need for 118 passenger motor vehicles, 94 of which are for replacement.

(The statement referred to follows:)

ADMINISTRATIVE PROVISIONS

Authorization is requested for the purchase of 118 passenger motor vehicles of which 94 are for replacement only, including not to exceed 50 for police-type use, the cost of which may exceed by $300 each the general purchase price limitation for the current fiscal year.

The vehicles to be replaced will be within the age or mileage standards for replacement as prescribed by the General Services Administration. Many of them are used for patrol purposes and law-enforcement functions by employees such as park rangers and the U.S. Park Police, and often at high speeds for the apprehension of speed and other violators. They must, therefore, be in good condition to insure safety of the operator and the public. Many of the vehicles operated by the Service are used in rugged mountainous and desert terrain and under trying weather and road conditions. The geographical location of many areas, far from railheads or other populated centers where Government business is transacted, makes it mandatory to use this type of transportation.

Vehicles to be purchased:	
Number	118
Estimated gross cost	$199,650
Old vehicles to be exchanged:	
Number	94
Estimated allowance	$42,350
Net cost	$157,300
Old vehicles still to be used	381

Expansion of the Service's activities under the Mission 66 program and the establishment of new park areas have brought about the need for additional passenger motor vehicles to serve protective, interpretive, and administrative functions of the areas. One of the additional vehicles requested is for the U.S. Park Police force for which an increase of 10 positions is provided in the estimate. The other 23 additional vehicles requested are all required to more nearly meet the needs of the staffs in existing areas, of which 8 are for areas activated since the beginning of Mission 66 and 15 are for pre-Mission 66 areas.

The language will permit the Service to purchase special features of equipment for vehicles used for law enforcement or police-type activities exceeding in cost the maximum amount established for the purchase of any passenger motor vehicle. In the discharge of its responsibilities the Service will need to purchase 50 cars equipped as police cruisers in 1965. They are required for patrolling such areas as the George Washington Memorial, Baltimore-Washington, Suitland, and Blue Ridge Parkways, and roads in the larger parks. Special features of equipment for police-type vehicles include heavy-duty front seat and upholstery, heavy-duty police-type engine, safety belts, safety padded sun visor and dashboard, special safety tires and tubes, and heavy-duty chassis, springs, shock absorbers, and alternators.

Chairman HAYDEN. Please supply for the record a table showing where the 24 new vehicles will be assigned.

Mr. HARTZOG. We will be pleased to do that, sir.

(The table referred to follows:)

New additional passenger motor vehicles—1965 budget

Region and area	Number of vehicles	
	Automobiles	Station wagons
Northeast region:		
Cape Cod	3	1
Minute Man		1
Lincoln Boyhood	1	
Subtotal	4	2
Southeast region:		
Blue Ridge Parkway	2	
Cape Hatteras	3	
Colonial	1	
Natchez Trace	4	
Subtotal	10	
Midwest region:		
Flaming Gorge	1	
Glacier	1	
Yellowstone	1	
Subtotal	3	
Southwest region:		
Lake Mead	1	
Mesa Verde	2	
Padre Island	1	
Subtotal	4	
National Capital region	1	
Total	22	2

EMPLOYMENT OF SEASONAL PERSONNEL

Senator MUNDT. How many summertime employees do you envision to handle the visitors? You mentioned part-time seasonal employees. I am curious to know how they are selected and whether these are jobs which are available to these college students who keep writing us that they wish to work outdoors for Uncle Sam in the summer.

Mr. HARTZOG. I believe there are over 4,000 seasonal employees in the parks.

Senator MUNDT. Would it be a big job if you were to send a statement to me setting forth how many of these will be in each park?

Mr. HARTZOG. It will be a big job but we will be pleased to send it to you by letter as soon as we can.

WIND CAVE NATIONAL PARK APARTMENT CONSTRUCTION

Senator MUNDT. On page 12 of your justification you discussed the construction of employee apartments at Wind Cave National Park. What do you have in mind there?

Mr. HARTZOG. Sir, if I may I will ask Mr. Baker to answer that. This is in the region he just left.

Mr. BAKER. Thank you.

Senator MUNDT. We hate to lose him, too, but we are kind of glad he got promoted.

Mr. BAKER. Wind Cave National Park, of course, has a number of seasonal employees who are hired to work in the caves for us and so forth. It is necessary for us to provide quarters for those employees because they cannot find adequate quarters in the neighboring communities. We have had a small set of facilities there which are not adequate for the number of employees we have.

Senator MUNDT. Do you feel that what you have asked for in this budget will take care of the problem?

Mr. BAKER. I think so.

BADLANDS NATIONAL MONUMENT

Senator MUNDT. How are things going out at Badlands National Monument? Last year we appropriated some money for the purchase of some in-holdings. Are there any problems remaining out there?

Mr. BAKER. We still have a number of in-holdings. We have been trying to acquire these in-holdings by purchase, by exchanging with the Forest Service and it is a very slow process to work out an exchange but we do have quite a few acres to acquire.

Senator MUNDT. Are you making some progress?

Mr. BAKER. Yes, we are making some progress but it is very slow.

MOUNT RUSHMORE HALL OF RECORDS

Senator MUNDT. What is the status of the facility at Mount Rushmore? Are there any major projects out there that need attention? For example, part of the original plan was to call for a Hall of Records.

Mr. BAKER. Mount Rushmore facilities have been very well taken care of in the last few years. We have a new visitor center just

opened. The parking facilities have proved to be quite inadequate. So, at the present time, we are enlarging the parking area. We have a very fine program that we put on every evening. Sculptor Borglum always had in mind the idea of carving a Hall of Records, which project he started while he was still alive. I think they excavated back in the mountains some 60 feet or so. He even carved out of the rock the frame of the doorway which would lead to the hallway. The National Park Service has never considered that this project should be carried forward. We felt the interpretative facilities that we have now and will have in the second workshop will include much of the material needed in the program to tell the people how the sculptor visualized the project, the tools that he used, and so forth.

Senator MUNDT. I may be wrong but my memory leads me to believe that program in the Hall of Records went far beyond construction of the monument. The Hall of Records really was to tell of the development of the Republic. This would not be covered in the workshop.

Mr. BAKER. That is right. But this is covered to a great extent in our new visitor center, the story of America and so forth, the part that the four Presidents played in the development of America. It is our opinion that we do not need the Hall of Records. Furthermore, it would be awfully difficult to get people to that Hall of Records.

You will recall that access is by stairway. It is quite expensive. The Hall of Records, itself, would be a very expensive proposition.

JEWEL CAVE NATIONAL MONUMENT

Senator MUNDT. Lately, I have been hearing a lot about new discoveries out in Jewel Cave. Even if parts of these reports are exciting as I have been led to believe, it seems to me this is one of the real great new attractions of the entire Park Service. I wonder if you would outline for the information of the committee just what has been discovered out there and what your plans are for the development of this new natural resource.

Mr. BAKER. Thank you, I will be very happy to do that. The Jewel Cave National Monument, at the present time, contains about 1,200 acres. We have found in the last 2 years, by a man and his wife who have been doing some exploring work for us, that we have some very new and interesting caverns which actually extend outside the present boundaries. The rooms and passageways are quite wet and we will find some very interesting formations and minerals.

Senator MUNDT. This, I take it, is an advantage instead of a disadvantage to have a wet cave?

Mr. BAKER. That is right. We will find some very interesting formations, some nice size rooms. In fact, there are two items called scintillates and magnesites which are quite unique among cave formations. There is boxwork in this cave. Boxwork is found in Wind Cave National Park, but this is still a different formation. The caves that we have explored, the caverns and so forth, go for almost 10 miles;

Senator MUNDT. As caves go, that is a pretty good size cave.

Mr. BAKER. That is a very good size cave.

Senator MUNDT. Is the cave all in the Park Service land?

Mr. BAKER. The principal part of this new discovery falls outside the national monument but within the Forest Service, but all on Government-owned land.

Senator MUNDT. I take it the transfer of that property would not be difficult with your program of coordination?

BOUNDARY ADJUSTMENT

Mr. BAKER. We will work it out with the Forest Service if possible and adjust the boundaries between the monument and the Black Hills National Forest.

Senator MUNDT. Those plans are now underway?

Mr. BAKER. We are just discussing them with the Forest Service. One of the first things we want to do is to verify our cavern surveys with our surface surveys to determine exactly where the principal caverns are in connection with the surface of the land. So, we have to make some preliminary test drillings to correlate our surface area. Once we have established these facts, then we can go ahead and make some developmental plans. Particularly we are going to have to have an access and ventilating tunnel so that people can get into the cavern part and see it, because it takes about 2½ hours' crawling to actually get back into the old Jewel Cave.

Senator MUNDT. You are thinking in terms of the new visitor center or entrance facility, however you designate it?

IMPROVEMENTS PLANNED

Mr. BAKER. We have always said that Jewel Cave, the old part of Jewel Cave, is of a primitive character. However, if the new part of the cave proves to be as interesting as we have been told by these people, then we are thinking of lighting the cave and serving it by an elevator.

Senator MUNDT. There is a tremendous amount of interest in the area. I would like to see us get started to take advantage of this great new discovery, if possible, with this appropriation bill. I wonder if you could supply for the record some estimate as to the cost of the facilities, the priority and what might be considered reasonable to be included in this appropriation bill.

Mr. HARTZOG. We will be pleased to do that.

(The information follows:)

STATEMENT ON JEWEL CAVE NATIONAL MONUMENT, SOUTH DAKOTA

Jewel Cave National Monument, in the Black Hills region, contains 1,274.56 surface acres. New and interesting caverns have been discovered which extend outside of the present boundaries into the Black Hills National Forest.

The caverns contain rooms up to a 100 feet in length with ceilings up to 60 feet in height. The rooms and passageways are damp and active which create very interesting cave formations.

The new part of the cave contains the following minerals and formations:

Manganese dioxide.
Flowstone.
Stalactites and stalagmites.
Red and plain boxwork.
Popcorn and cauliflower types of argonite.
Rimstone, geodes, and quartz crystal.
Scintillates and hydromagnesite bubbles.

The scintillates and magnesite bubbles are unique. These and other features in such variety and abundance combine to greatly enlarge the importance of Jewel Cave National Monument.

The National Forest Service is aware of the new finds and our interest in the possible adjustment of the boundaries of the monument by exchange between Forest Service and monument land.

Preliminary test drilling is required to correlate the cave and surface locations. This work we hope to accomplish this spring with the concurrence of the National Forest Service.

Following the successful completion of this correlation we would then be in a position to develop a plan for a boundary adjustment with the National Forest Service. Public lands only are involved. We are of the opinion these new portions of Jewel Cave are far superior to existing portions now open to the public. We consider these new portions should be electrically lighted and ultimately served by an elevator of about a 200-foot lift.

The first phase of the development which could be undertaken very soon after the boundaries were adjusted, and if funds were available, include the following items:

1st priority (work which must precede all other projects):	
Roads and trails:	
(a) Access road, grade, base and bituminous surface, including signs, ¾ mile	$75,000
(b) Parking area	12,500
(c) Access and ventilating tunnel (5 by 7 by 200 feet) and preliminary cave trails for public use	35,000
Subtotal	122,500
2d priority (work which would be essential to make area usable by the public on an interim basis but will require more planning):	
Buildings and utilities:	
(a) Water system including well, reservoir, and main distribution lines	75,000
(b) Sewer system	38,000
(c) Construction office and public contact station with public restrooms (to be designed to form part of permanent visitor center)	20,000
Subtotal	133,000
Total, 1st and 2d priorities	255,500

The present cave is unlighted, with visitation in 1963 amounting to 17,528 via cave tours, and a total of 44,000 visitors to the monument. The new portions of the cave should prove very interesting and when fully developed we would expect a great increase in interest and visitation. This visitation could start as soon as the basic facilities outlined above were installed.

Reproduction of Sequoia Trees

Senator Mundt. I have always been interested in these sequoia trees. I notice on page 27 you have a statement that is kind of startling. Sequoia trees have not reproduced themselves during the past 75 years. I wondered what the reason for this is. I would like to see them continue to reproduce. I think they are very attractive, very fascinating.

Mr. Hartzog. We appreciate that very much. We would, too. This is part of what is wrapped up in this $150,000 natural science and wildlife study money that we have asked for this year. These are some of the things we are faced with in national park protection.

Senator Mundt. Do you know any reason why they have quit reproducing?

Mr. Hartzog. We have not gotten any answers to these questions. This is one of the studies we would like to undertake this year.

Senator Mundt. No guesstimates.

Mr. HARTZOG. We have a guesstimate; yes, sir. I have a man here I think who can guesstimate on the subject.

SEQUOIA GROVES

Mr. STAGNER. The Sequoia groves have been in existence for perhaps 4,000 years. It is a tree that reproduces only when there are openings in the forest and where mineral soil has been disturbed and turned up. The seeds just don't reproduce otherwise. They have to have sunlight and mineral soil. Now, in the last 75 years that these groves have been under observation we know that other trees have come up to such extent below the canopy of Sequoias in by far the largest proportion of the groves, as to prevent reseeding. Some places where trees fall down, new Sequoias will start to grow. We would like to know if this represents a necessary stage in the normal cycle of nature, or is this heavy understory an artificial situation that needs to be corrected in order to insure the preservation of the Sequoias.

Senator MUNDT. Are these trees pretty generally found around the world or is this something pretty much indigenous to that area?

Mr. STAGNER. The only native home of the giant sequoia is on the western slope of the Sierra Nevada. It is restricted now to a number of isolated groves. It is not a continuous forest, not mixed with the other trees, but scattered groves from, let us say, from about mid-California southward in separated groves. It has been reproduced from seeds in various parts of the world but this is the only place it grows naturally.

Senator MUNDT. Thank you. That is all, Mr. Chairman. Except on this report on park employees, will you put this in terms of people instead of man-hours?

Mr. MONTGOMERY. Yes, sir; we will do that.

Senator BIBLE. Mr. Chairman, first, I want to commend Mr. Hartzog for a very able maiden voyage before the Appropriations Committee. I compliment his staff, too. I think they handled themselves very well. They were very adroit and I hope accurate in answering the questions.

Senator MUNDT. That might be called damning with faint praise.

VISITOR CENTER AT LAKE MEAD

Senator BIBLE. Some of these figures mixed me up a bit. But you did a good job. I am delighted to see you have a visitor center program for Lake Mead. Will this complete the job, $227,200?

Mr. HARTZOG. I believe this is the completion of it, Senator.

Senator BIBLE. It has not even started?

Mr. HARTZOG. No; but I meant the completion of the funding part. Here again, we are going to work with the Bureau of Reclamation on the possibility of doing some joint interpretation in the visitor center there at Lake Mead.

Senator BIBLE. That might be very well to do because this is, of course, the site of Hoover Dam.

What is the timetable on it? Do you have plans and designs already?

Mr. HARTZOG. They are being worked on now. We will be happy to supply you with a table for that for the record.

Senator BIBLE. I wish you would. Tell me what the construction period is. Do you plan to start construction in fiscal 1965? How long would it take, 120 days, 150 days? Will you supply it for the record?

Mr. HARTZOG. Thank you.

(The information referred to follows:)

TENTATIVE SCHEDULE OF CONSTRUCTION, LAKE MEAD VISITOR CENTER

Phase of construction:	*Target date*
Completion of plans	Oct. 15, 1964.
Bid opening	Nov. 1, 1964.
Award of contract	Jan. 1, 1965.
Time for performance	270 days.
Completion date	Oct. 1, 1965.

If the visitor center is developed jointly with the Bureau of Reclamation, the estimated timing will be extended about 4 months.

COMPARISON OF VISITATION FUND AND STAFFING FOR CERTAIN PARK AREAS

Senator BIBLE. Likewise, I would like to have you supply for the record the visitation figures over the last 5 years for the—I want to take some typical park areas, I would say Mammoth Cave, Grand Canyon, Yellowstone, and Yosemite. Also show the annual budget over those 5 years, as well as your organizational chart as to the number of people you employed and what they did. The thing which is concerning me, I say very frankly, is that I have just returned from Clark County and last year they had 6,650,000 visitors through the Lake Mead Recreation Area. This was an increase of 25 percent over the year before. They also tell me that in this January just passed, January 1964, there were 25 percent more visitors than there were in January 1963. I want to see that this area is sufficiently manned because of the tremendous interest in the area and the tremendous number of boats there, as well as fishermen, swimmers, and campers, for overnight stays. Would you make that comparison and either supply it to me individually or for the record?

Mr. HARTZOG. We deeply appreciate it, sir. We know of your deep interest and we appreciate it. I think you would be pleased to know that we recently appointed a special management study team for Lake Mead consisting of two officials from our Washington office and two from our southwest regional office to work with Superintendent Richey and his staff to develop this whole complex of staffing that is needed there at Lake Mead.

Senator BIBLE. I am happy to hear you say that because this is a tremendous load there.

Mr. HARTZOG. That is right.

Senator BIBLE. Of course, this committee's approval of an airplane last year helps in search and rescue missions.

Mr. HARTZOG. That is right.

(The material referred to follows:)

Comparative 5-year data on annual appropriations, permanent positions and man-years of other, fiscal years 1960–64; and annual number of visits, calendar years 1959–63

LAKE MEAD NATIONAL RECREATION AREA

	Calendar years				
	1959	1960	1961	1962	1963
Number of visits	2,238,000	2,254,200	2,220,000	2,688,700	3,349,600
	Fiscal years				
	1960	1961	1962	1963	1964
Annual appropriations and staffing:

NOTE.—Staffing data shown above does not include that which is applicable to construction appropriations or those administrative services (Field Finance Office functions) financed from all appropriations.

LAND ACQUISITION CONDEMNATION POLICIES

Senator BIBLE. This could also be supplied for the record or through this medium you might like to discuss it with your people. I am concerned about the condemnation policies of the Park Service insofar as they concern national parks and lake shores and seashores. It seems to me there are some conflicts and we have some problems in the legislative committee. I don't want to use the Appropriations Committee to determine that.

I wish you would get with your solicitors and get with me and see if we can't find out what the Park Service policy is on this very troublesome question of condemnation.

Mr. HARTZOG. We certainly shall get with you on the matter.

Senator BIBLE. Particularly on the unimproved lands.

Senator MUNDT. In that connection, I would like to congratulate the gentleman at the end of the table who said 80 percent of your acquisitions are from voluntary sellers which, I think, is wonderful because we have had a lot of trouble with the program of the Corps of Engineers in condemnation. When you have to take land away from people especially for recreational purposes you create a lot of unhappy folks.

Senator BIBLE. That was a refreshing and revealing statistic. Thank you, Mr. Chairman.

Chairman HAYDEN. Is there anything further? If not, we will stand in recess until 10 a.m. on Tuesday, February 25, to take up the Bureau of Mines and the Geological Survey.

Mr. HARTZOG. Thank you for your courtesy, Senator.

(Whereupon, at 12:45 p.m., Monday, February 24, 1964, the committee recessed to reconvene at 10 a.m., Tuesday, February 25, 1964).

DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR 1965

TUESDAY, FEBRUARY 25, 1964

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met at 10 a.m., pursuant to recess, in room 1223 of the New Senate Office Building, Hon. Carl Hayden (chairman) presiding.

Present: Chairman Hayden, Senators Bible, McGee, Bartlett, and Young.

DEPARTMENT OF THE INTERIOR

VIRGIN ISLANDS CORPORATION

STATEMENT OF JOHN J. KIRWAN, ASSISTANT DIRECTOR OF TERRITORIES, DEPARTMENT OF THE INTERIOR

BUDGET PRESENTATION FOR 1965

Senator BIBLE (temporarily presiding). The Subcommittee on Interior Department Appropriations will come to order.

I am pinch hitting in the absence of Chairman Hayden. We are expecting him momentarily.

Our first hearing this morning is on the Virgin Islands Corporation.

We have as our witness our very distinguished friend, John J. Kirwan.

JUSTIFICATIONS

We will be happy to hear from you, Mr. Kirwan.

First, there will be placed in the record the justification for the Virgin Islands Corporation for the fiscal year 1965. The statement indicates that no funds are being requested during the coming year.

However, the Virgin Islands Corporation does request a limitation on administrative expenses of $156,000 for the next fiscal year. This is a decrease of $30,000 under the authorization of the current law.

(The justification referred to follows:)

HIGHLIGHT STATEMENT

The principal purpose of the Virgin Islands Corporation is to develop the economy of the Virgin Islands, which it has done largely through its sugar program, its electricity and water production program, and its real estate management program.

The Vicorp sugar program consists of growing about 70 percent of all the sugarcane grown in the islands, and grinding 100 percent of all the cane grown into

raw sugar and molasses. The sugar is sold on the U.S. mainland and the molasses is sold for rum distillation in the Virgin Islands. Of all rum produced in the Virgin Islands, about 40 percent of the molasses is supplied by Vicorp, and the remaining 60 percent is purchased by distillers in Puerto Rico and the British West Indies.

The Board of Directors on August 16, 1963, voted to sell its entire power and water-producing system to the Government of the Virgin Islands, at the full appraised market value of such system. It took this step partly because it had been unable to secure sufficient funds for necessary expansion of the system, but largely because of its conviction that the providing of water and power was a local responsibility that the local government was both willing and able to assume at this time. Final transfer is expected to take place by the end of fiscal year 1964.

The real estate responsibilities of Vicorp consist of its managing the former Navy Submarine Base and Marine Corps Air Facility, both on St. Thomas. In addition to the operation of the only airport on St. Thomas, this responsibility consists largely of managing the hundred-odd commercial properties, both improved and unimproved, into which these excess military bases have been subdivided. The Department of the Navy is now in the process of disposing of the facilities, and it is expected that all of these properties will go to the Government of the Virgin Islands, for use as a site of the new College of the Virgin Islands, as the civilian airport, and as revenue-producing property related to the airport.

Once these transfers are made, the only program for Vicorp will be its sugar program, which the Board of Directors has voted to terminate as of June 30, 1966. It is not anticipated that Vicorp will have to request any additional funds from the Congress in the coming years.

Contributions, Virgin Islands Corporation

Appropriation, 1963	
Transferred from "Internal Revenue Collections for Virgin Islands"	$480,000

UTILIZATION AND CONTROL

Manpower

Review of manpower utilization.—Personnel are assigned to programs to which they can honestly make the most contribution, either in the form of know how or in accumulating useful data needed for study and the future success of the program. Under this procedure those with the greatest potential and capability are given an opportunity to utilize such skills for the greatest good. In this manner management gradually obtains the most for its dollars by accomplishing its objective at the lowest possible price.

Workload study.—Experience and time study have clearly established the normal number of man-hours required to perform routine as well as specialized duties. This can be accomplished only if the right man is assigned at the right place. This point receives particular consideration because it plays a vital role in completing a first-class job in the shortest possible period. This has been the key principle used in setting up controls on adequate staff requirements.

Automatic data processing.—The introduction and use of punch card equipment with computer capability has provided a great opportunity for savings in man-hours and dollars. Significant benefits have been realized primarily where these equipment are adaptable to several types of applications formerly hand processed and now require the utmost speed and accuracy with the retention of the initial data for future tabulation and analysis. The expansion of this system provides the accomplishment of a greater volume of work with a smaller staff.

Financial management.—Ceilings have been established on obligations and expenditures for power distribution facilities. This type of control has made it possible to avoid excessive investment beyond the ability of available resources and has thereby released working capital for other activities. This procedure has forced the acquisition of priority items which are urgently needed, and its success is considered a great contribution to the financial effort, primarily because it has eliminated waste. The accounting system is under constant review for simplification. There is also a favorable reception for suggestions which tend to improve the system of record keeping and make its application more meaningful.

Senator BIBLE. Mr. Kirwan, we will be delighted to hear from you. I have known for a long time of your splendid work in this field. I commend you on it.

STATEMENT OF JOHN J. KIRWAN, ASSISTANT DIRECTOR OF TERRITORIES

Mr. KIRWAN. Thank you, Mr. Chairman. I have a prepared statement.

Senator BIBLE. That will be incorporated in full in the record, and you may highlight it in any way you desire.

(The statement referred to follows:)

SUMMARY OF ACTIVITIES AND PLANS OF THE CORPORATION

The Virgin Islands Corporation is not seeking any funds at this time from the Congress, and in fact does not presently foresee any necessity for seeking funds in the future. The Corporation's life will expire in any event on June 30, 1969, and sooner should its Board of Directors terminate its existing programs and dispose of its assets in accordance with existing law.

There is a present limitation of $186,000 set on administrative expenses, and we are now proposing that this be reduced by $30,000 to the sum of $156,000, in contemplation of reduced administrative costs in fiscal year 1965.

Vicorp sought from the Congress in the Supplemental Appropriations Act, 1963 (Public Law 88–25) $3,350,000 for the construction of new electrical generating units on St. Croix and St. Thomas. The House allowed such an amount in reporting out the bill, but it recommended the immedate disposal of the entire electrical and water system, after the needed expansion was contracted for, to the local government at its full appraised value.

The Senate in considering such measure disallowed all funds for this purpose, and noted that it was informed that should such funds be disallowed that Vicorp then would seek to dispose of the system to the local government. The conferees upheld the Senate position.

Accordingly, the Board of Directors on August 16, 1963, voted to sell the entire system to the local government, at 100 percent of appraised value, as recommended by the House committee and as foreseen by the Senate committee. To accomplish this, it declared the system excess to the General Services Administration, which agency is now in the process of appraising it in order to ascertain its full market value, and expects to complete this sale at such price to the local government by about May 1, 1964, in accordance with the Federal Property and Administrative Services Act of 1949, as amended.

The Legislature of the Virgin Islands, on December 12, 1963, voted to purchase the system when it is tendered to it.

Meanwhile, the local government is going ahead with expansion plans, since the provision of additional generating capacity for St. Thomas is now long overdue. The local government expects to let a contract within the next few weeks for a new 7,500-kilowatt steam generator, and hopes to have it installed within a period which will hold to a minimum, hopefully no more than 3 months, the period when St. Thomas will be without firm power.

The Board of Directors voted in May 1963, to terminate all sugar operations on June 30, 1966, in view of consistent losses realized in the program without sufficient offsetting social benefits to the community at large. In the past 3 years more than $1 million in losses have been charged off against funds which would otherwise have gone to the local government for use in its capital improvement program as matching funds. In view of the very small number of local growers who have a substantial stake in sugar production, and the fact that all cane cutting must now be done with imported alien labor each year, it is felt that the losses incurred are all out of proportion to the local benefits realized.

Out of consideration for those local growers who may have planted sugarcane recently, which cane could continue to be harvested for several years, and to give everyone now involved in any way with sugar sufficient time to disengage gradually, the Board of Directors has provided for this full 3-year phasing out period.

The decision to go out of sugar, taken in May 1963, was made without regard to whatever disposition or use might subsequently be made of the land now being used for sugar production. Vicorp does have pending before it a proposal to lease some of its land, 1,700 out of a total of 3,400 acres, for citrus cultivation. It has not yet come to any decision with regard to such proposal, but I wish to make clear that the decision with regard to sugar termination in 1966 was made well before, and quite independently of, any decision with regard to the pending citrus proposal.

Expiration of the Virgin Islands Corporation

Mr. Kirwan. The Corporation not only does not seek funds this year, it presently does not foresee a need to seek any in the future.

As you know, Mr. Chairman, it expires by law on June 30, 1969.

It presently is carrying on only three significant programs. One is the generation of electric power and the distillation of water. The second is the production of sugar from grinding sugarcane in the islands. And the third is managing certain naval properties on St. Thomas.

Last year the Corporation sought from Congress $3,350,000 for new generating equipment. The House allowed us this money, but told us to sell the system to the local government as soon as the expansion was contracted for.

The Senate did not allow the money, but said it understood that we would dispose of the system if we were unsuccessful in getting funds.

Sale of Distillation System

The conferees upheld the Senate position. Therefore, in August of 1963, the Board of Directors of Vicorp voted to sell the entire electrical and water distillation system to the local government at its full appraised market value.

We have declared the system excess to GSA, therefore, GSA is having it appraised. We expect the sale to be finally consummated about the 1st of May. That will take us out of the power and water business.

Phasing Out Sugar Operations

Last May the Board of Directors of the Corporation also voted to close all sugar operations, effective June 30, 1966. The 3-year phaseout period was set to allow growers and other people on St.

Croix interested in sugar enough time to disengage in an orderly manner from the sugar business. We have lost money at the average rate of about a third of a million dollars a year in sugar over the past decade.

There are some benefits to the local people from our staying in sugar, but on balance our view is that the benefits are in no way commensurate with the cost.

And this cost, incidentally, has not been borne in the past 3 years by the Federal Government, but the incidence of the loss has fallen upon the local government. Over a million dollars in the past 3 years has been taken out of matching funds which otherwise would have gone to the local government but for the sugar losses.

PROPOSED CITRUS LEASE

The Board of Directors of Vicorp has pending before it, and will vote on it at its next meeting in about 3 weeks, a proposal to lease about half of the land presently in sugar for citrus purposes. I would like to make clear that the Board, (1) has not already decided whether to enter into this lease, and (2) in any event it decided to go out of sugar well before and in a context where the citrus proposal had nothing to do with the decision on getting out of sugar.

REDUCTION OF ADMINISTRATIVE EXPENSES

We do, lastly, Mr. Chairman, suggest that our ceiling on administrative expenses be reduced $30,000, from $186,000 to $156,000, due to a lessening of administrative expenses in the coming year due to disposing of power facilities.

That is all, Mr. Chairman.

Senator BIBLE. That is a very fine statement. And it is refreshing to find one agency of the Government that is reducing its administrative expenses.

What would your expense be at $156,000? How many people would you have with Vicorp?

PERSONNEL

Mr. KIRWAN. Well, with Vicorp itself there are several hundred, but the administrative ceiling only applies to about 18 people. A great portion of the $156,000 in the coming year will go for overhead in addition to personnel cost. But we only have 18 on the administrative side. The bulk of our strength is in power operation, distillation plant operation, and sugar growing and milling operations.

Senator BIBLE. Where are these 18 located? Are some in Washington and some in the islands?

Mr. KIRWAN. None in Washington, all in the Virgin Islands, most of them on St. Croix, but some on St. Thomas.

Senator BIBLE. None of this in Washington is chargeable to this $156,000?

Mr. KIRWAN. No.

Senator BIBLE. A very fine statement; thank you very much. Senator Young?

Operation of Power Facilities

Senator YOUNG. Who is taking over the operation of the power facilities?

Mr. KIRWAN. The government of the Virgin Islands itself is acquiring our power system, both generation and distribution.

Sugar Industry Operation

Senator YOUNG. And the sugar industry, too?

Mr. KIRWAN. No. It is our present intention to operate the sugar business through 1966. The Corporation itself grows 71 percent of all the sugarcane grown, and we grind 100 percent of all the cane ground. We intend to continue doing this through 1966, then we will stop grinding as far as the Corporation is concerned. At that time we will sell the sugar mill, and if any buyer wants to continue in the business, we will make arrangements for him to use the site and the mill in place.

If no buyer wants it, it will be sold off site.

Sale of Power Facilities

Senator YOUNG. Are you selling the powerplant, the water facilities, on a bid basis?

Mr. KIRWAN. No, at its appraised value, but it is not a bid basis. The foreseen purchaser is the government of the Virgin Islands. The GSA has hired a firm of outside engineers in New York to appraise the system. When they finish appraising it, the system will be offered to the local government at exactly the appraisal price, no more and no less. So it is not negotiated in that sense, but it is not advertised.

Senator YOUNG. You haven't arrived at a price yet?

Mr. KIRWAN. No, we have not. The appraisal is quite a comprehensive matter. It is taking a team of five men 10 weeks to complete it.

Senator YOUNG. Is this on terms?

Mr. KIRWAN. Yes. It is our hope that GSA— and GSA is handling the sale and not Interior—it is our hope and expectation that GSA will give the local government between 10 and 20 years to pay out at probably about 4 percent interest on the unpaid balance.

Senator BIBLE. The Senator from Alaska.

Senator BARTLETT. Mr. Kirwan, it is my thought that your suggestion that the administrative budget be reduced will be honored more quickly than any money request made to this committee for a long while.

Does the government of the Virgin Islands have money in the treasury now for downpayment on the electrical and water system?

Virgin Islands Government Purchase of Power Facilities

Mr. KIRWAN. Yes, Senator Bartlett. The government of the Virgin Islands has earmarked about a million and a half dollars from funds it otherwise would have spent this year on its normal capital improvement project to make up both the downpayment on the present system and also to make up the downpayment on the next-needed unit in the generating system.

Senator BARTLETT. Are they operating on a balanced budget?

Mr. KIRWAN. They are required to by law. Until just now they have not had bonding authority, they received it about 2 months ago from the Congress, therefore, they inevitably had to operate on a balanced budget basis.

CONTRIBUTION BY FEDERAL GOVERNMENT

Senator BARTLETT. Is there a direct contribution made to the treasury of the Virgin Islands by the Federal Government?

Mr. KIRWAN. There is no direct contribution, Senator. I would like to elaborate briefly to answer that, because the government of the Virgin Islands does receive two fiscal benefits from the Federal Government, and while neither is a direct contribution, they are both extremely important. One is that the equivalent of Federal income taxes collected in the Virgin Islands remains there rather than being deposited in the Treasury.

Second——

Senator BARTLETT. Let me interrupt right there. It remains there and is turned over to the local government?

Mr. KIRWAN. Correct, it is paid in directly by [the taxpayers individually to the local government and is appropriated by the local legislature. It isn't run through the Federal system at all.

Senator BARTLETT. Somewhat similar to the situation in Puerto Rico?

Mr. KIRWAN. Exactly. The origin of the law is a little different, but in practice is works out the same way.

TAXES COLLECTED ON VIRGIN ISLANDS PRODUCTS

The second great fiscal advantage is that excise taxes collected in the United States on products of the Virgin Islands—and as a practical matter, about 99.5 percent of it is rum—are remitted by operation of substantive law directly to the treasury of the Virgin Islands; they are not appropriated, there is no necessity for that, because the Congress in 1954 provided that whatever amount would happen to be collected each year would be automatically remitted by the Treasury Department to the local government, with the sole requirement that the local government itself raise at least that much money in local taxes.

Since the local government for the past 5 or 6 years has always raised more, the matching requirement is fully met.

Senator BARTLETT. Over 50 percent of the tax revenues, then, is locally generated?

Mr. KIRWAN. Considering the local income tax payments as truly local, yes, Senator Bartlett.

VIRGIN ISLANDS COMPANY

Senator BARTLETT. How long has the Virgin Islands Corporation been in existence?

Mr. KIRWAN. The Corporation per se has been in existence since 1949. It succeeded, however, a predecessor Virgin Islands Company that goes back to about 1934.

EMPLOYMENT AFTER CORPORATION PHASEOUT

Senator BARTLETT. You said that it has several hundred employees. Will these go into private employment or be employed by the local government?

Mr. KIRWAN. Over half will go directly to the local government as a practical matter when it takes over the power and water system. The local government has already indicated its intention of taking over wholly without change all of our employees. And our employees generally have indicated a desire to work for the local government. So we see very little personnel dislocation attendant upon the sale of the power and water system.

Now, where the sugar is concerned, we are dealing with three types of employees. The Virgin Islands Corporation during the cane-cutting season from January to May imports about 600 alien laborers from the British islands to the south of us. These are purely temporary alien laborers. Of course, we just won't employ them after 1966. We employ full time 68 employees at the sugarmill. When the sugarmill is sold, which is presently foreseen for 1966, if it is dismantled and sold offsite these 68 people will have to be hired elsewhere.

HARVEY ALUMINUM CO. JOB OPENINGS AND EMPLOYMENT

We have asked the Harvey Aluminum Co. which will be coming into production on the same island at about the same time, to give these permanent employees of ours first crack at jobs opening up for which they are either trained or for which they could be trained.

And Harvey has said they would cooperate with us.

We have in addition about 80 full-time fieldworkers in the sugarfield and the same provision with Harvey would be made with regard to these people.

Senator BARTLETT. And Harvey is agreeable to doing this?

Mr. KIRWAN. To doing it in principle. Now, there could be a given man who either is untrainable or who is not but broadly speaking, we expect to be able to place the bulk of our about 150 to 250 employees who would lose permanent employment due to the closing down of sugar in 1966 either by going over to Harvey, or alternatively, if the Corporation does lease land for citrus production, then there will be a substantial replacement of field agricultural crop coming into the picture again about the same time as we are closing down on sugar.

Senator BARTLETT. So you have no considerable worries about the possibility of unemployment as a consequence of what you plan to do?

Mr. KIRWAN. That is correct, Senator.

LAND DEVOTED TO SUGAR RAISING

Senator BARTLETT. How many acres devoted to sugar raising are controlled or owned by the Virgin Islands Corporation?

Mr. KIRWAN. About 2,100.

Senator BARTLETT. How much of this is used for sugar raising?

Mr. KIRWAN. I will have to put it this way, Senator. We grow 71 percent of all the sugarcane.

Senator BARTLETT. That answers it sufficiently.

Mr. KIRWAN. Our land is a little more productive, and we farm it a little more intensively, so I would say we have about 65 percent of the land.

LAND LEASE FOR CITRUS RAISING

Senator BARTLETT. You spoke of a proposal to lease this land for citrus raising?

Mr. KIRWAN. Right, Senator.

Senator BARTLETT. All of it?

Mr. KIRWAN. We own 3,400 acres of land, of which about 2,100 are in sugar. We would lease 1,700 acres of those 2,100 acres. Of the 1,700 acres we would require that 1,500 be devoted to citrus and the remaining 200 would be used for administrative buildings, housing sites, the end purpose of which would be devoted to citrus.

Senator BARTLETT. Is it your view that more economic benefits would be derived from the growing of citrus fruits than sugar?

Mr. KIRWAN. It is our view that tremendously more; it can be more intensively cultivated, the end product is more valuable, the market is better, there is greater and better employment in the facilities that would be established in the Virgin Islands to process it, and I would say most important of all, there would be a taxable asset in the form of private investment in the Virgin Islands that would enable the local government to get much more out of taxes on this whole enterprise than any of the benefits Vicorp is able to give locally through its sugar production.

Senator BARTLETT. Did you say that you have an offer for this land which is now being negotiated but no determination has been reached?

Mr. KIRWAN. That is correct. We have what we in the management of the Corporation regard as a very attractive offer, but it will be presented to the Board of Directors within about 3 or 4 weeks, and, of course, we abide by the pleasure of the Board.

Senator BARTLETT. Thank you.

WATER DISTILLATION PROJECT

Senator BIBLE. May I ask Mr. Kirwan one additional question. How has this water distillation project worked out in the Virgin Islands?

Mr. KIRWAN. The water distillation has worked out from all but one point of view. I don't want to magnify the last point. Let me take it first so I will get it out of the way.

Since we built the plant the price of barged water from nearby Puerto Rico has fallen to the point where today we could probably get water more cheaply through barging it than distilling it.

Having said that, however, I can say that the plant has been a wonderful success in that it has a design capacity of 275,000 gallons a day, and we have been running at 325,000.

Secondly, as late as the Christmas holidays, we had a great deal of trouble with barging. We had two tugs and two barges go out of commission, and if it hadn't been for the distillation we would have run out of water on St. Thomas during that period.

So we feel that it is important to have that amount of production on the island which is independent of hurricanes and tugs.

Senator BIBLE. Is it underground water or does it come right out of the ocean?

Mr. KIRWAN. The water from the plant comes right out of the ocean.

Senator BIBLE. Do you have a cost figure on production per thousand gallons?

COST OF DISTILLED WATER

Mr. KIRWAN. Yes, Senator. The cost figure attributable to the first 18 months of our operation we say is $2.32 a thousand. But I want you to know, this is not comparable to the cost reportable by the Office of Saline Water, because the Office of Saline Water costs its operations on an increment amount basis, so that if it were running our plant it would only charge to distilled water those costs that would not have been incurred on the power side alone.

We take each cost, for example, each item of equipment that makes a contribution on both power and distilled water, and we compute the costs on a pro rata basis. However, our costs are $2.32 a thousand, and we estimate that the Office of Saline Water for the same operation would probably report a cost of perhaps $1.75 or perhaps $1.65 a thousand. So that the costs I stress are not comparable.

Senator BIBLE. This is still high-cost water as we look at it?

CAPACITY OF THE PROJECT

Mr. KIRWAN. We have a production, nameplate capacity of 275,000 a day and actual capacity of 325,000. At relatively small additional cost, namely, $200,000, we can add a couple of more flash units and come up to a daily production of half a million gallons at relatively little additional outlay. That will bring our estimated, even under our system, costs down to about $1.75 a thousand, and under OSW, down near $1 a thousand. We are ready to do that, and this committee allowed $200,000 to do it when we made the decision to sell the entire system, and therefore we deferred this capital betterment. But it would be easy for us, in other words, to get our cost down to a more respectable figure.

NATIONAL INTEREST IN THE PROJECT

Senator BIBLE. All of these breakthroughs I know interest the Chairman and Senator Young and me, because we are in short water supply out West, and every breakthrough that we have is of great assistance. You show a tremendous facility in answering all these questions.

Senator BARTLETT. Do not forget that half Alaska is arid.

Senator BIBLE. I thought you had glaciers running all over the place.

But it could be helpful even in Alaska.

I very much appreciate your testimony, Mr. Kirwan. It is very competent.

(At this point, Chairman Hayden entered the hearing room.)

Chairman HAYDEN. Thank you, Mr. Kirwan.

THE ALASKA RAILROAD

STATEMENT OF EDWIN M. FITCH, ASSISTANT TO THE GENERAL MANAGER, ACCOMPANIED BY DALE L. ROTHROCK, FINANCE OFFICER, DEPARTMENT OF THE INTERIOR.

NARRATIVE JUSTIFICATION OF PROGRAMS AND FINANCING

The Alaska Railroad has submitted a narrative justification of its proposed program for 1965 and its estimated financing for the Alaska Railroad. This summation will be printed in the record.

(The justification referred to follows:)

Proper care for and custody of railroad properties and the maintenance of high standards of transportation service will again be primary objectives for the budget year. Expenditures for operation, maintenance, and repair will be gaged, to the extent practicable, by the rate of revenues to avoid impairment of working capital.

Consolidations of positions, improvements in supply operations, increased use of mechanical devices in freight handling and construction, results of which will be noticeable in the current year, will be continued in 1965.

The railroad is not seeking a direct appropriation. The annual appropriation acts heretofore have made revenues and other receipts available for operating and maintenance expenses; capital improvements have been financed solely from these sources since 1956. Exhibit A follows with detail of operating revenues and expenses as summarized on the revenue, expense, and retained earnings statement; total expenses on this exhibit are reduced to funded costs as shown on the program and financing schedule. Exhibit B sets forth the actual outlay for capital improvements in 1963; the estimates for 1964, including carryover authorizations; and new authorizations sought for 1965, together with the balance of carryover authorizations. Capital additions by transfers without exchange of funds appear on Exhibit C.

OPERATION OF THE RAILROAD

Chairman HAYDEN. I will appreciate it if you will place your statement in the record and discuss the operation of the railroad in such a manner as you see fit.

Mr. FITCH. My name is Edwin M. Fitch. I am assistant to the General Manager of the Alaska Railroad, and I have been with the railroad about 16 years. I have a statement to the committee by John Manley, the General Manager and would appreciate it if you would incorporate it in the record.

Chairman HAYDEN. It will be printed in the record.

(The statement referred to follows:)

STATEMENT OF JOHN E. MANLEY, GENERAL MANAGER, THE ALASKA RAILROAD

Mr. Chairman and members of the committee, we are grateful for the privilege of presenting to this committee the capital improvements and replacement program of the Alaska Railroad for fiscal year 1965. We are happy to report again that the Alaska Railroad is not requesting an appropriation for this program. We are requesting the approval of this committee for this program of capital improvements and replacements to be financed from income.

The program of additions and betterments which we propose for the fiscal year ending June 30, 1965, will cost an estimated $2,239,900. Of this amount $2,135,650 is represented by capital items while the balance of $104,250 is to be charged to expense accounts. The total program for fiscal year 1965 may be classified into the following general categories: Buildings, $6,000; other structures and facilities, $823,000; equipment, $761,000; nonoperating property, $150,000; and nonprogramed reserve, $500,000.

The operations of the Alaska Railroad for the fiscal year ending June 30, 1963, showed an improvement over the previous fiscal year. Rising costs were offset largely by the increased use of mechanization in track maintenance and by improved cargo-handling procedures.

Seatrain or Carfloat-Type Operations

Through the expanded use of the seatrain, or carfloat-type operations, we have been able to offer substantial economies to both the military and commercial shipper. At present, the Canadian National Railway car barges and Puget Sound-Alaska Van Lines car barges are operating between Prince Rupert and Whittier, and Seattle and Whittier, respectively. We have advice that the Alaska Steamship Co. will inaugurate seatrain service to Whittier by the end of April 1964. Such service has the inherent advantage of providing an avenue whereby a sealed carload of freight from the lower 48 States may move through to Alaska railbelt points with no intermediate handling or warehousing.

As the advantages and economies of this service become apparent to an increased number of shippers, the use of this service is increasing. In fiscal year 1962, when this service began, a mere 1,399 tons moved in this service. In fiscal year 1963, tonnage moving via this service increased to 11,500 tons. From July 1, 1963, to the end of January 1964, the tonnage using this service had increased to 21,000 tons, and will reach not less than 40,000 tons for fiscal year 1964. We expect this use to more than double again during the next fiscal year.

During fiscal year 1963, the Alaska Railroad moved 1,449,133 tons of freight a total of 202,159,000 ton-miles. During the same period the Railroad handled 63,682 passengers a total of 8,574,470 passenger miles. Total revenues of the Alaska Railroad for fiscal year 1963 were $14,893,839.09. Total expenses for the same period, including depreciation charges of $2,154,729.43, were $14,608,432.61. Net revenue for the year was $285,406.48.

Should there by further questions, I would appreciate the opportunity to furnish this information to the committee in order that the record may be complete and accurate.

To conclude my general statement, may I again thank you for the opportunity to present our proposed program for fiscal year 1965.

Program of Improvements and Betterments

Mr. Fitch. As has been true for several years, we are asking for no appropriations from the Congress. We do have a program of improvements and betterments amounting to about $2.25 million, and we would appreciate your approval of that program of improvements and betterments.

During the fiscal year 1963 we had a gross income of about $15 million, and we had a net income of $285,000. The fiscal year 1964 is going well, and, barring catastrophes, we will do somewhat better in 1964 than we did in 1963.

Rail-Barge Operations

The most interesting development of the year has been the rail-barge operations conducted from Prince Rupert to Whittier and from Seattle to Whittier. This enables a loaded freight car to be dispatched from Pittsburgh or Chicago or Los Angeles to Alaska under seal. It is not opened up until the car is spotted on consignee's track in Anchorage or Fairbanks.

I am ready to answer any questions you may have, but that is all of my statement.

Chairman Hayden. The Senator from Alaska, would you like to ask some questions?

Senator Bartlett. Not very many. Since the Alaska Railroad isn't requesting an appropriation, I don't think there will be a need for many questions, on my part, at least.

Mr. Fitch, the Alaska Railroad has not sought an operating appropriation from Congress for a good many years; has it?

Mr. Fitch. That is correct, sir.

INCREASED TONNAGE

Senator BARTLETT. How did your tonnage last year compare with the year before?

Mr. FITCH. It was slightly better, with the total for fiscal 1963 around a million and a half tons. Of course, a large proportion of that is domestically mined coal.

TONNAGE LOSS DUE TO ARMY PIPELINE

Senator BARTLETT. The Alaska Railroad was crippled in respect to its revenues some year ago, was it not, when the Army constructed a pipeline from Haines tidewater to Fairbanks?

Mr. FITCH. That is correct. We had to overcome a loss of gross revenues per year of nearly $3 million when that pipeline went through.

Senator BARTLETT. Does the Alaska Railroad lose revenue by reason of the fact that this rail-barge service is handling increased tonnage through Whittier rather than through the southern terminus of Seward?

Mr. FITCH. No. As a matter of fact, on the overall the Alaska Railroad gains revenue because of increased tonnage. The lower handling costs at Whittier are now reflected in our tariffs but the charge for the rail haul is the same.

Senator BARTLETT. The rate has been the same?

Mr. FITCH. The rate for the rail haul has been the same.

Senator BARTLETT. I have no more questions.

Chairman HAYDEN. Senator Bible.

Senator BIBLE. No questions, thank you, Mr. Chairman.

Chairman HAYDEN. Senator Young.

EXPENSES FOR IMPROVEMENTS AND BETTERMENTS

Senator YOUNG. Have you been spending as much money in recent years as you did, say, 10 years ago for improvement of the railroad?

Mr. FITCH. I was trying to think about that. We had a rehabilitation program that extended from about 1948 through about 1956 which required a considerable expenditure of money, and a large congressional appropriation. But since the time the rehabilitation program in the main was completed, we have tried to gage our improvements and betterments program by our depreciation for the previous year and our net revenue for the previous year. As of now our depreciation is about $2.25 million, and our net revenue is around $250,000 to $300,000. So that, on the average we attempt to keep our improvements and betterments program within that level, and we are doing it, and have done that for several years.

Senator YOUNG. If you don't make money you don't make any improvements?

Mr. FITCH. That is correct only in part. Remember that the depreciation charge, even if we lose money, constitutes a very large reserve which, if we earn, we can spend. Even in those years in which we have lost a little bit, we still have earned a very substantial depreciation charge. And that amount has been available for improvements and betterments.

Senator YOUNG. And do you have a reserve set aside for improvements and betterments?

REVOLVING FUND USED FOR EXPENSES

Mr. FITCH. It is not earmarked for that, but we have a revolving fund into which our depreciation charges and our retained earnings go. And that revolving fund in terms of retained earnings and depreciation charges is available for improvements and betterments. While we are quite radical when it comes to operations and new methods of doing business, we are quite conservative in terms of handing out money. We guard it quite jealously.

Senator YOUNG. Is the railroad in as good a repair now as it was 10 years ago?

Mr. FITCH. It is in better repair than it was 10 years ago. It is in the best state as regards both maintenance and new equipment that it has been in during my 16 years with the Alaska Railroad.

Senator YOUNG. Thank you, sir.

Senator HAYDEN. Thank you, sir.

OFFICE OF OIL AND GAS

STATEMENT OF JOHN RICCA, ACTING DIRECTOR, OFFICE OF OIL AND GAS, DEPARTMENT OF THE INTERIOR; J. CORDELL MOORE, ADMINISTRATOR, OIL IMPORT ADMINISTRATION; HENRY C. RUBIN, CHAIRMAN, OIL IMPORT APPEALS BOARD; AND RUSSELL W. SLIGHT, ADMINISTRATIVE OFFICER

1965 BUDGET REQUEST

Chairman HAYDEN. The Office of Oil and Gas.

There will be placed in the record the statements justifying the 1965 budget request of the Office of Oil and Gas in the amount of $660,000, an increase of $44,500 over fiscal year 1964.

(The material referred to follows:)

SUMMARY AND HIGHLIGHT STATEMENT

COORDINATION OF OIL AND GAS ACTIVITIES

Program objectives

The Office of Oil and Gas is a staff organization primarily responsible for the coordination of Federal oil and gas policies and activities.

Program for past year

Provided advice and assistance to Federal and State agencies, Members of Congress, congressional committees, industry, foreign governments and private citizens on oil and gas matters or activities.

Collaborated with the Office of Emergency Planning and the Departments of State and Defense on petroleum problems involved in potential and actual crises in the Far East, the Middle East, and Western Europe.

Participated in the development of petroleum policies and special papers to be used by U.S. delegations at meetings of the Petroleum Planning Committee of NATO and other international organizations.

Conducted regular and special petroleum supply-demand studies, both domestic and worldwide, including data for U.S. and free world economic development and military support programs.

Serves as the principal channel of communication between the Federal Government and the Interstate Oil Compact Commission, State oil and gas regulatory bodies, and the petroleum and gas industries.

Program changes

Any changes in the normal flow of petroleum and gas result in a shift of emphasis of the activities of the Office of Oil and Gas. This may result from specific situations such as those involved in Quemoy, Iraq, Jordan, Lebanon, or

Berlin; petroleum transportation system breakdowns, such as seizure of Suez, strikes or severe winter weather; breaks in pipelines whether due to natural causes or causes such as the destruction of pumping stations in Syria during the Suez crisis; and shortages or surpluses in supplies of petroleum and gas due to changes in economic conditions at home or abroad.

Programs for budget year

Most programs are expected to continue during the fiscal year 1965. The oil and gas activities must be flexible in order to meet specific situations at any given time. More emphasis is planned for the coordination of petroleum and gas matters concerning U.S. and free world economic development and military support programs.

ADMINISTRATION OF OIL IMPORT PROGRAM

Program objectives

The program is designed to insure a stable, healthy industry in the United States capable of exploring for and developing reserves to replace those being depleted. The basis of the program is the certified requirements of our national security which make it necessary that we preserve to the greatest extent possible a vigorous, healthy petroleum industry in the United States.

In addition to serving our own direct security interests, the program will also help prevent severe dislocations in our own country as well as in oil industries elsewhere in the free world which also have an important bearing on our own security. Petroleum, wherever it may be produced in the free world, is important to the security, not only of ourselves, but also of the free people of the world everywhere.

Program for past year

Analyzed applications from over 200 importers to determine eligibility for semiannual import allocations for crude oil, unfinished oils, and finished products.

Established semiannual allocations for imports of crude oil, unfinished oils, and finished products. Also established the amounts to be allotted to each eligible applicant by type of product.

Issued semiannual licenses to eligible importers authorizing the amounts of crude oil, unfinished oils, and finished products to be imported during each semiannual period and quarterly licenses for eligible importers of residual fuel oil. Furnished a copy of license to the appropriate collector of customs for their information and guidance.

Analyzed reports from each importer showing the amount of crude oil, unfinished oils, or finished products entering the United States under the license issued, the port of entry, and date of entry. Received and tabulated reports of exchanges of imported crude oil. Maintained and analyzed records of stock positions of residual fuel oil.

Maintained adequate records of imports for the preparation of regular and special reports to the Director, Office of Emergency Planning, the President, and the Congress.

Program changes

No significant change in the program is anticipated during the fiscal year 1965.

Program for budget year

The program is expected to continue at about the current level during the fiscal year 1965.

Salaries and expenses

Appropriation, 1963	$557,600
Appropriation, 1964	615,500

SUMMARY OF INCREASES AND DECREASES

1. Coordination of oil and gas activities:	
To provide for increased pay costs for fiscal year 1964 positions	14,000
Filling of authorized positions	26,500
Subtotal	40,500
2. Administration of oil import program:	
To provide for increased pay costs for fiscal year 1964 positions	4,000
Net increase, 1965	44,500
Budget estimate, 1965	660,000

Analysis by activities

Activity	Amount available, fiscal year 1963	Amount available, fiscal year 1964	Estimate, fiscal year 1965	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
1. Coordination of oil and gas activities	$439,106	$459,300	$499,800	$40,500	$14,000	$26,500
2. Administration of oil import program	103,644	141,700	145,700	4,000	4,000	
3. Oil import appeals board	11,389	14,500	14,500			
Unobligated balance lapsing	3,461					
Total	557,600	615,500	660,000	44,500	18,000	26,500

[1] To provide for increased pay costs for fiscal year 1964 positions.

JUSTIFICATION

The estimate of $660,000 is an increase of $44,500 over the amount available for fiscal year 1964. The increase includes $18,000 for increased pay costs and $26,500 for full employment of previously authorized positions and a small increase for other expenses. The estimate is distributed as follows: Coordination of oil and gas activities, $499,800, administration of oil import program, $145,700, and administration of the Oil Import Appeals Board, $14,500.

COORDINATION OF OIL AND GAS ACTIVITIES

FUNCTIONS

The Office of Oil and Gas, under the supervision of the Assistant Secretary, Mineral Resources:

1. Provides staff advice and assistance to the Secretary of the Interior, the Assistant Secretary for Mineral Resources, and the secretariat in the development, coordination, and management of programs and functions relating to oil and gas which are assigned to the Department of the Interior by the President or the Congress.

2. Provides leadership in obtaining the coordination and unification of oil and gas policies and related administrative activities of Federal agencies and enlists their cooperation to assure adequate development, distribution, and utilization of petroleum and gas resources and facilities to meet civilian, industrial, and military requirements in time of peace or national emergency.

3. Serves as the principal channel of communication between the Federal Government and the Interstate Oil Compact Commission, State oil and gas regulatory bodies, and the petroleum and gas industries.

4. Provides advice and assistance to U.S. delegations to meetings of NATO's Petroleum Planning Committee and, on occasion, participates in planning activities of the working group thereof.

5. Provides advice and assistance to U.S. delegations to the Energy and Oil Committees of the Organization for Economic Cooperation and Development.

6. Provides advice and assistance on petroleum and gas matters and, when necessary, represents the United States at meetings of international and other organizations such as the Economic Commission for Latin America, Economic Commission for Asia and the Far East, Economic Commission for Europe, Economic and Social Commission of the United Nations, and the World Petroleum Congress.

EVALUATION AND FORECASTING

The Office of Oil and Gas is the only Federal Government office that consolidates military, industrial, and civilian petroleum requirements, correlates these requirements with probable availability of petroleum and gas, makes comprehensive petroleum and gas supply-demand surveys, and prepares forecasts of the probable availability of petroleum and gas to meet the peacetime requirements of the United States and the friendly foreign nations from all sources at home and abroad. In collaboration with the military and the Office of Emergency Planning conducts petroleum and gas supply-demand surveys to coordinate probable military demands with essential civilian and industrial requirements of the

United States and the friendly foreign nations to meet emergency or wartime requirements.

Data includes information on capacity and facilities to locate, produce, refine, store, and transport petroleum and gas in the free world under peacetime, emergency, or wartime conditions; also, supply-demand information for the free world under the same conditions.

Information on petroleum and gas supply and demand is available from many sources. Federal sources include the Geological Survey, the Bureau of Mines, the Department of Commerce, the Federal Power Commission, the Interstate Commerce Commission, or any agency developing, maintaining, and publishing data which has a bearing on petroleum and gas supply. State sources include the Interstate Oil Compact Commission, Texas Railroad Commission, and other State conservation agencies of oil-producing States. Industry sources include information regularly published by oil and gas trade associations and by direct contact with the executive and technical personnel in the oil and gas industry.

Additional information is obtained by utilizing the services of industry advisory councils, boards, and committees established by the Secretary of the Interior. These include the National Petroleum Council, which provides the services of the best-qualified men in the oil and gas industries on broad technical matters concerning petroleum and gas; the Foreign Petroleum Supply Committee which provides an advisory service pertaining to sources and methods for obtaining petroleum supply and demand information for all countries of the free world, and develops plans of action to prevent, eliminate, or alleviate shortages of petroleum supplies which threaten to affect adversely the security of the United States; the Petroleum Security Subcommittee of the Foreign Petroleum Supply Committee composed of special groups of technical advisers to the Department of the Interior, Department of Defense, and Office of Emergency Planning on highly confidential petroleum and gas questions involving national security and free world defense; and, the Emergency Advisory Committee for Natural Gas which provides an advisory service pertaining to plans of action to assure adequate supplies of natural gas under emergency or wartime conditions. These correlations of the probable petroleum and gas supplies available with probable peacetime, emergency, or wartime requirements disclose areas of potential deficiencies. The Office then devises ways to alleviate or prevent such deficiencies.

The foregoing information also provides a basis for special studies, reports and papers, pertaining to:

(1) Planning by the military and interested civilian agencies for threatened or actual crisis in situations such as Quemoy, Matsu, Lebanon, Jordan, Korea, Suez, and Berlin;

(2) Advice and assistance on a wide range of oil and gas matters to the Congress, its committees, the Departments of State, Commerce, and Defense, Office of Emergency Planning, and to other Federal agencies concerned with petroleum and gas or the supply therof;

(3) Cooperation between the Federal Government and the oil-producing States and the State conservation bodies thereof, and the Interstate Oil Compact Commission;

(4) Cooperation between the Federal Government and the petroleum and gas industries and industry councils, boards and committees;

(5) Activities of U.S. representatives at meetings of the Petroleum Planning Committee of NATO;

(6) Activities of the U.S. representatives at meetings of the Energy and Oil Committees of the Organization for Economic Cooperation and Development;

(7) Activities of the U.S. representatives at meetings of special petroleum industry advisory groups appointed by the Organization for Economic Cooperation and Development composed of the friendly European nations;

(8) Activities of the U.S. representatives at meetings of other international organizations dealing with the economic development of areas of the free world other than the NATO countries;

(9) Petroleum planning by the Department of State in connection with its programs with the NATO countries and the friendly foreign nations elsewhere in the free world.

COMMITTEE ACTIVITIES

The Office of Oil and Gas chairs or furnishes representatives to a variety of Federal, State and industrial committees interested in or affected by petroleum and gas operations or supplies. Some of these are:

(1) Cochairman of committees or subcommittees of the National Petroleum Council (industry);

(2) Cochairman and the Executive Secretary of the Emergency Advisory Committee for Natural Gas and its subcommittees;
(3) Chairman of the Foreign Petroleum Supply Committee (industry) and its subcommittees;
(4) Petroleum advisers to working groups of petroleum committees of international organizations;
(5) Department of the Interior alternate representative to the Interstate Oil Compact Commission (State government);
(6) Department of the Interior representative and alternate on the Petroleum Subcommittee of the Economic Intelligence Committee of Central Intelligence Agency (Federal Government);
(7) Department of the Interior alternate representative on the Operating Committee of the Advisory Committee on Export Policy of the Department of Commerce (Federal Government);
(8) Department of the Interior representative on the Interdepartmental Committee to Develop Programs to Retard Western Europe's Dependence on Middle East Oil;
(9) Department of the Interior representative on the Interdepartmental NATO Petroleum Backstopping Committee.

Requests for advice and assistance from Federal, State, local, industrial and international organizations continued at a high rate during the past fiscal year. This can be expected to continue so long as the economic development and military assistance programs continue. The number, type, and scope of world-wide petroleum supply-demand studies have been increased in order to handle properly these urgent requests for advice and assistance. The supply-demand data must be maintained on a current basis so as to forecast promptly petroleum requirements under peacetime, emergency, or wartime conditions. Also, military-type studies essential to military defense needs anywhere in the free world have been expanded significantly and must be revised promptly to meet actual or potential emergencies as the world situation changes.

In addition, the Office must furnish chairmen, cochairmen, and/or petroleum advisers to industry advisory committees at national and regional levels, full-time Government employees for staff assistance, stenographic reporting service for committee meetings, staff assistance for the preparation of reports, and the Executive Secretary for the Emergency Advisory Committee for Natural Gas.

Although no additional positions are involved, an increase in funds is necessary to provide full employment in previously authorized positions as well as a small increase for travel in connection with industry advisory committee meetings.

Administration of Oil Import Program

AUTHORITY

Pursuant to section 2 of the act of July 1, 1954, as amended (72 Stat. 678, 19 U.S.C. 1352a) the Director, Office of Civil and Defense Mobilization, made an appropriate investigation and determined that crude oil and crude oil derivatives and products were being imported in such quantities and under such circumstances as to threaten to impair the national security.

The President concurred in the recommendation of the Director, Office of Civil and Defense Mobilization and issued Presidential Proclamation No. 3279, dated March 10, 1959, "Adjusting Imports of Petroleum and Petroleum Products Into the United States" (24 F.R. 1781) as amended by Proclamation 3290 (24 F.R. 3527); Proclamation 3328 (24 F.R. 10133); Proclamation 3386 (25 F.R. 13945); Proclamation 3389 (26 F.R. 507); Proclamation 3509 (27 F.R. 11985); Proclamation 3531 (28 F.R. 4077); and, Proclamation 3541 (28 F.R. 5931). The Presidential proclamation authorized the Secretary of the Interior to issue regulations for the purpose of implementing the provisions thereof.

The Secretary of the Interior, pursuant to the Presidential proclamation, established on March 13, 1959, an Oil Import Administration within the Department of the Interior, issued regulations for the operation of the oil import program, and delegated, except for appeals, the authority conferred upon him by the proclamation to the Administrator, Oil Import Administration (24 F.R. 1907; as amended) (25 F.R. 4957; 26 F.R. 2121; 27 F.R. 2603; 27 F.R. 5954; 27 F.R. 12442; 27 F.R. 12444; 28 F.R. 2677; 28 F.R. 2690; and, 28 F.R. 6363).

OBJECTIVES

The program is designed to insure a stable, healthy industry in the United States capable of exploring for and developing new hemisphere reserves to replace

those being depleted. The basis of the program is the certified requirements of our national security which make it necessary that we preserve to the greatest extent possible a vigorous, healthy petroleum industry in the United States.

PROGRAM

Prior to the beginning of each allocation period the Administrator shall determine in accordance with the limitations imposed by section 2 of Proclamation 3279, as amended, the quantities of imports of crude oil and unfinished oils which are available for allocation in districts I–IV and in district V, respectively, and the quantities of imports of residual fuel oil to be used as fuel and of imports of finished products other than residual fuel oil to be used as fuel which are available for allocation in such districts.

Pursuant to paragraph (d) of section 2 of Proclamation 3279, as amended, the Secretary will make a determination as to the level of imports into district I, districts II–IV, and district V, of residual fuel oil to be used as fuel in sufficient time to permit the making of allocations in advance of each allocation period.

Pursuant to section 2 of Proclamation 3279, as amended, it is determined (1) that the average barrels per day of imports of crude oil and unfinished oils into Puerto Rico during any particular allocation period shall not exceed the average barrels per day, as determined by the Administrator, during the month of July 1958 of imports of such commodities into Puerto Rico, (2) that the average barrels per day, as determined by the Administrator, of imports of residual fuel oil to be used as fuel and of imports of finished products other than residual fuel oil to be used as fuel into Puerto Rico during any particular allocation period shall not exceed the average barrels per day of imports of such products, respectively, into Puerto Rico during the last half of the calendar year 1958, and (3) such lower or higher levels as the Secretary may subsequently determine are required to meet increases or decreases in local demand in Puerto Rico or demand for export to foreign areas.

After each such determination, the Administrator shall as provided by these regulations make allocations and issue import licenses to eligible applicants for the appropriate allocation period.

ALLOCATION PERIODS

Allocations of imports of crude oil, unfinished oils, and finished products will be made for periods of 6 months—that is, July 1 through December 31; January 1 through June 30; except that allocations of imports into districts I–IV of residual fuel oil to be used as fuel will be made on an annual basis beginning April 1, 1961.

APPLICATIONS

An application for allocations of imports of crude oil, unfinished oils, or finished products and for a license or licenses, must be filed with the Administrator, in such form as he may prescribe, not later than 60 calendar days prior to the beginning of the allocation period for which the allocation is required. However, if the 60th day is a Saturday, Sunday or holiday, the application may be filed on the next succeeding business day. However, no application for an allocation of imports of finished products need be filed for the allocation period January 1, 1964, through June 30, 1964.

OPERATIONS

Involves (1) analysis of data published by the Bureau of Mines for crude oil, unfinished oils, and finished products by petroleum industry coordinating districts and Puerto Rico, and types of petroleum and petroleum products. Also, analyze data funished in reports by over 200 importers as well as past allowances for imports. Summarize data by districts and type of products and set overall amounts to be imported during each allocation period.

(2) Analyze applications from over 200 importers to determine eligibility for semiannual import allocations for crude oil, unfinished oils, and finished products.

(3) Establish semiannual allocations for imports of crude oil, unfinished oils, and finished products and yearly allocations for imports of residual fuel oil. Also establish the amounts to be allotted to each eligible applicant by types of products.

(4) Issue semiannual licenses to eligible importers authorizing the amounts of crude oil, unfinished oils, and finished products to be imported during each semiannual period, and quarterly licenses for eligible importers of residual fuel oil.

(5) Analyze reports from each importer showing the amount of crude oil, unfinished oils, or finished products entering the United States under the license issued, the port of entry, and date of entry. Each report must be filed with the Oil Import Administration within 15 days after the end of a particular month. Maintain adequate records of imports for the preparation of regular and special reports to the Director, Office of Emergency Planning, the President, and the Congress. Also, to answer telephone or written inquiries as well as inquiries by personal visits regarding the regulations, import allocations, or problems resulting therefrom or affected thereby from officials of interested importing companies, trade associations, and oil companies as well as State regulatory bodies, and the general public.

(6) Persons concealing material facts or making false statements in or in connection with any applications or reports filed, or in connection with any license presented to or statements made to a collector of customs, with respect to imports of crude oil, unfinished oils, or finished products, are guilty of a crime and upon conviction may be punished by fine or imprisonment or both. Analyze applications, licenses, and reports to prevent possible or actual violations of the oil import regulations. Initiate, when appropriate, action to start the necessary investigations to determine whether a crime has been committed. Initiate necessary reports to the Solicitor, Department of the Interior, for appropriate action.

