Office of attorney general	$59,993	$74,500	$86,600	$12,100
Office of public defender	31,284	30,000	34,000	4,000
Office of land management	125,184	141,500	157,200	15,700
Department of public safety	283,119	284,000	297,200	13,200
Total	499,580	530,000	575,000	45,000

Office of attorney general, $86,600.—Headed by the attorney general of the Trust Territory, this office provides comprehensive legal service and assistance to the High Commissioner and his staff at headquarters and throughout the Trust Territory. This includes the drafting of laws and amendments, executive orders, and other regulations having the force and effect of law, drafting or reviewing contracts for legal sufficiency, and all other documents of a legal nature. The accelerated elementary school construction program started in fiscal year 1963, as well as other areas of acceleration in construction, involve a considerable amount of construction on contract basis, greatly increasing the workload on this office for contract review and preparation.

The attorney general is assisted by two American assistant attorneys general, one primarily in land management affairs, and a Micronesian assistant attorney general, recently graduated from a law school in the United States. In addition, the immediate staff of the attorney general includes a U.S. secretary plus two Micronesian clerical assistants.

The functions and expenses of the district attorney are also included in this budget, as he functions under the direction of the attorney general. The district attorney represents the government in all matters, civil and criminal, in which the government is a party. To cover the wide areas involved in trust territory administration, a significant portion of the district attorney's expenses is in travel expenses, including per diem.

The public safety and the land management programs, although directly supervised by the attorney general are budgeted in their own categories, under this general heading of "Protection of persons and property." Certain generalized supports to these programs, however, are funded out of this attorney general budget. The $12,100 increase is primarily to fund pay increases and increments for both United States and Micronesian employees, fund an additional Micronesian clerk, and a very small increase in the level of funding for materials and supplies.

Office of public defender, $34,000.—This office, headed by an American attorney designated as the public defender, provides legal representation for the people of the trust territory, mainly those charged with a crime. In addition to the public defender, Micronesian public defender representatives are employed in each of the districts, some with assistants. They are trained to carry out legal defense in courts, as well as legal counseling on matters criminal or civil in nature.

This budget provides, in addition to the salaries of the above, funds for travel costs, witness fees, material, supplies, and equipment. The $4,000 increase in this category will provide for pay increments and raises and a small amount for increased purchasing of needed additional office equipment.

Office of land management, $157,200.—The functions of the office of land management include the making of title determinations, surveying, and verifying boundaries, holding of land hearings, settlement of claims against the gov-

ernment, homesteading, and implementation of the recommendations of the district land advisory boards, particularly with respect to utilization of public lands.

Although steady progress has been made in land matters, a considerable backlog of surveying remains to be performed in all districts to determine the extent of public land, and a major land claim for use of land by the United States is still pending in the Marshalls district.

At the headquarters level, the salary of the chief survey and cartographic engineer is herein included, as well as his necessary expenses, particularly allowing for his extensive travel throughout the trust territory. At the district level, two U.S. land law examiners, four Micronesian land title officers, and three U.S. surveyor and cartographic engineers are provided for. In addition, a regular complement of Micronesians, including assistant cartographers, engineering aides, etc., are employed.

The increase of $15,700 for this category will primarily fund pay increases and increments for existing positions with materials and supplies maintained at substantially the purchasing level of fiscal year 1964.

Department of public safety, $297,200.—The district constabulary and fire departments and the office of the director of public safety at headquarters make up this section. The constabulary (inclusive of the fire department) provides protection to persons and property in a literal sense as this unit is responsible for both police and fire protection throughout the Trust Territory.

Each district constabulary force is headed by a Micronesian district sheriff, appointed by the high commisssioner. The sheriffs are also fire chiefs in all districts. In addition to the sheriffs, the constabulary is staffed by deputies, sergeants, corporals, constables, matrons, and clerks. In the Mariana District, a definite fire complement exists, where in other districts, the constabularymen double as firefighters.

Technical and general supervision is provided by a U.S. director of public safety under the overall direction of the attorney general. Each district has a jail, police headquarters and fire station, which are operated and manned by the constabulary. The constabulary is armed and equipped with the usual items of police equipment, fully uniformed, and provided with police vehicles.

At Saipan, it has been necessary to include a special guard complement to patrol areas known as Marpi and Kagman, because of the high incidence of unexploded explosives in the areas, both as residues from World War II and from a more recent military training program.

In addition to necessary equipment, supplies and salaries, funds are provided for intensive and continuing training in all aspects of law enforcement, public safety, and combating of juvenile delinquency. Selected members of the constabulary serve as district prosecutors and funds are herein provided for the formal and intensive training courses received by these district prosecutors.

The increase of $13,200 for fiscal year 1965 will mainly cover pay raises and increments with materials, supplies, and other costs remaining substantially at the level of fiscal year 1964.

Resources management and development, $1,285,000

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase or decrease (−)
Programs office	$59,661	$33,000	$31,400	−$1,600
Political affairs office	33,357	36,000	35,000	−1,000
Commerce and community development	85,392	112,000	112,500	500
Economic development	98,574	104,000	186,100	82,100
Agriculture	429,466	705,000	750,000	45,000
Economic development fund	100,000	100,000	100,000	
Literature production	9,185	8,500	28,000	19,500
Information office	24,053	20,700	42,000	21,300
Total	839,688	1,119,200	1,285,000	165,800

Resources management and development, $1,285,000.—This activity, under the jurisdiction of the program officer, pertains to the broad field of economic, political, and social advancement of the people of the trust territory. Included as specific functional groups are the political affairs office; the commerce and community development department; economic development department; agriculture; fisheries; and literature production and information.

Programs office, $31,400.—This funding provides for the salaries of the program officer and his secretary plus administrative and office costs. A decrease of $1,600, below the funding level of fiscal year 1964, was made possible by better distribution of costs to other program areas described below. The program officer is charged with the direction and supervision over program development in the trust territory, and also includes staff advisory functions in the fields of public health and education.

Political affairs office, $35,000.—This section is headed by an American political affairs officer, with two Micronesian assistant political affairs officers and a clerk-typist. The two Micronesian assistants have received advanced education in the United States.

One of the basic functions of the political affairs office is to assist and advise the Council of Micronesia in its advancement toward status as the territory-wide legislature of Micronesia and $10,000 is provided under this heading for support of this Council of Micronesia. In addition to work with the council, the political affairs officer works with and advises local municipalities and congresses in development of political sophistication. He assists in chartering and seeks to develop responsibility for planning, budgeting, control of expenditures, and management of local government affairs. A decrease of $1,000 has been made possible in this category by the original acquisition of equipment and supplies during fiscal year 1964 which should not be a recurring expense.

Commerce and community development, $112,500.—An American community development officer heads this activity under the general direction of the programs officer. This is a program of active and advisory assistance to the people and communities of Micronesia, particularly in the villages and municipalities in outlying areas, in improving their standards of living by bettering their health, economic and social standards. This is primarily a coordinative program, whereby the community development officer, working with approximately 60 district employees in this field, work closely with village leaders and the people in implementing and improving sanitation, education development, local industries, etc., of the communities.

Funding at headquarters for this activity is requested in the amount of $40,500 to provide funding for pilot community development projects, in addition to the salary of the community development officer and a Micronesian clerk. Two Micronesian assistant community development officers for headquarters are funded for 1965. Requested at the district level is $72,000 to defray the salary and operational costs of the 60 district employees mentioned above.

Economic development, $186,100.—The $52,800 increase in this section ($29,300 in fisheries) will fund primarily the salaries and expenses of two new cooperative officers and a secretary, and fully fund two other positions (chief cooperatives officer, business analyst) which were vacant for portions of fiscal year 1964 and lapse funded. A $3,000 increase is also provided for in materials and supplies and to permit better coverage of the territory.

An American business analyst is being actively recruited during fiscal year 1964 to strengthen this section. In addition two additional American cooperative officers and a secretary are being added in fiscal year 1965 to further improve the cooperative management and accounting systems. The chief cooperative officer will be on the headquarters staff and the two new cooperative officers provided for in this budget will travel the districts to perform their inspections, teaching, and services at the field level. A Micronesian assistant economic development officer and a clerk-typist, plus a cooperative officer on a temporary loan basis from the South Pacific Commission round out the present economic development section at headquarters.

This section conducts research into economic and commercial development projects and takes active measures to encourage development of Micronesia toward economic betterment and self-sufficiency. The chief economist also serves as the chairman of the copra stabilization board. Under separate heading, additional funds for the economic development loan fund is requested. Among the functions of this group are the teaching of how to set up cooperatives, how to manage them, and keep proper records. Also, the officers in this section seek to develop local industry, such as handicraft merchandising, use of marine products, new uses of coconuts, etc.

Late in fiscal year 1963, the fisheries development and operations of the trust territory was shifted from agriculture and fisheries to the economic development section. This budget request of $186,100 includes funding for the fisheries program, estimated at $98,300—$87,800 in economic development section. The fisheries section is headed by a fisheries marine biologist, with headquarters at Palau. In fiscal year 1965, it is proposed to add three U.S. fisheries specialists to the Marianas, Palau, and Truk district staffs and funds for salaries are accordingly provided. Thirty-six Micronesian employees, ranging from assistant fisheries officers to shell divers, boat operators, clerks, etc., are also provided for. In addition, a boatbuilding project was started in Palau during fiscal year 1963 headed by an American boatbuilder working primarily with the various fisheries and boatbuilding cooperatives, and funding in the amount of $15,000 is included herein to defray his contract salary cost plus operating and administrative expenses.

Fisheries and other marine development offers one of the more promising economic development areas for Micronesia and is being given full attention. A commercial tuna-packing operation is starting operations in Palau and giving a big push forward to this program, and fisheries trainees continue being sent to the United States to develop further skill and knowledge.

The $29,300 increase in the fisheries budget will primarily be utilized in the addition of the three new American fisheries specialists and in the inauguration of organized fisheries programs at the Marianas and Truk as well as further development at Palau.

Agriculture department, $750,000.—The agriculture development program follows a basic policy of extending maximum sufficiency to the agricultural economy of Micronesia by development of the agricultural resources of the territory. The agriculture program has two basic divisions. First is the development of agricultural products for local consumption. The second is the improvement of the local economy by development of special crops and farm products for export to increase cash income. The major export crop and the basic source of locally generated income is copra. Cacao production, guided by an intensive program at Ponape, has potentials of developing into an important export crop. Ramie, from which a high-grade fiber is produced, is in great demand. This crop is being promoted as an export item. A pilot project has proven that the crop can be very successfully grown in Palau. A black pepper development pilot project initiated several years ago in Ponape is being extended on a commercial scale in that district. Vegetable and fruit crop production is being emphasized as a part of the basic agricultural economy of the Marianas especially on Saipan, Tinion, and Rota. Cattle, hogs, and poultry, also a vital part of the economy, are being emphasized especially in the Marianas where a livestock breeding and distribution center for the territory will be set up. Rice, the main starch staple that is imported into the territory, is being tested for development in several of the districts most suited for growing of this crop.

A pilot project initiated the last fiscal year will be continued and further developed in fiscal year 1965 at Ponape. Additionally, a pilot project dealing with the development and ultilization of coconut fiber as an item for local use and export has been initiated in Truk district and will be continued and further extended in fiscal year 1965. It is expected that coconut fiber can be developed as a byproduct of the copra industry and provide additional income for the low island areas where very little else can be produced as a source of cash income in support of increasing populations. The entomology program is being expanded to keep pace with the intensified agricultural crop development program. Funds requested are broken down by activities in the following manner:

Activity:	*Estimates, 1965*
Headquarters administration	$140,500
District agriculture station	433,500
Headquarters entomology (Palau)	25,000
Beetle control program (Palau)	10,000
Ramie development project (Palau)	18,000
Coir fiber development project (Truk)	15,000
Cacao development project (Ponape)	26,000
Cacao development project (Truk)	4,000
Rice development project (Ponape)	18,000
Pepper development project (Ponape)	20,000
Farm institute (Ponape)	40,000
Total	750,000

This budget is an increase of only $45,000 over 1964 fiscal year and provides funds in above estimates for the following United States and Micronesian employees and programs. A staff plant pathologist is needed to assist in the control or possible eradication of suspected coconut bud-rot disease in the Marianas, banana leaf-spot diseases in all districts, rice diseases in producing area, cacao diseases in the territory, vegetable crop diseases in the Marianas, breadfruit tree diseases in several districts plus several other minor unknown plant diseases in the territory. Additional agricultural training and education at the Ponape Farm Institute and practical training in suitable foreign areas are a vital and major aspect in assuring progress in developing necessary skills of the local supervisory staff in carrying out the above outlined program.

In addition, the increase will allow for a few additional Micronesian employees and materials and supplies.

Economic development loan fund, $100,000.—In each of fiscal years 1963 and 1964, $100,000 was provided to the loan fund for an initial capitalization of $200,000. It is proposed to add an additional $100,000 to the capital of the fund in fiscal year 1965, for a total capitalization of $300,000. It is hoped eventually to increase this development fund to a level of a million dollars. Loans are made primarily to promote the establishment and improvement of small local industrial and mercantile enterprises of all types. The loan fund is also used to guarantee bank loans, thus appreciably broadening the use of the fund.

Literature production, $28,000.—The literature production center was established for the purpose of serving each department in producing printed materials of various kinds, including text materials in vernacular and English for the education department as well as informational and instructional material for various other departments such as public health, agriculture, public works, etc. During fiscal year 1964, a specialist in literature production is being hired, and he will be assisted by a Micronesian assistant literature production officer plus a principal clerk.

This budget provides primarily for the administrative and basic operational costs of the office itself on a net basis and does not provide for all the costs of material and supplies incurred by this program. The activities utilizing the services of this literature production center are required to reimburse the center for all costs of such material as well as a reasonable portion of overhead.

The $19,500 increase over the fiscal year 1964 level will provide for the full salary of the literature production specialist (who was provided for in fiscal year 1964 for only part of the year), and permit approximately $8,000 increases in procurement of needed equipment and supplies inventory to more adequately provide for an expanding operation.

Information office, $42,000.—This office was formerly budgeted under the heading of "General Government." This office is headed by a Micronesian information officer who is assisted by an American assistant information officer, an American secretary and Micronesian clerk. In fiscal year 1965, a radio and broadcast specialist is being added to this office. This specialist will perform functions involving improvement and coordination of radio broadcast and program functions for headquarters and for the various district broadcast stations.

The basic function of this office is that of preparing and disseminating information releases concerning the trust territory and in preparing various reports for submission to other government agencies. Included are: The Micronesian Reporter, a trust territory house organ issued every 6 weeks, with articles and photographs of local events; monthly reports to the Office of Territories on trust territory activities, the annual report on the trust territory to the Secretary of the Interior, the annual report to the United Nations, as well as various other publications and press releases. Funds are provided for printing of the Micronesian Reporter by the Navy printing office at Guam, plus printing of photographs, done locally at Saipan.

The $21,300 increase will provide for the employment of the radio and broadcast specialist and full-year funding for the American assistant information officer, as well as a modest increase in supplies and equipment, primarily photographic.

Maintenance and operation of physical facilities, $2,100,000

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase or decrease (−)
Administration	$88,727	$100,000	$120,000	$20,000
Headquarters operation and maintenance	280,894	160,000	200,000	40,000
Central repair shop	37,936	25,000	50,000	25,000
District public works	1,591,097	1,413,100	1,730,000	316,900
Total	1,998,654	1,698,100	2,100,000	401,900

Administration, $120,000.—The modest increase of $20,000 over the estimate for 1964 fiscal year will be to cover the wages of four additional Micronesian employees, annual salary increments, personnel benefits, and materials and supplies. A reorganization of the public works and construction activities will be made during 1964 fiscal year that will see a better grouping of personnel whose duties are primarily concerned with operation and maintenance of physical plants and those engaged in supervision and construction of new facilities. Prior to this, all personnel were hired under public works and their time charged to public works or construction per daily time reports. That is primarily why no significant increase is requested for public works administration. Further information for the reorganization is provided below under "District public works." This staff consists of five U.S. employees including a director and a dredge operator. The duties of this group are to coordinate and provide technical supervision to construction programs as well as to maintenance and operations.

Headquarters operation and maintenance, $200,000.—This amount is requested to provide staffing and service to the headquarters public buildings and housing area. At the beginning of 1964 fiscal year, the Mariana district was performing this service, but a reorganization will see that personnel are transferred to the headquarters staff for this purpose and reduce the district staff. It is believed that greater efficiency and savings to the Government will result from these changes. These funds will provide for a supervisor under general supervision of the director of public works and a staff of 15 employees who will maintain the grounds and repair houses and office buildings. There are 91 houses and 4 public buildings in the area.

Central repair shop, $50,000.—This estimate is required to cover costs not readily determined and assigned to districts and activities using the repair services of this shop. As a rule, this shop repairs and overhauls major pieces of equipment only, that are too large or too complicated for the smaller district shops to handle. Work performed is on a reimbursable basis, and if all acquisition of equipment costs and repair costs can be fully covered, a saving might accrue here. The volume of work performed for other activities per annum is estimated at $500,000.

District public works, $1,730,000.—The increase of $316,900 over 1964 fiscal year will be required to provide maintenance and logistic support to program activities which have greatly accelerated over prior years. As the education and other programs increase, the support of utilities, maintenance, water systems, etc., will need to be increased to meet the demand.

Effective at the beginning of 1964 fiscal year, a reorganization of the public works department will cause all construction personnel to be transferred and assigned to construction duties only. In brief, each district will have a public works department which will perform ordinary maintenance to homes, public buildings, grounds, etc., repair vehicles and operate the power and water systems. A separate organization will do the force account construction work. During periods of little or no construction demand, the work force can be decreased. It is expected that greater efficiency and possible future dollar savings will result therefrom.

Under this reorganization, each district will be allowed a maximum of only four U.S. employees for operations and maintenance and an average (at this time) of four U.S. employees under construction. The only increases planned in personnel for 1965 are in the headquarters engineering and drafting departments at a cost of about $40,000. The construction plans badly need the support of better engineering and estimates. Other than in this area, if and when construction work can be contracted out, a reduction in force may be possible.

Micronesian employment will rise from about 900 to 950, at an additional cost of about $50,000. It should be pointed out that:

(*a*) Equipment costs to extent possible will, in the future, be funded through a central equipment purchase fund and not charged directly to this account. The new request for 1965 is included in the construction estimate.

(*b*) The stevedoring and cargo handling functions have been transferred to the transportation and communications department.

In addition to wage requirements, the balance of the $316,900 increase will be used to purchase materials, supplies, and expendable equipment. The need for spare parts, especially in powerplants has not been adequately met in the past.

Transportation and communication services, $1,475,000

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase or decrease (−)
Sea transportation	$1,350,540	$780,000	$750,000	−$30,000
Air transportation	948,985	495,000	450,000	−45,000
Stevedoring and cargo handling	19,384			
Communications	252,954	304,000	275,000	−29,000
Total	2,571,863	1,579,000	1,475,000	−104,000

Sea transportation, $750,000.—The reimbursable contract costs under this category are estimated at $1,750,000 for 1965 fiscal year. Application of revenues and distribution of net costs are computed as follows:

Reimbursable contract costs	$1,750,000
Less: Application of estimated cash revenues	−1,000,000
Net cost of operation	750,000

In addition to application of cash revenues from commercial sources within trust territory referred to above, all trust territory cargo is manifested and amount computed on each bill of lading.

The Pacific Micronesian Line fleet which now numbers eight ships is operated on a cost-plus-fixed-fee basis. The gross contract costs for 1965 will rise to approximately $1,750,000 from $1,350,540 mainly because the *Pacific Islander* will see a full year's service as compared to only 3 months use in 1963 fiscal year. This increase in costs amounts to about $250,000. The estimated overall reduction in costs for 1965 fiscal year is based on an estimated $1 million cash revenue figure.

Air transportation, $450,000.—The estimated reduction of $45,000 from the 1964 estimate is based on the assumption that cash revenues will hold up. Cash revenues collected from outside commercial sources in 1963 amounted to almost $300,000 compared to $63,000 in 1962 fiscal year. The 1963 fiscal year actual figure includes $140,000 of nonrecurring aircraft repair costs and also, revenues were not applied against costs that year. The contract for operation of a DC–4 and two SA–16's is presently with Pan American World Airways, and is on a per mile basis. Increased coverage in trust territory will depend on construction of an airfield at Ponape in addition to completion of the Palau field. The gross cost of operations are estimated at $795,000 in 1964 and $750,000 in 1965, the higher costs in the current year being due to the purchase of parts for existing aircraft.

Stevedoring and cargo handling, $———.—Stevedoring and cargo handling costs for 1965 fiscal year are estimated at $200,000. Reimbursement received for this service is expected to offset the wages and services costs employed in the work. The principal costs involved in this work are wages of laborers and use of cargo handling equipment and motor vehicles.

Communications, $275,000.—This activity was budgeted under general government in fiscal year 1964 but has been shifted to this transportation and communications services category to better identify its functional nature. Headed by a director of communications, this activity has two basic functions, the operational aspect involving operations and administration of the district and headquarters communication stations and the repairs and equipment aspect titled the electronic maintenance depot. Operationally, there is a communications station in all districts except Saipan. During fiscal year 1964, the central control station at

Truk will be moved to communications headquarters at Saipan, and the communication operations for Saipan will be incorporated within the control station operation.

In fiscal year 1965, communications will be staffed by 12 U.S. personnel including the director, his secretary, a supervisory electronics technician, 2 supervisory radio operators, and 7 electronics and radio mechanics, plus 71 Micronesian employees, including 1 district communications officer for each district except the Mariana district.

The communication stations connect throughout the trust territory with vessels and aircrafts, and a radio teletype connection is maintained with Guam from headquarters in Saipan. In addition to official communications for the trust territory, this activity provides commercial telegram services on a revenue basis as well as all of the U.S. Weather Bureau communications requirements in the area. Navigational aids are monitored, weather information provided as required, and a watch maintained on the international distress frequency.

The net decrease of $29,000 is made possible in this activity by the consolidation of the Saipan communication station with the central control station and the nonrecurrent nature of $50,000 provided in the fiscal year 1964 budget for the transfer of the control station from Truk to Saipan.

General government, $1,715,000

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase or decrease (−)
Personnel office	$54,807	$50,000	$63,400	$13,400
Property and supply	300,979	210,000	221,800	11,800
Budget, fiscal and audit	212,530	163,200	178,600	15,400
Administrative services	249,811	70,000	79,400	9,400
District administration	352,513	728,000	782,300	54,300
Personnel benefits	204,054	300,000	250,000	−50,000
Guam liaison office	136,976	70,000	75,800	5,800
Transportation office		21,000	21,700	700
Special projects unit		41,500	42,000	500
Total	1,511,670	1,653,700	1,715,000	61,300

Personnel office, $63,400.—This office administers a comprehensive personnel program for the trust territory, covering over 500 U.S. civil service employees plus nearly 3,000 Micronesian employees. With the inauguration of the accelerated elementary school program, an upsurge of employment involving over 200 U.S. elementary school teachers has considerably increased the volume of personnel processing in this division. The personnel office is headed by the personnel officer, who is assisted by the following U.S. employees: Assistant personnel officer, personnel assistant, administrative assistant, personnel clerk, and a secretary. In addition, four Micronesian clerks are employed. The increase of $13,400 provided for this activity will permit the filling of positions vacant in fiscal year 1964, provide for normal pay increments, a small increase in Micronesian staffing and allow approximately $2,000 for purchase of needed equipment and supplies.

Property and supply, $221,800.—This activity is responsible for the property and supply program for the trust territory, including procurement of all supplies and equipment, maintenance and operation of warehouses to store inventory stocks, and other related functions. A central supply depot is maintained at headquarters in Saipan, administering the stock fund inventory program with inventory valued at approximately $800,000 including medical stocks, spare parts, and general stores, as well as replenishment of packaged and bulk petroleum products stocked at the district levels. Also, this department administers the U.S. Department of Agriculture surplus commodity program for the trust territory. The accelerated construction program, launched in fiscal year 1963, has considerably stepped up the activities of this section.

In addition to the director of property and supply, there are 14 other U.S. employees, including an assistant director. Of these 14 additional, 2 general supply clerks (United States) are newly being added in fiscal year 1964 due to the unavoidable increases in the workload. There are presently 57 Micronesian employees in various categories, and this is being increased to 60 in fiscal year 1965. The $11,800 increase will partially defray the cost of these new positions with the balance of funding made available by projected economy in the procurement of equipment and supplies.

Budget, fiscal and audit, $178,600.—This activity performs the budgeting, accounting, collection, and disbursement functions for the trust territory. The accelerated program has considerably increased the workload in finance and budget to handle the necessary allotment and accounting controls, increased payrolls and vouchering and financial administration requirements. The office is headed by the comptroller who is assisted by a budget officer, a fiscal administrative officer, a chief accountant, a treasurer plus eight other American employees. Two additional employees are being newly hired in fiscal year 1965 due to the unavoidable increase in the workload.

The internal auditor, his American assistant, Micronesian staff, and operation requirements are also budgeted under this category. The internal audit program involves comprehensive review of local trading companies, cooperatives, and other activities, as well as audit of Government functions.

The increase of $15,400 will defray the cost of the two new fiscal U.S. employees, with other operational funding remaining at substantially the same level as fiscal year 1964.

Administrative services, $79,400.—This section performs various service type functions in support of all headquarters operations. The mail and files section handles all incoming and outgoing correspondence, primarily official government material. A stock of common-use office supplies are maintained and provided to all headquarters activities, and this section also operates the duplicating service. The administrative services office also operates the headquarters vehicle pool, performs duties in connection with the issuance of passports to Micronesian citizens, and operates a stenographer and typist pool.

Headed by the administrative services officer, this section also has a U.S. mail and files supervisor, a teletypist and 6 other clerical and secretarial U.S. employees as well as 12 Micronesian clerical and other employees.

The increase of $9,400 will defray the increased salary costs brought about by normal increments and promotions, and will provide a small amount for better stocking of common-use items for general headquarters usage as well as upgrading of duplication services, office supplies, and equipment.

District administration, $782,300.—Funds are provided here for the administration offices of the various districts, including the offices of the district administrators, the district finance offices, the district supply offices, personnel offices, and general administrative services offices. The district organization staffing varies from district to district but, generally speaking, consists of the following U.S. employees in each district: A district administrator, an assistant district administrator, an administrative officer, and/or an administrative assistant and district supply officer. All district finance offices are staffed by Micronesian district finance officers. In addition, U.S. secretaries and clerks are employed. The Micronesian staffing averages about 35 employees per district.

In addition to general administration over all district activities and logistics and support, the district administration offices administer general programs for economic, social, and political development in the districts, working closely with the local citizenry and congresses. This includes administration of the field trip program to cover areas away from the district center itself.

The increase of $54,300 in this category will primarily fund pay increments and promotions, with material and equipment purchasing and other administrative costs remaining substantially at the level of fiscal year 1964.

Personnel benefits, $250,000.—Funds are herein provided for defraying recruitment, termination, and vacation travel costs of employees, transporting of household effects, and other employee benefit programs, such as compensation insurance premium payments, safety program administrative and training costs, and the costs of the incentive awards program.

The decrease of $50,000 in this category as compared to fiscal year 1964 is made possible by increasing charges of benefits to end-use activities instead of generalized lump-sum budgeting in this category. Included in this apportionment to end-use activities will be education allowances, a greater part of the recruitment and termination costs, etc., thereby decreasing the requirement for funding in this category. However, the amount budgeted will not cover recruitment costs of teachers and will need to be supplemented by transfers from the elementary school program or distributed to those accounts.

Guam Liaison Office, $75,800.—Headed by the Guam liaison officer, this office provides liaison and other administrative services for the trust territory at

Guam, a still important crossroad for the entire trust territory area. Entrance and exit from the trust territory areas are still through Guam, both air and sea, since commercial carriers operate through Guam and not directly to the trust territory districts or headquarters at Saipan. Trust territory aircraft are maintained at Guam and fly out to the various districts and to headquarters from there. The Pacific Micronesian Line recently moved its administrative offices to Saipan from Guam, but connection with cargo vessels from the United States and from foreign ports are made in Guam. In addition to transportation and transient billeting, the liaison office serves as a vital link with Guam civil and military authorities, in local procurements of supplies and equipment for the trust territory (including purchases and other acquisitions from military sources), and various other administrative functions.

In addition to the liaison officer, seven other U.S. clerical, administrative, and maintenance personnel staff this office, as well as two Micronesians. The increase of $5,800 will primarily be needed to fund normal pay increments, with material and equipment purchasing remaining substantially at the same level.

Transportation office, $21,700.—This provides funds for the salary and other expenses of the transportation officer, who supervises and coordinates the surface transportation (vessels) program for the trust territory. Surface transportation service is provided by the Pacific Micronesian Lines, Inc., on a cost-plus-fixed-fee charter basis, utilizing trust territory vessels.

In addition to the salary of the transportation officer, funds are provided for his Micronesian clerk plus administrative expenses including funds for travel and per diem as well as supplies and equipment acquisitions.

The $700 increase will primarily fund salary increments.

Special projects unit, $42,000.—With the establishment of the accelerated program of development in the trust territory, initially in education, with long-range plans for eventual accelerated development in all areas, the High Commissioner has established a special office for the coordination, supervision and expediting of both construction and program areas. Included in this function would be coordination of the various trust territory organizations concerned, such as public works, finance, supply, personnel, etc., to obtain maximum efficiency in development, as well as liaison and administrative dealings with various outside contractors involved in the large-scale construction concerned.

Funds provided here are to defray the salary of the Special Assistant to the High Commissioner, the administrative officer of the special projects unit and an American secretary. Also funds for per diem and other travel expenses, as well as supplies and equipment are included. The increase of $500 will primarily defray pay increments.

Supply stock revolving fund, $150,000

The supply stock revolving fund was created at the start of fiscal year 1963 for the purpose of purchasing materials, supplies, tools, and equipment for all districts and for construction projects through one account and being reimbursed when these items were charged to the end-use activity. Main categories falling within this fund are general stores; medical supplies; equipment spart parts; petroleum, oil, and lubricants; manufactured gases; and cement. The fund was originally established through supplies taken over from the U.S. Navy at Saipan at the time the Mariana Islands district was transferred to the Department of Interior, as well as existing petroleum, oil, and lubricant inventories and other general stores inventories which had been in existence for several years. Through the liquidation of these inventories, the fund has been able to purchase additional items and has developed an inventory of approximately $800,000 as of June 30, 1963.

Because of the accelerated school construction and supply program, plus the increased activities in other areas of construction and in territorywide programing, the present fund is unable to finance the procurement of the supplies and materials required. Due to delays in purchasing, and to the length of the supply lines from the United States through Guam and Saipan, and eventually to the district centers, it is necessary that an inventory level of from 4 to 6 months be maintained of basic common use items.

The $150,000 requested will not bring the inventories up to a proper operating level, but will assist the director of property and supply by increasing certain categories. It is planned to expand in these areas:

General stores (including construction materials), an additional	$50,000
Medical supplies, an additional	50,000
Cement, an additional	50,000

Inasmuch as this is a revolving fund, such surplus funds as might accrue in future years, after the objectives of the present trust territorywide programs have been realized and the capital expenditure program completed, could be transferred to regular program activities to assist in their financing.

Construction program, $4,920,000

The 1965 construction (capital improvement) program has been geared to sustain an expansion in certain areas of the operations and programs of the trust territory. Particular reference is made to the acceleration of the elementary and secondary school programs, with emphasis upon the construction of new elementary schools and high school plants, with a secondary emphasis being placed upon the expansion of medical services facilities in certain districts of the trust territory. Planning is also going forward in two other areas which are logistic n nature, where expanson must go forward in order to support the accelerated programs in the field of economic and social development. These areas include the rehabilitation and expansion of existing utility systems in certain district centers where there exist heavy concentrations of population; and the improvement and expansion of airfields, a necessity in order that proper support can be given to a growing population and to increased government activities in each of the six districts of the territory.

In the preparation of the budget estimates for 1965 provision has been made for the funding of all projects which were programed within the 1963–64 budget years and will be completed within fiscal year 1965.

In section 1, below, a comparison is made of the fiscal years 1963 and 1964 with the estimates for 1965 in the various categories of construction. It should be pointed out here that the funds authorized by the 1963 fiscal year supplemental appropriation, were not available until May 1963, and therefore, those budgeted for construction, including the elementary school construction program, could not be obligated prior to the close of fiscal year 1963; and consequently, funds totaling approximately $6,600,000 were carried over into fiscal year 1964.

For comparative purposes, therefore, throughout this section, unobligated 1963 supplemental construction funds will be indicated in those areas where they were programed for fiscal year 1964, separately from 1964 funds. Actual expenditures for fiscal year 1963, amounting to $905,904, are also broken down into their respective categories.

1. Comparison of construction by categories (1963, 1964, 1965 fiscal years)

Type of construction	Actual, 1963	1963 programed in 1964	Estimate, 1964	Estimate, 1965
(a) Educational facilities:				
1. Elementary school classrooms and facilities	$76,142	$2,357,858	$1,918,000	$819,000
2. Secondary school plant and classrooms	248,806	430,500	500,000	485,000
Total, educational facilities	324,948	2,788,358	2,418,000	1,304,000
(b) Public health facilities:				
1. General hospitals	83,388	330,000	150,000	888,000
2. Other facilities		40,000		
Total, public health facilities	83,388	370,000	150,000	888,000
(c) Economic, agriculture, and fisheries	11,006	301,000	280,000	
(d) Communications facilities			100,000	110,000
(e) Public buildings and housing:				
1. Administration and public buildings	24,665	170,000	75,000	
2. Teacher housing, elementary		1,456,000	1,582,000	493,000
3. Teacher housing, secondary				510,000
4. Other housing	96,121	381,000	200,000	480,000
Total, public buildings and housing	120,786	2,007,000	1,857,000	1,483,000
(f) Transportation facilities:				
1. Airfields	273,436	159,653	200,000	210,000
2. Docks and port facilities	31,322	200,000		
3. Ships and small boats		74,000	200,000	
Total, transportation facilities	304,758	433,653	400,000	210,000
(g) Public works facilities:				
1. General facilities	38,108	25,000		
2. Roads	2,585		175,000	250,000
3. Construction equipment			100,000	200,000
Total, public works facilities	40,693	25,000	275,000	450,000
(h) Utilities:				
1. Power	12,225	265,000	250,000	225,000
2. Water		230,000	170,000	150,000
Total, utilities	12,225	495,000	420,000	375,000
(i) Grant-in-aid:				
1. Education grant-in-aid	1,500	90,000		
2. Municipal public works	6,600	84,900	100,000	100,000
Total, grant-in-aid	8,100	174,900	100,000	100,000
Total	905,904	6,594,911	6,000,000	4,920,000

2. Summary of construction by districts (1965 fiscal year)

Type of construction	Districts						TT-wide	Total
	Marianas	Palau	Yap	Truk	Ponape	Marshalls		
(a) Educational facilities:								
1. Elementary school classrooms	$31,500			$367,500	$220,500	$199,500		$819,000
2. Secondary school plants, etc	170,000	$165,000	50,000	55,000	45,000			485,000
Subtotal	201,500	165,000	50,000	422,500	265,500	199,500		1,304,000
(b) Public health facilities: 1. General hospitals				888,000				888,000
(c) Economic, agriculture and fisheries								
(d) Communications facilities		20,000	20,000		20,000		$50,000	110,000
(e) Public buildings and housing:								
1. Teacher housing, elementary				357,000		136,000		493,000
2. Teacher housing, secondary	85,000	85,000	85,000	85,000	85,000	85,000		510,000
3. Housing, other	80,000	80,000	80,000	80,000	80,000	80,000		480,000
Subtotal	165,000	165,000	165,000	522,000	165,000	301,000		1,483,000
(f) Transportation facilities: 1. Airfields		100,000			110,000			210,000
(g) Public works facilities:								
1. Construction equipment							200,000	200,000
2. Roads							250,000	250,000
Subtotal							450,000	450,000
(h) Utilities:								
1. Power		100,000		50,000	75,000			225,000
2. Water		150,000						150,000
Subtotal		250,000		50,000	75,000			375,000
(i) Grant-in-aid: 1. Municipal public works							100,000	100,000
Total	366,500	700,000	235,000	1,882,500	635,500	500,500	600,000	4,920,000

(*a*) *Educational facilities, $1,304,000*

1. *Elementary school classrooms and facilities, $819,000.*—This estimate applies to the third year of an accelerated elementary school construction program which is aimed at providing adequate classroom facilities and equipment for all elementary school age students in the trust territory. Two hundred and thirty-four classrooms were budgeted for in fiscal year 1963; 175 in fiscal year 1964; and 78 in 1965. The estimate for 1965 is based on a cost of $10,500 per classroom, which includes $7,100 for the building itself, and $3,400 for classroom furniture, fixtures, equipment, and supplies.

The program of elementary school construction is predicated upon an anticipated elementary public school enrollment of 20,400 by fiscal year 1968, and on the basis of 30 students per classroom. With full 4-year high schools to be in operation in fiscal year 1965, the ultimate objective is to revert to an 8-and-4 system, wherever feasible, with students who are normally attending intermediate schools of the seventh and eighth grades in the district centers, continuing to attend the municipal elementary schools which will be extended through the eighth grade. Elementary school classroom construction will be a continuing program through fiscal year 1966.

The new housing requirements for the additional elementary school teachers who will be recruited in fiscal year 1965 are covered in section (*c*) below: "Public buildings and housing."

2. *Secondary school classrooms and facilities, $485,000.*—In fiscal year 1965 full high schools will have been established in each of the six districts of the trust territory, and buildings scheduled for construction in this year are to provide facilities for an expanding secondary school enrollment. A portion of the $485,000 requested is to be used to complete construction on some buildings started in prior years. A breakdown on the estimate follows:

Mariana Islands district:	
Industrial arts building at Hopwood High School	$85,000
High school dining room and kitchen	85,000
Paulau district:	
Complete dining room scheduled for 1964	55,000
Construction of 2 student dormitories at $55,000	110,000
Yap district: Complete 7-building high school plant started in fiscal year 1963	50,000
Truk district: Construct 1 boys' high school dormitory	55,000
Ponape district: Complete funding for new high school dormitory partially funded in fiscal year 1964	45,000

All of the above projects include the procurement of necessary school equipment, kitchen appliances, beds, desks, etc., and in the cases of the dormitories, provide for inside toilet facilities.

(*b*) *Public health facilities, $888,000*

1. *General hospitals, $888,000.*—In the long-range construction program for public health, provisions have been made for the construction of new 90-bed hospitals in the districts of Truk, Ponape, and Yap at an estimated cost, completely furnished, of approximately $1,058,000 each. These hospitals will be equipped for inpatient and outpatient treatments, surgery, obstetrics, X-ray, and laboratories. Facilities will also be available for the sanitation and dental offices, administrative offices, warehouses, feeding, and classrooms for training of hospital and field medical personnel.

During fiscal years 1963 and 1964 funds in the amount of $170,000 were budgeted for the first increment of the new 90-bed hospital at Truk. In fiscal year 1965 $888,000 is to be used for the completion of the hospital and equipment.

(*c*) *Economic, agriculture and fisheries development projects, $———*

During fiscal years 1963 and 1964, increased emphasis was placed on this important phase of the trust territory construction program to the point that funds totaling almost $600,000 were programed for this area. These included improvements to district agriculture stations, the addition of poultry breeding units and piggeries, construction of fisheries reefers, and boatbuilding facilities. Due to the extent of these programs, it was elected to program no new projects pending a study of the long-range economic development programs for the trust territory, and to insure completion of the present projects.

(d) Communications facilities, $110,000

During fiscal year 1964, the first increment of the construction of the new central communications station at Saipan was funded in the amount of $85,000. Required in 1965 is $50,000 to complete this project, which will include two new buildings, a new antenna farm, installation of a 100-kilowatt auxiliary generator and facilities to house it, more than a mile of special cable, and the addition of certain special equipment. In addition, new homer beacons will be required in the districts of Palau, Truk, and Ponape; $20,000 for each station, or a total of $60,000, has been estimated as the cost of constructing new housing, laying of cables from the main stations, and preparation of these facilities for the eventual transfer of transmitting equipment to these sites.

(e) Public buildings and housing, $1,483,000

1. *Housing for elementary school teachers, $493,000.*—As part of the third phase of the accelerated elementary school program throughout the trust territory, 29 additional new houses at an estimated cost of $17,000 each will be required in fiscal year 1965. Twenty-one of these houses will be located in the Truk district, and eight in the Marshalls, all on outlying islands.

2. *Housing for secondary school teachers, $510,000.*—Present plans call for nine U.S. high school teachers at each district high school as the 12th grade opens in fiscal year 1965, with the number of teachers increasing up to and including fiscal year 1968 as enrollment reaches the anticipated 3,700 figure. Thirty new houses—five in each district center—will be required to house the first group of new teachers at an estimated cost of $17,000 each.

3. *Permanent housing (other), $480,000.*—Plans call for the replacement, where possible, of wornout World War II quonsets which are costly to maintain. Present planning calls for concrete hollow-tile block buildings, completely furnished.

(f) Transportation facilities, $210,000

1. *Airfields, $210,000.*—Provision has been made for the completion of funding of the new airfield presently under construction on Babelthaup Island in the Palau district, and for the initial engineering work for the airstrip to be located at Ponape. With the construction of an airfield at Ponape, the last vital link will have been completed, and landing fields will then be available in each district of the trust territory, thereby permitting the use of DC–4 and larger land aircraft throughout the territory. Of the $210,000 estimated for 1965, $100,000 will be required to complete the Palau airstrip, and $110,000 to complete engineering services for the Ponape airstrip.

(g) Public works facilities, $450,000

1. *Construction equipment, $200,000.*—In fiscal year 1964, $100,000 was budgeted for the establishment of a permanent central equipment revolving fund for the purchase of new construction equipment. As equipment is purchased, it is amortized over its life expectancy through rental charges to the various construction projects, the revolving fund thereby being reimbursed for its original acquisition cost and for the maintenance and repair charges. Two hundred thousand dollars is required in fiscal year 1965 to increase the size of this fund, and to permit the procurement of vitally needed equipment for use in the growing construction program.

2. *Roads, $250,000.*—In fiscal year 1964, $175,000 was budgeted for the start of a long-range road improvement program for the trust territory for the rehabilitation of approximately 400 miles of roads and highways. While it is not expected that all of these will be completely rehabilitated, emphasis is being placed on those sections which play an important part in the economic and educational development of the various districts. Babelthaup Island, the largest island in the trust territory, located in the Palau district, and Ponape Island, require special attention in order to develop the resources of these areas. The estimated cost of road construction averages $10,000 per mile.

(h) Utilities, $375,000

1. *Power, $225,000.*—In fiscal year 1963, first increments were funded for the rehabilitation of power facilities in the districts of Palau, Truk, and Ponape. These are areas where population growth has necessitated both the rehabilitation of former installations and the addition of new equipment and distribution lines.

2. *Water, $150,000.*—First emphasis on the rehabilitation of a district water system has been placed in the Palau district and the island of Koror, the district center, where there exists a population of more than 4,000 people living in a con-

gested area. This project calls for the rehabilitation of a former Japanese dam located on Babelthaup, which was damaged during the recent war, and the construction of new lines across the channel to Koror; the addition of new storage facilities on Koror; and the replacement of water mains and secondary lines throughout the islands.

(*i*) *Grant-in-aid, $100,000*

These funds are required for a continuation of the grant-in-aid program for local congresses and municpalities to assist them in secondary road improvements, construction of municipal and legislative buildings, dock and harbor improvements, etc. In accordance with current policies, assistance is given up to 50 percent of the estimated cost of a project if it meets certain requirements and there is a justification for the project.

TRUST FUNDS

The following trust funds are administered by the trust territory government for the benefit of the Micronesians:

1. Copra stabilization fund.
2. Angaur mining trust fund.
3. Angaur scholarship fund.
4. Kili trust fund.
5. Ujelang trust fund.
6. Saipan trust fund.

There is no management charge by trust territory, and the funds are self-supporting as to capital and income. Therefore, no appropriation is required or requested.

The following financial statements show the status of each fund as of June 30, 1963.

Copra stabilization fund balance sheet, June 30, 1963

Assets:	
Cash on deposit	$101,059.27
Time deposit with bank	450,000.00
Total assets	551,059.27
Liabilities and net worth: Net worth	551,059.27
Analysis of changes in net worth:	
Net worth at July 1, 1962	495,955.17
Additions to capital: Saipan copra stabilization fund incorporated into trust territory fund and capital transferred	69,456.95
Revenues: Interest on investments	13,812.50
Total	579,224.62
Less expenses:	
Price support settlements	19,657.58
Copra bags	2,633.09
Other charges	5,874.68
Total	28,165.35
Total net worth at June 30, 1963	551,059.27

Angaur mining trust fund balance sheet, June 30, 1963

Assets:	
Cash on deposit	$24,890.98
Investments (U.S. Government securities)	1,164,878.26
Total assets	1,189,769.24
Liabilities and net worth:	
Accounts payable	900.00
Net worth	1,188,869.24
Total liabilities and net worth	1,189,769.24
Analysis of changes in net worth:	
Balance at beginning of the year	1,184,786.67
Add: Interest on investments	42,527.48
Total	1,227,314.15
Less expenses:	
Commissions paid to trust company	1,051.69
Distribution to Angaur beneficiaries: 1962 fiscal year	36,493.22
Total expenditures during the year	37,544.91
Liabilities and net worth at June 30, 1963	1,189,769.24

Angaur scholarship fund balance sheet, June 30, 1963

Assets:	
Cash on deposit	$4,379.34
Loans receivable	8,248.05
Total assets	12,627.39
Liabilities and net worth: Liabilities and net worth at end of year	12,627.39

Kili trust fund balance sheet

Assets:	
Cash on deposit	$13.23
Investments, U.S. Treasury 3¼-percent bonds	299,986.77
Total assets	300,000.00
Capital:	
Trust as established	300,000.00
Income received from June 1957 to June 30, 1963 (6½ years x $9,945 per year)	64,642.50
Less distributions	64,642.50
Subtotal	
Total capital	300,000.00

Ujelang trust fund, balance sheet, June 30, 1963

Assets:	
Cash on deposit	$6.62
Investments, U.S. Treasury 3¼-percent bonds	149,993.38
Total assets	150,000.00
Capital:	
Trust as established	150,000.00
Income received from June 1957 to June 1963 (6½ years times $4,972.50 per year)	32,321.25
Less distribution	32,321.25
Subtotal	
Total capital	150,000.00

SAIPAN TRUST FUND

This fund was established in 1956 by order of the commander in chief, U.S. Pacific Fleet, as High Commissioner of the Saipan district with $984,183 received by the Trust Territory of the Pacific Islands as compensation for land use and occupancy agreements from the U.S. Government. The use of this fund was exclusively reserved for programs and projects designed to serve and enhance indigenous inhabitants of the Saipan district. On July 1, 1962, administration of Saipan district was transferred to the Department of the Interior from the Department of the Navy. As of that date the assets of the Saipan trust fund were turned over to the High Commissioner, as trustee. These assets were all in cash and amounted to $376,014.20.

Under jurisdiction of the Navy Department a new hospital was funded from this fund. This hospital was completed in September 1962. A scholarship program was also initiated by the Navy administration. The amounts spent on each of these programs prior to June 30, 1962, were $590,000 and $18,000, respectively. Since July 1, 1962, the only moneys spent have been to complete the hospital and continue a scholarship program in Honolulu that was started by the Navy. The balance sheet shown on the next page reflects an increase of $13,441.21 since July 1, 1962.

Saipan trust fund balance sheet, June 30, 1963

Assets:	
Cash on deposit	$14,455.41
Time deposit with bank	375,000.00
Total assets	389,455.41
Liabilities and net worth: Net worth	389,455.41
Analysis of changes in net worth:	
Net worth at July 1, 1962	376,014.20
Add revenues: Interest on investments of time deposit	35,415.00
Total	411,429.20
Less expenses:	
Cost for sending scholarship students to Hawaii	10,243.13
Additional expense incurred on Dr. Torres Hospital	11,730.66
Total	21,973.79
Total net worth at June 30, 1963	389,455.41

LAND USE AND OCCUPANCY FUNDS, JUNE 30, 1963

In June of 1956, the Navy Department transferred $1,245,323.80 to the trust territory government to pay for land used during World War II by military services, and for land retained by the military services for possible future use. The status of this fund as of June 30, 1963, follows:

Explanation	Detail	Balance
Cash transferred from Navy		$1,245,323.80
Interest earned on cash balance deposited with bank		35,940.70
Total amount available		1,281,264.50
Payments for land use:		
Eniwetok (Dec. 17, 1956)	[1] $175,000.00	
Bikini (Dec. 17, 1956)	[1] 325,000.00	
Truk (Apr. 10, 1957)	23,787.09	
Ulithi (Feb. 8, 1960)	19,839.28	
Roi-Namur (Apr. 13, 1961)	80,000.00	623,626.37
Cash balance at June 30, 1960		657,638.13

[1] Trust funds established by investing in U.S. Government bonds paying 3¼ percent interest. Interest collections are made semiannually and remitted to beneficiaries.

Supply stock fund balance sheet, June 30, 1963

Assets:	
Cash on deposit	$491,638.90
Accounts receivable	126,324.18
Inventories	825,550.91
Total assets	1,443,513.99
Liabilities and capital:	
Accounts payable	130,080.84
Advance payment credits	24,992.94
Capital	1,288,440.21
Total liabilities and capital	1,443,513.99
Sales to activities during 1963 fiscal year	1,635,371.54
Purchases during 1963 fiscal year	953,866.65

This fund will be continued during 1964 and 1965 fiscal years. By purchasing in large quantities through a central fund, materials and supplies will be on hand when required, and significant savings made over buying in small lots.

Itemization of estimate

Trust Territory of the Pacific Islands

STATEMENT OF M. W. GODING, HIGH COMMISSIONER OF THE TRUST TERRITORY OF THE PACIFIC ISLANDS

1965 Budget Request

Mr. Goding. Mr. Chairman, this is a real pleasure for me, my first opportunity to appear before the Senate Appropriations Subcommittee, and I want to express particularly our appreciation for the very fine consideration you have given our budget for the last 2 fiscal years.

Our programs have been greatly strengthened, accelerated, by the budgets that had been made available for 1963 and 1964.

I have a brief prepared statement.

Chairman Hayden. You can include that in the record if you desire.

(The statement referred to follows:)

STATEMENT OF M. W. GODING, HIGH COMMISSIONER OF THE TRUST TERRITORY OF THE PACIFIC ISLANDS

Mr. Chairman and members of the committee, it is a privilege to appear before this committee to present our operating and capital improvements budget for fiscal year 1965. We appreciate your sympathetic consideration and understanding of our objectives, responsibilities, problems, and fund requirements which were instrumental in getting our long-range capital improvement program underway beginning with the 1963 fiscal year. The appropriation request for 1965 fiscal is $17,500,000, of which $12,580,000 is for the various operating programs and $4,920,000 is for capital improvements. This budget is an increase of $2,500,000 over the amount appropriated for 1964 fiscal year, largely for the "Education and medical services" programs. This increase provides for additional operating and capital improvement expenditures which will be required for a continuance of the long-range educational, medical, and economic development programs for the trust territory. There is an overall increase of $3,580,000 in the programs estimate and a decrease of $1,080,000 in the capital improvement program. As the new program for the trust territory proceeds, the capital improvement sector will decrease and the operating costs increase as we make use of the new and improved facilities.

During 1964 fiscal year to date, considerable progress has been made in implementing the long-range capital improvement program for the territory. Although results thus far have not been what we might have hoped for because of delays in the funding, we have made much progress and the rate of our construction will accelerate greatly during the months ahead.

Our long-range program for improvement of educational facilities in the trust territory include the construction of 487 classrooms and 246 teacher houses by the end of 1965 fiscal year. By September 1 of this year we estimate that 237 classrooms and 161 teacher houses will be ready for occupancy and use. The initial phase of the capital improvement program for education will have been completed by the end of 1965 fiscal year, with replacement and new construction for expansion only being required thereafter. The program for use of these improved facilities is to upgrade the teaching standards by hire of U.S. teachers and purchase of modern equipment and supplies for use of the students. A total of $3,900,000 is requested in our 1965 fiscal year estimate for this education operating expense, which is an increase of $2,125,000 over 1964 fiscal year. As of this date we have employed 102 U.S. teachers for assignment in the elementary and high schools. By the end of 1965 fiscal year we hope to have 38 new U.S. teachers in our employ. The objective of this program, for which funds were substantially increased beginning with 1963 fiscal year, is to provide a level of education which will better enable the people of the territory to advance the educational, political, and economic standards, as well as fulfill the obligations which we have assumed for this area. We assure you that we are trying to set up our capital improvements and operations budgets in such a fashion that one will not outstrip the other.

In the area of "Medical services" we are requesting $888,000 for capital improvements; an increase of $738,000 over 1964 fiscal year, all of which will be used for completion of a general hospital in Truk district. For operation of our medical services the 1965 fiscal year figure is $2,120,000; an increase of $770,000 over 1964 fiscal year. This increase will allow for expansion and improvement of all medical services, but the principal emphasis and increase is in the hospital and field medical budgets. During 1964 fiscal year a territorywide immunization program was started, and recruitment of fully qualified physicians has been carried out to provide strengthened medical services for each district. These programs will be continued in 1965 fiscal year. Also, $60,000 is requested as a contingency to cover the cost of unforeseen epidemics, such as the 1963 fiscal year polio epidemic in the Marshalls.

As we proceed with our capital improvement program, emphasis will shift from the educational program, as classrooms and facilities are completed, to construction of aditionally required medical facilities in the other islands, transportation, equipment, public utilities, communications, and public road construction.

Although primary emphasis at present is on the educational and medical services programs, we are not neglecting other vital areas.

In the area of resources management we are requesting an increase of $165,800 over the $1,119,200 appropriated for 1964 fiscal year. This increase will permit continuation of the current programs plus assistance to local fishing industries and an addition of $100,000 to the Economic Development Loan Fund. During

1964 fiscal year a boatbuilding project was started in Palau and a U.S. commercial fisheries concern was also established in the same district.

A tremendous problem still exists in the fields of communications and transportation. Faced, as we are, by an immense area estimated at 3 million square miles, facilities for communicating with the various populated islands must be improved. During 1964 fiscal year we added one 3,500-ton ship to our fleet by transfer from the Bureau of Indian Affairs. The airfield at Yap has been completed and has been in full use for the past year. Construction of the Palau airfield will be completed during 1965 fiscal year. A preliminary survey for location of the Ponape field had been made and funds in the amount of $210,000 are being requested for engineering there, and to complete the Palau airstrip.

These improvements in our transportation system, both by sea and air, are necessary for the economic development of the area. Completion of airfields in all districts will enable us to better utilize the DC–4 aircraft which was acquired in 1962 and possibly allow us to profitably use another aircraft of comparable size and range.

We recognize the need to improve our radio communications system and our long-range program provides for this, but with emphasis presently on the education and medical services programs, the additional funds for communications improvements are not presently available.

Another weak link in our transportation and communications system is the lack of a good public road system. We are budgeting $250,000 for this purpose in 1965 fiscal year, an increase of $75,000 over 1964 fiscal year. Improvements in our transportation and communications systems are essential to the full development of the economic potential of the trust territory. Although we have dwelt largely with the capital improvements and program areas of the trust territory, we are not unmindful of the fact that as facilities are increased, greater administrative responsibilities will fall upon us, and with this responsibility the necessity to eliminate waste and improve the efficiency of methods for the accomplishment of our goals. We believe the continued support of this budgeted program will permit an orderly advance toward meeting our responsibilities to the people of the trust territory, and the full and effective advancement of the area politically and economically.

Educational Program

Mr. Goding. That treats in general the details of our submission as we have it before you. Our appropriations request for 1965 involves an increase of $2½ million from the level of $15 million available in 1964.

Our 1963 request totaled $15 million including a supplemental appropriation which became available last May and which has kept us very busy in the past 6 or 7 months.

The acceleration of our program has been oriented around education, our elementary schools and our secondary schools, practically every aspect of our educational program. Beginning in June, we initiated the first general school construction program involving a total of 240 classrooms. We have, as of now, 7 months later, completed about 50. We have the rest, or almost all of the rest, of the 240 in various stages of construction.

Along with the classrooms, we have had to build houses. We have had to build houses in every district throughout this area, which is approximately that of the 48 contiguous United States, some 3 million square miles. We are building houses. This week, we are finishing the first increment of 75 houses for American teachers.

American Teacher in Schools

The American teacher in our elementary schools is a complete innovation. This year marks the first year in which we have had other than our own Micronesian teachers. We began recruitment in

June and we are very fortunate in securing some 60 teachers, elementary teachers, for the beginning of the school year in September. We have been equally fortunate in that the caliber of the teachers that we were fortunate enough to get on board, in the short time that we had, has been very high, and, almost without exception, they have been very good representatives of the American public school system.

Fleet Operations

Obviously, in any program in our area with the long logistic lines, we have our difficulties in getting new construction in place at any given time. During the past year, we added another vessel to our fleet. We have doubled the frequency of service to the six district centers. The service involves the onward carriage of goods from Guam, which is the transshipment port for 90 percent of our supplies, equipment, and so on, and also involves a connection to Japan, carrying copra to Japan and certain merchandise and trade goods back from Japanese ports.

We operate a fleet of eight vessels: One tanker, five station vessels, two small ocean freighters, that carry on our logistic service. We have to maintain our own air service with three airplanes maintaining a basic weekly schedule between our headquarters and the six districts in the trust territory. This is approximately a transcontinental air service, if you take the length of the route mileage that is involved into consideration.

Kwajalein Island Land Claim

The Chairman. What is the status of the land claim on Kwajalein Island? As I recall, this is the only island on which there has been no settlement.

Mr. Goding. We, Mr. Chairman, were finally successful, 2 weeks ago, in effecting the settlement for the Kwajalein Island claims. I believe you recall that we submitted a settlement agreement, a tentative settlement agreement, to you and the other committees concerned, a few months ago. And the settlement has been consummated.

Chairman Hayden. At what cost?

Mr. Goding. At a cost of $750,000 for the 750 acres that were stipulated in the settlement agreement.

Educational Program Progress

Chairman Hayden. What progress are you making, and do you plan to make, in fiscal year 1965, with your educational program? I believe that you should provide the committee information in some detail as to the operations of the schools, their adequacy, and the construction plans which will provide better and more adequate plants.

Mr. Goding. Our construction program is moving now so that we hope by the fall of this year, we will have two-thirds of the total program completed in classroom units.

Chairman Hayden. Any questions?

HEADQUARTERS LOCATION AND CENSUS OF POPULATION

Senator BIBLE. I don't want to prolong this, Mr. Chairman, but it would be helpful if you have a map available that would indicate exactly where your headquarters and your six districts are, and how many people you have under your jurisdiction as Commissioner of the trust territory.

Mr. GODING. We have a total of about 85,000 people in the six districts.

Senator BIBLE. Where are your headquarters, Mr. Goding?

Mr. GODING. They are now on Saipan, in the Mariana Islands. There are about 10,000 people in the Marianas, about 10,000 in the Palau district, about 6,000 in the Yap district; 23,000 in the Truk district; 18,000 in the Ponape district; and 18,000 now in the Marshall Islands district. The distance is about 2,600 miles from Palau to the Marshall Islands, east to west.

Senator BIBLE. I have no other questions, Mr. Chairman.

I think the map is helpful in bringing this problem to force.

Senator BARTLETT. Just one or two questions.

CHANGE OF HEADQUARTERS LOCATION

You mentioned your headquarters as being at Saipan. When the United States took over the responsibility for governing the islands, the headquarters were at Honolulu for some time, were they not?

Mr. GODING. They were headquartered at Honolulu; the operating headquarters were actually at Guam. The Commander in Chief of the Pacific was at Honolulu.

Senator BARTLETT. After it went to Guam?

Mr. GODING. Prior to that, it had been moved to Honolulu from Guam.

Senator BARTLETT. To Honululu?

Mr. GODING. They were moved to Honolulu from Guam, and they moved back to Guam in 1954.

Senator BARTLETT. And you moved from Guam to Saipan?

Mr. GODING. We moved from Guam to Saipan in 1962.

Senator BARTLETT. When?

Mr. GODING. July 1, 1962.

PRESERVING CULTURE OF THE ISLANDS

Senator BARTLETT. Now, I want to ask the question, Mr. Commissioner, that Senator Mansfield put to Governor Lee: Is it your purpose to try to save, insofar as possible, compatible with your other responsibilities, some of the culture of these people who have been on these islands for so long?

Mr. GODING. It would be our policy to preserve it and at the same time not to interfere with their desire to accept western ideas and language and so on. Our problem is one in which, in many respects, the people desire to move further than they have up to the present time.

Senator BARTLETT. But they haven't been able to?

Mr. GODING. They haven't been able to, and in some instances, haven't desired to.

Senator BARTLETT. And you are, as fast as you can, making it possible for them to do this?

Mr. GODING. We are making it possible for them to exercise their own choice as to speed of acceptance of western culture and ideas.

TRUST TERRITORY ADMINISTERED UNDER TREATY

Senator BARTLETT. Mr. Goding, as I understand it, and I wish you would clarify it for my benefit, the situation with respect to Guam and American Samoa, both unincorporated territories of the United States, is entirely different from that prevailing in the trust territory; is this correct?

Mr. GODING. That is correct. The trust territory is an area that we administer under a treaty with the United Nations, the trusteeship agreement, it is called, entered into in 1947 between the United States and the United Nations. Under this agreement, we took over, in effect, what had been the Japanese mandate to the same area which was created following World War I.

Senator BARTLETT. And the administration of the trust territory is under the constant scrutiny of the United Nations?

Mr. GODING. It is under the scrutiny of the Trusteeship Council, which reports to the Security Council. This area is under a security trust.

UNITED NATIONS DELEGATES VISITS TO TRUST TERRITORY

Senator BARTLETT. Do delegations from the United Nations ever visit the trust territory?

Mr. GODING. They visit on a 3-year cycle. In fact, there is a visiting mission in the trust territory at the present time.

Senator BARTLETT. Let me ask you this question: Do the Communist members of the United Nations send delegates as members of the visiting delegation?

Mr. GODING. So far, there has not been a member of the Soviet or the Communist bloc on the visiting missions. Now the Soviet Union is a member of the Trusteeship Council and certainly enters into the questioning of the annual review that we make before the Trusteeship Council.

PROGRESS IN THE TRUST TERRITORIES

Senator BARTLETT. Mr. Chairman, I have no further questions, but I would like to say this: That recently I have had the pleasure of talking with members of a House committee who went over to the trust territory, and they were very laudatory, to me, of the work being performed by High Commissioner Goding in that great big area over there. And they told me—those who had been there previously—of really remarkable progress which had been made. And this was especially gratifying to me on a personal basis, although I was not surprised, because Mr. Goding started from Skagway, Alaska, and I knew he would do a good job there.

Thank you.

JAPANESE COMMERCIAL INTERESTS

Chairman HAYDEN. Do any other Senators have questions?

If not, just one question of my own.

When these islands were occupied by the Japanese, they made a monopoly of all the businesses, of course. What commercial relations do they have now?

Mr. GODING. The Japanese have had, and have for years, continued to sell quite a considerable quantity of types of trade goods, certain food products, certain clothing products; more recently, a considerable number of motor scooters, bicycles, and things of that type. A lot of the textile products, a lot of the prepared and canned food products are of Japanese origin.

Chairman HAYDEN. They have equal opportunity with everyone else?

Mr. GODING. They have, and under our trusteeship agreement, we have to allow it.

POPULATION OF ATOLLS AND ISLANDS

Senator MUNDT. I note 97 inhabited atolls and separate islands and a total population in the area of 84,777. What would be a minimal population? Looking on your map, they don't list them when they get below 10,000. I gather there are some.

Mr. GODING. We have some that have fewer than 25 people. There are not very many, but a few scattered outer islands would have a population of less than 50.

Senator MUNDT. As a permanent home, you mean?

Mr. GODING. That is right. And some of these situations, of course, involve considerable expense for our field trip service.

Senator MUNDT. How many islands or atolls would you say have a total population of less than 300 people?

Mr. GODING. I would say probably less than 30. The Marshall Islands have 22 inhabited atolls altogether.

Senator MUNDT. Do you have a map in more detail that shows the names of all the islands and atolls with the populations?

Mr. GODING. I am not sure with the population figures.

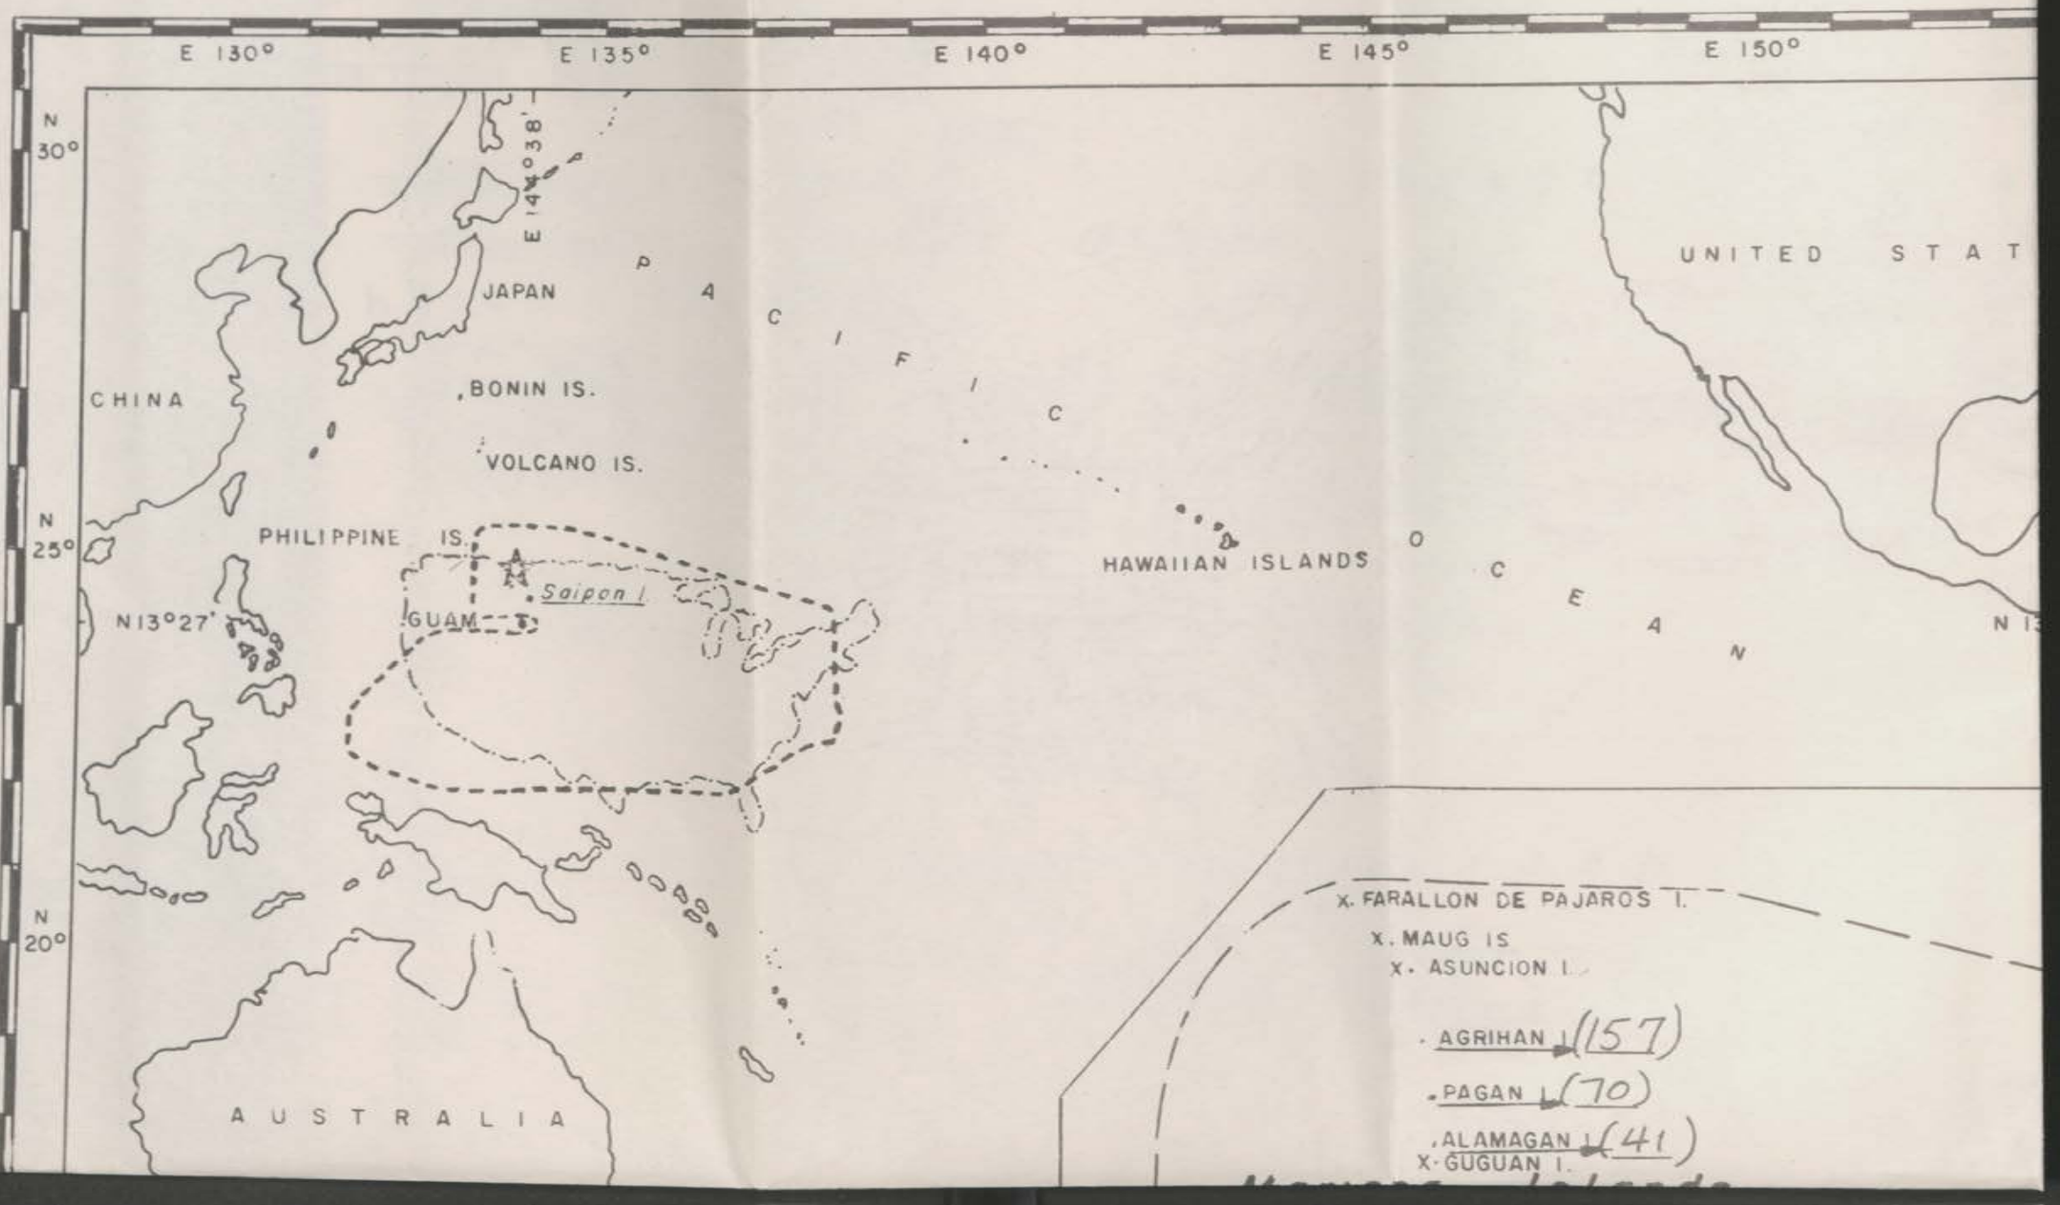
Senator MUNDT. You must have it in your records?

Mr. GODING. We have it; yes, sir.

Senator MUNDT. Will you supply, not a list but a map of all the islands and atolls with the populations?

Mr. GODING. Yes, sir.

Senator MUNDT. Thank you.



(The map referred to faces this page.)

Total, Trust Territory of the Pacific Islands (72) [1]	84,777

[1] This total of 72 is 25 less than the total of 97 shown on trust territory map SK.–S–30/63, dated July 1, 1963. This is due to the combining of certain small islands within their parent atoll grouping and by not listing areas where populations are of a more transient nature.

Chairman HAYDEN. Now, the Office of Minerals Exploration.

OFFICE OF MINERALS EXPLORATION

STATEMENT OF GEORGE FUMICH, JR., ACTING DIRECTOR; ACCOMPANIED BY FRANK E. JOHNSON, DEPUTY DIRECTOR; ALLEN S. DAKAN, CHIEF, DIVISION OF ADMINISTRATIVE MANAGEMENT; AND DALE L. ROTHROCK, FINANCE OFFICER

1965 BUDGET ESTIMATE

Chairman HAYDEN. The Office of Minerals Exploration proposes an appropriation of $900,000, an increase of $50,000 over the amount appropriated in fiscal year 1964.

The justification statement in support of this estimate will be included in the record.

(The statement referred to follows:)

HIGHLIGHT STATEMENT

Under Public Law 85–701, the Office of Minerals Exploration stimulates exploration by private industry for domestic sources of minerals by contracting to pay a specified part of the cost of authorized exploration work. Federal funds provided under a contract are repaid with interest by a royalty on pro-

duction from the property. The program is designed to encourage exploration for long-range mineral reserves rather than to bring new properties into immediate production. The Office of Mineral Exploration also administers the projects with royalty obligations under the program of the former Defense Minerals Exploration Administration.

The level of interest in exploration assistance is expected to continue in 1965 assuring the obligation of the entire amount requested for financial assistance.

Salaries and expenses

Appropriation, 1963	$750,000
Unobligated balance brought forward	196,732
Total amount available, 1963	946,732
Appropriation, 1964	850,000
Unobligated balance brought forward	144,868
Total available, 1964	994,868

SUMMARY OF INCREASES AND DECREASES, 1965

Decrease in financial assistance to participants in exploration projects	−94,868
Net decrease, 1965	−94,868
Budget estimate, 1965	900,000

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
1. Financial assistance to participants in exploration projects	$590,702	$760,868	$666,000	−$94,868	----------	−$94,868
2. Technical and administrative services	211,162	234,000	234,000	----------	----------	----------

Total	946,732	994,868	900,000	−94,868	----------	−94,868

[1] All increased pay costs absorbed.

JUSTIFICATION

The estimate for 1965 is $900,000, an increase of $50,000 in appropriated funds over 1964, but it is a decrease of $94,868 in funds available.

The amount requested for 1965 will allow a total of only $666,000 for exploration assistance compared to $760,868 available for the 1964 program. It is anticipated that the interest in exploration, especially gold and silver, will be sustained. The size of the contracts executed has increased as more interest is shown in exploration for such minerals as mercury, molybdenum, gold, and silver.

Present performance indicates that the entire $760,868 available for financial assistance will be obligated during 1964 and assures obligation of the $666,000 requested for 1965.

The overall workload promises to continue at the same level throughout 1964 and 1965. The number of employees at the end of 1965 is expected to be 12, 1 less than at the end of 1963.

The Office of Minerals Exploration program

The Office of Minerals Exploration offers financial assistance to firms and individuals who desire to explore their properties or claims for 1 or more of the 35 mineral commodities listed in the OME regulations. This help is offered to applicants who ordinarily would not undertake the exploration under present

conditions or circumstances at their sole expense and who are unable to obtain funds from commercial sources on reasonable terms.

The Government will contract with an eligible applicant to pay up to one-half of the cost of approved exploration work as it progresses. Each contract specifies the work to be performed in a described area at costs estimated on an actual or fixed unit cost basis but limited in total amount. The work, based upon sound engineering and geological principles, is approved by the Government only after careful investigation. Ordinarily, contracts will not be approved for work which will require more than 2 years to complete; however, the time limit for most projects is fixed for a much shorter period.

Funds contributed by the Government are repaid with interest by a royalty on production from the property. If nothing is produced, there is no obligation to repay. A 5-percent royalty is paid on any production during the period the contract is in effect, and if the Government certifies that production may be possible from the property, the royalty obligation continues until the Government's contribution is repaid with interest, or for the 10-year period usually specified in the contract.

Simple interest is calculated at a rate not less than the rate which the Department would be required to pay if it borrowed from the Treasury, plus a 2-percent interest charge in lieu of the actual cost to the Governmqent of administering the contract.

Accomplishments

Under the DMEA program, predecessor to the OME, 399 projects were certified as discoveries on which the net recoverable value of potential ore reserves exceeds $1 billion estimated at current market prices. Royalties paid on production from DMEA projects exceed $4 million, and royalty payments from DMEA and OME projects are expected to continue at about $200,000 per year. Thus, it has cost the Government approximately 3½ cents for each dollar of recoverable value. This figure lessens as royalty payments increase. Also, as the deposits are mined, they will result in more industrial production, more employment, and more taxable income.

Office of Minerals Exploration organization

The Office of Minerals Exploration is a separate agency of the Department of the Interior, functioning under the supervision of the Assistant Secretary for Mineral Resources.

All OME employees are headquartered in Washington. The organization consists of the Director's Office, Division of Field Operations, Division of Minerals, Division of Contract Administration and Audit, Division of Administrative Management, and a review committee. All contract actions are reviewed by this committee composed of the chiefs of field operations, Division of Minerals, and Division of Contract Administration and Audit for conformance with OME standards and policy. Legal services are performed by the Solicitor's Office of the Department.

OME field officers detailed from the field staffs of the Bureau of Mines and the Geological Survey are utilized for all onsite field examinations, work inspections, interim reports, checking monthly vouchers for the amounts of the Government's share of the costs, field administration of exploration contracts, final reports, inspecting and reporting on certified projects, and representing the OME in all other activities within their respective regions.

Itemization of estimate

PLANS AND RESPONSIBILITIES

Chairman HAYDEN. Will you please give your name, place your prepared statement in the record, and then discuss your past years' program for the committee and indicate your plans for the coming fiscal year?

(The statement referred to follows:)

STATEMENT OF GEORGE FUMICH, JR., ACTING DIRECTOR, OFFICE OF MINERALS EXPLORATION

Mr. Chairman and members of the committee, thank you for this opportunity to discuss the appropriation needed by the Office of Minerals Exploration to encourage exploration for domestic mineral reserves as authorized by Public Law 85–701.

PROGRAM FOR 1965

Although our request for $900,000 for 1965 is an increase of $50,000 in appropriated funds, it represents a decrease of $94,868 in funds available. It will allow $666,000 for exploration assistance in 1965 compared to the $760,868 available in 1964.

At this point our prospects for obligating 1964 funds look good. We have executed 5 contracts obligating $303,605 and we have 4 others approved for an additional $116,697 bringing total obligations to $420,302. In addition there are 22 applications in process and we can expect 25 to 30 more proposing $3 million in exploration work before the end of 1964.

In line with President Johnson's request for frugality, we are absorbing all increases in salaries and other costs. These costs will be held to $234,000; the same as for 1964. At the end of 1965 we will have only 12 persons on the OME staff, 1 person less than in 1964.

WORKLOAD

This small staff is responsible for three active programs, the current exploration assistance applications and projects, the surveillance of DMEA projects still obligated to pay royalty, and the lead and zinc stabilization program.

In spite of the decrease in available funds for exploration assistance, we anticipate no reduction in the volume of applications. We should receive at least 60 applications proposing more than $6 million in exploration projects and we expect to execute 15 contracts to obligate the entire amount available. In addition to this new business, there will be 30 or more contracts in

force with work in progress exceeding $2,600,000 which must be inspected and reported upon. We expect to collect about $225,000 in royalties from DMEA projects and $20,000 from OME projects. We will also work closely with the General Services Administration people on the lead and zinc stabilization program.

Much of the workload and a substantial part of the cost of administering the OME is devoted to the technical and professional assistance to applicants. We deal mostly with small firms and individuals who must rely on our staff for this help. Not only do we evaluate all applications submitted, but we are also called upon to aid in preparing or revising many applications to assure that the proposals are complete and well planned. These services provide a great saving to both the applicant and the Government by avoiding the cost of projects of little merit and by providing sound programs for those authorized.

PROGRAM

The OME offers financial assistance to firms and individuals who wish to explore their properties for 1 or more of 35 mineral commodities. This help is offered to applicants who ordinarily would not undertake the exploration under present conditions or circumstances at their sole expense and who are unable to obtain funds from commercial sources on reasonable terms.

We contract with an eligible applicant to pay one-half of the cost of approved exploration work. The applicant pays the rest. The Government participation in a single contract cannot exceed $250,000. Interest, at rates which have ranged from 5¾ to 6½ percent, is charged from the time funds are made available.

Funds contributed by the Government are repaid by a 5-percent royalty on production from the property. If nothing is produced, there is no obligation to repay. Royalty is paid on any production during the period in which work is being done under the contract; and if the Government certifies that production may be possible from the property, the royalty obligation continues until the Government's contribution is repaid with interest, or for the 10-year period usually specified in the contract.

NEED FOR LONG-RANGE EXPLORATION

Adequate supplies of new materials are of vital importance to our national economy, especially for the years of the future. These are indispensable to meet the needs of an expanding population and a rising standard of living. All of the projections point in that direction.

The OME program is primarily designed to encourage exploration for minerals which are in short supply or will be in the not too far distant future, and which will be required by an expanding economy. The extraordinary risks involved in searching for mineral deposits, the longtime lag between exploration and production, and the total loss of the investment in unsuccessful ventures with no possibility of converting to another type of business are among the factors that make an incentive program necessary. The supplies available and reserves developed for immediate production will have been consumed long before production begins from most of today's discoveries as the waiting time between the start of exploration and the flow of marketable ores from the mine is long—sometimes as much as 10 or 15 years.

We have vast areas of land which have not been explored for minerals. The mineral deposits, however, are not as easily found as in the past. They lie buried below overburden ranging from a few feet to several thousand feet in depth. Such deposits are now being found, but the risks and cost is so great that industry, especially the small operator, looks to other fields to invest funds. By sharing the risk and cost, OME channels some of this investment capital into exploration.

SHORT-TERM BENEFITS

Although the OME program is designed for the long-range needs of our Nation, it also results in benefits to the economy of today.

Every exploration project, whether successful or not, means more men at work, more supplies purchased, and more taxes paid in mining areas where most needed. Although we do not encourage the development of marginal, uneconomic deposits that would burden the minerals industry, there are and will be more discoveries of higher grade ore deposits, resulting in the development of economic mines that

can compete against the influx of imported ores, and in more employment and tax money for hard-hit mining communities.

If you have any questions, I shall try to answer them.

DMEA, OME, and Lead and Zinc Stabilization Programs

Mr. Fumich. My name is George Fumich, Jr. I am Acting Director of the Office of Minerals Exploration and, as such, I have three different responsibilities.

One, we administer the DMEA program, two, we administer the OME program, and three, we administer the lead and zinc stabilization program.

I also am Director of Coal Research. I will start on that after I finish the other three.

As you know, we are asking for $900,000 for fiscal year 1965. I think in order to give you a better perspective of that figure I should take about a minute to give you a little background of previous requests for the past 3 years.

When I first became director, we had a request for $750,000. We also had a $304,000 carryover which meant we had $1,054,000 for our program. The next year we had a $750,000 authorization. We also had $196,000 carryover which meant $946,000 in our program. This year, for fiscal year 1964 we have an $850,000 formal budget and a $145,000 carryover, meaning that we have $995,000 for fiscal year 1964. So, actually, we are asking for a formal increase of $50,000; but in reality it is a $95,000 decrease in funds available.

Now, to give you the reasons that we think that we need and can utilize the $900,000, I think perhaps we should go into the program just a little bit.

Contracts for Exploration Projects

This year so far we have signed nine contracts for exploration projects totaling $414,000. We have approved, and I have signed as the Acting Director, six different projects totaling $179,000, making a grand total of new business of $593,000, almost $600,000 in round figures.

We also have a project that we are now considering, totaling $48,000, which would throw that figure over $600,000.

We believe that we can easily utilize the $900,000 appropriation that we are requesting.

DMEA Program

Now, to give you a little perspective of the program, itself; as you realize, we are a successor to the DMEA organization that was terminated on June 30, 1958. Under that particular program, 3,888 applications were received and 1,159 contracts were signed, for a grand total of about $57 million. One billion dollars worth of ore was discovered in that program. Royalties amounting to $4.7 million have been received also as benefits under that particular program.

During my travels in connection with the program, I have checked with various individuals. One individual told me he had not only repaid the money he had borrowed, but had also paid a million dollars in income taxes.

Another individual told me that, as a result of an exploration project, he was expanding his force to a total of over 300 people. So,

you can see the indirect beneficial results emanating from the DMEA program which was terminated.

OME PROGRAM

We believe the OME program is just as beneficial, and we think it should continue.

Chairman HAYDEN. You may place in the record the statement which you furnished in connection with the lead and zinc stabilization program for which you are asking no funds in fiscal year 1965, depending on an estimated unobligated balance of over $1,600,000 to provide the financing you will need.

(The statement referred to follows:)

LEAD AND ZINC STABILIZATION PROGRAM

HIGHLIGHT STATEMENT

The Secretary of the Interior is authorized by the act of October 3, 1961, (Public Law 87-347) to establish and maintain a program of stabilization payments to small domestic producers of lead and zinc ores and concentrates produced during the calendar years 1962 through 1965.

The act authorizes maximum stabilization payments as follows:

Calendar year 1962	$4,500,000
Calendar year 1963	4,500,000
Calendar year 1964	4,000,000
Calendar year 1965	3,500,000

The fiscal year 1962 appropriation was $4,690,000 (no year money) and the fiscal year 1963 appropriation was $2,450,000 (unexpended funds revert to the Treasury).

Of the funds appropriated in 1962, $3,625,589 remained available at the close of 1963. It is anticipated that this amount will be adequate for obligations to be incurred during both 1964 and 1965.

Appropriation, 1963	$2,450,000
Unobligated balance available from prior year	4,690,000
Total available, 1963	7,140,000
Appropriation, 1964	
Unobligated balance available from prior year	3,625,589
Total available, 1964	3,625,589
Estimated obligations, 1964	−1,976,000
Estimated unobligated balance available, 1965	1,649,589

Analysis by activities

Activity	Amount available, 1963	Amount available, 1964	Amount available, 1965	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost	Program

AUTHORIZATION AND EXPENDITURE FOR THE PROGRAM

Mr. FUMICH. Yes, sir. We have a statement. Do you want me to make an informal statement on the lead and zinc program?

Chairman HAYDEN. Yes; if you will, but your prepared statement will be included in the record.

(The statement referred to follows:)

STATEMENT OF GEORGE FUMICH, JR., ACTING DIRECTOR, OFFICE OF MINERALS EXPLORATION

Mr. Chairman and members of the committee, no additional funds are required for the lead and zinc stabilization program during 1965. The funds available from previous appropriations are expected to be sufficient.

As of December 13, 1963, 75 small domestic producers of lead and zinc had received payments aggregating $1,772,000. Payments for fiscal year 1964 are estimated at $1,915,000 and for fiscal year 1965 at $1,588,589. Administrative costs are estimated at $61,000 for each year.

Under the act of October 3, 1961 (75 Stat. 766) small domestic producers may receive stabilization payments for lead and zinc ores or concentrates. To qualify for these payments the applicants must show that they are established producers whose production has not exceeded 3,000 tons of recoverable lead and zinc in any 12-month period since January 1, 1956, and that lead and zinc were the principal minerals produced.

Qualified small producers may receive stabilization payments on eligible production sold after January 1, 1962. The payment per pound for lead is 75 percent of the difference between 14.5 cents and the average New York price for the month in which the sale occurred. The payment per pound of zinc is 55 percent of the difference between 14.5 cents and the average St. Louis price for the month in which the sale occurred. The program will end on December 31, 1965.

The limited participation in the stabilization program may be attributed to the improvements in the market prices of lead and zinc and to the small number of producers who applied for participation.

Mr. FUMICH. Under the program in 1962, we were formally authorized a total of $4,690,000. We were also authorized for the 1963 fiscal year a total of $2,450,000. Now, we spent in calendar year 1962 $1,012,581 for subsidies during that period. We also had an administrative total of $51,830, making a grand total of $1,064,411. Now, subtracting the $1,064,000 from the $4,690,000 gives you a total of

$3,626,000 that we have available for the program during fiscal year 1964.

We expended $631,000 during 6 months of fiscal 1963 which meant that $1,819,000 reverted back to the Treasury. But we will not need any more money.

We are estimating that this program is going to cost during fiscal year 1965 a total of $1,650,000. This year it should cost $1,976,000, which means that we will have remaining for fiscal year 1965 enough money to continue the program.

We misjudged the scope of the program because when this legislation was passed it was estimated that during the first year, 1962, the payments would total $4½ million, the same amount in 1963, $4 million in 1964, and $3.5 million in 1965. So far, the total cost is $1,882,000, $96,000 of that being administrative expense.

We think the program has been administered very well. The total was about $51,000 for the first calendar year. It has been $44,000 so far during this year, making a total of $96,000 administrative funds already expended. We believe that for fiscal year 1965 it will be reduced to around $61,000.

PRODUCERS ELIGIBLE FOR THE PROGRAM

I think that from those figures alone you can get an idea of what is happening to the program. Originally, we thought that between 350 and 500 producers would become eligible for the program. The estimate was based on figures for the 5-year qualification period. For this program we have 5 years from January 1, 1956, to August 1961. Now we had estimates that there were 627 zinc and lead producers in the United States in 1956.

Senator BIBLE. What was that figure?

PROGRAM STATISTICS

Mr. FUMICH. 627 in 1956.

We also believed that 574 of those produced less than 3,000 tons of lead and zinc combined. In other words, they were eligible for that year.

In 1957 we found that 475 out of the 525 were small producers. The next year the figure was 326. The next year we found 213 out of 250 and the next year, 1960, 273 out of 350.

So, on the average, we figured at least 300 and probably 500 for the program as based on tonnage during that particular period.

For some reason we have only received 125 applications for the program. Of that number 98 have been certified and only 75 have received any payments.

The 75 were paid $1,786,000 during the program. Average tonnage was about 559 apiece. The average payment is about $23,800. The first year the figures were slightly smaller. We had 55 producers paid that year. The tonnage was 21,151 of lead and zinc combined. The average that year was 384 tons apiece, and I think the money expended for each producer averaged around $18,410. But this will give you an idea of what each producer received in the program on an average.

There were 10 States involved, and I can give you the number of applications and certificates in each State.

Chairman HAYDEN. Do you have a question?

Senator BIBLE. Mr. Chairman, I must compliment the witness on the method and manner of his presentation of statistics. He reminds me of our colleague, Senator Byrd, in this. He didn't consult a note. I trust his figures are right, and he reels them out like an IBM.

NUMBER OF EMPLOYEES OF PROGRAM PARTICIPANTS

I was one of the cosponsors of the lead and zinc program. I have mixed and mingled feelings about it. There are certainly a tremendously small number of participants at what it seems to me a rather high cost. In other words, you have told us as of December 13, 1963, you simply had 75 small domestic producers and you paid them $1,772,000 or $1,780,000, whatever it was. How many employees did these 75 producers have?

Mr. FUMICH. Sir, we have no figures on that. I am sorry to say I can't give them to you. We have tried to estimate how many participants might be encouraged into the program, and the resulting splaying over into the number of employees that would be increased in the industry. But we haven't been able to get those figures. We really don't administer the program. GSA administers it. We coordinate with them, and have the independent responsibility of reporting it.

Senator BIBLE. It seems to me that is a very, very small number, and I would have hazarded the guess that probably these small domestic producers, these 75 producers, are probably solo operators or maybe have one or two people along with them, what we think of as an old prospector.

Mr. FUMICH. If you don't get bored, I can give you some more figures on it.

Senator BIBLE. I don't want to lengthen the hearing; but I have some real doubt about the program.

BUREAU OF MINES STATISTICS ON PRODUCERS

Mr. FUMICH. Based on the Bureau of Mines statistics, we found that of the 574 producers producing less than 3,000 tons of lead and zinc combined, 420 of that group produced less than 100 tons each. They evidently fit the category you describe.

Senator BIBLE. A man producing that couldn't make much of a living.

Mr. FUMICH. That is it. A lot of those, because of attrition perhaps, or because the program was going to last only 5 years, went into other businesses. Out of 273 producers I mentioned in 1960 we found that 203 of that group produced less than 100 tons each, leaving 70 producers producing more than 100 but less than 3,000 tons each. It gives you a good idea of the great mortality rate in the small group.

Senator BIBLE. Just one more question, Mr. Chairman.

I have been interested in the region of the country this would help the most. Where are the 75 small domestic producers located?

LOCATION OF PROGRAM PRODUCERS

Mr. FUMICH. There are 125 that applied for the program and 98 were certified. Only 75 were paid so far. More will be paid. These are the only ones putting in invoices.

Senator BIBLE. I understand. Of 75 receiving payments where were they located?

Mr. FUMICH. We had 8 out of 9 in Nevada; 8 out of 10 in Montana; 3 out of 3 in California. We had 24 out of 30 in Oklahoma; 24 out of 29 in Idaho; we had in New Mexico 3 out of 4; in Arizona, we had 3 out of 4.

Senator BIBLE. Will you explain? You say in Nevada eight out of nine.

Mr. FUMICH. Eight producers were certified out of nine that applied for participation in the program.

Senator BIBLE. How many received payments in Nevada. I thought there was one producer in Nevada that received payments.

Mr. FUMICH. In Nevada, payments were $27,000. I know it wasn't much.

Senator BIBLE. I want to know how many producers.

Mr. FUMICH. Five producers were actually paid but there were eight eligible.

Senator BIBLE. I appreciate that information.

How many of the 75 were located in the so-called tristate area?

Mr. FUMICH. In Oklahoma 30 applied plus 6 in Kansas; so that would be 36. That would cover your tristate. None from Missouri.

Senator BIBLE. Those were the ones that received payments?

Mr. FUMICH. Thirty of these were certified eligible for the program. How many received payments? These would be eligible to receive payments.

Senator BIBLE. There were 36 in the tristate?

Mr. FUMICH. Twenty-six approximately out of that group have been paid.

Senator BIBLE. Thank you, Mr. Chairman.

Chairman HAYDEN. Any further questions?

Then I will ask you to take up the Office of Coal Research.

OFFICE OF COAL RESEARCH

STATEMENT OF GEORGE FUMICH, JR., DIRECTOR; ACCOMPANIED BY G. EDWARD LARSON, CHIEF, DIVISION OF CONTRACTS AND ADMINISTRATION; NEAL P. COCHRAN, CHIEF, DIVISION OF UTILIZATION; WAYNE A. McCURDY, CHIEF, DIVISION OF MINING AND PREPARATION; AND HOWARD A. SMITH, CHIEF, DIVISION OF ECONOMICS AND MARKETING

1965 BUDGET ESTIMATES

Chairman HAYDEN. The Office of Coal Research estimates its needs for fiscal year 1965 at $6,836,000, an increase of $1,761,000 over the fiscal year 1964 appropriation. The material submitted in justification of this budget request will be printed in the record.

(The highlight statement referred to follows:)

HIGHLIGHT STATEMENT

The Office of Coal Research estimate for fiscal year 1965 is $6,836,000. This represents an increase of $1,761,000 over the current fiscal year appropriation of $5,075,000. It is $24,928 less than the $6,860,928 available this year, which

includes the fiscal year 1964 appropriation of $5,075,000 and a carryover balance from fiscal year 1963 of $1,785,928.

The Office of Coal Research has a staff of 20 persons, 5 below the staff ceiling of 25. This ceiling has prevailed for the past 2 fiscal years.

Outstanding proposals for contract research work continue to come into the Office of Coal Research from industry, research organizations, and educational institutions.

The Office of Coal Research has signed a total of 17 contracts to date. Five have been completed. There will be several more signed with existing fiscal year 1964 funds and further contracts in fiscal year 1965 as outlined.

The General Technical Advisory Committee of the Office of Coal Research met twice during the past year and meet again in January 24, 1964. The Committee has been apprised of work underway as well as work contemplated. Individual members of the Committee have been consulted more frequently based on their special background and technical ability. Separate technical consultants have been used quite extensively to assist the Office of Coal Research in the review of the Office of Coal Reserach proposals and projects, and as a consequence the entire program has been benefited and strengthened through their advice and counsel.

The Office of Coal Research contractors have met with members of the Office of Coal Research staff on several occasions to discuss mutually the program under the respective contracts and also to exchange information and insure the greatest possible coordination of effort, and the avoidance of duplication.

The needs for funding of contract programs already underway will require the bulk of funds requested in the fiscal year 1965 the Office of Coal Research budget request. After these needs are met, it will be possible for the Office of Coal Research to carry out a total program no larger than the one which was possible this year.

Salaries and expenses

Appropriated, 1963	$3,450,000
Unobligated balance from prior year	113,237
Total available, 1963	3,563,237
Appropriated, 1964	5,075,000
Unobligated balance from prior year	1,785,928
Total available, 1964	6,860,928

SUMMARY OF INCREASES AND DECREASES, 1965

Administration and contract supervision: To provide for increased pay cost, 1964 positions	+11,000
Contract research: Net decrease in estimate over amount available due to carryover balance	−35,928
Net decrease	−24,928
Budget estimate, 1965	6,836,000

Analysis by activities

Activity	Amount available, fiscal year 1963	Amount available, fiscal year 1964	Estimate, fiscal year 1965	Increase (+) or decrease (−) fiscal year 1965 compared with fiscal year 1964		
				Total	Pay cost [1]	Program
Administration and contract supervision	$230,482	$325,000	$336,000	+$11,000	+$11,000	
Contract research	1,546,827	6,535,928	6,500,000	−35,928		−$35,928
Unobligated balance	1,785,928					
Total	3,563,237	6,860,928	6,836,000	−24,928	+11,000	−35,928

[1] To provide for increased pay costs for fiscal year 1964 positions.

JUSTIFICATION

OFFICE OF COAL RESEARCH

The Office of Coal Research (OCR) estimate for fiscal year 1965 is $6,836,000. This represents an increase of $1,761,000 over the current fiscal year appropriation of $5,075,000. It is $24,928 less than the $6,860,928 available this year, which includes the fiscal year 1964 appropriation of $5,075,000 and a carryover balance from fiscal year 1963 of $1,785,928.

The Office of Coal Research has a staff of 20 persons, 5 below the staff ceiling of 25. This ceiling has prevailed for the past 2 fiscal years, and OCR estimates that it may be possible to continue to perform its functions adequately during fiscal year 1965 at below the ceiling level.

Proposals for worthwhile contract research continue to be received from outstanding research-oriented organizations. A total of 277 proposals have been received from the inception of the Office to the present time. Currently, 12 contracts are underway. Five contracts have been completed. OCR has executed contracts in the past 6 months which greatly exceed in dollar amount the total of all contracts signed in the previous 2 fiscal years.

The contracts underway and planned complement one another in varying degrees. OCR seeks to assist the coal industry to be in a position, through the avenue of productive research, to avail itself of the opportunities that such research will afford for a stronger future role in the competitive fuels, energy, and byproduct markets in our Nation and abroad in the years immediately ahead.

The projects which OCR has underway or planned are aimed at improving the markets for coal in order to permit it to share more aggressively in the growing market for energy. In this connection, OCR is coordinating its efforts more closely than ever through our various panels of technical experts, and with the Bureau of Mines to insure a coordinated effort with present or prior private and governmental research.

Coal represents by far our greatest known source of energy, and it can become an increasingly important source of byproducts intended for further processing in America's growing industrial economy. Resources potentially available for use, total well in excess of 1 trillion tons.

The future will provide large-scale markets for coal in the areas of liquefaction and gasification, and the imminence of these new markets will depend on the results of the OCR contract research activity.

There is a growing requirement for coal and coal products to satisfy energy needs in a form that will most readily enable coal to meet consumer acceptance, and do it economically.

The program of the Office of Coal Research enables the Government to avail itself of all scientific skills that may in any way bear on coal technology, as well as of the extensive research backgrounds and facilities of outstanding research-oriented organizations in the country and enables the OCR to focus this scientific know-how on the problems of coal.

The Office of Coal Research gives emphasis to research and development projects involving relatively short-term effort and which offer a tonnage potential for improving coal's market position. OCR phases its contracts in such a manner that future work is contingent upon successful completion of the preceding phases.

The fiscal year 1965 budget requests contain only $500,000 to initiate contract work on new projects. The balance (exclusive of administrative and supervisory funds) totaling $6 million would be used to continue further efforts on contracts already in existence, or which is anticipated to be executed during the remainder of fiscal year 1964.

The problems confronting the coal industry are many and large. They have been developing over a long period of time, and a concerted effort will be required to diminish and alleviate the problems appreciably. The efforts of the Office of Coal Research to date have just begun to strike at the heart of some of these problems. In the future, considerably greater funds than are presently available may be necessary.

The recently published report of the Office of Science and Technology, Executive Office of the President, titled "Research and Development of Natural Resources" points out that, of approximately $1.5 billion of Federal research and development funds related to energy resources programed in fiscal year 1963, only about 0.4 percent is now directed toward coal. The report recommends more

coal research, in part to enhance its competitive position, but mainly because coal is regarded as a natural resource of tremendous significance, because we as a nation are blessed with relatively large quantities of it by comparison with other fossil fuels, and because coal is a valuable source of organic compounds and rare elements potentially useful for a wide variety of uses.

OCR PROJECT SCHEDULE

It is estimated that the fiscal year 1965 funds requested in this program for contract research ($6,500,000) would be used to fund continuing research on existing projects and to undertake research activity on projects shown in "C" (below):

A. Projects under contract (Dec. 31, 1963):
1. Pope, Evans & Robbins.[1]
2. Virginia Polytechnic Institute.[1]
3. FMC Corp.[1]
4. General Electric Co.[1]
5. Ralph M. Parsons Co.
6. West Virginia University [1a].
7. Spencer Chemical Co.
8. University of Utah.[1]
9. Westinghouse Electric Corp.
10. Consolidation Coal Co.[2]
11. Rand Development Corp.[2]
12. Bituminous Coal Research, Inc.[2]

B. Projects expected to be awarded contracts during remainder of fiscal year 1964:
1. M. W. Kellogg Co.
2. Institute of Gas and Technology.
3. Melpar.
4. South Dakota lignite project.
5. Pennsylvania State University.
6. Atlantic Refining Co.
7. General Electric Co.[3]
8. Economics (General).
9. Transportation system projects.

C. Projects proposed for contract in fiscal year 1965:
1. MHD Research, Inc.
2. Spencer Chemical Co.[3]
3. Iowa State University.
4. Westinghouse Electric Corp.[3]
5. West Virginia University.
6. Virginia Polytechnic Institute.
7. Parsons-Jurden, Inc.

[1] Project totally funded as of Dec. 31, 1963.
[1a] To be totally funded by June 30, 1964.
[2] Signed in fiscal year 1964.
[3] Contemplated extension of existing contract.

Description of projects to be funded with fiscal year 1965 moneys follows:

A. PROJECTS UNDER CONTRACT (DECEMBER 31, 1963)

1. Pope, Evans & Robbins

Designs and specifications for two alternative versions of a new automated coal-fired boiler plant developed under this contract were released to the public December 23, 1963.

In addition to the presently completed plants having a capacity of 100,000 pounds per hour of steam, additional designs will be developed and made available for plants of 80,000, 60,000, and 40,000 pounds of hourly capacity. Each design will offer above and below-ground coal-storage options.

It will be possible to install these units at costs considerably below present coal-fired units in this capacity range and will require no more attendance than oil and gas-fired units. The designs and specifications are of such detail and quality that, except for normal site engineering, a designer or manufacturer of coal-burning systems would be able to build a plant from them.

2. Virginia Polytechnic Institute

Mathematical model mining systems have been developed involving loading machines, continuous mining machines, and commonly used production area haulage systems. Models have also been developed to describe the cost of production supplies under these mining systems.

The computerized mining system programs have been field tested to a limited degree and have been demonstrated to correctly describe the actual operation and performance within a few percentage points.

Full-scale testing and demonstration of the program's accuracy and capability have begun. Actual mining operations will be varied as indicated by the computor methods to improve operations. Performance will then be compared with the computed improvements.

3. FMC Corp.

A laboratory-scale process has been developed for producing liquid crude from coal. The quantity of liquid is sufficient to act as a vehicle for transporting the remaining solid portion of the coal. Extrapolation of these results to a conceptual commercial plant indicate a solid commercial potential. During this fiscal year (1965) the contractor will be operating at a process development scale (about 100 pounds per hour) to confirm these laboratory results.

4. General Electric Co.

The General Electric Co. has hydrogenated coal at low pressure and temperature under the influence of corona. These test results, extrapolated to a full-scale plant, indicate commercial feasibility. Results are currently being checked and if these data can be validated, piloting of the process will be undertaken during fiscal year 1965.

5. Ralph M. Parsons Co.

This contract is presently inactive, and will not become active until the design and pilot plant development stage of the Consolidation Coal Co. is reached. At that time there will be further need for the services of Parsons.

6. West Virginia University

This contract seeks to determine the quantity, quality, and means of economic recovery of potentially valuable secondary products found in or adjacent to mineable coal seams. High-alumina clays underlying several major coal seams have been located and mapped, as well as other clays that appear amenable to processing to ceramic grade. Several seams has been determined to contain potentially interesting concentrations of germanium and other minerals and ores.

The university has developed a potentially patentable low-cost process for making super strength brick and other construction materials from fly ash, coal-associated sand and clay, and sodium silicate. Additional investigation of this development will be made.

7. Spencer Chemical Co.

The Spencer Chemical Co. has successfully operated their process development plant and have shown that a high quality, very low-ash coal can be produced at competitive prices. Commercial interest in this development is very substantial and estimates for piloting this process are currently being reviewed. Preliminary design of the pilot plant will be undertaken by April 1964.

8. University of Utah

The contractor is continuing the laboratory testing of reactions of western coals. Small-scale hydrogenation equipment is being installed and will be operable during the first half of 1964, thus considerably expanding the field of investigation.

9. Westinghouse Electric Corp.

The contractor is making good progress in developing economical materials, methods of construction, and methods of operation of a fuel cell with coal-derived gases. The objective is to produce a high temperature fuel cell system producing direct current electric power from coal in a compact, high-efficiency, economically attractive system. Fifteen-cell batteries have been built and operated and a 100-watt system soon will be constructed.

While many problems remain, the rate of progress in solving previous problems has been good and the possibilities for ultimate success in developing a useful coal utilization system are good.

10. Consolidation Coal Co.

This project was executed on August 30, 1963. The objective is to develop an economically competitive coal-to-gasoline process through the pilot plant stage. Work is presently proceeding on a bench-scale effort, primarily centered on the catalytic hydrogenation step which is a key to ultimate successful operation. Good progress has been made with preliminary indications of better results than originally contemplated. In addition, work is proceeding on planning for the engineering of the pilot plant which will be built and operated if the present bench-scale work is successful.

11. Rand Development Corp.

This contract has just begun. The project is directed toward developing an entirely new use of coal for treating sewage and industrial wastes. Success could open a new market for over 1 million tons of coal within a few years, and a market that will continue to expand. The Public Health Service has indicated that many waste treatment plants will be built and others will require expansion within a few years, making it desirable that this project be demonstrated quickly so that coal may share in the predicted expansion of sewage-treatment facilities.

The research work will seek to develop an integrated process whereby the unique properties of coal as an adsorbent and settling agent are utilized to facilitate the removal of sewage and industrial wastes from water.

12. Bituminous Coal Research, Inc. (Project Gasification)

This project will be directed toward development of gasification equipment for the industrial energy market, for generation of synthesis gas, and for a gas to transport low-ash coal in a coal-gas pipeline. Emphasis will be on improving throughput and on reducing costs. Use of waste products from existing coal-preparation plants will be evaluated as raw feed.

This work is related to other aspects of OCR's program in gas manufacture, in transportation of coal in coal-gas pipelines, and in the search for a low-cost fuel for the fuel cell under development in the Westinghouse project.

Work will be coordinated with the M. W. Kellogg and IGT projects.

B. PROJECTS EXPECTED TO BE AWARDED CONTRACTS DURING REMAINDER OF FISCAL YEAR 1964

1. M. W. Kellogg Co. (Project Gasification)

This work will seek to develop a method for gasifying coal with use of air rather than oxygen. The gas produced can be used to manufacture pipeline gas, chemicals, or to transport high-quality coal in a coal-gas pipeline. Low-cost hydrogen, needed in all conversion processes, may also be produced.

It is planned that Kellogg will provide engineering services to BCR and IGT for design and construction of pilot plants.

2. Institute of Gas Technology/American Gas Association (cosponsor) (Project Gasification)

This proposed project will accelerate development work currently underway and is an outgrowth of work performed in the past by IGT and the Bureau of Mines. The object is to produce pipeline gas at 50 cents a million B.t.u.'s, which may be sold to pipeline companies or directly to utility companies for distribution. Gas at 50 cents a million B.t.u.'s would be a technologic and economic breakthrough; the barrier is a cost of about 70 cents a million B.t.u.'s. Pilot-plant operation is contemplated. The outlook is for one commercial plant by 1970 and for three plants by 1975, for a coal consumption on the order of 10 million tons a year by 1975. Development of a high-B.t.u. gas to supplement natural-gas supply would benefit the coal and natural gas industries alike.

3. Melpar, Inc. (Project Anthracite)

This is the only promising project regarding anthracite that OCR has yet been able to develop. It would cover laboratory scale, bench scale, and pilot plant work in turn. The objective is to (*a*) reduce the ash content of anthracite, (*b*) make acetylene from some of it, (*c*) make a gas from the rejected anthracite, and (*d*) transport the high-value low-ash anthracite in the gas, for sale to nearby electric-generating plants. Proceeds from sale of the acetylene would be used as a credit to reduce the cost of the anthracite in order to assure anthracite sales.

If successful, this project could increase the annual production of anthracite by 5 million tons by 1970 and by 10 million tons by 1975. (1961 production was about 18 million tons.) Additionally, cheap acetylene could be instrumental

in creating a chemical manufacturing industry in the anthracite area, with additional attrition on unemployment. The project is related to other work of the Office of Coal Research in its gasification and coal gas pipeline phases.

4. South Dakota lignite project

This work is to develop a feasible process for producing gas from South Dakota lignites. An analysis of all known technology, supported by laboratory investigation, will be made to determine the best process. Based on this, a pilot plant will be constructed and operated to test the commercial value of the process.

5. Pennsylvania State University (Project Petrography)

This project would determine (*a*) whether certain constituents of coal may be convertible to liquid or gas more readily than others, (*b*) whether such constituents can be commercially concentrated, (*c*) what coal constituents contain the materials that found the catalysts in conversion operations, and (*d*) whether this material can be eliminated in ore-dressing operations. By eliminating the handling of worthless material, and by eliminating also the catalyst poison(s), success of this project would improve drastically the economics of all coal-conversion projects; a successful end result may be the determining factor as to whether a conversion process can be developed to the point of commercial use. The reject material may be more suitable for gasification than is regular coal.

6. Atlantic Refining Co.

This proposed project is to develop a process for mixing coal and residual fluid oil and treating the mixture to produce refinery feed stock and a low-priced coke for burning in nearby central station electric-generating plants. Any commercial plant would be at an oil refinery (oil refineries have and use part of the necessary equipment) and would be part of the refinery operation. Successful conclusion of the project would open up a market to coal not heretofore considered breachable via the OCR program; i.e., the residual fuel oil market (largely the northeastern seaboard area), in which there are many oil refineries and nearby power-generating plants.

In addition to the main process development, supporting research in the fields of catalysis and utilization of byproduct asphalts would be performed, work that could be universally useful in all OGR's coal conversion projects.

The earliest commercial plant would be about 1970, but by 1975 the new coal consumption could be about 3 million tons a year.

7. General Electric Co. (Project Bootstrap)

General Electric has produced gases and liquids from coal in small laboratory electric corona reactors without catalysts. Current efforts are directed toward testing the process in a larger reactor of improved design. It is expected that the yield of both liquids and gases will be improved.

If the yield is improved, and the apparent process economics are satisfactory, a pilot plant project may be undertaken. The commercial tonnage potential is estimated at perhaps 4 million tons a year by 1970.

8. Economics and marketing projects (general)

The Economics and Marketing Division is a point of evaluation of proposals received by the Office of Coal Research, as well as of economic evaluation at points of progress on going projects. In the course of this work areas may be revealed that require further economic research. Some of this can be done by the Division itself, but others require the more intensive efforts available through contract. Areas of activity being investigated for research projects are transportation, capital investment, and marketing.

9. Transportation system projects

The Office of Coal Research has several proposals in hand directed toward developing an integral transport system capable of delivering coal over a distance of several hundred miles at costs much below present rail rates. The advice of the OCR General Technical Advisory Committee is being sought on the precise nature and financial terms of research to be undertaken.

A successful end result would make possible substantial reductions in the total cost of delivered coal, and should attract or recover an ever-increasing number of large, bulk consumers; such as power generation stations and export markets.

C. PROJECTS PROPOSED FOR CONTRACT IN FISCAL YEAR 1965

1. MHD Research Corp.

MHD Research Corp proposes to apply latest developments in chemistry to

development of a process for commercial production of hydrogen. The cost of hydrogen is important in the economics of all coal-conversion processes. It is usually manufactured from natural gas at a cost of 35 cents or more per thousand cubic feet in the coal-producing areas. The target of the MHD process is a cost of about 25 cents a million cubic feet. Success could help assure the success of the Consolidation Coal Co. project and like projects.

The process would employ modern plasma (ionized gas) chemistry. Successful commercial application of plasma chemistry to coal would undoubtedly lead to other processes producing chemicals and fuels.

2. Spencer Chemical Co.

Successful completion of operations in the 100-pound-per-hour unit described under A may necessitate larger scale operations as a prelude to commercial scale production. A pilot plant with an estimated capacity up to 100 tons of coal feed a day would be constructed, probably in a suitable coal-producing area. Its output will be utilized and tested in commercial, or simulated commercial, channels. Successful completion of this operation should provide a sufficient basis for construction of full-scale commercial plants by others.

3. Iowa State University

This project is to explore, on a laboratory basis, a system of processing coal by electric resistance heating in a fluidized bed reactor. Theoretical considerations indicate that this method has the potential of producing a wide range of useful chemicals, liquid fuels, and gases from coal. This idea will be explored in the laboratory on a very small scale. Successful experiments will be followed by testing in the engineering lab. The end result of this exploratory work will be a process for subsequent development.

4. Westinghouse Electric Corp.

If the proposed 100-kilowatt coal-fed fuel cell described under A is successful, the next stage would be to build and operate a pilot plant unit. This unit would have a capacity of about 10,000 kilowatts. It probably would be constructed in a coal-producing area. It would be operated for a sufficient period of time to determine operating and design variables and to provide a firm basis for the construction by others of a full-scale commercial installation.

5. West Virginia University (Project Methane Recovery)

Work under this proposed contract would seek to determine an economically and commercially attractive method to recover free methane from coal seams prior to mining. The removal of the methane would permit safer, lower cost mining, provide a secondary mining product, and increase the Nation's natural gas reserves, and would provide a low-cost source for the hydrogen required in coal-conversion processes. OCR would seek to join it with the work of the Bureau of Mines in driving methane ahead of mining operations.

6. Virginia Polytechnic Institute

The work proposed is planned as an extension of coal mining operations research being performed under an existing contract with VPI. The present work is successfully developing formulas and models that permit simulation of lowest cost coal-production methods. The proposed contract would extend these novel techniques to cover the entire mining system, including power, transportation, ventilation, and coal cleaning, in order to bring about the lowest possible cost of coal delivered to the railroad car, pipeline terminal, or point of use.

Success of this project may lower the price of coal at the mine by several mills per million British thermal units and permit coal to expand its markets in major energy consuming areas.

7. Parsons-Jurden, Inc.

This proposal is closely related to the Southern Research Institute proposal. It would be an engineering study of the overall economics of the transportation of coal by pipeline, covering the use of both liquids (water and liquids derived from coal and petroleum) and gases (air, coal-derived gas, and natural gas) as the carrying medium. The final result would be a handbook of readily available data that would permit quick evaluation of economics and feasibility of any type of coal pipeline, located anywhere in the United States. The contractor also would make specific studies of the economics of coal pipelines in three actual locations: From the Kentucky-West Virginia coal area to the New York City areas; from the southern Illinois coal area to the Chicago areas; and from the Rocky Mountain coalfields to the southern California area.

This project is related to those other OCR projects concerned with the production of liquids and gases from coal, the fine grinding of coal, and the pro-

duction of low-ash coal. One way to get these products to competitive market is by pipeline. The results of this contract would provide a ready means of evaluating the factors required to connect, by pipeline, the various individual producers, processors, and users into an integrated economically feasible system.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$1,777,309	$6,860,928	$6,836,000	−$24,928
Unobligated balance brought forward	113,237	1,785,928		+1,785,928
Unobligated balance carried forward	1,785,928			
Appropriation	3,450,000	5,075,000	6,836,000	+1,761,000
Obligations by objects:				
11 Personnel compensation	186,738	249,000	260,000	+11,000
12 Personnel benefits	13,351	20,000	20,000	
21 Travel and transportation of persons	9,455	21,000	21,000	
22 Transportation of things	17	2,000	2,000

Chairman HAYDEN. If you have a written statement, you may file it in the record; or you may read it, if you prefer.

Mr. FUMICH. Sir, I think you have our statement.

Chairman HAYDEN. You can file that for the record.

Mr. FUMICH. Yes, sir.

(The statement referred to follows:)

STATEMENT OF GEORGE FUMICH, JR., DIRECTOR OF COAL RESEARCH

Mr. Chairman and members of the committee, it is a pleasure to appear before this committee on behalf of the Office of Coal Research program and I welcome the opportunity.

As you may be aware, the Office of Coal Research was without a Director from May 1, 1963—when Mr. Lamb left—until I was sworn in on November 1, 1963. If the committee wishes, I shall review my previous background, otherwise shall simply make available, for the record, a copy of the Department's press release which was issued at the time I was sworn in my new appointment.

The Office of Coal Research has signed a total of 17 contracts. Five of these have been completed. Twelve are currently in effect. Three of these were signed in the present fiscal year. The projects which have been completed, as well as those that are current, cover problems on which the coal industry needs research assistance and answers—economics and marketing, exports, mining and preparation, combustion, conversion, liquefaction, and gasification. Future work on proposals presently in hand, and projected for contract during the remainder of this fiscal year and in fiscal year 1965, will undertake additional, nonduplicative efforts in further areas of marketing, gasification, conversion, transportation, mining, and preparation.

Negotiations and planning are well advanced on several additional proposals which may result in contract awards before the end of this fiscal year. Funding on existing contracts as well as requirements for those which we plan to execute during the remainder of the fiscal year will, we estimate, quite fully utilize available contract funds.

OCR continues to receive good proposals for desirable research work from research-oriented organizations possessed of some of the finest scientific research brains in the country. We continue to review, evaluate, and screen out for contract only those contracts which it is desirable to go forward on at this time within the limitation of available and projected funds.

As a result of foresight and responsible action by members of this body and the entire Congress, in establishing the Office of Coal Research, we believe that the whole climate for research on coal is changing. As a result of this program we are already witnessing a degree of interest in coal as a raw material source for a host of new products which must rival the fondest hopes that had been envisioned by the supporters of the legislation. It is true that some quarters still think of coal solely in its raw energy form. But a new concept is beginning to take shape, stimulated in no small measure by the contract activities of OCR. This new concept entails an active interest in coal as a commodity, which through a variety of processes, temperatures, pressures, and considerable scientific know-how, can be processed and manipulated in such a way that the secrets are being unlocked. We hope, through research, to develop these ideas to their fullest economic potential. In so doing, we believe that the objectives of the Congress and the administration will be served, and that the Nation will be able to add additional strings to its economic bow for the betterment of the coal industry and the economy as a whole.

Following is a listing of action taken or contemplated on proposals submitted to OCR by various organizations:

Action:	*Proposals received*
Rejected	199
Withdrawn	12
To be evaluated	9
Under consideration	35
Contracts under negotiation	6
Contracts in operation	12
Contracts completed	5
Total	278

It is noteworthy that OCR has nearly six times as many proposals under consideration as it has proposals being negotiated for contract. In addition to a tinue to be important elements in our consideration of proposals for contract: tinue to be impotrant elements in our consideration of proposals for contract: Coal tonnage potential; economics of process or product; cost of project; suitability of contractor's personnel and facilities; time schedule for completion of contract work; and the applicability of the work to be undertaken to other elements of OCR's total program.

We believe that OCR's arrangements with the Bureau of Mines are functioning more smoothly and with better understanding than ever. Through these working-level arrangements and frequent day-to-day contact between our respective staffs we seek to avoid any duplicative efforts in any contracts. We are also working closely with the Bureau on precontract evaluations to preclude and minimize subsequent problem areas.

The General Technical Advisory Committee has met three times in the past 6 months. And OCR is utilizing to a greater degree than before, the services of its very able technical panelists who represent a broad range of scientific disciplines. Through the use of the GTAC and these scientists we believe that it has been possible for OCR to achieve the benefit of viewpoints reflecting years of experience and scientific know-how resulting in substantial value to the Government in the form of best potential contracts as well as continuing evaluation of results on existing contracts to insure a dollar of research effort for every dollar spent.

The OCR staff is presently comprised of 20 individuals—11 professionals and 9 clerical. This is five below our ceiling. We believe it may be necessary to eventually ask for an expansion of present ceiling levels, but this is not contemplated in our fiscal year 1965 request. It shall be our continuing endeavor to operate our program and utilize our manpower in such a manner that will preclude any requests for additional staff until absolutely necessary. We believe that the increasing contract workload, and the ratio of administrative and supervisory costs in our budget to contract costs helps to bear out this position.

The brief descriptions of OCR projects which are currently under contract, as well as those which are under consideration for contract during the remainder of this fiscal year and projects planned for contract in fiscal year 1965 are shown in "justifications for appropriations."

If there are questions or clarifications that I or members of my staff can assist on we shall do our best to provide such information.

Thank you.

BUDGET AUTHORIZATIONS

As you know, we are asking for $6,836,000 for fiscal year 1965. This is an increase of $1,761,000 over fiscal year 1964 but is an actual decrease of approximately $25,000 compared with total funds available in fiscal year 1964.

As you know, this program was inaugurated in 1961. That year, we were authorized $1 million of which $200,000 was authorized for administration. We actually spent $60,000. So, to give you a percentage ratio of administration money to total obligations, it was 20 percent. However, the ratio of administrative expenditures to appropriations was only 6 percent.

The next year another million dollars was appropriated. We had a $940,000 carryover, and were authorized $225,000 for administration. Of this administrative money we actually spent $196,000. We had an administrative percentage ratio of aproximately 22.5 percent based on the total of appropriated funds plus carryover. However, the ratio of administrative funds expended as a percentage of total funds available was only 10.1 percent.

The next year we had an authorization of $3,450,000. We had a carryover of $113,000. Our administrative figure was $311,000. We actually spent $230,000. Our ratio that year was 9 percent.

In fiscal year 1964 we receive an appropriation of $5,575,000. We had a carryover of $1,786,000. We were authorized $325,000 for administration. We estimate that $300,000 of that may be spent so our administrative percentage ratio should come down to 6.3 percent.

As you see, we are asking for $6,836,000 in fiscal year 1965; $336,000 of that will be for administration which means the administrative ratio has come down to 4.9 percent.

I am trying to show that the administrative cost ratio has been reduced from a total of 20 percent in 1961 to 4.9 percent for fiscal year 1965. These are authorized funds and not funds actually spent because if we include the carryover funds the percentage comes down even more.

1965 PLANNED PROGRAM

Chairman HAYDEN. Would you set out for the committee the need for the increase in the 1965 budget estimate over the amount appropriated to you in 1964, which in itself was $75,000 more than last year's budget estimate? Why do you have to have $75,000 more?

Mr. FUMICH. Sir, the bulk of the funds will be needed for projects now in our program. Some of these projects are moving into the latter and more expensive stages. Even with the increase we will be able to include only a few new projects.

MORE MONEY NEEDED FOR THE PROGRAM

I consider the OCR program in the intermediate period now. It is costing money. A little later, these increments are going to be even larger and in order to carry the program through we are going to need more money because, in order to get new projects in the program and complete these other projects, it is going to mean an escalation upward.

PROPOSED FUNDS FOR PROJECTS

Chairman HAYDEN. If feasible, I believe that it would be well to insert in the record a table showing the amount of funds which you propose for each of the 21 projects listed on pages 8 through 18 of your budget presentation.

Mr. FUMICH. I could give you that right now.

Senator BYRD. Mr. Chairman, I suggest that he put into the record the table and let the Senators ask questions concerning whatever projects they have in mind. I don't think the committee has the time to listen to a long rigamarole of memorized statistics. If he will insert the table in the record, we can study it to our hearts' content.

Chairman HAYDEN. We will do that.

(The table referred to follows:)

Contracts awarded by the Office of Coal Research

Date of award	Estimated, total cost	Contractor	Purpose
Aug. 4, 1961 (completed May 1962) (10 months).	$139,600	Booz, Allen & Hamilton, Inc., Chicago, Ill.	To identify new products, which are economically and technically marketable, that would expand present coal markets and generate new ones. The study has been completed.
Oct. 5 1961 (completed October 1963) (24 months).	170,000	Bituminous Coal Research, Inc., Monroeville, Pa.	To study the preparation, transportation, and utilization of superfine pulverized coal. Specific objectives are (1) to develop systems for preparing pulverized coal with the removal of sulfur and ash content, (2) to devise continuous transportation systems from mine to factory, and (3) to design and operate boilers to burn superfine coal in continuous sequence with transportation systems.
Feb. 26, 1962 (36 months).	164,185	Pope, Evans & Robbins, New York, N.Y.	To design and develop a new, completely integrated, coal-fired industrial heating plant of intermediate-size range requiring minimum attendance and space, and with initial and operating costs considerably more favorable than existing coal-fired equipment.
Mar. 29, 1962 (30 months).	750,000	General Electric Co., Schenectady, N.Y.	To study the conversion of coal to gas liquid fuels and chemicals using electrical corona as the catalyst.
Mar. 29, 1962 (27 months).	122,000	Virginia Polytechnic Institute, Blacksburg, Va.	To develop scientific engineering methods and formulas for determining the most favorable combination of various elements in underground mining which can be controlled by the mine operator to insure lowest cost production under the physical conditions existing in his coal-producing sections or face areas.
Mar. 29, 1962 (completed (March 1963) (12 months).	24,000	Georgia Tech Research Institute, Atlanta, Ga.	To study the reactions which occur between pulverized coal and various gases at high temperatures, and to identify the products or compounds formed.
May 16, 1962 (30 months).	1,121,000	FMC Corp. (formerly Food Machinery & Chemical Corp.), Princeton, N.J.	To determine the possibility of deriving from coal a synthetic crude oil of a kind that, mixed with the residue (char), can be transported by pipeline.
May 16, 1962 (42 months).	444,000	The Ralph M. Parsons Co., Los Angeles, Calif.	To analyze the engineering and economic feasibility of a process owned by the Consolidation Coal Co., Pittsburgh, Pa., to convert coal into gasoline and to act as design consultants to OCR during pilot plant construction, operation, and evaluation.
Aug. 14, 1962 (30 months).	139,140	Board of Governors of West Virginia University, Morgantown, W. Va.	To determine and evaluate the economics of processing marginal byproduct materials closely associated with minable coal.
Aug. 22, 1962 (30 months).	1,240,000	Spencer Chemical Co., Kansas City, Mo.	To produce low-ash and low-sulfur coal through solvation techniques.

Contracts awarded by the Office of Coal Research—Continued

Date of award	Estimated total cost	Contractor	Purpose
Aug. 24, 1962 (36 months)	[1] $102,397	University of Utah, Salt Lake City, Utah.	Bench-scale testing of the response of powdered coal in an electric arc, by flash photolysis, and in other reactions, toward recommending a final process for converting western coals into gaseous and liquid fuels.
Aug. 24, 1962 (completed December 1963) (16 months).	26,000	Endowment & Research Foundation, Montana State College, Bozeman, Mont.	To determine the yield and composition of liquid and gaseous products from bituminous coals.
Nov. 7, 1962 (completed September 1963) (12 months).	86,000	Robert R. Nathan Associates, Inc., Washington, D.C.	To study the coal export potential, identify the impediments to the full achievement of that potential, and recommend actions by Government and industry for expanding coal exports.
Dec. 5, 1962 (30 months)	1,000,000	Westinghouse Electric Corp., Pittsburgh, Pa.	To develop a fuel cell burning pulverized coal, a gas derived from coal, or a combination. End result will be construction and operation of a 100-kilowatt prototype cell system operated in conjunction with a connected dc load to provide engineering data required for the design of a commercial plant.
Aug. 30, 1963 (72 months)	9,993,000	Consolidation Coal Co., Pittsburgh, Pa.	Under this contract, a pilot plant will be designed to convert approximately 24 tons of coal per day into gasoline. The plant will be operated to determine the process and equipment alternatives which could enable a full-scale plant to be designed and built as a commercial venture by a private enterprise. The contract involves bench-scale research, design and construction of pilot plant facilities, and operation and evaluation of the pilot plant.
Nov. 12, 1963 (18 months)	164,000	Rand Development Corp., Cleveland, Ohio.	This contract will explore methods for utilizing coal to the treatment of sewage and industrial wastes. An attempt will be made to develop integrated processes utilizing fine-size coal. The use of coal as an adsorbent, settling agent, flocculent, and filter aid will be explored for the purpose of facilitating removal of sewage and industrial wastes from water and subsequent use of the heating values of the coal in treatment and removal of solids for incineration heat or steam generation.
Dec. 20, 1963 (36 months)	975,000	Bituminous Coal Research, Inc., Monroeville, Pa.	The overall objective of the contract is to develop equipment to produce gases suitable for process heat, as a source of hydrogen, or to mix with pulverized coal for pipeline transportation. It is anticipated that equipment can be developed ranging in size from small-scale use to very large scale applications, opening new markets to small, medium, and large coal producers.

[1] Cosponsored, OCR 150,000, University of Utah

South Dakota Lignite Project

Chairman Hayden. Will you please advise the committee of the South Dakota lignite project, indicating how much you have expended of the $375,000 made available for this project last year, when you expended it, and where?

Mr. Fumich. Sir, of the $375,000 that was authorized for that program, we have expended $10,000. We had four proposals that were submitted for project consideration. We had these particular proposals analyzed by the Bureau of Mines as well as by our own staff. They have recommended that we proceed with one of the proposals.

Chairman Hayden. Senator Mundt, did you want to ask a question?

Senator Mundt. If I may, because I have my TV program to do at

12. I don't have too many questions. We have covered this so many times, and I think we pretty well understand each other.

LIGNITE GASIFICATION PILOT PLANT

The project I am primarily interested in is the lignite gasification business. Last year you will recall that at my request our subcommittee added $375,000 to the Office of Coal Research budget. And the conference report directed $375,000 for planning and engineering a pilot plant in South Dakota for production of gas from lignite.

Now, we have been making some progress on this project. It hasn't been as fast as either one of us anticipated, but I wonder if you would bring us up to date as to just where we stand now.

Mr. FUMICH. Sir, as I stated previously, we received four different proposals based on the concept you had in mind. We had these proposals checked by the Bureau of Mines in their Morgantown Center as well as evaluating them in OCR. The Bureau checked these proposals and recommended one proposal as worthwhile to proceed on to a contract. We have expended $10,000 of the $375,000 that was authorized for the project.

Senator MUNDT. If you award a contract, will you require additional funding in fiscal year 1965 and, if so, how much?

FUNDING REQUIRED IF CONTRACT AWARDED

Mr. FUMICH. Yes, sir; if this contract is awarded, it will require $500,000 in additional funding for fiscal year 1965.

Senator MUNDT. Do you think you will finalize that contract before we get around to the markup of this year's budget?

Mr. FUMICH. I think there is a possibility but it would be hard to say.

Senator MUNDT. This would give you perhaps a month or 6 weeks?

Mr. FUMICH. Yes, sir.

Senator MUNDT. When will you be ready for the actual pilot plant design?

Mr. FUMICH. Sir, we estimate that that would be approximately 18 months from the date of the contract signing.

Senator MUNDT. And what is your estimation of what the total project will cost?

Mr. FUMICH. Sir, we have an estimate on that but I would prefer to give it to the committee confidentially.

Senator MUNDT. Will you send it up?

Mr. FUMICH. Yes, sir.

MERIT OF LIGNITE GASIFICATION PROJECT

Senator MUNDT. I have heard so many disturbing rumors that the lignite gasification project might be taking a back seat to other projects that you are working on or thinking about. Now, it is my opinion with regard to the merit of other projects that this one should stand on its own feet and we should try to make something out of these tremendous lignite resources. So, I am asking for the record if you are sure that this lignite program will go forward on its own without becoming secondary to some other project or involved with other projects so that the tail wags the dog, which I wouldn't like to see happen.

Mr. FUMICH. Sir, I have only been in the office for 3 months. I don't know what the basis was before that for the rumors, but I do know that we are pushing this as fast as we can. We are not trying to subordinate it to other projects.

Senator MUNDT. Any rumors which may be circulating are unfounded as far as your jurisdiction is concerned?

Mr. FUMICH. As far as my jurisdiction and as far as my personal knowledge is concerned.

Senator MUNDT. Thank you.

That is all, Mr. Chairman.

Senator HAYDEN. Also, would you bring the committee up to date on the increases provided by Congress for the Office of Coal Research in last year's bill?

LIGNITE AND PROJECT BOOTSTRAP

Mr. FUMICH. The $75,000 net increase, sir, was for the General Electric Project Bootstrap, lignite gasification, and alumina extraction. The net increase was small because there was a very sizable reduction in the amount appropriated for Project Gasoline compared to OCR's request. We are getting into an evaluation stage on Project Bootstrap the first part of this coming month. In fact, on March 3 and 4 we are going to evaluate the program. If it looks as good as we think it does we will go into the next stage. I don't want to mention what funds will be involved right now because I would rather submit that to the committee.

PROJECT GASOLINE

Also other funds that were mentioned in that particular category were for Project Gasoline. I'd better give the committee a little bit of personal history. I used to be an attorney for one of the subsidiaries of Consolidation Coal Co. That was before I joined the Office of Mineral Exploration as Director. Because of that past association, I would prefer to have one of the other members discuss that particular contract at the proper time.

Chairman HAYDEN. Do you have any questions?

Senator BIBLE. I have none.

Chairman HAYDEN. Anybody else?

Senator MCGEE. I have one, Mr. Chairman.

CONVERTIBILITY OF WYOMING COAL

Last fall, I was advised by the Office of Coal Research about the developments in this contract with Consolidation Coal Co. for a pilot plant in West Virginia in which we are all very much interested. I wrote the Department at that time expressing Wyoming's particular interest in that plant. As you know, our State is heavily underlaid with great deposits of coal. It used to be one of our very largest industries. Now southwestern Wyoming is an area of substantial unemployment because of the dieselization on the railroads and other factors that have reduced our coal operations. And so we are keenly interested in what comes from this pilot plant in West Virginia and would like to know from your office whether Wyoming coal, as we requested, would be utilized in the operation there in order to determine its convertibility.

Mr. FUMICH. Sir, my understanding is that it will be.

Senator MCGEE. Wyoming coal will be run through the plant?

Mr. FUMICH. Yes, sir.

Senator MCGEE. Do you have another plant affecting the State of Wyoming?

WESTERN COALS STUDY

Mr. FUMICH. Sir, at this time we are thinking about going into a western coals study. We believe that in order to really get some guidelines we should know where we are going, and then point our efforts in those directions. We have to walk before we can run. We will be getting into that particular phase in the very near future, sir. We have had two contracts dealing with western coals. One with the University of Utah and one with Montana State, both in the nature of research studies. We do think that after the particular economic studies that we are contemplating making in the near future we will have a better idea of what we can do and when.

PILOT PLANT PROJECTS FOR WYOMING

Senator MCGEE. You have a number of projects that you envisage for fiscal year 1965. I was looking over your list here. Naturally, we are very much interested in getting a pilot project in Wyoming because of the segment of our economy that once rested on coal and needs to return to a coal base if we are going to eliminate these rather substantial areas of unemployment. We have entire towns now wiped out as far as business activity is concerned. We have had no substantial replacement for particularly those family groups that were over the age of 40. They haven't moved into other areas. They are available for reemployment there and for that reason I am keenly interested in what your division is going to be doing in new pilot projects.

The State of Wyoming, through the university, should get pilot plant locations in some of our large coal areas particularly in the Southwest. This should be one of the target areas for your pilot plant considerations.

Mr. FUMICH. Sir, as I said, we are contemplating a western coals study.

Senator MCGEE. I am talking about Wyoming. I am not talking about the West in general right now.

Mr. FUMICH. As of now, we have no pilot plants projected for the State of Wyoming. I am talking about the very near future. Looking further than that, I wouldn't be able to say right now.

Senator MCGEE. I would like to have someone from your staff meet with my staff on this. Wyoming has much to offer, in my judgment, that ought to be brought into the focus of your pilot plant thinking as you are projecting in the next 2 or 3 years ahead.

Mr. FUMICH. Sir, I will be only too happy to come up at your convenience or your staff's convenience.

Senator MCGEE. As soon as you conclude the testimony that these hearings call for, we are ready and willing and waiting. We welcome the opportunity to visit with you.

Mr. FUMICH. Thank you, Senator.

Chairman HAYDEN. Senator Young.

RESEARCH IN LOW COAL ASH

Senator YOUNG. What is the status of your project research in low ash coal?

Mr. FUMICH. Sir, as you know, that contract with Spencer Chemical was originally signed for $1,240,000. As of right now, we have reached a point of decision. There is an evaluating committee leaving here tomorrow for Kansas City to look at the project first-hand, and we believe that they will have a decision within a month as to whether to proceed into a pilot plant stage, sir.

Senator YOUNG. Do you have any estimate as to whether you will need additional funds, if any?

PILOT PLANT STAGE WILL REQUIRE ADDITIONAL FUNDS

Mr. FUMICH. Sir, if we do go into a pilot plant stage, we estimate we will need roughly an additional million dollars.

Senator YOUNG. Mr. Chairman and members of the committee, this is a sample of liquid coal. They have been taking the ash out of it and it was poured into this container at a rather low temperature.

RESEARCH ON LIGNITE COAL

Have you conducted any research on lignite coal along this line?

Mr. FUMICH. Yes, sir; it is my understanding they have received some good results.

Senator YOUNG. What use can you make of this kind of research or this kind of a product?

Mr. FUMICH. Sir, if that product can be produced competitively, it may have future use in utilities in large cities with a problem of air pollution. It will also mean fuel for coal-fired turbines. It will mean that the blade corrosion and wear and tear problem will be largely solved because of the low ash content of the coal. The product would also find a market as electrode carbon in certain areas of the West. We think that there are widespread areas of possible use if this project is successful.

Senator YOUNG. How much is the British thermal units content in that sample of coal?

Mr. FUMICH. Could you give him that?

Mr. COCHRAN. About 15,000 British thermal units per pound, sir, on that particular coal, if it is the sample I think. I don't know where you obtained it.

Senator YOUNG. From Spencer.

BRITISH THERMAL UNIT CONTENT OF LIGNITE COAL

Mr. COCHRAN. Apparently almost any coal treated in this fashion emerges from the process with a British thermal unit rating exceeding 30 million a ton. This includes lignite. Almost all of them are independent of the source of coal. Once it has been treated, the material emerges at something in excess of 15,000 British thermal units a pound.

Senator YOUNG. You take out the ash and the sulfur?

Mr. COCHRAN. Yes. The ash is practically nil in that sample. The sulfur is reduced very substantially.

Senator YOUNG. Do you plan to do some work in lignite coal?

Mr. COCHRAN. We have done some work in the lab and in the process development plant. We have instructed the contractor to run lignite along with some other materials.

Senator YOUNG. How much additional funds did you say would be necessary, a million dollars?

Mr. FUMICH. Approximately a million dollars, sir.

Senator YOUNG. Are you spending more on research in lignite coal in addition to this particular project?

FURTHER RESEARCH PLANNED

Mr. FUMICH. That particular project would be a part of that. But we plan further efforts in the lignite field; yes, sir. The only way we can have a well-rounded program is to go into all these areas across the spectrum.

Senator YOUNG. That is all, Mr. Chairman.

Chairman HAYDEN. I think the way the situation is now we have a vote in the Senate to attend to.

Can you come back at 1 o'clock?

Mr. FUMICH. We can come back at any time.

Chairman HAYDEN. I suggest we recess now and return at 1 o'clock.

(Whereupon, at 12 o'clock noon, the hearing recessed, to reconvene at 1 p.m. the same day.)

(AFTERNOON SESSION, 1:15 P.M., WEDNESDAY, FEBRUARY 26, 1964)

Senator BYRD. The subcommittee will be in order.

OFFICE OF COAL RESEARCH

STATEMENT OF GEORGE FUMICH, JR., DIRECTOR, OFFICE OF COAL RESEARCH; ACCOMPANIED BY G. EDWARD LARSON, CHIEF, CONTRACTS AND ADMINISTRATION DIVISION; NEAL P. COCHRAN, CHIEF, UTILIZATION DIVISION; WAYNE P. McCURDY, CHIEF, MINING AND PREPARATION DIVISION; AND IRVING ZUCHERMAN, ASSISTANT CHIEF, ECONOMICS AND MARKETING DIVISION—Resumed

THE 1961 APPROPRIATIONS

Senator BYRD. Mr. Fumich, how much was appropriated for the Office of Coal Research for the fiscal year 1961?

Mr. FUMICH. $1 million, sir.

Senator BYRD. How much of this was obligated?

Mr. FUMICH. None of the $1 million was obligated for contracts; $60,000 was spent for administrative purposes.

Senator BYRD. $60,000 was spent. This left a carryover for fiscal year 1962 of how much?

Mr. FUMICH. $940,000, sir.

Senator BYRD. Where did you get your figure of 20 percent as being the administrative ratio?

Mr. FUMICH. Well, that was 20 percent of the $1 million which was authorized for administration. It would have been less than that

if we had figured it on the basis of $1 million as compared to the $60,000 actually spent.

Senator BYRD. So as compared with the money actually spent what was the administrative ratio?

Mr. FUMICH. It was about 6.3, sir.

Senator BYRD. Are you sure of your figures. Are you sure that is right, 6.3?

Mr. FUMICH. Actually it figured out to 6 percent.

THE 1962 APPROPRIATIONS

Senator BYRD. Now, for the fiscal year 1962 you had a carryover of $940,000. How much was appropriated?

Mr. FUMICH. We signed contracts during 1962 for a total of $2,944,000.

Senator BYRD. How much was appropriated in the fiscal year 1962?

Mr. FUMICH. $1 million again, sir.

Senator BYRD. So with the $940,000 carryover you had a total of $1.94 million.

Mr. FUMICH. That is right, sir.

Senator BYRD. And how much did you obligate?

Mr. FUMICH. We signed eight contracts for a total of $2,944,000, but actually obligated only $1,631,000 in fiscal year 1962 against those eight contracts.

Senator BYRD. And how much was spent for administrative expenses?

Mr. FUMICH. That year we spent $196,000.

Senator BYRD. Which would constitute what percent?

Mr. FUMICH. Approximately 10.1 percent.

Senator BYRD. 10.1 percent of what?

Mr. FUMICH. 10.1 percent of the $1,940,000 total funds available in fiscal year 1962.

Senator BYRD. What did you have as a carryover?

Mr. FUMICH. We had a carryover of $113,000 from fiscal year 1962 to fiscal year 1963.

Senator BYRD. How much was appropriated in fiscal year 1963?

Mr. FUMICH. That year we had $3,450,000 appropriated, sir.

Senator BYRD. So the appropriation plus the carryover made how much?

Mr. FUMICH. $3,450,000 plus the $113,000, $3,563,000.

THE 1963 APPROPRIATIONS

Senator BYRD. $3,563,000 was your total money for fiscal year 1963, is that right?

Mr. FUMICH. Yes.

Senator BYRD. What percent was used for administrative costs?

Mr. FUMICH. We had $300,000 authorized but we were also given $11,000 for pay raises, making a total of $311,000 that we had actually available. But we only spent $230,000 for administrative expenses.

Senator BYRD. What percent would this constitute?

Mr. FUMICH. That would be about 6.4 percent.

Senator BYRD. 6.4 percent of what?

Mr. FUMICH. That would be 6.4 percent of the $3,450,000 plus $113,000 of carryover, plus the $11,000 for pay raise costs, as against the $230,000 actually spent for administration, one total against the other.

Senator BYRD. So $230,000 constitutes 6-point-plus percent of $3,563,000, is that right?

Mr. FUMICH. Yes, sir; $3,450,000 plus $113,000, and $11,000 additional that we had for increased pay raise costs. That would be $3,574,000 we have here.

Senator BYRD. And the $230,000——

Mr. FUMICH. Actually spent?

Senator BYRD. Actually spent.

Now, what did you have carryover from that year?

THE 1964 APPROPRIATIONS

Mr. FUMICH. The next year, which is this year actually, fiscal year 1964, we had $1,786,000 carryover in round figures from fiscal year 1963. And also for our formally authorized budget $5,075,000 was appropriated for fiscal year 1964.

Senator BYRD. Making a total of how much?

Mr. FUMICH. $6,861,000.

Senator BYRD. And for fiscal year 1964?

Mr. FUMICH. Yes, sir. That is the total available for fiscal year 1964.

Senator BYRD. How much of this have you obligated thus far?

Mr. FUMICH. We have obligated approximately $4,680,000.

THE 1965 REQUESTED APPROPRIATIONS

Senator BYRD. What is your request for fiscal year 1965?

Mr. FUMICH. We are now requesting $6,500,000 for program, and $336,000 for administration and supervision, making a total of $6,836,000.

Senator BYRD. How many persons do you have on the staff?

Mr. FUMICH. Twenty, sir.

Senator BYRD. What is your ceiling?

Mr. FUMICH. Twenty-five. We have 11 professionals and 9 clerks and secretaries.

Senator BYRD. How long have you had 20?

Mr. FUMICH. Since approximately late last summer. It was before I arrived.

PROJECT BOOTSTRAP

Senator BYRD. Suppose you tell the committee what the status of Project Bootstrap is?

Mr. FUMICH. As you know, that contract was signed originally for $750,000. We were very much interested in it. We have spent $605,000 on that particular project. We are now at a point of decision. We are going to have an evaluating committee go up to Schenectady on the 3d and 4th of March to evaluate the project on the premises to see whether we should go ahead. We think the project has merit, and that is the reason that we are going through with this evaluating procedure.

Senator BYRD. How much has been spent on this project thus far?

Mr. FUMICH. $605,000, sir.

Senator BYRD. And how much has been allocated by the Congress for this project?

Mr. FUMICH. We had $750,000 originally, and we have $750,000 this fiscal year. And we are also requesting $750,000 for fiscal year 1965.

PILOT PLANT

Senator BYRD. When do you anticipate making a decision concerning a pilot plant for Project Bootstrap?

Mr. FUMICH. If the next stage goes forward we estimate that it will take approximately 12 months for us to get all of the answers nailed down. That would mean that within 6 months, starting from the date the contract is signed, we should be able to make a decision concerning a pilot plant.

Senator BYRD. So what date are you pinpointing?

Mr. FUMICH. Approximately September.

Senator BYRD. Of this year?

Mr. FUMICH. Yes, sir; if we assume that the evaluating committee's finding is affirmative at an early date, and that we can then promptly negotiate and sign the contract provisions which will permit continuing the work.

Senator BYRD. Mr. Lamb on February 28, 1962, appeared before this subcommittee, and I questioned him about Project Bootstrap. I said: "Mr. Lamb, you spoke of a contract you had hoped to have signed by today, is that right?"—today being February 28, 1962.

Mr. Lamb said:

Yes, that is right, sir. We had hoped to have another one when we appeared before this committee today.

Senator BYRD. Are you prepared to testify on the work to be done on this contract?

Mr. LAMB. Yes. This contract is highly promising from the standpoint of increasing the proposed market, and this is a project which I discussed with you, Senator, on several occasions.

Senator BYRD. Will this necessitate the construction of some type of pilot plant?

Mr. LAMB. Yes, it will. The first phase, of course, is the preliminary research. The second one would be the design of the equipment and the processing method. The third would be the pilot plant.

Senator BYRD. In which stage are you now, Mr. Fumich?

COMPLETED FIRST STAGE

Mr. FUMICH. Sir, we are nearing completion of the first stage, and we plan to go into the intermediate stage—the process development stage—if this evaluation procedure comes up in the affirmative.

Senator BYRD. What you are saying is that you are still in the first phase?

Mr. FUMICH. Yes, sir.

Senator BYRD. You have to await the decision which presumably will follow the trip on March 3 and 4 before you determine that you are going into the second stage; is that correct?

Mr. FUMICH. Yes, sir.

COST TO FIRST STAGE

Senator BYRD. So what has been the cost of the project up to this point again?

Mr. FUMICH. $605,000, sir.

Senator BYRD. And how much additional cost are you already committed to?

Mr. FUMICH. We originally signed a contract for $750,000, sir.

Senator BYRD. And that is the total amount?

Mr. FUMICH. Yes, of the original contract.

Senator BYRD. To which you remain committed.

Mr. FUMICH. That is right, sir.

Senator BYRD. Do you think that will be sufficient to carry you through the first phase?

Mr. FUMICH. The first phase; yes, sir.

SECOND PHASE

Senator BYRD. And the second phase would be the design of the equipment and the processing method; is that correct?

Mr. FUMICH. That, and also to get into a little larger reactor unit, and to operate such process development equipment. In other words, things have been working well so far, but it is not a big enough prototype to really give us a good story.

Senator BYRD. I continue to extract from the hearings of this committee on the bill making appropriations for the fiscal year 1963:

Senator BYRD. How far away would the third stage be?

Mr. LAMB. Well, it is proposed that the construction of the pilot plant will start within 3 years. The planning and so on might start in maybe 2 or 3 years.

Senator BYRD. Do you consider this to be a vital project to the coal industry?

Mr. LAMB. I think it is one of the better projects before us.

STATUS OF SCHEDULE

Senator BYRD. Now, Mr. Lamb at that time—which was 2 years ago almost to the day—indicated that the construction of the pilot plant would start within 3 years. "The planning and so on might start in 2 or 3 years." Would you say that you are ahead of schedule, behind schedule, or on schedule?

Mr. FUMICH. He said 3 years. I would say that we are approximately on schedule, sir.

Senator BYRD. You would say that within 3 years of February 28, 1962, the construction of the pilot plant would start?

Mr. FUMICH. Well, I stated that we are nearing completion of the preliminary stage now. The decision on the committee's evaluation should be coming up within a week or 10 days. That would mean that we can then proceed with execution of the necessary contract documents and that from the date of such execution the next stage would take approximately 12 months. We would within that time, within approximately 6 months, start working on the design and development of the pilot plant itself. And the next stage would take approximately 12 months. So generally giving or taking a few months it would seem that we would be into the pilot plant stage sometime after a year from the time that we start the next stage, sir.

Senator BYRD. So Mr. Lamb's prognostication that construction would begin within 3 years of February 28, 1962, which would be February 28 of 1965, more or less is still a true prognostication as far as you are concerned?

Mr. FUMICH. Unless we have unforeseen trouble, sir. I am just going by our schedule now.

Neal, is that about right?
Mr. COCHRAN. Yes, sir.

LOCATION OF PROPOSED PILOT PLANT

Senator BYRD. I proceeded in this way during those hearings:

Senator BYRD. Would this proposed pilot plant be located in low volatile or high volatile coal regions?

Mr. LAMB. Well, it should be located at a point central to the mining fields and near a principal place of coal mining. Now, you mentioned the low volatile coal and that appears centrally in the eastern Appalachian areas. That would be one of the central regions; that is correct.

Senator BYRD. By way of my own information, how does the area from which I come, my hometown being Beckley, located in Raleigh County, which is the heart of the "black diamond" area—how would that area fit into this proposed pilot plant that you envision?

Mr. LAMB. That is an area that is right in, you might say, the central part of the Appalachian field, eastern Appalachian field. It should be ideal for the location.

PROGRESS OF PROJECT BOOTSTRAP

Now, Mr. Lamb appeared before this subcommittee during hearings on the fiscal year 1964 appropriations bill, which precisely was on Tuesday, March 5, 1963. He said with reference to Bootstrap:

On the progress of Bootstrap we have a contract with the General Electric Co., and the progress has been very good. On this project we are now looking toward pilot plant operations.

PROJECTS INVOLVING CONSTRUCTION OF PILOT PLANT FACILITIES

I asked Mr. Lamb this question:

Now, how many projects would involve the construction and erection of pilot plant facilities and the acquisition of land therefore?

Mr. LAMB. Under our present program, there are 11 projects which may eventually involve construction and erection of pilot plants and perhaps the acquisition of land.

Senator BYRD. Would you care, Mr. Lamb, to identify these 11 projects in the OCR programs which may eventually require pilot plant erection and construction and land acquisition and identify these for which funds are to be obligated during fiscal year 1964.

PROJECT BOOTSTRAP

Mr. LAMB. There is only one for 1964; it is Project Bootstrap. There are some other projects we have for which perhaps equipment would be purchased during fiscal year 1964, but the erection and construction would get underway probably in 1965, fiscal 1965.

Senator BYRD. So only 1 of the 11 would be in the category of activities which would require pilot plant erection and construction in 1964, and that would be Project Bootstrap, is that correct?

PROJECT GASOLINE

Mr. LAMB. Well, Senator, there may be some modification and I might amend this answer, maybe another project; namely, Gasoline, for which equipment in 1964 should be included but there is some question yet as to whether there be construction involved.

Has equipment, Mr. Fumich, been purchased for Project Gasoline?
Mr. FUMICH. I would have to refer that to Ed Larson.
Senator BYRD. Mr. Larson.

ARCHITECTURAL ENGINEERING ON PILOT PLANT

Mr. LARSON. Senator, we have purchased some equipment, but only laboratory scale equipment at this point. We have not yet reached the point where we have purchased any equipment that would eventually be installed in a pilot plant. What we have done on Project Gasoline so far is this. The contractor began his work on the date the contract was signed, August 30 last year, and has proceeded with full speed ahead in the laboratory. We think we are getting some outstanding results already. And the contractor has prepared specifications, detailed scope of work, and so forth, which have been sent out to a number of companies in order to solicit proposals for the architectural and engineering work on the pilot plant.

BIDS REQUESTED

And I understand—correct me if I am wrong, Mr. Cochran—we have received two favorable responses from the companies that are willing to come in in response to the solicitation. And I think Consol is seeking two more, because in the initial go-around I think they sought solicitations from five companies. Three responded in the negative and said they weren't interested. Two responded in the affirmative and will come in with formal proposals, and Consol is now going out to at least two more before they sit down and begin to evaluate the proposals that have then been received and then enter into formal negotiations.

That is about where we stand on it at the present time.

Senator BYRD. So you feel that you are moving ahead nicely on Project Gasoline?

Mr. LARSON. Very good. We think that it is on schedule, given the kind of delay that occurred over a 2-year period that you are familiar with between the time of receipt of the original proposal and the time we actually entered the contract.

PROGRESS ON PROJECT BOOTSTRAP

Senator BYRD. Now, in continuing my interrogation of Mr. Lamb I asked this question:

But there is no question as to the progress that has been made in connection with Project Bootstrap and as to the desirability of your moving ahead with pilot plant construction in fiscal year 1964.

Mr. LAMB. That is correct. We are in a position to go ahead on the pilot plant activity.

What comment would you have on Mr. Lamb's response to my question?

Mr. FUMICH. Sir, I would say, as I stated previously, we estimate that we will be considering the pilot plant as of September. So that would make it fiscal year 1965, sir. But it will still be within the 3-year projected period that he mentioned previously.

PILOT PLANT PHASE

Senator BYRD. Mr. Lamb at that time said, "We are in a position to go ahead on the pilot plant activity." And here we are a year later,

and you are still not into your second phase, which must precede your third phase which is the pilot plant phase as I understand it.

Mr. FUMICH. Neal, would you have any answer to that question?

Mr. COCHRAN. Senator, about a year ago the thought was that we would enter into a pilot plant program that would embrace two portions, the first part of which Mr. Fumich has described to you. These things would proceed somewhat concurrently as he has indicated. And this would remain our plan. I think that with respect to the testimony from a year ago, we are still consistent with that, at the same time maintaining the posture of being quite certain before we proceed that we in fact do have something as good as we think it is.

Mr. FUMICH. In other words, we are using different words, aren't we?

Mr. COCHRAN. Yes.

SCHEDULING OF PHASES

Mr. FUMICH. What he is talking about is the contract that would decide the pilot plant phase but also include the intermediate stage phase. But we were trying to separate them and project the time that way. What he was saying was that the pilot contract would be signed this way, and work would be going concurrently, but what would be going on would be the intermediate phase, and then the discussions of the pilot plant phase would start in around September. So actually the scheduling is the same. I was frankly just talking about it one way and he was describing the same thing in another way.

Senator BYRD. Now, if the processes prove to be feasible can you once again give the committee a pretty definite idea as to when the office would be prepared to launch the pilot plant construction?

CONSTRUCTION

Mr. FUMICH. Sir, like I said, we are nearing the end of this stage, and we are at a point of evaluation. We think we will get to a decision within a period of about 10 days, which means that we would start the next phase soon, so it would be 12 months from the signing of that next phase contract before the possible construction of the pilot plant could begin. In the meantime, when that period has 6 months to go, say, around September 1964, that is when we would be going into the activity concerning the pilot plant itself, moving beyond the process and development stage.

Senator BYRD. Precisely what do you mean by the activity concerning the pilot plant?

Mr. FUMICH. That would be the time for a decision to move into the design and development phase of the pilot plant itself.

Senator BYRD. And this would you envision for about September 1 of this year?

Mr. FUMICH. Yes, sir, that is as close as we can estimate it. It will be about 6 months after we begin work on the process development phase.

Senator BYRD. The design of the pilot plant?

Mr. FUMICH. Yes. To move into the design phase of the pilot plant itself, if we can get the contract signed soon on the process development phase.

Senator BYRD. And you would further anticipate that by March or April of 1965 you would begin construction on the pilot plant?

Mr. FUMICH. That would be our projected date, sir, if we can keep to our timetable on the preceding steps.

ESTIMATED CONSTRUCTION COST

Senator BYRD. Continuing with the reading of portions of the testimony during these hearings I asked this question:

What would be the amount of money needed for the construction and erection of the pilot plant in connection with Project Bootstrap together with planned costs in fiscal year 1964?

Mr. Lamb answered thusly:

For the construction item, we estimate that it would take about $200,000, since this would be the preliminary work, and we estimate it would take about $10,000 for land acquisition.

What would you estimate the construction item to be, Mr. Fumich, and the land costs as well?

Mr. FUMICH. We have certain figures for what the next phase would cost, sir. I would rather not divulge those at a public hearing. We will submit them to the committee.

As far as the land is concerned, I think, based on my talks with Mr. Cochran, it would be around at least 40 acres for a pilot plant. We cannot cite what the cost will be; we have never really gone into that, but he can see nothing wrong with these particular figures, sir.

Senator BYRD. What do you think of Mr. Lamb's estimate of the construction item? He said that it would take about $200,000?

Mr. FUMICH. For the construction of what, sir?

Senator BYRD. The construction of the pilot plant, Project Bootstrap.

Mr. FUMICH. Our figure is somewhat larger than that, sir.

Senator BYRD. Your figures are considerably higher?

Mr. FUMICH. Yes, sir. We can submit them to the committee.

LAND REQUIRED

Senator BYRD. And you think it would require about 40 or 50 acres of land for the pilot plant?

Mr. FUMICH. Just an approximation. Yes, sir.

Senator BYRD. At the time Mr. Lamb was before the committee last year he indicated that the total cost of Project Bookstrap would be about $5.2 million. Does this figure hold true in your estimation?

Mr. FUMICH. Sir, again if I agree with that estimate, then we are projecting what our thinking might be toward what the contract cost might be, and we would rather give you our point of view on that figure confidentially, sir.

Senator BYRD. Now, a statement appears on page 598 of last year's hearings which may clarify, to some extent, the question concerning the cost of the pilot plant for Project Bootstrap. I stated that I noted the total cost of Project Bookstrap was $5.2 million. And I asked Mr. Lamb this question:

What part of this total sum, Mr. Lamb, would be spent on pilot plant erection and construction?

Mr. Lamb answered by saying:

We estimate that about $2 million would be spent on pilot plant erection and construction through fiscal 1968. Most of all this money would go for the purchase of equipment. Assembly of the equipment and its erection or putting it into place.

ESTIMATED COST OF BUILDINGS

I then asked the question:

How much of the $2 million would be needed for buildings?

Mr. Lamb answered by saying:

Well, probably 10 or 15 percent we spend on building to provide for offices, shop, or laboratory space.

Senator BYRD. You are saying between $200,000 and $300,000 would be needed for buildings?

Mr. Lamb answered by saying:

That is correct.

Senator BYRD. And the remainder would be needed for equipment?

ESTIMATED COST OF EQUIPMENT AND INSTALLATION

Mr. LAMB. Most of the remainder of the $2 million would be needed for equipment and its installation.

I asked the question:

Would General Electric plan and design and construct this pilot plant, Mr. Lamb?

And Mr. Lamb answered by saying:

Well, properly it is expected that the design will be started by General Electric by next June, that is, once we get the intention of the contract completed, construction would be then underway by late this year or early the next year.

Senator BYRD. So apparently the schedule is a little behind, insofar as it was envisioned at that time by Mr. Lamb.

Mr. FUMICH. You mean so far as the pilot plant is concerned, sir?

Senator BYRD. Apparenty he said construction would be underway by late this year.

Mr. FUMICH. I think what he was referring to was that the contract for the pilot plant and intermediate stage would be gone into this year. If that were the case, we would be on time. On the other hand, if he literally meant what he said, then we are behind in that particular schedule, sir.

PLACING OF CONTRACT FOR CONSTRUCTION

Senator BYRD. I quote these extracts from last year's hearings:

Senator BYRD. You would contract with General Electric for the construction of the plant.

Mr. LAMB. Yes, this is an extension of the present work.

Senator BYRD. Is this still the plan, then, Mr. Fumich?

Mr. FUMICH. Yes, sir. But I would have to—possibly not differ, but I think that in the design and development of the pilot plant stage we are going to have to have a lot to say as far as that particular item is concerned. It won't be a completely one-party situation, let's put it that way.

Senator BYRD. I then proceeded to ask this question:

When do you anticipate the plant's being in operation?

And I think we got a pretty firm answer to this.

Mr. LAMB. Well, the plant as completed—part of it would start pretty soon but the complete plant would probably be in operation by January 1965.

How do you view this date with reference to the schedule that you are on?

Mr. FUMICH. I would say we would have to start moving pretty fast, sir, to be honest about it.

DATE PLANT BEGINS OPERATING

Senator BYRD. Mr. Lamb indicated that the complete plant would probably be in operation by January of 1965.

Mr. FUMICH. I would rather not eat my words and say we would have it done at that time; I might as well be realistic and say that we are projecting a time area around that particular date, but I would frankly rather not commit myself and say that we are going to have a pilot plant in operation by January 1965. We are going to try our best, and I know that we are not going to delay anything, and we will go as far as we can with this particular project. And we believe, as I stated, that we have a good opportunity to have this thing in operation possibly in the spring of 1965 rather than in January of 1965.

Am I making an optimistic statement there, Neal?

Mr. COCHRAN. I think it is overoptimistic.

Mr. FUMICH. Let's be realistic. I don't want to say something and then not live up to it.

Senator BYRD. Based on your earlier statement that you would anticipate the beginning of construction by March of 1965, when do you think that you could have the plant in complete operation?

EVALUATION AND CONTRACT NEGOTIATIONS

Mr. FUMICH. It would take—let me get my projections together to make sure I am saying what I am thinking—as I said, we are nearing the point of completion on the preliminary stage as of right now. We are going to get into an evaluation as of the 4th and 5th of this coming month; actually it is next week. I honestly believe that a decision will be forthcoming within a week or so. From there we plan to go into the signing of another contract. How long this negotiation is going to take I don't know. But I don't see why we should have too much trouble, since we have already reached a lot of points of agreement on the current contract. So it won't be negotiating de novo again; it will be going on with the same item just a little bit advanced.

Then from the time we start the actual work on that phase we estimate that it will take 12 months from there until we get to the pilot plant stage. Of course, we plan to telescope the process development work and our design activity to run concurrently to stay within the September 1, 1965, estimate I mentioned previously. Now, that would be from March—it would be March of 1965. Allowing 2 or 3 months for negotiating—I still come back to my projection, in about the spring or early summer of 1965.

Mr. COCHRAN. Except that you haven't allowed time to build it.

Mr. FUMICH. I see. I am just going into the designing and starting.

PROJECT BOOTSTRAP APPROPRIATIONS

Senator BYRD. You will note that Mr. Lamb said that the complete plant would probably be, he didn't say it would be, he said it would probably be in operation by January 1965. What I am trying to determine here is just how slow we are in getting this thing on the road. I have gone to bat for this project in two successive years. In fiscal year 1961 you were appropriated $1 million. You spent about $60,000. That was before you were Director. And then, the next year you were appropriated an additional million dollars, and you had a carryover of $940,000. And the next year, which was fiscal year 1963, I offered an amendment in committee to add $450,000 to Project Bootstrap, based on Mr. Lamb's testimony that the project could go forward more expeditiously, and that this money could be economically and feasibly utilized.

I offered the amendment to add $450,000, and the amendment was adopted, and the House concurred in the amendment.

And in addition to that amendment, I offered an amendment to add $1 million for Project Gasoline in fiscal year 1963.

So instead of the $2 million which you would have had without the two amendments I offered, the Office of Coal Research had $3,450,000.

Of course, not only was the appropriation thereby increased for that particular year, but as a result the base was also increased for the next year.

PILOT PLANT PROGRESS

Now, last year when we had Mr. Lamb before this committee I again queried him about the progress of Project Bootstrap. And he stated that the complete plant would probably be in operation by January 1965. Now, today we are told by the Director of the Office of Coal Research that the construction will probably begin on the pilot plant around March or April of 1965. Now, how long do you anticipate it will take to complete the construction of the pilot plant once the construction is begun?

Mr. FUMICH. Mr. Cochran, would you answer that question, please?

Mr. COCHRAN. I would estimate it would take 6 to 9 months, sir.

Senator BYRD. So if you begin in March or April of 1965 you would anticipate having the pilot plant completed in January of 1966?

Mr. COCHRAN. Correct.

Senator BYRD. I proceeded to question Mr. Lamb in this way:

Now, I referred a little earlier to my amendment to include $450,000 for Project Bootstrap last year. Has this $450,000 been fully utilized or has it helped to accelerate the progress toward the construction of a pilot plant facility?

ACCELERATING CONSTRUCTION PROGRESS

Mr. LAMB. This money has accelerated the laboratory work and the activity toward the design of equipment and the preliminary plans for a pilot plant.

This additional $450,000 of fiscal year 1963 funds plus the $500,000 as is requested for this project in fiscal year 1964 should provide adequate funds for getting the pilot plant underway.

EQUIPMENT DESIGN

Has any equipment been designed in connection with Project Bootstrap?

Mr. FUMICH. Mr. Cochran.

Mr. COCHRAN. Yes. I don't know any way to answer it, Senator, except at a little length.

During the spring of this past year the General Electric Co. projected what a commercial plant might look like. And from this commercial plant, or to price out this commercial plant, it presented us with preliminary designs of what the equipment itself would be like. We have the drawings. And based on this it submitted a proposal for the pilot plant work during this past year.

So that preliminary designs of the special machinery for a commercial plant and its pilot plant prototype—the idea would be to use one unit out of what might be a multiple-unit commercial plant, which has been reduced to drawings which are now completed. We are still doing experimental work, but in general the design of the equipment is specified, and the unit laid out. So the answer is "Yes."

Senator BYRD. Has Mr. Lamb's prognostication been borne out by the facts wherein he said that this additional $450,000 of fiscal year 1963 funds plus the $500,000 as was requested for this project in fiscal year 1964 should provide adequate funds for getting the pilot plant underway?

Mr. FUMICH. Sir, we believe that we don't need any more funds based on the funds that we now have available and what we are asking for in fiscal year 1965. We should have ample funds to keep this project moving the way it should.

FUNDS AVAILABLE

Senator BYRD. How much do you have now?

Mr. FUMICH. Well, we had $750,000 plus another $750,000. We also have $750,000 in the fiscal year 1965 budget that we are asking for. We will have about $1,500,000 combining this year's funds with what we are asking for in fiscal year 1965.

Senator BYRD. How much are you asking for in fiscal year 1965 for Bootstrap?

Mr. FUMICH. $750,000, sir.

Senator BYRD. $750,000. And how much do you have to add to that in carryover moneys?

Mr. FUMICH. About the same; $750,000. However, it should be noted that if we sign the contract for the process development phase we will obligate the $750,000 available in fiscal year 1964. Therefore, there would be no carryover into fiscal year 1965.

Senator BYRD. About the same amount?

Mr. FUMICH. Yes.

BOOTSTRAP PROJECT EXPENDITURES

Senator BYRD. And how much have you spent thus far on Bootstrap?

Mr. FUMICH. Approximately $605,000.

Senator BYRD. You spent $605,000. You have about $750,000 carryover, and you are requesting $750,000?

Mr. FUMICH. Yes, sir; with the exception I just mentioned if we get the additional contract work underway.

Senator BYRD. To which point will this bring you? Will this carry you through the complete construction of the pilot plant, or will it get the pilot plant underway?

Mr. FUMICH. It will get the pilot plant underway, sir. It will take much more than that to complete the pilot plant.

Senator BYRD. So a year ago Mr. Lamb said that an additional $500,000 appropriated for the project in fiscal year 1964 when added to the carryover should provide adequate funds for getting the pilot plant underway. Now, you are saying today that with the carryover moneys of $750,000 and with $605,000 already having been spent you still need $750,000 to get the pilot plant underway.

Mr. FUMICH. I think, sir, that is partly semantics. When we say "getting underway," we think we would be able to carry it further toward fruition than what Mr. Lamb is referring to, because we haven't spent any more money than was originally contemplated as far as the stages are concerned. And that is the only explanation being given, that we would take the project further along than what we have; than what he was referring to at the time he testified.

PILOT PLANT LOCATION

Senator BYRD. Continuing with my references to Project Bootstrap, I said to Mr. Lamb:

Last year, in offering the amendment to include an additional $450,000 for Project Bootstrap, and in developing the testimony during the hearings in connection with Project Bootstrap, it was my impression that the pilot plant for Project Bootstrap could be most advantageously located in the southern part of my State, and more specifically in the Beckley area.

Mr. LAMB. That is correct.

Senator BYRD. Do you think I was correct in getting this impression from the testimony?

Mr. LAMB. I believe you were, sir.

Senator BYRD. Is it fair for me to continue to assume that the pilot plant can or at least may be located in the Beckley area?

Mr. LAMB. Yes. I can't make the final decision on location, but as I stated last year, Beckley would be one of the better locations, one of the best locations you could find because of it being the center of the Appalachian coal mining area.

Senator BYRD. Perhaps this is not a fair question, but Beckley, being one of the favorable locations, or one of the best, as you say, "Is it fair to assume that the company with which you are contributing would not have any objection to locating the pilot plant in the Beckley area."

Mr. LAMB. None that I know of. I know of no objection.

Senator BYRD. In a situation of this kind can the Office of Coal Research, or perhaps I should say the Department of the Interior, indicate to the company with which you have the contract as to where the Department wants the pilot plant located.

DEPARTMENT OF THE INTERIOR AUTHORIZED TO PASS ON PLANT LOCATION

Mr. LAMB. The Department has the authority to tell or to pass on the pilot plant location; that is correct, sir.

Senator BYRD. Well, I have assumed, beginning with last year, that this pilot plant, if the processes prove to be feasible leading up to the planning and construction of the pilot plant, would be located somewhere in the Beckley area, and I would like to proceed under that continuing assumption.

Mr. LAMB. Yes, sir.

Do you have any comment, Mr. Fumich?

Mr. FUMICH. Sir, I can go along generally with what has been stated, although you know of course the Secretary of the Interior, as contracting officer, makes the final decision on that, sir.

Senator BYRD. I would like to state for the record that I have assumed, beginning with the year before last, and I am continuing to assume that this pilot plant will be located somewhere in the Beckley area, as was indicated by the OCR during hearings for fiscal years 1963 and 1964.

DELAYS IN PROJECT BOOTSTRAP PROGRESS

Are you satisfied with the progress to date on Project Bootstrap?

Mr. FUMICH. Sir, at least since November 1 I am satisfied that we haven't done anything to hinder it. And as far as the contractor is concerned, I think that we have had very good cooperation. And frankly I see no reason for any delays ahead.

DELAY OF PILOT PLANT BEGINNING OPERATING

Senator BYRD. I realize that there is a good deal to what you say about semantics. There may have been some misunderstanding as to the precise meaning which Mr. Lamb placed on his words. However, I think it is to some extent discouraging to note that the committee was led to believe that the pilot plant would be in complete operation by January of 1965. And according to today's testimony, it seems that this date will be extended by about 1 year, to January 1966. I have supported this project. I am quite sure that no one on the committee would dispute my statement when I say that had I not offered the amendment for $450,000 in fiscal year 1963 for Project Bootstrap, and the amendment last year adding $1 million for the three gassification projects, to say nothing of the $1 million amendment which I offered in behalf of Project Gasoline the year before last, these moneys would not have been included in the Office of Coal Research budget.

I don't think there would be any refutation of that statement coming from any member of this committee.

EXPECT SCHEDULES TO BE MAINTAINED

I am very interested in the progress of coal research. I suppose I am the only member on the committee who represents an area the economy of which is so vitally based upon the coal industry. And I just want you to understand, Mr. Fumich, that while my interest cannot be surpassed in this matter, I do expect schedules to be kept, if they can be kept. I realize that you can't always foresee what the outcome of test tube experiments and bench scale work might be, and you can't foresee precisely the date when you can award a contract. Many of these things are unpredictable. I know that. But at the same time I don't want to continue working hard for appropriations for coal research unless we can see that we are really making substantial progress and that we are staying pretty much on schedule.

Mr. FUMICH. Would you mind if I made a comment on that statement?

Senator BYRD. I would be glad if you would, yes.

Mr. FUMICH. I understand your interest, sir, and that is one reason I was very cautious in making projections on the future of this particular project. I wanted to make very sure that if I am around next year, and if we are not on schedule I will know why we are not on schedule. But I didn't want to try to be very favor-

able in some of my comments here just to get off the hot seat when I knew that they weren't true. I thought it would be better to come up with some very realistic estimates to try to live by so that we can still keep them in the event that we have some unforeseen delays in some aspects of the program.

Senator BYRD. I congratulate you, Mr. Fumich, in responding to my questions on this basis. I think we have to be conscientious and sincere in our approach to this thing on both sides of the table.

Now, you spoke of a decision having to be made following the dates of March 3 and 4. Who will make this decision?

COMMITTEE OF EXPERTS MAKING DECISIONS

Mr. FUMICH. Sir, we have a departmental ad hoc committee, and depending upon the type of project it is, whether it is to convert coal to gas and oil, we recommend maybe two or three persons with expertise in that field to join our chief of the Utilization Division and others who compose the committee. They go out and check the technical aspects as well as all the other considerations, and make a recommendation back to us, sir.

We only do this where we go into a large financial increment or where we are going into a hardware stage, sir.

Senator BYRD. Suppose the $750,000 request for fiscal year 1965 is not forthcoming, what will this do to your time schedule?

Mr. FUMICH. If we proceed on schedule with everything else, frankly, it is going to slow us up, sir.

Senator BYRD. So you have to have the $750,000?

Mr. FUMICH. Yes, sir.

Senator BYRD. Will that be sufficient? Can you effectively utilize more money than that?

Mr. FUMICH. I don't think so, sir, to be honest about it.

Senator BYRD. In connection with Project Bootstrap I would ask our faithful and competent clerk to request that representatives of the General Electric Co. appear before this subcommittee on March 6 and testify.

PROJECT GASOLINE

Now, turning our attention to Project Gasoline, do you feel that Project Gasoline is proceeding on schedule, Mr. Larson?

Mr. LARSON. Senator, I think that Project Gasoline is on schedule. The delays that have been encountered thus far were encountered in the precontract period, and now that the contract has been signed we are on schedule. I hope and trust that we will stay on schedule. And I think right now there is every indication that we will.

Senator BYRD. Do you have any uncertainties at this point concerning the processes that are involved in the success of this research project?

Mr. LARSON. I think that so far as the processes are concerned, on the technical details Neal Cochran is much more able to answer than I. But from my own knowledge and the reports that the contractor has rendered to our office thus far on a monthly basis, and my reading of them, I think the chances of its success are very good.

Senator BYRD. Mr. Cochran, would you like to add something?

PROGRESS

Mr. COCHRAN. I would say, compared to the original schedule, from the date of signing the contract, that we are a little ahead timewise. The areas of uncertainty concerning the process are being investigated now. And the results so far have been favorable. And if anything I would have to say that the process is better—I would guess today the process is better than we thought it was when we undertook the contract.

ADVANCE IN CATALYST TECHNOLOGY

Mr. LARSON. Senator, I would point out at this juncture that the contractor has made what we believe to be a rather significant advance in catalyst technology on this project, or this process. We feel that this could have a very pointed effect on the ultimate end product cost. If the process reaches the commercial stage, this will, of course, be extremely important.

However, since this development of the catalyst process was reported to the Office of Coal Research for patent consideration, we don't want to get into the precise details. It looks very good.

1964 APPROPRIATION FOR PROJECT GASOLINE

Senator BYRD. In questioning Mr. Lamb about Project Gasoline I asked, "What funds were included in the 1954 budget?"

Mr. Lamb excused himself, of course, from answering the questions as did Mr. Fumich, and rightly so.

Mr. Lasky answered, "2 million dollars. That would allow first for a continuation of bench-scale operation and for completion of engineering and design work on the pilot plant. The major part of the estimate is for longtime load items of equipment to be installed in the proposed pilot plant."

As you know, the House struck this item last year. I spoke on behalf of its restoration in the committee, urged that it be restored, moved that it be restored, and it was restored. How much of it has been spent, as Mr. Lasky indicated would be the case, for the long leadtime items of equipment to be installed in the proposed pilot plant?

PLANNED PROCEDURE FOR PROJECT GASOLINE

Mr. LARSON. As I stated earlier in response to a question, the contractor has not actually ordered equipment at this time. We think that we will reach that point as soon as the contractor has received responses to the design solicitation proposals, and eventually negotiate and settle on a design organization. Once that organization completes its designs, and we then proceed to the pilot plant construction phase but before construction actually begins—and I will ask Neal if he will bear this out in further testimony—we will know the kind of equipment that must go into the pilot plant which is eventually constructed. We will then begin ordering on a long leadtime basis those items of equipment.

Neal?

Mr. COCHRAN. I have to change that a little bit, Senator, I am sorry. The plan which was laid down subsequent to these hearings, and as a result of the change in appropriation, the approach to the project,

the timing of how it went and the way it was handled was modified to fit the funds which were made available. As a result of that, rather than proceeding exactly as Mr. Lasky had indicated, we would now proceed through design, and then execute a construction subcontract for the construction of the entire pilot plant.

CHANGING CURRENT PLANNING

And this was done to make the planning of the project fit the funding of the project. But we have now wrung out all possibility of changing or modifying the plan, if the project is to proceed, with respect to the appropriation needed for the next year; for fiscal year 1965.

Senator BYRD. Would you repeat that, the last sentence?

Mr. COCHRAN. The plan for the project has been changed two or three times to suit the appropriation which was made available to the Department for this particular project. So that we have accommodated the planning for the project to fit the funding. Now, we can no longer change or modify this without adding years on to it each time you do it—I won't say it is completely impossible, but we do not believe that we can now adjust the plan to accommodate any further reduction in the money which is needed, the amount Mr. Fumich indicated is on hand for this year, coupled with the budget request for this particular project for next year.

In other words—I don't recall the testimony with certainty—but the pilot plant is going to cost on the order of $3.5 million based on the contract estimate. And this amount of money must be available to the contractor if he is to subcontract for the construction of the entire plant, or we can't have the contractor let the subcontract.

I trust this answers your question.

AUTHORIZATIONS AND EXPENDITURES FOR PROJECT GASOLINE

Senator BYRD. How much has been spent on Project Gasoline up to this point?

Mr. LARSON. We obligated $2,300,000 when we signed the contract. This was the amount of funds that the Congress had made available.

Senator BYRD. How much money over and above the obligated amount do you have for Project Gasoline?

Mr. LARSON. We have obligated everything that was earmarked for Project Gasoline, and everything that the Congress had intended us to earmark for it initially.

BUDGET REQUEST FOR 1965

Senator BYRD. And you have how much in this budget request for Project Gasoline?

Mr. LARSON. In the fiscal year 1965 request we have $2.5 million. But of the $2.3 million that we actually obligated, we have actually expended about $202,000 to date. We are estimating the expenditure of approximately $1 million by June 30 of this year, which would include, we estimate, the subcontract for the design phase of the pilot plant work, plus the additional bench-scale work that will occur between now and June 30. This will give us approximately $1,300,000

of carryover into the next fiscal year on the money available for this contract.

So when we couple the $1,300,000 of carryover with the $2,500,000 that we are asking for, we would have $3,800,000 next year. Then as you have just heard Mr. Cochran say, we are still sticking with our estimate of approximately $3,500,000 for construction of the pilot plant. The overage of $300,000 above that would be for the continuing bench-scale effort that would be going on even while the pilot plant is under construction. This, we think, is ample, and should meet our needs for the next fiscal year.

SCHEDULE IF REQUESTED FUNDS DENIED

Senator BYRD. If the requested amount of $2.5 million for Project Gasoline should not be forthcoming, what would this do to your schedule?

Mr. LARSON. We think, sir, that this would cause us to slow down the project. Again referring to the testimony that Mr. Cochran just gave you, the contractor, at the time he signs a construction subcontract, should have in hand all of the moneys necessary to sign this subcontract and pay for its cost, whatever that cost may be.

Senator BYRD. Can you effectively utilize more money than is involved in this request?

Mr. LARSON. I would say, sir, it would be probably a slight amount to expedite the bench-scale effort that will be continuing while the pilot plant phase is on. Any moneys that would be made available for the project would simply mean that much less that would be required in the future because, as you are well aware, we have a "no year fund" arrangement. These funds would simply carry over, and if we would allocate these funds for this particular program, we estimate that they would be spent in the next year.

TOTAL CONTRACT COST

Senator BYRD. What is the total contract cost?

Mr. LARSON. The total contract amount is estimated at $9,993,000.

Senator BYRD. Is this pilot plant still being planned for location at Cresap?

Mr. LARSON. Yes, sir; that is written into the contract.

PILOT PLANT CONSTRUCTION

Senator BYRD. Will Consolidation Coal build the pilot plant?

Mr. LARSON. No, we think that this will be subcontracted to a construction subcontractor.

Senator BYRD. Is there a target date as to when construction will begin?

Mr. LARSON. Neal, what is your thinking on that?

Mr. COCHRAN. I would say about a year from date, sir, give or take some small period of time.

Mr. LARSON. Early calendar 1965.

Senator BYRD. Has the site been selected?

Mr. LARSON. Yes, sir. This is also stipulated in great detail right in the body of the contract.

SITE SELECTION

Senator BYRD. Referring back to Project Bootstrap, when do you think a site will be selected?

Mr. FUMICH. Sir, I would visualize a site being selected just about the time we start thinking about going into the pilot plant research, we would be thinking about it at about that time, sir.

Senator BYRD. So that would be about September of this year?

Mr. FUMICH. I would say something like that.

Senator BYRD. About the time you begin your design?

Mr. FUMICH. Yes, sir. That would mean that we would be going concurrently with the other part of the project so that we wouldn't delay it.

COAL GASIFICATION PROJECT

Senator BYRD. Now, if we may refer to the coal gasification project, I asked Mr. Lamb about the potential awards on coal gasification, which at that time involved Bituminous Coal Research, Inc., M. W. Kellogg, and I believe the American Gas Association. I asked him whether or not there would be any duplication of activities in the performance of those three potential contracts. He indicated there would be no overlapping or duplication.

I asked if the three projects involved pilot plant construction and operation.

PILOT PLANTS

Mr. Lamb answered by saying:

Yes. Each project will involve pilot plant construction and operation carried to completion.

One of the potential contractors, the M. W. Kellogg Co., would engineer the three projects to keep them coordinated.

I asked:

What would be the earliest, Mr. Lamb, that you would anticipate the pilot plant's construction could begin?

Mr. Lamb answered by saying:

Well, based upon our proper budget estimate it would be perhaps around January 1965 before we could start on pilot plant construction.

I asked whether or not he was talking of all three projects.

Lamb answer by saying:

Yes; all three as far as pilot plants are concerned.

COST OF GASIFICATION PROJECTS

I asked what the overall 1964 fiscal year estimates for the three gasification projects happened to be.

Mr. Lamb said:

The budget estimates for the three projects amount to $650.000.

I asked this question of Mr. Lamb:

Would you need any additional money in fiscal year 1964 to get the gasification pilot plant underway in the fall of 1963?

Mr. Lamb answered in this way:

Yes; we could get the pilot plant started as early as that, because the American Gas Association and Kellogg have done a great deal of background work already and they are in a position to get right into pilot plant design, so the

start of the pilot plant work could begin as early as the start of the fall of 1963 if funds were available.

I then asked the question:

How much additional funds would be necessary to reach this goal?

Mr. Lamb said:

We need about another $1 million in addition to the $650,000 to get the pilot plant activities started.

I offered an amendment in subcommittee to add the $1 million, and the House conferees accepted it in conference, I being one of the Senate conferees.

So the money was advanced on the proposition that pilot plants would be started in the fall of 1963.

What is your batting average on this one?

PROGRESS ON PROJECTS

Mr. FUMICH. Sir, I would have to say we have a very low batting average on that one. My understanding is that there wasn't much progress during the last year. I can only answer it as of November 1. I do know that we signed the BCR contract for a total of $975,000. We will obligate $350,000 this fiscal year for that project. We are also asking $350,000 in fiscal year 1965 for this particular project.

Now, concerning IGT and the Kellogg contract, I can give the committee the figures confidentially after the hearing of what we expect the total will be. We are now negotiating with IGT and Kellogg on their respective projects. We expect, and we hope, to sign these particular contracts before this fiscal year is over. As I say, we are in the process of negotiating. We plan to obligate $200,000 apiece for each one of these contracts this fiscal year. We are also asking for $350,000 for BCR next year, $400,000 for IGT, and $500,000 for Kellogg.

Now, whatever the timetable evidently was that Mr. Lamb was talking about we would have to project possibly the same timetable beginning from the date we sign these contracts. Because frankly we are just getting into these things, and we hope to sign them as quickly as possible.

CONTRACT NEGOTIATION

Mr. Larson here has been conducting the negotiations. He might be able to give you a little more detailed information than I can.

But like I said, we are hoping that we can get these contracts signed in this fiscal year, and we are asking money next fiscal year to continue them.

Senator BYRD. Mr. Larson.

Mr. LARSON. Senator, I would say, in defense of the position that Mr. Fumich has just laid out that, as you are aware, we were without a Director from May 1 up until early November, and certainly this covers the first full 4 months of the new fiscal year, and we were almost at a dead standstill.

Senator BYRD. You think this impeded progress?

Mr. LARSON. I am sure it did, sir. And very shortly thereafter we signed the BCR contract, which is the first part, or one-third of the total gasification trio that we talked about here.

KELLOGG CONTRACT

Negotiations are well along on the Kellogg contract. We had originally hoped to have the Kellogg people down for a final negotiation this week on Friday. And they are now going to delay it until next week on Friday, because one of the key members of our staff, namely, Mr. Cochran, is going to be out of the city, Friday, and early next week as well.

This being the case, we will not enter into final negotiation with Kellogg until next weekend. But I would hope that very shortly thereafter we will have a signed contract to proceed on Kellogg.

But we are not waiting only for that contract to be signed, because negotiations are also proceeding with IGT, which is the research arm of the American Gas Association which you mentioned earlier. We have held preliminary negotiations with IGT already, and we are waiting for additional figures and data to come in from IGT which we asked them for and which they promised to send. We will then revise the contract into a new draft, and we will plan to have a negotiation with IGT again at an early stage looking for contract signing there as quickly as possible.

I am certain that with good fortune we will have the Kellogg one signed before the end of March, and I am hoping the IGT one very shortly thereafter.

OPINION OF GENERAL TECHNICAL ADVISORY COMMITTEE

Mr. FUMICH. For your additional information, we brought these particular projects up before the General Technical Advisory Committee, since they were meeting anyway. They were highly enthusiastic about all three. It is a package that fits together and the three projects complement each other rather than representing any duplication.

Senator BYRD. How much carryover total do you have on these three projects from last year?

Mr. LARSON. Since we just signed BCR, sir, we only obligated $350,000 to BCR, and they have barely begun their work. Nearly all of that money that was obligated is still available, and all the money that was on hand for Kellogg and IGT is still available, and I would guess this to be a total of about $700,000.

Senator BYRD. So you would have a total of $700,000 carryover?

ANTICIPATED CONTRACT SIGNING

Mr. LARSON. Well, we expect to sign these contracts this year so it won't be carried over.

Senator BYRD. So you are going to utilize the $1 million in a very effective and economical way?

Mr. LARSON. Yes, sir; we believe so. And again we will say that the delays, to the extent that there have been any, will have occurred in the precontract stage. Once the contract is signed there should be no delay on the contractor's part.

Senator BYRD. So although Mr. Lamb's prophetic statement did not materialize, to wit, that pilot plant activities would be underway in the fall of 1963, the work of this committee in appropriating an additional $1 million over and above the budget request last year was not indeed love's labor lost?

Mr. FUMICH. We don't think so, sir.

LOCATION OF GASIFICATION PROJECT PILOT PLANTS

Senator BYRD. Now, I asked Mr. Lamb this question:

Would you envision the pilot plant activity in connection with all three of these gasification projects being located at the same site?

Mr. Lamb said:

This could be done with advantage. There would be an advantage in bringing all three together.

It also could be of advantage if this could be done in the coalfields and at a location that is central to a number of different kinds of coal that are easily available for testing purposes.

Senator BYRD. So if all could be located in the same area, this would be ideal, would it?

Mr. LAMB. I think this is true, sir; because one project complements the other and you would have them together at one site, and you would have one company coordinating all activity. This would be a real advantage.

Mr. FUMICH. I have no reason to refute that statement, sir.

Senator BYRD (reading):

Senator BYRD. It is the desire of the Office of Coal Research, then, to locate the three in the same area?

Mr. LAMB. This would be the ideal plan. That is correct, sir; locate the pilot plant activity at a single pilot plant location.

Is it your position, Mr. Fumich, that this would still be the view of the Office of Coal Research, that it would be advantageous to locate all three in one complex?

Mr. FUMICH. That is my information, sir.

Senator BYRD. Is there any indication as to where this complex would be located?

(Discussion off the record.)

SITE DETERMINATION

Mr. FUMICH. Sir, we haven't come to any conclusion as to the actual site. I understand that Kellogg has space. But frankly the plans haven't been projected that far yet.

Senator BYRD. Now, Mr. Fumich, in summation would you state for the record the anticipated dates in connection with Project Bootstrap which will constitute milestones in the progress toward completion and operation of the plant.

Mr. FUMICH. Yes, sir; I can.

PROJECT BOOTSTRAP

As I stated previously, the preliminary stage is nearing completion as of today. We are now proceeding with an evaluation of the particular project, which will take place by a committee on which our chief of utilization is a member. That committee will go to Schenectady on the 4th and 5th of March. And we assume that the deci-

sion will be forthcoming within a week or 10 days after that. If the decision is favorable, we should then be able to proceed quickly to the next contract stage.

We think that the work that has been going on has been highly satisfactory. That is one reason we are going through with this evaluating procedure.

PILOT PLANT CONSTRUCTION

Then from the time the next phase starts we would project another 12 months from that date. In other words, 12 months from the time the next phase would start we would think about a pilot plant construction phase. But within that period, or 6 months within that period, possibly by next September, we would also start concurrently with the next phasing into the design and development stage of a pilot plant so there would be no lost time or lost motion. Just about at that time we would also start seriously considering a plant site, sir.

Senator BYRD. And this would mean that as of about March or April 1965 the actual beginning of construction of the pilot plant would get underway.

Mr. FUMICH. I would say within that particular area of time, sir. I would rather not come out and say it is going to be March or April. I would say in that vicinity of time we think that this thing will take place.

Senator BYRD. And it will require approximately 1 year to complete the pilot plant once construction was begun?

Mr. FUMICH. Yes, sir.

Senator BYRD. Which would be around March or April of 1966?

Mr. FUMICH. Around March or April of 1966. These are the timetables that we are estimating now, sir.

TOTAL COST OF PROJECT

Senator BYRD. Did I ask you what the total cost of Project Bootstrap is contemplated to be?

Mr. FUMICH. Yes, you did, and I am willing to give you that information immediately, sir.

(Discussion off the record.)

Senator BYRD. Did you indicate what the total cost of Project Bootstrap would be?

Mr. FUMICH. We could give you that information immediately, sir, but we would rather give it confidentially.

Senator BYRD. Would you be able to supply this for the record by the time we wrap our——

Mr. FUMICH. We can do it right now, sir.

Senator BYRD. For the record?

COST FIGURES AND NEGOTIATIONS

Mr. FUMICH. We don't want it in the public record. We don't want to prejudice the negotiations. What we would rather do, sir, is to give it to the committee but keep it off the record. We can give it to you in writing. We don't want the contractor to know what we think this is going to cost, because if he does it prejudices our negotiations.

Senator BYRD. Would you supply that to Mr. Eaton, the committee clerk, so that we might have it for use in marking up?

Mr. FUMICH. Yes, sir.

Senator BYRD. And did you make some reference earlier to some additional figures that you preferred not to have in the public record?

Mr. FUMICH. That is the next stage, sir.

Senator BYRD. Would you supply those in the same manner in writing so that we will have some record of them for the committee's use?

Mr. FUMICH. Yes, sir.

Depending on your time, we do have a projector here, we could give you some slides just to show you how our program ties together. I know time is of the essence, but if you do have the time——

Senator BYRD. I am 40 minutes late in chairing another subcommittee. But I appreciate the offer to show these slides to the subcommittee.

I may want to go over this transcript and then submit additional questions to you in writing, if I see some loose ends.

I think you have made a good statement, and I congratulate you on your desire to be factual and candid with the committee.

Mr. FUMICH. Thank you, sir.

SUPPORT FOR OFFICE OF COAL RESEARCH

Senator BYRD. I know you will understand my reasons for wanting to get into this in a very thorough way, because as I have already indicated, I am extremely interested, and could not be otherwise. I feel that I have carried the ball for the Office of Coal Research on this committee, and I think the record will show it. I want to feel that in so doing I am being supported by the Office of Coal Research. I also want the record of the Office of Coal Research to be such that I can continue to support the requested appropriations in this committee and to continue to support amendments, adding moneys over and above the budget request if such amendments seem to be justified.

Mr. FUMICH. I appreciate your position, sir.

Senator BYRD. And I think it is important that we tie in last year's testimony with this year's so that we can see where we have been and where we are now and where we are going.

Do you have anything else?

Mr. FUMICH. No, sir.

Senator BYRD. Mr. Larson?

Mr. LARSON. Nothing special.

Senator BYRD. Mr. Cochran?

Mr. COCHRAN. No.

Senator BYRD. Thank you very much, sir.

The subcommittee will stand in recess until 10 a.m., Thursday, February 27, 1964, at which time the subcommittee will hear the Fish and Wildlife Service.

(Whereupon, at 2:40 p.m., Wednesday, February 26, 1964, the committee adjourned, to reconvene at 10 a.m., Thursday, February 27, 1964.)

DEPARTMENT OF INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR 1965

THURSDAY, FEBRUARY 27, 1964

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met at 10 a.m., pursuant to recess, in room 1223, New Senate Office Building, Hon. Carl Hayden (chairman) presiding.

Present: Chairman Hayden, Senators Bible, Byrd, McGee, Bartlett, Mundt, and Young.

DEPARTMENT OF THE INTERIOR

FISH AND WILDLIFE SERVICE

OFFICE OF THE COMMISSIONER

STATEMENTS OF MR. CLARENCE F. PAUTZKE, COMMISSIONER OF FISH AND WILDLIFE; MR. DONALD L. McKERNAN, DIRECTOR, BUREAU OF COMMERCIAL FISHERIES; MR. DANIEL H. JANSEN, DIRECTOR, BUREAU OF SPORT FISHERIES AND WILDLIFE; AND MR. CLEO F. LAYTON, ASSISTANT DIRECTOR FOR ADMINISTRATION, BUREAU OF COMMERCIAL FISHERIES:

1965 BUDGET REQUESTS

Chairman HAYDEN. The committee will be in order.

Mr. Pautzke, we will take up the Fish and Wildlife Service first. There will be placed in the record the statements in justification of an appropriation request of $393,000 for fiscal year 1965 for salaries and expenses of the Office of Commissioner of Fish and Wildlife. This is an increase of $7,000 over the amount appropriated last year. The increase is due to the necessity to provide for increased pay costs for fiscal year 1964 positions.

(The statement referred to follows:)

SALARIES AND EXPENSES

HIGHLIGHT STATEMENT

In accordance with the provisions of the Fish and Wildlife Act of 1956, the Commissioner provides supervision of the activities of the two Bureaus of the Service through coordination and review of programs from the standpoint of policy direction and management improvement; provides an information, education, and safety facility; and carries on liaison of the Service with the Assistant Secretary for Fish and Wildlife. The Commissioner also acts as the U.S. Govern-

ment representative at international meetings of the International North Pacific Fisheries Commission and the International Pacific Salmon Fisheries Commission, and participates in other international, national, and local conferences of fishery and wildlife interest.

Office of Information.—The Office of Information is responsible for the conservation education program of the Fish and Wildlife Service, serving both the Bureau of Sport Fisheries and Wildlife and the Bureau of Commercial Fisheries, through the issuance of publications, informational and educational materials, audiovisual aids, and the dissemination of research and technical data through all media.

Public interest in the fish and wildlife resources of the United States, and the growing use of visitor facilities at the Nation's fish hatcheries, wildlife areas, and scientific facilities indicates the need for a sustained conservation education program.

Office of International Relations.—This Office is concerned with international interests, activities, and policies of the Fish and Wildlife Service. In both the commercial fisheries and wildlife fields, there are major international problems.

Fish and wildlife resources of growing importance for food and recreation, have been propelled to the forefront as an international problem and as an economic asset to the Nation. The increased exploitation of fish and wildlife resources by nationals of many nations has greatly augmented the need for international conservation measures. Larger and larger amounts of time are being required in international consultation and negotiation, and in meetings with industry leaders and organizations. Much of this activity is in the political realm of policymaking to obtain proper consideration for fish and wildlife interests and to plan a total national program of greatest benefit to the Nation.

Office of Program Review.—This Office has staff responsibility for coordination and review of Service programs and legislation. Bureau programs are reviewed primarily from the standpoint of policy direction and management improvement. The Office also conducts and coordinates a servicewide safety, health, and fire prevention program directed at the reduction of personnel injuries, property damage loss through accidents, tort claims, and inefficiencies arising from unsafe conditions and unsafe acts.

Salaries and expenses

Appropriation, 1963	$364,000
Supplemental appropriation, 1963	10,450
Total available, 1963	374,450
Appropriation, 1964 (total available)	386,000

SUMMARY OF INCREASES AND DECREASES, 1965

Salaries and expenses: To provide for increased pay costs for fiscal year 1964 positions (net increase, 1965)	7,000
Budget estimate, 1965	393,000

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964		
		Total appropriation	Transfers [1]	Amount available
Departmental expenses	$374,116	$386,000		$386,000
Unobligated balance lapsing	334			
Total	374,450	386,000		386,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

Analysis by activities—Continued

	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
Departmental expenses	$374,116	$386,000	$393,000	+$7,000	+$7,000	
Unobligated balance lapsing	334					
Total	374,450	386,000	393,000	+7,000	+7,000	

[1] To provide for increased pay costs for fiscal year 1964 positions.

Departmental expenses.—The estimate for 1965 is $393,000, an increase of $7,000 over 1964. This increase is for pay costs.

Plan of work.—The Office of the Commissioner will continue to provide general supervision of the programs of the Bureau of Sport Fisheries and Wildlife and the Bureau of Commercial Fisheries to insure the carrying out of the objectives of the Fish and Wildlife Act of 1956. The estimate will provide necessary funds for operation of the Office and the cost of general administrative services rendered by the Bureau of Commercial Fisheries on a reimbursable basis.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$374,116	$386,000	$393,000	+$7,000

Past Activities and Future Plans

Chairman Hayden. The committee will be glad to receive your statement, either by highlighting the activities of the Fish and Wildlife Service during the past year and your plans for the future year, or by your reading your written statement into the record.

Mr. Pautzke. With your permission, I would like to submit the written statement for the record and make a few comments, if I may.

Chairman Hayden. That will be fine.

(The statement referred to follows:)

Statement by Clarence F. Pautzke, Commissioner, U.S. Fish and Wildlife Service

Mr. Chairman and members of the committee, the estimate for "Salaries and expenses, Office of the Commissioner," for the fiscal year 1965 is $393,000, an increase of $7,000 over 1964. The increase is for increased pay costs.

The Office of the Commissioner continues to provide general supervision of the Bureau of Sport Fisheries and Wildlife and the Bureau of Commercial Fisheries

to insure the carrying out of the objectives of the Fish and Wildlife Act of 1956. Organizationally, in addition to the Commissioner's immediate office, there is an Office of International Relations, an Office of Information, and an Office of Program Review.

The Office of the Commissioner has major responsibilities in connection with international fishery and wildlife matters. International cooperation in the conservation of marine fishery resources, international competition for these resources, the rights of American fishermen on the high seas, and the competition in domestic and foreign markets offered by foreign fishery products are matters which affect virtually all of our important fisheries. The increased importance of fish and wildlife and their involvement in the world economic and strategic tensions has resulted in an ever-growing volume of work.

The astounding growth of foreign fisheries and their exploitation of waters traditionally fished by American fishermen raise new conservation problems as well as pose difficult economic problems for American fishermen. Expanding Soviet fisheries in the Northwest Atlantic; expanding Soviet and Japanese fisheries in the North Pacific; the appearance of Soviet fishing vessels in the Gulf of Mexico are causes for concern on both counts. Not only are we faced with the need for new or improved mechanisms for insuring the conservation of heavily exploited resources off our coasts, but also we have the new problem of insuring that the appearance of these highly efficient foreign fleets does not result in driving U.S. fishermen from traditional grounds. At the same time, we continue to be confronted with the problem of maintaining longstanding U.S. fisheries in distant waters in the face of claims by foreign governments to exclusive jurisdiction over those waters.

The Commissioner and his staff participate actively in the formulation and implementation of policy relating to these problems. The Commissioner, himself, is a member for the United States of two international organizations—the International North Pacific Fisheries Commission (Canada, Japan, and the United States) and the International Pacific Salmon Fisheries Commission (Canada and the United States); and his staff provides essential advice to other officers of the Fish and Wildlife Service who serve on other similar organizations. The Commissioner and his staff play an active role in negotiations relating to the rights of American fishermen on the high seas. During the past year, a substantial part of the time and effort of the Commissioner has been devoted to these problems.

The growing need for a continentwide approach to the conservation of migratory waterfowl raises problems of bringing about more effective cooperation between the United States, Mexico, and Canada. The Commissioner's Office has provided advice to the Assistant Secretary for Fish and Wildlife on the conduct of informal discussions with representatives of Mexico and Canada aimed at exploring the possibilities of closer coordination of the activities of the three Governments in this field.

The Outdoor Recreation Resources Review Commission report has pointed up the need and demand for recreational resources and the importance of land and water to this program, and that 90 percent of all Americans participated in this activity in 1960. The 1960 survey of hunting and fishing was specifically directed to the use and importance of those resources.

The problems of the States and those on Federal lands have specifically pointed up the need for public education. The increasing intensity of use, the limitations of land and water areas, the need to change philosophy in the management of waterfowl, other recreations competing with fishing on the same area, the litterbug and despoiler problem, the rising importance of private land for the production of game, the necessity for providing runoff for streams and lakes, the changes in habitat creating problems of dwindling species, private development of land that was formerly thought suitable only for fish and wildlife, the changes in agricultural practices which encourage depredations—all these are factors creating problems in managing lands and the public.

Preservation of these resources can only be accomplished with the cooperation of an enlightened public. The sheer pressure of numbers of people is a problem in itself. Sympathy and concern for the resources and the land, and a knowledge of why regulations are imposed or restrictions promulgated are the only means of carrying out our responsibilities adequately. Public support and action, with respect to the basic Fish and Wildlife Service program of conservation of important food and recreational resources, are available only to the degree that the public understands the program and what each individual must do to make it succeed. Within the lifetime of persons now being born, the population of this country will pass the 300 million mark, offering a constantly growing challenge to our basic

resources. Thus, information and education are vital to our basic task of assuring adequate resources for the future.

With a modest staff, we are making every possible effort to bring information on Federal fish and wildlife programs to as many persons as possible. We are also striving to contribute to the education of our young people in conservation, working in cooperation with personnel of other Federal departments and of State and private agencies and through the various youth groups.

The coordination and review of Service programs is also a responsibility of the Commissioner's Office. Bureau programs are reviewed primarily from the standpoint of policy direction and management improvement. A specific example is the servicewide safety, health, and fire prevention program directed at the reduction of personnel injuries, property damage loss through accidents, tort claims, and inefficiencies arising from unsafe conditions and unsafe acts. The Commissioner's Office is represented on the National Committee for the International Conference on the Prevention of Pollution of the Seas by Oil and serves in an advisory capacity to the Secretary's Office on water quality activities of the Service.

Foreign Nationals Fishing in U.S. Territorial Waters

Mr. Pautzke. Mr. Chairman, this morning I have with me on my left Mr. McKernan, the Director, Bureau of Commercial Fisheries; and on my right Mr. Janzen, Director, Bureau of Sport Fisheries and Wildlife. You know a football team has to bring their two backfield men with them.

Chairman Hayden. That is right.

Mr. Pautzke. I do not desire to discuss the Bureau programs, as these two gentlemen will cover them at a later time. I do feel, however, Mr. Chairman, that there are a couple of issues that would be well to elucidate briefly, as we are more or less at a crossroads with regard to these subjects.

First, I would like to mention the international fisheries scene. I am certain that you have read in recent press reports about the number of intrusions we have had by foreign nationals fishing in our territorial waters.

Chairman Hayden. Do you mean on both oceans, the Atlantic and the Pacific?

Mr. Pautzke. Yes, sir; on both oceans and in addition, in the Gulf of Mexico in our shrimp waters.

Prevention Except Under License

The intrusion of Cuban fishing vessels in our waters has caused considerable concern with respect to how far we could go regarding this situation. I am very pleased to report to you that Congress has recognized this problem and has given serious consideration to Senate bill 1988, which is designed to prevent foreign nationals from fishing U.S. territorial waters, except under special license formulas. I did not know that the Senator from Alaska, Senator Bartlett, would be here, but he is the author of that bill. It is a very fine piece of legislation, by the way.

Protection of Migratory Waterfowl

In addition to the areas recently in the news, we are also concerned with major issues such as protection of our migratory waterfowl. Because of the encroachments of civilization, we are dealing with the two governments to the north and south of us (Canada and Mexico) to protect these birds that are left, to increase their populations, and to add to our recreational potential.

NORTH PACIFIC FISHERIES CONVENTION

Mr. Chairman, you are probably also well acquainted with our recent negotiations with Canada and Japan relative to a new treaty to replace the one that will soon expire, having run its 10 years of life. This is the North Pacific Fisheries Convention.

At the present time, this treaty is still in force, and if it continues to be in force through renegotiation, we shall be able to protect our North Pacific fisheries resources at their present population density levels.

ECONOMIC STATUS OF RESERVATION INDIANS

We are also, on a domestic issue, very much concerned about improving the economic status of Indians on reservations. The Commissioner's Office has at the present time a very close working relationship with a number of other bureaus associated with the Department of the Interior on this particular subject. Fish and game play an important part in helping the Indian toward self-sufficiency. We have participated actively with Indian tribes to try and resolve a number of their problems.