(7) Analyze monthly reports of stocks of residual fuel oil on the east and gulf coast areas as a major factor in determining necessary adjustments to import levels for residual fuel oil.

(8) Analyze monthly reports furnished by collector of customs showing the amount of crude oil, unfinished oils, and finished products imported by overland transportation from the country in which produced and exempt from the overall import program to determine whether these imports tend to threaten the accomplishment of the purpose of Proclamation 3279, as amended.

(9) Review and take appropriate action upon exemption requests for the importation of small quantities of crude oil, unfinished oils, and finished products, including samples for testing or analysis, baggage entries, and informal entries.

(10) Prepare affidavits and furnish other technical exhibits, information, and advice to the Department of Justice in the continual attacks upon the program in suits brought in the Federal courts. Review all exchange agreements. Any exchange of foreign for domestic crude oil that is made on less than a barrel-for-barrel basis must have the prior approval of the Administrator.

(11) Analyze all petitions filed with the Oil Import Appeals Board and, in cases deemed necessary, prepare and file with the Board a formal statement setting forth the position of the Administration. Attend hearings before the Board and file posthearing statements commenting on testimony and evidence presented at the hearing.

(12) Make inspections of records and facilities of importers to verify their compliance with the program and the accuracy of materials submitted by them.

There have been 7 amendatory Presidential proclamations and 20 amendments to the original oil import regulations. Each of these changes has resulted in additional work and a small increase in staff was authorized in the past fiscal year. No significant changes in the program are anticipated during the budget year. The workload is expected to continue at present levels. No additional funds, except for pay act costs, are contained in the estimate for the Oil Import Administration.

The program for the Oil Import Administration is highly important, controversial, and vital to the development of mobilization programs of the United States and the nations of the free world. Import policies affect diplomatic relations with our friends in the free world, the economic development and defense mobilization programs for the North American Hemisphere, the operation and construction programs of the petroleum, gas, and allied industries, and the utilization of petroleum, gas, and petrochemicals by consumers. Not one phase of the oil-import program can be accomplished inadequately without the possibility of embarrassment.

Oil Import Appeals

Mandatory restrictions on the importation of oil became effective March 11, 1959, and involve allocations and licenses for the importation of crude oils, unfinished oils, and finished products. The initial allocation period was March 11 through June 30, 1959. Allocations of crude oil and finished products other than residual fuel oil are now made and licensed on a 6-month basis. Effective April 1, 1961, residual fuel oil to be used as fuel is allocated on an annual basis and licensed on a quarterly basis.

Experience obtained since the inception of the program in March 1959, indicates that, if extensive revisions are not made in the oil import program or in the Board's authority, the administrative functions of the Board can continue to be met by the continued employment of one clerk-stenographer, paid from funds requested in this budget. In addition, the position of Chairman of the Board (formerly Counsel to the Board), a full-time position, continues to be paid from funds appropriated to the Office of the Solicitor.

In addition to the one salary, the major expenditure is for transcripts of Appeals Board hearings; however, it is not possible to determine an exact amount since the number of petitions to be received varies widely from one allocation period to another (because of program changes or changes in the Board's authority) as shown in the following table:

Allocation period:	*Number of petitions*
March to June 1959	81
July to December 1959	24
January to June 1960	55
July to December 1960	26
January to June 1961	26
July to December 1961	31
January to June 1962	48
July to December 1962	34
January to June 1963	30
July to December 1963	17
Total	372

Petitions under two separate allocation periods will be considered with the funds requested.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$554,139	$711,500	$860,000	+$148,500
Reimbursement for emergency preparedness functions		−96,000	−200,000	−104,000
Unobligated balance lapsing	3,461			
New obligational authority (appropriation)	557,600	615,500	660,000	+44,500
Obligations by objects:				
11 Personnel compensation	477,469	609,200	682,000	+72,800
12 Personnel benefits	34,717	44,900	47,000	+2,100
21 Travel and transportation of persons	7,190	16,000	60,000	+44,000
22 Transportation of things	587	2,000	2,000	
23 Rent, communications and utilities	8,677	10,500	15,000	+4,500
24 Printing and reproduction	7,987	8,400	14,000	+5,600
25 Other services	3,445	3,500	6,000	+2,500
Services of other agencies	9,736	11,500	20,000	+8,500
26 Supplies and materials	2,290	2,500	6,000	+3,500
31 Equipment	2,041	3,000	8,000	+5,000
Total obligations	554,139	711,500	860,000	+148,500

SUMMARY OF ACTIVITIES AND PROPOSED PROGRAM

Chairman HAYDEN. Mr. Ricca, we will be glad to hear from you. If you care to present a statement to the committee summarizing your activities in the past year and indicating your prospective program for the coming year, you may do that.

(The statement referred to follows:)

STATEMENT BY JOHN RICCA, ACTING DIRECTOR, OFFICE OF OIL AND GAS

The 1965 estimate of $660,000 for regular funds is an increase of $44,500 over the amount available for fiscal year 1964. The increase includes $18,000 for increased pay costs and $26,500 for full employment in previously authorized

positions as well as a very small increase for other expenses. The estimate is distributed as follows: Coordination of oil and gas activities, $499,800; administration of oil import program, $145,700; and administration of the Oil Import Appeals Board, $14,500.

The estimate of $499,800 for the Office of Oil and Gas is essential for the effective handling of regular oil and gas matters. Although there is a constant increase in workload, we expect to handle it without an increase in the number of positions. Full employment in previously authorized positions, however, will be necessary to accomplish the growing workload. Additional positions are not requested.

The Office develops, evaluates, and coordinates oil and gas information to provide sound bases for establishment and implementation of Government plans and programs for oil and gas; provides information and service to Government agencies with respect to strategic and economic factors affecting the petroleum and gas industries both in the United States and abroad; recommends programs and policies to improve the position and capabilities of these domestic industries; and, provides expert advice with respect to international oil and gas activities.

The Office prepares national emergency plans and develops preparedness programs to provide a state of readiness in petroleum and gas for all conditions of national emergency in collaboration with other Federal agencies, State, and local governments and industry; provides for a standby national Emergency Petroleum and Gas Administration; and selects and trains executive reservists to staff the EPGA. The Office of Oil and Gas would serve as the nucleus of EPGA in an emergency. The Office also participates with other Federal agencies in petroleum activities of international organizations and U.S. alliances in planning and testing programs designed to meet United States and allied emergency oil and gas requirements. Several members of the staff hold key emergency assignments in the EPGA.

The Office receives detailed factual studies and outstanding assistance from the petroleum and gas industries through industry advisory committees such as: The National Petroleum Council, Emergency Advisory Committee for Natural Gas, Foreign Petroleum Supply Committee, and Petroleum Security Subcommittee of the FPSC. The studies made by such groups contributed considerably toward keeping the Office small and effective. The Office participates in international committees, State organizations and interagency organizations concerned with petroleum and gas matters. These include the Petroleum Planning Committee of NATO, Special Committee for Oil of the OECD, Committee on Gas of the Economic Commission for Europe (United Nations), Interstate Oil Compact Commission, and numerous Federal interagency groups.

Favorable action is requested for a regular appropriation of $499,800.

Appropriation Highlight

Mr. Ricca. Mr. Chairman, since you have made a part of the record the prepared statement, my brief discussion will highlight the appropriation.

Chairman Hayden. Very good.

Mr. Ricca. As you gentlemen are aware, this appropriation request for regular funds of $660,000 actually finances three separate small organizations. One of them is the Office of Oil and Gas, another is the Oil Import Administration, and a third one is the Oil Import Appeals Board. I will answer questions for the Office of Oil and Gas, and Mr. J. Cordell Moore, who is the Administrator of the Oil Import Administration, will answer questions for that section and Mr. Henry C. Rubin for the Oil Import Appeals Board.

Purpose of Funds Requested

The regular funds that we are requesting for the Office of Oil and Gas actually total $499,800. This is an increase of $40,500 over the funds available during the fiscal year 1964; $14,000 of this increase is to cover increased pay costs for the last half of the fiscal

year. And the remaining increase of $26,500 is primarily for financing full-year employment of the 39 previously authorized positions.

We are not asking for any new positions at this time from these regular funds. Our workload is continuing to increase, but we feel that through internal adjustments, better supervision and increased productivity, we can handle this without asking for any additional people. We do feel, however, that we need to bring our present staff up to full strength in order to handle our workload.

The requested funds that are before you for the Office of Oil and Gas, we feel, are the minimum requirements, and we request your favorable action.

That completes the highlights, and I will answer any questions.

Chairman HAYDEN. Questions?

Senator BIBLE. I have none, Mr. Chairman.

Chairman HAYDEN. Senator Young.

Senator YOUNG. I have none.

Chairman HAYDEN. We thank you for your statement.

Now we will hear from Mr. Cordell Moore.

OIL IMPORT ADMINISTRATION

Mr. MOORE. Mr. Chairman, I will file the formal statement, and I will, if I may, just highlight it.

(The statement referred to follows:)

STATEMENT BY J. CORDELL MOORE, ADMINISTRATOR, OIL IMPORT ADMINISTRATION

The 1965 estimate of $145,700 is an increase of $4,000 over the amount available for fiscal year 1964. The increase is for increased pay costs for previously authorized positions for the Oil Import Administration.

The Oil Import Administration was established by the Secretary of the Interior March 13, 1959 (24 F.R. 1907, as amended), pursuant to Presidential Proclamation No. 3279, dated March 10, 1959 (24 F.R. 1781, as amended). Substantial changes have been made in the program since it was inaugurated There have been 7 amendatory Presidential proclamations and 20 amendments to the original oil import regulations.

The program is designed to insure a stable healthy industry in the United States capable of exploring for and developing reserves to replace those being depleted. This program is vital to the defense mobilization activities of the United States and the nations of the free world. Oil import policies affect diplomatic relations with our friends in the free world, economic development and defense mobilization plans of the Western Hemisphere and other free world areas, and, last but not least, the petroleum, gas and allied industries, and the consumers of petroleum and gas.

The basis of the program is the certified requirements of our national security which make it necessary that we preserve to the greatest extent possible a vigorous and healthy petroleum industry in the United States. In serving our own direct security interests, the program will also help prevent severe dislocations in our own oil industry and in oil industries elsewhere which also have an important bearing on our own security.

The Administration establishes import quotas by petroleum districts and types of products; establishes semiannual allocations to individual importers for imports of crude oil, unfinished oils, and finished products and yearly allocations for imports of residual fuel oil; issues semiannual and quarterly licenses to eligible importers; analyzes monthly reports of imports and prepares consolidated regular and special reports by types of products and individual importers; analyzes applications, licenses and reports to prevent possible or actual violations of the oil import regulations and initiates necessary action incident thereto; evaluates monthly imports to determine whether these imports tend to threaten the accomplishment of the purposes of Proclamation 3279, as amended; analyzes and takes appropriate action upon exemption requests and exchange agreements; prepares affidavits and other technical exhibits required by the Department of Justice in

suits brought into Federal courts involving the program; prepares formal statements on petitions filed with the Oil Import Appeals Board setting forth and justifying the position of the Administration; makes inspections of records and facilities of importers to verify compliance to the program and the accuracy of the material submitted to the Administration, etc.

The workload will be heavy during the budget year. The presently authorized staff can handle this workload, but in order to do so all currently authorized positions must be filled. The funds requested will make it possible to fill all authorized positions and to meet the additional cost of the pay increase for a portion of the budget year.

Considerable travel will be necessary to handle import problems with groups of producers, refiners, importers, State regulatory bodies, and trade associations. Long-distance telephone calls and telegrams will be required to expedite and adjust oil import information urgently needed. Considerable funds will be needed for the reproduction of forms, regulations, press releases, and reports.

Favorable action on this request for an appropriation of $145,700 is respectfully requested.

THE 1965 BUDGET REQUEST

Mr. MOORE. The funds requested for the Oil Import Administration total $145,700. The increase of $4,000 over the amount available for the fiscal year 1964 is for increased pay costs for fiscal year 1964 positions. No new positions are involved in the estimates.

The workload for the year will be heavy, but we think we can handle it with the staff that we currently have on hand with no necessity for an increase in the number of positions. It will, however, be necessary for present personnel to perform some travel to handle the important problems with groups of producers, refiners, importers, State regulatory bodies and trade associations.

Long-distance telephone calls and telegrams will be required to expedite and adjust oil import information urgently needed. Considerable funds will be needed for the reproduction of forms, regulations, press releases, and reports.

Favorable action on this request for the appropriation of $145,700 is respectfully requested.

I will be pleased to answer any questions you may have.

Senator YOUNG. Would you give more detailed information as to what you will use this $145,700 for?

Mr. MOORE. $112,000 is for salaries of personnel; personnel benefits, $8,000; travel expenses, $5,000; transportation of things, $500; $5,000 for communications; $5,000 for printing and reproduction; $8,000 for other services; supplies and materials, $1,800; equipment, $400.

Senator YOUNG. Do you have this additional money?

Mr. MOORE. Additional money? There is only $4,000. That is merely to take care of increased pay costs.

IMPORTATION OF OIL

Senator YOUNG. Are you importing more oil or less?

Mr. MOORE. Well, it remained fairly constant with the exception of residual fuel oil. Importation of residual fuel oil, in the past year, increased by about 25,000 barrels per day. For the first half of this year the increase in crude oil and unfinished oil is about 10,000 barrels per day.

Senator YOUNG. I am trying to figure out, did you get more money to import more or less?

Mr. MOORE. Well, I think——

Senator YOUNG. You don't need to answer. That is all.
Chairman HAYDEN. Any further questions?
(No response.)
Chairman HAYDEN. Thank you for your appearance.
We will now hear from the Geological Survey.

GEOLOGICAL SURVEY

STATEMENT OF THOMAS B. NOLAN, DIRECTOR, GEOLOGICAL SURVEY, DEPARTMENT OF THE INTERIOR, ACCOMPANIED BY ARTHUR A. BAKER, ASSOCIATE DIRECTOR; ROBERT H. LYDDAN, ASSISTANT DIRECTOR; GEORGE D. WHITMORE, CHIEF TOPOGRAPHIC ENGINEER; CHARLES A. ANDERSON, CHIEF GEOLOGIST; ERNEST L. HENDRICKS, ASSOCIATE CHIEF HYDROLOGIST; HAROLD J. DUNCAN, CHIEF, CONSERVATION DIVISION; ROBERT L. MORAVETZ, CHIEF, PUBLICATIONS DIVISION; PERRY B. SIMMS, ASSISTANT EXECUTIVE OFFICER; AND FRED E. STEARNS, BUDGET OFFICER.

1965 BUDGET REQUEST

Chairman HAYDEN. For fiscal year 1965 the Geological Survey proposes a budget of $69,223,000, an amount $5,523,000 in excess of the amount appropriated in fiscal year 1964. The justifications for this estimate will be included in the record.
(The statement referred to follows:)

SURVEYS, INVESTIGATIONS, AND RESEARCH

HIGHLIGHT STATEMENT

Economists have recently estimated that the value of the gross national product will increase $30 billion in 1964, over 1963, and forecast sustained growth in 1965. Predictions of continued prosperity of such magnitude in a resource-based economy necessarily depend heavily on up-to-date, accurate and continuous inventories of water and mineral resources.

It is the responsibility of the Geological Survey to provide certain information which plays a key roll in the wise development of natural resources. This includes studies of minerals and mineral fuels, the general geology of the Nation and detailed geology of specific areas, the quantity and quality of water resources and the preparation of accurate maps at scales suitable for planning the development of these resources and for many other planning purposes.

There is frequent reference in the body of this budget proposal to long-range planning and of the 1965 proposals in relation to a 10-year set of goals. These plans were set forth in a booklet which has been reviewed by representatives of industry, agencies at various levels of government and university departments. Long-range programs of the Geological Survey are planned to hold its expenditures to the minimum consistent with its responsibilities.

We feel that this type of review has established a solid planning reference for the Survey's programs by gaging the needs of industry, State and Federal agencies and others who are engaged in resource appraisal, planning, or development. We feel, also, that offering others an opportunity to review our plans and goals has considerably lessened the likelihood of unwitting duplication. There is evidence that those who reviewed the Survey's long-range plan believed it would assist them in planning their work. Surely, in some cases, it will provide a basis for better coordination between the programs of the Survey and those of other agencies, both Federal and State.

The urgency of the need for basic information for planning and developing was consistently emphasized in the comments received on the Surevy's long-range plan. Public and private development programs covering highways, industries, and communities rely heavily on good topographic map coverage. Similarly, modern planners require more exact information on surface and ground-water supplies as industrial, domestic, and agricultural requirements continue to rise and the remaining supplies diminish. Clearly, these needs call for surveys in many areas where none have been made and new surveys where modern needs or the changes wrought by devlopment render the old surveys obsolete.

The long-range plan for the Geological Survey outlines the growth that will be required for this bureau to keep pace with the demands placed on it by the growth of our Nation. The fiscal year 1965 program proposed here is the first step in the orderly development of this plan, and is designed with both immediate needs and future demands of the growing Nation in mind.

FINANCING OF GEOLOGICAL SURVEY PROGRAMS

An appropriation of $69,223,000 is requested for fiscal year 1965, an increase of $5,523,000 over the current year. The total program of the Geological Survey, estimated at $101,311,000 in 1965, is financed approximately 68 percent by direct appropriation, 15 percent by contributions from State and municipal agencies, and 17 percent by reimbursement from Federal agencies and sundry non-Federal entities. The sources of funds for each activity for 1963, 1964, and 1965 are shown below.

	Actual, 1963	Estimate, 1964	Estimate, 1965
Topographic surveys and mapping:			
Direct appropriation	$19,869,216	$21,640,000	$22,301,000
States, counties, and municipalities	2,449,535	2,756,000	2,750,000
Miscellaneous non-Federal sources	224,934	235,000	235,000
Bureau of Reclamation	959,914	1,017,000	1,011,000
National Science Foundation	330,482	363,000	385,000
Miscellaneous Federal agencies	475,632	468,000	414,000
Total	24,309,713	26,479,000	27,096,000
Geologic and mineral resource surveys and mapping:			
Direct appropriation	15,367,701	16,260,000	17,510,000
States, counties, and municipalities	1,076,921	1,070,000	1,085,000
Kingdom of Saudi Arabia		503,000	459,000

Total	86,605,703	96,018,000	101,311,000

AUTHORIZATION FOR THE PURCHASE OF 50 PASSENGER MOTOR VEHICLES FOR REPLACEMENT ONLY

The vehicles requested are used to transport men and equipment over all kinds of roads and terrain and in all kinds of weather, in the conduct of the field work of the Geological Survey. These cars must give dependable service at all times, since a great deal of the transportation required is in areas where repair services are not available. Field use tends to shorten the efficient life of a vehicle.

The 50 vehicles to be replaced meet or exceed the age or mileage replacement standards prescribed by General Services Administration, and can no longer give dependable and economical service. The vehicles will be used in areas not serviced by vehicle pools maintained by the General Services Administration.

Gross cost of vehicles to be purchased	$81,200
Allowance on old vehicles to be exchanged	20,200
Net cost	61,000
Number of old passenger vehicles still to be used	191

Surveys, investigations, and research

Appropriation, 1963 (total available)	$57,943,000
Appropriation, 1964	63,700,000

SUMMARY OF INCREASES AND DECREASES, 1965

Topographic surveys and mapping:		
To provide for increased pay costs for fiscal year 1964 positions	+$315,000	
For purchase of stereocompilation instruments to reduce extent of second-shift operations in Denver	−300,000	
To accelerate production of standard quadrangle mapping	+300,000	
For resumption of work on the National Atlas	+346,000	
		+661,000
Geologic and mineral resource surveys and mapping:		
To provide for increased pay costs for fiscal year 1964 positions	+265,000	
For space renovation at Denver Federal Center to provide laboratory facilities for research in isotope geology	−250,000	

Surveys, investigations, and research—Continued

SUMMARY OF INCREASES AND DECREASES, 1965—continued

Geologic and mineral resource surveys, etc.—Con.		
For accelerated program in economic and engineering geology	+$250,000	
For accelerated studies of the earth's crust and upper mantle	+985,000	
		+$1,250,000
Marine geology and hydrology: For extension of marine geologic and hydrologic studies		+500,000
Water resources investigations:		
To provide for increased pay costs for fiscal year 1964 positions	+$288,000	
Payment to employee compensation fund (Public Law 86–767, sec. 209)	+34,964	
Expansion of primary networks for studies of the surface and ground water resources of the Nation	+1,265,036	
To match anticipated increase in State offerings for cooperative investigations of surface and ground waters	+502,000	
		+2,090,000
Soil and moisture conservation: To provide for increased pay costs for fiscal year 1964 positions		+2,000
Conservation of lands and minerals:		
To provide for increased pay costs for fiscal year 1964 positions	+$90,000	
Increased workload in lease supervision and land classification activities	+100,000	
		+190,000
General administration: To provide for increased pay costs for fiscal year 1964 positions		+30,000
Special-purpose buildings:		
Preliminary design of Geological Survey building at Washington, D.C.	−$100,000	
Design of nuclear research laboratory at Denver, Colo	−100,000	
Construction of nuclear research laboratory at Denver, Colo	+1,000,000	
		+800,000
Net increase, 1965		+5,523,000
Budget estimate, 1965		69,223,000

Consolidated accounts and central services financed by benefiting activities

Services, supplies, or equipment which are in common need by two or more divisions are, for efficiency and economy, reported in consolidated accounts. Charges are initially made to these accounts, are ultimately charged to the activity benefited, and are justified in the budget document for those activities. The

actual costs of these accounts for 1963 and the estimates for 1964 and 1965 are summarized below:

	Actual, 1963	Estimate, 1964	Estimate, 1965
Consolidated accounts:			
Motor vehicle fleet operation	$1,407,983	$1,523,000	$1,514,000
Rental and maintenance of certain facilities at headquarters and field centers	511,358	674,000	701,000
Warehouse stock of common-use supplies and materials	632,405	664,000	649,000
Survey's proportionate share of departmental charges, safety committee, professional staffing committee, and contingencies arising from operation of field centers	94,419	139,000	120,000
Total consolidated accounts	2,646,165	3,000,000	2,984,000
Central services:			
Map reproduction	2,080,522	2,360,000	2,600,000
Editing and illustration of publications	1,953,870	2,589,000	2,802,000
Distribution of maps and reports, response to public inquiries and related functions	1,027,809	1,496,000	1,654,000
Property maintenance and instrument development	546,193	574,000	596,000
Computing and tabulating services	605,924	659,000	680,000
Total central services	6,214,318	7,678,000	8,332,000
Grand total	8,860,483	10,678,000	11,316,000
Less interoffice billings	360,154	902,000	1,024,000
Net cost	8,500,329	9,776,000	10,292,000

Financial support for these accounts and services is summarized as follows:

	Actual, 1963	Estimate, 1964	Estimate, 1965
Topographic surveys and mapping	$3,251,758	$3,779,000	$3,990,000
Geologic and mineral resource surveys and mapping	2,871,796	3,235,000	3,317,000
Marine geology and hydrology	9,450		
Water resources investigations	2,080,911	2,417,000	2,606,000
Soil and moisture conservation	5,319	6,000	6,000
Conservation of lands and minerals	147,214	164,000	192,000
General administration	133,881	175,000	181,000
Net cost [1]	8,500,329	9,776,000	10,292,000

[1] Includes charges to direct appropriation and reimbursements.

Topographic Surveys and Mapping

The estimate of $22,301,000 is an increase of $661,000 over 1964. The increase includes $315,000 for increased pay costs.

IMPORTANCE OF THE PROGRAM

The national topographic map series is a source of valuable data for the investigation, development, and management of the country's natural resources, for military and civil defense, and for other matters.

Topographic maps are important in (1) geologic studies and minerals exploration, (2) appraising the feasibility of water resource projects, (3) designing and constructing transportation systems, (4) developing comprehensive river basin plans, (5) locating and preserving future reservoir sites, (6) zoning of flood plains, (7) planning development of forests including necessary access roads, (8) improved resource management of public lands, (9) the preservation of wilderness areas, (10) planning for recreational facilities in parks, forests, seashores, and urban localities, and (11) other related matters. Topographic surveys should be completed in advance of resources investigations and development to take full advantage of the detailed terrain information provided.

Analysis by subactivities

Subactivity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
(*a*) Standard quadrangle mapping	$16,133,499	$18,420,000	$18,690,000	+$270,000	+$270,000	
(*b*) Map revision and maintenance	2,443,059	2,270,000	2,300,000	+30,000	+30,000	
(*c*) Small-scale and special mapping	1,292,658	950,000	1,311,000	+361,000	+15,000	+$346,000
Total	19,869,216	21,640,000	22,301,000	+661,000	+315,000	+346,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

(*a*) *Standard quadrangle mapping.*—The estimate of $18,690,000 includes $270,000 over 1964 for increased pay costs.

This subactivity covers field and photogrammetric surveys, cartographic processing, printing and distribution operations required for 7½- and 15-minute mapping published in the national topographic map series. For all States except Alaska, original mapping will be at 1-to-24,000 scale, but first publication will either be 7½-minute series (1-to-24,000 scale) or 15-minute series (1-to-62,500 scale) depending on urgency of immediate need for the 1-to-24,000 publication. In case first publication is in the 15-minute series, photocopies of the original map drawings at 1 to 24,000 will always be available on open file. These maps would ultimately be published in colors in the 7½-minute quadrangle series.

The program under this subactivity is directed from a headquarters office in Washington, D.C. Mapping operations are carried out by four area offices located in Arlington, Va.; Rolla, Mo.; Denver, Colo.; and Menlo Park, Calif. Each area office maintains personnel and equipment sufficient to accomplish the field and photogrammetric surveys and cartographic processing needed for its part of the total program. The field surveys are done from temporary duty stations within the areas to be mapped.

NEED FOR FUNDS

Requests by Federal, State, and local agencies for topographic maps have been greatly in excess of mapping capacity for several years. Both private and governmental committees and agencies reporting and preparing studies on the development of the Nation's natural resources have agreed that accurate, up-to-date topographic maps are a basic need and should be provided as soon as possible. In the long-range water resource development program, major emphasis is being given to coordinated planning of river basin development and research on water resources. The information on the physical environment provided by topographic quadrangle maps will be valuable supporting data for comprehensive river basin plans developed by the Departments of Agriculture; Defense; Health, Education, and Welfare; and Interior, and outlined in Senate Document No. 97, 87th Congress. Requirements for topographic maps will be further emphasized as the demand on the Nation's natural resources increases over the next few decades to meet the needs of the expanding population.

PLAN OF WORK

Each year, priority requests for topographic mapping are submitted by Federal map-using agencies under procedures established by the Bureau of the Budget, and by State sources including officially established State mapping advisory committees. Areas to be included in the topographic mapping program are selected after these requests have been evaluated.

Under the requested funds it is proposed to start about 85,000 square miles of mapping in fiscal year 1965, of which about 23,000 square miles will be resurveys at 1-to-24,000 scale of areas covered by older, inadequate 15-minute maps.

Topographic quadrangle maps are important to military as well as civil map users. Mapping projects of particular interest to the Army are under way in

several areas such as southern Arizona (the electronic environmental test area) and the vicinity of Fort Bragg. Under an agreement with the Army Map Service, the Geological Survey is modifying the format of the topographic maps it publishes to provide for certain military needs, thereby reducing the requirements for separate military editions and resulting in considerable savings to the Government.

Through current cooperative agreements, 32 States and Puerto Rico are contributing a total of over $2 million to the national topographic mapping program. These contributions range from a few thousand dollars a year to over a half million dollars a year. Cooperative programs in New York and Pennsylvania were increased during fiscal year 1963 and are continuing at the increased rate in 1964. Fiscal year 1965 will be the third year of a 6-year cooperative program to complete the mapping of Virginia. Minnesota increased its cooperative offering in fiscal year 1964, and Vermont renewed its offering after an interval of 4 years.

SOURCE OF FUNDS

The total program for standard quadrangle mapping is financed from several sources as listed below:

	Amount available, 1963	Estimate, 1964	Estimate, 1965
Source:			
Direct appropriation	$16,133,499	$18,420,000	$18,690,000
States and municipalities	1,938,528	2,201,000	2,190,000
Bureau of Reclamation	959,914	1,017,000	1,011,000
Other Federal agencies	150,506	117,000	
Total	19,182,447	21,755,000	21,891,000

(*b*) *Map revision and maintenance.*—The estimate of $2,300,000 includes $30,000 over 1964 for increased pay costs.

This subactivity includes (1) of all mapping operations necessary to revise or improve existing 7½- or 15-minute quadrangle maps; and (2) reprinting such maps as required to maintain stocks.

Population increases and the attendant problems of expanding water and power facilities, sanitation systems, transportation routes, and industrial development for urban growth, accent the need for up-to-date topographic maps. Revision efforts are being directed toward these critical areas.

The corridors of development that will result along the expanding Interstate Highway System are expected to bring about a heavy demand for updating of maps, particularly for industrial plant location. Prudent management of the investment required to produce topographic maps requires that they be maintained in the most up-to-date condition.

The Census Bureau states that reasonably current maps of the urbanized 3 percent of the land area of the United States would vastly reduce the mapping difficulties associated with more than 50 percent of the efforts of their field staff. Topographic quadrangle maps of many of the largest cities have been completed, but a large proportion of these maps are out of date. These are also the areas where the most changes have taken place. Accordingly, much of the proposed revision program in 1965 would be devoted to urban and suburban areas.

NEED FOR FUNDS

The estimate for 1965 of $2,300,000 is needed to keep the number of maps revised in 1965 up to the current level and to replenish map stocks depleted by increased sale of maps to the public.

About 5,700 7½-minute maps are now in need of revision. As more maps are made, expenditures increase for reprinting and distributing stocks. About 1,700 maps will be reprinted in fiscal year 1964 which is 800 more than was estimated only a year ago. This explains the increased expenditure in this subactivity over what was planned in the 1964 budget. Receipts from the sale of maps, which revert to the U.S. Treasury, amounted to $739,966 in fiscal year 1963.

In fiscal year 1963, 214 maps were revised. In fiscal year 1964, it is estimated that revision production will be about the same as fiscal year 1963.

PLAN OF WORK

The length of time between revision surveys depends on the changes within the area covered by each quadrangle map. In suburban areas changes occur frequently; in some rural areas, 15 or more years may pass before enough changes occur to affect the utility of the maps. The current practice is to review changes in each area periodically, and, within the limitations of funds available, to revise the original map drawings and publish a new edition when the changes are deemed to be numerous enough and important enough to warrant such action.

About 20 percent of the funds in the current program for this subactivity are contributions from States for cooperative programs. It is expected that in 1965 some of the larger revision projects will be financed in this way in California, Connecticut, Florida, Indiana, Massachusetts, New York, Ohio, Tennessee, and Virginia. These projects are designed to keep the 7½-minute maps of each of these States continuously up to date.

SOURCE OF FUNDS

Those funds that have been available for map revision and maintenance and those expected for fiscal year 1965 are as follows:

	Amount available, 1963	Estimate, 1964	Estimate, 1965
Source:			
Direct appropriation	$2,443,059	$2,270,000	$2,300,000
States and municipalities	494,285	550,000	550,000
Total	2,937,344	2,820,000	2,850,000

(c) *Small-scale and special mapping.*—The estimate of $1,311,000 is an increase of $361,000 over fiscal year 1964. This increase will allow resumption of work on the National Atlas; $15,000 of the amount is for increased pay costs.

This subactivity includes the cartographic and printing operations necessary to compile special maps from available field and photogrammetric surveys, or from other maps used as source material. It may also include original surveys for maps to be published at scales smaller than 1 mile per inch. The principal work included in this program consists of:

(1) The National Atlas of the United States, with maps illustrating various types of geographical, physical, economic, and social information.
(2) 1:250,000-scale series.
(3) International Map of the World (IMW) series, at 1:1,000,000 scale.
(4) State map series at 1:500,000 scale, in base, highway and contour, and shaded-relief editions.
(5) Metropolitan area series, at 1:24,000 scale.
(6) National park series, at various scales.
(7) Topographic maps of Antarctica, at various scales.
(8) Intermediate-scale series (1:62,500 maps made from existing 7½-minute maps and published as 15-minute quadrangle maps).

NEED FOR INCREASE

Work on the National Atlas of the United States began in 1962, after the Secretary of the Interior approved a recommendation by the National Academy of Sciences that the Survey undertake this long-awaited project. The Atlas will provide to users of geographic data a composite record of physical, historical, economic, social, cultural, and other information from a wide variety of Federal, State, and other sources. More than a dozen agencies, organizations, institutions, and individual scholars have so far participated in the creation of maps for the Atlas, and many more have indicated their willingness to do so in the future. A marketing survey revealed that the Atlas project will be essentially self-liquidating through the sale of at least 15,000 volumes at an estimated price of $50 each and immediate sale of individual sheets as they are issued.

PLAN OF WORK

The program for this subactivity is developed from requests by Federal and State agencies and from various indications of need throughout the country

reflecting the national interest. The work is planned, within feasible limits, to fulfill these requirements.

Work on the National Atlas program will be resumed and some major segments of the Atlas will be completed in fiscal year 1965.

Through agreement with the Army Map Service, the Geological Survey has assumed the responsibility for completing and maintaining the 1:250,000-scale map series, inasmuch as these maps have important civilian uses. A program for continuous revision of the 1:250,000-scale maps is underway.

As a result of international agreements on specifications in 1962, the Survey has resumed work on the U.S. part of the worldwide million-scale series of topographic maps (International Map of the World). At least one completed map in this series is planned for each year. The Lake Superior map is now in work.

Work will continue toward completion of 1:500,000-scale State maps for the 20 States which are not yet covered by maps at modern standards in this series.

Metropolitan-area maps combine several 7½-minute topographic quadrangle maps into one map covering an entire metropolitan complex. Of the 215 areas designated by the Bureau of the Census as standard metropolitan statistical areas about 150 cities cover a sufficient area for a metropolitan-area map. The long-range plan is to produce maps in this series for all appropriate cities when new 7½-minute quadrangle maps become available. Work will continue on this program in fiscal year 1965.

It is planned to continue production of maps in the national park series for all national parks and monuments, except those that are of insufficient size to warrant separate coverage. This series is compiled from source data developed from the standard quadrangle mapping program.

The 1:62,500-scale maps have served many purposes as intermediate-scale maps. These maps are prepared by reducing 7½-minute maps, redrafting at 1:62,500 scale, and publishing in 15-minute quadrangles. This program will be continued during fiscal year 1965.

SOURCE OF FUNDS

Funds available for this subactivity are as follows:

Source	Amount available, 1963	Estimate, 1964	Estimate, 1965
Direct appropriation	$1,292,658	$950,000	$1,311,000
States and municipalities	16,722	5,000	10,000
National Science Foundation	330,482	363,000	385,000
Total	1,639,862	1,318,000	1,706,000

OTHER OPERATIONS

In addition to work carried out under its regular subactivities, the Topographic Division also performs some work within its field of competence, on a reimbursable basis. One of these activities is technical assistance to other nations through cooperation with such organizations as the Agency for International Development and the United Nations. This cooperation occasionally requires the services of division personnel in foreign countries, on a reimbursable basis, in support of technical or scientific projects, and the technical training of foreign nationals.

The kinds and amounts of reimbursable work under these other operations are listed below:

Reimbursable work	Amount available, 1963	Estimate, 1964	Estimate, 1965
Cartographic operations for other Federal agencies	$60,347	$58,000	$64,000
Sale of photo copies of aerial photos, map manuscripts and other data:			
Other Federal agencies	204,779	233,000	290,000
Non-Federal agencies	148,021	170,000	170,000
International activities	60,000	60,000	60,000
Sale of personal property: Non-Federal agencies	76,913	65,000	65,000
Total	550,060	586,000	649,000

Geologic and Mineral Resource Surveys and Mapping

The estimate of $17,510,000 is an increase of $1,250,000 over 1964. The increase includes $265,000 for increased pay costs and $985,000 for an accelerated program in support of the Upper Mantle project, described below.

GEOLOGIC RESEARCH FUNDAMENTAL TO NATIONAL PROSPERITY

Minerals, mineral fuels, and the land itself are the essential building blocks of our industrial structure and the principal ingredients in our economic growth and prosperity. Through its geologic and mineral resource surveys and mapping activity, the Geological Survey seeks the knowledge essential for the intelligent exploration, development, and use of these resources—knowledge that (1) permits the Federal Government to appraise the Nation's resource base and to establish policies that will encourage wise development and use of these resources, and (2) assists private enterprise in its search for economic sources of mineral raw materials, and in its use of land for highway construction, and urban and other engineering developments. The resource base of the Nation can be extended both in magnitude and variety through geologic research; indeed, it should be emphasized that our present base cannot be maintained without geologic research.

Geologic and mineral resource surveys and mapping is a long-range continuing activity designed specifically to:

(1) Yield geologic maps, in detail adequate for modern needs, of all parts of the United States, its territories, and possessions.

(2) Provide basic geologic, geophysical, and geochemical data and develop new and refined techniques essential to the increasingly difficult and crucial task of finding new mineral and mineral fuel deposits to maintain reserves necessary for our economy, national welfare, and defense.

(3) Provide the Federal Government with background data and resource appraisals needed in making policy decisions regarding mineral raw materials.

(4) Provide basic geologic data needed to implement the study, appraisal, and development of water resources; needed as background in modern soil studies; and needed to help solve land utilization, health, and welfare problems.

(5) Provide long-range research into basic geologic principles and processes to extend the frontier of geologic knowledge and provide basic data for future applied research programs.

(6) Provide the general public with a better understanding of the geologic history of the many natural phenomena displayed throughout the Nation, and of the geologic processes that resulted in their development.

Aggressive steps must be taken to replenish those resources that will soon be exhausted at current rates of consumption. This calls for more precise knowledge of the constitution and distribution of the materials of the earth's crust, a better understanding of the geologic processes that affect the earth's materials and an increased knowledge of the nature of the mantle that underlies the earth's crust, including those parts that underlie the oceans.

UPPER MANTLE PROJECT

The upper mantle project is a cooperative worldwide program whose specific goals are to determine the variations of the physical and chemical properties of the outer 1,000 kilometers of the earth, the movements of material in the mantle, and the sources of energy within it. This knowledge is fundamental to understanding of the processes through which the crust of the earth has evolved. Such understanding is necessary for: (1) the intelligent exploration of hidden mineral resources; (2) the prediction of such destructive phenomena as earthquakes and volcanic eruptions; and (3) the application of geology to engineering problems such as bridge, dam, highway, and building construction. A knowledge of the nature of the earth's crust and upper mantle has direct applications also to the fields of communications, to detection of underground nuclear explosions, and to oceanography. The $985,000 increase is for investigations that the Geophysics Research Board, National Academy of Sciences, has specifically recommended as part of the Survey's contribution to the upper mantle project.

Analysis by subactivities

Subactivity	Amount available, fiscal year 1963	Amount available, fiscal year 1964	Estimate, fiscal year 1965	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Field and laboratory projects in economic geology	$3,301,358	$3,469,000	$3,651,000	+$182,000	+$57,000	+$125,000
(b) Field and laboratory projects in regional geology	7,116,918	7,289,000	7,648,000	+359,000	+134,000	[2] +225,000
(c) Field and laboratory projects in experimental geology	4,336,332	4,855,000	5,427,000	+572,000	+62,000	[2] +760,000 [3] −250,000
(d) Field and laboratory projects in engineering geology [4]	613,093	647,000	784,000	+137,000	+12,000	+125,000
Total	15,367,701	16,260,000	17,510,000	+1,250,000	+265,000	+985,000

[1] To provide for increased pay costs for fiscal year 1964 positions.
[2] Program increases for upper mantle project.
[3] Amount available in 1964 for renovation of Isotope Geology Laboratory in Denver; in 1965 these funds are urgently needed to accelerate high priority programs in economic and engineering geology and comprise the program increases for these two subactivities.
[4] A new subactivity to centralize continuing activity in this increasingly important field.

FIELD AND LABORATORY PROJECTS IN ECONOMIC GEOLOGY

The estimate of $3,651,000 is an increase of $182,000 over 1964. The increase includes $57,000 for increased pay costs and a $125,000 transfer from "Experimental geology" subactivity (see above table) for new work in resource field.

Need for increase.—The increase in 1965 is needed to expand and accelerate that portion of the program dealing with the appraisal of the mineral and fuel resources of the United States and the world.

The Resources Research Group (for resource appraisal, evaluation, and research) was formed during fiscal year 1962, by reconstruction of existing units, to lay more direct emphasis on the compliation and analysis of data on resources of minerals and fuels and to accelerate work on techniques bearing on the appraisal, discovery, and development of mineral and fuel resources. The demand for resource data, both on a regional and national basis, has increased steadily during the past several years. At the present time this group, at the request of Members of Congress, is preparing resource reports on several of the Western States, and estimates on national and world sources of energy are being prepared to meet requests from several investigating groups. During fiscal year 1965, work on State and regional compilations will be continued and a national summary—the first systematic analysis since 1946—will be undertaken.

As pointed out by several reports, available data on reserves and resources of petroleum and other minerals are inadequate, particularly because they do not take account of probable and possible reserves. The main reason such estimates are not made, or are not adequate when they are, is that methods for estimating the extent of mineral deposits in advance of complete exploration are poorly developed. As a first step in preparation of better estimates of potential supplies, research will be undertaken to improve methods of reserve appraisal, and part of the increased funds requested for 1965 will be used for that purpose.

Importance of work.—The continued growth and expansion—indeed the very existence—of an industrialized nation such as the United States depends upon the availability of mineral and fuel resources. In recent years, the United States has become increasingly dependent on foreign sources for both metals and petroleum and while this trend may continue for a time, the availability of foreign sources will diminish as other nations industralize. Moreover, the total of known world resources of many minerals is not adequate to meet growing needs for more than a decade or so. New supplies must be continually sought and developed, therefore, and we must look to domestic sources as our chief mainstay for the future. The Geological Survey's investigations in this field develop methods of exploration, establish guides useful in prospecting, and outline favorable areas for the occurrence of concealed deposits and in these and other ways lay the ground work for efficient and effective exploration and development of mineral resources by industry.

PLAN OF WORK

Detailed geologic mapping and related field and supporting laboratory studies are in progress and will continue on (1) base and ferrous metals, including copper in the Western States; lead, zinc, and iron in Wisconsin, Michigan, and the southeastern States; and many other less common metals; (2) light metals and industrial minerals, such as beryllium in Alaska, Nevada, Colorado, and Utah; phosphate in California; borates in California; and titanium, graphite, asbestos, zeolites, and quartz sand; (3) rare but strategic metals such as selenium, germanium, rhenium, niobium, cesium, and scandium; (4) organic fuels, including oil and gas in California, Kansas, and other States; oil shale in Colorado and Wyoming; and coal in the Western States, Pennsylvania and Kentucky, and elsewhere; (5) radioactive materials, including uranium and thorium in several Western States; and (6) geochemical and other methods of modern field prospecting for specific mineral commodities. The data from the above program, in addition to aiding directly in the search for new mineral deposits, provide information on the magnitude of our resources essential for national policymaking and planning related to economic development, utilization of the public lands, and national security. In addition, special studies and advisory services required by the Office of Minerals and Solid Fuels are also included in this subactivity.

FIELD AND LABORATORY PROJECTS IN REGIONAL GEOLOGY

The estimate of $7,648,000 is an increase of $359,000 over 1964. The increase includes $134,000 for increased pay costs.

Need for increase.—Of the total $225,000 increase for program, $200,000 is for compilation of geologic maps at a scale of 4 miles to the inch, and $25,000 is for gravity surveys. These items are in support of the U.S. program for the upper mantle project.

Geologic maps are indispensable tools in the interpretation of geophysical data to be gathered in connection with the upper mantle project. Geophysical measurements must be made with instruments placed at or near the earth's surface, so the instrumental readings are affected by the surface rocks. The effects of the surface rocks must therefore be reckoned with in determining the effects due to the rocks at depth. In addition, the nature and structure of the rocks at the surface provide important geologic clues to the nature and structure of the rocks at depth. Geologic maps at a minimum scale of 4 miles to the inch are essential for this purpose. Such maps are now available for only about half of the transcontinental strip that will be the principal target for geophysical investigations, and even where geologic information does exist, there is a need to bring together this information from scattered sources and compile it into geologic maps of a uniform series. Some State geological surveys, notably California, Utah, Texas, and Tennessee have programs underway that will provide some of the needed coverage. The proposed increase of $200,000 is for compilation and geological reconnaissance in some of the most critical gaps in the southwestern and southeastern States.

Gravity measurements supplement explosion seismology and other geophysical techniques for the interpretation of buried crustal features, and are comparatively inexpensive. The requested increase of $25,000 is needed for gravity studies in the areas where crustal structure will also be studied by other methods.

Importance of work.—Regional geologic studies are the means by which we learn, in detail, what kinds of rocks occur in what places. The information, once obtained, is presented in the form of geologic maps and reports. Without knowledge of the distribution of rocks at and near the earth's surface, we are needlessly handicapped in all types of endeavor that involve use or modification of the ground beneath our feet, whether these endeavors be regional resource appraisal, the search for resources, engineering operations, or scientific agriculture. Just as the nautical chart is useful, if not indispensable, to the mariner approaching shoals, so a geologic map and the knowledge it represents can be indispensable to anyone venturing below the surface of the ground. Successful techniques of mineral and petroleum exploration all presuppose a knowledge of where to expect certain rocks or geologic structures; this is why the first step in mineral and petroleum explorations normally involves geological and geophysical mapping.

The Geological Survey and other institutions are being called upon at an increasing rate for information to be used in regional resource appraisals of various sorts. Existing knowledge of the basic geology of many areas is far from adequate to make these appraisals as useful as they should be. Questions must often be answered on the basis of scattered observations made decades ago, simply because

comprehensive or up-to-date information does not exist. Geologic investigations are necessarily time consuming. It may be estimated that some 15,000 man-years have been expended in the past by Federal, State, and private institutions in regional geologic investigations, yet geologic maps at a scale of 1 mile per inch or larger have been published for only about 17 percent of the area of the United States, and many of these are already obsolete. For the remaining 83 percent of the Nation, the geologic information available is not detailed enough for most purposes, and for many areas, there is almost no information at all. This situation can be improved only by a much accelerated program of regional geologic investigations, so that this information is actually at hand when it is needed. To aim for complete large-scale geologic map coverage for the entire Nation is to follow the lead of other highly industrialized nations in anticipating the needs that the future will bring.

PLAN OF WORK

Most of the effort in this subactivity is devoted to studying the geology of specific areas. Geologic maps, principally at scales of 1 : 24,000 (1 inch equals 2,000 feet) and 1 : 62,500 (about 1 inch equals 1 mile) are basic products of this work, although in areas of complex geology, particularly, many of the features and interpretations that are of greatest importance to users do not lend themselves to representation on a map and must be supplied in accompanying reports. Our efforts in regional geologic mapping are being concentrated into specific groups of quadrangles, or "target areas." This is to permit a more concentrated attack, by several men, on major geologic problems that encompass large areas. It is more efficient to study groups of quadrangles than to study isolated quadrangles singly; experience or information gained in one quadrangle will commonly have application in one or more neighboring quadrangles, and make it easier and quicker to decipher the geology of these adjoining quadrangles.

A small part of our present effort is devoted to preparation of geologic maps at a scale of 1 : 250,000 (1 inch equals about 4 miles). In the conterminous United States, these maps are prepared by a combination of new reconnaissance field work and compilation of data from existing maps. In Alaska, the 1 : 250,000 mapping program is essentially all new reconnaissance mapping in areas where very little is now known about the geology.

Considerable effort is also devoted to synthesizing and interpreting geologic knowledge for public use. Paleotectonic maps, for example, summarize what is known of the rocks of a given geologic era over the whole United States, unlike standard maps which depict all the rocks exposed in a specific area.

The field mapping program is made possible by the active collaboration of paleontologists and geophysicists, the former aiding primarily by using fossils to define the age and environment of specific formations, and the latter by using physical properties of rocks to determine more about their distribution, both close to and far below the surface, than can be determined from inspection of scattered exposures at the surface.

FIELD AND LABORATORY PROJECTS IN EXPERIMENTAL GEOLOGY

The estimate of $5,427,000 is an increase of $572,000 over 1964. The 1965 estimate includes $62,000 for increased pay costs, $760,000 for program increases, and a decrease of $250,000 that was provided in 1964 for renovation of laboratory space in Denver for work in isotope geology. The nonrecurring item of $250,000 is deducted from this subactivity and offset by increases of $125,000 for economic geology and $125,000 for engineering geology.

Need for increase.—An increase of $760,000 in 1965 is needed for experimental work in support of the upper mantle project, as recommended by the National Academy of Sciences. The proposed experimental investigations would contribute to the upper mantle project through (1) field geophysical studies—including seismic, gravity, geomagnetic, heat flow, and electrical measurements—of the outer 1,000 kilometers of the earth (the region which is accessible by present technology); (2) laboratory study of the physical and chemical properties of rocks and rock-forming minerals at temperatures and pressures approximating those in the lower crust of the earth; (3) direct observation, at the Survey's Hawaiian Volcano Observatory, of material derived from the mantle through volcanic eruption and of the tectonic events attendant to such eruption; and (4) dating of past crustal disturbances by means of radioactive isotopes.

Importance of work.—Experimental geology, when coordinated with a program of field studies, is essential in advancing knowledge of the physics and chemistry of the earth and of the processes by which it is continually being modified. Experi-

mental studies contribute new concepts that provide both a framework and the limitations into which geologic interpretation must fit, and they help to develop new tools and techniques that may be used to complement and to assist in the interpretations of field investigations. For example, the remote sensing techniques currently under investigation include infrared sensing systems that provide detailed data relating to the patterns of thermal emissions from the earth, and which, when correlated with the geology, give additional information on the nature and structure of the earth's crust.

These basic, long-range investigations provide fundamental information on the nature and composition of the earth's crust that is necessary for the intelligent development of the Nation's resources, particularly of the rarer elements which are receiving ever-increasing attention.

PLAN OF WORK

In experimental geology, a wide variety of investigations are underway that are designed to integrate the fields of chemistry and physics to geology. These include investigations in (1) experimental geochemistry and mineralogy; (2) field geochemistry and petrology; (3) isotope geology; (4) geochemical census (abundance and distribution of elements in the earth's crust); (5) crustal studies; (6) theoretical geophysics; and (7) research on analytical techniques.

FIELD AND LABORATORY PROJECTS IN ENGINEERING GEOLOGY

The estimate for this new subactivity of $784,000 is an increase of $137,000 over 1964. The increase includes $12,000 for increased pay costs and $125,000 transferred from experimental geology subactivity.

Need for increase.—The increase is needed to expand the present program of engineering geologic studies in fast-growing urban and industrial areas and to continue work on the application of geophysical methods to engineering construction and related land use problems. The Survey's current urban program covers only 12 of the nearly 200 rapidly expanding metropolitan areas of the United States that have more than 50,000 people and require engineering geologic studies for judicious planning of urban and industrial growth. Boston, Mass., Charleston, S.C., Atlanta, Ga., San Diego, Calif., and Phoenix, Ariz., are typical examples; in these cities population growth in the past 10 years ranged from 24 to 99 percent. In fiscal year 1965, engineering geologic studies are planned for two of these metropolitan areas.

Engineering properties of earth materials determine, in part, how the land can be most effectively utilized. Measurement of these properties can best be made by geophysical seismic and electrical methods, either in bore holes or by surface testing. New equipment designed by our Denver Laboratory and tested at the Nevada Test Site should be put in use to measure the bulk engineering properties of rocks that are important in major urban construction programs.

Importance of work.—Geologic information is a necessary prerequisite for the efficient and economic use and development of the lands in the Nation's rapidly growing metropolitan areas. Engineering geologic studies provide results that can be directly applied to land development and construction problems. For example, engineering geologic mapping completed as part of our urban studies has identified potential landslide areas in Seattle, Los Angeles, San Francisco and our Nation's Capital. Geologic mapping alone can only provide data on the distribution of rock units. Laboratory analysis and geophysical studies are also necessary in any engineering study to provide data on the chemical and physical properties of the rock units. Of particular importance to engineering construction are the bulk properties of the rocks. Techniques to determine these properties are needed to supplement the geologic mapping and laboratory studies.

PLAN OF WORK

Work underway in this subactivity includes geologic mapping and related laboratory and geophysical research on areas of land reclamation, of highway construction, and of rapid urbanization. Our program in connection with the Straight Creek highway tunnel under the Continental Divide west of Denver has provided a significant contribution to the science of constructing major underground facilities. Detailed geologic mapping enabled our geologists to predict the types of rocks to be encountered in the tunnel, thereby aiding engineering planning and making possible a reduction in the estimated cost. Further work is planned during tunnel construction in order to evaluate and refine the

techniques for application to future feasibility studies. Laboratory analysis of rocks made as part of the urban geologic studies aided in solving the major landslide problem at Rapid City, S. Dak. Additional studies in our Denver Laboratory on lightweight aggregate and strength of rocks under varying climatic and geologic conditions are supporting the field studies in San Antonio, Tex., Salt Lake City, Utah, and Great Falls, Mont., with data pertinent to preparation of engineering geologic maps of these areas.

Marine Geology and Hydrology

The estimate of $998,000 is an increase of $500,000 over 1964.

Geologic and hydrologic knowledge of the oceans contributes materially to the Nation's economy, to national security, and to the health and welfare of man: the oceans and ocean floors have vast undeveloped resources of energy, minerals and food which are needed to maintain an expanding economy. They are the most important barrier to invasion from overseas. Their beaches, islands, reefs, and life are among the Nation's most important recreational resources.

Geologic and hydrologic surveys and studies of the ocean floor will contribute specifically to the following aspects of national security and growth of the Nation's economy:

(1) Location and evaluation of mineral and mineral fuel resources of the ocean and ocean floor that have potential interest to the mining and petroleum industries.

(2) Identification and mapping of geologic and hydrologic conditions and appraisal of related marine processes that apply to man's engineering activities both along the coasts and on the floor of the oceans, including conservation and development of beaches and other areas for recreation.

(3) Determination of the relations between geologic, hydrologic, and biologic conditions and processes which will be of use in development of commercial and recreational biologic resources of the oceans, and will provide knowledge concerning the formation of rocks, petroleum, and other resources.

(4) Determination of geological, geophysical, and hydrologic conditions and processes that have immediate and potential importance to the operation of vessels on and within the oceans and to the search for submerged objects such as submarines and mines within and beneath the oceans.

(5) Assessment of the relations of water beneath the earth's surface to water of the oceans, including the effects of sea-water encroachment on the occurrence, availability, and contamination of fresh-water supplies.

(6) Evaluation of the effects of discharge from the land of water, sediments, and wastes on the marine environment.

(7) Accomplishment of long-range research on basic geologic and hydrologic principles and processes which will produce data for future applied research programs and provide knowledge concerning the origin, history, and cultural aspects of the oceans.

LONG-RANGE PLANS

The Geological Survey's current program in marine geology and hydrology is designed to provide a firm foundation for future studies within oceanic areas. Abundant geologic information for land areas bordering the Atlantic Ocean is being assembled and analyzed to form a basis for interpretation of data collected offshore. The amounts and composition of water, sediments, and wastes discharged from land areas are being determined in order to evaluate their influence on the marine environment. General information concerning the composition and structure of the ocean floor along the east coast is being obtained to define areas of significance for future detailed study. Where sufficient information exists, within bays, estuaries, and along the coasts, individual detailed studies are being initiated to develop techniques which can be applied to the solution of much broader problems.

Operations comparable to those now underway along the east coast will be initiated along the Pacific coast during fiscal year 1965 and along other coasts of the United States during subsequent years. As these operations progress and specific objectives and problems are defined, emphasis of the program will be shifted toward detailed mapping and studies, and toward extension of activities seaward to the ocean basins. Concurrently, coordination and support of related studies within other programs of the Geological Survey and within oceanographic programs of other Federal agencies will be continued.

The present and future plans represent an integral part of the national oceanographic program developed by the Interagency Committee on Oceanography and approved by the Office of Science and Technology and the Federal Council

for Science and Technology. Some existing activities and many planned for the future entail active cooperation with other Federal agencies, private organizations, and industry.

Need for increase.—The requested increase is needed to meet increased costs of projects begun during fiscal year 1963, to provide support to interagency oceanographic activities in which the Survey participates, and to initiate studies of bays and near-shore areas along the west coast of the United States, including a joint study with the Coast and Geodetic Survey of the Pacific Continental Shelf and slope. The formal program initiated during fiscal year 1963, has been maintained at a fund level that is appreciably below the level considered desirable withing the national oceanographic program as developed by the Interagency Committee on Oceanography.

The major project begun during fiscal year 1963 was a planned 5-year reconnaissance study of the Atlantic Continental Shelf and adjacent marine areas from Maine to Florida undertaken in cooperation with the Woods Hole Oceanographic Institution at Woods Hole, Mass. During the first 2 years, emphasis of this project has been directed toward establishment and equipping of laboratories, collection and analysis of existing data and samples supplied by other laboratories, and short cruises to obtain new data and samples from the sea floor and to develop techniques, near the New England States. During fiscal year 1965, longer cruises to study the southern portions of the shelf along the southeast coast of the United States are planned. The longer cruises and full utilization of techniques which are now operational involve increased costs which must be met for efficient and successful continuation of this project.

A very modest program to study geologic and hydrologic processes within bays was also started during fiscal year 1963 at Willapa Bay, Wash. Plans for fiscal year 1965, include expansion of this program to determine the dispersal of the water and deposition of the sediments and related constituents within the bay.

Of the amount requested for fiscal year 1965, about $25,000 is needed for support of interagency activities related to the Geological Survey's program. This amount includes $20,000 for support of the National Oceanographic Data Center which is assembling data from many sources that will be of use in present and planned investigations in marine geology and hydrology.

In order to outline and assess economic resources and bottom conditions that are important for future development of resources and defense of marine areas adjacent to the United States, the Geological Survey, and Coast and Geodetic Survey are planning a joint study of the marine geology and hydrology of the Continental Shelf and slope along the west coast. The scope and objectives of the study will be similar to those of the cooperative Geological Survey and Woods Hole Oceanographic Institution investigations on the Atlantic Continental Shelf. Within the program on the west coast, the Geological Survey will be responsible for all operations on land, including laboratory study of samples and data collected at sea and for the acquisition and analysis of geological and geophysical information for coastal areas that are needed to interpret the offshore data. Scientists of the two organizations will collaborate in the collection of samples and data aboard Coast and Geodetic Survey vessels and in the interpretation and publication of results.

In addition to the joint studies with the Coast and Geodetic Survey, the Geological Survey also plans a detailed study of San Francisco Bay, Calif. Rapid development of the bay area has created an urgent need for much more information on the resources of the floor of the bay, on foundation conditions within the bay and along its shores, on the disposal of wastes within the sediments of the bay, on the effects of dredging within the bay and use of dredged material to make new land along the shores, and on sources of fresh water within sediments on the floor of the bay. The types of rocks and sediments adjacent to and within the bay, the discharge of California's two largest rivers into the bay and the frequency of strong earthquakes within the bay area present geologic and hydrologic conditions that are of critical importance to the economy and to the health and welfare of the population of this rapidly developing area. This study will be coordinated with existing Geological Survey investigations of the engineering geology of large parts of the land area of the bay.

PLAN OF WORK

The expanded research program in marine geology and hydrology in fiscal year 1965 conforms to long-range plans for laying a firm foundation for future studies of broader scope within oceanic areas. The specific activities underway or planned in fiscal year 1965 are described above.

Water Resources Investigations

The estimate for 1965 is $20,797,000, an increase of $2,090,000 over 1964. The increase includes $288,000 for increased pay costs.

The intensity of the competition for water in the United States, as a consequence of the growth in demand and the prospect that demand will continue to increase rapidly, has heightened national concern over every aspect of water development and use. In the past 2 years, an unprecedented number of measures relating to water—water research, river basin planning, pollution, floods, saline water conversion, weather modification, to mention a few—have been before the Congress. The Senate Select Committee on National Water Resources gave focus to this resource by defining the Nation's water problems and goals and urging action. Much of the activity concerning water resources that is planned or proposed is a direct result of the recommendations of that committee.

Essential to the success of these plans that have optimum development and use of water as their common goal is adequate basic information about water as a resource. Of central concern are current plans to carry out comprehensive river basin planning. Water facts are basic to the development of water plans. Facts concerning the supply, distribution, variability, and chemical and physical quality of both surface and ground waters are fundamental to the framework of water knowledge upon which practically all water projects are based. They make possible interpretive studies of areas of potential or existing water problems and the evaluation of alternatives for water development. Water facts are indispensable to needed research on the fundamental principles of the relation of water to the environment.

It is the Geological Survey's responsibility systematically to describe the Nation's water resources systems—to obtain water facts. The Survey's long-range plan calls for obtaining basic descriptions of water resources and monitoring these resources to provide a continuing appraisal of them as extensively and intensively as the need for information requires. Basic descriptions of water resources include the collection, compilation, evaluation, and synthesis of water facts and the use of these facts to define natural and man-modified hydrologic systems. These form the basis for the interpretation of the cause-and-effect relations of water in its environment, and thus provide the Nation's water users and managers with a basis for decisions between possible choices in the development and use of water. Although impressive progress has been made in establishing networks of data collection sites and conducting local and regional appraisals, the rate of accumulation of water facts has lagged with respect to the need for them. In keeping with the goals of its long-range program, the 1965 program of the Survey will move toward alleviating some of the major deficiencies in water knowledge.

Program element	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
1. Federal program	$7,094,806	$8,557,000	$9,997,000	+$1,440,000	+$140,000	+$1,300,000
2. Federal-State program	8,806,078	10,150,000	10,800,000	+650,000	+148,000	+502,000
Total	15,900,884	18,707,000	20,797,000	+2,090,000	+288,000	+1,802,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

FEDERAL PROGRAM

The estimate for 1965 is $9,997,000, an increase of $1,440,000 over 1964. The increase includes $140,000 for increased pay costs.

The Federal program consists of investigations in which the national interest is dominant. Broad coverage in the collection of basic water data, research in hydraulic and hydrologic principles, broad areal investigations covering several States, and type studies of recurring water problems receive special attention. This program complements the cooperative programs which are financed, in part, by State and local governments.

Need for increase.—In 1965 the Geological Survey proposes to accelerate implementation of its plans to obtain needed water information. Recent and anticipated demands for basic facts by many water development planners throughout

the Nation have strongly indicated that the current rate of expansion of that portion of the Geological Survey's program is too modest to meet this new growth in demands for information. In 1965 increases will be directed toward the following:

(1) Collection and compilation of streamflow data. The central core of the network of streamgaging stations is the base stations, classified as "primary" and operated to provide a long-term index of streamflow for any part of the Nation. Studies show a need for 3,400 of these stations. Twenty-eight hundred are now in operation; many of these are deficient as to location or instrumentation. Included in this item are critically needed rehabilitation and upgrading of key streamflow stations and associated facilities, including two primary stations on the Colorado River.

(2) Description of ground-water systems. Large geographic areas of the Nation are underlain by extensive aquifer systems, some of which are the principal sources of ground water for municipal, industrial, irrigation, and other water supplies. Among the many such systems are the sand and limestone aquifers of the Atlantic and gulf coastal plains, the deep-lying sandstone aquifers of the upper midcontinent, those in the High Plains, the Great Basin, and elsewhere. Small parts of these systems have been described in the many county and other area ground-water studies made by the Geological Survey. To date, only about 1 million square miles, or a little more than 30 percent of the United States, has been covered by ground-water studies. The goal is to obtain basic descriptions of the important aquifer systems underlying about 75 percent of the country by 1973. These descriptions would show the areal extent and thickness of the aquifers; the physical characteristics that control the rate, direction, and quantity of water movement; and the changes that take place within the systems.

To obtain the essential basic information for the description of aquifer systems, the nationwide network of observation wells must be expanded. The network provides facts pertaining to changes of ground water in storage, relation of ground water to surface water, changes in the characteristics of ground water, and the physical environment in which water occurs—lithology, composition, thickness, and structure of aquifers and their porosity, permeability, and storage capacity. It serves to identify such things as areas in which ground-water levels are declining or rising and changes in the amount and suitability of ground water in storage. In addition to providing information needed for the description of aquifer systems, the ground-water network furnishes basic data needed for basinwide water resources studies and for the solution of ground-water problems.

(3) Benchmark network. A start has been made in establishing a network of benchmark areas to distinguish natural variations in water supply from those caused by man. For optimum benefits to future appraisal studies, the remainder of this network of stations in areas where the water resources have been, and will continue to be, free from influence by man's activities should be placed in operation within the next several years. Seven areas are in operation and 10 more will be established in fiscal year 1964. About 100 areas are needed for adequate nationwide coverage.

(4) Basinwide water resource studies. National needs in comprehensive river basin planning efforts, as evidenced in pending legislation, require that the Survey expand its efforts on studies which will provide knowledge of interrelationship among the factors in hydrologic systems which will directly or indirectly determine the effect of project development on the hydrologic environment. Such knowledge is prerequisite to optimum planning.

(5) Payment to Employee Compensation Fund pursuant to Public Law 86–767, section 209.

PLAN OF WORK

Analysis by subactivities

Subactivity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Surface-water investigations	$3,058,147	$3,702,000	$4,277,000	+$575,000	+$60,000	+$515,000
(b) Ground-water investigations	2,317,812	3,075,555	3,875,591	+800,036	+50,000	+750,036
(c) Quality-of-water investigations	1,716,235	1,744,000	1,774,000	+30,000	+30,000	----------
(d) Employee compensation payments	2,592	35,445	70,409	+34,964	----------	+34,964
Total	7,094,806	8,557,000	9,997,000	+1,440,000	+140,000	+1,300,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

(a) *Surface-water investigations.*—The subactivity includes collection and computation of basic streamflow data, analysis, and interpretation of these data for specific purposes, and basic and applied research in the occurrence, movement, and measurement of surface water.

A significant improvement in the method of recording and processing streamflow data and other water facts has been achieved through automation. Basic components of the system are a digital recorder, a translator, and a computer. In order to reap the maximum benefits, in terms of savings in manpower, increased accuracy, speedup in compilation and publication of data, and solution of complex hydrologic problems, 5,000 digital recorders should be purchased and installed as quickly as possible. Toward this end, 780 recorders were operational at the close of fiscal year 1963, and an additional 1,200 stream-gaging stations are scheduled for automation during fiscal year 1964. Conversion of 5,000 stations is expected to be completed in fiscal year 1968.

(b) *Ground-water investigations.*—The subactivity includes systematic collection, analysis, and interpretation of hydrologic and geologic data, basic and applied research in fundamental principles of ground-water hydrology, and to improve the scope and methods of investigations.

(c) *Quality-of-water investigations.*—This subactivity includes collection and interpretation of data on the source of chemical and physical characteristics, quantity, movement, and distribution of suspended and dissolved substances in water. Research dealing with sediment movement in streams and the chemistry of surface and ground water are continuing parts of this subactivity.

(d) *Employee compensation payments.*—The estimate is for the Geological Survey payment to the Bureau of Employee Compensation to cover payments made during fiscal year 1963 on account of Survey employees injured since December 1, 1960 (Public Law 86–767, sec. 209).

FEDERAL-STATE PROGRAM

The estimate for 1965 is $10,800,000 an increase of $650,000 over 1964. The increase includes $148,000 for increased pay costs.

Appraising the Nation's water resources is a large task. Because it is large, and because need for water information extends through all levels of government, it is advantageous to both the Federal Government and the States to share this task to the greatest extent possible consistent with their common interests and responsibilities. The size and scope of the cooperative program clearly reflects the interest of State and local agencies in being "partners" in this nationwide water-resources appraisal task. All of the States plus American Samoa, Guam, Puerto Rico, the Virgin Islands, and the District of Columbia share in water resources investigations through financial cooperation with the Geological Survey. Over 300 individual State and local agencies participate. Federal-State cooperation began in 1895 and since that time Federal funds have been available annually for this purpose. Since 1929, the appropriation language has required that the Survey's share not exceed one-half the total cost of investigations.

Need for increase.—Plans for cooperative investigations are formulated at the local level, with cooperating officials and field representatives of the Survey

working together to develop programs tailored to fit local needs and, at the same time, to contribute to the national need for a comprehensive appraisal of water resources. Discussions with cooperators reveal a need for substantial increases in many State and local cooperative programs; largely basic-data collection and analytical and interpretive studies. The requested increase in funds to support this activity is based on estimates by cooperating agencies of increases in contributions requiring matching by the Survey. Among the kinds of work most in need of expansion, as shown by requests from cooperators, are definition of the extent and frequency of flooding in urban areas; studies of flood characteristics of small streams—urgently needed as a planning aid in highway design and for other purposes; appraisals of ground water supplies; investigation of possibilities of artificially recharging ground water aquifers from surface water supplies; studies of the interrelationship of ground and surface waters to estimate the effects of water development on overall supplies; and studies of low-flow characteristics of streams as an aid in planning optimum development of surface water supplies.