That, Mr. Chairman, in brief, concludes my general remarks. I will be happy to answer any questions you may wish to ask.

Chairman HAYDEN. My Apache Indians are very happy about the hatcheries that have been established there. People are coming from great distances to fish.

Are there any questions?

Senator BARTLETT. I have just a few, Mr. Chairman.

OFFICE OF INTERNATIONAL RELATIONS

Mr. Pautzke, will you tell us about your Office of International Relations. How many people staff it?

Mr. PAUTZKE. In our Office of International Relations, we have five—three specialists and two secretaries funded in this budget, Senator. This small trained staff works with these problems of international significance.

Senator BARTLETT. What is your budget item for this activity?

Mr. PAUTZKE. The budget item at the present time is $50,400.

ADEQUACY OF STAFFING

Senator BARTLETT. In light of the increasing complexity of this subject, the need for more and more negotiations with more and more foreign nations, I should like to ask you if, in your opinion, you are adequately staffed to meet the problems that face the Department?

Mr. PAUTZKE. Sir, the Office of International Relations endeavors to cover these various fields and problems, but we are spread real thin. One of my greatest concerns beyond the minimal staffing or lack of depth in numbers is the length of time required to train new people to come up through the ranks so that they have sufficient familiarity with the subject matter and techniques to be able to sit down at the table with these foreign nationals. Foreign delegations seem to be overflowing with trained personnel.

COOPERATION WITH DEPARTMENT OF STATE

Senator BARTLETT. Do you work in cooperation, in this Office, with the Department of State?

Mr. PAUTZKE. We do, sir. However, we are the representatives that deal with the resource whereas they are the ones that deal with regard to effects on the country as a whole.

In other words, we deal with this situation by representing the national resource and the protection of our fisheries industry.

Senator BARTLETT. Was your budget request trimmed either in the Department or at the Bureau of the Budget?

Mr. PAUTZKE. Yes, our budget was trimmed.

Senator BARTLETT. How much more money did you desire for how many people?

ADDITIONAL PERSONNEL REQUESTED

Mr. PAUTZKE. I had believed necessary, as I recall, sir, additional personnel of at least two foreign affairs specialists for the purposes of more adequate staffing in that Office and one person for stenographic help.

Senator BARTLETT. How much money would that be?

Mr. PAUTZKE. This as I recall would cost about $35,000.

FOREIGN FISHING FLEET ACTIVITIES

Senator BARTLETT. Commissioner Pautzke, will you be good enough to supply for the record a statement showing the activities of the foreign fishing fleets off our coasts, including the Gulf Coast, and couple that with figures revealing the notable increases in the numbers of foreign fishing vessels that are taking fish that were formerly caught only by American fishermen as to geographic locations? Can you do that?

Mr. PAUTZKE. Yes, sir; I will.

Chairman HAYDEN. That will be placed in the record.

(The statement referred to follows:)

SUMMARY FOR 1963

Over 1,000 Soviet, Japanese, and Canadian fishing vessels were believed to have operated off U.S. coasts in 1963, including about 30 factoryships, 700 trawlers, about 170 trollers, and over 100 other support vessels. The breakdown by major areas is given below:

NORTH PACIFIC AND BERING SEA

Soviet fishing in the eastern North Pacific and Bering Sea in 1963 reached a peak of 200 vessels. Soviet exploratory fishing vessels were reported off the coasts of Oregon and Washington.

In late June 1963, the Japanese fleet strength in the eastern North Pacific and Bering Seas was estimated at 180 vessels, while in July 1963, the fleet numbered 210 to 215 vessels. In addition, salmon craft operating in the western Aleutian area included 11 factoryships and nearly 300 catcher boats. At the same time, two Japanese whaling factoryships, each accompanied by three killer vessels, operated in the Gulf of Alaska, while a fourth whaling fleet was reported operating at the far end of the Aleutian Islands. Incidental whaling was also conducted by the Soviets.

About 170 Canadian trollers operated in the area during the year.

NORTHWEST ATLANTIC

A peak of approximately 160 Soviet fishing vessels was sighted on Georges Bank in the Northwest Atlantic. In addition, Japanese fishermen have conducted exploratory operations but have not as yet dispatched fishing fleets.

GULF OF MEXICO AND OFF THE SOUTHEASTERN ATLANTIC COAST

Several Soviet vessels were also reported operating off the Carolina coasts and Florida. At least 20 Soviet trawlers are believed operating in the Caribbean and Gulf of Mexico out of Cuba. In August 1962, announcement was made of a Soviet-Cuban fishing base to be built in Havana Bay. This important base is expected to facilitate Soviet fishing operations throughout the Western Atlantic.

Background Information

NORTH PACIFIC AND BERING SEA

About 10 years ago the Soviets began to develop extensive high seas fisheries in the North Pacific area. In this area, a peak of about 200 Soviet fishing vessels were sighted in mid-June 1962, mostly in the Bering Sea. Segments of this fleet began to move into the eastern North Pacific and the Gulf of Alaska in June; over 100 sightings of Soviet vessels were reported in the Gulf of Alaska in late November. In mid-November, 18 Soviet fishing craft were 30 miles south of Cordova, Alaska.

King crab, herring, ocean perch, cod, sablefish, Alaska pollock, and flounder have been reported as being caught; quantities of each species taken are unknown. No reports have been received of Pacific halibut being taken.

Over 200 Russian fishing and support vessels operated in the Gulf of Alaska in the summer of 1963. During the winter of 1963–64, the Soviets have operated in the Bering Sea with a fleet of up to 150 vessels. The Soviet catches are primarily groundfish and herring, with some king crab fishing in the Bering Sea.

Before World War II, Japanese operations in the North Pacific were small compared to operations at the present time. In the early 1950's the Japanese fishing effort in the North Pacific increased markedly. Japanese operations for the summer of 1963 have included over 150 vessels in the Bering Sea and 6 vessels in the Gulf of Alaska. The Japanese caught groundfish in the gulf and groundfish, shrimp, and king crab in the Bering Sea. In addition, the Japanese licensed 78 vessels to fish in the eastern Bering Sea and landed 3.6 million pounds of halibut in the Bering Sea halibut quota area. Halibut in that area were formerly caught by North American fisherman exclusively. Japanese fishermen took over 10 million pounds of additional halibut in the eastern Bering Sea outside the quota area.

The Japanese sent three trawlers, three gillnetters, and one factoryship into the Gulf of Alaska during the summer of 1963. This fleet of seven vessels landed a total catch of 6.4 million pounds, consisting primarily of ocean perch, black cod, and shrimp. Japanese vessels have operated in the Gulf of Alaska during only the last year or two.

Gear conflicts between Soviet trawlers and U.S. king crab fishermen have occurred recently in the Gulf of Alaska. There have been several instances of damage to U.S. crab pots alledgedly caused by Soviet trawlers. The United States has brought these incidents to the attention of Soviet Embassy officials. It is hoped that a mutually satisfactory resolvement of this serious problem can be obtained in the near future.

NORTHWEST ATLANTIC

The rapidly increasing fishing activity in the area covered under the International Convention for the Northwest Atlantic Fisheries (ICNAF) has created several problems. Increased competition on the fishing grounds has led to claims of gear and vessel interferences among fishermen of several nationalities. While fishing effort of the original signatories to the Convention has tended to remain more or less static, the last few years have witnessed the entry of new nations into the fisheries; i.e., the U.S.S.R., Poland, West Germany, and East Germany.

The growth of the Soviet fishing activity in the Convention waters has been meteoric. In 1956, Soviet vessels caught 3,000 metric tons of haddock and cod in the ICNAF area; in 1961, this catch totaled 198,000 metric tons. Although haddock and cod are the principal food fish species taken by U.S. fishermen, the

Soviets have not for the most part, done their fishing for these species in the same subareas as those fished by U.S. fishermen. This, of course, does not preclude the possibility that these species will be fished in the same areas in the future.

Since their initial efforts in 1956, the Soviets continually have increased their annual catches in the ICNAF area until in 1961 their total catch was 340,557 metric tons or about 14 percent of all fish taken in that area.

U.S.S.R. catches in the ICNAF Convention area, 1959–61

[In metric tons]

Species	1959	1960	1961
Cod	15,453	103,306	158,066
Herring	(1)	(1)	67,584
Ocean perch	155,004	104,147	60,498
Haddock	(1)	36,306	40,077
Flounder	678	4,392	5,448
Halibut	224	237	140
Other	10,578	9,689	[2] 7,848
Total	181,937	258,077	[3] 339,661

[1] Included in "other."
[2] Includes only other species of groundfish.
[3] Includes only groundfish and herring.

Source: Statistical bulletins of the International Commission for the Northwest Atlantic Fisheries.

Their catch in the vicinity of Georges Bank, an area formerly fished almost exclusively by North American fishermen, was 207,000 metric tons in 1962.

The Soviet delegation to the ICNAF meeting held in Halifax in June 1963 reported the Soviets' 1962 fish catch from ICNAF subarea 5 (principally Georges Bank) in metric tons as follows:

	1962	1961	Increase over 1961 landings
Cod	5,303	55	5,248
Haddock	1,134	0	1,134
Redfish	1,590	0	1,590
Silver hake	41,900	0	41,900
Other groundfish	6,089	6	6,083
Herring	151,144	68,000	83,144
Other	153	0	153
Total	207,313	68,061	139,252

The first large concentration of Soviet vessels in 1963 was seen on June 11 when a Fish and Wildlife agent counted 167 vessels and estimated he probably missed an additional 25. This fleet was located on what is known as the southeast part of Georges Bank, an area which lies on the eastern side of Georges Bank, approximately 100 miles southeast of Nantucket Island. These grounds are usually fished by New Bedford vessels seeking scallops or yellowtail flounder. Fishing there continued through July and until about the first week in August when the fleet moved northwestward about 40 miles to an area just southwest of Cultivator Shoal. During August, approximately 200 vessels concentrated their fishing in an area about 20 miles wide and 40 miles long. Observations made by Coast Guard personnel on special flights indicated that on several occasions well over 200 Soviet vessels were fishing on Georges Bank. From limited observations indications are that the fishing conducted by the Soviet fleet was primarily for the purpose of catching herring and whiting.

Interference with U.S. fishing activities was at a minimum until August when the Soviet fleet moved into the Cultivator area usually fished at this time of the year by the Gloucester whiting fleet. In addition, the Soviets did fish to within at least 4 miles of the shores of Cape Cod and the Bay of Fundy on several different occasions. These are also waters traditionally fished for herring and whiting by trawlers from Portland, Gloucester, and Provincetown.

These foreign activities in the North Atlantic have created numerous problems which are being given serious study and, where desirable have been subjected to international negotiations. These problems include:

1. Discarding of old nets on the fishing grounds leading to entanglement of these nets in vessels running gear and possible loss of life and property.
2. Inadequate marking of floating gillnets.
3. Failure to give sufficient berth to a vessel already in the act of fishing.
4. Confusion regarding use of proper signals.
5. Obtaining international agreement on conservation measures, e.g., mesh sizes, chafing gear, and other attachments to trawl gear.
6. Implementing a joint system of international enforcement.

GULF OF MEXICO AND OFF THE SOUTHEASTERN ATLANTIC COAST

Information available to the Fish and Wildlife Service is seriously lacking in specific details concerning foreign fishing activities in the Gulf of Mexico. The most recent statistical information on the Mexican fishing fleets is for the year 1961 when 688 vessels over 3 net tons operated in the gulf.

The catch by the Mexican fleet in all areas has increased from 71,000 metric tons in 1954 to 218,600 metric tons in 1962. The Service does not have the catch figures for the Gulf of Mexico but it is assumed that the gulf fleet shared in the increased catch.

The size of the Cuban fleet is unknown. The Cuban Government plans to expand fishing operations to a considerable degree. Increased Cuban activity is evident from the recent invasion of U.S. territorial waters off the coast of Florida by four Cuban vessels. Cuba's total catch in 1954 was 11,500 metric tons and this catch increased to 35,900 metric tons in 1962. Future increases in the catches can be expected.

Soviet activities in the gulf have not been extensive until recent years. It is expected that vessels operating out of Cuba will increase in the near future. The harbor at Havana is being modified to serve as a home base for such vessels. Four Soviet fishing vessels have picked up supplies at Veracruz, Mexico, within the past year. In addition, a Soviet-Cuban research expedition to study the fishery resources of the gulf and Caribbean is planned for the summer of 1964.

Japanese activities have not yet been important in the Gulf of Mexico. An exploratory operation took place last year. Extensive commercial operations have not developed, but some exploitation by Japanese tuna vessels and, possibly, by shrimp vessels can be expected. The Japanese will doubtless attempt to establish a fishing base somewhere in the gulf.

Various Soviet explorations have been conducted off the coasts of Virginia, the Carolinas, and Florida. Stern trawler activity off the New Jersey and New York coasts with four to seven vessels was the greatest during March and April 1963. On April 16, seven of these vessels were observed about 60 miles south of Montauk Point, Long Island, fishing for whiting. Other species that have probably been taken off the southeast coast would include herring and menhaden. For example, Soviet scientists have reported in Rybnoe Khoziaistvo that they are making a detailed study of the menhaden resources of the northwestern Atlantic Ocean.

The problems relating to foreign fishing operations in the gulf and off the southeastern coast of the United States are expected to increase and will require additional time and effort of technicians with a view toward reaching solutions which are in the best interests of the United States and its fishermen.

BUDGET REQUEST INCREASE

Senator BARTLETT. Finally, Commissioner Pautzke, I want to applaud you for endorsing so wholeheartedly S. 1988. Thank you, that is all.

Chairman HAYDEN. Any questions?

Senator YOUNG. You are asking only for $7,000 more than the budget of a year ago?

Mr. PAUTZKE. Sir, this was the amount that was allowed me to provide additional pay costs. As I mentioned earlier in response to Senator Bartlett's question, my budget was trimmed and did not include what we had asked for.

Senator YOUNG. I expected it was not. But you can live with this, can you not?

Mr. PAUTZKE. Yes, sir; but we will not be able to do the full job required of us.

Senator YOUNG. That is all. Thank you, Mr. Chairman.

Chairman HAYDEN. We thank you for your statement.

Now we will take up the Bureau of Commercial Fisheries.

BUREAU OF COMMERCIAL FISHERIES

STATEMENTS OF DONALD L. McKERNAN, DIRECTOR; CLEO F. LAYTON, ASSISTANT DIRECTOR FOR ADMINISTRATION; PHILLIP NELSON, ACTING ASSISTANT DIRECTOR FOR BIOLOGICAL RESEARCH; JOHN A. HOLSTON, ACTING ASSISTANT DIRECTOR FOR INDUSTRIAL RESEARCH; JOHN I. HODGES, ACTING ASSISTANT DIRECTOR FOR RESOURCES DEVELOPMENT; AND HAROLD W. SORRILL, CHIEF, BRANCH OF BUDGET AND FINANCE

NATIONAL OCEANOGRAPHIC PROGRAM

Chairman HAYDEN. The Bureau of Commercial Fisheries has included with its justifications a statement of its accomplishments under the national oceanographic program. This statement will be included at this point in the record. I believe that the various activities of the Bureau in connection with the national oceanographic program will be covered as we consider the budget requests for the various projects to be carried on in fiscal year 1965.

(The statement referred to follows:)

ACCOMPLISHMENTS UNDER THE PROGRAM

Since 1959 the Bureau of Commercial Fisheries has been working closely with other Government agencies, with the Interagency Committee on Oceanography (ICO) of the Federal Council for Science and Technology, with the National Academy of Sciences Committee on Oceanography (NASCO), and with university and private research institutions to plan and carry out a coordinated national program in oceanography. During the past 5 years, the Bureau has paid increasing attention to oceanographic research as a means of increasing and maintaining the yield of living resources.

The Bureau's oceanographic investigations have now reached a level of maturity with many substantial achievements. Some of the more noteworthy of these are as follows:

PHYSICAL AND CHEMICAL OCEANOGRAPHY

The physical and chemical properties of the oceans have an important influence on the basic productivity of the sea and the distribution and abundance of its fishery resources. Some of the principal contributions of these studies have been: (1) monitoring the seasonal north-south drift of the California current extension from stations in or near Hawaii where trends in sea-surface temperature and salinity were determined; (2) calculation of heat transfer and energy systems of the central Pacific as related to ocean currents, atmospheric conditions, and fish distribution and migration; (3) detailed analysis of lengthy time series of North Pacific sea-surface temperature data along with related meteorological processes that may cause variations in water transport, heat gain or loss, sea level differences, and fish abundance and distribution; (4) definition of physical and chemical features of Pacific subarctic waters as part of an extensive program to explain factors controlling high seas distribution of salmon; (5) cooperative studies with California agencies on the California current system and physical oceanographic features of the eastern, subtropical, and tropical Pacific; and (6) observations on the influence of currents in the western North Atlantic on the drift and survival of fish larvae.

In cooperation with the Scripps Institution of Oceanography, 24 topographic charts of the eastern Pacific have been produced, showing the locations of sea mounts and other features of the ocean floor that have a bearing on fish aggregation. Monthly temperature charts of the eastern Pacific have aided fishermen in locating fish and have been useful to fishery scientists, oceanographers, and meteorologists. Temperature studies have been conducted and charts issued for the western North Atlantic.

Much of our research in the Gulf of Mexico and along the Atlantic coast has been directed toward increasing our understanding of environmental conditions in coastal and estuarine habitats. Circulation and net current flow through bay and inland passages have been studied by means of drift bottles and radio transmitting, free-floating buoys.

The Director of the Biological Laboratory in Washington, D.C., was selected as coordinator of the international cooperative investigations of the tropical Atlantic. This program, the first two parts of which were completed in 1963, has concentrated its efforts on the study of the relationships between the circulation of ocean and atmosphere and their influence upon potential fishery yields of the tropical equatorial belt between the east coast of South America and the West Coast of Africa. Two Bureau vessels participated, along with at least a dozen other ships from six other countries.

BIOLOGICAL OCEANOGRAPHY

Significant progress has been made toward achieving an important objective: the maximum development and use of the living resources of the sea. Looking toward the need of the United States for an additional 3 billion pounds of fish and shellfish annually by 1980, the Bureau has conducted active programs of exploratory fishing to discover new fishery resources, and of biological research to rehabilitate depleted stocks and conserve presently exploited fisheries. Explorations off the Columbia River have given evidence that commercial quantities of fish and shellfish occur to depths of at least 600 fathoms. These resources have not previously been utilized by our commercial fleets. The results of this exploratory fishing have stimulated new commercial operations in a number of areas on what were primarily unknown or underexploited resources. Extensive new scallop beds, having important commercial potential, have been located off the east coast of Florida. New data have been collected concerning stocks of shrimp and bottomfish along the northeast coast of South America and their relations to environmental factors. New fishing methods and sampling techniques have been developed to ascertain the presence of unknown or little used fishery resources, particularly in the middepths of the ocean that have been little exploited in the past.

Considerable research effort has been devoted toward gaining a better understanding of the oceans in order to develop reliable methods for predicting places and times of fish concentration. Since 1959, annual predictions, based on changes in ocean circulation, have been made for the catch of the Hawaiian skipjack fishery. In the eastern Pacific, forecasts now can be made of the distribution and relative abundance of albacore and bluefin tuna during the summer season on the basis of rates of warming during early spring. In New England waters, forecasts are made on the abundance of groundfishes and of sea scallops.

Results of pioneering studies in the scientific field of serology, or blood group analysis, have been used to identify and separate races or subpopulations of marine fishes. Such studies have been used to identify subpopulations of tuna throughout the Pacific, of sardines in the eastern Pacific, of salmon in the eastern North Pacific, and of herring and groundfishes in the western North Atlantic. Information from such studies on the occurrence of subpopulations and the degree of overlap or mixing is essential for the intelligent management and full utilization of these resources.

Our scientists have made important contributions to knowledge of the physiology and behavior of fishes and invertebrates. They have strengthened their efforts in improving knowledge of the kinds of animals in the sea, and their distribution. A new field station for this purpose was established at Stanford, Calif., early in 1963. Studies have been pursued on the artificial culture of marine organisms, particularly shellfish. Tolerance of these animals to environmental factors such as salinity, temperature, and turbidity during critical periods in their life cycle has been determined.

Considerable effort has been devoted to the work of a number of international commissions concerned with the conservation and use of marine resources

Much of our research on salmon and fur seals in the North Pacific, on tuna in the eastern tropical Pacific, and on groundfishes in the Atlantic is designed to provide information to assist in the management and preservation of these international resources. The Bureau has participated in the International Indian Ocean Expedition by providing scientists, skilled fishermen, and special fishing gear for assessing the varying abundance of tunas, spearfishes, and other potential commercial fishes in relation to oceanographic factors. Since 1950, a laboratory for the study of radiobiology has been maintained at Beaufort, N.C. In recent years, with the assistance of the Atomic Energy Commission (AEC), research has been conducted on the effects of radioactive substances and pollution on marine organisms and how these may be concentrated by plants and animals and transmitted to man. This knowledge has been useful in evaluating the effect of proposed atomic powerplants on marine resources.

TRAINING OF SCIENTISTS

Recognizing that our rapidly developing programs in marine science could be severely handicapped by a shortage of qualified scientists, the Bureau established, in 1962, a program for graduate educational grants in aquatic sciences. In 1962 we supported 17 students at 12 universities, and in 1963 made grants in support of an additional 21 students. This program has been singled out for special commendation by review panels of the Federal Council of Science and Technology.

INSTRUMENTATION

One of the most critical needs of the national oceanographic program is for new and improved instruments. The Bureau played an important role in planning a Government-industry oceanographic instrumentation symposium, held in Washington, D.C., in August 1961. This symposium provided an excellent means for exchange of information between Government scientists and industry with capabilities in instrument development. In the fall of 1962, an instrumentation unit was established at the Biological Laboratory in Washington, D.C. This unit provides instrumentation services and coordinates instrument development within the Bureau and with other agencies.

LOOKING AHEAD—REQUIREMENTS IN FISCAL YEAR 1965

To maintain this favorable rate of progress additional support is required in fiscal year 1965, chiefly for four purposes. First, under the national oceanographic program, the Bureau has completed, or has under construction or in the planning stage, several new research vessels and laboratories. It is necessary that funds be made available to operate and maintain these facilities, and to provide the qualified scientists needed for proper staffing. Such funds will operate a new ship and a new laboratory at La Jolla, Calif.; a new ship and a new laboratory at Seattle, Wash.; and new ships in the Gulf of Mexico and in Hawaii. Required increases for these purposes total $676,000.

Secondly, the Bureau has underway a substantial number of programs in oceanography which require continuing support in fiscal year 1965 if they are to reach their objectives according to schedule. These include research programs in fish physiology and behavior, serology, taxonomy, plankton studies, biological and physical oceanography, and exploratory fishing. Some phases of these programs are being discontinued as they reach their objectives; others will require budget increases if they are to meet planned schedules. Since these are, in the main, growing programs not yet operating at a level consistent with national needs, increases exceed decreases and amount to $827,000.

Thirdly, certain new programs need to be started if the proper balance anticipated by NASCO and the ICO is to be achieved. These new programs include detailed, oceanographic studies in the eastern tropical Pacific, in the trade wind zone of the central Pacific, and in coastal and offshore areas on the Gulf of Alaska. The Bureau also plans to begin new studies on the diseases of oysters. These new programs will require increases of $365,000.

Fourthly, construction funds will be needed for research vessels and shoreside facilities for which planning will be completed in fiscal year 1964. Money also is needed for outfitting a new research vessel, the construction of which was funded in fiscal year 1964. The total requested for such construction and outfitting is $4.2 million.

Although considerable progress has been made toward achieving the national goals, first defined by NASCO in 1959, the Bureau's rate of progress is lagging

far behind the schedule that was recommended for increasing our knowledge of the living marine resources. Funding in fiscal year 1965 is required at the level requested if our country is to overcome the disadvantages we now experience in competing with other nations for the sea's fishery resources.

A report now under preparation by NASCO on economic benefits from oceanographic research states that rational development of the U.S. domestic fisheries could double U.S. fishery production within a decade. The growth of high seas fisheries by the United States could be much more rapid. It is estimated that our high seas catch could quadruple within a decade. These growth rates cannot be established or maintained, however, unless oceanic investigations are conducted on a worldwide basis to determine: (1) how the distribution and abundance of fish populations vary with changing conditions in the sea; (2) the ocean conditions which bring about economically hatchable fish concentrations; and (3) those aspects of fish behavior which can be exploited to reduce the costs of catching fish. The necessary levels of research and development to produce these results have not yet been reached.

Direct economic returns can be expected from oceanographic research expenditures in the form of larger catches at lesser cost. In addition, there are substantial but less tangible benefits from the development of foreign-based fisheries, in terms of better fed people and increased foreign exchange earnings in the underdeveloped countries. These are important matters in which our Nation has a large stake.

National oceanography program

[In thousands of dollars]

Appropriation, activity, and subactivity	1964	1965	Increase
Management and investigations of resources	9,525.1	11,393.1	1,868.0
Marketing and technology: Exploratory fishing and gear research	1,142.5	1,305.5	163.0
Gear research, faunal surveys, and fishery explorations to locate new fish stocks of commercial importance. Studies to improve fishing gear and to develop new ways of fishing are being conducted in the Pacific Northwest, the Gulf of Mexico, and off the North and South Atlantic coasts of the United States. Presently unexplored areas of the ocean are being explored for high seas pelagic fish, bottom species, and shellfish. New work in the oceanography program will be for shrimp and fish stocks in the northeastern Pacific Ocean, and new gear research activities will be directed at more efficient harvest of pelagic species.			
Research	8,382.6	10,087.6	1,705.0
Coastal and offshore	7,745.0	9,428.0	1,683.0
Shellfish	637.6	659.6	22.0
Biological research and physical oceanographic studies on coastal and high seas fisheries. Principal investigations are on tuna and other important pelagic species, ground-fishes such as haddock and halibut, the ocean phases of salmon life cycles, shrimps, oysters, clams, and sea scallops. They represent part of the national oceanographic program and are designed to meet the specific needs of important U.S. fisheries. The programing in 1964 and 1965 provides added emphasis in whale research, fish behavioral studies, fish and shellfish diseases, food cycles, instrumentation, taxonomy, ecology of larval fishes, the biological aspects of ocean surveys, and basic studies in oceanography. The total program is coordinated with those of other Government agencies through the Inter-agency Committee on Oceanography (ICO), the Office of Science Adviser, and the National Academy of Sciences.			
Promote and develop fishery products and research pertaining to American fisheries (S–K funds)	2,616.5	2,616.5	----------
Marketing and technology: Exploratory fishing and gear research	297.1	297.1	----------
New trawl and pelagic fisheries are sought off New England and the central Atlantic coast. Extensive gear research is conducted, particularly to seek new advances in the efficient capture of trawl fish species. Special explorations to meet the more immediate needs of industry are conducted.			
Research	2,319.4	2,319.4	----------
Coastal and offshore	2,037.4	2,037.4	----------
Shellfish	282.0	282.0	----------
Biological and oceanographic research to meet the needs of specific fisheries. Programs are closely related to those carried out with annual appropriations but in general include objectives of more immediate urgency to the industry. Major programs continue to be on tuna, shrimp, sardines, menhaden, and bottom fish.			
Construction: Fishery facilities	3,352.0	4,200.0	848.0
Provides research and exploratory ships, construction of new laboratories and improvements to existing laboratories with which to carry out the Bureau's total program in oceanography. Continues a program of upgrading of fishery research facilities as recommended by the National Academy of Sciences, Committee on Oceanography.			
Total	15,493.6	18,209.6	2,716.0

MANAGEMENT AND INVESTIGATIONS OF RESOURCES

Chairman HAYDEN. I also will place in the record the statement in justification of the Bureau's request for management and investigations of resources. This amounts to $20,681,000, an increase of $2,848,100 over the amount appropriated last year.

(The statement referred to follows:)

JUSTIFICATION STATEMENT

The Congress established a sound and comprehensive national fisheries policy in the Fish and Wildlife Act of 1956.

It is the national fishery policy to—

1. Increase and maintain forever, for the people of the United States, a fishery resource capable of yielding the maximum annual product.

2. Strengthen and maintain a vigorous fishery by assuring full and fair access to its raw materials and the American market.

3. Do these things in partnership with the States and in full accordance with our international obligations; and without sacrificing our system of free enterprise.

Consistent with its responsibilities under this policy, the Bureau conducts, with funds provided under this appropriation, programs with two broad objectives: (1) to strengthen the commercial fishing industry through research, development, and services; and (2) to conserve the fishery resources in rivers, lakes, estuarines, and the seas and oceans. These programs include fishery research, primarily of a fundamental and applied research nature, using fundamental research to develop new knowledge and then applying this knowledge to the practical solution of fishery research problems; management, and habitat improvement of aquatic resources; locating and developing new fishery resources; developmental research on fishing gear and methods; technological research in production and processing of fishery products; market promotion; economic research and services; statistical services; educational aids; and technical advice and assistance in international fishery relations and enforcement activities.

The Bureau is developing its programs to make certain that our fishermen have continuing access to the fisheries resources of the oceans of the world; that they harvest these resources in consonance with scientific conservation practices in order to insure continuing high rates of productivity; that these resources are made available to the American public in the best palatable form with the highest quality.

These programs involve supplying important services to the industry, consistent with services supplied by Government to other basic industries of our country.

Continued progress was made in fiscal year 1963 in the prosecution of Bureau programs.

The Bureau assisted the Coast Guard in expanding aerial and sea patrols in the Northwest Atlantic Ocean and in the Bering Sea and Gulf of Alaska to provide more effective surveillance of foreign fleet operations and to satisfy the growing concern and interest in foreign fleet operations by Members of Congress, the officials of the States, and the general public. The Bureau's contribution to this cooperative effort with the Coast Guard involved joint planning, providing qualified fishery management agents to accompany and assist all patrol craft, and the conduct of a limited sea patrol with a Bureau vessel. Of particular concern during the past year was the expansion of foreign fishery activities from the Bering Sea to the Gulf of Alaska with resultant gear conflicts with U.S. crab fishermen in the Kodiak area. Activities of foreign fishing vessels documented by Bureau personnel include entry into the king crab fishery, repeated violations of territorial waters, and questionable practices in the taking of whales. The Bureau staff developed new sources of information and new methods of analyses pertaining to foreign fleet activities which expedited the flow of and increased the value of such information.

As a result of the review of the Bureau's economics program by a panel of well qualified economists, a program designed to develop and disseminate up-to-date economic situation analyses for the major segments of the fishing industry was further developed. Another recommendation of the panel included the increased use of fundamental economic research to solve basic problems such as low productivity and lack of knowledge of market demand potentials. This basic research is planned for future years.

Staff members worked successfully in support of the industry's needs for flexible transportation services to get fishery products to market expeditiously and in good condition, and reviewed operations of fishery cooperatives for compliance with the Fishery Cooperative Marketing Act.

New shrimp grounds, discovered during explorations off the northeast coast of South America, provided an immediate source of additional raw material for the ever-expanding U.S. shrimp fleet operating there. Excellent quantities of highly desirable food fish such as snappers and croakers were located during trawl

explorations off South Carolina and Georgia. Additional stocks of king crab were located during explorations conducted in the Gulf of Alaska.

Gear research and exploratory fishing efforts in New England proved the effectiveness of long-line gear for taking swordfish, and has increased tremendously the production of this species. In the Northwest Pacific, gear research activities were strengthened considerably through the establishment of a gear research unit at Seattle, Wash. Preliminary tests in the Gulf of Mexico with experimental shallow water shrimp trawls having an electrical field ahead of the net produced daylight catches of shrimp as large as the catches normally made only at night. Fishing gear instrumentation was advanced by the development of a selfcontained deepwater camera system for photographing the behavior of shrimp and fish species in front of trawls under natural conditions. Preliminary explorations and gear development efforts were initiated in the Oahe Reservoir section of the Missouri River. Initial results indicated good quantities of underutilized fish as well as suitable locations for the commercial harvesting of fish are available.

Market News coverage was streamlined and improved to adequately meet changing conditions in the fishing industry and to supply timely information by mail, telephone, and teletype on market conditions and trends for fishery products and byproducts.

The collection and dissemination of prices and market conditions for a wide variety and forms of fresh, frozen, and canned fishery products and byproducts continued. Other statistical services included periodic overall summaries and reports on prices and specific products; and general and specific fishery information from domestic and foreign sources. For the first time, information was compiled and released on the age distribution of the nearly 12,000 vessels in the U.S. commercial fishing fleet. Information was assembled for publication in the Bureau's annual Statistical Digest, for the first time, on the amount of fishing effort expended in taking fish in the Great Lakes and the international lakes of northern Minnesota. The collection and publication of monthly information on the production of breaded shrimp was undertaken.

A comprehensive program of research on fish oil has indicated potential value in reducing incidents of atherosclerosis when used as human food. The use of fish oils for pharmaceutical and nutritional uses are being investigated and show promise as valuable supplements in relieving diabetes and thyroid ailments.

Investigations on the quality of fish products in conjunction with the development of U.S. standards for grades have revealed the need for methods to improve handling, storage, and transportation techniques. These investigations resulted in the development and promulgation of 3 additional U.S. standards for grades of quality, making a total of 14 now available.

To cope with the problems brought about by the rapid expansion in the world's fisheries, the Bureau expanded its coverage of foreign fishery activities and developments. Basic information on the technological, biological, and economic aspects of the fisheries of foreign countries was collected, coordinated, and analyzed for use in shaping U.S. policy and programs and in assessing the impact on the U.S. fisheries. The Bureau participated in the fishery activities and programs of the United Nations Educational, Scientific, and Cultural Organization (UNESCO), Food and Agricultural Organization (FAO) of the United Nations, Organization for Economic Cooperation and Development (OECD), and other international governmental and nongovernmental organizations. Trade and tariff developments affecting the U.S. fisheries were followed closely, export and import trends in fishery products were also studied, and preparations were made for U.S. participation in international trade negotiations.

The Bureau, at the request of industry, initiated an aggressive educational and market promotion program aimed at restoring consumer confidence in fishery products as a result of a botulism incident which reflected adversely on the canned tuna market. This program was successful and restored tuna sales to their normal level. Fish cookery demonstrations were conducted to teach new methods of preparing farm-raised fish, and additional market outlets for these products (buffalofish and catfish) were explored and liaison services were provided between market sources and farm-fish producers.

In the Atlantic Ocean biological research was intensified in response to the impact of foreign fleets on stocks off New England. Management of the important groundfisheries continued under the International Commission for the North west Atlantic Fisheries. Cod, haddock, flounder, and redfish were under regulation based on the Bureau's biological research. Reliable catch predictions were made for these fishes also. The seas between Africa and South America were the scene of the large scale International Cooperative Investigations of the Tropical

Atlantic. Bureau biologists were instrumental in planning this 11-vessel undertaking, and the Bureau's vessel *Geronimo* participated in the investigations.

The several species of tuna constituted the major subject of biological research in the central Pacific Ocean. Understanding of the relation between ocean conditions and abundance of skipjack tuna in the Hawaiian Islands was greatly, improved. Contributory steps were discovery of ocean-atmosphere relations, development of means to recognize independent stocks, and an increase in the understanding of skipjack sensory perception of the biological environment.

In the North Pacific Ocean interest centered around salmon and groundfish. Information was obtained on Japan and U.S.S.R. fishing for salmon in the western North Pacific and for bottom fish in the eastern Bering Sea and North Pacific Ocean. Six observers were placed aboard Japanese fishing vessels to collect data on fishing effort, amount of catch. and size and age of fish caught. Comprehensive reports are under preparation on the offshore distribution of all six species of Pacific salmon. These will form an extremely useful background for international negotiations.

In addition to work in the two oceans, valuable research was done in the important estuarine and inland areas. Experimental work with shellfish larvae has shown the possibilities inherent in selective breeding. Some stocks have unusual tolerance to low temperature, low salinity, and other adverse factors. Methods and some stocks are available to begin genetic studies. Thus the first steps have been taken toward development of selective breeding methods that will help the shellfish industry. Artificial culture of oysters is being approached through laboratory studies preliminary to full-scale applications. Much valuable knowledge, leading toward improved management, was obtained for Great Lakes fishes. Material from both experimental fishing and commercial catches was studied for Lakes Michigan, Superior, and Erie. Data on abundance, distribution, year class strength, and general life history were secured, in addition to discoveries as to the relation of fish to their environment.

Tracking studies completed in upper Snake River indicated that salmon moved upstream in a normal manner after the 70-mile transport around Brownlee Reservoir. Prototype tests of giant fyke nets for sampling entire turbine discharge up to 13,000 cubic feet per second were completed. The results of Ice Harbor fishway studies were submitted to State fishery agencies of Oregon, Washington, and Idaho. These findings will permit the installation of steeper and less costly fishways at three Corps of Engineers' dams now under construction in the Columbia and Snake Rivers. Guiding and collecting experiments at the head of Brownlee Reservoir were completed and it was determined that guiding efficiency of long lead nets under reservoir conditions is relatively low. Future efforts to collect juvenile chinook salmon migrants will be concentrated in streams tributary to the reservoir. There is evidence that diseases of upstream migrating adult salmon may be controlled by treating with chemicals such as malachite green, sulfa drugs, and vaccines.

Fourteen applications for mortgage insurance were received and 13 applications were approved. With the more general acceptance of the program by banks the interest rates charged have decreased slightly.

Results from operation and maintenance of the facilities and improvements constructed under the Columbia River fishery development program are promising. The hatchery program has been operating at full capacity. The largest silver salmon run in the Columbia River in the past 28 years produced approximately 52 million eggs at program hatcheries. Outstanding adult spring chinook salmon returns to Carson and Eagle Creek National Hatcheries produced over 3 million eggs at each station in calendar years 1962 and 1963. The Skamania steelhead hatchery in the State of Washington received a return of approximately 800 fish in 1963, of which over 90 percent of the adults were marked, and the run more than doubled the parent run. The egg take of fall chinook has been adequate to fill to capacity the 16 hatcheries that rear this species, although the total runs of fall chinook into the Columbia River have been erratic. Approximately 7½ million young chinook salmon at program hatcheries were marked by excision of fins and released in 1963 as a part of the overall hatchery appraisal program. Encouraging reports of catches of 2-year-old marked fish in the ocean have been received. Program fishways constructed at natural barriers are receiving excellent utilization, and in 1963 a total of 18,500 adult fish were counted at four of the fishways. Screening of water diversions has resulted in an increase of salmon in the Lemhi River, Idaho, and a strong resurgence of steelhead runs in the John Day River, Oreg.

The Bureau's objectives for the budget year are to maintain a favorable rate of progress toward the goals outlined in the Bureau's long range report "Trident" and the national oceanography program and to fullfill its responsibilities with regard to such other problems as botulism poisoning and the effects of pesticides. The increase requested for oceanographic programs includes operation and maintenance costs of new facilities and vessels; expansion of research programs in fish physiology and behavior, plankton studies, biological and physical oceanography, and exploratory fishing; and for new programs, including detailed oceanographic studies in the eastern tropical Pacific, in the trade wind zone of the central Pacific, and in coastal and offshore areas of the Gulf of Alaska. The budget also provides funds for botulism and pesticide studies important to the health of the American public as well as the future of our country's fishing industry. Research on *Clostridium botulinum* type E will be conducted in cooperation with other Federal agencies to establish methods of eliminating the public health hazard of botulism poisoning from seafood products. Recent cases of smoked fish poisoning resulted in seven deaths and severe economic injury to the fishing industry.

Biological research will be conducted to determine the effects of pesticides on aquatic life in its natural environment. Technological research will be conducted to establish when, and under what conditions, pesticides are taken up by fish and shellfish, and how to modify processing procedures to minimize harmful residues in fishery products offered for consumption. These studies will help to eliminate health hazards to the public and protect the economic position of the fishing industry.

Programs under the research in fish migration over dams activity will be continued with the level of effort reduced on studies involving racial migration rates and time of migration, and the transportation of adult and juvenile salmonoids. The fishing vessel mortgage insurance program will be continued at the same level as in 1964.

The Federal-State Columbia River fishery development program designed to offset losses to salmon and steelhead runs resulting from Federal water-use developments in the Columbia River Basin will be continued, with additional emphasis on the program for appraisal of project results. The Columbia River salmon runs are a vital part of the highly important and valuable Pacific coast salmon industry. Damage to these runs have been mitigated through construction and operation of hatcheries, fish screens, fish ladders, and stream clearance.

Management and investigations of resources

Appropriation, 1963	$15,225,000
Supplemental appropriation, 1963	658,400
Total appropriation, 1963	15,883,400
Transferred to "Operating expenses, Public Buildings Service," General Services Administration	−29,285
Total available, 1963	15,854,115
Appropriation, 1964 (total available)	17,832,900

SUMMARY OF INCREASES AND DECREASES, 1965

Management: To provide for increased pay costs for fiscal year 1964 positions	+9,366

Management and investigations of resources—Continued

Marketing and technology:	
To provide for increased pay costs for fiscal year 1964 positions	+$69, 300
For operation and maintenance of new facilities: Exploratory fishing vessel *Delaware*	+11, 500
Technological-Biological Research Laboratory, Seattle, Wash	+30, 000
For exploratory fishing and gear research projects	+140, 000
For uncontrollable increased costs for fishery market news service	+30, 000
To provide for botulism research program	+190, 000
To provide for technological research on pesticides	+35, 000
Subtotal, marketing and technology	+505, 800
Research:	
For nonrecurring item for disease resistant oyster brood stock research	−100, 000
To provide for increased pay costs for fiscal year 1964 positions	+150, 200
For operation and maintenance of new facilities:	
Technological-Biological Research Laboratory, Seattle, Wash	+50, 000
North Pacific research vessel	+100, 000
Laboratory, La Jolla, Calif	+187, 000
Research vessel *David Starr Jordan*	+171, 000
Research vessel *Townsend Cromwell*	+145, 000
Radiobiological Laboratory, Beaufort, N.C	+6, 800
Laboratory facilities, Oxford, Md	+5, 000
Research Laboratory, Ann Arbor, Mich	+40, 000
For North and Central Pacific oceanography	+550, 000
For North Atlantic and Gulf of Mexico oceanography	+286, 000
For cooperative oceanographic programs	+66, 500
To provide for biological research on pesticides	+495, 000
For radiobiolgical and shellfish studies	+100, 000
To provide for employees compensation fund	+7, 900
Subtotal, research	+2, 260, 400
Research on fish migration over dams:	
To provide for increased pay costs for fiscal year 1964 positions	+10, 300
To provide for reduction in operations	−100, 000
Subtotal, research on fish migration over dams	−89, 700
Fishing vessel mortgage insurance: To provide for increased pay costs for fiscal year 1964 positions	+800
Columbia River fishery facilities:	
To provide for increased pay costs for fiscal year 1964 positions	+10, 100
To provide for fixed commitments for operation and maintenance of program facilities	+160, 000
Total	+170, 100
Net increase, 1965	+2, 856, 766
Budget estimate, 1965	20, 681, 000

ENFORCEMENT AND ADMINISTRATION

The estimate for 1965 is $400,100, an increase of $9,366 over 1964. The increase is for pay costs.

1. Enforcement of Sockeye Salmon, Northern Pacific Halibut, North Pacific Fisheries, Northwest Atlantic Fisheries, Eastern Pacific Tuna Fisheries, Fur Seal, and Whaling Convention Acts

Plan of work.—To continue the enforcement of restrictions on fishing, whaling, and sealing as provided by law and regulation which implement the treaty obligations of the United States. Seventeen full-time agents and several seasonal employees are actively engaged in the program in Alaska, Washington, Oregon, California, Maine, and Massachusetts. Patrols by vessel and aircraft are carried out under cooperative arrangements with the Coast Guard for offshore waters of both coasts and for enforcement of the Sockeye Salmon Act in Puget Sound waters. In addition, the Bureau operates one seagoing vessel in Alaska, the *John R. Manning*. Continued expansion of foreign fishing fleet operations off U.S. coasts will require continual surveillance. Dockside inspection of catches by U.S. vessels is conducted at fish ports on the Pacific coast from southern California to the Canadian border, and at major ports in New England.

2. Administration of Northwest Atlantic Fisheries Convention Act.

No increase requested.

Plan of work.—To continue collection and analysis of statistical information relating to current conditions and trends of the fishery resources of the northwest Atlantic Ocean and to conduct studies concerned with the maintenance of the northwest Atlantic fisheries as required under provisions of the International Convention for the Northwest Atlantic Fisheries (art. VI, par. 3).

2. Marketing and technology

[1] To provide for increased pay costs for fiscal year 1964 positions.

(a) *Economics*

The estimate for 1965 of $176,000 is an increase of $4,900 over 1964. This increase is for pay costs.

Plan of work.—The general objective of the Bureau's economics program is to provide technical assistance in the form of research and services for the commercial fishing industry which will enable the industry to achieve its potential as a source of gainful employment for labor and capital and thus contribute a maximum to national income. Some of the economic problems that require study to attain this objective are increased competition from imports, increased competition for the marine resources per se as a result of increased fishing effort by foreign countries and fishery product transport problems. The industry has not experienced the growth and expansion prevalent in the general economy. A continuation of this process would eventually be reflected in a substantial reduction in the quantity of resources utilized and marketed by the domestic industry. The Bureau's economic programs are designed to counteract such a trend. These programs consist of (1) a program of current economic analysis to develop a series of economic situation and outlook reports to provide the Bureau and industry a continuing analysis of the current economic conditions in the major sectors of the commercial fishing industry as an aid in furnishing data and information to assist industry and Government in decisionmaking, (2) a program of basic economic research to determine and analyze the basic underlying economic principles operative in the commercial fishing industry as support to the program of current economic analysis and to coordinate with the work of other divisions of the Bureau to achieve the objectives of the Bureau's trident program, and (3) a program of economic services to discharge responsibilities delegated to the Bureau in the area of transportation by the Agricultural Marketing Act of 1946, as amended (7 U.S.C. 1621–1627), and a Bureau of the Budget determination (23 FR 2304, Mar. 22, 1958), and for fishery cooperatives by the Fishery Cooperative Marketing Act of 1934 (48 Stat. 1213).

(b) *Exploratory fishing and gear development*

The estimate for 1965 of $1,383,300 is an increase of $163,500 over 1964. The increase includes $12,000 for pay costs and $151,500 for program increases. The entire program increase is to provide for the essential resource-utilization aspects of the national oceanography program. Of the total program increase, $11,500 is for uncontrollable costs for maintenance and operation of a new vessel, and $140,000 is to provide for exploratory fishing and gear research projects. The increases proposed for fiscal year 1965 will not require any increase in overall Bureau employment over that authorized for fiscal year 1964.

(1) Operation and maintenance of new facilities:

Need for increase.—An increase of $11,500 is needed to provide for uncontrollable costs associated with the maintenance and operation of the vessel being constructed to replace the exploratory fishing vessel *Delaware*. The new vessel, financed with funds appropriated in the fiscal year 1962, is scheduled for completion in December 1964 The additional operation and maintenance costs for approximately 6 months includes $2,500 for special stern trawler nets, $7,200 for fuel and lubricating oils, and $1,800 for hull and deck maintenance.

(2) Exploratory fishing investigations and gear research projects:

Need for increase.—The increase of $140,000 is needed to undertake exploratory fishing investigations off the Pacific coast of the State of Alaska where only a limited amount of such work has been done; to compile a national inventory of the characteristics, concentrations, and seasonal movements of the individual species of fish and shellfish of the Continental Shelf and Continental Slope; and to undertake important gear research work at our Panama City, Fla., Gear Research Station.

The very important shrimp and king crab fisheries of Alaska cannot be expanded because there are now no known new fishing grounds available to the industry. The tremendous increase in shrimp and king crab production during the last few years has resulted in maximum utilization of previously discovered grounds much sooner than anticipated. The present level of activity in the king crab industry, owing to the rapidly increasing consumer demand for its products, is only a fraction of that possible, providing new fishing grounds are located. The limited amount of exploratory work which has been carried out, in addition to locating many of the presently utilized king crab and shrimp grounds, has indicated there are additional grounds which could support a much larger industry than now exists. Other nations are now exploring for these shellfish south of the Alaska Peninsula; the success of these explorations would place our domestic fishermen under a disastrous competitive disadvantage. It is essential, therefore, that the proposed program be initiated without delay. The total shellfish exploration effort will provide, when completed, a basic inventory of the shellfish potential of the Continental Shelf areas from Dixon Entrance to the Aleutian Islands in the Pacific.

The extensive data developed by past, current, and proposed exploratory fishing programs, on the communities of fishes and shellfish inhabiting the Continental Shelf and Slope, and the observations on topographic, meteorological, ecological and mass water movements resulting from this work, will be compiled, interpreted and published in a readily understandable form useful to the fisherman. This resource inventory, based primarily on the findings of over 10 years of explorations, will be of great value (1) to our fishermen as a basis for a scientific and efficient system of fishing, (2) in our international treaty negotiations on the fisheries of both the Atlantic and Pacific, and (3) in evaluating the impact on our offshore resources of the increasing fishing pressure by foreign fleets. This information will also reveal those gaps in our present knowledge of resource availability which require immediate attention; would facilitate operational planning and prevent duplication of effort. Our obligation to supply national synopses of our explorations and results, coupled with interpretive summaries and transvisual presentations on known resource potentials, can be met through this proposed investigation.

The proposed gear research work is aimed at developing economical methods of extending the present search capabilities of vessels harvesting pelagic species of fish. Recent design advances in closed-circuit television and the development of a towed "flex wing" offer one avenue of approach for successful development of extended-search techniques for locating pelagic species of fish. A particular advantage of this approach is the possibility of extending the search area significantly both horizontally as well as vertically, below the surface of the ocean. This would be of tremendous benefit in locating commercial concentrations in oceanic areas where great distances from land are involved and no hydrographic information is available which could be used for determining the presence of subsurface fish schools. Although the initial application envisioned is for the tuna industry, this, and other systems to be investigated, would probably have application in other pelagic fisheries such as herring, menhaden, and mackerel.

Plan of work.—For the Alaska explorations, a suitable vessel would be chartered on a full-found basis. Initial work would extend from Prince William Sound to Kodiak Island and from inshore waters seaward to 100 fathoms. Particular attention, during initial operations, would be directed at locating commercial shrimp and king crab concentrations in areas near existing processing centers. The location of inshore stocks of shrimp within reach of small vessels, which

presently lie idle during the off season for salmon, would be an important facet of initial operations.

Under the supervision of existing Bureau personnel all exploration data collected to date will be compiled, analyzed, and interpreted by an agency specializing in the handling of large amounts of data in automatic data processing equipment. Studies of various methods of data presentation will be contracted to qualified organizations to determine their relative informative usefulness to fishermen, scientists, and administrators. Independent agencies would then be contacted and contracts initiated to integrate the findings of our intensive Federal oceanographic programs to attempt to find a causal relationship between fish concentrations and one or more oceanographic, topographic, and ecological factors, which causal relationship may enable us to help place commercial fishing operations on a more firm scientific basis.

In carrying out the gear research investigations, flex-wing devices, capable of supporting a 200-pound payload at vessel speeds of 8 to 10 knots, will be acquired and fitted with a closed-circuit television for location of offshore fish schools. The television camera will be equipped with optics capable of standard telephoto and polarized viewing. The vehicle will be towed by the research vessel *Oregon* at various heights and used to scout for schools that are not visible from the vessel. The trials would be undertaken while the vessel is en route to fishing areas in the Gulf of Mexico and off the northeast coast of South America. During subsequent years, other search-extending methods, such as infrared radiation detection, will be investigated.

(*c*) *Market news*

The estimate for 1965 is $640,000, an increase of $44,200 over 1964. The increase includes $14,200 for increased pay costs and a program increase of $30,000.

Need for increase.—The $30,000 is needed to cover uncontrollable increased costs for postage, communication services, mimeograph paper, other supplies, and replacement of old processing equipment. A one-third increase in postage rates under Public Law 87–793, a steady increase in mailing lists, higher rates for teletype messages, and higher prices for supplies and other operating expenses—all these entail built-in increased costs at field stations over which there is no control. In addition to these, there are similar increased operating and mailing costs for commercial fisheries review (CFR) in the central office. The CFR keeps the industry informed on current trends and developments in the United States and foreign countries.

Plan of work.—To continue at the present level to collect, compile, publish, and disseminate data on fishery landings, receipts, prices, stocks, packs, market conditions, trends, imports, rail and truck movements, and information on developments in this country and foreign countries affecting our fishery industries. Information is distributed by daily, monthly, annual and other periodic reports; through newspapers, periodicals, and radio, and by telephone, wire, and personal contacts. Work is performed by Bureau employees. This information is used primarily by the fishery and allied industries and is not available from any other source.

(*d*) *Statistics*

The estimate for 1965 of $365,500 is an increase of $9,000 over 1964. This increase is for pay costs.

Plan of work.—To conduct statistical surveys of the fisheries of the United States. These include the collection, tabulation, analyzing, and dissemination of information on (1) the volume and value of the catch of each species by types of gear, area of capture, and point of landing; (2) the number and quantity of operating units employed in the fisheries; (3) the volume and value of processed fishery products; (4) monthly freezings and stocks of frozen fish; (5) monthly production of fish meal and oil; (6) the publication of monthly State landing bulletins; (7) release of monthly foreign trade statistics; and (8) the conduct of staff activities relating to statistical matters.

(*e*) *Technology*

The estimate for 1965 is $1,869,000, an increase of $279,100 over 1964. The increase includes $24,100 for pay costs; $30,000 for uncontrollable costs incident to the occupancy of, and operating and maintenance costs in connection with, new laboratory space at Seattle, Wash.; $190,000 for research on botulism; and $35,000 for pesticides research. The increases proposed for fiscal year 1965 will not require any increase in overall Bureau employment over that authorized for fiscal year 1964.

(1) Operation and maintenance of new facilities:

Need for increase.—An increase of $30,000 is needed to meet the uncontrollable costs of moving the technological research unit at Seattle, Wash., to the new Biological-Technological Laboratory and for additional building operation and maintenance costs to the technological unit, on a prorated basis, for a 6-month period. The new facility is scheduled for completion in December 1964. The cost of moving equipment, furniture, supplies and materials, etc., is estimated at $10,000. Additional operation and maintenance costs are estimated at $20,000. The $20,000 includes salary costs for operating and maintenance personnel, janitorial and security services, janitorial and maintenance supplies, electricity, heat, water, and telephone. The estimated cost of moving and the estimated additional operation and maintenance costs were developed by a Bureau building committee based on a survey of local costs and experience in operating and maintaining the old facility.

(2) Research on clostridium botulinum type E:

Need for increase.—An increase of $190,000 is needed to initiate a program in cooperation with other Federal agencies that will establish methods for eliminating the contamination from seafood products which in some cases has resulted in a public health hazard. The recent cases of smoked fish poisoning, which resulted in seven deaths and severe economic injury to the Great Lakes fishing industry, point out the potential danger that will continue to face the fishing industry until this problem has been solved. This program will be carried out by utilizing research agreements with qualified universities or public or private research institutions.

Food poisoning from type E clostridium botulinum has been commonly associated with fishery products. In the past 33 years, 24 deaths in the United States were attributed to this toxin, and 11 of these fatalities occurred since 1960. In calendar year 1963 alone, nine fatalities, the highest recorded number in any one year, resulted from the consumption of seafood (canned tuna and smoked fish) contaminated with the neurotoxin of the botulinum organism. In addition to the loss of human life, these incidents have had an adverse impact on the American public's confidence in seafoods. The smoked fish industry has virtually ceased operations and the national consumption of fresh, frozen, and other preserved seafood products has fallen off greatly. Government officials, American consumers, and those who obtain their livelihood from the catching, processing, and marketing of seafood are deeply concerned about this grave situation and the possible catastrophic effects of any future outbreaks.

Years of concentrated research effort in the canned food industry have produced processing methods to protect the American public from types A and B botulism poisoning, diseases that took a large toll of human life in the infancy of home canned foods. The type E organism has not been adequately studied, however, and consequently techniques are not available to prevent its deadly toxin from occurring in seafood products. There is a lack of scientific information on the distribution of cl. botulinum in the environment, the methods used to transfer the organism from its natural habitat to fish flesh, and the role that commercial fish processing, packaging, or handling methods play in encouraging or discouraging organism growth and formation of the fatal toxin in seafoods. The absence of prima facie evidence on the contributory role of these suspected conditions or processes makes it impossible to establish preventative measures. These and other interlocking variables must be thoroughly studied, their role precisely defined, corrective techniques established and properly applied in the fishing industry.

Plan of work.—This program will (1) determine the natural distribution of the clostridium botulinum organism in the environment, (2) study the biochemical and processing factors that contribute to organism growth and the formation of highly fatal toxin in fish and fishery products, (3) develop quality control methods for preventing the development of this fatal toxin in seafood products, and (4) advise distributors, retailers, and consumers in the proper and safe handling of fishery products.

Surveys will be conducted in the Great Lakes and New England areas to determine the location and abundance of the botulinum type E organism. Using existing Bureau vessels, samples will be obtained from waters, mud, plankton and other parts of the marine and fresh water environment. These surveys will be extended to fishing vessels and fish processing plants in an effort to pinpoint possible sources of contamination. The sanitary conditions of the vessels and processing plants and other observations will be correlated with the occurrence of the botulinum organism.

Laboratory research will be conducted to determine how the botulinum organism is transferred to fish flesh and chemical and physical techniques will be used to establish methods for preventing or reducing contamination. These investigations will be supplemented by more fundamental studies designed to define the conditions in fish flesh that contribute to the support, growth, and toxigenicity of *Clostridium botulinum* type E.

Processing studies will be carried out to establish measures for rendering the organism or its lethal toxin ineffective. Control samples of different species of fresh seafood will be innoculated with botulinum organism and subjected to various predetermined processing variables involving different smoking procedures, temperatures, and packaging environments. Thermal death times will be established for destroying the organism and the toxin it produces. Studies will also be conducted to ascertain the effect of salt, nitrites, antibiotics, and other chemical additives in reducing the thermal resistance of the organism or in completely inhibiting its growth and the formation of toxin. The effect of vacuum and air packaging methods will also be studied to establish completely acceptable and safe methods of packaging fresh and smoked fish. Steps will be taken to convey the results of the research to consumers, wholesalers, and processors to enable them to readily employ methods that will insure the marketing of wholesome and safe seafood products. This will be accomplished through the use of seafood merchandising clinics and television, radio, and other mass media.

(3) Pesticides studies:

Need for increase.—An increase of $35,000 is needed for studies leading to the control and removal of possible harmful residues in human food products derived from fish and shellfish. These food product-oriented studies are designed to complement the Bureau's research on the effects of pesticides on the living resource, which is financed under the research activity. The expanding use of chemicals to control insects, weeds, fungus, etc., has caused great apprehension among our leading food researchers and the American public. There is a wealth of evidence to indicate that the pesticide levels in all foods are increasing and may reach levels of concern for the health of mankind. The proposed studies will be carried out by utilizing research contracts with appropriate public or private institutions.

There has been very little research on the gross effect of pesticide residues in marine organisms on the nutritional value or wholesomeness and safety of human food produced from these organisms. Although we do not fully understand the effects of these compounds on our health, many doctors have recommended that human intake of pesticides be kept at minimum levels until safe tolerances are established. The proposed studies will (1) determine the level and locations of pesticides and their metabolized products in the body oils and edible muscle of the many species of fresh water and marine fish and (2) will develop processing techniques designed to remove pesticide residues from the edible portions of fishery products.

Plan of work.—During the first year, a survey of biochemical and physiological publications dealing with estuarine and offshore fishing areas will be made to obtain specific information on the types of pesticides which can be deemed to be prevalent in marine organisms. Fish and shellfish will be sampled from such areas at predetermined intervals and analyzed by chemical or other analytical procedures. Data will be gathered on the types and quantities of pesticides present and on the distribution of these chemicals in the flesh, oil, and organs. During the second year, studies will be conducted to determine the movements of various pesticides through the body of the fish or shellfish after being ingested and their ultimate location in the body. These more fundamental investigations will enable the Bureau to determine the susceptability of both edible and nonedible portions of fish and shellfish to contamination by different pesticides. After data is compiled on the levels of pesticides in various parts of the fish, research will concentrate on methods of inactivating or eliminating these residues from the processed fishery product. The effectiveness of various heating, chemical, and biological processes as pesticide inactivators will also be determined and procedures will be established to assure the safe processing of marine life exposed to pesticide-contaminated environments. Successful completion of this research will assure that the edible portions of fish and shellfish available to the American public are safe and nutritious.

(f) Foreign fisheries and trade

The estimate for 1965 of $131,000 is an increase of $3,700 over 1964. This increase is for pay costs.

Plan of work.—Foreign fishery activities and developments have direct bearing on the status of the U.S. fishing industry and on the foreign and domestic policies

and programs of the U.S. Government. Information on, and analysis of, foreign fishery developments supply background materials necessary in determining U.S. policy and actions in programs concerned with high-seas conservation and management, international trade, technical assistance, and intergovernmental fishery development projects. The Bureau is responsible for collecting, coordinating, analyzing, and evaluating current intelligence information on the technological, biological, and economic aspects of the fisheries of foreign countries. The Bureau also participates actively in fishery programs and activities of international organizations, and provides services relating to trade and tariff matters as they affect the U.S. fisheries. To achieve these objectives the foreign fisheries subactivity has programs in foreign reporting, international organization affairs, and trade and tariff investigations.

The foreign reporting program will:

(1) Conduct and service the foreign reporting program for fisheries; service the fishery attaché program; coordinate and prepare requests for current information from Foreign Service posts; take appropriate actions regarding incoming dispatches; and disseminate information received from abroad to industry and Government.

(2) Provide current reports on the status of foreign fisheries.

(3) Evaluate the effects of accelerated foreign fishery expansion programs on various segments of the U.S. fishing industry, and assist in determination of solutions to foreign competition problems.

The international organization affairs program will:

(1) Coordinate and/or participate in Bureau preparations involving meetings and activities of international organizations, such as Organization for Economic Cooperation and Development (OECD), Food and Agricultural Organization (FAO), United Nations Educational, Scientific, and Cultural Organization (UNESCO), U.N. Special Fund, and regional FAO councils and commissions.

(2) Take appropriate Bureau actions regarding fishery programs of intergovernmental and other international organizations; collaborate with other U.S. agencies on international organization matters requiring interdepartmental action.

(3) Coordinate and/or prepare U.S. position papers, background papers, contingency papers, briefing books, and other supporting materials dealing with fishery matters for use at international meetings.

(4) Prepare reports and publications on the activities and meetings of international organizations for use of Government officials and the U.S. fishing industry.

The trade and tariff program will:

(1) Prepare background papers, current reports, position papers, and recommendations for actions on legislation, interdepartmental trade and tariff considerations, and international meetings concerned with trade and tariff matters.

(2) Conduct studies and provide services on trade and tariff problems, analyze import and export trends in relation to problem areas, and determine impact of trade and tariff developments on the domestic industry.

(3) Assist in determining solutions to foreign competition problems arising from trade and tariff developments.

(*g*) *Fishery education and market development*

The estimate for 1965 of $37,000 is an increase of $1,400 over 1964. This increase is for pay costs.

Plan of work.—The development of fish farming into a prosperous industry will have a healthy impact on the economy of Arkansas and the adjoining States in the Mississippi River Delta area. The Arkansas rice-fish farm program has now developed to the point where the Bureau's marketing efforts in developing increased sales and markets for rice-farm-produced fish need to be intensified. Work will be conducted to develop new and appealing products from buffalofish and catfish which are the principal species now being harvested in these areas. Development of additional recipes to meet the specialized needs of institutional, school lunch, restaurant, and consumers will be continued. New recipes will be developed to include smoked and barbecued ribs, portions, and boneless bologna shaped rolls in fish cookery demonstrations throughout the States comprising the Mississippi Valley. Consumer acceptance tests will be conducted to determine acceptability of rice-farm species and new products. Continuing close relation will be maintained with the mass media (newspapers, magazines, radio, and tele-

vision) as a public service in supplying material to stimulate public interest in the use of these products.

In addition to funds shown under this activity, additional funds are available under the Saltonstall-Kennedy program as shown in the following table:

[In thousands of dollars]

Subactivities	Annual definite appropriation		Saltonstall-Kennedy funds		Total program	
	1964	1965	1964	1965	1964	1965
(a) Economics	171.1	176.0	158.8	158.8	329.9	334.8
(b) Exploratory fishing and gear development	1,219.8	1,383.3	391.9	391.9	1,611.7	1,775.2

3. Research

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Coastal and offshore research	$7,417,670	$8,742,100	$10,925,100	+$2,183,000	+$132,500	+$2,050,500
(b) Inland fisheries	215,409	277,500	323,000	+45,500	+5,500	+40,000
(c) Shellfish	498,821	643,600	666,000	+22,400	+10,600	+11,800
(d) Designing fish protective devices	36,196	39,400	41,000	+1,600	+1,600	----------
(e) Employees' compensation fund payments	----------	6,500	14,400	+7,900	----------	+7,900
Total	8,168,096	9,709,100	11,969,500	+2,260,400	+150,200	+2,110,200

[1] To provide for increased pay costs for fiscal year 1964 positions.

(a) *Coastal and offshore research*

The estimate for 1965 is $10,925,100, an increase of $2,183,000 over 1964. The increase includes $132,500 for increased pay costs, $653,000 for uncontrollable increased operating and maintenance costs for new facilities, $902,500 for expansion of oceanographic research programs, and $495,000 for pesticides research. The increases proposed for fiscal year 1965 will not require any increase in overall Bureau employment over that authorized for fiscal year 1964.

(1) Operation and maintenance of new facilities (oceanography):

Need for increase.—An increase of $653,000 is needed for uncontrollable operating and maintenance costs for new facilities that will be completed and put into operation during the fiscal year 1965, and for those new facilities in operation during a portion of fiscal year 1964 that must be operated for the full 1965 fiscal year. The facilities involved are listed below:

Facility	Estimated completion date	Additional fiscal year 1965 O. & M. costs
(a) Laboratory, Seattle, Wash	December 1964	$50,000
(b) North Pacific research vessel	June 1965	100,000
(c) Laboratory, La Jolla, Calif	August 1964	187,000
(d) Research vessel *David Starr Jordan* (*Black Douglas* replacement)	October 1964	171,000
(e) Research vessel *Townsend Cromwell* (Central Pacific Ocean)	November 1963	145,000

The cost estimates reflected under this item were developed on the basis of Bureau experience in operating and maintaining similar facilities, local surveys, and data furnished by building designers and other operators of similar facilities.

(*a*) The $50,000 increase for Seattle includes $10,000 for moving the biological research unit to the new biological-technological laboratory and $40,000 for additional costs to the biological research unit, on a prorated basis, for building operation and maintenance. Major items of increase included in the $40,000 are $12,000 for wages of operating and maintenance personnel, $14,000 for janitorial and security services, and $13,000 for utilities.

(*b*) Funds appropriated for the Bureau's construction program for fiscal year 1964 include $2,650,000 for construction of a fishery research vessel for use in the North Pacific and Bering Sea. The conduct of essential biological research programs planned for the North Pacific and Bering Sea area in the fiscal year 1965 are dependent upon the new vessel, or a suitable charter vessel substitute, being available from December through the end of the fiscal year. The $100,000 requested is needed to provide for either operation and maintenance of the new vessel or for vessel charter cost, during the December–June period. Operation and maintenance costs for the new vessel for the full period would include $60,000 for wages and related costs for officers and crew; $19,000 for basic ship supplies, including shop tools, linens, mess equipment, safety equipment, etc.; and $12,000 for fuel and lubricating oil. The balance of $9,000 would be for mess costs, vessel maintenance, and miscellaneous. Savings in operating and maintenance costs for any portion of the 6–7 month period that the new vessel is not available would be used to meet vessel charter costs.

(*c*) The $187,000 increase needed for the La Jolla, Calif., biological laboratory includes $100,000 for salaries, wages, and related costs for required operation and maintenance personnel; $39,000 for utilities; and $30,000 for building and grounds maintenance equipment and supplies. The balance of $18,000 is for moving costs, trash removal, shop equipment, and miscellaneous costs.

(*d*) The $171,000 increase needed for operation and maintenance of the research vessel *David Starr Jordan* includes $72,800 for wages and related costs for officers and crew; $31,000 for maintenance of electronic trawl gear, engines, galley and deck and hull; $30,000 for equipment; and $13,000 for fuel and lubrication oils. The balance of $24,200 is for mess costs, dockage, vessel shakedown overhaul and miscellaneous costs.

(*e*) The $145,000 increase needed for operation and maintenance of the research vessel *Townsend Cromwell* includes $70,300 for wages and related costs for officers and crew; $35,000 for vessel and equipment maintenance; $17,000 for mess supplies; and $21,000 for fuel and lubricating oils. The balance of $1,700 is for supplies and miscellaneous costs.

(2) North and Central Pacific oceanography (oceanography):

Need for increase.—An increase of $550,000 is needed for biological research programs in this area.

Several of the major fishing nations of the world are engaged in exploiting the fishery resources of the North Pacific. The United States is committed to an increase of its activities in this area through its treaty obligations and membership in various commissions. Furthermore, oceanic research activity must be expanded if we are to keep our industry in a favorable position in the world fishery trade and if our fishery scientists are to obtain the necessary information that will serve as the basis for further negotiations to conserve these valuable resources. Overfishing of yellowfin tuna, the erratic fluctuations of the salmon fisheries, and the fishing by other nations in waters and on stocks which historically have been harvested almost exclusively by Americans and Canadians, emphasizes the importance of the work.

The essential objective of the various programs to be undertaken is to achieve an understanding of the basic relationship between important fish species and their environment.

One important approach is to study variations in the distribution and abundance of fish in relation to variations in the physical properties of the ocean. Temperatures, salinity, currents, and other physical parameters form a changing but characteristic pattern from which predictions of abundance of any given fish stock may be made. For example, remarkable success has been achieved

in skipjack abundance predictions. Operation of a network of unmanned anchored oceanographic buoys for monitoring changes in the ocean is an essential feature of these expanded studies. The cost of obtaining such continuous observations from research ships would be prohibitive.

Each year scientists are uncovering new facts on the significance of trace elements to living organisms. The production of agricultural crops has increased significantly by the addition of certain trace elements to the soil. It is probable that production of fish can be similarly increased by an understanding and proper use of trace elements. Laboratory and field studies will be undertaken to measure the role of trace elements in the growth and survival of fish. These studies will use radioisotopes and neutron activation analysis. Differences in amounts of certain trace elements in the muscles and other parts of salmon may be useful for identifying river of origin of fish caught on the high seas.

Studies of the general biology of commercially important fish populations also must be expanded. For example, a knowledge of oceanic mortality becomes of utmost importance in predicting the size of returning salmon runs. Studies on the distribution of populations, migratory patterns, population structure and growth, species composition, plankton and bottom fauna dynamics (to assess and understand fluctuations in food organisms), and in larval fish taxonomy, are further examples of expanded studies that need to be undertaken.

The requested increase will permit the conduct of work required to relate the oceanographer's findings to the fishery, to increase our understanding of migratory patterns and population groups in relation to changes in distribution and abundance, and to increase our knowledge of predator-prey relationships as they are affected by the changing environment.

Studies in fish behavior, genetics, and physiology should be accelerated and will be possible with the availability of new shore facilities.

It is increasingly important to identify the racial origin of many important species. Such specialized studies using differences in scale growth patterns, blood types, and morphological studies will be expanded.

The North Pacific Ocean and Bering Sea are among the most critical areas for our fisheries today. A large portion of our Bristol Bay red salmon migrate far to the westward and are taken in large numbers by Japanese mothership fleets. Increasing intrusion of foreign fishing fleets into the fishing areas south of the Aleutians and into the Gulf of Alaska, to conduct both fishing and exploratory operations, make it mandatory that U.S. interests in the vast king crab, shrimp, and groundfish resources be supported by expansion of ocean fishery research studies. Knowledge of the migration and distribution of king crab obtained from tagging studies in international waters is necessary to effectively guard the interests of U.S. fishermen. To protect our fishermen and our industry, information on the magnitude and characteristics of the fishery resources off our coast is required as a basis for management and negotiation. The International North Pacific Fisheries Commission has requested that Bureau research biologists be placed as observers aboard the Japanese trawl vessels to monitor groundfish landings in order to determine the effects of trawling on the rich halibut resource of the Gulf of Alaska.

Plan of work.—This work involves projects to be conducted under the following programs:

(*a*) Oceanography of the trade wind zone of the central Pacific.
(*b*) Tuna and sardine biology of the eastern Pacific.
(*c*) Oceanography of the eastern tropical Pacific.
(*d*) North Pacific fishery and oceanographic investigations.

Portions of this research will be conducted in cooperation with various governmental agencies the Pacific coast States, universities, and oceanographic institutions. Contracts will be awarded for research work and vessel use, as required. Coordination and cooperation will also be carried on through various treaty organizations, commissions, intergovernmental and interagency organizations, and the National Academy of Sciences.

Automatic data processing equipment, telemetry, and instrumentation will be employed or developed to increase efficiency of all operations. Whenever possible, oceanographic and biological data gathered at sea will be processed while the vessels are at sea to make more data available for immediate use.

An advanced and detailed study will be carried out to investigate the way in which ocean and atmospheric climates are related to fishery problems. Present knowledge, which makes it possible to predict skipjack abundance from oceanographic data, suggests that a real understanding of the relationship between air-sea-fishery interactions is possible. It is important that we learn the "why" of these relationships in order that general statements can be made which would have application in other geographic areas and fisheries.

Other programs to be expanded include research on filter feeding fishes and plankton, involving rearing of delicate pelagic fish larvae for research use, studies of all developmental stages of fishes from tiny larvae to large sharks, investigation of plankton dynamics, by which to improve our understanding of available food in the ocean, and research on environmental conditions of the North Pacific.

Testing and further development of an existing prototype of an unmanned anchored oceanographic buoy is to be obtained through contract with the University of California, Institute of Marine Resources (IMR). IMR will operate and process data from a small network of buoys across the California current off southern California or Baja California, thereby gaining operational experience essential for the conduct of the eastern tropical Pacific program that is scheduled to follow. At the same time, this preliminary program will provide synoptic information for the present temperature tuna forecasting program and for cooperative research on sardines, mackerels, and anchovies.

Additional research will be done by scale analysis and serological techniques to determine continent of origin, and eventually river of origin of salmon and their places, times, and degrees of intermingling.

Biological studies on ocean growth and mortality of salmon will be extended to the Columbia or Fraser Rivers where a "pilot type" study of high seas and inshore fisheries will be started. The oceanographic data collecting and research program will be expanded by the use of unmanned free-floating buoys to continuously monitor ocean conditions in the North Pacific. This information will be processed immediately for application to problems of distribution and abundance of salmon and marine fish.

Laboratory studies on the relation of certain environmental factors (temperature, water quality, etc.) to the growth and survival of salmon and other fish using facilities available in the new biological laboratory will be started.

Studies on the role of trace elements in the environment will be started using radioactive and nonradioactive isotopes as tags to trace the utilization of these elements by fish or by their food organisms.

The increased ocean fishery research in Alaska will involve:

(*a*) Extension of present marine sampling cruises into Icy Straits, Frederick Sound, and Clarence Straits areas of southeast Alaska for ecological data on bottom and pelagic fish, shellfish, and salmon. More sophisticated oceanographic instruments will be used in addition to midwater and bottom trawl equipment.

(*b*) Sampling the estuaries and ocean near field research stations in Bristol Bay for red salmon juveniles and in Prince William Sound and southeast Alaska for young pink salmon to determine their growth, abundance, distribution, survival rates, and controlling environmental factors. Two small Bureau vessels, the *Heron* and *Sockeye*, will be refurbished and two additional 30-foot boats will be chartered for the above purposes.

(*c*) Tagging king crabs near the Shumagin Islands and westward by use of Bureau or chartered vessels. This will require a systematic sampling program to locate, capture, tag, and release the crabs. Close coordination with the fishery will be maintained for collecting tagged crabs, recording and interpreting information, and payment of rewards.

(*d*) U.S. observers who have technical knowledge of fish and familiarity with the Japanese language will board trawling vessels in Japan and accompany them on groundfish operations off the coast of Alaska. They will keep statistics on the composition of the Japanese catch, determine numbers of halibut caught, and gather information on age and growth of the important commercial species.

(3) North Atlantic and gulf oceanography (oceanography):

Need for increase.—An increase of $286,000 is needed for groundfish investigations in the North Atlantic, expansion of current gulf estuarine studies, support of taxonomic programs at two laboratories, and for oceanographic planning and coordination activities.

Expansion of the North Atlantic groundfish programs will permit the Bureau to (A) intensify surveys of the groundfish populations of the North Atlantic which have recently been subjected to increased fishing pressure, particularly by the Russian fleet, (B) make observation of environmental conditions and relate these to observed changes in abundance of groundfish or relative successes of spawning, and (C) assess the total effect of the recent increased fishing effort in terms of wise utilization of the resource, and upon the availability of fish to American fishermen.

Most fishery resources of the gulf area are "estuarine dependent," the organisms spending part or all of their lives in shallow inshore waters. Demands upon gulf coast water resources for residential, commercial, agricultural, and industrial development are rapirly altering and, in many cases, destroying estuarine nursery and harvest areas. The Bureau is called upon with increasing frequency to determine effects on fishery resources of construction projects employing channelization, spoiling, bulkheading, and filling, and to recommend corrective action, or alternative proposals. Expansion of our estuarine studies program is necessary to gain the knowledge needed to permit the Bureau to adequately carry out its responsibilities in this field. Studies of biogeochemical alteration, taking into account rates of degradation and reestablishment of biological communities relative to estuarine engineering, are required to provide a sound basis for recommendations made to preserve the fishery resources. It is also important that good estimates be made of present and potential values of the fishery resources supported by the gulf estuaries.

Additional funds are needed to increase the effectiveness of taxonomic studies being conducted at two Bureau laboratories. An increase for the Ichthyological Laboratory at Washington, D.C., is needed to finance research on the biology and taxonomy of crustaceans, particularly shrimp. Many crustacean species are of direct commercial importance; other forms are abundant and have no commercial value. Accurate identification of these species, especially in the drifting larval stages, and information on their life histories and distribution are essential for their effective utilization and management. The funds are needed for travel, translation, and procurement of laboratory equipment. Additional funds are needed at the Brunswick Laboratory to facilitate specimen collection and examination at commercial and sport fishing centers in the southeast. Also of vital importance is increased participation of the laboratory's staff in exploratory cruises of the research vessels *Silver Bay* and *Oregon* to collect and identify new marine organisms and to relate them to other species and to known oceanographic factors.

Plan of work.—The increased funds requested will be used as follows:

(*a*) The research vessel *Albatross IV* will be used in the conduct of groundfish studies. Intensive sampling will be carried out in the Northwest Atlantic, particularly on Georges Bank and surrounding waters, throughout the year. On planned special cruises extensive plankton collections will be made to estimate the extent of fish spawning, study the possible effects of fishing on the spawning stocks and determine the fate of the planktonic eggs and larvae. Examination of environmental conditions will be intensified in order to interpret intelligently the population changes which are observed. Variations in the success of year classes will be compared with variations in fishing effort and environmental conditions. Results will be used in advising management as to the need for additional fishery regulations, an important commitment of the United States to the International Commission for the Northwest Atlantic Fisheries.

(*b*) The increase in estuarine study funds will be used at Galveston, Tex., to begin field studies designed to document specific effects of manmade changes and to establish criteria for modifying construction plans in the best interest of fishery resources. The program also contemplates assessment of the value of estuaries to the fishery resource as a whole and will facilitate computation of the losses resulting from natural and man-induced alterations.

(*c*) The Ichthyological Laboratory receives shrimp specimens for study and classification from routine Bureau cruises, as well as special or cooperative programs such as the tropical Atlantic fishery oceanography program. As a result a considerable backlog of material has been building up which requires im-

mediate attention. Research on the taxonomy of this material will be conducted through a contract with a specialist in the field. Additional supporting aids required includes translation of foreign documents, a microscope and other laboratory equipment, preparation of scientific illustrations and travel.

The Brunswick Laboratory staff will classify and study the life histories of selected families, genera, and species of fishes of the western North Atlantic Ocean with emphasis on species occurring off the southeastern coast of the United States. This involves studies of early life histories, abundance, and distribution; and the distribution and abundance of zooplankton organisms associated with them.

(4) Cooperative oceanographic programs (oceanography):

Need for increase.—Increases totaling $66,500 are needed for the following purposes:

(*a*) $26,000 to allow the Bureau to pay a proportionate share of the increased costs of operating the National Oceanographic Data Center (NODC). The Center, which is supported cooperatively by Government agencies using its services, needs additional funds for expansion to keep pace with the growth of the National Oceanographic program and the ever-increasing volume of data. This is part of a planned program to bring NODC up to full operating capacity by about 1967.

The NODC is a respository for all physical and chemical oceanographic data. It performs an important service to the entire oceanographic community by analyzing vast amounts of oceanographic data through use of computers, by assisting in research planning through data analysis, by producing data summaries for specific areas and atlases for more general purposes, and by promoting the free flow of oceanographic information. NODC has the complete responsibility for continuing the function of World Data Center A-Oceanography and processing responsibility for data from the International Indian Ocean Expedition and other international cooperative programs. Its services are used very extensively by the Bureau's marine laboratories. The present-day oceanographer must examine large volumes of data in the course of his studies. He has been able to operate much more effectively as a result of the many services provided by the Data Center.

(*b*) $20,000 to make possible Bureau participation in oceanwide surveys being planned through the Interagency Committee on Oceanography. The objective of the survey is to map accurately the physical, chemical, and biological properties of the sea. Such maps are necessary for intelligent planning of research programs and for effective development and exploitation of ocean resources. The proposed survey program to be conducted by U.S. Government agencies in fiscal year 1965 is estimated to cost $25.7 million, an increase of about $5.5 million over the national survey program in fiscal year 1964.

(*c*) $8,000 for oceanographic planning and coordination within the Bureau, between agencies and internationally. The amount of staff time required to provide the Bureau with adequate representation on interagency and intergovernmental oceanographic programs and committees is growing rapidly along with the widespread interest in oceanographic research. Such coordination is necessary to avoid duplication of effort, and to make the most effective use of scientists, vessels, and shoreside facilities.

(*d*) $12,500 is requested for an instrumentation program. Present-day studies on physical oceanography and marine biological resources require specialized instruments for measuring environmental factors and for capture and study of the marine organisms. Most instruments now in use are in need of improvement, and new instruments must be designed.

Plan of work.—The increase will be used for the cooperative programs listed and for contracts for design, development, testing, and evaluation of instruments needed in Bureau research programs. Particular emphasis will be placed on the development and further improvement of telemetering buoy systems.

(5) Pesticide studies:

Need for increase.—An increase of $495,000 is required for urgently needed expansion of this program. The current research program has demonstrated that (*a*) marine species of commercial importance, as well as their food, are highly sensitive to many agricultural chemicals now used as pesticides; (*b*) these chemicals may be stored at greatly magnified levels in animals used as man's

food; and (c) the toxicity of these chemicals, and their persistence as residues, both in food and in the estuarine environment vary greatly. These variations are caused by variations in physical conditions of the environment, meteorological conditions at the time of application, and other factors yet unknown. The present program is staffed and equipped to evaluate adequately only a few chemicals per year. More than 100 pesticides now are in use in areas where they may endanger the marine environment. It is urgent that the program be augmented to evaluate the most widely used chemicals before injudicious use permanently damages some of the important estuarine areas or so contaminates man's food supply as to create serious health hazards. The program will be expanded in the following ways:

(a) Development of analytical procedures: Research is required in the adaptation, development, and standardization of more precise methods for qualitative and quantitative analysis of pesticide residues in plants and animals resident in the estuarine environment.

(b) Field studies on experiment scale: Toxicity factors determined under controlled laboratory conditions need to be confirmed under field conditions where environmental variations may alter the acute toxicity, transport, and persistence of the pesticide.

(c) Field studies on national scale: Large control programs conducted by various public and private agencies need to be carefully evaluated in areas where estuaries may be affected.

(d) State cooperative projects: Pre-spray and post-spray surveys and evaluations of smaller scale control programs such as for marsh mosquitoes, in regions having important estuarine nursery areas are needed. Essentially no information is available on the rate of decay or immobilization of pesticides in marsh or delta mud and sediment.

(e) Laboratory evaluation of new pesticides: It is planned that a Bureau Pesticides Registration Review Committee will be established which will be responsible for review of registration of all new pesticides.

Plan of work.—The same general plan of work now underway will be continued on an expanded scale. Emphasis will be placed on studies to determine the amounts of pesticides transported into estuaries under natural conditions in areas where fish and shellfish are being harvested, and on the development of bioassay and analytical techniques for determining presence in and effect of pesticides on marine species.

(b) *Inland fisheries*

The estimate for 1965 is $323,000, an increase of $45,500 over 1964. Of the increase, $5,500 is for pay costs and $40,000 is for uncontrollable increased costs incident to the occupancy of, and operating and maintenance costs in connection with, the new laboratory under construction at Ann Arbor, Mich. The increases proposed for fiscal year 1965 will not require any increase in overall Bureau employment over that authorized for fiscal year 1964.

(1) Operation and maintenance of new facilities:

Need for increase.—An increase of $40,000 is needed to meet the uncontrollable costs of moving the Ann Arbor, Mich., biological research unit from the University of Michigan grounds to the new biological laboratory and for the additional operation and maintenance costs of the new building. The new facility is scheduled for completion in December 1964. The cost of moving laboratory equipment, specimens, supplies, and furniture is estimated at $5,000. Operation and maintenance costs, which are estimated at $35,000, includes salary and related costs for operating and maintenance personnel, building and janitorial supplies, utilities, and equipment and supplies for grounds maintenance. The cost estimate for maintenance and operation for this 38,000 (gross) square-foot laboratory is based on cost data furnished by the superintendent of the University of Michigan powerplants and the manager of the university's building service unit.

(c) *Shellfish*

The estimate for 1965 is $666,000. This is an increase of $22,400 over 1964, which included a $100,000 nonrecurring item for disease-resistant oyster brood stock research. The increase, considering the nonrecurring item, includes $10,600 for increased pay costs, $11,800 for operation and maintenance of new

facilities, and $100,000 for additional research on shellfish culture and its application. The increase is for programs recommended in the national oceanographic program. The increases proposed for fiscal year 1965 will not require any increase in overall Bureau employment over that authorized for fiscal year 1964.

(1) Operation and maintenance of new facilities (oceanography):

Need for increase.—An increase of $11,800 is needed to meet uncontrollable increased costs for operation and maintenance of a new radiobiological laboratory at Beaufort, N.C., and new facilities, including service buildings, a salt water system, and shops at the Oxford, Md., laboratory. The Beaufort laboratory scheduled for completion in April 1964 will be in operation for approximately 9 months more in fiscal year 1965 than in fiscal year 1964. The additional operation and maintenance costs for the laboratory is $6,800, including $2,300 for salaries, $2,500 for utilities, and $2,000 for building maintenance and janitorial supplies. The Oxford facilities scheduled for completion in March 1964 will be in operation for approximately 8 more months in fiscal year 1965 than in fiscal year 1964. The additional operation and maintenance costs for the Oxford facilities are $5,000 including $2,200 for salaries, and $2,800 for electricity required for pumping operations. The additional cost estimate for Beaufort is based on the additional floorspace and facilities that will be available. The additional cost estimate for Oxford is based on operation and maintenance cost of similar facilities at other field stations.

(2) Shellfish culture and its application (oceanography):

Need for increase.—An increase of $100,000 is needed to accelerate the applied research work leading to the development of practical methods of increasing shellfish production and demonstrating these methods to the industry. Knowledge is now available concerning equipment and techniques for artificial propagation of bivalves, for the rearing of larvae to setting, and for maintaining juvenile stages for the first year of their existence. While it is possible to produce clams and oysters on a routine basis in the laboratory, techniques for expanding operations to a commercial scale hatchery are not yet developed sufficiently to demonstrate their feasibility. This increase will be used to expand experimental phases of the program concerned with rearing larvae and bivalves on a large scale in tanks and ponds and to determine rates of growth and survival of juvenile stocks transplanted to natural waters.

The genetics program conducted by the Bureau during fiscal years 1963 and 1964 will be accelerated so that an early determination can be made as to whether desirable characteristics can be developed in shellfish through selective breeding. Selective breeding in the field of agriculture has been one of the primary reasons for the substantial increase in agricultural production in the United States.

Knowledge and methods are presently available which can aid the shellfish industry to improve their operations. A shellfish advisory and consulting service on both the Atlantic and Pacific coasts is needed to bring the accumulated results of research to the knowledge of oystermen and to assist them in understanding the benefits that can be derived from scientific management.

Plan of work.—These programs will lead to the development of races of shellfish that (*a*) will be able to exist and propagate under conditions that are adverse to existing stocks, (*b*) will be resistant to diseases that cause heavy mortalities in both hatchery and field conditions, and (*c*) will have characteristics of growth and form that are superior to those of the original parent stock.

This increase will be used to demonstrate the feasibility of operating shellfish hatcheries through artificial propagation of clams and oysters and provide valuable information to shellfish producers. The Shellfish Advisory Service will work closely with the shellfish industry to develop methods for applying research results. Demonstrations of techniques will be conducted, practical experiments to make methods economically feasible will be undertaken, meetings and discussions with industry groups will be held. The increase will also provide for the documentation of accumulated knowledge and preliminary reports resulting from studies that have been made on oyster and clam cultures.

(d) Designing fish protective devices

The estimate for 1965 is $41,000, an increase of $1,600 over 1964. The increase is for increased pay costs.

Plan of work.—Design and inspection services will be continued for projects already constructed or under construction in the Pacific Northwest, California, and Alaska. Services will be required for Little Goose, Lower Monumental,

Lower Granite, Hells Canyon, Wells, John Day, Bruces Eddy, Green Peter, and Foster projects in the Columbia Basin as well as Iron Gate, Don Pedro, Feather River, Yuba River, and American River projects in California. Further services will be provided for any Federal Power Commission hearings which may be held involving fish facilities at new or existing projects. It is anticipated that a workload of approximately 52 projects will be involved in the design and/or inspection category during fiscal year 1965.

(e) *Employees compensation fund payments*

The estimate for 1965 is $14,400, an increase of $7,900 over 1964, to provide for payment to the employees compensation fund, Bureau of Employees Compensation, as required under section 209, Public Law 86-767. In addition to funds shown under this activity, additional funds are available under the Saltonstall-Kennedy program, as shown in the following table:

[In thousands of dollars]

Subactivities	Annual definite appropriation		Saltonstall-Kennedy funds		Total program	
	1964	1965	1964	1965	1964	1965
(a) Coastal and offshore research	8,742.1	10,925.1	2,068.9	2,068.9	10,811.0	12,994.0
(b) Inland fisheries	277.5	323.0	162.5	162.5	440.0	485.5
(c) Shellfish	643.6	666.0	279.6	279.6	923.2	945.6
(d) Designing fish protective devices	39.4	41.0			39.4	41.0
(e) Employees' compensation fund payments	6.5	14.4			6.5	14.4
Total	9,709.1	11,969.5	2,511.0	2,511.0	12,220.1	14,480.5

4. Research on fish migration over dams

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
Research on fish migration over dams	$1,480,385	$1,496,700	$1,407,000	−$89,700	+$10,300	−$100,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

Research on fish migration over dams

The estimate for 1965 is $1,407,000, a decrease of $89,700 compared to 1964. The decrease results from a program decrease of $100,000, offset in part by an increase of $10,300 for pay costs.

Plan of work.—The level of effort on studies involving racial migration rates and time of migration and the transportation of adult and juvenile salmonoids will be reduced. Although these studies are essential to the overall program some projects are being deferred to a subsequent fiscal year. Additional emphasis will be given to refining known methods of collecting young salmon in streams at the head of reservoirs and to developing new techniques for this purpose. Vertical and horizontal distribution of salmon in streams will be determined to provide a basis for the most efficient locations of collection devices. Research in large reservoirs will be augmented to include studies of the behavior of sockeye and silver salmon. Work in small reservoirs and on fish disease will continue under contracts to State fishery agencies. Additional effort will be placed on fish performance and physiology under various stresses, on movement of adult salmon in vicinity of dams, on fingerling passage through turbines and development of means to reduce losses, and on prediction of future environment.

5. Fishing vessel mortgage insurance

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
Fishing vessel mortgage insurance	$43,500	$41,800	$42,600	+$800	+$800	----------

[1] To provide for increased pay costs for fiscal year 1964 positions.

Fishing vessel mortgage insurance

The estimate of $42,600 is an increase of $800 over 1964. The increase is for pay costs.

Plan of work.—This program provides for the insurance of mortgages given to aid in the construction, reconstruction, or reconditioning of fishing vessels. The funds loaned are provided by banks or other private lending institutions and their loans on mortgages are insured by the Bureau. An insurance premium is paid by the borrower which goes into a revolving fund along with investigation and commitment fees paid by the borrower. This fund will be used to pay any claim which may occur provided the mortgage or loan goes into default. In this circumstance the collateral will be taken over by the Bureau and can be liquidated with the funds obtained being returned to the revolving fund. Work necessary to the administration of this program is performed by the Bureau with legal assistance furnished by the Office of the Solicitor, a unit of the Office of the Secretary.

6. Columbia River fishery facilities

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
Columbia River fishery facilities	$2,086,546	$2,089,900	$2,260,000	+$170,100	+$10,100	+$160,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

Columbia River fishery facilities

The estimate for 1965 is $2,260,000, an increase of $170,100 over 1964. The increase includes $10,100 for increased pay costs for Bureau personnel; $60,000 for increased pay costs for personnel employed in operating program hatcheries under contract; and $100,000 to continue the program for appraisal of project results at an effective level. The increased proposed for fiscal year 1965 will not require any increase in overall Bureau employment over that authorized for fiscal year 1964.

Need for increase.—**An increase of $160,000 is needed to provide for generally** rising uncontrollable costs involved in the effective conduct of this program. These increased costs are associated with the following:

(*a*) Rising salaries in State and Federal organizations cooperating in the conduct of the program. The operation and maintenance of the 21 program hatcheries, all operated under contract or agreement with State fish and game **agencies and the Bureau of Sport Fisheries and Wildlife, requires an increase of $60,000 which will be needed to meet salary increases** (6-percent average) projected for State and ungraded Federal employees at hatcheries. Salaries represent about 56 percent of the cost of hatchery operations.

(*b*) The conduct of a sound, statistically planned program for assessing **the effectiveness of the multimillion-dollar hatchery program in the Columbia River Basin. This program was initiated on the basis of an agreement made** with the Bureau of the Budget in 1960. Approximately 15 million young salmon have been marked and released, and an additional 10 million will be marked and released by fiscal year 1965. **Recovery of marked adult fish and the successful conclusion of the hatchery evaluation study cannot be achieved unless**

sufficient funds are available to allow for the planned extensive marking and recovery efforts. Sampling of commercial and sport fisheries in the ocean and Columbia River must be conducted in order to obtain valid data. Fiscal year 1965 will be the initial year of a full-scale effort for the recovery of adults at various ports from northern California to Alaska. An increase of $100,000 is necessary for the conduct of this work, which will be contracted to State agencies for performance. Recovery of adult marked salmon along the coast will require $80,000 of the $100,000 needed, and $20,000 will be required for tabulation and analysis of recovery data.

Plan of work.—A minimum maintenance program will be conducted for facilities in operation prior to 1963 and for facilities placed in operation during fiscal years 1964 and 1965. The operation and maintenance of facilities constructed under the Columbia River fishery development program will be continued in cooperation with the State fish and game agencies of Idaho, Oregon, and Washington. Principal items of work are the following: (a) operation and maintenance of hatcheries; (b) operation and maintenance of screens; (c) maintenance of fishways and stream clearance; (d) appraisal of project results; and (e) administration and inspection. Approximately 64 percent of the funds available for this program are utilized by State agencies conducting appraisal, operating 15 fish hatcheries, 59 fishways, and approximately 650 screens. Another 27 percent is utilized by the Bureau of Sport Fisheries and Wildlife operating six hatcheries and three major fishways. Special emphasis will be placed on the hatchery evaluation program to insure steady progress and proper emphasis on artificial propagation methods. That program will have to be conducted at approximately the same level for the next few years in order to obtain the data necessary for complete and valid evaluation. Full-scale sampling of fishing ports from northern California to Alaska will be conducted in an effort to obtain, through a statistically planned program, a representative coverage of the catch of adult chinook salmon in sport and commercial fisheries.

The excellent production at the program hatcheries in recent years, which has resulted in improvement of some runs of fish, is attributable in part to longer periods of rearing and improvements in diet. All effort will be made to continue the longer term rearing and to operate the hatcheries at capacity.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$15,821,954	$17,824,234	$20,681,000	+$2,856,766
Unobligated balance lapsing	32,161			
Transferred to "Operating expenses, Public Buildings Service," General Services Administration (Public Law 87-141)	29,285	8,666		−8,666

Subtotal	15,850,530	17,846,234	20,712,000	+2,865,766
Deduct quarters and subsistence charges	28,576	22,000	31,000	−9,000
Total obligations	15,821,954	17,824,234	20,681,000	+2,856,766

PREPARED STATEMENT

Chairman HAYDEN. If you have a statement the committee will be glad to receive it at this time. You may proceed either by reading your statement, or by inserting it in the record and highlighting it.

Mr. McKERNAN. Mr. Chairman, it is a pleasure, again, to appear before this committee. I will submit my statement for the record and make a few general remarks.

(The statement referred to follows:)

STATEMENT BY DONALD L. McKERNAN, DIRECTOR, BUREAU OF COMMERCIAL FISHERIES

Mr. Chairman and members of the committee: It is a pleasure to meet with this committee to discuss the programs of the Bureau of Commercial Fisheries and to present for your consideration the estimates of the financial needs of the Bureau for fiscal year 1965. I believe that the Federal Government's efforts during the past year have been of significant benefit to the commercial fishing industry of our country and in the broad national interest as well. Our objectives as set forth by Congress are to increase both maximum sustained use of our fishery resources and well-being of the commercial fishing industry. These are challenging tasks, Mr. Chairman, but we face the new year with determination as well as with optimism that the fishing industry of the United States will be an ever-increasing important source of protein food for our people and new wealth for our expanding economy.

Our estimates for fiscal year 1965 total $26,445,000. Of this total, $20,681,000 is for management and investigations of resources; $300,000 is requested under the special foreign currency program; $4,788,000 is for construction; and $676,000 is for general administrative expenses. An additional $2,442,000, to be derived from the Pribilof Islands fund, is requested for administration of the Pribilof Islands. The Bureau's budget includes a decrease of $750,000 under the construction of fishing vessels appropriation due to termination in the fiscal year 1964 of the subsidy program authorized under the act of June 12, 1960.

Increases totaling $2,856,766 are included in the estimate for "Management and investigations of resources," the principal item being $250,066 for increased pay costs for positions authorized in the current year; $151,500 for exploratory fishing and gear research; $255,000 for technological research which includes $225,000 for botulism and pesticides studies; $2,102,300 for biological research which includes $704,800 for operation and maintenance of new vessels and laboratories, $902,500 for the Bureau's contribution to the national oceanographic programs, and $495,000 for implementation of the recommendations of the President's Science Advisory Committee report on pesticides; and $160,000 for the operation of facilities under the Columbia River fisheries development program. A decrease of $100,000 is proposed for programs involving research on fish migration over dams.

Of the total increase requested under this appropriation $754,200 is for operation and maintenance of new facilities.

The estimate of $300,000 for the "Special foreign currency program" is the same as the 1964 appropriation. It provides for the use of foreign currencies to prosecute biological and technological research programs of benefit to the United States. The availability of these funds on a no-year basis will serve to increase their usefulness to the Bureau.

The $4,788,000 "Construction" estimate includes $4,200,000 for facilities required for our oceanographic programs, and $588,000 for construction and related purposes necessary to carry out the objectives of the Columbia River fisheries program. These include $1 million for construction of a Shellfish Research Center at Milford, Conn.; $1,500,000 for the construction of a Biological Research Laboratory for the tropical Atlantic area; $350,000 for scientific equipment for the North Pacific fishery research vessel constructed with funds appropriated in fiscal year 1964; and $1,350,000 of the total of $2 million required for the construction of a replacement of the exploratory fishing vessel *Oregon* for use in the Gulf of Mexico, Caribbean, and tropical Atlantic areas. The balance of $650,000 will be budgeted in fiscal year 1966. Funds for design of the *Oregon* replacement were appropriated for the fiscal year 1964.

The estimate of $676,000 for "General administrative expenses" represents an increase of $23,000 over 1964 to provide for increased pay costs for fiscal year 1964 positions.

I shall be pleased to discuss the estimates for specific items in the budget in greater detail as they come up for discussion in the course of the hearing.

The United States, for generations a leader among the fishing nations of the world, has during recent years slipped from second place to fifth in the harvest

of the resources of the sea. Not only do Japan, Russia, and Red China now catch more fish than the United States, but so does Peru, a relative newcomer to the world fisheries scene.

Fishing has been an important activity in this country for nearly three and a half centuries. From the time in the early 1600's when the first colonists fled England for America in the tiny, sail-powered *Mayflower* to the present day, fishing—first for food and later for both food and industrial products—has been a traditional American occupation, and the industry based upon this way of life has over the years made significant contributions to the Nation's welfare.

But times are changing, and while the commercial fishing industry in the United States is still a billion-dollar-a-year business, it faces serious problems on many fronts. Markets are being lost to imports, some ocean resources historically fished only by Americans are being exploited by other nations, and the industry, with a few exceptions, is failing to keep pace technologically with its competitors. Fishing as an industry is made up of many very small units which are scattered along the thousands of miles of coastline from the Arctic Circle on the Pacific coast to the Canadian border on the Atlantic, and along the entire length of the Mississippi River and shores of the Great Lakes.

The United States cannot afford a continuing decline in its commercial fishing industry. More than half a million people depend on this industry for their livelihood. It supplies over a million tons of food each year for our population, in a variety of forms, flavors, and textures that cannot be matched by any other protein commodity. The industry contributes substantially to the Nation's transportation system. It helps to keep the shipyards busy, is important to container and packaging manufacturers, and provides this country with a reserve of trained mariners in the event of a national emergency. Beyond this, the oceans of the world are a vast storehouse of renewable food and industrial resources that can contribute substantially to the diets and economies not only of our own people but also to those of the rest of the world. With our own population expected to increase by nearly 75 million in the next 20 years, the time may soon be at hand when the United States will have to look to the sea for more of its food supply.

The Bureau has been contributing to a solution to these problems. During the past year, the Department of the Interior published "Trident," a 10-year program of fishery and oceanographic research, development, and industry services. This document comprises two major parts (1) "The Long Haul," the Bureau's long-range program and (2) "Action Now," the Bureau's program for immediate remedial action. After publication, we established a task force to review our current programs and services, with a view of reorienting them to bear directly on the 13 problem areas listed in "Trident's 'Action Now'." The task force is also reviewing the need for additional legislation, where such an approach appears to be the most suitable means of resolving a problem.

To remain in competition for the world's fishery resources the U.S. commercial fishing industry must be revitalized and made more productive and profitable. It must be quick to utilize technological advances and it must use available knowledge regarding maximum sustainable yield of the resources fished, both now and in the future. Exploratory work must be done to first delineate, then find economic ways to fully utilize presently underutilized or nonutilized fisheries available to our fishermen.

A primary task of the Bureau is to develop knowledge about fishery resources and their environment. Such knowledge will provide background information for industry to use in determining where to fish, what to fish, and how much to fish. Included with this knowledge will be facts relating to the size and nature of resources, methods for their economic harvesting, development of new processes and products, and assessment of domestic and world market potential for new fish and fishery products.

Essential to accomplishment of this task are programs conducted by the Bureau under the national oceanography program. "Oceanography" in the broad sense is the study of all phenomena that take place on and beneath the surface of the sea, whether they relate to circulation of waters, their chemical composition, contours and structure of the bottom, or the habits and interrelationships of plants and animals that inhabit all levels of the sea. The Committee on Oceanography of the National Academy of Sciences has recommended that the Bureau of Commercial Fisheries begin new work or expanded present investigations in such diverse fields of oceanography as fish survival, disease, and behavior; genetics; distribution, and classification of marine life; possibilities of

increasing the productivity of the sea by adding or redistributing nutrients, transplanting organisms from one part of the sea to another, or growing animals under controlled conditions in ponds; utilization of unmanned buoys and other new devices, such as submersible chambers like the mesoscaphe, for making oceanographic observations; determination of physical, chemical, and biological interrelationships in estuaries; and cooperation with Navy, Coast and Geodetic Survey, National Science Foundation, and other Government agencies in the operation of a National Oceanographic Data Center. The Bureau is playing a leading part in the coordination of all oceanographic effort within the Government and has benefited in a major way from this effort.

Because the work of the Bureau is of very direct interest to the fishing industry, much of our research program has been oriented toward solution of questions of direct practical concern. Consequently, basic research is only now beginning to receive the attention it deserves, yet research is necessary to the understanding of the causes and effect relationship of practical problems of the fishing industry.

Research on aquatic resources is difficult and costly. Such research must be done in a medium which is not man's natural environment, gathering information by probing blindly from above, working from extremely expensive yet unstable and crowded ship platforms, subject to all the vagaries and dangers inherent in oceanic weather, and able to identify the geographic location of our observations quite inaccurately by scientific standards. It is truly remarkable that with limited resources and relatively primitive methods we have been able to gather so much useful information about a domain so vast and so mysterious as the sea. The problems of devising methods of capture, tracing migrations, studying geographic distribution, and counting and measuring rates of birth, growth, and mortality of fishes are tremendous.

Several important advances in this field have been made in recent years. Bureau scientists have discovered new areas of high biological productivity in the central Pacific, heretofore unsuspected, and have demonstrated that the ocean is by no means the desert it was popularly supposed to be. A Bureau scientist discovered also a major new ocean current in the equatorial Pacific, flowing eastward well beneath the surface and carrying more than a thousand times the volume of water discharged by the Mississippi River. The Bureau has identified and described the complex oceanographic processes that govern the movement of skipjack tuna into the area exploited by the Hawaiian live-bait tuna fishery.

In the Atlantic and Gulf of Mexico, Bureau scientists are faced with even more difficult questions, for the important fisheries and concentrations of marine life are found in the coastal areas where oceanic circulation is far more complex and conditions more variable. Scientists are just beginning to realize the great importance of the estuarine environment, which harbors large permanent stocks of oysters, crabs, and many kinds of fishes, and which is an important nursery ground for young shrimp, menhaden, and other rich marine resources. This environment is much more complex than the open ocean, hence much more difficult to understand, yet limited efforts in research have been fruitful. We have learned much of the important effects that temperature and salinity changes exert upon the movements and abundance of clams, oysters, shrimp, crabs, menhaden, and other life. Bureau scientists have succeeded in the difficult task of learning how to grow and maintain in the laboratory continuing cultures of the microscopic organism that causes periodic disastrous outbreaks of red tide in the Gulf of Mexico. The Bureau has been successful in breeding artificially, and maintaining in the laboratory, successive generations of oysters and clams. This achievement offers exciting possibilities for breeding shellfish for fast growth, disease resistance, high survival rate, fatness, flavor, and a host of other desirable qualities. Progress also has been made in the development of chemical controls for shellfish predators.

In both oceans the Bureau is exploring the relation between long-term meteorological conditions, oceanography, and the distribution, migrations, and abundance of marine life. These investigations are beginning to clarify the ways in which changes in atmospheric pressure influence ocean current patterns, which in turn alter routes of fish migration and affect survival and growth rates. In both oceans, also, basic studies of distribution, growth, and survival of fish eggs and larvae in relation to oceanographic conditions have produced results of wide interest. Our new research vessel for the North Atlantic, the *Albatross IV*, will allow the Bureau once again to pursue these important oceanic investi-

gations in a region of great international importance, where 13 nations, including the U.S.S.R., are operating and expanding their fishing interests.

The great salmon runs of the Pacific Northwest and Alaska are among the Nation's most valuable fishery resources. Resumption of Japanese high seas salmon fishing after World War II offered a serious threat to our management program. In 1953 the International Convention for the High Seas Fisheries of the North Pacific Ocean, with Canada, Japan, and the United States as participants, recognized this problem. At that time the distribution of salmon on the high seas was not known, and Japan's agreement to abstain from fishing salmon of North American origin was effected by creating a provisional line at longitude 175° W., east of which Japan agreed not to fish. The task of the scientists was to determine whether salmon of Asian and North American origin intermingle on the high seas; and, if so, when and where intermingling occurs. U.S. scientists developed ingenious new techniques to identify continental origin of salmon caught on the high seas, and demonstrated that the valuable red salmon resources of Alaska dominate high seas catches in a very large area of the Bering Sea and the North Pacific Ocean, extending considerably westward of the provisional line. This proved that Japanese fishermen, even under the rather severe restrictions imposed by the treaty, can take large numbers of North American salmon. This was a scientific achievement of the greatest importance to the U.S. fishing industry.

On the Atlantic coast the Bureau has investigated the decline of the shad fishery and has made recommendations for rehabilitation of runs in certain rivers. The Bureau has discovered valuable new shrimp grounds off the Alaska Peninsula and in international waters off South America which are now being fished commercially by U.S. vessels. A great deal has been learned about the behavior of salmon in fishways, and this has led to simplification of the structure of fishways and to the design of fishways that are effective in passing salmon over lower dams.

The Bureau has developed a method of guiding and capturing fishes with curtains of air bubbles. This air-bubble curtain is now in commercial use. The feasibility of using trawls for catching fish in the Great Lakes has been demonstrated, and this development promises to relieve current economic distress in certain fisheries of that region.

Programs for eradicating the destructive sea lamprey from the Great Lakes are showing extremely promising results, and the rehabilitation of the lake trout resource, decimated by the depredations of the lamprey, are now underway.

A voluntary inspection and certification service has been set up for fishery products and standards of quality have been developed, which will greatly improve marketing of fishery products and which will assure the housewife of consistently good quality at the marketplace. Well over 200 million pounds of fishery products were inspected and certified during the past year.

It has been known for some time that fish oils have unusual characteristics that set them apart from other animal oils, but the limited levels of past research prevented development of a sufficient understanding of these characteristics to develop their uses. Recently, a concentrated study of the fatty acid components of fish oils has led to a research breakthrough. The unsaturation of the fatty acids, which has limited the use of fish oil in its natural form, now shows promise of being a valuable characteristic. Research with Bureau funds has shown that these fatty acids are unusually effective in reducing the level of cholesterol in the serum of animal blood. Cholesterol is believed by some researchers to be involved in the occurrence of atherosclerosis, a type of hardening of the arteries. This exciting discovery has attracted wide attention, and equipment is already set up to produce adequate amounts of highly purified fish oil fractions for use in medical research. A successful conclusion to this limited but important phase of research could be of immeasurable value to people throughout the world. Recent information points also to important applications in dietary control of the endocrine glands, especially the thyroid, which ultimately regulate the mechanisms of the human body.

Other programs, important to the health of the American public as well as to the future of our country's fishing industry involve botulism and its causes and the effect of improper use of pesticides. Research on *Clostridium botulinum* (type E) will be conducted, in cooperation with other Federal agencies, to establish methods of eliminating this public health hazard from seafood products. Recent cases of poisoning resulting from botulism on smoked fish caused seven deaths and severe economic injury to the fishing industry.

Studies are being conducted to determine the effects of pesticides on fish and other aquatic life in bays, estuaries, and other natural environment. Technological research will be conducted to establish when, and under what conditions, pesticides are ingested by fish and shellfish. These studies will insure that a minimum of pesticides reach the consuming public and the resources do not suffer from the improper application of the chemicals.

Bureau scientists will intensify studies on the composition of fishery products to provide data for use by dietitians, physicians, and homemakers in developing properly balanced diets. These studies will concentrate on such essential food components as amino acids, minerals, fats, and vitamins.

Through research, new methods for improving the handling of raw materials and developing better preservation techniques, including freeze drying and irradiation pasteurization, will be sought. The development of standards of grade for the principal fishery products will be expanded, and the Bureau's voluntary inspection service, which utilizes these standards, will be continued to assure the housewife of certified quality through the use of Department of the Interior quality grade labels. Bureau service programs, such as our daily market news dissemination, vessel repair loans, and consumer education will continue to receive appropriate emphasis and guidance.

The Bureau believes the goals embodied in our budget estimate are consistent with, and will contribute to, the Department of the Interior's balanced program of conservation and wise use of natural resources. It further believes that our plans will be of benefit to the ever-growing marine sport fishery and will complement the conservation programs of other Government agencies.

Economic Condition of Fisheries

Mr. McKernan. Commercial fisheries in 1963 suffered some loss in catch, dropping approximately 600 million pounds, but the value of the commercial fisheries during 1963 was at an alltime high, with a value of close to $400 million at the fisherman level.

This means, Mr. Chairman, that its effect on the economy of our country at the retail level was then pretty close to $2 billion during 1963 or a rather sizable economic benefit to our country.

Budget Request, 1965

Now, Mr. Chairman, in 1965 the Bureau for the direct annual budget is asking for a total of about $26.4 million. In addition, the Bureau has $6.8 million in permanent funds. Our overall increase is about 9 percent over the preceding fiscal year. This increase, Mr. Chairman, largely reflects increases in pay costs and increases for operation and maintenance of new facilities which are being completed during 1965 and which require such things as personnel for new research ships, and maintenance people at new laboratories

Research on Botulism and Pesticides

Our budget for 1965, in my view, Mr. Chairman, is a very modest one. It reflects a sincere attempt to hold down the expenditures. There are really only two programs where the Bureau is requesting sizable increases for new efforts. One of these is in the Midwest where we have had a serious problem with botulism in certain species of fish.

The Bureau is cooperating with the Public Health Service, the Food and Drug Administration, and the several States adjacent to the Great Lakes. The Bureau believes it to be absolutely necessary to carry out some expanded research in this area, because the Great Lakes fishing industry has been hurt to a major degree by this serious problem and the health of the public is involved.

The second program, Mr. Chairman, is an increase in research on pesticides. We are attempting to find ways of accommodating the tremendous need for control of weeds and insects affecting our agricul-

ture and yet not affect the aquatic resources which abound in and about our inland and coastal waters.

NEW ITEMS IN BUDGET

These two items are the only substantial new items in our budget. These are the only programs for which we are really making new starts or substantial new starts during 1965.

Senator YOUNG. Mr. Chairman, could I ask a question at this point?

Chairman HAYDEN. Yes.

Senator YOUNG. How much do you have in your budget for this purpose?

Mr. MCKERNAN. About $530,000 for pesticide research, Senator.

Senator YOUNG. This would be in the order of research?

MONITORING THE ESTUARY AREAS

Mr. MCKERNAN. This would be for research and for some monitoring of the estuary areas. You are probably aware, Senator Young, that the discharge from the land in many of our coastal regions comes into the estuaries and backwaters that are the nursery grounds for some of our major commercial fisheries, such as menhaden and shrimp and oysters in the gulf.

Now, we have found in the laboratory that many of these chemicals in very, very small concentrations, down to a few parts per billion, do adversely affect the larval and postlarval stages of some of these species.

What we are trying to do is to pinpoint the problems and study in cooperation with the agricultural scientists how the problem can be corrected.

COOPERATION WITH OTHER FEDERAL AGENCIES

Senator YOUNG. What laboratories do you have to do this work, and do you work with the Department of Agriculture?

Mr. MCKERNAN. We have biological and technological research laboratories in which we can do this work. Yes; we do work with the Department of Agriculture. As a matter of fact, the Federal establishments have put together a team of people here in Washington. These people meet regularly and, in fact, now are reviewing all new applications for the use of new chemical pesticides.

Where pesticides are now being used, programs are being designed and assigned to different laboratories and different agencies which have the primary interest or expertise to carry out the studies. The results are brought back into this particular committee where they are evaluated and judged.

In my view, in the past year, Senator Young, there has been a tremendous improvement in the cooperation and coordination of the entire Federal effort and especially that between Agriculture, Health, Education, and Welfare, and Interior.

Senator YOUNG. I am glad you are all working in this same direction.

Mr. MCKERNAN. We are all working in this same direction, and, I think, for the same end.

Senator YOUNG. Thank you.

Mr. MCKERNAN. Mr. Chairman, that completes my general remarks. We would be very pleased to answer any questions.

PROGRAM ON BOTULISM RESEARCH

Chairman HAYDEN. I observe from your justification notes that you request an increase of $190,000 to initiate a program of research on botulism. Apparently this program will be carried out in conjunction with other Federal agencies. Do you have one part of a research program and they have another, or do you and other Federal agencies work on the same question?

Mr. MCKERNAN. What we have done here, Mr. Chairman, is to set up an interagency committee to coordinate work on the problem of botulism and on other organisms which might contaminate fishery products. We have been working with the Food and Drug Administration and with the Public Health Service in drafting a program. Each agency has the part of the program where its own particular specialists have the greatest competence.

COOPERATION WITH OTHER FEDERAL AGENCIES

We are making certain that there is no overlap and that there is coordination at every step and every stage of the way.

Chairman HAYDEN. What other Federal agencies are involved?

Mr. MCKERNAN. These are primarily the Food and Drug Administration and the Public Health Service of the Department of Health, Education, and Welfare, the Bureau of Sport Fisheries and Wildlife and our own Bureau. In addition the States involved are Wisconsin, Michigan, and Minnesota, which especially are cooperating with us. Other States have been attending our meetings and have been supplementing our total efforts.

Chairman HAYDEN. Each one of these agencies provides its own money? There is no transfer of funds?

Mr. MCKERNAN. That is right, there is no transfer of Federal funds.

RESEARCH IN PRIOR YEARS

Chairman HAYDEN. How much work have you done on this particular subject in prior years?

Mr. MCKERNAN. We have done too little, Mr. Chairman, I am sorry to say. We had not thought that this particular problem affected fishery products until very recently. In fact, we are puzzled by the increase in incidence of this organism in fisheries products.

It has been an absolute rarity until the past year. For these reasons, we have not thought it had a particularly high priority. What we are afraid of, of course, is that this may be a prelude to other infestations. We want to make certain that the public welfare is preserved, as well as the welfare of the fishing industry dependent upon these resources and upon these products for their economic benefit.

TECHNICAL ASSISTANCE ON RESERVOIR AREAS IN SOUTH DAKOTA

Chairman HAYDEN. Last year Congress added $92,000 to your budget request for providing technical assistance on commercial fisheries in

the Big Bend and other reservoir areas in South Dakota. What progress have you been able to make with these funds?

Mr. McKernan. Mr. Chairman, I am pleased to report that we have made quite good progress. We have established a team of scientists at a reservoir and we have brought in special gear and equipment. We have been sampling and designing experiments and, in fact, carrying out research to find out how large the fish population is and to what extent it is dispersed throughout the reservoir.

FISH POPULATION RESEARCH

We have some quite good results, too, Mr. Chairman. We have caught over 100,000 pounds of fish at the present time of many species. We have found that there are large quantities of fish in these reservoirs which are not being used by recreational fishermen. It would be advantageous from the standpoint of developing recreation if such fish as the buffalo, crappie, and other fish were thinned out.

Senator Mundt. Such as the carp?

Mr. McKernan. Right. You will be interested to know that in our catches so far we have caught 45 percent buffalo fish, about 19 percent crappie, and about 10 percent carp. These are the three most abundant species that have been found in the reservoir.

COOPERATION WITH STATE AND COMMERCIAL INTERESTS

We are working with the State agencies and we have commercial fishermen operating there. In fact, we have been fishing under the ice to follow the population movements throughout the year. We have finclipped close to 50,000 fish so far and we have been on the lake for less than 6 months.

In my opinion, Mr. Chairman, we have made rather outstanding progress thus far and we are very optimistic that this program will show us the way to utilize the resources, the living resources, of these great inland bodies of water, not only in South Dakota but in many other Midwestern and Western States.

Chairman Hayden. Is there a market?

Mr. McKernan. Yes; we do think there will be a market.

Chairman Hayden. Do you have a question?

Utilization of Indian Reservation Labor

Senator Mundt. Yes. Thank you for that very interesting report. I have been visiting that area and I want to commend you on the caliber of the people you have sent out there. You have some mighty high-type people working there and they have created a most favorable reaction, I can assure you, and I would like to thank you personally for following one suggestion that I made and that is utilizing, when available, Indian labor from the reservation.

I think that has made a great hit with the people, because our big problem with the Indian is education and employment. You have recognized that, as far as possible, in employing these people and the Indians and non-Indians like it.

Mr. McKernan. Senator Mundt, I am going to pass that on to our staff there, because they will like it.

Senator Mundt. Thank you. I mean it. I wonder what funds you have for that work in this budget?

BUDGET REQUEST

Mr. McKernan. We have $92,000 at the present time, Senator Mundt.

Senator Mundt. That you are asking for?

Mr. McKernan. Yes.

Senator Mundt. Is that the same amount as last year?

Mr. McKernan. That is right.

Senator Mundt. Is that the amount you feel is required to carry it forward at the optimum rate, or would more money create better results?

Mr. McKernan. More money will create better results. We have attempted, as I said, before you mentioned this item, to submit what we consider to be an extremely conservative budget this year and in the Oahe Reservoir area, we can accomplish good research with the present funds. We can make much faster progress, however, if we had more money.

PURCHASE OF VESSEL

For example, we simply cannot afford with present funds a suitable vessel to get from one place on the lake to another.

Senator Mundt. I was leading up to that as to whether the $92,000 provides you with a way to get out on the water when it is not frozen.

Mr. McKernan. No, it won't.

Senator Mundt. How much more money will you need for that?

Mr. McKernan. I had not anticipated this question, but I would judge in the neighborhood of $50,000 would provide us with an adequate vessel. I would be glad to supply that for the record, that is, a more precise figure.

Senator Mundt. May I suggest that you do supply that to the clerk for the record and any other item you think essential for moving forward at the optimum rate?

Mr. McKernan. Senator Mundt, I would like to mention, and I think I would be negligent if I did not, that we are working not only with the State of South Dakota but also with our sister bureau, the Bureau of Sport Fisheries and Wildlife. I believe that bringing together the two Bureau disciplines in this area is going to provide good results.

(The statement referred to follows:)

RESEARCH IN SOUTH DAKOTA RESERVOIRS

An increase of $132,000 for a vessel and additional research with five additional permanent positions would be required to provide for progress at the optimum rate on the South Dakota reservoir research work.

RESEARCH VESSEL

A more precise estimate of the cost of an adequate research vessel of the type needed, would be $45,000. This would provide for the highly versatile vessel which is required since we are uncertain as to which method or methods of fishing are going to prove economically feasible. Of particular importance is an adequate size fish hold since we intend to conduct holding experiments to determine the best way to preserve fish under a variety of conditions. The vessel would be capable of independent operation throughout the 250-mile length of Oahe Reservoir and would necessarily have living accommodations and a speed of at least 15 knots. It would be a vessel of the latest commercial design modified as a reservoir fisheries research vessel. Although it is expected that future reservoir commercial fishing vessels will be relatively compact, high performance

craft, this research vessel must be equipped with sufficient deck gear, equipment, and instruments to permit the use of a wide range of fishing and biological sampling gear and associated instruments. The vessel could be obtained and put into use within 3 months after receipt of funds. This would be a nonrecurring item.

PROGRAM INCREASES

The amount of $87,000 is required for operation, maintenance, and carrying out experimental fishing and biological sampling programs involving the new vessel, and a program of fisheries development and research in waters immediately below dams.

Of this total, $42,000 is needed for the vessel program including salaries and related costs for one crewmember, and two scientists. The program involving vessel utilization will be initiated in Oahe Reservoir. The program will be concerned with determining the seasonal abundance, distribution, and availability of major species of fish to commercial gear in all areas and depths throughout the entire Oahe Reservoir. A variety of experimental and conventional types of gears including bottom and midwater trawls, shore and open-water seines, draglines, trotlines, gill nets, trap nets, and other yet to be determined types will be experimentally fished in order to determine the most efficient and commercially feasible fishing methods. Fish taken by experimental fishing will be studied for species, age, size, and year class strength. For major species of commercial value, studies will be conducted on growth rates, stages of maturity and food habits. Fish wil be tagged to determine distribution, movement, and rate of capture.

Methods, techniques, and knowledge obtained from work in Oahe Reservoir will be extended to other impoundments in this area.

The remaining $45,000 is needed to extend fishery development and research activities immediately below dams. Great concentrations of fishes are common below the dams forming these reservoirs at certain times of the year. The capture of large quantities of these fish would be possible at relatively low cost if methods of fishing suited to such areas could be worked out. Studies of the methods to catch these fish on a large scale never have been attempted seriously. Full consideration will be given to protection of recreational fishing and game fish populations in developing methodology. Our greatest potential for immediate fishery development is in the waters just below the dams at Oahe, Randall, Big Bend, and Lewis and Clark Reservoirs. Experimentation to develop procedures and gear would be done at the dam on one reservoir but, once the development was accomplished, fishing rights could be contracted by the State to commercial operators or Indian groups. This program would require the services of two scientists.

SPAWNING AND RAISING OF SPORT FISH

Senator MUNDT. When you take a carp or sucker out of the reservoir, you increase the potential for the spawning and raising of sport fish. The experience of so many of our fishing areas has been that when the carp gets in in great numbers they devastate a lake.

They are like a water hog. They destroy vegetation and the nesting areas. And I think what has happened in little lakes can take place in large lakes.

You remember, Mr. Chairman, we have talked about putting a screen over the lake and preventing this terrible devastation. It is rough to do. You almost have to harvest rough fish to get the sport fish.

HARVESTING ROUGH FISH

Mr. MCKERNAN. We are certain we can devise means for harvesting rough fish economically.

Senator MUNDT. Unquestionably, the situation is different than it was for the 6½ years I served on a bipartisan game and fish commission in South Dakota. We did not have much money there, because her majesty, the pheasant, had not been produced. Now we are doing better financially.

For years, and years, and years, we controlled the fish in our lakes. At that time, the commercial fisherman paid us for seining rough fish. They do provide table food, do they not? There is a human market as well as an almost unlimited animal market?

Mr. McKERNAN. You are correct, Senator Mundt. I think we will agree that we do have to get the people of South Dakota to like fish a little better.

Senator MUNDT. They do like the sport fish. Thank you, Mr. Chairman.

Chairman HAYDEN. There will be included in the record a letter to the subcommittee from the entire congressional delegation from Oklahoma urging an appropriation of $196,000 to embark on a 3-year research program to determine the commercial possibilities of developing supplies, markets, methods, and related information for profitably utilizing rough fish in Oklahoma reservoirs.

(The letter and attachment referred to follows:)

U.S. SENATE,
COMMITTEE ON APPROPRIATIONS,
February 25, 1964.

Hon. CARL HAYDEN,
Chairman, Interior Appropriations Subcommittee, Senate Appropriations Committee, U.S. Senate, Washington, D.C.

DEAR CARL: I am authorized by the entire Oklahoma delegation to submit to you a proposal for a commercial fisheries research project.

The authority for such a project exists and may be activated by an appropriation as herein suggested. This proposal has been carefully revised and approved by the Oklahoma Department of Wildlife Conservation and the Bureau of Commercial Fisheries, Department of the Interior.

We believe that this project will provide the basis for a new and profitable industry in the 34-county area in Oklahoma designated as qualified for Area Redevelopment Administration grants and loans. Further, we believe the industry may well reach a potential of $50 million annually in the United States.

We would appreciate your interrogation of the appropriate government witnesses relative to this proposal. Although we believe the attached proposal contains complete justification for the proposal, we would be glad to testify if you wish additional information.

Your favorable consideration of this request will be greatly appreciated.

Sincerely,

MIKE MONRONEY.

For the Oklahoma delegation:

Senator MIKE MONRONEY.
Senator J. HOWARD EDMONDSON.
Congressman PAGE BELCHER.
Congressman ED EDMONDSON.
Congressman CARL ALBERT.
Congressman TOM STEED.
Congressman JOHN JARMAN.
Congressman VICTOR WICKERSHAM.

COMMERCIAL FISHERIES RESEARCH

A commercial fisheries research program at Federal reservoirs in Oklahoma to determine the commercial possibilities of developing supplies, markets, methods, and related information for a profitable industry, utilizing "rough" fish in the more than 450,000 acres of impounded waters in Oklahoma, is herein proposed.

We propose that an appropriation for this purpose be made to the Bureau of Commercial Fisheries as follows:

	1st year	2d year	3d year
Branch of:			
Biological Investigations	$86,000	$86,000	$86,000
Exploratory Fishing	47,900	47,900	47,900
Economics	6,000	6,000	6,000
Marketing	28,100	32,500	62,200
Technology	28,000	77,000	29,000
Total	196,000	249,400	231,100

We believe this proposal will provide an opportunity to add materially to gainful employment in the 34 counties designated as qualifying for Area Redevelopment Administration grants and loans. We believe that a new and profitable industry can evolve from this research, with $50 million a year potential for Oklahoma and other States.

The large number of reservoirs impounded or authorized in the United States, the apparent large populations of fish that appear to be available in these waters, and the growing need for fishery products throughout the world all point toward the need to develop commercial utilization of those resources. In cooperation with the State of Oklahoma in this case, and with other States ultimately, the Bureau of Commercial Fisheries is intensely concerned with the full development of possible commercial enterprises that this potential stock of fishes might support.

Sport fishing is popular on all the Oklahoma reservoirs and tailwaters and fishing intensity is relatively high. Commercial fishing has been conducted on a limited scale on only a few reservoirs, but catch rates have been high.

Oklahoma has a history of fishery research and management on reservoirs that has been directed almost entirely to sports fish and the sports fishery. The results of the many years of effort have not been entirely satisfactory. Sports catches have not improved. In fact, there has been a decline in some waters, and the high abundance of nonsports fish in the reservoirs has caused the public widespread alarm. Fishery administrators and biologists in Oklahoma agree that research must take on a new direction—that management must be more realistic. The new direction agreed upon by Oklahoma and the Bureau of Commercial Fisheries is one of studying the only biological feature of reservoirs that usually can be controlled or manipulated—the fishing and the rate of removal of the fish. It was further agreed that effective research on fish removal must be based upon the use of commercial gears.

The objectives of the biological investigations are to determine levels of abundance and availability of fish, the response of populations to high rates of removal on sports and commercial fisheries. The studies should lead ultimately to a system of efficient exploitation of biological (fish) productive capacity for the common good of all interests.

The research should be conducted in the reservoir in Oklahoma that holds the greatest promise for completing satisfactorily all phases of research.

All nonsports fish (carp, buffalo, suckers, bowfin, gar, shad, white bass, bullheads, flathead catfish, and blue catfish) captured will be removed from the reservoir by fishermen and sold, given to institutions, or used in experiments. Channel catfish and perhaps other game fish will be removed at carefully controlled rates as part of the research program, and the disposition or use of the fish taken shall be the responsibility of the State.

Research will be conducted continuously as findings dictate. Commercial and experimental fishing would be allowed in all areas of the reservoir except for local areas of high recreational use as agreed upon by the agencies concerned (Oklahoma Department of Wildlife Conservation, Bureau of Commercial Fisheries, and the Corps of Engineers, or other management agency).

The interrelationships of fish removal and changes in fish populations, catch, and the environment will be determined, and evaluation of the problems and benefits of various changes or controls will be made.

Costs of conducting a study of the sport fishing intensity and catch will be borne by the Oklahoma Department of Wildlife Conservation. In the event that other phases of biological research or expenses programed by the Bureau will be fi-

nanced and assumed by the Oklahoma Department of Wildlife Conservation, the obligated funds of the Bureau that are released will be used to conduct related studies on connecting waters in a manner that will increase the value of the findings of the project outlined here. The Oklahoma Department of Wildlife Conservation has requested special funds for cooperative investigations on reservoirs.

Economic investigations on reservoirs in Oklahoma will be concerned with the overall benefits obtained from commercial fisheries in the area. The studies will cover the following points:

1. Income and employment generating potential from the fishery.
2. Total potential economic development resulting from improved sport fishing and recreational activities.
3. The relationhsip between improved sport fishing and expanded income and employment will be analyzed.
4. An analysis of technological research will be made to determine the most economic method of processing and storage of commercially landed species.

Following is an outline for a marketing program to assist development of commercial fishing reservoirs:

1. Survey market utilities for fish produced in initial biological and gear research studies. This survey would explore commercial possibilities in human, animal, and industrial use markets for fish species discovered or known to be in the reservoir.
2. Based on the market survey, recommendations would be made to technology on the most promising (market and profitwise) products on which processing and new product development studies could be made.
3. A marketing program would be instituted to develop and expand market outlets for unprocessed fish species discovered in the survey.
4. Assistance will be given industry in implementing and conducting a market development program including market research to introduce new products developed by technology research on the market.
5. Test kitchen research on receipe and menu development and nutritional evaluation of reservoir fishery products will be conducted on the principal market species discovered and on new products as they are developed.

The proposed studies are concerned with the evaluation and development of industrial products from fishery byproducts and species not used for human consumption from fresh water impoundments.

Feed industries are constantly searching for abundant and inexpensive protein supplements as additions to various types of feed materials such as poultry and livestock feeds, and pet foods and mink rations. As the demand and production of the valuable catfish increases and artificial feeding of pond stocks develop, rough fish and byproducts of food fish could be processed to be used as catfish food, particularly as growth factor supplements.

Ideally, an industrial processing operation for impoundment fisheries should consist of a portable plant. Most individual impoundments are not capable of producing at sufficiently high rates to maintain a reduction-type operation for sustained periods. Also, the transportation of fish to a stationary plant may not prove economical.

In order to properly develop industrial products from reservoir fish stocks, we must first survey existing methods of reduction and associated equipment and develop suitable methods of processing.

In order to evaluate the capabilities of a projected reduction process to produce a stable, high-quality, high-protein meal, nutritional evaluation of the finished product should be conducted. Protein availability and quality should receive particular attention.

Although Oklahoma is rather far removed from the seacoast and generally considered an agricultural State, it has a great potential for commercial fishing. This can be substantiated by the fact that there are 14 large reservoirs with about 350,000 surface acres, 12 smaller reservoirs, and 9 others authorized for construction. Within a relatively short period of time, Oklahoma will have public works reservoirs that will total more than 545,000 surface acres, or an area about one-fifth the size of Lake Ontario. Private, municipal, industrial, and recreational lakes number 170 with 30,000 surface acres. There are in excess of 75,000 farm ponds and 1,671 retardation structures which have a surface area of more than 183,000 acres. So the total water surface of Oklahoma, not counting streams and smaller ponds, will be about 750,000 acres when presently authorized projects are constructed.

Sport fishing is popular on all the existing reservoirs and tailwaters but has been selective for certain desirable game fish. A limited amount of commercial fishing has produced high catches of less desirable species. The large populations of underutilized fish which appear to be available in these impounded waters, plus the increasing requirements for high-quality protein, especially from the industrial standpoint for such as pet foods and fish meal, would support the need to develop commercial utilization of this latent fishery resource.

If only the low figure of 250 pounds per acre is considered, the production from Oklahoma reservoirs would far exceed that of either the Mississippi River or the Great Lakes. Through proper management, the production of both game and commercial species could be increased and maintained at a high level.

The Federal Government in cooperation with the States is vitally concerned with the fullest development of any and all commercial enterprises that this potential stock of fishes might support. Through the use of Federal funds provided by this proposal, the Government could apply in orderly phasing its capabilities in biological research, exploratory fishing, economics, technology, and marketing in order to develop this resource to its top dollar value.

Approximately one-half of the total U.S. fish production of 5.2 billion pounds is now utilized as animal feed. In addition, about 2 billion pounds of fishery products are imported to meet domestic industrial requirements. Another 2.2 billion pounds of fish consumed as human food in the United States is imported. The explosive growth of world populations since World War II has turned the eyes of man toward the waters as a source of protein. The reservoirs in Oklahoma could help provide an answer to this problem.

The development of a commercial fishery in reservoirs presents problems of great magnitude because there is presently a lack of knowledge necessary to establish a basis for an economically sound commercial fishing industry. A program to provide solutions to these problems must include consideration of production, processing, and marketing of commercially available species, and at the same time provide for the conservation of those species considered valuable to the continuation of sport fishing and recreational aspects in reservoir utilization.

In summation the development of a prosperous commercial fishing industry in Oklahoma would provide the following benefits to the State:

1. Development of an entirely new industry at the basic production level.
2. Development of a fish processing and distribution industry involving products for both human food and industrial uses.
3. Attainment of knowledge with which to develop and maintain a ready reserve of protein for human food and industrial uses in the event of an emergency or other need to supplement the inshore and high seas fisheries. This would benefit the entire Nation as well as Oklahoma.
4. Creation of additional income and employment to allied industries such as those engaged in the production and distribution of boats, motors, petroleum products, nets, packaging materials, and refrigeration and transportation equipment.
5. Expansion of capital investment, employment, and sources of both personal and revenue income.
6. Enhancement of the recreational uses of reservoirs and connecting waters.

Chairman HAYDEN. Would you care to comment on this proposal, Mr. McKernan?

Mr. MCKERNAN. Yes, I would, Mr. Chairman. We were asked by the Oklahoma Fish & Game Council to help them develop such a program. This program would require $196,000 for the first year and 12 additional permanent personnel. It would provide for comprehensive studies toward development of a fishing industry utilizing rough fish in the more than 450,000 acres of impounded waters in Oklahoma. This program has the same basic objectives as our work in South Dakota. However, we find different conditions and problems in northern and southern reservoirs. Since our findings in the north will not apply to southern reservoirs, we consider research on southern reservoirs essential for development of the total reservoir fishery resource. It is quite possible that this program will bring about the development of a new industry. Furthermore, we anticipate that

sport fishing in southern reservoirs will be enhanced by orderly harvest of "rough" fish which complete with sport fish for food and space.

Fish Protein Concentrate

Chairman Hayden. Research with regard to fish protein concentrate for human use in the United States and other countries has been a matter of interest for some years. What is the status of the experimental work on this subject?

Mr. McKernan. Mr. Chairman, here again, we have made what I consider to be rather outstanding progress during this past year. You will remember that the Congress was very generous in providing funds for this special project. With these funds we have done a number of things.

Special Committee, Trained Staff, and Scientist Assisting

In the first place, we have asked the National Academy of Science to set up a special committee of scientists, comprised of food engineers, nutritionists, fishery scientists, and food chemists of national and international reputation. These people have been advising us on the general direction of our program.

In addition, we have accumulated a staff of highly trained and very highly specialized scientists at our technological research laboratory at College Park, Md. They have designed and assembled equipment at the laboratory which is necessary for study of the different methods for producing fish protetin concentrates.

At the present time they have produced some of the first experimental products. We think these studies will eventually lead to economical, nutritious, and wholesome fish protein concentrates which will be acceptable to our colleagues in the Food and Drug Administration and will be acceptable for human use.

Biological Digestion Process

One of the processes under study is quite interesting, Mr. Chairman. This is a biological digestion process. We grind up these fish. We then inoculate the mixture either with a mold or bacteria and this causes its digestion.

When this digestion occurs as a result of a yeast inoculation vitamin B–12 is produced. So we have a secondary nutritional benefit added to the very high quality protein that is produced.

We can envisage, Mr. Chairman, using some of the rough fishes in this way.

We might have very clean, almost sterile tanks aboard the vessels. We might catch the schooling fishes, grind them into a liquid pulp as they come aboard, put them in the hold and inoculate them on the fishing grounds. The digestion process occurs while the vessel is coming back from the fishing grounds. We would then pump the liquid out of the vessel, through centrifuges and into a spray dryer. It would be ready for sale very soon after it comes off our factory ships.

We do not think this is impossible, and, in fact, we are looking forward to this development.

RESEARCH VESSEL FOR NORTH PACIFIC AND BERING SEA

Chairman HAYDEN. Last year when funds were provided for construction of a fishery research vessel for use in the North Pacific and Bering Sea, it was expected that the contract would be advertised about mid-September and awarded in December. What is the status of this construction at this time?

Mr. MCKERNAN. Mr. Chairman, the final design is just out. We were a little delayed on it. The final plans and specifications are being reviewed prior to its going out for bid. Construction will start soon.

Chairman HAYDEN. How long will it be before you have it?

Mr. MCKERNAN. We will have the vessel in approximately 1 year after the construction starts.

INCREASES FOR OCEANOGRAPHY PROGRAM

Chairman HAYDEN. Your summary sheet shows a proposed increase of over $900,000 for various oceanography programs. Would you please place in the record for each of the programs the amount available in fiscal year 1964 and the total amounts requested for fiscal year 1965? Also, discuss briefly each of the programs.

Mr. MCKERNAN. Yes, Mr. Chairman. The $900,000 refers to oceanography programs in the coastal and offshore subactivity in our budget. We also have increases of $100,000 in the shellfish subactivity, and $140,000 in the exploratory fishing subactivity. In several of these programs the increases are required because of either a new vessel or a new laboratory. And these, in a sense, are built-in increases brought about by laboratories that have been approved by this committee and by Congress in the past several years.

NORTH PACIFIC OCEAN

Now, there are some increases, slight increases, in programs in the North Pacific Ocean, for example, where we have been working with Japan and Canada in attempting to understand the fishery resources of the North Pacific Ocean, especially those that are fished intensively by the fishermen of the three nations and, in fact, also by a fourth nation, the U.S.S.R.

ATLANTIC COAST

On the Atlantic coast, we are also carrying out rather intensive work as a part of our obligation under the International Commission for the Northwest Atlantic Fisheries. Here, again, in connection with our new research vessel, we have found it necessary to request some increased funds to fully utilize the facilities and to carry out our obligation under the International Convention for the Northwest Atlantic Fisheries.

CENTRAL PACIFIC

Now, in the central Pacific, Mr. Chairman, we have a laboratory at Hawaii, and at this particular laboratory we are carrying out rather extensive investigations of the central Pacific Ocean as it affects the eastern Pacific and the fishery resources of the eastern Pacific.

In addition, we have achieved a rather important breakthrough scientifically showing the relationship between the ocean currents and the tuna resources of the central Pacific Ocean. We are in a position

now to predict abundance and time of occurrence of some important tuna resources in this particular area.

Now we are attempting to study and find out exactly what it is in the ocean that is causing this correlation to occur. And we are extremely pleased with the progress we are making in this area, Mr. Chairman.

We will be glad to add additional information for the record as requested.

Chairman HAYDEN. Will you, please?

(The information requested follows:)

Oceanography programs with increases

Program	Available, 1964	Increase budgeted	Total proposed for 1965
A. Coastal and offshore research	($5,989,300)	($902,500)	($6,891,800)
1. North and central Pacific oceanography	3,562,200	550,000	4,112,200
2. North Atlatic and gulf oceanography	2,186,100	286,000	2,472,100
3. Cooperative oceanographic programs	241,000	66,500	307,500
B. Shellfish	[1] 543,600	100,000	643,600
C. Exploratory fishing and gear research	1,219,800	140,000	1,359,800
Total	[1] 7,752,700	1,142,500	8,895,200

[1] Excludes $100,000 nonrecurring item.

NORTH AND CENTRAL PACIFIC OCEANOGRAPHY

The principal programs in these areas are concerned with biological and oceanographic factors influencing the growth, survival, migrations, distribution, and abundance of such important commercial species as the salmons, tunas, king crab, and whales. New techniques have been developed for identifying the continent of origin of red salmon captured at sea. Blood typing is being used in separating races of salmon and tuna, knowledge of which is essential in management of these resources. The behavior of tunas in response to various physical and chemical factors and to fishing gear is being studied in order to improve the efficiency of the fishing process. Research on whale biology and movements is being coordinated with the International Whaling Commission. A 3-year environmental study has been started on the major bays and straits of southeastern Alaska.

NORTH ATLANTIC AND GULF OCEANOGRAPHY

Research on fishes of the North Atlantic is now particularly urgent because of the increased fishing effort from U.S.S.R. and other foreign nations now being applied to stocks that are already heavily exploited. Studies are underway on the ecology of the New England ground fishes to determine the effects of this additional fishing effort. Bureau laboratories along the Atlantic coast are also concerned with the biology and fluctuations in abundance of the Atlantic herring (or Maine sardine); predator control, diseases; and taxonomic and life history studies on estuarine and other coastal fishes. In the Gulf of Mexico, programs are devoted primarily to studies of the biology and conservation of shrimp. Also underway is a program of exploration and development of the fishery resources of the tropical Atlantic.

COOPERATIVE OCEANOGRAPHIC PROGRAMS

Four programs are included under this category that are related to the national oceanographic program being coordinated by the Interagency Committee on Oceanography. The National Oceanographic Data Center, founded in 1961, is becoming increasingly important to oceanographers because of the expanding body of knowledge in this field. Ocean surveys are not a primary concern of the Bureau of Commercial Fisheries but they do provide an opportunity to obtain

useful information. Bureau scientists are placed on the survey ships of other agencies, such as the Coast and Geodetic Survey. The coordination of our oceanographic effort both internally, with other Federal agencies, and internationally is an important function that requires special staffing. One of the bottlenecks in the growth of oceanography, particularly biological oceanography, is the present obsolescence of instruments in current use. Our modern ships and laboratories require the development of new and specialized instruments and equipment.

SHELLFISH

The national oceanography program emphasizes the need to develop better methods for farming the sea and understanding the genetics of marine species. One of the most fruitful avenues of research by Bureau scientists in this direction has been the studies of artificial culture methods for oysters and clams. Literally millions of these shellfish have been hatched and grown in the laboratory. Using leased oysterbeds, in bays and estuaries bordering the sea, scientists need to study the application of these laboratory experiments to commercial practice. Selective breeding has been an important procedure in the success of American agriculture. Application of selective breeding techniques to the farming of shellfish could be equally important. The basic knowledge of shellfish genetics is very limited and is essential to the development of selective breeding.

EXPLORATORY FISHING AND GEAR RESEARCH

An important part of our biological oceanographic program involves explorations aimed at discovery of new fishery resources as well as research and developmental investigations aimed at improving the efficiency of fish-harvesting methods. This work has resulted in direct benefit to U.S. fishermen. For example, explorations off the northeast coast of South America have resulted in some 140 U.S. shrimp vessels currently producing about 5 million pounds of shrimp annually valued at $2.5 million. Benefits have also accrued to U.S. ground-fish fishermen off the northwest coast as a result of the discovery of new trawling grounds. Gear research efforts aimed at developing electro trawling gear for groundfish and shrimp have yielded encouraging results. Indications are that an increase of one to five times the catch of conventional trawls may be commercially feasible.

The increase of $140,000 will provide for shrimp and king crab explorations in the offshore waters of Alaska, compilation of a national inventory of fishery resources, and gear development for locating pelagic species of fish. Initial explorations off Alaska would be concentrated in the offshore waters between Prince William Sound and Kodiak Island, where it is believed that considerable unutilized quantities of these shellfish exist.

As a documentation of the resource survey portion of our oceanographic program, a compilation of a national inventory of the characteristics, concentrations, and seasonal movements of the individual species of fish and shellfish of the Continental Shelf and Slope will be undertaken. This investigation will bring together the extensive data developed by past, current, and proposed exploratory fishing programs in readily usable form so that data will be of maximum benefit to U.S. commercial fishermen and scientists. Gear research and development efforts will be concerned with devising economical methods of extending the search capabilities of vessels harvesting pelagic species of fish. Efficient methods of locating commercial quantities of fish, such as tuna, in the oceanic areas are necessary in order for U.S. fishermen to harvest the tremendous potentials existing there.

TROPICAL ATLANTIC OCEANOGRAPHIC LABORATORY

Senator MUNDT. Mr. Chairman, if I may ask a question. There is an item of $1½ million for biological research in the tropical Atlantic area. What do you propose to find in this laboratory that you do not get in the others?

Mr. MCKERNAN. This proposed laboratory will be located in Florida and its primary purpose would be to house a scientific staff for high-seas fishery research and exploration. Incidentally, research in cooperation with other agencies of the U.S. Government, including the

Atomic Energy Commission and the Navy, will be conducted in the tropical Atlantic Ocean.

There has been relatively little exploration or exploitation of the fishery resources of the tropical Atlantic. We are quite well aware that there are potential sources here of tuna, mackerel, and herring and pilchardlike fishes.

And, in fact, we have encouraged the American fishing industry to explore this area. Right at the present moment, in cooperation with us, there are large fishing vessels exploring the area off the West Coast of Africa.

We have tied in fisheries with some programs of the Government which are assisting some of the new west African governments. We think these efforts will be of benefit to our own industry, Senator Mundt.

COMMISSION FOR TECHNICAL COOPERATION FOR AFRICA SOUTH OF THE SAHARA

There is an organization for countries south of the Sahara, the Commission for Technical Cooperation for Africa south of the Sahara (CCTA), which is interested in developing the fishery resources. It is getting some aid from the State Department in this area.

We have planned in our Bureau to tie it in with our exploration out farther in the Atlantic and with some of the South American countries.

All of this information is coming into our data center here in the United States, and we expect to use it. We are looking for the time when our fishermen will harvest these areas. We think the tropical Atlantic is the last great unexplored potential fishing area in the ocean.

PESTICIDE RESEARCH

Chairman HAYDEN. Something more than $500,000 increase is requested for research on pesticides, for which $190,000 was appropriated in fiscal year 1964. Also, you have pending a supplemental estimate in the amount of $100,000 for this purpose which I will place in the record at this point.

(The estimate referred to follows:)

Management and investigations of resources, 1964

Appropriation to date	$17,832,900
Obligations to Oct. 31, 1963	$7,550,572
Expenditures to Oct. 31, 1963	$5,941,584
Request	$100,000
Employment:	
Average number, current appropriation	1,053
Number involved this estimate	5

PURPOSE AND NEED FOR SUPPLEMENTAL FUNDS

The $100,000 is needed to expand, to the level required by existing conditions, research on the effects of pesticides on commercial marine species and other organisms important to the food chain of these species. Funds now available to the Bureau could not be diverted for the pesticide program without detriment to the programs for which the funds were appropriated.

JUSTIFICATION

[In thousands of dollars]

Activity and subactivity	Presently available, 1964	Revised estimate, 1964	Increase
Research:			
Coastal and offshore research	$8,742,100	$8,842,100	$100,000
Other	967,000	967,000	
Activity total	9,709,100	9,809,100	100,000
Other activities	8,116,600	8,116,600	
Total obligations	17,825,700	17,925,700	100,000

NEED FOR INCREASE

An additional $100,000 is needed to expand, to the level required by existing conditions, research by the Bureau of Commercial Fisheries on the effect of pesticides on commercial marine species and other organisms important to the food chain of these species. Under the act of August 1, 1958 (85 Stat. 582), as amended by the act of September 16, 1959 (86 Stat. 279), the Bureau has responsibility for review of pesticide applications, providing advice to the fishing industry and the States on effects of pesticides on fish and shellfish, and rendering advice to the chemical industry on testing activities. These responsibilities cannot be met adequately without increased knowledge. This knowledge is presently lacking and cannot be obtained without significantly expanded research.

The widespread use of broad spectrum chemicals to control pests has had detrimental effects on fish and shellfish. Studies conducted to date have determined the concentration causing both acute and chronic toxicity of a number of common pesticides and have demonstrated the sensitivity of marine species to these chemicals. Information is needed especially on pesticide effects on larval and juvenile shrimp, menhaden, salmon, oysters, and other species, and the possible contamination of oceanic food fish. The screening program, to assess the importance of the increasing array of new chemicals being developed and to find less toxic formulations, must be strengthened.

Publication of the book, "Silent Spring" by Rachel Carson has increased public awareness of the dangers to fish and wildlife from indiscriminate use of pesticides. The administration's concern over the situation is reflected in the report prepared by the President's Science Advisory Committee, "Use of Pesticides," released May 15, 1963. This report points out the serious effects of pesticides on organisms such as shrimp, oysters, and salmon, which support commercial fisheries. The report also urges that research and evaluation programs be expanded immediately to counteract the disastrous effects on the fish and wildlife as well as on the health of the Nation's population and the economic aspects of the essential commercial fishing industry.

An increase of $87,600 was requested for Bureau pesticides programs for the fiscal year 1964 to meet program needs as foreseen at that time. That increase was provided. However, an analysis of the "Use of Pesticides" report indicates clearly the need for acceleration of the pesticides programs at a more rapid rate than that possible with available funds. It is evident now that the Bureau cannot, with financing at the present level, accumulate required knowledge rapidly enough to keep pace with the increased public concern over the adverse effects of pesticides, in view of the many compounds already in use and the number of new chemicals being registered.

Concentrations of dangerous chemicals are constantly building up in marine organisms including food fish. Any delay in expanding our pesticides research programs would mean lost ground that can never be regained. It is imperative, therefore, that additional effort in this field be undertaken immediately.

PLAN OF WORK

Expand field studies of the effects of pesticides on marine species under natural conditions by collection of samples of water and animals from several estuaries, bays, and inshore areas throughout the country. Undertake broad studies with other Federal, State, and private agencies of the variations

in toxicity of pesticidal compounds under diverse conditions of climate and terrain. Contract the development of analytical techniques of acute sensitivity to determine residues in living tissues, water and soil with suitable agencies with special competance in this area. Increase laboratory screening programs to speed up the bioassay of new pesticides and to advise pesticide users of better and more specific compounds.

Program and financing

	Presently available, 1964	Revised estimate, 1964	Increase
Program by activities:			
1. Management	$390,700	$390,700	
2. Marketing and technology	4,097,500	4,097,500	
3. Research	9,709,100	9,809,100	$100,000

REQUESTED BUDGET INCREASE

Chairman HAYDEN. Would you please inform the committee of the type of work which you plan to do with the $600,000 increase over the appropriation for fiscal year 1964, indicating wherein it differs from your present program?

Mr. MCKERNAN. Mr. Chairman, the increase this year would be $530,000, and the total program level in 1965 would be at $720,000. Now, the pesticides research program as it affects the fishery resources really started in Alaska where, of course, it is necessary to use pesticides to preserve some of our forests in this area.

These pesticides do get into the water and might be carried by some of the fish, such as the salmon. They could be carried out when

they are young and back as they are adults. We need to know whether this actually does occur.

We are doing this to reduce the potential hazards and are working with agencies such as the Public Health Service to make sure there is no danger to people.

Pesticides in the Gulf Coast Area

Now, in the Gulf Coast area where perhaps the potential hazard to fishery resources is the greatest, as I mentioned in answer to Senator Young's question a little while ago, we find in the laboratory that some of these pesticides in very low concentrations, just a few parts per billion, kill the larval and post-larval stages of some of our most important commercial species, such as oysters, menhaden, and shrimp—the very valuable resources of the gulf and South Atlantic.

What we are attempting to do is to learn how the fishery resources can survive in the face of the need to use pesticides to protect our great agricultural industry. We are cooperating with the Department of Agriculture fully and I am optimistic about the future.

Chairman Hayden. Will all of the $190,000 appropriated last year be expended?

Mr. McKernan. Yes; it will.

Chairman Hayden. How many personnel do you have on this work now and how many more do you propose to employ?

Mr. McKernan. May we submit that for the record, Mr. Chairman?

Chairman Hayden. That will be all right.

(The information referred to follows:)

Employment for Pesticides Research Program

There are 15 permanent positions attached to the Bureau's pesticides research program for which funds have been appropriated for the fiscal year 1964. The proposed expansion of this program in fiscal year 1964 and in fiscal year 1965 will not require an increase in the number of budgeted permanent positions. An increase in seasonal employment equivalent to 5 man-years would be required for the expanded program proposed in the supplemental budget estimate for fiscal year 1964. No increase above that would be required for the fiscal year 1965 program.

Chairman Hayden. Will you be able to secure fully qualified personnel to fill all these positions?

Mr. McKernan. Yes, Mr. Chairman. We have been working on this problem with the Federal Council for Science and Technology, and other agencies, and are stimulating the interest of young people in colleges to specialize in marine sciences and these particular disciplines.

Coordination With Other Federal Agencies

Chairman Hayden. Other agencies are also involved in the pesticide research program. How and to what extent do you coordinate your activities with these other agencies?

Mr. McKernan. In this matter of training, we are working through the Interagency Committee on Oceanography and have what we call a Manpower Committee which looks at technical manpower needs in ocean sciences; the National Science Foundation; the Navy; the Atomic Energy Commission; the Smithsonian; practically all agencies in Government carrying out work in marine sciences are involved.

The program is coordinated with these agencies, Mr. Chairman, through a Pesticide Control Board and the Federal Council of Science and Technology. Programs are planned and initiated accordingly.

Menhaden Research

Chairman Hayden. Last year Congress added $125,000 to your budget to provide for biological studies of menhaden in the Gulf of Mexico. Will you please advise the committee regarding the success you have had with this fund?

Mr. McKernan. Yes, Mr. Chairman. We have this program well underway now. The menhaden fishery in the Gulf is becoming a major fishery. In fact, this year, for the first time, more menhaden were taken from the Gulf of Mexico than along the Atlantic coast.

We, of course, are concerned that these resources do not become overfished. We have had no research done on this before and these funds have provided a good start for us to study the biology and the dynamics of these particular resources to make certain that our fisheries are maintained at the very maximum level of productivity.

Red Tide Research

Chairman Hayden. Also, last year $60,000 was added to study means of controlling the red tide phenomenon. What have been your results from these studies?

Mr. McKernan. Mr. Chairman, we have been working with scientists in the universities and on our own, and in this regard we are attempting to find a pracitcal means of controlling the bloom of species of the phytoplankton which causes the red tide and kills the fish.

We have studied this to the point where we feel we must carry out research to find a practical means of controlling this. One possible method is chemical control.

We feel that there is something in the water, perhaps one of the dissolved nutrients, causing these conditions. This is what we are trying to find out.

Chairman Hayden. Something is happening. You do not know what it is and you are going to try to find out?

Mr. McKernan. Yes, and try to find out a way to control it, because there is a tremendous investment in recreational facilities in this part of Florida.

Oyster Research

Chairman Hayden. $100,000 was added to the bill on the floor of the Senate to promote production of oysters by the propagation of disease resistant strains in accordance with Public Law 87–580. Would you describe for the committee the use made of this fund and indicate the results obtained?

Mr. McKernan. Yes, Mr. Chairman. We have been working with the States of Delaware, Maryland, New Jersey, and Virginia in this regard. We have contracted with Rutgers University, the University of Delaware, the University of Maryland, and the Virginia Institute of Marine science.

This is a State-contributing program. The States are contributing one-third of the total funds, and we are hopeful that this particular program will provide the basis for disease-resistant oysters.

DISEASE DEVELOPED IN DELAWARE BAY

Now, you may remember, Mr. Chairman, that this was a new disease that had developed in Delaware Bay. This particular disease is being studied by a number of scientists on the east coast.

Our problem with this $100,000 was to attempt to develop a disease-resistant strain, just like we have in cattle, and in wheat, and in other areas. We have not succeeded yet, but these particular funds were helpful in getting this started and getting State participation in this particular program in the States that are affected.

Senator MUNDT. Did you mention something about Delaware in this, because Senator Boggs has been very much interested in this and I believe it was his amendment that got the money.

Mr. MCKERNAN. Yes, sir.

Senator MUNDT. Is there a contract with some organization?

Mr. MCKERNAN. Yes, the University of Delaware. That is the organization that was chosen by the State to carry out this program and we are working very closely with them.

SURF CLAM RESEARCH

Chairman HAYDEN. Each of the Senators from New Jersey has written to the committee urging that additional funds be provided to enlarge your research program on the sea clams. I believe that your 1965 budget proposes $30,000 for this purpose. The Senators suggest a 3-year program at a total cost of $680,000. Of this amount $230,000 would be required for the first year's work. I presume that this would be inclusive of the amount budgeted.

Would you please comment on the need for such a survey, indicating the situation which gives rise to this need?

MID-ATLANTIC AREA SURVEY

Mr. MCKERNAN. The $230,000 does not include what we have in our budget. We are aware of the interest of many of the people in the mid-Atlantic area to carry out the intensive study on surf clam research. The Atlantic coast surf clam fishery currently produces about $10 million worth of clams at the wholesale level. This is a new fishery, having developed, really, in the last 20 years, and in the past 10 years has increased several fold. It has become a very large fishery and quite an important one.

Unfortunately, there has been very little research done on this clam, because it is taken at some depth, and because the fishery is such a new one. In fact, the fishery is now operating as deep as 20 or 25 fathoms of water. This is about 120 or 150 feet. They are taken by jet dredges and the difficulty is that the Federal Government and the commercial fishermen are concerned lest this type of fishing deplete the beds.

BIOLOGICAL STUDIES

The work suggested by the people in the area would start with biological studies on the surf clam to see what needs to be done in the way of regulation or new gear or more intensive farming of this area to protect the future of these resources.

Now, we have put a small amount of money on surf clam studies. In fact, what we did was complete some other studies and transfer a small amount to this, I believe, $30,000.

Chairman HAYDEN. Do you have any idea of the value of the clams now taken?

Mr. MCKERNAN. Yes. About a total of $10 million a year is the value of this particular sea clam fishery. In my view, there are many more resources of sea clams of the mid-Atlantic coast which we do not know about yet.

Senator MUNDT. In an industry as large as that, are they doing anything in a financial way to make these studies independently or to offer to cooperate with the Federal Government on a matching basis to explore it?

COOPERATION WITH PRIVATE INDUSTRY

Mr. MCKERNAN. This is a very good point, Senator Mundt, and the fact is that the industry has cooperated with us to a considerable degree. At the present time they are putting more money into it than the Federal Government. I would anticipate that they would continue to cooperate.

They have furnished vessels and they have actually furnished money. In fact, they are contributing somewhere in the neighborhood of $25,000, as I recall it, at the present time. I am pulling these figures out of my head, and I might be a little bit off. But this is the general order.

So here we have an industry that is willing to cooperate and furnish not only equipment, but also directly funds. And I would anticipate, having had conferences with these people, that they would continue to cooperate in this way in any new programs.

Senator MUNDT. Is this fishery devoted solely and exclusively to clams of this type, or is this a general fishery operation?

Mr. MCKERNAN. No. There are apparently somewhere in the neighborhood as I remember about 40 or 50 vessels devoted to this particular fishery. They have hydraulic equipment, and there are somewhere in the neighborhood of 300 clam fishermen and about 1,700 people involved in processing these particular clams.

The clams go into the manufacture of such things as clam chowders, the fried clams that are showing up in restaurants, such as Howard Johnsons and other places and are becoming a very valuable resource.

Chairman HAYDEN. Can you economically use the sum proposed for the first year's research?

Mr. MCKERNAN. Yes, Mr. Chairman, we can.

Chairman HAYDEN. I will include in the record the Senators' letters and the attachments to each of them.

(The letters and other matter referred to follow:)

U.S. SENATE,
Washington, D.C., February 26 1964.

Hon. CARL HAYDEN,
Chairman, Subcommittee on Department of the Interior and Related Agencies, Senate Appropriations Committee, Washington, D.C.

DEAR MR. CHAIRMAN: The eastern sea clam industry now faces a serious threat of depletion of clam beds which could cripple the industry within a few years. I believe the Federal Government should undertake without delay a broadened program of research to assist in this matter.

The Bureau of Commercial Fisheries is already engaged in a small-scale research effort along these lines, and the proposed budget for fiscal 1965 provides

$30,000 for this purpose. The industry has also undertaken a complementary effort on its own initiative. But the situation has become so potentially serious that a greatly intensified research program is essential. Particularly needed are (1) improved knowledge about repopulating depleted clam beds; (2) discovery of additional clam beds; and (3) development of more efficient dredges and other gear.

The sea clam, also known as the surf clam or skimmer, is the basis of an industry which has gained important commercial significance in recent years. This large white clam, which grows up to about 7 inches, now serves as the primary source of supply for minced clams, frying clams, and clam chowder. The chief known beds of these clams, now rapidly being depleted, are located at sea some 15 to 25 miles southeast of Point Pleasant, N.J., the home port for much of the clam fishing fleet.

Some 30 million pounds of raw clam meat are produced annually in this industry, with more than 2,000 fishermen and processing plant employees located in the States of Maine, Massachusetts, New York, New Jersey, and Delaware.

The Bureau of Commercial Fisheries, in cooperation with the Eastern Sea Clam Committee of the Oyster Institute, has recently completed preparation of a "Surf Clam Research Proposal," a copy of which I am enclosing. I am also enclosing more detailed figures on the proposed program, together with an "object classification" of the proposal, both of which were prepared by the Bureau of Commercial Fisheries.

Unfortunately, the program was drawn up too late for inclusion in the 1965 budget at the time of its submission. It is my hope, however, that because of the worsening of the situation, the subcommittee will act to provide the Bureau of Commercial Fisheries an additional $230,000 for sea clam research in fiscal year 1965. Departmental witnesses scheduled for the February 27 hearing of the subcommittee will, I am sure, be able to discuss the program in detail and answer any questions the subcommittee may have.

May I request that this letter, together with its enclosures, be made a part of the subcommittee's hearings record.

Sincerely,

CLIFFORD P. CASE, *U.S. Senator.*

Enclosures.

Surf clam research program

Biological research:	
1. Studies of reproduction, growth, and life history of surf clam	$45,000
(*a*) Reproductive cycle	20,000
(*b*) Growth rates and relative abundance of year classes in different areas	25,000

I. BACKGROUND INFORMATION

Introduction

The Atlantic coast surf-clam fishery currently produces approximately 30 million pounds of raw clam meats per year. The production approximately equals the total landed weight of whole lobsters. The fishery is a relatively new one, having been developed during the last two decades. The catch reached 1 million pounds for the first time in 1944 and totaled 11 million pounds in 1954 and 30 million in 1962. The fishery was originally a bait fishery, but has now achieved national importance as a primary source of supply for minced, chowder, and frying clams.

Occurrence

Surf clams are known to occur in coastal waters from Newfoundland to the Gulf of Mexico. Locally, fishermen and trawlers occasionally catch clams or empty shells on various parts of Georges Bank in depths as great as 200 feet. Populations of sufficient density to support commercial fishing activities, however, have been located only along the shores of Long Island, N.Y., and off New Jersey. The dense beds apparently have rather clearly defined and abrupt margins corresponding to physical features of the bottom, such as sand bars or sand ridges. Fishing observations indicate that individual beds or "colonies" are predominantly of one size, suggesting that each colony may be the result of a single spawning that occurred during a period of favorable physical and chemical conditions.

Fishing areas

The surf-clam fishery for food, as distinguished from the bait fishery which for many years was an important source of bait to cod fishermen and the party boat fishermen, first developed in the New York coastal area during World War II. It soon spread to more productive beds off the New Jersey coast. Landings were made at various ports along the coasts of New Jersey, Delaware, and Maryland. In 1950, a plant for processing surf clams was opened in Wildwood, N.J., and the New Jersey-Delaware coasts became the center of the fishery. Today, owing to the presence of readily accessible beds of clams nearby, most of the fishing fleet operates out of Point Pleasant, N.J., and most New Jersey landings are made in that port.

Fishing is conducted in an area approximately 15 to 25 miles southeast of Point Pleasant. The more productive clam beds now fished are in depths ranging from 60 to 90 feet. Some fishing is done in depths to 120 feet. Vessels make individual 1-day trips and usually fish 4 days a week. The daily catch is either shucked and shipped by truck as fresh clams to other plants for further processing or shipped whole as shell stock.

Vessels and gear

There are about 30 vessels engaged in the New Jersey surf-claim fishery. These range in length from 65 to 90 feet, are diesel powered, and are mostly of Florida shrimp boat design. An average crew consists of the captain and two fishermen. Vessels are pilothouse controlled and rigged with a special towing bit and steel outrigger boom for retrieving fishing gear.

The fishing gear consists primarily of a sled dredge, a centrifugal pump, and a 5-inch (internal diameter) hose. The hose is permanently attached to the

dredge during fishing operations. Sea water is pumped under pressure through a series of nozzles into the ocean floor. By proper direction of the nozzles, the hydraulic action of the water washes the sand from over and around the clams. This action allows the deep-set knife blade to pass under the clams and lift them from the bottom so that they pass back into the sled section.

Surf clams, because of their size, relatively thin shells, and ability to bed in hard, coarse-grained sand, present a problem in dredging. The nonhydraulic dredges, used in the hard clam (*Venus mercenaria*) fishery of southern New England, tend to crush the surf clams when forcing them from the bottom. The high-pressure jet clam dredge was therefore developed specifically for harvesting surf clams.

II. INDUSTRY PROBLEMS

Problem A: Depletion of existing beds

The demand for surf-clam meats has grown continually since inception of the food fishery and consequent fishing intensity has increased accordingly. The nature of the fishery is such that productive beds are rapidly fished down to a point where they no longer support profitable fishing. When a new bed of clams is found, several boats characteristically "go to work on it" until production of good marketable clams decline to the point of uneconomic fishing. Heavy exploitation of a species which is slow growing and has a low replacement rate can result in rapid depletion. This process may be occurring with surf clams. Practically nothing is known of the rate of repopulation of depleted areas. In fact, there is some evidence that there may be a number of successive years in which no appreciable recruitment has occurred. Knowledge is required on the life-span of surf clams, the age when they first enter the commercial fishery, the ages that are important to the fishery, the annual rate of recruitment, and the growth rate before and during their period of economic importance.

Problem B: Lack of knowledge about abundance and distribution

Since the landed value of raw surf clam meats is relatively low ($0.06 per pound in 1961) as is the wholesale market value of processed meats ($0.25 to $0.35 per pound), clam fishing must be carried out at peak efficiency and is dependent on the continued availability of large clams in heavily populated, easily accessible beds. Therefore, the abundance and distribution of stocks, as well as the effects of fishing on abundance and on the clam stocks must be fully understood. Means must also be found to detect and evaluate significant changes in abundance and to estimate the reproductive capacity and sustained yield of clam stocks. The limited exploratory fishing that working fishermen can afford to do has not been sufficient to locate new areas to support the fishery in the future. Within 1 or 2 years, the supply on known grounds and potentially productive areas will likely be exhausted. At this point, the surf clam fishery, which has been vital, growing, and prosperous to date, will inevitably go into decline unless additional clam populations can be found.

Problem C: Need for more efficient gear

Current commercial fishing gear can be fished to approximately the 100-foot depth. Fishing and sampling results, however, indicate that the resource likely extends beyond this. Developmental work is needed to extend the depth range of the fishing gear to the maximum depth of the clam resource. Moreover, while the commercial jet dredge produces well on heavy, dense clam beds, there are other areas apparently of much greater extent that produce clams at a lower catch rate. These areas may be the future fishing grounds of the surf clam fishery. More efficient equipment capable of covering more ground in a fishing day will be required to harvest the more sparsely populated grounds.

Developmental work is also needed on sampling equipment for survey work. Operations with standard commercial fishing gear are effective but time consuming. Considerable developmental work is needed on sea-sampling methods to allow rapid progress in survey work.

III. PLAN OF ATTACK

A survey and exploration of all possible surf-clam-producing areas is required as a first step in the solution of the problems of the surf clam industry. Such a survey is needed to completely delineate the surf-clam resource available for current use and for future expansion. Two limited short-term surveys

have been made in the past. One was conducted by the U.S. Bureau of Commercial Fisheries in Nantucket Sound in 1958. The second, financed largely by contributions from fishermen, was conducted by the Bureau in the summer of 1963, adjacent to some of the current fishing areas. These limited surveys made it possible to develop basic surf clam study methods and procedures and made the more complete and needed survey work technically possible.

Solution to problem A: Depletion of existing beds

The surf-clam fishery usually depends on an accumulation of year classes, but the relative contribution of each is important in determining the total "standing crop" of commercial sizes in any given year. Also, long-term changes in proportions of different ages in fished stocks should provide clues to the intensity of fishing effort that the stocks can tolerate. For these reasons, it is important to know the ages and relative proportions of each age group in the fished stocks. Yearly surveys of age structures of clam stocks in various areas should be initiated and combined with an assesment of the success of each new year class.

An important aspect of this work involves repopulation studies of areas depleted by the fishery. This should involve a comparison of virgin, fished, and depleted areas, and should determine the rate of recruitment and the number of years it takes for stocks of depleted beds to return to commercial levels of abundance.

While most immediate studies are directed toward assessing survival, long-term studies of factors that affect survival are important. The role of such factors as predation and disease should be examined.

In summary, the following basic biological studies of the surf clam should be started quickly and simultaneously with work on problems B and C: (1) the annual reproductive cycle of surf clams in different areas should be studied to determine the frequency, duration, and times of spawning: (2) determination should be made of geographic variations in spawning time and frequency: (3) the size and age at which surf clams reach sexual maturity in the area of commercial importance must be determined.

Solution to problem B: Source of supply

In order to alleviate or avoid the impending crisis and to provide adequate knowledge of the extent of the resource upon which it depends, a comprehensive exploratory fishing program to assess the occurrence, abundance, and commercial potential of the surf clam in the waters off the North Atlantic coast is required and could be implemented in the following manner:

A sturdy, seaworthy fishing vessel of 65 to 85 feet overall length (50 to 75 tons displacement) should be made available for the sea operations. This vessel would be equipped with the most efficient and effective jet-dredge equipment available. A grid pattern of 1-mile-spaced coordinates based on the loran navigation system would be laid out over areas of survey. Fishing tows would be made at the intersections of the 1-mile coordinate lines. As the survey proceeds, additional sampling devices which might be more efficient and so result in accelerated coverages of survey area would be evaluated. Possible auxiliary devices and systems that might be of particular use are:

1. Underwater television to allow observation and photographic recording of clam beds and the operation of sampling gear.
2. A clam sounder equipped with special underwater hydraphones and submarine-type, electrical-conductor cable.
3. A large clamshell bucket-type dredge to take a standard size sample of the sea bottom and its inhabitants.

Areas showing best potential would be fished intensively with the jet-dredge gear to provide definite commercial evaluation of the available resource. As the survey proceeds, special attention would be given to the depth range of the surf clam and the black quahog. When the depth ranges have been definitely established, survey operations would be restricted to those depths, resulting in more rapid and intensive coverage of the areas of potential value.

Operations would be started off the New Jersey-Delaware coasts adjacent to the present active commercial fishery. Areas south of this and then to the northward of it would be explored in succession. Finally, more distant offshore

banks would be investigated. The general order of succession of these areas is as follows:

1. New Jersey coastal waters offshore from existing fishery to the maximum depth range of exploitable populations.
2. Delaware coastal and adjacent waters.
3. Maryland coastal and adjacent waters.
4. Virginia coastal and adjacent waters.
5. Long Island, N.Y.
6. Long Island to Cape Cod.
7. North Cape Cod to Cape Ann.
8. Cape Ann to Portland, Maine.
9. Georges Bank and Gulf of Maine Banks.

Solution to problem C: Development of more efficient gear

A gear-development program should be prosecuted simultaneously with the exploratory fishing program. Such investigations would include the use of a submersible electrically driven pump to supply the dredge water jets; possible application of an airlift system to allow continuous transfer of clams from the dredge to the vessel deck; an automatic shell separator to remove the dead shell stock from the catches; and an investigation of the possibility of landing the dead shell stock ashore at a financial gain.

IV. Proposed annual budget

	1st year	2d year	3d year
Biological studies of surf clam, life history, and population dynamics	$100,000	$100,000	$100,000
Exploratory fishing studies of surf clam distribution and abundance	75,000	80,000	85,000
Development of more effective gear	55,000	50,000	35,000
Total	230,000	230,000	220,000

U.S. SENATE,
COMMITTEE ON LABOR AND PUBLIC WELFARE,
February 24, 1964.

Hon. CARL HAYDEN,
Chairman, Interior Appropriations Subcommittee,
U.S. Senate, Washington, D.C.

DEAR MR. CHAIRMAN: I am attaching for your subcommittee's information a copy of a letter from Mr. William J. Kleb concerning the need for a 3-year surf clam survey and research program. I believe a substantial case was made for such a program at hearings before the House Merchant Marine and Fisheries Committee last October, so I urge the subcommittee's approval of the necessary funds in the fiscal year 1965 budget.

With best personal regards,
Sincerely,

HARRISON A. WILLIAMS, Jr.

F. H. SNOW CANNING CO.,
Wildwood, N.J., February 12, 1964.

Hon. HARRISON A. WILLIAMS, Jr.,
U.S. Senate, Washington, D.C.

DEAR SENATOR WILLIAMS: On February 27, 1964, there will be an amendment made to the fisheries appropriations to cover a 3-year ocean survey and research for the surf clam industry. This industry represents $25 million in trade per year. Our raw clam supply is being depleted along the eastern seaboard and we have asked the Fisheries Subcommittee to hear our case for Government assistance. The dates of this hearing were October 2 and 3, 1963.

Sir, this industry is located in the State of New Jersey, approximately three-quarters of the companies involved having plants, boats, and labor all from New Jersey. The passage of this fisheries appropriations to include our portion would keep our plants located where they are, and no matter where the Government may find new beds or areas of clams, they can be trucked or shipped to our existing plants.

We hope you will investigate and help in all ways to have this appropriation go through.

Very respectfully yours,

WILLIAM J. KLEB, *General Manager.*

FISH MIGRATION OVER DAMS

Chairman HAYDEN. Last year you stated that the last remaining problem on research on fish migration over dams was that of successfully passing fish up over the high dams and getting the young fish over them on their way back down to the ocean. I assume that this will be the major expense in the coming fiscal year. I note, however, that the $1,407,000 which you request is a decrease of $89,700 from the amount appropriated for you last year. Your justifications state that it will be necessary to defer some projects to a subsequent fiscal year. Which projects will be deferred?

Mr. MCKERNAN. What we will do is defer some projects dealing with upstream migration of adult salmon. We are a little bit further ahead on this particular phase of the work than we are on the downstream phases.

COLUMBIA RIVER FISHERY DEVELOPMENT PROGRAM

Some time ago, Mr. Chairman, about 3 years ago, we stopped any further expansion of the Columbia River fishery development program. This is a program in which we are attempting to mitigate losses of fish resulting from Federal water development projects in the Columbia River. We contributed, at least the Federal Government as a whole did, to some 21 new or rehabilitated hatcheries in this area. Well, the real question was whether they were producing adult fish economically.

EVALUATING THE PROGRAM

So, working with the Bureau of Sport Fisheries and Wildlife, we started to evaluate this particular program. We have marked each year in the neighborhood of 7 to 10 million young salmon at the hatcheries prior to their release for migration to the sea. Now we do not have the money necessary to evaluate the results of these marking experiments.

By clipping certain fins we have a distinctive mark for identifying these fish in order to study their survival. If we find hatcheries not producing economically, then we can look at that particular hatchery and find out why and correct the deficiency or do more drastic things, if necessary.

It is necessary that we protect the initial investment of the Federal Government. Because of limitations of budget, we have proposed a reduction of $100,000 from the fish migration study for use in the evaluation study. Since the two programs are in different parts of the budget structure, it appears as an increase in the Columbia River fishery facilities—the operation and maintenance of the Columbia River fishery development program.

FISHING VESSEL MORTGAGE INSURANCE PROGRAM

Chairman HAYDEN. Do you care to comment on the value of the fishing vessel mortgage insurance program for which you request $42,600 in fiscal year 1965?

Mr. MCKERNAN. Yes, Mr. Chairman. I think we have approved, through fiscal year 1963, 23 applications under this mortgage insurance program, and it has been a tremendous help to an industry in need of additional capital. I see that we have approved six additional insurance applications so far this fiscal year and it is anticipated that the amount approved will be $2.2 million at the end of fiscal 1964.

By the end of 1964, we anticipate that we will have approved 40 applications. This has been a helpful program and it has not been costly to the Federal Government. The Federal Government has not suffered because of these mortgage insurance programs.

COLUMBIA RIVER FISHERY DEVELOPMENT PROGRAM

Chairman HAYDEN. Also, the committee would appreciate your comments with regard to the status and success of your program on Columbia River fishery facilities.

Mr. MCKERNAN. I mentioned that very briefly before, Mr. Chairman. The Columbia River fishery resource is a very valuable one, because people, not only of Washington, Idaho, and Oregon, participate in the harvest of this resource from the recreational and commercial standpoint from the mouth of the Columbia River all the way up into Idaho, for that matter. Also these fish are taken from Alaska to San Francisco Bay by the high seas troll fishery.

This particular resource, of course, suffered because of these many, many dams which are blocks to their migration and spawning.

Now, our programs of providing hatcheries and fish ladders as well as stream clearance, where we have cleared out logging debris that has clogged the streams, has been effective in providing new spawning areas.

PROBLEM OF IRRIGATION CANALS

In the past, agricultural interests in the Columbia Basin have gone very heavily into the irrigation of crops. Irrigation canals located on the tributaries of the Columbia River were dead end traps to the young salmon.

We have put in very inexpensive screens in these ditches and diverted the young fish back down the stream again. We have put in about 650 of these and they have been very successful.

EVALUATION OF THE PROGRAM

Right now, Mr. Chairman, we are carrying out what I consider to be a quantitative evaluation of this program. I think next year when I appear before you we will have some concrete numbers.

Chairman HAYDEN. We hope so because there is no more valuable fishery anywhere.

Mr. MCKERNAN. No, sir; it is a wonderful fishery.

SPECIAL FOREIGN CURRENCY PROGRAM

Chairman HAYDEN. You estimate your needs in fiscal year 1965 for the special foreign currency program at $300,000. This is the same

amount as was made available in fiscal year 1964, and the division of it into funds for marketing and technology, and for research, is the same. The justifications will be placed in the record.

(The justification statement referred to follows:)

HIGHLIGHT STATEMENT

The purpose of this program is to complement Bureau research programs for the benefit of the American fishing industry through work performed in foreign countries with surplus foreign currencies. Since the Bureau program began in fiscal year 1962, contracts have been signed with research institutions in India, Pakistan, and Israel.

In technological research, studies are being continued in India by the Council of Scientific and Industrial Research, New Delhi, and are entitled "Investigations on the Influence of Processing Methods and Other Factors on the Edible Quality and Nutritional Value of Fish Protein Concentrate (FPCC)." In fiscal year 1963 the Nutritional Research Laboratories, Indian Council of Medical Research, initiated research entitled "Studies on Nutritive Value of Fish Protein Concentrate." The Hebrew University of Jerusalem is continuing studies entitled "Lipid Metabolism in Fish Muscle." An additional study was entered into in fiscal year 1963 with the Hebrew University of Jerusalem, entitled "Lipoproteins of Fish Tissues." Additional projects for fiscal year 1964 are currently under consideration for inclusion in the Israel and India research programs on fish protein concentrate and lipid chemistry.

In biological research, good progress is being made on four contracts in Israel with the Hebrew University and Sea Fisheries Research Station. A comprehensive report has been received on the contract concerning breeding schemes for the improvement of edible fish. This important scientific document has been made available to laboratories of both Bureaus where research in this field is being carried out for use in furthering their research efforts. The contract to develop a control for external fish parasites achieved success in eliminating parasites on live market-bound fish by use of a chemical compound. Results on the contract dealing with the life history of tuna show the type of food consumed plus information on tuna age and growth. In India, a research contract on the nervous system of fish was signed this year with the University of Delhi, and a contract has been established covering research on lake productivity in Pakistan.

Management and investigations of resources (special foreign currency program)

Appropriation, 1963 (total available)	$300,000
Appropriation, 1964 (total available)	300,000
Budget estimate, 1965	300,000

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964		
		Total appropriation	Transfers	Amount available
1. Marketing and technology	$125,000	$125,000	----------	$125,000
2. Research	175,000	175,000	----------	175,000
Total	300,000	300,000	----------	300,000

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost	Program
1. Marketing and technology	$125,000	$125,000	$125,000	----------	----------	----------
2. Research	175,000	175,000	175,000	----------	----------	----------
Total	300,000	300,000	300,000	----------	----------	----------

A tabulation of the programs to be conducted with the foreign currencies by country follows. Amounts are shown in their U.S. dollar equivalents.

Country	Marketing and technology	Research	Total
India	----------	$55,000	$55,000
Israel	$75,000	80,000	155,000
Pakistan	----------	40,000	40,000
Poland	50,000	----------	50,000
Total	125,000	175,000	300,000

1. Marketing and technology

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost	Program
Technology	$125,000	$125,000	$125,000	----------	----------	----------

Technology.—The estimate of $125,000 is the same as for 1964.

Plan of work.—Technological studies using counterpart funds are being designed to complement similar studies being done in the Bureau's domestic technological laboratories. During the current fiscal year, new contracts will be negotiated in foreign countries in the fields of nutrition as it relates to fishery products and investigations of the fundamental chemical and physical characteristics of fish oil and fish protein. Special emphasis will also be placed on negotiating an agreement with Polish researchers for studies on fisheries refrigeration aboard the vessel and at shore installations. Poland is presently using a number of modern sterntrawling factory ships on which fish are caught, processed, packaged, and frozen. The vessels are far more technically advanced than any similar vessels in the United States. The results of research on improving the techniques of freezing and handling fish at sea, using these modern vessels, will provide technical information badly needed to design and construct similar vessel and shore installations in this country.

2. Research

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost	Program
Coastal and offshore research	$175,000	$175,000	$175,000	----------	----------	----------

Coastal and offshore research.—The estimate of $175,000 is the same as for 1964.

Plan of work.—Research will be continued on the two 3-year projects underway in India with the University of Delhi and Aligarh Muslim University. A number of other contract proposals have been received from India, Israel, and Pakistan. These are in the process of being evaluated by Bureau scientists for possible financing in fiscal year 1965. We find that most of the contract proposals under consideration supplement Bureau programs. These countries assign high-caliber scientists to these contracts.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing: Total obligations	$300,000	$300,000	$300,000	
Appropriation	300,000	300,000	300,000	
Obligations by objects:				
21 Travel and transportation of persons	5,796			
22 Transportation of things	176			
23 Rent, communications, and utilities	5			
25 Other services	288,668	300,000	300,000	
26 Supplies and materials	5,355			
Total obligations	300,000	300,000	300,000	

PAST ACCOMPLISHMENT AND FUTURE PLANS

Chairman HAYDEN. Please comment for the committee on your accomplishments with the funds which have been provided to you in the past year, and relate them to the work which you plan during the coming year.

Mr. MCKERNAN. Yes, Mr. Chairman. We have contracts with educational institutions in India, Pakistan, and Israel. In Israel, for example, for the fat metabolism in fish muscle, and for the genetic breeding of fish. This latter contract I just mentioned has produced some very interesting results.

BREEDING OF FISH

As you know, Mr. Chairman, we have been experimenting in various parts of the country with this. Perhaps the best known work in the United States on selective breeding of fish stocks has been done by Professor Donaldson at the University of Washington.

These scientists in Israel are carrying on this work and developing certain concepts and certain principles for producing a superior brood stock of fish which we believe will complement very well our programs here in the United States.

We are having some difficulties in some countries, because of negotiation delays and other matters, but, on the whole, this program has been successful, although not as successful as I would have liked. It has produced both in the technological and biological research some new data and information which I believe will be of value to the American fishing industry when it is applied.

Chairman HAYDEN. At least to the extent of the value of the foreign currency?

Mr. MCKERNAN. I think even more so, Mr. Chairman.

Senator MUNDT. Are there any dollar amounts involved in this?

Mr. MCKERNAN. These are all Public Law 480 funds.

REQUEST FOR ADDITIONAL TIME FOR CONTRACT NEGOTIATION

Chairman HAYDEN. You are proposing a difference in the appropriation language. Please explain to the committee why you feel that the language used in prior years is not sufficient for your purposes.

Mr. MCKERNAN. We propose an appropriation language change to make the funds available until expended, Mr. Chairman, in order to give us a little more time to negotiate the contracts. We have had difficulty in this respect.

Mr. Chairman, if my information is correct, practically all other agencies do have these funds on a no-year basis.

CONSTRUCTION

Chairman HAYDEN. There will be placed in the record the justifications for the proposed appropriation of $4,788,000 for construction. This amounts to an increase of $388,000 over the amount appropriated in fiscal year 1964.

(The justification statement referred to follows:)

Construction

Appropriation, 1964	$4,450,000
Unobligated balance from prior years	4,164,125
Total available for obligation	8,614,125
Decreases (1964):	
Fishery facilities	7,281,165
Columbia River fishery facilities	1,332,960
Subtotal	8,614,125
Increases (1965):	
Fishery facilities	4,200,000
Columbia River fishery facilities	588,000
Total available for obligation	4,788,000
Budget estimate 1965	4,788,000

Analysis by activities

Activity	Amount available fiscal year 1964	Fiscal year 1965			Total available 1965 compared to total available 1964
		Unobligated balances from prior years	Budget estimate	Estimated total available	
1. Fishery facilities	$7,281,165		$4,200,000	$4,200,000	−$3,081,165
2. Columbia River fishery facilities	1,332,960		588,000	588,000	−744,960
Total obligations	8,614,125		4,788,000	4,788,000	−3,826,125

GENERAL STATEMENT REGARDING CONSTRUCTION

All construction items proposed for fiscal year 1965, other than those under the Columbia River facilities activity, are part of the national oceanography program recommended by the Interagency Committee on Oceanography to and approved by the Federal Council for Science and Technology.

The Public Buildings Act of 1959, Public Law 86–249, provides generally that public buildings shall be constructed by the Administrator of General Services. Section 13 of the act excludes from the definition of "public buildings" any

buildings or construction projects "on lands used in connection with Federal programs for * * * conservation purposes, including research in connection therewith." The funds requested herein for construction are required for research on the conservation of fishery resources and, in the opinion of this Bureau, are not required to be included in appropriations of the General Services Administration or to be constructed by the Administrator of General Services.

Funds requested for fiscal year 1965 construction projects will not require any increase in Bureau employment over that authorized for fiscal year 1964.

The estimate in the amount of $4,788,000 for fiscal year 1965 includes $4,200,000 for the fishery facilities activity and $588,000 for the Columbia River Fishery Facilities activity.

FISHERY FACILITIES—$4,200,000

(*a*) Construction of a Shellfisheries Research Center at Milford, Conn	$1,000,000
(*b*) Construction of a Biological Research Laboratory for the tropical Atlantic area	1,500,000
(*c*) Construction of an exploratory fishing vessel as a replacement for the *Oregon* (1st phase)	1,350,000
(*d*) Equipment for fishery research vessel for use in the North Pacific and Bering Sea	350,000
Total	4,200,000

(*a*) *Construction of a Shellfisheries Research Center at Milford, Conn., $1,000,000.*—Construction of this facility was authorized by the act approved August 30, 1961 (Public Law 87–173) at a cost of not to exceed $1,325,000. The Department of the Interior and Related Agencies Appropriation Act, 1963, included $160,000, for the purchase of land and land filling to initiate construction. An additional $70,000 was appropriated in the fiscal year 1964 for design of this facility. Work in connection with the acquisition of land for the project has been completed and title to the land is vested in the United States. The contract for architectural-engineering services for the facility provides for completion of design by May 1964. Land filling operations will be started shortly after the design work is completed. The funds requested will provide for construction of the laboratory building, sea water system, outdoor tanks and ponds and service facilities. The balance of the amount authorized for the facility—$95,000—will be required in fiscal year 1966 for the purchase of scientific and other nonfixed equipment needed for maximum utilization of the laboratory.

The research center will be used for the conduct of basic research on the physiology and ecology of commercial shellfish, the development of hatchery methods for cultivation of mollusks, including the development of principles that can be applied to the use of artificial and natural salt water ponds for shellfish culture.

Development of techniques in recent years for artificially spawning and rearing oysters and clams has opened numerous possibilities for more productive research toward solving many important industry problems Such methods as artificially producing seed, selective breeding for desirable characteristics, and chemical control of predators now appear possible. Much of the research has been accomplished with small numbers of shellfish in the laboratory; however, it is important to note that seed production and selective breeding will require the growing of large numbers of bivalves under controlled conditions for considerable periods of time. Present facilities are inadequate to allow suitable development of the techniques that will be of material aid to the industry.

In carrying out this work, special facilities and equipment needed will include an extensive sea water system consisting of storage and settling tanks, filtering and ultraviolet treatment equipment, a heating system, and nontoxic piping and pumps.

Special constant temperature rooms are needed for raising shellfish food and for controlled experiments. Also, special sterilization equipment will be required for growing the food algae.

Expansion of our Milford facility will provide space and equipment for raising and holding large numbers of shellfish. It will also enable the Bureau to conduct pilot-plant studies of the commercial possibilities of desirable shellfish hatchery procedures as well as the training of personnel from industry and State conservation agencies in the use of these methods.

(*b*) *Construction of a Biological Research Laboratory for the tropical Atlantic area, $1,500,000.*—The tropical Atlantic is one of the last remaining ocean areas

with large stocks of undeveloped food resources. The West Coast of Africa, particularly the Gulf of Guinea and waters off the east coast of South America have enormous fishery potentials. A number of foreign countries are exploring and fishing these waters on an ever-increasing scale, and the U.S. fishing industry is also greatly interested in these areas.

In the spring of 1961 the Bureau of Commercial Fisheries proposed to the Interagency Committee on Oceanography (ICO) of the Federal Council for Science and Technology that they sponsor an oceanographic fishery investigation of the tropical Atlantic. The proposal was approved by the ICO and also adopted by the Intergovernmental Oceanographic Commission (IOC). It has now become an international program, with support pledged by several foreign governments and a number of academic oceanographic institutions. The Bureau's part in these international cooperative investigations of the tropical Atlantic will be carried out, initially, by the Biological Laboratory, Washington, D.C. We envision that our Bureau's interests in the tropical Atlantic will extend far beyond these present investigations because of a long-term need to define the resources of the tropical Atlantic and describe their variations in time and space. It is essential, therefore, to establish a land base closer to the area of operations than that at Washington, D.C. The Laboratory will be located in the Miami, Fla., area. A site in Miami has been donated to the Government for construction of the proposed Laboratory.

Sum of $125,000 was appropriated for design of the laboratory in the fiscal year 1964. Preliminary plans have been completed by an architect in Miami. It is expected that final construction plans and specifications will be completed by June 1964.

Preliminary plans call for a three-story concrete building of adjustable module design of about 30,000 square feet. Because of local weather and climate conditions it must necessarily be air conditioned and hurricane proof. The laboratory will initially house a staff of approximately 60 people. The estimate also provides for the demolition and reconstruction and relocation of public facilities.

(c) *Construction of an exploratory fishing vessel as a replacement for the "Oregon" (first phase), $1,350,000.*—In fiscal year 1964, $100,000 was appropriated for the design of a $2 million exploratory fishing vessel to replace the *Oregon*, which now operates in the Gulf of Mexico, Caribbean Sea, and tropical Atlantic areas. A naval-architect-engineering contract has been awarded and design work is scheduled for completion in March 1964.

Funding of the construction of the vessel is planned in two phases, for fiscal year 1965 and 1966. For completion of phase 1 in fiscal year 1965, $1,350,000 would permit the construction of hull and house, installation of the main and auxiliary engines, navigating, safety, and communications equipment. In fiscal year 1966, $650,000 would be necessary to complete the vessel by providing for trawling winches, laboratory, oceanographic, and fish detection equipment, and furnishing and outfitting.

The new vessel will be an essential part of the national oceanographic program. The *Oregon* was built in 1946 for use in commercial fisheries. Its limited range of 4,800 miles, slow speed of 9 knots, and lack of adequate scientific facilities have been a serious handicap in effectively carrying out Bureau exploratory programs, particularly in waters far distant from the Pascagoula, Miss., base of operations. The new vessel is to be about 170 feet in length, will be designed especially for operation in tropical climates and have the following features: (1) Capabilities for an extended cruising range of 9,000 miles; (2) a speed of 14 knots so that time to and from the far-distant portions of the investigation area is held to a minimum, thus allowing maximum working time; (3) sufficient versatility so that adequate assessment of the resources of an area, which is dependent upon sampling that area with a wide array of types of gear, since each type is highly specific in action, can be carried out; (4) sufficiently automated handling and working capability so that the number of operating personnel can be kept to a minimum; and (5) sufficient size and seaworthiness to allow remaining on station in the extremely adverse weather conditions sometimes encountered in tropical waters (hurricanes, water spouts, etc.) and sufficient seaworthiness so that experimental fishing operations can proceed in the face of relatively heavy seas.

The future of the Gulf States fishing industry lies in the location of untapped and entirely new fishery resources in the Gulf of Mexico and adjacent waters. These resources can be defined and their commercial potential ascertained more expeditiously and economically through use of the proposed vessel which would be capable of independent high seas exploratory fishing and gear research opera-

tions. The vessel would be equipped for acoustic and electrical experiments and capable of performing, without major alteration, any and all types of exploratory or experimental fishing operations. The vessel will play an important part in the Bureau's tropical Atlantic oceanography program which is international in scope and requires the utmost skills and equipment.

(d) Equipment for fishery research vessel for use in the North Pacific and Bering Sea, $350,000.—The Department of the Interior and Related Agencies Appropriations Act, 1964, included $2,650,000 for this vessel. The basic concept of the new research vessel for the Seattle Biological Laboratory was a suitable platform for progressive research in the fields of fisheries and oceanography. This vessel completely equipped was estimated to cost over $3 million. An additional $350,000 is therefore, required to equip the vessel with the scientific equipment necessary to perform the research for which it has been designed.

This equipment, its cost, and uses are briefly described below:

1. Research sonar, $165,000: Necessary for the detection of fish and food organisms. This specialized sonar is required both to locate and monitor fish populations and food concentration at sea.

2. Precision navigation equipment, $80,000: This is in addition to normal navigational requirements. It will include high resolution radar, loran C, precision depth recorders, and lesser instruments necessary for precise positioning at sea and for setting out and locating floating scientific instruments.

3. Television vehicle and television, $60,000: This is necessary to seek out and study fish, and their behavior, reactions to gear, and other external influences, and their interrelationships.

4. Scientific equipment, $45,000: This would include electronic test and repair equipment, electric core cables for trawl-sensing equipment, monitoring buoys, and special handling equipment for delicate overside scientific equipment.

Fishery Facilities

The Bureau operates 28 major research laboratories and bases and 24 research vessels over 40 feet in length in discharging its responsibilities for research in marine biology and technology. As a result of steadily increasing responsibilities and expanding programs in the past 15 years many of the shore and vessel facilities have become inadequate. The following reflects the status of program on those projects which have had capital improvements funded beginning with fiscal year 1962:

Alaska

Auke Bay:

1962: Construction of salt water system and dock facilities at the Biological Research Laboratory, $200,000. Construction of these facilities is now underway and it is expected that the work will be completed in April 1964.

Juneau:

1964: Design of exploratory fishing vessel for use in the North Pacific Ocean and Bering Sea, $100,000. A contract has been awarded to a naval architect in Seattle, Wash., and design is scheduled to be completed in October 1964.

1964: Design of an oceanographic research vessel (replacement for the *Mackinaw*), $15,000. A contract has been awarded to a naval architect in Seattle, Wash., and design is scheduled to be completed in July 1964.

California

La Jolla:

1962: Construction of a Biological Research Laboratory, $2,450,000. This building is now under construction by the M. H. Golden Construction Co., of San Diego and is scheduled to be completed in August 1964.

1963: Construction of an oceanographic research vessel (replacement for the *Black Douglas*), $2,500,000. This vessel which will be based in San Diego is now under construction by The Christy Corp., of Sturgeon Bay, Wis., and the contract calls for completion in October 1964.

1964: Construction of unmanned buoys for use in the eastern Pacific Ocean, $50,000. A contract has been awarded to the University of California at San Diego for design and construction of these instruments. The contract provides for completion by November 1964.

Connecticut

Milford:

1963–64: Purchase of land for and design of a Shellfisheries Research Center, $230,000. In fiscal year 1963 $160,000 was appropriated for the purchase of land and for necessary land filling to initiate construction. An additional $70,000 was provided in fiscal year 1964 for design of this laboratory. The land acquisition portion of this project has been completed. Land filling will be deferred pending the completion of design which is now underway by an architectural firm in New Haven, Conn. Preliminary design has been completed and final contract design is scheduled to be completed by May 1964.

Florida

Miami area:

1964: Design of a Biological Research Laboratory for the tropical Atlantic, $125,000. A site has been donated to the Government for construction of the proposed Laboratory. Preliminary plans have been completed by an architect in Miami. It is expected that final construction plans and specifications will be completed by June 1964.

Georgia

St. Simons Island:

1963: Rehabilitation of facilities at St. Simons Island Lighthouse Station, $30,000. Rehabilitation of the office building has been completed. Other work is either underway or will be commenced in the near future and should be completed by September 1964.

Hawaii

Honolulu:

1962: Construction of the *Townsend Cromwell*, an oceanic research vessel for the central Pacific Ocean, $1,775,000. This vessel was built by the McDermott Shipyard, Morgan City, La., and delivered to the Government in November 1963.

Maine

Boothbay Harbor:

1962: Construction of shop-garage building and installation of temperature control equipment at the Biological Research Laboratory, $85,000. The construction of these facilities has been completed.

1964: Design of an oceanographic inshore research vessel for use in the Northwest Atlantic Ocean, $15,000. Proposals from naval architects interested in the design of this vessel are now being evaluated. It is expected that the design contract will be awarded in February 1964, with plans and specifications to be completed by August 1964.

Maryland

Oxford:

1962: Construction of service buildings and other facilities at the Biological Research Laboratory, $170,000. These facilities are now being built by the Evans Construction Co., of Salisbury, Md., and construction is estimated to be completed about March 1964.

Massachusetts

Gloucester:

1962: Construction of an exploratory fishing and gear research vessel for use in the Northwest Atlantic Ocean (replacement for the *Delaware*), $1,250,000. Design of the vessel was delayed in order to make a thorough review of stern-ramp trawlers recently built in Europe so as to incorporate the most modern features in this prototype vessel. The Bureau has issued a bid invitation for construction in accordance with plans and specifications prepared by a naval architect in New York City and it is expected that the construction contract will be awarded in January 1964. The estimated schedule for completion of the vessel is December 1964.

Michigan

Ann Arbor:

1963: Construction of a biological research laboratory, $1,356,000.

1964: Scientific equipment for the biological research laboratory, $90,000. The laboratory building is under construction by Spence Bros. of Saginaw, Mich., and work is expected to be completed by December 1964.

1964: Design of hydrobiological research vessel for use in the Great Lakes, $20,000. Design is being performed by a naval architect in New York City and the plans and specifications are scheduled to be completed by February 1964.

Mississippi

Pascagoula:

1964: Design of an exploratory fishing and gear research vessel (replacement for the *Oregon*), $100,000. This design is being prepared by a naval architect in Pascagoula, Miss., and the plans and specifications are expected to be completed in March 1964.

North Carolina

Beaufort:

1963: Construction of a radiobiological laboratory, $395,000. This building is now under construction by the Fred C. Gardner Co., Inc., of Kinston. N.C., and it is estimated that work will be completed in April 1964.

Texas

Galveston:

1962–64: Construction of an oceanographic research vessel for the Gulf of Mexico, $350,000. The sum of $200,000 was appropriated in fiscal year 1962 for construction of this vessel to be based at Galveston, Tex. When the Bureau attempted to contract for design, competent naval architects advised that any vessel built with the funds available would be totally inadequate for the purposes intended. Compromise attempts to build a vessel that was not equipped with the basic facilities for a well-rounded program of biological research but which could fit the funds available would not assure a reasonable likelihood of success of the specific research tasks outlined for the gulf coast resources. An additional $150,000 was appropriated in fiscal year 1964 for this vessel. Design will be completed by a naval architect in New Orleans, La., about March 1964 and it is expected that construction will be completed about 1 year later.

Washington

Seattle:

1963: Construction of a research laboratory, $2,257,000. This building is now under construction by the John H. Sellen Construction Co., of Seattle. The contract provides for completion in December 1964.

1963–64: Construction of an oceanographic research vessel for use in the North Pacific Ocean and Bering Sea, $2,800,000. Design funds in the amount of $150,000 were provided in fiscal year 1963 and $2,650,000 was appropriated in fiscal year 1964 for construction of this vessel to be based in Seattle. The plans and specifications which are being prepared by a naval architect in Seattle will be completed in February 1964. It is expected that a construction contract will be awarded by April 1964 and that the vessel will be completed by June 1965.

1964: Design of a gear research vessel for use in the North Pacific Ocean, $35,000. Proposals from naval architects interested in the design of this vessel are now being evaluated. It is expected that the design contract will be awarded in January 1964, with the plans and specifications to be completed by October 1964.

COLUMBIA RIVER FISHERY FACILITIES, $588,000

The estimate of $588,000 for the Columbia River fishery facilities activity is a decrease of $400,000 from 1964. Programs conducted under this activity are grouped under five general categories as follows:

	Appropriation, 1964	Estimate, 1965	Increase (+) or decrease (−)
(a) Hatchery facilities	$45,000	$67,000	+$22,000
(b) Operational studies	300,000	300,000	
(c) Screening diversions	75,000	75,000	
(d) Stream improvement	478,000	56,000	−422,000
(e) Program supervision and inspection	90,000	90,000	
Total	988,000	588,000	−400,000

(a) *Hatchery facilities.*—The $67,000 is to provide for replacement of a deteriorating wood stave pipeline at the Big Creek, Oreg., hatchery, with a new conduit. Failure of the existing pipeline would jeopardize the entire hatchery production operation as it carries all of the water supply for the current hatchery operations, including hatching of eggs and rearing of young fish.

(b) *Operational studies.*—The $300,000 is needed for operational studies involving four major areas—predator control, habitat improvement, supplemental methods of propagation, and improvement of fish culture techniques. These studies are designed to provide information necessary to accomplish essential revisions in management procedures in the Columbia River program and to provide answers to difficult problems basic to resource management. Emphasis is being placed on studies and methods to improve the total production of salmon and steelhead at minimum cost.

Seventeen operational studies are to be conducted in fiscal year 1965. Sixteen of these will be conducted under contract by the five State fish and game agencies of Idaho, Oregon, and Washington; and by the Universities of Idaho, Oregon State, and Washington. The Bureau of Sport Fisheries and Wildlife will conduct one study on a reimbursable basis.

Nine studies, totaling $187,000, will be conducted on development of fish cultural techniques. This work includes selective breeding of salmon, development of means of marking young fish for future identification of adults, reintroduction and transplantation of runs, and determination of factors associated with downstream migration of young fish.

One study, for $6,000, will be conducted on improvement of natural habitat. It will be directly concerned with improving streamflow conditions and spawning areas.

Two studies, totaling $33,000, will be conducted on predator control. Both are concerned with reduction of numbers of scrapfish by chemical or toxin treatments.

Five studies, for a total of $74,000, will be conducted on controlled natural rearing. Four rearing ponds in Oregon and Washington will be operated to determine the biological and economic feasibility of utilizing natural and artificial ponds and lakes as rearing areas for salmon.

(c) *Screening diversions.*—The $75,000 is to provide for screening of 25 existing unscreened irrigation diversions on the main Salmon River and East Fork Salmon River in Idaho to prevent entrance into the diversions and subsequent loss of downstream migrating juvenile salmon and steelhead in this area.

(d) *Stream improvement.*—The $56,000 is needed for stream clearance projects in the States of Oregon and Washington. Detailed stream surveys in Oregon have provided information that justifies the improvement of selected areas as suitable habitat for anadromous fish. Streams have been selected for improvement through removal of logjams and other obstructions. Eventually, more than 160 miles of additional stream habitat will be made accessible by the stream improvements planned. A combination of logjam removal, minor falls correction, and stream channel alteration in the eastern Washington area, particularly on the Methow and Yakima systems, will greatly assist in distribution of adult Chinook salmon and steelhead to spawning and rearing areas now partially or wholly unavailable. Serious logjams and small falls exist in Nason Creek and the Chowack, Twisp, and Methow Rivers.

(e) *Program supervision and inspection.*—The $90,000 is for program supervision and inspection, including engineering services required for the design of, and review of detailed plans for, facilities constructed by the Bureau and the cooperating States, as well as inspection services during construction, to insure adequacy and conformity to specifications. During fiscal year 1965, inspection of projects initiated during the year and inspection of projects initiated in fiscal year 1964 but still under construction in fiscal year 1965 will be required. The majority of these projects are located in remote areas where access is difficult and extensive travel is required. Among projects for which inspection will be provided are Lewiston Dam and Selway Falls fishways on the Clearwater River, Idaho, and the Three Mile Dam fishway on the Umatilla River, Oreg. In addition, screening of irrigation diversions in the headwaters of the Salmon River, Idaho, and stream clearance activities in Oregon and Washington will require inspection. Preparation of design and review of plans, as well as inspection during construction, will be necessary for the hatchery pipeline at the Big Creek hatchery.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$10,552,438	$8,614,125	$4,788,000	−$3,826,125
Unobligated balance brought forward	−6,243,563	−4,164,125		+4,164,125
Unobligated balance carried forward	4,164,125			
Appropriation	8,473,000	4,450,000	4,788,000	+338,000
Obligations by objects:				
11 Personnel compensation	288,196	29,000	29,000	
12 Personnel benefits	19,186			
21 Travel and transportation of persons	21,322	24,000	12,000	−12,000
22 Transportation of things	14,940	2,000	2,000	
23 Rent, communications, and utilities	9,583	14,125	11,000	−3,125
24 Printing and reproduction	2,637	3,000	1,000	−2,000

26 Supplies and materials	77,020	31,000	3,000	−28,000
31 Equipment	3,278,164	2,734,000	1,700,000	−1,034,000
32 Lands and structures	5,005,034	4,005,000	2,500,000	−1,505,000
Total obligations	10,552,438	8,614,125	4,788,000	−3,826,125

SHELLFISH RESEARCH CENTER AT MILFORD, CONN.