Plan of work.—Much of the work done in the Federal-State program is to inventory and describe the quantity and quality of water resources of specific areas such as States, counties, cities, and particular water problem areas. In addition the program includes a variety of interpretive studies. Examples are definition of the extent and frequency of flooding in urban areas; studies of flood characteristics of small streams; appraisals of ground water supplies; investigation of artificial recharge of ground water aquifers from surface supplies; studies of interrelationship of ground and surface waters to estimate the effects of water development on overall supplies; studies of the chemical quality of both surface and ground waters in areas where contamination exists or threatens; salt water encroachment into ground water supplies; and salinity conditions in a stream basin. These studies, and many more in the Federal-State program, although linked closely to local water problems, are of substantial national, as well as local, interest because they yield information that has applicability to similar problems elsewhere. More importantly, they comprise segments of the regional or national picture.

Analysis by subactivities

Subactivity	Amount available, 1963	Amount available, 1964	Estimate, fiscal year 1965	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
(*a*) Surface water investigations	$4,859,644	$5,400,000	$5,735,000	+$335,000	+$78,000	+$257,000
(*b*) Ground water investigations	3,056,193	3,550,000	3,847,000	+297,000	+52,000	+245,000
(*c*) Quality-of-water investigations	890,241	1,200,000	1,218,000	+18,000	+18,000	----------
Total	8,806,078	10,150,000	10,800,000	+650,000	+148,000	+502,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

Soil and Moisture Conservation

The estimate of $195,000 is an increase of $2,000 over 1964. The increase is for increased pay costs.

PLAN OF WORK

The Survey's program consists of two parts, (1) evaluation of specific sites as possible locations for water supply and (2) research in arid-lands hydrology such as erosion and sedimentation principles, stability of river channels, effects of land treatment measures, and relations between rainfall, runoff, ground water, sediment transport, and other hydrologic factors. During 1965, both parts of the program will continue at the current level. Some current research projects will be completed during 1965, some will be expanded to increase the value of the final results, and several new studies will be initiated.

CONSERVATION OF LANDS AND MINERALS

Analysis by subactivities

Subactivity	Amount available, fiscal year 1963	Amount available, fiscal year 1964	Estimate, fiscal year 1965	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Supervising oil and gas leases	$2,200,509	$2,265,000	$2,362,000	+$97,000	+$46,000	+$51,000
(b) Supervising mining leases	524,868	550,000	565,000	+15,000	+11,000	+4,000
(c) Mineral classification	884,802	930,000	975,000	+45,000	+20,000	+25,000
(d) Waterpower classification	266,943	280,000	305,000	+25,000	+5,000	+20,000
(e) Connaly Act compliance	311,933	376,000	384,000	+8,000	+8,000	
Total	4,189,055	4,401,000	4,591,000	+190,000	+90,000	+100,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

SUPERVISING OIL AND GAS LEASES

The estimate of $2,362,000 is an increase of $97,000 over 1964. The increase includes $46,000 for increased pay costs.

Need for increase.—To provide funds for meeting the progressively increasing responsibilities in enforcement of the operating regulations on public, Indian, acquired, and Outer Continental Shelf leases; to provide for still further need of over-water transport to the increasing number of Continental Shelf leases and wells; for substantially increased programing and utilization of the electronic data processing (EDP) equipment for royalty accounting purposes; to provide additional petroleum engineers and supporting services for the steadily increasing exploration and development operations. The increase requested will provide 4 man-years of personal services to bring the engineering work force more nearly in line with the workload and improve supervision in the area of advanced primary and secondary recovery techniques and processes, the prevention of waste, and the determination of royalties due the United States.

Plan of work

	Estimate, 1963	Estimate, 1964	Estimate, 1965
Value of oil and gas produced	$1,188,000,000	$1,281,000,000	$1,402,000,000
Royalty accruals	$166,000,000	$175,000,000	$188,000,000
Available funds for supervision (including funds transferred from Navy)	$2,231,300	$2,308,300	$2,405,300
Number of employees	244	244	248

Supervising operations and enforcing the operating regulations pertaining to oil and gas leases issued under the various mineral leasing acts is a continuing subactivity. The work involves supervision of exploration, development, and production of oil and gas on Federal and most Indian lands in the United States, and the determination and maintenance of an accurate account of the production and of the royalties due and, when appropriate, taking such royalties in kind and disposing of them pursuant to applicable laws and regulations.

Current developments pertaining to oil and gas potentials of the Outer Continental Shelf areas of the United States continue to have a significant bearing on the actual and anticipated future workloads of this subactivity. The interest previously manifested in new areas off the Atlantic and Pacific coasts has been sustained.

Overwater transportation to offshore platforms remains a difficult phase of properly supervising Outer Continental Shelf development operations. Offshore platforms may be reached by boat, float plane or by helicopter. From the standpoint of efficiency and time saved the helicopter is the best method. During the current year the Survey is making increased use of helicopter charters and is substantially reducing its acceptance of free transportation offered by the various operating companies; because of the high cost of boats and helicopters the Survey has not purchased and operated such equipment in Outer Continental Shelf operations. Therefore, it is expected that still further increase in the use off chartered transportation will be necessary during the budget year 1965.

The decision of the Supreme Court on December 12, 1960, established 3 nautical miles seaward of the coastline as the seaward boundary of the States of Louisiana, Alabama, and Mississippi. The decision, however, did not establish the location of the coastline. The six-man committee, composed of three members appointed by Louisiana and three members appointed by the Federal Government, with a charter to resolve areas of disagreement as to the locations of the coastline, has completed its investigation and submitted its report. Unfortunately, there still remain areas of disagreement, particularly with reference to point-to-point delineation of embayments. Resolution of these differences during 1964 is still possible but may not occur until later. The final decision will affect the ownership of a goodly portion of the submerged lands. It should be noted that if this dispute is settled in favor of the U.S. Government all wells and leases lying seaward of a line 3 nautical miles from the coastline will become the sole responsibility of the Federal Government, and will add substantially to the workload of supervisory functions of the Survey. Another important phase of the ownership dispute is the sum of approximately $643 million being held in escrow by the Federal Government pending the outcome of the dispute.

On June 30, 1963, there were 908 Outer Continental Shelf leases under Federal supervision of which 57 were off California and 851 were off Louisiana and Texas. There were 3,333 oil and gas wells, 2 salt and 21 sulphur wells, completed or drilling on these leases. Production from these wells during fiscal year 1963 is estimated to have been 94 million barrels of oil and condensate, 533 billion cubic feet of gas, 451,000 long tons of sulphur, and 258,000 tons of salt, all off the coast of Louisiana. This is a substantial increase over last year.

Application of the electronic data computer to royalty accounting is increasing rapidly and is approximately according to plan. The transition from manual royalty accounting to automated royalty accounting by EDP is approximately 29 percent completed. If the transition continues according to plan it will be approximately 40 percent completed by the close of fiscal 1964, and 80 percent completed in 1965. As conversion to EDP continues, the workload of the associated postaudit of accounts function will increase. Competent accountants will be shifted from manual royalty accounting to postauditing of royalty accounts.

As the number of new discoveries and the rate of making new substantial discoveries diminishes, it is increasingly important that we continue to obtain the optimum recovery of petroleum from those reservoirs already discovered. The Survey exercises constant vigilance to see that such new techniques as air drilling, sand fracing, pressure acidizing, and multiple completions are applied to primary recovery of petroleum from Federal and Indian leases, and that such accepted secondary recovery methods as waterflooding, repressuring, combustion in situ, or miscible fluid drive are utilized wherever they are required. The complete and precise engineering work necessarily precedent to the application of any of these techniques becomes more complex each year and continues to require more and more time of the Survey's supervisory and engineering staff. Technically correct well spacing for maximum recovery in new areas or zones is also becoming a complex and time-consuming problem.

In practically ever session of Congress new amendments and supplements to the mineral leasing laws are enacted with consequent new regulations. Other changes in the regulations also occur each year. The result is that the complexity of and responsibility for administrative, regulatory, and engineering supervision substantially increases each year.

SUPERVISING MINING LEASES

The estimate of $565,000 is an increase of $15,000 over 1964. This includes $11,000 for increased pay costs.

Need for increase.—To provide funds for meeting the progressively increasing responsibilities in enforcement of operating regulations on public, Indian, and acquired land leases; personnel to handle normal workload increases, and to absorb the continuing increases in operating costs.

Plan of work

	Estimate, 1963	Estimate, 1964	Estimate, 1965
Value of minerals produced	$168,000,000	$170,000,000	$175,000,000
Royalty accruals	$8,375,000	$8,750,000	$9,250,000
Available funds for supervision	$525,000	$550,000	$565,000
Number of employees	41	41	42

This is a continuing subactivity responsible for the enforcement of the operating regulations under the various mineral leasing acts governing the exploration, development, and production of mineral deposits from leases on Federal and Indian lands in the United States. This function is conducted in such manner as may best serve the interests of conservation of the resources. The responsibilities include the maintenance of an accounting record of the minerals produced, the determination of the royalty liabilities, and the collection of lease rentals and royalties.

The work includes:

(1) The assembly of data from Federal and Indian lands under lease or permit being prospected for coal, potassium, phosphate, sodium, uranium, manganese, fluorspar, mica, lead, zinc, etc.

(2) The assembly of data on known and possible ore reserves in areas being mined.

(3) The assembly of data on ore reserves of quality too low to merit beneficiation by present techniques, but which may be made marketable through research and improved beneficiation processes.

(4) Approval of mine development plans and supervision and regulation of development and production operations.

(5) Attention to protective methods for workmen exposed to radiation or other mining hazards.

The workload of this subactivity is expected to show an increase during the year. Exploration for minerals (coal, copper, stone, and iron) on Indian lands, is expanding at an accelerated rate. Also, there is increased interest in coal for thermal power and petrochemicals in Arizona and New Mexico, and for thermal power in Colorado and Utah, which will substantially increase the supervisory workload.

During the budget year, the Survey proposes to further intensify the examination program by making more frequent inspections of all mining operations to effectively minimize mine hazards. To accomplish this objective, one additional engineer will be employed.

MINERAL CLASSIFICATION

The estimate of $975,000 is an increase of $45,000 over 1964. This includes $20,000 for increased pay costs.

Need for increase.—The program of systematic review and classification of public land withdrawals provides valuable information with regard to the mineral resources of the public domain through detailed geologic mapping and sampling and analysis for mineral evaluation. Additional funds are needed to provide for more sampling and analyses to supplement geologic mapping in order to support the resulting classification actions. In addition, the ever-increasing demand for land for urban development imposes additional workload in the form of reports on the mineral character of lands subject to disposal. The increase will provide for approximately 2 additional man-years to handle the increased workload in the aforementioned functions.

PLAN OF WORK

This is a continuing subactivity responsible for classifying the Federal land as to mineral character, for determining what Federal land is to be withdrawn for the purposes of investigation for leasable minerals, and for recommending the restoration of such land from withdrawal after adequate geologic mapping and classification.

The primary objectives are:

(1) Geologic mapping and investigation to determine the quality, thickness, and depth of any leasable minerals in or near areas of public lands included in withdrawals and in areas of prospective values for leasable minerals.

(2) The determination, from geological data and other evidence, of the actual or probable presence of mineral deposits of value in specific tracts or parcels of public land anywhere in the United States.

(3) The protection of the mineral values in such tracts or parcels by prevention, through timely notice, withdrawal, or classification, from disposal under nonmineral land laws.

(4) The prompt referral to the administrative and supervising agencies involved, of the geologic determinations and counsel required to effectively discharge their responsibilities.

Under the mineral leasing laws, determination and definition of the "known geologic structures" of producing oil and gas fields are the basis for differentiating

between lands subject to lease by application and those subject to lease by competitive bidding. For each lease application the Survey determines whether the land sought is within the known geologic structure of a producing field. The Survey, as required by law, reports to the Bureau of Land Management all first discoveries of oil and gas under application-type leases and discoveries of new oil and gas fields, or deposits, for their effect on rental and royalty liabilities. Reports to the Bureau of Land Management are also made on the occurrence of other leasable minerals: coal, oil shale, phosphate, potash, sodium, sulfur, and asphaltic minerals. These reports involve State selections, forest exchanges, mineral permits and leases, nonmineral entries and lands under the jurisdiction of other Government bureaus and agencies.

Expansion of industrialization in the United States, particularly in many of the Western States, is resulting in an increasing demand for land and mineral resources. This demand has stimulated the search for and development of leasable minerals on Federal and Indian lands, particularly in the public land States west of the Mississippi River. A similar interest exists in acquired and public lands east of the Mississippi River. Mineral land classification is an essential function in the administration of the mineral leasing laws which apply to Federal lands. The timely performance of this function is of particular importance if this Nation is to derive optimum benefits from the conservation, development, and production of its mineral resources.

The estimated additional increases in workload shown for 1964 and the budget year 1965 are deemed to be conservative, owing to:

(1) Substantial increases in patent cases.

(2) Increased Forest Service, Health, Education, and Welfare, General Services Administration, and Bureau of Indian Affairs requests for mineral reports.

(3) Increased State indemnity selections and exchanges.

Following is a résumé of the work planned for 1965:

(1) Prepare and revise maps showing the current status of development of about 520 producing oil and gas fields in 17 Western States where Federal lands are relatively abundant. Additional geologic mapping will be required in the Rocky Mountain and Midcontinent States.

(2) Continue the preparation and revision of maps showing mineral occurrences in public land States as an aid to classifying the lands as to their mineral content.

(3) Continue geological studies of surface and subsurface features on lands involving leasable minerals in Alaska, Arizona, California, Colorado, Florida, Idaho, Kansas, Louisiana, Mississippi, Montana, Nevada, New Mexico, North Dakota, Oregon, Oklahoma, Utah, and Wyoming.

(4) Continue geologic mapping of withdrawn lands as a means of expediting classification for minerals. Nearly 50 million acres are withdrawn awaiting mineral classification. Systematic topographic mapping and geologic investigation and mapping are prerequisites to classification of mineral lands and its restoration where appropriate. Approximately 1 million acres formerly included in withdrawals were classified during fiscal year 1963 for coal, with appropriate notification to the Bureau of Land Management. The accelerated program of geologic mapping in aid of mineral classification, which commenced July 1, 1960, is proceeding on schedule. During the current year 36 geologists are engaged in mapping about 1,500 square miles in Montana, Idaho, New Mexico, California, Utah, Colorado, Oregon, and Wyoming in the aid of classification.

WATERPOWER CLASSIFICATION

The estimate of $305,000 is an increase of $25,000 over 1964. This includes $5,000 for increased pay costs.

Need for increase.—To provide for the staffing of activities in Alaska and the conterminous States. The increase will provide for salary increases already approved and for an additional 2 man-years of personal services to augment the small staff performing the waterpower classification function. In view of the increased emphasis on water resources and their utilization, the program should be expanded modestly in an orderly manner.

PLAN OF WORK

This is a continuing subactivity. The objectives are the location, investigation, and evaluation of prospective waterpower and water storage sites on public lands, and the classification of the lands in order to protect the Government's interest in such sites. Classification formally identifies those lands that have waterpower or storage potentials and establishes controls over their disposition.

Lands so classified may be selected and used for other purposes until they are needed for a water or power development. These objectives are reached through field investigations to gather the basic data and related information needed to locate and evaluate prospective waterpower and storage sites on the public lands, and through subsequent office studies in which the basic data are analyzed and final reports are prepared. The reports provide the basis for scientific classification of lands with regard to their power and storage values. Maps and reports prepared during these investigations bring potential waterpower and storage sites to the attention of the public, and are extensively used by industry and State and Federal agencies in the preliminary planning of proposed developments. They are of particular value to the Bureau of Land Management and the Federal Power Commission in fulfilling their responsibilities in the administration of the public lands.

The ever-increasing demand for water, and the need for its conservation through storage for optimum use, emphasize the need for the search for and classification of potential storage sites, even those of comparatively small capacity. Another facet in the classification of waterpower resources is the possible use of pumped storage for meeting peakload demands and a search is being carried on for sites where such type of development may be practicable.

The large unexplored waterpower potential in Alaska requires extensive field surveys and investigations for proper evaluation. These should be carried on at an expeditious rate in order that the information will be available for use in effectively selecting and planning projects that will be most beneficial to the development of the State. Also, the areas valuable for waterpower development should be identified and protected by classification of the lands affected as soon as possible in order to prevent their selection for speculative purposes. The survey and investigation of waterpower sites in Alaska is much more difficult and expensive than in the conterminous States due to unfavorable terrain, climatic conditions, and inaccessibility.

An important continuing objective of the branch, begun in 1955, is the systematic review and reappraisal of all land classifications for waterpower and storage purposes. Lands previously classified that, on the basis of present information, do not have power value, or have insufficient power value to justify being continued in a classified status, are recommended for elimination from classifications. There are approximately 7 million acres classified or withdrawn for waterpower and storage sites, and about 1 million acres of this land have been reviewed since 1955.

The comprehensive report by the Senate select committee (Kerr committee), water resources activities in the United States, emphasized the need for the investigation, evaluation, and inventorying of all possible water development sites in order that the most effective plans can be made for the fullest possible utilization of the Nation's water resources. The Geological Survey has been engaged in a continuing program with these same objectives since 1909 in connection with its authority to classify the public lands for waterpower and water storage values. Except for Alaska, most of the sites on the Nation's public land have been identified, investigated, and classified. Much work remains to be done, however, in refining these classifications to reduce the land affected to a minimum.

CONNALLY ACT COMPLIANCE

The estimate of $384,000 is an increase of $8,000 over 1964. This increase is for increased pay costs.

PLAN OF WORK

The Branch of Connally Act Compliance administers the Connally Act of February 22, 1935. The act supports conservation activities of certain oil-producing States by prohibiting the interstate shipment of oil produced in violation of the State oil and gas proration laws.

The Connally Act is applicable wherever State laws limit the rate of production and prescribe conditions for producing and handling the oil. However, due to the small size of the Branch, most of its activity has been limited to 106 counties of Texas, all of Louisiana, and to Lea and Eddy Counties in New Mexico.

Examiners of the Branch, by gaging lease production, by inspection of leasehold operations, by lease visits, by checking pipelines, feeder lines, or tank batteries, by interviewing lease employees, lessees, operators, or well service company employees, and by thoroughly checking records of production and oil shipments, seek to detect violations of the State proration laws. Following such preliminary investigations and formal docketing of the cases, the Branch examiners make a

full-scale investigation, take depositions, and prepare cases against violators for submission through departmental channels to the Attorney General for prosecution.

The Branch occasionally strives to enforce provisions of the act in other States conveniently accessible from its offices in Texas and Louisiana and should extend such regulatory activity to other farther removed oil-producing States as well. Presently, all available investigative personnel and effort are directed toward the gathering of evidence and preparing cases charging violations of the Connally Act by parties charged by the State of Texas with drilling illegally deviated wells.

Under normal circumstances, due to the diversity of activities concerned in Connally Act investigations, ranging from routine office work, through records research, minute examinations of leases, refineries, tank batteries, pipelines, pumping stations, tax returns, and undercover "snooping" to the taking of depositions and the gathering of evidence, it is extremely difficult to establish an appropriate workload measurement related to manpower requirements. Due to the size of the ever-present job to be done, which has always been grossly out of proportion to the staff available to do it, we believe that manpower requirements for this work have never been met. There has been no problem of achieving a reduction in manpower requirements, but rather one of providing enough manpower to make a significant contribution toward fulfilling the objectives of the Connally Act.

Under present circumstances, where it appears that the State of Texas may continue to uncover hundreds of illegally deviated wells, the problem will be one of financing and staffing a greatly enlarged Branch if we are to deal effectively with the violations to be uncovered.

General Administration

The estimate of $1,831,000 is an increase of $30,000 over 1964. The increase is for increased pay costs.

PLAN OF WORK

This activity provides for the executive direction and overall management of the Geological Survey, as well as such essential services as organization and procedures, systems development, investigations on manpower utilization, budgeting, accounting, voucher examination, internal audit, payroll, personnel, purchasing, property control, mail and messenger. It is financed from funds appropriated directly and by an assessment against reimbursements from other Federal agencies and certain nongovernmental sources.

A comparison of funds for executive direction and administration, relative to the entire program of the Survey follows:

	Amount available, fiscal year 1963	Amount available, fiscal year 1964	Estimate, fiscal year 1965	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
Direct appropriation	$1,743,975	$1,801,000	$1,831,000	+$30,000	+$30,000	----------
Assessment against reimbursable programs	602,936	683,000	680,000	−3,000	+10,000	−$13,000
Total general administration	2,346,911	2,484,000	2,511,000	+27,000	+40,000	−13,000
Total Survey program (excluding special-purpose buildings)	86,553,764	95,818,000	100,311,000	+4,493,000	+1,440,000	+3,053,000
Ratio of general administration to total (percent)	2.71	2.59	2.50	----------	----------	----------

[1] To provide for increased pay costs for fiscal year 1964 positions.

SPECIAL-PURPOSE BUILDINGS

The estimate of $1 million is an increase of $800,000 over 1964.

Project	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Nuclear Research Laboratory, Denver Field Center	$51,939	$100,000	$1,000,000	+$900,000	----------	+$900,000
(b) Preliminary design of a Geological Survey building in Washington, D.C.	----------	100,000	----------	−100,000	----------	−100,000
Total	51,939	200,000	1,000,000	+800,000	----------	+800,000

NUCLEAR RESEARCH LABORATORY, DENVER FIELD CENTER

Funds in the amount of $1 million are requested for the construction of a laboratory building at the Denver Field Center, for research in isotope geology and hydrology involving radiation-emitting equipment and materials.

The use of radioactive tracers shows considerable promise as a tool to trace the course and behavior of chemicals, such as herbicides, insecticides, and detergents, which enter in increasing quantities into hydrologic systems, and to facilitate determination of dilution and rate of travel in streams of materials such as toxic or radioactive substances that could have serious impact on municipal water supplies. Laboratories engaged in analytical work—basic research or qualitative analysis—are making extensive use of nuclear radiation as the basis of modern analytical techniques. These examples of the utilization of radiation-emitting materials and equipment, suggest the potential of nuclear radiation and radioactive materials as an up-to-date tool for today's problems in geology and hydrology.

In order to maintain adequate facilities in the use of radiation-emitting materials and equipment as investigative tools, the Survey proposed a laboratory in Denver to house appropriate research and analytical groups. When design funds became available in fiscal 1963, a recognized expert in nuclear chemistry from Pennsylvania State University was retained as technical adviser and the services of an architectural firm, proficient in this highly specialized field, were obtained. With General Services Administration reviewing the procedures as well as architectural details, preliminary plans have been completed and working drawings will soon be available. A review of the building design and incorporated equipment was recently made to insure that the construction costs would remain within the amount requested. Core samples are being analyzed for foundation information and site studies have been completed.

The technical adviser and the architects have met with Bureau of Standards experts to discuss means of minimizing electrical interferences expected in a building of this type. Early recognition of problems of this type is expected to contribute substantially to efficient operation of the laboratory.

FALLOUT PROTECTION

The 1965 estimate includes funds for construction of the nuclear research laboratory at Denver which, because of the special purpose of this building and its inclusion in the Geological Survey complex at the Federal Center, will not contain fallout protection features. The Office of Civil Defense has concurred that fallout protection facilities should not be included in this laboratory.

PROGRAM OBJECTIVES

Chairman HAYDEN. Dr. Nolan, do you want to present a statement?

Mr. NOLAN. I have a formal statement which I would be glad to put in the record. I would like to highlight it and refer to some of the charts on the easel.

(The statement referred to follows:)

STATEMENT OF DIRECTOR THOMAS B. NOLAN, DIRECTOR, GEOLOGICAL SURVEY

It is a pleasure to meet with this committee again to discuss the programs of the Geological survey.

The committee is familiar with the objectives of the Geological Survey to provide data on our mineral, water, and land resources that will help this country maintain its standards of living and economic growth. The results of our studies of the occurrence of mineral and water resources and of our topographic mapping are used in many practical ways by other agencies of Government, industry, and the general public. Indeed they save many times the cost of producing them.

Recently we have given much attention to the development of plans that would spell out program objectives as completely as possible and also present a schedule for accomplishing these objectives in an orderly manner consistent with effective utilization of manpower and facilities. With the helpful comments and criticisms of many interested persons in Federal, State, and local governments, universities, and industry we have arrived at a long-range plan that we hope will be of interest to you in evaluating our funding requests. The printed document was delivered only a few days ago by the Government Printing Office.

The ultimate goals, as described in the long-range plan, and the schedules for attaining them are, we believe, clearly justified by the real benefits that will result as the maps and technical information are published. Overall policy regarding the 1965 budget has made somewhat reduced schedules necessary. We believe, however, that support for these programs is widespread and genuine, and we hope that in subsequent years we will be able to return to the schedules that have been developed. I base this remark on past experiences which show that efficiency and economy are best served by an orderly program such as the plan contemplates; delays or postponements eventually lead to costly and less effective "crash" programs.

As I have observed in another place, there appears to be a direct relationship between the economic health of the country, as measured by such indexes as the gross national product, and the increase in knowledge of the nature and extent of the resources that are basic to the national economy. The Survey s programs provide such knowledge and thus are essential elements in our national growth.

TOPOGRAPHIC MAPPING

The goals in the national topographic mapping program are to complete standard quadrangle mapping of the Nation and to maintain these maps in an up-to-date condition. Topographic maps are widely used, of course, for such purposes as planning transportation systems, the selection of industrial sites, recreation, as three-dimensional bases for plotting and analyzing a great variety of data, comprehensive river basin planning, zoning of flood plains, and for development and administration of lands for forests, parks, wilderness areas, or many other purposes.

Requests for topographic mapping far exceed our mapping program each year. Priority requests for topographic mapping are submitted annually by Federal map-using agencies under procedures established by the Bureau of the Budget and by State sources, including officially established State mapping advisory committees. These requests are evaluated and are the basis for selection of areas for new mapping and revision.

Cooperative agreements with States help expedite progress on the Federal program. Many of the larger cooperative programs have resulted in early coverage of entire States with modern maps such as was recently completed in Ohio. Currently our largest cooperative program is with Virginia—the State is contributing $510,000 for fiscal year 1964 which is the second year of a 6-year program to complete the mapping of Virginia.

For topographic mapping, the estimate of $22,301,000 provides for a program increase of $346,000 for resumption of work on the National Atlas of the United States—a project that began in 1962. The Atlas will be a composite of information drawn from many sources, bringing into one volume a great deal of data of interest to many users.

I would like to mention just one of the new techniques being used in topographic mapping. It was developed by the Geological Survey and is called the airborne-control-survey system. A helicopter hovering at a measured distance above ground points for which positions are desired serves as a target to which distance and direction can be quickly measured. The system promises to yield dividends in expediting map-control operations in difficult terrain.

GEOLOGIC INVESTIGATIONS

For geologic and mineral resource surveys and mapping the estimates provide $17,510,000 which includes a program increase of $985,000. Geologic and mineral resource surveys and mapping are basic to the country's economic health. They provide knowledge essential for intelligent exploration, development, and use of the Nation's mineral resources. Supplies of mineral commodities, fuels, and water must keep pace with steadily increasing consumption. Maximum utilization of supplies from domestic sources can be accomplished only through a better understanding of the composition and structure of the rocks that comprise the Nation's surface, subsurface, and adjoining continental shelves.

The program of geologic investigations includes studies in addition to those directly related to resources of minerals and fuels. Engineering geology studies have assumed increasing importance, with the spread of urbanization, to provide a sound basis for development of plans for land use which will anticipate problems related to landslides, subsidence, earthquake, and other hazards and which will provide information on conditions to be met in construction of highways, tunnels, large buildings, and other major projects. Experimental geologic studies involve the chemistry and physics of the earth and the understanding of the geologic processes operative in the past and that continue to modify the earth on which we live. Regional geologic mapping and supporting geophysical studies are the groundwork for all the investigations carried on under this activity.

Specifically, the increase requested for geologic investigations is to provide support for an accelerated program of the Geological Survey's participation in the upper Mantle project. This project is a coordinated national program to gain knowledge of that portion of the earth, just below the surficial crust, that will have direct application to an understanding of earthquakes and volcanic eruptions and, hopefully, the eventual ability to predict them; to improved long-distance communication through the mantle, rather than the air; to the VELA project for detection of underground nuclear explosions; to oceanography; and, of course, to the systematic and sound search for new sources of minerals and fuels.

MARINE PROGRAM

The marine geology and hydrology program, with both short- and long-range importance, is based on the Survey's competence and capacity to supplement the efforts of other agencies engaged in related problems. The estimate of $998,000 provides for a program increase of $500,000. Although the request submitted here for the Geological Survey is only a small part of the cost of a coordinated program involving many Federal agencies, it is agreed that a study of marine geology and hydrology is an important part of the whole program. It is urged that the request for these funds be viewed as a component part of an overall balanced program.

In effect, the shelf areas and adjacent slopes are submerged portions of the continent and knowledge of the geology of these areas, as for the adjoining land areas, is necessary to the search for and development of their potential mineral resources.

The rapid growth of coastal communities, industry, and commerce and their need for fresh water uncontaminated by seepage from the sea; the need for knowledge of the engineering properties of sediments deposited in bays and estuaries; the conditions created by the intermixing of fresh and salt water along the coasts; and the effects of marine geologic and hydrologic conditions in the complex defense effort are among the problems creating new and urgent needs for information on the geology and hydrology of marine areas.

WATER RESOURCES ACTIVITIES

The need for information on the Nation's water resources is a matter of great urgency. We need the maximum possible amount of data on water resources to provide for effective development and utilization of available supplies. In this connection we recently conducted a 2-day conference with representatives of more than 20 Federal agencies that depend largely on the Survey for streamflow, ground water, and water-quality information. This conference, in a sense, was another phase in the review of our long-range plan in which these agencies participated as reviewers of the plan. It enabled us to hear agencies express their basic water-data needs on a national scale and under conditions of general discussion of mutual problems. The conference also made clear the extent to which these agencies, having responsibilities in the field of water, need the type of basic data that the Survey has traditionally supplied.

The program increase requested is $1,802,000 of which $502,000 is for cooperative investigations with States and municipalities.

One activity to which additional effort will be devoted will be on problems involving ground water. More effort will also be devoted to the mapping of the occurrence of saline water. Information on the depth to saline aquifers, their salinity, and areal extent is being developed as research continues through the Office of Saline Water on methods of saline water conversion.

I made reference to cooperation with agencies of State and municipal governments in water resource activities. Costs of such activities are shared equally and have the obvious advantage of insuring the programs thus financed represent joint interests of these levels of government.

CONSERVATION OF LANDS AND MINERALS

Under conservation of lands and minerals the Geological Survey will supervise the collection of an income of $197 million from oil, gas, and mineral royalties in connection with the supervision of development operations on Government and Indian lands. The requested program increase of $100,000 provides for an increase in these supervisory activities which cost about 1½ percent of the total income. During the last 15 years, the cost of this supervision per dollar collected has been cut in half.

The continuing increased rate of oil production and prospecting activities in Alaska and on the Outer Continental Shelf in the Gulf of Mexico and off the west coast accounts for most of the requested program increase. We have introduced electronic data processing for royalty accounting which will expedite the royalty computation and by the close of fiscal year 1965 it is expected that the transition to automatic data processing will be about 80 percent complete. Increases are also required for classification of lands in connection with the Nation's mineral and water power inventory and to handle the increasing number of reports on the mineral and water power values of lands subject to disposal.

LABORATORY FACILITIES

The special-purpose Nuclear Research Laboratory, which we need in Denver near our present offices, will enable us to develop new methods for everyday application in many fields. We plan to work on problems that will apply to mineral deposit studies and marine geology, to analysis of impurities found in water in only minute quantities, to the studies of sewage pollution, detergents, and industrial wastes, and to safe disposal of radioactive wastes.

The Nuclear Research Laboratory will, of course, help to relieve some of the acute space problems that have plagued the Survey in recent years and will provide much safer working conditions for the men and women already working with radioactive materials in present laboratories. Specialized talent has been engaged to design the building and tentative plans for the building have been completed. The plans have been scaled down to the barest minimum to get us the most building for the least money.

The site studies for the long-sought Washington building, which were made possible by the committee in last year's bill are currently underway; we hope it will be possible to begin detailed planning in the near future.

SURVEYS, INVESTIGATIONS, AND RESEARCH

Mr. NOLAN. I am sure the committee is familiar with the objectives of the Geological Survey to provide data on the mineral, water, and land resources that will help this country maintain its standards of living and economic growth. And as you know, the results of our studies on the occurrence of mineral and water resources and of our topographic mapping are used in many practical ways by other agencies of the Government, industry, and the general public.

Recently we have given a great deal of attention to the development of plans that would spell out program objectives as completely as possible, and also present a schedule for accomplishing these objectives in an orderly manner consistent with effective utilization of manpower and facilities. With the helpful comments and criti-

cisms of many interested persons in Federal, State, and local government, universities and industry, we have arrived at a long-range plan that we hope will be of interest to you in evaluating our funding requests.

LONG-RANGE PLAN

The printed document has been delivered only recently.

We believe that support for these programs is widespread and genuine, and we hope that in subsequent years we will be able to achieve the schedule that has been developed.

As I have observed in another place, there appears to be a direct relationship between the economic health of the community, as measured by such indexes as the gross national product, and the increase in knowledge of the nature and extent of the resources that are basic to the national economy. The Survey's programs provide such knowledge and thus are essential elements in our national growth.

TOPOGRAPHIC MAPPING

In regard to our topographic mapping request, the requests for topographic mapping far exceed our mapping program each year. Priority requests for topographic mapping are submitted annually by Federal map-using agencies under procedures established by the Bureau of the Budget and by State sources, including officially established State mapping-advisory committees. These requests are evaluated and are the basis for the selection of areas each year for new mapping and revision.

The chart that is on the easel shows in pink the first and second priority requests, for mapping needed within 4 years, that we have received for this present year. From those pink areas we select the areas that will be put on the program for the coming year.

REMAPPING IN GREATER DETAIL

Chairman HAYDEN. Many of these areas have been topographically mapped in years gone by, but you want to bring it out in more detail, so you do it over again, is that it?

Mr. NOLAN. Actually, almost all of the pink areas shown have been mapped only on the 4-mile-to-the-inch scale, the reconnaissance scale, and the requests now are mainly for 2,000-feet-to-the-inch mapping. The area shown in gray represents the areas that are now covered by standard mapping. The white areas are those for which the requests are of third priority.

Chairman HAYDEN. Percentagewise, how much does that amount to in the United States?

Mr. NOLAN. The gray area represents about 66 percent of the country, for which mapping has been completed, and about another 4 percent in which mapping is in progress. So we are now very close to 70 percent completion of the country on standard scales.

Chairman HAYDEN. At the rate you have been going how long will it take to finish the United States in standard?

Mr. NOLAN. We are doing about 3 percent a year, so that with 30 percent remaining it would be, theoretically, another 10 years before once-over coverage is completed. However, I would like to submit a further statement on this.

(The statement referred to follows:)

TOPOGRAPHIC MAPS

We are now producing standard topographic quadrangle maps at a rate of 3 percent of the country's area each year, about 110,000 square miles. About a fourth of this, however, are resurveys of some of the older inch-per-mile maps, to replace them with the more detailed and modern 1:24,000-scale maps. These are in areas where there are very high priority requirements because of needs in connection with a variety of problems such as development of water resources, location studies for new major highways, mineral resources investigations, and national defense matters. In 1965 more than half of the resurvey work will be done on cooperative and specially financed projects. Thus, although only 30 percent of the country does not now have topographic quadrangle coverage at the scale of either inch-per-mile or 1:24,000, it may take somewhat more than 10 years to complete this coverage.

Mr. NOLAN. In the meantime, of course, we are getting more involved in the revision of mapping; this is becoming an increasingly important part of the requests from other agencies.

Chairman HAYDEN. Communities will grow and conditions will change, of course, as you know.

You may proceed.

NATIONAL ATLAS OF THE UNITED STATES

Mr. NOLAN. For topographic mapping, the estimate of $22,301,000 provides for a program increase of $346,000 for resumption of work on the National Atlas of the United States, the project that began in 1962, but which was deferred during the past year. The chart, which is a very generalized one, shows the large number of agencies, both Government and non-Government, that are to contribute material for use in the Atlas. We also show in a very general way the broad subject areas that will be included.

During the past year, I might interject, we have had a number of communications from universities, and from some of the commercial map publishers expressing the hope that we will be able to resume work on the Atlas during the coming year. And I sincerely hope that we will.

Senator BIBLE. May I ask a question at that point, Mr. Nolan?

LENGTH OF TIME TO COMPLETE ATLAS

What percentage of the National Atlas is completed as of now? How long will it take to finish it?

Mr. NOLAN. I think we will require 2 additional years plus the coming year, if the appropriation is made. We have had only about 1 year's functioning so far, and in that time much of the effort necessarily was devoted to the development of plans for the Atlas and preparation of new base maps on which the Atlas information would be compiled. We will have much more assistance from here on, although in the past we have received assistance from a number of the professional groups around the country, the historical societies, the political scientists, other learned societies, as well as the several Government agencies involved.

Senator BIBLE. How much will it require to complete the job roughly? You say it is a 3-year job.

Mr. NOLAN. It will be roughly $700,000 or $800,000, excluding the $346,000 we are proposing this year.

Senator BIBLE. So with something in the neighborhood of a million dollars you could complete the job?

Mr. NOLAN. I believe so, sir.

PRIVATE INDUSTRY AND THE ATLAS

Senator BIBLE. Is there anyone in the private field, the scientific field, or the commercial field that is equipped to produce this same National Atlas of the United States of America as the Federal Government is? We are asked this occasionally, and I don't know the answer.

Mr. NOLAN. This came up last year, and as a result we made inquiries of a number of the commercial firms, both textbooks and atlas-producing groups. They had previously, I might add, been represented on a National Research Council committee that recommended that the Atlas be assigned to the Survey. Since then we have had letters from Rand McNally—a very strong letter from Andrew McNally III, who is president of that firm.

CORRESPONDENCE FROM RAND M'NALLY CO. AND M'GRAW-HILL

Senator BIBLE. The Rand McNally Co.?

Mr. NOLAN. The Rand McNally Co., the well-known map producer.

From the General Drafting Co., which I believe produces many of the automobile road maps.

And most recently, I have had a letter from McGraw-Hill, who is perhaps one of the largest of the textbook publishers.

All of them have expressed the belief that it would be very desirable for the Atlas project to be done by the Survey as the agency in Government that is able to call on not only the other Federal agencies but the learned societies and the industrial groups that would be involved in making contributions to the project.

Senator BIBLE. In other words, there is no one in private industry that is able to produce and wants to produce the National Atlas, as nearly as you know?

Mr. NOLAN. As near as I know. Certainly the requests and responses that we received seem to me to indicate very clearly that there is general agreement that it requires an agency like the Geological Survey to accomplish this job.

Senator BIBLE. I don't think I quarrel with your conclusion.

When the National Atlas is completed, who will actually produce it? Will it be a Government operation?

Mr. NOLAN. The plan is to do the printing in the same map-reproduction plant that we print our topographic maps. This is within the Survey. The distribution, I suspect, will be achieved in the same way that our topographic and other maps are now being distributed: in part through direct sales, but in large part through the sales by agents throughout the country.

Senator BIBLE. How big an atlas will this be pagewise if you could make an estimate?

PLAN FOR SIZE AND CONTENTS OF THE ATLAS

Mr. NOLAN. My recollection is about 100 sheets—I have the details of it here which I would be glad to supply to you.

Senator BIBLE. Supply it for the record.

(The information referred to follows:)

The basic plan for the National Atlas of the United States, developed in fiscal year 1963, provides for printing on approximately 100 sheets, size 19 by 28 inches which will fold into about 400 pages size 19 by 14 inches. As indicated by the draft table of contents (attached below), there will be about 10 pages of preliminary material, 352 pages of special subject maps, and an extensive index of place names.

SELLING PRICE OF ATLAS

Senator BIBLE. How much would it sell for?

Mr. NOLAN. Our estimate is that in order to recover the cost of production it would be about $50.

Senator BIBLE. Who would be able to buy it at that cost?

Mr. NOLAN. With the approval of the Budget Bureau, we circulated a questionnaire among certain groups of about 8,000 potential buyers—these are mostly industrial and business groups, libraries, educational institutions, commercial publishers and Government agencies—and at that time from the relatively large response we arrived at an estimate which indicated that a minimum of 15,000 or more volumes would be and could be sold.

The proposed price of $50 was arrived at in the belief that the initial printing cost could be met, but if not that there would be further opportunities to do so through the sales of successive reprints and revisions. In other words, there would be a continuing demand that would meet the cost of production. Furthermore, we could expect to net a considerable return from the sale of the separate map sheets when they are first printed, and, in many cases, when they are later periodically revised.

FREE DISTRIBUTION OF ATLAS

Senator BIBLE. I am probably unduly anticipatory, but when the National Atlas is ready for distribution, would one or more copies be made available to the State governments? What if the Governor of my State wrote and said, "I would like to have a National Atlas," should I write back and say, "Send $50 and you will get it." Is that what I write to him?

Mr. NOLAN. There would, of course, be a certain amount of free distribution such as to depository libraries to which all of our publications go. And my expectation would be that copies of the Atlas would be available to the various State governments.

Senator BIBLE. This would go to the depository library set up by law for each of the States?

Mr. NOLAN. They are not individually set up by law, but there is a list of depository libraries; yes.

Senator BIBLE. Thank you, Dr. Nolan.

Senator MCGEE. With the number of Governors that are interested in States rights and no Federal aid, I expect you would get $50 more quickly than you might believe otherwise. They are afraid of Federal influence, you know.

WIDE USE OF THE ATLAS

Mr. NOLAN. My expectation is that this will be very widely used and be very helpful to all of the industrial and university groups.

Senator BIBLE. I am sure it will.

It is contemplated that this makes the U.S. Government whole for the cost of production and distribution?

Mr. NOLAN. That is our expectation, sir.

Senator BIBLE. Thank you, Doctor.

REVISIONS OF THE ATLAS

Senator YOUNG. How often would you have revisions, if any?

Mr. NOLAN. The plan so far is that revisions will be handled in the same manner as for a looseleaf atlas, although the users' preference is for solid binding and that is less costly to produce. Under this procedure there would not be a complete revision at particular times, but as individual sheets in the Atlas become obsolete or out of date, these would be brought up to date and reprinted without going through the mechanism of a complete reprinting of the whole Atlas, and these individual sheets would be available for sale. Thus professional users of the Atlas could have the most up-to-date data at all times, and at infrequent periods the entire volume could be reprinted.

PUBLISHING THE ATLAS BY THE GOVERNMENT

Senator YOUNG. Do you think the publishing of an atlas always has to be a government business—private enterprise couldn't handle this?

Mr. NOLAN. Well, we have talked to a good many of the publishers about this, Senator Young. The experience of other governments certainly has been that it is a government operation, because it represents a large initial cost for research and requires the capability of utilizing information that is so widely scattered among both government agencies and learned societies. Thus it would seem to be next to impossible for a private company to achieve the same degree of comprehensive coverage at any cost, or at a cost that would permit them to recover their initial investment. I have the impression from the discussions that we have had with companies like Rand McNally, General Drafting, McGraw-Hill, and the like, that they would look forward to the production of this Federal atlas as something which they could then use as the basis for preparation of more popular atlases that would sell through their normal channels.

Most of them I think would regard this as a source book rather than as a competitive atlas.

SUPPLYING INFORMATION TO PRIVATE INDUSTRY

Senator YOUNG. Are you supplying the information to private institutions now for a price, or fee?

Mr. NOLAN. You mean the sort of information that would go into the Atlas?

Senator YOUNG. Yes.

Mr. NOLAN. Of course, much of that we don't have now and it would not originate with the Geological Survey. The main effort has been and will be for a time to acquire the information from numerous sources and put it in form suitable for the Atlas.

Senator YOUNG. Are you supplying any information now to private industries?

Mr. NOLAN. Yes, sir; through our topographic maps, geologic maps, and other publications.

INCOME FROM SUPPLYING INFORMATION

Senator YOUNG. What is the income from that?

Mr. NOLAN. The sales from topographic maps, that now goes into the Treasury, is something on the order of three-quarters of a million a year. These are the regular maps that are produced by the Survey, and have been for many years. They sell at 30 cents apiece. The book publications are sold through the Superintendent of Documents at the Government Printing Office.

Senator YOUNG. Thank you.

LESS EXPENSIVE ATLAS

Senator BARTLETT. Doctor, may I ask, I suppose a long view has been taken also as to what would be involved in a kind of national atlas that would still have a broader base of interest than what you are envisaging here would involve in terms of additional studies and in terms of a larger compendium of information available in your agency. And I assume that you have ruled that out of the realm of either need or feasibility.

Mr. NOLAN. No. I think the Atlas, as we have scheduled it, will be composed of information that must be obtained outside of our agency. It will include maps prepared by other Federal agencies, Agriculture, Weather Bureau——

Senator BARTLETT. That is why I wondered whether there might not be a need for a broader clientele for a $5 atlas or a $10 atlas that would involve——

Mr. NOLAN. My guess is that the Atlas that we prepare will provide a broad base for the less expensive atlases, and my suspicion is that companies like Rand McNally anticipate that the Federal or United States Atlas that we will prepare will be extremely useful to them in preparing the more popular type of atlas. We have modeled ourselves to some extent on the atlas that the Canadians produced about 10 years ago, which is a very comprehensive one, and which has been acclaimed in Canada as a compendium of knowledge that can be used very widely.

Senator BIBLE. May I ask one further question at that point?

U.S. GOVERNMENT PRODUCTION OF PREVIOUS ATLAS

Has the U.S. Government ever produced a similar national atlas in the past?

Mr. NOLAN. No, sir.

Senator BIBLE. This is the first time it has been done?

Mr. NOLAN. In fact, we are one of the few countries, as compared with Europe and Canada, that have not produced a national atlas. And it was the absence of such an atlas that led some 10 or 15 years ago to the establishment of a committee by the National Academy of Sciences and National Research Council to look into the production of a national atlas. For a number of years this Committee endeavored to devise a technique or a system whereby the necessary information could be acquired through the Research Council-Academy Committee and released as a series of separate sheets.

This failed to jell. It was not a successful effort. And after several years the Committee, through the President of the Academy, addressed

a letter to the then Secretary of the Interior requesting that the Survey take over the responsibility of preparing it, in order to give single agency guidance.

Senator BIBLE. Thank you, Doctor.

INCREASED PAY COSTS

Chairman HAYDEN. Throughout the budget you show amounts required for increased pay costs in connection with your various activities. Please indicate to the committee the total amount of pay costs which you would expect in the fiscal year 1965, indicating how much of these you propose to absorb?

Mr. NOLAN. The pay costs, as I remember, are shown on page GS–10, and amount to $990,000——

Chairman HAYDEN. Is there any further statement you want to make?

Mr. NOLAN. I have a few additional observations I might make.

NEW DEVELOPMENTS IN TOPOGRAPHIC MAPPING

I would like to mention one of the new developments in topographic mapping that we feel is going to be of considerable assistance. It was developed by the Survey, and it is called the airborne control survey system. In it, as the chart shows, a helicopter hovers at a measured distance above the ground points for which positions and elevations are desired with accuracies sufficient for our topographic mapping. As the helicopter hovers, instruments at established ground control points, a few miles distant, can be aimed at it for simultaneous observation.

Through the use of the observed distances which are measured by a new device called the tellurometer we can achieve sufficient accuracy for new points which are almost inaccessible by other means or which can be reached only at very high expense. Someday I hope that I will be able to show the committee a moving picture which has recently been completed by the Survey and by the Hiller Helicopter Co., which illustrates the use of this equipment and which we anticipate is going to decrease significantly the cost of mapping operations in difficult terrain, as well as speed them up.

UPPER MANTLE STUDIES

In regard to our geologic investigations, the estimates provide $17,510,000, which includes a program increase of $985,000. This particular increase is requested for geologic investigations to provide support for an accelerated program of participation in the upper mantle project.

This is a coordinated national program to gain knowledge of that portion of the earth just below the surface. It will have direct application in the understanding of earthquakes and volcanic eruptions, and, hopefully, the eventual ability to predict them; to improved long-distance communication through the mantle rather than through the air; to the VELA project for the detection of underground nuclear explosions; to oceanography; and, of course, to systematic and sound research for new minerals and fuels.

We have tried to show graphically on the chart some of the types of work that would be done. Three directions of effort I think are going

to result in immediate benefits. One, through better knowledge of the upper mantle, we anticipate that we will have a much better understanding of the occurrence, frequency, and eventually, we hope, the timing of eruptions from the volcanic areas in both the Hawaiian Islands and in the Pacific coastal area.

Two, what we call heat flow, is really an intensive study of geothermal energy. This is becoming a topic of very great interest and potential use, especially in our Western States. The projects that are planned under the upper mantle project will help to determine more accurately where potential areas of geothermal energy may be located and developed.

Promise and Nature of Geothermal Area Minerals

Three, new sources of minerals and fuels are being better understood by current exploration. One area that is currently being developed for geothermal energy in the Salton Sea is producing minerals at the same time. This potential for mineral production, that was completely unexpected, is now exciting a great deal of interest. I attended the meeting of the American Institute of Mining Engineers in New York last week, and one whole session was devoted to a discussion of the promise and nature of the minerals that may be obtained from this geothermal area in the Salton Sea. In the course of a month this one well deposited 2½ tons of sediment that contained 20 percent of copper and 2 or 3 percent of silver. In addition, it yielded a brine that contains 2½ percent of potash.

If developments of this sort continue, the country may have not only a source of power but a very real addition to the mineral potential.

Chairman Hayden. At what depth?

Oil Companies' Interest in Salton Sea Area

Mr. Nolan. These wells—there are three down now—have a depth ranging from about 5,000 to 7,000 feet. They have bottom hole temperatures of more than 300° centigrade, that is over 500° Fahrenheit. These mineral-bearing fluids are very hot, and they present many technical problems in recovery. But two major oil companies have now become interested in the Salton Sea area, and are doing a great deal of work there.

Chairman Hayden. How much would it cost the Geological Survey during the current fiscal year?

Mr. Nolan. For the entire upper mantle project we propose to expend $985,000. This is the amount of increase requested.

Potentials for Geothermal Energy and Mineral Wealth

Senator Bible. Might I, Mr. Chairman, commend this particular project to the committee's attention. I think this has untold possibilities not only for geothermal energy, but it also is a potential source of very, very rich mineral wealth. And I think this is a great program, particularly for public domain States. My State, so I am advised, has one of the greatest potentials for geothermal energy of any of the public domain States.

Mr. Nolan. Nevada is one of the States that is currently under investigation, in fact I wrote a paper about the Beowawe geyser area back in 1932.

Senator BIBLE. We are tapping new horizons, and I think this is one that deserves increased attention and emphasis, Mr. Chairman. I think there are intriguing possibilities.

Chairman HAYDEN. You are right.

MARINE GEOLOGY AND HYDROLOGY

Mr. NOLAN. Our marine geology program is based on the Survey's competence and capacity to supplement the efforts of other agencies engaged in related problems. The estimate of $998,000 provides for a program increase of $500,000. The request for the Geological Survey is only a small part of the cost of a coordinated program involving many Federal agencies, and it is agreed that a study of marine geology and hydrology is an important part of the whole program.

The shelf areas and adjacent slopes are submerged portions of the continent, and knowledge of the geology of these areas, as well as of the adjoining land areas, is necessary to the search for and the development of their potential mineral resources.

I have shown on the chart the areas in which we are currently working on the east coast, and the areas that we propose to begin working on next year.

Chairman HAYDEN. At what cost?

Mr. NOLAN. An increase of $500,000 is requested over and above the $498,000 that we have this year.

WATER RESOURCES INVESTIGATIONS

In regard to our water resources work, the need for information on the Nation's water resources is a matter of great urgency. We need the maximum amount of data on water resources to provide for effective development and utilization of the available supply. The program increase requested is $1,802,000, of which $502,000 is for cooperative investigations with States and municipalities.

CONFERENCE ON UTILIZATION OF WATER INFORMATION

About a month ago we conducted a 2-day conference with representatives of all the other Federal agencies concerned with the utilization of water information. And since then we have started a series of meetings with State, municipal, and other groups to determine the need they have for increased information.

Chairman HAYDEN. Will the $10,800,000 which you request for the Federal-State program of water resources investigations provide you funds to meet the matching requests of all State proposals?

Mr. NOLAN. We anticipate that the $502,000 increase for cooperative investigations will meet the needs for proposed surface and ground water investigations, but it will not meet the requests, which amount to about $200,000, for quality-of-water work.

QUALITY OF WATER INVESTIGATION

Chairman HAYDEN. You have to have $200,000 more?

Mr. NOLAN. We would need the additional sum to meet the quality of water offerings.

Senator BIBLE. Would you develop that just a little—with the Chairman's permission—would you develop that quality of water work just a little bit more. Exactly what do you mean by that, and where is it conducted? Is this the salt content, for example, of the flow in the Colorado River after it gets to its lower reaches? Is that the type of thing you are talking about?

Mr. NOLAN. Our quality of water work involves both salt content and the sediment load in surface streams. It also includes work on the chemical quality of groundwater. It is essentially the analytical determination of both the salt content and the sediment content—the amount of silt and sand that is carried by the streams.

RESPONSIBILITY FOR COLORADO RIVER CONTENT INVESTIGATIONS

Senator BIBLE. Who is responsible on the Colorado River, for example, for the determination both of content——

Mr. NOLAN. We are.

Senator BIBLE. You are responsible rather than the Bureau of Reclamation?

Mr. NOLAN. Yes, sir. We have stations on the Colorado—in fact, as I recall, the Colorado at Grand Canyon was the station at which some of the earliest sediment load determinations were made. And from that work, which was done, as I recall, almost 40 years ago, the initial estimates of the sediment load that would be carried into Boulder Dam were made. Since then we have expanded the quality network. Actually the stations at which we make these determinations to a considerable extent are the same ones at which discharge measurements are made, or in the case of ground water, stations where the ground water levels are measured.

Senator BIBLE. When we ask the Bureau of Reclamation how many years it would take to fill up Lake Mead with sedimentation, then they go to you for the source?

Mr. NOLAN. They use our information; yes, sir.

Senator BIBLE. As well as the quality, whether it is salty water or clear and pure water?

Mr. NOLAN. Yes, sir. For many years we have made determinations, both for Reclamation and for the Corps of Engineers, as well as for other agencies, in part through transferred funds.

COLORADO RIVER GAGING STATIONS

Chairman HAYDEN. Last year I received a letter from the executive director of the Upper Colorado River Commission urging appropriation of funds to rehabilitate the stream gaging stations and attendants' quarters at Lees Ferry and at Grand Canyon. The Secretary has advised me that $50,000 is included in your 1965 budget for this purpose, and that $50,000 more will be requested in fiscal year 1966 for the station at Lees Ferry on the Colorado River and on the Paria River, and at Grand Canyon.

What is the total amount required for this rehabilitation?

Mr. NOLAN. My recollection of that correspondence, sir, is that the total amount required will be $100,000, of which $50,000 is proposed for this year, and $50,000 for the following year.

Chairman HAYDEN. Which station do you propose to work on during present fiscal year, the coming fiscal year?

Mr. NOLAN. I will ask Mr. Hendricks to provide the information.

Mr. HENDRICKS. The question of which station will come first depends on the plans of the National Park Service. We are coordinating with them in the development of the Grand Canyon station. If they are ready with plans which they are drawing for the structures, and certain other work for the development of a pipeline as scheduled, then we will do Grand Canyon first in 1965 and Lees Ferry station in 1966.

This could be reversed, however, depending on the circumstances.

Chairman HAYDEN. Do you have a question?

LONG-RANGE PLAN

Senator BIBLE. The only question I was going to ask, Mr. Chairman—you opened up the field in asking Dr. Nolan the earlier questions and that would be: Are the sums included in your water investigations estimates sufficient to meet the annual needs of your long-range plan of water resources investigations? I understand that that is a 10-year plan. Now, are your annual needs being met?

Mr. NOLAN. As I mentioned at the beginning, sir, this is a long-range plan that the Survey has developed. It does contemplate increased support for both the data collection activity as well as the research activity. The increase that is proposed here represents a part of that, but not the full proposal.

Senator BIBLE. How many more years does your long-range plan have to go?

Mr. NOLAN. The long-range plan provided for a 10-year program of expansion.

Senator BIBLE. When did it start?

PLAN PROPOSED TO START THIS YEAR

Mr. NOLAN. We had hoped it would start this year.

Senator BIBLE. So, it hasn't even started?

Mr. NOLAN. No.

Senator BIBLE. We are projecting ourselves 10 years ahead?

Mr. NOLAN. Yes, sir.

ESTIMATED COST OF PLAN

Senator BIBLE. What is the overall total estimated cost?

Mr. NOLAN. For water or the whole——

Senator BIBLE. Everything envisaged in the long-range plan that you have?

Mr. NOLAN. I would like to supply that for the record.

Chairman HAYDEN. You may supply it for the record.

(The statement referred to follows:)

TEN-YEAR COST OF PLAN

To obtain the objectives of its long-range plan, the Geological Survey estimates that a program increase averaging approximately 5 percent each year for the 10-year program will be required. The proposed rate of increase reaches a maximum of 8 percent in the third year of the program and drops to 4 during the fifth year, then 3 percent during the last 2 years of this plan. In estimating the cost of the long-range plan we worked in terms of permanent man-years of employment in the belief that this is perhaps a more stable measure than dollars for long-range estimates. It is on the basis of the personnel required to carry out the work that

the above figures were calculated, giving the annual increases needed over the 10-year period in order to accomplish the proposed long-range programs.

WATER LOSSES BY PHREATOPHYTES

Senator BIBLE. I think it would be very helpful if at least the staff, Mr. Chairman, were supplied with copies of that. I would like to see one individually, and maybe the other Senators, it doesn't have to be done right now.

I think that would be very interesting.

Mr. NOLAN. We will be pleased to supply copies to the committee. A great deal of interest has been expressed in the plan by many individuals. The response has really been enthusiastic.

Chairman HAYDEN. What is the status of your investigations of water losses by phreatophytes which you are carrying on in Arizona at this time?

Mr. NOLAN. There are several areas in which we are working in Arizona on phreatophytes. The major one, as you know, is on the Gila River. I have a statement here which I would like to put in the record.

Chairman HAYDEN. I would be glad to have it in.

(The statement referred to follows:)

GILA RIVER PHREATOPHYTE PROJECT, SAN CARLOS INDIAN RESERVATION, ARIZ.

NATURE OF THE PROBLEM

The possibility of reducing water use by phreatophytes and recovering of the water for beneficial purposes has aroused wide interest. This study is to evaluate the reduction of water loss from a large flood plain that would result from removal of phreatophytes and substitution of a beneficial vegetation having a lower water use.

APPROACH

The water loss is being measured by evaluating a water budget for 16 miles of the flood plain of the Gila River within the San Carlos Indian Reservation, Ariz. Phreatophytes, consisting mainly of salt cedar and mesquite, here cover an area of 6,000 acres. The reach will be divided into three subreaches for comparative evaluation.

The water budget for undisturbed phreatophytes will be evaluated for the calendar years 1963 to 1966. In 1967 the phreatophytes will be removed and a suitable replacement vegetation will be established. From 1967 to 1970 the water budget will be evaluated for the replacement vegetation.

The water budget includes inflow and outflow from the Gila River, contributions from tributaries within the reach, precipitation on the flood plain, and change in storage of ground water and soil moisture. New techniques are being developed for making precise measurements of ground water movement and the change in storage of ground water and soil moisture. Maximum value from the data collected will be obtained by making rapid analyses and frequent adjustments to both the data collection and methods of computation. Where possible, punched tape records are secured so that all data will be collected or translated for computation by digital computers. Analog computers will be used in the analysis of the data.

The water loss computed by the budget method will be compared with observations of evaporation from San Carlos Reservoir and direct measurements of evapotranspiration at locations on the flood plain.

A study of the effect of phreatophyte removal on the quality of ground and surface water, and on erosion and sedimentation will be included in the project.

WORK PROGRESS

A major part of the effort thus far has been the installation of equipment and the collection of basic data. Four gaging stations on the Gila River and 63 stations on tributaries were installed. The establishment of 89 observation wells

and the installation of soil-moisture equipment is about completed. Access roads at right angles to the trend of the flood plain were cleared at each gaging station and at three intermediate points in each subreach. The rail gages were installed on the flood plain. Equipment for the computation of evaporation by the energy-budget method was installed on the San Carlos Reservoir. All gaging stations were placed in operation and preliminary discharge rating curves have been developed for the Gila River stations. Processing of discharge data was completed for the first few months of operation. Complete water-budget data is being collected.

Fieldwork for the preparation of a geologic map of the flood plain was completed. An inventory of all existing wells in the area tributary to the reach was made. A reconnaissance of the area including collection of water samples from selected wells and surface waters was made in preparation for a detailed chemical quality-of-water study. An intensive study was made for the calibration of neutron soil-moisture meters for the installations and soils of the project. Plans were developed for analysis of the data by digital computer.

Plot studies are being established by the Bureau of Indian Affairs and the San Carlos Apache Indian Tribe to determine methods of eliminating the phreatophytes and to test the feasibility of various species of beneficial vegetation.

FUTURE PLANS

The University of Arizona and the Bureau of Indian Affairs have urged the Geological Survey to extend the investigation to certain plots of special interest to them that are outside the current project area. We believe that such an extension would broaden the scope of the project and considerably increase the value of the results that we expect to obtain. To do this, however, will require a larger expenditure than the $900,000 initially estimated as the total cost of the project. Other factors have conspired to increase the project costs. They are (1) Federal salary increases; (2) unforeseen difficulties in putting down the necessary test wells; and (3) difficult stream-gaging conditions that have required more elaborate installations than originally anticipated. The table below reflects revised estimates of the annual costs of the program to its completion in fiscal year 1964:

Estimated cost of program

Fiscal year:	*Estimated cost*
1962	$100,000
1963	160,000
1964	200,000
1965	200,000
1966	200,000
1967	150,000
1968	100,000
1969	100,000
1970	100,000
1971	30,000
Total	1,340,000

NOTE.—Estimates do not include the cost of removing the phreatophytes.

MEASURING CONDITIONS OF INFLOW AND OUTFLOW

Mr. NOLAN. I can summarize it by emphasizing that we are in the midst of the initial period of establishing existing conditions of inflow and outflow; at the end of 1966 we plan to start eliminating the phreatophytes in order to determine the savings that can be made.

In the course of preparing for this series of measurements we have installed not only gaging stations at a number of points on the river, but 63 stations on tributaries of the Gila as well. In addition, we have put down 89 observation wells and have installed soil moisture measuring equipment. The study will be a very thorough and comprehensive one.

RESULTS ON LOSSES ON LOWER COLORADO PROJECT

In the meantime, we have done some work on the losses from phreatophytes along the lower Colorado, as part of the lower Colorado project. As a result of small-scale work. This has already shown that—but perhaps I had better read this statement so that I can make sure that it is not poorly phrased:

Results from the evaporation-transpiration station near Yuma indicate that a moderate stand of arroweed uses about 5 feet of water per year with the water table about 4 feet below land surface. This is about two-thirds as much water as that used by a normal stand of salt cedar under the same conditions. Cattail used about 8 feet compared with 7.5 feet of evaporation from the surface of an open water tank set in a swamp of the same area, and 9.1 feet from the standard class A evaporation pan.

Evaporation from a bare soil surface with the water table at the same distance below ground surface was negligible, less than 2 inches a year.

We think this is the critical point, that in the absence of these phreatophytes there is essentially little or no evaporation—2 inches. With a stand of phreatophytes there is a loss of up to 8 feet of water a year.

This is a very graphic illustration of the water losses due to these plants.

WATER LOSSES BY EVAPORATION FROM RESERVOIRS

Senator BIBLE. May I interrupt and ask a question at that point? I don't want to be interrupting, except that it seems to me it properly comes in here. You have told about the losses from the phreatophytes in the studies that you are making. We, also, as you well know, have a great problem—and I know the Chairman is far more familiar with it than I am—from evaporation from the great reservoirs, I mean Lake Mead and Havasu and the lake back of Glen Canyon. And I have forgotten how many hundreds of thousands of acre-feet are supposed to evaporate and get up in the atmosphere and can never be recaptured.

Is this your responsibility to make those studies? What agency makes the studies, and are you making any progress, if you are not the agency?

JOINT STUDIES BY GEOLOGICAL SURVEY, BUREAU OF RECLAMATION, AND DEPARTMENT OF THE NAVY

Mr. NOLAN. We are not the only one. Actually the major studies that have been made on evaporation losses, both from Lake Mead and several other smaller lakes, have been done jointly by the Geological Survey and the Bureau of Reclamation with some very considerable assistance in instrumentation from the Navy Electronics Laboratory in San Diego. A very comprehensive study was made on Lake Mead about 10 or 15 years ago, and an even more detailed one on a smaller scale on one of the lakes near Oklahoma City. I would be very glad to furnish a summary statement.

Senator BIBLE. I would like to have that supplied for the record.

(The statement referred to follows:)

EVAPORATION RESEARCH

As greater demands are placed on our limited water supply, loss of water through evaporation becomes increasingly important. Evaporation is a large part of the water budget in most areas. The Geological Survey estimates that

an average of nearly 25 million acre-feet of water is lost annually in the 17 Western States. Reliable estimates of the annual evaporation loss for the other 33 States have not been made, but it is believed that they are large, also.

Until recent years the methods of measuring evaporation were highly unsatisfactory because of the near impossibility of measuring losses in natural water bodies directly. Evaporation research by the Geological Survey has been directed toward the development of sounder techniques and methods to replace the inaccurate methods of the past and to seeking the fundamental principles involved in the process of evaporation. About 15 years ago the Geological Survey conducted a study of the utility of selected western lakes and reservoirs for water-loss studies. As a result of this work Lake Hefner, near Oklahoma City, was selected as a site for detailed evaporation research. A number of other studies have been conducted since that time and several are underway at present.

MECHANICS AND MEASUREMENT OF EVAPORATION

In 1954 the Geological Survey published Professional Paper 269, Water-Loss Investigations: Lake Hefner Studies, Technical Report, prepared in collaboration with the Department of the Navy, Bureau of Reclamation, and Weather Bureau. These studies were an integrated cooperative effort by specialists in five fields of science (hydrology, geology, meteorology, oceanography, and physics) to attack the water-loss problem by a comprehensive study of old and new methods of determining evaporation. Using the water-budget method, which at Lake Hefner met the requirements for accuracy, as a control, previous studies of evaporation-pan coefficients were confirmed and refined, modern mass-transfer equations were tested and two found adequate for general use, and the energy-budget equation was found satisfactory under limited conditions. A simple empirical equation was developed from the water-budget data which proved satisfactory for computing daily evaporation at Lake Hefner using standard meteorological observations plus surface-water temperature of the lake. Development of these improved techniques was an essential prerequisite to further studies and determination of evaporation losses on large reservoirs in the Western States, notably Lake Mead.

During the period March 1952 to September 1953 the same agencies collaborated with the Geological Survey in a project to make use of the techniques for measuring evaporation developed in Professional Paper 269 to determine the evaporation loss from Lake Mead. In addition, further tests were made of mass-transfer equations, a quasi-empirical equation, evaporation-pan coefficients, and of equipment for measuring radiation. Techniques were developed for the continuing determination of monthly evaporation from the reservoir. Results of this project were published in Professional Paper 298, Water-Loss Investigations: Lake Mead Studies.

Professional Paper 272 reports, in several chapters, results of investigations of various aspects of evaporation as follows:

272A The effect of salinity on evaporation.
272B The effect of the addition of heat from a powerplant on the thermal structure and evaporation of Lake Colorado City, Tex.
272C Review of literature on evaporation suppression.
272D Evaporation from the 17 Western States.
272E A practical field technique for measuring reservoir vaporation utilizing mass-transfer theory.

Because of the great scattering in many publications of available knowledge of evaporation and transpiration, the Geological Survey compiled and published Water-Supply Paper 1539–R, Selected Bibliography on Evaporation and Transpiration. The references emphasize papers from the United States from the early 1880's into 1958.

The current research program is a continuation of efforts to improve understanding of the theory of evaporation, to further refine the techniques for its measurement, and to obtain broad aereal coverage of information on evaporation from large natural or manmade water bodies. Investigations are made toward adapting recent technological advances, such as the measurement of the attenuation of light by vapor in the air, to the direct measurement of evaporation. Newly developed instruments are being studied for applicability or adaptation to the requirements for increased quality and accuracy, or measurement of parameters.