Chairman HAYDEN. Would you please comment briefly on each of the major items of your proposed construction program?

Mr. MCKERNAN. Yes, Mr. Chairman. In response to a question by Senator Mundt I did speak about the biological research laboratory for the tropical Atlantic area, so I will not repeat myself here, unless you especially want me to.

We also have in the budget the construction of a shellfish research center at Milford, Conn., for $1 million. This particular expansion of this research laboratory would allow us to further our work in developing oyster farming and the techniques and technology of both oyster and clam farming as we now farm our lands.

Senator MUNDT. Do you mean if this laboratory, if constructed, will go part way in meeting the problem you described about this New Jersey clam fishery? Is that not a shellfish, the clam?

ARTIFICIAL PROPAGATION OF THE CLAM

Mr. MCKERNAN. Yes, it is, Senator. We do not know enough about surf clam biology yet to be certain, but in general, I can say this, that we have developed techniques for artificially farming and artificially

raising the hard shell clam. This is the little clam that is found in the markets here in Washington, the quahog.

If we learn enough about the surf clam, I think eventually we might be able to propagate it artificially.

Senator MUNDT. You are talking about a new laboratory, are you not?

Mr. MCKERNAN. We are talking about expansion of an existing laboratory.

Senator MUNDT. I was simply raising the question whether or not one of the missions might well be to pursue the potentiality of this surf clam field.

Mr. MCKERNAN. Yes, eventually it could. The reason I hesitate, Senator Mundt, is because we do not really have enough scientific information to be sure that the habits of this clam will lend itself to the kind of artificial propagation work we are considering for the clams which are found inshore and in brackish waters and bays.

But, in a sense, I think what you say is correct.

FRESH WATER CLAMS ARTIFICIAL PROPAGATION

Senator MUNDT. Have you done any work in your department on fresh water clams? Do they have any commercial value?

Mr. MCKERNAN. Yes, they do. The clams of the Mississippi are now being used for seeds for artificial cultivation of pearl oysters in Japan.

I have seen these particular blanks from our Mississippi fresh water clams inserted into the flesh of the pearl oyster, the mother shell as the Japanese call it, in Japan and then they leave it in there a certain length of time and the mother shell, the mother oyster puts a secretion around it which forms the cultered pearls that we buy in the market.

Senator MUNDT. That is very interesting, because I had a friend who almost went broke in South Dakota trying to develop this.

Mr. MCKERNAN. You will be interested to know that the Japanese have developed their techniques in the fresh water mussel and they are doing that in one of their very large lakes. So it is possible. We just have not learned the technique.

EDIBILITY OF FRESH WATER CLAMS

Senator MUNDT. Other than the pearl industry, is there any edibility value in fresh water clams?

Mr. MCKERNAN. No, it is not found to be a very highly desirable species. I have never eaten one myself, so I cannot say from first-hand experience, but it has been used to some extent, I think, for stock feed in some places. But mostly the shells have been used, because they comprise a very lusterous mother-of-pearl layer on the shells themselves.

REPLACEMENT FOR "OREGON"

Coming back to your question, Mr. Chairman, we have requested the construction of an exploratory fishing vessel as a replacement for one of our vessels which is about 20 years old. This is a vessel that was not constructed for fishery research at all, the *Oregon*. It is based in the Gulf of Mexico.

We are asking for $1,350,000 for the first phase of construction. The total cost of this vessel, as I recollect, is about $2 million.

EQUIPMENT FOR NORTH PACIFIC RESEARCH VESSEL

We are also asking for equipment for a fishery research vessel for use in the North Pacific and the Bering Sea in the amount of about $350,000. This will provide the highly technical and specialized equipment necessary to locate fish schools and so on, for doing this sort of research.

Chairman HAYDEN. It is not standardized? You have to work it out for your own specifics?

Mr. MCKERNAN. That is correct, Mr. Chairman.

Senator MUNDT. May I ask a question?

Chairman HAYDEN. Yes.

NATIONS HARVESTING FISH IN NORTH ATLANTIC

Senator MUNDT. I notice at the bottom of page 9 of your statement you say that 13 nations, including Russia, are harvesting fish in the North Atlantic. What are these nations, and how many of them have the latest vessels you were talking about?

Mr. MCKERNAN. The United States, Canada, U.S.S.R., Poland, West Germany, Denmark, Norway, the United Kingdom, Iceland, France, Spain, Portugal, and Italy.

Senator MUNDT. How many of them have these latest ships?

MODERN STERN TRAWLERS

Mr. MCKERNAN. The West German ships comprise a growing fleet of big stern trawlers. The Poles, as well as the Soviets, of course. We have all heard about the expansion of the Soviet fleets.

The United Kingdom has several of these new vessels. France, as well as Italy, Iceland, and Canada, are all rebuilding and reconstructing their ground fish fleets.

Senator BARTLETT. How many of these modern stern trawlers do we have?

Mr. MCKERNAN. We do not have any.

USE OF FOREIGN CURRENCY TO BUILD STERN TRAWLER

Senator MUNDT. Have you ever thought about getting the use of foreign currency to get Poland to build you a stern trawler?

Mr. MCKERNAN. I would like to. I do not think it is allowed. We do have, I am told by my staff, Senator Mundt, a plan for some design studies by these people, because they are ahead of us in the design of these latest trawlers. There is no question about this. I do not mean to belittle the attainments of our naval architects, because we have some very excellent ones in this country. But these people have been building these ships and have them at sea.

Our naval architects can design all they want, but if they cannot find anyone to build them, we do not know if they will work.

Senator MUNDT. Do the fishermen or the Government provide the ships for these other nations?

PURCHASE OF FOREIGN FISHING VESSELS

Mr. MCKERNAN. It varies, of course, Senator, considerably. But, for the most part, most countries provide greater assistance than does our own country in the construction of these ships. One of the biggest problems we have—incidentally, I think the Senate should be very proud to have passed the Magnuson-Bartlett bill which would provide for an equalization of construction costs. One of our problems is that our fishermen cannot buy foreign fishing vessels in foreign countries where they can get them the cheapest.

We can buy all kinds of radios or other equipment, but fishermen cannot buy fishing vessels except in U.S. yards.

Fishing vessels are approximately 50 percent more expensive to build here in the United States than elsewhere. Right to begin with, it puts our fishermen in the same North Atlantic fishing grounds at a disadvantage with these foreign nations.

But countries such as Canada, at the present time, and in the Atlantic area, are allowing their fishermen either to build vessels at home, in which case if they build in Canadian yards, they have a 55-percent government subsidy, or they can build them overseas if they wish.

BUILDING FISHING VESSELS OVERSEAS

Senator MUNDT. Why can we not build them overseas?

Mr. MCKERNAN. It is against the law. I think it is prohibited by an act called the Jones Act, passed in 1792, and is still on the books.

Senator MUNDT. Does that apply to all ships?

Mr. MCKERNAN. Just those ships that are documented for fishing or coastal trade. But, you see, our fishermen now, as never before, are in dire competition on common fishing grounds with foreign fishing boats. And in addition to this, of course, they are competing on the same markets, on the same products, with these fishermen on foreign vessels. It really is a very great handicap to our fishermen.

FISHING IN THE PERU CURRENT

Senator MUNDT. When you listed the countries catching more fish than the United States, how did they get ahead of us? Particularly, how did Peru get ahead of us?

Mr. MCKERNAN. Because they happen to be wonderfully favored by nature. Off the coast of Peru occurs one of the most, if not the most, prolific area of the world ocean, in what is commonly called the Peru current. It swings up along off the coast of South America and heads across the equator.

In doing so, it causes turbulences that bring enrichment from the bottom. In fact, they are really fertilizers and exactly the same kinds of fertilizers that we apply on our lands.

When you get to the upper surfaces of the ocean, plants are formed and in the presence of light these fertilizers stimulate food production for anchoveta.

This particular fishery last year landed about 7 million tons of anchoveta, which produced a little over a million tons of fishmeal. A great deal of the fishmeal came into this country for use in preparation of poultry and hog food.

El Niño and Callao Painter

Incidentally, they are having a little trouble right now. Occasionally, when the winds die down, the current system tends to break down off the coast of Peru and Chile, and they have what they call an El Niño. This reverses the trend of oceanic productivity and leads to the so-called Callao Painter.

This is translated as something having to do with foul paint and what it amounts to is, the whole current system breaks down and fish and plankton die in tremendous quantities.

The anchoveta are spread out a great deal at such times and are not caught so the fishery is not doing as well at the present time as it has in the past few years.

Senator Mundt. Are these fish something that the Peruvians have exclusive rights to fish, or can other countries fish there?

Mr. McKernan. Fishermen from our country fish tuna off the coast of Peru. The anchoveta occurs really within their own territorial limits for the most part.

Some are found outside their territorial limits, but at the present time no other fishermen are fishing anchoveta. Other fishermen are fishing tuna in this area and our own fishermen are, too.

Stream Improvement Program on the Columbia River

Chairman Hayden. There is a reduction of $422,000 from the amount available to you last year for stream improvement under the activity headed Columbia River Fishery Facilities for which you request only $56,000 this year. Does this indicate that your stream improvement program is nearing completion?

Mr. McKernan. Yes, Mr. Chairman, insofar as stream clearance is concerned. We are coming to a point where the costs of stream clearance will be less and less. We have cleared the major streams in the lower Columbia Basin that are available to salmon and steelhead and we propose a reduction in this program, at least until we have evaluated more precisely the results of the stream clearance carried on there.

Construction of Fishing Vessels

Chairman Hayden. For fiscal year 1965 you are not requesting funds for subsidy payments in connection with construction of fishing vessels. The statutory period for applications for such assistance has expired. I will, however, place in the record the statements which you furnished concerning this item.

(The statements referred to follow:)

Highlight Statement

The purpose of this activity is to assist those segments of the fishing industry which have been injured by imports to construct new, modern fishing vessels to assist them in meeting foreign competition. This program began in fiscal year 1961. A total of 14 applications have been received totaling $1,254,000. Subsidies totaling $549,200 have been paid to assist in the construction of six vessels. Seven applications for subsidy payments totaling $648,000 were received during fiscal year 1963. Seven applications were being processed as of December 31, 1963, and one application has been withdrawn. The final date for the filing of subsidy applications under this program was June 12, 1963. The processing of applications will be completed during fiscal year 1964.

Construction of fishing vessels

Appropriation, 1963 (total available)	$750,000
Appropriation, 1964 (total available)	750,000
Budget estimate, 1965	None

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964		
		Total appropriation	Transfer	Amount available
1. Subsidy payments	$93,443	$670,000		$670,000
2. Program administration	54,630	80,000		80,000
Unobligated balance lapsing	601,927			
Total	750,000	750,000		750,000

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost	Program
1. Subsidy payments	$93,443	$670,000		−$670,000		−$670,000
2. Program administration	54,630	80,000		−80,000		−80,000
Unobligated balance lapsing	601,927					
Total	750,000	750,000		−750,000		−750,000

Funds are not requested for this program in the fiscal year 1965. The program will terminate in fiscal year 1964 because of the deadline of June 12, 1963, for the filing of applications for assistance under the program, provided in the authorizing legislation (74 Stat. 212).

Itemization of estimate

Total obligations	148,073	750,000		−750,000

CONSTRUCTION SUBSIDY PROGRAM

Chairman HAYDEN. Would you please indicate to the committee your views as to the value and success of the program?

Mr. MCKERNAN. Yes, Mr. Chairman. We are not asking for any funds for this construction subsidy program, because it terminates this

year. The program that has been in effect applied only to the New England area, and I think it has been successful. It relates to this problem I mentioned previously in response to a question of Senator Mundt.

The New England fisherman simply has not been able to afford the construction of new fishing vessels, and for many years there has been no new construction in New England of these larger fishing trawlers which had formerly fished the Grand Banks and a considerable distance off our coast.

NEW TRAWLERS

Since this program has been in effect, we have approved the construction of about eight new trawlers. Several, now, have been constructed, one by a company in New England. I just recently have talked to the president of this particular company. His vessel was delivered in December 1962, so it had a full year's operation, you see, at the end of this past year.

This has been a very successful operation. The fact that they had some working capital, because they did get a 30-percent construction subsidy from the United States, gave them an opportunity to get the boat out at sea and keep it out there.

The managing owners reported that they expect the first year's operation to be as good or better than they had planned and anticipated.

PLANNED CONSTRUCTION

In fact, they tell me that their projection in the first instance called for a net profit, after taxes, of approximately $20,000. They are planning on constructing another vessel and have applied for another vessel under this program.

So, in other words, if they do have the application in, they will be eligible, even though the program ceases this year. I, personally, think, Mr. Chairman, that the necessity for reconstruction of the American fishing fleet is the primary problem of the American fishing industry today. We must get a new and more modern fleet of vessels if American flag vessels are going to remain in contention as a major fishing fleet.

GENERAL ADMINISTRATIVE EXPENSES

Chairman HAYDEN. For general administrative expenses in fiscal year 1965 the budget proposal is $676,000, which is $23,000 more than was appropriated in fiscal year 1964. The justification will be printed in the record.

(The justification statement referred to follows:)

HIGHLIGHT STATEMENT

The purpose of the general administration program financed by this appropriation is to provide the executive direction and the general administrative management required by the operating programs financed by annual definite appropriations. The administrative management activities, divided into the broad categories of functional-staff work and processing work, include budget formulation and execution, finance management, personnel management, inspection, internal audit, safety, and contract and property management.

Efforts to improve the efficiency of operations financed under this appropriation continued as the task of providing for adequate administrative management for significantly expanded Bureau programs, without increase in administrative staff, became increasingly difficult.

Included under accomplishments in the personnel management program was the development of new classification and qualification standards that emphasize the quality factor in staffing scientific, technical, and administrative programs. Major emphasis has been concentrated on the training and retraining of available manpower. A major objective is a general increase in the level of academic achievement of the professional and supporting staff.

As a further step in management improvement, the regional and area offices developed a regional or area comprehensive budget submission for fiscal year 1965. This change in procedure served to utilize to a greater extent the knowledge and skills of field personnel responsible for program operations, executive direction and administrative services in the interest of improved long-range financial planning and budget formulation.

Considerable effort has been devoted to improving financial reports to better serve management requirements. New accounting equipment has been purchased during the past 2 fiscal years which has the capability of producing certain information through an automatic process. A study is being conducted in the Washington office to determine the feasibility of utilizing punchcard equipment in conjunction with the new accounting equipment for processing monthly cost accounting and distribution data. The use of an automatic data producing technique will make possible the production of more timely and meaningful financial reports.

The major effort of the property management unit was devoted to construction contract administration, execution of research and development contracts with universities and other outside groups, and procurement of specialized scientific equipment. With the significant Bureau program expansion, the contract administration workload requires an ever greater amount of time and effort to handle these activities adequately.

During fiscal year 1963, 28 research and development contracts with educational and scientific institutions required audit. In fiscal year 1964, a minimum of 92 audits will be required on research and development contracts. Currently, audit programs are being developed for the recurring review of all Bureau financial management activities. As a further protective and constructive aid to management, future plans include the audit of each regional and area accounting office every 2 years including a selected number of laboratories and field stations.

General administrative expenses

Appropriation, 1963	$600,000
Supplemental appropriation, 1963	21,850
Total available, 1963	621,850
Appropriation, 1964	653,000

SUMMARY OF INCREASES AND DECREASES, 1965

Departmental expenses:	
Nonrecurring cost of replacing bookkeeping machine	−13,000
To provide for increased pay costs for fiscal year 1964 positions	+10,100
To provide for increased costs of executive direction and general administrative services essential to the most effective conduct of expanded Bureau programs	+9,000
Subtotal	+6,100
Regional office expenses:	
Nonrecurring cost of replacing bookkeeping machines	−26,000
To provide for increased pay costs for fiscal year 1964 positions	+12,900
To provide for purchase of accounting equipment	+30,000
Subtotal	+16,900
Net increase, 1965	23,000
Budget estimate, 1965	676,000

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964		
		Total appropriation	Transfers [1]	Amount available
1. Departmental expenses	$225,611	$291,900		$291,900
2. Regional office expenses	356,224	361,100		361,100
Unobligated balance lapsing	40,015			
Total	621,850	653,000		653,000

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	program
Departmental expenses	$225,611	$291,900	$298,000	+$6,100	+$10,100	−$4,000
Regional office expenses	356,224	361,100	378,000	+16,900	+12,900	+4,000

Total	621,850	653,000	676,000	+23,000	+23,000	

[1] To provide for increased pay costs for fiscal year 1964 positions.

The estimate of $676,000 is to provide for executive direction at the Bureau's headquarters and at the five regional offices, and for the general administrative services at these offices in connection with programs financed with funds budgeted under annual appropriations. Administrative activities, divided into the broad categories of functional-staff work and processing work, include budget formulation and execution, financial management, personnel management, inspection, internal audit, management analysis, safety, and contract and property management. The cost of facilitating services not identified here as administrative activities are financed from program funds. General administrative services from programs financed by the permanent appropriation, "Promote and develop fishery products and research pertaining to American fisheries," and by contributed funds, advances and reimbursements, and transfer funds are financed by assessment against the program funds on the basis of predetermined costs. Washington headquarters staff also provides administrative services for the Office of the Commissioner of Fish and Wildlife Service.

1. Departmental expenses

Activity	Fiscal year 1963, amount available	Fiscal year 1964, amount available	Fiscal year 1965, estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
Departmental expenses	$225,611	$291,900	$298,000	+$6,100	+$10,100	−$4,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

Departmental expenses.—The estimate for fiscal year 1965 is $298,000. This is an increase of $6,100 over 1964 which included a nonrecurring item of $13,000 for replacement of a bookkeeping machine. The 1965 increase, considering the nonrecurring item, includes $10,100 for increased pay costs, and $9,000 for increased costs of executive direction and general administrative services essential to the most effective conduct of the Bureau's expanded programs. The increase proposed for fiscal year 1965 will not require any increase in overall Bureau employment over that authorized for fiscal year 1964.

Need for increase.—The $9,000 increase is needed to provide for increased costs of executive direction and general administrative services required for the most effective conduct of the Bureau's expanded programs. The funds are for additional travel costs and other general expenses. The continued expansion of the Bureau's oceanography programs, and other research programs such as those dealing with pesticides and botulism, and increased responsibilities in the international field has increased significantly the workload of the executive direction and administrative staffs. Increased travel by the Director, Deputy Director, and key administrative officials to meet with international organizations, State officials, officials of cooperating agencies, and field personnel of the Bureau, and to conduct program inspections, is necessary to the most effective discharge of Bureau responsibilities. Increased costs for other than travel, result from additional processing work required to service new and expanded Bureau programs.

Plan of work.—The Office of the Director will carry out its responsibilities for the formulation and execution of basic policies for carrying out the functions of the Bureau prescribed by Congress and by the Secretary of the Interior, the conducting of relations between the Bureau and the public, and the preparation and development of program objectives and budgets. The Deputy Director shares with the Director the responsibilities for the supervision and direction of the Bureau.

The Division of Administration will exercise staff supervision over all administrative management activities of the Bureau, including budget formulation and execution, finance management, inspection, management analysis, incentive awards, personnel management, safety, contract and property management, internal audit, and financial assistance investigations. The Division will also provide administrative services for the headquarters office and the Office of the Commissioner of Fish and Wildlife.

2. Regional office expenses

Activity	Fiscal year 1963, amount available	Fiscal year 1964, amount available	Fiscal year 1965, estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	program
Regional office expenses	$356,224	$361,100	$378,000	+$16,900	+$12,900	+$4,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

Regional office expenses.—The estimate for fiscal year 1965 is $378,000. This is an increase of $16,900 over 1964, which included a nonrecurring item of $26,000 for replacement of bookkeeping machines. The 1965 increase, considering the nonrecurring item, includes $12,900 for increased pay costs, and $30,000 for the purchase of accounting equipment.

Need for increase.—An increase of $30,000 is needed for the purchase of six card-punch couplers and six card-punch machines. This accounting equipment will provide more flexibility in the use of, and greater utilization of the new bookkeeping machines acquired by the Bureau. Compilation of detailed accounting information required for Bureau management, external reporting, and budget use will be simplified and expedited through the automatic recording of accounting data on punchcards. This will result in more efficient utilization of the Bureau's limited administrative staff and more timely and accurate financial and budgetary reporting.

Plan of work.—A card-punch coupler and card-punch machine will be synchronized with and wired to each of the new bookkeeping machines. Punchcards containing budget and accounting data will be provided automatically as fund control is being maintained by bookkeeping machine postings. Budget and obligation reports, cost distribution reports, and other accounting statements will be provided to management by machine tabulation of these punchcards and will eliminate the manual maintenance and compilation of this information.

Analysis by activities (total fund)

Activity	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
1. Departmental expenses:				
Direct appropriation	$225,611	$291,900	$298,000	+$6,100
Saltonstall-Kennedy funds	118,006	118,300	118,300	
Reimbursement from the Office of the Commissioner of Fish and Wildlife	8,200	8,200	8,200	
Subtotal	351,817	418,400	424,500	+6,100
2. Regional office expenses:				
Direct appropriation	356,224	361,100	378,000	+16,900
Saltonstall-Kennedy funds	260,381	273,900	273,900	
Great Lakes Fishery Commission (contributed funds)	36,200	37,500	38,000	+500
Subtotal	652,805	672,500	689,900	+17,400

CHANGE OF BUDGET FORMULATION PROCEDURE

Chairman HAYDEN. In the highlight statement accompanying this request is a statement that a change in procedure has been developed during the past year. Would you comment on that procedure?

Mr. MCKERNAN. Mr. Chairman, I think that your question must refer to our budget formulation procedure. We have changed that procedure to provide for greater participation of our field personnel in financial planning and budget execution in the interest of improving our operations in these fields.

Chairman HAYDEN. For fiscal years 1964 and 1965 would you please submit a breakdown by sources of all funds which are to be available for general administrative expenses, including, of course, the program funds of the Bureau of Commercial Fisheries which will be used. If there is an established percentage of the program funds used for general administrative expenses, please indicate that percentage.

Mr. McKERNAN. We will supply that for the record, Mr. Chairman
(The information referred to follows:)

Funds for general administrative expenses, facilitating and use-based services

Source	Fiscal year 1964 amount	Fiscal year 1965 amount
Annual appropriation for general administrative expenses	$653,000	$676,000
Permanent appropriation for promote and develop fishery products and research pertaining to American fisheries	392,200	392,200
Contributed funds: Great Lakes Fisheries Commission	37,500	38,000
Reimbursement from Office of the Commissioner of Fish and Wildlife	8,200	8,200
Total	1,090,900	1,114,400

Funds budgeted for general administrative expenses are to provide for executive direction and general administrative services which includes budget formulation and execution, financial management, personnel management, inspection, internal audit, management analysis, safety, and contract and property management.

The cost of facilitating services and use-based charges essential to all Bureau operations are charged to funds available to the Bureau, including those for general administrative expenses on a pro rata basis. Facilitating service costs include charges for office rental, utilities, general supplies, telephone, postage, mail handling, employee training, contractual services, transportation, and other items of a similar nature. Also included are charges made by the Department for legal services, library services, health services, etc. The cost of facilitating services and use-based charges are estimated at $670,000 for fiscal year 1964 and $725,000 for fiscal year 1965, or an amount equal to slightly less than 2 percent of the total Bureau funding.

TRAVEL COST AND GENERAL EXPENSES

Chairman HAYDEN. In the amount requested for departmental expenses, $298,000, the notes show that there is a $9,000 increase for additional travel costs and other general expenses. Will you please distribute this $9,000?

Mr. McKERNAN. Yes, Mr. Chairman.

(The information referred to follows:)

DISTRIBUTION OF $9,000 INCREASE

The $9,000 is to cover the additional cost of providing essential executive direction and administrative services required for the most effective conduct of the expanded Bureau program proposed for fiscal year 1965. The expanded program will require additional travel by the Bureau directorate and key administrative personnel estimated to cost $5,000. The remaining $4,000 would provide an additional $2,000 for communication expenses, $1,000 for supplies and materials, and $1,000 for other services.

ADMINISTRATION OF PRIBILOF ISLANDS

Chairman HAYDEN. In fiscal year 1965 you request $2,442,000 for administration of Pribilof Islands, a decrease of $26,000 in the amount made available in the last fiscal year. The justification for this request will be included in the record.

(The justification statement referred to follows:)

HIGHLIGHT STATEMENT

The U.S. Government protects and manages the fur seal herd of the Pribilof Islands in Alaska, maintains the islands as a special reservation for this purpose, and is responsible for the harvesting, processing, and sale of the sealskins. As the operating agency, the Bureau of Commercial Fisheries manage all fur sealing and maintains 2 communities for the 650 Aleuts on the islands. Several hundred persons are employed during the sealing season, including almost 200 Pribilof residents, 50 Aleuts from the Aleutian Islands, 25 technicians from the mainland, and staff supervisors. Physical facilities on the islands include some 200 U.S.-owned buildings—warehouses, residences, dormitories, commissaries, schools, hospitals, powerhouses, shops, and fur-curing plants; an airport on St. Paul Island capable of handling 4-engine aircraft, and concrete landings on each island for tying up shipping lighters. Equipment operated includes five LCM's for lightering freight between shore and ship; rolling stock including trucks, tractors, cranes, etc., and a supply tender operating out of Seattle.

The Pribilof fur seal herd spends the greater part of each year on the high seas where the animals in earlier years were taken in large numbers by other countries. A treaty with Canada, Japan, and the U.S.S.R. commits the United States to a cooperative approach to fur seal research and management problems and a product-sharing system whereby the United States delivers 15 percent of the sealskin production each to Canada and Japan.

The Bureau is responsible for disposition of the U.S.-owned products of the fur seal industry. Sealskins are dressed and dyed and sold at public auction for the account of the United States by private fur processors under contract with the Government. At times the processing of certain byproducts is economically feasible and they are disposed of to the highest bidder.

The 1962 season take of sealskins from the 2 islands for commercial purposes was 77,915. The byproducts plant was not operated because current prices for meal and oil would not have offset the costs of operation. Approximately 10,000 seal carcasses were transported to Vancouver, British Columbia, under a cooperative agreement for experimental utilization as mink feed.

Fewer sealskins were taken in the 1963 season and a portion of the carcasses were again taken by the cooperator processor for experimental utilization. In addition to 150 tons of seal meat, 7 tons of liver were frozen and transported to Bellingham, Wash., by the processor. A contract for disposal of the carcasses at a profit is a future possibility.

The number of permanent island positions was 54 less in 1963 than in 1962, after a new compensation plan was placed in effect on July 1, 1962, which equalized Pribilof wages with rates paid elsewhere in western Alaska. Funds in the amount of $380,000 were made available under the accelerated public works program (APWP) for the rehabilitation of some structures and the award of a contract for construction of four new residences on St. Paul. Through August 31, 1963, 307 man-months of employment have been supported by the APWP. The alleviation of unemployment resulted in a tremendous economic impact on the resident Aleuts.

The work starting on November 1, 1962, embraced a backlog of maintenance and repair jobs on both islands ranging from small jobs requiring only a few man-hours such as replacing broken windows, cleaning and painting walls to more complex projects like completing the electric distribution systems or the construction of four new residences for resident Aleuts.

During the fiscal year 1963 a surplus 210-foot refrigerator vessel, *FSR–791*, was obtained from the Army on a loan basis to replace the inadequate Bureau supply vessel *Penguin II*. The vessel was put to use in the island supply operations in September 1963. Funds in the amount of $150,000 for reactivating the vessel were made available under the APWP.

Operational costs of the 210-foot replacement vessel will be greater than for the 147-foot *Penguin II*, but probably no greater than the combination of using the *Penguin II*, and obtaining necessary additional transportation services required on a reimbursement or charter basis. The *FSR–791* will carry to the islands all of the items of supply required for subsistence of the residents and to support the sealing program, and backhaul annually cured sealskins and byproducts valued at over $5 million.

Future plans for administration of the Pribilof Islands call for the following:

1. Gradual consolidation of the 2 villages over a 10-year period, involving construction of about 40 residences and expansion of facilities at St. Paul to accommodate the St. George population. Construction of the first group of four homes has now been completed.

2. Gradual progression of the Aleut people through guidance and assistance to attain the objectives of maximum economic self-sufficiency, equal participation in American life, and equal citizenship privileges and responsibilities. This includes continued emphasis on education, training, and relocation programs from resident Aleuts; transfer of typical community responsibilities in social, economic, and governmental matters to the Aleut residents, accompanied by withdrawal of the Bureau to interests concerned primarily with fur seal conservation and utilization; and continued cooperation with the several State and Federal agencies which provide special services to local residents under Bureau authority and financing.

3. Continuation of the fur seal industry, and rehabilitation and maintenance of physical structures on St. Paul Island.

Pelagic investigations in fiscal years 1963 and 1964 were centered in the eastern Bering Sea and Unimak Pass area where the feeding range of nursing seals was determined, the migration timing of seals by age class was traced, and the feeding habits of seals, including predation on salmon was studied. Major feeding areas for Pribilof seals were plotted.

Culminating a research program hookworm infection in fur seals was found to be an uncontrollable factor in their environment transmitted through nursing. Many thousand seal pups die annually from the effect of hookworms.

Tag loss, stress and mortality from tagging, and other factors were studied to determine the accuracy of population estimates made from tagging experiments. These sources of error are common to all animal tagging programs. An intensive behavior study conducted on a rookery furnished information vital for future investigations of the early ocean life of fur seals when heavy mortality occurs.

Administration of Pribilof Islands

Appropriation, 1963	$1,998,000
Supplemental appropriation, 1963	19,000
Total available, 1963	2,017,000
Appropriation, 1964	2,468,000

SUMMARY OF INCREASES AND DECREASES, 1965

Administration of Pribilof Islands:	
Nonrecurring cost of vessel conversion	−115,000
To provide for increased pay costs for 1964 positions	+16,000
To provide for increased costs of sealskin curing operations	+64,000
To provide for increased vessel charter costs for fur seal research program	+9,000
Net decrease, 1965	−26,000
Budget estimate, 1965	2,442,000

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964		
		Total appropriation	Transfers	Amount available
Administration of Pribilof Islands	$2,001,014	$2,468,000		$2,468,000

Total	2,017,000	2,468,000		2,468,000

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
Administration of Pribilof Islands	$2,001,014	$2,468,000	$2,442,000	−$26,000	+$16,000	−$42,000
Unobligated balance lapsing	15,896					
Total	2,017,000	2,468,000	2,442,000	−26,000	+16,000	−42,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

Administration of Pribilof Islands.—The estimate of $2,442,000 is a decrease of $26,000 compared to 1964. A program decrease of $115,000 for a nonrecurring item for vessel conversion is offset by an increase of $89,000 of which $16,000 is for pay costs and $73,000 is for program increases. The increases proposed for fiscal year 1965 will not require any increase in overall Bureau employment over that authorized for fiscal year 1964.

ADMINISTRATION OF THE ISLANDS

Need for increase.—An increase of $64,000 is needed to provide for wages and travel costs in connection with the employment and transportation to and from the Aleutian Islands of approximately 30 to 35 additional temporary employees required to assist with preliminary sealskin curing operations on the Pribilofs. Prior to the 1963 season the processing contractor was responsible for such wage and transportation costs. Such costs were then deducted from the gross proceeds from sealskin sales as were other contractor operational and cost of goods sold expenses. In the 1963 season the increased costs were met by deferring building maintenance and rehabilitation work. It is essential that the regular maintenance and rehabilitation program be resumed in fiscal year 1965.

Plan of work.—The Bureau will continue, and refine, its scientific management and technological utilization of the northern fur seal resource. Local residents from the Pribilof and Aleutian Islands' villages will continue to be used as the principal source of seasonal labor. Programs providing for the care of the 650 Aleut residents of the 2 Pribilof communities and maintenance and rehabilitation of village facilities will be continued.

A major step toward achieving economy, as well as advancing personal development of the Pribilof Aleut population, was initiation of a 10-year program in 1963 to gradually phase out St. George Island as a village and merge it with St. Paul Island. Movement of families will depend on the number of houses constructed per year on St. Paul. It is estimated that funds budgeted for fiscal year 1965 for replacement of residences and maintenance of existing structures and equipment will permit the replacement of two residences.

The permanent labor force will be reduced as rapidly as possible, although during the 10-year consolidation period both villages must be maintained year round, and a larger number of seasonal workers will be required for expanding the facilities at St. Paul Island.

FUR SEAL RESEARCH

Need for increase.—The increase of $9,000 is needed for increased costs of vessel charter to operate a larger vessel needed in autumn and early winter in Alaska and increased rent and contractual services for laboratory operation and maintenance.

Plan of work.—The renewal of the Convention on Conservation of North Pacific Fur Seals for an additional 6 years requires the United States "to devote to pelagic research an effort similar in extent to that expended in recent years * * *." Present studies of intermingling of seals from Asian and American islands, distribution, abundance, and food habits of seals at sea are to be continued. The protocol to the convention calls for additional research to determine the relative effectiveness of land and pelagic sealing for managing and utilizing fur seal resources and the quality of sealskins produced by each method; and a study to

determine whether land sealing in conjunction with pelagic sealing could satisfy the objectives of the convention.

A long-term population dynamics experiment planned to show whether the Pribilof fur seal herd can be put on a maximum sustained yield basis will be continued. The convention specifies that an adequate number of seal pups will be marked for this purpose. Much of the voluminous routine data needed for population studies will be collected as a management operation and the research effort will be concentrated increasingly on the improvement of population estimation techniques and on studying sources of mortality. These things must be done before satisfactory forecasts of seal harvests can be made or additional action taken toward maintaining a maximum yield of fur seals.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:

Deduct charges for quarters and subsistence	343,768	350,000	350,000	
Total obligations	2,001,014	2,468,000	2,442,000	−26,000

Fisheries Loan Fund

Chairman Hayden. There will also be placed in the record your statement in support of your request for an administrative expense limitation of $277,000 in fiscal year 1965 for operation of the fisheries loan fund. This is $7,000 more than was authorized in fiscal year 1964, the increase being attributable to increased pay costs.

(The statement referred to follows:)

Highlight Statement

The fishery loan fund is a revolving fund established to provide financing and refinancing of operations, maintenance, repair, replacement, and equipment of fishing vesels and gear and for research into the basic problems of the fisheries. A total of $20 million has been authorized for this program of which $13 million has been appropriated.

Between October 1956, when the program began, and December 31, 1963, 1,341 applications ($35.9 million) were received. During this period 689 applications ($15.7 million) were approved.

Ninety-eight applications ($1.6 million) were received during the fiscal year 1963. Fifty-five of these for $827,000 were approved. During the first 6 months of fiscal year 1964, 73 applications ($1,272,000) were received and 16 applications ($264,000) were approved. Thirty-six cases ($843,000) were being processed as of December 31, 1963. This represents an increase in activity in the fiscal year 1964 program in comparison to the fiscal year 1963 program.

No major changes in the program are anticipared for fiscal year 1965.

The status of fishery loan fund cases, as of December 31, 1963, is reflected in the following tabulation:

Status of fishery loan fund cases as of Dec. 31, 1963

Applications	New England and Middle Atlantic		California		South Atlantic and gulf		Pacific Northwest

[1] Net less amounts approved on reconsideration.
[2] Applications approved for amounts less than applied for.

Administrative expenses

Administrative expense limitation (total available, 1963)	$258,550
Administrative expense limitation, 1964	270,000
Administrative expense limitation to provide for increased pay costs for fiscal year 1964 positions (net increase)	+7,000
Administrative expense limitation, 1965	277,000

Administrative expenses

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
Administrative limitation	$249,881	$270,000	$277,000	+$7,000	+$7,000	
Unobligated balance lapsing	8,669					
Total	258,550	270,000	277,000	+7,000	+7,000	

[1] To provide for increased pay costs for fiscal year 1964 positions.

Administrative expense limitation.—The estimate for 1965 is $277,000, an increase of $7,000 over 1964. This increase in limitation is for pay costs.

Plan of work.—Work will be carried on in about the same manner as in the current fiscal year. Functions performed in connection with the administration of the program will include investigating the fishery aspects of loan applications, the financial investigation of loan applications, consideration of applications for approval or disapproval, preparation of authorizations for a loan or letters of decline, preparation of the final loan documents, closing of approved loans, collecting payments, and keeping the required financial records. Legal matters con-

cerned with the closing and servicing of loans are supervised by the Office of the Solicitor in the Secretary's Office.

LOBSTER RESEARCH

Chairman HAYDEN. Do you have any questions, Senator Mundt?

Senator MUNDT. Mr. Chairman, Senators Margaret Chase Smith, Leverett Saltonstall, and Norris Cotton have advised of their deep interest in the problems of the North Atlantic lobster industry. This industry has its principal fishing areas off the coasts of their respective States of Maine, Massachusetts, and New Hampshire.

It is their understanding from the Atlantic States Marine Fisheries Commission that several acute situations are in need of immediate attention, one of which is the very critical problem of the near exhaustion of the inshore fishery supply.

It has been pointed out that a research program designed to protect and enhance the lobster population is vital to continued operation of this important industry.

Representatives of the lobster industry have made certain representations relating to a research program, a copy of which the the Senators ask be made a part of the record at this point.

Chairman HAYDEN. That may be done.

(The information referred to follows:)

A Proposal for Lobster Research

INTRODUCTION

A program of lobster research is vitally needed to solve the problems facing this facet of the fisheries in the Northeast. Recognition of this need was voiced at the recent meeting of the Atlantic States Marine Fisheries Commission, and a resolution requesting this research was adopted by the commission.

The lobster fishery is fast reaching a critical stage. The inshore fishery is exploited at or near its maximum, while renewed interest in the offshore fishery has been shown by foreign nations as well as Americans. Many inshore fishermen contend that the young of offshore lobsters are carried by ocean currents and eventually recruited to the inshore fishery. If this phenomenon exists, it is imperative to determine the extent and significance of its occurrence. Without such knowledge, continued expansion of the offshore fishery could cripple the inshore supply, or on the other hand, unwarranted restrictions on the offshore fishery could deprive our fishermen of a valuable resource. The information is also essential if foreign fleets enter the fishery and international regulation becomes necessary.

This problem and the others described in this proposal—particularly those concerning basic conservation principles such as the capture of egg-bearing female lobsters—demand attention if the New England lobster fishery is to continue on a productive basis. Without this attention and proper management, a decline in the inshore production can be anticipated if the present rate of increased fishing intensity continues.

THE RESOURCE

The lobster (*Homarus americanus*) ranges from North Carolina to Labrador, and the principal fishing areas are between Massachusetts and Newfoundland. The New England area accounts for most of the U.S. production, but fishermen from Virginia, Maryland, New Jersey, and New York, as well as Connecticut, Rhode Island, Massachusetts, New Hampshire, and Maine, participate in the fishery. Nationwide, the lobster fishery ranks seventh with an annual landing of 25 to 26 million pounds worth $13 to $15 million. This catch is worth more than the individual total harvests of haddock, scallops, clams, herring, flounders, or mackerel and more than the landings of Pacific halibut and Atlantic Ocean perch combined. Of all major U.S. fisheries the American lobster is one of the first in value per pound—almost $0.50 per pound at dockside. Unit fluctuations in the annual lobster catch produce a greater unit change in value than in any other major fishery.

Baited lobster traps and otter trawls account for nearly all of the U.S. lobster catch. Skindiving is permitted in some States and is the newest method of capture. About 8,000 fishermen use lobster traps and, although relatively fewer fishermen are engaged in otter trawling for lobsters, this latter method has been growing in importance in recent years. The yearly rate of increase in otter-trawl catches since 1958 has been greater than 20 percent and total landings have increased from 1 to 3 million pounds in the last 5 years.

LOBSTER RESEARCH AND PROBLEM AREAS

Until recently, the lobster fishery was mainly confined to the territorial waters of the several States, and the State research is generally directed toward assisting industry with local practical problems; such as testing new types of lobster traps, devising better methods of holding live lobsters in recirculated water, disinfecting lobster pounds, and providing troubleshooting services to operators of tank storage facilities. In recent years, however, there have been several gradual changes which are destined to alter the entire New England lobster fishery. These changes present problems which are beyond the scope of State responsibility and which are of interstate and international concern.

The most critical change has occurred in the inshore fishery, where in many areas the increase in fishing intensity has already or is nearing the maximum for given populations. This is evidenced by the fact that individual catches are generally decreasing, while the total catch remains more or less static. Coupled with this change is the consistent increased catch of recruit lobsters which is indicative of a reduced abundance of older specimens—a phenomenon associated with an excessive fishing effort.

A more subtle change has occurred in the offshore lobster fishery. The State of Massachusetts indicates that there are now 20 trawlers engaged in this fishery on a year-round basis, and there is growing interest in this fishery from States as far south as Virginia. Catches of these vessels reach 10,000 pounds in a 5-day trip, and Massachusetts studies indicate that oftentimes 60 percent of the catches are egg-bearing females. Fishermen in both Maine and Massachusetts have often expressed concern about the offshore fishery and its effects on the inshore population of lobsters.

There is also concern that the foreign fishing fleets, now operating along the Continental Shelf, will begin fishing for lobsters. Both the U.S.S.R. and France have expressed interest, and the U.S.S.R. is actively engaged in collecting environmental data which would be useful in establishing such a fishery. So little basic information is available on the offshore populations that it is impossible to predict the effects of an increased fishing intensity.

These problems are within the scope of responsibility of the U.S. Bureau of Commercial Fisheries, and their solutions demand the basic biological information which the State research agencies have been unable to provide. The Bureau has been requested to formulate the necessary research program. This program is attached and includes studies suggested by the States of Massachusetts and Maine, as well as the required basic research to cope with problems in Rhode Island, Connecticut, New York, and the offshore fishery. If funded, the program will operate from the U.S. Bureau of Commercial Fisheries Biological Laboratory, Boothbay Harbor, Maine. During the initial years, certain phases of the investigation will possibly be contracted either to private institutions or to the fishery agencies of the States.

Lobster Research Program

This program is based upon the needs of the New England States engaged in inshore lobster fishing, the problem arising from interstate lobster fisheries, and the questions concerning the offshore lobster fishery. It is a program designed to provide the biological information needed to answer the basic problems of the lobster industry. The overall objective is, in essence, efficient and lasting utilization. Specifically, the program includes the study of the effects of fishing on the offshore and inshore lobster populations and the interrelations of these populations; the influence of biological and environmental factors on the distribution and abundance of lobster populations; and the management of the resource consistent with economic as well as biological demands.

PROJECT A. OFFSHORE POPULATIONS

The exploitation of offshore lobster populations and the effects of this fishery on the lobster populations along the coast must be determined to formulate proper management of these fisheries. To obtain the maximum annual catch of lobsters from the offshore populations, it is essential that the rates of recruitment growth, and mortality be known. These data are needed to determine the optimum stock size that can be maintained and that will produce a sustained yield. The fishing intensity required to produce this stock size and yield can then be established.

Solutions

(1) Sampling of the fishery will involve the collection of length-weight data, sex ratios, and fecundity data such as number of eggs per seeded female, and the proportion of egg-bearing lobsters by size, etc., in numerous offshore locations. These data will be helpful in providing estimates of growth rates, age or size composition, and relationships of spawners to recruitment.

(2) Catch-effort data in conjunction with tagging studies should provide estimates of total survival, population sizes, fishing and natural mortality rates, and extent and rate of migration.

(3) From the above, the annual yields in weight will be computed for a range of fishing rates for various ages of recruitment.

(4) Special offshore cruises will be undertaken to tag and/or mark lobsters; to determine the size distributions of the populations through sampling with small-mesh otter trawls; to ascertain the mortality rates of prerecruits and to collect specimens for laboratory studies, and to trace movements and migrations. Oceanographic data will be analyzed for possible means of intermixing of offshore and inshore populations through environmental influences. Serological

techniques and other biochemical approaches, as well as morphometric studies, will be undertaken to determine whether inshore and offshore populations are discrete.

PROJECT B. INSHORE POPULATIONS

The state of the inshore lobster fishery appears to be one of heavy exploitation with insufficient data to permit the proper regulatory procedures. An inadequate system of data collection does not allow a careful analysis of the fishery, and funds have not been available to remedy the situation. The advantages and disadvantages of size restrictions (minimum and maximum) are not clearly understood or known. Very little is known of the migration of lobsters, their natural mortality, population sizes, or rates of growth. To obtain the maximum catch of lobsters annually from inshore populations, it is essential that the size restrictions dictate removal of lobsters at an age which is in accord with growth and natural mortality rates. Further, the rate of fishing must be adjusted so that the stocks establish and maintain the level required for maximum sustained yield.

Solutions

The research on the inshore lobsters will consist of several short-term studies and a continuing more detailed study attempting to provide estimates of population parameters, sizes, recruitment, etc.

(1) An adequate system of collecting detailed catch-effort data on a monthly basis will be initiated.

(2) Extensive tagging and/or marking will be done in widely separated areas to determine differences in mortality and migration. With suitable catch-effort data available, estimates of population sizes can be made and trends of yield with stock sizes calculated.

(3) Extensive sampling of the fishery will be similar to that mentioned in problem A and will be carried out along the entire coast.

(4) A larval sampling program will be undertaken to establish the source of recruits to given inshore areas and to determine the influence of hydrographic conditions on the distribution of lobsters.

PROJECT C. BASIC BIOLOGY

The solutions to problems confronting the lobster fisheries in the various States demand a thorough understanding of lobster biology. Items such as age and growth rate are essential to the estimates of yield. Natural fluctuations in the abundance and availability of lobster populations occur in both the inshore and offshore fisheries, and it is important to understand the causes of these fluctuations.

Solutions

(1) Since no aging technique is now known for lobsters, it is imperative to know the molting rate with age as well as the length increase per molt with age in order to relate size composition with age. Variations in growth rates will be assessed through laboratory experiments with controlled temperature, salinity, food supply, and so forth.

(2) Density levels, cannibalism, and the establishment of territory among lobsters of different ages will be studied to determine the effects on the distribution and abundance of populations. These results will be related to fecundity studies, rates of growth, and natural mortality.

(3) Lobsters will be raised from eggs to study more fully the larval stages and to develop known age laboratory specimens. The influence of various environmental parameters on the mortality of various stages during larval development will be determined.

(4) The tolerance of lobsters to various environmental factors such as temperature and salinity will be studied, as will the influence of disease on the abundance and distribution of lobsters.

Annual budget for lobster research

Project A. Offshore populations	$125,000
Project B. Inshore populations	125,000
Project C. Basic biology	75,000
Total	[1] 325,000

[1] Includes contracts with State agencies.

Senator MUNDT. Senators Smith, Saltonstall, and Cotton have asked that Mr. McKernan advise the committee of the situation and your best judgment as to what can and should be done about it.

Mr. MCKERNAN. Senator Mundt, the North American lobster fishery is an important fishery in the United States. We land about 25 to 30 million pounds a year and a value to the fishermen of about $15 million a year.

DECLINE OF PRODUCTIVITY

The Federal Government and the States have done a great deal of research on this. The fishery does show some signs of decline in its productivity. One of the disturbing things, Senator Mundt, has been the development of interest by both the Soviet Union and France in some recently discovered offshore populations of lobsters.

Now, our scientists discovered these offshore populations and our own fishermen began to fish them. I mean, this area is beyond our territorial limits. We have about 40 vessels that have been landing lobsters. They have been very large, desirable lobsters bringing the best price.

But the problem is, What is the relationship between these offshore and inshore populations? Can we continue to fish these without endangering the large supply inshore. We do not know. They ask us and we just do not know. We certainly want to know what the relationship is, because if there is a relationship between these stocks, we must make certain arrangements.

ESTABLISHING A CONSERVATION REGIME

Perhaps the International Commission for the Northwest Atlantic Fisheries can adequately establish a conservation regime which would apply to the French or to the Soviets or to anyone else who might come in these offshore waters and fish lobsters, thereby protecting our inshore lobsters.

Senator MUNDT. Do you have treaties that are enforceable to keep other people from fishing these beds if we restrict our fishermen?

Mr. MCKERNAN. No, but we could try to reach a bilateral or a multilateral agreement with these nations that would give us the best protection on these stocks.

Failing some special consideration for these stocks, if they were the brood stock for the inshore area, we would most certainly try to get an agreement with these nations on a conservation program which would limit the total annual landings and lead to some kind of a sharing arrangement.

But until we have scientific knowledge of this, obviously we are not in a position to judge what needs to be done.

Senator MUNDT. Mr. Chairman, in further reference to the lobster research matter, I have here a letter addressed to Senator Cotton by Philip J. Sawyer, associate professor of the Department of Zoology at the University of New Hampshire.

Senator Cotton has requested that this letter be made a part of the record at this point.

Chairman HAYDEN. That will be done.

(The letter referred to follows:)

UNIVERSITY OF NEW HAMPSHIRE,
Durham, N.H., February 24, 1964.

Hon. NORRIS COTTON,
Senate Office Building,
Washington, D.C.

DEAR SENATOR COTTON: I have been asked to write you a letter respectfully requesting you to support an amendment to the budget of the Department of Interior concerned with lobster research. This modification of the original Department of Interior budget will come before a subcommittee of the Appropriations Committee concerned with this area of Federal commitments on February 27, 1964. I am writing you as the executive member of the New Hampshire representation to the Atlantic States Marine Fisheries Commission. This amendment to the Department of Interior budget if granted would provide funds to support an investigation of our lobster fishery. Perhaps a few figures and dollar signs would help you put this request in perspective.

The lobster fishery in the United States has the highest unit value to the fisherman of all the fisheries. He receives $0.55 for every pound he sells. The total fishery has a value of approximately $15 million annually. This makes up about 4 percent of the total landed value of all fish products in the United States, which places it as the seventh most valuable fishery.

In 1961, New Hampshire issued licenses to 51 fishermen, permitting them to set over 75 lobster traps each. Mr. Ralph C. Carpenter II, director of the New Hampshire Fish and Game Department estimates that a real good fisherman can earn about $8,000 annually from his catch. This provides the Portsmouth-Rye-Hampton area with a good many hard-earned dollars each year. I feel this is a typical Yankee industry worth support. In addition to the licenses mentioned above, there were 53 5-trap permits and 129 75-trap or less permits granted. The income to these fishermen is unknown.

Because of its value, the lobster attracts the attention of many fishermen. Most of their fishing pressure is placed upon the inshore fishery—the one in which lobster pots are set. The inshore populations of lobsters are being harvested at just about a maximum level at this time and the demand for lobsters continues to be heavy. To satisfy this demand, an offshore fishery for lobsters has developed. In Massachusetts the landings from this offshore fishery has increased from 1 million pounds to 3 million pounds in the last 3 years. These lobsters are captured with trawls.

The inshore fishermen are protesting to the biologists about this, for they believe that the inshore lobsters are offspring of the offshore populations. They feel that uncontrolled, continued harvest of the large deep-water lobsters will eventually cause the collapse of the shallow-water part of the industry. At present nobody knows whether or not this is true. Biologists have never investigated this situation, but it has become an obvious problem now. Some action should be taken to assure continued yield of this resource.

This leads me back to my original statement. Biologists interested in the problems of the lobster fishery have drawn up investigational procedures. The estimated cost of this work is $325,000. The Bureau of Commercial Fishery would be heavily involved in the offshore work because it takes the larger vessels and gear that they have to do the deeper water work. The States would help considerably with the inshore investigation.

I hope I have stated clearly both the problem and the reasons why I feel it important to aid the industry. This would be an opportunity for politicians and biologists to work together for a common good. I do hope you will give my request your careful consideration.

If you desire more information concerning this problem I would be pleased to try and provide it.

Sincerely yours,

PHILIP J. SAWYER, *Associate Professor.*

FISH LOSSES IN POTOMAC RIVER AND CHESAPEAKE BAY

Senator MUNDT. I have one other question. I remember reading about a great loss of fish in the lower Potomac, rockfish. I do not know whether they come in your jurisdiction or not. Has anything been done to ascertain the reason for it or to mitigate it in any way?

Mr. McKernan. Yes, Senator. This problem was studied by a group of people and we did cooperate with the State of Maryland laboratory that did the primary work on this. The head of the laboratory generally led this particular investigation. What they found was this: Apparently in the late summer, and especially this last summer, there was not much rainfall. There had not been a great influx of fresh water and the bay became very warm. Of course, the Chesapeake Bay is a very rich bay and the fish populations apparently became subject to disease and there was an epizootic that struck the fish, especially the perch.

EPIZOOTIC

Senator Mundt. Is this a piscatorial way of saying epidemic?

Mr. McKernan. Yes. And this epidemic, if you prefer, did kill tremendous amounts, especially of the perch, but some other species as well. A certain amount of fish kill has occurred in the Chesapeake Bay. My own view is that one of the contributing problems here, of course, is the pollution.

Senator Mundt. I asked about that.

Mr. McKernan. The increasing amount of biological material, that is, material which tends to use up oxygen in its decay, of course, reduces the oxygen and reduces the resistance of the various fish populations in the bay, making them quite susceptible to diseases of various kinds.

I think one of the things that we must do in this area is to find ways of rehabilitating the fresh waters and the bays themselves, because this is perhaps one of the most prolific and best producing inland bays in the world, the Chesapeake Bay itself.

POLLUTION AND OYSTERS

Senator Mundt. Pollution that kills fish probably is conducive to raising big oysters?

Mr. McKernan. No. When there is so much biological material fish are lost, this is not conducive to the growth of any animals. In fact, when it gets to this particular point, oysters tend to close up and to get thin.

Chairman Hayden. Senator Bartlett, do you have some questions?

Senator Bartlett. A few, only.

ALASKA SALMON

Mr. McKernan, the Alaska salmon fishery is the greatest in the world, is it not?

Mr. McKernan. I was referring to salmon in general, in a generic sense.

Senator Bartlett. I was sure of that.

Mr. McKernan. And I am sure the chairman was also.

FISH PROTEIN CONCENTRATE

Senator Bartlett. I just wanted the record completely straight on that point. First, Mr. McKernan, I want to congratulate the Fish and Wildlife Service upon its continuing and persistent efforts to put fish flour in a form that will be acceptable to the Food and Drug Administration.

So far as I am concerned, right now, it is most attractive in appearance and magnificent in its bodybuilding results. I think it should be approved as it is. But since that is not the case, I am glad to learn that you are working so diligently to obtain the blessing of the Food and Drug Administration. We all know what a wonderful source of protein this is and how it could be used especially in those nations where proteins are in short supply.

North Pacific Research Vessel

Where is this North Pacific research vessel, to which you referred, to be built?

Mr. McKernan. We have not yet advertised for construction bids, Senator Bartlett, so we do not know what yard will be the successful bidder at the present time.

Senator Bartlett. There is no contract yet?

Mr. McKernan. There is no contract yet.

Operations in American Samoa

Senator Bartlett. Are you operating in American Samoa?

Mr. McKernan. Not directly, Senator Bartlett. But we have carried out research in waters adjacent to American Samoa in cooperation with the government of Samoa.

As you know, the Samoan government operation is coordinated through the Department of Interior, so we are in close contact with their government, and we do attempt to cooperate very closely with them in the development of their fisheries programs.

Senator Bartlett. I asked that question because it was my recollection that Governor Lee testified yesterday that the Fish and Wildlife Service was going to put a vessel down there or do some kind of work.

Mr. McKernan. We have been cooperating with Governor Lee in the development of proposals necessary to enhance the fisheries in American Samoa.

Technicial Assistance to South American Countries

Senator Bartlett. Are we giving any technical, scientific, or related assistance to Peru, Ecuador, Chile, in aiding them to develop their fisheries?

Mr. McKernan. Indirectly we are, both through the Food and Agriculture Organization of the United Nations and through the Special Fund of UNESCO. We supply considerable amounts of funds in both of these particular areas, and there are projects in Ecuador and Peru under these particular programs. We are not dealing directly with them, but on the other hand, famous American scientists have collaborated with the fisheries experts in these countries in setting up programs, including some people from our own staff and such men as Dr. Milner B. Schaefer, and others from the Scripps Institution of Oceanography.

There is increasing cooperation between these people and the United States in this area.

INTER-AMERICAN TROPICAL TUNA COMMISSION

Ecuador is a member of the Inter-American Tropical Tuna Commission.

Senator BARTLETT. Are Federal funds being allocated to assist in this?

Mr. MCKERNAN. Federal funds are being used through our contributions to the United Nations organizations.

Senator BARTLETT. There are no direct contributions insofar as you know by the State Department or the Interior Department?

Mr. MCKERNAN. No. Interior Department has none. I do not believe there are any AID programs in fisheries at the present time, so I do not believe that the State Department is contributing directly now. I believe they have in the past. In fact, I am quite sure they have in the past.

SEIZURE OF AMERICAN VESSELS

Senator BARTLETT. We have had considerable difficulty with some of the maritime nations in South America, have we not, Mr. McKernan, in respect to their seizure of American fishing vessels far beyond the 3-mile limit?

Mr. MCKERNAN. Yes. The three nations you mentioned, the so-called CEP countries, Chile, Ecuador, and Peru, have claimed a 200-mile jurisdiction over fisheries. So we have had considerable trouble and they have intermittently taken our boats operating in the high seas off their coast. That is, from water we consider to be the high seas.

Senator BARTLETT. They have subjected them to fairly large fines in some cases, have they not?

Mr. MCKERNAN. That is correct. And they have held the boats in port and confiscated the catch. So they have caused considerable economic loss to our tuna industry.

U.S. FISHERY PRODUCTION

Senator BARTLETT. You were discussing with Senator Mundt, awhile ago, how the United States is situated in respect to modern vessels for high sea fishery. Can you just tell us, in terms of fishery production, how the United States is faring vis-a-vis the other principal producers?

Mr. MCKERNAN. Well, we have not been doing too well, I am sorry to say.

We have gone from second place to fifth place in about the last 7 years. Such nations as the U.S.S.R. and Japan have continued to put considerable amounts of their resources into new fishing vessels and into expanding their high seas fishing fleets.

Now what this means is that many countries of the world are now realizing that there are great protein resources in the sea and they are willing to invest in these resources.

Many of these large fishing nations are fishing in practically all oceans of the world, including the Antarctic, Indian Ocean, and the South Atlantic and the tropical Atlantic. You find the Japanese flag in all these areas, and they are expanding their fisheries to a tremendous degree.

PRODUCTION STABILITY

Our fisheries, on the whole, are not expanding, to speak of. We are staying about at a level basis. We in Government, in cooperation with industry and, I might add, with the assistance of a number of people in the Congress of the United States, especially yourself, are doing a great many things to try and stimulate the development of modern U.S. fleets and expand our fisheries.

Senator BARTLETT. Our production, you say, then remains relatively stable while the catches of such nations as the U.S.S.R. and Japan are accelerating at a very fast pace?

Mr. MCKERNAN. Yes. Perhaps the best example of this, Senator Bartlett, would be to point out in the last decade world fish production has doubled, whereas our own fish production has increased in the neighborhood of something like 5 percent.

WORLD FISHING POTENTIAL

Incidentally, scientists estimate, and I generally agree with these estimates, that the sea can probably produce in a general order of 5 to 10 times as much protein in the form of fish and fishlike products as it is doing at the present time.

Senator BARTLETT. Isn't it true, however, that in particular areas there is such serious overfishing that the supply may not only be depleted but exhausted?

Mr. MCKERNAN. Yes; the supply of certain special species—in this regard, conservation programs, programs of management to sustain the optimum yield are necessary. In principle, these programs are somewhat like the programs applied to the land and to herds of cattle and sheep and other domestic animals in our own country. That is, we apply the same kind of biological mathematics to ocean populations as we apply to populations of land animals.

Senator BARTLETT. Everyone knows, Mr. McKernan, that the Fish and Wildlife Service, more particularly the Bureau of Commercial Fisheries, has a large and ever-increasing responsibility, with the advent of these foreign fleets, of managing and conducting enforcement activities in the Bering Sea, in the Gulf of Alaska. We have noted during the last several years the big Soviet and Japanese fleets streaming there.

MANAGEMENT AND ENFORCEMENT PROGRAM

How much money for management and enforcement did you ask for in this budget?

Mr. MCKERNAN. There is no increase in the budget, Senator Bartlett, and at the present time, we are spending about $400,000 for management. This involves the enforcement aspects of all of the eight international fisheries commissions in which we are a participating nation. This enforcement program takes place in the Grand Banks area, in the North Pacific area, and we anticipate enforcement in the tropical Pacific area with tuna and in other places as well, Senator Bartlett.

PROGRAM IN GULF OF ALASKA, AND BERING SEA

Senator BARTLETT. Do you have enough money, in your judgment, Mr. McKernan, in this budget, for the management and enforcement of the Gulf of Alaska and the Bering Sea?

Mr. MCKERNAN. The Gulf of Alaska is a very critical area right at the present time. You may be aware, Senator Bartlett, that we have asked the Coast Guard to put some additional vessels and airplanes in this area because of this very critical matter of joint fisheries for halibut in the Bering Sea.

The United States needs to enforce the regulations in the Bering Sea as we never have before. In other words, it is a new responsibility. The answer is that we are tight on money for enforcement in the Gulf of Alaska and the Bering Sea area.

Senator BARTLETT. How much money could you use effectively in that activity during the coming fiscal year?

Mr. MCKERNAN. I could use an additional $100,000 to good advantage. But this is not in the President's budget this year.

Senator BARTLETT. Will you submit for the record an explanatory statement, perhaps, of why you need this $100,000 and what you would use it for?

Mr. MCKERNAN. Yes, sir; I will be glad to.

(The statement referred to follows:)

MANAGEMENT AND ENFORCEMENT NEEDS

An increase of $100,000 and four additional permanent positions would provide a more adequate Bureau program for the enforcement of international fisheries regulations and the surveillance of foreign fishing activities in the Alaska area.

The Bureau of Commercial Fisheries, the U.S. Coast Guard, and the Bureau of Customs have joint responsibility for enforcing various acts and regulations which implement the several international fishery treaties to which the United States is a party in the North Pacific Ocean off the coast of Alaska. These treaties include: the International Pacific Halibut Convention, the North Pacific Fur Seal Convention, the International North Pacific Fisheries Convention, and the International Whaling Convention. The Bureau's enforcement program objectives are designed to insure observance of the provisions of these treaties, prevent violations of implementing laws and regulations, and provide data on foreign fishing trends and movements for use in connection with provisions of existing treaties and future treaty negotiations.

Developments contributing to the need for additional patrol in the Bering Sea and Gulf of Alaska are (1) special regulations for halibut fishing in Bering Sea, (2) a tremendous increase in Japanese and Russian fishing requiring more effective surveillance to satisfy the concern and interest in these operations by Members of Congress, the officials of the States, and the general public, as well as the needs of the Bureau, (3) Soviet entry into the king crab fishery in the Kodiak area with resultant gear conflicts with U.S. king crab fishermen, (4) violations of territorial waters by foreign vessels, and (5) questionable practices in the taking of whales by foreign vessels.

In view of these developments, each year, beginning in 1962, the Coast Guard has increased its aerial and sea patrols in the Bering Sea and Gulf of Alaska. The Bureau's contribution to this cooperative effort with the Coast Guard involves joint planning; providing qualified fishery management agents to accompany fishery surface patrol units and most of the low-level aircraft patrols; and the conduct of a limited sea patrol with a Bureau vessel.

The Bureau has already taxed its limited facilities to the fullest extent possible. An increase of $100,000 will be used to renovate the Bureau patrol vessel *John R. Manning* to make it suitable for year-round operations in the hazardous Alaskan waters; for increased costs involved in operating the vessel on a year-round basis instead of at the current 5-month level; for the salaries of

two additional fishery management agents needed to provide enforcement and surveillance specialists aboard all Coast Guard fishery patrol vessels in the light of increased patrol by the Coast Guard; and to employ two additional clerks to compile and process the increased data resulting from intensified patrolling operations.

The Bureau vessel, used to supplement the patrol operations conducted by the Coast Guard, is needed to observe foreign fishing operations at close range and over longer continuous periods of time than is feasible or economical with Coast Guard ships of greater size, with larger crews and much larger operating costs. Close range observation will permit identification of species and will provide information regarding the compliance of foreign fishermen with international treaty obligations.

Shellfish Explorations in Gulf of Alaska

Senator Bartlett. I remember that you asked at one time for an appropriation which may be in this budget, of an item of $70,000 for shellfish explorations in the Gulf of Alaska. Is that a budgeted item?

Mr. McKernan. Yes, Senator Bartlett.

Senator Bartlett. Was it the last year?

Mr. McKernan. If my memory serves me correctly, Senator Bartlett, this committee considered adding $140,000 to our budget last year, but it was not approved.

Senator Bartlett. And you are asking now for $70,000?

Mr. McKernan. We are now asking for $70,000 in our budget. The additional $70,000, of the $140,000 which you mention, could be utilized to good advantage.

Senator Bartlett. Will you be good enough, with the Chairman's permission, to place in the record a statement explaining the need for this $70,000?

Mr. McKernan. Yes, sir.

(The statement referred to follows:)

KING CRAB AND SHRIMP

Only work related to king crab and shrimp, could be undertaken to develop localized small boat fisheries in Alaska with the modest amount in the Bureau's budget request for fiscal year 1965. The program proposed herein financed with an additional $70,000, for a total of $140,000, and three additional permanent positions would be undertaken with a wide variety of gear especially adapted for small fishing vessels with crews of only one or two men. This program would be designed to permit small boat fishermen to fish all resources available when salmon are not running. It will lessen the extremely unhealthy dependency of the Alaskan fishermen upon single highly seasonal runs of fish. The gear used would include gulf style shrimp trawls, small beam trawls, scallop dredges, king crab pots, and shrimp and octopus traps. Every effort would be made to develop fisheries which would require only the least expensive gear in order for small boat fishermen to outfit for new fisheries at minimum cost.

A limited amount of previous exploratory work has indicated that there may be a good potential for large size shrimp which are available only to traps. Adequate delineation and commercial development of these and other resources depends on the use of small boats, which can be easily maneuvered and the gear set in confined areas. The octopus potential is largely unknown and development of this fishery would lessen the dependence of Alaska halibut fishermen on Japan as a source of supply for this important bait, millions of pounds of which are imported annually.

All exploratory work would be conducted with a chartered vessel. Careful records of catches would be maintained and widely publicized.

Test landings, as a result of intensive production-type fishing efforts, would be an important part of this program and would be carried out in cooperation with the Bureau's technologists. Demonstration cruises would be under-

taken to acquaint local fishermen with types of gear and fishing techniques entirely new to them.

Development of local fisheries, especially during the off season for salmon, would be of tremendous benefit to the small boat fishermen as well as to rather isolated communities where large shoreside facilities are unavailable.

Alaska is on the verge of a continuing influx of new pioneers, and the development of fisheries requiring low volume, high valued products, harvested with a minimum amount of labor and investment, would be a tremendous aid in establishing a firm economy of which new residents, as well as currently unemployed residents, could readily become a part.

KETCHIKAN, ALASKA, LABORATORY PROGRAMS

Senator BARTLETT. Now are you asking for any money for the Ketchikan Laboratory?

Mr. MCKERNAN. No, Senator Bartlett. There is not any increase in the budget for the Ketchikan Laboratory. This is a technological laboratory of the Bureau.

Senator BARTLETT. Again, relying upon a memory that may be deficient, I seem to recall that last year the Senate committee added some money to the bill for that Laboratory and that it was deleted in conference. Does that coincide with your recollection?

Mr. MCKERNAN. Yes, Senator Bartlett, $75,000 was added last year and that was disallowed in conference.

Senator BARTLETT. And that is not in the budget now?

Mr. MCKERNAN. No.

Senator BARTLETT. Do you still think that is an essential item?

Mr. MCKERNAN. Yes; I think it is an important item.

Senator BARTLETT. Will you again place in the record your reasons for so stating?

Mr. MCKERNAN. Yes, Senator Bartlett.

(The information referred to follows:)

TECHNOLOGICAL RESEARCH ON ALASKAN FISHERIES

It is important that an increase of $75,000 and two permanent positions be made available for research on utilization and quality improvement of Alaskan shellfish in fiscal year 1965. The Alaskan shellfish industry is now faced with increasing foreign competition and with product quality problems that threaten the existence of its shellfish products in the marketplace. This program will be closely coordinated with our shellfish exploratory fishing program and both will initiate research that is essential to the future livelihood of this growing industry.

The eastern Pacific is yielding shellfish of significant economic importance to the Alaskan fishing industry. In fact, since 1955, the landings of king crab have risen from under 10 million pounds to approximately 75 million pounds. During this same period, a new shrimp fishery was introduced and it now produces over 17 million pounds of product annually.

This almost spectacular growth has brought to light some serious technological problems that serve as a deterrent to successful and profitable marketing of Alaskan shellfish. Although king crab, shrimp, tanner crab, and other shellfish caught in Alaskan waters are of high nutritive value, they are nevertheless quite perishable and in fact undergo quality changes not found in other seafoods. Discoloration of the meat of king crab and tanner crab is a major problem that must be overcome. Also freezing of these species as well as of shirmp causes excessive drip, or loss of free fluids, after thawing. The final product becomes soft and mushy and loses its firm texture and desirable taste.

In addition to these quality problems, which threaten the acceptability of Alaskan shellfish products in the marketplace, the industry is faced with rising production costs. Seasonal fluctuations in supply, the lack of satisfactory long-term storage methods, and the absence of mechanized processing tech-

niques all contribute to the seriousness of this problem. Further cause for concern is the increasing competition from Russian and Japanese fishermen employing modern factory vessels to harvest and process shellfish in waters close to our Alaskan shores.

With the $75,000, a new program on shellfish processing and utilization would be initiated at the Bureau's technological laboratory, Ketchikan, Alaska. These investigations would (1) study the physical changes that occur in these species during freezing, frozen storage, and thawing and develop methods, i.e., chemical inhibitors or new processes, for minimizing quality loss; (2) develop new products to permit production of Alaskan shellfish in different and attractive forms; and (3) introduce engineering and processing procedures to increase production output and trim rising operating costs. Methods of mechanizing the picking and packing of crabmeat are particularly important here.

Senator BARTLETT. I have no further questions, Mr. Chairman.

Chairman HAYDEN. Senator Young?

Senator YOUNG. No; I have no questions.

Chairman HAYDEN. Thank you.

BUREAU OF SPORT FISHERIES AND WILDLIFE

STATEMENTS OF DANIEL H. JANZEN, DIRECTOR; ABRAM V. TUNISON, ASSOCIATE DIRECTOR; LANSING A. PARKER, ASSOCIATE DIRECTOR; RAYMOND E. JOHNSON, ASSISTANT DIRECTOR, SPORT FISHERIES; NOBLE E. BUELL, ASSISTANT DIRECTOR, WILDLIFE; JAMES T. McBROOM, ASSISTANT DIRECTOR, TECHNICAL SERVICES; WESLEY E. CORBIN, ASSISTANT DIRECTOR, ADMINISTRATION; AND RAYMOND E. PODOLAK, CHIEF, DIVISION OF BUDGET AND FINANCE

1965 BUDGET ESTIMATE

Chairman HAYDEN. The budget estimate for fiscal year 1965 for "Management and investigations of resources, Bureau of Sport Fisheries and Wildlife," is $34,419,000, an increase of $3,829,100 over the amount appropriated for fiscal year 1964. The justifications for this request will be placed in the record at this point.

(The justification statement referred to follows:)

HIGHLIGHT STATEMENT

The purpose and long-range objectives of the program for management and investigations of resources are the perpetuation, use, and enjoyment by the people of the sport fish and wildlife resources of the Nation. These objectives are attained through production and distribution of hatchery fish; the maintenance of a nationwide system of wildlife refuges; the regulation of migratory bird hunting; and the management of fish and wildlife populations by scientific research and methods, all conducted in cooperation with the States and private organizations.

In 1964, appropriation increases provided for operation of new stations and facilities and expansion of programs in certain areas to better meet Bureau responsibilities. Funds were provided for operation of new facilities at 36 fish hatcheries and planning for the National Fisheries Center and Aquarium. Fishery management services were expanded by five additional cooperative fishery units and two fishery management projects. Fishery research was expanded in the fields of pathology, husbandry methods, reservoir, marine, genetics and pesticides, and reservoir research in the Missouri River Basin. Additional funds were provided to operate new refuges, and to improve maintenance at all refuges. The enforcement and migratory game bird surveys program was expanded. Pro-

vision was made for premium pay of game management agents. Wildlife research was expanded in the areas of waterfowl management, control methods, diseases-parasites, and pesticides. The river basin studies program received additional funds for inspection of drainage applications under the wetlands preservation program.

The 1965 estimates include increases for operation of new facilities at fish hatcheries, wildlife refuges, and fishery research and wildlife research laboratories; a more adequate program of management of refuges; replacement of aircraft used in law-enforcement activities and an acceleration of pesticides research.

The estimates for this appropriation include a net increase of 62 authorized permanent positions. This increase is offset by reductions in permanent positions in other appropriations. There is no increase over 1964 in total authorized permanent positions of the Bureau.

There is no substantive language change.

Management and investigations of resources

Appropriation, 1963	$27,729,500
Comparative transfer from "Resources management, Bureau of Indian Affairs"	+92,556
Transferred to "Operating expenses, Public Buildings Service," General Services Administration	−34,616

Total available, 1964	30,559,727

SUMMARY OF INCREASES AND DECREASES, 1965

Management of fishery resources:	
To provide for increased pay costs for fiscal year 1964 positions	+$66,000
To provide for operations of new hatcheries and other new facilities	+325,000
To provide for wage board pay increases	+101,000
Total	+492,000
Extension and training: To provide for increased pay costs for fiscal year 1964 positions	+14,000
Fishery research:	
To provide for increased pay costs for fiscal year 1964 positions	+29,000
To provide for operation of new facilities	+87,000
To expand research on effects of pesticides	+680,000
Total	+796,000
Administration of wildlife resources:	
To provide for increased pay costs for fiscal year 1964 positions	+140,400
To provide management of new refuges	+512,119
To provide more adequate management at existing refuges	+229,173
To provide for employees' compensation payments	+25,881
To provide for replacement and overhaul of aircraft to meet FAA standards	+86,200
To provide for wage board pay increases	+81,000
Total	+1,074,773

Management and investigations of resources—Continued

Wildlife research:	
To provide for increased pay costs for fiscal year 1964 positions	+58,500
To provide for operation of new facilities	+155,000
To provide for acceleration of pesticide wildlife studies	+1,250,000
Total	+1,463,500
River basin studies: To provide for increased pay costs for fiscal year 1964 positions	+19,000
Net increase, 1965	3,859,273
Budget estimate, 1965	34,419,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

(A) FISH HATCHERIES

The estimate for 1965 is $7,290,000 an increase of $492,000 over 1964. The increase includes $66,000 for increased pay costs, $325,000 and 12 positions for operation of new hatcheries and new facilities constructed at existing hatcheries, and $101,000 for increases in compensation of unclassified wage board positions.

Need for increase

(a) *Operation of new hatcheries and new facilities, $325,000.*—Funds for construction of new hatcheries and expansion or improvement of rearing facilities at existing hatcheries have been included in appropriations for past years. Thirty-five stations are included in this construction program. They are located in areas where the need for fish for stocking purposes has far exceeded production. The construction program will greatly expand facilities for the propagation of fish at these hatcheries. The estimate will permit use of some of the new facilities at 34 of these hatcheries, and will be utilized for salaries, fishfood and other operational expenses, and costs of distributing the increased production of fish. The estimate for the remaining new Wytheville, Va., hatchery is for personnel and materials needed to prepare it for operation. No fish production is expected at this hatchery in 1965. The increase is broken down by hatcheries as follows:

Operation of new hatcheries and new facilities constructed at existing hatcheries

Hatchery	Available 1964		Increase		Estimate 1965		When operating at 100 percent of capacity	
	Operation costs	Estimated production (pounds)	Operation costs	Estimated production (pounds)	Operation costs	Production (pounds)	Operation costs	Estimated production (pounds)
Carbon Hill, Ala.	$26,350	4,000	$4,000	2,000	$30,350	6,000	$30,350	6,000
Marion, Ala.	81,700	10,000	10,000	2,000	91,700	12,000	114,700	17,600
Alchesay, Ariz.	103,400	90,000	10,000	10,000	113,400	100,000	152,000	150,000
Greers Ferry Dam, Ark.	30,000		20,000	10,000	50,000	10,000	138,000	150,000

Total	2,142,100	1,796,500	325,000	252,000	2,467,100	2,048,500	3,273,250	3,050,800

NOTE.—All cost figures exclude major maintenance and equipment items.

(*b*) *Wage board increases, $101,000.*—Employees occupying unclassified positions in the trades, crafts, or occupations are compensated at hourly rates of pay fixed and adjusted from time to time to correspond with prevailing rates in the local recruiting areas, through wage rate surveys and wage board action. Unlike classified positions where salary increases are offset by normal turnover, with replacements usually starting at the base salary for the grade, replacement employees in the unclassified group must be recruited and hired at the currently approved rate, with the result that there is no salary saving. The estimate of $101,000 will partially cover the increased cost of these positions.

The total increase of $492,000 is broken down by functions as follows:

Functions	Available, 1964	Increase, 1965	Estimate, 1965
Production	$3,501,000	$428,800	$3,929,800
Maintenance	1,954,300	57,700	2,012,000
Recreation	295,500	3,300	298,800
Training	197,000	2,200	199,200
Supervision	850,200	----------	850,200
Total	6,798,000	492,000	7,290,000

Plan of work

The $7,290,000 estimate is for costs of operation and maintenance of hatcheries and distribution of fish produced, operation of the existing aquarium, and planning for the new National Fisheries Center and Aquarium in Washington, D.C. The Bureau works in connection with all States in the distribution of hatchery-reared fish to insure that stocking will conform with State management plans and to avoid duplication of effort.

(B) ENFORCEMENT OF BLACK BASS LAW

The estimate of $18,000 and two permanent positions is the same as last year. Pay costs are being absorbed.

Plan of work

The estimate of $18,000 is used for enforcement of the black bass law of 1926, as amended (16 U.S.C. 851–856). This law prohibits interstate traffic in black bass and all other fishes taken contrary to the laws of the State in which taken.

2. Extension and training

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
Extension and training	$646,887	$895,000	$909,000	+$14,000	+$14,000	----------

[1] To provide for increased pay costs for fiscal year 1964 positions.

The estimate of $909,000 is an increase of $14,000 over 1964. There is no increase in permanent positions.

Need for increase

The increase of $14,000 is needed for increased pay costs.

Plan of work

(*a*) *Technical assistance in sport fishery management.*—The estimate of $527,000 will provide technical guidance for approximately 250 federally owned areas and 45 Indian reservations. Waters in these locations are among the finest in the Nation and are expected to support an increasing load of sport fishing. There is a positive Federal responsibility for their management, since State jurisdiction does not extend to many of the national parks, most Indian reserva-

tions, certain of the Department of Defense areas, and is limited on certain of the national wildlife refuges. On many areas, Federal and State agencies cooperate in the management of sport fishery resources. The Bureau has working agreements with the Department of Defense, the National Park Service, the Forest Service, and the Bureau of Indian Affairs. In addition, it has field level agreements with 18 of the Indian tribes.

Giving technical assistance to the Indian tribes has resulted in greatly increased recreational opportunities to visitors of the reservations and has added to the income of the tribes through employment of its members as guides and operators of concessions, and through development of physical facilities such as boat docks, parking areas, campgrounds and trails for fishermen, and dams to impound new water areas. Nearly 400,000 man-days of fishing were provided in 1962. The success achieved at the Fort Apache Reservation in Arizona where sport fishing is credited with generating 75 percent of an income of $860,000 in 1962, has led other tribes to ask for assistance in conducting similar programs. Fish from the Federal hatcheries are used to maintain the fishing, and technical guidance assures their being stocked effectively on the reservations.

More than 100 Department of Defense areas depend upon Bureau biologists for technical guidance in the development and maintenance of recreational fishing. About half of these installations completed cooperative plans for fish and wildlife management and 85 percent of these call for technical assistance from the Bureau. During fiscal year 1964 additional plans, which include an inventory of fish and wildlife resources, are being developed in cooperation with State conservation agencies and defense establishments, as called for by the act of September 15, 1960 (16 U.S.C. 670a–e).

Several activities of national significance will be carried on in cooperation with the State fish and game agencies. These include fishery programs of the Upper Mississippi River Conservation Committee and the Colorado River storage project.

Fishery management services to be provided the public include reports, circulars, and correspondence related to sport fishery resources. Several thousand letters will be answered and information will be furnished the public in a variety of forms. Fishery circulars on management subjects, such as management of ponds, use of chemicals in fish control, improved stocking procedures, and habitat improvements are planned for production in 1965. Public interest in outdoor recreation is increasing and leads to many requests to the Bureau for information on sport fishery subjects.

(*b*) *Better fishing from hatchery fish.*—The estimate of $22,000 will be applied toward a more effective use of hatchery fish. More than 100 national fish hatcheries are providing fish for stocking public and private waters of this country. Although a portion of the total hatchery production is allotted to the States for stocking under cooperative agreements, the Bureau maintains an interest in the contribution which all of its fish make to the betterment of sport fishing. Within the funds specified, limited guidance will be provided in the formation of stocking plans, determination of the need for hatchery fish and assistance in problems of fish distribution and selection of broodstocks. The results of stocking will be evaluated in terms of sport fishing and fish survival. Improved stocking plans will make for better sport fishing and increase the effectiveness of the hatchery operation.

(*c*) *Cooperative fishery units.*—The estimate of $360,000 will maintain the cooperative fishery unit program at the 1964 level. Each cooperative fishery unit functions under an agreement involving the Bureau, a university, and usually, the fish and game department of the State where the unit is located. The program emphasizes the training of fishery scientists for employment by State and Federal agencies and at the same time, the performance of beneficial fishery research and management work. There has been a continuing shortage of fishery biologists which these training programs seek to alleviate. The Federal Government is the largest single employer in the field and it has a responsibility to contribute to the training of these scientists. The ratio of funds is approximately half State to half Federal. The units provide opportunity for seasonal employment of students who are seeking careers in fisheries. Surveys of fishery resources on large Federal holdings, development of new management techniques, studies of fish behavior, life histories and development of recreational fishing in new impoundments are subjects receiving attention by unit staff members and graduate students under their supervision. Twelve units are presently in operation.

The estimate for 1965 will meet program goals, to the following extent:

(*a*) *Technical assistance in sport fishery management.*—33 percent of presently known requirements. Cooperative work with the Indian tribes, 60 percent (additional tribes are seeking help); with the national wildlife refuges, 20 percent; with the national parks, 10 percent; with the Department of Defense, 30 percent; and with the agricultural agencies, 5 percent.

(*b*) *Better fishing from hatchery fish.*—Guidance in the stocking of hatchery fish will be conducted at about 10 percent of the program goals.

(*c*) *Cooperative fishery units.*—The 12 units, now established, will be operated in 1965. These represent 66 percent of the program goal.

Fishery management services provided to Federal areas and Indian reservations

	Actual, calendar year 1962	Scheduled, calendar year 1963	Estimate, calendar year 1964
Areas receiving management assistance	277	290	295
Federal areas	239	248	250
Indian reservations	38	42	45
Acres of water under management assistance	550,000	600,000	610,000
On Federal areas	420,000	460,000	470,000
On Indian reservations	130,000	140,000	140,000
Reports submitted	266	300	310
For Federal areas	232	250	260
For Indian reservations	34	50	50
Man-days of fishing provided	2,926,000	3,400,000	3,600,000
On Federal areas	2,530,000	3,000,000	3,150,000
On Indian reservations	396,000	400,000	450,000

Through increased efficiency it is expected to increase the level of the program by the continued standardization of reports to be submitted. The establishment of the 12 new cooperative fishery units as authorized by Congress has been accomplished without adding additional supervisory or administrative positions. Close cooperation with other Federal and State agencies in making surveys and in the exchange of data gathered is also saving man-hours of labor which can be directed to filling additional requests for assistance.

3. Fishery research

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
Fishery research	$1,883,572	$2,053,000	$2,849,000	$796,000	$29,000	$767,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

The estimate of $2,849,000 is an increase of $796,000 over 1964. The increase includes $29,000 for pay act costs and $767,000 and 16 permanent positions for expansion of the program.

Need for increase

An increase of $29,000 is needed for pay act costs and $767,000 and 16 permanent positions are needed as follows:

Fish-pesticide relationships.—$680,000 and 13 permanent positions are needed for accelerated studies of fish-pesticide relationships and for operational pro-

gram surveillance. The increase will permit expansion and improvement of existing experimental facilities and recruitment of additional professional and supporting staff to investigate the following promising areas: the detoxication of pesticidal chemicals in water by micro-organisms as a means of rehabilitation of treated aquatic habitat; preliminary screening of new pesticide chemicals to determine their effect on fish and other aquatic organisms under prescribed, controlled conditions; the physiology of translocation, metabolism, and elimination of ingested or absorbed pesticide chemicals at acute and chornic levels; and the relation of water qualities on chemical activity and toxicity. Histopathological examination of experimental tissues and needed chemical residue analyses will be done by contract.

Large areas of forested and agricultural land have been and will be treated with pesticides in tremendous quantity and great variety of formulation and method. The direct and indirect effects of these operations upon fish and wildlife are unknown and cannot be predicted even roughly, on the basis of present knowledge or limited experiments. The increase will initiate a cooperative program of field surveillance of major operational pesticide applications, designed to record consequences to fish and wildlife and to forestall serious detriment to these resources through development of safer pest control practices. Residue analysis of field specimens will be accomplished by contract.

Genetics and selective breeding.—$50,000 and two permanent positions will place the Fish Genetics Laboratory on an operating basis, provide full-year salaries for personnel employed in fiscal year 1964 and permit a first-stage selection of brood stock and progeny in available rehabilitated facilities, in anticipation of completion of the planned 360-unit fish holding structure.

Husbandry methods.—$37,000 and one permanent position for fish husbandry research laboratories will provide for required additional maintenance, utility, and operating costs following from this year's completion of expanded facilities at the Southeastern Fish Cultural Laboratory, Marion, Ala., and the Convict Creek Experiment Station, Bishop, Calif.

4. Administration of wildlife resources

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Wildlife refuges	$8,518,000	$9,142,427	$10,091,000	$948,573	$100,400	$848,173
(b) Management and enforcement of migratory bird and Lacey acts	2,952,766	3,161,800	3,288,000	126,200	40,000	86,200
Total	11,470,766	12,304,227	13,379,000	1,074,773	140,400	934,373

[1] To provide for increased pay costs for fiscal year 1964 positions.

(A) WILDLIFE REFUGES

The estimate of $10,091,000 is an increase of $948,573 and 18 permanent positions over 1964, of which $100,400 is for increased pay costs and $848,173 and 18 permanent positions are for other increased costs and expansion of the program.

Need for increase

The increase of $848,173 and 18 permanent positions is needed for the following purposes:

(1) $81,000 for wage board increases.

(2) $25,881 for an increase in employees' compensation payments.

(3) $229,173 and seven permanent positions for increased protection of refuge areas and better handling of visitors.

(4) $512,119 and 11 permanent positions for management of 9 new refuges, and waterfowl production areas in the State of Nebraska, as follows:

State	Refuge	Positions	Estimate, 1965
Alaska	Izembek	1	$50,000
Colorado	Alamosa	1	60,000
Delaware	Prime Hook	1	35,000
Georgia	Harris Neck	1	54,000
Maryland	Eastern Neck	1	56,119
Nebraska	Waterfowl production areas	2	30,000
Nevada	Pahranagat	1	40,000
New Jersey	Great Swamp	1	42,000
North Carolina	Pungo	1	90,000
Oregon	Willamette	1	55,000
Total		11	512,119

The total increase of $948,573 is broken down by functional elements involved in management of the national wildlife refuge system as follows:

Function	Actual, 1963	Available, 1964	Increase	Estimate, 1965
(1) Maintenance	$3,834,892	$4,077,467	$228,273	$4,305,740
(2) Management:				
Croplands	1,808,000	1,912,740	199,500	2,112,240
Timberlands	400,000	493,050	13,900	506,950
Grasslands	433,000	463,150	37,100	500,250
Marsh and water	976,000	1,089,370	93,900	1,183,270
(3) Protection	764,000	779,198	184,019	963,217
(4) Recreation	292,000	293,010	166,000	459,010
(5) Employees' compensation	10,108	34,442	25,881	60,323
Total	8,518,000	9,142,427	948,573	10,091,000

(1) *Maintenance, $228,273.*—

(*a*) 9 new refuges, and waterfowl production areas in Nebraska $138,100
(*b*) Existing refuges 25,173
(*c*) Pay act and wage board increase costs 65,000

The $138,100 is needed to initiate maintenance services on nine new refuges, and on approximately 44,000 acres of waterfowl production areas in the State of Nebraska. Such services are necessary to take care of facilities acquired and constructed on newly acquired areas. The $25,173 is needed to improve maintenance services on the 289 existing refuge areas and eliminate a backlog of work. The $65,000 is needed for pay act costs for permanent personnel on existing refuges and periodic wage board pay adjustments based on local and areawide surveys.

(2) *Management, $344,400.*—

(*a*) New refuges and waterfowl production areas $260,400
(*b*) Pay act and wage board increase costs 84,000

The increase for new areas includes $155,500 to initiate management of croplands to feed waterfowl and other wildlife; $7,900 to manage timberlands to improve wildlife food and cover; $28,100 to improve grassland habitat to create favorable nesting conditions for waterfowl and upland game birds; and $68,900 to manage the marsh and water habitat which is the most basic requirement for preserving the waterfowl resource.

(3) *Protection, $184,019.*—

(*a*) New refuges and waterfowl production areas $86,119
(*b*) Existing refuges 72,500
(*c*) Pay act and wage board increase costs 25,400

The $86,119 is needed to initiate protection activities on new refuges and waterfowl production areas. This includes patrol to prevent trespass and enforce migratory game bird regulations and provide fire control and protection from vandalism and other destructive forces. The $72,500 is needed to intensify protection activities on the 289 existing refuges and on approximately 491,640 acres of waterfowl production areas in fee or under easement. The refuge system sustains about 100 wild fires annually which damage approximately 17,000 acres of wildlife habitat. The potential loss is far greater.. The increase will permit more adequate suppression and presuppression activities, such as improved firebreaks, more adequate firefighting equipment, and improved firefighting training. Also needed are more intensive patrol activities to control trespass, prevent game law violations, reduce vandalism and better control ever-increasing public use activities amounting to 12 million visitors annually.

(4) *Recreation, $166,000.*—

(*a*) New refuges	$27,500
(*b*) Existing refuges	131,500
(*c*) Pay act and wage board increase costs	7,000

The $27,500 is needed to carry out supervisory activities in connection with the visitor load on new refuges; $131,500 is needed on existing refuges to meet the heavy demands of the public to picnic, swim, boat, fish, sightsee, and observe waterfowl and other wildlife. There has been a growing awareness of the pleasure to be found in the great out of doors, and the public in seeking it out, is turning increasingly to federally owned lands. As public use expands on lands in the refuge system, facilities must be developed to provide for such use and to concentrate it in those areas where it does not interfere with waterfowl and wildlife management. Such facilities include adequate access roads, parking areas, picnic sites, boat docks, launching ramps, swimming beaches, and water and sanitary facilities. An excellent opportunity exists through a recreational program to carry out conservation education activities. To provide the public with the opportunity to learn about conservation first hand, in natural surroundings, the facilities must first be developed to handle visitors in a way that does not detract from the natural resource.

(5) *Employees' compensation payments, $25,881.*—This increase when added to the $34,442 available in 1964, will provide a total of $60,323 which is needed under 5 U.S.C. 785 to reimburse the employees' compensation fund for 1963 payments on account of the injury or death of employees after December 1, 1960.

During calendar year 1962, the Bureau's work injury frequency rate was a record low of 8.6 per million man-hours of work. This compares with a 5-year average of 11.6 for 1958 to 1962. The Bureau is working toward a goal of five or less disabling work injuries per million man-hours of work with a consequent reduction of the losses in time and money from this cause.

Plan of work

The estimate of $10,091,000 will be used for salaries and other refuge operating and management costs in carrying out the waterfowl, other wildlife, and land resource management program of the national wildlife refuge system, and for employees' compensation payments. Significant to this year's plan of work are the following factors:

(1) Continued emphasis is given to the improved management of natural resources which makes improved habitat available for waterfowl and other wildlife.

(2) Management of nine new refuges is undertaken.

(3) Management of waterfowl production areas is initiated in the State of Nebraska and expanded in North and South Dakota and Minnesota.

(4) Particular emphasis is given to the protection and recreation functions of the wildlife refuge management. These activities must be strengthened in order for wildlife management to continue to be effective in the face of ever-increasing visitor use.

(B) ENFORCEMENT OF MIGRATORY BIRD AND LACEY ACTS

The estimate of $3,288,000 is an increase of $126,200 over 1964 of which $40,000 is for pay costs and $86,200 is for replacement and overhaul of aircraft.

Need for increase

The $86,200 program increase is needed for the following: $56,000 for replacement of three overage (7 to 9 years) aircraft, and $30,200 for overhaul of engines, accessories, and instruments of three other aircraft to meet FAA maintenance standards. The aircraft to be replaced have reached and gone beyond the life expectancy for low-level flying and must be replaced to maintain the effectiveness of the program.

Plan of work

The estimate of $3,288,000 will be used for (1) the administration and enforcement of the Migratory Bird Treaty Act as amended (16 U.S.C. 703–711) and regulations promulgated thereunder to give effect to the treaties with Great Britain and Mexico for the protection of migratory birds, the Lacey Act (18 U.S.C. 42–44) regulating interstate commerce in birds and furs, and other Federal statutes enacted for the protection, conservation, and management of certain wildlife resources in the United States, the Virgin Islands and Puerto Rico; providing farmers with assistance in curbing and reducing damages caused by migratory birds; and (2) the gathering, evaluation, and application of data affecting the preservation and utilization of migratory game birds. The functional breakdown follows:

	Amount available, 1964	Estimate, 1965	Increase
Enforcement and depredations control	$2,683,800	$2,806,000	$122,200
Migratory game bird surveys	478,000	482,000	4,000
Total	3,161,800	3,288,000	126,200

Enforcement and depredations control.—The 157 U.S. game-management agents are presently employed throughout 49 States and Puerto Rico and the Virgin Islands in carrying out this program. Although often identified principally with enforcement of the Federal game laws, game-management agents engage in a variety of other management activities. They conduct migratory game-bird surveys and banding projects in the United States, Canada, and Mexico; aid farmers in control of depredations to crops by migratory birds at points of actual or potential damage; investigate, report, and act on disease, poisoning, or pollution outbreaks; investigate, inspect, and maintain continuing surveillance over the activities of more than 13,000 wildlife permitees; conduct a progressive and intensive program of wildlife conservation education. Game-management agents maintain close working relationships with the States in furtherance of a cooperative conservation program. The October 14, 1962, amendment to the Bald Eagle Act (U.S.C. 668–668d) extended protection to the golden eagle. There has been a significant increase in illegal traffic in eagle plumage. Complaints of depredations to livestock by golden eagles call for investigations of a continuing nature, increase law enforcement responsibilities, and necessitate an expansion of permit management activities. Prevention of illegal importation of game from Mexico requires a special, well-conducted program. Additional emphasis must be placed at ports of entry in this country to prevent the introduction of exotic species of mammals, fish, reptiles, or birds known to be or likely to prove dangerous to the welfare of agriculture or wildlife resources.

During the period 1952–1963 the Bureau's antimarket hunting enforcement campaign resulted in the apprehension of 372 individuals of whom 97 percent have been brought to trial and convicted. Enforcement activities in this particular field have been successful but, because of the lucrative returns involved, market hunting persists in a number of localities and continued effort is necessary to halt it.

Damages to agricultural crops by migratory waterfowl are an important management problem in many areas of the country. Trained personnel investigate areas of waterfowl concentrations where there is potential or actual damage to crops. They advise farmers and demonstrate dispersal techniques and methods including the use of pyrotechnics in herding the birds. Distribution of Government owned surplus grain for control purposes (act of July 3, 1956, 7

U.S.C. 442 et seq.) has been beneficial in protecting crops from serious losses due to depredating waterfowl. Surplus grain is also distributed where migratory waterfowl are threatened with starvation due to inclement weather (act of August 17, 1961, 7 U.S.C. 447 et seq.).

Migratory game bird surveys.—The scope of this program extends throughout the United States and from Canada to Mexico. In all the world there are no more intensive or extensive wildlife surveys than those conducted on the North American Continent and the Bureau is the principal agency involved in the program. The information and data gathered are essential to formulating migratory game bird management plans, and particularly in developing the annual hunting regulations. Waterfowl surveys are conducted throughout the year to determine the utilization of habitat as well as obtain an evaluation of the distribution of the birds and the carrying capacity of the habitat utilized. Surveys of woodcock, dove, band-tailed pigeons, jacksnipe, rails, and gallinule populations have not been conducted on the same scale as waterfowl and there is increasing need to improve the work being done. Banding programs on waterfowl and doves have been stepped-up throughout the country in accordance with Federal-State cooperative plans. The Bureau banding program is in the second 5-year phase on waterfowl on the breeding grounds in Canada. Gradually the remaining work there will shift to the more northern "bush country" where transportation problems are difficult. A small banding program of migratory waterfowl will be initiated in Mexico in 1964 to clarify further the migration routes, habitat utilization, and mortality of birds utilizing the Mexican wintering grounds. Increased emphasis is being placed on preseason and winter banding programs.

5. Control of predatory animals and injurious rodents

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost	Program
Control of predatory animals and injurious rodents	$2,647,918	$2,710,000	$2,710,000	----------	----------	----------

The estimate for 1965 is $2,710,000, the same as for 1964.

Plan of work

A major responsibility of the Bureau is to assist States, counties, municipalities, associations and individuals in protecting agricultural, industrial, and recreational resources from intolerable depredations of animal pests. The animal control program is a Federal-State-private organization partnership arrangement, with the Federal Government providing professional supervision, or demonstrational, technical, and investigative services for programs sponsored and cooperatively financed by these agencies. All possible safeguards are provided for the public, domestic animals, beneficial wildlife, and property.

The 1965 estimate covers Bureau responsibilities for mimimizing the depredations of wildlife and the diseases they transmit to man and animals. The amount requested is essential to uphold present standards of technical quality in the conduct of this Bureau's function under a constantly increasing workload.

The mushrooming human population is effecting drastic changes in both the domestic economy and the American way of life. These changes are not only bringing about vastly increased demands upon the Bureau's animal control program, but they also restrict control techniques to those compatible with multiple land-use practices. Increasing numbers of State and local agencies, recognizing the value as well as the practicality of placing operations under a unified and coordinated approach, are turning to the Bureau for assistance. With increasing public concern over careless use of pesticides and with the increasing variety of toxicants becoming available, it is essential that highly skilled and trained technicians provide close supervision over population management activities.

The remarkable growth and spread of the American population has had, as a natural consequence, an overwhelming demand for information and assistance in mitigating wildlife depredations. The Bureau's response has been to utilize every means at its disposal to reach as large an audience as possible—to encourage people to handle their own problems and provide them with recommendations that are reasonably safe and practical to use. Last year, program personnel conducted 1,445 meetings with community groups, gave 1,325 demonstrations of techniques in the field, held 230 specialized training courses for employees of cooperators, made 830 television and radio presentations, prepared 450 information leaflets and releases, showed 115 exhibits, and investigated 5,625 separate instances of serious damage. Planning for 1965 is based on demands for an increase of a third to a half in these activities merely to maintain the proportional coverage currently obtained.

The necessity for a nuisance bird control program is demonstrated by the increasing number of reports of bird damage inflicted in all parts of the United States, and corresponding requests for assistance. Nine States that tabulated available data reported annual damages to agriculture exceeding $25 million. A 1963 survey of Colorado feedlots by the State department of agriculture found 65 percent suffering damage by starlings. In addition to bird damage to agriculture, which has reached serious proportions, almost every large city has a severe bird problem consisting of roosting pigeons, starlings, and English sparrows. Recent studies indicate the diseases they carry are as serious as the filth they cause. With the introduction of jet-powered aircraft, the hazard from birds has become critical as occurrences of "bird strikes" are more frequent and far more serious.

Cooperative approval and support of the animal control program are indicated by provisions for increases of half a million dollars, making a total of $4,142,000 furnished by cooperators.

Protection of livestock and game.—Bureau share, $1,720,000. This function provides for protection of livestock and game from the large wild carnivores commonly referred to as predatory animals. The program is conducted in cooperation with States, counties, and livestock associations. This protection is aimed at maintaining a healthy livestock industry and assisting in restocking of game. Federal participation consists largely of supervision, to assure safety to humans, beneficial wildlife, and domestic animals. Cooperative participation pays for most of the salaries and expenses of trappers and hunters. The ratio between the two types of participation in 1963 was approximately 37 percent Federal and 63 percent cooperative.

Protection of crops, forage, and forests.—Bureau share, $720,000. Crop losses from wildlife, once accepted in a farming operation, can no longer be tolerated if the farmer is to remain solvent. Intensified agricultural pursuits aim to improve production and to convert low-yield submarginal lands to forests, rangeland, and soil bank retirements. Realization that the Nation's forest resources have become seriously depleted has resulted in accelerated forest plantings, and former wastelands are now valuable properties undergoing improvement programs. These activities have resulted in improved habitat conditions for many wildlife species, sometimes causing startling increases in their numbers which compounds agricultural problems.

Wildlife losses can be severe. The Bureau of Land Management estimated a loss of over $1½ million per year on reforested lands in one 20,000-acre area in western Oregon. Rodents are unbelievably destructive, causing multimillion-dollar losses to virtually every type of agricultural endeavor. Meadow and pine mice attack orchards, nurseries, and tree plantings. In much of the Northwest and Southeast, deer mice must be controlled before forest reseeding can be successful. Cotton rats, which destroy crops and pine plantings in the Southeastern and Gulf States, are increasing in these States. Pocket gophers cause extensive losses to crops, forage lands, tree plantings, and underground cables; ruin irrigation ditches and canal banks; and are a major factor in range deterioration. Woodchucks cause losses to truck crops, orchards, and forage on eastern farms. Ground squirrels are agricultural pests from the Midwest to the Pacific and the tree squirrels in parts of the East. Muskrats are a menace to farm ponds. Beaver have become intolerable pests in much of the Southeast, the Dakotas, and some Rocky Mountain States. Nutria cause major damage in sugarcane and crop fields. Porcupine damage to forests is a significant problem in the Northeastern and Western States. Rabbits feed heavily on cultivated plants, trees, and crops. Moles damage Pacific coast bulb plantings and bears

ruin timber trees in the Washington and Oregon forests. Coyotes, surprisingly, are a source of major trouble to Texas watermelon growers. One farm group supports two trappers to protect their crops.

The problem of birds in relation to farming, particularly grains and fruits, is of considerable concern, and has become critical in most areas of the country. Most complaints concern blackbirds, crows, starlings, and English sparrows. The damage they cause is widespread and of considerable economic significance. A year ago, directors of agricultural experiment stations in 18 States, reporting on significant bird depredations in their States, noted damage to corn in nearly every State, 9 reported damage to sorghum, 4 to rice, and 4 to fruits. Ohio predicts an annual loss of approximately half a million dollars in field corn (a survey of one county showed blackbirds caused a 17 percent crop loss, amounting to $110,000). Massachusetts, with a $300,000 blueberry crop, estimates an annual loss of $163,000. Arkansas rice farmers estimate an annual loss of $1,400,000, with one farmer alone reporting a loss of about $40,000. Delaware's financial loss to its corn crop is about $170,000, with a 40 to 90 percent crop loss in some areas, and New York's is $272,000. New Jersey's losses are estimated at $2½ to $4 million annually, with perhaps $2 million in corn. Starlings consumed over $22,000 worth of feed from a single Idaho feedlot owner in less than 4 months. One northwestern Missouri feedlot manager reports actual loss records of 600 pounds of mash per day, and a total loss of over $10,000. Within the past 3 to 4 years, Oregon has lost about $1 million worth of holly. Annual losses to starlings sustained by duck farms on Long Island are about $150,000. Fruit and grape growers are experiencing heavy losses. Ravens killed over 400 ewes and lambs in Sonoma County and caused heavy losses in Humboldt County, Calif. It is difficult to appraise intangible losses such as occur when a crop is no longer grown because of economically overpowering losses.