In recognition of the need for broad national coverage of information on natural water losses, the Geological Survey began in 1961 a program to sample net evaporation losses in a variety of climatic environments. Using the improved energy-budget instruments and techniques developed from some of the research pre-

viously described, determinations are being made of the variations in evaporation rates from representative lakes and reservoirs widely scattered throughout the United States. Studies are currently underway at reservoirs in Arizona, California, Florida, Kansas, Louisiana, North Carolina, North Dakota, Oregon, and Texas. It is anticipated that this continuing program will eventually yield valuable evaporation information on most of the major reservoirs in the United States.

In the Federal-State cooperative program there are currently two evaporation studies. In cooperation with the city of San Diego, Calif., the Survey is making a determination of evaporation coefficients for reservoirs in San Diego County. In Louisiana a cooperative project for the department of public works is the determination of evaporation by the mass-transfer method for a pond evaporation station. Comprehensive areal appraisals of water resources may include evaporation studies, where evaporation is a significant factor. In Florida and Utah, for example, new areal investigations started as cooperative projects this year include measurement of the evaporation item in the water budget.

EVAPORATION SUPPRESSION

The Geological Survey has participated, in cooperation with other Federal and local agencies, in several investigations of evaporation control methods. The general purpose of these investigations has been to develop a practical, safe, and effective method of treating the water surface of a reservoir with a monomolecular chemical film to reduce losses of water by evaporation. The Geological Survey has taken part in both laboratory and field studies for approximately 10 years. Its specific role in these studies has been to evaluate the effectiveness of the various chemicals and techniques used.

Principal among these studies are several that have been conducted in Texas in cooperation with the Southwest Research Institute, Texas A. & M., and the State of Texas. Field tests between 1955 and 1958 on several small reservoirs indicated that the reduction in evaporation was somewhat less than 20 percent under the prevailing conditions and the application procedure used. Slightly greater reductions have been obtained on other studies on small stock tanks. However, the amount of retardant material needed per acre, and thus the relative cost, was much greater in case of the stock tanks.

During 1958 extensive tests were carried out on Lake Hefner by the Geological Survey, Bureau of Reclamation, Public Health Service, and the city of Oklahoma City. The Survey measured the evaporation losses and computed the savings due to the monofilm and the rise in water surface temperature caused by the monofilm.

Several major problems associated with this method of reducing water losses have not yet been fully solved; in particular, the effects and action of wind on the monofilm; the breakdown of the monofilm by biochemical oxidation; the long-range effects of monofilms on the limnology of a reservoir; toxicological aspects of chemicals used; and the fundamental principles involved in the mechanism of evaporation and its reduction by a monofilm.

PREVENTION OF EVAPORATION LOSSES

Senator BIBLE. The main thing I am interested in is this: As the result of these studies, has any effective solution been found to preventing these tremendous evaporation losses? I know that I have heard that you could pour some kind of compound or something on the water and that would lessen the evaporation, but has it ever actually worked out?

Mr. NOLAN. There has been and there is continuing a great deal of experiment and research on the use of these monomolecular films, as they are called. Acetyl alcohol has the ability to spread out as a very thin film, which prevents evaporation losses of the kind you have mentioned.

The difficulty—and I think this is where we are now, is the physical problem of maintaining that film unbroken at times when the surface of the water is disturbed by high winds or gusty winds. The Bureau of Reclamation is carrying on a great deal of research in that field now.

Senator BIBLE. That is a constant problem, as you very well know, on Lake Mead, using that as an example.

Mr. NOLAN. In this area I think most of the work is currently done by Reclamation rather than by us.

Senator BIBLE. I see.

Thank you, very much.

GROUND WATER PROBLEMS

Mr. NOLAN. I did want to say, in the discussion of our ground water work, that the chart shows areas of current ground-water projects. The other chart shows the areas in which there are serious ground water problems facing us in the future. This is the result of a study that we made through our district offices. And then the chart below represents the areas in which we propose to extend our ground water work in an effort to meet some of the problems that can be foreseen.

Chairman HAYDEN. In looking at the map, a ground water problem is indicated near the ocean and the coast. I am curious about that.

Mr. NOLAN. That is perhaps not so much the result of inadequate supplies as in the contamination of existing supplies by the incursion or invasion of salt water from the ocean. These areas, in which there is a considerable amount of ground water available, tend to be heavily pumped. As a result of the heavy pumping, salty ground water is drawn into the aquifers from the ocean. And this requires a very considerable amount of study as to both the proper location of the wells, the volume of water, the rate of pumping, the rate of recharge, and things of this sort.

And this same problem, I might observe, is being attacked from another angle under the marine geology and hydrology program. We are making some progress in resolving the difficulties there as well.

I might add in regard to water that insofar as getting the basic data, the measurements of stream discharge——

Senator MCGEE. May we leave that map up there a minute?

Mr. NOLAN. Surely.

GROUND WATER INVESTIGATIONS IN WYOMING

Senator MCGEE. I notice that the State of Wyoming is about half covered by your green designations on that map. I think it would be interesting, if you could supply it for the record, in a status report on your studies on those Wyoming projects.

Mr. NOLAN. I would be glad to.

(The information referred to follows:)

OBJECTIVE OF THE PROGRAM

The long-range objective of the Geological Survey's ground water program in Wyoming is to determine and describe the occurrence, availability, and quality of the ground water resources of the State. Much of the work is being done in cooperation with the State engineer, the city of Cheyenne, and with other Federal agencies.

The current program includes detailed ground water appraisals of three areas, reconnaissance studies of three structural basins, investigations of several small areas with present or potential water problems, two research projects concerned with hydrologic principles, and maintenance of a statewide basic data network. The following statements describe the principal segments of the program.

Investigations of the geology and ground water resources of Sheridan County and of northern and central Johnson County have been completed and reports

on the areas are nearing completion. A study of the ground water resources and geology of Laramie County will be started during fiscal year 1964.

Field work on a reconnaissance study of ground water in the Great Divide and Washakie basins and the Rock Springs uplift is scheduled to be completed in 1964.

During the past year, brief hydrologic investigations were made in the vicinities of Newcastle and Ten Sleep, and short reports on these areas were released to the open file.

Brief reports for the National Park Service on ground water conditions at Devils Tower National Monument and near Jackson Lake, Grand Teton National Park, are near completion. Investigations in Yellowstone National Park currently are underway at the east and northeast entrances, at Bridge Bay, and at Cave Falls. Three deep wells at recreational sites adjacent to Flaming Gorge Reservoir are being logged and tested.

Work on the Missouri River Basin program is continuing in cooperation with the Bureau of Reclamation. A report on the Glendo area has been completed and is being published as a U.S. Geological Survey water-supply paper. Periodic measurements of water levels in observation wells will be continued in the Wheatland Flats area and in the North Platte Irrigation District in eastern Wyoming and western Nebraska.

A continuing program in cooperation with the city of Cheyenne relates to the effects of ground water pumpage in the area. A progress report each year summarizes the results.

A statewide network consisting of about 240 observation wells is used to obtain information regarding the amount of water in storage and water-level fluctuations in the various water-bearing formations. The data is compiled and published periodically.

Problems in ground water management practices usually involve the effects of manmade disturbances on natural water systems. The Ten Sleep sandstone in the Big Horn Basin is being used in research on the characteristics and functional nature of hydrologic systems, so that quantitative predictions can be made of the response of the systems to manmade disturbances.

A special investigation of the mining hydrology of trona deposits in the Green River Basin was begun in November 1960 and is nearing completion. The study is expected to provide important data on the occurrence and quality of ground water in strata adjacent to the trona deposits and will assist in the efficient exploitation of the deposits.

Under its soil and moisture conservation program, the Geological Survey is conducting investigations dealing with the hydrologic effect of conservation practices on the public domain and Indian lands. Close working relationships are maintained with the Bureaus of Land Management and Indian Affairs. The program includes investigations relating to the development of range water supplies to facilitate the distribution of grazing, to runoff and sediment yields in small watersheds, and to progress of erosion. During 1964 it is expected that about 40 individual well sites proposed by the Bureau of Land Management will be examined in the Wind River, Powder River, Big Horn, and Green River Basins.

Senator McGEE. Ground-water development is rather significant to us in Wyoming.

Mr. NOLAN. Ground water is important to many of the Western States.

AUTOMATION OF STREAM-FLOW MEASUREMENTS

But I did want to mention before I moved on, the next exhibit, which shows the progress that we are making in replacing the old recorders that we use at the several thousand streamflow measurement stations by so-called digital recorders, the records from which can be fed directly into automatic data processing equipment.

This is not only speeding up the processing of the records, but makes possible also a considerable saving in the acquisition of the streamflow discharge measurements.

Senator BIBLE. May I ask one question, simply as a matter of interest. How many stream flow measurement devices do you have that are operational in the United States? You mentioned thousands.

Mr. NOLAN. I think there are about 8,000. Mr. Hendricks probably has the exact figure.

Mr. HENDRICKS. About 7,800 continuous record stations and approximately the same number of partial record stations.

Senator BIBLE. Scattered all over the United States, measuring streamflow?

Mr. NOLAN. Yes, sir.

Senator BIBLE. Thank you.

CONSERVATION OF LANDS AND MINERALS

Mr. NOLAN. The last of the major operational groups in the Survey is the Conservation Division.

Under conservation of land and minerals the Geological Survey will supervise the collection of an income of $197 million from oil, gas, and mineral royalties in connection with the supervision of development operations on Government and Indian lands. The requested program increase of $100,000 provides for an increase in these supervisory activities which cost about 1.5 percent of the total income.

And the chart, I think, shows by the line, which is rising rapidly to the right, the amount of royalties that are collected, whereas, the line sloping down to the right shows the cost of the activity in terms of the total income. This shows the results of the very considerable efforts we have made in recent years to cut that cost.

The continually increasing rate of oil production and prospecting activities in Alaska and on the Outer Continental Shelf in the Gulf of Mexico and off the west coast accounts for most of the requested program increase. And as can be seen from the chart, there has been an extremely rapid increase in income to the Government from the oil and gas operations on the gulf coast.

Senator MCGEE. I am interested in this unitization section.

Mr. NOLAN. There are some unit plans on the Gulf Coast, sir, just as there are other places.

WASHINGTON UNITIZATION SECTION EMPLOYEES

Senator MCGEE. What about the unitization section here in Washington? How many employees are there in that section of the Survey?

Mr. NOLAN. The unitization work to a large degree is initiated and carried out in the field offices of the Conservation Division. We have only four full-time employees in the section here in Washington.

Senator MCGEE. Only four? The reason for that inquiry is that I have an inquiry from the Casper, Wyo., Chamber of Commerce which is interested in it. The oil industry is very much interested. Much oil activity is concentrated in the Casper area, and many persons are concerned about the size of the section now here in Washington.

Mr. NOLAN. Most of the unitization plans are drawn up through the seven regional oil and gas offices in the field, including Casper. We keep the small number of people here in order to accomplish the coordination with the Solicitor's Office and the Secretary's Office. The Secretary must approve the unit agreements for Outer Conti-

nental Shelf leases as they come in. I think the small group is essential for central office review, coordination, and processing.

Mineral Leasing Increase

I have one other chart which gives some idea of the rate at which the mineral leasing is increasing.

The next two charts, also, show the rate at which the amount of income to the Government and the number of individual leases from which production is being obtained is increasing.

Public Use of Maps Increasing

Finally, the last chart shows the rate at which public use of our maps is increasing. The lower part of these bars shows the number of new maps printed, the upper part shows the number of reprints, which reflects the increasing demand for maps. As I have observed earlier, the more than 5 million maps that we are distributing in 1964 will bring in an income to the Treasury of something on the order of $750,000, and this doesn't count the revenue received from sale by other agencies of the remainder of the 16 million we will print this fiscal year.

Nuclear Research Laboratory

The final item that I wanted to mention represents an increase of $900,000 over this year for a special purpose nuclear research laboratory, which we need in Denver near our present offices, and which will enable us to work on new methods for application in many fields of geology and hydrology. In the present appropriation act $100,000 was provided for preparation of plans. That has been accomplished. We hope to be able to start construction next year.

Chairman Hayden. Who will construct it?

Mr. Nolan. This will be done by GSA through an agreement that we have reached with them.

Washington Area Building

Finally, the site studies for the long-sought Washington building which were made possible by the committee in last year's bill are currently underway, and we hope it will be possible to have detailed planning start in the near future.

Chairman Hayden. What have you done as the result of the committee's provision last year for a study of the housing needs of your activities in the Washington area?

Mr. Nolan. With the $100,000 that was made available for the current year a preliminary study has been made for the design of a building to house the Survey's activity in the Washington metropolitan area.

We are undertaking the negotiation of an agreement to conduct a more detailed analysis of the adaptation of the necessary facilities to a suitable site.

Procurement of Site and Building Plan Progress

Chairman Hayden. The appropriation act for the General Services Administration included an item for the procurement of a site and

the preparation of plans for this Survey building. What progress has been made as a result of that action?

Mr. NOLAN. To the best of my knowledge, sir, there has been very little, if any, progress made by the General Services Administration. There has been some discussion with them but we have been concerned that there has not been more progress made. We had been hopeful that advantage could be taken of available sites so that development plans could be focused on a specific site. Suggestions have been made that much of the Survey's activities should be located outside of Washington, but this is no solution.

Chairman HAYDEN. I don't see what advantage it would be for the Government to take the Geological Survey far away from Washington. Don't you need to have a location in this vicinity because of your close contacts with other agencies of the Government here?

Mr. NOLAN. We certainly believe very strongly that we should remain in the Washington area and that these contacts should be maintained. In addition to a headquarters facility here, we need a center of operations for the eastern seaboard that would be comparable to existing centers at Denver, Colo., for the Rocky Mountain area and at Menlo Park, Calif., for the west coast. Washington is conveniently located to serve as base of operations for an area extending from Maine to Florida. In addition, the availability of the operational group provides effective and economical technical support in the day-to-day functioning of the headquarters facility in its relationships to the Congress, the Department, industry, cooperators—as well as the day-to-day relationships with scientists of other organizations centered in Washington. The growth of Washington as a scientific center emphasizes the importance of scientific organizations such as the Survey having a location there. I sincerely believe that the activities of the Survey are so interlocked with the activities of many other organizations located in Washington and are a necessary point of contact for so many official and industry visitors to the city that performance of our job from some remote location would be greatly handicapped.

Senator BIBLE. I just want to ask a couple of questions, some that have been suggested, and one I had in mind myself.

NUCLEAR RESEARCH LABORATORY

I wish you would supply for the record the data and information concerning this Nuclear Research Laboratory which you say is much needed near Denver?

Mr. NOLAN. Yes, sir.

Senator BIBLE. The purpose of the question, and what I am trying to drive at is that we have many facilities, such as radiological labs, which have facilities on the test site in Nevada. These conduct many, many nuclear studies, and I would like to see your justification of what you say on the last page of your statement. Please supply for the record. I don't want to burden you now.

(The statement referred to follows:)

SPECIAL-PURPOSE NUCLEAR RESEARCH LABORATORY

The Geological Survey needs the proposed Laboratory in order to apply newly developed nuclear techniques and equipment to problems in geology and hydrology. In addition, the Survey plans to utilize the facility to devise new methods, which

utilize this equipment, that will improve our ability to explore for new sources of minerals and to extend our knowledge of the behavior of water in surface streams and in underground aquifers.

To illustrate, activation analysis has been developed as an analytical procedure for determining the occurrence of minor elements such as the recently developed beryllometer in the exploration for beryllium. Use of this technique enables the geologist to understand better the processes by which the ores are formed and provides a better basis for mineral exploration.

Radiological tracers have proved to be a useful tool in following the course and behavior of chemicals which enter in increasing quantities into hydrologic systems, and to facilitate determination of dilution and rate of travel in streams of materials that could have serious impact on municipal supplies. The use of activatable tracers in field studies not only eliminates all cause for public objections such as are stimulated by the use of radioactive isotopes, but also allows the study of long-term processes.

In order to meet the heavy demand for chemical analyses which are basic to investigations in geology and hydrology, radiological methods have been introduced in the Survey laboratories. In the interest of economy, greater efficiency, and safety for the men and women now engaged in this type of analytical work, it is necessary to consolidate the various laboratory groups in a special-purpose Nuclear Research Laboratory. The advantages of applying the powerful tools of radiological chemistry to our extremely heavy analytical load cannot be overemphasized. Currently some 40,000 or more analyses are needed yearly for normal geological and hydrological studies and this need can be expected to become even larger. We also hope to initiate studies whereby some of the future needs can be anticipated and handled more efficiently and economically through the use of radiological chemical techniques designed especially for some of the unique analytical problems which confront the geologist and hydrologist.

The Laboratory is designed to consolidate and service existing needs related to the normal work of the Geological Survey and to improve its capabilities in these fields. It will advance the safety of the operations. It will not duplicate other available facilities.

Detection of Underground Explosions

Senator Bible. It has been suggested, and I think it is a very timely suggestion, that you describe this VELA project for nuclear detection. Now, is this a cooperative effort with AEC?

Mr. Nolan. The work up to now has been not with AEC, but with the ARPA group in the Department of Defense. This group in Defense has financed the specific work that we have done in nuclear detection. As a result of this support we have become very much interested in the further application of the techniques that we have developed. The information that has been obtained applies to the more general questions of heat flow, geothermal energy, and the like.

With the strong support and encouragement from the ARPA group, it is proposed to supplement current work by a more broadly based study. This is our proposal for additional work to be done by the Geological Survey.

Senator Bible. A number of these projects, as you know, are being carried on in my State. Most of them, I think, are AEC projects.

Mr. Nolan. Yes, sir.

Shoal Project Cooperation

Senator Bible. Are you a cooperator in the so-called Shoal project which is being conducted just east of Fallon?

Mr. Nolan. Yes, sir. We were active participants in the selection of the Shoal site. In addition, we have a very considerable program with AEC support at the Mercury test site; a number of Survey men are stationed there. Much of the work at the test site has been to

anticipate and to protect against the effects of the underground shots on the local environment to determine their effect on the rocks themselves and especially to determine the effect on ground-water conditions. The VELA project, on the other hand, is sponsored by Defense, and is aimed at the detection of underground shots, to distinguish between them and natural earthquakes, and to help detection at a distance. The work that we have done for the VELA project has been carried on to a small degree in Nevada, but extends pretty much throughout the country.

Senator BIBLE. Mr. Chairman, this is most important work. As you know, Fallon, Nev., is the site of the Newlands project. And this is also very important for a man in political life, because we had been having some underground explosions over the years, and these people who live below the dam were very much interested as to whether the Geological Survey was correct in saying that the dam wouldn't break. So all I know is that if the dam had broken I would be back practicing law in Reno, Nev. I assured them that this wouldn't break. And I relied on these men in DOD and AEC and the Bureau of Reclamation. And so I hope that these very interesting facts in this field are correct.

Mr. NOLAN. We have a great deal of interest in this program and we are confident it is the type of program that is going to promote understanding in many areas.

Senator BIBLE. I am sure it is correct.

LONG-DISTANCE COMMUNICATION THROUGH UPPER MANTLE

May I ask just one question? What is the value of improving the long-distance communication through this upper mantle that you were describing? What is the benefit?

Mr. NOLAN. I think the real importance of it is that currently long-distance communication through the atmosphere is subject to disturbance by atmospheric conditions, by sun spots, and the like. It isn't, in other words, a hundred percent effective at all times. We know this just from radio interference and "snow" on our television screens. The expectation is that through the transmission of electrical or other signals through the crust and through the mantle, it will be possible to assure a much higher degree of reliability under all conditions and the signals will not be subject to outside interference.

Senator BIBLE. With whom do you conduct this work?

Mr. NOLAN. Various governmental agencies.

CONTRIBUTIONS BY GOVERNMENT AGENCIES

Senator BIBLE. And they are the main contributor's moneywise?

Mr. NOLAN. They have been up until now. The proposal is that this will become a part of a comprehensive program of studying and understanding the conditions in the crust that may affect signal dissemination. The upper mantle project is an effort to bring a comprehensive viewpoint to the environment which will have a bearing not only on the objectives of VELA, but as a package it is expected will yield results that will be applicable to a great many areas, and thus strengthen all of them rather than to have the efforts broken up into a number of independent and uncoordinated projects.

PARTICIPATION BY PRIVATE INDUSTRY

Senator BIBLE. Does private enterprise cooperate in this? For example, I have A.T. & T. in mind. I can see how this could be of great value to them. Are they a participant in any way, or are the big radio industries, or the big television industry?

Mr. NOLAN. Not that I am aware. Most of the work so far on the transmission of signals underground that we have done for other governmental agencies is in areas in which work is just beginning. And I am not certain to the extent that other groups have participated.

Senator BIBLE. Thank you, Dr. Nolan.

Thank you, Mr. Chairman.

Chairman HAYDEN. Thank you.

BUREAU OF MINES

STATEMENT OF MARLING J. ANKENY, DIRECTOR, BUREAU OF MINES, ACCOMPANIED BY PAUL ZINNER, ACTING ASSISTANT DIRECTOR, MINERAL RESOURCES DEVELOPMENT; JOE B. ROSENBAUM, ACTING ASSISTANT DIRECTOR, MINERALS RESEARCH; JAMES WESTFIELD, ASSISTANT DIRECTOR, HEALTH AND SAFETY; HENRY P. WHEELER, JR., ASSISTANT DIRECTOR, HELIUM; JOHN E. CRAWFORD, PROGRAM COORDINATOR, AND ELWOOD THOMSON, CHIEF, DIVISION OF BUDGET.

FISCAL YEAR 1965 CONSERVATION AND DEVELOPMENT BUDGET

Chairman HAYDEN. For fiscal year 1965 the Bureau of Mines asks $30,377,000 for "Conservation and development of mineral resources," an increase of $973,000 over the amount appropriated for this purpose in fiscal year 1964. The justification statement will be included in the record.

(The statement referred to follows:)

CONSERVATION AND DEVELOPMENT OF MINERAL RESOURCES

HIGHLIGHT STATEMENT

Long-range objectives and budget year program

Natural resources, particularly an adequate, dependable supply of the mineral raw materials and fuels from which are derived a continually increasing share of the necessities and luxuries of modern civilization, assume ever greater importance as the rest of the world strives to match the U.S. standard of living. American mineral production and use technologies are today the world's most advanced and are still improving; however, the rate of improvement is not commensurate with the decline in tenor of domestic deposits and increase in costs of production. The percentage of the U.S. mineral requirements met by imports increases every year. At the same time, world demand for minerals is growing at such a rate that competition for supply from foreign deposits may soon provide other nations with a powerful political tool. Domestic mineral resources are vast, if the technology to produce them economically can be developed. Therefore, supplies may continue to be imported without the United States becoming vulnerable through dependence on foreign sources, provided an economic domestic production capability is retained.

The long-range objective of the Bureau's minerals research program is to insure a continuously advancing mineral technology that will (1) encourage production from domestic mineral deposits at costs that will not adversely affect the national economy; (2) assure a healthy domestic mineral industry capable of meeting varying requirements for domestic production and maintaining its important

contribution to the total economy; (3) improve efficiency and safety of mineral mining and processing operations; and (4) minimize waste and improve recovery of irreplaceable domestic mineral resources.

The segments of the minerals research program must be so constituted that they can be responsive to the national need as indicated by the mineral resource study activity. Therefore, the various research programs must be balanced with respect to (1) short-range research on problems of immediate importance and (2) longer range research to develop new scientific knowledge and concepts related to the natural phenomena involved in mineral extraction, processing, and utilization which can quickly be brought to bear to provide practical solutions to new problems as they arise.

In mining research fundamental studies of the basic nature and mechanical behavior of rocks will be continued. Applied research will be conducted on such presently critical technologic problems as artificial support of underground openings, rock fragmentation and mine operation design. Research to develop means for reducing and eliminating the hazard from methane outbursts in mines will be expanded substantially to include both basic studies to develop a better understanding of the physical factors that govern methane occurrence, migration, and emission into mine workings and applied research to devise and test interim protection techniques that will reduce the hazard until permanent solutions based on sound scientific principles can be developed. Research on acid mine water abatement, ground control, rock drilling and blasting, transportation, mineral deposit sampling and open-pit slope design will receive slightly increased emphasis.

The metallurgy research program will be reoriented to better approach the long- and short-range goals of the Bureau. Working toward the goal of development of economic processes for treatment of low-grade mineral materials, effort will be intensified in the field of beneficiation. Work will include basic and applied studies in grinding, conditioning, and concentration methods. Procedures will be sought for improved accuracy and speed in the analysis of research products and to meet the demand for parts-per-billion measurement of impurities in high-purity materials. Investigations of shorter range importance include those to determine the reason for failure of zinc volatilization retorts, casting studies designed to develop improved procedures for forming difficult-to-shape metals such as beryllium and tungsten and research for preparing mineral-base materials with high strength properties at elevated temperatures.

The broad objectives of the resources investigations program are to assure an adequate, dependable, and continuing supply of minerals and fuels, promote the conservation and wise utilization of domestic resources, improve the economic position of domestic industry, and develop mineral-based materials to meet the increasingly rigid requirements of rapidly advancing industrial, defense, and space technologies.

Careful planning to assure the orderly development of this country's resources of peat, coke, coal chemicals, minerals, petroleum, and oil shale to meet tomorrow's needs is of growing importance. To illustrate this, it should be noted that in the past 30 years the United States has consumed more minerals than all the peoples of the world have previously used. That current demands for mineral and fuel raw materials are being met without difficulty is primarily due to the technological and exploratory efforts since World War II. But with national requirements constantly expanding and shifting among commodities, the Nation faces a future of critical shortages unless it can continue to add to its fund of knowledge of all factors that permit discovery and processing for utilization of new sources of these essential raw materials.

The bituminous coal research program is designed to develop new and improved methods of processing and utilizing coal that will improve its competitive position in the overall energy market. The program involves both short- and long-range projects for meeting the objectives with increasing attention being given to those of shorter range. In the short-range projects, the Bureau will continue its program of test work on the coal-fired gas turbine, which if successful, will be a means for opening additional markets for coal because of the increased efficiency obtained with this type of power generation. Research on Western lower rank coals will be expanded for improving their economic use in making steel and as a source of gas that can be used either as a fuel or a raw material for making chemicals. A new project will be initiated for making producer gas from caking coals for use in a variety of industrial processes.

The anthracite program is specifically concerned with accomplishing advances in the mining, preparation, and utilization of Pennsylvania anthracite. Primary

efforts in applied research are aimed at developing new or improved mining and preparation equipment and methods, and the establishment of additional uses for anthracite as a fuel and basic raw material. Fundamental research on the chemical and physical properties of the coal are governed by the same objectives. Mine drainage control comprises a further area of special importance to the anthracite program. The 1965 plans call for demonstrating the technical and economic feasibility of the integrated hydraulic mining-hoisting system and proving the value of the Bureau's boring machine in developing and mining thin, pitching seams.

The petroleum, natural gas, and oil shale programs will provide conservation of these vital fuel resources through research directed to increased discoveries of oil and gas from underground reservoirs, increased productive capacities of oil and gas wells, increased efficiencies in the processing of oil and gas for ultimate consumption increased economies in utilization, and increased technologic data for the establishment of an oil-shale industry. Adequacies of present supplies face mounting future demands that must be met at the most economic levels to support the Nation's expansion. These programs also will provide Government, as well as industry, with basic data, both scientific and economic, that are required for economic and policy guidance.

Expansion of oceanographic research will be directed toward development of the mineral resources beneath the seas. This is the responsibility of the Bureau of Mines and is recognized as such in the President's national oceanographic program. Incidental to oceanographic surveys by private institutes and Government groups, deposits have been discovered of nodules rich in manganese, nickel, cobalt, and copper, as well as occurrences of gold, glauconite, titanium-bearing black sands, phosphate, and limestone. These and other marine ores await only detailed study by Bureau scientists to unlock the doors of an immense reserve of raw materials for the future use of American industry.

Foreign mineral activities of the Bureau are designed to provide industry and Government with current technical and economic information on mineral developments in foreign lands that affect the mineral economy of the United States. The program includes interpretation of data on resources, production, consumption, international trade, technology, and the actions of foreign governments that affect production and marketing of foreign minerals and restrict foreign markets for mineral products and mining supplies and equipment manufactured in the United States.

Accomplishments during the past year

Recent metallurgy research investigations have resulted in numerous significant contributions to scientific and technology knowledge. Some of these accomplishments have received wide industrial interest. For example, Blast Furnace Research, Inc., a cooperative organization of the major U.S. steel companies, has entered into a cooperative agreement with the Bureau of Mines to continue development of injected fuel techniques for iron blast furnaces. Two mica recovery plants were built in Southeastern United States using a Bureau-developed flotation method. An industry-sponsored pilot-scale study demonstrated the feasibility of a Bureau method for extraction of columbium and tantalum chlorides from furnace slags.

In mining research the Bureau developed a rapid simple method for determining tensile strength of rock which promises to be an invaluable new tool for mining engineers. One of its many important potential applications for mine design is in the field of quarry blasting. Since the strength of rock generally varies with direction, a cheap portable device, based on the Bureau technique, will enable the engineer to orient his quarry face to take advantage of the natural weakness of the rock, thus lowering the amount of explosives required and reducing the cost of production.

In coal research, a fully automated transportation system has been designed and constructed to hydraulically transport coarse coal (2-inch top size) in a 1-mile-long, 6-inch-diameter pipeline. The coal will be fed into the line through lock hoppers on the discharge end of two series-connected centrifugal pumps. Considerable interest has been shown in this project. Preliminary calculations indicate that this method of transportation may be the most economical for relatively short distances, particularly underground and from the mine or mines to the preparation plant.

Research from the petroleum, natural gas, and oil shale studies was used by industry to establish a waterflood project in Utah that will yield over 100 million barrels of oil, and to create increased productivity in Pennsylvania oilfields. Mathematical computer programs developed by the Bureau are in use

by industry to predict, with greater accuracy, the production performance of oil reservoirs. Analyses of crude oils, shale oils, oil fractions, and products were completed and published, including identification of compounds never before identified in these oils. Fundamental combustion data for organic boron compounds—rocket propellant fuels—were obtained through new instrumental techniques. Studies were completed on the extent and quality of specific oil shale deposits in Colorado. Laboratory studies have indicated possible technical feasibility of the in situ conversion of oil shale to shale oil.

In resources investigations a study of the mineral raw materials for the chemical industries of California and Nevada was completed and a report published. Through close cooperation between mineral producers and chemical consumers, the raw material requirements and the sources of supply were described together to suggest possible economies through utilization of local resources. A similar study of importance adjoining and possibly extending into the Appalachian area is being initiated in the Ohio Valley. Evaluation of studies were made of many Alaskan mineral resources which would be affected by construction of the Rampart Dam and resulting low-cost hydroelectric power.

Conservation and development of mineral resources

Appropriation 1963 (including supplementals)		$27,502,450
Transferred to "Operating expenses, Public Buildings Service," General Services Administration		−34,368
Total available, 1963		27,468,082
Appropriation, 1964		29,404,000
Transferred to "Operating expenses, Public Buildings Service," General Services Administration		−35,000
Total available, 1964		29,369,000

SUMMARY OF INCREASES AND DECREASES, 1965

Bituminous coal:		
To provide for research on drainage of methane during mining	+$217,000	
To provide for increased pay costs for fiscal year 1964 positions	+162,000	
		+379,000
Anthracite coal:		
Decrease in scope of anthracite coal program	−235,000	
To provide for increased pay costs for fiscal year 1964 positions	+9,000	
		−226,000
Petroleum, natural gas, and oil shale:		
To provide for recovery of shale oil by in situ retorting of oil shale	+200,000	
To provide for increased pay costs for fiscal year 1964 positions	+120,000	
		+320,000
Minerals and metals:		
To provide for employee compensation payments	+5,000	
To provide for increased pay costs for fiscal year 1964 positions	+376,000	
		+381,000
Oceanographic research:		
To provide for increased marine minerals research	+126,000	
To provide for increased pay costs for fiscal year 1964 positions	+3,000	
		+129,000
Foreign mineral activities: To provide for increased pay costs for fiscal year 1964 positions		+25,000
Net increase, 1965		+1,008,000
Budget estimate, 1965		30,377,000

Analysis by activities

Activity	Fiscal year 1963, amount available	Fiscal year 1964		
		Appropriation	Transfers [1]	Amount available

Total	7,342,270	7,957,000	8,336,000	+379,000	+162,000	+217,000

EXTRACTION RESEARCH

The estimate of $1,198,000 is an increase of $237,000 over 1964. The increase consists of $20,000 for increased pay costs, and $217,000 for research aimed at overcoming production problems caused by the emission of methane gas during mining operations.

Need for increase.—The increase requested for fiscal year 1965 will constitute the expansion considered necessary for the Bureau to start a well-balanced research program with the objective of developing economic and practical methods for removing the explosive mine gases from coalbeds prior to and during underground mining operations. The sudden emission of methane at the face during mechanical mining continues to take its toll of lives, destroy equipment, and cause losses in production that challenge a mining company's financial capacity to regain production schedules. The full amount of the increase will be applied to this research program and the studies will be coordinated closely with those conducted by the health and safety activity.

Plan of work.—A major objective of the Bureau of Mines coal mining research program is to develop a sound scientific basis for an improved coal mining technology that will (1) assure a continuing and adequate supply of a wide variety of coals for metallurgical, manufacturing, steam generation and domestic uses; (2) conserve this irreplaceable fossil fuel through maximum recovery of salable coal; (3) minimize the cost of mining through the use of efficient machines and mining techniques; (4) promote the health and safety of miners by the application of engineering principles, and (5) minimize the defacement of land and contamination of surface waters by reducing subsidence effects of underground mining, restoration of surface mining operations and the abatement of stream pollution by mining wastes.

Although mechanization has increased the productivity of the American coal miner far exceeding any country in the world, many serious technical, economic and social problems exist. There is little hope for significant decreases in the total mining cost with present mining equipment and mining systems; only through imaginative and diligent research can coal's important role be assured in today's highly competitive energy market.

The Bureau of Mines with its nucleus of specialized scientific and engineering personnel is ably suited to meet the challenge of solving these and other basic technical problems now facing the coal industry.

Environmental control: Under this program element are included research in methane drainage and acid-water mine drainage. Methane drainage research will be expanded in fiscal year 1965 by initiating basic studies to develop fundamental information on the occurrence of methane in coal beds that can lead to a permanent solution to the hazard of methane outbursts. The program will include (1) research to determine the capacity of coals to contain methane and the mechanics of containment. (2) fundamental studies of the physical factors that govern the occurrence, migration, and emission of methane into mine workings, (3) field studies to develop techniques for removing the methane from the coalbeds prior to mining, and (4) in cooperation with mining companies demonstrations of means for integrating degasification techniques into their normal mining cycle.

The acid-water mine drainage research program will be moderately expanded in fiscal year 1965 by redistribution of funds utilized in fiscal year 1964 for field trials in hydraulic mining. The expanded program will include the continuation of the evaluation of mine sealing as a means of preventing acid drainage from abandoned mines and applied research to develop improved methods of solidification and cementation. This research is also discussed under the minerals and metals activity. A project will be continued to investigate the possibility of self-sealing a mine internally by the injection of neutralizers to form a sludge, an evaluation of equipment and costs of neutralization, and study of the biochemical effect of iron oxidizing bacteria on the rate of acid-mine water formation. An effort will be made to determine means to minimize the amount and acidity of mine water discharges to the surface from operating mines through cooperative studies with operating mines. In addition, methods for preparing a mine for closure to minimize its acid potential after its abandonment are needed.

Rock disintegration: The Bureau has completed four full-scale field trials on the use of high-pressure water jets to extract bituminous coal. In coalbeds pitching more than about 25 degrees, hydraulic mining of coal was more productive than hand-mining methods. Further extensive field trials in coal are not considered necessary at this time. However, for most efficient hydraulic mining system design, basic data must be developed to determine the optimum cutting rates of hydraulic jets as a function of the physical properties of the coal to be mined, and the effect of such characteristics of the hydraulic jet as water pressure and volume, geometry of nozzle, proximity of the jet to the mineral, and the speed of traversing the jet. As it is impractical to set up a multitude of field trials to determine the minability of a wide variety of coals and even other sedimentary deposits, a simple laboratory technique will be devised to obtain cutting rates. Reduction in emphasis on the field trials in coal will permit some of the funds utilized in these studies to be redistributed to the acid-water mine drainage research program.

Materials handling: After initial extraction, mining is largely a matter of ground support and material handling. A variety of means is available for material handling including hydraulic transportation in pipelines and in open flumes, pneumatic transportation in pipes and transport by chutes, conveyors, mine cars, skips and scrapers.

Work during fiscal year 1965 will be limited to hydraulic transportation research, continued at the same rate as fiscal year 1964, and will include the continuation of

the tests with the 1-mile long test loop to study the effect of such variables as size and specific gravity of the solids, solids concentration and velocity on the pressure drop, erosion, corrosion, and power requirements.

Ground stabilization and control: Studies of coal longwall mining that have been made by the Pittsburgh Mining Research Center will be continued at the Denver Mining Research Center with emphasis on stress distribution and concentration studies in longwall mining of coal. The change in location of the study will permit applying the fully developed capability of the rock mechanics unit at Denver on the problem.

Fundamental aspects of mine rock behavior: This study is related to practically all the facets of a total mining operation from exploration through beneficiation. In the case of coal, the mechanical and physical properties determine to a great extent the mining system; the geometry of the openings; the type of roof support required; the dimensions of coal pillars used for support; the amount of energy required for extraction; and the material required for cutting and drilling tools. To this list might also be added the fact that to a great extent the physical properties of the coal are related also to the amount of methane that may be held in the pores and microfractures of the coal and the rate at which it can be moved from a highly pressurized area into the mine atmosphere. It may thus be seen that the solution to many of the practical mining problems is contingent on the mining engineer's ability to assess the properties of the coal at the face and the soft underlying and overlying rocks. Application of scientific and engineering principles in coal mining must necessarily await the development of fundamental measurements of the coal and enclosing rocks in their natural and disturbed environment. The program will be coordinated with the basic research program discussed under the minerals and metals activity. Significant progress has already been made in the studies of rocks and minerals other than coal, and initial efforts in this study will be to adapt the techniques and methods developed for the studies of minerals to a similar study of coal.

Coal preparation: Evaluation of coal preparation equipment using dense-medium suspensions in water to effect the separation will be studied. It is anticipated this study will enable the coal operator to select and install the proper cleaning method and equipment best suited to the quality demands of the market and the washing characteristics of the coal to be cleaned.

Studies of the design and operation of the hydrocyclone will continue. This cleaning unit holds promise of effective separation of coal from refuse without the use of dense medium thereby materially reducing the cost of operation.

A heavy liquid cyclone will be developed as a means to monitor continuously the feed to cleaning units. Success in this field will provide instant detection of malfunction of washing equipment thus permitting prompt remedial action.

One of the most pressing problems in coal preparation is the need for cheaper and more effective means to dewater flotation tailings. Studies will be continued of the absorption properties of tailing materials as related to size and mineralogical composition. The objective of the investigation is to improve the handling characteristics of the refuse material for ready disposal.

The expanding market for lignite is in the generation of electric energy. Many of the new power stations are considering use of pulverized lignite as fuel. Studies will be made of the power requirements to grind lignite in various types of mills both with and without in-the-mill drying. To develop a more effective method of drying lignite, the principal of pulsating combustion will be studied.

One of the fastest growing trends in coal preparation is the use of froth flotation to clarify the wash water and to clean and upgrade the fine sizes of coal. A study is proposed to investigate simultaneously the numerous variables that effect the flotation process and analyze their primary effects and interactions in relationship to yield and quality of float product. Consideration will be given to the use of a digital computer for analyzing statistically the mass of experimental data generated by the study.

Coal sampling, analysis, and inspection: This continuing program involves the inspection, sampling, analysis, and evaluation of coals available for purchase by the Federal Government to provide procurement agents and others with information on the availabilities, qualities, and characteristics of coal within geographic areas of the United States, for the purpose of increasing efficiencies of utilization and minimizing costs of operation. Advice and consulting service is given upon request to other Government agencies in the preparation of coal bid specifications, evaluation of coal bid responses, selection of proper procedures to obtain representative coal samples of coal shipments, and related analytical activities.

PROCESSING AND UTILIZATION RESEARCH

The estimate of $5,827,000 is an increase of $115,000 over 1964, all of which is for increased pay costs.

Plan of work.—During fiscal year 1965, emphasis, is planned on the operation of the coal-fired gas turbine. The study into the injection of coal as a supplemental fuel into the blast furnace will be concluded and the research effort transferred to the program to develop further and operate more continuously the slagging gasifier using lignite as fuel. The cooperative study with the Atomic Energy Commission on the nuclear gasification of coal will be deferred and a cooperative study with the Commission started on the closed cycle gas turbine using inert gases as working fluids. Bureau funds now devoted to the nuclear gasification study will be directed toward higher priority activities involving the manufacture of producer gas under pressure from caking coals with little or no pretreatment to destroy the caking characteristics and the cleaning up of producer gas under pressure over a wide range of temperature levels.

The following activities will also be included in the program: The entrainment carbonization of western coals to prepare a char that can be substituted for a portion or all of the low- or medium-volatile bituminous coal used in blends for the production of metallurgical coke by the western steel industry will be expanded. This investigation, if successful, will make it unnecessary for the western steel industry to import coal for blending purposes from distant eastern sources and, through the cost savings involved, to improve its competitive position with foreign produced steel. Formed coke, produced by pelletizing or briquetting the char will be studied.

Facilities are maintained to analyze industrial water used in the heating and powerplants of the Federal Government. A consulting service is provided to other Government agencies, upon request, concerning the most efficient techniques of waterside boiler maintenance. Technical information is published on boiler feed water, cooling water treatment, and industrial water qualities. These services result in considerable saving to the Federal Government by minimizing maintenance and replacement costs of heating and powerplant equipment, and are valuable guides to public and private industrial water utilization.

Operation of the slagging fixed bed pressure gasifier will continue on lignite to determine optimum conditions for operation. Modifications will be made to improve reactor and process design and to permit maximum throughputs and improved gas quality at pressures up to 450 pounds per square inch gage. Around-the-clock operation will be conducted to determine life of refractories, tuyeres, and other high temperature components. Design data for prototype commercial scale gasification will be obtained.

A semipilot plant scale experimental unit for production of carbon disulfide from lignite char will be constructed and operated for establishing optimum conditions and obtaining commercial scale design information.

Semipilot plant equipment for a dilute phase system will be constructed and operated to determine conditions under which dry coal and hydrogen can be reacted under pressure to produce high British thermal unit gas autogenously without use of external heat. Modifications of the process will be made as needed to achieve autogenous operation and to obtain the quality of gas and conversions of coal desired.

Exploratory studies will be conducted on dry coal hydrogenation to liquid fuels. It would eliminate pastemaking and preheat operations and equipment required in the conventional process. Other novel ideas will be sought and investigated.

Reacting coal at extremely high temperatures in a gaseous plasma for making valuable chemicals will continue. Hydrogen and other gases will be used.

Preheating of lump coal in a falling-bed, up-flow hot gas system, for destroying the caking properties will be investigated to decrease time required for effective treatment. Equipment will be constructed, and pretreated coal fines will be gasified in a continuous flow 2- or 3-step fluidized system to simulate gasification reactions now obtainable only in the Lurgi fixed-bed lump coal gasifier.

Catalysis of the gasification reaction at moderate temperatures will be investigated and a bench-scale externally-heated reactor will be constructed to determine the feasibility of gasifying only the hydrogen-rich portion of the coal in a balanced operation which would yield only sufficient char required for plant power and for combustion to furnish the gasification reaction heat.

A semipilot plant scale unit will be designed and constructed to determine optimum conditions for synthesis of methane in a tube wall reactor in which the

catalyst is flamesprayed on the wall. Engineering and design information will be obtained for prototype commercial units. The reactor will be tested for production of liquid fuels as well. Search for a cheaper catalyst such as flame-sprayed Allen Wood magnetite for use in the tube wall and hot gas recycle processes will continue.

Upon completion of investigation of production of hydrogen cyanide from bituminous coal, experiments will be made in the production of carbon disulfide using similar techniques. Production of carbon black from coal will be considered and plans developed for its investigations.

The search for more efficient and cheaper solvents and absorbents for purification of synthesis gas will continue. The effectiveness and efficiency of materials showing merit will be determined on bench-scale continuous-flow equipment.

A pulse-jet system for conducting chemical reaction of coal will be evaluated. If such a system appears to be of merit, gasification of coal and making chemical from coal will be investigated in the laboratory.

Data on pneumatic transport of coal obtained in a 1-inch-diameter line will be evaluated and correlated and larger systems for 2- and 3-inch-diameter lines will be installed and operating data obtained for extrapolation to commercial-size lines.

If separation of ash material from pulverized coal by dielectro-phoresis now being conducted in laboratory-scale apparatus indicates merit, larger scale equipment will be designed and operated to obtain data for determining the economics for such a process.

A pilot-scale combustor for producing dust laden synthesis gas will be constructed and the efficiency of the pilot-scale electro-static precipitator for removing dust from hot synthesis gas under pressure will be determined. The use of corona to accelerate chemical reaction will be carried out on a larger scale equipment as indicated by the success of laboratory experimentation now in progress.

Work will continue on the upgrading of low temperature tars. Emphasis will be placed on conversion of the tar and/or fractions to valuable products such as pitch for electrode carbons and olefins to alcohols for plasticizers and soft detergents. New techniques and possibilities of producing new products for which commercial demand may develop will be investigated. Semipilot plant equipment will be constructed and operated to determine economics of the upgrading processes indicating merit.

Pelletizing and sintering equipment to investigate the utility of fly ash from combustion of coal in powerplants will be operated to make lightweight aggregate. Fly ash from a variety of coals of different ash composition will be tested, and the composition and aggregate quality will be evaluated. Use of fly ash as road-building material, soil conditioner, etc., will also be investigated.

In the study of the magnetohydrodynamic process of electric power generation, a high-temperature combustion unit burning coal at 4,000° F. will be operated to determine the effect of coal ash and seeding material on steam and heat exchange tubes. Following these tests, the equipment will be redesigned for operation at 5,500° F. Factors to be determined include the extent of ionization and electrical conductivity and corrosion of magnetohydrodynamic components induced by coal ash.

Increased attention will be given to solution of ash problems associated with combustion of lignite at powerplants in North Dakota and adjacent States.

Work will continue on development of a meter for determining simultaneously the amount of moisture, ash, and sulfur in moving streams of coal, for example, on a conveyor belt.

For obtaining valuable chemical products, experiments involving the reaction of coal under the influence of various forms of electric discharge will be made.

For a better understanding of the complex physical and chemical nature of coal for its improved processing and utilization, studies of coal structure will continue using all available modern analytical tools and techniques.

Work will continue on the study of coal combustion in fuel beds under pressure as a source of clean hot gas for the gas turbine. The development of instrumentation for measurement of radiant heat flux within furnaces will be extended to field studies to determine flame configuration and its effect on heat transfer from flames and to find explanation of hot spots not reasonably explained by the furnace radation model studies. Emphasis in the continued work on deposits and corrosion of boiler surfaces resulting from the release of mineral matter from coal will be shifted more to the study of the reactions of mineral matter under the high temperature conditions of combustion processes. Equipment and techniques developed for the laboratory study of pulverized coal flames will be adapted to studies of the release and reactions of mineral matter in flames.

The effect of process variables on the production of chemical coke suitable for the carbide, phosphate and similar industries on a pilot-plant chain-gate stoker will be investigated. Emphasis will be placed on achieving higher coal feed rates, better furnace performance, and utilization of weakly coking coals.

To utilize coal more efficiently for carbonization, attempts will be made to elucidate the coking process by determination of the structure and composition of the chloroform extracts of chars produced at temperatures within the plastic range, thermogravimetric studies of coals and blends, and the effect of particle size on the type, quantity, and rate of volatile evolution at temperatures within the plastic range.

A study will be made to determine whether the tumbler stability and hardness of coke obtained by ASTM methods at room temperature follows the same pattern as those tested at elevated temperatures similar to those in blast furnaces, where the coke is utilized. If the cokes do not follow the same pattern when tested hot as when tested cold, the number and type of coals that can be used for commercial carbonization may be increased markedly.

RESOURCES INVESTIGATIONS

The estimate for the subactivity for fiscal year 1965 is $800,000, an increase of $17,000 over 1964 all of which is for increased pay costs.

Plan of work.—The funds requested for this program will be used to make resources investigations, assemble comprehensive information and report on coal's changing position in the energy market as compared to other energy fuels and waterpower, and to make an assessment of coal's position in the heavily increasing national energy requirements. Related factors include shifts in patterns of coal distribution from districts of origin to States of destination; changes in f.o.b. mine costs and value of output; changes in exports and influencing factors in the international energy market as they affect U.S. coal exports and our international balance of payments; potentials for increasing coal exports under national or international trade expansion of data on coal consumption, marketing, and trade so that studies and analyses can be made on State and regional breakdowns for guidance to local industry and communities and the Government.

Special studies will be made in selected areas of the possibilities of mine-mouth powerplants, with particular attention to localities where unemployment is high as a result of reduced employment in coal mining, as in the Appalachian area.

Surveys will be conducted to determine the extent of the remaining minable reserves of metallurgical coking coals on an area, county, and State basis to obtain information relevant to further coal research in the blending and modification of marginal coals or noncoking coals. Investigations of the coals of the Arctic coalfield in Alaska will be continued, using special equipment moved in last season to obtain bulk samples for analysis and testing. Coalfields of southwestern Utah will be studied with a view to appraising their economic availability, considering the various factors in cost of production, and also analyzing various methods of marketing and utilization.

Surveillance will be maintained of commercial, industrial, and consumer needs pertinent to the reserves, production, distribution, and utilization of coal and related products; engineering, technical, and related economic studies will be conducted pertaining to mining operations, consumption, and other coal-related problems, and recommendations will be made for technological research based thereon. Comprehensive reports will be published pertaining to the various phases of coal mining operations and to related trends and forecasts and to marketing, consumption, exports, and other important features of the coal industry, coal production, and trade.

Upon request, and supplementing other analyses pertaining to coal and coal utilization factors, technical information and advice will be given other Federal agencies and investigative tests will be conducted on heating and powerplant equipment, both new and old, to establish information to effect efficient operation or to ascertain if contractual obligations of Government purchases are fulfilled by the contractors. In addition, assistance will be given on fuel combustion and ash deposition problems, fuel selection, equipment maintenance, and comparative fuel cost studies.

EXPLOSIVES RESEARCH

The estimate for this subactivity for fiscal year 1965 is $511,000, increase of $10,000 over 1964 all of which is for increased pay costs.

Plan of work.—Funds requested for this subactivity will be used by Bureau laboratories and offices for a continuing program of fundamental and applied re-

search involving (1) the development of safer explosives for use in underground coal mines and in other underground operations where a gas and/or dust explosion hazard may exist; (2) approval testing and monitoring of explosives of commerce and related items to determine their conformance to safety standards prescribed in published schedules; (3) the safety and performance characteristics of commercial explosives and blasting agents; and (4) factors pertinent to the reduction of fires and explosions in industries producing, transporting, or utilizing the mineral fuels and their products. This program work will be closely coordinated with related research supported by other governmental agencies and industry.

The Bureau's objectives will be accomplished through short- and long-range, often interrelated, research programs which include laboratory, pilot plant, and field investigations. A balance is maintained between the solution of practical problems of immediate interest and fundamental studies for the development of information necessary for the solution of future problems.

The relatively widespread use of ammonium nitrate-fuel oil (AN–FO) in underground mining operations makes it essential to place emphasis on the safety characteristics of such mixtures. Within the limitation of funds available, a start will be made on a study to determine the relationship between the physical properties of the raw AN and factors believed to affect the safety and performance of the blasting agent such as aging; evaporation of oil from mixture; migration of oil through mixture; type of oil added; etc. Additionally, work will be initiated on the hazard potential of sensitized ammonium nitrate prepared as a water resistant slurry. Practically no safety information is available on this very important commercial explosive.

Long-range, basic investigations will be continued on combustion characteristics of hybrid flammable gas-combustible dust-air mixtures; initiation and propagation of flames in flammable gas-air mixtures; initiation and propagation of flame through incompletely mixed (layered) systems of combustible gas in air; hazard characteristics of potentially explosive materials of commerce.

Investigation of factors affecting the incendivity of explosives to flammable gas-air mixtures will be continued. Research will be directed also toward the development of test procedures which will predict more definitively the hazard potential of various explosives materials.

All work will be closely coordinated with other work of the Bureau, particularly that relating to safety in the mineral industries. Cooperation with other governmental agencies and industries having problems involving explosives and explosion hazards will be continued. The broad experience of the scientific staff will be available as needed for consultation regarding potentially hazardous situations.

Anthracite coal

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Extraction research	$412,278	$430,000	$328,000	−$102,000	+$4,000	−$106,000
(b) Processing and utilization research	515,856	512,000	400,000	−112,000	+4,000	−116,000
(c) Drainage control	87,330	117,000	105,000	−12,000	+1,000	−13,000
Total	1,015,464	1,059,000	833,000	−226,000	+9,000	−235,000

EXTRACTION RESEARCH

The estimate for this subactivity for fiscal year 1965 is $328,000, a net decrease of $102,000. This decrease consists of a program decrease of $106,000 and an increase of $4,000 for increased pay costs. The decrease is part of an overall decrease in the anthracite program requiring termination of a number of projects by the end of fiscal year 1964, in order that other phases of research showing greater potential can be vigorously pursued. The projects to be terminated are the heavy-media testing of various coals, the study of effect of size on ash content of anthracite, washability studies on the various minable anthracite seams, and the construction of a wire-saw for use in mining steeply pitching anthracite seams.

Plan of work.—The funds for this subactivity will be used at Bureau laboratories, principally the Anthracite Research Center, and mines of cooperating

companies for research to be conducted independently by Bureau personnel, and in collaboration with personnel of the cooperator. The program will be coordinated with those of other Government agencies, educational institutions, and private industries engaged in similar research. The following research activities are planned under the program:

In cooperation with a mining company, the hydraulic hoisting mechanism and the redesigned hydraulic mining machine (called the Jumbo) along with the necessary auxiliary equipment, will be installed and testing begun in a new mine containing several million tons of minable anthracite. The purpose of the research will be to determine the technical and economic feasibility of using a fully integrated hydraulic mining system. The coal in this particular location cannot be economically mined by conventional methods because of the high underground transportation costs.

Testing of the Bureau's large diameter boring machine will continue in a mine of the cooperator to fully evaluate its potential in the development and productive mining of thin, steeply pitching beds.

Microfilming of maps of active and abandoned anthracite mines will continue following completion of this work in the northern field, available maps of mines in the other anthracite fields also will be filmed and filed at a depository.

Studies will continue in the low-ash anthracite pilot plant. Various flotation agents and media will be tested to determine their relative effectiveness in de-ashing the coal. The effect of particle size and various physical and chemical pretreatments will be explored.

The Bureau will again provide sampling of coal at the breakers to make available, to Government agencies and prospective buyers, analyses, and data on the quality of anthracite output from preparation plants throughout the anthracite-producing region.

Economic and statistical information on anthracite production will be collected and published as in the past.

PROCESSING AND UTILIZATION

The estimate for fiscal year 1965 is $400,000, a net decrease of $112,000. This decrease consists of a program decrease of $116,000 and an increase of $4,000 for increased pay costs. The decrease is part of an overall decrease in the anthracite program requiring termination of a number of projects by the end of fiscal year 1964. Projects to be stopped are: Study of electrical properties, study of fine coal properties, investigation of use of ultrasonics in the processing of anthracite, and research on irradiation of anthracite.

Plan of work.—Funds requested for processing and utilization research will be used at Bureau laboratories, principally the Anthracite Research Center, for independent and cooperative research conducted by Bureau personnel. The work will be coordinated with that of other Government agencies, educational institutions, and industry. The following research activities are planned under the program:

Research on anthracite surface properties will be directed toward determining practical areas of application for these properties, particularly in the field of anthracite utilization. Processes involving phenomena such as adsorption, displacement, and diffusion of gases or liquids will be given special consideration.

Hydrogasification research will be continued in an effort to develop competitive gaseous fuels through the reaction of anthracite with hydrogen in a fluidized bed reactor. Various catalysts will be considered and modern research tools and techniques evaluated for their effect in producing increased yields of methane. Alternatively, this system will be studied as a production unit for other hydrocarbons.

Following evaluation of the effectiveness of the methods previously investigated for removing deleterious materials from acid mine water, research will be concentrated on the development of the most promising methods. Special emphasis will be given to the possible utilization of regional resources as treatment materials because of the implicit advantage which will be afforded the regional economy if this can be achieved.

Subsequent to the successful calcination of a small quantity of anthracite briquets in a laboratory-size Dwight-Lloyd traveling grate machine, a sufficient tonnage of low-bulk-density briquets will be heat treated in this type of unit to permit further pilot-plant testing of the formed anthracite in the Bureau's experimental blast furnace at Bruceton, Pa. At the conclusion of this work, a cooperative arrangement will be considered for testing the briquets in a commercial blast furnace.

Economic and statistical surveys will be made on the marketing, distribution, and utilization of anthracite. Additional studies will include special investigations of world production, export trade possibilities, and other aspects of world trade in coal which might affect the domestic industry.

DRAINAGE CONTROL

The estimate for this subactivity for fiscal year 1965 is $105,000, a net decrease of $12,000. The decrease consists of a program decrease of $13,000 and an increase of $1,000 for increased pay costs. The decrease is part of the overall decrease in the anthracite program.

Plan of work.—The purposes of this subactivity were expanded by the 87th Congress which by the act of October 15, 1962 (Public Law 87-818, 76 Stat. 934) amended the act of July 15, 1955 (Public Law 162, 84th Congress, 69 Stat. 352, 30 U.S.C., 571-576). The act of July 15, 1955, authorized the Secretary of the Interior to contribute not more than $8,500,000 to the Commonwealth of Pennsylvania on a matching fund basis in establishing a joint program for the control and drainage of water, which if not controlled or drained, would cause the flooding of anthracite formations. The act of October 15, 1962, expanded the purposes to include the sealing of abandoned coal mines and the filling of voids in abandoned coal mines where such work is in the interest of public health and safety.

The subactivity comprises the evaluation, engineering, and inspection work necessary to carry out the Federal Government's obligations in the expanded joint program. Conservation projects, as in the past, will be designed to prevent inundation of active mine workings and will include pump installations to control the level of water pools in abandoned mines and surface drainage works to prevent seepage into underlying mine workings. Projects for health and safety will be designed to prevent surface subsidences through filling underground voids and to fill or slope abandoned strip pits where serious public health and safety hazards exist to the extent of minimizing such hazards.

Petroleum, natural gas, and oil shale

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost	Program
(*a*) Extraction research	$1,549,423	$1,602,000	$1,652,000	+$50,000	+$50,000	----------
(*b*) Processing and utilization research	671,567	795,000	820,000	+25,000	+25,000	----------
(*c*) Resources investigations	368,200	557,000	574,000	+17,000	+17,000	----------
(*d*) Oil shale research	877,856	908,000	1,136,000	+228,000	+28,000	+$200,000
Total	3,467,046	3,862,000	4,182,000	+320,000	+120,000	+200,000

EXTRACTION RESEARCH

The estimate for this subactivity for fiscal year 1965 is $1,652,000, an increase of $50,000 over 1964, all of which is for increased pay costs.

Plan of work.—The funds requested under this program will be used for research by Bureau personnel at laboratories, in oil and gas fields, and at storage facilities directed primarily toward the conservation of liquid and gaseous fuels. Industry organizations, such as the American Gas Association, the Pennsylvania Grade Crude Oil Association, the Independent Petroleum Association of America, the North Texas Oil & Gas Association, the Kansas Independent Oil & Gas Association, various States where oil and gas are produced, and the Atomic Energy Commission all are supporting the Bureau research either technically or financially, or both. The objectives of this program are to develop technical data that will result in improvements in primary and secondary recovery and in more reliable methods of locating, producing, and evaluating petroleum reserves. The principal program elements under this subactivity are presented in the following paragraphs:

Petroleum and natural gas reservoir performance and related production problems in California.—Laboratory and computer research will be conducted on appraisals of oil-recovery mechanisms and performance, other laboratory research will be designed to measure recovery of natural gas by water drive, and studies will be made of well-completion practices. A computer program will be devised to indi-

cate the most profitable time for initiating waterfloods and a study will be made of sea water as an injection medium in waterflood operations.

Properties and performance of petroleum, natural gas, and reservoir rocks in Rocky Mountain oil and gas fields.—Research will be conducted to evaluate the productive potential of the major oil-producing formations in the region, to determine the best methods of well completion, to study the response of reservoir rock to waters of various chemical composition which are available for water injection, to determine physical properties and composition of petroleum reservoir fluids in the Rocky Mountain area, and to assess the possible use of a local high-nitrogen content natural gas as a pressure-maintenance fluid.

Research in the production and storage of petroleum and natural gas in the mid-continent area.—The program of research to be conducted includes field and laboratory experimentation on the properties and flow of reservoir fluids, increased emphasis on the development of methods of handling, detecting, and measuring radioactive tracers for various applications in petroleum-production research, evaluations of current stimulative methods of oil production and development of new methods, testing of theories on migration of oil and gas, mechanisms and energies involved in the displacement of crude oil from solid surfaces, methods for determining physical, chemical, and mineralogical properties of rock cores, and gas repressuring and recycling of semidepleted petroleum reservoirs.

Field studies of engineering and related problems in oil production in Texas, Arkansas, and Louisiana.—Field studies will be made to evaluate the effects of remedial measures for preventing channeling of injected waters in waterflood operations of cooperating oil operators in north Texas. An engineering analysis will be initiated on the application of modern techniques in oil recovery from gas-cap oil reservoirs.

Susceptibility of Appalachian oilfields to newer production techniques.—Crude paraffin wax samples will be analyzed and the effects of acoustic energy on such waxes will be studied. Laboratory experiments will determine the effects of vibrational, magnetic, and electrical energy on fluid flow and oil recoveries. Field investigations of thermal recovery projects will be continued. Evaluations of depleted oil reservoirs will be made to determine if newer recovery techniques are applicable. Radiotracer tests will be continued to improve the technique and to determine the efficiency of injection projects. Final reports on the studies of vertical flow of oil and gas in small-diameter tubing will be published.

PROCESSING AND UTILIZATION RESEARCH

The estimate for this subactivity for fiscal year 1965 is $820,000, an increase of $25,000 over 1964, all of which is for increased pay costs.

Plan of work.—The funds requested will be used for research to be conducted by Bureau personnel at research centers. The work will be coordinated with work of other Government agencies and private industries concerned with processing and use of petroleum and natural gas. Projects will be conducted in cooperation with State agencies, trade associations such as the National Petroleum Refiners Association and the American Petroleum Institute, and Federal agencies such as the Atomic Energy Commission, Public Health Service, Navy Bureau of Ships, and other defense agencies. The objective of the work is to provide information required for efficient development of new and improved products and processes in order that maximum benefit be derived from the Nation's supply of crude oil and from refined petroleum products. The principal program elements under this subactivity are described in the following paragraphs:

Sulfur and nitrogen compounds in petroleum.—Research studies will be directed to isolation and identification of sulfur and nitrogen compounds in petroleum. Chemical and instrumental methods of analysis will be developed and applied and pure standard samples of sulfur and nitrogen compounds will be prepared and their physical and thermodynamic properties determined.

Characteristics of crude oils and asphalts.—Routine determinations will be made of properties of about 270 crude oils and their fractions and of specially prepared asphalts. Methods will be developed for more accurate and rapid methods of analysis and for correlating properties of oils and asphalts.

Fuel stability in storage, phenomena of combustion of petroleum fuels, thermodynamic properties of hydrocarbons and related organic materials, and chemical-physical research on oilfield fluids.—The thermodynamic research program will include low-temperature calorimetry, combustion, and vapor-flow calorimetry studies of nitrogen, sulfur, and fluorine compounds. Theoretical work will be done on the development of improved intermolecular potential energy relations

for gaseous systems, studies will be made of molecular structure and energetics, and chemical thermodynamic properties will be calculated. Molecular spectroscopy studies will be continued. Combustion research will be done on reactions of automotive exhaust-gas components, composition of diesel exhausts, and effects of engine and combustion system parameters on exhaust emissions. Radioactive-tracer techniques will be applied to chemistry and to exhaust-gas studies. Fuel-storage-stability studies will be continued.

RESOURCES INVESTIGATIONS

The estimate for this subactivity for fiscal year 1965 is $574,000, an increase of $17,000 over 1964, all of which is for increased pay costs.

Plan of work.—The funds requested for resource investigations will be used to collect factual data required to provide a more complete picture of the availability, distribution, and utilization of the Nation's petroleum, natural gas, and oil shale resources. This work will be coordinated with that of other Government agencies, and certain investigations will be conducted in cooperation with State agencies. Continuation of the following activities is planned under the program:

Work on the study to determine the status of reserves of petroleum and natural gas and the future availability of these resources. Efforts will be directed toward the determination of reserves within different mineral resource areas and toward establishing an accurate breakdown of production into flowing and pumping primary production, pressure maintenance, and secondary recovery categories. In fiscal year 1965 the petroleum natural gas research program of the Bureau of Mines will provide for preliminary investigation of certain engineering problems inherent in the determination of reserves and the estimation of availability.

Preliminary economic-engineering surveys and studies of petroleum and natural gas activities that are required by other Government agencies, and are beneficial to the industry and to the general economy of pertinent areas.

Collection and publication of monthly statistics and analysis of the U.S. petroleum producing and refining industries, of quarterly statistics and analysis of the free-world petroleum, refining and trade, and annual statistics on and analysis of U.S. natural-gas production and distribution.

Preparation of forecasts of petroleum supply and demand for use of State regulatory agencies, the Oil Import Administration, and the industry.

Correlation of data available from the various State agencies with those collected by the Bureau.

Essentially, the program of work in resource investigations during fiscal year 1965 will be extension of the fiscal year 1964 program. Continuity of work procedures is essential in resource activities; otherwise the usefulness of the data for making comparisons and for determining trends will be lost.

OIL SHALE RESEARCH

The estimate for this subactivity for fiscal year 1965 is $1,136,000, an increase of $228,000 over 1964. The increase includes $28,000 for increased salary costs and $200,000 for research on in-situ retorting of oil shale.

Need for increase.—The probable commercial production of oil from the Athabascan tar sands of Canada and the present intense interest of U.S. industry in the possible commercial production of oil from western oil shales and domestic tar sand deposits by both conventional and in-situ operations warrant a study by the Government of the basic technology associated with in-situ production of oil from oil shale and tar sands, and a study that will demonstrate the possible resource recoveries that can be anticipated from such ventures. Additionally, this study will provide an answer to the possible utilization of all our oil-shale resources in the future.

About 60 percent of the estimated cost of producing shale oil is attributable to mining, transporting, and preparing the shale for retorting. Elimination of these steps by less conventional means, such as in-situ retorting, should result in substantial cost savings, as well as elimination of transportation and spent-shale disposal problems. An additional benefit will be that Government will maintain technological competence in the possibilities for oil-share utilization.

Plan of work.—The funds requested for this subactivity will be used for research and development to be conducted by Bureau personnel at the Laramie Petroleum Research Center, Laramie, Wyo., for maintenance of the Government research facilities at Anvil Points, Colo., and at project sites in Utah, Colorado, and Wyoming.

Information will be developed at Laramie on the characteristics of the Nation's oil-shale resources, with particular emphasis on the vast deposits of Colorado, Wyoming, and Utah. In addition, research will include work to provide the knowledge of special problems involved in developing effective means of oil-shale retorting technology and in converting the resulting shale oil into usable products. The following activities are included in the program:

Development of methods and techniques for characterizing oil shales which includes: (1) Thermal degradation behavior of oil shales and their organic concentrates, mineral constitutents, and admixtures; (2) quantitative determination of the mineral constituents; (3) direct oxygen determination by the isotope-dilution technique; and (4) behavior of retort gases and mists in various environments.

Product distribution and other properties of hydrogenated shale oil are studied to obtain information that will permit selection of optimum boiling ranges for subsequent refining to produce regular- and high-octane gasoline as well as other distillate fuel products and optimum fractionation temperatures for recycle hydrogenation to reduce nitrogen content.

Studies of oil-shale deposits by analyzing samples to determine oil yields, determining lithologic characteristics of deposits and using electric logs and other stratigraphic data for correlating characteristics of the deposits.

Studies of physical and chemical properties of kerogen which include quantitative determinations of the specialized chemical groups and continued efforts to develop methods of preparing unaltered kerogen concentrate.

Evaluation of crude shale oil as a source of chemical products with a goal of determining quantitatively what chemical materials are naturally present, methods of separating the chemicals from the oil, and defining each oil in terms of technical and economic potential as a source of chemical material as well as fuel.