While birds have always been a hazard to aircraft, strikes to propeller-driven planes were rarely disabling in the past, with windshields and propellers sustaining the bulk of the damage. With the introduction of jet-powered aircraft, the hazard to aircraft has become critical as occurrences of bird strikes are more frequent and far more serious. The U.S. Air Force, and commercial airports as well, reports bird hazards at many major installations. One report concerning naval aircraft listed 457 bird strikes in a 20-month period in 1960–61, causing $1½ million in damage. Crashes of at least three jet aircraft (two military, one civilian) last year were directly attributable to bird strikes.

Birds, until recently, have received little attention as disease carriers. A veterinary report in 1963 stated that at least 27 diseases, including 11 bacterial, 7 viral, 4 fungal, and 5 parasitical, are transmissible from birds to man. Studies by the National Institutes of Health have shown starlings and pigeons to be important factors in histoplasmosis outbreaks in urban areas. This fungus disease of the respiratory tract, which causes a debilitating type of pneumonia, is occasionally fatal. A recent survey of Loudoun County, Va., schoolchildren by the NIH showed close to 90 percent human reactors. Mason City, Iowa, and Mexico, Mo., experienced outbreaks with some loss of life. Another, in Milan, Mich., recorded a 62 percent human infection rate, and human cases have now been reported in most population centers in the United States. Starlings and pigeons also, along with English sparrows, transmit ornithosis—a virus similar to the causative agent of parrot fever. A wide variety of external and internal parasites and diseases of domestic animals are carried by these birds. Starlings are also suspected carriers of transmissible gastroenteritis (TGE), a virulent disease of hogs. The U.S. Public Health Service reports a number of species of native birds are carriers of encephalitis.

Bureau research programs in recent years have developed control techniques that are invaluable to farmers, foresters, airport managers, municipal officials, and others if used correctly and within their capacities. State and local agencies are contributing funds to the Bureau for control of nuisance birds. The 1959 Oregon Legislature included a $20,000 biennial appropriation for research and control of starlings. Washington has subsequently appropriated $5,000, and Idaho, $2,000.

Protection of people, Bureau share, $135,000.—The Bureau's efforts are directed toward the reduction of wildlife having wildlife-carried diseases and parasites that are transmissible to man and domestic animals. Rabies is the most spectacular, and is responsible for the greatest known losses. Livestock losses are particularly severe, amounting to millions of dollars a year. An

average of upward of a thousand or more people per year per State are bitten by animals, and the majority are required to undergo the painful and dangerous antirabies treatments. Incidences of rabies were on the increase during 1962. In many areas, particularly in the West and the Southwest, much of the service provided by livestock protection functions also affords protection to people. These carefully designed dual benefits are examples of the Bureau's efforts to obtain the widest possible utilization of its manpower.

Protection of structures and facilities, Bureau share, $135,000.—Damage caused by commensal rodents and nuisance native species that invade and damage property is tremendous. Rats and mice have long been recognized as one of the most destructive pests of mankind. Every State harbors these pests. Costs to the American public have been variously estimated in the billions of dollars. Ohio alone estimates an annual loss to rats and mice of $42½ million. The grain sanitation program includes assistance to grain elevators, mills, and food processors, warehouses, retail outlets, and consumers. Processed foods in warehouse and retail store suffer heavily and the value of materials condemned or voluntarily discarded runs into millions.

Grouped as nuisance species for this function are most forms of wildlife that at times and in places cause significant damage to property. Major damage occurs when burrowing rodents invade water structures and impoundments, fringe-area warehousing and storage facilities, and communications centers. Municipal dumps, particularly in rural areas, are prime attractants to many animals, some undesirable. Nearly all are sources of rat infestations in adjacent areas.

Educational programs to teach property owners practical techniques safe to use in residential areas must reach millions of people. The commercial pest control industry must also be taught proper practices when dealing with wildlife. Planning for 1965 anticipates demonstrations, community meetings, preparation of informational leaflets, and technical training sessions.

6. Wildlife research

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Waterfowl management	$538,820	$698,000	$863,000	$165,000	$10,000	$155,000
(b) Other migratory bird research	318,694	351,000	357,000	6,000	6,000	----------
(c) Upland wildlife	203,920	213,000	217,000	4,000	4,000	----------
(d) Pesticide-wildlife relationships	546,642	662,000	1,920,000	1,258,000	8,000	1,250,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

(a) Waterfowl management

The estimate of $863,000 is an increase of $165,000 and 10 permanent positions over 1964, of which $10,000 is for pay costs and $155,000 and 10 permanent positions is for program purposes.

Need for increase.—The increase of $155,000 and 10 permanent positions is needed for staffing of the Northern Prairie Wildlife Research Center in order to perform laboratory, controlled environment, and field studies concerning means of obtaining optimum waterfowl production from available wetland habitats and ways of maintaining maximum waterfowl populations compatible with other resource and spatial needs.

Plan of work.—The estimate of $863,000 will be used for scheduled waterfowl research projects, annual hunter success and productivity surveys, analysis of data and publication of results. Emphasis will be placed on means of managing waterfowl to provide maximum sustained recreational benefits in harmony with

other land use objectives. Projects will be carried out to evaluate effects of hunting and other mortality factors on waterfowl to ascertain environmental requirements of individual species, and to develop improved methods of habitat management. Although migrational and wintering aspects of waterfowl conservation will receive continuing attention, intensified efforts will be directed to productivity studies and to production enhancement measures. Dissemination of research findings to waterfowl managers and administrators will be carried out promptly. The waterfowl research program is cooperative in nature involving the Mexican, Canadian, Provincial, and State governments, flyway councils, and private organizations.

(*b*) *Other migratory bird research*

The estimate of $357,000 is an increase of $6,000 over 1964 for pay costs.

Plan of work.—The estimate of $357,000 will be used for scheduled migratory bird research projects, for the processing and maintenance of bird banding records, and for the classification, storage, retrieval, and analysis of research data. Mourning dove research will be continued under the plans developed jointly with the International Association of Game, Fish, and Conservation Commissioners with primary emphasis on the development of population inventory and harvest estimates. Woodcock and snipe studies will involve the collection of data for regulation determinations and the refinement of inventory survey techniques. The status and seasonal movements of nongame migratory birds will be studied in cooperation with the National Audubon Society and other cooperators. Avicultural studies will be continued with captive sandhill cranes and Aleutian geese at Monte Vista National Wildlife Refuge.

(*c*) *Upland wildlife*

The estimate of $217,000 is an increase of $4,000 over 1964 for pay costs.

Plan of work.—The estimate of $217,000 will be used for scheduled research projects and for preparation, publication, and distribution of "Wildlife Review," a literature reference and abstracting service for wildlife conservationists. Forest-wildlife relationship studies will continue to evaluate the impact of forest management practices on wildlife and to seek methods or modifications which will lead to the maintenance of optimum wildlife populations consonant with the multiple-use philosophy. The pattern of joint studies with Forest Service personnel will be continued. The response of farm game populations to soil conservation practices will also be studied.

(*d*) *Pesticide-wildlife relationships*

The estimate of $1,920,000 is an increase of $1,258,000 and 15 permanent positions over 1964, of which $8,000 for pay costs and $1,250,000 and 15 permanent positions are for expansion of the program.

Need for increase.—The increase of $1,250,000 and 15 permanent positions are needed for the following:

Seventy-five thousand dollars and one permanent position are needed to develop a sampling design and perform pilot tests leading to the establishment of an environmental contamination monitoring program. Kinds and quantities of chemicals in one component of the environment (soil, water, air, plants, and animals) are irrevocably linked with kind and quantities of chemicals in each of the others. Quantitative and time relationship are complex, and direct readings from one to the other are presently possible. We do not know how long the process takes or the degree of the transferable pollution, whether magnified or diminished. It is essential, therefore, that current readings of contamination be maintained in a continuous surveillance program, both to sound warnings and to gain understanding.

Two hundred and fifty thousand dollars and two permanent positions are for the evaluation of new pest control materials and methods. New chemicals are being marketed at an increasing rate which will increase with the search for more specific chemicals that will act on target organisms rather than on the whole complex of life. It is a Government responsibility to help bring new, more effective, less dangerous chemicals to the using public in an expeditious, orderly fashion. Prompt and dependable evaluation is essential and the purpose of the research work in this connection is to study how the evaluations should proceed and how more effective screening methods can be developed before the establishment of standardized procedures, the ultimate objective.

Five hundred and fifty thousand dollars and 4 permanent positions are needed for basic research on the toxicology and pharmacology of pesticidal chemicals

to gain an understanding of the effects of pesticides on wildlife and their food chain organisms. Carefully designed experiments are needed to provide knowledge of the rates of gain and loss of chemicals in animals, the damages chemicals do therein, and possible changes in toxicity of chemicals as they go through the metabolic system of the animal. Accumulation and analysis of this data will allow intelligent interpretation of the significance and consequence of pesticidal residues in tissues and plants and animals.

Two hundred and twenty-five thousand dollars and two permanent positions are needed for studies of the ecological effects of pesticides on plants and animals. In addition to the study of the effects of pesticides on the individual organism, knowledge must be acquired as to the effects of pesticides on whole populations. Populations are affected through food and water supplies, by soil and air contamination and by the effects of the chemicals on their natural enemies. Measurement of the total ecological effects is the most difficult and most important aspect of pesticide control and evaluation. It involves complex interactions between individual animals, and animals and their environments. Much of the initial research will involve the development of improved methods and criteria for the evaluation of ecological impact of pesticidal applications.

One hundred thousand dollars and five permanent positions are needed for the surveillance of operational pest control programs to ascertain the effects of some of the larger operational pest control programs to ascertain the effects of the treatments on forest and agricultural wildlife. Field surveillance is necessary since effects on the total environment cannot be fully predicted from studies in the laboratoy or on trial plots. This work should provide guidelines which will forestall serious unforseen consequences and develop better and safer modifications of existing procedures.

Fifty thousand dollars and one permanent position are needed for interdepartmetal coordination and public information purposes. Coordination of objectives in research, operations, and public information is the only avenue to the maintenance of public confidence in the technical branches of the Government and the only avenue to true protection of man, wild animals, and fishes, and the lands and waters on which they jointly depend. To achieve this goal the technical liaison and conservation information and education staff must be bolstered to assume meaningful initiative and discharge fully the responsibilities inherent in this line of activity.

Plan of work.—The estimate of $1,920,000 will be used for scheduled pesticide-wildlife research projects, related laboratory service work, surveillance activities and for research contracts. Acute and chronic toxicity evaluations of pesticides in common usage and studies of their ecological and physiological effects will be continued through feeding tests and controlled plot studies using a variety of key bird and mammal species. Dosage rates, active ingredients, carriers, timing, and methods of applications of pesticides will be correlated with observed effects on wildlife to assist in the development of new materials and techniques which will enable effective control with minimum damage to wildlife. Extrameral research and service work will be performed on selected aspects of the problem which are not feasibly handled on an in-house basis. This will include contracts with educational institutions for research in ecology and toxicology amounting to $450,000 and contracts for special studies and specimen analysis amounting to $225,000.

(e) Diseases and parasites

The estimate of $383,000 is an increase of $5,500 over 1964 for pay costs.

Plan of work.—The estimate of $383,000 will be used for scheduled disease research projects and for associated laboratory service work. Studies designed to investigate the principal etiological agents of diseases in wildlife will be continued in an effort to accumulate information on which to base feasible control measures. Attention will be given to diseases, such as encephalitis, which affect both humans and wildlife. The potential of disease organisms in the control of nuisance wildlife populations will be explored. Contract research on regional wildlife disease problems will be continued at the University of Georgia and all possible assistance will be given the southeastern wildlife disease study. Cooperative studies with the National Institutes of Health, the Walter Reed Army Institute of Research, and Johns Hopkins University will be continued to insure the maximum effectiveness of available talent and existing facilities.

(f) Control methods

The estimate of $1,059,000 is an increase of $16,500 over 1964 for pay costs.

Plan of work.—The estimate of $1,059,000 will be used for scheduled research projects and laboratory service work oriented to the control of nuisance and destructive populations of birds and mammals. Studies have been intensified to develop selective and effective control methods for alleviating damage to corn, rice, orchard crops, livestock, and forest reproduction. Particular emphasis will continue to be placed on the corn blackbird problem in the East, the rice blackbird and nutria problems in the South Central States, the starling and forest rodent problems in the West, and the predator and rodent problems on the rangelands. In addition to the screening of repellent, sterility-producing, and lethal chemicals, which will be carried out in cooperation with the chemical industry, work will continue on the refinement of scaring and trapping devices, cultural methods, and habitat manipulation as means of effecting damage control. Studies of the biology distribution and behavioral traits of birds and mammals will be made to provide the basis for selective control procedures. Extensive control operations will be appraised for total impact on the wildlife environment.

(g) Classification, distribution, and life history

The estimate of $159,000 is an increase of $4,500 over 1964 for pay costs.

Plan of work.—The estimate of $159,000 will be used for scheduled research projects, bird and mammal identification services, maintenance of the scientific specimen collections, and coordination of the nationwide bat-banding program. Basic taxonomic research will continue to focus on migratory game birds and other species of primary concern in the Bureau's management programs. Manuscripts on the sea otter, Pacific walrus, and birds of the northern Rocky Mountains will be brought to completion. Data will be provided on the ranges and status of endangered and rare bird and mammal species for delineating acquisition areas or for taking precautions to prevent catastrophe in pest control programs.

(h) Cooperative wildlife research units

The estimate of $264,000 is an increase of $4,000 over 1964 for pay costs.

Plan of work.—The estimate of $264,000 will be used for the Bureau's share of the costs of the cooperative wildlife research units, a program supported jointly by the Bureau, the Wildlife Management Institute, and the land-grant colleges and conservation departments of 18 States for the purpose of conducting wildlife research, facilitating the training of professional wildlife biologists, promoting conservation education, and providing technical advice and information to conservation agencies. Bureau biologists serve as unit leaders and guide the programs developed by the local coordinating committees. Research on migratory birds, pesticide-wildlife relationships, animal depredations control, and other subjects of national interest is encouraged.

The estimate of $264,000 is distributed among the units as follows:

Field station	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Auburn, Ala.	$12,000	$12,200	+$200
College, Alaska	19,300	20,300	+1,000
Tucson, Ariz.	13,000	14,000	+1,000
Fort Collins, Colo.	13,200	13,100	−100
Moscow, Idaho	13,200	14,000	+800
Ames, Iowa	13,200	14,000	+800
Lafayette, La.	11,100	11,700	+600
Orono, Maine	13,100	14,000	+900
Amherst, Mass.	13,100	14,000	+900
Columbia, Mo.	13,200	14,000	+800
Missoula, Mont.	13,200	14,000	+800
Ithaca, N.Y.	11,000	11,700	+700
Columbus, Ohio	13,200	14,000	+800
Stillwater, Okla.	12,000	12,300	+300
University Park, Pa.	12,200	12,500	+300
Brookings, S. Dak.	14,000	13,200	−800
Logan, Utah	13,200	14,000	+800
Blacksburg, Va.	12,000	12,100	+100
Central office supervision	24,800	18,900	−5,900
Total	260,000	264,000	+4,000

7. Soil and moisture conservation

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost	Program
Soil and moisture conservation	$694,126	$705,000	$705,000	----------	----------	----------

Soil and moisture conservation

The estimate for 1965 is $705,000, the same as for 1964. Pay costs are being absorbed.

Plan of work.—The estimate of $705,000 is for work on 118 units of the refuge system in 43 States as compared with 94 units in 41 States in 1964. The estimate will serve a threefold objective: (1) continue the work in progress; (2) initiate work on additional refuges which has long been delayed, and (3) plan and initiate work on a few recently acquired areas.

8. River basin studies

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
River basin studies	$1,177,472	$1,318,000	$1,337,000	$19,000	+$19,000	----------

[1] To provide for increased pay costs for fiscal year 1964 positions.

RIVER BASIN STUDIES

The estimate for 1965 is $1,337,000, an increase of $19,000 over 1964. This increase is for pay costs.

Plan of work

Under authority of the Fish and Wildlife Coordination Act (16 U.S.C. 661 et seq.), the Bureau studies water-use projects of Federal agencies and other agencies under Federal license or permit throughout the United States to determine their effects on fish and wildlife resources, and recommends measures needed for the protection and improvement of these resources. Investigations by this Bureau are conducted in close cooperation with the Bureau of Commercial Fisheries and with the State fish and game agencies concerned. The workload of the river basin studies program is not controlled by the Bureau but depends entirely upon the size of the water-use programs of other Federal and private agencies, which have been increasing substantially each year. More and larger Federal projects will be included in these programs in 1965 than in 1964. This will have an increasing impact on fish and wildlife resources. In 1965 the various phases of the river basin studies activity will be continued as follows:

1. *Wetlands preservation program.*—The act of October 2, 1962 (16 U.S.C. 590 p. 1) prohibits the Department of Agriculture from providing technical or financial assistance in the drainage of wet lands on farms in North Dakota, South Dakota, and Minnesota if the Secretary of the Interior finds that such drainage will be harmful to wildlife. The Bureau of Sport Fisheries and Wildlife inspects applications for this drainage in cooperation with the Agricultural Stabilization and Conservation Service and the Soil Conservation Service of the Department of Agriculture.

On areas found to be of value, the Bureau makes offers to landowners under authority of the act to buy or take easements on the wet lands during

a 1-year period in which no assistance will be given. If the offer is not accepted, the landowner is not eligible for Federal assistance in drainage for a period of 5 years. This phase of the wetlands preservation program will be continued at the same level as 1964. During 1965, it is expected that the Department of Agriculture agencies will refer to this Bureau for review 13,000 drainage applications from 179 counties in Minnesota, North Dakota, and South Dakota which are critical from a waterfowl production standpoint. The Bureau will be able to inspect about 7,000 of these applications from 118 of the most critical counties in the 3 States during 1965.

The rest of the wetlands preservation program will also be continued at the same level throughout the remainder of the United States. Proposals affecting wet lands will be studied, and, when harmful, appropriate corrective action will be recommended to Federal, State, and other conservation organizations. Liaison will be carried out with appropriate agencies and organizations to keep them advised as to wet lands offering opportunities for preservation and development as wildlife habitat.

2. *Surveys of water-use projects.*—This phase of the program will be continued at the same level as 1964. Investigations will be conducted of Bureau of Reclamation projects; Corps of Engineers projects; hydroelectric projects subject to Federal Power Commission license or permit; small reclamation projects; private dredging, filling, and other projects subject to Corps of Engineers permits; and projects subject to Forest Service and Bureau of Land Management permits. Studies of Corps of Engineers and Bureau of Reclamation projects under this activity are of a reconnaissance nature and will be used in determining the extent to which further detailed studies will be required.

3. *Small watershed program.*—Work under this program will be conducted at the same level as 1964. Both reconnaissance and detailed studies will be carried out on projects proposed under the Watershed Protection and Flood Prevention Act (16 U.S.C. 1008) administered by the Department of Agriculture. Section 12 of that act specifically assigns to the Secretary of the Interior responsibility for investigation of the fish and wildlife aspects of these projects and for assistance in planning federally cost-shared fish and wildlife developments. This program provides an excellent opportunity for State fish and game departments to obtain needed fish and wildlife developments at a reasonable cost. Interest among State fish and game departments and among local project sponsor groups in this program is increasing rapidly.

4. *Urban planning assistance program.*—This program will be continued at municipal governments in planning fish and wildlife areas for urban and rural development programs. Such cooperation by this Bureau has been urged by the Federal Housing and Home Finance Agency at both the Washington and regional levels. Section 701 of the Housing Act of 1954 (40 U.S.C. 461) authorized the urban renewal program of the Housing and Home Finance Agency to administer Federal grants to State planning agencies for use in planning for development of urban and rural areas.

On September 23, 1959, the act was amended to provide broader authority for participation by State planning agencies and to increase the Federal grants and aid available for such agencies. Through close coordination with State and private planners and with local residents and governments, fish and wildlife planning is effectively introduced into county zoning plans, and areas are thereby set aside for future fish and wildlife benefits. Similar areas are set aside by municipal governments in the development of plans for urban expansion.

5. *Follow-up program.*—This phase of the activity will be conducted at the same level as 1964. Under this program, basic information is obtained on completed projects for use in analyzing future water resource projects more effectively. Projects previously studied by the Bureau are reanalyzed to determine whether or not recommendations were adopted, to evaluate the biological soundness and results of conservation measures incorporated in these projects, and to evaluate the estimates of fishing and hunting utilization made prior to project construction. Data of this type are vitally needed to forecast as accurately as possible future fishing and hunting use of proposed projects.

The 1965 estimate is broken down by areas as follows:

	Available, 1964	Increase	Estimate, 1965
Region 1, Pacific	$263,000	$5,000	$268,000
Region 2, southwest	226,000	4,000	230,000
Region 3, north central	341,000	4,000	345,000
Region 4, southeast	164,000	2,000	166,000
Region 5, northeast	137,000	7,000	144,000
Washington office	187,000	−3,000	184,000
Total	1,318,000	19,000	1,337,000

Detailed studies of projects being planned and constructed by the Corps of Engineers and Bureau of Reclamation and also reconnaissance surveys in the Missouri River Basin will be financed by funds included in the public works appropriation estimates.

FINANCING THE RIVER BASIN STUDIES PROGRAM

The following tabulation shows by sources total funds available to the Bureau in 1964 and estimate for 1965 for financing river basin studies:

	Available, 1964	Increase (+) or decrease (−)	Estimate, 1965
Annual definite appropriation: Management and investigations of resources	$1,318,000	+$19,000	$1,337,000
Permanent indefinite appropriation: Federal aid in wildlife restoration	30,000	−30,000	
Transfer appropriations:			
Bureau of Reclamation	360,559	+9,441	370,000
Bureau of Reclamation (Missouri River Basin studies)	327,888	+6,112	334,000
Corps of Engineers	786,577	−76,577	710,000
Total	2,823,024	−72,024	2,801,000

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase or decrease (−)
Program and financing:				
Total obligations	$27,577,322	$30,559,727	$34,419,000	$3,859,273
Unobligated balance lapsing	210,118			
Comparative transfer from other accounts	−92,556			
Transfer to "Operating expenses, Public Building Service," General Services Administration (75 Stat. 353)	34,616	30,173		−30,173
Appropriation	27,729,500	30,589,900	34,419,000	3,829,100
Obligations by objects:				
11 Personnel compensation	16,373,274	19,221,000	20,841,000	1,620,000
12 Personnel benefits	1,324,593	1,493,000	1,646,000	153,000
21 Travel and transportation of persons	1,352,489	1,430,000	1,634,000	204,000
22 Transportation of things	174,015	192,000	207,000	15,000
23 Rent, communications, and utilities	629,925	621,727	789,000	167,273
24 Printing and reproduction	173,506	227,000	264,000	37,000
25 Other services	1,279,478	1,312,000	1,815,000	503,000
Services of other agencies	380,435	290,000	511,000	221,000
26 Supplies and materials	3,591,028	3,951,000	4,295,000	344,000
31 Equipment	1,883,457	1,578,000	1,957,000	379,000
32 Lands and structures	646,974	464,000	685,000	221,000
42 Insurance claims and indemnities	9,161	10,000	5,000	−5,000
99 Undercover payments	1,928	15,000	25,000	10,000
Subtotal	27,820,263	30,804,727	34,674,000	3,869,273
Deduct quarters and subsistence charges	242,941	245,000	255,000	10,000
Total obligations	27,577,322	30,559,727	34,419,000	3,859,273

Chairman HAYDEN. If you care to, you may read your statement or, if you prefer, you may highlight the management and investigations activities of the Bureau of Sport Fisheries and Wildlife for this past year.

Mr. JANZEN. Mr. Chairman, I have a statement which I would like to insert for the record and I would like to very briefly highlight our budget.

(The statement referred to follows:)

STATEMENT OF DANIEL H. JANZEN, DIRECTOR, BUREAU OF SPORT FISHERIES AND WILDLIFE

Mr. Chairman and members of the committee, we are glad to be here today to answer your questions on the 1965 budget estimates of the Bureau of Sport Fisheries and Wildlife.

The 1965 budget estimates for the annual definite appropriations show a net increase of only $233,773. However, by readjustment of priorities of continuing programs it is possible to augment the pesticides research program by $1,930,000, provide $1,079,119 for operation of new installations and facilities, and also cover $593,781 in uncontrollable increased pay and compensation costs of the existing staff.

The annual definite appropriation estimates total $47,396,000 with a net increase of $233,773 over 1964 as mentioned above. The management and investigations of resources estimate is $34,419,000, an increase of $3,859,273. The construction estimate is $3,593,000, a decrease of $1,650,500. The advances to migratory bird conservation account estimate is $8 million, a decrease of $2 million. And the general administrative expenses estimate is $1,384,000, an increase of $25,000.

The increase in pesticide research funds will enable the Bureau to implement the recommendations of the President's Science Advisory Committee as contained in its report "Use of Pesticides." It will answer demands of the public for forthright governmental action to meet the many unprecedented problems stemming from the widespread use of pesticides with attendant losses and dangers to fish and wildlife resources.

The increase will enable an acceleration of the basic work of testing the acute and chronic effects of present and proposed chemicals on individual animals under controlled laboratory conditions. Several relatively new programs of study will be undertaken to explore the present and future effects of chemicals in the total environment, and to devise effective methods of monitoring and determining the effects of pesticidal contamination of soil, air, water, plants, and animals over large areas.

The pesticides problem is not simply one of a "Yes" or "No" answer to any use of chemicals. Chemicals are invaluable for specific purposes and their use is here to stay. The problem may best be met by controlled use, avoidance of contact by animals, or acceptance of the inevitably of some contamination. To this end, the estimates are intended to provide a practical, useful program leading to effective surveillance of large-scale applications of pesticides on forests and agricultural lands, devising methods of avoiding harmful effects or preventing contact with contaminants, and establishing tolerances for pesticides in animals. Solving these problems involves work of other agencies and private organizations. The estimates not only include contract research work, but also provide for interdepartmental coordination of efforts and public information.

Laboratory space and facilities for the expanded pesticides research program will be provided by an estimate of $1,335,000 in the "Construction" appropriation for new laboratories at Columbia, Mo., and Denver, Colo. The first will meet the peculiar needs of work on fishes; the second of pesticidal chemical screening.

The estimates also include $1,079,119 to place into operation new facilities at 34 fish hatcheries, commence management of nine new refuges and a number of waterfowl production areas, initiate research work at the new fish genetics laboratory at Beulah, Wyo., and staff the new Northern Prairie Wildlife Research Center near Jamestown, N. Dak. Also provided is $315,373 for more adequate management of refuges and replacement and overhaul of aircraft.

In addition to the pesticide research laboratories, the construction estimate includes $150,000 for replacing the water supply line at the Leavenworth (Wash.) National Fish Hatchery, $500,000 for plans and specifications for the National Fisheries Center and Aquarium at Washington, D.C., at $1,468,000 for development on 12 national wildlife refuges, and advance planning and $140,000 for wildlife research facilities at Jamestown, N. Dak., and Laurel, Md.

The $8 million estimate for advances to the migratory bird conservation account, together with $4 million from the sale of duck stamps in a permanent indefinite appropriation, will support a balanced program of acquisition of 225,000 acres of land for migratory waterfowl, of which 85,000 acres will be in refuges and 140,000 acres in waterfowl production areas.

The Bureau will have obligated by the end of 1964 all the funds appropriated for the accelerated land acquisition program and has a backlog of projects approved by the Migratory Bird Conservation Commission in excess of the total estimate of $12 million for land acquisition in 1965.

Economy in the utilization of manpower and the expenditure of funds for travel, supplies, and equipment will continue to be a major goal of the Bureau. While the 1965 estimates enable expansion in a number of areas, such as pesticides research and operation of new facilities, total Bureau employment is being held at the 1964 level with no increase in the number of authorized permanent positions. Personnel increases in certain activities are offset by decreases in other programs. Travel in the Bureau's budget schedules (which include the annual and permanent indefinite appropriations, advances and reimbursements, and contributed funds) is estimated at $2,646,000, an increase of $155,000 over 1964; supplies and materials are estimated at $5,202,000, a $5,000 decrease under 1964; and equipment is estimated at $2,378,000, a $110,000 increase over 1964. The increases in travel and equipment are the minimum needed to support program expansion in pesticides research, operation of new facilities, and a shift in emphasis in the land acquisition program to the acquisition of small wetlands areas requiring more travel.

Management and Investigation of Resources

Mr. JANZEN. I think our budget could be probably best summarized by saying that it has a net increase of only $233,773, although we are providing for a number of increases by readjustment within the budget to take care of an expanded pesticide research program, to provide for the operation of a number of new facilities, and for a little over half a million dollars to take care of uncontrollable increased pay and compensation costs. This adjustment has involved a decrease in the level of construction for 1965 and a decrease in our land acquisition program.

Pesticide Research Program

We are pushing our pesticide research program simply because the problem has become so serious to the fish and wildlife. It is probably one of our major pollution problems, both on land and water. It is so complicated, keeping in mind that we are talking about many hundreds of chemicals with about 700 species of birds, many hundreds of species of fish and mammals and each of these chemicals can affect each of these species in a different manner which makes the combination almost unbelievable. And we feel it is so important that we are giving the pesticide program special consideration. In this pesticide program we also are including an amount of a little over $1 million for the construction of new laboratories at Columbia, Mo., and Denver, Colo. We also felt that we had to get our new facilities, such as our refuges, fish hatcheries, under operation. And that is another reason we needed this adjustment under our budget.

PROPOSED NEW PROGRAMS

We plan to commence management at 9 new refuges, to place into operation new facilities at 34 fish hatcheries, and to initiate research work at a new fish genetics laboratory. Also, we had to provide for the replacement of six airplanes, and for the major overhaul of three others which had reached the stage where they were no longer flyable. We have a few construction items. They consist of replacing a water supply line; $500,000 for plans and specifications for the National Fisheries Center and Aquarium at Washington, D.C.; about $1.5 million for development at 12 national wildlife refuges and for advanced planning; and $140,000 for facilities at Jamestown, N. Dak., and Laurel, Md.

LAND ACQUISITION PROGRAM

Our land acquisition budget is being reduced from a figure of $10 million, which was approved by Congress for 1964, to a figure of $8 million for 1965. I might say in connection with this land acquisition program that we will have all of the funds which were appropriated for 1964 obligated by the end of the fiscal year and that we have a very substantial backlog of projects approved by the Migratory Bird Conservation Commission. So we are in pretty good shape there.

MANPOWER UTILIZATION

We have been stressing better manpower utilization and this year we are asking for no increase in personnel as we did last year. I think that very briefly summarizes my statement and I will be very glad to answer any questions you might have.

WAGE BOARD INCREASES

Chairman HAYDEN. I note that a part of the increased costs of fish hatchery operations are wage board increases. However, you say that the $101,000 increase which you request will only partially cover the growing costs of the wages. How much is actually being absorbed?

Mr. TUNISON. I cannot answer that and may we submit that for the record?

Chairman HAYDEN. You may.

(The statement referred to follows:)

BUDGET ESTIMATE

In fiscal year 1965, an additional $177,200 is needed to cover the increased costs of wage rate payments for unclassified positions. The budget estimate for this item is $101,000. The difference between the amount needed and the budget allowance, which must be absorbed, is $76,200. In order to absorb this amount it is necessary to curtail fish production at some of the hatcheries.

ASSISTANCE TO INDIAN TRIBES

Chairman HAYDEN. You say that since the work done by you and by the Indians on the Fort Apache Reservation in Arizona has been so successful, other tribes have asked for assistance in establishing and conducting similar programs. Which tribes have asked for such assistance and to what extent are you furnishing it?

Mr. TUNISON. There are some 45 tribes that have requested assistance and we are helping them. There are more that hope to have help. If you wish, we can give you a list of those tribes.

Chairman HAYDEN. You might do that for the record.

Mr. TUNISON. All right, Mr. Chairman.

(The statement referred to follows:)

INDIAN RESERVATIONS PROVIDED FISHERY MANAGEMENT SERVICES IN 1965

Arizona:
- Fort Apache
- Hualapai
- Navajo
- Hopi
- San Carlos
- Colorado River
- Gila River

Colorado:
- Southern Ute
- Ute Mountain

Florida: Seminoles

Idaho: Fort Hall

Minnesota:
- Grand Portage
- Red Lake

Montana:
- Rocky Boy
- Blackfeet
- Fort Belknap
- Flat Head

Nevada:
- Pyramid Lake
- Walker River
- Summit Lake

New Mexico:
- Mescalero Apache
- Laguna
- United Pueblos
- Zuni
- Jicarilla Apache

North Carolina: Cherokee

North Dakota:
- Fort Berthold
- Standing Rock

Oregon:
- Umatilla
- Warm Springs

South Dakota:
- Rosebud
- Crow Creek
- Lower Brule
- Pine Ridge
- Cheyenne River

Utah:
- Goshute
- Uintah-Ouray

Washington:
- Tulalip
- Quinalt
- Yakima
- Muckleshoot
- Puyallup
- Nisqually

Wisconsin: Lac Du Flambeau

Wyoming: Wind River

In addition to the above, about 18 additional Indian reservations have requested assistance beyond that contemplated in the 1965 budget proposal.

COOPERATIVE FISHERY UNIT AT TUCSON, ARIZ.

Chairman HAYDEN. I have been in correspondence with Dr. Richard A. Harvill, president of the University of Arizona, concerning the desirability of establishing a cooperative fishery unit at Tucson. I believe that the Arizona Game & Fish Department now participates in the fisheries management curriculum at the university which offers a degree in fisheries management. Would you please prepare for the record a statement as to the desirability and cost of establishing such a unit?

Mr. JANZEN. Yes, sir.

(The statement referred to follows:)

DESIRABILITY AND COST

Funds required to initiate the unit, $40,000

The University of Arizona, through its president, Dr. Richard A. Harvill, has expressed a desire to participate in the cooperative fishery unit program. The Bureau concurs in this proposal and believes that a fishery unit in Arizona would result in improved recreational fishing following the application of new information to the aquatic resources of the State. In establishing the unit,

the university and the Arizona Game and Fish Department would enter into an agreement with the Bureau of Sport Fisheries and Wildlife. State funds would be used in supporting work of graduate students, and the university would make available office and laboratory space, and the use of its various facilities and services.

The University of Arizona is well located for a fishery unit where activities related to fishery research and management can be profitably pursued. In addition to augmenting facilities to train students for employment by State and Federal agencies, the fishery unit would make a valuable contribution to fishery science through its research activities. The unit leader and assistant leader, appointed under Civil Service procedures, would supervise the work of graduate students seeking advanced degrees.

The Bureau of Sport Fisheries and Wildlife already has a strong interest in recreational fishing in the Fort Apache, Navajo, San Carlos, Colorado River, and other Indian reservations in Arizona, through its cooperative management programs. The fishery resources of the reservoirs of the Salt River Valley, as well as the large impoundments of the Colorado River, offer exceptional opportunity for research to obtain information needed for proper management of the fishery resources. A large variety of fishes occur in the State, including trout and the warm water species. Many studies which would be conducted under the sponsorship of the unit would be of equal interest to the Arizona Game and Fish Department.

The population of Arizona increased from 750,000 in 1950 to 1,302,000 in 1960. Projected estimates show that the population may surpass 5,800,000 by the year 2000. At the same time, a greatly expanded program of water resources development is expected to occur and the problems of providing and sustaining the recreational fishing will become more complex. In Arizona, over 73 percent of the State area is in Federal or tribal ownership, and there is a strong Federal responsibility to participate in resource management programs.

The funds proposed, $40,000, would provide approximately $22,000 for the salaries of the unit leader and the assistant leader; $10,000 for salaries and expenses of students; and $8,000 for general expenses, including technical equipment for laboratory and fieldwork.

Pesticides Research

Chairman Hayden. Over half of your proposed increase for management and investigations of resources is contained in your request for funds to investigate fish and wildlife relationships with pesticides. In fiscal year 1964, you had $934,000 available for investigation of toxicological effects of pesticides on fish and wildlife and carried on your work with 83 personnel.

In a supplemental appropriation request transmitted to Congress last November, you asked for an additional $300,000 and 31 permanent employees for this purpose. I will place that request in the record.

(The statement referred to follows:)

Management and investigations of resources

Request (for 6 months from Jan. 1, 1963)	$300,000
Appropriation to date	$30,589,900
Obligations to Oct. 31, 1963	$10,372,745
Expenditures to Oct. 31, 1963	$7,851,790
Employment:	
Average number, current appropriation	2,985
Number involved this estimate	31
Actual employment (Sept. 30, 1963)	2,383

Purpose and Need for Supplemental Funds

An amount of $300,000 is requested to implement the recommendations in the report "Use of Pesticides" which was prepared by the President's Science Advisory Committee.

JUSTIFICATION

This supplemental estimate of $300,000 is to carry out the President's desires to implement the recommendations in the report "Use of Pesticides" which was prepared by his Science Advisory Committee.

Fishery research, $125,000.—An amount of $125,000 and 21 permanent positions are requested for accelerated studies of fish-pesticide relationships.

Basic, comparative, acute pesticide toxicity data, under standardized bioassay conditions, will be collected at a more rapid rate. More compounds await testing than have been tested in the last 5 years. Interrelated factors affecting such acute toxicities, including species, size, and condition of test animal; temperature; light; physical and chemical variations of water quality; and kind, formulation, application, duration, and stability of the agent, all must be understood in order to anticipate results of control applications in diverse field environments.

Physiological effects of sublethal exposure to pesticides may well be more important to the welfare of fish populations than are spectacular quick kills. Additional studies will be undertaken to define the importance of chronic dosages on reproduction; growth; and susceptibility to stresses like low oxygen, high temperature, decreased food, and exposure to pollutants, including more or different control chemicals. Evidence of the significance and nature of such effects upon the individual organism, derived from controlled experimentation, are essential to eventual understanding of population effects on a scale too big for laboratory controlled study, but approachable through observations of small, simple microcosms that are established in small ponds and in plastic pools.

Similarly, knowledge is needed of the physiological kinetics of common pesticides—their kinetics, metabolism, mode of action, and the involvement of poorly understood endocrine and intermediary metabolic systems. The surface of these problems will be scratched.

Additional field surveillance of operational control programs and more field testing to confirm laboratory-based hypotheses will be undertaken. Existing facilities must be expanded and improved to accommodate new research units, although certain elements of the work (chemical residue analyses and histopathological examinations of tissues) will be accomplished by increased contract services.

Exploratory research and planning will be initiated to ascertain the feasibility and cost of a cooperative program of monitoring naturally occurring pesticide residues in fishes and associated aquatic organisms. These data would be correlated with waterborne pesticide level data collected by other agencies. Tentatively, this possible future program would be coordinated with the expanded surveillance of specific field control operations and most of the work might be accomplished by contract.

WILDLIFE RESEARCH, $175,000

An amount of $175,000 and 10 permanent positions are requested for accelerated studies of wildlife-pesticide relationships.

Fragmentary evidence demonstrates that pesticide residues are widespread, but no system exists for determining how much of what pesticide is where. Planning and design of a system adequate to measure contamination in wildlife, their food organisms and the environment is an immediate necessity so that an adequate system can be placed in operation soon.

Acceleration of pen and controlled plot studies is essential to permit testing for acute and chronic effects of additional compounds on selected wildlife species. Studies during the last 6 years have included only about 70 compounds; there are at least 20 additional pesticides upon which data are urgently needed now, and many others of somewhat less urgency. Funds include contractural services for determining residue levels in a large backlog of specimens from previous field and pen studies.

Program and financing

	Presently available, 1964	Revised estimate, 1964	Increase
Program by activities:			
Fishery research	$2,052,680	$2,177,680	$125,000
Wildlife research	3,758,825	3,933,825	175,000
All other activities	24,748,222	24,748,222	
Total program costs, obligations	30,559,727	30,859,727	300,000
New obligational authority:			
Appropriation	30,589,900	30,889,900	300,000
Transferred to "Operating expenses, Public Buildings Service," General Services Administration (75 Stat. 353 and 76 Stat. 728) (−)	−30,173	−30,173	
Appropriation (adjusted)	30,559,727	30,859,727	300,000

Object classification

		Presently available, 1964	Revised estimate, 1964	Increase
11	Personnel compensation:			
	Permanent positions	$17,056,200	$17,138,200	$82,000
	Positions other than permanent	1,780,100	1,784,100	4,000
	Other personnel compensation	385,050	385,050	
	Total personnel compensation	19,221,350	19,307,350	86,000
12	Personnel benefits	1,493,150	1,498,650	5,500
21	Travel and transportation of persons	1,430,400	1,438,400	8,000
22	Transportation of things	192,300	193,300	1,000

42	Insurance claims and indemnities	9,700	9,700	
99	Undercover payments	15,100	15,100	
	Subtotal	30,805,027	31,105,027	300,000
	Deduct quarters and subsistence charges	245,300	245,300	
	Total obligations	30,559,727	30,859,727	300,000

PERSONNEL AND BUDGET INCREASE

Charman HAYDEN. Your budget for fiscal year 1965 proposes a total of $2,872,000, an increase of $1,938,000 over the amount appropriated in fiscal year 1964, and 28 additional personnel. Is it correct that this would give you 142 personnel working on pesticide relationships?

Mr. PARKER. If you do not mind, Mr. Chairman, I would like to submit the statement for the record as to the number that we have now. The increase that you gave is correct; yes.

Chairman HAYDEN. All right; you may do that.

(The statement referred to follows:)

WORKING PERSONNEL

Statement concerning number of personnel working on pesticides research

	1964 appropriation [1]	1965 estimate	Increase
Fishery research: Fish-pesticide relationships	23	36	13
Wildlife research: Pesticide-wildlife relationships	64	79	15
Total	87	115	28

[1] Does not include increases of 21 for fish-pesticide relationships, 10 for pesticide-wildlife relationships total 31 in 1964 supplemental estimate.

REQUIRED PERSONNEL

Chairman HAYDEN. Is this number of employees necessary to carry on the work which you propose?

Mr. PARKER. There is no question about that. If I might digress a bit, this is part of a Government-wide program of research on pesticides. As you may know, the President's Science Advisory Committee reported in May of last year, indicating recommendations that should be carried out by the Federal agencies. Within our budget of 1965 we are trying to meet those recommendations.

Chairman HAYDEN. Will you expend all of the $934,000 appropriated for this purpose last year?

Mr. PARKER. Yes, sir.

EVALUATING EFFECTS OF NEW CHEMICALS

Chairman HAYDEN. What sort of work is done in this field?

Mr. PARKER. So far the greater effort has been placed on attempting to evaluate the effects of new chemicals on fishes, birds, and mammals. The additional work in the future will emphasize the impact on test species of the chemicals at the various levels. In other words, what does it mean if a pheasant carried 7 parts per million of DDT in its body as contrasted to 24 or 100 parts per million? We need to know what the impact of the chemical on the individual is. We also need to know what the total effect on the environment is. For example, in previous research we have determined that when you use a certain chemical on certain insects, it enters into the soil, is absorbed by the angleworm, a robin comes along and eats the angleworm and dies. This is a very simple case of one of the total environmental impacts and we need to get into this for not only woodcocks and robins but all birds.

Chairman HAYDEN. By all means we must preserve the robins.

DRIFT IN CHEMICAL APPLICATION

Mr. PARKER. Another facet is to have some idea of the amount of chemicals building up in the environment. We know from the studies made so far there is a considerable amount of drift that occurs when the chemicals are applied, particularly from the air. As much as 75 percent of the chemicals will go other places than where we intend them to land because of drifting. We have recovered some ducklings, and have taken soil samples, and vegetation samples in the far northern reaches of Canada, hundreds of miles from the nearest control efforts, and recovered sizable amounts of DDT in the soils,

ducks, and in the vegetation. So we need to do some monitoring. We also need to figure out other ways of approaching the problems of insect control, of noxious weed control and so forth by developing more specific chemicals and methods that would be more pointed at getting to the target organisms rather than a general widespread application.

Chairman HAYDEN. Will you use the increased funds only for intensification of the ongoing program; or do you propose to initiate studies not now underway? If so, please describe them briefly.

Mr. PARKER. We intend to go along increasing our current research as well as the initiation of a monitoring system that I just described. We have not done any of that work as yet.

COOPERATION WITH OTHER AGENCIES

Chairman HAYDEN. Specifically, how and to what extent do you coordinate your activities along this line with other agencies also involved in the pesticide problem?

Mr. PARKER. Within the Department of the Interior this is done through committees, joint efforts in planning budgets, and in the exchange of information within the Fish and Wildlife Service. It is done with periodic meetings of the research people involved. We put out a joint publication embracing the work done by commercial fisheries, as well as our own Bureau. Within Government, generally, part of this is coordinated through the Federal Pesticide Control Review Board. That Board is primarily concerned with operational programs, but it does get into the exchange of information on research programs. Within Government, the program dealing with research on fish and wildlife is carried out by the Department of Interior. I do not know of any other departments that have programs that would be measuring the effects on fish and wildlife. We are also in the process of developing a review procedure with the Department of the Interior and other agencies, who will participate in the review of applications of new chemicals that are presented to the Department of Agriculture for registration. In other words, we will have a chance to look at the applications and to furnish recommendations to Agriculture concerning the desirability of registering the chemicals.

AGRICULTURE RESEARCH LABORATORY, FARGO, N. DAK.

Senator YOUNG. Mr. Chairman, if you would yield at this point, the Subcommittee on Agricultural Appropriations, provided funds to build a $2 million research laboratory in Fargo, N. Dak., to find exactly the answers you are concerned about now. Last year we had a very difficult time in even getting part of the funds to staff and equip that laboratory. Have you looked into this?

Mr. PARKER. Senator Young, the information I have read on it indicates that they will be working largely on domestic animals and determining the impact on dairy cattle, hogs, and sheep.

Senator YOUNG. You had better look into it again, because your information is completely wrong.

Mr. PARKER. I will be glad to look into it again.

Senator YOUNG. I wish you would and I wish you would advise that committee to try to get them to staff and equip this.

Mr. PARKER. We very definitely have an interest in this field. I was not aware that there were any other agencies involved in it as far as the Fish and Wildlife are concerned.

I do know that Agriculture was intending to carry on their research in that laboratory pointed at domestic animals.

Senator YOUNG. I wish you would look into that and advise this committee what, if any, duplications are likely.

Mr. PARKER. I will do that.

(The statement referred to follows:)

DISTINGUISHING BETWEEN OBJECTIVES OF THE LABORATORY AND THE PESTICIDE RESEARCH PROGRAM

Both the U.S. Department of Agriculture and the Bureau of Sport Fisheries and Wildlife are conducting research on pesticides. The U.S. Department of Agriculture's program at Fargo, N. Dak., is directed at basic research on metabolism of insects with a view to developing safer, more selective chemicals and other insect controls. Research is directed toward the target organism. The Bureau of Sport Fisheries and Wildlife research is directed at understanding, and thereby possibly circumventing, effects on nontarget organisms of chemicals used or proposed for use as pesticides. The Fargo Laboratory will undoubtedly yield compounds that will require study by the Bureau of Sport Fisheries and Wildlife. There is no overlap between these functions, but close cooperation will be helpful to both organizations. Confusion in the programs of the two organizations apparently resulted from a newspaper article headline; the program objectives outlined by the Agricultural Research Service are quite different than suggested by the newspaper. Following are the newspaper article and a statement of the actual program at Fargo.

[From the Aberdeen American News, Aberdeen, S. Dak., Jan. 12, 1964]

WILDLIFE LAB BEING BUILT ON NDS CAMPUS

FARGO.—Laboratory construction being finished here this winter could answer the literary charge of "The Silent Spring."

Authoress Rachel Carson writes in "The Silent Spring," of the possibility of insecticides and pesticides destroying life slowly but surely.

As if to answer the book published in 1962, the U.S. Department of Agriculture has designed and built a $2 million Laboratory on the North Dakota State campus. The Laboratory when equipped with a staff of 135 persons, will research the metabolism of agricultural chemicals by plants, animals, and insects. Emphasis at the USDA laboratory will be on basic research relating to agricultural chemical hazards and means of avoiding these hazards.

Director of the USDA Metabolism and Radiation Research Laboratory is Dr. Raymond C. Bushland. About the work to be done at the Laboratory, Dr. Bushland says: "Every bit of basic research has to be to attain knowledge that will help us detect potential hazards of new agricultural chemicals and to expedite the development of safer chemicals for use in our agricultural industry."

The Laboratory is not a duplication of the North Dakota agricultural experiment station, Dr. Bushland points out. No dirt specimens from a farmer will be tested, but rather work will be on projects such as use of sterile insects that cause self-destruction by failure to reproduce. Dr. Bushland is internationally known for his work with self-destroying sterile insects. He said such work will probably be started next fall at the laboratories here.

Another scientist, Dr. M. R. Clarkson of USDA's Agricultural Research Service, said the sterile approach is probably the most spectacular now being planned by scientists. There have been encouraging results from first efforts to test the sterility principle against several other important agricultural insects.

In terms of money, the Laboratory's operation will cost about $1,830,000 a year, according to Senator Milton R. Young, Republican, of North Dakota.

Part of this figure will be salaries for the staff which will include 80 scientists, and 55 supervisory staff members, secretaries, clerks, attendants, etc., for a total payroll of 135. Of this staff, 10 Ph. D. scientists with 10 technical assistants will be required for study of the metabolism of agricultural chemicals in plants,

and the same number of personnel for the study of metabolism of agricultural chemicals in animals and insects.

General Services Administration will inspect the complex of laboratory buildings about February 15, Dr. Bushland said. The complex includes the main Laboratory, which is a large E-shaped building with two greenhouses attached, another building primarily for cattle, a small entomology support building and attached greenhouse, plus a building to house shops, garage and heating facilities.

Dr. Bushland noted that it would be about 9 months to a year after the GSA inspection before the complex is completely operational. He said the first basic research projects may be underway by this summer, getting into full operation by next fall.

North Dakota State will feel the impact of the Laboratory complex, Dr. Bushland said. The Laboratory plans to use graduate students as research assistants as well as advanced undergraduate students. Also, the Laboratory will cooperate with NDSU in library facilities and an exchange of information.

STATEMENT CONCERNING AGRICULTURE LABORATORY AT FARGO, N. DAK.

Fargo, N. Dak., $320,000 (metabolism and radiation research).—Construction of this laboratory is expected to be completed early in February 1964. Funds in the amount of $680,000 appropriated in fiscal year 1964 have provided for initial staffing including the director, administrative officer, and some of the key scientists and supporting personnel, as well as many major items of equipment. Additional funds are needed to strengthen research to provide basic information that would aid in the development of new, highly selective, and safer chemicals to control pests through studies of metabolism in insects, crops, and livestock; also, to develop improved methods for irradiating insects and to determine the genetic effects of radiation on them. Part of the increase is needed for additional equipment.

These studies would provide information on how pesticides and their identifiable metabolites affect insects and crops, how they are absorbed, transported, and eliminated in plants and animals, and help to determine the complex relationship between the insect, its host and the toxicant.

The insect sterility research would be strengthened by initiating research to develop methods of inducing sterilization on selected insect species by radiation that will avoid loss of sexual vigor and to determine the genetic effects of radiation on insects.

TWO-MAN SUBMARINES

Chairman HAYDEN. I note in the narrative accompanying your fishery research item that you state the Bureau is testing, preparatory to full-scale operation, its two-man submarine. When did you get it and how much did it cost?

Mr. TUNISON. Mr. Chairman, we have two. We purchased them last year. One is located in California and one we are trying to use in a reservoir in Arkansas. This is a picture of what it looks like. It is about 12 feet long, weighs about a ton, and it goes down to about 300 feet and stays there, as I recall, about 10 hours. Now this is an alternate to the use of scuba divers and our men can make much closer and better evaluations of the fish underwater and for a longer time and to do a better job. One of them costs $8,500 and one of them costs $4,400 in round figures. We feel that it is a good device. They have taken some pictures underwater of fish life. Really, the proof of this device will not come for at least another year, but we think it is a good thing. It saves us money, from the standpoint of scuba divers. In fact, they could not go in some of these areas.

Chairman HAYDEN. The real advantage is to be developed?

Mr. TUNISON. Yes, indeed.

Senator MUNDT. How deep can they go?

Mr. TUNISON. 300 feet.

Chairman HAYDEN. What does one of these cost?

Mr. TUNISON. The first one we bought was $4,400. That was an experimental submarine. The second cost $8,500.

Chairman HAYDEN. Where are they made?

Mr. TUNISON. I believe they are made in Chicago.

MATCHING OF PREDATOR AND RODENT CONTROL FUNDS

Chairman HAYDEN. Is all of the $2,710,000 which you request for control of predatory animals and injurious rodents matched by State or local or private cooperators?

Mr. PARKER. It is matched.

In 1965 we anticipate matching funds of over $4 million.

BIRD DAMAGE TO AIRCRAFT

Chairman HAYDEN. Is the Bureau of Sport Fisheries and Wildlife still doing research on methods of avoiding bird damage to aircraft? If you are, how much did you expend during fiscal year 1964 and how much do you propose to expend for this type of research in the coming fiscal year?

Mr. PARKER. Much of that work was done under a contract with funds furnished by the FAA and we have now completed the contract so that currently there is very little in the budget. I would have to furnish the exact figure.

Chairman HAYDEN. What have you developed that you think would be helpful in the future in avoiding such accidents?

AVOIDING FUTURE ACCIDENTS

Mr. PARKER. Much of the efforts have reference to Logan Airport in Boston. There we have come up with the determinations that much of the habitat should be cleaned up, that is, sources of food, the open fish piers, the piggeries, and the garbage dumps that are furnishing food for the gulls, and attracting the birds immediately around the airport. We have hopes that this spring there will be a general meeting of the officials concerned wherein an action program will be developed to alleviate the problems of the gulls up there.

We have, in addition, done some work on the possibility of eliminating weeds and so on that might attract birds around there. We have tested out these frightening devices that we spoke to you about briefly. We are also working on an exchange of information with a Canada bird-aircraft committee. They have similar problems and are primarily trying to develop frightening devices. Our particular part has been aimed at testing distress calls, recording these calls of gulls and then playing them back in problem areas. This has, in many instances, driven the birds off the airports.

We can do pretty well using these distress calls.

FEDERAL AVIATION AGENCY CONTRIBUTION

Chairman HAYDEN. Is the Federal Aviation Agency contributing to this research and how much is that Agency providing for you?

Mr. PARKER. As I indicated, the contract is wound up now. I would have to furnish, for the record, the total amount of money, if that is all right with you, sir.

Chairman HAYDEN. Yes.

(The statement referred to follows:)

RESEARCH ON BIRD HAZARDS TO AIRCRAFT

National attention was first focused on bird hazards to aircraft following the fatal crash of a commercial airliner at Logan Airport in Boston, Mass., on October 4, 1960. As a result of this accident the Federal Aviation Agency allocated funds to the Bureau of Sport Fisheries and Wildlife for research into the several aspects of the problem. These funds totaled $100,000 in fiscal year 1961, $200,000 in fiscal year 1962, and $190,000 in fiscal year 1963. FAA did not provide funds in fiscal year 1964 and none are anticipated in fiscal year 1965.

The research program was geared to determine the extent and seriousness of bird hazards to aircraft, identification of the species involved, and the development of ways and means of reducing the attractiveness of airports to birds and techniques of dispensing them from sensitive areas. The Bureau's Wildlife Leaflet 429 "Bird Hazard to Aircraft" published in January 1961 provided airport managers with available information concerning habitat manipulation and the use of scare devices as bird deterrents.

Bird strikes caused the death of 17 people and the loss of 2 aircraft in 1962. During the period January 1961 through April 1963, 430 bird-plane strikes were reported. In 135 strikes where bird identification was made, gulls were involved in 50 and waterfowl in 25. Various bird species, numbering 23 during the late fall and 35 during the spring, were identified and considered potentially dangerous to aircraft at Washington National Airport. In all parts of the country the hazard is obviously greatest during the spring and fall migration periods.

Extensive knowledge of the seasonal movements, flight patterns, feeding habits, concentration areas, and other characteristics of problem bird species was summarized and made available to alert aircraft operators and airport managers as to potential danger periods and locations. Through research contracts with the Massachusetts Audubon Society, detailed data were obtained on herring gulls in the Northeast. The findings clearly indicated that this species is frequently attracted to airports by the abundance of food present at nearby dumps, piggeries, sewage outlets, and fish-processing plants. Ecological and direct means of reducing gull populations to tolerable levels were summarized.

In other cases, the attractiveness of airports to species such as blackbirds and starlings has been dramatically reduced through elimination of roosting vegetation such as reeds, trees, and shrubs; by the draining of impoundments which serve as resting places or as sources of drinking water; and by the control of insects and seed-bearing weeds and grasses. Partial success has also been achieved in repelling birds from runways through broadcasting their recorded distress cries, especially when these were used in conjunction with other scare techniques such as shellcrackers and carbide exploders. Intensive search was also made to discover and develop selective lethal agents, antiflying compounds, soporific agents, and chemosterilants for possible use in reducing bird populations at problem sites.

Those facets of the research work which have a relationship to the agricultural damage problems are being continued. The studies which relate only to the aircraft and airport problems have been phased out.

Mr. JANZEN. Mr. Chairman, I might add when we discussed this with the Federal Aviation Agency we more or less tentatively agreed that the Federal Aviation Agency would consider collisions between birds and airplanes after the airplanes had left the airport area as a problem to be solved by the airplane industry, that they were going to have to somehow or other birdproof the airplanes. But at the time of takeoff and landing, when the planes were particularly vulnerable, it would be our problem to make the airport as repellent as possible to the birds and that is why our research has been in that direction.

MOURNING DOVE RESEARCH

Chairman HAYDEN. The question of mourning dove research has come before the committee on prior occasions. I note that you do have research on this bird going on. How much did you allot for this purpose in fiscal year 1964, and how much do you propose to make available during the coming fiscal year?

Mr. PARKER. As I recall, Mr. Chairman, it is $60,000 for dove research and there is no increase in 1965.

Chairman HAYDEN. Do you need any more money than you are getting?

Mr. PARKER. The mourning dove, as you know, is an important game bird, particularly in the southern half of the United States. In 1960 we worked with game and fish commissioners of the States and developed a cooperative program. The Federal part of the program totaled about $225,000, as I recall. If this were updated now, it would be in the neighborhood of $280,000 or $282,000. Currently, we have in the budget, as I indicated, about $60,000. When we started the new program, we put $26,000 in. So, financially speaking, I guess we are still about $250,000 or $256,000 short of meeting the total objectives that were agreed upon back in 1960.

CONTROLLING BLACKBIRDS AND STARLINGS

Chairman HAYDEN. Also, methods of controlling and ridding the country of blackbirds and starlings has been a matter of concern. How much did you expend for this purpose in fiscal year 1964, and how much will be allocated in fiscal year 1965? It may be well for you to submit for the record a statement indicating your activities along this line and setting forth such results as you have obtained.

Mr. PARKER. We will be happy to do that, Mr. Chairman.

(The statement referred to follows:)

1965 BUDGET REQUEST FOR RESEARCH

The fical year 1965 budget request of the Bureau of Sport Fisheries and Wildlife includes $639,000 for research on methods for preventing crop depredations and other losses caused by nuisance and destructive species of birds. This amount represents a $10,000 increase above the fiscal year 1964 budget for pay cost adjustments and permits a continuation of the research program at its present level.

Starlings and blackbirds are the major problem birds in the United States. The several species of blackbirds important in crop depredations are natives; however, the starling is an exotic. Since their introduction in New York's Central Park in 1870, starlings have spread to the Pacific coast and southern Canada. Only small flocks were observed on the west coast during the late 1940's. By 1962 the Western wintering populations numbered in the millions. During winter months the starlings and blackbirds intermingle in tremendous flocks which frequently gather at livestock feedlots. They not only consume great quantities of grain but also contaminate much of the remainder. Their role in the spread of livestock diseases is not completely known, but evidence points to their implication in this regard. At night they often gather in large roosts. Over 200 million were estimated to be present in 227 roosts located during the winter 1961–62. While these are scattered throughout all but the extreme Northern States, the largest winter concentrations are found in the lower Mississippi Valley. When located in forest plantations adjacent to water reservoirs, such as at Hanover and York, Pa., these large flocks set the stage for the contamination to drinking water and the destruction of watershed vegetation. Starling roosts on buildings in towns and cities likewise create health hazards and damage structures.

During spring, summer, and fall months starlings and blackbirds feed upon a wide variety of fruits, vegetables, and cereal grains. Blackbird damage to corn is particularly severe throughout the Middle Atlantic States, the Great Lakes region, and in Florida. Damage which occurs in rice and grain sorghum fields of Arkansas, Mississippi, Texas, and Louisiana is a matter of serious concern. Starling damage to small fruits is increasing rapidly in many parts of the country, particularly in New England, western New York, Michigan, Washington, Arizona, and California. While the total annual loss owing to bird depredations cannot be determined, one survey by the American Farm Bureau Federation estimated that it was in excess of $26 million.

Because of the variety of problems involved, the research program is broadly based. It includes investigations of the basic biology of the birds; the elaboration and improvement of mechanical, sonic, electronic, and chemical repellents; development of selective population reduction measures, such as chemosterilants and lethal agents; and cultural methods of minimizing damage. The biological studies are basic to an understanding of reproduction rates, flocking and feeding habits, daily and seasonal movements, and other traits which reveal the vulnerability of the birds to different control methods. This is illustrated by recent success achieved through the use of strategically placed decoy traps for capturing large numbers of starlings and blackbirds in the vicinity of cherry orchards and rice fields. The presence of live decoy birds in the traps attracts other members of the same species. Progress is also being made in the discovery and development of selective pesticides which possess high avian toxicity but pose little hazard to mammals. These and all other promising research developments for bird control must be thoroughly field tested under a wide variety of conditions to insure safe and effective application techniques before their release to the general public.

Chairman HAYDEN. The starling problem, if I understand it, has spread all over the United States.

Mr. PARKER. It has spread to all of the States, yes, sir.

PESTICIDE-WILDLIFE RESEARCH

Chairman HAYDEN. With regard to pesticide-wildlife relationships for which you ask a total of $1,920,000, you have set forth six different types of work on which the increased expenditures will apply. Would you please supply for the record the total amount that will be available for these six purposes during fiscal year 1965?

Mr. PARKER. I will be glad to.

(The statement referred to follows:)

Estimate for pesticide-wildlife relationships research

Description of work	Available, 1964	Increase	Estimate, 1965
Monitoring studies		$75,000	$75,000
Evaluation of new pesticides	$30,000	250,000	280,000
Toxicological and pharmacological studies	520,000	556,000	1,076,000
Ecological effects	112,000	227,000	339,000
Surveillance of operations		100,000	100,000
Public information		50,000	50,000
Total	662,000	1,258,000	1,920,000

Chairman HAYDEN. Is it proposed that work on these activities will continue indefinitely, or is there any way for you to know how long the work must continue?

Mr. PARKER. I wish I could look ahead so that I could assure you when it will wind up. As long as there are new chemicals developed, and they are being developed in increasing numbers every day, there is still some research going to be necessary. However, I am opti-

mistic to this extent that the industry is now well aware of the impact of the chemicals on fish and wildlife. We have been working with them in developing procedures and test animals that they might work on early in their experiments so that by the time they come to register a chemical, the company itself will have checked out many of the effects that we should know. I am optimistic that in time we are going to be on top of the problem.

Chairman HAYDEN. Are these new fields of research in which the Bureau has not heretofore participated?

Mr. PARKER. We have done very little. We are just starting to get a feel for the possibilities of destroying or eliminating the potential of some of the pesticides. Some very early work was done by our fishery people which indicates the possibility of bacteria breaking down the hydrocarbons in particular, so that it may be possible to clean up some of the habitats using bacteria, for example.

RESEARCH CONTRACTS

Chairman HAYDEN. Of the amount requested, $675,000 is for research contracts. Would you describe briefly the type of work you propose to accomplish by contract, and indicate in general the terms which will be written into the contracts?

Mr. PARKER. The contracts will be in large measure those which we will ask a laboratory that has facilities to test or determine the amount of pesticides in collected specimens. These are specimens that are picked up as a result of following up on surveillance programs or the long-term studies of the impact of chemicals on fish or wildlife. These are routine tests that we feel could better be done by somebody fitted to do rather than using our scientists and research men to do these service functions that are part of the research program. Now the terms of the contract would be the standard governmental provisions.

SOUTHEASTERN COOPERATIVE WILDLIFE DISEASE STUDY

Chairman HAYDEN. Last year, Congress provided $200,000 unbudgeted for the southeastern cooperative wildlife disease study at the University of Georgia. Would you please outline for the committee the use to which this money was put, and indicate to the committee the total amount to be available for this purpose in fiscal year 1965?

CATTLE TICK FEVER AND DEER

Mr. PARKER. The $200,000 was used to enter into three contracts with the University of Georgia Veterinary Medicine Department. One of them is to determine the relationship of the cattle tick fever and deer. In other words, is the deer an alternate host? This is a research project that will be carried out in the Virgin Islands, because as far as we know, fortunately, there are no cattle tick fever ticks in the United States proper at the present time. There is always the danger that the disease may show up again.

LIVESTOCK DISEASE, ANAPLASMOSIS

The other one is a contract dealing with the livestock disease anaplasmosis that some veterinarians think deer are a host to. Both of these contracts were designed to determine what part deer might play in the transmittal of these two diseases. I think it is obvious that if we don't know that deer are important hosts and if these two diseases result in epidemics in the Southeast particularly, there is going to be quite a contest because the deer hunters on one hand will not want to see any deer killed and on the other side the livestock interests will be looking to protect their herds.

What we are trying to establish once and for all is whether or not deer are important alternate hosts of these diseases.

The third contract is the appraisal of the diseases and parasites that game birds might be carrying as they relate to the important ones in poultry.

Chairman HAYDEN. The same amount is available for the next fiscal year?

Mr. PARKER. Yes.

FOREST ANIMAL DAMAGE PROBLEMS

Chairman HAYDEN. What progress are you making on the forest animal damage problem in the Pacific Northwest? It is my understanding that a survey several years ago revealed that animal damage to seeds, seedlings, and saplings amounted to about $15 million annually in that region alone, and we are anxious to see this loss prevented if at all possible.

Mr. PARKER. We have, as you know, been working on rodents, particularly seed-eating rodents, but we have also been studying deer, rabbit, and porcupine damage. We have four compounds currently that are being tested out there that look good. These are compounds that were screened in our Denver laboratory and are now being tested at the tree nursery in Olympia, Wash. So far the trials have not progessed far enough to be able to tell you for sure just how good or when the chemicals will be available for operations, but we are rather optimistic with them. This is a cooperative venture that is being carried out with the U.S. Forest Service, concerning plant aspects as well as the State forest service.

Chairman HAYDEN. Do you think that your present level of research is adequate?

Mr. PARKER. So far all of our efforts have been concerned with problems of the Pacific Northwest. There are animal damage problems in the Lake States, in the Northeast, and in the Southeast. In other words, in all of the forest regions of the country foresters have trouble with seed-eating and other tree-damaging animals.

Chairman HAYDEN. What additional funds do you think you could use advantageously?

Mr. PARKER. About 2 years ago we developed a program in the magnitude of $850,000, but I believe we could adequately, considering personnel available, use in the neighborhood of $320,000, plus 20 scientists and technicians.

Land Acquisition Program

Chairman Hayden. Do you think that the level of your land acquisition program is adequate?

Mr. Janzen. Mr. Chairman, Congress authorized a $105 million land acquisition for a 7-year period and our $8 million budget for this year does not meet the schedule that has been, of course, proposed for that. But under our limitations, under our fiscal policy, this year, we felt this was as much as we could include in the budget.

Chairman Hayden. In your opinion, what would be an adequate funding level?

Mr. Janzen. If we were to meet the funding level as Congress had requested or authorized us to proceed with, it would have to average $15 million a year for a 7-year period. The first year we did not get any funds, and the second year we got $7 million. Last year we received $10 million, so we are quite a bit behind.

River Basin Studies

Chairman Hayden. Your justifications indicate that you will require $1,337,000 for river basin studies in fiscal year 1965, and have broken down the description into five phases. Would you please supply for the committee the amounts expended on each of these phases in fiscal year 1964, and the amount which you propose to expend on them in fiscal year 1965?

Mr. Janzen. Yes; we will be glad to do that.

(The statement referred to follows:)

Available and estimated funds

	Available, fiscal year 1964	Estimate, fiscal year 1965
Wetlands preservation program	$300,000	$305,000
Surveys of water-use projects	836,000	847,000
Small watershed program	112,000	115,000
Urban planning assistance program	10,000	10,000
Followup program	60,000	60,000
Total	1,318,000	1,337,000

Chairman Hayden. Would it be agreeable to adjourn now and come back about 2:30?

Senator Byrd. Yes, sir.

Chairman Hayden. How about you?

Senator Young. If I could have about 2 minutes, I think I could finish my questions.

Wildlife Research Facilities

I note, Mr. Janzen, that you have $140,000 for wildlife research facilities at Jamestown, N. Dak., and Laurel, Md. How much of this is for Jamestown?

Mr. Parker. The construction figure is $100,000 for Jamestown.

Senator Young. Will that complete the construction?

Mr. Parker. No. If I recall correctly, there is need for $75,000 for buildings that are necessary.

Senator YOUNG. In your item for staffing a new Northern Prairie Wildlife Research Center, you have some money for staffing here.

Mr. PARKER. Yes.

Senator YOUNG. How much?

Mr. JANZEN. There is an item of $155,000 to initiate the staffing which will be in connection with the section which has been completed.

TEWAUKON LAKE AREA PROJECT

Senator YOUNG. How much money do you have for this Lake Tewaukon area project?

Mr. PARKER. Construction that you are speaking of, or operations?

Senator YOUNG. It is a refuge and recreation center.

Mr. PARKER. There is $24,800 for the operation and maintenance.

Senator YOUNG. That is for the construction and operation and maintenance?

Mr. PARKER. The last figure I gave you was operations and maintenance. What did you give for construction?

Mr. TUNISON. I said $62,000.

Senator YOUNG. Is that a small building or something?

Mr. PARKER. That is for a new water-control structure, Senator Young. The old dam is about shot and we are afraid it will go out. This will replace that dam.

Senator YOUNG. This is a very popular project you have here. Thank you, Mr. Chairman.

Chairman HAYDEN. We will now recess until 2:30.

(Whereupon, at 12:30 p.m., the committee recessed to reconvene at 2:30 p.m., the same day.)

(AFTERNOON SESSION, 2:30 P.M., THURSDAY, FEBRUARY 27, 1964)

1965 BUDGET ESTIMATE FOR CONSTRUCTION

Senator BIBLE. The subcommittee will come to order. I understand that during the morning session you finished your presentation down to the construction items. Is that correct?

Mr. JANZEN. That is correct.

Senator BIBLE. The budget estimate for 1965 for construction for the Bureau of Sport Fisheries and Wildlife amounts to $3,593,000, $6,633,957 less than the amount appropriated in fiscal year 1964.

The justification will be placed in the record at this point.

(The justification referred to follows:)

HIGHLIGHT STATEMENT

The purpose and long-range objectives of the program for construction are to provide land, buildings, and other facilities for the conservation, management, and investigations of the Nation's sport fish and wildlife resources.

Accomplishments planned for 1964 include new construction and improvements at 17 fish hatcheries; site investigations and preliminary designs for a national fisheries center and aquarium; continued construction at 4 fishery research laboratories, planning for a fish-pesticide laboratory, and site selection and engineering design for a fishery research laboratory at Narragansett Bay, R.I.; construction and development at 13 wildlife refuges; engineering planning at refuges; construction at 2 wildlife research centers; and planning for a new chemical screening center for pesticide research.

The 1965 program provides for replacement of water supply line at Leavenworth, Wash.; plans and specifications for the new National Fisheries Center and Aquarium; first phase construction at a fish-pesticide laboratory in Columbia, Mo.; construction and development of 12 refuges; engineering planning at refuges; continued construction at the Northern Great Plains Research Station in Jamestown, N. Dak.; first phase construction of a pesticide research facility at Denver, Colo.; and plans for a general purpose laboratory-office building at Patuxent, Md.

Construction

Appropriation 1964	$5,243,500
Unobligated balance from prior years	+4,983,457
Total available for obligation 1964	10,226,957
Decreases:	
Fish hatchery facilities	5,169,772
Fishery research facilities	867,955
Wildlife refuge facilities	3,590,119
Wildlife research facilities	599,111
Total, decreases	10,226,957
Subtotal	
Increases:	
Fish hatchery facilities	650,000
Fishery research facilities	735,000
Wildlife refuge facilities	1,468,000
Wildlife research facilities	740,000
Budget estimate 1965	3,593,000

Anaylsis by activities (total funds)

Activity and appropriation	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−)
1. Sportfish facilities:				
Construction	$2,683,725	$6,037,727	$1,385,000	−$4,652,727
Construction of recreational and fish and wildlife facilities, Bureau of Reclamation	108,440	833,039	1,290,000	+456,961
Subtotal	2,792,165	6,870,766	2,675,000	−4,195,766
2. Wildlife facilities:				
Construction	3,981,206	4,189,230	2,208,000	−1,981,230
Construction of recreational and fish and wildlife facilities, Bureau of Reclamation	272,053	1,275,920	1,000	−1,274,920
Subtotal	4,253,259	5,465,150	2,209,000	−3,256,150
Total, direct appropriation	6,664,931	10,226,957	3,593,000	−6 633,957
Other funds	380,493	2,108,959	1,291,000	−817,959
Grand total	7,045,424	12,335,916	4,884,000	−7,451,916

Analysis by activities

Activity	Amount available 1964	Fiscal year 1965			Total available 1965 compared to total available 1964
		Unobligated balances from prior years	Budget estimate	Estimated total available	
1. Sportfish facilities	$6,037,727		$1,385,000	$1,385,000	−$4,652,727
2. Wildlife facilities	4,189,230		2,208,000	2,208,000	−1,981,230
Total	10,226,957		3,593,000	3,593,000	−6,633,957

1. SPORTFISH FACILITIES, $1,385,000

(a) *Fish hatchery facilities, $650,000*

The estimate of $650,000 is for construction as follows:

(1) *Leavenworth, Wash., $150,000.*—This fish hatchery was established in conjunction with Grand Coulee Dam to save and help perpetuate salmon that were forever blocked from their spawning grounds by the dam. It not only saved but substantially increased the sockeye salmon run. With the continuing development of power dams on the Columbia River, the station's activities are now of even greater importance. The hatchery produces sockeye salmon, chinook salmon, kokanee, cutthroat, and rainbow trout. The average annual production of all species averages about 70,000 pounds, approximately 7,725,000 fish. In addition, the need for trout is increasing each year to the point where the station's production is taxed to the limit.

The estimate is for replacement of the station water supply line. This line is a continuous, untreated, wood stave pipe, 25 years old, with a discharge capacity of 18 cubic feet per second, and is in extremely poor condition. Replacement with the proposed larger line will increase the line's capacity to 54 cubic feet per second, increasing the water available for fish production.

(2) *National Fisheries Center and Aquarium, Washington, D.C., $500,000.*—The Administrator of General Services is authorized by the act of October 9, 1962 (16 U.S.C. 1051 et seq.) to plan, construct, and maintain a National Fisheries Center and Aquarium in the District of Columbia for the display of fresh water and marine fisheries and other aquatic resources for educational, recreational, cultural, and scientific purposes, at a cost not to exceed $10 million.

This facility is expected to provide great assistance to the people and the fishing industry in understanding conservation and prudent management of an important natural resource; outstanding opportunities for scientific research and education; and recreation for thousands of tourists as well as the inhabitants of the metropolitan area of Washington, D.C.

In 1964, $260,000 was appropriated for site investigations, test borings for water, surveys of site, and details preliminary for preparation of plans and specifications.

The estimate of $500,000 consists of $450,000 for the use of General Services Administration for architectural services (approximately 5 percent of total estimated cost) which will complete the plans and specifications and $50,000 for the Bureau for assistance to GSA in design of the facilities.

The following is a summary of the construction program:

Stations	Total cost	Previously appropriated	Estimate 1965	Required to complete construction
Leavenworth, Wash.	$510,000	----------	$150,000	$360,000
National Fisheries Center and Aquarium, Washington, D.C.	10,000,000	$260,000	500,000	9,240,000
Total	10,510,000	260,000	650,000	9,600,000

(b) *Fishery research facilities, $735,000*

The estimate of $735,000 is for use at Columbia, Mo., for construction of a major new fish-pesticide research laboratory. This includes an office-laboratory of approximately 25,000 square feet, service buildings, and holding and rearing ponds for experimental fishes. In prior years, $100,000 was appropriated for site investigations and design.

2. WILDLIFE FACILITIES, $2,208,000

(a) *Wildlife refuges, $1,468,000*

The estimate of $1,468,000 is for development on 12 national wildlife refuges and advance planning as follows:

Refuges:	
Havasu Lake, Ariz	$50,000
Kern, Calif	90,000
Savannah, Ga	80,000
Quivira, Kans	140,000
Sabine, La	117,000
Charles M. Russell, Mont	240,000
DeSoto, Nebr. and Iowa	175,000
Tewaukon, N. Dak	62,000
Ottawa, Ohio	51,000
Ouray, Utah	115,000
Missisquoi, Vt	67,000
Horicon, Wis	81,000
Total refuges	1,268,000
Advance planning	200,000
Total estimate	1,468,000

The estimate will provide—

Impoundment facilities	$860,000
Biological facilities	67,000
Buildings	135,000
Fencing	48,000
Roads and trails	66,000
Recreational development	92,000
Advance planning and water rights	200,000
Total	1,468,000

The construction will create operable management units within the refuges. Master plans are the basis for the estimates and engineering studies have been made for all areas cited. Recreational development compatible with wildlife management and consistent with public need is required to implement the authorization in the act of September 28, 1962 (16 U.S.C. 460k et seq.). Additional facilities for compatible public use permitting the enjoyment of the wildlife resource by people is essential due to an increasing annual visitor use which presently exceeds 12 million.

Havasu Lake, Ariz., $50,000.—This area is of chief importance as a resting and wintering area for waterfowl, especially the Great Basin Canada goose. It is essential that Topock Marsh be developed to control water levels, land clearing, leveling and installation of irrigation facilities to provide essential food. The estimate will permit land leveling of areas cleared with $33,200 provided in fiscal year 1963. This work is needed to facilitate the growing of browse crops for goose food. Biological studies and engineering feasibility surveys have been made.

Kern, Calif., $90,000.—This new refuge in the southern San Joaquin Valley, will restore, in part, the once vast waterfowl and other wildlife habitat destroyed by agricultural development and reclamation of Buena Vista, Kern, Goose, and Tulare Lakes. It will provide the only federally owned waterfowl resting, feeding, and wintering grounds in the Pacific flyway between Merced and Salton Sea for approximately a half million ducks and geese. The development is based on a master plan and will permit completion of an operable unit. New dikes and control structures will create urgently needed waterfowl habitat with Tulare drain water. This is the third phase of the overall development program involving $1,474,700, of which $518,800 has previously been appropriated.

Savannah, Ga., $80,000.—Development is based upon master plans totaling $1,039,500, which will greatly improve this area for wintering waterfowl. Much of the marsh area cannot be managed because of lack of dikes, canals, and control structures. The $80,000 estimate for this purpose will be the first of four development phases which will create manageable units.

Quivira, Kans., $140,000.—A continuation of work is necessary to complete the third segment for water development. This is essential to support a declaration of taking action in acquisition of certain properties required for development. It is also vital that this area of excellent waterfowl potential be developed to aid in the recovery of waterfowl populations generally. Quivira is the spring stopover of northward bound white-fronted geese and is becoming increasingly valuable from the standpoint of duck nesting and production. An approved master plan shows a total need for $1,275,000. With this amount and the $452,200 previously appropriated, $682,800 remains to complete development.

Sabine, La., $117,000.—A master plan has been prepared and serves as the basis for this estimate. Sabine is an important terminal wintering area for ducks and geese, and provision for food and rest areas is essential. Extensive canal dredging and repair, new control structures, and repair of pool three dikes are required as the first phase of development. $680,400 will be required to complete the remaining three phases.

Charles M. Russell, Mont., $240,000.—The newly dedicated Charles M. Russell National Wildlife Range, Montana, encompasses 951,062 acres along the Missouri River bottoms and rugged beaches. It provides important breeding habitat for migratory birds including waterfowl, doves, and several endangered or rare species of wildlife. Total development need is planned at $3,900,000. Recent Secretarial action placed this area (the former Fort Peck Game Range) under the primary policy and program direction of this Bureau. The Departmental program for this area stresses road construction, wildlife developments and recreational enjoyment of this scenic and important wildlife range. Initial development for which these funds are requested will provide improved waterfowl production habitat, permit construction of a residence, service building or oil house, and boundary fencing to facilitate grazing administration, all on the first stage of total development.

DeSoto, Nebr.-Iowa, $175,000.—This refuge was established in 1958 as a combination waterfowl management and public use area. A master plan has been prepared and total development cost will be $1,606,500. This estimate is for the third phase of work. When it is accomplished, remaining development will require about $1,200,700. Biological development includes clearing and leveling necessary for goose food production. Roads are needed for patrol activities and field access. Recreational development is essential to meet the extremely heavy visitor load, and will include construction of buildings and boating facilities for public use.

Tewaukon, N. Dak., $62,000.—A master plan has been prepared for this refuge. Tewaukon is an important duck production and goose concentration refuge and is also important as a public use area in a region of North Dakota where recreational facilities are scarce. The estimate will permit construction of a new water control structure for Lake Tewaukon. This will create additional duck production habitat, and will improve the lake for fishing and other water-related activities. The master plan includes a development program requiring a total of $738,500. When this first phase is carried out, $676,500 will be required for completion of development.

Ottawa, Ohio, $51,000.—This is a new refuge established to preserve vital wetlands along Lake Erie which are essential to waterfowl management, particularly for diving duck species in the first phase of a master planned development program. Work involved includes major rehabilitation of dikes on newly acquired lands.

Ouray, Utah, $115,000.—The new Ouray Refuge requires intensive water development in the form of dikes and water control structures to provide essential waterfowl habitat. A master plan has been completed which envisions a total cost of $1,300,000. The first phase of development has been started with an appropriation in 1964 of $133,000 for buildings and impoundment facilities. The 1965 estimate will also be utilized for buildings and water development. This area will play a vital role in the production and care of ducks and geese.

Missisquoi, Vt., $67,000.—Missisquoi is an important migration and production area for waterfowl but no major development has yet been accomplished.

A dike and control structure are needed to permit management of Big Marsh Slough. This work is based on biological and engineering studies.

Horicon, Wis., $81,000.—A master plan has been prepared which programs total development of $498,000. This estimate is for the first phase of work. Dikes, ditches, and control structures to create peripheral subimpoundments are essential to sustain high duck production. Deep plowing and levelling are necessary for food production to accommodate Canada goose concentrations often exceeding 100,000 each spring and fall. When this work is done, $417,000 additional will complete the development.

Advance planning, $200,000.—The orderly development of 289 existing National Wildlife Refuges for wildlife conservation, resource utilization, and public recreational enjoyment is dependent upon the program of master planning. Scheduled for accomplishment this year are eight major units of the refuge system, at an estimated cost of $150,000.

With water shortages becoming more prevalent in many sections of the country, there is an acute concern for water rights. It is essential that water rights for each refuge be reviewed, and necessary action be taken to file and obtain additional rights where necessary. Without water, waterfowl and other wildlife management cannot be carried out. $50,000 is estimated for this purpose.

(*b*) *Wildlife research facilities, $740,000*

The estimate of $740,000 is for construction and planning as follows:

Denver Wildlife Research Center, $600,000.—This amount is needed to provide laboratory and office space as well as enclosures, pens, and animal shelters for a chemical screening center, for which planning funds in the amount of $50,000 were appropriated in 1964. The primary purpose of the laboratory is to develop selective chemical control methods for nuisance animals so as to enable abatement of damage with minimal hazard to beneficial wildlife and other resource values as well as to carry out basic research on the pesticide wildlife problem. In the latter instance it is necessary to screen potential pesticides for their effects on indicator species of wildlife before they are marketed commercially. In this manner costly development of unacceptable compounds will be avoided and the promotion of selective chemicals will be effected. The facility will be located on the grounds of the Denver Federal Center where associated facilities are already available.

Northern Prairie Wildlife Research Center, Jamestown, N. Dak., $100,000.—This amount is needed to construct a residence, a garage-equipment shed, a waterfowl propagation facility, and holding pens, and to provide fences, roads, water supply, and equipment for the central laboratory facility at Jamestown, N. Dak. to enable basic research on factors affecting waterfowl production and means of enhancing wildlife resources in a manner compatible with agriculture and other land use needs.

Migratory Bird Populations Station, Laurel, Md., $40,000.—This amount is needed for development of plans and specifications for a general purpose laboratory-office building on the grounds of the Patuxent Wildlife Research Center. The building will house the bird banding records and machine data processing units of the station in proper juxtaposition to insure accessibility of records and efficient work flow. The structure will also provide adequate space for the storage of bird banding records which are accumulating at a rapid rate and which become more valuable as time goes on. Offices will be provided for the scientists who work with this data as well as data obtained from the waterfowl questionnaire survey and the productivity surveys of migratory game birds based on mail receipts of feather specimens. The research carried out by this group provides basic data on population dynamics, mortality rates, and migratory habits as well as management oriented information on the effects of hunting on game populations and the extent to which hunting regulations variations affect the level of the kill.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase or decrease (−)
Program and financing:				
Total obligations	$6,664,932	$10,226,957	$3,593,000	−$6,633,957

CONSTRUCTION WORK TO BE ACCOMPLISHED

Senator BIBLE. Will you please describe briefly the work you propose to accomplish with the construction request?

Mr. TUNISON. We have several items under "Fisheries." Leavenworth (Wash.) station was established about 1941 as a part of the Grand Coulee project. The Leavenworth, Entiat, and Winthrop fish hatcheries were established to take care of the runs that would no longer go above Grand Coulee.

At that time a pipeline was put in from Snow and Nada Lakes to Leavenworth, a wood stave pipe. It has now deteriorated to a point where we need to replace it. That is one item under the hatchery program.

NATIONAL FISHERIES CENTER

We also have under our construction program for hatcheries, $500,000 for design and specifications of the new National Fisheries Center—$450,000 of that will go to General Services Administration for the design work, $50,000 will be used by the Bureau to conduct tests and studies in order that we may advise the architect.

FISH PESTICIDES LABORATORY IN MISSOURI

The largest item is for the fish pesticides lab to be located in Missouri. We have completed the detailed plans. I shall be glad to leave a copy with the committee if they so wish.

Senator BIBLE. It will be received and adopted by reference for the use of the committee.

Mr. TUNISON. Included therein is a breakdown of our cost. The first phase amounts to the $735,000 indicated. We have shown in this three later phases. We may wish to combine those with just one more phase in order to complete this facility as soon as possible.

We would hope that the fiscal policy will enable us to do that next year. That takes care of the fishery construction work in the budget.

National Wildlife Refuges Improvements

Mr. Parker. On the wildlife side, Mr. Chairman, the construction items call for improvements of 12 of the national wildlife refuges in the amount of $1,468,000. At Havasu in Arizona we are continuing the land leveling and clearing started previously.

At Kern, Calif., we will be constructing new dikes and control structures to develop one of the impoundments there. At Savannah in Georgia, the money will be used to develop dikes and canals and control structures. Likewise at Quivira, Kans. At Sabine in Louisiana we will be doing extensive canal dredging and repair of the control structure for one of the pools there.

Charles M. Russell Refuge

At the Charles M. Russell in Montana, we will be building a residence, and service building and boundary fence.

Senator Bible. On that point—I am reading from page 106 of the justification—the total estimated cost of Charles M. Russell is $3,900,000. Is that correct?

Mr. Parker. That is correct.

Senator Bible. Is this the first step?

Mr. Parker. There has been work done there previously, prior to the preparation of a master plan. The master plan calls for $3.9 million. The $240,000 is for the first stage of this master plan.

Senator Bible. So at that present level of funding that looks like that is a good 10- or 15-year program.

Mr. Parker. That is right.

Senator Bible. Thank you.

De Soto, Tewaukon, and Missisquoi Refuges

Mr. Parker. De Soto in Iowa and Nebraska, we are doing land leveling and development of roads.

Tewaukon in North Dakota, there will be the replacement of an existing dam that is about ready to wash out. At Ottawa in Ohio, there will be major rehabilitation of the dikes. At Ouray, Utah, $115,000 is being requested for buildings and the start of some impoundment facilities.

At Missisquoi, Vt., there will be a dike and control structure to permit the management of one of the impoundments. At Horicon the work will also be dikes and ditches. We also have an item of $200,000 for the development of master plans similar to the one I referred to for the Charles M. Russell.

Wildlife Research Program

In the wildlife research program the big item is $600,000 for a chemical screening lab at Denver. This will be a combination structure, one part of it used to search for chemicals to be used for wildlife purposes, that is management tools such as chemicals to facilitate forestry seeding and so on.

The other part of it will be used to carry out the work of research on the impact of chemicals on birds and animals. Also, we have a $100,000 item in the budget for the Northern Prairie Wildlife Research Station in Jamestown.

Senator BIBLE. At the Denver Wildlife Research Center, will that $600,000 complete the job?

Mr. PARKER. It completes the building. There will be about $100-000 worth of equipment needed. So far as the building itself is concerned, that will complete it.

Senator BIBLE. What was the figure in addition?

Mr. PARKER. $100,000. At the Jamestown station, there is $100,000 for buildings which will pretty well complete the station there. We also request $40,000 of planning money for a proposed building at the Patuxent refuge.

Senator BIBLE. Senator Byrd?

LEETOWN, W. VA. FISH HATCHERY

Senator BYRD. How are you coming along with your fish hatchery at Leetown, W. Va?

Mr. TUNISON. That is a combination station of research, production and training school. We have been helped some here in this last year with the accelerated public works money. The people out there claim that they don't have enough space.

One of our problems of course, is water. Some of their work does not require water, but that is under study at the present time and the feasibility of additional space.

Senator BYRD. What do you have in the budget for Leetown, Bowden, the Elkins fishery management projects and White Sulphur Springs this year?

Mr. TUNISON. Are you speaking now of construction or of management and propagation?

Senator BYRD. I am speaking of both if I might at this point. Let us take Leetown, first.

Mr. TUNISON. The amount of money for research at Leetown is $147,000. For the hatchery work which would include the training is $104,400. Bowden——

SUFFICIENCY OF BUDGET REQUEST

Senator BYRD. Now in connection with these two items is this going to be sufficient?

Mr. TUNISON. I think, Senator, on the management and investigations, yes, both of those will be sufficient for this year.

Senator BYRD. In other words, you could not effectively utilize an increase in the $147,000 item or in the $104,400 item?

Mr. TUNISON. The $104,400 is sufficient at the present time. The problem in the case of research, as Mr. Parker mentioned this morning, is that we are testing some of the chemicals and we have selected Leetown for testing chemicals that we use in treating fish in hatcheries.

Actually it is a national program. We will receive some help from some of the States, but Leetown will be the center of activity. Now in conducting those of course, we are squeezing our production hatchery work.

So, actually I would say that we have enough money with the space that we have. It is not of a type that we can contract out.

CONSTRUCTION REQUEST

Senator BYRD. But you do need additional space.

Mr. TUNISON. We do need additional space.

Senator BYRD. Do I understand you to say there is no construction request for Leetown?

Mr. TUNISON. There is no construction request for Leetown.

Senator BYRD. Were any requests submitted to the Bureau of the Budget?

Mr. TUNISON. No, sir.

Senator BYRD. For Leetown?

Mr. TUNISON. No, sir.

BOWDEN, W. VA., FISH HATCHERY

Senator BYRD. Now the next item was Bowden.

Mr. TUNISON. At Bowden we have $103,600 for the management and investigations and at White Sulphur Springs——

Senator BYRD. While you are at Bowden, when you speak of the management investigation are you speaking of the $30,000 item which we included last year?

Mr. TUNISON. No, sir: this is entirely on the hatchery work.

Senator BYRD. There is no additional construction to be done.

CONSTRUCTION AND LANDSCAPING

Mr. TUNISON. They need a storage building. If you were there recently I think you will recognize that we have not caught up on landscaping yet that we should have there.

Senator BYRD. Would you be prepared to proceed with additional construction if you had the money?

Mr. TUNISON. Yes; we are.

Senator BYRD. Was there any request to the Bureau of the Budget?

Mr. TUNISON. No, sir.

Senator BYRD. What would be the amount needed?

Mr. TUNISON. $34,000.

Senator BYRD. This would permit you to do what?

Mr. TUNISON. Construct the storage building and complete the landscape.

Senator BYRD. How great is the need for each of these two jobs?

Mr. TUNISON. With increased visitor load—we, of course, like other Federal agencies are subject to criticism by the public because of the looks of the place. It is not right to leave the equipment outside. So, the urgency is there and it would be desirable.

Now, naturally, it can be postponed until funds are available.

WHITE SULPHUR SPRINGS, W. VA., FISH HATCHERY

Senator BYRD. The next item was White Sulphur Springs.

Mr. TUNISON. We have $55,400 for management and investigations at White Sulphur Springs and that is ample for the operation of the hatchery.

With the funds that have been provided recently now for construction, we feel as of the present that is completed.

Senator BYRD. Last year the Congress appropriated $100,000 for the rehabilitation of that hatchery.

Mr. TUNISON. That is correct.

Senator BYRD. Will that amount be sufficient to complete the work?

Mr. TUNISON. As far as we now know.

Senator BYRD. As far as you now know?

Mr. TUNISON. As far as we now know.

Senator BYRD. So you need nothing over and above what is in the budget request for White Sulphur Springs?

Mr. TUNISON. That is correct.

ELKINS, W. VA., FISHERY MANAGEMENT PROJECT

Senator BYRD. With respect to the fishery management project which is headquartered in Elkins, I believe.

Mr. TUNISON. That is right, that was initiated last year.

Senator BYRD. With an appropriation of $30,000?

Mr. TUNISON. Yes. We have people on the job and their work is primarily in connection with the Monongahela Forest, also working with the State people on the proper distribution of the hatchery fish and rather shortly we will be starting in a new program in conjunction with other agencies on acid mine drainage.

That may in the long run be one of the most important things that we do.

FISHERY MANAGEMENT PROJECT

Senator BYRD. What do you have in the budget for the continuation of the fishery management project at Elkins?

Mr. TUNISON. That would remain at the same level.

Senator BYRD. $30,000?

Mr. TUNISON. Yes.

Senator BYRD. You have that in the budget?

Mr. TUNISON. That is right.

Senator BYRD. You did not ask for more at the Bureau of the Budget level?

Mr. TUNISON. No, sir.

MINE DRAINAGE PROJECT

Senator BYRD. Do you need additional moneys to carry out the mine drainage project?

Mr. TUNISON. I am not prepared to say at this time, Senator, because, like Bureau of Mines, Geological Survey, it is a larger program. I don't know if that has been reported here at the hearings this year yet or not. So far as we are concerned and with my present knowledge of that program I would say the level at Elkins for our management investigation work there would be ample for this year.

Senator BYRD. You have two personnel engaged in that work?

Mr. TUNISON. That is right.

Senator BYRD. That is sufficient for the time being?

Mr. TUNISON. That is sufficient.

ADDITIONAL FACILITIES IN WEST VIRGINIA

Senator BYRD. You do not feel that any additional construction is needed at the White Sulphur Springs Hatchery?

Mr. TUNISON. No, sir.

Senator BYRD. You don't feel there is any need for the enlargement of the hatchery?

Mr. TUNISON. No, sir. It is a limitation of water supply.

Senator BYRD. Do you feel there is any other location needed for an expansion of the facilities?

Mr. TUNISON. There is that possibility, but back at the time when Bowden was established, we surveyed the State of West Virginia and Bowden was the best site we could find.

I would say that for the present we would not desire to expand into a new hatchery in West Virginia at this time.

Senator BYRD. When was the survey conducted?

Mr. TUNISON. I would say that would be about 1956, possibly 1957.

Senator BYRD. Would you bring the survey up to date and indicate to the committee whether or not as of now there appears to be any need for additional facilities in West Virginia?

Mr. TUNISON. We will be glad to do that.

Senator BYRD. Will you submit for the record a statement as to expenditure capability for each of the hatcheries to which I have alluded?

Mr. TUNISON. We will be glad to do that.

(The statement referred to follows:)

LEETOWN NATIONAL FISH HATCHERY, W. VA.

The Leetown National Fish Hatchery rears brook, brown, and rainbow trout, largemouth bass, and bluegill. These fish are distributed to farm ponds, open State waters, and waters on Federal lands in Delaware, Maryland, Virginia, and West Virginia. The cold-water sport fishery in these States is supported to a large extent by the stocking of hatchery fish.

The current average annual production at this station is 43,000 pounds. With the expansion of the farm pond program, improved fishery management practices, and opening of new waters to public sport fishing, the needs of the area which this station serves will continue to increase.

The Bureau's Eastern Fish Disease Laboratory is headquartered at this station. This Laboratory is operated by the Division of Fishery Research and devotes most of its activities to pathological studies on trout. One of the Bureau's three in-service training schools is located at this station. Each year, employees from National, State, and commercial fish hatcheries, as well as representatives of foreign governments, are selected to participate in these training programs.

In January 1963, $203,000 was made available under the accelerated public works program to rehabilitate and modernize facilities at this station. With these funds it was possible to repair warm-water production facilities, develop a supplemental water supply, and construct buildings required for housing Bureau trainees, for storage of operating equipment, and for the information-education program. This work was completed in December 1963.

Funds are required to enlarge the present hatchery building, or to construct an additional building to provide rearing space for small fish and incubation of eggs. This space has become inadequate as both the research and the production programs have been expanded to meet existing needs.

The cost of this program is $180,000.

Construction funds were not provided in the 1964 fiscal year budget for this hatchery, nor were any included in the 1965 fiscal year budget. The fiscal year 1964 budget does contain $95,400 for the operation of fish-cultural activities of the station. In the fiscal year 1965 budget, as presented to Congress, an increase

of $9,000 was requested. In order to operate the hatchery to capacity, an additional $5,000 would be required. With this increase, the annual production of the station would be increased by 9,000 pounds.

Bowden National Fish Hatchery, W. Va.

Congress authorized the establishment of the Bowden National Fish Hatchery in 1956 and appropriated $80,000 in fiscal year 1957 to begin construction. It was possible to construct most of the planned facilities for the production units and other physical facilities with additional funds made available in fiscal years 1958 and 1963.

Fish-cultural operations were begun initially in 1960 with the production of 60,000 pounds of brook, brown and rainbow trout. Production has since been expanded to 95,000 pounds of trout annually. The bulk of the production is of catchable-size fish with some fingerlings being provided for farm pond management.

Fish produced at the Bowden hatchery are distributed to waters in southwestern Pennsylvania, western Maryland, and West Virginia under cooperative stocking agreements with these States. These fish are stocked in farm ponds, waters of the Monongahela National Forest and other waters open to public fishing in accordance with cooperative agreements between the States concerned and the Bureau. Heavy fishing pressure throughout the Bowden distribution area coupled with a reduction of productive habitat has created a situation whereby the bulk of the trout fishing is supplied by hatchery-reared fish. Nearly all suitable waters require frequent periodic stocking to maintain adequate sport fishing throughout the normal season. Approximately 60 percent of the cold-water sport fishery in West Virginia is supported by hatchery-produced fish.

This hatchery has become an important segment in the recreation complex of the area. With the construction of a visitor's center, the visitor use of the hatchery for recreation and conservation education is expected to reach 60,000 people per year. As much effort and expense is being expended on outdoor recreation in this part of West Virginia as a means of bolstering economy, increased emphasis on this aspect of hatchery use can be expected.

Construction funds were not provided in the 1964 fiscal year budget for this hatchery, nor were any included in the 1965 fiscal year budget. In fiscal year 1964, $100,600 was provided for the operation of the Bowden hatchery and in fiscal year 1965 the budget provides for an increase of $3,000 which will enable the station to operate at full capacity.

To complete the hatchery as presently planned the following items are needed:

Construction funds needed for the program

Water infiltration galleries	$10,000
Storage building (equipment)	10,000
Oil and paint storage building	2,500
Landscaping and sidewalks	10,000
Fencing	2,000
Total cost of the program	34,500

Senator Byrd. Thank you very much. Thank you, Mr. Chairman.

South Dakota Refuges

Senator Bible. Senator Mundt?

Senator Mundt. With regard to your listing on page 104 of the refuges and operable management units, I would like to inquire as to the status of our South Dakota refuges. Do you have operable management units in each of them now in the master plan which you have prepared?

Mr. Parker. So far as I recall that is right. At the moment I don't have any information that would indicate that they are not.

Senator Mundt. Will you check on that?

Mr. Parker. Yes.

Mr. JANZEN. Do you want that supplied for the record?
Senator MUNDT. To my office, please.
(The statement referred to follows:)

LACREEK REFUGE, BENNETT COUNTY

Lacreek Refuge was established in 1935. It contains 9,442 acres of marsh and rolling short grass prairie in southwestern South Dakota. Eleven impoundments are fed by spring creeks from the adjacent sandhills of Nebraska. Despite its relatively small size, it provides excellent waterfowl habitat. It produces up to 6,500 ducks annually. Trumpeter swans have been reintroduced, and this past summer two pairs nested and successfully raised one young each. This is the first known nesting of this magnificent bird east of the Continental Divide in modern times. Canada goose production also occurred for the first time last summer.

Developments planned will require about $420,000. These include:

Dikes and water control structures	$220,000
Biological development	50,000
Buildings and utilities	50,000
Roads and fencing	80,000
Recreational development	20,000
Total	420,000

Crossdikes and water control structures are needed in the four largest water areas to effect more intensive management for waterfowl production. Biological facilities will include creating 600 potholes, 300 nesting islands, and marsh vegetation control on 400 acres. All of these features will make it possible to produce more waterfowl—ducks, geese, and trumpeter swans. One additional residence, remodeling of an existing residence, one equipment storage building, an oil house, and three small storage buildings are needed for proper refuge administration and maintenance. Five miles of new fence are needed, and rehabilitation of 22 miles are needed to control livestock grazing and facilitate enforcement and management. Improvement of 25 miles of roads, including construction of four bridges, is also needed for administrative and management purposes. Recreational development will include improvement of 3 miles of roads, four picnic sites, one swimming beach, and one boating area.

Phasing of development funds

1st year	$101,000
2d year	169,000
3d year	150,000
Total	420,000

Operation and maintenance will require $47,700 in fiscal year 1965 and increase to $85,000 in future years. The increase is needed for more intensive management of the waterfowl production habitat, and to maintain additional facilities.

LAKE ANDES REFUGE, CHARLES MIX COUNTY

The Lake Andes Refuge was established in south-central South Dakota in 1934. There are 862 acres in fee ownership; the 5,200 acres of water in Lake Andes proper are under easement from the State of South Dakota. The primary purpose it to provide a resting and feeding area for large concentrations of waterfowl, especially diving ducks and geese. An important function too, is the alleviation of depredations which are often associated with full concentrations of up to 20,000 Canada geese and 1 million mallards in the Lake Andes and Fort Randall Reservoir area. Refuge farming is an important factor in depredations control.

Development requirements include $49,000: of this $25,000 is for water facilities, and $15,000 for a small service building and oil house. The $25,000 for water facilities is for a new lining in the artesian well that supplies Owens Bay, the principal area used by wintering waterfowl. All development will be completed in 1 year when funds become available.

Operation and maintenance in fiscal year 1965 will require $21,400 and will increase to $30,000 in future years as the primary program is expanded.

THE POCASSE REFUGE, CAMPBELL COUNTY

The Pocasse Refuge, in north central South Dakota, was established in 1962 on 2,460 acres of Corps of Engineers lands on the Spring Creek arm of the Oahe Reservoir. Establishment was made under the Fish and Wildlife Coordination Act. Effort is being made to acquire an additional 3,200 acres of land under the Coordination Act to complete the refuge. The refuge, when completed, will be of value as a production area for ducks and geese. It will also become an important resting and feeding area for migrant ducks, geese, and sandhill cranes.