For the new project on possible recovery of shale oil by in-situ retorting, work in fiscal year 1965 will include careful selection of a proper site on the public domain for the experiments, the obtaining of clearances for the use of the site from proper official agencies, and a partial assessment of the quantity, quality, and extent of the selected oil shale deposit through analysis of geological factors and analysis of oil-shale cores obtained from drilled core holes. This work will be conducted in cooperation with the Geological Survey and other interested agencies.

Minerals and metals

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost	Program
(a) Extraction research	$2,032,830	$2,067,000	$2,117,000	+$50,000	+$50,000	----------
(b) Processing research	7,443,743	7,674,000	7,851,000	+177,000	+177,000	----------
(c) Utilization research	2,579,900	2,657,000	2,721,000	+64,000	+64,000	----------
(d) Resources investigations	2,890,803	3,512,000	3,597,000	+85,000	+85,000	----------
(e) Employee compensation payments	2,000	7,000	12,000	+5,000	----------	+$5,000
Total	14,949,276	15,917,000	16,298,000	+381,000	+376,000	+5,000

EXTRACTION RESEARCH

The estimate of $2,117,000 is an increase of $50,000 above 1964, which is for increased pay costs.

Plan of work.—Research will be conducted in laboratories in the States of Maryland, Minnesota, Colorado, Nevada, Pennsylvania, and Washington; however, the work at these sites will constitute only a part of the effort. The major effort will be in operating mines throughout the United States in cooperation with mining companies, utilizing the mines as open pit and underground laboratories. This active, cooperative research will be at mines in Idaho, Montana, Wyoming, Utah, Nevada, Arizona, New Mexico, Colorado, Missouri, Michigan, Pennsylvania, and possibly other States where operating mines can be utilized as research sites. The capability in rock mechanics will be maintained and available for

limited service studies for units of the Department of Defense and Atomic Energy Commission. The principal program elements for this subactivity are as follows:

Ground stabilization and control.—The artificial support program is an important segment of the ground stabilization and control research. Hydraulic backfill is one method of support that already has proven to be useful in deep mines, and structural analysis studies of hydraulic stopefill started in fiscal year 1963 and continued in fiscal year 1964 will be continued in fiscal year 1965. Research to date has succeeded in developing a method of classifying the fill. Proceeding from the experimental data developed in fiscal years 1963–64, the study in fiscal year 1965 will consist of research in methods of compaction and the effect of chemically active and inert additives on the fill.

Research on development of mechanical fragmentation methods for mining thick tabular mineral deposits is expected to be completed in fiscal year 1964, and the full effort in this program will be redirected toward studies in distributed load supports. The improved supports will be designed to carry the load evenly at all points. Studies have been underway on this technique on a limited basis concerned primarily with the use of metal as a structural unit. Mine tests will be made employing sectionalized concrete and other materials. The rockbolt program has been one of the most successful applied research programs undertaken in the past 3 years. The direction of the research will be changed toward determining the mechanics of anchorage of rockbolts, with the objective of improving anchorage and rockbolting materials and developing better rockbolting procedures. Laboratory and field tests on a support prop developed by the Bureau will be completed in fiscal year 1964. The crop has specific uses that are applicable only under certain structural conditions.

Studies of block caving mines will be continued. Instrumentation of new test sites in operating block caving mines will be undertaken for determining the stress patterns in rocks surrounding mine openings. The longwall mining project concerned with uranium mining that has been in progress since fiscal year 1962 will be completed in fiscal year 1965; the underground stress determinations under various conditions of prop loading will be completed and a publication issued on the research. Longwall mining research is discussed further under the bituminous coal activity, extraction subactivity. Stress and deformation studies in potash completed in fiscal years 1963–64 will be evaluated in fiscal year 1965 determine design factors in preparation for a full-scale field test in fiscal year 1966 to prove or refute the design hypotheses. Recognizing the enormous amount of valuable mineral lost in current room-and-pillar methods of mining, the Bureau has had research underway for 3 years on the determination of stress changes in pillars during pillar recovery operations. This research will be continued in fiscal year 1965. Design factors will be formulated for improved pillar recovery and an experimental test section in one or more mines is planned. The studies will include strata control in semiplastic rock, design of pillars in a salt mine, and the development of techniques and instrumentation measuring pressure in a viscoelastic and/or plastic medium, such as salt, potash, and trona. A pioneer study on the mechanics of floor heave in mines will be started to quantitatively determine cause-and-effect criteria and remedial measures.

Open-pit methods are accounting for an increasingly larger share of total mine production, particularly of such mineral raw materials as copper, iron, and certain nonmetallics. As open-pit mines increase in number, size and depth, precision in determining the maximum safe angle for the pit walls assumes even greater importance. In large pits an increase of only a degree or two in the overall slope angle can make millions of tons of additional ore economically available. The research on open-pit slope design will include completion of the fieldwork of a case history study of natural and manmade rock slopes to determine the significance of certain types of geologic features on slope stability; investigations involving the analysis of rock structures and measurement of in-situ stresses in active open-pit mines; and research to develop devices for automatic warning of imminent slope failure.

Physics of earth-structure studies will be directed toward three-dimensional photoelastic studies with the objective of determining the effect of major geological features on the stresses applied to laboratory specimens, and a statistical fracture study in an operating mine to determine the effect of the fractures on pressure distributions. Concurrently with these studies, work will continue on property testing and successive scaling up of the models in the laboratory with the research climaxing in a full-scale field test at an operating property in fiscal year 1966. The information gained from each test on continuously larger specimens will be correlated so that meaningful model testing can be undertaken in

the laboratory with assurance and accurate predictions made as to the action of the rock in place. Studies in the deep lead-zinc mines of the Coeur d'Alene mining district will be a part of the physics of earth-structures research. The importance of this study is emphasized when it is realized that some of these mines are approaching 7,000 feet in depth and are the major element in the economy of the area; and continuously advancing mining technology is urgently needed to keep these mines in operation, and the operating companies in the district have offered their wholehearted cooperation in the effort. The study in the cause and effect of rock bursts will continue in fiscal year 1965 with no change in emphasis from fiscal year 1964.

Rock disintegration.—Rock disintegration research will be continued in fiscal year 1965 with increased emphasis in some areas and reduced effort in others. Continuous mechanical mining research with the Bureau developed phosphate planer will be concluded in fiscal year 1964. Studies of the effect of surface active agents in drilling will be continued with emphasis on the use of organic reagents.

Empirical research to develop workability standards (drillability indexes) to gage rates and effectiveness of various drilling methods will be continued with completion of work on rotary drilling and initiation of investigations of percussive drilling.

Basic drilling research will include studies of stress distributions in rock under a drill bit, together with fracture and deformation phenomena using the techniques of three-dimensional photoelastic stress analysis as well as more conventional static and dynamic stress analysis methods.

Hydraulic rock breaking research will be continued with emphasis on fragmentation under a static head involving such mechanisms as cavitation and electrospark. Research by induced thermal stress using both conventional and dielectric heating methods will be at essentially the same rate as fiscal year 1964. Studies of underground blasting techniques will be started. Previously Bureau blasting research effort has been applied to the problems of surface mine and quarry blasting; however, starting with fiscal year 1965 the studies will include underground blasting. Research to perfect model techniques for study of blasting problems and to determine the limitations of the methods will be continued as will the basic studies of the mechanisms by which rock is broken by explosives. The fundamental blasting research to study the basic physical processes involved in cylindrical explosive charges, and the rock breaking abilities of certain types of explosives will be continued. Presplitting studies as a means of control of the slope of a cut blasted in rock and reducing the vibration from blasting will include a study of presplitting underground. These studies are related to the study on vibrations from blasting.

Mining engineering.—This program element constitutes the development of new methods and the adapting of mathematical and statistical techniques to problems in mining engineering. Within this broad concept, research is being conducted on problems in sampling methods, mine systems, analysis and the development of mathematical tools for use in ore search. Accomplishments in this program are immediately applicable to industry problems today, and it is of great value to the mining industry because of the short-range nature of the research. Mineral sampling research will continue at the same rate as in fiscal year 1964. Mine systems analysis studies will be expanded primarily to define variables that contribute to optimal solution of problems encountered in mine production and operations. Defining these variables will permit better management decisions in making an economic and/or valuation analysis of a mineral deposit. Development of mathematical tools for ore search will continue at a moderately reduced rate in fiscal year 1965. The research is long-range in nature, but interim results from the study will have immediate application in ore search techniques.

Environmental control.—Basic studies on rock permeability and applied research to develop improved methods preventing or reducing water inflow in mines by sealing, solidification, and cementation will be continued. This research will be coordinated with research on the acid mine water problem discussed under the bituminous coal activity, extraction subactivity.

PROCESSING RESEARCH

The estimate for this subactivity for fiscal year 1965 is $7,851,000, an increase of $177,000 over 1964, all of which is for increase pay costs.

Plan of work.—The funds requested will be used for research conducted by Bureau personnel at Bureau research centers and laboratories. The work will be coordinated with research of other Government agencies and private industry,

and some projects will be conducted in cooperation with and partly financed by other Federal Government agencies, States, or private companies. The principal program elements for this subactivity are presented in the following paragraphs:

Mineral process studies.—Research will be intensified to develop more efficient methods for physically treating the plentiful low grade and currently uneconomic domestic minerals deposits and for preparing usable mineral products for further processing. Studies will embrace both basic and applied research in gravity, magnetic, and flotation concentration. In fundamental flotation studies, efforts will be aimed at acquiring needed data on the complex chemical reactions involved in conditioning, collecting, and floating mineral particles. Other studies will emphasize the application of the basic information to develop improved procedures for concentrating beryllium, fluorspar, and iron minerals and work will be initiated to devise flotation techniques for removing deleterious contaminants in phosphate rock. Greater efforts will be devoted to further development of continuous heavy liquid process for separating minerals with small differences in specific gravity and of small particle size. Work will be speeded up on measuring the magnetic properties of minerals and improving magnetic and electrostatic processes for separating minerals. The Bureau-developed process for microgrinding clay will be evaluated for the fine grinding of other materials and promising leads for dewatering phosphate waste slimes will be studied further.

Experimental process development will be emphasized to devise integrated procedures for treating mineral raw materials and producing commercial quality products. Studies will be continued on extraction and separation of hafnium and zirconium and expanded on the simultaneous grinding and magnetic roasting of iron ores, selective sulfatization of manganese and reduction of iron in manganiferous ores, and on the reduction roasting of manganiferous materials to enable manganese recovery by leaching and iron recovery by magnetic methods.

Evaluation of processes for extracting aluminum, magnesium, and manganese from various materials, including low-grade domestic resources, will be continued to obtain sufficient data to evaluate the relative merits and costs of the processes as well as delineate areas requiring further study. In the theoretical study of the iron blast furnace process, refinements will be made in the thermochemical model, developed by previous studies, and the work will be redirected to simulate other metallurgical processes.

Chemical metallurgy.—The largest single effort in chemical metallurgy research will be the comprehensive study of the iron blast furnace process conducted in cooperation with Blast Furnace Research, Inc., representing the major domestic iron and steel producers, at the Bureau's experimental iron blast furnace. Advancements will be sought in the Bureau-developed techniques for increasing smelting efficiency and production rates through the use of much higher than conventional top pressures in the furnace, coupled with supplementary fuel and oxygen injection at the tuyères and higher blast temperatures and wind rates. Other studies will be directed to developing improved methods for smelting complex lead-zinc ores and concentrates, and high-iron aluminum raw materials by electric furnace procedures, and for recovering copper from refractory ores by the Bureau-developed segregation process.

Emphasis will be continued on the extraction of beryllium, columbium, tantalum, molybdenum, tungsten, and titanium from ores, concentrates, and rare metal scrap by a promising process involving chlorination, purification of the metal chlorides, and reduction of the cholrides to metals. Simiarly, recovery of manganese, gallium, and germanium by volatization-reduction methods will also receive attention.

Continued efforts will be applied to the separation of base metal constituents in secondary materials, purification of molten metals, and reduction of gaseous metallic compounds by vacuum distillation, carrier gas distillation, flux refining, and formation of intermetallic compounds. In related research on the preparation of high-purity metals, work will be initiated on the use of pure organometallic compounds as source materials.

Increased emphasis will be placed on the reduction roasting of iron oxide minerals to yield lower oxides and metal. Efforts will be devoted to preparing stronger iron oxide pellets needed in blast furnace feed, establishing optimum conditions for prereducing iron oxide pellets as a new improved blast furnace feed, evaluating prereduced pellets as a feed material in steelmaking, and to the use of prereduced pellets, iron and steel scrap, and molten pig iron in the oxygen converter steelmaking process.

Research on recovering metals from ores and concentrates by solution methods will include a variety of selected processes. Studies on the Bureau-developed

fusion-acid leaching procedure for recovering alumina from anorthosite and other abundant domestic silicate minerals will be expanded to include techniques for accelerating the crystallization and precipitation of alumina from solution. New solvents will be sought for extracting rare earth elements from bastnasite with subsequent isolation of the individual elements by solvent extraction, iron exchange, and related chemical processing techniques.

Fundamental studies will be continued on the use of bacteria to extract metals from submarginal ores and to selectively separate metals from solutions, and to determine the factors that affect the separation and recovery of metals from solution by cementation processes to extend the efficiency of this widely used technique. Both pressure leaching and roasting leaching will be examined as possible methods for recovering phosphorus and vanadium from currently wasted ferrophosphorus, a byproduct of elemented phosphorus production from western phosphate ores.

Substantial effort will be directed toward development of better methods and reagents to recover rubidium and cesium from ores and concentrates; separation and recovery of molybdenite from copper concentrates; and for preparing pure beryllium salts from low-grade domestic beryllium ores and concentrates. Research will be expanded on the development of promising, potentially inexpensive chemical compounds for extracting common metals such as copper, nickel, or zinc by solvent extraction methods and continued on recovery of valuable constituents in saline water bitterns.

Electro- and thermochemistry research.—Emphasis will be given to the extraction, refining, and recovery of high-purity metals from ores, concentrates, crude metals, and alloys through electrolysis of fused salt or aqueous media. Research will be carried out to refine primary tungsten metal and to recover tungsten from scrap materials. Parallel research will be conducted on the electrochemical preparation of refined vanadium. Investigations will be continued to develop molten-alloy anode systems suitable for electrorefining of uranium, vanadium, and manganese. Other fused salt electrochemical reduction studies will include the electrowinning of beryllium and titanium from their respective chemical compounds; extraction of chromium, tungsten, and molybdenum from domestic chromite, sheelite, and molybdenite concentrates, respectively; recovery of columbium from its oxides, halides, or carbide compounds; and the codeposition of thorium metal with various alloying metals. Electrowinning of various high-purity rare earth metals will continue to be investigated as will fused-salt electrorefining of hafnium and yttrium. A study of suitable molten salt electrolytic baths for separation and purification of nickel and cobalt will be pursued with efforts directed toward development of a continuous process.

The effects of ultrasonics on the electrodeposition of metals and alloys will be studied and the properties of the deposits formed will be determined. Efforts will be extended to improve processes incorporating the separation of cobalt and nickel by solvent extraction and subsequent electrodeposition separately of pure nickel and cobalt from impure metals, metal compounds, ferroalloys, and alloy scrap.

Fundamental electrochemical reaction mechanisms of the commercial Hall alumina cell will be investigated and means of preparing high-purity zinc through electrolysis of zinc amalgam will be carried out. Chemical, electrical, and mechanical properties of manganese, titanium, and chromium phosphides prepared by fused salt electrolyses will be studied and evaluated.

Research in thermochemistry will be expanded to derive significant information on the fundamental properties of elements and compounds needed for improving existing and developing new metallurgical processes. Thermodynamics measurements involving low-temperature heat capacity, high-temperature enthalpy, and other related properties will be made on selected metal and compounds.

Vapor pressure studies will be accelerated to obtain precise measurements of metal halide systems of cadmium, lead, tin, and zinc and of other various metals for use in devising volatilization techniques for extracting, purifying, and separating metals from their source materials. Research will be continued to learn the cause of fuming in oxygen steelmaking and to devise ways of eliminating fume emission and thus prevent a hazardous air-pollution problem.

Reaction rate studies will be continued to acquire scientific data on reduction of iron oxides to metal at various temperatures and in selected atmospheres for use in raising the efficiency of iron smelting; on the oxidation of molten lead and other metals to evaluate selective oxidation as a purification process; to collect and correlate data on properties of catalysts and assess their significance in chemical reactions; and to ascertain definitive information on the nature of reactions

between metals and compounds in molten electrolytes to make possible further improvement in electrometallurgy processing methods.

Other continuing fundamental research will involve the cobalt 60 cell to study the effects of gamma radiation on inorganic liquid, gaseous, and solid state reactions under a wide variety of physical-chemical conditions, and petrographic and X-ray diffraction studies on iron minerals to determine the influence of crystal structure, composition, and other properties on behavior of the minerals during metallurgical processing.

Analytical research.—In seeking to improve the speed and accuracy of all analytical determinations and to develop new sensitive techniques for the precise measurement of minute impurities in metallurgical research products, selected chemical and instrumental methods will receive increased attention. A substantial effort will be devoted to developing and adapting new analytical instruments such as the neutron activation generator for analyzing trace elements in minerals, metals, and nonmetals. Increased effort will also be made to extend the usefulness of the X-ray spectrograph electron probe for the identification of microphases in alloys.

Research using radioisotope techniques will be continued and phases will be intensified to facilitate the development of metallurgical separations and to check analytical data obtained by classical procedures. Isotopic dilution analysis studies will include procedures for measuring impurities and characterizing the research products of physical metallurgy. Research on gas chromatography methods will be continued to develop ways of detecting and quantitatively determining gases such as hydrogen, carbon dioxide, nitrogen, and chlorine. The principles will also be used in adapting the method to vacuum fusion determination of interstitial elements in metals and to analyzing samples of gases resulting from arc melting and halogenation reactions.

UTILIZATION RESEARCH

The estimate for this subactivity for fiscal year 1965 is $2,721,000, an increase of $64,000 over 1964, all of which is for increased pay costs.

Plan of work.—The funds requested will be used for research conducted by Bureau personnel at Bureau research centers and laboratories. The work will be coordinated with research of other Federal and State Government agencies and private industry and some projects will be conducted in cooperation with and partly financed by other Federal Government agencies, States, or private companies. The principal program elements for this subactivity are described in the following paragraphs:

Physical metallurgy and basic research.—Melting and casting studies will be expanded on beryllium and tungsten metals and alloys in an effort to develop improved procedures for forming those difficult-to-shape materials, and related research on forming will be continued on the use of high-energy techniques for forming metals and alloys into desired shapes. Studies on chemical, galvanic, and high-temperature corrosion properties of metals and alloys will receive increased emphasis to acquire necessary information to permit discreet selection of those metals and alloys which would be suitable for specific corrosive enivronments.

In alloy research, a large effort will continue to be devoted to development of tungsten, columbium, and tantalum alloys and ultra-high-strength steels to utilize their high-temperature and other desirable properties. Work will be expanded on zinc alloys to improve their strength, creep resistance, recrystallization during fabrication, and other properties and determining the effects of aluminum, copper, and titanium additions on the properties of zinc alloy. Attempts will be made to further improve the vibration-damping properties of the Bureau-developed manganese-copper alloys and selected magnesium alloys. The properties of high-purity electrorefined tungsten, molybdenum, vanadium, rare earths, and other metals will be studied and the effects of oxygen, carbon, nitrogen, and other contaminants on those properties will be determined.

Research will be accelerated to devise procedures for preparing materials with improved properties which will be suitable for elevated temperature and strength uses. These studies will comprise ways of applying thermal and corrosion protective coatings of platinum-group metals, refractory metals, and composite mixtures of metals and compounds on other structurally desirably reactive metals and materials; and preparing heterogeneous metal-nonmetal compacts by coating nonmetallic particles of oxides, nitrides, and carbides with tungsten or molybdenum, pressing and sintering the coated particles, and evaluating the materials for high-temperature properties.

In the development of refractories with superior qualities needed for high-temperature and high-strength uses, research will be intensified to acquire, correlate, and analyze data on the thermal, mechanical, crystallographic, and electrical properties of rare-earth oxides and other promising compounds and materials.

Acquisition and correlation of fundamental data on properties of abrasives will be extended to include information on the microstructure and crystallographic characteristics of synthetic aluminum oxide and silicon carbide and to evaluate the effects of those factors on the strength and abrasive action of the materials. Continuing fundamental research will be aimed at developing alloys and methods to increase the service temperature and strength of solders; developing equipment and methods for using plasma-cathode discharges; obtaining fundamental data on the emission of electrons from molten cathodes in arc melting; and to develop and evaluate efficient thermoelectric materials.

Synthetic minerals and materials.—Research to develop methods for continuous forming of ceramic materials with close dimensional tolerance will be continued to obtain fundamental data on the effects of various types of stresses on the properties of single and polycrystalline ceramic materials. The information will be used to devise techniques for preparing ductile ceramics that would be more resistant to heat, deformation, or thermal shock. Related studies on the joining of refractory materials will be intensified to develop welding procedures for fabricating complex ceramic shapes for use in the chemical, electronic, and aircraft industries which are difficult or impossible to form by conventional methods. Work will continue on the development of thin, dense, shock resistant, stabilized ceramic membranes with sufficiently high ionic mobility for satisfactory use in electric energy fuel cells.

Greater efforts will be devoted to determining the cause of early failure of clay retorts used in zinc extraction. The problem which will be attacked through a study of raw materials and of mixing, aging, forming, and use procedures of the retorts, has existed for several years, and is becoming more acute with the increasing competition of other materials for a share of the zinc market. Studies will be continued on the preparation of hard materials and evaluating their high-temperature strength, thermal shock resistance, and other properties with the objective of developing boride refractories having outstanding properties.

The preparation and evaluation of synthetic asbestiform and micaceous materials for chemical, electronic, and elevated temperature uses will receive continued emphasis and efforts will be accelerated on preparing a comprehensive publication on synthetic mica.

RESOURCES INVESTIGATIONS

The estimate for this subactivity for fiscal year 1965 is $3,597,000, an increase of $85,000 above 1964, all of which is for increased pay costs.

Plan of work.—The Bureau of Mines program of resources investigations is a long-range continuing factfinding and research-oriented activity designed specifically to (1) provide the Federal Government with necessary background data upon which to base policy decisions affecting the mineral industry; (2) promote intelligent and effective utilization of the Nation's mineral resources through collection and analysis of economic and technical data on production, distribution, consumption and use minerals, and engineering and examination and scientific and economic interpretation; (3) provide the foundation of basic knowledge essential to research advancements in all branches of mineral technology and which will form a basis for intelligent programing of Bureau technologic research; (4) complete and keep current adequate appraisals of the Nation's available mineral resources; and (5) provide the general public with a clearer understanding of the economics of the mineral industries.

Current and careful planning to assure the orderly development of this country's mineral resources to meet tomorrow's needs is of growing importance. In the past 30 years the United States has consumed more minerals than all the peoples of the world have previously used. That most current demands for mineral raw materials are being met without difficulty is primarily due not to new discoveries, but rather to the technological advances achieved since World War II. Even so, domestic production is supplemented increasingly by imports. With national requirements rapidly expanding and with shifting emphasis among commodities, the Nation faces a future of critical shortages unless it can continue to add to its fund of knowledge of all factors that permit the development, mining, and processing for utilization of new sources of these essential raw materials.

Changes in economic conditions and changes in technology often cause serious national and sectional economic dislocations. Historically, solutions of problems caused by such circumstances are sought after serious dislocation has resulted. Insofar as the problems are the result of economic and technologic change in the mineral industry, a part of the minerals and metals resource programs will be devoted to continuous studies on a national basis and in potentially critical areas in order to anticipate problems and permit initiation of programs by industry and Government to solve them in advance.

Through its resources investigations program, the Bureau of Mines is seeking the knowledge essential for the intelligence and wise development and use of the Nation's mineral heritage. A major element in this sought-for store of new knowledge relates largely to the marginal and submarginal mineral deposits, the large and ever lower grade or poorer quality ones, from which the bulk of future supplies inevitably must be obtained. Other elements relate to the current history, so to speak, of the mineral industries, both economic and technologic. From such facts and trends, properly interpreted, forecasts can be made to guide industry and Government in the shaping of their mineral policies.

In carrying out the resource program, comprehensive and authoritative industry information is obtained through regular canvasses, special technical and economic studies, mine and plant visits, and systematic surveillance and verification of such news sources as technical and trade publications and Government reports. Regular dissemination of mineral information for particular States or industries is achieved through Minerals Yearbook, monthly, quarterly, and annual Mineral Industry Surveys, Mineral Trade Notes and Annual State Reports. Teams of engineering, technical, economic, and statistical experts work together to prepare publishable reports on special projects. These staffs also work closely together in assembling information requested by the Congress, the Department, and other Government agencies. The Bureau's various resource organization units cooperate with State and Federal agencies such as the State geologists, the Office of Emergency Planning, river basin committees, and State Department, to provide mineral resource and industry material for inclusion in State, Federal, or international reports of broad scope.

EMPLOYEE COMPENSATION PAYMENTS

The estimate for this subactivity for fiscal year 1965 is $12,000, an increase of $5,000 over 1964. The increase will provide funds to reimburse the employees' compensation fund for payments made on account of the injury or death of employees under the jurisdiction of this Bureau as required in section 209 of Public Law 86–767.

Oceanographic research

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost	Program
Oceanographic research	$50,000	$53,000	$182,000	+$129,000	+$3,000	+$126,000

OCEANOGRAPHIC RESEARCH

The estimate for this activity for fiscal year 1965 is $182,000, an increase of $129,000 over 1964. The increase includes $126,000 for increased emphasis on marine mining research and $3,000 for increased pay costs.

Need for increase.—In response to industry's mounting demands and increased public interest, and in accordance with the Bureau's responsibilities for conservation and development of the Nation's mineral resources, on wet or dry land, the Bureau will step up its emphasis on marine mining research studies in fiscal year 1965. The increase is requested to provide funds for new studies by Bureau researchers to determine the economic significance, methods of recovery, and utilization of marine mineral deposits. The ultimate objective of these investigations is the establishment of a stable, self-supporting marine mining industry and delineation of mineral reserves for future use when required by the mineral economy of the United States.

Plan of work.—Bureau engineers and scientists will cooperate with researchers in other Government agencies, institutes, and industry in the collection and re-

view of oceanographic data to ascertain geographic areas of potential interest as a source of economic marine mineral deposits. Samples of ocean-bottom deposits obtained from oceanographic surveys by other groups will be solicited and examined in the laboratory for industrially valuable minerals.

Sea-floor mineral data collection.—Random sampling and analysis of heavy metal sands in submerged beach deposits near Port Orford, Oreg., and near Grays Harbor, and the mouth of the Columbia River in Washington, will be undertaken by the staff to determine areas of heaviest concentration for subsequent mining studies. These shallow, near-shore occurrences are potential sources of platinum, titanium, chromium, iron, zirconium, and glauconite. The possibility of submerged beach deposits of heavy mineral sands along the Pacific Northwest coast was defined during fiscal year 1964 appraisals of known marine mineral data.

It is planned to do some initial sampling of phosphorite off the coast of California. Considerable information on the California phosphorites was developed by Bureau scientists in fiscal year 1964 through the cooperation and the Scripps Institute of the University of California and other west coast groups. Development of these phosphate deposits might support a California fertilizer industry. One private venture for the mining of sea-floor phosphorite failed recently because of the lack of basic information about the occurrence and how it might be recovered. Bureau research could have prevented this by providing basic reserve data, mining feasibility information, and utilization costs.

These preliminary familiarization surveys will be made from a leased, small work boat. Costs will be minimal as the investigations are cursory in nature and the minerals to be examined are inshore and in shallow waters where a small boat and simple equipment can be used advantageously for prefatory studies. Reports of field studies will be prepared for publication and distribution.

Sea-floor sampling devices will be procured and tested using the small work boat. From the testing of these sampling tools and instruments at inshore locations and in the protected waters of the bay, Bureau engineers will determine the need for and design new and more efficient marine mineral investigation equipment and methods for deep-sea work in subsequent fiscal years. This research is needed as present sampling tools required for use in marine mineral development are open to vast improvement. By using the leased, small craft for near-base testing, costs will be minimal.

The Bureau will act as consultants to the Navy, the AEC, and industry in the development of conceptual designs, engineering detail, and other features in the development of special purpose platforms, submersibles, and facilities for sea-floor drilling, and recovery operations. Numerous requests for such assistance were received in fiscal year 1964.

Equipment planning studies.—Mining under the ocean will present a new challenge. The Bureau of Mines must examine current mining and processing procedures to ascertain their adaptability to a marine environment, study the feasibility of entirely new concepts of recovery, and demonstrate the practicability of extracting mineral resources from the ocean.

The problem of mineral recovery from the oceans will vary greatly with the type of mineral to be mined, the extend and grade of the deposit, whether it is composed of unconsolidated sediments or hard rock, the distance from the underwater occurrence to land, the depth of water in which it lies, and other pertinent factors. A major part of any investigations on means of underwater mining must be an exhaustive research of marine or submarine craft, floating or fixed surface platforms, and underwater shelters from which mining and proecssing operations can be initiated and maintained.

The Bureau's research effort will delineate what modifications of existing mining and processing methods or development of new techniques are required to remove petroleum, coal, and mineral products from beneath the ocean floor.

The development of equipment and facilities composed of materials having a high resistance to salt water corrosion and to attack by the many organisms of the sea will be prime requisites for exploitation of the ocean's mineral resources. In this field the experience of Bureau metallurgists will be utilized.

Appraisal of current marine mineral knowledge.—Work will continue on the assembly, analysis, and evaluation of marine mineral information and samples from other Government agencies, institutes, universities, and industry. Scripps Institute, Oregon State University, and other well-known oceanographic groups have formally agreed to provide Bureau scientists with cuts of sea-floor samples and location data on any material which appears to hold promise for industrial

utilization. Information will be compiled in report form complete with nautical charting of mineral locations, material analyses, and estimated quantity of material present. These reports will offer recommendations for later field studies to determine minable reserves of specific occurrences, for mining method research, and processing investigations.

Foreign mineral activities

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost	Program
Foreign mineral activities	$411,694	$521,000	$546,000	+$25,000	+$25,000	----------

FOREIGN MINERAL ACTIVITIES

The estimate for this activity for fiscal year 1965 is $546,000, an increase of $25,000 over 1964, which is for increased pay costs.

Plan of work.—The funds requested will be used to support the Bureau's program of systematic collection, interpretation, and publication of foreign mineral data. Its objective is to provide current information and analytical appraisals of foreign mineral developments that affect domestic mineral industries and the overall mineral economy of the United States. The need for this type of service grows as the U.S. mineral requirements expand because of ever-increasing population and advances in the standard of living. Both the quantity and variety of minerals required by the United States expand steadily and as a consequence the Nation's peacetime and wartime security becomes more involved in international mineral affairs.

The Bureau maintains a technical staff to evaluate mineral developments abroad for the benefit of Government and industry groups concerned with foreign minerals and advises the foreign statistical unit in compiling mineral statistics from all parts of the world which are used in Bureau publications and by other agencies engaged in current Government operation in the mineral field. This activity covers both free and Communist worlds. The program is closely coordinated with other Government units and particularly the information-collecting activities of the Foreign Service. This assures efficiency in the use of funds appropriated for this purpose.

One of the most important objectives of the work in fiscal year 1965 is publication of the first volume of an annual world survey of mineral affairs, which will be issued in the Minerals Yearbook series. This volume will include summarized treatment of world mineral production showing its distribution by commodities, country, and continents. Basic trends will be evaluated. Individual chapters will present the highlights of mineral developments in foreign countries during the current year including those in production, consumption, international trade, internal policy changes, mineral discoveries and other technical, economic, and political factors that influence the availability of minerals from the area for use in the United States or the foreign markets for mineral products produced at home. This publication containing the review for 1963 calendar year will be issued the middle of fiscal year 1965. Planning and initial implementation is being conducted in fiscal year 1964.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$27,235,750	$29,369,000	$30,377,000	+$1,008,000
Transferred to "Operating expenses, Public Buildings Service," General Services Administration	34,368	35,000		−35,000
Unobligated balance	232,332			
Appropriation	27,502,450	29,404,000	30,377,000	+973,000
Obligations by objects:				
11 Personnel compensation	19,048,851	21,035,000	21,985,000	+950,000
12 Personnel benefits	1,448,918	1,610,000	1,670,000	+60,000
21 Travel and transportation of persons	618,700	700,000	725,000	+25,000
22 Transportation of things	124,227	125,000	137,000	+12,000
23 Rent, communications, and utilities	836,146	840,000	851,000	+11,000
24 Printing and reproduction	412,347	375,000	409,000	+34,000
25 Other services	829,230	750,000	812,000	+62,000
26 Supplies and materials	1,571,864	1,689,000	1,797,000	+108,000
31 Equipment	2,224,250	2,180,000	1,926,000	−254,000
32 Lands and structures	121,311	65,000	65,000	
42 Insurance claims and indemnities	1,134	1,000	1,000	
Subtotal	27,236,978	29,370,000	30,378,000	+1,008,000
Deduct quarters and subsistence charges	1,228	1,000	1,000	
Total obligations	27,235,750	29,369,000	30,377,000	+1,008,000

Plans and Programs for the Bureau

Chairman Hayden. Mr. Ankeny, if you have a statement that you desire to have printed in the record, that may be done; or you may highlight it, whichever you please.

Mr. Ankeny. I have a statement which I would like to submit for the record and then highlight it.

(The statement referred to follows:)

Statement of Marling J. Ankeny, Director, Bureau of Mines

Mr. Chairman and members of the committee, it is a pleasure for me to appear again before you, to discuss the plans and programs of the Bureau of Mines, and to present for your consideration estimates of the Bureau's financial requirements for fiscal year 1965.

Throughout its history the Bureau's fundamental responsibility has been to promote the wise development and use of this Nation's mineral and fuel resources—resources that are the building blocks of industrial civilization, the essential keys to economic growth.

Gentlemen, you know as well as I that an adequate supply of minerals and fuels for the United States must be assured. Providing such assurance has never been easy and, considering the complex forces at work in the world today, it can hardly be expected to become less difficult in the future. The demands being generated by our growing population with its constantly rising standard of living must be met either with imports from other countries or with domestic resources that are slowly but steadily diminishing in grade.

Obviously, the mineral-resource problems that we face are not simple. But they are by no means insurmountable. The free world is rich in mineral raw materials, and we have only begun to tap the wealth that lies in our own plentiful deposits of minerals and fuels. Moreover, we have within our reach the inexhaustible potential of still another resource—technology. By refining our industrial technology with the catalysts of science and engineering we can assure an adequate supply of essential materials now and in the future.

An advancing technology can protect the United States against certain danger in an uncertain world by preventing us from becoming irreversibly dependent on distant and vulnerable sources of mineral raw materials. Technology can enable us to search more effectively for untapped domestic resources. It can improve the safety and efficiency of the methods we now use to extract and process

minerals and fuels, provide us with new and more economic processes and machinery, and permit us to alter at will our use patterns for minerals. It can also reduce the drain on scarce resources by showing us how to minimize waste, to utilize scrap materials more efficiently, and to substitute plentiful minerals for those in relatively short supply.

The development of such a technology, as a dependable means of achieving conservation in its truest sense, has long been a major concern of the Bureau of Mines. Over the years the Bureau has contributed significantly to the methods, techniques, and equipment used by American industry in providing the mineral raw materials that sustain and increase our Nation's economic strength. Today, the Bureau is engaged in a broad and intensive program of scientific research that is providing a wealth of fundamental knowledge about our mineral and fuel resources and at the same time is yielding practical advances in methods for extracting them and putting them to use.

And now, Mr. Chairman, with your permission, I shall turn to the Bureau's budget estimate for 1965. Before discussing it in any detail, however, I want to say that we have scrutinized carefully and critically every item it contains. We have limited our request to essentials and have included only those programs that are indispensable to the national good and those that can be expected to yield substantial returns in a relatively short time.

For example, the Bureau is requesting no increase in fiscal 1965 for the varied resource studies and the mining and metallurgical research conducted under its comprehensive and integrated minerals and metals programs. After careful analysis, we have concluded that the progress necessary in these programs can be accomplished by shifting emphasis as the attainment of research goals or changing trends warrant such action. Also to be continued at the same level is the program by which the Bureau provides current information on international developments in the minerals field and appraisals of events affecting the mineral economy of the United States. Although the need for this type of service is growing as the Nation's mineral requirements expand, the Bureau is convinced that the improved efficiency it has achieved in the conduct of the international minerals activity will enable it to meet these requirements at least through fiscal 1965.

We have made substantial cuts in two other items. By limiting research on anthracite to areas that have the very highest potential, we have been able to effect a decrease of $235,000. In addition, we have accomplished a reduction of $75,000 in general administrative expenses through a reorganization and consolidation of administrative functions, which has permitted more effective utilization of manpower. The budget also reflects a reduction of $100,000 made possible by the termination of a study of health and safety conditions at metal and nonmetallic mines, authorized by Public Law 87–300.

The Bureau's budget estimate for fiscal year 1965 is $41,332,000 compared with $39,528,000 for 1964. This includes $30,377,000 for conservation and development of mineral resources; $9,530,000 for health and safety; and $1,425,000 for general administrative expenses. In addition, the Bureau is requesting $20 million of borrowing authority. This authority, $14 million more than the amount allowed for 1964, is essential for sustaining the helium conservation effort that has been so effectively begun.

The Bureau's estimate would provide for increases in the following items:

Increases totaling $317,000 are needed to move ahead with a well-balanced program aimed at overcoming safety and production problems resulting from the emission of methane gas during mining of coal. In recent months two major mine disasters were caused by explosions involving the ignition of this highly combustible gas. Odorless and invisible, methane can accumulate unnoticed in working places of underground mines until a sudden arc or spark touches it off. The result, too often, is death and destruction.

The Bureau is attacking the methane menace on two fronts. In experiments conducted during the past year, a "water-infusion" method being developed by the Bureau successfully removed methane from one of West Virginia's gassiest coal seams at rates up to 1,540 cubic feet a minute. These tests are continuing, with major emphasis now being placed on incorporating methane removal as part of the normal work cycle in a mine. This will not only aid safety but also facilitate operations in many of the Nation's mines. Of the $317,000 total I have mentioned, $217,000 is requested for this work under the "Conservation and development of mineral resources" appropriation.

The other $100,000 is requested under the "Health and safety" appropriation and is needed to expand research that will expedite development of rugged, practical devices for precise, automatic methane detection, and monitoring.

There is urgent need for additional testing and investigation of many physical principles that might prove valuable in developing such devices. The disasters that have resulted from methane ignition testify to the importance of providing some reliable and continuously operating safeguard against this danger.

In another area of health and safety, the Bureau is requesting an increase of $140,000 to expand the Bureau's safety education and training program to meet requirements of present-day mining industries and to keep abreast of rapidly changing conditions. The increase will substantially enhance the Bureau's ability to conduct special studies of outstanding health and safety problems, to provide up-to-date training materials and visual aids, and to offer training courses specifically designed to meet industry's needs.

An increase of $370,000 is requested for badly needed expansion of health and safety research and development work essential to control of the float-coal dust hazard, which is assuming dangerous proportions particularly in mechanized coal mines. The tremendous progress that has been made in mechanized mining has caused operations to be concentrated more and more at mine faces. As a result, greatly increased quantities of fine coal dust are generated in these relatively confined areas. These dust particles pose the constant threat of spreading an otherwise local gas ignition throughout a working section, or even an entire mine. Further research is vital to permit early development of basic criteria needed in formulating standards and practices to control the float-dust hazard.

The final increase requested under "Health and safety" is for $150,000, which will enable the Bureau to extend its mine ventilation research and related investigations. Ventilation is a major factor in all underground mining, and adequate ventilation becomes increasingly difficult to achieve as coal and other minerals are mined at greater depths. This problem and the difficulties in ventilation created by new and more rapid mechanized mining systems demand that research efforts in this area be stepped up.

Returning to the items under "Conservation and development of mineral resource":

The Bureau requests an increase of $200,000 for research on in situ retorting of oil shale—that is, retoring the shale in place, as it occurs in the ground. The promise of early production of oil from tar sands and the intense interest of American industry in the commercial promise of oil from Western oil-shale deposits indicate that the time is ripe for investigating the basic technology of in situ combustion. The enormous energy potential of our vast oil-shale resources has been established and the technical feasibility of converting this potential to some usable form has been indicated. We must now determine how this resource can be developed most economically. The study of in situ retorting will give us information on the recoveries that are possible by this method, and it may well determine the direction in which oil-shale development will proceed.

An increase of $126,000 for oceanographic research will provide the minimum funds required for the Bureau to establish its modest but extremely important program to explore the mineral potential of the ocean floor. The proposed program of marine minerals research will extend the Bureau's present effort, which is limited to reviewing available data on types, grades, and tentative location of areas of possible mineralization. Preliminary surveys will be made in inshore and shallow waters. Various sea-floor sampling devices will be tested and needs for specialized equipment will be carefully delineated. In this way a solid basis can be established for an efficient and productive investigation of what may ultimately prove to be a most abundant source of mineral raw materials.

As I have already indicated, $20 million of additional borrowing authority is needed to assure that the Bureau will be able to pay for helium that will be delivered in fiscal year 1965 by the five private industry plants that are now in operation. It is expected that these plants will extract and deliver to the Bureau of Mines for conservation, about 3½ billion cubic feet of helium that would otherwise be wasted into the atmosphere through stoves and furnaces in fiscal year 1965.

That, gentlemen, concludes my statement. We will be pleased to answer any questions that you may have.

Responsibility of the Bureau of Mines

Mr. Ankeny. The Bureau of Mines continues to carry out its fundamental responsibility, which is the promotion of the wise development and use of the mineral resources of our country, and the promotion of safety and health in the mineral industries.

We feel that it is our mission to see that an adequate supply of mineral raw materials is assured to support the growing population of our country and the rising standard of living.

The mineral resources problem is not simple. Despite the fact that the world is rich in mineral raw materials, we have only began to tap the wealth of minerals that lies within our borders.

Technology and Its Development

Moreover, we have within our reach an inexhaustible potential of another resource, technology. Advancing technology in minerals can prevent us from becoming dependent on other nations for essential mineral raw materials. It can enable us to search more effectively for minerals within our own boundaries. It can improve the safety and efficiency of mining methods and methods of extracting metals from ores. It can permit us to alter at will our use patterns of minerals, and can permit us to reduce the drain on scarce resources, and to substitute plentiful minerals for those that are in short supply.

The mission of the Bureau of Mines is to develop such a technology as a dependable means of achieving conservation in its truest sense. And to this end we are engaged in a broad and intensive program of scientific research.

Now, in our budget for 1965 we have scrutinized carefully every estimate, and the requests that we are making this year are limited to bare essentials.

We are asking for no increase for our studies of mineral resources, nor for the mining and metallurgical research.

Budget Request Increases

The increases that we are asking for consist of $217,000 for methane drainage research; $100,000 for the development of a methane monitor for use in coal mines to detect methane at the mine faces; $140,000 to expand safety, education, and training in the coal mining and mineral fields; $370,000 to expand research on the control of float dust in coal mines, which has contributed to some of our more recent mine disasters; $150,000 to expand mine ventilation research; $200,000 for a preliminary study of the in situ retorting of oil shales; and $126,000 for our marine minerals research program.

The budget for 1965, then, consists of $30,377,000 for conservation and development of mineral resources, $9,530,000 for health and safety activities of the Bureau of Mines, $1,425,000 for general administrative expenses—a total of $41,332,000 for the regular activities of the Bureau.

And in addition, we are asking for $20 million borrowing authority for our helium conservation purchase program.

Methane Gas Recovery Coordination

Chairman Hayden. Your justification statement indicates that the $237,000 increase for extraction research is to be aimed at overcoming production problems caused by methane gas. The Office of Coal Research is planning to enter into a contract with the West Virginia University to determine an economically and commercially attractive

method to recover free methane from coal seams prior to mining. How are the two agencies coordinating their work?

Mr. ANKENY. Well, these agencies are working very close together in coordination of this work. This is becoming a very important problem in the production of coal, for the reason that as the coal seams get deeper and production methods become more rapid, this results in a high rate of liberation of methane, so high, in fact, that the ventilation facilities that we now have are not enough to remove this methane as fast as it is being liberated.

So our project envisions the drainage of some of this methane before mining, so that our mechanical equipment can operate at full efficiency.

Chairman HAYDEN. By suction or otherwise?

Mr. ANKENY. Well, by drilling holes in advance, and by water infusion into these bore holes, and controlling the flow of methane from the coal seams.

Chairman HAYDEN. Last year the Congress added to your budget $250,000 for studying production of tars and oils from western coal through carbonization, as well as $100,000 for a comprehensive study of new uses for asphalt. Would you please indicate to the committee what you have been able to accomplish with these funds.

Mr. ANKENY. Mr. Chairman, I have with me Mr. Joe Rosenbaum, who is Assistant Director for Research, and I would ask him to respond to that question.

Chairman HAYDEN. All right, sir.

ECONOMIC METHOD FOR CARBONIZING COAL

Mr. ROSENBAUM. The additional money that was granted for the work on coal is to make more economic the bituminous coal in the Western States, particularly those in Utah, Colorado, and Wyoming. Much of the steel industry now in the Western States is having some trouble competing with steel imported on the west coast. Part of the high cost of operation in the production of the Western States stems from the necessity to transport coal of a suitable coking grade for blending with the Utah coal and the Wyoming coals to make a suitable coke. By a low temperature carbonization process being developed and demonstrated at the Bureau's laboratory in Denver, we can make a char with a part of the western coal and blend this back with the bulk of the coal to make a suitable coke. This would avoid the necessity of hauling coal from long distances to blend with the Utah, Wyoming, and Colorado coals.

Chairman HAYDEN. Is that work now being done?

Mr. ROSENBAUM. This work is now being done. We have conducted coking tests at Pittsburgh, and we have made some char at Denver which has been sent to our Schuylkill Haven Laboratory for the preparation of briquettes. Tar and the pitch are byproducts of the carbonizing operation. We are addressing ourselves to finding uses for these tars and pitches. But basically the program is oriented to finding an economical method for carbonizing the coal for use in making coke.

Chairman HAYDEN. You are getting a good start, is what it amounts to?

Mr. ROSENBAUM. We are underway, equipment for handling carload lots of coal has been installed and we have advanced well with the laboratory procedures

Senator McGEE. Last year, Congress provided $100,000 to begin a 5-year program of asphalt research. As you know, we have a very fine research facility at the University of Wyoming in Larami.

What is the status of this program?

Mr. ROSENBAUM. The asphalt research project has gotten off to a good start and significant progress has been made in laying the foundation for the new work. Experienced, qualified personnel have been assigned and an advisory committee of four experts has been appointed, representing the Asphalt Institute and the industry. In the laboratory, preliminary tests of a new and unique analytical method, based on chromatography, are underway. A literature survey of past work, methods, and accomplishments is well advanced, and other analytical equipment has been modified for purposes of this study. A study of the kinds and quantities of samples that will be needed has been completed and arrangements have been made, with industry where indicated, to secure these samples.

ASPHALT RESEARCH

Asphalt is the residue from oil refining, it varies with the kind of refining process and the kind of oil feed that goes to the refinery. Recently we had a meeting with officials of the American Petroleum Institute, who complimented us upon undertaking this particular research. The asphalt consists of a conglomeration of substances that have never been completely identified. The properties have never been completely described nor cataloged. We have set up laboratory procedures, and are in the process now of categorizing the constituents that make up the asphalt. By learning what these components are we will better be able to modify them so that they will stick to the aggregate that goes into the asphalt pavements. More durable asphalt will result in fewer chuckholes when the weather gets bad.

Senator McGEE. How much have you requested this year for the program? Do you feel this is an adequate amount to continue the work on schedule? If not, how much more would you need? How will this money be spent?

Mr. ROSENBAUM. The budget request in fiscal year 1965 for the asphalt research is still $100,000, plus a small amount to pay for increased payroll costs. This is an adequate amount to continue the work on schedule. The 5-year schedule for the asphalt research work will require an increase in fiscal year 1966 of about $100,000 for several additional personnel and for equipment. In fiscal year 1965 the literature survey will be completed and published and the analytical equipment and procedures will be developed and in full use on a series of samples. Mass spectroscopy instruments, already available and in use at the Laramie Center, will be used in part for work on this project.

Chairman HAYDEN. What work do you have underway with respect to lignite?

LIGNITE RESEARCH

Mr. ROSENBAUM. Our work on lignite at our research station on the campus of the University of North Dakota, is being oriented in several directions. In one project we try to find ways by which the

lignite can be modified so it can be used as a soil conditioner. A major effort is being made on the gasification of lignite. We hope to develop processes for using lignite in the production of high-quality gases suitable for use in industry and for home heating.

Chairman HAYDEN. I understand there are quantities of it.

Mr. ROSENBAUM. That is correct, sir.

RECLAMATION OF STRIPPED LAND

Chairman HAYDEN. In your justification statement there is an indication that a manuscript has been prepared in regard to the reclamation of stripped land. What recommendations are contained in the manuscript?

Mr. ANKENY. Mr. Zinner, our Assistant Director for Resource Activities.

Mr. ZINNER. Mr. Chairman, I believe that item referred to some work we did on three demonstration projects in Pennsylvania. The attempt here is to demonstrate that with the explosives the high walls left after stripping coal could be broken down, and the contour reestablished, so that some type of vegetation could be grown there.

Chairman HAYDEN. As it is, after strip mining the land is just utterly useless unless something like this is found. Isn't that right?

Mr. ZINNER. That is correct, sir.

Chairman HAYDEN. And how are you getting along with it?

Mr. ZINNER. We have done very little with it. The subject is under discussion now with regard to the whole Appalachia area. And I think that the committee now making a report to the President probably will bear very heavily on this subject.

CHAIRMAN Hayden. There is enough of it.

Mr. ZINNER. There certainly is; yes, sir.

OIL-SHALE RESEARCH

Chairman HAYDEN. You are requesting a $228,000 increase for oil-shale research. Will you describe your activity in this field?

Mr. ANKENY. Mr. Rosenbaum.

Mr. ROSENBAUM. The $28,000 is for increased pay costs; $200,000 is to do the engineering and associated studies in selecting a site that might be amenable to production of oil directly from shale without mining the shale. The idea here is that possibly the shale could be fractured in place and a flame front induced to propagate through the shale, distilling the oil and driving it on ahead. Or perhaps if the site were suitable it might be possible to do the fracturing and retorting by the use of a nuclear device.

MONEY REQUESTED

Senator McGEE. How much money have you asked for in the fiscal year 1965 budget for oil-shale research?

Mr. ROSENBAUM. The request for oil-shale research in fiscal year 1965 is for $1,136,000.

Senator McGEE. How does this compare with last year's funds, and how were those funds spent?

Mr. ROSENBAUM. The request for $1,136,000 represents an increase of $228,000 over the money provided in fiscal year 1964, of which

$28,000 is for increased pay costs for fiscal year 1964 personnel, and $200,000 is for the initiation of a project to study the in situ production of shale oil from oil shale.

A recently completed study of black shale cores from the New Albany shale deposits in Kentucky shows that from 10 to 20 gallons of oil per ton of rock can be recovered from the black shale and that each square mile of the deposits contains 10 million tons of this oil-bearing shale. Revegetation tests on spent oil shale conducted by the University of Wyoming at Laramie under an informal cooperative agreement with the Bureau indicate that drouth-resistant native plants and grasses will grow in the spent shale and that their seeds will germinate in it. Water retention by the spent shale seems to be the key to revegetation.

With the cooperation of State agencies, the U.S. Geological Survey, and oil and gas companies, the Bureau continues to assay and analyze core samples from oil shale deposits in Wyoming, Colorado, and Utah. The characteristics of oil shales occurring in a 2,000-foot depth interval over a 325-square-mile area in Colorado have been established and a correlation of the specific gravity of the assay shale oil with depth will be useful in many ways, including the assessment of the oil shales in other areas. The State of Utah now has granted oil shale leases on all State school lands and holders of the leases will benefit from the Bureau's study of core samples obtained from 40 coring operations and the drilling of 83 oil and gas wells in the Uinta Basin of eastern Utah.

Progress continues in determining the physical and chemical characteristics of the organic matter (kerogen) in raw oil shale. Industry has expressed its interest in the Bureau's work on the characteristics of oil shale, particularly the reactions that occur in the oil shale when it is heated. Extraction studies on oil shales show that the soluble material becomes more like crude oil as the depth of deposition increases. Some 18 different porphyrin compounds have been identified in raw oil shales and analyses indicate that retorted shale produces a shale oil in which the number of different porphyrin compounds is reduced markedly. Additional organic nitrogen compounds of possible commercial importance have been separated from shale oil fractions.

Progress has been good in the laboratory experimental work directed to the more efficient production of fuel and chemicals from shale oil by a combination of hydrogenation and catalytic cracking. A new study has been initiated to determine the efficiency and possible advantages that might result from retorting oil shale by heat transfer from a solid to the solid oil shale.

The recent approval by the Alberta government in Canada of a project to produce 45,000 barrels of oil a day from the Athabasca tar sands in northern Alberta, and the increased interest of U.S. oil companies in oil shale leases and in the future production of oil from oil shale, reflect the general feeling that crude oil production in the United States will have to be augmented by production of shale oil. The Bureau's research on oil shale and shale oil will be fundamental to the establishment of such an industry. In response to the many requests for information, both by mail and from visits to the Laramie Research Center, the Bureau has prepared and will soon publish a timely review of oil shale technology.

Senator McGEE. How do you plan to spend this year's funds that you have requested?

Mr. ROSENBAUM. A very careful review of the oil shale and shale oil research now in progress at the Laramie Research Center will be continued and emphasis will be shifted from unproductive areas to the most promising research prospects as they develop. The work plan for fiscal year 1965 is set forth in the justification beginning on page 46.

STATUS OF PROGRAM

Senator McGEE. What is the status of your research program in this area?

Mr. ROSENBAUM. The status is excellent and good progress can be expected to continue. The research staff is competent and enthusiastic and has been supplied with the necessary support and laboratory equipment. The status of the program is detailed in the justifications beginning on page 54.

Senator McGEE. Does your research program involve the oil shale deposits in Wyoming? With the excellent facilities existing at the University of Wyoming in Laramie and with the vast oil shale deposits in Wyoming it appears to me that Wyoming should figure prominently in your program.

Mr. ROSENBAUM. Our research program definitely involves the oil shale deposits of Wyoming. Core and drill samples are being obtained from Wyoming oil shale lands and are being assayed and analyzed. Some of the information is used immediately to further delineate the Wyoming deposits and to assess the oil shale potential. Careful consideration will be given to Wyoming lands in selecting a site for the proposed new field study of the possible production of shale oil by in situ retorting. Practically all of the research results obtained at Laramie are applicable to Wyoming oil shale and shale oil, as well as to the other Rocky Mountain area resources.

Senator McGEE. Is the Executive order of 1930 which limits your work in some particular areas hampering your oil shale research program?

Mr. ROSENBAUM. The Executive order of 1930 withdrawing all public lands from oil shale leasing does not hamper our research program at all. Executive Order No. 5327 states that the lands are "* * * withdrawn from lease or other disposal and reserved for the purposes of investigation, examination, and classification." We anticipate no difficulties in our research program from the provisions of the order.

Chairman HAYDEN. I have just received a statement from Senator Bennett supporting the oil shale field test proposed by the Bureau of Mines. This statement will be included at this point in the record.

(The statement referred to follows:)

OIL SHALE FIELD TEST

Mr. Chairman, I would like to thank the committee for allowing me the opportunity to testify today in behalf of an important Interior Department request for an oil shale test.

Oil shale is the Nation's first supplementary source of liquid fuels. Stored in huge deposits, this tremendous energy resource is greater than the known petroleum reserves and assures adequate domestic supplies of liquid fuels, gases, and petrochemicals for the foreseeable future.

Oil shale is the second most abundant fossil fuel in the Nation. It is exceeded only by coal and is more plentiful than petroleum and natural gas, which together furnish more than 70 percent of the energy consumed domestically.

The shale is found in many States throughout the Nation, but information and documentation of reserves in all except the Green River formation of Colorado, Utah, and Wyoming are sparse and incomplete.

Geologists have told us the Green River shales represent more than a trillion barrels of oil in place.

The chemical makeup of the organic matter in oil shale is not completely understood, but heat, normally applied to mined and crushed shale in retorts, converts the organic matter to gas, oil, and a carbonaceous residue. Oil obtained in this manner contains large proportions of unsaturated compounds, both hydrocarbons and derivatives of hydrocarbons containing oxygen, nitrogen, and sulfur.

By the proper techniques, this oil can be converted to products similar or identical to those from petroleum.

However, there is a considerable lack of information regarding oil shale technology. Research is needed to fill these gaps so an oil shale industry, not now in existence in the United States, can be operated economically when it becomes desirable to utilize this resource.

Among these areas of needed research are resource evaluation, composition and properties of oil shales, mining, crushing, materials handling, retorting or other conversion processes, refining, and properties and composition of products.

"IN SITU" TECHNIQUE

A big step forward in assuring the start of an oil shale industry is a proposed $200,000 field test of the "in situ" (in place) technique for oil shale production. The Interior Department has asked Congress to authorize the funds for the test in fiscal year 1965. The work would be accomplished by the Laramie Petroleum Research Center, a Bureau of Mines installation in Wyoming.

The "in situ" method of testing calls for retorting of the oil shale under ground. Simply speaking, holes would be drilled, fire and air would be forced down into the holes, and the resultant shale oil would be pumped to the surface.

The Utah area has vast deposits of oil shale, and if tests such as that proposed could work out successfully, the area could provide the Nation an excellent storehouse of energy.

Since about 95 percent of Utah's oil shale reserves are located underground they would lend themselves to an "in situ" method of extraction.

Utah's oil shale reserves total 4,680 square miles and the estimated oil shale deposits may total upward of 120 billion barrels. The oil-shale-bearing rocks of the Utah formation have been well defined in an area covering portions of Uintah, Duchesne, Wasatch, Utah, Carbon, Grand, and Emery Counties.

Utah's shales fill the Bureau's requirement for reduction tests. The Bureau is looking for overburdens of 500 to 600 feet, distant from cliff face or other escarpment, necessary to controlling fire or oil pressures.

I strongly urge the Interior Subcommittee to consider favorably the inclusion of $200,000 in the Interior Department's budget request for this test. If the oil shale industry is to become a reality, there has to be a start somewhere and a Government-conducted test of this type is a good approach.

I also am hopeful that the test would be conducted in Utah, where the conditions for the test are excellent.

Thank you, Mr. Chairman.

OCEANOGRAPHIC RESEARCH

Chairman HAYDEN. I note that you are proposing an appropriation of $182,000 for oceanographic research, an increase of $129,000 over the amount made available in fiscal 1964. Please explain to the committee how you used the $53,000 appropriated last year and how you propose to use the amount of your request in fiscal year 1965.

Mr. ANKENY. Mr. Chairman, I have with me this morning the project leader of our marine minerals research program, John Crawford, and I would like to have him explain this situation.

Mr. CRAWFORD. Thank you, Mr. Ankeny.

In this fiscal year, Senator Hayden, we have examined and appraised technical information on marine minerals that has been made available to the Bureau from the various groups working in oceanography, and have charted the areas in which minerals of potential industrial value have been found to occur. We have been considering concepts for equipment and instruments to develop and mine these marine mineral deposits. We have made a start, a modest start with a few people, toward gaining a better knowledge of the economics of sea-floor minerals as they are known today.

In fiscal year 1965 this work would be extended, but again very modestly, with the funds that are being proposed. We would continue the appraisal of new information on marine mineral occurrences provided from time to time by people working in the field of marine geology. We would conduct some preliminary field examinations of known mineral deposits on the Continental Shelf, in shallow waters at near-shore locations. We would try to determine the amount of ore in the deposits that can be mined; that is, define the economic reserves of the raw materials. We would also help industry develop deep-sea mining methods, because new types of equipment and procedure will be required to recover minerals from the sea floor; and we would conduct research and processing systems for the economic utilization of the marine materials.

Accelerated Public Works Program Projects

Chairman Hayden. Have you accomplished any projects through the use of accelerated public works funds? If you have, will you please supply for the committee a table showing the projects, their costs and location, and if a local or State government participated, the extent of that participation.

Mr. Ankeny. We would be happy to supply that; yes, sir.

(The statement referred to follows:)

Projects Under the Program

The Bureau of Mines has been assigned and is conducting two projects under the accelerated public works program, both of them in Pennsylvania.

One of these projects is in the anthracite district in Northumberland County. Its purpose is to extinguish a fire in a seam of coal, which is done by trenching and backfilling and by flushing fill into the underground openings through drill holes. A contract was let at the end of fiscal 1963. The project is now about 65 percent complete and will be finished before the end of this fiscal year. The Commonwealth of Pennsylvania has contributed a little over $83,000 and the Bureau of Mines has received and obligated about $65,000 of accelerated public works funds against the contract.

The El Campton project, in Clearfield, Clinton, and Elk Counties, is a demonstration of reclamation procedures for strip-mined areas. Approximately $117,000 of accelerated public works funds have been obligated on this project, which is now about 70 percent complete. Work has been recessed for the past 3 months but will be resumed as soon as weather permits.

Susceptibility of Minerals to Electrometallurgical Processes

Senator McGee. As you know, I introduced Senate Joint Resolution 7 last year which called for a study to determine the susceptibility of minerals to electrometallurgical processes.

The economic stability and prosperity of the Rocky Mountain area depends largely upon the development of industrial processes which will make economically usable minerals found in the United States.

The Senate Interior and Insular Affairs Committee advised me that the Bureau of Mines already had sufficient authority to conduct this type of study.

Do you now have a program operating to perform this study? How much have you asked for to continue it? How much would you need to get it started? Will you describe for the committee the status of the program?

Mr. ROSENBAUM. The present Bureau of Mines research program includes studies related to the susceptibility of minerals to electrometallurgical and other metallurgical processes. Since studies of this type have been a part of the Bureau of Mines research program from its beginning, no additional funds are needed to start the work and projects are continuing under regular authorizations.

A large part of the Bureau's metallurgical research program is conducted in the Rocky Mountain and adjacent areas by research centers at Albany, Oreg.; Reno, Nev.; and Salt Lake City, Utah; and a laboratory at Boulder City, Nev. Their respective budgets (1964 fiscal year) for all metallurgical research and the respective portions allocated specifically for electrometallurgical research are as follows:

Location	Total metallurgical research	Electrometallurgical research
Albany, Oreg., research center	$1,820,000	$80,000
Reno, Nev., research center and Boulder, Nev., laboratory	1,840,000	760,000
Salt Lake City, Utah, research center	1,090,000	130,000
Total	4,750,000	970,000

The total fiscal year 1964 Bureau of Mines budget for metallurgical research at the seven centers and five laboratories is $8,875,900, with $1,071,000 allocated for electrometallurgical research. The program is expected to continue essentially at the same level in fiscal year 1965.

HEALTH AND SAFETY PROGRAM

Chairman HAYDEN. There will be placed in the record a statement in support of the request for $9,530,000 for health and safety in the coming fiscal year, an increase of $866,000 over the amount provided in fiscal year 1964.

(The material referred to follows:)

HIGHLIGHT STATEMENT

PURPOSE AND LONG-RANGE OBJECTIVE

Bureau of Mines health and safety programs are designed to: (1) Prevent accidents and injuries primarily in the mineral extractive industries of the United States, represented by coal, metal, and nonmetallic mining, quarrying, metallurgical, petroleum, and natural gas; (2) develop safeguards to protect the lives and health of persons employed in such industries; and (3) extinguish or otherwise control fires in inactive coal deposits. The purpose of these programs is to save lives and improve the economy of the Nation's mineral industries by eliminating costly accidents, personal injuries and impairment of health, and by avoiding destruction of valuable natural resources and destruction or disablement of facilities to produce them.

Although the ultimate long-range goal of the Bureau's health and safety programs is the elimination of accidents and injuries throughout the mineral indus-

tries, it is unlikely that such a goal can be attained. The nature of underground mining occupations, whether in coal or noncoal mines, is inherently hazardous. Underground mining poses dangers that most other industries do not have to combat. Progress toward the ultimate goal should, therefore, be considered satisfactory if a steadily declining frequency rate—lost-time injuries per million man-hours of exposure—can be achieved in the extractive mineral industries, particularly underground mining.

ACCOMPLISHMENTS DURING PAST YEAR

The record of Federal coal mine inspections for 1962 shows that the average number of inspections per active mine regularly employing 15 or more men underground (classed as title II in the Federal Coal Mine Safety Act) was 2.4 times; whereas for mines regularly employing less than 15 men underground (classed as title I in the Federal Coal Mine Safety Act) the average was 1.3 inspections. Strip mines were inspected 0.8 time, and auger mines 0.7 time during the year. Because of seasonal or otherwise intermittent operation or abandonment of the mines, some facilities could not be inspected during the year.

Experience of the Bureau of Mines, extending over a half century, discloses that best results in preventing accidents and injuries are obtained largely through safety-educational activities. Over 5,400 persons completed various Bureau accident-prevention training courses and approximately 26,600 persons completed the first-aid and mine-rescue courses during the fiscal year 1963. Also contributing to the overall effort was the attendance of approximately 57,000 persons at the Bureau's demonstrated lectures on safety and 81,000 persons at Bureau screenings of safety films. In addition, approximately 90,000 persons attended Bureau-sponsored safety meetings, including those of the Holmes Safety Association.

Special emphasis was given to safety education in the metallic and nonmetallic (other than coal) mining industries during the fiscal year 1963 as a coordinated effort with mine inspections, fatal accident investigations, and statistical canvassing studies authorized by Public Law 87-300, pertaining to a 2-year mine-safety study conducted by the Bureau of Mines.

The testing of underground equipment and devices and approving as permissible those which conform with prescribed regulations, coupled with research on and development of new devices to keep abreast of changing or newly encountered conditions, contributed substantially to the overall safety performance of the mineral industries.

Falls of roof, back, or ground cause most of the fatalities and serious injuries in underground mining operations. Research continued on roof control through the year. Studies of roof and rock bolting to prevent falls coupled with new techniques of bonding poorly consolidated roof strata with resinous substances and the scientific study of "bumps" or rock bursts, provided guidance for the mining industry to combat its most prolific hazard—unexpected falls of roof or ground.

A breakthrough was reached in studies to predict failures of roof and pillars in coal mines that are subject to "bumps" and rock bursts through the use of Bureau-designed encapsulated hydraulic-load cells that are embedded in coal or rock strata surrounding mine passageways.

New chemical formulations, spraying equipment, and application techniques for rigid foam applied in mines were developed. The foam is an effective aid to mine ventilation, prevents corrosion of metals, inhibits weathering of mine surfaces, provides thermal insulation, and is used in rapid construction of mine seals and nonload-bearing walls.

Two prototype methane monitoring detectors were tested in an operating coal mine. The results were used to prepare specifications for five experimental prototypes with different amplifying circuits for electric signals of changes in methane concentration detected by small catalytic gas-sensing elements.

Methods employed to control dust generated by continuous mining machines in coal mines were studied to provide the basis for further research into more effective dust control procedures. Investigation was started on the use of foam instead of water for dust control.

Investigation of air conditioning and ventilation of high temperature mines was continued with a study of mechanical refrigeration operated in series with cooling towers.

The 2-year study, authorized by Public Law 87-300, to appraise health and safety conditions and practices in metal and nonmetallic (other than coal mines was completed. The study included the causes of work injuries, relative effec-

tiveness of safety education conducted for the employees, State laws pertaining to such mines, and effectiveness of law enforcement in the various States.

The control of fires in inactive coal deposits is a continuing activity in which eight fires were extinguished or controlled during the fiscal year 1963. Some maintenance work was necessary to prevent previously controlled projects from rekindling.

PROGRAM CHANGES

Although primary objectives continue unchanged, the programs in health and safety are subjected to continual scrutiny because working and economic conditions in the mineral industries change or new conditions arise, requiring flexibility to shift emphasis or to add other programs as conditions warrant. Based on facts revealed by investigation of recent disasters and fatal accidents, emphasis on and expansion of accident-prevention education and training in all types of mines is needed to combat rising trends in fatalities and disabling injuries. The rapid advance of mine workings and mineral extraction through widening application of new mining methods and high-output machines, particularly in ultragassy coal mines, has caused revision of precautions necessary to safeguard against gas and dust ignitions. This has led directly to the Bureau's investigations to develop a practical and effective methane monitoring system, to develop more effective dust-control measures, and to improve face and general mine ventilation.