Development costs will be approximately $203,000, including: $55,000 for dikes and controls to create small impoundments for waterfowl production purposes; $9,000 for nesting islands and marsh improvement work; $95,000 for two residences, a service building, an equipment storage building, and an oil house; $38,000 for roads and fences to facilitate management and operations; and $6,000 for recreational facilities including a well, bathhouse and entrance road.

Phasing of development funds

1st year	$118,000
2d year	85,000
Total	203,000

Operation and maintenance in fiscal year 1965 will require $30,400, and increase to $50,000 in future years when land acquisition and development are completed.

SAND LAKE REFUGE, BROWN COUNTY

The Sand Lake Refuge was established in northeastern South Dakota in 1935. It contains 21,451 acres along the James River Valley. There are 10,580 acres of marsh and water in two units; flat, fertile grasslands and agricultural land bound the marsh on two sides.

Sand Lake is an important concentration area for central flyway ducks and geese. It is especially important to the group of small Canada geese known as the Sand Lake goose flock. Special management attention is being given these birds all along their flyway because of the heavy gunning pressure they are subjected to. Fall concentrations of geese include up to 25,000 Canadas and 175,000 snow and blue geese. Spring concentrations exceed 400,000-some years. Waterfowl production is another important function.

The refuge is being utilized as a laboratory in the study of the serious blackbird depredations problem, where damage to corn has been of significant consequence since the area was first settled.

Hunting, and particularly goose hunting, is an important recreational activity on areas adjacent to the refuge, on both private and State managed areas.

Development needs at Sand Lake are $293,000, which includes $60,000 for dikes and water control structures; $54,000 for biological facilities including goose nesting islands, marsh vegetation control, and goose browse production; $151,000 for six residences (all but one of the six existing residences are old farmhouses), an equipment building and a service building; $25,000 for road and fence rehabilitation; and $3,000 for recreational facilities which include a well and parking area.

Phasing of development funds

1st year	$100,000
2d year	95,000
3d year	98,000
Total	293,000

Operation and maintenance will require $54,400 in fiscal year 1965, but will increase to $98,000 in future years. The increase will be needed to expand refuge farming to provide adequate food for the large waterfowl concentrations, and to more intensively manage waterfowl production habitat.

WAUBAY REFUGE, DAY COUNTY

This refuge, containing 4,651 acres in northeastern South Dakota, was established in 1935. Marsh and water areas total 2,000 acres. The upland areas are rolling prairie, containing many small potholes important to waterfowl production. Canada goose and duck production constitute the primary value of this small refuge, but it also provides resting and feeding areas for fall migrants. Annual use totals about 1½ million days for ducks, and 100,000 for geese. Approximately 10,000 people visit the refuge annually for picnicking and wildlife observation.

Development needs are for $124,000, which will provide the following: $61,000 to improve water control on five marsh and water areas; $3,000 for nesting islands and pothole development to further improve production habitat; $10,000 for rehabilitation of the residence and construction of a small garage; and $50,000 for recreational development. The latter will include sanitary facilities, tables and fireplaces at the picnic areas, and a small visitors building.

Phasing of development funds

1st year	$74,000
2d year	50,000
Total	124,000

Operation and maintenance activities will require $24,000 in fiscal year 1965, but increase to $30,000 in future years with more intensive management of waterfowl production habitat.

WATERFOWL PRODUCTION AREAS

Senator MUNDT. On page 44 you have a listing under point 3 dealing with the expansion of the management program for water fowl production areas, including South Dakota. I wonder if that fits in with the financial program as you start out on page 50.

Mr. PARKER. This particular item, Senator Mundt, relates to management of the small areas that we are purchasing and leasing. This is a case of arranging for local landowners to graze the areas, maintain the fences and signs and so on.

It is a management man with a fencing crew that visits each of these particular areas.

Senator MUNDT. You lease from the farmer and he leaves part of the grain intact?

Mr. PARKER. No, sir, this for management of the small wetlands which we have acquired or leased throughout the counties. Those we own we fence and post.

GAVINS POINT, MCNENNY AND SPEARFISH, SOUTH DAKOTA FISH HATCHERIES

Senator MUNDT. As regards the three hatcheries listed on page 17, Gavins Point, McNenny and Spearfish, do you feel that the amount of money which you have budgeted is adequate to do the job in those three fish hatcheries?

Mr. TUNISON. I think that is right, they are adequate. As you know, McNenny and Spearfish are operated as one unit. I believe with the water supply there we are operating at just about full capacity.

In case of Gavins that is relatively new, as you know, and I believe that with the funds that we now have and with the requirements those funds are adequate.

Senator MUNDT. Well, the Gavins Point Hatchery has to serve a tremendous amount of that river reservoir work. I notice that the $5,000 increase you provide still leaves it $9,000 short of capacity. I doubt whether even at capacity it is going to quite meet the fishing pressure which has developed in the area.

I was wondering if there was any valid reason that you knew of why we could not put this thing on a full-scale operation at this time provided the $9,000 was made available.

Mr. TUNISON. We could use the $9,000, yes, advantageously and put it in full-scale operation.

Senator MUNDT. That would operate it at the level at which it was intended?

Mr. TUNISON. Yes, sir.

Senator MUNDT. You could not expand beyond that without expanding the facilities?

Mr. TUNISON. That is correct, Senator.

BEULAH, WYO., LABORATORY

Senator MUNDT. What is your plan up there, you still call it Beulah, Wyo.? Are you going to do a little fish hatchery work in that connection, replenishing the stream or will it be a matter of genetics?

Mr. TUNISON. There will be fish available for distribution but it will be a byproduct of the research. Now, to what extent that will develop at the moment I am not prepared to say. I would anticipate that it may run as high eventually as perhaps 25,000 pounds a year.

As I say, it would be secondary to the research and as a byproduct.

Senator MUNDT. Thank you.

TRANSFER FUNDS

Senator BIBLE. Mr. Janzen, I don't know whether this question is yours or Mr. Tunison's. On page 100 of the justification you show an item of $1,291,000 in fiscal year 1965 designated as "Other funds." Just what are those funds and from where do they come?

Mr. CORBIN. Those are funds for the Colorado River storage project which come from the reclamation appropriation by transfer.

Senator BIBLE. These are transferred from the reclamation fund for the development of the Colorado River storage project?

Mr. CORBIN. That is right, sir.

Senator BIBLE. I was interested in the source of them. This will be shown as a transfer, we will take it, from the public works appropriation bill, is that correct?

Mr. CORBIN. Yes.

PROGRESS ON ADDITIONAL CONSTRUCTION ITEMS

Senator BIBLE. Now, I think it might be well for you to submit for the record a statement as to the progress which you have made with each of the additional nonbudgeted construction items provided last year by the Congress. Senator Byrd asked you about some of the West Virginia items. I refer to amendment No. 35 that was adopted in conference on the Interior appropriation bill last year.

It is page 10 in the conference report and shows the items that were added by the House. Will you simply give us a statement as to the progress you have made on those various items and submit it for the record?

Mr. TUNISON. We will be glad to.

(The statement referred to follows:)

1964 CONSTRUCTION ACCOMPLISHMENTS

1. Acquiring a surplus vessel for the Sandy Hook Marine Laboratory, New Jersey, $80,000.

The LT-1959 has been obtained on indefinite loan from the Army. It is a steel-hulled, seagoing tug, 400 gross tons, 107 feet in length, with a 1,200-horsepower engine. Built in 1957, it has never been used. It can cruise at 12 knots and stay at sea for 2 or 3 weeks.

Reactivation and fitting it for ocean research will proceed in two stages. Plans, specifications, and estimates for reactivation have been completed and the contract for this work will be awarded and administered by the Army. The second stage will follow immediately thereafter and we expect that a contract for this stage will be awarded before July 1, 1964.

2. Additional facilities, Fish Control Laboratory, Warm Springs, Ga., $72,000.

About $8,000 of the total has been obligated for engineering and related costs and contracts will be awarded within the next 2 or 3 months for piping the supplemental water supply from a spring; for constructing covered outdoor concrete fish holding troughs and runoff diversion structures; and for slope stabilization, protective fencing and grading.

3. Surveys, plans, water supply, and building repair at the fish genetics facility, Beulah, Wyo., $115,000.

These funds have been obligated: force-account rehabilitation of garage apartment ($11,000); A. & E. design contract with Banner & Associates, Inc., Laramie, Wyo., and Brookings, S. Dak. ($60,000); and regional engineering services ($7,000). It is anticipated that the remaining available funds ($37,000) will be obligated during fiscal year 1964 for urgent repairs to the existing structures and limited remodeling of facilities to permit some preliminary investigational and specific planning activities in fiscal year 1965.

4. Impoundment facilities, Ouray National Wildlife Refuge, Utah, $133,000.

These funds are being utilized as follows: two residences, $40,000; dikes and water control structures, $82,000; land clearing, irrigation canals, landscaping, utilities, $11,000. The plans for the residences were 70 percent complete as of January 31, 1964. It is anticipated that a contract will be awarded in May of this year. Fieldwork to obtain the data needed for earthmoving contracts for dikes, land clearing, canals, and landscaping is now being accomplished. Contracts will be awarded by June 30, 1964.

5. Construction at the following national fish hatcheries, $1,165,500:

(a) Warm Springs, Ga., $116,500.—$3,846 obligated for engineering work in preparation of detailed plans and specifications. Bids will be solicited on April 15 and work will begin about June 15. Contract will include fish holding house, storage building, residence, fertilizer house, fences and roads.

(b) Garrison Dam, N. Dak., $90,000.—The entire amount has been obligated. Funds were used to complete items which could not have been undertaken in previous years because of excess costs for excavation of pond area. Work completed in October 1963.

(c) White Sulphur Springs, W. Va., $100,000.—$10,135 obligated for engineering and contract awarded November 8, 1963, for development of supplemental water supply. Balance of funds will be obligated for engineering and contract to replace existing raceways. Work will start in April and be completed in October 1964.

(*d*) *Hagerman, Idaho, $105,000.*—$10,789 obligated for preparation of engineering plans and specifications. Bid solicitation is scheduled for April on contract to construct raceways and provide water supply and drainage lines. Work to be finished in October 1964.

(*e*) *Ennis, Mont., $113,000.*—$94,475 obligated to date for engineering costs of preparing plans and specifications and for contracts covering residence construction, other buildings, and facilities. Balance of funds to be used to complete development and for engineering inspection. Work to be completed in April 1964.

(*f*) *Greers Ferry Dam, Ark., $188,000.*—Bid solicitation scheduled for April 1964 on contract for raceways, buildings, and domestic water well. Design completed and preliminary plans approved by the Washington office. Work is scheduled to start in June and will be completed in May 1965.

(*g*) *Lyman, Miss., $104,000.*—Contract awarded February 17, 1964 ($146,407, included carryover funds from fiscal year 1963) for pumping unit, pond water supply and drain lines, and new earthen ponds, and other work. Balance of 1964 funds to be obligated for contract to construct residence and provide domestic water supply and sewage disposal system and for engineering inspection. All work scheduled for completion in November 1964.

(*h*) *Cheraw, S.C., $159,000.*—$926 obligated to date for engineering costs of preparing plans and specifications. Bid solicitation on contract is scheduled for March 15. This to include repair and reworking ponds, supply and drain lines, residences, domestic water supply, and sewage disposal. All work is scheduled for completion by January 1965.

(*i*) *Mescalero, N. Mex., $190,000.*—$10,000 obligated to date for engineering work, including surveys, plans, and specifications. Lease agreement for site and water supplies between Mescalero Tribe and Bureau of Sport Fisheries and Wildlife approved by Solicitor February 28. Bid solicitation on contract for construction of hatchery facilities is scheduled for April. All work under this contract is scheduled for completion in March 1965.

ACCELERATED PUBLIC WORKS PROJECTS

Senator BIBLE. Also submit for the record a statement showing Accelerated Public Works projects constructed by the Bureau of Sports Fisheries and Wildlife, indicating the type of project and location, and if the cost was not entirely Federal, show the amount and source of the non-Federal contribution.

Will you submit for the record a statement showing all of them which have been accomplished through the Accelerated Public Works program.

Mr. TUNISON. We will be glad to do that.

(The statement referred to follows:)

Accelerated public works program

SUPPLEMENTAL APPROPRIATION ACT 1963

State and project	Eligible area and county	Eligibility category	Man-years	Cost	Work description
				Thousands	
Alabama:

REESTABLISHMENT OF PYRAMID LAKE FISHERY

Senator BIBLE. I have one further question. Maybe this is yours, Mr. Tunison, or yours, Mr. Janzen. What is the status of your study of the lower Truckee River looking to reestablishment of the Pyramid Lake fishery?

Mr. TUNISON. That is in connection with the Washoe project?

Senator BIBLE. Yes.

Mr. MCBROOM. Mr. Chairman, we are working very closely with the California-Nevada Compact Commission on that subject right now. We are attempting to have the commission recognize or bring to the attention of the commission the importance of providing water for Pyramid Lake in connection with their deliberations. We are hopeful we can work it out.

Senator BIBLE. Do you have any idea of the timetable on it? We are under certain pressures in western Nevada on the Washima Reservoir and Stampede Reservoir, all in connection with the Washoe project, on the evaluation and reexamination of the Pyramid Lake fishery. Do you know when your studies will be completed?

COMPACT COMMISSION NEGOTIATIONS

Mr. MCBROOM. A year I would say. I want to point out that the success of what we might do in Pyramid Lake at this point hinges on the outcome of our negotiations with the compact commission.

Senator BIBLE. I understand, you have to have a guarantee of a certain amount of water available to you?

Mr. MCBROOM. That is the idea. We don't have any control whatever over the progress of the commission's deliberations.

Sentaor BIBLE. This I understand.

Mr. MCBROOM. Then you realize it will have to come here to the Congress for consent legislation.

Senator BIBLE. I am aware of that part of the compact. You say it would be within a year?

Mr. MCBROOM. I would estimate that. I am speculating. I am talking about a commission that is entirely independent.

Senator BIBLE. We hope that they can resolve most of their interstate problems as between California and Nevada at Truckee but I recognize there are some problems there.

Mr. MCBROOM. I might say this, Mr. Chairman. The Reclamation Act of 1902 of course, requires that these matters be undertaken pursuant to State water laws. Unfortuntely, the Nevada State water law does not give a very good shake to fish and wildlife.

Senator BIBLE. I hope that you will pursue that as vigorously as you can and we will be talking with you from time to time because we must make some accelerated progress.

Mr. MCBROOM. We will. We are working with the Bureau of Indian Affairs as well as the Bureau of Reclamation.

COOPERATIVE FISHERY UNIT FOR SOUTH DAKOTA

Senator MUNDT. I have a few questions, some of which pertain to South Dakota and some handed to me by my colleague who could not be here. This you could do by sending my office a rundown on the

work done at Pierre on the sports fisheries and management program listed on page 25.

On the same pages 25 and 26 you list the cooperative fisheries units and I have received a number of letters of inquiry in the last few months from people in South Dakota communities who feel they might like to participate in this program.

Will you give me an idea of the funds required if the committee were to decide to establish such a unit in South Dakota in fiscal 1965?

Mr. TUNISON. I will be glad to do that, Senator. You will notice on pages 25 and 26 the appropriation requested is $30,000. This program is very new and it was estimated that $30,000 would cover it.

STUDENT PROGRAM PARTICIPATION

In response to your question this $30,000 does not recognize the recent pay act cost and we have also learned more and more of the students will not participate in some of these programs unless we are able to give them a fellowship of some kind.

So at the present time, we are estimating that for a sound program it will be $40,000 a year. That will be a cooperative program among the State's fish and game department, the university, and our Bureau.

Senator MUNDT. It is handled under the direction of the college or State fish and game commission.

Mr. TUNISON. A unit is established at a university, for instance. Then there is a committee made up of members of the three agencies who decide on the type of program and administer it.

Senator MUNDT. It looks like in the justification you are just asking for $30,000 in 1965 instead of $40,000.

Mr. TUNISON. That is right.

Senator MUNDT. From here on out you are going to be asking for $40,000?

Mr. TUNISON. I think we almost have to do that, Senator.

(The statement referred to follows:)

ADVANTAGES OF THE UNIT

Funds required to initiate the unit, $40,000

The establishment of a cooperative fishery unit in South Dakota, as authorized under Public Law 86-686, would give needed support to a program of training, research, and sport fishery extension. The Bureau of Sport Fisheries and Wildlife concurs in the proposal.

South Dakota offers many advantages for a fishery unit, including its geographical location. Many types of fish habitat are available for study, and there are subjects of broad interest which can be profitably pursued. The area has both cold and warm water species inhabiting streams, ponds, lakes, and a variety of reservoirs. The Bureau of Sport Fisheries has a national reservoir research project with headquarters at Yankton for studying some of the large reservoirs on the main stem Missouri River. The Bureau also provides technical assistance at several Federal installations and Indian reservations in South Dakota. These established programs and the fishery unit would complement one another to the benefit of fishery science and management.

In establishing a unit, the designated university or college and the South Dakota Department of Game, Fish, and Parks would enter into an agreement with the Bureau of Sport Fisheries and Wildlife. The school would provide office and laboratory space and the use of its various facilities and services. State funds would be used in supporting work of graduate students. The fishery unit would provide training to students in preparation for careers in fishery science and management. The unit leader and assistant leader, appointed under U.S. civil service procedures, would supervise the work of graduate students

seeking advanced degrees, would conduct research in subjects of broad interest to fishery management, and would participate in extension-type programs of State and regional interest.

The funds proposed, $40,000, would provide approximately $22,000 for the salaries of the unit leader and the assistant leader; $10,000 for salaries and expenses of students; and $8,000 for general expenses, including technical equipment for laboratory and fieldwork.

Reservoir Studies

Senator Mundt. On page 31 of your justification you request an increase of $2,000 for reservoir studies, $162,000 for the North Central Reservoir investigation this year. That is page 31.

Will this be enough to do the job? And can you briefly outline what has taken place so far in this program?

Mr. Tunison. To answer your first question, we can continue of course at that level. Now with that level of funds we are more or less restricted in our program to not more than the Lewis and Clark Reservoir. Were additional funds provided, we could expand that work there as well as go into Oahe and Randolph and Great Bend.

Senator Mundt. What about the funds required for the next reservoir?

Mr. Tunison. For that complex we would require $90,000 additional.

Senator Mundt. To take care of another reservoir?

Decrease in Game Species Reproduction

Mr. Tunison. That is right. Now in response to your second question on what we are doing, we are rather proud of what we have found so far. This is again a rather young program. We have found so far that the reproduction of game species in Lewis and Clark has decreased very appreciably after 2 years of impoundment.

We do not know why. For instance, four out of five of the female saugers had almost no reproduction at all. Our people have developed a device to measure the plankton production.

It is a continuous process. For instance, during the winter months there are about 800 tons of plankton that pass through the dam per month. That is a lot of food. One would think, that is wonderful, you ought to have more fish. We will not know that answer until we test some other sidelines and do further research.

We have carried on studies of the life history of sauger and white crappie. I might say that the crappie are considered as a commercial species in some States. We are trying to develop better methods to assess the population of various species in the large reservoirs.

It has not been done up to this time.

Automatic Water Chemistry Analyzer

We are hoping to find a way to do that. We also have an automatic water chemistry analyzer that measures about seven different components of water—temperature, for instance, the "pH." That is about the extent of our progress so far.

Senator Mundt. Have your technicians out there come across a sort of unusual fish called a paddlefish?

Mr. TUNISON. I can't say. I know that they are in the drainage. Whether they have found them there I am not sure, Senator. There are not too many of them.

Senator MUNDT. You don't know whether they are reproducing or not?

Mr. TUNISON. I could not say.

PROTECTION OF EAGLES

Senator MUNDT. I was interested in the comments that you made on the protection of the eagles, outlined on page 55. I have heard reports lately that the eagles are causing a lot of damage out in the western South Dakota counties and the ranchers are being allowed to shoot them.

Do our game management agents work on this type of program and if so what happens when the eagles become predatory?

Mr. PARKER. A recent amendment to the Bald Eagle Act brought the golden eagle under the protection of the law and provided for killing permits to be issued if eagles are about to cause damage.

Also the law contains a provision that the Governor of a State can request areas to be open to shooting for certain periods of the year whenever he anticipates damage. The latter has been the course of action we have taken so far.

In other words, we have opened areas when the State government has requested that they be opened. We have not done any of the actual control ourselves.

Senator MUNDT. In other words, when you open them anybody shoots them.

Mr. PARKER. In the area that is open.

SOUTH DAKOTA ENFORCEMENT AND DEPREDATIONS CONTROL PROGRAMS

Senator MUNDT. Yes. On page 57 you are reducing the funds for enforcement and depredation control programs in South Dakota from $54,000 to $41,000. In going down through the list of States on page 56, 57, and 58, it seems to me that South Dakota is the only State which takes a reduction this year.

Mr. PARKER. I think that was the case of a purchase of an aircraft last year and it was a nonrecurring item.

Senator MUNDT. In other words, you are not going to decrease your program. Migratory waterfowl still fly through the State in great numbers.

Mr. PARKER. That is right.

ANIMAL CONTROL PROGRAM

Senator MUNDT. On page 69 you list a total of $102,000 for the animal control program in 1965 in Nebraska and in South Dakota. Will you tell me how this is broken down between States and do you have depredation control units in these States?

Mr. BUELL. Of the figure $102,000, about $68,000 is in South Dakota and $33,000 or $34,000 is in Nebraska. Of the cooperative funds listed there which I think totals $137,000, approximately $100,000 are from South Dakota, about half of which is from the South Dakota Game, Fish, and Parks Department, or something more than half. I don't remember exactly.

The remainder will come from livestock tax and from the livestock associations such as the Faith-Isabel Predatory Control Association and the Black Hills, permittees of the forest there.

Senator MUNDT. Do you have what you call depredation control units in those States?

Mr. BUELL. Yes, sir; we have a district office in Mitchell, S. Dak., which serves both Nebraska and South Dakota.

Senator MUNDT. They work with the local units?

Mr. BUELL. Yes, sir; that is correct.

WHOOPING CRANE

Senator MUNDT. Last year you remember we had under discussion in this committee the whooping crane. It fell to my lot to become the great advocate of the whooping crane to get the money for the maintenance of the whooping crane.

Has it done any good? Has there been any increase among those in the wild or in captivity—what is the present status?

Mr. PARKER. I am happy to report that there probably are more whooping cranes now than we have had since accurate records have been kept, but not necessarily as a result of our efforts in this past year. There were 7 young and 26 adults that returned this last fall for a total of 33. The $20,000 which was added to this year's budget was used to employ an aviculturist.

PRACTICING WITH SANDHILL CRANES

We are not working directly with the whooping crane yet because it is such a rare species. We are practicing propagating the sandhill cranes first, incubating their eggs and handling the birds. When we perfect the techniques used then we will consider the whooping crane.

POPULATION AND LOCATION

Senator BIBLE. Is that the total population?

Mr. PARKER. 33.

Senator BIBLE. That is the entire U.S. population?

Mr. PARKER. Over all the world in the wild. There are seven in zoos. One in San Antonio and six in New Orleans. But in the wild, 33 is the total.

Senator BIBLE. Where are they located in the United States?

Mr. PARKER. They winter on our Arkansas refuge in Texas on the gulf coast, and in the summer they nest in the Wood Buffalo National Park near Great Slave Lake, Canada.

Senator MUNDT. Do you have any increase in the whooping crane population of those in captivity, in the zoos?

Mr. PARKER. Last year there was none. In the year before as I recall there was one. There is a total of four young which have been raised to adulthood in the New Orleans Zoo since 1958.

Senator MUNDT. A final question on whooping cranes. Is there anything this committee should do about the whooping crane this year?

Mr. PARKER. At the moment--Mr. Janzen, do you want to answer?

Mr. JANZEN. I would say what we have in our budget should take care of what we are able to.

NEED TO DEVELOP TECHNIQUES

Mr. PARKER. There are techniques we have to develop first.

Senator MUNDT. If you have gained seven that is not bad. We don't know if the money we provided had anything to do with it, but you are moving in the right direction. What did you do with the money?

Mr. PARKER. It was used to employ an aviculturist. We intend to take sand-hill crane eggs out of wild nests in the spring to learn the technique of propagation before we attempt to do anything with the whooping crane.

Mr. JANZEN. And also learn how to capture these animals without putting one of the specimens in jeopardy. The sand-hill crane is so much like the whooping crane that if once we are satisfied we can capture them without jeopardizing them, maybe we can consider the method.

Again, there is a public relations problem involved here and we are going to move very slowly in this field.

SOIL AND MOISTURE CONSERVATION AT LAKE ANDES NATIONAL WILDLIFE REFUGE

Senator MUNDT. What do you propose to do in the line of soil and moisture conservation work in the appropriation listed on page 87. I am still stimulated by the fact you have reached way down in your pocket and gotten $2,000 for Lake Andes.

Mr. PARKER. These are attempts at either adding soil amendments to the cultivated land or rearranging the fields or gully plugging, sodding draws, and so forth. This particular item of $2,000 I can't say for sure but I will be glad to furnish information for you.

(The matter referred to follows:)

BUDGET ESTIMATE FOR 1965

The $2,000 estimate for soil and moisture conservation work on the Lake Andes National Wildlife Refuge is for seeding grass and legume mixtures on steep slopes and eroded lands; laying out strips to reduce wind erosion; using nitrogen fertilizer on eroded areas; tilling of stubble mulch; controlling weeds on croplands; and planting of shelterbelts. Several waterways will be shaped and seeded. Erosion and deposition into the lake along the Owens Bay shoreline will be reduced by shaping, reseeding, and riprapping. Some fencing will be accomplished to obtain more uniform grazing and improve vegetation on overgrazed areas and improve the nesting habitat.

BROOKINGS, S. DAK., COOPERATIVE WILDLIFE RESEARCH UNIT

Senator MUNDT. You have reduced the funds available for the cooperative wildlife research unit at Brookings, S. Dak., by $800. That does not sound like a very serious cut but there must have been some reason for it.

I was wondering what it is because it seems to me there were cuts made in only 2 of the 18 States conducting programs of that type.

Mr. PARKER. The South Dakota unit, as you well recall, is a new one. I would say the reduction there represented the cost of an automobile which is a nonrecurring item.

Senator MUNDT. You talk on page 84 of over 100 publications coming out of these cooperative programs. I don't want to be surfeited with all of them but I would appreciate if you will send to my office 10 or a dozen samples.

WETLANDS INSPECTION PROGRAM

A final question dealing with the wetlands inspection program. As you know this has been a bone of contention for a long time. North Dakota and South Dakota are directly involved. You say you plan to investigate 7,000 applications during 1965.

That looks like a lot of progress. How much land do you expect to buy and how much acreage do you expect to get and are you going to keep the landlords and the county commissioners happy in the process?

Mr. JANZEN. We do have the assistant director who is responsible for the whole program, the acquisition and inspection program, Mr. McBroom. He is prepared to answer the question.

LAND REQUIREMENT

Mr. MCBROOM. I take it your question is as to how many acres of land do we expect to acquire and take easements on under the drainage referral program?

Senator MUNDT. That is right.

Mr. MCBROOM. I will have to be candid with you, Senator, and say not very many. We have worked on this pretty hard and so far we have acquired only 1,400 acres of easements in all three States since the beginning of the drainage referral program in October 1962. In South Dakota we have acquired 653 acres in easement. As you know——

Senator MUNDT. This is by easement?

Mr. MCBROOM. Yes, sir.

Senator MUNDT. How much by purchase?

METHOD OF ACQUIRING LAND

Mr. MCBROOM. Less than that, Senator. Almost none. We are finding out that the farmers are preferring to hang on to their lands and not go into a sale or easement proposition under the inspection program.

Senator MUNDT. Don't they prefer easements to purchase when it gets to that point?

Mr. MCBROOM. I think we will have to conclude that they prefer nothing. They prefer to wait out the 5 years until they can be eligible for drainage assistance. That would probably be the most candid way of saying it.

Senator MUNDT. How many would you like to get?

Mr. MCBROOM. We would like to get them all.

Senator MUNDT. What would be your optimum target?

Mr. MCBROOM. Here is a situation in your State of South Dakota, for example. We inspected wetlands there and a lot of them we find are not of high value. You will recall under the act calling for the

referral inspection, our people are to decide whether they are or are not of high value. Some are not of particularly high value.

From the record so far, we have found out that there were some 1,971 individual wetlands of high value for waterfowl under the drainage referral program in South Dakota, embracing 5,614 acres. We would like to buy those or take easements on them. The figure is $25,500 for all three States—South Dakota, North Dakota, and Minnesota.

POOR RECORD FOR ACQUIRING LAND

But our record of getting them is pretty poor. The total take of easements in South Dakota is 653 acres.

Senator MUNDT. Could you juice up your offer a bit on easements? Would that help?

Mr. MCBROOM. We are able to get a lot of easements under the regular program, pursuant to the Migratory Bird Conservation Act, where a drainage referral inspection is not involved. Just the first 6 months of this fiscal year we have gotten as many acres in easements as we did in the 2 previous years in these States. So we think our price is probably right.

Senator MUNDT. That brings to mind, I have met a few fellows out there who claim they have potholes and sloughs that they might be willing to sell, they might be willing to make easements on.

OFFICES TO CONTACT IN LAND ACQUISITION

They have mentioned it to me to that effect. Whom should they contact? Do they initiate it at that end?

Mr. MCBROOM. Yes, sir, they should contact one of our field offices or our regional office in Minneapolis. I can give you those addresses.

Senator MUNDT. Send those over. Maybe we can stimulate some business interests. I am all for it.

PROBLEM IN GETTING GOVERNOR'S PERMISSION IN LAND ACQUISITIONS

Mr. MCBROOM. Our problem in acquiring these areas in the Dakotas, Senator, is not a problem of getting together with the owner. Our problem is getting permission from the Governors to acquire these areas.

Senator MUNDT. That would not apply to easements.

Mr. MCBROOM. Technically the Governor has to give approval for those, too, but he has generally done so.

Senator MUNDT. You have no trouble with the Governors?

Mr. MCBROOM. No problem there.

Senator MUNDT. His only reticence is because of the tax payment problem.

Mr. MCBROOM. With the easement, the land stays on the tax rolls. As I mentioned our acquisition of easements has taken a very dramatic and sudden rise just within the last few months.

Senator MUNDT. I am mighty glad to hear that. I think there must be something in this easement formula which can be used to stimulate further inspection, assuming your rates are fair.

Mr. McBroom. That is right. He goes on just like before except that he agrees with us not to drain, burn, or fill his wetland acres.

Senator Bible. The Senator from Wyoming.

BEULAH, WYO., FISH GENETICS RESEARCH LABORATORY

Senator McGee. I have some questions on two or three Wyoming projects. First, our fish genetics lab at Beulah. We have gotten the initial $340,000 to acquire the property. We have had $115,000 this last year for development and planning in the initial stage at the facilities there.

I note in the current budget request that only $50,000 has now been added to go on from here. Now, with the $0.5 million already invested there, how much really is it going to cost us to delay another year on starting construction there?

Mr. Tunison. Senator, there is a point. There is a delay in many programs; not only Federal Government, but States and even on personal properties.

There are times you just don't feel that you can afford it. In our case, we have our fiscal policies and one of the projects that we had to postpone——

MONEY REQUIRED TO COMPLETE PROJECT

Senator McGee. How much yet needs to be expended to complete the project at this stage?

Mr. Tunison. I am hoping, personally, that we can develop the establishment to the extent of about $1,400,000 and at that level get into the genetics work and then if it is decided that it is necessary, say, after 10 years—I am picking that perhaps rather loosely—we may need to expand it maybe another $1 million.

This is a long-time research project that will be dealing with many generations of trout. Some of those we will want to retain every year. There will be many strains that we will work on.

As far as our Bureau is concerned, we are hoping that we can arrange through budget to construct this to the extent of roughly $1,400,000.

Now, we have used planning money this year and we do have preliminary plans for the facility. I think this comes out to a little better than $2 million.

I am hoping that we can find ways to hold the level; say, at around $1,400,000, and still produce something for the good of research and production.

Senator McGee. Again, the real point of my question is that we have that sizable investment and, in effect, under the proposed budget, it is being permitted to lie almost idle.

PROBLEM OF INCREASING CONSTRUCTION COSTS

I would think that would become a cost factor in your calculations.

Mr. Tunison. That is correct, Senator. We are aware that construction costs are increasing; they have year after year. Actually, we are embarrassed at times when we report to the committee here a price tag on a certain project and then come back a couple or 3 years later and it has gone up.

It happens. We recognize it. As I say, within the fiscal limits that we had we could not include it.

Senator McGEE. What sum could you carefully make use of if appropriated this year?

WATER COLLECTION SYSTEM AND BUILDINGS REHABILITATION

Mr. TUNISON. For this pending year—one of the major things that we want to undertake would be a water collection system, to get it into our laboratories.

Then, in addition, with what is remaining of the 115 that was appropriated, last year, there will be not enough there to complete the rehabilitation of the buildings and the sum total of those would be $231,000.

Senator McGEE. So, you could actually use in this 1965 budget an additional $231,000?

Mr. TUNISON. That is correct, Senator.

EMPLOYES AT THE LABORATORY

Senator McGEE. I also note that you referred to two permanent positions at the lab. I have been advised that the caretaker appointment was temporary and that your regional office in Albuquerque had no idea when the announcement for the exam for the permanent position would be made. Would you care to comment on that?

Mr. TUNISON. We have there now a caretaker and a professional biologist.

Senator McGEE. Temporary?

Mr. TUNISON. Well, the biologist is permanent civil service but the job itself may be classed as temporary. However, there is no need to worry on that. With the $50,000 that we are requesting this year, we hope that with that staff there will be no question but it will be a firm installation and we can proceed.

As you know, this is the first year that we have had any activity there other than the purchase of land which occurred last May.

Senator McGEE. I was interested in when these temporary positions might become permanent.

Mr. TUNISON. Now, I get your point. Offhand at the moment——

Senator McGEE. There is great feeling up there in that corner of the State on this matter. That is the reason I wanted an assurance from you.

ESTIMATE OF REQUIRED PERSONNEL

Mr. TUNISON. I would hesitate to report right now on the total number of positions that we will have, say, 10 years from now. I would like very much, if we could submit for the record, if I may, Mr. Chairman, what our best estimate is on personnel in the next——

Senator McGEE. I would like to have that. Now, I want a firm indication from you as to whether or not the personnel now there are going to acquire permanent status before we are advised of that or before we have a chance to have another look at it.

Mr. TUNISON. We will be glad to report on that.

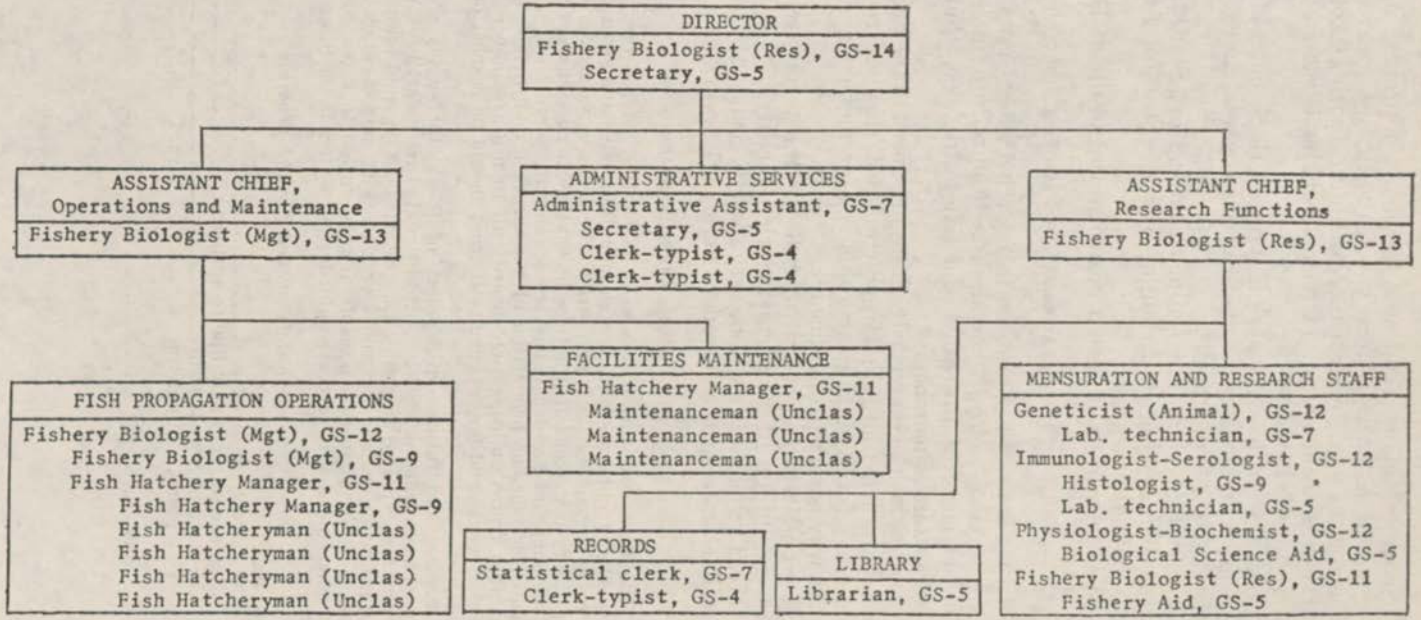
Senator McGee. We would like an understanding that there will be no move to make the individuals permanent until we can resolve our personnel questions there, if that is agreeable or consistent with your procedures.

Mr. Tunison. That is right.

Senator Bible. It may be supplied for the record.

(The statement referred to follows:)

PERSONNEL AND ORGANIZATION CHART



At present the staff of the Fish Genetics Laboratory consists of two persons. Mr. Peter F. Smith was employed on a TAPER appointment immediately following acquisition of the valuable site in an unclassified (wage board) position of maintenanceman. Mr. Smith's familiarity with the property, gained as operator of the small commercial hatchery and as owner, has been of great assistance in its maintenance and in the planning of its development. Later, Mr. Robert G. Piper was transferred from the Division of Fish Hatcheries to the position of fishery biologist (management), GS–12. Mr. Piper's professional experience in private, State, and Federal hatchery management has enabled him to give substantial help in planning the laboratory's facilities and the future complex fish propagation operations which he is scheduled to conduct. Mr. Ronald DeVall who was employed for a period during fiscal year 1964 as an administrative assistant, GS–5, resigned for personal reasons and has not yet been replaced. Temporary student help was satisfactorily used and is planned.

Anticipated available funds for fiscal year 1965 will permit appointment of the director of this new installation, provisionally a fishery biologist, GS–14. It is anticipated that he will recruit for the vacant administrative assistant position, and will establish and fill during the year either a fish hatchery manager or a fish hatcheryman position and at least one of the professional research biologist positions.

Subsequent recruitment of staff, as outlined in the accompanying organization chart will be contingent upon the available funds, the availability of well-qualified personnel (particularly in the professional specializations) and the progress of construction of needed facilities.

ORGANIZATION CHART

FISH GENETICS LABORATORY
Ranch A
Beulah, Wyoming

Senator McGEE. And now to the other project, in Saratoga, Wyo.

Senator MUNDT. Before you leave that, I took up Beulah before. There is a lot of interest in North and South Dakota. Except for a surveyor's accident, Sand Creek should have been in South Dakota but it is on the other side.

We do want to associate ourselves with Senator McGee. You have a wonderful product, a fine source of water, and it will be a highly productive fish operation.

Senator McGEE. The senior Senator from South Dakota was very helpful in getting it through. We are grateful for whatever error was made there.

We are glad to have that beautiful corner of the Black Hills.

SARATOGA, WYO., FISH HATCHERY

In regard to the Saratoga fish hatchery, that is an old fish hatchery built 50 years ago. It was designed to produce small fingerlings when the old theories prevailed about how to raise trout, what size, and where to put them.

Now, with the increased fishing pressures in the area and the greater trend toward planting larger trout for survival reasons and others, the need for updating or replacing or modernizing this facility in some way is very pronounced.

I wonder if you could provide for the record what the estimated cost might be of modernizing this facility.

Mr. TUNISON. We will be very glad to, Senator.

(The statement referred to follows:)

DEPARTMENTAL STATEMENT

The Saratoga station was established in 1914 for the production of small fingerling trout for stocking high mountain lakes and streams. Since that time, greatly increased fishing pressure in the area served by the station and changes in fishery management practices have made it necessary to restock waters with large fingerling and legal-sized trout. Rearing facilities at the station are inadequate for efficient production of the larger size fish now required. Also, the original frame buildings which are still in use are in very poor condition. A major repair and improvement program should be carried out to modernize the unit.

Present and future development of the water supply will greatly increase the potential fish production. Additional rearing facilities, outlined in the program, are expected to double the present 30,000-pound annual production. The future requirements for trout for restocking purposes are expected to exceed the greatest production possible at this station in a few years due to the tremendous increase in recreational fishing of waters in the State.

Funds needed for the program

1st phase:	
Construct raceways	$85,000
Replace water supply line to spring	70,000
Replace intake structure	23,000
Well, pump, and pipeline	10,000
Subtotal	188,000

Funds needed for the program—Continued

2d phase:	
Combination hatchery building, including hatching room, feed and cold storage, equipment, shop and office	$140,000
2 residences with garages	40,000
Display tank	3,000
Equipment	5,000
Subtotal	188,000
Total estimated cost of the program	376,000

1965 BUDGET REQUEST

Senator MCGEE. Are there any funds in this budget at all for this project in Saratoga?

Mr. TUNISON. No construction funds; no.

Senator MCGEE. They are just maintenance funds?

Mr. TUNISON. Operation and maintenance funds; yes, sir.

Senator MCGEE. Did you request funds originally?

Mr. TUNISON. No, sir.

Senator MCGEE. There was no request made to the Bureau of the Budget?

Mr. TUNISON. No.

Senator MCGEE. I understand that in the rehabilitation of the facility there that there have been enough projections made so that we could have a reasonably close estimate on what it might cost.

Mr. TUNISON. I believe that is correct, Senator.

Senator MCGEE. This could be divided into phases, perhaps, in terms of getting the available funds underway?

Mr. TUNISON. That is correct.

Senator MCGEE. When we have that in the record, I would like to keep in touch with you on starting to move on this project.

Mr. TUNISON. We will be very glad to.

YELLOWSTONE NATIONAL PARK FISHERY MANAGEMENT PROJECT

Senator MCGEE. Up in Yellowstone National Park we have had much interest in the Bureau's fish research program there. I understand the program has been completed. Yet the need for continuing the fish management program there, of course, is even greater than it was before. The increased pressure of visitors up there and the number of people fishing increases annually.

I was advised that during this past season just ended, for example, 192,000 anglers spent over 400,000 hours catching 320,000 cutthroat trout. It is this kind of pressure I would think that builds up a greater need for continuing the management program. I wonder if you could supply for the record a description of the work you have been doing in this area and the reasons why it ought to be continued if sufficient funds were made available.

Mr. TUNISON. We will be glad to do that, Senator.

Senator MCGEE. Likewise, include what has been spent up to now on the programs and what is needed to fund it and keep it going in the future.

(The statement referred to follows:)

DEPARTMENTAL STATEMENT

Funds required to implement the project, $50,000.

Yellowstone National Park reported 3,320,000 visitor-days use in 1963. One of the most attractive features in the park is the recreational fishing. Management of the fishery is entirely a Federal responsibility since State licenses are not required and Wyoming does not have legal authority to enforce regulations or manage the fishery. The National Park Service and the Bureau of Sport Fisheries and Wildlife have cooperated in fishery studies in park waters and this arrangement in the past proved effective. Fishery research studies were concluded in 1961 and the program reassigned as a function of management services. Subsequently, only limited attention has been given the fishery.

Yellowstone Lake is one of the centers for sport fishing, where the native cutthroat trout is highly sought by anglers. During 1963, estimates show 192,332 anglers took 321,523 cutthroat trout from Yellowstone Lake. The fishery is presently in good condition; however, management information must be maintained on an annual basis to assure this favorable status. The pressure on the fishery is increasing and is expected to rise in future years. Public use of the developments recently made in the Yellowstone Lake area depends in large part on the quality of the recreational fishing.

A field agreement is in force which outlines the responsibilities of the National Park Service and the Bureau for continuing this work. Under the agreement, the National Park Service maintains the fish traps and weirs which are used in gathering data on the migration and spawning of the cutthroat trout in the tributaries of Yellowstone Lake. The Bureau of Sport Fisheries and Wildlife has agreed to provide technical personnel, seasonal employees, equipment, and motor vehicles needed to conduct the fishery study. Both agencies agree that the work should be continued and expanded so as to obtain the information needed to protect the unique fishery resources of the park and to properly manage them on a long-term basis. Surveys would be conducted on other park waters where important fishery resources and management problems occur. Attention would be given the grayling, a species which is greatly restricted in its range both within and outside the park. The need for continuing the fishery studies at Yellowstone was also recognized in the discussions and report of the National Park Service Research Committee of the National Academy of Sciences, which met at Yellowstone, June 13–16, 1963.

Of the total of $50,000 proposed, $30,000 will be used to pay the salaries of two full-time biologists and several assistants during the summer season; $10,000 for the necessary expenses of the project; and $10,000 for new and replacement equipment, including truck-type motor vehicles, electric fish shockers, and other needed items.

NATIONAL ELK REFUGE, WYOMING

Senator MCGEE. The last question which you can supply for the record has to do with our elk refuge in Teton County. We have heard some fine things about the refuge. If you will advise the committee on its status and how things are going for the record, it will save the time of the Chairman and those here this afternoon.

Senator BIBLE. You may supply it.

(The statement referred to follows:)

DEPARTMENTAL STATEMENT

The primary purpose of this refuge is to provide forage for 7,000 to 11,000 elk. Supplemental feed is provided only when the annual grass stand is insufficient or is covered with snow so deep that the grass is not available to the elk. There are 23,791 acres in the refuge. About 1,500 additional acres are administered under a lease agreement with the Grand Teton National Park.

Considerable water runoff and soil loss is taking place on parts of the refuge that have been overgrazed by elk which migrate into the refuge in winter. Many of the irrigated meadows on the refuge need rehabilitating and reseeding as well as having the ditches repaired. Streambank control is needed along Flat

Creek to counteract erosion and improve the fishing asset. In addition, an old diversion system, constructed prior to the time the land was designated as a refuge, is being threatened. It diverts water out of the Gros Ventre River on the refuge into Flat Creek to supply irrigation water for part of the refuge as well as for irrigators of private lands just below the refuge. The diversion, which was originally a native grass drainageway, has formed a very severe gully one-half mile in length which is 100 feet wide and 70 feet deep in places. It is presently bisecting the refuge and dumping sediment into Flat Creek, thus affecting the wildlife habitat and the fishing area. This erosion must be corrected before it destroys the system including the diversion dam leaving the refuge and private operators without sufficient water. It could eventually intercept all or nearly all the waters from the Gros Ventre River and seriously affect Flat Creek.

Plans are in progress for applying protective measures to this highest priority project and $50,000 has been allocated to get the work underway, but current studies show that $100,000 more will be required to complete this project alone.

A master plan is being prepared for the National Elk Refuge at the present time. This plan will outline the total development needed to enable the refuge to meet its management objectives, and will be based on complete biological and engineering studies. Included in that plan will be replacement of several buildings which were first constructed by ranchers in the late 1800's and early 1900's, improvement of irrigation water facilities, improvement of waterfowl habitat, particularly trumpeter swans, and improvement of physical facilities needed for elk management.

Senator BIBLE. I have a number of items of interest to various Senators, which I should like to inquire about now.

NATCHITOCHES NATIONAL FISH HATCHERY, LOUISIANA

The Chairman advises me it is his understanding that no funds have been provided in the budget for construction and repairs of the U.S. fish hatchery in Natchitoches, La. It is also his understanding that the hatchery is in need of repairs and that the employees need housing. Can you estimate what funds would be required to provide the necessary repairs to the fish hatchery?

Mr. JANZEN. It will require $421,000 to accomplish these repairs. I will place a complete statement in the record.

(The statement referred to follows:)

DEPARTMENTAL STATEMENT

The Natchitoches National Fish Hatchery produces bluegill and red-ear sunfish, largemouth black bass, and channel catfish. At the present, distribution is made to 48 parishes in Louisiana and 13 counties in southern Arkansas. Additional allotments are made to the Mississippi Game and Fish Commission. Average annual production is approximately 3 million fish, and about 4,000 fish applications are received each year.

Most of the fish are stocked in farm or ranch ponds of less than 10 acres. It is estimated that there are 90,000 acres of these impoundments in Louisiana. In 1960, on a national basis, these ponds provided about 2,880,000 man days of fishing; by 1976 impoundments of this nature will provide over 4 million man-days of fishing each year in the State. Management stocking of existing ponds and initial stocking of new ponds place an increasingly heavy demand on hatchery facilities.

In order to meet the need for warm-water species, it is necessary to undertake extensive repair and renovation of existing pond areas and to provide special facilities required for channel catfish rearing programs. Other improvements are needed to provide adequate housing for permanent employees and to improve the level of efficiency of station operations. The development outlined below represents the first reconstruction program at this station since before World War II. On completion of the development, this hatchery will have a potential annual production of about 5 million fish.

Funds needed for the program

1st phase:	
Deepen, regrade, divide, and seal pond area, provide supply and drainage facilities (initial development approximately 15 acres)	$100,000
Install catfish production facilities	19,000
2 residences	39,000
Fertilizer storage building	5,000
Domestic water supply and sewage systems	3,500
Equipment	9,000
Subtotal	175,500
2d phase:	
Complete renovation of pond area, provide supply and drainage facilities (approximately 25 acres)	180,000
Aquarium building (with public restrooms)	49,500
Repair and resurface station roadways and levees	16,000
Subtotal	245,500
Total estimated cost of the program	421,000

BOZEMAN NATIONAL FISH HATCHERY, MONTANA

Senator BIBLE. I will place in the record a letter to Chairman Hayden from Senator Mansfield in which he urges that the national fish hatchery at Bozeman, Mont., be renovated.

(The letter referred to follows:)

U.S. SENATE,
OFFICE OF THE MAJORITY LEADER,
Washington, D.C., February 17, 1964.

Hon. CARL HAYDEN,
Chairman, Appropriations Committee,
U.S. Senate.

DEAR MR. CHAIRMAN: As you know, I have advocated in recent years a program of improving and developing the national fish hatcheries in the State of Montana. Through your cooperation and that of the Senate, in recent years modernization and improvement programs have been financed at both Ennis and Creston in my State. These projects now have adequate funds available, and the work at the most recent facility, Ennis, should be completed in the not too distant future.

I now believe that the next facility which needs to be considered is the one at Bozeman, Mont. Several years ago, during the earthquake, there was a certain amount of damage, and I am not sure that the necessary improvements have been taken care of. I am informed that the representatives of the Fish and Wildlife Service will be before the Interior Appropriations Subcommittee on February 27, and I would appreciate it if you would alert the staff to obtain the necessary estimates and question the representatives on what needs to be done at the Bozeman Federal Fish Hatchery.

Thank you for your cooperation, and with best personal wishes, I am,

Sincerely yours,

MIKE MANSFIELD.

Senator BIBLE. Will you indicate, by a statement in the record, the condition of the Bozeman National Fish Hatchery and work which should be done there, including the cost?

Mr. JANZEN. We will place that information in the record, sir.

(The statement referred to follows:)

DEPARTMENTAL STATEMENT

The Bozeman National Fish Hatchery was established in 1893 to produce small fingerling trout for stocking waters of western Montana. During the intervening years, many changes have been effected through improved hatchery

methods and new techniques in fishery management. At the present time, the hatchery produces approximately 60,000 pounds of rainbow and cutthroat trout annually for stocking waters of southwestern Montana. This extensive recreational area includes the East and West Gallatin Rivers and their tributaries, the Missouri River from its source to the Gates of the Mountains near Helena, Canyon Ferry Reservoir with a surface area of over 30,000 acres, and numerous high mountain lakes in the Gallatin, Madison, and Beaverhead drainages.

The waters of southwestern Montana, which include those on Federal lands as well as open State waters, are nationally known for their excellent fishing. It is reported that nearly half of the fishing licenses purchased in the State are sold in this general area. This fact coupled with the expanding population and more leisure time has resulted in a steadily increasing fishing pressure. The need for large fingerling and yearling trout in the area stocked by the hatchery can be more fully met if maximum development of facilities at the station is accomplished.

The hatchery building and residences recommended for replacement were constructed prior to the turn of the century and have far surpassed their normal life expectancy. Their condition is such that further remodeling is not practical. Since World War II, only a small amount of construction funds has been available for work at this hatchery. This included a total of $59,600 appropriated in fiscal years 1950–52 and $20,000 in fiscal year 1962 to repair earthquake damage. The development program outlined provides for the replacement of these deteriorated and outmoded structures and additional facilities for a modern, safe, and efficient fish-cultural unit. When completed, facilities at the Bozeman hatchery will be adequate to rear approximately 85,000 pounds of trout annually. This will allow the station to more adequately fulfill its responsibilities in preserving and enhancing sport fishing in southwestern Montana.

Funds needed for the program

1st phase:	
Aerator tower	$5,000
Sump and pumps	5,000
Production well	15,000
Supply lines (sump and well to aerator)	10,000
10 raceways (6 by 60 feet)	30,000
Tanks	8,000
Hatchery building (replacement)	110,000
Subtotal	183,000
2d phase:	
Incubators	5,000
2 residences (replacement)	40,000
Storage building (2 garages, oil and paint storage, equipment storage)	20,000
Roads and drives	15,000
Grounds, landscaping	10,000
Utilities	10,000
Subtotal	100,000
Total estimated cost of the program	283,000

CORNING NATIONAL FISH HATCHERY, ARK.

Senator BIBLE. At the request of Senator Fulbright, who has written to Senator Hayden and whose letter I will include in the record, I will appreciate your furnishing a statement concerning construction needs at the Corning, Ark., National Fish Hatchery.

Mr. JANZEN. I will be glad to do that, Mr. Chairman.

(The letter and statement referred to follow:)

U.S. SENATE,
COMMITTEE ON FOREIGN RELATIONS,
February 21, 1964.

Hon. CARL HAYDEN,
Chairman, Subcommittee on the Department of the Interior Appropriations Bill, Committee on Appropriations, U.S. Senate, Washington, D.C.

DEAR MR. CHAIRMAN: As your subcommittee is now considering the Interior Department appropriation bill, I wish to bring to your attention an item which I sincerely believe should be included.

The Federal Government operates a fish hatchery in Corning, Ark., which has served the northeast section of my State very well. The installation is now in need of renovation and the necessary repairs and improvements are estimated at $99,000. This work has been programed by the Bureau of Sport Fisheries, but no funds were included for it in the 1965 budget.

I need not tell you that the number of fishermen on the streams and lakes is increasing each year and it seems to me imperative that every effort be made to maintain the facilities necessary to keep an adequate supply of fish in our streams.

I will appreciate the subcommittee's attention to this item.

With best wishes, I am,

Sincerely yours,

J. W. FULBRIGHT.

DEPARTMENTAL STATEMENT

The Corning National Fish Hatchery located in Clay County, Ark., was established in 1938 to produce warm-water species of fish for farm ponds and reservoirs in the general vicinity of the hatchery. During the ensuing years the distribution area has been progressively enlarged to include all of eastern Arkansas, 10 counties in Illinois, and several counties in southeastern Missouri and western Tennessee. In addition to this, the hatchery has frequently been called upon to allocate fish for stocking in Kentucky waters.

Currently, the Corning hatchery produces about 1.8 million fish annually weighing in excess of 5,500 pounds. This includes four different species; channel catfish, largemouth bass, bluegill, and redear.

In fiscal year 1961, Congress appropriated $100,000 to enlarge rearing facilities and to make improvements of other physical facilities. This work has been accomplished.

At the present time, additional funds are required to complete a general renovation and modernization of the physical plant. This program would modernize existing facilities and provide new facilities for greater efficiency and ease of operation. The items included in this program are as follows:

Funds needed for the program

Repair pond levees	$4,000
Deepen 5 acres of ponds	4,000
Concrete steps for 20 ponds	5,000
Garage building	7,000
Equipment storage building	8,000
Repair existing buildings	5,000
Replace pumphouse	2,000
Combination building (office, display facilities, public restrooms, food preparation room)	45,000
Blacktop station roads	10,000
Landscaping	4,000
Equipment	5,000
Total estimated cost of the program	99,000

ARKANSAS FISH AND WILDLIFE PROJECTS

Senator BIBLE. Senator McClellan has forwarded a statement to the committee concerning the Greers Ferry, Corning, and Mammoth Spring National Fish Hatcheries. His statement will be made a part of the record.

(The statement referred to follows:)

STATEMENT OF SENATOR JOHN L. MCCLELLAN

Mr. Chairman, I am grateful for this opportunity of bringing to the subcommittee's attention the need for funds for several Arkansas projects administered by the Fish and Wildlife Service, Department of the Interior. The budget contains no funds for national fish hatcheries construction in Arkansas, and I believe there are several such projects that merit the subcommittee's serious consideration.

GREERS FERRY NATIONAL FISH HATCHERY

Congress provided $170,000 in fiscal year 1962 to initiate construction of the Greers Ferry Dam National Fish Hatchery in Cleburne County, Ark. This was followed by subsequent appropriations of $265,000 in fiscal year 1963 and $188,000 in fiscal year 1964.

The construction of this hatchery is needed to produce trout for stocking reservoirs and cold tailwaters of streams resulting from Corps of Engineers construction activities in the Little Red River and Red River drainage areas of southwestern Arkansas and eastern Oklahoma. Moneys received thus far will not be sufficient to complete this unit. Additional funds in the amount of $177,000 would result in completion of the unit with a potential production of 150,000 pounds of trout annually.

We are attempting to develop the area of Arkansas in which this fish hatchery is located. For various reasons, a great deal of emphasis must be placed on tourism if we are to raise the standard of living and the opportunities for the citizens of this area. Trout fishing is one of the more important inducements to tourists to come to this area. Both the Area Redevelopment Administration and the Department of the Interior have conducted studies in regard to the development of the area in which this fish hatchery is located, and I believe that both of these studies will bear out the importance of good fishing as an inducement to tourists. I, therefore, most respectfully urge the subcommittee to consider an appropriation of $177,000 for Greers Ferry National Fish Hatchery for fiscal year 1965.

CORNING NATIONAL FISH HATCHERY

The Corning National Fish Hatchery located in Clay County, Ark., was established in 1938 to produce warm-water species of fish for farm ponds and reservoirs in the general vicinity of the hatchery. During the ensuing years the distribution area has been progressively enlarged to include all of eastern Arkansas, 10 counties in Illinois, and several counties in southeastern Missouri and western Tennessee. In addition to this, the hatchery has frequently been called upon to allocate fish for stocking in Kentucky waters.

At the present time, additional funds are required to complete a general renovation and modernization of the physical plant. This program would modernize existing facilities and provide new facilities for greater efficiency and ease of operation. Ninety-nine thousand dollars is needed to accomplish the renovation and modernization which I have referred to and, consequently, I hope the subcommittee will recommend an appropriation of $99,000 for Corning National Fish Hatchery.

MAMMOTH SPRING NATIONAL FISH HATCHERY

The Mammoth Spring National Fish Hatchery located in Fulton County, Ark., was established in 1904 for the production of trout and bass. Since that time, the production program has been changed to meet present management requirements. At this time, the station propagates largemouth bass, bluegill, redear, and channel catfish. These fish are stocked in waters of 47 counties of northern and western Arkansas and 7 counties of southern Missouri. There are approximately 2,900 farm ponds stocked from the Mammoth Spring Hatchery each year.

Annual production at Mammoth Spring currently averages about 1¾ million fish of the species mentioned. In addition, about 5,000 people, mostly schoolchildren, visit the hatchery each year.

Additional funds are required to continue the development of the hatchery as planned. Upon completion of the program, at an estimated cost of $122,000,

new facilities will improve operating efficiency and permit a large increase in fish production. I, therefore, most respectfully request the subcommittee to recommend an appropriation of $122,000 for this project.

ARKANSAS FISH HATCHERIES

Senator BIBLE. The Senator from Arkansas recommends appropriation of funds to continue construction work at these facilities. Will you place in the record statements covering each of them, indicating the work to be done and its cost?

Mr. JANZEN. Yes, sir.

(The statements referred to follow:)

GREERS FERRY DAM NATIONAL FISH HATCHERY

Congress provided $170,000 in fiscal year 1962 to initiate construction of the Greers Ferry Dam National Fish Hatchery in Cleburne County, Ark. This was followed by subsequent appropriations of $265,000 in fiscal year 1963 and $188,000 in fiscal year 1964.

The construction of this hatchery is needed to produce trout for stocking reservoirs and cold tail waters of streams resulting from Corps of Engineers construction activities in the Little Red River and Red River drainage areas of southwestern Arkansas and eastern Oklahoma. The Greers Ferry Dam and Reservoir project on the Little Red River is nearly completed and the construction of additional dams and reservoir projects which are authorized will follow in the near future.

Biological investigations have revealed that for mitigation purposes, 60,000 pounds of trout will be required annually for stocking the cold waters created by the Greers Ferry Dam. These investigations also show an additional 90,000 pounds of trout will be required to stock other cold water habitats located in southwestern Arkansas and eastern Oklahoma.

A suitable site on Federal lands below Greers Ferry Dam was selected for the construction of hatchery facilities. An adequate supply of cold water is available from the Greers Ferry Reservoir and suitable outlets were provided during construction of the dam to allow for operation of the hatchery.

Funds received to date are expected to be obligated by June 1964 and construction completed in the summer of 1965. Moneys received thus far will not be sufficient to complete this unit. The total estimated cost of the hatchery is $800,000. Additional funds in the amount of $177,000 are required to complete the unit which will have a potential production of 150,000 pounds of trout annually.

Funds needed to complete the program

Concrete raceways with individual water supply and drainage features	$50,000
2 residences	40,000
Outside utilities, including supply and drainpiping, overhead lights, and domestic sewage facilities	12,000
Paved drives, parking area, fencing, and landscaping	45,000
Equipment	30,000
Total funds needed	177,000

NORFOLK NATIONAL FISH HATCHERY

Construction of the Norfork National Fish Hatchery, as originally designed, was completed in 1957 and operations began in August of that year. With facilities then completed, the hatchery had a production potential of 200,000 pounds of trout annually. Since establishment of the hatchery, requirements for trout in the area stocked have increased by 100 percent.

In order to meet this increased requirement for trout, Congress appropriated funds in fiscal year 1962 to initiate an expansion of hatchery facilities. Additional funds made available in fiscal years 1963 and 1964 were sufficient to complete the expansion program. Current work schedules indicate that this construction program will be finished by the end of 1964. On completion, the hatchery should have a potential annual production of 400,000 pounds of trout.

MAMMOTH SPRINGS NATIONAL FISH HATCHERY

The Mammoth Spring National Fish Hatchery located in Fulton County, Ark., was established in 1904 for the production of trout and bass. Since that time, the production program has been changed to meet present management requirements. At this time, the station propagates largemouth bass, bluegill, redear, and channel catfish. These fish are stocked in waters of 47 counties of northern and western Arkansas and 7 counties of southern Missouri. There are approximately 2,900 farm ponds stocked from the Mammoth Spring Hatchery each year.

Annual production at Mammoth Spring currently averages about 1¾ million fish of the species mentioned. In addition, about 5,000 people, mostly schoolchildren, visit the hatchery each year.

Congress provided $100,000 in fiscal year 1960 and an additional $82,000 in fiscal year 1964 to initiate a modernization and improvement program for this hatchery. With the funds, it was possible to remodel the existing ponds and provide additional rearing facilities, repair old buildings, and construct a new combination building, replace supply and drain lines, and make other improvements of the hatchery's facilities.

Additional funds are required to continue the development of the hatchery as planned. Items needed along with their estimated costs are listed below. Upon completion of the program, at an estimated cost of $122,000, new facilities will improve operating efficiency and permit a large increase in fish production.

Funds needed for the program

Install concrete raceways	$13,500
Raze old buildings	2,000
Replace residence No. 1	20,000
Storage building	10,000
Fish holding house	26,000
Fertilizer storage building	6,000
Oil and paint house	3,000
Landscaping and walkways	4,000
Hard surfacing station roadways	17,500
Fencing	14,000
Equipment	6,000
Total funds needed	122,000

MARION NATIONAL FISH HATCHERY, ALABAMA

Senator BIBLE. Senators Hill and Sparkman have written to urge continued renovation work at the Marion National Fish Hatchery. Their letters will be included in the record at this point.

(The letters referred to follow:)

UNITED STATES SENATE,
COMMITTEE ON LABOR AND PUBLIC WELFARE,
Washington, D.C., February 26, 1964.

Hon. CARL HAYDEN,
Chairman, Senate Appropriations Committee,
Washington, D.C.

MY DEAR CARL: As you know, I am very much interested in the appropriation of funds in the Department of the Interior appropriation bill to carry forward the modernization work at the Marion, Ala., National Fish Hatchery.

A program for the correction of deficiencies at the Marion National Fish Hatchery is needed, to include construction of of additional buildings, and to provide new earthen ponds to satisfy the need for fish production units, training facilities, and pond space for warm water fish-cultural research. Funds in the amount of $175,000 can be effectively used during the fiscal year 1965 for the first phase of the improvement program, and I will appreciate your and the subcommittee's earnest consideration and assistance in this matter.

Thanking you and with kindest regards, I am

Very sincerely,

LISTER HILL.

UNITED STATES SENATE,
SELECT COMMITTEE ON SMALL BUSINESS,
February 19, 1964.

Hon. CARL HAYDEN,
Chairman, Subcommittee on Interior
Committee on Appropriations, U.S. Senate,
Washington, D.C.

DEAR CARL: Hon. David S. Lee, chairman, Court of County Commissioners of Perry County, Ala., has been in touch with me concerning the need for appropriations to continue the modernization of the fish hatchery at Marion, Ala. It is a pleasure to write in behalf of the project. I hope that funds for this work can be appropriated.

With best wishes and kindest regards, I am
Sincerely,

JOHN SPARKMAN.

Senator BIBLE. How much will be needed next year to carry on the work which should be done at this hatchery?

Mr. JANZEN. For next year $175,000 would be used. The total cost of the proposed work remaining to be done is $690,000. I will be glad to supply a statement for the record.

Chairman HAYDEN. That may be done.

(The statement referred to follows:)

DEPARTMENTAL STATEMENT

The Marion National Fish Hatchery, established in 1932, produces five species of warm water fish for stocking waters in an assigned distribution area in Alabama, Georgia, and Florida. On occasion, fish are also made available to hatcheries in Mississippi and other Southeastern States when production at stations in those States is inadequate to meet the need. In addition to the normal production program, two other important functions are carried on at the Marion Hatchery. These are the In-Service Training School for warm water fish culturists—the only school of its kind in the United States—and the Southeastern Fish-Cultural Laboratory. This latter activity is under the Division of Fishery Research.

During the years since original construction, production and other facilities at this station have become badly outmoded. This has occurred because of changes and increased need for specific species, sizes, and numbers of fish required for management purposes and new developments in fish-cultural methods. Additionally, there has been a serious deterioration of substandard pond installations, such as water supply and drain lines, embankments, and other essential facilities.

In order to correct these deficiencies, it is necessary to renovate existing ponds and other facilities, to construct additional buildings, and to provide 80 small new earthen ponds. This development will satisfy present needs for fish production units, training facilities, and pond space for warm water fish-cultural research.

Congress appropriated $165,000 in fiscal year 1963 to initiate the development program and $115,000 in fiscal year 1964 for continuation of the program. Work to be accomplished with 1963 funds has been completed; work to be carried out with 1964 funds—pond division, water supply and drainage facilities, roads, culverts, and grading—will begin in April of this year and is scheduled for conclusion in December. In order to complete the program at the Marion station, the following funds will be required:

Funds needed for the program

First phase:	
Wet laboratory, including constant temperature room	$80,000
Triplex for trainees	40,000
Divide and rebuild ponds No. 27, 30–34 with a surface area of 11 acres and install water supply and drainage facilities	55,000
Subtotal	175,000

Funds needed for the program—Continued

Second phase: Construct experimental earthen ponds (50 one-tenth acre, 20 one-quarter acre, and 10 one-half acre ponds) and install water supply and drainage facilities by dividing ponds No. 29, 38, 39, 44, 49, 50 (21.1 acres)	$200,000
Third phase:	
Raceways, 400 linear feet of double raceway	25,000
Fertilizer, dry feed, and chemical storage building	15,000
Triplex for trainees	40,000
Water recirculation system	50,000
Laboratory and fish-cultural equipment	20,000
Subtotal	150,000
Fourth phase: Divide and rebuild remaining ponds (32.4 acres)	165,000
Total cost to complete the program	690,000

SPRINGVILLE NATIONAL FISH HATCHERY, UTAH

Senator BIBLE. A request has been received from Senator Moss of Utah inquiring concerning needs at the Springville National Fish Hatchery in his State. I will appreciate your placing in the record a statement showing what is necessary at that facility, including an indication of the total cost of the work as well as that portion of it which may be done in fiscal year 1965.

Mr. JANZEN. Very well, sir.

(The statement referred to follows:)

DEPARTMENTAL STATEMENT

The Springville Hatchery established in 1915 produces rainbow and brook trout for distribution to waters on Federal lands and other managed waters. Some warm-water fish are also reared for stocking suitable waters in Utah. The distribution area is composed principally of national forests, Indian reservations, and military reservations. Average annual production is about 80,000 pounds of fish. In order to more adequately stock this area and more fully meet the obligation to preserve and enhance the fishery resource on lands under Federal control, it will be necessary to further develop and rehabilitate station facilities. The water supply has gradually decreased to the point where current production levels are increasingly difficult to maintain. An increase in the water supply is required in order to produce the pounds of trout needed and to improve efficiency of fish-cultural operations. Other improvements are designed to modernize the operations program and provide adequate station facilities. The existing hatchery building is outmoded and in need of extensive repairs. This building should be replaced with one of modern design. The new building would incorporate a small aquarium-display room to present conservation education information for the visiting public. On completion of the development program outlined below, this hatchery will have a potential annual production of 125,000 pounds of fish.

Funds needed for the program

First phase:	
Water supply improvement, including the collection of spring flows and protection of intake facilities, well, and pipeline installations necessary to provide an efficient system	$48,000
Replace hatchery building	120,000
Subtotal	168,000

Funds needed for the program—Continued

Second phase:	
Earthen ponds, rehabilitate present ponds including supply and drainage facilities, construct additional ponds with supply and landscaping, fill and level area east of highway	$18,000
Chain-link fence, roads, and sidewalks	20,000
drainage features	$40,000
Subtotal	78,000
Total estimated cost of the program	246,000

WYTHEVILLE NATIONAL FISH HATCHERY, VA.

Senator BIBLE. A letter from Senator Robertson, which I will place in the record, urges continued improvement at the Wytheville and Harrison Lake National Fish Hatcheries in Virginia.

(The letter referred to follows:)

U.S. SENATE,
COMMITTEE ON BANKING AND CURRENCY,
February 18, 1964.

Mr. PAUL R. EATON,
Clerk, Subcommittee on Interior, Committee on Appropriations,
U.S. Senate, Washington, D.C.

DEAR PAUL: Frankly, I was surprised when I found that the President included in his budget for fiscal year 1965 no funds whatever to proceed with the Fish and Wildlife construction projects at Wytheville and Harrison Lake, Va. These are both vital fish stations and it would be poor economy not to proceed with the current construction plans.

When the Fish and Wildlife Service appears before the Interior Appropriations Subcommittee on February 27, please have someone to ask for me that they state what is needed to prudently continue the construction work at these two fish hatcheries.

With best wishes, I am,
Sincerely yours,

A. WILLIS ROBERTSON.

Senator BIBLE. Will you please supply for the record a statement with regard to each of these hatcheries, and include in those statements the work and its cost which needs to be done in the coming fiscal year?

Mr. JANZEN. I will be glad to do that.

(The statement referred to follows:)

NATIONAL FISH HATCHERY, WYTHE COUNTY, VA.

Funds were provided in fiscal year 1961 to initiate construction of a new National Fish Hatchery in Wythe County, Va. This station will replace the old Wytheville Hatchery established in 1879. Rehabilitation of the existing hatchery was considered impracticable because of a steady decline in the water supply, both as to quantity and quality, together with advanced deterioration of physical facilities and a topographically undesirable site.

Trout produced at this new station will be stocked in water on State and Federal lands. A large percentage of the fish allotted to waters on Federal lands will be stocked in the Jefferson National Forest, an area of some 2,364,881 acres, in accordance with cooperative agreements with the U.S. Forest Service and the States concerned. This station will also supply trout eggs to other national fish hatcheries for rearing and subsequent stocking. It is estimated that 90 percent of the cold-water sport fishery in Virginia is supported by stocking of hatchery fish. By 1976, it is expected that fishing pressure on trout populations in this State will result in a 100-percent increase in requirements for hatchery fish.

Funds appropriated in fiscal year 1961 ($150,000) have been obligated for site acquisition, water rights, preliminary engineering, and installation of water supply lines. Congress appropriated an additional $159,000 in fiscal year 1963 and $205,000 in fiscal year 1964 for buildings, raceways, roads, and other hatchery

facilities. Bidding schedules for this construction are being circulated at the present time and contracts are expected to be let in early March 1964.

Additional funds are required to complete development at this station as outlined below in the amount of $326,000. On completion of development the new station will have a potential production in excess of 100,000 pounds of trout annually.

Funds needed for the program

First phase:	
Four residences with single garages	$80,000
Garage and storage building	28,000
Oil, paint, and chemical building	5,000
Roads, grading, and fencing	27,000
Domestic water and sewage facilities	20,000
Equipment (fish cultural and automotive)	30,000
Subtotal	190,000
Second phase:	
Concrete raceways (8 feet by 100 feet) double	106,000
Floodlights and landscaping	20,000
Equipment (fish cultural and maintenance)	10,000
Subtotal	136,000
Total funds needed	326,000

HARRISON LAKE NATIONAL FISH HATCHERY

The Harrison Lake National Fish Hatchery was established in 1934 to provide warm-water fish for farm ponds and reservoirs for a large area in eastern Virginia. Since the original construction only minor changes have been made to the hatchery facilities, although there has been a major change in production requirements.

The area served by the hatchery has been increased to include approximately half of the State of Maryland. In addition to this, four species of fish are now being produced (bass, bluegill, redear, and channel catfish), whereas 15 years ago only two species were propagated.

Current studies by a Federal agency show approximately 1,200 to 1,400 farm ponds being constructed annually. Reclamation of lakes and ponds is increasing and now averages in excess of 200 acres a year. It is predicted that 6,300 acres of water will be impounded by public and private enterprise annually throughout the next decade. These waters, which are within the distribution area of the Harrison Lake Hatchery, will require the stocking of fish from a hatchery source.

Recognizing the need, Congress appropriated $84,000 in fiscal year 1964 to complete the first phase of a modernization and improvement program. This included construction of a new residence, fertilizer and chemical storage building, repairs to the office building, and the renovation of the water supply canal.

To continue the improvement of the hatchery as planned, funds in the amount of $78,000 are needed which include the following items:

Funds needed for the program

Replace pond supplies and drainlines	$40,400
Gravel pond levees	8,000
Concrete steps in ponds	3,000
Rebuild and blacktop station roads	23,200
Install parking area	3,400
Total cost of the program	78,000

CHERAW NATIONAL FISH HATCHERY, SOUTH CAROLINA

Senator BIBLE. Again this year Senator Johnston has expressed an interest in completing the redevelopment program at the Cheraw National Fish Hatchery, South Carolina. I will place his letter asking this in record.

(The letter referred to follows:)

U.S. SENATE,
COMMITTEE ON POST OFFICE CIVIL SERVICE,
February 25, 1964.

Senator CARL HAYDEN,
Chairman, Appropriations Committee,
U.S. Senate, Washington, D.C.

DEAR SENATOR: This letter is to request that there be inserted in the Department of the Interior appropriations bill an item providing $61,000 for continued improvement of the Cheraw Fish Hatchery, Cheraw, S.C. This expenditure has been substantiated by the Department of the Interior.

With kind regards, I am,
Sincerely,

OLIN D. JOHNSTON.

Senator BIBLE. Would you supply for the record a statement showing what work still must be done and its cost?

Mr. JANZEN. We will do that, sir.

(The statement referred to follows:)

DEPARTMENTAL STATEMENT

The Cheraw National Fish Hatchery was established in 1944 to assist in maintaining the warm water fishery resource of northeastern South Carolina. The distribution area has been subsequently enlarged and now includes 21 counties in South Carolina and 23 counties in North Carolina. Since World War II, the farm pond construction program has been accelerated throughout the country. This is particularly true in the Southeastern States, where management of farm ponds is also highly developed. Initial stocking of new ponds and management stocking of existing ponds has placed an increasingly heavy demand on the production capabilities of the Cheraw station. At the present time, the Cheraw hatchery produces five species of warm water fish; bluegill, redear sunfish, largemouth bass, speckled bullhead, and white catfish.

In order to produce efficiently the numbers of fish required for management stocking needs and to provide other necessary station facilities, it is necessary to undertake an improvement and redevelopment program at the Cheraw hatchery. Congress appropriated $159,000 in fiscal year 1964 to initiate this program. These were the first construction funds available for this station since the date of establishment. Work financed by this appropriation—pond repair and development, water supply and drainage lines, and residences for permanent employees—will be accomplished by contract this season.

An additional $61,000 is required to complete the redevelopment program. These funds are needed to construct a combination building, repair roads, and landscape station grounds.

Funds needed for the program

Combination building (display room, fish food preparation room, laboratory, public toilets)	$28,000
Roads	21,000
Landscaping	4,000
Equipment	8,000
Total funds needed to complete the program	61,000

CORTLAND NATIONAL FISH HATCHERY, NEW YORK

Senator BIBLE. I have here a letter from Mr. Harold G. Wilm, commissioner of the Conservation Department of the State of New York, urging construction of new and enlarged buildings at the Cortland, N.Y., station of the Bureau of Sport Fisheries and Wildlife. I will place his letter in the record.

(The letter referred to follows:)

STATE OF NEW YORK,
CONSERVATION DEPARTMENT,
Albany, February 19, 1964.

Hon. CARL HAYDEN,
Chairman, Senate Appropriations Committee,
Senate Office Building, Washington, D.C.

DEAR SENATOR HAYDEN: I should urge your support of the budget request of the Bureau of Sport Fisheries and Wildlife of the Department of Interior for the construction of new and enlarged buildings at the Federal fish hatchery at Cortland, N.Y.

Our department participates in the work of the Cortland hatchery through a cooperative agreement with the Federal Government and Cornell University. This hatchery has for many years done outstanding research on the nutrition of fishes and served as a training station for Federal and State fish hatchery personnel.

The old frame buildings and facilities at the Cortland hatchery are obsolete and inadequate. New and expanded facilities are essential if this station is to continue to perform its important functions. The improved facilities will be of direct benefit to fish hatchery operations of the Federal Government and all the States.

Sincerely,

H. G. WILM, *Commissioner.*

Senator BIBLE. Please file for the record a statement indicating the needs at this station and the cost of doing the work.

Mr. JANZEN. We will do that.

(The statement referred to follows:)

DEPARTMENTAL STATEMENT

This station is operated jointly by the Division of Fish Hatcheries and the Division of Fishery Research and consists of the Eastern Fish Nutrition Laboratory, Cortland Inservice Training School and Cortland National Fish Hatchery. Intensified studies are conducted pertaining to fish nutrition and physiology, including the use of radioactive tracer materials. Results of these activities are published in the New York State Conservation Bulletin, "The Progressive Fish-Culturist," and in scientific journals, thus making this valuable information available to conservation agencies in the United States and abroad.

Selected promising personnel are given inservice training at the Cortland station each year. The training school is not limited to Bureau personnel, but extends its facilities to State conservation employees and fishery personnel from foreign governments—resulting in direct cooperation between the Bureau and State and foreign governments.

The Cortland station engages in an active cooperative agreement with the New York Conservation Department and Cornell University in effect since 1932. Research work on the graduate level is conducted at this installation by Cornell students.

Three species of trout are produced at this station and are stocked in Federal, State, and agricultural waters within the State of New York.

Facilities at the station are badly deteriorated and inadequate for the experimentation and training programs. The facilities have reached the point where their poor condition is also influencing the production of fish for stocking purposes. Several of the buildings were constructed over a hundred years ago and therefore maintenance costs have become exceptionally high and impractical. Unless funds are made available for the complete reconstruction of this installation, the research, training, and fish-cultural activities will be seriously handicapped, if not eventually terminated. The proposed reconstruction program has been designed to provide suitable facilities required to carry on the research and training programs and will result in a modern, efficient unit available for the production of fish, which in turn is essential to the research and training programs. This program will permit expansion of activities at a future date, if needed.

Recent drilling of test wells and other water exploration work indicate that sufficient water is available for the facilities proposed and future expansion if required.

Funds needed for the program

Phase 1:	
Purchase 5 additional acres	$1,800
Water supply and drain lines	61,800
Wells, pumps, and lines	11,500
Replace 18 raceways	115,000
Replace 2 brood ponds	20,000
Subtotal	210,100
Phase 2:	
Replace hatchery building	138,000
Replace laboratory building	230,000
Remove old buildings	11,500
Subtotal	379,500
Phase 3:	
Replace residences (3)	60,000
Student quarters (4 duplexes)	122,000
Garage (8 stalls)	16,000
Replace oil and paint storage building	2,300
Subtotal	200,300
Phase 4:	
Replace domestic water and sewage systems	10,000
New domestic water and sewage system	7,300
Replace and relocate entrance road	34,500
Surface parking areas	12,000
Landscaping and fire lanes	2,500
Fencing	2,500
Equipment for laboratory, school, quarters	116,300
Subtotal	185,100
Total program	975,000

OURAY AND BEAR RIVER CONSTRUCTION PROJECTS

Senator BIBLE. There will be included in the record a statement prepared by Senator Bennett of Utah with regard to the Ouray National Wildlife Refuge and the Bear River Migratory Bird Refuge road.

(The statement referred to follows:)

OURAY NATIONAL WILDLIFE REFUGE

Mr. Chairman, I appreciate this opportunity to testify concerning the development of the Ouray National Wildlife Refuge in Utah.

The Department of Interior budget for fiscal year 1965 includes $115,000 for buildings and the construction of dikes and water control facilities at the Ouray National Wildlife Refuge. However, additional development work must and can be accomplished at this refuge in fiscal year 1965 in order to keep within the timetable for the development of this important wildlife conservation project. An additional sum of $232,400 is needed for the following items:

Boundary fencing (33 miles)	$32,400
Additional buildings, including residences, sanitary system, headquarters roads and parking, oil and paint storage building, gasoline storage tanks, water supply system, and electric system	86,500
Canals, dikes, water control structures, riprap, gravel surfacing dikes, and pumping facilities in Leota Bottoms	113,500
Total additional required	232,400

Allow me briefly to retrace the history and outline the importance and the need for early development of this wildlife refuge.

The Ouray National Wildlife Refuge was established on November 20, 1960, by former Secretary of the Interior Fred A. Seaton. Thereafter the Bureau of Sports Fisheries and Wildlife proceeded to acquire the necessary acreage and to prepare a master development plan. The master development plan was completed in July 1962, but because of some delays in the land acquisition program, development actually did not begin until fiscal year 1964 when the committee at my request wisely added funds to initiate construction, thereby also securing the necessary water rights which were contingent upon approval and incorporation of the development plan. The committee approved $250,000 last year, which unfortunately was cut to $133,000 in the conference bill.

The Ouray National Wildlife Refuge is located in Uintah County, Utah, 26 miles southwest of Vernal and 1 mile north of the small Indian village of Ouray, and extends north along either side of the Green River for 7½ miles. It is technically located in the Pacific flyway, but it is a mere 30 airline miles to Colorado and the central flyway.

The committee is aware of the declining population of the Great Basin Canada goose flock. The refuge will take up the void in Canada goose production areas that will be lost as a result of Flaming Gorge Reservoir. If a suitable area is not provided at an early date to offset this loss, there is question as to the future status of the Great Basin Canada goose flock.

Ouray will provide habitat conditions capable of producing at least 1,000 geese each year with sufficient food to maintain a peak population of 3,000 during migration and an annual use-day population of 400,000. Moreover, it is expected the refuge will produce 13,000 ducks each year, provide food for peak populations of 75,000 ducks during fall migration, with overall duck-use days totaling 4,250,000.

In addition to its importance as a prime waterfowl production area and a resting and feeding area for migratory birds, the refuge will protect and maintain the upland game birds, big game, and furbearer populations that now use the area. Ultimately the refuge also will provide hunting and recreational facilities.

The total cost of developing the Ouray refuge is estimated at $1,300,000, which it is hoped can be accomplished over a 5-year period. The additional $232,400 is urgently needed this year to bring the construction schedule to a reasonable point on that timetable. If additional funds are not appropriated, development activity at the refuge will not continue through fiscal year 1965 and much valuable time will be lost with a consequent detrimental effect on the wildlife population the refuge is designed to serve.

In view of the urgent need for early development of this important refuge, I strongly urge the committee to include the required addition of $232,400 in the Interior appropriations bill.

Bear River Migratory Bird Refuge Road

A second item on which I would like to testify is the road from Brigham City, Utah, to the popular Bear River Migratory Bird Refuge. This 14-mile road extends from just west of Brigham City to the refuge headquarters. Both the Bureau of Sport Fisheries and Wildlife and the Box Elder County Commission have surveyed the road and report that 11½ miles are in poor condition and in need of repairs. Some sections are in extremely bad condition and in some places are hardly passable.

Mr. Daniel H. Janzen, the Director of the Bureau of Sport Fisheries and Wildlife, indicated to me in a letter of February 20, 1962, that the Bureau feels a "moral responsibility" to cooperate with county officials to "whatever extent possible" in rebuilding the Bear River Road. No doubt his statement is based upon the fact that the road is the sole access to the refuge and the great bulk of its use comes from Government employees and others using the refuge. Over 20,000 people visited the refuge last year.

The Box Elder County officials have estimated the road could be placed in good condition by adding a new gravel base along with a 3-inch bituminous surface. They also believe the road should be widened to 24 feet and the bridge across Reeder's Canal replaced and relocated to remove a hairpin curve in the road at that point. The total cost of the road improvements outside of the refuge boundaries is estimated at $105,000. The budget last year

contained $12,000 for repair and refurbishing of roads directly within the refuge.

Box Elder County is not in a position to build a road because its funds are already committed elsewhere to roads which serve residents of the county and which have a higher priority than the Bear River Refuge access road, which is essentially a service road for the refuge. Although the county does not have funds to rebuild the road, it is willing to cooperate fully and will furnish county labor and equipment to rebuild the road. It is also willing to maintain the road in the future just as it has in the past.

At the present time, Box Elder County realizes only about $100 in taxes from this vast 64,000-acre area which has almost totally been removed from the county property tax rolls.

As the committee will recall, I testified both last year and the year before in support of funds to rebuild this road, and the committee both times added a sum of $105,000 for this purpose, only to have the funds deleted by the House in conference. This is a most worthwhile cooperative project, and I urge the committee to appropriate $105,000 for this purpose, as it has done before. As the committee is aware, Federal participation in this kind of a road program for national refuges has recent precedents.

Thank you.

Senator BIBLE. Do you need additional funds for work at these points during the coming year? If so, will you please supply statements indicating the work to be done, the total costs, and the amount needed in fiscal year 1965.

GENERAL ADMINISTRATIVE EXPENSES

Now, Mr. Janzen, I will get back into the item of "General administrative expenses." I imagine these are properly directed to you. The budget estimate for 1965 for general administrative expenses is $1,384,000, an increase of $25,000 over the amount available last year.

All of the $25,000 is attributable to increased pay cost for fiscal year 1964 positions. The justification will be placed in the record and we will make the insertion at this point.

(The justification referred to follows:)

HIGHLIGHT STATEMENT

The purpose and long-range objectives of this program are to provide executive direction and general administrative services for the Bureau. Executive direction consists of the services of the Director, two associate directors and secretaries at Washington, D.C. headquarters and a regional director and secretary at each regional office. General administrative services include personnel, budget and finance, property management, and related business management activities.

The 1964 program provides increases for costs of processing punched bookkeeping machine tape and for an internal audit function that is needed to meet requirements of law and an objective of the joint financial management improvement program.

The 1965 program provides increases for more adequate servicing of Bureau programs and specialized assistance in contracting.

The estimates for this appropriation include a net increase of seven authorized permanent positions. This increase is offset by reductions in permanent positions in other appropriations. There is no increase over 1964 in total authorized permanent positions of the Bureau.

There is no substantive language change.

General administative expenses

Appropriation, 1963	$1,292,750
Appropriation, 1964	1,359,000

SUMMARY OF INCREASES AND DECREASES, 1965

Departmental expense:		
Replacement of bookkeeping machine	−$12,000	
To provide for increased pay costs for fiscal year 1964 positions	+8,000	
Improved services	+12,000	
Additional contracting workload	+10,000	
		+18,000
Regional office expense:		
Replacement of bookkeeping machines	−58,000	
To provide for increased pay costs for fiscal year 1964 positions	+17,000	
Improved services	+33,000	
Additional contracting workload	+15,000	
		+7,000
Net increase, 1965		25,000
Budget estimate, 1965		1,384,000

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964		
		Total appropriation	Transfers [1]	Amount available
Departmental expense	$369,506	$401,000		$401,000
Regional office expense	922,592	958,000		958,000
Unobligated balance lapsing	652			
Total	1,292,750	1,359,000		1,359,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

The estimate of $1,384,000 and 151 permanent positions is an increase of $25,000 and 7 permanent positions over 1964. This increase includes $25,000 for increased pay costs. In addition a nonrecurring item of $70,000 for accounting equipment in the 1964 appropriation is needed for other purposes in 1965.

Need for increase

The appropriation increase of $25,000 plus the nonrecurring item of $70,000 provides a total increase of $95,000 and seven permanent positions is needed for the following: $25,000 is needed for increased pay costs for fiscal year 1964 positions. $70,000 and seven permanent positions are needed for program increases consisting of (1) $45,000 and four permanent positions to service more adequately Bureau programs and (2) $25,000 and three permanent positions for specialized assistance in contracting.

(1) *Servicing Bureau programs, $45,000, four permanent positions.*—Bureau programs have increased in number of employees and dollar volume since 1959, the first year of appropriations for a separate Bureau administrative services organization. In that year employees numbered 2,571 and programs amounted to $52,409,000. These figures had climbed to 3,832 employees and $81,620,000 in 1964 and the 1965 estimate is for the same number of employees and $81,881,000. The following ratios of administrative employment and appropriations to total Bureau employment and appropriations are taken from page SFW–119 and indicate that administrative appropriations have barely kept pace with the growth of the Bureau.

Administrative ratio (percent)

Year	Positions	Funds
1959	6.25	2.41
1963	5.25	2.28
1964	4.91	2.17
1965 (estimate)	5.09	2.23

An increase of $45,000 and four permanent positions is needed, in addition to the increases in (2) below, to establish a more adequate position ratio of 5.09 percent and a funds ratio of 2.23 percent in 1965. Aside from these statistics, this increase will provide better administrative support for Bureau programs and contribute much to their effectiveness, efficiency, and economy.

(2) *Specialized assistance in contracting, $25,000; three permanent positions.*—Contracting for supplies, equipment, services, and construction has increased vastly in volume and complexity. In 1959 the first year of appropriations for a separate Bureau administrative services organization, the total dollar value of procurement as reported to the General Services Administration (SF–37) amounted to $6,435,000. In 1963 this figure had climbed to $14,191,000. Most of this volume represents contracts that are advertised, awarded, and administered by the administrative services organization. Aside from the increase in volume, contracts have been increasing in complexity in all phases. Bidders' lists have lengthened with increased interest in Government business. Contract-

ing now involves increased emphasis on such matters as small business set-asides, preference to distressed labor areas, nondiscrimination, safety and Davis-Bacon wage regulations. Disputes, contractor's claims, and findings of fact add to the problems of contract administration. The volume of work has increased to such an extent that additional staff is necessary to properly handle all administrative phases of contracting and thereby protect the Government's interest in getting the best contract performance and value received from the substantial amounts spent on procurement. The estimate is for one GS–11 contract specialist in the procurement sections of two regional offices and the Washington office.

Plan of work

The estimate is for executive direction and general administrative services at the Washington headquarters and regional offices. Executive direction is provided by the Director and two Assistant Directors at Washington and a regional director at each regional office. Executive direction consists of overall management control including internal audit, program coordination and decisionmaking for all organizational units and functions of the Bureau. General administrative services are provided by the Division of Administration consisting of an office of the Assistant Director—Administration and four service branches in Washington and an administrative officer and staff at each regional office. Administrative services consist of inspection of field offices; development, presentation and execution of budgets; making all payments and collecting all amounts due; maintaining payroll, retirement, and leave records; maintaining accounts for control of funds and recording assets, liabilities, and income and expense; preparing financial reports; recruiting, training, placing, classifying, and servicing employees; maintaining administrative and other manuals for Bureau guidance; forms and reports control; organization and staffing studies; centralized mail, filing and communication services; procurement of supplies, equipment and services; contracting for construction; and control of, utilization and disposition of property.

The 1965 estimate of $1,384,000 will provide executive direction and general administrative services to the programs financed by the "Management and investigations of resources," "Construction," "Migratory bird conservation account" (annual definite) appropriations totaling $46,012,000. This is a ratio of 3 percent. Executive direction and general administrative services for programs financed by permanent indefinite appropriations, appropriation transfers and advances and reimbursements are provided for by these funds on the basis of predetermined cost or assessment ratios. These ratios are 4 percent in the case of funds that are available primarily for salaries and expenses and 0.3 percent of funds that are available for other purposes such as land acquisition and payments to States. The total estimate for executive direction and administrative services from these sources in 1965 is $440,000 which added to the $1,384,000 estimate for the "General administrative expenses" appropriation makes a total estimate of $1,824,000. A summary table comparing the total 1965 estimate with 1964 follows:

General administrative services program

[In thousands]

Source of funds	Estimate, 1964	Estimate, 1965	Increase
1. "General administrative expenses" appropriation	$1,359	$1,384	$25
2. Financing from permanent indefinite funds, transfer appropriations and advances and reimbursements	414	440	26
Total general administrative services program	1,773	1,824	51

Following is a table showing the specific sources and details of computation of the 1965 estimate of $440,000 in supplementary financing for general administrative services:

Financing from permanent indefinite funds, transfer appropriations, and advances and reimbursements, 1965

[In thousands]

Appropriation or fund	Total available	Assessable at 4 percent	Assessable at 0.3 percent	Total assessment
Migratory bird conservation account (permanent indefinite)	$4,000	$1,220	$2,780	57.0
Expenses for sales	115			
Federal aid in fish restoration and management	6,000	469	5,531	34.8
Federal aid in wildlife restoration	16,000	1,351	14,649	97.9

1965 REQUESTED BUDGET

Senator BIBLE. Actually, your fiscal year 1965 budget represents an increase of $95,000 over the amount appropriated last year inasmuch as in the last year's budget there was a $70,000 nonrecurring item for replacement of bookkeeping machines.

You propose to use this $70,000 for seven permanent positions, four to service more adequately Bureau programs and three for specialized assistance in contracting.

Please be more specific in describing just why these additional employees are necessary.

Mr. CORBIN. I will answer that, Mr. Chairman. As you have indicated, the net increase is $25,000 which is for pay act costs. We are requesting permission to use the $70,000 that was spent this fiscal year for bookkeeping machines next year for personnel and general expenses.

NEED FOR ADDITIONAL PERSONNEL

The need for this additional personnel partly arises from the increased program that we expect from the budget, the program items in this budget and particularly to service the pesticide program where we intend to do a considerable amount of work by contract.

Senator BIBLE. That is the three?

Mr. CORBIN. That is the contracting officers. In the other areas administrative work is increasing and the programs for fiscal year 1965 are larger and we would anticipate that in one or two of our offices we would need a payroll clerk, a personnel worker or secretary.

We have provided for four additional positions just to carry on the increased program of work that we expect. We expect our administrative work to run about 10 percent higher in 1965 than it was in 1964.

Senator BIBLE. Why would that be a jump under almost identically the same budget?

INCREASE IN RESEARCH, CONTRACTING, AND ADMINISTRATION

Mr. CORBIN. The context of our budget varies a little bit. In 1965 there will be more of the research type of work which will involve, as I said, contracting and the more minute and detailed type of administrative work.

Now, on construction; yes, it is simpler to handle but there is a shift in emphasis.

I might say also that our administrative staff has shown, we believe, to have a rather good record of manpower utilization. In 1959, for example, we had 6 administrative employees for each 100 people employed.

Senator BIBLE. What was that figure again?

Mr. CORBIN. 6.25. In 1965 that will be reduced to five. In 1959 the ratio of our administrative funds to our total program operations was 2.41 percent.

In 1965 it is 2.23. I think it is a fair statement that the administrative work of the Government is getting more complex every year and in behalf of our staff, I think it is fair to state that we have become more efficient. Our records have shown that.

TOTAL ADMINISTRATIVE STAFF

Senator BIBLE. What is your total strength in your general administration? How many men and women are you talking about in your administrative staff?

Mr. CORBIN. 195 in total. Now, that includes the executive staff, our directors and our regional directors as well as our administrative people.

Senator BIBLE. 195?

Mr. CORBIN. That is right.

Senator BIBLE. How many of the 195 are located in Washington and how many in the field?

Mr. CORBIN. There are 57 in Washington and 138 in the field.

Senator BIBLE. You had another thought I think you wanted to add there. You are giving me these percentages.

Mr. CORBIN. Only the general thought, and I believe I did state it before, that I believe it is a correct statement to say, certainly we think so, that our work is becoming more complex and our record does show that we are handling more money and more people with less administrative money in pro rata and less personnel in pro rata during the last 5 years than we ever did before.

RESEARCH REQUIRES MORE PERSONNEL THAN LAND ACQUISITION

Mr. JANZEN. I might mention here also that in this program adjustment we did reduce our land acquisition budget by $2 million. Land acquisition requires a much lower amount of administrative overhead because the major amount of land acquisition costs goes into the actual land purchase costs.

If you replace a part of the land acquisition budget with a research operation, it does require more administrative overhead work generally. Also the mere shifting of program requires more administrative overhead. There is no question about this.

SELECTION OF TYPE OF EMPLOYEE

Senator BIBLE. This question should probably be directed to you as the Director. If the committee should decide only to approve the four employees or the three—the four employees to more adequately staff the Bureau programs or the three for specialized assistance in contracting—which would be more important to the operation of the Bureau of Sports Fisheries?

Mr. CORBIN. If I had to make a choice I would take the four for general administrative work rather than for the specialized contract work.

Senator BIBLE. Do you agree with that?

Mr. JANZEN. Yes; I will accept his word on that because he is responsible for this operation.

Senator BIBLE. Why do you say that? Why do you make that choice?

Mr. CORBIN. I say that on the basis that we can always use generalists. Sometimes generalists can do specialists' work. We would rather have the seven. If we have to get by with the four, I would take the payroll clerk where we need the payroll clerk more than

the contract man. Or we could have the clerk do the payrolls and do some contract assistance, too.

MIGRATORY BIRD CONSERVATION ACCOUNT

Senator BIBLE. The Bureau estimates its needs for acquisition of wet lands for preservation of waterfowl to be $8 million in the direct appropriations for 1965 as compared with $10 million made available in 1964.

In addition, the Bureau expects that $4 million will be available from the sale of migratory bird hunting stamps; which provides a total of $12 million. The justification will be printed in the record at this point.

(The justification referred to follows:)

HIGHLIGHT STATEMENT

The purpose and long-range objectives of this program are to provide over a 7-year period for an acceleration in the acquisition of wet lands for the preservation of waterfowl under the provisions of the act of October 4, 1961 (16 U.S.C. 715k–3–5). Funds provided under this appropriation supplement amounts available from the sale of migratory bird hunting stamps (16 U.S.C. 718).

The appropriation for 1963 initiated the program with $7 million, and with the $3,418,638 available from the sale of hunting stamps, provided a total of $10,418,638 for the acquisition of the following lands:

	Acres
Refuges:	
Fee title	63,253
Leases	13,366
Refuge total	76,619
Waterfowl production areas:	
Fee title	12,554
Easements	12,774
Leases	1,455
Waterfowl production area total	26,783
Fiscal year total	103,402

The program for 1964, consisting of an appropriation of $10 million and $4 million from hunting stamp sales, will provide $14 million for the acquisition of a minimum of 12 new refuge areas and a number of small waterfowl production areas totaling 207,000 acres in critical nesting, migration, and wintering areas.

In 1965 greater emphasis will be put on the acquisition of easements and leases for the waterfowl production area program, and if pending legislation for increased revenues to the States is passed, our acquisition goals for fee title of waterfowl habitat will be reached. With an appropriation of $8 million and $4 million from hunting stamp sales, it is anticipated that a total of 225,000 acres will be acquired.

Advances to migratory bird conservation account, 1965

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
Acquisition of refuges and other areas	$7,000,000	$10,000,000	$8,000,000	−$2,000,000	+$34,000	−$2,034,000

[1] To provide increased pay costs for fiscal year 1964 positions (Public Law 87-793, Oct. 11, 1962).

The estimate for 1965 is $8 million, a decrease of $2 million under 1964 for the wetlands acquisition program.

Plan of work

The estimate of $8 million is needed to continue the expanded wetlands acquisition program authorized by the act of October 4, 1961 (16 U.S.C. 715k-3-5), which provides for the appropriation of not to exceed $105 million for a 7-year period for the acquisition of wetlands and other essential waterfowl habitat.

The items making up the $8 million are as follows:

(a) *Realty costs, $999,500.*—For location, ascertainment, and appraisal of areas and presentation of proposals to the Migratory Bird Conservation Commission; and, following approval of the Commission, negotiation, title verification, title clearance, and other expenses incident to the vesting of title to areas in the United States. There is no increase in permanent positions.

(b) *Engineering costs, $240,000.*—For the location and ascertainment of areas, drafting services, and other costs incident to the preparation of preliminary development plans, outline specifications, estimates, and topographic maps, engineering studies, and water rights investigations and filings, and other costs incident to preparing cases for presentation to the Migratory Bird Conservation

Commission; and, following approval by the Commission, cadastral surveys incident to the vesting of title in the United States. There is no increase in permanent positions.

(c) *Acquisition and rental of areas, $6,760,500.*—For costs of acquisition or rental of areas, including water rights, rights-of-way, easements, removal expenses of occupants, and other direct costs of acquiring the areas or rights therein.

The total estimate of $8 million will be merged with and supplement the $4 million estimate for the migratory bird conservation account from the sale of Federal migratory bird hunting stamps, and will provide a total of $12 million for 1965. This sum will provide for the acquisition of 225,000 acres of land, of which 85,000 acres will be for migratory waterfowl refuges. The remainder of 140,000 acres will be for the waterfowl production area program, with 45,000 acres acquired in fee, and 95,000 acres controlled by easements.

STATUS OF LAND ACQUISITION PROGRAM

Senator BIBLE. The committee will be glad to have such comments as you care to make on this program, and will appreciate your placing in the record your statement of accomplishments for the acquisition of wet lands with funds provided in prior years.

Mr. JANZEN. We will do that.

(The statement referred to follows:)

LAND ACQUISITION GOAL

The goal of the land acquisition program for the preservation of the waterfowl resource is a total of 8 million acres under Federal control. As of now, 3,609,475 acres are under Federal control. It is proposed to acquire, before the end of the 7-year program for which the $105 million loan was authorized, 2,386,796 acres. This leaves for acquisition 2,003,729 acres after fiscal year 1968. Of the total 4,390,525 acres still be be acquired, 3,259,887 acres are to be acquired in fee and easements for 1,130,638 acres.

Since October 4, 1961 (date of approval of the loan fund act), 138,909 acres have been acquired or contracted for in fee, and easements covering 43,986 acres have been purchased. Acquisition progress in fiscal year 1965 is estimated to total 225,000 acres for migratory waterfowl, of which 85,000 acres will be in refuges and 140,000 acres in waterfowl production areas.

Need for Passenger Motor Vehicles and Aircraft

Senator Bible. There will be placed in the record a statement setting forth the need for purchase of passenger motor vehicles and aircraft for the Bureau of Sport Fisheries and Wildlife, and also for the Bureau of Commercial Fisheries.