OBJECTIVES AND PROGRAM FOR FISCAL YEAR 1965

The Federal Coal Mine Safety Act requires at least one inspection of each title II mine annually and also authorizes the Bureau of Mines to make annual or necessary inspections of title I mines. The Bureau, however, recognizes that its obligations under the act cannot be discharged by adhering to minimum requirements. Currently the objective is to inspect each title II mine at least 3 times annually, each title I underground mine twice a year, and each strip and auger mine at least once annually.

Bureau of Mines studies during fiscal year 1963 revealed that one of the most successful means of preventing accidents and injuries in the mining industries is through accident-prevention educational training; however, a modern approach and up-to-date aids and test materials are needed to keep abreast of rapidly changing mining conditions. To accomplish the overall objective, contingent on the availability of funds, mine-safety instructional publications, sound motion picture films and other visual aids will be developed and others updated; and closer cooperation with industry will be initiated to develop new courses and instructional materials to meet industry needs. Also, additional Bureau instructional personnel will be trained and equipped to carry on this important work.

With the tremendous increase in mine mechanization, the hazards of explosions and fires have greatly increased due in a large measure to the rapid generation of fine coal dust at working faces. Such dust readily becomes airborne and the problem of counteracting it has greatly increased. Research to combat the fine-coal float-dust hazard will be stepped up by reexamining basic rock dust standards, including the use of rock dust barriers; determining float-dust characteristics; exploring new methods for collecting, inhibiting or otherwise limiting deposition of fine-coal dust; and modifying present means of dust control to effectively reduce the fine-coal float-dust explosion hazard.

Ventilation research and investigations will be augmented to keep abreast of modern mine-ventilation requirements. The health and safety of mine workmen is dependent in a large measure on an adequate volume of clean air to breathe and to dilute, render harmless, and carry off the explosive or noxious gases that may be liberated or generated in mining operations. Mining has become progressively more difficult as coal, and metal and nonmetallic ores are extracted from increasing depths below the earth's surface. In some gassy coal mines operations can be carried on only with close attention to ventilation because of the large volumes of methane liberated.

In some deep metal mines high rock temperatures complicate the ventilation problem by requiring air conditioning and cooling to maintain the comfort, health, and productivity of the workmen. The use of underground diesel-powered equipment and new types of blasting agents require attention of the skilled ventilation engineer. The mining industry has long looked to the Bureau of Mines for guidance and assistance with its more difficult ventilation problems.

Prompt detection of methane, particularly in coal mines, has been as difficult to achieve as to carry methane away harmlessly as it is liberated from the coalbed or contiguous rock strata. The problem of timely detection by officials and mine

workmen has been intensified especially in ultragassy mines by the demands of mechanized mining. High productivity usually is accompanied by a high rate of methane liberation in a gassy coal mine. Recent gas ignitions and explosions have demonstrated that human beings cannot be depended upon to test for methane at frequent enough intervals to assure prompt detection of dangerous accumulations. The Bureau has conducted some research to develop a suitable device for automatic methane detection and monitoring. This is a high-priority undertaking that calls for a rapid solution; and the effort is to be expanded and expedited to the end of preventing disastrous methane ignitions.

Research and testing in gas analysis is planned to: (1) Determine with a non-dispersion infrared analyzer trace concentrations of carbon monoxide in gases from sealed fire areas of coal mines; (2) examine methane in coal mine atmospheric samples by gas chromatography to detect higher hydrocarbons; and (3) broaden utilization of the dispersion-infrared spectrometer to analyze mine gases and other gaseous mixtures.

Encapsulated hydraulic-load cells will be utilized extensively to study pressure changes in mine roofs and pillars in the investigation of the causes of "bumps" and pillar bursts. Preliminary results have been very encouraging in predicting occurrences.

Testing will be continued on roof bolts, bearing plates, and anchors to improve minimum standards of roof bolting. Studies will continue on the use of rock-bonding chemicals to improve roof-bolt anchorages in soft strata and to stabilize and consolidate mine roof by injecting such substances into fractures and other planes of weakness in mine roof.

The Bureau's service to the mining industry in testing for permissibility of various electric- and diesel-powered machines, auxiliary devices, and respiratory-protective equipment will be continued and improved, where possible.

The control of fires in inactive coal deposits will be continued. Projects will be initiated in order of urgency and availability of funds. The Bureau has records of 231 uncontrolled fires in inactive coal deposits, 115 fires that have been extinguished or controlled under this program, and 6 fires that are currently being fought. The objectives are to prevent losses of valuable natural resources and to prevent loss of life or impairment of health of those living or working near such fires.

Inspections, investigations, and rescue work

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost	Program
Inspections, investigations, and rescue work	$6,444,277	$6,670,000	$6,887,000	+$217,000	+$177,000	+$40,000

INSPECTIONS, INVESTIGATIONS, AND RESCUE WORK

The estimate of $6,887,000 is a net increase of $217,000 over 1964, consisting of—

(1) A decrease of $100,000 from 1964 caused by termination of the metal and nonmetal (other than coal) mine study authorized by Public Law 87–300.

(2) An increase of $317,000 including (*a*) $177,000 for increased pay costs, and (*b*) $140,000 to provide for expansion of the safety educational program.

Need for increase

Safety education and training, increase, $140,000.—The Bureau's safety education and training is a continuing program that calls for expansion to meet requirements of the present-day mining industries and to keep abreast of rapidly changing mining conditions. Needed in this program are up-to-date mine health and safety publications, more motion-picture film productions and other aids on mine health and safety subjects, development of new accident-prevention instruction courses in cooperation with industry, and training and equipping of additional instructional personnel to carry out the augmented educational program.

During the 1963 fiscal year, studies were made of company injury rates before and after accident-prevention training. On an overall basis, the results showed that very favorable reduction of fatal and nonfatal injuries followed such training for periods ranging up to 2 years, but that injury rates ordinarily rose to average levels after longer periods without additional training. Other studies showed that arrangements for accident-prevention training were accomplished mainly through Bureau solicitations with favorable responses from approximately 11 percent of the industry that was solicited. Recent disasters in the mining industry have demonstrated clearly the need for broader coverage and more active participation of the industry in safety-educational programs.

The expanded program will provide means for making special studies of health and safety problems in industry, providing up-to-date training materials and visual aids, and developing courses that meet the needs of industry. Most important, it will increase the Bureau capabilities for service to the mining industry—coal, metal, and nonmetallic—through safety education and training.

Plan of work

Appropriated funds will be expended mainly in the field coincident with inspections, field investigations, and educational aspects of the Bureau's health and safety activities. The primary objectives of these activities are to prevent industrial accidents, injuries, and occupational diseases of mineral-industry workmen and by so doing protect the lives and health of those who work in the mineral (coal and noncoal), metallurgical, petroleum, natural gas, and allied industries. This is accomplished through mine inspections, safety investigations, accident prevention education, and roof-control, ventilation, and working environment investigations in mines.

Coal mine inspections and investigations are carried on in accordance with the requirements of the Federal Coal Mine Safety Act (Public Law 552, 82d Cong.). The administration and enforcement of this law was delegated by the Congress to the Bureau of Mines.

Established methods for disseminating accident-prevention education in the mineral industries (coal and noncoal) for workmen and supervisors will be continued by classroom and on-the-job instruction, demonstration, films, and other visual aids, and instruction in first-aid and mine rescue procedures. New techniques in teaching accident prevention to stimulate company-sponsored training have been instituted to broaden the base of accident-prevention educational training.

Service to the mining industry through improved ventilation, dust-control, and roof-control techniques is a continuing activity germane to the general overall objective of preventing loss of life and impairment of health of workmen, particularly those engaged in underground mining operations.

Control of fires in coal deposits

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost	Program
Control of fires in coal deposits	$383,352	$419,000	$403,000	−$16,000	+$7,000	−$23,000

CONTROL OF FIRES IN COAL DEPOSITS

The estimate of $403,000 is a net decrease of $16,000 from the amount available for 1964, representing—

(1) A reduction of $23,000, representing unobligated funds appropriated without fiscal year limitation for the control of an underground fire in the vicinity of Scranton, Pa.

(2) An increase of $7,000 to cover increased pay costs.

Plan of work.—Funds for this activity will be spent almost entirely in the field to control or extinguish fires in inactive coalbeds on private property and on the public domain. The purpose is twofold: (1) To prevent destruction by fire of valuable resources, and (2) to protect the lives and health of persons living or working in proximity to such fires. Thirteen fires are scheduled for control during the fiscal year 1964, together with six uncompleted projects carried over from fiscal year 1963. The Bureau has records of 231 other fires in inactive coal deposits on private property and the public domain. These will be attacked in order of urgency and availability of funds.

Health and safety research

Activity	Fiscal year 1963, amount available	Fiscal year 1964, amount available	Fiscal year 1965, estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost	Program
Health and safety research	$1,553,899	$1,596,000	$2,240,000	+$644,000	+$24,000	+$620,000

HEALTH AND SAFETY RESEARCH

The estimate of $2,240,000 is an increase of $644,000 over 1964. The increase includes $24,000 for increased pay costs, and $620,000 to (*a*) extend research and development for controlling the float-coal dust hazard, particularly in mechanized coal mines ($370,000), (*b*) extend research to improve mine ventilation, particularly face ventilation in highly mechanized mines ($150,000), and (*c*) expedite development of methane-monitoring devices to combat the hazard of mine explosions ($100,000).

Need for increase

Fine-coal float-dust explosion research, increase, $370,000.—With the tremendous progress in mechanized mining technology and concentrated loading at mine faces, problems and hazards of mine explosions and fires have been greatly increased. Further dust explosion research is vital to develop basic criteria that will permit evaluation of present safety standards in modern mining, particularly as applied to fine coal float dust. Concentrated mechanical mining has greatly intensified the float-dust problem and requires that basic rock-dust standards considered adequate for many years be improved and possibly supplemented by other means to control float-dust explosions, including rock-dust barriers. The Bureau of Mines is responsible for conducting research to reduce this hazard by determining float-dust characteristics and methods for collecting, inhibiting, or otherwise limiting deposition of fine coal dust thereby minimizing the difficult and often poorly applied rock dust to coal mine surfaces.

The instruments presently used at the Bureau's experimental coal mine are obsolete, inadequate, and inaccurate for obtaining needed information. Present dust preparation equipment is old, hazardous to operate, and incapable of providing coal dust of the required fineness in the quantity desired for the proposed large-scale experiments. New auxiliary facilities should be provided to study the transport and deposition of float dust as affected by air velocity, particle size, type, and quantity of dust. Fundamental information is necessary for coal, rock, and other dusts to facilitate meaningful large-scale mine experiments. The requested increase in funds will provide for replacing obsolete equipment, including instrumentation, and the addition of 12 new positions—4 professional, 7 subprofessional, and 1 clerical—to carry on the expanded research.

Experience from recent coal mine disasters emphasizes that the need for fundamental research in the experimental coal mine is fully as great, if not greater, than when the Bureau of Mines was organized. Results obtained at the experimental coal mine have merited national reputation. The coal mine industry depends upon the continued development of Bureau of Mines information through ex-

haustive experiments which utilize technological progress toward improving safety in modern coal mining operations.

Mine ventilation research and investigations, increase, $150,000.—Long-range planning is required to fortify the Bureau of Mines reputation throughout the mining industry to direct and guide progress in mine ventilation—a field in which expert knowledge is limited. The Bureau's capabilities in this field should be extended to keep abreast of rapidly advancing mining methods, to maintain its high standard of leadership, and to provide the mining industry with improved technological information.

Ventilation is a foremost safety factor in all kinds of underground mining operations, and becomes progressively more difficult as coal and ores are extracted from increasing depths below the earth's surface. Even now some gassy coal mines can be operated only with the most exacting attention to ventilation to prevent dangerous accumulations of methane. Especially vital is the need to improve ventilation in face areas to counteract the effects of rapid liberation of dangerous gas and generation of explosive dust. New methods of mining and more powerful mining machines, both developed for more rapid, economic, and efficient extraction of mineral substances, have intensified hazards in the face areas and complicated the problems of providing adequate ventilation. Increasing use of diesel-powered equipment and new types of blasting agents require careful attention of the ventilation engineer. With mining at greater depths, air-conditioning and cooling are required in many instances to maintain the comfort, health, and productivity of mine workmen, with corresponding need for engineering knowledge and skill for effective design and operation. The augmented mine ventilation research program would embrace the establishment of four additional professional positions.

Ventilation studies necessitate laboratory experiments to improve instrumentation and measurements used to study fan performance and design for special face-ventilation applications, vent-tube air conductors, patterns of air flow with changes in velocity, characteristics of blowing and exhausting systems, resistance factors as they affect loss and regain of static pressure, and power needs. Such information requires supplemental trials and analyses of ventilating systems in commercial mines to appraise their effectiveness. Ventilation costs at different operations require analysis to obtain data that will assist mine management in improving ventilation of their mines thereby increasing safety, particularly in face areas of coal mines, or point the need for installing new ventilating equipment. Increased facilities and personnel are needed for detailed studies by the absolute pressure method and other advanced techniques to aid mine managements in detecting and correcting abnormalities and to increase efficiency. Field observations are necessary to keep abreast of new industrial developments in ventilation equipment; mine air conditioning; use of synthetic foams and mineral products for mine stoppings, dust collectors, and space filters; and instrumentation pertaining thereto.

Methane detection and monitoring research, increase, $100,000.—In coal mine operation there is an imperative need for rugged, practical devices for precise, automatic methane detection and monitoring. Additional funds are required to expand and expedite research and development of this high-priority project to provide more adequate testing and investigation of many physical principles that might be used for methane detection and to discover and develop auxiliary equipment for an automatic monitoring system that must not be affected by the rugged use of operating mining machines.

Investigations of recent coal mine explosions have disclosed that human failure to test for and detect methane buildup in the working-face areas was an important contributory factor. To overcome the frailty of human nature a device is required that will continually sample the mine atmosphere in the working area, sound an alarm when the methane content reaches approximately 1.5 percent; then, if this warning is ignored, cut off electric power from the equipment and power cables in the affected area when the methane content reaches about 2.5 percent.

Enlargement of methane-detection research and field testing of methane monitors through additional personnel, consisting of six professional and one clerical positions, and development of specialized instruments and facilities will enable the Bureau of Mines to maintain its rightful leadership in preventing accidents and injuries from methane ignitions and explosions. Current research to develop a practical methane monitor has been encouraging but much more remains to be done to improve various components to provide the most reliable instrument possible.

Plan of work

Appropriated funds will be expended mainly in Bureau of Mines laboratories and its two experimental mines. Research will be directed toward improving electric- and diesel-powered equipment for underground work; methods and equipment to counteract health hazards of the mineral industries; establishing more scientific bases for roof control, including prevention of "bumps" or rock bursts; improving mine ventilation, particularly at working faces, and aiding the mining industry in solving difficult ventilation problems, including air conditioning and cooling; and preventing dust explosions and mine fires by applying new concepts of controlling float-dust transport, rock dusting, and dust binding and settling.

Test work will be continued on improvements in mine equipment that previously had been approved by the Bureau as well as new equipment. Increasing demand for testing and approval of underground electric- and diesel-powered equipment, lighting and shot-firing devices, gas detectors, drill-dust collectors, gas masks, respirators, and self-contained breathing devices, calls for greater application of Bureau personnel to provide and improve these important services that the mineral industries depend upon for unbiased evaluation of the safety of such equipment.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$8,381,528	$8,685,000	$9,530,000	+$845,000
Unobligated balance brought forward	−23,000	−23,000		+23,000
Unobligated balance carried forward	23,000			
Unobligated balance	44,111			
Appropriation	8,425,639	8,662,000	9,530,000	+868,000
Obligations by objects:				
11 Personnel compensation	6,290,599	6,600,000	7,012,000	+412,000
12 Personnel benefits	460,960	485,000	520,000	+35,000
21 Travel and transportation of persons	348,275	350,000	375,000	+25,000
22 Transportation of things	26,529	26,000	27,000	+1,000
23 Rent, communications, and utilities	128,285	130,000	138,000	+8,000
24 Printing and reproduction	67,864	60,000	85,000	+25,000
25 Other services	508,847	500,000	533,000	+33,000
26 Supplies and materials	289,315	298,000	410,000	+112,000
31 Equipment	260,854	236,000	430,000	+194,000
Total obligations	8,381,528	8,685,000	9,530,000	+845,000

Chairman HAYDEN. Now, will you please comment on the various aspects of this program?

Mr. ANKENY. Mr. Westfield, the Assistant Director for Health and Safety, will respond to that question.

Mr. WESTFIELD. Thank you, Mr. Ankeny.

Senator Hayden, there are four increases we are asking for.

COAL DUST PROBLEM STUDY

The first is to study the coal dust problem in coal mines. We are asking for a $370,000 increase, which will include 12 additional employees.

Mechanized equipment, particularly continuous mining machines that grind the coal out of solid veins without blasting, has introduced a new hazard in coal mining. This is in the form of large amounts of extremely fine float-coal dust that is deposited on top of the rock dust for long distances in return air courses in our mines.

This fine coal dust is definitely explosive. Research will be directed toward collecting or suppressing the dust at its source, or toward

developing means of rendering such dust inert so that it will not propagate an explosion.

In the last three major disasters we have had in coal mines this float-coal dust has carried the explosion much farther than it would be normally. In some cases it resulted in the loss of additional lives. We have used rock dust to render coal dust nonexplosive for many years, using the standard that had been established before, which was that if we had 65 percent incombustible material we could prevent the propagation of an explosion.

We find this is not true at the present time. We find float-coal dust will explode when the ratio of incombustible is even higher than 80 percent. So, if we are going to prevent major disasters, and particularly propagation of the explosion, we have to come up with a solution to this problem.

Chairman HAYDEN. And that is what you are working on?

Mr. WESTFIELD. Yes, sir.

Chairman HAYDEN. How many additional personnel do you need during the fiscal year 1965 for your health and safety program, and for what purposes will you use them?

Mr. WESTFIELD. I think it would be better if I went on and explained—I don't want to get away from that answer, but I would like to explain the other items first.

Chairman HAYDEN. All right.

MINE EXPLOSIONS STUDY

Mr. WESTFIELD. In these explosions we have had in the last 2 or 3 years, we have found the mining companies and the men themselves are not using the protective instruments they have at hand, particularly the safety lamp and the methane detector.

So, accumulations of methane have developed, ignitions have occurred, and a number of people have been killed. We have been working on a methane detector or a monitoring system that will detect the gas, one that will be placed on the mining machine so that in case the methane gets up to the established dangerous figure this monitor will automatically give an alarm. Then, if this is not heeded immediately, as the methane increases the monitoring system will provide an automatic cutoff of electric power. This will get away from the human failure.

We plan on speeding up this research by adding seven additional employees. Most of these will be technical and research people in our Pittsburgh station.

VENTILATION SYSTEM RESEARCH

We also find in investigation of our explosions, that with the high speed development, as explained by Mr. Ankeny earlier, our present ventilation systems are not adequate.

In many cases methane has been liberated at a higher than normal rate, and we find this not only stops production but it also makes it very dangerous, in that accumulations of gases occur, are ignited, and cause explosions. We plan on doing some research work in mine ventilation, particularly in the face areas where these accumulations occur.

For this ventilation research we are asking for a $150,000 increase which will include four additional employees.

Safety Educational and Training Program

The fourth increase, and the last, is for our safety educational and training program. In this case we are asking for an additional $140,000 with four more employees. It is recognized that the best method of preventing accidents is through education. We are now spending in our safety education training and work around a million dollars at the present time. We have been quite successful with the larger mining operations, but we find we are not reaching the smaller operators, particularly in the coal-mining areas. Many of these are out in isolated places, and we haven't been successful in getting these people out to attend accident-prevention training courses for officials, and also for miners, because there are no meeting places available.

Mobile training units

In this instance, we plan on purchasing or having constructed two or three mobile training units that we can take directly to the locations of small mines and be able to train these people.

Chairman Hayden. Train them in one place and move to the next place?

Mr. Westfield. That is right. So, in connection with the 4 increases requested, we are asking for a total of 27 additional people.

Construction Request

Chairman Hayden. The Bureau of Mines does not ask for appropriation of additional money in fiscal year 1965 for construction. However, it proposes to use an unobligated balance of $712,108 for design and preparation of engineering plans and specifications in connection with proposed new construction in Bruceton, Pa., and Frederick, Md.; and to complete the construction and equipment of the engineering and physical science building at Bartlesville, Okla. The statements submitted in support of this action will be printed in the record.

(The statement referred to follows:)

Construction

Appropriation, 1964	
Unobligated balance from prior years	$712,108
Total available for obligation	712,108
Decreases:	
Construction and equipping of Bartlesville facilities	248,662
Research facility planning	463,446
Total	712,108
Budget estimate, 1965	

Analysis by activities

Activity	Amount available, 1964	Fiscal year 1965			Total available, 1965 compared to total available, 1964
		Unobligated balance from prior years	Budget estimate	Estimated total available	
Laboratory facilities	$712,108				−$712,108

LABORATORY FACILITIES

The funds available in fiscal year 1964 will be used to design and prepare engineering plans and specifications in connection with proposed new construction at Bruceton, Pa., and Frederick, Md.; and to complete the construction and equipping of the engineering and physical science building at Bartlesville, Okla.

Itemization of estimate

	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:			
Total obligations	$712,108		−$712,108
Unobligated balance brought forward	−712,108		+712,108
Appropriation			
OBLIGATIONS BY OBJECTS			
Bureau of Mines:			
25 Other services	157,066		−157,066

Total, Bureau of Mines	226,064		−226,064
Allocation to General Services Administration:			
24 Printing and reproduction	1,095		−1,095
25 Other services	481,960		−481,960
32 Lands and structures	2,989		−2,989
Total, General Services Administration	486,044		−486,044
Total obligations	712,108		−712,108

Chairman HAYDEN. What is the new construction proposed at Bruceton, Pa., and at Frederick, Md.?

BRUCETON, PA., FACILITY

Mr. ANKENY. With respect to this new construction, the planning money was authorized in the 1963 appropriation. And it consists so far as Bruceton is concerned of a new facility there to replace the station at 4800 Forbes Avenue in Pittsburgh, Pa. We plan in time, when this construction is authorized at Bruceton, to abandon the 4800 Forbes Avenue location.

FREDERICK, MD., LABORATORY

The construction at Frederick, Md., would consist of a new special-purpose laboratory designed to carry out research on more refined analytical methods of research on mineral materials. But no money for either of these projects has been asked for this year.

Chairman HAYDEN. How about Bartlesville?

Mr. THOMSON. At Bartlesville we propose to spend about $170,000 to complete the engineering facility for which funds were appropriated in 1961. This is primarily for the changeover of air conditioning and heating to the new powerplant; addition to the radio chemistry laboratory; and dust and fume hoods in the laboratories.

AUTHORIZATION FOR CONSTRUCTION

Chairman HAYDEN. What consideration have you given to securing specific authorization for the construction of a Bruceton facility, as was suggested last year by the House committee?

Mr. ANKENY. The specific authorization for Bruceton has not been asked for.

Has it, Mr. Zinner?

Mr. ZINNER. We have submitted draft language to the Department that proposes to specifically authorize this building. The Department is considering this in the light of what authorities might already exist. There is some question of whether existing authorities would apply to Bruceton or whether new legislation would have to be sought. This is the matter that is being examined at the moment.

ANALYTICAL RESEARCH EXPERIMENT STATION, FREDERICK, MD.

Nothing has been submitted to the Congress as yet.

Chairman HAYDEN. On September 9, 1963, Assistant Secretary Kelly sent proposed legislation to Congress to provide for the establishment of an analytical research experiment station. To date this bill has not been enacted. Are you asking for these funds even if this proposed legislation is not approved?

Mr. ANKENY. We wouldn't ask for the funds unless it would be approved; the bill has been introduced.

Senator BIBLE. Is that the Frederick, Md., facility?

Mr. ANKENY. Yes, sir.

Chairman HAYDEN. How far along are you with it?

Senator BIBLE. It has not been authorized, Mr. Chairman.

Mr. ANKENY. The bill has not yet been passed by Congress.

Senator BIBLE. May I ask a question there?

How about the planning money? Is this the one that is involved with the University of Maryland? Is this the same project?

Mr. ANKENY. No, this is a different project.

Senator BIBLE. This is a different project from the facility you have at the University of Maryland at College Park?

Mr. ANKENY. That is right.

Senator BIBLE. What was your reply as to the planning money for the Frederick, Md., project?

Mr. ANKENY. Mr. Rosenbaum.

ARCHITECT PLAN AWARDED

Mr. ROSENBAUM. An architect contract has been awarded. GSA is handling this for us. The architect is proceeding with the preparation of plans so that these will be complete when it is appropriate to ask for construction funds.

Senator BIBLE. You would go ahead and contract for the plans with what funds?

Mr. ROSENBAUM. Planning money was granted by the Congress a couple of years ago.

Senator BIBLE. Do you have special authorization to go ahead and plan for this facility? I assume you do not.

AUTHORIZATION FOR PLANNING

Mr. ANKENY. Not specific authorization. There was a question as to just what authority we do have. From past legislative history of the Bureau of Mines' authority for construction it looks very much like we do have authority to build two or possibly three buildings. Yet the validity of this has been questioned because it is an old authority that dates back a good many years.

Senator BIBLE. I would hope the staff would go into this, Mr. Chairman, because it seems just a little bit ironical to me that they are asking for planning money before we are even authorized a certain facility.

Suppose they don't authorize it, then you have expended the planning money, isn't that right?

Mr. ANKENY. The question of authority was raised after the Congress granted us the money to proceed with the planning of this building.

Chairman HAYDEN. Congress gave you money before they authorized the projects?

Mr. ANKENY. Before this was a specific authorization. We asked for this money on the basis of a blanket authorization that authorized a number of facilities. And this number of facilities has never—this authorization for the number of facilities has never been entirely used by the Bureau of Mines in its construction program.

BUREAU FACILITIES LOCATIONS AND FUNCTIONS

Senator BIBLE. At that point, Mr. Chairman, before you move into the "General administrative expenses" questions, I would like to have you supply for the record, Mr. Ankeny, the total number of Bureau of Mines' facilities that you have in the 50 States, where they are located, what their function is—I am directing this primarily to the minerals and metals rather than to the coal and shale side of your responsibility—but I would like to know where each of them are located, how many employees you have at each of them, what their area of responsibility is, because, as you know—I have discussed this with you a number of times, and it seems to me that within the framework of the Bureau of Mines we have adequate facilities in many areas of the United States rather than building additional facilities.

I know this is true in Nevada. I can't speak for Arizona, but we have facilities there that are not fully occupied or fully utilized. And I would like to have you supply me at your earliest possible convenience this information. I don't want to burden the record with it now.

And you are free to make any comment you want.

Mr. ANKENY. We would be happy to do that. We have developed a long-range building program, and we would be happy to supply you with a copy of this long-range program.

BUREAU OPERATIONS OUTSIDE THE COAL INDUSTRY

Senator BIBLE. One of the main problems in the area of minerals and metals particularly is that it is at a somewhat general low ebb. I mean gold and silver and copper, is so-so, and lead and zinc is deplorable. And you look to your radium and your oil and gas revenues to somewhat justify your requests for increases. But I would like to see a complete tabulation of all of the Bureau of Mines' operations, outside of the coal industry that you have under your jurisdiction, and where they are located, and how many people you employ, and what their assigned responsibility is.

Mr. ANKENY. I would be very happy to supply that.

Senator BIBLE. I would not expect you to furnish that right out.

Bureau of Mines

METALLURGY RESEARCH

Location	Personnel	Activity
Tuscaloosa, Ala	30	Primary: Mineral dressing of industrial minerals; heavy liquid beneficiation techniques. Auxiliary: Development of thermodynamic data in specified areas.
Tucson, Ariz	11	Mineral beneficiation, primarily copper ores.
Berkeley, Calif	13	Development of thermodynamic data of inorganic materials.
Minneapolis, Minn	60	Primary: Iron ore beneficiation and preparation; fundamentals and practice of agglomerating, sintering, and pelletizing ores. Auxiliary: Manganese ore processing.
College Park, Md	115	Primary: Physics of nonmetal refractories; secondary metals recovery and refining, principles of electrochemistry; bacteria in metallurgical processes; techniques of instrumental analysis; cost estimation and process evaluation. Auxiliary: Process simulation; principles of electrostatic and magnetic separation; corrosion of metals and alloys.
Rolla, Mo	91	Primary: Physical metallurgy of steels, light metals, and base metals; vapor pressure measurements. Auxiliary: Pyrometallurgy processing; physical properties of minerals, metals and alloys; vapor phase plating technology; mineral dressing services; oxidation of metals and alloys.
Reno, Nev	110	Primary: Molten salt electrowinning and electrorefining of metals and alloys.
Boulder City, Nev	85	Auxiliary: Techniques in neutron activation analysis; analytical techniques for rare-earths metals and compounds; processing metallurgy of alumina, titania and rare-earth metals; evalution of Bureau research products.
Bruceton, Pa	89	Primary: Iron smelting. Auxiliary: Iron and steel processing and testing.
Albany, Oreg	208	Primary: Halogenation technology; reduction of metallic oxides and halides; melting and casting technology; physical metallurgy of reactive and refractory metals. Auxiliary: Fabrication and utilization of ceramic materials; mineral dressing research and services; electric furnace processes; high energy forming of metals and alloys; development of thermodynamic data in specific areas.
Norris, Tenn	34	Primary: Mineral synthesis. Auxiliary: Refractory hard materials.
Salt Lake City, Utah	112	Primary. Hydrometallurgy process development—chemical extraction and recovery; aqueous electrolysis and electrorefining of metals and alloys. Auxiliary: Mineral beneficiation and process development; flotation fundamentals; pyrometallurigical processes; radiotracer technology.

Bureau of Mines—Continued

MINING RESEARCH

Location	Personnel	Activity
Spokane, Wash	21	Research in artificial stabilization of underground openings: design and development of support members for underground openings.
Reno, Nev	10	Emphasizes research to develop engineering and scientific principles applicable to the design of efficient open-pit slopes.
Denver, Colo	38	Research in rock mechanics applied to ground stabilization and control; the development of engineering principles and mathematical techniques applicable to the exploration, development, and operational problems of mining.
Minneapolis, Minn	58	Basic and applied research in rock disintegration, and on the geologic and engineering aspects of water control in mining; research in the fundamental aspects of mine rock behavior.
College Park, Md	29	Research in the broad field of physics as related to all phases of mineral mining; fundamental studies in blasting; instrumentation development for measurement of rock pressures.
Pittsburgh, Pa	17	Research in materials handling, environmental control with respect to acid-mine water drainage and methane drainage; laboratory and applied research in disintegration by hydraulic mining; basic research in the study of coal.

General Administration Expenses

Chairman Hayden. The fiscal year 1965 estimates for "General administration expenses" is $1,425,000, a reduction of $35,000 in the amount appropriated for fiscal year 1964.

The justification will be placed in the record.

(The material referred to follows:)

General administrative expenses

Appropriation, 1963	$1,390,950
Appropriation, 1964	1,460,000

SUMMARY OF INCREASES AND DECREASES, 1965

To provide for increased pay costs for fiscal year 1964 positions	+40,000
Increased efficiency due to reorganization	−75,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

General administrative expenses

	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost	Program
General administrative expenses	$1,359,683	$1,460,000	$1,425,000	−$35,000	+$40,000	−$75,000

GENERAL ADMINISTRATIVE EXPENSES

The estimate for 1965 is $1,425,000, a decrease of $35,000, accounted for as follows:

(1) A program decrease of $75,000 resulting from increased efficiency due to reorganization and consolidation of administrative functions of the Bureau of Mines.

(2) An increase of $40,000 to cover additional pay costs of fiscal year 1964 positions.

In a recent reorganization of the Bureau of Mines six offices performing administrative services were replaced with two larger offices. These offices are located at Pittsburgh, Pa., and Denver, Colo. This consolidation has increased efficiency and provided sound overall management at lower costs.

Plan of work.—The estimate provides for the expenses of the immediate office of the Director and the administrative functions in the Washington office, except for certain services performed for field activities of the Health and Safety and Coal Division. The two area administrative offices also are financed from this fund to the extent necessary to cover the salaries and expenses of the chiefs and their key administrative staffs. All other expenses generally classified as administrative, required to carry on the activities of the technical research staffs, will be charged to program funds.

The Office of the Director provides executive direction in conducting programs designed to conserve and develop mineral resources and to promote safety and healthful working conditions in the mineral industries.

The administrative functions, headed by an Assistant Director, Administration, provides administrative management advice and assistance to Bureau managers on administration and management matters; and provides personnel, budget, management analysis, finance, auditing, procurement, property management, data processing, and employee relations services for the Bureau as a whole.

The Bureau's proposed 1965 administrative program totals $3,200,000 of which $1,425,000 is requested under the "General administrative expenses" appropriation.

Following is a comparison of the program:

Obligations

	1963	1964	1965
General administrative program	$2,975,855	$3,200,000	$3,200,000
Share of participating program activities	1,616,172	1,740,000	1,775,000
General administrative expenses appropriation	1,359,683	1,460,000	1,425,000

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$1,359,683	$1,460,000	$1,425,000	−$35,000
Unobligated balance	31,267			
Appropriation	1,390,950	1,460,000	1,425,000	−35,000
Obligations by objects:				
11 Personnel compensation	1,093,844	1,194,000	1,150,000	−44,000
12 Personnel benefits	82,395	90,000	87,000	−3,000
21 Travel and transportation of persons	42,939	54,000	58,000	+4,000
22 Transportation of things	2,378	2,000	2,000	
23 Rent, communications, and utilities	21,784	23,000	23,000	
24 Printing and reproduction	29,401	27,000	29,000	+2,000
25 Other services	46,692	35,000	30,000	−5,000
26 Supplies and materials	19,516	17,000	24,000	+7,000
31 Equipment	20,522	18,000	22,000	+4,000
32 Lands and structures	212			
Total obligations	1,359,683	1,460,000	1,425,000	−35,000

Chairman HAYDEN. Please comment on the proposed use of this fund.

Mr. THOMSON. This fund provides for the general administration of the Bureau. This includes the immediate office of the director, and the various administrative functions including budgeting, accounting, personnel, auditing, property management, and other administrative activities. These are the normal functions carried on in all agencies.

EXPLANATION OF THE ADMINISTRATION PROVISIONS

Chairman HAYDEN. We will place in the record your statement explaining the administrative provisions pertaining to the Bureau of Mines.

(The statement referred to follows:)

PURCHASE OF PASSENGER MOTOR VEHICLES

The Bureau of Mines requests authority to replace 75 passenger motor vehicles. The vehicles requested for replacement represent about 21 percent of the Bureau's fleet of passenger motor vehicles and all meet the Bureau of the Budget standards for replacement on the basis of age or mileage. The replacement of these vehicles is necessary in the interest of economy and efficiency since most of the Bureau's vehicles are subject to use under adverse conditions due to poor roads in mountainous areas and under all types of weather conditions in the various field areas.

TRANSPORTATION OF STUDENTS

Due to the remoteness of the Bureau's helium plants and some of the synthetic liquid fuels installations, it is necessary to furnish the children of employees with transportation to areas where adequate school facilities are available.

CONTRIBUTIONS

Various industrial organizations have expressed interest in many phases of the Bureau's activities and are at times willing to contribute funds, experienced personnel, special equipment, etc., toward accomplishing certain objectives useful to industrial purposes. The Bureau endeavors to cooperate with industry wherever possible and authorization to accept such contributions is a distinct aid in furthering such cooperation.

SALE OF METALS AND MINERAL PRODUCTS

In some of the metallurgical pilot plants of the Bureau quantities of special metals may be manufactured which might be of value to industrial concerns. Funds received from the sale of such products would be covered into miscellaneous receipts.

AUTHORIZATION PURSUANT TO HELIUM ACT OF 1960

Chairman HAYDEN. There will be placed in the record a statement submitted in support of a request that the Bureau of Mines be authorized to use $20 million additional borrowing authority pursuant to the Helium Act Amendments of 1960, to be made available without fiscal year limitation.

(The statement referred to follows:)

HELIUM FUND

The Bureau of Mines requests that $20 million additional borrowing authority, pursuant to section 12(a) of the Helium Act Amendments of 1960 (Public Law 86-777), be made available without fiscal year limitation for the purpose of carrying out its responsibilities under the act for helium production, distribution, conservation, and research.

The $20 million additional borrowing authority is needed, in addition to income received from the sale of helium and related services, to finance the helium program in fiscal year 1965, including the operation and maintenance of the five Government-owned production plants and distribution facilities, the helium research program, purchases of helium produced for conservation, and the related supporting facilities and services.

The five private plants producing helium for conservation have all operated successfully in fiscal year 1964, and it is expected that they will operate continuously throughout fiscal year 1965. These plants were financed, built, and operated by four companies which have long-term (22-year) contracts under which the Government purchases helium for conservation. It is estimated that these plants will produce 3.7 billion cubic feet of helium in fiscal year 1965 which will be acquired by the Bureau of Mines and transported in a 425-mile Government pipeline system to the Cliffside field for storage underground until needed in the future.

The five Government-owned plants will continue operating to produce an estimated 787 million cubic feet of helium, 600 million cubic feet of which will be required to supply the estimated needs of Federal and non-Federal consumers. The remaining 187 million cubic feet of helium will be put in underground storage in the Cliffside gasfield along with helium purchased under long-term contracts with private producers.

The Bureau of Mines will also continue its program of research aimed at achieving a wiser and more efficient utilization of our limited natural helium resources. This research will include studies on the properties of helium and helium mixtures, a continuing survey of the helium resources of the United States, and investigations looking to improvements in methods of producing, transporting, and using helium.

Two important changes appear to be imminent in the helium program. One of these involves the distribution of helium—particularly shipments of helium to Federal agencies and their contractors. The Bureau of Mines has agreed to

attempt to negotiate an agreement with the Department of Defense whereunder the Bureau would assume the responsibility for operating and maintaining in fiscal year 1965 three helium redistribution facilities now operated by the Navy at Lakehurst, N.J.; Santa Ana, Calif.; and Moffett Field (near San Francisco), Calif. Both the Bureau of Mines and the Navy are convinced that such an arrangement would achieve some immediate savings to the Government in the costs of helium distribution to the Federal agencies, and open up the possibility of even greater savings in the future. Pending an agreement between the Bureau of Mines and the Department of Defense, this development must be considered to be tentative, and neither the cost of operating the facilities nor the income to be derived from them are included in the budget estimate. However, the Bureau is not contemplating any substantial capital expenditures at the facilities, and the revenue derived from the services afforded by the facilities will be made to offset the current expenditures. An adjustment in any personnel limitation applicable to the Bureau of Mines helium program would be needed to accommodate the addition of about 55 positions in the Bureau in lieu of the same number of positions now occupied by Navy employees at the facilities.

The second important development is an increasing demand for liquid helium—particularly within the NASA. Coupled with a possibility of savings in freight costs through the transportation of liquid helium instead of gaseous helium, this development could lead to the need for a liquid helium production and transportation capability within the Bureau of Mines in fiscal year 1965. Funds for such a capability are therefore included in the budget in order that the plans of the NASA for liquid helium will not be impeded by any uncertainty in this regard.

EXPLANATION OF ADJUSTMENT IN OBJECT CLASSIFICATION, FISCAL YEAR 1964

When the 1964 budget for the helium activity was being prepared, the expenses of operating and maintaining their motor pool were shown under object classes 25 (other services) and 26 (supplies and materials). Thereafter the vehicles were transferred to the General Services Administration and in pursuance of Budget Bureau Circular A–12, charges for their rental are properly chargeable to object class 21 (travel).

Since the rental charges were not included in the budget as part of the $48,000 estimated for travel, an adjustment was made between the three object classes involved so as to increase object class 21 by $13,800 to $61,800, and decrease object classes 25 and 26 by a corresponding amount. The overall budget was not increased and no additional travel is contemplated. Future budgets will reflect these charges under the proper classification.

Helium fund

Estimated income, 1964:	
Operations	$21,802,000
Borrowing authority	6,000,000
Estimated income, 1965:	
Operations	23,359,000
Borrowing authority	20,000,000

Financial summary

	Actual, 1963	Estimate, 1964	Estimate, 1965
Income and expenses (funded):			
Income:			
Sale of helium to Government agencies	$16,153,000	$14,534,000	$15,330,000
Sale of helium to non-Federal consumers	4,867,000	5,166,000	5,670,000
Other income	2,374,000	2,102,000	2,359,000
Total income	23,394,000	21,802,000	23,359,000
Expenses:			
Manufacturing expenses	4,699,000	4,344,000	4,658,000
Administrative and other expenses	1,071,000	1,253,000	1,348,000
Research	434,000	541,000	647,000
Total expenses	6,204,000	6,138,000	6,653,000
Net income (funded)	17,190,000	15,664,000	16,706,000
Unobligated balance brought forward:			
Cash (operating fund)	3,638,000	9,180,000	1,145,000
Borrowing authority	10,000,000	16,000,000	8,000,000
Borrowing authority (new)	6,000,000	6,000,000	20,060,000
Changes in selected resources	2,342,000	169,000	275,000
Funds repaid to Treasury	−6,000,000		
Total funds available	33,170,000	47,013,000	46,126,000
Capital outlay:			
Crude helium for underground storage	4,268,000	36,045,000	42,074,000
Land, structures and equipment	1,999,000	1,733,000	2,094,000
Pipeline construction	1,723,000	90,000	
Total capital outlay	7,990,000	37,868,000	44,168,000
Unobligated balance carried forward:			
Cash (operating fund)	9,180,000	1,145,000	1,958,000
Borrowing authority	16,000,000	8,000,000	
Total	25,180,000	9,145,000	1,958,000

THE 1965 PROPOSED CHANGES

Chairman HAYDEN. Would you please relate for the committee your experience with the program for the past year and set forth any proposed changes in the fiscal year 1965?

Mr. ANKENY. Mr. Henry Wheeler, Assistant Director for Helium, will make this explanation.

Mr. WHEELER. The helium program is going along as has been authorized by the Congress, and as we have contemplated, with about one exception.

First let me tell you what we have been doing. We have been producing a little less than 800 million cubic feet of helium a year in our own facilities, and we have been selling about 600 million cubic feet of helium a year, with the difference of about 200 million cubic feet being conserved for the future from our own plants.

ANTICIPATED PURCHASES UNDER CONTRACTS

In addition, in the present year we will buy from five private plants under our existing contracts about 3 billion cubic feet of helium, which will also be stored to meet future requirements. The exception that I spoke of earlier is that the private plants have not produced as much helium for sale to us as we had anticipated. There are several reasons for this—one being that they took a little longer to construct than we anticipated. Consequently they came on stream at a later date

than we anticipated, and a couple of the plants have had operating problems which prevented them from getting up to capacity production as quickly as we had anticipated. And for these reasons we have not purchased as much helium for conservation as we had thought we would, and we have not expended as much money for that purpose as we had anticipated.

Chairman HAYDEN. Is your outfit the sole purchaser? Is there anybody else buying it from these private companies?

Mr. WHEELER. Nobody else is buying from the private companies with whom we have contracts. There is one private helium producer in the United States, Kerr-McGee Oil Industries, Inc., with a plant at Navajo, Ariz. This plant is producing and selling helium to the civilian market and without regard to our program.

Chairman HAYDEN. Are they finding a market for all they produce?

Mr. WHEELER. My information is that they are selling about half as much as they could produce.

CLIFFSIDE GASFIELD STORAGE

Chairman HAYDEN. If the information is not classified, how much helium will you purchase from private helium producers to store in the Cliffside gasfield?

Mr. WHEELER. In the coming year we expect to purchase about 3.7 billion cubic feet, in 1965.

Chairman HAYDEN. You state that this borrowing authority is needed in addition to income received from the sale of helium and related services in order to finance the helium program in fiscal year 1965. What is your total expected program during the coming fiscal year, and how much income do you expect to receive from the sale of helium and related services?

ANTICIPATED RECEIPTS FROM SALE OF HELIUM

Mr. WHEELER. We expect to receive about $23.3 million in 1965, and we expect to spend, I think—these numbers are all in the budget, Senator, I will have to look in our budget to get them.

Chairman HAYDEN. Fill it in for the record.

Mr. WHEELER. I will have to fill it in for you.

(The information referred to follows:)

Estimate of income and expenditures, fiscal year 1965

[In thousands]

Income:	
Helium sales	$21,000
Other income	2,359
Total	23,359
Expenditures:	
Operating costs	6,653
Helium stored underground	42,074
Capital outlay	2,094
Total	50,821

COST OF OPERATING HELIUM PLANTS AND FACILITIES

Chairman HAYDEN. What is the cost of operating and maintaining the five Government-owned production plants and distribution facilities?

Mr. WHEELER. The cost of operating our own facilities is approximately $6 million.

Chairman HAYDEN. All of your own?

Mr. WHEELER. All five plants. This includes our costs of administration, but does not include $647,000 that will be spent on research in fiscal year 1965.

Chairman HAYDEN. Any questions, Senator.

Senator BIBLE. Only one, Mr. Chairman.

EXTRACTIVE RESEARCH

You say on page 57 of your justification, when you talk about—this is under the minerals and methane, you say:

> Research will be conducted in laboratories in the States of Maryland, Minnesota, Colorado, Nevada, Pennsylvania, and Washington; however, the work at these sites will constitute only a part of the effort. The major effort will be in operating mines throughout the United States in cooperation with the mining companies, utilizing the mines as open pit and underground laboratories. This active cooperative research will be at mines in Idaho, Montana, Wyoming, Utah, Nevada, Arizona, New Mexico, Colorado, Missouri, Michigan, Pennsylvania, and possibly other States where operating mines can be utilized as research sites.

What do you specifically do in that area of work? Is it a subject of extractive research? I think you are requesting something in the neighborhood of $2 million, just about the same as last year.

Mr. ROSENBAUM. This extractive research is a term we use for mining research. In the State of Nevada we have a contract with Kennecott Copper Co. We are studying the stability of open-pit slopes. If you can assure by improved planning and engineering design that you can have a stable slope on a 1- or 2-percent steeper pitch, then you make millions of tons of additional ore available.

COOPERATIVE PROGRAM IN RESEARCH

Senator BIBLE. Give me an example of how that cooperative program in research works out. Does Kennecott Copper Co. put up 50 percent of the money and the Federal Government 50 percent? How does it work?

Mr. ROSENBAUM. Kennecott Copper Co. provides the site, and we work together with them in formulating a program.

Senator BIBLE. What does the Government supply?

Mr. ROSENBAUM. We provide two or three engineers on design, instrumentation and data gathering. The actual work is done by Kennecott Copper Co. They conduct the experiments with their people and equipment. They drill the holes, put in the explosives, and move the rocks.

Senator BIBLE. You signed a cooperative agreement on this?

Mr. ROSENBAUM. Yes.

Senator BIBLE. Is this all reduced to writing?

SIGNED AGREEMENTS

Mr. ROSENBAUM. These are signed cooperative agreements, and the questions of publications and responsibility are ironed out. In other mines we may have cooperative agreements looking to the development of mining machinery. In Montana we are studying the development of an experimental mining machine for phosphate rock.

The company supplies the operators, and they move the ore. We do the engineering, compile data, evaluate data, and write the report for publication.

By these cooperative studies the mine itself becomes our laboratory.

PURPOSE OF THE AGREEMENT

Senator BIBLE. What is the end result of the cooperative agreements? Do you produce a paper available to industry saying, this is what we found out about open pit mining at the open pit of the Kennecott Copper Co.?

Mr. ROSENBAUM. That is correct.

Senator BIBLE. And this is made available to the industry?

Mr. ROSENBAUM. Yes.

Senator BIBLE. Made available to anybody that wants it?

Mr. ROSENBAUM. This is the heart of all our cooperative agreement, that the findings become public.

Senator BIBLE. Thank you, very much.

Chairman HAYDEN. Is there anything further?

If not, we thank you for your presence.

The committee will stand in recess until 10 a.m., Wednesday, February 26, 1964, when we will take up the Office of Territories, Office of Mineral Exploration, and Office of Coal Research.

(Whereupon, at 12:30 p.m., Tuesday, February 25, 1964, the subcommittee adjourned, to reconvene at 10 a.m., Wednesday, February 26, 1964.)

DEPARTMENT OF INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR 1965

WEDNESDAY, FEBRUARY 26, 1964

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met at 10 a.m., pursuant to recess, in room 1223, New Senate Office Building, Hon. Carl Hayden (chairman) presiding.

Present: Chairman Hayden, Senators Bible, Byrd, McGee, Mansfield, Bartlett, Mundt, and Young.

DEPARTMENT OF THE INTERIOR

OFFICE OF TERRITORIES

STATEMENTS OF MR. RICHARD F. TAITANO, DIRECTOR; HON. M. F. L. GUERRERO, GOVERNOR OF GUAM; MR. ANTONIO B. WON PAT, SPEAKER, LEGISLATURE, TERRITORY OF GUAM; HON. H. REX LEE, GOVERNOR OF AMERICAN SAMOA; MR. JOSEPH F. SCREEN, DIRECTOR OF ADMINISTRATIVE SERVICES, AMERICAN SAMOA; HON. M. W. GODING, HIGH COMMISSIONER, TRUST TERRITORY OF THE PACIFIC ISLANDS

ADMINISTRATION OF TERRITORIES

Chairman HAYDEN. The committee will be in order.

We will first hear from the Office of Territories. At this time, I will place in the record the fiscal year 1965 budget estimate for Administration of Territories which is $18,814,000, an increase of $5,815,000 over the amount appropriated for this purpose in fiscal year 1964.

This increase results from a budget estimate of $10 million for Guam rehabilitation, and a decrease in the requirements of American Samoa of over $4 million.

(The statement referred to follows:)

HIGHLIGHT STATEMENT

The major purpose of the Office is to carry out its responsibility to assist in guiding the growth of the non-self-governing areas toward full economic and political maturity. Included in this program are the Virgin Islands, Guam, and American Samoa. The activity of the Trust Territory of the Pacific Islands which is also under the supervision of the Office of Territories is reported separately in this presentation. In addition, the Office of Territories has administrative jurisdiction over Canton and the neighboring islands. All of these areas are in different stages of political and economic development. They are encouraged to and are constantly moving toward a greater degree of home rule and economic development.

The budget year program for Guam provides for continuation of the rehabilitation program of all major island facilities under the Guam Rehabilitation Act, Public Law 88–170, approved November 4, 1963. This program is scheduled to begin in the current fiscal year if supplemental funds requested are made available.

Although the budget year estimate for American Samoa contemplates a sharp decrease in construction expenditures from the anticipated level for 1964, continued emphasis is being placed on programs for education, public health, and communications.

INTRODUCTION

The Office promotes economic and political development in territorial and trusteeship areas under U.S. jurisdiction. It originates and implements Federal policy, guides and coordinates certain operating programs, provides information and advice, and participates in foreign policy matters concerning the territories. In addition, the Office represents the Governors of the Virgin Islands, Guam, and American Samoa in Washington; and assists the Virgin Islands Corporation.

Administration of territories

Appropriation, 1963	$13,768,000
Pay cost supplemental	28,500
Total available, 1963	13,796,500
Total available, 1964	13,000,000

SUMMARY OF INCREASES AND DECREASES, 1965

Virgin Islands:	
To provide for increased pay costs for fiscal year 1964 positions in the Governor's and Comptroller's offices	+6,700
Increased operating costs in the Governor's and Comptroller's offices	+1,300
	+8,000
Guam:	
To provide for increased pay costs for 1964 positions in the Governor's office	+900
Increased operating costs, Governor's office	+100
To continue the Guam rehabilitation program scheduled to begin in the current fiscal year if supplemental funds are made available	+10,000,000
	+10,001,000
American Samoa:	
Increased pay costs for 1964 positions	+2,900
Increased operating costs	+11,289
Decrease in grants due to completion of the 3-year crash rehabilitation program in the current year	−4,253,189
	−4,239,000
Canton Island administration:	
Increased pay costs for fiscal 1964 positions	+900
Increased operating costs	+100
	+1,000
General administration:	
Increased pay costs for fiscal 1964 positions	+6,600
Increased operating costs	+36,400
	+43,000
Net increase, 1965	5,814,000
Budget estimate, 1965	18,814,000

Analysis by activities

Activity	Amount available, fiscal year 1963	Amount available, fiscal year 1964	Estimate, fiscal year 1965	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
1. Virgin Islands:						
(a) Governor's office	$66,737	$90,000	$92,000	+$2,000	+$1,700	+$300
(b) Legislative expense	11,940	13,000	13,000			
(c) Comptroller's office	157,598	179,000	185,000	+6,000	+5,000	+1,000
2. Guam:						
(a) Governor's office	79,314	83,000	84,000	+1,000	+900	+100
(b) Legislative expense	24,675	24,000	24,000			
(c) Loans			6,539,000	+6,539,000		+6,539,000
(d) Grants			3,461,000	+3,461,000		+3,461,000
3. American Samoa:						
(a) Governor's office	117,288	161,000	168,489	+7,489	+1,900	+5,589
(b) Legislative expense	29,950	35,000	30,600	−4,400		−4,400
(c) Chief justice and high court	61,806	78,000	89,100	+11,100	+1,000	+10,100
(d) Grants	12,807,400	12,002,000	7,748,811	−4,253,189		−4,253,189
4. Canton Island administration	15,350	21,000	22,000	+1,000	+900	+100
5 General administration	312,266	314,000	357,000	+43,000	+6,600	+36,400
Unobligated balance lapsing	112,176					
Total	13,796,500	13,000,000	18,814,000	+5,814,000	+18,000	+5,796,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

1. Virgin Islands, $290,000

(a) Governor's office	$92,000
(b) Legislative expense	13,000
(c) Comptroller's office	185,000

(a) Governor's office, $92,000

The estimate represents an increase of $2,000 over the amount available in the current year, $1,700 of which is for increased pay costs. The expenses of this office are distributed as follows:

Personnel compensation and benefits	$88,700
Contractual services and supplies	3,300

(b) Legislative expense, $13,000

The funds requested are required to pay the salaries of 11 legislators at $600 per annum, in addition to their per diem and travel expenses, as authorized in the Revised Organic Act of the Virgin Islands.

(c) Comptroller's office, $185,000

The estimate represents an increase of $6,000 over the amount available in 1964, $5,000 for increased pay costs and $1,000 for miscellaneous operating costs. Expenditures of the office are distributed as follows:

Personnel compensation and benefits	$167,600
Travel and transportation of persons	5,000
Transportation of things	2,700
Rent, communications, and utilities	3,400
Printing and reproduction	100
Other services	2,000
Supplies and materials	2,000
Equipment	2,200
Total estimate	185,000

2. Guam, $10,108,000

(a) Governor's office	$84,000
(b) Legislative expense	24,000
(c) Loans	6,539,000
(d) Grants	3,461,000

(a) *Governor's office $84,000*

The estimate is based on the fact that operating requirements for this activity will continue at the current year level. The small increase of $1,000 will provide for increased pay costs and other operating expenses.

(b) *Legislative expense, $24,000*

The estimate for this activity is the same as for the current year. The legislature meets annually in regular sessions for 60 days, and in special sessions not to exceed 14 days for any one session, as authorized under section 18 of the organic act. The estimate covers the expense of 21 members at the rate of $15 per day for each member.

(c) *Loans, $6,539,000*

(d) *Grants, $3,461,000*

Public law.—The Guam rehabilitation bill provides for a grant and loan program not to exceed $45 million for the rehabilitation of the territory of Guam. Such rehabilitation is needed (1) to replace public facilities destroyed as a result of Typhoon Karen in November of 1962 and (2) to replace wornout World War II temporary public facilities with more modern and efficient construction to provide a setting whereby Guam may develop its social and economic potential to a greater level of self-sufficiency.

The act provides that all projects other than water, power, and telephone service, for which funds are appropriated under its authorization, will have 50 percent of its costs returned to the U.S. Treasury; for water, power, and telephone projects, the appropriations will be in the form of 100 percent loans. All moneys returned to the Treasury will be at an interest rate fixed by the U.S. Treasury and will be amortized over a period of 30 years.

This is the second phase of the program, the first being completed under a fiscal year 1964 supplemental appropriation, which primarily funded projects required because of the destruction by Typhoon Karen. This fiscal year 1965 budget request of $10 million is fully concerned with the rehabilitation phase of the Guam program which will develop the Guam community into one comparable to mainland communities.

A breakdown of the estimate by project between loans and grants follows:

Project	Loans	Grants	Total estimate
Sewer system and drainage	$1,947,500	$1,947,500	$3,895,000
Air terminal	425,000	425,000	850,000
College of Guam	470,000	470,000	940,000
Village development	568,500	568,500	1,137,000
Commercial port of Guam	50,000	50,000	100,000
Water resources and distribution	1,078,000		1,078,000
Power production and distribution	2,000,000		2,000,000
Totals	6,539,000	3,461,000	10,000,000

Sewer system and drainage, $3,895,000

This project provides for the construction of three badly needed sewer systems at an estimated total cost of $4,100,000. Since advance planning funds of $205,000 are being requested in a proposed 1964 supplemental, the balance of $3,895,000 is required in 1965 to complete the project. Only the city of Agana and the village of Agat are now served. With the rapidly increasing population, the use of septic tanks and cesspools on small urban lots is becoming a serious health hazard as well as a potential hazard to water supplies.

Cost breakdown is:

Labor	$1,558,000
Materials	1,947,500
Equipment	389,500
Total	3,895,000

Air terminal, $850,000

This project is to provide a civilian air terminal building and facilities adjacent to the Naval Air Station, Agana, with unrestricted access by Route 10A, eliminating the necessity of passing naval security gates.

The project consists of a terminal building of 17,000 square feet, a parking area, and hardstands for planes with access to the naval air station runways.

Planning funds of $25,000 have been provided by the government of Guam.

Labor	$344,250
Material	420,750
Equipment	85,000
Total	850,000

College of Guam, $940,000

With the expansion of the College of Guam to a 4-year institution, additional classroom and library space is essential. The estimate of $940,000 will provide for:

(a) *Classroom building, $435,000.*—Present enrollment is 320 full time and 1,700 in evening classes. Additional fourth-year classes will be operating in the next school year which will increase full-time enrollment 25 to 30 percent. Also, an increase of approximately 300 students from the trust territory is indicated in the next 2 years. Two additional classroom buildings will be required to take care of this anticipated enrollment increase, one provided for herein for the budget year, and the other to be included in the 1966 estimates. These buildings will be two story, of reinforced concrete, with a usable area of 19,000 square feet. The cost breakdown is:

Labor	$209,000
Materials	171,000
Equipment	55,000
Total	435,000

(b) *Library building, $505,000.*—The present library building, covering 5,760 square feet and designed for a junior college, was originally partitioned off for needed administrative office space. It is essential that additional library space be provided if the institution is to receive full accreditation on a 4-year program.

This project covers construction of a one-story concrete structure of about 20,000 square feet, located in conformance with the master plan of the College of Guam and architecturally compatible with the present college buildings. This construction will also free the present inadequate library space for full utilization in connection with the expanded administrative functions.

The estimated cost of the new building is $25.25 per square foot, broken down as follows:

Labor	$240,000
Materials	142,000
Equipment (shelves only)	43,000
Air conditioning	80,000
Total	505,000

Village development, $1,137,000

The estimate of $1,137,000 for 1965 provides for the second phase of this program, the total cost of which is estimated at approximately $12.1 million, $6 million of which is to be financed by the Guam rehabilitation bill. This budget contemplates the acquisition of existing lots and structures for Sinajana only.

Commercial port of Guam, $100,000

Guam's commercial port operations are being carried on in a limited area within the military boundaries of the U.S. Navy in inner Apra Harbor. This limited area restricts and congests the port operation, as well as inhibiting the development of industrial activity due to the lack of adjacent land. As in any island locale, Guam is thereby restricted in its economic growth unless proper port facilities and adjacent industrial areas are provided.

The improvements shall consist of berthing space and channel for three vessels, and backup land for marine-related industrial activities.

A joint Navy-government of Guam survey of the port area is now underway as a result of which the bed new location area for the commercial port outside the inner harbor will be selected. This survey is expected to be completed early in fiscal 1965. The government of Guam should be in a position to accomplish engineering plans for the new location. The sum of $100,000 is requested for the budget year.

Water resources and distribution, $1,078,000

This project is urgently needed to replace water mains of wartime material which are now causing excessive water losses. Losses in the areas are over 30 percent, and this replacement program will result in a substantial increase in the water supply to these specific areas.

Cost breakdown is:

Labor	$431,976
Materials	539,000
Equipment	107,024
Total	1,078,000

Power production and distribution, $2,000,000

Electric power is essential to Guam's economic growth. The civilian population is estimated to be 80,000 by 1985 as compared to 45,000 at present. The commercial community is also expanding. Guam is now entitled to 14,500 kilowatts per day. This is expected to increase approximately as tabulated below. The Department of the Navy has been aware of the necessity of constructing additional generating capacity to meet Department of Defense and civilian needs.

At present two additional units are under construction by the Navy, which will increase the present generating capacity by 40,000 kilowatts per day, which will increase the government of Guam power allocation as noted below:

Year	Estimated consumption (kilowatts)	Allocation (kilowatts)
1963	16,200	14,600
1965	26,450	18,800
1970	30,800	23,850

The government of Guam has been requested to participate in the cost of Navy plant expansion to the extent of $3 million for the first increment, which has already been appropriated by the Guam Legislature, and $2 million which is estimated as government of Guam contribution for the second increment. This $2 million is now requested.

Guam is now in a position to finance a powerplant for civilian use only, and continuation of the present arrangement seems necessary.

3. American Samoa

Summary of appropriations and grants

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
A. Direct appropriations:				
1. Governor's office	$117,288	$161,000	$168,489	+$7,489
2. Legislative expense	29,950	35,000	30,600	−4,400

[1] Fiscal year 1963 figures include what was formerly business tax.
[2] Hotel profit not programed in fiscal year 1965 as it is contemplated that by that time other than Government hotel will be in operation.
[3] To be operated on a revolving fund basis. Net profit only reflected as revenue. Print shop will be in 1st year of revolving fund operation and no revenue is estimated. Airport tariffs have been programed to defray maintenance costs.
[4] The petroleum products tax has been repealed and revenue from this source is reflected in import and export duties.

(*a*) Governor's office	$168,489
(*b*) Legislative expense	30,600
(*c*) Chief justice and high court	89,100
(*d*) Grants	7,748,811
Total estimate	8,037,000

The estimate to operate the government of American Samoa, including the construction program, for the 1965 fiscal year is $8,037,000. This represents a net decrease of $4,239,000, the primary reason being a sharp decline in construction needs.

The anticipated revenue to help defray the cost of government this forthcoming year is estimated at $2,416,000 as compared to $1,800,000 estimated for fiscal year 1964 and $1,685,209 actual in fiscal year 1963.

Of the seven islands comprising the territory of American Samoa, the island of Tutuila is the largest. This island is divided into eastern and western districts while to the eastward, the Manu'a Island group comprises the third district by that name. The government is based on the north beach of the almost landlocked harbor of Pago Pago. This is on the south side of the island, with towering mountains surrounding it. It has long been noted as a safe haven for shipping. Aunu'u Island is at the southeastern tip of Tutuila. The Manu'a Islands eastward are comprised of Ta'u, Ofu, and Olosega. Little Swains Island, 240 miles north, is also part of the group with about 100 population. Eastward of Manu'a is the uninhabited island known as Rose Island. The islands comprise only 76.1 square miles of land, largely mountainous. About a fifth of the population resides in the bay area.

A population figure of 20,051 was given in the last 1960 official census. Serious efforts are being made to improve farming methods as taro and breadfruit shortages exist with inflated prices of these commodities resulting. Green bananas are also a commonly used staple.

The government is divided into three branches—the executive, legislative, and judicial. Effective in fiscal year 1963, an additional U.S. associate judge was added to the judiciary department of the government. Funds for expenses that are involved in the administration of the government of American Samoa are derived from a grant which is appropriated by the Congress of the United States plus funds from local revenues. Funds requested for each branch of the government are justified as follows:

(a) *Governor's office*

The sum of $168,489 is needed in the budget year for operating expenses of the Governor's office. This is $7,489 higher than the amount available in the current year, $1,900 being required to cover increased Federal pay costs. The position of Governor was upgraded to GS–18 as approved in March 1963 by the Civil Service Commission. This is a small office and increased Federal pay costs cannot be absorbed without reducing required positions.

The Governor of American Samoa has duties as the chief executive of the territory that include the supervision and general direction of various administrative agencies and instrumentalities of the local government. The Governor has the authority to formulate and execute territorial policies under the approval of the Secretary of the Interior. The Legislature of American Samoa passes bills and resolutions, and these are presented to the Governor for approval or veto. In addition, the Governor acts on behalf of the U.S. Federal agencies, such as the Passport and Visa Division of the Department of State. He maintains contact with Federal agencies through the Department of the Interior. American Samoa's chief executive is assisted by the Secretary of American Samoa in the handling of various executive duties. The Secretary serves as Acting Governor during the temporary absence of the Governor from the territory.

The expenses of this office are distributed as follows:

	Estimate, 1965
Personnel compensation	$124,698
Personnel benefits	7,074
Travel and transportation of persons	25,100
Transportation of things	1,017
Rent, communications, and utilities	1,500
Printing and reproduction	3,000
Other services	2,000
Supplies and materials	3,100
Equipment	1,000
Total estimate	168,489

(b) *Legislative expense*

The estimate of $30,600 for fiscal year 1965 reflects a decrease of $4,400 under the current year. The decrease is due to savings in equipment costs for the year.

The Legislature of American Samoa is comprised of the senate and house of representatives. The legislature meets in an annual major session, and also in special sessions when such are convened by order of the Governor after due consultation with the senate president and the speaker of the house.

There are 15 members in the senate and 18 in the house. Members of the senate are elected to office by age-old traditional lines through the majority opinion of Samoan village councils. As there are five counties in both the eastern and Manu'a districts and only four in the western, the latter is permitted to choose one additional senator. This method is rotated within the four counties of this district. Members of the house of representatives campaign for their office and achieve this position when elected by the people in secret ballot. The counties have one representative each except for a bay area county in the eastern and one county in the western district. Due to the heavy population congregated in the bay area, three representatives are selected; two are chosen from the heavily populated area in the western portion. A delegate is also chosen from remote Swains Island to sit in the house.

The president of the senate and the speaker of the house of representatives are elected by their associates. The constitution allows all members to receive a maximum of $300 each on a yearly basis.

The expenses of this office are distributed as follows:

	Estimate, 1965
Personnel compensation	$19,900
Personnel benefits	880
Travel and transportation of persons	5,270
Transportation of things	50
Rent, communications, and utilities	100
Printing and reproduction	1,000
Other services	800
Supplies and materials	2,000
Equipment	600
Total estimate	30,600

The amount requested for personal services is distributed as follows:

Senate, 15 members, $5 a day for a maximum of 60 days	$4,500
House of representatives, 17 members and 1 delegate from Swains Island, $5 a day for a maximum of 60 days	5,400
Employees engaged on a per diem basis during sessions	10,000
Total, personnel compensation	19,900

(c) *Chief justice and high court*

The estimate of $89,100 for this activity in 1965 is $11,100 higher than the amount available in the current fiscal year. The increase is almost entirely due to step increases for Federal employees, as well as the Federal pay raise.

The judicial system of American Samoa is composed of a high court and five district courts. The high court, with jurisdiction throughout the islands, has an appellate, a trial, and a probate division. Appeals may be taken from the district courts and the trial and probate divisions of the high court to the appellate division of the high court.

The judicial branch of the government is under the administration and supervision of the chief justice of American Samoa. By express constitutional provision, the judicial branch is independent of the executive and legislative branches.

Samoan judges sit on all courts with the exception of the probate division of the high court in the first instance.

The high court has a clerk, a deputy clerk, a court officer, and a process server. These same officials serve the district court for the first district, each in the same capacity as he serves the high court. Each of the district courts for the second, third, fourth, and fifth districts has a clerk and a marshal. The clerk of the high court serves as court reporter. He is also registrar of titles, registrar of vital statistics, secretary of the land commission, and archivist for the government. He and his deputy issue marriage licenses and perform the functions usually performed by a county recorder in the States.

The deputy clerk of the high court and the court officer are the official interpreters for the high court and the district court for the first district.

The Samoan judges and the clerks and marshals of the four outlying district courts are paid from local funds.

During the fiscal year ending June 30, 1963, the various courts disposed of 729 criminal cases and 375 civil cases.

The expenses of this office are distributed as follows:

	Estimate, 1965
Personnel compensation	$73,335
Personnel benefits	3,411
Travel and transportation of persons	6,900
Transportation of things	2,100
Rent, communications, and utilities	225
Printing and reproduction	200
Other services	200
Supplies and materials	218
Equipment	2,511
Total estimate	89,100

(d) Grants—Summary of operating costs by object class

Object class	Actual, 1963	Estimate, 1964	Estimate, 1965
11 Personnel compensation:			
Stateside	$497,422	$1,747,124	$1,792,668
Samoan	1,622,022	2,103,882	2,413,409
Terminal leave	33,234	52,700	63,095
12 Personnel benefits	69,967	147,256	162,295
13 Benefits for former personnel	37,500	20,000	
Subtotal	2,260,145	4,070,962	4,431,467
21 Travel and transportation of persons	129,788	260,641	260,345
22 Transportation of things	27,865	136,480	104,260
23 Rent, communications, and utilities	16,184	69,100	21,000
24 Printing and reproduction	1,874	10,981	21,786
25 Other services	129,807	121,258	148,820
26 Supplies and materials	1,131,681	1,014,297	1,514,886
31 Equipment	475,335	402,916	613,190

Total operating costs	4,223,696	6,269,000	7,306,811
Less receipts applied	1,100,000	1,800,000	2,416,000
Net operating costs	3,123,696	4,469,000	4,890,811

Health, education, and welfare, $4,313,348

Samoan information	$29,703
Department of education	2,773,785
Medical services department	1,217,553
Public defender	8,597
Department of public safety and legal affairs	267,246
Local judicial	9,600
Civil defense	6,864
Total	4,313,348

Samoan information, $29,703.—The sum of $29,703 is the estimate for fiscal year 1965, the same amount as for the current fiscal year. This activity is continuing in its plans to expand the present broadcasting system and is generating a wider interest in the programs presented. In addition to the evening programs, a schedule is maintained during the morning hours, and also on Saturday and Sunday. A college-trained Samoan is in charge of the radio station and also supervises a weekday publication of the news in mimeographed form. The government continues to pay United Press International $1,500 annually for teletype news service. Employees from this activity attend all major ceremonial and public affairs at which they obtain taped recordings for later broadcast to the general public. This procedure is also done for various legislative sessions, permitting the public to hear rebroadcasting of debates in both the house and senate.

Department of education, $2,773,785.—The estimate for fiscal year 1965 is $2,773,785 which is $566,204 over the current fiscal year. The following information supports material variations from fiscal year 1964 budgeted amounts. In fiscal year 1965, a net increase of 1 stateside position and 57 indigenous personnel are programed. Personal services costs are $188,173 higher than in 1964. The 1964 budget was programed for educational TV personnel at one-half year's salary due to programed activation of educational TV in the third quarter of fiscal year 1964. On an annual basis the cost of educational TV personnel would have been $223,000 higher; however, nine Samoan personnel have been located for positions originally programed for U.S. employees. Travel and transportation of things decreased $56,479 due to reduced requirement for the forthcoming year. Rents, communications, and utilities has a decrease of $45,525 due to time phasing of industrial funding of utility services set for fiscal year 1966. Supplies and materials increased $157,500. This is primarily due to the proposal to upgrade the quality of the school lunch program to a cost of 12 cents per day for each child in public schools as our share in the national school lunch program, and to the programing of $10,000 in local funds matching those available under the National Library Services Act (sec. 5–70, Stat. 293, 20 U.S.C. 351). The scholarship program cost has increased by $78,060. Of this, $18,230 is the result of consolidating the scholarship program within the department of education, and the balance is to cover costs of scholarships for an additional 35 students in the forthcoming fiscal year.

Medical services department, $1,217,553.—The amount requested in fiscal year 1965 shows a decrease of $375,625 under the current fiscal year. There is a decrease in stateside positions from 32 to 20. These positions have not been activated due to the delayed time phasing in the completion of the new hospital. Along with nonoccurrence of terminal leave, the total reduction in personal stateside, is $148,460. A net increase of eight Samoan positions is programed. The medical supply division was transferred to this department to permit better service on procurement control and issue of medical supplies, while the garbage disposal unit which employs 11 positions was transferred to the public works department. Additional housekeeper and housemother positions were added to maintain the hospital in a clean state, control linen and housekeeping supplies, and provide necessary supervision for the nurses dormitory. There has been some general reclassification of local national salary scale to keep personnel from moving to local industries. Travel cost and transportation of things have been decreased $18,428. Supplies and materials have a decrease of $58,174, primarily due to the vigilance of better trained staff members. Equipment costs are reduced by $128,215 over the preceding year. The epuipment requirement reflected in this budget is primarily for replacement of wornout, uneconomical to repair, equipment.

Public defender, $8,597.—The estimate for fiscal year 1965 is $8,597 which is an increase of $1,097 over the preceding year. The primary increase in fiscal year 1965 is in the cost of the contractual services for a lawyer from western Samoa employed on a part-time basis to represent defendants in all criminal cases in American Samoa; he also acts as a counsel for the people of this territory.

Public safety and legal affairs, $267,246.—The estimate for fiscal year 1965 is $267,246, an increase of $46,924 over the current year. Material variations from budget fiscal year 1964 are explained as follows: Personal services costs have increased by $24,664 due to the need for an assistant in the attorney general's office to assist in the greatly accelerated workload caused by expanding economic development. Travel and transportation of things are increased $12,050 due to repatriation of the present attorney general and public safety director, and procuring their reliefs, as well as expense incurred in procuring the new assistant attorney general. Other services have increased $7,800 primarily to obtain services of a professional fire instructor to train the Samoan staff employed in the local fire department.

The attorney general is Samoa's chief legal officer. His duties also include such work in immigration matters, incorporation of all amendments into the local code and proper dissemination of same. During the past year 248 complaints were handled, of which 94 were convicted, 7 acquitted, 12 annulled, 43 settled out of court, and 92 cases remaining open. There were 519 traffic cases prosecuted during the year, 436 were completed, 39 found not guilty and 44 nolle prosequi's were entered. The average prison population during the year was 35.2.

Local judicial, $9,600.—The estimate for fiscal year 1965 is $9,600, which is $150 over the current year. This increase covers $40 for a slight salary increment for the four Samoan associate justices, $50 more for travel costs to Manu'a, and $60 for supplies and materials.

There are five district courts: One for Ituau and Mauputasi Counties and Swains Island; one for Ofu and Olosega Counties in Manu'a, and one for Faleasao, Fitiuta, and Ta'u Counties, also in Manu'a; one for Lealataua, Leasina, Tualatai, and Tualauta Counties; and one for Sua, Vaifanua, and Sa'ole Counties. There is also the high court which has jurisdiction throughout the islands. The high court has a trial division, a probate division, and an appellate division.

The high court has a clerk, a deputy clerk, a court officer, and a process server. These same officials serve the district court for the first district, each in the same capacity as he serves the high court. Each of the four outlying district courts has a clerk and a marshal.

With the exception of the chief justice, the associate justice, and the clerk of the high court, all three of whom are from the United States, all court personnel are Samoan. The four Samoan judges and the clerks and marshals of the four outlying district courts are paid from local funds.

During the fiscal year ending June 30, 1963, the various courts disposed of 729 criminal cases and 375 civil cases.

Civil defense, $6,864.—This activity is conducted in conjunction with funds received from the national civil defense program under Public Law, 920, 81st Congress, as amended, and Public Law 85–606 which amended portions of Public Law 920, together with Executive Order 10925 of August 1, 1961. Half of the costs, totaling $13,837, contemplated for this forthcoming fiscal year are borne by local funds and half by the Department of Civil Defense. The director of civil defense is the incumbent director of port administration; only one-third of his salary is paid by this division. He is assisted by a deputy director and one clerk.

	Samoan information	Department of education	Department of medical services	Public defender	Public safety and legal affairs	Local judicial	Civil defense	Totals
Personnel compensation:								
Stateside employees		$1,180,273	$238,800		$39,175			$1,458,248

Total estimate	29,703	2,773,785	1,217,553	8,597	267,246	9,600	6,864	4,313,348

Economic and industrial development, $338,881

Department of agriculture	$288,603
Local government	50,278
Total	338,881

Department of agriculture, $288,603.—The estimate for fiscal year 1965 is $288,603. This is an increase of $100,952 over the current year. The department of agriculture has been completely reorganized and expanded to facilitate better training of Samoans in agriculture and service to the community with the stress being placed on assistance in producing commercial crops, livestock, fruit trees, and fishing industries. With the increase in air traffic and a general increase in agricultural production, continued emphasis must be placed on quarantine and insect control. The department has added an entomology division and a fisheries division, requiring 13 additional local national employees in the first and 5 in the second group. The increase in personal service costs will be $31,119, which includes terminal leave pay of the director and entomologist, and some incremental salary increases and reclassification of some local national positions. A net increase of $4,834 is programed for "Travel and transportation of things" in connection with repatriation of the director and the entomologist. An increase of $9,350 in "Other services" is necessary to handle costs of hiring peak season employees. Supplies and materials costs have increased by $41,795 to provide for the purchase of larger quantities of poultry feed for the increased flock which will be recovered in revenues from sale of poultry and eggs, and increased requirements for fertilizer, various fungicides and insecticides for filariasis vector control for use by the entomologist. Equipment reflects an increase of $11,200, mainly to procure laboratory furnishings and equipment and a 1,500-cubic-foot fumigation chamber. Other miscellaneous objects of expenditure show a net increase of $2,654.

Local government, $50,278.—The estimate for fiscal year 1965 is $50,278. This is $862 higher than the preceding year. The net increase is in personal services due to a salary increment for the Secretary of Samoan Affairs. It is the intention of this government to gradually phase out the old positions of pulenu'u (mayor) and leoleo (policeman) in the various villages in American Samoa and replace each in the three districts with 10 trained policemen to maintain law and order. Funds are already allocated for such a move in the department of public safety and legal affairs; and, as long as the pulenu'us and leoleos are in office pending ultimate release from their positions, cost of their salary will be defrayed from the funds in the public safety activity. The positions of district governors (3), county chiefs (14), 3 administrative and 3 agricultural assistants will continue to be filled and budgeted for under this activity.

District governors generally attain office by being selected from the highest ranking chiefs in the island group after being considered by the district councils; their recommendations go to the Governor who then makes final selection. County chiefs are nominated by the county councils; their appointments are approved by district governors, and a formal appointment is made by the Governor of American Samoa.

The following is a distribution of the expenses of the activities under "Economic and industrial development":

	Department of Agriculture	Department of local government	Total
Personnel compensation:			
Stateside employees	$51,000		$51,000
Samoan employees	86,432	$42,311	128,743
Personnel benefits	5,028	1,967	6,995
Travel and transportation:			
Stateside employees	7,511		7,511
Samoan employees	2,900	2,400	5,300
Transportation of things:			
Stateside employees	2,900		2,900
Samoan employees	1,650		1,650
Rent, communications, and utilities	750	50	800
Printing and reproduction	5,105	100	5,205
Other services	27,950	400	28,350
Supplies and materials	56,995	1,450	58,445
Equipment	37,100	1,600	38,700
Grants, subsidies, and contributions	3,282		3,282
Total estimate	288,603	50,278	338,881

Operations, maintenance, and transportation services, $2,152,143

Communications	$166,687
Public works	1,624,509
Port administration	360,947
Total	2,152,143

Communications, $166,687.—This estimate represents a decrease of $27,391 under the current fiscal year. Savings were achieved by reducing the stateside positions from 9 to 6 and increasing local positions from 30 to 44 with a net reduction in "Personal services" costs of $13,696. "Travel and transportation of things" has been reduced by $10,000.

The communications service of American Samoa operates on a 24-hour worldwide basis, principally through Hawaii and using a multichannel teletype system connecting with commercial operating companies. Oversea telephone service is also now in operation with the United States and foreign countries. Communications service with coastal shipping is maintained as well as seagoing vessels. Commercial point-to-point telegraph circuits are maintained with Fiji, Western Samoa for best routes to Australia, New Zealand, Tahiti, and other Pacific points. Consolidation of services with those provided by the FAA is being effected to the extent feasible.

Department of public works, $1,624,509.—The estimate for the fiscal year 1965 indicates an increase of $565,009 over the amount available for fiscal year 1964. The primary reasons for this increased request are:

(*a*) Greatly increased plant, now under construction, which will require operation and maintenance in fiscal year 1965. This includes 4,000 kilowatts of additional installed power capacity and islandwide electrification system, extended telephone and water systems.

(*b*) Accumulative and deferred maintenance on plant buildings and housing caused by primary attention to accelerated heavy construction program, the first phase of which was completed in 1963.

(*c*) Rapidly increasing private interest in construction, electrical service, water supply, and sanitation. The Government provides all such services on a reimbursable basis.

(*d*) Continuing loss of higher skilled personnel to newly established island private industries necessitating importation of U.S. citizens as supervisors and skilled technicians.

"Personal services, stateside employees" is up $32,547 to provide supervision and special skills not available in Samoa, and to meet shortages aggravated by flow of higher skilled personnel to private industry. This will continue only until additional Samoa employees are trained and retained.

"Personal services, indigenous employees" is up $142,857 partly to perform maintenance of buildings, water system and rolling stock deferred because of engagement of forces on urgent new construction. Approximately 100 miles of village water supply mains serving Tutuila and Manu'a group islands, exclusive of the Pago Harbor area constructed during World War II from various sizes and types of pipe and tanks, are reaching the end of their service life. At the same time villagers are desiring to receive the benefits of electrification and improved sanitation. Therefore, much of these systems, will need to be rebuilt in fiscal year 1965.

Funds requested for "Supplies and materials," are increased by $87,133. The majority of government buildings are of wood frame construction and average from 21 to about 60 years in age. Roofs and floor framing disclose extensive deterioration, and typhoon anchors have corroded beyond all usefulness in many structures. Much replacement is due now and must be performed throughout fiscal year 1965. Though completion of the islandwide electric system is still 10 months away, more than 350 requests have been received for house electrical connections and complete wiring. At least an equal number of additional requests are anticipated before July 1964. Most of these will request complete house wiring from the government, resulting in large use of electrical materials on a reimbursable basis. Like increases in sanitary facilities and water services are anticipated.

Funds requested for "Equipment" show an increase of $324,494. This reflects the need for new items of construction equipment and maintenance vehicles to replace old and wornout items on which continuing repairs are uneconomical since they range in age generally from 10 to 20 years and are badly deteriorated from the corrosive climate of Samoa. Also the rural extension of utilities and

refuse collection points will require more vehicles for proper service and maintenance performance.

Port administration, $360,947.—The estimate of $360,947 for fiscal year 1965 is $197,647 over that of the current year. For the past several years, American Samoa has not had surface vessels to carry out interisland service. In order to assure adequate operations early in calendar year 1963 the Congress approved the reprograming of funds for $150,000 for two boats. One was to be a 45-foot launch and the other a 100-foot seagoing vessel for search and rescue and offshore island duty. After 6 months of searching, it was found impossible to find such a boat in the United States within the money allowed. However, in September 1963, two boats within the allowable amounts were located in Hong Kong. At about this time, however, it appeared that the Coast Guard might establish a much needed base in Pago Pago, and, therefore, the Governor delayed placing the order for the boats in Hong Kong until a final decision was made to cover the area by a locally based Coast Guard ship. In the meantime the *Hugh M. Smith* was acquired from the Fish and Wildlife Service. This boat is too expensive and too old to continue service but it was felt that it could do for possibly 1 year pending arrival of a Coast Guard vessel or pending the construction of new boats in Hong Kong. An increase of $39,282 is required for a crew to man the *Hugh M. Smith.* A seagoing tug and two YTL's have been acquired by the government for its needed operations. It is felt that the crew will be able to operate the two larger vessels when one or the other is called for. The $6,000 increase in "Other services" covers costs of drydocking and repairing small craft. A $103,694 increase in "Supplies and materials" is added cost of fuel and supplies for the vessels referred to above. Equipment costs are up $50,000 of which $25,000 is required to obtain three new marine engines and $25,000 to replace No. 3 motor launch.

The port administration department handles all matters involving planes and vessels, their arrivals and departure in American Samoa. A port patrol is employed for security measures for both harbor and docks. The customs division is also a function of this department and increased incoming cargo has placed more responsibility in this area. The addition of a harbor tug will greatly facilitate berthing and unberthing ships in the harbor. Small boats are also used to provide water transportation to remote villages on the north side.

The following is a distribution of the expenses of the activities within "Operations, maintenance, and transportation services":

	Communications	Public works department	Port administration	Total
Personnel compensation:				
Stateside employees	$52,965	$148,481	$41,140	$242,586
Samoan employees	65,416	569,254	91,429	726,099
Personnel benefits	4,316	23,072	5,694	33,082
Travel and transportation of persons:				
Stateside employees	4,450	20,350	1,200	26,000
Samoan employees	1,800	10,600	1,500	13,900
Transportation of things:				
Stateside employees	1,600	12,000	900	14,500
Samoan employees	3,250	600		3,850
Rent, communications, and utilities	15,250	125	50	15,425
Printing and reproduction	500	3,050		3,550
Other services	2,140	2,100	17,100	21,340
Supplies and materials	15,000	510,383	151,546	676,929
Equipment		324,494	50,388	374,882
Total estimate	166,687	1,624,509	360,947	2,152,143

General administration, $502,439

Audit office	$18,647
Administration services	413,942
Executive office operations	16,600
Personnel office	53,250
Total	502,439

Audit office, $18,647.—The estimate for fiscal year 1965 is $18,647 which is $9,953 less than the previous year. This decrease is due primarily to reorganization of the audit staff, and nonrecurrence of travel and transportation of things.

Audits of all phases of the government finances are conducted by this division. This includes general review and appraisal of policies, plans, and procedures in coordination with the local government and activities. The audit office acts in an advisory capacity and not as a line or operating function.

Department of administrative services, $413,942.—The estimate for the fiscal year 1965 is $413,942 which is a decrease of $4,579. This is primarily due to the transfer of the motor pool to the public works department, and medical supply to the medical services department. Due to the inability to procure a suitable, trained U.S. business machine repairman, the position has been cancelled and contractual services will be utilized.

The director, department of administrative services, is also treasurer of the government of American Samoa. The position of the treasurer is reflected in this department budget. An increase is programed for two U.S. employees. The activation of the income tax unit, administering the equivalent of the U.S. Federal Income Tax Code as the Income Tax Code of American Samoa, requires the employment of a qualified tax practitioner or tax agent presently with the Internal Revenue, if one can be located. The position established is that of comptroller to utilize the services of the incumbent of this position in the overall treasurer's office when tax work is not required. The position of assistant accounting and disbursing officer has been established to provide for better internal control and closer supervision and implementation of required procedures. The position of director of administrative service-trasurer has been established as GS-13 (excepted service). The net increase for personal services over the current year amounts to $50,603 which also reflects regular increments to local national employees.

"Travel and transportation of things" reflects a $6,265 increase to obtain U.S. personnel. A $1,450 increase in printing is due to plans to print a "Manual of Operating Procedures" for the department, and income and other tax instructions that will be needed. Supplies and materials show a decrease of $7,313 due to placing the printshop in a revolving fund status, and general reduction in fuel and other costs. Equipment is reduced $21,487 primarily due to the fact that needs of the general supply division were filled during the current year in this regard.

All financial matters, including payrolls, reports, and financial statements of the government are handled by this department. All storage, procurement and issue of supplies, as well as property inventory control, are maintained. Budgeting and budgetary control, as well as management services; including dependent supply, housing, land transportation, printshop, and the government hotel, are provided by this department.

Executive office operations, $16,600.—The estimate for fiscal year 1965 is $16,600 which reflects slight increases in "Other services" ($200) and "Supplies and materials" ($500); the first increased item is for repairs to the ceremonial fale, and the second for replacement of essential household utensils and linen.

Personnel office, $53,250.—The estimate for fiscal year 1965 is $53,250. This is a decrease of $31,050 as compared to the current year. "Personal services" shows a $6,789 increase due to the need to raise the salary of the industrial relations development officer position in order to procure a suitably qualified man, salary increments, terminal leave of the personnel officer, and the addition of one new clerk due to the greatly increased workload in this office. Decreases of $2,780 in "Travel and transportation of things" and $17,160 in "Other services" is due to reallocating the training program costs to the department of education. The retirement fund is adequate to provide for "Benefits for former personnel" obviating this requirement in fiscal year 1965.

The personnel office handles social security and other employee benefits as well as benefits for retired personnel. All matters of recruitment, employment locally and from overseas, as well as personnel reclassification, promotion, demotion, or discharge, are handled by this office. The staff consists of three United States and four Samoan employees. The office also handles travel and transportation of household effects, documents for incoming and outgoing personnel, and renders assistance on personnel problems, procedure, or programs to staff and departmental members, acting under the authority of the Governor.

The following is a distribution of the expenses of the activities within "General administration":

	Audit office	Administrative services	Executive office operations	Personnel office	Total
Personnel compensation:					
Stateside employees	$10,000	$62,527	----------	$31,402	$103,929
Samoan employees	7,387	193,144	----------	10,349	210,880
Personnel benefits	560	11,986	$200	1,120	13,866
Travel and transportation of persons:					
Stateside employees	----------	8,300	2,500	4,260	15,060
Samoan employees	50	2,200	500	2,160	4,910
Transportation of things:					
Stateside employees	----------	1,400	500	1,600	3,500
Samoan employees	----------	200	----------	300	500
Rent, communications, and utilities	----------	2,400	----------	300	2,700
Printing and reproduction	----------	2,500	300	100	2,900
Other services	150	9,650	9,600	----------	19,400
Supplies and materials	200	50,920	2,000	944	54,064
Equipment	300	68,715	1,000	715	70,730
Total estimate	18,647	413,942	16,600	53,250	502,439

Construction program $2,858,000

Road program, $500,000

In the supplemental budget for fiscal year 1962 we proposed a program of paving 35 miles of main road from one end of Tutuila Island to the other and asked for $1,520,200. Of this amount $671,000 was for equipment to be used on the total program. Very shortly after we did this our engineer said he could complete the remaining 20 miles in fiscal 1963 for $744,000, which was substantially under our fiscal year 1962 estimate and proved to be totally inadequate. The fiscal year 1963 budget enabled us to complete 77 percent of the job. When the total program is complete, the cost per mile will be $57,840, as compared to the original programed estimate of $60,800. Because of the major importance of the main road as compared to the secondary road system, we are moving ahead on main road construction with some of the funds approved in fiscal 1964 for secondary roads. Of the $500,000 approved in fiscal year 1964 and the $500,000 requested in this budget, $490,000 will be used to complete the main road.

Electrical system, $823,000

Final phase of system. The total installed capacity of the Satala powerplant will be 6,000 kilowatts by March 1964. Increased power demands are programed for a total load by 1965 of 5,200 kilowatts. These power demands have been computed on presently operating industrial plant capacity and do not include power to potential industries such as the hotel which is not yet under construction. To insure that a minimum margin is maintained and plant flexibility is achieved, it is proposed that one additional 3,000-kilowatt unit be installed in fiscal year 1965 to include necessary building expansion and auxiliaries.

Water development, $240,000

The first phase of major improvements to the water system of Pago Pago and Tafuna areas was authorized in fiscal year 1964 at $1 million of a total program of $2,500,000. This fiscal year 1965 budget includes only the second phase of improvements and connections with government housing. With continued industrial development in the bay area and expansion of the Tafuna area both for residential and tourist utilization, it is planned to develop sufficient storage for at least an 8-day supply of water. A complete study was made of the supply, storage, and distribution system for the entire Pago Pago Bay area and vicinity with the recommended total program of $2,500,000.

Sewerage and sanitation development, $284,000

In fiscal year 1964 the Congress approved funds for alternate plan A for the construction of a sewer system in the bay and village areas totaling $1,500,000. This did not include $600,000 for development of the village system in the Tafuna and outlying areas. It is proposed to begin development of the village system in the Tafuna area in fiscal year 1965 which is a continuation of the approved program.

Telephone system, $254,000

This is the last phase of the telephone system on Tutuila and includes a 25-line, 50-connector, automatic telephone exchange with interoffice trunking equipment for two-way dial trunks into the Tafuna and Fagatogo exchange with the villages of Leone and Faga'itua. Telephone cables and lines will then be extended to all villages and schools east, west, north, and south of these points. The contemplated program was outlined in the fiscal year 1963 budget justification when Congress appropriated $112,000 to begin construction for the proposed system.

Marine railway, $212,000

In the supplemental budget for fiscal year 1962, $55,000 was requested to repair the marine railway. The money was granted. However, at about the time the money was received, the fishing fleet increased substantially and has continued to increase to the point that we have been unable to shut down the marine railway long enough to repair it. In fiscal year 1963, we requested the reprograming of $70,000 to repair and tow a surplus drydock from Honolulu to Samoa to handle the surgent situation. After getting a final estimate from the navy yard on the repair and tow of this vessel, we found we were $53,000 short. Consequently, we requested these additional funds and they were approved. After approval of these funds, we had a final review made by a competent naval engineer, and it appeared that the activation and repair costs along with the estimated operating costs of the dock would make it too expensive for operation in American Samoa. It was thereafter determined that it would be much cheaper to build a new marine railway, and thus we requested $212,000 to add to the $123,000 to build it. In fiscal year 1963, a total of $88,500 was approved for equipment to be used for the marine railway and land reclamation. The equipment was a 100-ton steel barge, a 25-ton truck crane, and a 310-cubic-foot-per-minute air compressor. We were able to secure a barge that was surplus to the Navy at no cost and got it to American Samoa by opportune lift. We can use a construction crawler-type crane and air compressor for dredging and pile driving operations. It is proposed to use the $88,500 along with $5,000 in this budget to procure replacement equipment for a lathe and milling machine over 20 years old and not capable of cutting to required tolerance, and additional accessory equipment necessary to the expanded operation of the marine railway.

Harbor development, $140,000

The budget justification for fiscal year 1964 included $500,000 for the first phase of harbor reclamation and development. The second phase of this program for which funds are requested in fiscal year 1965 is the estimated cost for replacement of dock buildings, improvements to the main dock, and for replacement of the timber portion of the customs dock now beyond economical repair.

Motor-pool facility, $49,000

Garage, parking, and maintenance facilities are required to provide adequate service to the 259 Government vehicles, 2½-ton and smaller. The present motor pool is inadequate and the traffic creates further congestion in the already crowded dockside area at Fagatogo. The proposed facility will include a wash pad and a grease rack and will provide a physical plant necessary to the daily and weekly maintenance of these vehicles.

Maintenance shop facility, $35,000

The present utility shop and storage areas are individually and temporarily located where space permits. The increase in Government facilities and increase in maintenance requirements dictates the need for a more efficient utilization of maintenance equipment and personnel. This proposed prefabricated building to be constructed will provide storage and centralization of shops and will permit pooling of tools, machines, and personnel common to all the utility shops.

Main dock dredging, $11,000

Silting around the main dock has reduced the draft to approximately 32 feet. It is proposed to dredge the area to the required 40 feet. The volume of dredging is approximately 3,000 cubic yards.

Small-boat landing, $10,000

The small-boat landing of timber construction, approximately 20 years old, is beyond economical repair. It is proposed that the landing be replaced with a 50- by 12-foot composite landing with temporary dock facilities provided in order that small boats may be docked near the customs dock during the interval of the construction.

General supply revolving fund, $300,000

The present authorized general supply revolving fund is inadequate to the requirements for ready availability of supplies and spare parts; further, the increased plant capacity will increase requirements. It is proposed to increase the capabilities of the general supply revolving fund to maintain adequate stock supply and obviate the need for air shipment of parts and supplies.

THE BANK OF AMERICAN SAMOA, PAGO PAGO, AMERICAN SAMOA

Statement of condition, June 30, 1963

4. Canton Island Administration, $22,000

The estimate for this activity is $1,000 more than for the current year, $900 of which is for increased pay costs. Estimated expenditures are distributed as follows:

Personnel compensation and benefits	$19, 650
Contractual services and supplies	2, 350

5. General administration, $357,000

The estimate represents an increase of $43,000 over the amount available for this activity in the current fiscal year, $6,600 of which is for increased pay costs. The balance of the increase is related directly to the greatly accelerated and expanded programs in our territories, particularly in Guam and the trust territory. Primary increase over the next few years will be in the construction activity due to the Guam rehabilitation bill and the "Report of the U.S. Survey Mission to the Trust Territory." Specifically, the total overall construction program in our territories will approximate a need for $25 million in fiscal year 1965. This greatly expanded program will require increased and closer technical surveillance by this office of the various territorial construction projects, to include contract administration.

Estimated expenditures for the Washington office are distributed as follows:

Personnel compensation and benefits	$318,000
Contractual services and supplies	37,000
Equipment	2,000
Total estimate	357,000

Itemization of estimate

1965 BUDGET REQUEST

Chairman HAYDEN. Would you please present to the committee your statement discussing the need for this appropriation?

Mr. TAITANO. I thank you very much, Mr. Chairman. I have a very short statement and, if it pleases you, I will just have it inserted in the record and I will just highlight it.

Chairman HAYDEN. That may be done

(The statement referred to follows:)

STATEMENT OF RICHARD F. TAITANO, DIRECTOR, OFFICE OF TERRITORIES

Mr. Chairman and members of the committee, I appreciate the opportunity to appear again before you to discuss the budgetary needs for the administration of our territories and possessions. I should like to present for your consideration, Mr. Chairman, our estimates for the activities under the jurisdiction of the Office of Territories for the fiscal year 1965.

The estimate of $36,314,000 for 1965 for the administration of our offshore territories represents a net increase of $8,314,000 over the present adjusted appropriations for our activities for the current fiscal year; however, since there is included in the budget an item of $11,464,000 for separate transmittal for the current year for the territory of Guam, there would be a net decrease of $3,150,000 if the proposed supplemental funds are made available in fiscal 1964.

ADMINISTRATION OF TERRITORIES

The $18,814,000 requested herein for this activity is $5,814,000 more than the adjusted appropriation for 1964; however, if the proposed supplemental funds of $11,464,000 for the current year are made available to begin the Guam rehabilitation program as authorized by Public Law 88–170 of November 4, 1963, there will be a net decrease of $5,650,000 in the budget year. The 1965 estimate provides funds for Guam to continue the rehabilitation program, for American Samoa activities with continued emphasis on expanded programs in education, public health, and communications, and for territorial support activities, such as the immediate offices of the Governors, the Virgin Islands comptroller, and the Office of Territories.

TRUST TERRITORY OF THE PACIFIC ISLANDS

The estimate of $17,500,000 for the trust territory program is $2,500,000 more than the present adjusted appropriation for 1964. The 1965 program includes $4,920,000 to finance the cost of the construction program, $1,304,000 of which is for the education program, $888,000 for the hospital at Truk, and $2,728,000 for housing, airfield, power and water, road, communications, and other facilities. Other significant amounts are $3,900,000 for educational services, $2,120,000 for medical services, $1,285,000 for resources management and development activities, and $3,575,000 for operations, maintenance, transportation, and communications services.

VIRGIN ISLANDS CORPORATION

Funds are not being requested for the Virgin Islands Corporation in 1965.

Mr. Chairman and members of the committee, I have here today our territorial officials and certain members of my office staff who will furnish any detailed information the committee may desire regarding our territorial budgetary programs for the ensuing fiscal year.

Thank you.

REHABILITATION AND IMPROVEMENT

Mr. TAITANO. The request that you mentioned, Mr. Chairman, for this year, includes a request for the government of Guam. This is for rehabilitation purposes primarily.

With the trust territory request, there is also an increase of $2½ million. This is primarily for the improvement of our educational and health activities and services in the trust territories. Then, we have requests for the various Governors' offices, for the Virgin Islands, for Guam, for our office here in Washington.

Mr. Chairman, this just about highlights the statement for 1965. I understand that we are to take up, also, the supplemental for Guam for 1964 and this is a request of $11,464,000, if it pleases you, Mr. Chairman. I have with us today our territorial officials. We have the High Commissioner of the Trust Territory; we have the Governor of Guam, Mr. Guerrero; and because of the requirement of our statute, which sets up the authorization bill for the rehabilitation of Guam, we have with us today, Mr. Won Pat, the speaker of the Guam Legislature, who merely desires to insert a statement from the legislature about their concurrence with the Governor's request of this year.

Governor Lee of American Samoa is out of the room for a few minutes, but he will be right back. These officials will be able to answer in detail your questions.

Chairman HAYDEN. The major new item in the request this year is the need for funds to implement the Guam Rehabilitation Act, Public Law 88–170, November 4, 1963. There is also a supplemental estimate for this purpose in the amount of $11,464,000 which may be included in the record at this point.

(The justification estimate referred to follows:)

JUSTIFICATION STATEMENT

Administration of territories

Request (for 6 months from Jan. 1, 1964)	$11, 464, 000
Appropriation to date	13, 000, 000
Obligations to Nov. 30, 1963	7, 179, 385
Expenditures to Nov. 30, 1963	7, 096, 516
Budget estimate next fiscal year	18, 814, 000

PURPOSE AND NEED FOR ADDITIONAL FUNDS

The $11,464,000 is urgently needed to initiate a complete rehabilitation program for Guam involving all major island facilities because of the extensive damage wrought by typhoons which struck the area in November 1962 and April 1963. Of the total amount requested, not to exceed $200,000 shall be available to carry out the purposes of section 6 of the Guam Rehabilitation Act, Public Law 88-170, approved November 4, 1963.

GUAM REHABILITATION PROGRAM

Public law: The Guam rehabilitation bill provides for a grant and loan program not to exceed $45 million for the rehabilitation of the territory of Guam. Such rehabilitation is needed (1) to replace public facilities destroyed as a result of Typhoon Karen in November of 1962 and (2) to replace worn out World War II temporary public facilities with more modern and efficient construction to provide a setting whereby Guam may develop its social and economic potential to a greater level of self-sufficiency.

The act provides that all projects other than water, power, and telephone service, for which funds are appropriated under its authorization, will have 50 percent of its costs returned to the U.S. Treasury; for water, power, and telephone projects, the appropriations will be in the form of 100-percent loans. All moneys returned to the Treasury will be at an interest rate fixed by the U.S. Treasury and will be amortized over a period of 30 years.

This supplemental request of $11,464,000 is the first phase of the rehabilitation program which primarily funds projects required because of the destruction caused by Typhoon Karen.

George Washington High School, $1,742,000

This school consisting of quonsets completely demolished by Typhoon Karen, was located in path of jet planes landing at naval air station. Reconstruction on permanent basis in new area is necessary.

The construction is for an estimated enrollment of 1,500 at an estimated construction cost of $2,450 per student for a total of $3,675,000. Cost breakdown is:

Labor	$1,732,500
Materials	1,417,500
Equipment	525,000
Total	3,675,000
Less OEP funds	1,933,000
Net	1,742,000

George Washington Junior High School, $1,536,000

This quonset school was badly damaged by Typhoon Karen and in poor location under jet landing pattern. Reconstruction in new area is required for 800 students estimated at $1,920 per student. It presently has 541 students but will be supplemented by over 200 additional students from Tumon Junior-Senior High School when it is converted to a senior high school only. Cost breakdown is:

Labor	$739,200
Materials	604,800
Equipment	192,000
Total	1,536,000

Chalan Pago Elementary School, $351,000

The old school is quonset type and was completely destroyed by the typhoon. This is one of the facilities which must be replaced on an enlarged scale to meet the overall elementary expected enrollment. The project is for 500 enrollment at an estimated cost of $1,300 per student for a total project cost of $650,000. Cost breakdown is:

Labor	$312,812.50
Materials	255,937.50
Equipment	81,250.00
Total	650,000.00
Less OEP funds	299,000.00
Net	351,000.00

Barrigada Elementary, $332,000

Like the Chalan Pago School, the old Barrigada School was demolished by the typhoon and needs to be replaced with a larger facility for the projected enrollment of 500 students. However, the total cost $650,000 less OEP funds of $318,000 leaves a net amount of $332,000. Cost breakdown is:

Labor	$312, 812. 50
Materials	255, 937. 50
Equipment	81, 250. 00
Total	650, 000. 00
Less OEP funds	318, 000. 00
Net	332, 000. 00

Talofofo Elementary, $264,000

Again, this school was destroyed and must be replaced. The project is for an enrollment of 350 students at $1,300 per student for a total cost of $445,000. Cost breakdown is:

Labor	$218, 968. 75
Materials	179, 156, 25
Equipment	56, 875. 00
Total	455, 000. 00
Less OEP funds	191, 000. 00
Net	264, 000. 00

Tumon Junior-Senior High School, $225,000

This project covers the conversion from junior-senior to exclusively senior high school usage, with a capacity of 1,500 students. Tumon and the new George Washington Senior High School will then meet the total requirements for senior high school facilities.

This school was constructed for an enrollment of 1,500 students, but as a junior-senior high school. To convert this facility to a senior high school requires—

1. Eight classrooms to be equipped as science and biology laboratories, complete with fixed equipment and necessary utilities.
2. Enlargement of the cafeteria, including kitchen and storage areas, and the addition of a second serving line.
3. Enlargement of the physical education area, including additional shower and dressing facilities for both sexes.
4. Construction of an additional shoproom, one-story concrete to match present shops.
5. Acoustic treatment of the bandroom to permit adjacent areas to be used as classrooms. Provisions for dehumidified storage for band instruments.
6. Stairway revisions to provide for increased traffic during class change periods.

Estimate

Item	Labor	Equipment	Material	Total
1. Convert 8 classrooms to laboratories	$3, 500	$71, 000	$7, 000	$81, 500
2. Enlargement of cafeteria facilities	25, 000	9, 000	38, 000	72, 000
3. Enlargement of physical education area	16, 000	----------	25, 000	41, 000
4. Construction of additional shop	9, 000	----------	14, 000	23, 000
5. Band room alterations	1, 200	2, 000	1, 800	5, 000
6. Stairway revisions	1, 000	----------	1, 500	2, 500
Total	55, 700	82, 000	87, 300	225, 000

Tamuning-Dededo Junior High (new), $1,536,000

This school is needed to absorb part of the junior high students who will need other quarters when Tumon Junior-Senior High is converted to a senior high school only. At present there are 1,041 junior high students. They will be distributed between this school and the new George Washington Junior High (item 2).

This project is for an estimated 800 school enrollment at $1,920 per student for a total cost of $1,536,000. Detail cost estimate is:

Labor	$739,200
Materials	604,800
Equipment	192,000
Total	1,536,000

Agat-Santa Rita Elementary School, $455,000

Population expansion and additional military children requires additional school near Navy base. Estimated cost $455,000 for 350 students at a cost of $1,300 per student.

Labor	$218,968.75
Materials	179,156.25
Equipment	56,875.00
Total	455,000.00

Dededo Elementary School, $244,000

This school and the Yigo Elementary School were of frame and quonset-type construction, and were completely demolished by the typhoon. This project proposes to replace the two schools with a new permanent-type facility, adjacent to the village of Dededo. This school would be a 500-student project, with an estimated total cost of $650,000. Cost breakdown is:

Labor	$312,812.50
Materials	255,937.50
Equipment	81,250.00
Total	650,000.00
Less OEP funds	406,000.00
Net	244,000.00

Merizo Elementary School, $165,000

This school was badly damaged by the typhoon and is uneconomical to reconstruct. Replacement of this facility in permanent-type construction is necessary to accommodate the number of pupils enrolled.

The project covers a school of 300 students at an estimated cost of $1,300 per student, or a total project cost of $390,000. Cost breakdown is:

Labor	$187,500
Materials	153,750
Equipment	48,750
Total	390,000
Less OEP Funds	225,000
Net	165,000

Trade and technical school (partial construction), $432,600

The trade and technical school is presently conducting classes and shop activities in buildings which were hastily repaired. Needed immediately are six shop buildings and the administration building. Classes may be held in the shop building as a temporary measure. This is not desirable but has to be done even if the other buildings are being constructed at the same time. It takes longer to construct the concrete and hollow tile than the prefabricated metal shop buildings. The other buildings needed, but may be deferred another year, are 4 shop buildings, a 20-classroom building, and a building for 8 drafting rooms and cafeteria.

The cost breakdown is:

6 prefabricated steel buildings, each 60 by 140, at $21 per square foot	$604,800
1 administration building, 60 by 30, 1,800 square feet, at $20	36,000
Site preparation	30,800
Total cost	671,600
Less OEP funds	239,000
Additional funds required	432,600

The cost breakdown is:

Labor	$268,000
Materials	335,800
Equipment	67,800
Total	671,600

Department of education, administration building, $56,000

The administration building, which was damaged severely by Typhoon Karen was evaluated by OEP at $193,000 based on replacement of the old quonset hut with prefabricated metal buildings.

For permanency, it is proposed that the building be constructed of concrete. The building will be two stories high with a ground floor office area of 39.5 by 96 (3,792 square feet) and 10-foot corridors on the longitudinal sides. The second floor will have an office area of 45 by 96 (4,320 square feet) and 10-foot corridor.

1st floor:	
Office area, 3,792 square feet, at $26	$98,592
Corridors, 1,920 square feet, at $12	23,040
2d floor:	
4,320 square feet, at $25	108,000
Corridor, 960 square feet, at $14	13,440
Equipment room, 88 square feet, at $18	1,584
Site work	4,344
Total cost	249,000
Less OEP funds	193,000
Additional funs required	56,000

The cost breakdown is:

Labor	99,600
Materials	124,500
Equipment	24,900
Total	249,000

Juvenile home (partial), $121,200

The juvenile home which was damaged completely by Typhoon Karen was housed in a quonset hut. Its replacement-in-kind was evaluated at $75,000 by OEP.

At the present time the inmates are housed in makeshift structures.

The plan is to construct four permanent-type dormitories, an administrative office, and a prefabricated metal shop. This complex will have a maximum capacity of 80 inmates.

The present population varies from 18 to 25 inmates. For the first increment, two dormitory buildings and workshops are needed.

Each dormitory building will contain a large dormitory room for 16 inmates, 4 isolation cells, kitchen, toilets, living room, dining area, and storage.

The shop building shall contain an auto shop, mechanics shop, vocational shop, all-purpose room, and administrative offices.

The estimate of cost for the present need is:

2 concrete and hollow-tile dormitories, 30 by 120, 7,200 square feet, at $16	$115,200
1 prefabricated metal shop building, 168 by 30, 5,080 square feet, at $12	60,960
Site preparation, fencing, and playgrounds	20,040
Total	196,200
Less OEP funds	75,000
Additional funds required	121,200

The cost breakdown is:

Labor	$78,480
Materials	98,100
Equipment	19,620
Total	196,200

Penitentiary (partial construction), $169,000

This project requires the construction of a new penitentiary to replace the one destroyed completely by Typhoon Karen. Needed immediately, is a facility for a dormitory unit containing 30 bunks and 10 isolation cells, an administration building, and workshops. The cost breakdown is:

Men's dormitory containing 30 bunks, 1 toilet and shower room, 1 dining and day room—hollow tile and concrete roof, 5,883 square feet, at $16	$94,128
Administrative and service building containing storeroom, laundry, kitchen, classroom and library, records and control rooms, employees' dining, office, waiting and visiting room—hollow tile and concrete roof, 4,780 square feet, at $18	86,040
Shop building—prefabricated metal building, containing auto repair shop, hobby shop, vocational trades classroom, 3,584 square feet, at $14	50,176
Site preparation, security fence, water, sewerage, electrical and tower	88,656
Total	319,000
Less OEP funds	150,000
Additional funds required	169,000

The cost breakdown is:

Labor	$127,600
Materials	159,500
Equipment	31,900
Total	319,000

General government buildings and facilities—Public works (utilities), $201,600

This project covers the construction of new facilities to replace those damaged by the typhoon. The buildings are to be relocated adjacent to the proposed public works area. The project covers construction of a permanent type administration building, a steel frame warehouse for the power division, and a similar structure for the water division. Paved and fenced open storage areas will be provided for pole and pipe storage. Estimated cost is $233,600 less OEP funds $32,000, net $201,600. Cost breakdown is:

1-story building for administration building—concrete and hollow tile building, 40 by 90 feet, 3,600 square feet, at $16	$57,600
Warehouse for power section—1 prefabricated metal building, 40 by 100 feet, 4,000 square feet, at $12—$48,000 × 2	96,000
Warehouse for water section—1 prefabricated metal building, 40 by 100 feet, 4,000 square feet, at $12	48,000
Paving—20,000 square feet, at $0.30	6,000
Fencing—2,000 linear feet, at $2.50	5,000
Engineering and contingencies	21,000
Total	233,600
Less OEP funds	32,000
Additional funds required	201,600

The cost breakdown is:

Labor	$93,440
Materials	116,800
Equipment	23,360
Total	233,600

Public works, $319,000

The department of public works office and shop buildings were approximately 75 percent destroyed by Typhoon Karen. Presently, the department is operating in makeshift shape and offices. The proposed project includes the construction of one concrete and hollow tile office building, three preengineered metal buildings for shops, equipment sheds, and parking areas. The estimated cost is $744,000, less OEP funds $425,000, net $319,000. The OEP funds will not even suffice for the construction of the three preengineered metal buildings.

The cost breakdown is:

Office building—Concrete and hollow tile with concrete roof—7,743 square feet, at $20	$154,860
Dispatcher's office—240 square feet, at $16	3,840
2 parking sheds—5,760 square feet, at $3	17,280
Gas pumps and tank	4,000
3 80- by 200-foot preengineered metal buildings without partitions, concrete floor—3, at $130,000	390,000
Equipment shed, tire storage, and grease pit—8,800 square feet, at $9	79,200
Site preparation, grading parking areas, fencing, water, power, and sewer	94,820
Total	744,000
Less OEP funds	425,000
Additional funds required	319,000

The cost breakdown is:

Labor	$297,600
Materials	372,000
Equipment	74,400
Total	744,000

Procurement and supply warehouse, $563,000

The project covers the replacement of the damaged and destroyed procurement and supply division storage area by relocation of a new area near commercial port. The functions of the present scattered small warehouses will be concentrated in two 100- by 200-foot permanent type warehouses, consisting of structural steel frame sections, equipped with a sprinkler system. An adjacent 200- by 200-foot paved and fenced area will provide for open storage requirements. Estimated cost is $637,000 less OEP funds $74,000, net $563,000. Cost breakdown is:

Warehouse (2) 100 by 200 feet—40,000 square feet, at $12	$480,000
Overhang (2) 10 by 200 feet—4,000 square feet, at $6	24,000
Sprinkler system	60,000
Fencing, 3,200 linear feet, at $1	3,200
Paving, 200 by 200 feet—40,000 square feet, at $0.30	12,000
Engineering and contingencies	57,800
Total	637,000
Less OEP funds	74,000
Additional funds required	563,000

The cost breakdown is:

Labor	$254,800
Materials	318,500
Equipment	63,700
Total	637,000

Sewer system, $220,000

This project covers the preparations of plans and specifications for the following proposed sewer systems. Only the city of Agana and the village of Agat are now sewered.

Location:	*Estimated cost*
1. Central area:	
(a) Agana Heights	$305,000
(b) Barrigada	550,000
(c) Mongmong-Toto-Maina	300,000
(d) Sinajana	370,000
(e) Tamuning	650,000
(f) Anigua	125,000
(g) Treatment plant	500,000
(h) Interceptors to villages	700,000
Subtotal	3,500,000
2. Dededo:	
(a) 45,000 feet of 8–18 inch	350,000
(b) Treatment plant	50,000
Subtotal	400,000
3. Yona:	
(a) 21,400 feet of mains	167,000
(b) Treatment plant	33,000
Subtotal	200,000
4. Asan-Piti:	
(a) 26,200 feet of mains	205,000
(b) Intercepts	48,000
(c) Treatment plant	47,000
Subtotal	300,000
Total	4,400,000
Engineering fees at 5 percent	220,000
The cost breakdown is:	
Labor	1,760,000
Materials	2,200,000
Equipment	440,000
Total	4,400,000

Dededo water wells, $290,200

One of the areas which will grow rapidly is Dededo where there is a large tract of land owned by the government of Guam. The land can be developed as a housing area for families displaced by the typhoon. Dededo is presently drawing water from the U.S. Air Force but the supply is limited. The existing U.S. Navy lines terminating at Tamuning could not be extended to Dededo because of the limitation in the quantity of water which can be drawn from the U.S. Navy and also due to the small size of existing transmission lines.

The project proposes the construction of two wells and pumps, one ground level reservoir and pumps, two elevated reservoirs, and interconnecting pipes, valves, and other appurtenances.

The wells will yield 300,000 gallons per day to serve an estimated population of 3,000 persons.

	Estimated cost
2 wells, each 10 inches in diameter, 380 feet deep (with casing), at $2 per foot	$15,200
2 deep-well pumps with water column, well point, 300-gallon-per-minute capacity, 2, at $25,000	50,000
1 concrete 400,000-gallon reservoir at ground level	80,000
2 100,000-gallon elevated steel reservoirs, at $50,000	100,000
Connecting pipes and valves between wells, 8-inch-diameter cast iron pipe, 1,500 linear feet, at $10	15,000
Connecting pipes and valves from ground reservoir to elevated reservoirs, 8-inch-diameter cast iron pipe, 2,000 linear feet, at $10	20,000
2 electric pumps, at $5,000	10,000
Total cost	290,200

The cost breakdown is:

Labor	$116,080
Materials	145,100
Equipment	29,020
Total	290,200

Village development, $2,241,400

The estimate of $2,241,400 for fiscal 1964 provides for the initial phase of this program, the total cost of which is estimated at approximately $12.1 million, $6 million of which is to be financed by the Guam rehabilitation bill. This project anticipates total requirement for Yona, acquisition of new subdivision land for Sinajana and development, and acquisition of new subdivision land for Asan and development.

Yona:	
New land acquisition (46 acres)	$119,300
Condemnation (present properties, 168)	240,500
Development (180 lots)	484,000
Demolition (168 structures)	33,600
Yona, total	877,400
Sinajana:	
New land acquisition (44 acres)	264,000
Development (500 lots)	600,000
Sinajana, total	864,000
Asan:	
New land acquisition	200,000
Development	300,000
Asan, total	500,000
Grand total	2,241,400

REHABILITATION PROGRAM

Chairman HAYDEN. The supplemental estimate is for the first phase, and the $10 million included in the fiscal year 1965 budget is to accomplish a second phase of the rehabilitation program. Your statements advise that the rehabilitation is required (1) to replace public facilities destroyed by Typhoon Karen in November of 1962, and (2) to replace worn out World War II temporary public facilities. Would you please tell the committee how much each of these two aims is estimated to cost?

Mr. TAITANO. Thank you very much. I have the Governor of Guam here, Mr. Guerrero.

Mr. GUERRERO. Mr. Chairman, thank you very much, sir. I have a statement here which I would like to file.

Chairman HAYDEN. You may do that.

(The statement referred to follows:)

STATEMENT OF MANUEL F. L. GUERRERO, GOVERNOR OF GUAM

Mr. Chairman, members of the committee, and friends, I am deeply grateful for the privilege of appearing here today and for the opportunity to discuss appropriation proposals for Guam under our territory's rehabilitation capital improvement bill which was passed by the Congress late last year.

I feel that this committee is familiar, to a great degree, with Guam, with our problems, and with our desires to solve them through our own efforts as well as through any assistance we merit from the Congress.

Members of your committee and your staff have visited our island, and I have always been impressed by your ability to comprehend and appreciate our needs and by your sympathetic determination to give our territory reasonable help.

I have with me today Mr. George Ingling, who has been with the government of Guam for 8 years. Mr. Ingling retired several years ago from the Federal Internal Revenue Service, and has served our government as tax commissioner, director of finance, and now as assistant secretary on the Governor's staff, with great credit. His principal duty as assistant secretary is to keep the rehabilitation program under continual scrutiny—to see that we get full value for every dollar spent. He will assist me in answering your questions.

It was just about 1 year ago that I appeared before several House and Senate committees. I was Acting Governor at that time, and I attempted then to describe the devastation our island suffered during Typhoon Karen in November 1962.

I also discussed our other needs which I felt would not only help us recover from the storm but would place our territory on a firmer footing economically, so that we could progress on our own on a long-range basis.

We on Guam feel that the programs we are discussing today are vital to the island's rehabilitation. They have had detailed attention from people in our Government, in the Interior Department, the Bureau of the Budget, and various other Federal agencies.

In a recent magazine interview I was asked if I felt that a dedicated American could serve both the Federal Government, as an appointed Governor of Guam, and the territory, without sacrificing the interests of either. My reply was that I saw no conflict in serving as a Federal appointed Governor, because the best interests of Guam and the United States are never in conflict.

I feel the same way about the Guam rehabilitation program. I honestly believe it is good for Guam and for the United States.

Now, in the interest of brevity, I will not attempt to discuss individual allocations in the proposed appropriations. However, we do have with us information which I feel will fully justify individual requests and we would, of course, be pleased to discuss them with members of the committee.

At the moment, I would like to direct your attention to one facet of action under the supplemental budget request which I feel is very important.

Soon after Typhoon Karen ravaged our island, destroying over 90 percent of our public and private structures, President Kennedy declared Guam a natural disaster area and, as a result, we eventually received allocations of about $16 million from the Office of Emergency Planning for replacement of public facilities.

It was our feeling—and the feeling of everyone up the line—that it would be highly inadvisable to use this OEP money to replace the jerry-built pretyphoon structures with jerry-built posttyphoon structures which would not withstand future storms. For that reason we have worked during the past year with the Navy, which has contracted architectural and engineering services, on a more permanent program of rebuilding.

In every case possible we have planned to supplement OEP funds in order to build modern and adequate structures with stormproof concrete instead of the wood and tin which the OEP financing would have provided.

A large majority of these projects are school buildings. We have pledged slightly over $4.5 million of our OEP funds in these areas, our plans are being completed, and we are nearing the day when we should contract these construction jobs. But we cannot secure clearance for use of the OEP funds until we are certain of the financing we will need to complete these jobs, and that financing is included in the supplemental budget bill.

Almost $9 million of the proposed $11.4 million in the supplemental is earmarked for these particular projects, and this money is urgently needed so we can contract them and push them to completion under the joint-funding plan which will use OEP and rehabilitation bill funds without a loss of continuity and a consequent loss of vitally needed dollars from each of the two areas.

Now, in speaking of the rehabilitation bill as a whole, I feel that I should give the committee some assurances on two counts. I am referring to the probable effectiveness of the bill in helping us develop a more stable economy in the future; and to the ability of the territory to repay the portions of the funds which are to be reimbursable to the Treasury.

Admittedly, I can only give you indications of assurances because Guam's economic growth has been hamstrung through the years and only in recent months have we seen evidence of real advancement.

You are familiar, I am sure, with our history of naval government from the Spanish American War until the capture of Guam by enemy forces after Pearl Harbor.

There followed almost 4 years of cruel enemy occupation, which ended with the bombardments of the U.S. forces which brought our liberation.

We functioned again under U.S. military governments until 1950, when the Organic Act was signed, and went through periods of postwar reconstruction in which economic development was hampered by various factors. These include, among many others, Guam's inability to fully recover from the devastation of World War II and certain defense requirements in Guam.

All these things have combined, through the years, to offset progress, although I believe our accomplishments since 1950 have equaled those of any infant government in 14 years, despite these difficulties.

I would hesitate to call the typhoons blessings in disguise, but they did create the need for new construction in all fields and they did instill in our people strong determinations to survive and better our community.

In the trying months since November 1962, our executive branch has functioned with top efficiency, our legislature has shown good judgment and foresight; and our business community has become more progressive in every respect.

On Guam today we are seeing activities and hearing plans which would not have existed except in the wildest dreams a few years ago.

For the first time outside capital is becoming interested in Guam. The Henry J. Kaiser interests have launched a large-scale homebuilding program, and are studying other ventures. Honolulu Gas Co. is investigating the possibilities of placing bottled gas on the market in a move which could lower utility costs, reduce our burden of providing electric power, and eventually lead to some industrial developments. American Telephone & Telegraph has constructed and will shortly open a tremendous underground cable station which will give us our first underwater communications link with the United States and the Far East.

A Guam firm, Jones & Guerrero, operating on the west coast run, recently began chartering ships in an effort to reduce our high freight rates which cause us to pay $600 more for a compact automobile than you pay on the mainland.

Two local groups have started small charter airlines, which we hope to see develop to increase service between Guam and the islands of the trust territory.

We have received indications of activity in the commercial fishing field, and are working on programs for the utilization of large tracts of unused land for commercial farming expansions.

There are indications that the only thing delaying development of a tourist industry is the lack of a modern hotel, and while on the mainland I hope to discuss the possible development of one with a number of groups.

Our strategic importance on Guam is being emphasized by facility expansions by the Federal Aviation Agency, as well as the Navy, which soon will open a POLARIS base which will increase our military population by several hundred families.

Our local business community has not been idle during the past year, and new buildings are springing up in Agana and other business areas.

During 1963, 1,746 residential building permits for new construction and repairs were issued, for a total of $7,752,946, and 157 commercial permits accounted for $2,897,284 in construction.

The Small Business Administration, which opened shop in Guam shortly after Typhoon Karen, has approved applications for 809 home loans totaling $7,151,261, and for 105 business loans totaling $2,441,938.

The SBA's overall approval total of $9.5 million is expected to increase substantially, as the office still has over 250 applications to process.

Many of these things may provide our economy only a temporary stimulant, so we are making every effort to move forward on a long-range basis.

One of our greatest needs is the development of more skills among our local people. Included in the supplemental budget are funds for the construction of a new trade and technical school to replace the inadequate facility destroyed by Typhoon Karen, and we hope to be able to accommodate 1,000 students in the next few years. I intend to make every possible effort to upgrade the status of this school and make the various skills which will be tailored to local demands attractive to our young people.

I have cited some of the developments of the past year and some of the things which we expect in the coming months. All of them give me confidence in our eventual success in making Guam a full member in the American community.

But the thing which gives me the most confidence is the faith of our people.

I recall that in December 1962, 1 month after Typhoon Karen, when Guam still was a shambles, the first installment on our real estate taxes, totaling $622,953, came due.

Our people not only paid that installment, they overpaid it by over $25,000, when many of them paid both the first and second installments.

And many of them were paying on homes which had been destroyed in the storm.

I have seen that same spirit demonstrated time and again, and it not only gives me confidence—it gives me pride in my fellow Americans on Guam.

Our problems on Guam are not solved.

But with the continued sympathetic assistance and guidance which this committee has always shown us, they will be solved, because our people are dedicated to their solution.

Forgive me for taking so long, and again let me thank you for the opportunity of appearing here today.

Typhoon Destruction

Mr. Guerrero. And I would like to brief the committee of what these moneys are requested for. We are asking for moneys to take care of our schools, both on the junior level, the senior level, and the elementary level. We have many of our schools that were destroyed after the two typhoons and we have many of our public facilities that were destroyed after the two typhoons.

We are also asking for some money to take care of the air terminal, and we are asking for some money to take care of our water resources and sewer system. This is in accordance with Public Law 88–170.

Time Required To Accomplish Rehabilitation

Chairman Hayden. How many years do you estimate will be required to accomplish the authorized rehabilitation?

Mr. Guerrero. We have a plan that has been already made. Since Typhoon Karen in December 1962 we started working on our plans, designs, and architectural needs. We have a timetable here of how this money will be expended, when it will be expended, and just about when these plans will be available.

Chairman Hayden. What is the ultimate date?

Mr. Guerrero. The ultimate date on the supplemental budget, we will be able to obligate and contract it by July this year, sir. On the 1965 budget, we will be able to obligate and contract it by January 1965.

I would like to insert for the record the schedules of these things.

Chairman Hayden. They may be included in the record.

(The schedules referred to follow:)

The 1964 Supplemental Budget Request (Guam)

Project and final plans due:

George Washington High School, April 10, 1964.
George Washington Junior High School, April 20, 1964.
Chalon Pago Elementary, February 28, 1964.
Barrigada Elementary, February 28, 1964.
Talofofo Elementary, plans prepared.
Tumon Junior-Senior High School conversion, March 1, 1964.
Dededo Junior High School, April 20, 1964.
Agat-Santa Rita Elementary, April 20, 1964.
Dededo Elementary, February 28, 1964.
Merizo Elementary, February 28, 1964.
Trade and technical school, April 10, 1964.
Department of Education administration building, May 26, 1964.
Public Works Buildings, May 26, 1964.
Public Utilities Buildings, May 26, 1964.
Procurement and Supply Warehouse, May 1, 1964.
Penitentiary, March 4, 1964.
Juvenile Home, May 26, 1964.
Sewer system plans, awaiting funds requested 1964 budget.
Dededo wells and pumps, April 30, 1964.

Village development:
Yona:
New land acquisition, appraisal made, ready to proceed.
Development, start when land acquired.
Old land, building purchase, under urban renewal project.
Building demolition, under urban renewal project.
Sinajana:
New land acquisition, appraisal made, ready to proceed.
Development, start when land acquired.
Asan:
New land acquisition, appraisal made, ready to proceed.
Development, start when land acquired.
1965 budget request (Guam):
College Guam library, July 15, 1964.
College Guam classroom, July 15, 1964.
Sewer system, November 15, 1964.
Air terminal, July 15, 1964.
Commercial port plans, awaiting funds appropriation.
Utilities:
Water lines and tank replacement, general layout completed, can complete final plans 60 days after funds available.
Power contribution, plant construction under way, completion, December 1964.

COSTS IN THE FORM OF LOANS

Chairman HAYDEN. I note that 50 percent of all costs for projects other than water, power, and telephone service will be returned to the United States. The costs of the water, power, and telephone projects will be in the form of 100 percent loans which, I assume, will be returned in toto to the U.S. Treasury. Is that correct?

Mr. GUERRERO. Yes, sir. This is according to Public Law 88–170.

ACCELERATED PUBLIC WORKS PROJECTS

Chairman HAYDEN. Have any accelerated public works projects been constructed in Guam?

Mr. GUERRERO. No, sir.

Chairman HAYDEN. You have none at all?

Mr. GUERRERO. No, sir.

RESULTS OF LATE ENACTMENT OF SUPPLEMENTAL APPROPRIATIONS

Chairman HAYDEN. For a portion of the planned projects, for instance sewer system and drainage, advance planning funds have been requested as a part of the fiscal year 1964 supplemental estimate. What will be the situation if the supplemental estimate is enacted very late in the current fiscal year? Will you still need the same amount of funds to carry on your planned 1965 program?

Mr. GUERRERO. If the supplemental is enacted late, sir, we will be forced to continue with many of the problems that we are now faced with, double sessions in schools, operating in temporary facilities, and the expenditure of the Government will be tremendous just to keep this thing going.

We have schools that were destroyed so that we have to send children from villages to other villages farther away by transportation, and this program, incidentally, is also predicated on the basis of our needs since December 1962 when the typhoon struck Guam. We have been overdue in asking for this loan, sir.

Chairman HAYDEN. You would like to get the money as soon as possible, then?

POWER PRODUCTION AND DISTRIBUTION PROJECT

On page 19 of your estimates, in discussing the power production and distribution project, for which you estimate a need of $2 million, you indicate that the Legislature of Guam has appropriated $3 million as a first increment of the cost and that $2 million is now estimated as the contribution of the Government of Guam for the second increment. Is the $2 million referred to here a grant or a loan?

Mr. GUERRERO. This is a loan, sir.

Chairman HAYDEN. Do you have any questions you want to ask about Guam?

Senator BIBLE. Mr. Chairman, I want to compliment Governor Guerrero and his group for the fine job they are doing in Guam and particularly on the rehabilitation efforts.

TOTAL COST OF REHABILITATION

So that I might have a bird's-eye view of the overall picture and the total costs, what is your estimate, Governor, of the total cost of the rehabilitation of Guam?

Mr. GUERRERO. Sir, when we first started to estimate this thing, we presented to the Department of Interior an amount close to about $72 million. Of course, through revisions and changes, it came down to $56 million when we asked for the authorization, then Congress considered it and changed it to $45 million.

Senator BIBLE. Correct.

Mr. GUERRERO. I would like to point out that every year we delay the construction costs and supplies and material and labor will add about 3 percent, normally. So, I cannot just guess how much. If it takes us 10 years, sir, that is a long time and it is going to cost a lot of extra money.

AUTHORIZED EXPENDITURES

Senator BIBLE. You are authorized to spend $45 million.

Assuming that that is made available to you at a reasonable timetable, without delay, how effective a job will that do in rehabilitation?

Mr. GUERRERO. It will do the job, sir. Of course, the responsibility of the people will have to be responsive. In this case, the people, too, themselves, they would have to help, and not necessarily just wait for the Federal Government to help. In this way, I mean to say, there are agencies in the Government that the people can take advantage of like FHA, SBA, and other facilities that we from time to time, the people individually, can take advantage of.

Senator BIBLE. Refresh my memory as to the authorizing act, Governor Guerrero. Is the $45 million partly loan and partly grant?

LOAN AND GRANT

Mr. GUERRERO. It is more loan than grant.

Senator BIBLE. How much of it is loan, at this time, 50 percent?

Mr. GUERRERO. About two-thirds.

Senator BIBLE. About two-thirds is on a loan basis. And that is loaned and repaid by Guam over how long a period of time?

Mr. GUERRERO. For 30 years.

Senator BIBLE. And one-third is an outright grant?

Mr. GUERRERO. Yes, sir.

Senator BIBLE. How many years will it take to effectively and economically use this $45 million? What is your timetable? You are asking for $11 million now by way of a supplemental.

Mr. GUERRERO. Yes, sir. We have until 1973 to effectively use this money.

Senator BIBLE. The point you make is that the more delay there is the more it will cost you?

Mr. GUERRERO. Yes, sir.

REPAYMENT OF LOAN

Senator BIBLE. How soon will Guam, itself, be able to set up the machinery for the repayment of this loan? Would this money be best used if you had it within the next 3, or 4, or 5 years?

Mr. GUERRERO. Under the law, the money that we will have to repay, we have started repaying in the 5 years since the date we started to get the money. That means, sir, that we have to try to utilize all we can and be responsive to what appropriation is given to us, so that we can best utilize the funds.

Senator BIBLE. Are you talking about a 3- to 4-year program? Is that it?

Mr. GUERRERO. A 5-year program.

Senator BIBLE. You would like to receive all of the $45 million within the period of 5 years? That is all I am trying to develop, because we find frequently that it is false economy to make the money available at an earlier date. Again, I commend you for the fine work you are doing, Governor Guerrero.

Senator YOUNG. May I ask a few questions?

Chairman HAYDEN. Yes.

MILITARY ASSISTANCE IN RECONSTRUCTION

Senator YOUNG. Is the military helping some in the reconstruction? Or is what you are asking for entirely separate?

Mr. GUERRERO. What we are asking is entirely separate, but we have, at the moment, an agreement for contract administration with the Navy. The Navy is doing the contracting administration and architectural work for many of our projects.

Senator YOUNG. And they are doing this free?

Mr. GUERRERO. No, sir. We are going to pay them about 70 percent.

Senator YOUNG. You have to pay for it?

Mr. GUERRERO. Yes, sir.

FINANCING PRIVATE HOMES

Senator YOUNG. Will any private homes be built out of these funds?

Mr. GUERRERO. No, sir. These are all for public facilities, governmental facilities. The private homes will be financed through banks and agencies that provide for that kind of loan. Not one penny is for private homes. I will assure you of that.

Senator YOUNG. Thank you.

Mr. TAITANO. Senator, if I may further elaborate on that, the Navy does have its own reconstruction program which is only military. They have their own activities.

Senator YOUNG. This does not help the local people?

Mr. TAITANO. No, sir.

Senator BARTLETT. Mr. Chairman, may I ask a question or two?

Chairman HAYDEN. Yes.

Senator BARTLETT. Governor, you are asking for $11 million supplemental, and how much in the regular appropriation?

Mr. GUERRERO. $10 million, sir.

AVERAGE INCOME OF GUAMANIANS

Senator BARTLETT. And what is the average income of the Guamanians?

Mr. GUERRERO. According to the 1960 census, family median income was about $3,500 per year, a family of 5.6 members.

Senator BARTLETT. Isn't that an extraordinarily high income for that part of the world?

Mr. GUERRERO. I don't think so.

Mr. WON PAT. For that part of the world, it is high.

Mr. GUERRERO. I think in Guam the income is not high.

Senator BARTLETT. I don't mean to imply that, but for that section of the world, isn't it quite high?

Mr. GUERRERO. Yes; if you probably compared it with the Trust Territories. Yes.

Senator BARTLETT. How about American Samoa?

Mr. GUERRERO. Yes, sir.

PRIVATE INDUSTRY EMPLOYMENT

Senator BARTLETT. What industries do you have there to provide gainful employment for the people?

Mr. GUERRERO. We have none, sir.

Senator BARTLETT. How do they arrive at this income?

Mr. GUERRERO. We have what is called a service economy. We service the military bases there, providing supplies, labor, and other needs.

Senator BARTLETT. The economy is entirely dependent, at the moment, on U.S. Federal spending?

Mr. GUERRERO. Yes.

Senator BARTLETT. Would you say that the lot of the people there has improved in the last decade, for example?

Mr. GUERRERO. Yes, sir.

EFFORTS TO PRIVATE INDUSTRY

Senator BARTLETT. Do you see any possibility or any prospect of establishing an industrial base of any kind?

Mr. GUERRERO. We are trying to develop a tourist community there. Some agricultural economy is established and we hope to try to invite industry to Guam, particularly on the basis that many of our American companies are operating on foreign bases, or foreign areas, and if they can pull back to an American territory where the system of government, the due process of law, is applicable, I think it will save them the headaches and the extra expenditures.

AGRICULTURAL PRODUCTION

Senator BARTLETT. What is your agricultural production now? What do you raise that is marketable?

Mr. GUERRERO. The regular truck farming, poultry, we have an egg cooperative. That is about all that we have, sir.

Senator BARTLETT. There is a ready market for this, is there not?

Mr. GUERRERO. The island consumption has not been met, up to now.

Senator BARTLETT. You import considerable quantities?

Mr. GUERRERO. We import more than we produce.

CENSUS OF GUAM

Senator BARTLETT. How many Guamanians are there?

Mr. GUERRERO. The census shows a population of 45,000 to 50,000. There are about 35,000 natives of Guam.

Senator BARTLETT. What percentage of them speak English?

Mr. GUERRERO. English has been the official language of Guam since 1900, sir, and I would say that about 90 percent speak it and understand it. They may not write it, but they speak and understand English.

Senator BARTLETT. Is the native language taught in the schools?

Mr. GUERRERO. No, sir.

PRESERVING CULTURE OF GUAM

Senator BARTLETT. Is it intended to discard the native language and customs?

Mr. GUERRERO. I think, sir, this is very much dependent on the population. At this time, the people of Guam think in terms of the American way of life. They assimilated it. Their education, their thinking, the way they want to eat, dress is all American. As far as preserving the culture of the old Guam, there is some attempt to do that, but I do not believe that it is intended, or it is the desire to spread it out to make it a part of Guam, from the standpoint that we should practice it.

Senator BARTLETT. I think that is very well expressed, Governor, very well, indeed. I, personally, would hate to see all the ancient customs, traditions, habits, language, discarded and forgotten.

Thank you very much.

Chairman HAYDEN. Do you want to ask a question, Senator?

Senator MANSFIELD. No questions, Mr. Chairman. Thank you.

Chairman HAYDEN. Thank you for your appearance.

LEGISLATURE OF GUAM

Mr. WON PAT. I would like to present a statement and be able to answer any questions you may ask. I would do that in accordance with the provisions of Public Law 88–170.

Chairman HAYDEN. This will be put in the record.

(The statement referred to follows:

STATEMENT OF ANTONIO B. WON PAT, SPEAKER, SEVENTH GUAM LEGISLATURE

Mr. Chairman and members of the subcommittee, I am Antonio B. Won Pat, speaker of the Seventh Guam Legislature. Our territorial legislature is a uni-

cameral body comprised of 21 members elected by the people of Guam and as the speaker of this legislature I am the highest elected official in our territorial government.

I have the pleasure of appearing before you today in support of requests for appropriations submitted under the authority of Public Law 88–170, November 4, 1963, the Guam rehabilitation bill. It was my privilege to appear in support of this legislation before both the Senate and House Committees on Interior and Insular Affairs in the previous session of Congress and I now consider it a privilege to appear before you to further support this legislation which is so vital to Guam and its people.

Resolution No. 292, Seventh Guam Legislature, 1964 (second) regular session, creates a select committee on federal legislation from the membership of that body for the purpose of appearing before the committees of Congress to present the views of the people of Guam in regard to the present requests for appropriations as well as other matters of importance to them. I am chairman of that select committee and my appearance before you today is pursuant to that resolution.

The "Guam rehabilitation bill" authorizes certain appropriations upon the request of the Governor of Guam with the "concurrence of the territorial legislature" and the approval of the Secretary of Interior. The Governor of Guam has submitted and testified in support of two appropriations covering educational facilities, public works, utilities, resources development, and village development projects. I will not labor you with further testimony as to these items.

It is, however, my pleasure to state to you that the programs contemplated by these appropriations have been carefully considered and have the full support of the Seventh Guam Legislature. Resolution No. 305, Seventh Guam Legislature, 1964 (second) regular session, officially expresses the requisite concurrence of the Guam Legislature and I offer a copy of this resolution as part of my testimony.

In concluding my testimony I wish to thank you for your consideration, both on behalf of myself and the people of Guam. We urge your early consideration and support of this much-needed assistance.

Thank you.

RESOLUTION NO. 305

SEVENTH GUAM LEGISLATURE

1964 (SECOND) REGULAR SESSION

Introduced by Committee on Rules

Relative to expressing the concurrence by the Guam Legislature in the appropriation requests to be made by the Governor of Guam to the U.S. Congress pursuant to the provisions of Public Law 170, 88th Congress

Be it resolved by the legislature of the territory of Guam:

Whereas section 2 of Public Law 170, 88th Congress, "an act to provide for the rehabilitation of Guam, and for other purposes," provides that before the funds authorized by said act may be appropriated, the Governor of Guam in requesting the same must have the concurrence of the territorial legislature; and

Whereas there have been submitted to the legislature the requests, pursuant to said act, that the Governor of Guam intends to make to Congress in the immediate future, said requests being set out in exhibits hereto attached and corporated herein by reference; and

Whereas the legislature has had the opportunity to examine such budget requests and has in fact participated in the preparation thereof, and finds that said requests are those that now should be made to the Congress: Now, therefore, be it

Resolved, That the Seventh Guam Legislature does hereby, on behalf of the people of Guam, concur with the requests for appropriations under Public Law 170, 88th Congress, to be made by the Governor of Guam, such requests being outlined in the exhibits annexed hereto, and does further authorize the spokesmen of the legislature, created by Resolution No. 292, who shall accompany the Governor of Guam to Washington to testify in support of said appropriation requests to present this resolution as evidence of the legislature's concurrence; and be it further

Resolved, That the speaker certify to and the legislative secretary attest the adoption hereof and that copy of the same be thereafter transmitted to the Governor of Guam.

COMPOSITION AND ELECTION

Senator BIBLE. Will you tell us about your legislative setup briefly? How many members do you have? How often are you in session?

Mr. WON PAT. The Guam Legislature is a creature of the U.S. Congress, enacted in 1950. It established a civil government with the traditional three branches of the American system of government. In the executive branch, the chief executive is the Governor of Guam, appointed by the President and confirmed by the U.S. Senate.

The legislature is elected at large. It is comprised of 21 members and the members, in turn, elect the speaker. The only part of the government that is responsive to the people of Guam.

Senator BIBLE. It is composed of how many people?

Mr. WON PAT. Twenty-one members, elected at large.

Senator BIBLE. Thank you. I just wanted that for the record, Mr. Chairman. I think it is helpful in understanding the Legislature of Guam. Thank you, Mr. Chairman.

1965 Budget Request for American Samoa

Chairman Hayden. Governor Lee, do you have a statement about American Samoa which you care to put in the record?

Mr. Lee. Yes, sir; I do have a statement and I will be glad to put it in the record. I can give you a brief summarization, or you can start asking questions.

Chairman Hayden. Just as you please.

(The statement referred to follows:)

Statement of H. Rex Lee, Governor of American Samoa

Mr. Chairman and members of the committee, it is a pleasure for me to appear again before your committee and to explain Samoa's needs and problems. This committee has been very helpful and sympathetic in what we are trying to do in Samoa and in the not too distant future I hope that we will have the pleasure of a visit from members and staff of this committee. We enjoyed the visit from Senator Mansfield and Senator McGee a little over a year ago and they have been personally helpful to us.

Our large-scale development program which the Congress authorized a little over 2 years ago is well underway. We have made good progress since I appeared before you last year, although we have had many problems develop that we had not anticipated and we have certainly not completed as many things as we had hoped to by this time. Some of the delay in completing our public works projects was occasioned by the fact that we were able to enter into attractive agreements with three new industries. These agreements required us to turn over our entire public works compound to the industries and we had to build a new public works center. We did this with the money supplied by the industries. This slowed us down considerably on our public projects but we think it was worthwhile. Two of these industries are now operating and we hope the third will be operating very shortly. As a result of these new industries the total number of private jobs has more than doubled in the past year.

The costs of some of our projects are exceeding the costs we had projected when we originally proposed our program. At that time we had no past construction experience in Samoa on which to base our cost estimates. As a matter of policy we held our estimates to a minimum and in some instances they proved inadequate. Fortunately, some of our other costs have been down. We have made some operating savings and because of the stepped-up program and increase in private activity we have produced more local revenue than anticipated and I do not believe the total cost to the taxpayer is going to be substantially more than we had estimated. The thing that is causing us the most trouble is the lack of trained personnel to do the types of jobs that we are undertaking. We are now paying very dearly for our failure to educate the Samoan people over the past 60 years. Also our supply lines are long and if a mistake is made on one little order, it can delay us for months and cause additional expense. We have also found it very difficult to recruit good technical personnel for employment in Samoa. We have tried to hold the number of these stateside employees to the absolute minimum and in many instances have operated difficult and technical jobs with untrained natives. While this has cost us some efficiency, in most situations the overall cost has still been lower and the training value to the Samoan people has been great.

Things change so rapidly in our progress that some of the things that we told the House last month are no longer valid today. I would like to review briefly the status of the majority of the programs that are underway.

ROADS

Our road program is moving more slowly and is costing more money than we had hoped last year in our estimates but not more than our original estimates. Of the $500,000 appropriated in fiscal 1964 we had hoped to complete the main road from one end of the island to the other for $100,000 leaving $400,000 for access and secondary roads. It is taking the entire amount to complete the main road and we are requesting $500,000 for secondary roads in this estimate.

SCHOOLS

Our big problem moneywise is with our school program. With the $1,581,150 you authorized in fiscal 1963 we are consolidating 43 village schools, most of which

are simple grass thatch or lean-to types of structures, into 26 modern elementary schools that are especially designed for educational television. These elementary schools will act as community centers for adult educational television instruction after normal school hours. They will become the community centers for all types of activity. Our design for these schools is a good one but our costs on the first one, which we are just completing, are too high.

On the basis of the information we had when we had our House hearing, we advised the House that these costs were running 25 percent above estimates; but upon my return to American Samoa I found that the first or pilot school ran almost 100 percent over our estimate. One of the factors that our design engineers that we hired did not give enough consideration to was the isolation factor of some of the sites and the difficulties of getting materials ashore in areas that are inaccessible by road. Also the original estimates were completely unrealistic. We had budgeted at a rate of approximately $6 per square foot which is too-low for any area. We also had to increase the number of schools to 26 instead of 20 in order to put them all within walking distance. We had also hoped to use gratuity labor for all building. This has proved unrealistic as we need at least a skeleton crew of trained workmen on each project. If we were to use this first school as a true measure of future costs it would cost another $1½ million over the amount presently appropriated to complete the entire elementary school system. However, in analyzing the pilot project we have figured out a number of ways of saving money and feel that the additional cost can be cut substantially below this amount, although the exact amount is difficult to estimate at this time.

Our educational television studio is progressing on schedule and will be completed for the amount we now have available. However, on our air conditioning contract for the studio, the low bid was $69,800 or $9,800 more than we have available. On the advice of our engineers we cut some of the units out and accepted the low bid with the option to add the units back in within 90 days' time without any penalty. Last week we were advised by our engineer-adviser from the States, who visited the project, that the elimination of the additional units would jeopardize the equipment in case of a partial breakdown and he strongly recommended that I exercise the option. I did exercise the option on the last day, even though it meant taking the money from our overall educational fund.

The educational television equipment which was proposed 2 years ago in our overall program was put out to bid in various parcels that would insure the best price. Four major electronics producers were the successful low bidders. As these low bids were higher than the estimates we had submitted, we bought four, instead of six, television tape recorders. The remainder of the equipment was absolutely essential and we accepted the low bid even though the total was $28,394 over the amount budgeted. Here again, we had to commit funds from other parts of our educational budget to cover this deficiency.

Our greatest difficulty has been trying to get access to the high mountain on which we are to place our transmitter building and towers. We had originally budgeted $100,000 to build a road to the top of this mountain, but after building part of it we found that timewise and moneywise it was not feasible because of unforeseen water and rock conditions. We explored doing the job by helicopter but gave it up because of the danger involved. We then reprogramed it for an aerial tramway and contracted for the milling of the special cable and erection installation. We agreed to construct the terminal anchorages and a work cable to the top of the mountain for the transport of prefabricated construction materials for the transmitter building and for building the permanent tramway. This work cable and the transmitter building on top the peak have proved to be difficult undertakings and even with the assistance of two Navy riggers this access along with mountaintop site preparation plus additional costs for the transmitter building are exceeding estimated costs by $84,000. We have done everything possible to cut these costs, including the redesign of the transmitter building, but the initial cost estimates, both on the transmitter building and the access, were totally inadequate in light of the construction difficulties that have arisen.

We have carefully studied our junior high and high school needs in relation to educational television and have decided that an 8-year elementary system plus a 4-year high school system would be the most flexible and economical type system for Samoa. Consequently, we are putting the money that had been programed for junior and senior high schools, including the technical high school buildings, into two new high schools in Leone and Manu'a. The amount of money we have will be a bare minimum but it will get our program started

and will relieve the congestion in the existing high school. We are receiving assistance in the planning of these new facilities from the School Facilities Planning Laboratory of Stanford University. This group has committed $20,000 for this purpose and they are furnishing their time for the planning work on a gratuitous basis while working with the architect selected for the design portion which is now underway. We hope to have the Leone facility available for the 1964–65 school year.

AIRPORT

We are just completing our work on the airport. While the jet strip has been opened and in use by commercial airlines for slightly over a year we have been completing our work on the terminal, the shoulders, the seawall, the turnoff, the service buildings, and other auxiliaries that go to make an airport functional. In the original estimates no provision was made for service buildings, firehouse or supply buildings. We have been able to build them with the airport funds available. Fortunately, we have an excess of $104,500 in this fund, which can be reprogramed into other activities.

ELECTRIFICATION

Our two new 2,000-kilowatt generators are being installed at the present time and powerlines are being extended to the outlying villages. Most of the transmission lines on the main island will be in by the end of this calendar year. Public works has already received more than 350 requests and more are coming in daily for the wiring of the villagers' houses. This will be done on a reimbursable basis during fiscal year 1965. You will note in our new budget that we have requested $823,000 for a new 3,000-kilowatt unit which will include building expansion and auxiliaries. This additional unit is necessary in order to keep up with the very great expansion which we have with the new cannery and the prospect of a new hotel along with providing a minimum reserve capacity for future expansion. Since this estimate was submitted we have again reviewed our costs with our consulting engineer and feel that this item can be reduced $50,000 and this amount diverted to our deficiencies in the school and television programs.

WATER DEVELOPMENT

An engineering firm from Hawaii has completed a detailed design for the first stage of our water program and construction is just starting on these facilities. By July of this year when the dry season starts some of these new facilities should be in operation and will help alleviate the water shortage problem that we have had the last few years with our fish canneries. The first phase of this program will cost $1 million which was approved in our fiscal 1964 budget. We are requesting $240,000 in the fiscal year 1965 budget to continue this program. The total estimated cost of an integrated water program to provide for approximately an 8-day water supply for the islands is $2,500,000. It is planned to request money for this only as the development requires it. One of our big problems at the present time is that the water system which was installed during and before the war by the U.S. Marines has deteriorated to the point that we are having to spend a great deal of money for the replacement of the various distribution systems throughout the island. This will be accomplished to a major extent by the integrated program and to a lesser extent by funds approved in prior years for small unrelated water projects. Over the past several years we have had appropriations totaling $342,000. We have delayed construction of some of these items until we could fit them into the overall integrated program that was being engineered. Some of these funds will be used for replacement of water pipe and the remainder will be integrated into the overall development program.

SEWER AND SANITARY DEVELOPMENT

In fiscal year 1964 Congress granted $1,500,000 of a $2,100,000 program to start the sewer system in the bay area and to provide materials for the systems in the villages. The sewer system for the bay area is now in the design stage and it is anticipated that construction will start late this spring. We would like to commence construction in some of the villages throughout the islands during fiscal year 1965 and are requesting $284,000 to start that program.

TELEPHONE SYSTEM

We are requesting $254,000 to complete the telephone system on Tutuila Island. The new exchange building is about completed and it will house a 25-line, 50-connector automatic telephone exchange with interoffice trunking equipment.

MARINE RAILWAY

We are somewhat embarrassed about our ship repair facility program. In our supplementary budget request for fiscal year 1962, we requested $55,000 to repair the marine railway which had been improperly designed when it was first built. You granted the funds for this repair work but unfortunately the activity of this plant increased so that we have never been able to shut it down and accomplish the necessary repairs. By the end of this year we anticipate that the traffic for the marine railway will be more than triple what it was 2 years ago because of the operation of the new fish cannery and the almost double capacity of the old cannery.

The fishing fleets supplying the canneries will have increased from 40 to 130 boats in 1965. You may likewise recall that we next came to you with a reprograming request last year to repair and tow to Samoa a floating drydock which would be used to supplement the existing marine railway. We found that the original reprograming request of $70,000 was inadequate and came back for an additional reprograming request of $53,000 which you approved. However, after personally inspecting and reviewing the proposed floating drydock at Pearl Harbor, we had a new feasibility study made of this proposed move to Samoa and concluded that the proposed dock was too large and would be too expensive to operate. Furthermore, it was determined that the actual cost of building a second marine railway would be less than our anticipated expenditures over a period of time to transfer the floating drydock from Pearl Harbor and operate it in American Samoa.

The total cost of the new marine railway is estimated at $330,000 plus $5,000 in additional equipment. Subtracting the $123,000 which was reprogramed we are requesting $212,000 for this activity. As soon as we complete the new facility we will be able to close down and repair the old one and thus have two railways that will be economically self-sufficient and produce some income.

HOUSING

During the past 2 years you approved a total of 88 houses to be built by the government of American Samoa in connection with its medical, educational, and other programs. These houses were originally estimated at a totally inadequate $11,000 per house but you permitted us last year to reprogram some of our savings to an extent of $2,000. While the houses in the airport area that are easily accessible will be completed for very little above our estimate, it appears that because of the access problem in the case of about 38 of the houses, the total cost of these 88 houses will require an additional $114,400 or an additional 10 percent. While we hate to run this much over, we feel that our houses are being built at a very economical sum. This will make our houses cost an average of $17,500 complete, which we think will certainly compare favorably with any U.S. housing that is being built anywhere in the Pacific, in spite of our isolation factor. Recently the Federal Aviation Agency advertised 17 houses for bid at varied design. The lowest bid on the 3-bedroom house of our design was $29,000 for the basic house and $38,000 for the complete unit, which is far above our costs. The FAA has asked us to build its houses, which we will do. While we had agreed to build them at cost, the agency had to have a fixed price and so we quoted them a price of $23,000 per house, well above our current cost. This profit will be available for reprograming.

HOSPITAL AND MEDICAL FACILITIES

We are unhappy to report to you that we have not yet found a final solution to our hospital problem. When we requested $3 million last year, which you granted, we advised you that we had several architectural estimates ranging from $6 to $7 million but that we felt we should be able to construct it for a maximum of $3 million exclusive of equipment. Since that time we have had another engineering concern review the project and they have given us a preliminary estimate of $4,500,000. One of the problems seems to be that each of these firms feels that the hospital has to be built by a stateside contractor and to stateside design. We

feel that we can build this hospital by force account and on island design at substantially less. Unless this committee objects, we are now going to go ahead and get a final design and try to build the hospital for the $3 million that has been appropriated. However, we want you to know before we start, there is the possibility of our not completing it for this amount of money. We are also reviewing the possibility of cutting down the number of beds.

Normally, we would prefer to complete all of these projects by putting them out to bid and have reputable contracting firms step in and take the complete responsibility. We have not been able to do this primarily because of cost and furthermore, we believe that by doing these projects by force account there has been a great advantage in training literally hundreds of Samoans in various trades and crafts. Our whole building program is a constant training process. As our natives become trained, we lose many to private industry. We believe this is good even though it slows down our construction progress and in some instances, increases cost. On the basis of the jobs that we have completed, we believe our construction is costing less than if we had contracted and at the same time we are getting extra training benefits. As we complete our development program we hope that many of the people we have trained will go into small building businesses so that much of the future building can be done by small Samoan construction firms.

TOURISM AND ECONOMIC DEVELOPMENT

As we have indicated previously, tourism is one of the big hopes for economic development in the area. We advised you a year ago that we were trying to assist the Samoan people in building a large luxury hotel themselves and to put many of the Samoans in the small businesses that are attached to tourism. We had hoped a year ago that by now we would have such a hotel near completion. The financing has been much more difficult than anticipated. However, it is now completed and we are starting the construction. The American Samoan Development Corp., which consists of all Samoans, has approximately 1,200 stockholders and has raised approximately $250,000 in cash. The corporation is borrowing the remainder from the Bank of Hawaii, the Bank of American Samoa, and the Area Redevelopment Administration. The total cost of this project is estimated at $1,555,300. After having four top hotel experts in the Pacific inspect American Samoa, they all recommended the Goat Island site which is owned by the Government as the logical place to build our principal hotel. There is not enough land there, however, and we are proposing to reclaim several acres at this site with part of the land reclamation funds you granted us last year. The cost of this land reclamation should be returned to the Government by increased rentals from the hotel corporation over a 20-year period. Once the hotel is completed, a series of small businesses should be profitable in Samoa, such as gift shops, beauty shops, flower shops, sport fishing, and land-transportation companies. We are doing our best to reserve these small business opportunities for native Samoans. All of the other island areas are watching this development to see whether the benefits will accrue to the native Samoans or whether they are going to be taken over by people from the mainland. We have been severely criticized by people wanting to come in from the outside to exploit these many opportunities, but feel it is extremely important to develop Samoa for the Samoans if they are to become self-supporting and if the proper image of the United States is to be maintained in the Pacific.

OPERATING BUDGET

The operation and maintenance program submitted herein reflects an increase of $421,811 in the net operating costs of government. Personnel compensation increases $355,071 attributed primarily to the ETV schedule of a full year's operation as compared to a 6-month budget in fiscal 1964. Increases are programed in stateside teachers, an assistant attorney general, and an income tax supervisor with reductions scheduled in doctors and nurses due to delayed time phasing in the new hospital construction. The increase in Samoan positions is generally in the ETV program to provide training for the Samoans in this medium to allow for eventual replacement of the statesider positions; the school-lunch program; the maintenance and repair, and land and survey divisions of public works; all due to needed expansion of the programs and in providing required reimbursable services along with preventative maintenance of increased plant.

Supplies and materials will increase an aggregate of $500,589. The following are the material variances: the operation of the newly acquired *Hugh M. Smith* and the *YF–340* along with the harbor tugs will cost an increased $103,694; the

school-lunch program now being extended to approximately 7,000 students will increase $82,142; public works materials required for reimbursable services and marginal maintenance increases $87,133 while the production farm requires more feed, chicks, and fertilizer and the entomology division additional chemicals totaling $41,795. The requirement for construction equipment is for replacement of items uneconomical to repair, ranging in age from 10 to 20 years old. Revenues are increasing $616,000 generally in every major category. We propose to eliminate the 4 cents per gallon aviation fuel tax, from which we are currently realizing approximately $42,000 annually in revenues, offsetting this reduction with anticipated profits from the liquor control fund which was established by the last legislature. It is necessary to promote the use of our new airport and terminal facilities and to do this the reduction in this fuel tax will place American Samoa on a competitive basis with other aeronautical facilities in the South Pacific.

We have continually had to reprogram funds or to delay or change projects. In some instances we have underestimated our costs. In several projects like our schools and television project it appears that our actual costs will exceed substantially the amount budgeted. While this is irritating it is not surprising. We had to move quickly on these projects and we did not have exhaustive engineering or cost data. There had been no contracts in the area or nearby areas and the labor and other cost factors were completely unknown. Even with the building experience we have gained in the past 2 years our cost estimates are difficult because we have had problems properly allocating costs between projects due to lack of trained accounting personnel. We now have what we consider to be reasonable estimates but because of our experience over the past 2 years, we are somewhat reluctant to say they are final. All we can say is that we will do everything possible to hold costs down and to build at as reasonable a rate as we can.

Based on these estimates it will take these additional funds to complete the major programs that you have authorized.

Housing	$114,400
Educational television transmitter building with access tramway and additional equipment costs	122,194
Elementary schools	

At the present rate of expenditures, additional costs could be as much as $1,500,000.

We are convinced that we can cut these costs substantially but whether we can cut this additional amount to, say, 50 to 75 percent cannot be ascertained at this time.

We have $1,150,000 unprogramed from last year's operation, which was built up largely from delays in getting our full educational program going in time; in health because of our inability to reach agreement on the hospital standards and to recruit additional doctors; and, increased local revenues because of expanded economic activity on the island. These funds are available to meet the unanticipated costs of these various projects. We have not moved any funds from this major category without first coming back to the Congress for reprograming approval. It would be helpful if you could give us general authorization to proceed in using these funds to meet the overruns as indicated. In this way we would complete each major project as rapidly and economically as possible with maximum flexibility in ordering materials and scheduling our work. If, of course, there were any overall savings we would reprogram them back through the Congress.

In order of priority we would complete our education television system and our housing and then we would schedule the remainder of approximately $1,100,000 to complete all of the elementary school consolidations and possibly some additional high school classrooms. If we can have the flexibility so that we can move these funds between these projects, we believe that we can physically complete most of them within the fiscal year, without having to come back and ask for any additional funds from the Congress.

Problems and Progress in Samoa

Mr. Lee. Mr. Chairman, I have, at my right, Mr. Screen, our Director of Administrative Services. It is nice to be back with you gentlemen, again, and I will tell you briefly some of our problems

and progress in Samoa. Congress has been very good to Samoa in terms of appropriations in the past 2 or 3 years.

We have, I think, a very good development program going there and have made a lot of progress in the past couple of years. I think Samoa has rapidly advanced from a place that was more or less pitied to an area that people are looking at with a certain amount of pride. We have cleaned the area up. We are putting in a very good educational system. We are improving our public facilities. But, more important, we are providing some economic opportunities to Samoans. We were successful in the contracts with three new industries.

ECONOMIC OPPORTUNITIES

We have more than doubled the private payroll in the last year and a half. We are in the process, at the present time, of launching a new tourist industry which will be controlled by the Samoans themselves. They are building their own hotel and we are trying to put the Samoans into the small businesses that go with the tourist industry.

We are reserving those opportunities for the Samoans. This is extremely important to the image of the United States in the Pacific. The other islanders are watching us to see whether all of this development which is going on is going to be to the advantage of the Samoans, or whether people from the States and other areas simply come in and use up all of the opportunities and leave the Samoans the ditchdiggers and busboys and so on.

CONSTRUCTION

The Samoan people are excited about this and I think the other island people are excited about it. It is moving along. We have some problem areas. Some of our construction is not moving quite as fast as we thought it would. We are now paying a price for not having educated these people over the 50 or 60 some odd years we have had it in the past. We are having difficulties in training, because of this lack of education.

The thing is, I think, moving as good as could be expected under the circumstances. We have deficiencies in some of the major projects that we have had approved and that we had hoped to complete. These deficiencies, however, are offset by savings in other areas.

I do not think the total requirement for Government funds is going to be any greater than we had anticipated, although it is going to require some flexibility and shifting of funds. We made some savings in operating expenses last year which we would like you to consider in reprograming.

By and large, I think the thing is in as good a condition as we can expect.

ESTIMATED GRANTS

Chairman HAYDEN. For grants to American Samoa, you estimate that $7,748,811 will be required. Of this amount $2,773,785 are needed for the department of education. How much of this latter amount is for continuing work on your educational television system? And how far along has the system developed?

EDUCATIONAL TELEVISION SYSTEM

Mr. LEE. Of that amount $610,000 is for the educational television system which is moving along very well. We have about completed our studio. We are having difficulties on our transmitters. We are putting these up on top of one of the high peaks overlooking Pago Harbor. We are having a serious problem in getting transmitters and the building on top of this mountain.

Chairman HAYDEN. When do you expect to have it in full use?

Mr. LEE. We think we will have the system in full use by July, Senator.

STATUS OF NEW MEDICAL FACILITY

Chairman HAYDEN. Last year, explanation was made to the committee of a need for a new medical facility. At that time a satisfactory architectural firm had not yet been engaged. What is the status of this facility at this time?

Mr. LEE. Senator, we still have not agreed on a satisfactory architectural design. You will recall that we asked for $3 million. The architects had said that it would cost us $6 million or $6½ million at a minimum. I told you I thought we could do it for $3 million and that we wouldn't start construction until we were reasonably sure that we could or that we would come back.

A new group has looked at it and given a cost of $4½ million. We are now working with some consultants and some architects to see if we can cut it down. I think we can still build it at $3 million. Before starting it, I wanted to come back and tell you that we are still having problems. I think the design engineers are still talking of standards that you would have in San Francisco or some mainland area.

Chairman HAYDEN. Have you been able to employ a satisfactory and competent medical officer to take charge of the hospital?

Mr. LEE. We have. We have had a great deal of difficulty on it, but I think at the present time we have a very competent staff. You granted us some raises for medical personnel last time and we have been successful in getting a good number of medical personnel.

ALL-SAMOAN DEVELOPMENT CORP. HOTEL

Chairman HAYDEN. Also, last year, reference was made to an All-Samoan Development Corp. to build a hotel and develop other business opportunities for the natives of Samoa. What is the status of the hotel plans?

Mr. LEE. The status of that is that we have 1,200 native stockholders. They have saved, from payrolls and other things, a quarter of a million dollars, which they have put into this corporation.

We have just completed arrangements with the Bank of Hawaii for a $250,000 loan, with ARA for approximately $1 million, with the Bank of Samoa for about $61,000. We were completing plans in Samoa last week, and we will start building very shortly. This will be a hotel that will be completely Samoan owned.

LEASED TO INTERCONTINENTAL HOTEL CORP.

It will be leased out for management to Intercontinental Hotel Corp. of New York for at least a 10-year period, until the Samoans gain the necessary experience.

Chairman HAYDEN. What is the volume of your tourist trade?

Mr. LEE. Senator, we have continued problem on this. We have no place to put them. We have many who want to come, but we can't let them in, because we don't have the beds for them. We think they will be able to fill the hotel, as soon as it is built. I think our problem will then be one of expansion.

PURCHASE OF BOATS

Chairman HAYDEN. During the past year Congress has approved use of $150,000 to permit purchase of two boats necessary to the administration of Samoa. Have you been able to secure boats which will serve your purpose?

Mr. LEE. Senator, we have continued problems on this. You people granted $220,000. The House approved $150,000. We spent about 5 or 6 months scouting this country trying to find somebody that would build a large boat for this amount. We could not find a builder.

Finally, I went to Hong Kong and found a firm that would build the boats there. But after finding this builder, on my return to Samoa, I found two things had happened. The Coast Guard had agreed to tentatively put a station in Samoa. So, we held up on the purchase of the big boat, pending a final decision by the Coast Guard on this.

COAST GUARD STATION

The Coast Guard has very recently told us they would go on this as of July 1. If they do this, our need for one big boat is out. We will, then, purchase the small boat we need for inter-island activity and I think we will be in fair shape. At the same time we had located this big boat in Hong Kong, it would have taken about a year to build, we also had the Fish and Wildlife Service declare surplus one of their old boats in order to cover us for this interim period.

We took the boat and it is now in Samoa and it is serving our needs. It is too expensive to operate; as soon as the Coast Guard comes in, we will dispose of the boat.

Chairman HAYDEN. Some of my inquiries have been directed to particular portions of your construction program. However, I believe that it might be well for you to sum up your construction plans for the coming year.

CONSTRUCTION PLANS FOR 1965

Mr. LEE. For the coming year, we will simply continue our major activities that you have approved, our road program, our schools, including the consolidation of all of these native-type houses into modern consolidated schools in 26 sites, the completion of our educational television system.

We have just completed our airport compound. We are putting in an additional service building. I am happy to say that we are going to have a surplus of money in the airport construction fund. Our airport is going to be dedicated in April. It is a good airport. We are increasing the traffic there.

We are hoping it will be a crossroads, once we get our hotel built, to bring in a great deal of industry to Samoa. Our electrification industry is growing. With these new programs we will use up our present supply and we are asking for an additional 3,000-kilowatt unit in this budget.

WATER DEVELOPMENT PROGRAM

Our water development program is now under construction. The sewer and sanitation system is being designed and we expect the designs to be completed soon and we will move ahead. The telephone exchange is completed and we are asking an additional $254,000 to complete that system throughout the islands.

One area that we are in difficulty about is our marine railway. We have increased the number of fishing boats based at Pago Pago from 40 to what we expect by the end of this year to be 130. We have an old marine railway built a number of years ago that broke down very shortly after it was built.

DRYDOCKS

It has only partial capacity. You people granted us $55,000 to repair it; however, we have never been able to close the yard down long enough to repair it. We are working several shifts, long hours, and we are doing an inadequate job. We came back with a request to purchase a surplus drydock from Pearl Harbor.

You granted this money. But after further exploration, we thought it would be a white elephant. So, we are proposing in this budget this amount, plus a new amount to build a new drydock. When we build that, we will close down the old one long enough to repair it, and then we will have two drydocks.

HOUSING PROGRAM

It is very important for us to maintain good service, otherwise we lose our fishing business. Our housing program is progressing on schedule. It is going to run a little more than we had anticipated on costs, but the costs are substantially lower than any contractor has been willing to contract for, either FAA or other agencies.

Chairman HAYDEN. Senator Mansfield, do you have a question?

RECOGNITION FOR SAMOAN ABILITIES AND CONTRIBUTIONS

Senator MANSFIELD. Governor, I had the opportunity to read your statement, before you came in and to listen to the Director of the Office of Territories, and the Governor of Guam, and the others that appeared. I was very much impressed with what you have to say beginning at the bottom of page 12, under the title, "Tourism and Economic Development," and ending at the bottom of page 13.

You spent some time there covering the building of the hotel which you have been discussing with this committee, and some congressional groups, personally, over the past several years. It appears that there are times when you have been criticized by people who wanted to come in and exploit the opportunities which this hotel may offer in the way of ships, businesses, and the like.

I only want to express the personal hope, that I am pretty sure is widespread, that your policy to maintain Samoa for the Samoars is

not lessened in any degree, but, if anything, is strengthened, and that these people who are doing so much on the basis of their only abilities and contributing so much on the basis of their own savings toward the building of this hotel, roads, and things of that sort, should be given the recognition which is their due.

Reviving Samoan Culture and Tradition

I would hope, also, that your policy of continuing to revive the old Samoan culture and traditions, and to keep it alive, and to bring back some of these people who have gone to the mainland to reinvigorate the spirit will continue. Now I am sure that that will be your policy and I am sure that would be the policy which the Congress would want to see continued and enforced, because the Samoans have quite a lot in the way of consideration.

Their culture is different from ours. To lose it and become Americanized, so to speak—and I hope what this committee has stated on occasions, and congressional committees have said in their reports would receive very serious consideration, as it has up to this time.

School Teachers in Samoa

What is the teacher situation in Samoa? Are you doing anything to see that Samoan students are sent to Hawaii, the mainland, so that they can become qualified to teach the children in the schools of Samoa so that you will not have to depend upon American teachers from the United States to take up the slack?

Preserving Business Opportunities for Samoans

Mr. Lee. Yes, sir. First, Senator Mansfield, I would like to comment on your statement about our policy down there. I want to assure you and this committee that our policy is to reserve the business opportunities for the Samoans. I think this is extremely important from the standpoint of the American image in the Pacific.

These other islanders are watching very closely to see whether under these developments the Samoan people are going to benefit, or lose out and become ditchdiggers and busboys and others take the profits. The other islanders are excited about this hotel angle.

They are excited about the fact that 1,200 barefooted Samoans, so to speak, would be able to form the corporation and own this hotel.

American Samoan Policy Creates Good Relations in Pacific

Senator Mansfield. This is an all-Samoan corporation?

Mr. Lee. It is an all-Samoan corporation, strictly. I said they have saved up $250,000 to start this out and it is something that the other islanders are looking at. They are coming up and exploring it and looking at it with great favor. I think it is doing our relations in the Pacific a great deal of good. And I want to assure you this is our policy. In addition to doing this, though, reserving these opportunities and helping them preserve their culture, we are trying to give them a good American education, the equivalent of Hawaii or the mainland so these people can have an opportunity to exploit their own resources and hold their own in this world so we won't have to continue to subsidize them.

SCHOLARSHIP AND TRAINING

On the teaching situation, we have four or five teachers now with mainland training. We have approximately 100 Samoans that are off on scholarships throughout the United States, that are scattered throughout the United States. As rapidly as they get degrees, we are bringing them back.

I would like to point out to you in this budget that we have made provision for a Samoan to be in every position with a statesider on the operation of this educational TV. We have a TV engineer. We have given him a Samoan assistant, a trainee, that will learn the job in the hopes by the time the 2- or 3-year contract for the technician is up the Samoan will be able to step into his job and take over and thus greatly reduce the cost of operating this system.

ON-THE-JOB TRAINING PROGRAM

We are running, all the way through, a vast training program, on construction, on education, and everything else. It is an on-the-job training program.

Senator MANSFIELD. Governor, I am delighted to hear that. Of course, as I think I have indicated to you, we have a Samoan girl, a student in eastern Montana by the name of Alauni S. Tauto'o, who is doing an excellent job there and has as her objective the return to help her people and to participate in the education of the folks in the area from which she has come. We like Alauni a lot in Montana. We would sort of like to keep here there but she feels she ought to go home and she is right.

But I am glad to note that your dependence on mainland teachers is decreasing and that you are bringing, as they qualify, more and more Samoans into the teaching profession in Samoa, itself.

SCHOOLING FOR ALL CHILDREN

And I would assume that, as far as education is concerned, one of your prime objectives is to see to it that every Samoan child is given as much of an education as possible under your administration.

Mr. LEE. That is right. Last year, for the first time ever, all Samoan children were able to go to school. We had been turning down two-thirds of our potential high school children because we didn't have the place for them. We are now taking them in and providing as good an education as mainland United States.

STRONG EDUCATION SYSTEM

This matter of stateside teachers is something we will cut down as rapidly as we can. We will begin to get back our children on scholarships like the young lady you mentioned. This will cut down our expenses because we will not have the expense of bringing them to Samoa and housing them and returning them.

And I think that, all in all, we can look forward to a very strong educational system.

This educational TV is, I think, going to be very good and very exciting, and eventually less expensive, although the initial expense is very great.

FLEXIBILITY IN FUND ADMINISTRATION

Senator MANSFIELD. Mr. Chairman, I have one more question.

Governor, in the administration of the funds which have been allocated to you, I suppose there are times when you find that its costs a little more to do a job than anticipated and on the other occasions it costs a little less. And, do you have the proper flexibility—and I want you to answer this question candidly—in the use of these funds so that you can get the maximum benefit in the administration of the various projects needed to carry on the affairs of that program?

Mr. LEE. Senator, the Congress has been very good to us in terms of funds. You have granted us everything I think that we need. We have had difficulty in programing various items because our estimates were not good estimates. Some,, as you will see from our statement, were grossly inadequate. Some were on the generous side. We are not able to program within the amount of funds available.

MORE FUNDS REQUIRED

And I have suggested this in the statement, and I think we will be probably sending you more on this shortly. We do need more flexibility to move between projects. Our housing is costing more and airport costing less. Other items vary. We have made savings on overall administration. Our schools were grossly underestimated. We are going to have to have more funds in that. We require the funds but it will require some programing and flexibility.

Senator MANSFIELD. I am sure the committee will give you that consideration.

I want to say that we are fortunate to have a man with your outlook, Governor, looking after the affairs of the Samoans. I think the record will bear out that statement in some detail.

I am only sorry, Mr. Chairman, that because I have to go to another meeting that I won't be able to be here to listen to the testimony of Mr. Goding, the High Commissioner of the Trust Territory and Mr. Akimoto, because I am interested there, but I am sure that Senator Bartlett and Senator Young and the other members of the committee will take care of that.

Excuse me.

Chairman HAYDEN. Any questions?

Senator YOUNG. Yes; two or three.

HOSPITAL FACILITIES

What do you have for hospital facilities on the island now?

Mr. LEE. Senator, at the present time, we have an old marine hospital, a temporary structure built in World War II. It is plenty large enough; however, it is a frame structure that has deteriorated, bug infested, and our worst problem is that it is a firetrap. We are trying to replace this with a modern structure that will be resistant to these and we are having difficulties.

As I have said, we have had at least three different architects look at this and have had estimates running from $9 million down to $4½ million. I think they are too high. I think they are trying to build the type of hospital that is not necessary in the tropics and in this

particular area. We are trying to get it down and I think we are going to.

Senator YOUNG. Wasn't there a Baptist Hospital there a few years ago, a hospital operated by the Baptists?

Mr. LEE. No, sir; not that I know of. We have only one medical facility on the island and that is operated by the Government of American Samoa.

Senator YOUNG. What flights do you have in there?

AIRPLANE AND BOAT TRANSPORTATION

Mr. LEE. At the present time, a weekly jet flight by Pan American from Honolulu to Sidney. We are the halfway point. They run three flights, one through Samoa, two through Fiji. We are in hopes that when we have the hotel they will have other flights through Pago Pago and we will have more services.

Within the past few weeks, the French have canceled Teal flights to Tahiti. They are only going to run into Pago Pago so this will cut us off from our cross flights to Papeete. We will hope that Pan Am will fill us in on that flight so we will get cross flights as well as north and south.

Senator YOUNG. Mr. Chairman, I visited Samoa some years ago and the only way to get in there was by boat from British Samoa. I got sicker than a dog. I thought I would have to stay there until they got the airport.

Mr. LEE. You are now 4 hours and 45 minutes out of Honolulu on a nonstop jet. We would like to have you come down and see our development program.

Senator YOUNG. I think this was an 8-hour trip from British Samoa at the time.

Mr. LEE. And that is a very rough trip, and even sailors get sick.

RESERVING BUSINESS OPPORTUNITIES FOR SAMOANS

Senator YOUNG. You have made a lot of progress since I was there. There was practically no opportunity for local people.

Mr. LEE. We are making progress but we are trying to reserve a lot of these small business opportunities for Samoans. The minute we started improving our public facilities and got air transportation, we had a lot of people wanting to build hotdog stands and bowling alleys. The Samoan people want to develop these opportunities themselves and I think it is extremely important from the standpoint of our image in the rest of the Pacific to let them do this. Otherwise, development doesn't mean anything to the native people. They are simply onlookers. This way they are participating.

AGRICULTURE DEVELOPMENT

Senator YOUNG. Governor, what do you do in agriculture? Do you have an experimental station?

Mr. LEE. We have a small experimental farm. It is more of a demonstration farm. We are increasing our request, if you will note, for agricultural work. It is mostly a subsistence type of agriculture. We do not have large land areas that can be developed. We are simply trying to improve their particular needs in their village. Cer-

tainly every family has a few banana trees, a few taro plants, a few coconut trees, a few papayas and things of this kind. We are trying to improve that, get them some brood stock or chickens and pigs and supplement their existence.

Use of Surplus Food

Senator Young. Do they use any of our surplus food there?

Mr. Lee. Last year, for the first time, we brought surplus foods there. We are initiating a school lunch program in the schools because we had some malnutrition amongst the youngsters. We have had a sort of feast and famine. The people live from the sea, get most of their protein from the sea. When there is good weather, there is lots of fish, but when it is poor weather, nothing.

We have had some malnutrition so we have started a school lunch program.

Senator Young. Thank you very much.

Senator Bible. I simply want to join the commendation of Rex Lee, and I know he is doing a good job on American Samoa.

Census of American Samoa

I would like to ask him just what the population of American Samoa is, natives.

Mr. Lee. 21,000.

Senator Bible. How many American do we have from stateside?

Mr. Lee. Stateside, we have about 300 at the present time.

Senator Bible. How many do you have in the school system based on that population of 21,000?

Mr. Lee. The total school population is approximately—were you asking total American school population?

Senator Bible. Overall school population.

Mr. Lee. About 6,800.

Senator Bible. That is what, first grade through——

Mr. Lee. First through twelfth; yes. We have several parochial schools, in addition to that.

Adequacy of School Facilities

Senator Bible. How close are the school facilities to being adequate at the present time? I notice in your statement that you give high priority to completing all elementary school consolidations and possibly some addition of high school classrooms at an estimated cost, if I read this correctly, of $1,100,000.

Mr. Lee. At the present time, the school facilities are completely inadequate. We have a good share of the children sitting on the floor. This isn't too bad in itself. But the shelter is poor and we are trying to consolidate some 43 village schools into some consolidated schools with a modern building that is designed for educational TV. Our plan, as you know, is to do direct TV teaching into these schools and have the Samoan teacher monitor and maintain order and to be educated along with the children. We will cut down at that time the number of mainland people that we have. We will have a very few outstanding mainland teachers teaching over the educational TV system.

Senator BIBLE. So you will have adequate facilities? This money is available now?

Mr. LEE. Yes, sir; we will have very good facilities.

Senator BIBLE. I have no further questions, Mr. Chairman.

Chairman HAYDEN. Any questions.

Senator BARTLETT. Governor, is American Samoa one island, several, or many?

Mr. LEE. It is seven islands, but most of the population is concentrated on one, Senator Bartlett.

TOTAL GOVERNMENT EMPLOYEES

Senator BARTLETT. How many government employees are there altogether?

Mr. LEE. Altogether, we have about 1,500. This varies a great deal because we are involved in this large development program, so at certain stages we might have more, we might have 2,500, but at the present time our operations maintenance runs to about 1,500.

Senator BARTLETT. And of these, 300 are Americans?

Mr. LEE. It is less than 300. It is about 225, as I recall, with this peak budget. Then it will cut down and they will be replaced by Samoans as rapidly as we get these trained people back.

Senator BARTLETT. Do the civil service, U.S. civil service rules and regulations apply in respect to your employees?

Mr. LEE. Senator Bartlett, they apply to some employees. Until very recently, we could not hire Federal employees and keep them under the civil service system. Last year, the Civil Service Commission agreed, because of our difficulty in recruiting qualified persons, to let us recruit Federal employees, keep them under the retirement system, but we are in excepted positions.

INCREASED PRIVATE INDUSTRY PAYROLL

Senator BARTLETT. Did you say the private payroll had doubled in the last 18 months?

Mr. LEE. Yes, sir.

Senator BARTLETT. What does it amount to now?

Mr. LEE. It would amount to about 1,200.

Senator BARTLETT. What are these three new industries?

Mr. LEE. The three new industries are the Star Kist Fish Co., fish processing company; the American Can, a company which manufactures tin cans for the fish industy; and Cocoanut Processing Co. We also have a small bottling works.

Senator BARTLETT. Star Kist is tuna exclusively?

Mr. LEE. Star Kist is tuna.

AIRPORT FACILITIES

Senator BARTLETT. When was the airport completed?

Mr. LEE. The airstrip was completed in July of 1962. We have just completed the terminal building within the past week or two. We are going to dedicate it in April of this year.

Senator BARTLETT. How long is the runway?

Mr. LEE. It is 9,000 feet.

Senator BARTLETT. It will accommodate all jets?

Mr. LEE. It will accommodate all jets.

Senator BARTLETT. Was this built under the FAA?

Mr. LEE. No, sir. It started way back in 1956 with a very small appropriation from the Congress and some local funds they had there. When I arrived, it was about 40 percent complete. We completed it within a year for this South Pacific Conference that was there, as far as taking jets. One of the reasons we rushed completion, we wanted to get into the allocation of air routes to the South Pacific.

Senator BARTLETT. Were the field and the terminal built exclusively with Federal funds?

Mr. LEE. That is correct.

Senator BARTLETT. How much did the field, itself, cost?

Mr. LEE. Mr. Screen tells me about $3.8 million for the field. We spent about a total of $4.2 million. This is exclusive of expenditures of FAA. Since the field was built, FAA has come in to put in certain control facilities that they are building.

Senator BARTLETT. The $4.2 million includes the terminal building?

Mr. LEE. Yes, sir.

Senator BARTLETT. And you have one flight a week at the present time?

Mr. LEE. At the present time on the north-south route and one cross run. We are starting to get a great deal of military traffic. Our military people have been using the landing airport in Fiji and since we have completed our facilities the military have agreed to run as many of their flights as possible through American Samoa and to engender new jobs, and so on.

HOTEL FACILITIES AND LESSEE

Senator BARTLETT. How large will this luxury hotel be?

Mr. LEE. One hundred rooms.

Senator BARTLETT. And it will be operated, I believe you said, by Intercontinental Hotels?

Mr. LEE. That is right.

Senator BARTLETT. Which is controlled by Pan Am?

Mr. LEE. It is a subsidiary of Pan Am.

Senator BARTLETT. Will there be management positions for the Samoans?

Mr. LEE. We expect that probably Intercontinental will put, at the most, two or three of their people into the hotel from the outside to start out with. The rest will be Samoans. Our agreement specifically calls for the use of Samoans. They will simply provide the overall management.

APPLICATION OF U.S. MARITIME LAWS

Senator BARTLETT. Do the U.S. maritime laws apply in Samoa?

The reason I ask that question, I was interested because you said that you had gone over to Hong Kong with the idea of having a boat built there. And I would infer from that that the laws don't apply because here you couldn't go abroad to have the ship built.

Mr. LEE. I hesitated a little. They do not apply in the sense they applied to Alaska, when Alaska was a Territory, or other Territories. We have ships registered on the west coast, that maintain their headquarters there, that comply with maritime laws. But general laws within American Samoa are not in effect.

U.S. JURISDICTION OVER AMERICAN SAMOA

Senator BARTLETT. Does the United States own American Samoa?

Mr. LEE. Yes. The chiefs ceded American Samoa to the United States.

Senator BARTLETT. Is it a territory?

Mr. LEE. It is an unincorporated territory. It has never had an organic act. It was simply set up under Navy jurisdiction and operated that way for about 50 years and then turned over to Interior in 1951. It has a constitution that has been approved by the Secretary of the Interior about 3½ years ago. It is unincorporated, no organic act.

Senator BARTLETT. You are appointed by the President; that is, the Governor?

Mr. LEE. By the Secretary of the Interior.

Senator BARTLETT. For how long a period?

Mr. LEE. It is an indefinite period. I serve at the pleasure of the administration.

OFFICIALS AND BRANCHES OF THE GOVERNMENT

Senator BARTLETT. What immediate members of the official family do you have, the top?

Mr. LEE. We have a secretary of the territory who is also appointed by the Secretary of the Interior. We have a chief justice and an associate justice appointed by the Secretary of the Interior. The remainder of the people are appointed by the Governor.

Senator BARTLETT. Does the judiciary report to the Interior?

Mr. LEE. They report to the Secretary of the Interior and there is a complete separation between the executive and judiciary.

SCHOOL FACILITIES

Senator BARTLETT. You said every child can go to school now?

Mr. LEE. That is right.

Senator BARTLETT. You will be interested to know, Governor Lee, I was thinking that that can't yet be said of Alaska, with respect to Indians and Eskimos.

Thank you.

Chairman HAYDEN. Senator Mundt?

Senator MUNDT. No questions.

TOURISTS AND TOURISM

I might say, flying back from South Dakota last Sunday night, I had to go by way of Denver. A lady and a man sat down and they turned out to be a Washington couple who had just made a vacation trip to the Trust Territory and they came away very impressed with the kind of treatment they got from Governor Lee. So, I was glad to know that he developed that kind of diplomatic chivalry that we like to have prevail.

Thank you for sending home some happy tourists.

Mr. LEE. Thank you, Senator.

When we get the hotel, I hope we will have a lot of happy tourists. At the present time, we are trying to keep tourists out. This is one of the most promising things we have. We have beautiful islands. I am hoping to see local revenues show that some time in the future so this island will be self-sufficient.

Chairman HAYDEN. If there are no further questions, we thank you, sir; and we will hear Mr. Goding.

TRUST TERRITORY OF THE PACIFIC ISLANDS

For the Trust Territory of the Pacific Islands in fiscal year 1965, there is a request for $17,500,000, the maximum apropriation authorized by law. This is $2,500,000 more than was appropriated in fiscal year 1964. The justifications for this estimate will be printed in the record.

(The statement referred to follows:)

HIGHLIGHT STATEMENT

The purposes and objectives of the administration of the Trust Territory of the Pacific Islands are to promote the political, economic, educational, and social development of the inhabitants and to improve the health and well-being of the people through the introduction and use of modern and improved health measures.

A long-range plan to achieve these purposes and objectives has been undertaken. In order to obtain these objectives, funding has been greatly increased. It is recognized that this funding must be at a level commensurate with expansion and upgrading at all levels of operation.

Initial emphasis in this upgrading program has been given to the school system. The large-scale elementary school and elementary teacher housing program started in 1963 fiscal year will continue into 1965 fiscal year. It is anticipated that the original plan for construction of 409 classrooms and 217 teacher houses and hiring 240 schoolteachers will be approximately realized during 1965 fiscal year. Concurrently, secondary-school expansion is underway.

In addition to completition of the major portion of the large-scale school and teacher housing construction in the budget year, funding is also requested to continue the basic construction program, including hospitals, utilities, etc. Particular emphasis in 1964 and 1965 has been placed on public health requirements. A polio treatment center has been established in the Marshalls. Balance to complete funding for a new hospital at Truk is requested.

Gross costs for transportation and communications systems are expected to increase from $2 million in 1963 fiscal year to $2,500,000 in 1965. The principal reason for this is the increase in traffic caused by acceleration of programs.

The increases requested for all other programs and support activities are relatively minor, with emphasis to shift in 1966 fiscal year after completion of the school and public health construction program.

TRUST TERRITORY OF THE PACIFIC ISLANDS

Appropriation, 1963	$6,600,000
Transferred from "Operation and maintenance, Navy"	950,000

A. DIRECT APPROPRIATIONS

High Commissioner's office, $105,000

The High Commissioner is responsible to the Department of the Interior for administration of the Trust Territory of the Pacific Islands. The 1965 estimate of $105,000 will provide for salaries of his immediate staff, consisting of the High Commissioner, Deputy High Commissioner, a secretary to the High Commissioner, a secretary to the Deputy High Commissioner, and the executive officer, as well as necessary travel and other transportation expenses, purchasing of supplies, equipment and defraying of other necessary expenses.

The estimate is broken down as follows:

Personnel compensation and benefits	$88,000
Travel and other transportation	14,000
Supplies, materials, and equipment	3,000
Total	105,000

Judiciary, $155,000

The estimate of $155,000 is an increase of $48,000 over the current year. It provides for the salaries of the chief justice, associate justice, 2 court reporters, and a new position of law teacher-trainer as well as 25 full-time Micronesian judges and clerks of court as well as approximately 110 part-time judges and clerks who serve on a per diem basis, and are only on duty and paid when court is in session. Of this increase over fiscal year 1964, $8,000 is in the area of travel, equipment, and supplies, with the balance of increase of $40,000 in salaries, including the addition of a law teacher-trainer, upgrading of the court reporter and judicial secretary, and general pay increases for Micronesian employees.

The breakdown for the funds requested is shown below:

U.S. personnel compensation and benefits	$75,000
Micronesian judges and clerks of courts (including part-time per diem employees)	55,000
Travel and transportation	20,000
Supplies, materials, and equipment	5,000
Total	155,000

B. Grants, $17,240,000

Administration and operation	$12,320,000
Construction	4,920,000
Total	17,240,000

An appropriation of $17,240,000 is estimated to be required for the trust territory grant funds operations and construction in fiscal year 1965 to supplement local revenues. These funds will permit continuation of the development program in education, and expansion in public health, political and economic development, public works, and construction.

PROGRAM ACTIVITIES

Medical services, $2,120,000

Category	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase or decrease (—)
Administration	$90,332	$253,000	$202,000	—$51,000
Hospitals	639,071	728,800	1,083,000	354,200
Field medical services	65,228	133,500	463,000	329,500
Sanitation services	35,240	55,600	85,000	29,400
Dental services	62,087	105,700	152,000	46,300
Medical education and training	15,410	33,000	70,000	37,000
Nursing school	26,158	40,400	65,000	24,600
Total	933,526	1,350,000	2,120,000	770,000

Medical services, $2,120,000

This amount requested is an increase of $770,000 over fiscal year 1964, and reflects expansion and upgrading of medical care in all aspects—hospitals, field medical services, sanitation services, dental services, training, and the territory nursing school.

1. *Administration, $202,000.*—The decrease of $51,000 is offset by the increases shown under hospital and field services, for more accurate budgeting. There is actually an increased medical and public health staff at the headquarters level which is required for direction of the overall public health and medical services program. This staff will be increased by the addition of an assistant director of medical services and a medical records statistician. Funds are also provided for the director of medical services, the public health statistician, the supervisory hospital administrator, director and assistant director of sanitation services, two special assistants to the director of public health, and eight technical and clerical positions. A contingency fund of $60,000 is also established to cover unforseen emergencies, such as the polio epidemic which struck the Marshalls in fiscal year 1963.

2. *Hospitals, $1,083,000.*—An increase of $354,200 is required to cover salary costs brought about by the addition of 1 U.S. senior medical officer, GS–13, on each district hospital staff (about $102,000), better feeding programs at all hospitals, staff increases in 2 new hospital units as well as in other existing district hospitals, essential increases in medical supplies, and overall salary increases for 373 Micronesian employees. Funds are also included for the operation of the new polio rehabilitation clinic at the Marshalls Hospital. Nine hospitals—six of them general hospitals at each of the district centers plus three enlarged field hospitals—one at Ebeye in the Marshalls, one at Kusai in Ponape, and one at Rota in the Mariana Islands district, are covered by this category. These hospitals provide inpatient and outpatient care, and perform surgery, X-ray

and like diagnosis, operate laboratories for diagnosis of blood, tissue, etc., as well as all the many services involved in the operation of a hospital.

A capital equipment fund of $100,000 is also established, which will be used to replace obsolete and wornout equipment in the nine hospitals.

3. *Field medical services, $463,000.*—Increased emphasis will be placed during fiscal year 1965 upon the field medical services, with close association with sanitation services. Six public health doctors will be recruited at an estimated cost of $120,000 to work in the districts to supervise health education and preventive medicine programs. The sum of $100,000 will be used to establish a territory-wide immunization fund to protect the more than 80,000 population poliomyelitis, influenza, diphtheria, whooping cough, tetanus, tuberculosis, typhoid, measles, cholera, and smallpox. Included also is $56,000 which will cover the operating of a field medical vessel, funded in fiscal year 1964, and scheduled for construction in 1964. This ship will be used primarily to carry public health teams for extended stays in the various districts.

There are approximately 140 field dispensaries scattered throughout the territory which provide immediate first aid and limited medical treatment through the services of health aids. An increase of $53,500 is required to provide all field dispensaries with adequate medical supplies and equipment and to operate an intensified training program which will permit all health aids to spend at least 6 months in specialist training at district center hospitals every 2 years.

4. *Sanitation services, $85,000.*—Intensive education, policing, and constructive measures are needed in the field of general sanitation. An increase of $29,400 is required for expanded programs of pest eradication, particularly rodents, flies, mosquitoes, for an increase of sanitation staff, for public education programs, and for purchase of essential equipment and supplies. Specific attacks will be launched against amoebic dysentary, filiariasis, and rodent eradication. These programs will be coordinated with those of the new public health doctors under the field medical program.

5. *Dental services, $152,000.*—Complete dental services including preventive care, oral hygiene, dental surgery, dental education and training, as well as the usual extraction, filling, and cleaning of teeth is covered in this category. Each district center has a dental office and, in addition, major population centers are staffed and equipped with dental personnel to provide immediate dental services. Dental officers also accompany field trips to the various islands and atolls, equipped with portable dental equipment and supplies, and provide on-the-spot treatment and preventive measures. An increase of $28,800 has been provided in general dental services to cover costs of programed pay raises for 43 Micronesian employees, for increased supplies for district center dental offices, and for field dental work, and for new equipment. A school of dental hygiene in the Marshall Islands graduates students from throughout the Trust Territory as dental hygienists. For this school, in fiscal year 1965, an increase of $17,500 has been provided, $14,000 of which defrays the salary of the director of dental services who also supervises the school of dental hygiene. This formerly was covered in headquarters administration and thus does not reflect additional fund increase over prior years. Feeding costs, school supplies, and needed equipment are covered in the remainder.

6. *Medical education and training, $70,000.*—An increase of $37,000 is needed to upgrade and expand the medical education and training program under which Micronesian young men and women are assuming leadership and operation of the public health and medical service program. Prior to 1964, the bulk of medical training was at the Central Medical School at Fiji with refresher training at the Navy hospital in Guam or in Honolulu. A new policy of providing full medical training leading to the M.D. degree has greatly increased costs of medical student training. Twelve premedical scholars now are in colleges and universities working toward medical degrees and this number will be doubled in 1965. Some 10 students are completing work at the Central Medical School in Fiji. Except for technicians—i.e., X-ray, laboratory technicians—the Suva School will not be used in the future. Additionally, postgraduate and refresher training for present Micronesian medical officers has been intensified and expanded in universities and hospitals in Guam, in Hawaii, and in the United States. Scholarships in hospital administration, in other technical fields have been established, in many instances, for the first time in the history of the public health administration. Sanitation training also is expanded. In fiscal year 1965, it is expected that some 50 personnel will be in medical and public health scholarships or in special training courses.

7. *Nursing school, $65,000.*—In fiscal year 1964, the nursing school was transferred from inadequate school facilities in Koror, Palau, to Saipan to permit expansion from a student body of approximately 25 to 40. New nursing school buildings are in the process of construction and when completed in 1964 will permit an enrollment of 50 young men and women. The increase of $24,600 is required for salaries of two additional professionally trained nurse-instructors holding degrees, increased feeding costs due to expansion of student body to approximately 40 students, salary increase for Micronesian staff members, and for essential equipment and teaching supplies for the expanded school enrollment. The expansion of the nursing school is of major significance since all aspects of hospital and medical services expansion, both district and field, rest upon an adequately trained nursing staff.

Education department, $3,900,000

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Education—Administration	$264,669	$203,200	$223,200	$20,000
Secondary schools (high schools)	306,917	668,200	851,600	183,400
Elementary schools	312,505	721,900	2,483,400	1,761,500
Special training (scholarships)	79,181	123,000	250,000	127,000
Adult education and radio		58,700	91,800	33,100
Total	963,272	1,775,000	3,900,000	2,125,000

This budget presentation recognizes the need to greatly strengthen the educational system of the territory at all levels. While the bulk of this emphasis since fiscal year 1963 has been at the elementary level, provision is also made herein for the establishment of full senior high schools in each district, for a sharp increase in the amount of higher education available, and for more attention to the educational level of the adult populace.

At the elementary level it provides for the employment of 211 stateside qualified teachers and for their housing. It provides for the construction of additional classrooms to make a grand total of 487 newly constructed since the beginning of this program in fiscal year 1963. This section provides only for the program costs of education, as the construction aspects, both classroom and housing, are included in the construction budget request. With a view to eventually replacing this complement of teachers with fully certified Micronesian teachers, it provides additional opportunities for high school and college education for future teachers and other leaders, and it also provides for the continued operation of a center within the territory for upgrading teachers now in the profession who for reasons of age or family obligations are unable to leave the territory for higher education.

Administration, $223,200.—Funds are herein provided for the administration offices of the educational program, including the office of the director of education and the offices of the district educational administrators at all six districts. Three new positions needed in the overall expansion program have been added. These are a coordinator of secondary education, coordinator for nonpublic schools assistance, and a supervisor of health education. Other staff covered are the director of education, six district educational administrators, and the following U.S. positions: A coordinator of elementary education, a supervisor of the English program, a supervisor of library services, an administrative assistant as well as 16 clerical and administrative Micronesian positions. Funds requested are to be used for salaries, travel, printing and publication, equipment and supplies.

Secondary schools (high schools), $851,600.—The $183,400 increase requested will expand secondary education to full high school level in all districts. The term "secondary school" is used to cover grades 7 through 12 (although in some more isolated communities grades 7 and 8 are being added on to existing elementary schools; here the costs of grades 7 and 8 are included under the amounts for elementary schools). The Pacific Islands Central School, a senior high school, is being integrated into the Ponape secondary school system, and with fiscal year 1965 will become the Ponape District High School. Thus Ponape in effect already has a full 12-year school system. In fiscal year 1963, a 10th grade was added onto the existing intermediate schools in four other districts (Marianas, Palau, Truk, and Marshalls), and in fiscal year 1964 an 11th grade was added in

these same districts. With fiscal year 1965 these districts will add the 12th grade, thus becoming full senior high schools. The Yap District is proceeding along these same lines in the creation of a senior high school, having added one grade per year in fiscal year 1964, and thus should attain its full senior high school 1 year later, in fiscal year 1966. A new junior high school was begun on the outlying island of Ulithi in the Yap District in fiscal year 1964. It is anticipated that the secondary enrollment will increase by 778, from 2,257 in fiscal year 1964 to 3,035 in fiscal year 1965. Additional Micronesian teachers will be needed to cope with the enrollment increases at the junior high level, and as support personnel for the newly added grades in boarding schools. The establishing of new senior high schools makes necessary the building up of new senior high libraries and the purchase of additional appropriate textbooks and instructional equipment, materials and supplies for the added grades. This budget presentation provides for a total of 57 U.S. teachers, teacher-supervisors, and principals and 127 Micronesian teachers and support personnel to staff a total of six junior-senior high schools and two junior high schools (Kusaie and Ulithi) with a total anticipated enrollment of 3,035. The increase of $183,400 over fiscal year 1964 provides for an increase of 27 U.S. personnel and 9 Micronesian personnel for the grades being added on and to handle anticipated enrollment increases in existing grades, and for the acquisition of library books, textbooks and instructional aids for the newly created senior high schools, and for nonpublic secondary schools.

Elementary schools, $2,483,400.—This is the area (grades 1 to 6) which is the most affected by the accelerated development program launched in fiscal year 1963. Prior to this program, the elementary schools were financed primarily by the district revenues with funds derived from local taxes, fees, and assessments. The trust territory provided supervisory personnel, and most of the school supplies, with the local areas paying the teacher salaries. Hampered by too little funds locally (and the inability of the trust territory government to provide substantial assistance), the elementary school system struggled under extreme hardships. Salary payments to teachers was irregular and generally at a very low pay level. School structures ranged from barely adequate to completely inadequate, unfurnished dilapidated buildings. In fiscal year 1963, not taking into account the accelerated construction itself, a long stride forward toward financial improvement was made in the establishment of the elementary teacher subsidy program, whereby salaries were raised to a more equitable level, and greater regularity in payment as assured. Also, in fiscal year 1963, a massive program of elementary classroom construction was launched, and is scheduled to result in 487 classrooms being built, as well as 246 teacher houses, to permit the hire of 271 stateside qualified teachers to upgrade the quality of teaching at the elementary level. In this fiscal year 1965 elementary school budget, funds are provided to employ 211 teachers at a cost of $1,578,600. In addition to the salaries of these teachers, $904,800 is requested to continue the employment of the elementary supervisory and administrative personnel, programed at 19 U.S. positions and 40 Micronesian positions in fiscal year 1965, and stock and support all the existing classrooms, including nonpublic schools. Also included in this amount is $450,000 needed to pay approximately 488 locally hired Micronesian teachers in the elementary school system, and to continue the operation of the Micronesian Teacher Education Center located at Ponape, which was inaugurated in fiscal year 1964 to help in the upgrading of this force of Micronesian teachers. By fiscal year 1965, elementary enrollment is expected to rise to 12,250 children.

Special training (scholarships), $250,000.—Funds are herein provided for scholarships to promising students throughout the trust territory. Most of the scholarship students matriculate at the College of Guam, but certain of the scholarships are in the Philippines, Hawaii, and other areas of the United States when deemed more advisable and where specialized training is called for. Some 65 students received scholarships in 1964. This fund has been increased by $127,000 to approximately double the number of scholarships in order to make it possible for more Micronesian high school graduates to avail themselves of higher education so that they may return to assume positions of leadership in Micronesia, thereby eventually decreasing the need for U.S. personnel. Included in this amount are the costs of the operation of the dormitory opened by the trust territory for its students at the College of Guam, including the salaries of a dormitory manager and headmaster, an assistant manager in charge of counseling, and a cook. Salaries for the dormitory operation are $27,700.

Adult education and radio, $91,800.—In line with the need for the education level to be raised for all age groups, the administration is attaching increasing

importance to this program. With increasing numbers of transistor radios among the general populace, the medium of radio broadcasting has been found to be an extremely effective means of reaching more and more citizens. By fiscal year 1965 all districts are expected to have broadcast stations. Other aspects of this program include the learning of skills and the participation of the people in community advancement, with both formal classroom work where called for, and less formal types of instruction and learning. The increase of $33,100 over fiscal year 1964 is occasioned chiefly by the hiring of a U.S. specialist in adult education and educational broadcasting in each of the six districts.

Protection to persons and property, $575,000