(The statement referred to follows:)

Passenger Motor Vehicles

The estimates of the Bureau of Sport Fisheries and Wildlife for the fiscal year 1965 contemplate the purchase of 121 passenger motor vehicles, 103 of which are for replacement, as follows:

Type	Replacements	Additions	Total requested
Police-type automobiles	66		66
Standard-type automobiles	26	11	37
Total automobiles	92	11	103
Station wagons	11	7	18
Total	103	18	121

All of the vehicles to be replaced will meet the age and mileage replacement standards, or both. Many will have run over 100,000 miles in hard service. In estimating these requirements, careful consideration has been given to the effective use of the services of interagency motor pools where their locations and equipment permit.

The principal use for the police-type passenger motor vehicles is by U.S. game management agents. Police-type vehicles are necessary to effectively carry out responsibilities for enforcing fish and game laws including the Black Bass Act (16 U.S.C. 851–856); the Bald Eagle Act (16 U.S.C. 668–668d); the Lacey Act (16 U.S.C. 701–2); the Migratory Bird Treaty Act (16 U.S.C. 703–711) and the Criminal Code (18 U.S.C. 41–44). Enforcing these laws involves police-type work of patrol and pursuit and apprehension of law violators. Vehicles used by the Bureau for law enforcement average 30,000 miles per year. Much of this mileage is on unimproved roads and over rough and hazardous terrain. Power is needed to travel in snow or on ice and pull out of mud, sand, and deep ruts. Power is needed to get in and out of areas where violations are likely to occur and for pursuit of violations are likely to occur and for pursuit of violators with rapid acceleration and sustained high speeds. The work often involves using the vehicles to haul cargo or boat trailers which can be done efficiently only with vehicles equipped for heavy duty.

The 11 additions of standard-type motor vehicles are needed primarily for the expanded pesticide research program and for the control of predatory animals and injurious rodents. The 26 replacements are for various Bureau programs and will provide safe and economical transportation in areas not serviced by motor pools.

The 18 station wagons, of which 7 are additions to the fleet, will be used principally by biologists, wildlife refuge managers and predator and rodent control operators for extensive driving, the hauling of personnel, scientific instruments, materials, and field equipment.

General Services Administration standards provide for replacement of passenger motor vehicles every 6 years or 60,000 miles. On an age basis this permits an economical replacement of the entire fleet in 6 years. On a mileage basis economical replacement is every 2 to 4 years. Replacement of vehicles in the number estimated for 1965, will permit maintenance of the fleet on an economical as well as a safe basis in accordance with replacement standards established by General Services Administration.

Classification	Number of cars meeting replacement criteria				Number of replacements requested in 1965			
	Mileage		Age	Total	Mileage		Age	Total
	60,000 to 80,000	80,000 or over			60,000 to 80,000	80,000 or over		
Automobiles	100	20	6	126	77	15	----------	92
Station wagons	32	8	3	43	7	4	----------	11
Total	132	28	9	169	84	19	----------	103
Additions to the fleet:								
Automobiles	----------	----------	----------	----------	----------	----------	----------	11
Station wagons	----------	----------	----------	----------	----------	----------	----------	7
Total vehicles to be purchased	----------	----------	----------	----------	----------	----------	----------	121

AIRCRAFT

The estimates include purchase authority for six new aircraft which are needed for replacement.

One replacement aircraft is needed in Alaska. There are 15 aircraft in Alaska engaged in sport fish and wildlife activities which are used for patrol and transportation of Bureau personnel to widespread areas having no other access. These aircraft are piloted by U.S. game management agents, biologists, refuge managers, predator control operators, and in a few instances by pilot-mechanics. Operations are largely in isolated areas where transportation facilities and roads are inadequate, making it necessary to rely on aircraft and boats. The nature of the work is such that good equipment is necessary in the interest of safety.

The five replacement aircraft for use in the contiguous 48 States are needed as follows: Three for use in enforcement activities in the Middle West, one for use in wildlife refuge activities, and one for river basin studies. Aircraft in the 48 States are used for waterfowl surveys; law enforcement; refuge management including plant control, seeding of waterfowl feeds, and crop depredation control work; and predator control.

No aircraft are used to transport personnel as a primary function.

Aircraft to be purchased:	
Number	(6)
Gross cost	$122,500
Aircraft to be exchanged:	
Number	(6)
Allowance	$18,500
Net cost	$104,000
Old aircraft still to be used	28

JUSTIFICATION FOR PASSENGER MOTOR VEHICLE REQUIREMENTS

The estimates for the Bureau of Commercial Fisheries for the fiscal year 1965 contemplate the purchase of 26 passenger motor vehicles. Twenty-one of the vehicles are for replacement, and five will be for addition to the fleet. All of the vehicles to be replaced will have met replacement standards.

Fourteen passenger cars and seven station wagons will be replacements. Eight of the 14 cars are for use by statistical agents in collecting fishery statistics; 2 are for use by field biologists engaged in conducting research programs in the Southeast; 1 is for use in the market development program being conducted in the Great Lakes region; 1 is for the conduct of field inspections in Alaska; and the remaining 2 are for law enforcement activities in the Pacific Northwest. Police-type vehicles are required for the enforcement function.

The seven station wagon replacements are to be used by field personnel engaged in the conduct of biological investigations. Vehicles of this type are necessary for transportation of field equipment and supplies.

The five additional vehicles required as passenger cars that are needed for the use of field personnel engaged in the Bureau's expanded pesticides research programs.

Classification	Number of cars meeting replacement criteria				Number of replacements requested in 1965			
	Mileage		Age	Total	Mileage		Age	Total
	60,000 to 80,000	80,000 and over			60,000 to 80,000	80,000 and over		
Automobiles	19	11	13	43	3	6	5	14
Station wagons	9	3	5	17	2	3	2	7
Total	28	14	18	60	5	9	7	21
New automobiles to be purchased								5
Total vehicles to be purchased								26

IZEMBEK NATIONAL WILDLIFE RANGE

Senator BIBLE. Senator Bartlett has suggested these questions. What facilities are now on Izembek National Wildlife Range?

Mr. PARKER. Actually there are no facilities on Izembek. The building that is proposed to house the individual that is set up in the 1965 budget actually will be located at the Aleutian Refuge.

In effect, there are no facilities on Izembek.

Senator BIBLE. Have any funds been expended on Izembek?

MANAGEMENT AND OPERATIONS

Mr. PARKER. No. The 1965 budget is the first time we are asking for any money for Izembek. This is a management and operations item.

Senator BIBLE. Why is there a need this year for operation and maintenance funds in view of the action of Congress, specifically declining heretofore to make money available for this range?

PREVIOUS DENIAL OF FUNDS

Mr. PARKER. At that time we had put money in for the Arctic and for the Izembek Refuges. I think probably some of the concern was over the objection of the State fish and game department to the implementation of management on the Arctic and Izembek.

Probably less on Izembek than the Arctic. The reason we feel that we should get in operation on it is that it is a very valuable concentration ground for waterfowl.

It has large extensive beds of eelgrass and is a gathering place for the Pacific brant. Unless we have somebody watching things, this area will go to pot particularly with the interest there is in oil exploration, and so on, in that general area.

OPPOSITION OF ALASKA STATE FISH AND GAME COMMISSION

Senator BIBLE. If I understand you correctly, it was denied before because of opposition from the Fish and Game Commission of the State of Alaska.

Mr. PARKER. They had expressed concern. It was established from public domain lands.

Senator BIBLE. I am given to understand that the State government at that time opposed the use of this money to start on this particular project. What is the present attitude of either the Governor or the other authorities in Alaska?

Mr. PARKER. At the moment I am unable to say just exactly what their reaction is. As I said earlier, the impression I have is that they had less objection to Izembek than they did have to the Arctic.

Senator BIBLE. You don't know whether they do or do not object to Izembek at the present time?

Mr. PARKER. I can't answer that; no.

Senator BIBLE. If you have any information that is of value to the committee in case this point is brought up, please supply it for the record. Senator Bartlett was quite concerned.

Mr. PARKER. Right. May I make one correction in my statement? I have been advised there are two field camp buildings located on Izembek. I indicated earlier there were none.

FEDERAL EXPENDITURES

Senator BIBLE. The answer is that you have two field camps there. How much money has been expended by the Federal Government on Izembek?

Mr. PARKER. These were surplus buildings that we inherited from the Air Force. We have never spent any money.

Senator BIBLE. No money was spent there, although there are two field camps at the present time.

Mr. PARKER. That is right.

Senator BIBLE. They are Army surplus and you inherited them?

Mr. PARKER. Yes.

(The statement referred to follows:)

ESTABLISHMENT AND INFORMATION

The Izembek Refuge was established by the President in 1960, pursuant to Executive Order 10355, published in Federal Register Document 60-11521, December 8, 1960.

The Alaska Department of Fish and Game has approved the operational program for Izembek as evidenced by a telegram received February 28, 1964, as follows:

"DANIEL H. JANZEN,
"*Director, Bureau of Sport Fisheries and Wildlife,*
"*Washington, D.C.:*

"Have reviewed proposed 1965 budget of $50,000 for Izembek Refuge with Mr. Woolford. The State has no objection to this program.

"WALTER KIRKNESS,
"*Commissioner, Alaska Department of Fish and Game.*"

The Izembek Refuge, though established in 1960, has not yet been staffed or provided with an operation and maintenance fund. Limited custodial work has been carried out by personnel of the Aleutian Islands Refuge. No funds have been provided.

The $50,000 requested in fiscal year 1965 will be spent approximately as follows:

Road and trail maintenance	$7,000
Boundary posting, 152 miles	5,000
Maintenance of two buildings	1,000
Management of 177,000 acres of grasslands, 138,000 acres of marsh and water, and 100,000 acres of tundra	14,000
Enforcement on 415,000 acres	12,000
Maintenance of two camping areas	1,000
Wildlife survey and censuses	10,000
Total	50,000

Senator BIBLE. Are there further questions?

Thank you, gentlemen, we will stand in recess until 10 o'clock tomorrow morning for the Forest Service presentation.

(Whereupon, at 3:50 p.m., Thursday, February 27, 1964, the subcommittee recessed, to reconvene at 10 a.m., Friday, February 28, 1964.)

DEPARTMENT OF INTERIOR APPROPRIATIONS FOR 1965

FRIDAY, FEBRUARY 28, 1964

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met at 10 a.m., pursuant to recess, in room 1223, the New Senate Office Building, Hon. Carl Hayden (chairman) presiding.

Present: Chairman Hayden, Senators Bible, Byrd, Mundt, Young.
Also present: Senator Stennis.

DEPARTMENT OF AGRICULTURE

FOREST SERVICE

STATEMENT OF HON. JOHN STENNIS, A U.S. SENATOR FROM THE STATE OF MISSISSIPPI

FOREST SOIL AND HYDROLOGY LABORATORY, OXFORD, MISS.

Chairman HAYDEN. The committee will be in order. Senator Stennis.

Senator STENNIS. Thank you very much, Mr. Chairman. We have a cotton bill on the floor for debate today, and you know, with one Senator from Mississippi and one from Arizona, when you say cotton, you had better be on the job, so I will only take a few minutes of the subcommittee's time.

I did want to appear here this morning and express an interest in this program and some additional level of research for our forest insect and disease study at the Southern Hardwood Laboratory at Stoneville, Miss.

I have a few questions to be propounded to Dr. Harper. And, if I may, I would like to leave them with your clerk, Mr. Eaton, and he could ask them of Dr. Harper when he comes on.

And the same thing will apply to a laboratory working in research on wood-destroying pests and diseases, which is located at Gulfport, Miss. It is housed there with the Genetics Laboratory, and they urgently need a few extra funds this year. I find that the Armed Forces Pest Control Board is deeply interested in this project, Mr. Chairman. I am going to get some statement from them on the preservation of wood. Also, the Southern Pine Industry Committee has filed a statement with me which I would like to give you, if I may.

And I have, too, a special interest in possible installation of a forestry hydrology laboratory at Oxford, Miss., which I have discussed with the subcommittee before. If I may, I would like to have

29-120—64——58

my statement in the record that I have on that, and I also have some questions for Dr. Harper to answer through Mr. Eaton, please.

And I thank the Chairman very much. If I may come back when you have your other witnesses, I can go into some other points. Thank you kindly.

Chairman HAYDEN. Your statement and that of the Southern Pine Industry Committee will be included in the record.

(The statements referred to follow:)

IN SUPPORT OF THE FOREST SOIL AND HYDROLOGY LABORATORY, OXFORD, MISS.

Mr. Chairman, the Nation is becoming more and more aware of the pressures that modern living is putting on our water supplies. Not only do we have increasing demands from an increasing population for water, but the needs per capita are increasing also. The problem is becoming more pressing in all localities, but its nature differs depending on climate, on soils, and on the impact that use has on the land. Quality of the water supply may be as important as its volume.

In the South we have abundant rainfall as compared with some other parts of the country. An annual fall of 40 to 60 inches in the coastal plain supplies surface and ground water in large quantity. Adequate water supplies have been one of the reasons for industrial expansion in our region. But the very abundance of rainfall sometimes creates serious problems of excessive storm runoff and erosion that continue to damage our soil resource and impair the quality of the water supply. We need the abundance of water, but we also need greater protection of our watersheds to stabilize soils and improve water quality.

Some patterns of agricultural use in the Southern Coastal Plain during the past 100 years have left millions of acres depleted beyond further use for crops or pasture. Unprotected soil has washed away from the fields and silted channels downstream. A 4-million-acre area in northern Mississippi is an example. It is estimated that 100 million tons of soil move downstream from the area each year. Some gullies are eroding at the rate of 300 tons per acre annually. Flooding and deposition of sterile sand occur on 65 percent of bottomland fields each year. The threat to bridges and other improvements with each large storm adds to the problem.

One of the most promising methods of stabilizing eroded lands is through reforestation. We know that forested lands have a critical role to play in the safeguarding of the volume and quality of downstream water supplies. The water problem in a large segment of the coastal plain is thus a forest management problem aimed at learning how to fix the soil in place and improve the amount and quality of the water.

Forests affect water supplies by catching rainfall in the crowns, by mechanically holding soil in place with tree roots, and by providing a mulch of leaves or pine needles to allow moisture to infiltrate rapidly into the soil. The use of water by the trees themselves is of importance, also. Each of these processes needs to be fully understood in the variety of forest and soil combinations that are found in the Southern Coastal Plain, if we are to develop and maintain adequate water supplies. Something is known but much remains to be found out about the effects on runoff, erosion and ground water recharge, of tree species, stand density, timing of successive timber harvests, logging techniques, and other aspects of multiple-use management.

Some work on this problem is underway now in the woods and fields at Oxford, Miss. Scientists are adding to the information available to landowners and the application of results can be observed on a considerable acreage. But a forest hydrology laboratory and related auxiliary facilities are urgently needed at Oxford to provide the necessary space and equipment for the watershed research program underway. A laboratory, greenhouse, and service building would enable scientists to move ahead faster and with greater economy in manpower than is now possible in the crowded, outmoded facilities available.

The existing program would be greatly accelerated if this modest, well-equipped laboratory were available so the scientists could employ the latest time-saving research techniques. Laboratory facilities are needed to learn more about the fundamental principles governing storm runoff, erosion, and sedimentation from forested watersheds. These facilities are needed to determine forest soil properties and their relationship to trees and other vegetation they support. No other forest watershed laboratory of this type is planned for the southern coastal plain.

The laboratory and auxiliary facilities are estimated to cost $450,000. They would immediately increase the effectiveness of the present research. A building site has been provided by local interests, at a nominal cost to the Forest Service, and it is at an excellent location where cooperation with university and other programs will be more effective.

I strongly urge the committee to give this project its closest consideration so that this vital research in the field of forest hydrology can move ahead at a rapid pace.

SOUTHERN PINE INDUSTRY COMMITTEE,
Philadelphia, Miss., February 21, 1964.

Senator JOHN C. STENNIS,
Senate Office Building,
Washington, D.C.

DEAR SENATOR STENNIS: We understand that the Armed Forces Pest Control Board has expressed an urgent need for stepped-up research in the protection of wood in use from insects and disease. To give wooden docks, buildings, and other structures in use throughout the world by the Armed Forces a longer life would result in substantial savings in the Federal budget. It is such areas of saving, apparently, that the President has in mind in his current drive for economy in Government operations.

Since you will no doubt learn of this need by the military through your committee responsibilities in the U.S. Senate, we wish to add a word regarding the value of such research to the civilian economy. Products competitive to wood have thrived on one important selling point—their so-called permanence. Metals, masonry, and plastics all claim a service life superior to that of wood. No single field of research can be more important to the future stability of the wood industry than that leading to increasing the service life of wood products sufficiently to offset the claims of competitors.

The two research projects currently active in the South on the protection of wood in use are conducted by the U.S. Forest Service at Gulfport, Miss. One is concerned with the biology and control of insects attacking wood and the wood products in storage and in use. One important example is subterranean termites.

The other project is working toward the protection of wood from decay.

Both these projects have contributed notably to the needs of the Armed Forces and the construction and housing agencies in the past. Both, however, have inadequate staffs at present to meet the increasing needs for protecting wood in use. Military and civilian requirements taken together provide, in our opinion, ample justification for strengthening this research as soon as possible.

Any action you may take to help secure necessary appropriations for these projects to the level considered desirable by the military, will be appreciated by this industrywide committee which represents all southern lumber producers on matters of this kind. It will aid the Nation's forest industry and, in turn, boost the economy of Mississippi and the South by promoting fuller use of our tremendous forest resources.

Kind personal regards.

Sincerely yours,

TOM DEWEESE, *SPIC Chairman, for Mississippi.*

RESPONSES TO QUESTIONS BY SENATOR STENNIS

FOREST HYDROLOGY LABORATORY, OXFORD, MISS.

Question. At the appropriations hearings for fiscal year 1964, the need for a Forest Hydrology Laboratory at Oxford, Miss., was discussed. This is a project in which I am very interested, and I would appreciate your outlining the nature of the research program this laboratory would house.

Answer. The research program at Oxford, Miss., is concerned with two broad problems of major importance to the management of forest land watersheds of the upper and lower coastal plain areas of the South. One of the problems is the development of efficient and economical methods of rehabilitating seriously eroded areas through reestablishment of forest stands and supplementary measures to arrest the erosion and heal gullies; and further to develop effective forest management guides to provide for use of rehabilitated areas for timber production, wildlife habitat, and recreation without starting a new cycle of progressive de-

terioration. The other problem is concerned with how best to manage the timber and other surface resources and uses so as to provide for effective recharge of ground water supplies and to promote regulated yields of good quality water.

Studies of these factors of watershed management under controlled conditions which this laboratory, equipped with modern scientific facilities, would house will provide a more rapid and sounder advance toward solution of the problems outlined. Currently, Forest Service research scientists are housed in university space which is crowded and inadequately equipped with makeshift laboratory facilities.

Question. What are the estimated costs for construction of this laboratory?

Answer. The estimated cost for construction of this laboratory is $450,000.

Question. I understand this estimated cost is exclusive of the building site due to the fact that the necessary land has already been contributed to the Forest Service by local interests. Is this correct?

Answer. The cost is exclusive of the building site. The site was made available to the Forest Service by local interests at a nominal cost.

Insect and Disease Research, Gulfport, Miss.

Question. What is the status of forestry research at Gulfport, Miss., dealing with the problem of insects and diseases that damage or destroy wood used in structures of various kinds?

Answer. The status of research on problems of insects and diseases that damage or destroy wood used in structures is that present efforts deal primarily with improvement of chemical methods of treating soil to protect foundation structures and other parts of buildings from termites. Some research is also underway on protecting wood against the more common rots by brush-on or short-soak, preservative treatments. Other research also deals with problems of protecting tool handles, floors, and other wood from insect borers.

Progress is being made in developing effective and economical treatments to safeguard wood from damage but there are many problems involved on which the program of research at Gulfport, Miss., has not been able as yet to undertake adequately. Logs, pulpwood, lumber in storage, as well as finished structures and items made from wood are subject to attack, by many species of destructive pests, including termites. The Gulfport wood protection laboratory is the only facility of the Forest Service engaged exclusively in research on insects and diseases attacking wood structures and other wood or wood products. This laboratory is located in the heart of the serious problems which, generally speaking, are most acute throughout a humid belt extending across the southern part of the United States.

Question. What is the financing of the current program and what additional funds could be effectively used in fiscal year 1965?

Answer. Approximately $90,000 is provided in the fiscal year 1965 budget estimate for this work. Our plans call for strengthening of this work and an additional $200,000 when the financial situation permits augmenting the budget for this work. These additional funds could be effectively used as soon as they can feasibly be made available. The present laboratory facilities at Gulfport are adequate for the program.

Question. I understand that the Armed Forces Pest Control Board is deeply interested in speeding up this research due to the annual costs of controlling these insects and diseases as well as the costs of repairing structural damage to the various facilities of the Defense Department. Can you provide us with information as to the extent of the costs to the Government?

Answer. The Armed Forces Pest Control Board has estimated that each year the military agencies spend $1,500,000 for control of wood destroying insects. In addition, the Board estimates that much more than this amount is spent each year by the military agencies for repair of structural damage caused by insect or disease pests.

According to the Armed Forces Pest Control Board the military agencies of the United States have under their management buildings and other structures, built wholly or in part of wood, worth approximately $25 to $30 billion today on the basis of probable replacement costs. These structures are distributed widely in geographic areas representing almost every major type of climate and soil. The wooden components of these structures, which represent more than half of their total value, are subject to attack by wood destroying pests. The Armed Forces Pest Control Board meets annually with representatives of the Department of Agriculture for the purpose of reviewing those portions of the Department of

Agriculture research program conducted for the Armed Forces. The Armed Forces depend upon the Forest Service for research on wood damaging and destroying insects and fungi and for recommendations regarding their control. Many of the problems of the military agencies in controlling these wood pests are similar in nature to the problems of civilian agencies, homeowners, and wood industries. The magnitude of costs involved in the civilian economy in dealing with control of wood pests and repair of damage is of course much greater than that of the military agencies. Research of the Forest Service is aimed at effective control measures and reduced costs.

INSECT AND DISEASE STUDIES, STONEVILLE, MISS.

Question. What is the present program at the Southern Hardwood Laboratory at Stoneville, Miss., in insect and disease research?

Answer. The present program is primarily on problems of the many borers that attack hardwood timber trees and on diseases of hardwood trees such as cankers and heartrots. We have approximately $70,000 in the fiscal year 1965 budget for this work, of which $30,000 is for forest insect research and $40,000 for forest disease research. In the insect research, a powerful female attractant has been discovered for use against the carpenter worm moth—one of the serious damaging insects to hardwood timber which degrades its use for lumber. Other insect research deals with insects that attack hybrid cottonwood cuttings in the early year of growth by controlling them through systemic chemicals. Cottonwood trees developed in our silvicultural research are rapid growing and promising for planting purposes. The control measures for the insects attacking these young trees look very promising. In the disease research some progress is being made in determining the causes and in developing silvicultural control measures for cankers and heartrots.

The forest insects and diseases in the southern hardwood region served by the Stoneville Hardwoods Laboratory cause considerable damage throughout the 45 million acres of hardwood forests in the Mississippi River Delta and similar sites of the South. Trunk-boring insects and bark-scarring insects attack living hardwood trees and cause defects in the wood which seriously degrade and lower the value of products cut from them. Outbreaks of hardwood defoliators have caused excessive mortality and reduced growth over some 3 million acres in the past decade. Heartrots, cankers, diebacks, and wilts in the forest disease category have caused an estimated loss of some 500 million cubic feet of wood, largely in sawtimber-size trees.

Question. What additional amount would be needed to bring the level of this research up to a point where adequate attack could be made on the most pressing problems?

Answer. I would estimate about $60,000 additional would strengthen this research and provide a reasonably balanced attack on the most pressing problems. As soon as the budget situation and priorities of problems permit, we plan to strengthen this program to this extent. Ultimately more may be required depending upon progress of the research.

DEPARTMENT OF AGRICULTURE

Forest Service

STATEMENTS OF JOHN A. BAKER, ASSISTANT SECRETARY OF AGRICULTURE; E. P. CLIFF, CHIEF, FOREST SERVICE; C. W. HENDEE, DEPUTY CHIEF, FOREST SERVICE; V. L. HARPER, DEPUTY CHIEF, FOREST SERVICE; A. W. GREELEY, DEPUTY CHIEF, FOREST SERVICE; M. M. NELSON, DEPUTY CHIEF, FOREST SERVICE; G. M. JEMISON, ASSOCIATE DEPUTY CHIEF, FOREST SERVICE; E. W. SCHULTZ, ASSOCIATE DEPUTY CHIEF, FOREST SERVICE; B. H. PAYNE, ASSOCIATE DEPUTY CHIEF, FOREST SERVICE; G. D. FOX, ASSOCIATE DEPUTY CHIEF, FOREST SERVICE; A. R. SPILLERS, ASSOCIATE DEPUTY CHIEF, FOREST SERVICE; H. B. MACK, BUDGET OFFICER, FOREST SERVICE; AND HARRY B. WIRIN, DEPUTY DIRECTOR OF FINANCE, DEPARTMENT OF AGRICULTURE.

1965 Budget Request

Chairman Hayden. The budget for consideration this morning is that of the Forest Service for fiscal year 1965. I will place in the record a "purpose" statement supplied by the Forest Service with its budget estimate. There also will be included a summary of estimated appropriations and receipts for fiscal year 1964. The appropriation request is $17,170,000 greater than the amount appropriated in fiscal year 1964.

(The statements referred to follow:)

Purpose Statement

The Forest Service is responsible for promoting the conservation and wise use of the country's forest and related watershed lands, which comprise one-third of the total land area of the United States. To meet its responsibility the Forest Service engages in three main lines of work, as follows:

MANAGEMENT, PROTECTION, AND DEVELOPMENT OF THE NATIONAL FORESTS AND NATIONAL GRASSLANDS

The 186 million acres of national forests and national grasslands are managed under multiple use and for sustained yield. Under these principles natural resources of outdoor recreation, range, timber, watershed, and wildlife are utilized in a planned combination that will best meet the needs of the Nation without impairing the productivity of the land. These management and utilization principles were recognized in the Multiple Use-Sustained Yield Act of June 12, 1960 (Public Law 86-517, 74 Stat. 215).

In managing the national forests, technical forestry is applied to the growing and harvesting of timber crops. Grazing use is managed to obtain proper range conservation along with utilization of the annual growth of forage. Watersheds are managed to regulate streamflow, prevent floods, and provide water for power, irrigation, navigation, and municipalities. Management includes the handling of 125 million visits of people to the national forests for recreation purposes. Wildlife habitat is managed to provide a suitable land and water environment for both game and nongame wildlife.

Under the multiple-use principles most areas are used for, or serve, more than one purpose or objective. For example, about 50 percent of the area within the national forests serves five different purposes: (1) Timber production, (2) watershed protection, (3) forage production, (4) wildlife production, and (5) recreation. An additional 28 percent serves four purposes in varying combinations. Of the remainder, 21 percent of the total serves three purposes with only 1 percent of the total reserved exclusively for a single purpose; mainly, campgrounds and special-use areas, such as summer homesites, pastures, corrals, etc. The varied interests which frequently conflict and which must be reconciled, and the vast areas covered,

clearly require careful planning and skillful management of the national forest properties.

Gross area within unit boundaries encompasses about 226 million acres in 44 States and Puerto Rico, of which some 186 million acres are under Forest Service administration. Protection from fire and trespass is made difficult by the large area to be protected, the general inaccessability, the many thousands of miles of exterior boundary, the intermingled public and private land, the impossibility of taking preventive action with such a problem as lightning-caused fires, and the rapidly increasing public utilization of these lands and their associated resources.

The protection of the national forests includes the control of forest fires, the control of tree disease and insect epidemics, and the prevention of trespass.

The major development activities of the national forests are reforestation; timber stand improvement; revegetation; construction of roads, recreational facilities, range and other necessary improvements; and land acquisition and exchanges.

The economic importance of the national forests and national grasslands is evident when it is considered that—

(*a*) They produced a cash income in the fiscal year 1963 of over $126 million. The following table summarizes cash receipts, showing actual for fiscal years 1962 and 1963, and estimated for fiscal years 1964 and 1965:

Class of receipts	1962 actual	1963 actual	1964 estimated	1965 estimated
Timber sales	$106,158,478	$117,387,497	$121,000,000	$123,200,000
Grazing	3,196,128	3,385,978	3,500,000	3,600,000
Land uses	3,306,433	3,738,160	4,000,000	4,300,000
National grasslands	1,512,929	1,712,565	1,750,000	1,800,000
Total receipts	114,173,968	126,224,200	130,250,000	132,900,000
Above amounts include: Suspense account, Alaska [1]	(633,861)	(820,828)	(900,000)	(900,000)
Suspense account, Oregon and California lands [2]	(3,548,809)	(4,341,916)	(4,000,000)	(4,000,000)

[1] Account established pending settlement of Indian rights on Tongass National Forest, Alaska.
[2] Account established for Oregon and California railroad grant lands, for which receipts are transferred to Department of the Interior for distribution under the acts of Aug. 28, 1937, June 24, 1954, and Aug. 3, 1961 (43 U.S.C. 1181f-g).

Approximately 65 percent of this amount is credited to the general fund in the Federal Treasury (miscellaneous receipts). The remainder is distributed in accordance with special acts of Congress, including 25 percent to the States or counties in which lands are located, and 10 percent made available for construction and maintenance of the Forest Service system of roads and trails. In addition to these cash receipts, there are the even greater economic values which result from the processing of end products derived from this utilization of national forest timber, forage, minerals, etc. There are also the important values of water, recreation, and wildlife which cannot be readily expressed in monetary terms.

(*b*) The area within national forest boundaries is equivalent to some 10 percent of the area of the continental United States Over 40 percent of this land is within areas now experiencing severe economic distress. Proper management, development, and utilization of these lands are important factors in permanent improvement of these local economies. Millions of people who live in and near the national forests are supported in whole or in part through the economic development arising from the forests and their resources.

(*c*) The national forests supplied 10 billion board feet of timber in fiscal years 1963 to the Nation's forest products industries. This is expected to increase to 11 billion board feet in 1964. Dependence of the forest products industries on national forest timber continues to increase as the result of depletion of good quality timber on private lands.

(*d*) About 6 million head of domestic livestock (including calves and lambs) are grazed on the national forests and grasslands.

(*e*) These lands provide protection to municipal water supplies for nearly all western cities and towns and many in the East, to irrigation water used on about 20 million acres of western lands, and to many streams with waterpower developments. They provide flood protection to thousands of acres of rich valley lands and help to prevent more rapid siltation of reservoirs and stream channels.

(*f*) They provide a habitat for a large part of the big game animal population for birds, for millions of small game animals and furbearers, and for fish.

(*g*) They provide opportunities for healthful outdoor recreation, with a minimum of restrictions, for millions of people who yearly visit the national forests.

FORESTRY RESEARCH

The Forest Service conducts research in the entire field of forestry and the management of forest and related ranges. This includes the growth and harvesting of timber, its protection from fire, insects, and diseases, the protection and management of watersheds, and improved methods for development and management of recreation resources. It conducts studies in forest economics, marketing of forest products, and a survey of the present extent and potential growth and use of the Nation's forest resources. It also conducts research to develop new and improved products from wood, to increase efficiency of utilizing forest products, and to advance the efficiency and mechanization of forestry operations. Results of research are made available to owners of private forest and rangelands to public agencies which administer such lands, to forest products industries, and to consumers. The program has a two-fold objective: (1) To backstop the national forest development program by devising more efficient practices for protecting, managing, and utilizing forest resources; and (2) to develop new and improved practices that will lead to sounder uses of forests in other public and private ownerships and more efficient and profitable utilization and marketing of forest products.

The Forest Service also cooperates with the Agricultural Research Service of the Department by reviewing and appraising for technical adequacy forest research projects beneficial to the United States which are conducted abroad. These projects are carried out with foreign currencies under section 104(k) of Public Law 480, as amended, and the dollar expenses of the Forest Service in connection with this work are paid from the appropriation "Forest Protection and Utilization."

COOPERATION WITH STATE AND PRIVATE FOREST LANDOWNERS

The Forest Service cooperates with State agencies and private forest owners to (*a*) better protect the 440 million acres of State and privately owned forests and critical watersheds against fire, insects, and diseases; (*b*) encourage better forest practices, both for resource conservation and profit, on the 358 million acres of private forest land; (*c*) aid in the distribution of planting stock for forests, shelterbelts, and wood lots; (*d*) stimulate development and proper management of State, county, and community forests.

The Forest Service is also responsible for carrying out the provisions of section 401 of the Agricultural Act of 1956 (16 U.S.C. 568c), by providing assistance to the State forester or equivalent State official, through advice, technical assistance, and financial contributions for increased tree planting and reforestation work, in accordance with plans submitted by the State and approved by the Secretary of Agriculture.

Proper administration, protection, and development of these forest resources is essential as they must be so managed as to yield the maximum resource potential. In many rural areas, the forestry resource is the key to the establishment and maintenance of sound local economies. The State and private forestry programs of the Forest Service are a vital part of the Department of Agriculture's overall rural area development program.

Other work related to forestry includes:

INSECT AND DISEASE CONTROL

Activities to suppress and control destructive insects and diseases that threaten timber areas include two types of work carried on jointly by Federal, State, and private agencies: (*a*) Surveys on forest lands to detect and evaluate infestations of forest insects and infections of tree diseases and determination of protective measures to be taken, and (*b*) control operations to suppress or eradicate forest insects and diseases, including white pine blister rust.

FLOOD PREVENTION AND WATERSHED PROTECTION

On national forest lands and on non-Federal forest lands within the watersheds authorized for treatment by the Department of Agriculture under the Flood Control Act of December 22, 1944, the Forest Service plans and installs watershed improvement measures, in the form of minor physical structures, cultural measures, and intensified fire control, to retard runoff and reduce floodwater and sedi-

ment damage. Work on non-Federal land is carried on in cooperation with the Soil Conservation Service and the appropriate State and local agencies.

The Forest Service also cooperates with the Soil Conservation Service, appropriate State agencies, and the local organizations sponsoring small watershed protection and flood prevention projects initiated under the Watershed Protection and Flood Prevention Act of 1954, as amended, in planning and installing forestry and related measures on the watersheds and in interagency studies of proposed water and land resource developments on river basins for the purpose of obtaining integrated resource development programs.

WORK PERFORMED FOR OTHERS

The Forest Service is frequently called upon to perform services for other Federal, State, or private agencies on a reimbursable or advance payment basis. Examples of these activities are—

(*a*) Protection of other Federal and non-Federal forest lands intermingled with the national forests.

(*b*) Disposal of slash resulting from sales of timber and the rehabilitation of such areas.

(*c*) Construction and maintenance of roads, and other improvements.

(*d*) Research investigations in forest, range, and water management and utilization problems.

(*e*) Cooperative survey, mapping, administrative, and reforestation projects, etc.

(*f*) Cooperation with defense and mobilization agencies on forest production and utilization projects, and related work.

RURAL FIRE DEFENSE

The Forest Service, as a part of its regular programs, also directs Federal activities and provides technical guidance and training to States concerned with the prevention and control of fires which might be caused by an enemy attack in rural areas of the United States.

The Forest Service maintains its central office in Washington, with program activities decentralized to 10 regional offices, 129 forest supervisors' offices, 801 district rangers' offices, 10 forest and range experiment stations, the Institute of Tropical Forestry, and the Forest Products Laboratory.

Summary of estimated appropriations and receipts, 1964 and 1965

Item	1964	Budget estimates, 1965	Increase (+) or decrease (−)
Appropriations:			
Forest protection and utilization:			
Forest land management	[1] $146,834,000	$150,419,000	+$3,585,000
Forest research	25,853,000	29,944,000	+4,091,000
State and private forestry cooperation	15,917,000	16,955,000	+1,038,000
Total, forest protection and utilization	[2] 188,604,000	197,318,000	+8,714,000
Forest roads and trails	[1] 63,200,000	72,300,000	+9,100,000
Acquisition of lands for national forests, special acts	70,000	70,000	
Acquisition of lands for Wasatch National Forest	250,000	150,000	−100,000
Cooperative range improvements	700,000	700,000	
Assistance to States for tree planting	[1] 1,000,000	1,000,000	
Expenses, brush disposal (permanent)	9,000,000	9,200,000	+200,000
Roads and trails for States (permanent)	12,000,882	12,400,000	+399,118
Forest fire prevention (permanent)	[1] 45,000	25,000	−20,000
Restoration of forest lands and improvements (permanent)	[1] 100,000	100,000	
Payment to Minnesota (permanent)	130,986	133,000	+2,014
Payments to counties, national grasslands (permanent)	437,500	450,000	+12,500
Payments to school funds, Arizona and New Mexico (permanent)	100,413	110,000	+9,587
Payments to States, national forests fund (permanent)	29,993,959	31,100,000	+1,106,041
Total	305,632,740	325,056,000	+19,423,260
Deduct permanent appropriations (shown in detail above)	51,808,740	53,518,000	1,709,260
Total (excluding permanent appropriations)	253,824,000	271,538,000	17,714,000
Receipts: Forest resource utilization	130,250,000	132,900,000	+2,650,000

[1] In addition, prior year balances are available.

[2] Exclusive of $123,000 transferred to General Services Administration and $421,000 transferred to the Office of the Inspector General, Department of Agriculture.

CHAIRMAN HAYDEN. If you have a statement on the overall program of the Forest Service, the committee will be glad to hear it at this time.

Mr. BAKER. Mr. Chairman, I have a brief statement, yes, sir. I will read it, if I may, sir.

Chairman HAYDEN. You may insert it in the record or read it.

STATEMENT OF MR. JOHN A. BAKER, ASSISTANT SECRETARY OF AGRICULTURE

Mr. BAKER. Thank you, Mr. Chairman.

We are pleased to have this opportunity to review with you the programs of work planned for the Forest Service for fiscal year 1965. During the past 3 years excellent progress has been made in keeping pace with our forest conservation needs. The financing you have provided through regular appropriations, and the program benefits derived from the Accelerated Public Works program, have been effectively used. Your continued support of our forest conservation effort is greatly appreciated.

This has been a very difficult budget to develop because of the need to coordinate the urgency for accelerating forestry conservation activities with the administration's direction to hold the Federal budget to the minimum and for reduction of Federal employment.

One of the President's primary concerns is the seriousness of the poverty situation that currently exists in many sections of our country. We in the Department of Agriculture share this concern since much of this poverty is in rural communities.

FORESTED LAND AREA

Over one-third of the total land area of the United States is forested. These lands have a great natural resource potential if they are adequately protected and properly managed. They can produce the timber, forest recreation, water, wildlife, and livestock forage that will be needed to support our expanding population requirements. These resources can provide for the industrial development, forest land uses, and jobs that are so necessary for an improved and stable economy. However, these benefits won't just happen.

FOREST CONSERVATION PROGRAMS

Positive action must be taken to assure that forest conservation programs for both publicly and privately owned lands are aggressive, timely, and adequate. These resources can be the key to economic stability in many of these critical rural areas, particularly those that have the greatest incidents of poverty, Mr. Chairman.

The 1965 budget request provides for only modest increases in the highest priority items. However, it is a strong budget as it assures continued progress in all major program responsibilities. The increases for reforestation, recreation, and road construction represent what we feel are the highest priority needs for management of the national forests.

Provision has been made for some intensification of fire protection for State and privately owned lands to reduce fire losses. Since much of the privately owned forest land will not be adequately managed and utilized without additional technical forestry assistance,

the programs for providing assistance to small forest landowners and the forest products industry are being expanded.

Forest Products Laboratory, Madison, Wis.

One of the most significant items in this budget is the construction of the addition to the Forest Products Laboratory at Madison, Wis. This is a large item, but it is the highest priority research facility need we now have. This is of major significance to the timber industry throughout the Nation. It is particularly important to those areas where the lower quality timber resources are not now being fully used. Finding uses for such material will promote the establishment of permanent timber-based industries that will provide stable employment and markets for both present and future forest production.

Control Research and Harvesting

Modest increases have been included for forestry research to find safer methods for control of forest pests, diseases, and animal damage so as to eliminate the hazards associated with chemical controls that may be injurious to humans or wildlife. Some increases are also requested for work related to the inventory, management, and proper harvesting methods for our timber resources.

Substantial increases could be justified for almost all of our forest conservation programs but, in view of the tight budget situation for 1965, we have limited proposed increases to these highest priority items, and have concentrated on those activites that can have the most immediate and lasting effect for improving the economic situation in the forested portions of the rural areas.

Once again I would like to express my appreciation for this opportunity to review our 1965 program of work for the Forest Service.

It is an honor to appear before your committee, Mr. Chairman, the distinguished Chairman not only of this subcommittee but the full committee and a gentleman of longstanding importance.

I would like to ask Mr. Cliff to add to this statement anything he would care to say in introducing our budget to you.

Chairman Hayden. Thank you for your statement. We will now hear from Mr. Cliff, Chief of Forest Service. Do you have a statement to submit?

General Statement of Mr. E. P. Cliff, Chief, Forest Service

Mr. Cliff. Thank you, Mr. Chairman. I would like to make a few brief remarks before we get into the questions. It is always a pleasure to appear before this committee. We have enjoyed this association for a long time and look forward to meeting with you.

Assistant Secretary Baker has summarized some of the major considerations included in our 1965 budget request, so I will confine my opening remarks to a few examples of recent accomplishments.

Accomplishments

Fiscal year 1963 was a year of real progress. Our timber harvest set a record. The 10 billion board feet cut in the national forests exceeded the previous high of 1960 by 600 million board feet. In 1964 we expect to further increase this cut to 11 billion board feet.

We have planted and seeded over 220,000 acres in the national forests to restore their timber productivity.

This is also a new high except for 1 year during the CCC program when we planted about 2,000 acres more han we did last year. Timber stand improvement work was accomplished on almost 600,000 acres.

Recreation Use Increase

Recreation use continues to increase rapidly. It is expected to reach nearly 140 million visits in calendar year 1964. That is about 3½ times what it was in 1954.

Chairman Hayden. We will soon get to a place where there is standing room only.

Mr. Cliff. We still have room in the national forests, but people are coming in in increasing numbers.

We made good progress in providing additional campground, picnic, and other facilities needed to accommodate this recreation use. But overuse of existing facilities is still about 60 percent of this capacity during peak periods.

Additional Campground Units

During fiscal years 1963 and 1964 we will have constructed over 16,400 additional campground units that will accommodate over 80,000 forest visitors at one time.

Chairman Hayden. By campground, you mean a place where visitors can stop and also where they can find water and some sanitary provisions?

Mr. Cliff. Yes. These 16,400 campground units I am talking about would consist of a table, and a fireplace, water, and sanitary facilities sufficient to accommodate one family.

Fire Suppression

The calendar year 1963 fire season started with severe fire hazard conditions throughout the Southern and Eastern States. Again in the fall, we had severe drought conditions. Fire suppression costs were high. The western fire season was delayed in the spring and generally normal for the balance of the year. Fire occurrence on all forest lands, that is State, public and private, increased 61 percent and burned area increased over 200 percent over the 5-year average. This is on all forest land.

On the national forests, our fire occurrence was slightly less than the 5-year averages as contrasted to the great increase on all forest land. And the burned acreages were 75 percent below the 5-year average. While our total burned area was less than 134,000 acres, we are greatly concerned over the fact that we had 6,000 man-caused fires, almost double what we had in 1957. Under the right combination of conditions, any one of these fires could have resulted in major resource and financial losses. This problem of curtailing or cutting down man-caused fires is one of the more serious problems that we are facing.

INCREASED HAZARDS WITH INCREASED USE

Chairman HAYDEN. Does that indicate that people are simply careless and do not pay attention to the worth of the forests?

Mr. CLIFF. I do not think they are any more careless, Mr. Chairman, but we are just getting more people. We have over 3½ times more people using the forest than we had 10 years ago, and we are making greater use of the timber and all other forest resources. So there are increased hazards with this increased use. We are continuing our intensive fire-prevention activities and we think it is making a good impact, but we still have a major job of getting at the root of these man-caused fires. A fire that is prevented is the least costly fire to fight.

INSECTS AND DISEASE

Last year's supplemental insect and disease appropriations permitted us to make considerable progress in arresting insect infestations. However, the mountain pine beetle continued to cause heavy losses in the Rocky Mountain and Intermountain States, so it was necessary to accelerate control work in these areas. We still have many critical situations throughout the Nation. We have a serious one in the Black Hills that needs very intensive action.

We have serious defoliator attacks continuing in a number of places. These serious insect and disease losses will continue until we are able to reduce insect populations below epidemic proportions.

One of the things that Mr. Baker mentioned that we are trying to do is to put added emphasis on trying to find better methods of control, and safer methods of control so we do not have to rely so heavily on chemicals. So we are stepping up our research in this direction.

ACCELERATED PUBLIC WORKS PROGRAM

In fiscal year 1964 we received an additional $28 million of accelerated public works financing. We are very proud of our achievements in both 1963 and 1964 in meeting the objectives of providing immediate employment and of contributing to permanent improvement of the local economies of the communities involved. At the peak of the program we provided employment for over 9,000 people who would otherwise have been out of work, many of them on relief rolls.

Our long-range planning really paid off because we were ready to move into these emergency employment programs rapidly and to put the people to work on useful projects. This was not made work, it was useful, needed work and people were proud to contribute to the kind of projects we had. Since we had a big backlog of road construction, campground development, timber stand improvement, and similar work developed and ready to go, we were able to move rapidly. I think we put more people to work more quickly than all of the other Federal agencies combined for the first year of the program.

By virtue of the combination of our regular financing and the Accelerated Public Works program, our timetable of accomplishments for the development program for the national forests will be approximately 93 percent on schedule through fiscal year 1964.

Now we are not making uniform progress on all activities, but on the average it will be about 93 percent of our planned goals through the fiscal year 1964.

STATE AND PRIVATE FORESTRY

We feel that all of the items in this budget are important and are well justified. I would just like to mention two, not that I want to deemphasize the others, but one is the State and private forestry increases. Our State and private forestry programs have been lagging behind the other programs of the Forest Service.

This year we have included in this budget an increase of $1 million for State and private forestry programs. This is a small amount compared with the total needs, and we sincerely hope that the committee can find a way to approve the increases for State and private forestry.

FOREST PRODUCTS LABORATORY

The other one Secretary Baker mentioned, we feel is very important not only to the national forests, but to the State and private landowners all over the country, and that is the Forest Products Laboratory. We have a great deal of timber in this country for which there is no ready market. This timber can contribute a great deal to the development of rural economies. We need to accelerate our research work in the Forest Products Laboratory. This is the first year that we have had an increase for construction of the Laboratory in the budget. Your committee added it to the budget once before, but it was not carried through the total appropriations process. This year we have it in the budget and we are very hopeful that it can be held and approved.

As Secretary Baker stated, "We welcome this opportunity to review our budget and our work with you and we are happy to discuss with you any individual questions or problems that you might wish to bring up." Thank you very much.

RESEARCH PROGRAM AT BOTTINEAU, N. DAK.

Senator YOUNG. Mr. Chairman, I wonder if I might ask a couple of questions.

Chairman HAYDEN. Certainly.

Senator YOUNG. With reference to the Bottineau Laboratory, do you have many staff members at that laboratory now?

Mr. CLIFF. Only at the level we have been staffing it. Dr. Harper may want to add to that.

Dr. HARPER. That is correct. We carry the same amount in 1965 estimate that we had in 1964, $69,000.

Senator YOUNG. Did you ask the Bureau of the Budget for more money or is this your total request?

Dr. HARPER. In our original agency request, yes, we planned to step up the research at Bottineau as well as at some other locations, but, as you know, this is a very tight budget and we were not able to accommodate increases except for a few high-priority items in the final estimates for 1965.

1964 BUDGET REQUEST

Senator YOUNG. How much did you request?

Dr. HARPER. The exact figures were not identified by locations in our initial estimates. What we need there and what we have planned when financially feasible, is $150,000, Senator Young. This would make full use of the new facility that we have just completed at Bottineau. This would enable us to tackle many of the shelter belt problems which we have not been able to get to in the present program.

GREENHOUSES

Senator YOUNG. Do you have any money in the budget for greenhouses at Bottineau?

Dr. HARPER. No, sir; we do not

Senator YOUNG. You need those, too; do you not?

Dr. HARPER. Yes. Our estimates on greenhouses and a storage building amount to $70,000. I think, however, Senator Young, that we possibly could get by for the present without them. When we get an increase in the program we could provide some facilities such as a greenhouse out of our research program funds.

Senator YOUNG. You think you may be doing this?

Dr. HARPER. I say I think we could. When we are able to increase the research program there, I think we could provide some facilities out of our research funds, such as a small greenhouse and some storage buildings.

Senator YOUNG. Do you plan to do that this year?

Dr. HARPER. No. This will have to wait until we have an increase in our research funds at Bottineau. This will have to wait until the budget situation permits it.

Senator YOUNG. Thank you, Mr. Chairman.

STATUS OF DEVELOPMENT PROGRAM FOR THE NATIONAL FORESTS

Chairman HAYDEN. In your explanatory notes there is a table which I shall place in the record, setting forth the development program for the national forests for fiscal years 1963 and 1964.

(The table referred to follows:)

Financing of development program for the national forests, cumulative fiscal years 1963–64 (including Pay Act costs, Public Law 87–793)

[In thousands of dollars]

	1963–64 planned level	1963–64 available			Difference	Percent financed
		Appropriation	Public works	Total		
National forest protection and management:						
Timber resource management:						
Sales administration and management	52,492	52,513	----------	52,513	21	100.0
Reforestation and stand improvement	44,572	31,091	7,000	38,091	−6,481	85.5
Subtotal, timber resource management	97,064	83,604	7,000	90,604	−6,460	93.3
Recreation-public use	74,637	51,389	10,500	61,889	−12,748	82.9
Wildlife habitat management	8,438	7,067	1,700	8,767	329	103.9
Range resource management:						
Management	10,136	9,864	----------	9,864	−272	97.3
Revegetation	5,615	5,400	100	5,500	−115	98.0
Improvements	7,305	6,470	2,300	8,770	1,465	120.0
Subtotal, range resource management	23,056	21,734	2,400	24,134	1,078	104.7
Soil and water management	14,583	10,919	1,300	12,219	−2,364	83.7
Mineral claims, leases, and special uses	8,064	7,369	----------	7,369	−695	91.4
Land classification, adjustments, and surveys	9,473	7,557	----------	7,557	−1,916	80.0
Forest fire protection	49,129	44,816	1,600	46,416	−2,713	94.5
Structural improvements for fire and general purposes	27,705	22,804	13,000	35,804	8,099	129.2
Total, national forest protection and management	312,149	257,259	37,500	294,759	−17,390	94.4
Insect and disease control:						
White pine blister rust control	7,463	7,057	----------	7,057	−406	94.6
Other pest control	13,510	17,266	300	17,566	4,056	130.0
Total, insect and disease control [1]	20,973	24,323	300	24,623	3,650	117.4
Purchase of lands (Weeks and special acts)	7,445	3,812	----------	3,812	−3,633	51.2
Forest roads and trails (including all related appropriations)	174,868	137,400	18,800	156,200	−18,668	89.3
Total	515,435	422,794	56,600	479,394	−36,041	93.0

[1] Includes $4,500,000 for lands not administered by the Forest Service.

Chairman HAYDEN. Does this budget provide the funds required in the implementing of this program which was sent to Congress by President Kennedy? If not, how much does it fall short of that goal?

Mr. CLIFF. Mr. Chairman, as I stated, through fiscal year 1964 we will be in approximately 93 percent of our planned program, on the average. The budget that is before you will not provide for continuation of the program at this same rate.

Financing under this budget will be at the level of approximately 67 percent of that planned for 1965. You see, in the program for the national forests we proposed acceleration for about 5 years. This budget proposal would slow down that rate of acceleration.

Chairman HAYDEN. In other words, level off instead of advancing.

Mr. CLIFF. Yes; this budget, if it is approved, will result in our accumulative accomplishments through fiscal year 1965 being at about 83 percent of our total planned program.

Timber Resources Review

Chairman Hayden. I understand that during the past year or two the Forest Service has been making a comprehensive study to update the "Timber Resources Review" that was published some years ago. What is the status of this project? Are you on schedule?

Mr. Cliff. Mr. Chairman, I am glad to comment on that. We have completed our reanalysis of the "Timber Resources Review." It is now in a review draft which we plan on having reviewed in the Department and possibly by some outside people, and we expect to have the final review and the publication of this in final form about the middle of the year.

I might say that the general outlook for meeting our timber needs through the year 2000 is somewhat more optimistic than the "Timber Resources Review" indicated, but it will still require a big effort to keep up the progress that has been made and to keep the trend in forestry in this country going upward in order to meet these goals. There is a big problem, although it does not look quite so formidable as the TRR indicated.

Forest Protection and Utilization

Chairman Hayden. I will insert in the record the justifications for your budget estimate of $197,318,000 for forest production and utilization. This is an increase of $8,170,000 over the amount appropriated for you in fiscal year 1964.

(The statements referred to follow:)

(*a*) *Forest protection and utilization*

	Forest land management	Forest research	State and private forestry cooperation	Tota
Appropriation Act, 1964	[1] $147,312,000	$25,893,000	$15,943,000	[1] $189,148,000
Transferred to operating expenses, Public Buildings Service, General Services, General Services Administration for space rental	−123,000			−123,000
Activities transferred in the 1965 estimates to:				
Salaries and expenses, Office of the Inspector General	−346,000	−39,000	−25,000	−410,000
Salaries and expenses, Office of Management Services	−9,000	−1,000	−1,000	−11,000
Base for 1965	[1] 146,834,000	25,853,000	15,917,000	[1] 188,604,000
Budget estimate, 1965	[1] 150,419,000	29,944,000	16,955,000	[1] 197,318,000
Increase	+3,585,000	+4,091,000	+1,038,000	[1] +8,714,00

[1] In addition, $700,000 is available by transfer from "Cooperative Range Improvements."

Summary of increases and decreases, 1965

Forest land management:	
For reforestation and stand improvement to accelerate the rate of reforestation and timber stand improvement measures	+$1,200,000
For recreation-public use to provide for operation and maintenance of recreation areas and facilities	+800,000
For maintenance of structural improvements for fire and general purposes	+123,000
For additional payments to employee's compensation fund	+95,000
Reduction in acquisition of lands (Weeks Act) due to special land purchase included in fiscal year 1964	−462,000
Forest research:	
Reduction in timber management research due to savings resulting from consolidation of program activities	−47,000
For watershed management research to strengthen the technical basis for management of watersheds and adjacent water-producing mountain lands	+36,000
For forest insect research to intensify search for pest control methods that will reduce hazards associated with chemical control	+200,000
For forest disease research to strengthen research on serious diseases damaging young natural stands, plantations, and natural hardwood forests	+41,000
For forest engineering research to develop new systems for harvesting and transporting timber	+75,000
For forest survey to accelerate and strengthen survey activities	+150,000
For forest research construction to construct facilities at Madison, Wis., for research on forest products utilization	+3,165,000
State and private forestry cooperation:	
For cooperation in forest fire control to strengthen fire protection	+250,000
For cooperation in forest management and processing to provide technical assistance to additional small private forest owners and sawmill operators	+500,000
For general forestry assistance to provide specialized technical forestry assistance	+250,000
For additional pay act costs in 1965 on the 2d step of the pay increases required by Public Law 87–793	+2,338,000
Total increase, forest protection and utilization	+8,714,000

(32) Total increased pay costs on second step of pay increase (PL 87-793)	(.....)	(2,139,000)	(+2,338,000)	(+49,000)	(4,526,000)
Total available or estimate	198,016,222	188,604,000	+2,338,000	+6,376,000	197,318,000
Transferred to Operating expenses, Public Buildings Service, General Services Administration	+275,478	+123,000			
Transferred to Operating expenses, general administration, Agriculture	+7,300				
Comparative transfer to other accounts	+376,000	+421,000			
Total appropriation or estimate	198,675,000	189,148,000			

[1] Includes allocation to the Department of the Interior: 1964, $344,520; 1965, $344,000.
[2] Includes $3,000,000 provided by supplemental appropriation, Public Law 88-25, approved May 17, 1963; $1,284,336 of this amount was obligated in fiscal year 1963; $1,715,664 will be obligated in fiscal year 1964.
[3] Includes allocation to the Department of the Interior: 1964, $1,102,171; 1965, $900,000.
[4] Represents obligations as follows:

Obligated fiscal year 1963 (excluding $376,000 comparative transfer)	$196,156,413
Estimated obligations, fiscal year 1964, per [2] above	1,715,664
Applied costs for fiscal year 1963 are	198,721,479

The difference of $849,402 reflects, primarily, contractual services and equipment received in 1963 over contracts made and orders placed in that year.

JUSTIFICATIONS OF 1965 ESTIMATES

The net increase of $8,714,000 in the forest protection and utilization appropriation consists of:

1. Increased pay costs, Public Law 87-793	$2,338,000
2. Program increases and decreases	6,376,000
Total net increase	8,714,000

(*1*) *Timber resource management*

(*a*) *Sales administration and management, $29,314,000.*—No program increase is proposed for fiscal year 1965.

An estimated 11.2 billion board feet of national forest timber will be cut, an increase of 200 million board feet over the estimated 11 billion being cut during fiscal year 1964. Approximately 12 billion board feet are to be offered for sale.

In many sections of the Nation the timber-based industries are becoming increasingly dependent on national forest timber as a major source of supply. This is evidenced by the fact that although total annual domestic production of industrial roundwood has remained fairly constant over the past 10 years, the annual cut of industrial roundwood products from the national forests has nearly doubled, and continues to increase as other sources of timber supply dwindle. The increasing dependency of timber-based industries on national forest sawtimber is even more striking. In 1952 the sawtimber cut from these lands amounted to an estimated 12 percent of the total domestic production; by 1962 this figure had risen to nearly 28 percent of the total production even though national forest land capable of producing continuous crops of industrial wood comprises less than 18 percent of the total estimated commercial forest land in the Nation.

The Forest Service goal is to meet these increasing needs by offering timber for sale at full allowable cut rates insofar as practicable. The orderly cutting of national forest timber in accordance with sound forest management principles and in harmony with other forest resources and uses not only improves conditions for future timber growth, but keeps mills going, provides employment, and contributes substantially to the general economy. The program proposed for 1965 is:

Sale preparation 12 billion board feet at $0.65 per thousand	$7,800,000
Sale administration 11.2 billion board feet at $1.66 per thousand	18,600,000
Advance sale preparation 3 billion board feet at $0.30 per thousand	900,000
Timber inventories and management plans	1,488,000
Subtotal	28,788,000
Pay act costs	526,000
Total	29,314,000

(*b*) *Reforestation and stand improvement, $17,009,000.*—An increase of $1,200,000 in reforestation and stand improvement would be used to accelerate the rate of reforestation by 40,000 acres and timber stand improvement measures by 10,000 acres. These increases would provide for program accomplishments of less than 36 percent of the planned acreage objectives established for 1965 under the development program for the national forests. Even with the additional accomplishments made possible with accelerated public works funds in 1963 and 1964 and the proposed 1965 increase, less than 10 percent of the 10-year needs will have been met during these 3 years.

If the national forests are to make their full contribution to the country's projected annual requirements for industrial wood by the year 2000, reforestation of nonstocked and poorly stocked areas and cultural improvement of young overdense or suppressed timber stands must proceed at a much faster pace than has been possible thus far. As of fiscal year 1963 there were approximately 4.4 million acres of commercial forest land on the national forests in need of reforestation, of which an estimated 3.8 million acres should be planted by 1972. There were also an estimated 10 million acres of existing young timber stand urgently in need of thinning, release and weeding, and other cultural measures to improve their productive condition. The level of commercial timber harvesting on the national forests and the development and maintenance of a thrifty growing forest are directly dependent on the timely execution of the reforestation and stand improvement program.

Summary of total program proposed for fiscal year 1965:	
Reforest 160,000 acres of nonproductive commercial forest land, including cost of trees and tree seed production	$10,700,000
Develop and improve nurseries at 10 locations and 130 tree seed orchards and seed production areas [1]	1,245,000
Release and weed, thin, or otherwise improve conditions for future timber growth on 245,000 acres of young timber stands	4,900,000
Subtotal	16,845,000
Increased pay costs	164,000
Total	17,009,000

[1] Nursery development costs include $72,000 for the purchase of 80 acres of land to complete the development of the Humboldt Nursery in California.

(2) *Recreation-public use, $26,010,000*

An increase of $800,000 for recreation-public use would be used to provide for adequate operation, sanitation, cleanup, and maintenance of recreation areas and facilities; develop new sites to alleviate some of the overcrowding and to properly meet expanding use; and to provide necessary visitor information services.

Recreation use of the national forests continues to rise sharply. During the period 1950 through 1962, annual visits have increased from 27 million to 113 million (over 400 percent). Recreation use is expected to increase to 125 million visits in calendar year 1963, 140 million visits in 1964, and near 200 million visits by 1972. As of June 30, 1962, overuse of national forest campground and picnic facilities amounted to 70 percent of their capacity. During fiscal years 1963 and 1964, approximately 16,450 additional family camp and picnic units are being constructed with regular and accelerated public works funds. However, due to the rapid increase in recreation use, overuse at camp and picnic sites will still be 58 percent based on the 1963 installed capacity of 28.8 million and expected use of 45.5 million visitor-days use. This overuse contributes to rapid deterioration of facilities, permanent damage to land and resources, and detracts from the enjoyment of the visitors. To meet this use impact, 283,000 new units, plus development of 4,000 other types of recreation facilities, must be completed during the period 1963–72.

This increasing use of the forests, particularly during the past 5 years, has given emphasis to the need for providing visitor information services ranging from simple nature trails and scenic overlooks to visitor centers, housing exhibits, and other interpretive facilities to better explain natural resource management. As the national forest visitor load continues to grow and the expanding population makes even greater demands upon the vital timber, range, wildlife, and water resources of these public lands it becomes important for visitors to more clearly understand the benefits of forest lands and the need to protect and use them wisely.

At the 1964 recreation appropriation level it would take almost 30 years to provide the facilities that will be needed by 1972. Failure to provide these facilities on a timely basis would result in critical overuse demands on inadequate facilities, greatly increased cost for operation and maintenance, major sanitation and safety problems, and would jeopardize other forest resources by exposure to fire hazards and improper utilization.

The proposed 1965 recreation budget would provide for the following:

Operation and maintenance.—Adequate sanitation, cleanup, and maintenance would be provided for all recreation areas to protect public health and safety, and to permit full enjoyment of these forest areas. The problems of sanitation, care, and impact on recreation resulting from an estimated 140 million visits in calendar year 1964 cannot be delayed or postponed. This work must be done daily in many places. The load and impact is there and so is the obligation to provide safe and satisfactory conditions for public enjoyment of the national forests. The $800,000 increase included in this budget request is required to meet this need.

Rehabilitation of facilities.—As of July 1, 1964, there will remain to be rehabilitated approximately 600 campground and picnic sites and other sites such as organization camps, winter sports, swimming, and boating. Work planned for 1965 includes rehabilitation and betterment of 6,000 campground family units and 119 other recreation sites.

Construction of new recreation facilities.—The development of additional recreational facilities would be accelerated to accommodate the rapidly increasing public

recreation impacts. The proposed financing would provide for the construction of 5,550 family camp and picnic units which will accommodate 30,000 persons at one time, and 100 swimming, boating, and other sites.

Recreation management plans.—To provide for the continually increasing national forest use, forest managers must operate under sound recreation management plans. All of the 154 national forest recreation management plans are expected to be completed by July 1, 1964. The proposed 1965 financing would provide for the preparation of 495 recreation area plans involving important classification of lands valuable for recreation. These plans are needed in advance of development work.

Visitor information service.—In addition to the operation and maintenance of present facilities, construction is planned as follows:

(*a*) Primary visitor centers at—

Madison River Earthquake Area—Gallatin National Forest, Mont. ($95,000).

Cradle of American Forestry—Pisgah National Forest, N.C. ($80,000).

(*b*) Secondary units. Small information centers and orientation buildings will be built at eight locations. (Examples are: Elizabeth Furnace, George Washington National Forest, and Carp Lake, Grand Mesa-Uncompahgre National Forest.)

(*c*) Guided and self-guided facilities. Trails (nature, historical, geological), auto tours, and boat tours in and near recreation complexes at 20 locations.

(*d*) Other facilities and services. Additional vistas, overlooks, wayside exhibits, campfire circles, exhibits at headquarters, and interpretive signs will be installed at 25 areas.

(*3*) *Wildlife habitat management, $3,624,000*

No program increase is proposed for fiscal year 1965.

Approximately one-twelfth of the land area of the United States lies within the national forests and national grasslands. The land and its waters provide the home for wildlife and fish, both game and nongame. Within this 186 million acres are some 80,000 miles of fishing streams and 2 million acres of lakes and reservoirs. Approximately one-third of this Nation's big game animals live within these lands. Wildlife has always been an attraction to the public—both those who hunt and those who do not. It is an important part of outdoor recreation enjoyment. Visits to the national forests for hunting and fishing have trebled in the last 10 years. During calendar year 1964, it is estimated that there will be over 30 million forest visits for these purposes, and such use will increase to 50 million by 1972.

The wildlife habitat must be protected, managed, and developed so that it can support, on a multiple-use basis, the wildlife populations and fish resources that will be necessary to meet this need. Productive habitat is the key to wildlife production. The national forests can provide the essential habitat through technically directed coordination with other resource activities and by direct habitat improvement projects. Proper management and use of the wildlife resource can be of great economic benefit to forest area communities.

Under the proposed 1965 budget it it estimated that the following wildlife work would be accomplished:

Improvement of wildlife range	acres	50, 000
Water developments	units	320
Fish stream improvement	miles	260
Lake improvement	acres	2, 000

(*4*) *Range resource management*

(*a*) *Management, $5,108,000.*—No program increase is proposed for fiscal year 1965.

Grazing of livestock is one of the principal uses of the national forests and national grasslands The grazing resources must be managed to provide the optimum use by livestock in coordination with other resource values and uses. To achieve this objective in addition to recurrent workload associated with administration of about 11,400 separate allotments involving over 22,000 permits, special attention must be given to the following specific needs:

1. Range allotment analysis must be completed on 4,500 range allotments as of fiscal year 1965 to provide the factual information necessary for intensive and effective management and for final determination of rehabilitation and improvement needs.

2. Development of intensive use management systems on 9,800 allotments now receiving only extensive management. This job cannot be accomplished until the needed facilities are constructed.

The 1965 budget request provides for completion of 620 units of range allotment analysis work. This accomplishment would raise the level of completion to about 65 percent of the initial analysis task. Periodic reanalysis and annual maintenance of management plans for a portion of the 11,400 allotments would be a part of the 1965 work.

(*b*) *Range revegetation, $2,737,000.*—No program increase is proposed for fiscal year 1965.

Part of the national forest rangelands remains in poor condition. Many of these depleted lands lie within important watersheds and, in their present condition, are a menace to urban and rural areas as they are a continuing source of flood damage and erosion loss. These lands can be restored to good forage production and watershed condition by proper rehabilitation treatment. Improving the range watershed lands will help to alleviate the need for reductions in numbers of permitted livestock or length of grazing seasons on critical allotments. Methods used to improve forage cover and stabilize soils include seeding of grasses and other forage plants, application of herbicides, grubbing with power equipment, controlled burning, water spreading, and controlling rodents and noxious farm weeds.

During the period 1963–72, 4 million acres of rangeland must receive revegetation and rehabilitation treatment to restore its productivity. Failure to meet this need could have serious impact on the livestock industry dependent on these rangelands. Soil losses and damage to other forest resources will continue until these lands are properly rehabilitated. The fiscal year 1965 appropriation will provide for accomplishment of 186,000 acres.

(*c*) *Range improvements, $3,280,000.*—No program increase is proposed for fiscal year 1965.

Range improvements are necessary to control movement of livestock in rotational management systems, provide stock water in arid areas and make possible full and sustained use of the forage resource.

An additional 16,000 miles of fence and 8,100 water developments should be built to assure full and effective use of the range resource. Failure to meet this need will result in inability to properly manage the use of these ranges. The financing proposed for fiscal year 1965 would provide for the maintenance of existing facilities and for construction of approximately 1,000 miles of range fencing, 1,300 stock watering developments and some 120 cattleguards. It is estimated that cooperating stockmen will contribute $270,000 for cooperative maintenance and $700,000 for new construction.

(*5*) *Soil and water management, $5,345,000*

No program increase is proposed for fiscal year 1965.

The water yield from the national forests and national grasslands is a basic requirement of a sustained or improved economy, particularly in the rural areas of the Nation. In the 11 Western States these watersheds yield about 53 percent of the total runoff. This water is a direct source of supply for more than 1,000 communities and for a major segment of the agricultural, recreational, and industrial water needs. National forest lands therefore must be managed to assure a continuing and improved supply of high-quality water. Soil and hydrologic surveys must be prepared to guide proper land use and water yield improvement. Since protection of the soil and water resource is basic to all other forest uses, it is essential that this work keep pace with increased programs such as road construction, mining, timber harvest, and recreational development. During the period 1963–72 standard soil surveys are urgently needed on 29 million acres. Water yield improvement by means of vegetation management and snowpack management is being extended at the rate of 3 to 5 watersheds per year. This is about 1 percent of the national forest watersheds in which such treatment holds promise of helping alleviate water supply deficiencies of dependent rural areas. Watershed rehabilitation is needed on 1.3 million acres and in 22,000 miles of gullies or abandoned roads—570 pollution and flood prevention projects should be installed. Current progress is less than 25 percent of the annual need. There is an increasing use of national forest lands by other agencies for reservoirs, highways, mining, and other land uses which can have a major impact on watershed and other multiple-use values. Each such use requires careful study and evaluation to insure a design compatible with multiple-use objectives and field supervision during construction to insure proper installation.

Major fiscal year 1965 program goals are—

(*a*) Complete standard soil surveys on 1.2 million acres and reconnaissance surveys on 3 million acres.

(*b*) Make comprehensive watershed plans for 40 representative watersheds which are the primary source of domestic, irrigation, or industrial water supply or are known flood source areas.

(*c*) Provide technical watershed protection specifications and soil management service on 800 projects located on fragile watershed lands to prevent water pollution and to prevent accelerated erosion.

(*d*) Prepare multiple-use surveys and provide for field coordination during construction on 250 water resource and other major construction projects of other agencies which have a major impact on national forest multiple-use programs. These surveys are required to meet the criteria and standards for formulation of water and related resource programs established by the President and published in Senate Document 97, 87th Congress.

(*e*) Improve hydrologic functioning, water quality, soil stability, and reduce flood potential on selected watersheds which are in a seriously deteriorated condition and treat an estimated 100,000 acres damaged by forest fires to reduce damage repair costs and to protect these lands from deterioration until site productivity is restored.

(*6*) *Mineral claims, leases, and special uses, $3,794,000*

No program increase is proposed for fiscal year 1965.

This work involves mineral leasing, special uses (other than recreation), and mineral reservations and outstanding rights administration. Occupancy and use of national forest land for disposal of mineral or other purposes is necessary and desirable as a part of sound multiple-use management. However, strict and adequate control of occupancy and mineral operations is necessary to protect forest resources from damage and to assure the highest use of the land consistent with good management of all other resources.

With close to 28,000 active mineral permits and leases in force, involving several million acres of land, and rentals and royalties in excess of $13 million per year, the work must be kept current to protect the public interest. Annually about 5,000 mineral applications must be comprehensively reviewed and processed. The volume of mineral leases has steadily increased from 5,200 in 1951 to an estimated 30,000 in 1965. In addition, some 140 mineral reservations are being actively operated, covering 80,000 acres. These are privately owned minerals under lands owned by the United States. The public values in the surface must be fully protected.

New mining methods and new and more efficient machinery have caused a big step-up in mining operations, both in the leasing field and in the mining of privately-owned minerals under national forest lands. Adequate control must be maintained over mineral reservations, outstanding rights, and leases to protect the other valuable forest resources and to provide for prompt productivity restoration of surface mined lands. Failure to maintain such control has and will continue to result in serious resource losses if adequate management and control are not provided. This situation is particularly critical to the economy of many of the areas now experiencing severe economic depression where deep coal mining and iron mining have steadily declined with a resulting sharp decrease in employment. In these areas the other forest resources, such as timber and recreation, must be fully and effectively restored, developed, and utilized. Increased mining law effort is required to handle the extra work created by the Church-Johnson Act (Public Law 87–851) for the relief of mining claimants.

Another important part of this activity is the detection and elimination of unauthorized use of mining claims which constitutes trespass and interferes with the orderly administration of the national forests. Approximately 10,000 such cases now exist that should be cleared within the next 8 years. Failure to aggressively pursue such cases further complicates the problem, as it encourages others to disregard the mining laws.

Other uses of national forest lands have likewise increased sharply. At present there are approximately 40,000 permits and easements involving almost 5 million acres of land and 60,000 miles of rights-of-way. Failure to properly administer these special land uses could result in serious resource damage and direct monetary loss to the Government.

Television and other public entertainment broadcast stations require high mountain peaks for greatest coverage. Sites most frequently occur in national forests. Competition for sites is heavy from other radio-electronic uses for

commercial but nonpublic service such as logging and pipeline monitoring and from the emergency and safety field.

Acceleration of highway construction has added to Forest Service workload as many such roads cross lands under Forest Service jurisdiction. Impact studies and close cooperation with State highway departments and the Bureau of Public Roads is required to provide adequate protection of national forest scenic, recreation, soil, water, wildlife habitat, and timber resources.

(7) *Land classification, adjustments and surveys, $3,899,000*

No program increase is proposed for fiscal year 1965.

This program provides for the study and classification of lands with respect to their suitability for inclusion or exclusion from the national forests, national grasslands, and other land areas administered by the Forest Service; adjustments of land ownership in these areas; the establishment of property lines; the maintenance of accurate ownership and status records for all lands administered by the Forest Service and the reproduction of essential administrative maps. These functions are basic to the Forest Service land management program. Ownership patterns are a first consideration in planning and installing improvements and land treatment measures and in carrying out protection work.

Land classification.—A continuing analysis of the exterior boundaries and interior landownership patterns of national forests and national grasslands is conducted to facilitate conservation programs. Studies are conducted to determine and recommend changes in landownership or jurisdiction that would enhance opportunities for public programs to provide outdoor recreation, wildlife habitat, timber products, livestock forage, and protection of water resources. Analyses include consideration of potential purchase areas, land transfers or exchanges. Careful consideration is given to changing patterns in land use, especially on private lands, public need for national forest resource development, opportunities for improving the efficiency of public land administration, and to analyzing the probable effects on local economies.

Representative of such studies is one recently completed involving a gross area of 125,000 acres in southern Illinois. Based on study findings, the National Forest Reservation Commission recently approved establishment of a purchase unit which will connect the two units of the Shawnee National Forest. Similarly, under a contract with the Forest Service, the University of Arkansas completed a study of an area adjacent to the northern border of the Ozark National Forest. The study considered alternatives under present landownership and weighed them against potentials for national forest programs as an assistance to the depressed rural economy. This study and supplemental data will provide the basis for recommendations with regard to national forest programs in the area.

In cooperation with the Bureau of Land Management, Department of the Interior, continuing consideration is being given to opportunities for providing more efficient management of the public lands through specific transfers of jurisdiction. Studies are being completed in Montana, Idaho, Colorado, and several other Western States. Federal lands no longer needed for military or other program purposes, or lands involved in flood control or reclamation projects frequently are located close to national forests. Analyses are made of the status and long-term administration of these lands for meeting public needs most effectively and efficiently, and programs for land transfers or interchanges are recommended. By Public Law 88–99, land adjoining the Pineview Reservoir of the Weber Basin reclamation project was included in the Cache National Forest to facilitate resource management and public recreation use. In cooperation with the Bureau of Outdoor Recreation and other agencies involved with public recreation, field analyses have been made and information assembled on land use, development and jurisdiction aspects of four proposed national recreation areas involving national forest lands in California, Utah, West Virginia, and Pennsylvania.

In fiscal year 1963 boundary action was initiated to exclude a considerable area of private lands from the Los Padres National Forest in California and from the Carson National Forest in New Mexico. Some 24,000 acres were added to the Wasatch National Forest in Utah. About 137,000 acres and 64,000 acres were added respectively, to the Superior National Forest in Minnesota and to the Clark National Forest in Missouri. These latter areas comprise those portions of purchase units which were determined to warrant retention in national forest status; national forest holdings in the remainder of the purchase units concerned will be disposed of by exchange.

A transfer to TVA of a site in North Carolina needed for industrial purposes was accomplished, as were transfers to the National Park Service for parkway or

national monument uses in North Carolina and South Dakota. Studies in connection with proposed extension of the Blue Ridge Parkway across national forest land in North Carolina and Georgia are underway. Some 12,000 acres of former land utilization project lands in South Dakota were transferred to the Department of Army in connection with the Oahe Reservoir project. Analyses were undertaken of public domain lands near or adjacent to national forest boundaries in some of the Western States. These analyses will be continued pursuant to objectives of interdepartmental transfers to promote more effective and economical public land management.

Joint studies are continuing relevant to establishment of national recreation areas which include national forest lands at certain major reservoir sites in California, West Virginia, and Utah. These involved selection or jurisdictional boundaries, suitability of lands, and related programing for acquisition and development of lands having important recreational values.

Land exchange and ownership adjustments.—Congress has authorized exchange of lands to meet the need for adjustments in the pattern of the Government's ownership in national forests, national grasslands, and other properties administered by the Forest Service. The need for landownership adjustments is particularly acute in areas experiencing rapid urban expansion and population growth such as the California and southwestern regions. Through exchange, the Government can consolidate and otherwise adjust its holdings for more effective and economical management. Also, exchange provides a means of eliminating from Government ownership lands suited to and needed for private, community or industrial purposes that benefit the development and economy of rural and urban areas. Substantial savings can be realized in the cost of administering Federal lands through ownership consolidation. The long-range program of land adjustments provides for the acquisition by purchase or exchange of 7.7 million acres of the 40 million acres of non-Federal lands within the national forests and national grasslands. The land exchange goal for the 10-year period 1963–72 is to exchange 1.5 million acres of lands for suitable private lands to consolidate national forest and national grassland ownership for more effective and efficient administration. This would require the examination and appraisal of 350,000 to 400,000 acres of lands each year because this work must be done for lands both given and received by the United States in exchange. The fiscal year 1965 budget provides for examination of approximately 250,000 acres for exchange and the completion of land exchanges involving some 150,000 acres (80,000 acres offered, 70,000 acres selected).

In fiscal year 1963 the Forest Service completed 83 exchange cases in which the United States gave approximately 34,500 acres and received in exchange 40,000 acres. During the year, field examinations were made of 743,000 acres and appraisals and valuation reports were completed for 135,000 acres in connection with proposed cases.

Land line location.—An accelerated land line location program was initiated in 1958 to meet the greatly expanding multiple-use impact on lands administered by the Forest Service and to cooperate with adjoining landowners in perpetuating and remonumenting corners and marking and posting property lines. The total land line program involves the monumentation of 1,132,353 property corners and the marking of 281,168 miles of property lines. During the period 1958–62, search was made for 62,925 corners and 26,198 corners were monumented or remonumented. Also, 1,788 miles of property line were marked and posted to full standard and an additional 11,581 miles were marked and posted to less than full standard.

Following is the work proposed for fiscal year 1965:

Field search for property corners	20,000
Corners monumented or remonumented	8,000
Identify, survey, and post land lines (miles)	1,000
Maintain land lines (miles)	1,000

Original monumentation is usually old—from 50 to 150 years old. Until recent years land values and demand for multiple use in many areas administered by the Forest Service were low. Consequently, corners were not adequately maintained and many disappeared. Others have become "thread hangers" and must be remonumented soon or be lost, thus requiring expensive cadastral surveys for their reestablishment (about $1,000 per corner). Missing corners on national forest public domain lands must be reset by the Bureau of Land Management, Department of the Interior.

During calendar year 1962 field search was made for 18,832 property corners. It was found that 11,381 could be remonumented, or otherwise maintained,

without expensive cadastral surveys. The remainder, 7,451 or about 40 percent, will require cadastral surveys for reestablishment. Some 7,975 corners were permanently monumented with brass-capped iron and concrete posts; 984 miles of property lines were located, marked, and posted to standard; 1,274 miles were marked and posted to partial standard to perpetuate the location of lines. This is significant accomplishment, but it must be accelerated to meet current needs in protecting Government lands from trespass, to prevent further unnecessary loss of corners (4,000 to 5,000 now being lost each year), and to further the expansion of multiple uses on Government lands without jeopardizing "good neighbor" relationships with adjoining landowners.

Land status records.—The objective for ownership and status records is to have available on each management unit accurate and current records of all ownership and the reservations, outstanding rights, and encumbrances that affect administration of the Government's lands. There are some 170 national forest and national grassland management units for which this information and data must be developed and assembled. The program for installing an adequate system was initiated in 1962 with the objective of completing the job by 1968. However, only about 6 percent of the work was completed by the end of fiscal year 1963. Complete and accurate records of landownership and status are an essential working tool of Forest Service land managers. Records of lands in approximately 14,000 townships, or equivalent quadrangles, are being examined and recorded in the revised system. Through fiscal year 1963, 582 townships have been completed. This review is revealing about two serious errors or omissions per township in previous status records. The conversion should be completed as soon as possible. However, at the present rate of financing it would require some 20 years to complete this work. Work proposed for fiscal year 1965 includes the completion of records for the equivalent of 2.5 management units.

Mapping.—The estimated mapping program for fiscal year 1965 includes:

Contour maps (square miles)	3,100
Planimetric maps (square miles)	7,000
Forest series maps	11

During fiscal year 1963, contour maps were completed for 1,208 square miles. Work accomplished on contour mapping of additional area was equivalent to completion of another 1,717 square miles. Planimetric mapping was completed for 4,800 square miles and is from 50 to 90 percent complete for an additional 6,750 square miles. Eight general purpose maps of national forests were produced.

Reliable planimetric maps meeting the requirements for accelerated management activities are now available for about 43 percent of total requirements for administering the national forests and grasslands. Topographic maps are available for approximately 36 percent of the required coverage.

(8) *Forest fire protection, $23,011,000*

No program increase is proposed for fiscal year 1965.

Uncontrolled fire destroys or seriously damages all forest resources. During the past 5 years estimated resource losses have averaged more than $20 million annually in areas protected by the Forest Service. In addition to this critical resources loss, millions of dollars have been expended for forest firefighting. During the past 5 years, firefighting costs have averaged more than $27 million annually. Adequate fire protection can be accomplished only by elimination of fire hazards, reducing the number of man-caused fires, and by prompt and efficient detection and suppression of fires that occur. As the use of national forest resources increases, there is a corresponding increase in the risk from man-caused fire. Fire protection must meet this impact with more fire prevention, expanded programs of hazard reduction and fuel type conversion, and strengthening of fire control forces in terms of location, adequate manpower, and more effective fire control equipment.

The fire that is prevented results in no resource loss or suppression cost. When prevention fails or fires result from lightning, rapid and adequate initial attack can control such fires at a minimum of cost and resource loss. The long-range fire objective is to hold fire losses below the level which will seriously interfere with intensive multiple-use management of the national forests and national grasslands. It is estimated that for every additional $1 spent for fire protection during the period 1956–63 resulted in a fire damage saving of $5.

The proposed 1965 budget would provide for the following estimated protection measures:

Fire prevention	$3,300,000
Fire detection	3,200,000
Fire attack forces	13,000,000
Air operations	2,100,000
Fuel modification	300,000
Equipment development	600,000
Studies, surveys, plans, and special training	511,000

(9) Structural improvements for fire and general purposes, $11,021,000

An increase of $123,000 would be used for maintenance of dwellings, barracks, service and storage buildings, communication facilities, and other fire and general-purpose improvements.

Many ranger headquarters and field projects are located in remote areas or small communities where adequate housing is not available. Unless adequate housing is provided, it would not be possible to headquarter needed personnel at these work locations. Program costs would be increased excessively and the job of managing the lands and serving the public would suffer severely. There is also a great need for additional fire control structures such as aerial bases, service buildings, and offices in outlying locations. Adequate communications facilities are mandatory for national forest protection and administration. Obsolete telephone systems are being converted to radio networks. Inadequate radio systems are being improved to meet communications needs.

Landing fields, helispots, and heliports are essential to the effectiveness of the fire control program and multiple-use management of the national forests to make the best use of aerial operations and air equipment. They greatly facilitate rapid initial attack on forest fires, thereby increasing the chance for early control at small size which would result in a reduction of both suppression costs and resource losses. Construction and reconstruction of airport facilities such as airfields, heliports, and helispots are urgently needed.

Existing facilities must be adequately maintained and additional facilities built to meet forest management and protection needs. During the period 1963–72, additional needs include 2,640 housing units, 2,517 service and special purpose buildings, 455 fire lookout towers, 2,000 radio installations, replacement of 3,000 miles of telephone line, and construction of 62 landing fields.

In addition to providing for the maintenance of existing facilities and GSA leasing costs, it is estimated that the following facilities will be constructed in fiscal year 1965:

Dwellings and barracks (60)	$1,000,000
Fire lookouts (30)	350,000
Service and storage buildings (70)	1,450,000
Airstrips and helispots (750)	270,000
Betterment of existing structures, landscaping, and miscellaneous construction	600,000
Water and sewage systems	500,000
Site acquisition	131,000
Communication facilities	800,000
Major structures:	
Arcadia Equipment Development Center, California	190,000
Redmond Air Base, Oreg	100,000
Gifford Pinchot Conservation Institute, Pennsylvania (repair and remodel)	200,000
Planning and design: Regional office and research station headquarters, Philadelphia	[1] 96,000

[1] In addition, approximately $60,000 of project research funds will be used to cover the portion of the costs related to the research portion of this building.

(10) Payments to employees' compensation fund, $615,000

An increase of $95,000 for Bureau of Employees' Compensation is required to reimburse the employees' compensation fund, Department of Labor, in accordance with Public Law 86–767 (5 U.S.C. 785), which was enacted September 13, 1960, for benefit payments made from that fund to employees of the Forest Service who are injured while in the performance of duty. The 1965 payment will be $614,581. The payment for 1964 was $520,000.

(11) Fighting forest fires, $5,000,000

No program increase is proposed for fiscal year 1965.

This program provides for firefighting on the national forests and the buildup of emergency firefighting forces under peak burning conditions. Experience has demonstrated material savings are made by having a strong force ready to discover, attack, and stop fast-spreading fires while they are small. Costs for the regular fire protection organization are financed from the national forest protection appropriation. The temporary buildup in forces when fire conditions are critical and for the suppression of fires are financed from the fighting forest fires activity to the extent that such needs cannot be met from the regular fire protection financing.

The calendar year 1962 fire season.—An alltime record low of 85,457 acres (including 63,893 acres of national forest land) burned in 1962. This compares to the previous low of 107,816 acres in 1937, and represents a tremendous drop from 224,394 acres destroyed in 1961. The average fire burned 7.4 acres in 1962 compared to the 5-year average of 21.4 acres. However, the 11,494 fires that occurred represent a 3-percent increase over the 1957–61 5-year average. Man-caused fires exceed the 5-year average of 4,411 fires by nearly 18 percent. There has been an increase in man-caused fires since 1957 when a modern-day low of 3,305 fires was reached.

Nationally, burning conditions during the 1962 season were about normal in severity. Severity was above normal in California, Arizona, New Mexico, Colorado, Nevada, and Utah, much below normal in Alaska, and much above normal on the Atlantic seaboard because of drought in the spring and winter.

Fourteen men lost their lives fighting forest fires in 1962. Six were killed in aircraft accidents. On the ground, five were killed from burns, two by rolling rocks, and one by a falling snag.

The calendar year 1963 fire season.—The eastern spring fire season was very severe; 2,578 fires burned 45,236 acres in the three eastern regions through July. This compares to the 5-year average of 1,557 fires that burned 19,562 acres for the same period. Man-caused fires were up materially over 1962 and the 5-year average. The eastern fall fire season was very critical. Drought conditions prevailed over much of the United States east of the Rocky Mountains and were most severe in the Southern, Middle Atlantic, and New England States. Recorded fire danger reached a 30-year high in many areas. Restrictions were imposed on burning, smoking, and camping to reduce fire occurrence. Intensive prevention efforts were made in all areas.

The western fire season was 2 to 3 weeks later than normal due to favorable weather conditions. Western regions, including Alaska, had 8,570 fires in 1963 as compared to the prior 5-year average of 9,779 fires. Burned acreage was 54,301 as compared to the 5-year average of 203,898 acres.

During calendar year 1963 a total of 12,506 fires burned 127,965 acres (including 91,066 acres of national forest lands).

(12) Insect and disease control, $10,852,000

No program increase is proposed for fiscal year 1965.

The objective of this program is to reduce damage and loss caused by insects and diseases to levels commensurate with uses and values involved on all forest lands irrespective of ownership. Control work is accomplished in cooperation with other Federal and non-Federal agencies. Authorization is contained in two Federal laws—the Lea Act of 1940 which deals specifically with the white pine blister rust disease, and the Forest Pest Control Act of 1947 which deals with forest insects and all other tree diseases. Both acts contain provisions for Federal cost sharing on non-Federal land.

(*a*) *White pine blister rust, $3,587,000.*—This serious disease of soft pines was accidentally introduced from Europe in the early 1900's. It has since spread to all major white pine forests in the Nation. Widespread damage has been prevented by a continuing program of control. The program of keeping to tolerable levels losses caused by white pine blister rust disease is being continued on all commercially and aesthetically important white-pine-bearing lands in the Nation. In Eastern United States the disease is largely under control on the 8.6 million acres of white-pine-bearing land selected for treatment. Remaining work involves a continuing maintenance program. In Western United States, control still is not established on 73 percent of the 2.8 million acres selected for white pine management. Major control effort in calendar year 1962 was concentrated in the

West, especially north Idaho, where future white pine lumber production is so vital to the economy. Major accomplishments were—

1. Thirteen million western white pine trees on 95,000 acres were treated by applying antibiotic fungicide to the basal stem by hand equipment or to foliage by aircraft.

2. Control by removal of ribes (alternate host of the disease) included:

(*a*) Initial work done on 55,000 acres.

(*b*) Rework to establish control done on 81,000 acres.

(*c*) Surveys done on 1.5 million acres in connection with initial work and rework.

(*d*) Work done to maintain control on 1.6 million acres.

(*e*) 8.6 million ribes plants destroyed.

3. Continued economic studies in the East and in north Idaho to determine more precisely cost-benefit ratios, and a tree-breeding program to develop white pine stock resistant to damage by blister rust.

(*b*) *Other pest control, $7,265,000.*—Forest insects and diseases are constant and continual threats to the Nation's valuable forest resources. Annual losses are currently estimated at nearly $350 million. During the past 5 years, weather and forest conditions have been conducive to serious epidemic conditions which have resulted in widespread timber losses. The seriousness of the situation has been further compounded by lack of sufficient financing to provide for adequate control programs, as shown in the following summary:

[In millions of dollars]

Fiscal year	Minimum control needs	Funds available	Unfinanced
1959	4.5	3.2	1.3
1960	5.0	3.6	1.4
1961	6.1	4.1	2.0
1962	9.3	6.4	2.9
1963	12.2	[1] 10.1	2.1
Total	37.1	27.4	9.7

[1] Includes $3,000,000 supplemental appropriation.

During this period, outbreaks left uncontrolled for lack of financing have multiplied threefold. Lack of timely control has resulted in increased damage and increased control costs. The losses resulting from delay in control of the attacking pest outbreaks far exceed what it would have cost to provide for adequate control in a timely manner.

The tabulation on the following page shows the manner in which these funds were used in fiscal year 1963, and how they will be used in 1964 and 1965.

Obligations, insect and disease control funds (exclusive of white pine blister rust control) fiscal year 1963 and estimates for fiscal years 1964 and 1965

Project	1963	1964 (estimated) [1]	1965 (estimated) [1]
Forest insects feeding on or under the bark [2]			
Northern Rocky Mountain States	$38,100	$50,000	$40,000
Rocky Mountain States	587,643	1,110,000	950,000
Southwestern States	157,996	150,000	150,000
Intermountain States	1,879,604	1,421,000	980,000
California	404,790	610,000	400,000
Pacific Northwest States	24,100	20,000	10,000
Eastern States	10,100	10,000	10,000
Southern States	1,309,961	1,150,000	400,000
Forest insects feeding on cones, seeds, buds, shoots, or foliage [3]			
Northern Rocky Mountain States	301,905	400,000	230,000
Rocky Mountain States	19,500	----------	5,000
Southwestern States	415,621	10,000	5,000
Intermountain States	134,490	400,000	220,000
California	1,500	----------	----------
Pacific Northwest States	144,019	60,000	20,000
Eastern States	172,381	30,000	10,000
Southern States	31,023	25,000	10,000
North Central States	42,829	110,000	50,000
Alaska	67,871	5,000	----------
Forest tree diseases [4]			
Northern Rocky Mountain States	14,375	15,000	36,000
Rocky Mountain States	15,500	13,000	72,000
Intermountain States	4,950	10,000	36,000
California	15,000	64,000	72,000
Pacific Northwest States	43,200	43,000	70,000
Eastern States	74,155	110,000	40,000
Southern States	13,569	23,000	34,000
Alaska	----------	20,000	----------
Detection and evaluation	963,282	1,024,000	1,695,000
Methods improvement [5]	----------	60,000	175,000
Equipment development	21,200	45,000	45,000
Forest Pest Control Act administration	577,916	630,676	600,000
Department of Interior forest insect and disease projects	667,949	1,281,988	900,000
Total available or estimated	[6] 8,154,529	[7] 8,900,664	7,265,000

[1] Estimates of project needs are forecast a year or more in advance of anticipated needs and are always subject to fluctuations. Adjustments are made between projects as necessary, depending on discovery of new outbreaks and expanded needs on approved projects.

[2] Includes Black Hills, mountain pine, western pine, southern pine, Engelmann spruce, black turpentine beetles, Ips, flatheaded borers, balsam woolly aphid, and scale insects.

[3] Includes spruce budworm, jackpine budworm, Douglas-fir tussock moth, elm spanworm, sawflies, Saratoga spittlebug, European pine shoot moth, white pine reproduction weevil, seed and cone insects.

[4] Includes oak wilt, dwarf-mistletoe, and *Fomes annosus* root rot.

[5] This item provides for initial implementation of a chemical pesticide screening unit, jointly financed with Forest Pest Control Act and research funds. Work on the unit was started Jan. 2, 1964, and will be further expanded in fiscal year 1965. Its purpose is to screen and field test selective nonpersistent chemicals in search of replacements for persistent chemicals currently used in forest insect control.

[6] Includes $1,284,336 of the fiscal year 1963-64 supplemental appropriation.

[7] Includes $1,715,664 of the fiscal year 1963-64 supplemental appropriation.

Activities Under Funds Transferred From This Appropriation for Insect and Disease Control

Approximately 182 million acres of forest and woodlands are administered by the Department of the Interior, including 8.3 million acres by the National Park Service, 2 million by the Bureau of Sport Fisheries and Wildlife, 13.1 million acres by the Bureau of Indian Affairs, and 159.8 million acres by the Bureau of Land Management.

White pine blister rust.—There are 606,704 acres of control area administered by the Department of the Interior (424,367 acres National Park Service, 82,485 acres Bureau of Land Management, and 99,852 acres Bureau of Indian Affairs). Blister rust has been controlled on 76 percent of these lands; 78 percent on national parks; 88 percent on Indian lands; and 50 percent on control area administered by the Bureau of Land Management. Future control needed includes: (1) maintaining control already established on some 460,000 acres, and (2) completing the establishment of control on the remaining 147,000 acres of white pine lands.

Insect and other diseases.—Increased public demand on forest areas has emphasized the importance of maintaining them in a healthy condition. This has intensified the need for additional control work. The maintenance of insect populations

at endemic levels is becoming increasingly difficult because of continued abnormal moisture conditions.

Control of dwarf-mistletoe infections on limber pine continued at Craters of the Moon National Monument and on ponderosa pine on the Mescalero Indian Reservation in New Mexico. Outbreaks of bark beetle in pine at Grand Teton, Lassen Volcanic, Yosemite, Sequoia, and King's Canyon National Parks continued. A new unit at King's Canyon National Park was also treated during 1963. Four Black Hills beetle control projects were carried out in Wyoming and Colorado. Ground surveys have been conducted on two additional units in South Dakota and Wyoming. Very good results have been reported on areas treated. A Black Hills beetle infestation in Wyoming is being treated through accelerated public works funds.

Spruce budworm infestations were aerial sprayed in New Mexico and Montana. A buildup of spruce budworm infestation in other areas of Montana is being considered for aerial spraying during fiscal year 1964. A tussock moth infestation has been reported in Idaho. Ground surveys have been conducted to determine the extent and severity of the outbreak.

Supplemental appropriations received during fiscal year 1963 assisted materially to abate the spread of Black Hills beetles in Colorado and Wyoming and spruce budworm infestations in New Mexico and Montana. Accelerated public works funds used in Oregon for forest development work have assisted in the abatement of bark beetles through elimination of host material.

(13) Acquisition of lands (Weeks Act), $500,000

A decrease of $462,000 is proposed for fiscal year 1965.

The fiscal year 1964 appropriation included $462,000 for special land purchase needs on the Chattahoochee National Forest in Georgia and the Ouachita National Forest in Oklahoma and Arkansas. This decrease will reduce the appropriation to the 1963 level which will permit continuation of a limited program of land-ownership consolidation and acquisition of private lands in national forests and purchase units.

The development program for the national forests provides for the purchase of approximately 500,000 acres important for recreation development and use and 950,000 acres for other important resource management purposes during the period 1963–72. The objective of the Weeks Act purchase program is to acquire key tracts of inholdings in national forests and purchase units, primarily in the East, which are essential to meet the public forest resource need, and to facilitate program installation and efficient administration. This purchase program provides an opportunity to reverse undesirable use patterns.

The pattern of ownership in the national forest system is quite irregular. While some areas are well consolidated, the general situation is one of Government lands intermingled with private and other types of ownership. One consequence is that some private inholdings are developed for purposes that are not compatible with the resource management programs operating on the national forests. Some lands which are suitable for tree growing and other forest resource purposes are unmanaged or in need of rehabilitation. Their resource potential will not be developed and used under the present ownership. In their present condition these lands are contributing little to the economy. There is an urgent need to acquire specific key tracts of inholdings needed for the expansion of public recreation areas in the national forests and to provide new areas for development to meet the steadily increasing demand for this type of use. Also, inholdings which are key tracts from the standpoint of effective and economical administration, or where prospects of critically needed rehabilitation are remote, should be acquired as soon as possible. It is estimated that the proposed 1965 budget will permit acquisition of 23,500 acres.

(14) Timber management research, $6,619,000

A decrease of $47,000 is proposed for fiscal year 1965.

This change involves a decrease of $83,000 from savings realized as a result of consolidation of research programs by closing out work formerly done at isolated locations, and an increase of $36,000 for acceleration of that part of timber management research concerned with animal pests which damage forest trees. Emphasis would be placed on control of animal damage to seeds and trees, through habitat manipulation and through influencing palatability of nursey stock by physiological means such as with systemics and other methods to substitute for chemical repellants or chemical controls.

Timber management research develops cheaper and more effective methods of establishing, managing, and improving forests for the production of timber and

timber-related products. The core of this research is determining the proper culture for over a hundred different commercial timber species in the United States. This silvicultural research includes seed production, seeding, planting, thinning, pruning, and stand regeneration measures. It involves the control of brush and other competing vegetation, and the protection of the new stand from animals. Other phases of the program deal with soil and site improvement for timber production, and the development of improved strains of trees through selection and breeding of superior types.

Timber management research also provides forest managers with information on the yield of forests in terms of various products such as lumber, plywood, poles, piling, and pulpwood, and the influence of cultural practices on the yield and quality of the stand. The program also includes research on methods of producing timber-related forest crops such as gum naval stores, maple sap, Christmas trees, and other income-producing natural products from forests.

This production-oriented research is backstopped by advanced research on the physiological growth requirements of forest trees, on variation and inheritance in tree characteristics that have economic value, and on new approaches to difficult measurement problems involved in the management of forest properties.

In all of this research the aim is to meet the Nation's need for production of timber and related forest crops. In view of the inroads on forest lands being made by urban expansion, highways, parks, and other developments, these future needs will not be met at reasonable cost unless technological progress in timber management is increased. Better methods must be found to reforest 50 million deforested acres, to keep existing forest lands continuously productive, to reduce the cost of growing the crop, and to increase its value for industrial use.

During fiscal year 1965, increasing emphasis will be given to research which will lower the cost and raise the value of timber and timber-related forest products, and thereby be of special benefit to underdeveloped areas. More effort will be directed toward cheaper ways to perform silvicultural operations. Attention will be given to maintaining a high standard of scientific research on the difficult basic problems which block rapid progress toward greater production efficiency.

(15) Watershed management research, $2,713,000

An increase of $36,000 would be used to strengthen the technical basis for management of national forest watersheds and adjacent water-producing mountain lands. The proposed increase would be used primarily for studies of stabilization and control of landslides on logged steep slopes and studies of techniques for preventing siltation and damage to gravelly salmon-spawning beds in the coastal streams of southeast Alaska.

Watershed management investigations are aimed at development of methods and techniques for managing forest and related range watersheds to: (*a*) increase water yields or improve the timing of water yields under a variety of climatic, soil, geologic, vegetative, and topographic conditions by changing the pattern, density or type of forest cover; (*b*) give adequate protection to soil and water resources while forest and related rangelands are being used for timber production, grazing of domestic livestock and big game, wildlife habitat and forest recreation; (*c*) rehabilitate forest and related rangeland watersheds that constitute serious sources of damaging flood runoff and sediments; and (*d*) aid forest soil development and improvement.

Between half and three-fourths of the waterflow of the United States originates in forests, associated rangelands, and alpine regions which form the headwaters of all major river systems. Generally accepted estimates of water demand indicate a doubling by 1980, and the most logical place to look for additional supplies of good quality water is in these headwater regions. However, there is ever increasing demand to use these lands for other products and services and the manner of their management can make the difference between beneficial, well-regulated, sustained streamflow of good quality or erratic and silt-laden flow of destructive character.

The objectives of the watershed management research program in fiscal year 1965 are to develop practical guides for the management of forest land for improving the yield of good quality water; to improve forest and range soils for better watershed control, and to improve and stabilize unsatisfactory watershed conditions. Highest priorities will be given to improving the management of snow in the forest and alpine zones of the western mountains where the snowpack is the main source of water for summer streamflow; to better management of wetland forests in the northern Lake States and the coastal plains of the Southeast where extensive areas are poorly drained and of low forest productivity; to ways

of manipulating forest cover to increase municipal water supplies and at the same time protect the quality of the water; to develop timber harvesting techniques to prevent erosion and landslides on steep mountain slopes; to improve management of high-elevation ranges and chaparral forests to assure watershed stabilization; to further development of watershed protection standards for logging road construction; and to development of methods for rehabilitation of severe gully eroded areas of the Southeast.

(16) Range management research, $1,161,000

No program increase is proposed for fiscal year 1965.

Range management research aims to find the best and most practical means to manage, improve, and maintain the productivity of forests and related lands used for grazing domestic livestock. It encompasses a variety of activities including: (*a*) determination of management systems and grazing intensities for the many different range types and conditions and properly coordinated with other uses, (*b*) development of range improvement measures such as conversion of low-value vegetation to desirable forage plants through prescribed burning, (*c*) determination of characteristics, responses, and requirements of range vegetation and classification of range condition and trend through studies of plant ecology, physiology, and taxonomy, and (*d*) determination of the identity and ecological relations of rodents, insects, and disease to range vegetation as a basis for indirect and inexpensive control.

Grazing is the largest single use of land in the United States and as such constitutes a substantial portion of our agricultural economy. About half the total land area of the contiguous 48 States, some 940 million acres, is grazed by domestic livestock, and all of it is important for its wildlife values. These lands furnish forage for about one-half of the beef cattle and three-fourths of the sheep for at least 6 months of the year. A total of 560 million acres is forested or forest-related rangeland. Some 240 million acres of this is in Federal ownership and blankets the headwaters of the major rivers.

Vast areas, particularly in the western mountains, have been damaged by past land use practices to the point where grazing is seriously affecting the quantity and quality of water produced. Moreover, present range forage production is far below the potential, on the average only half or less of potential, and falls far short of meeting the demands for livestock and game grazing. Demands on the forest ranges for all uses are sharply increasing. As a result, difficult problems continuously arise in the conservation and coordination of use of these lands. In the West, these lands pose many problems because of the variable and often droughty climate, highly erodible soils, and vegetation that will not withstand close grazing use. In the South, integration of grazing with timber production poses serious problems, particularly to small woodland owners. Furthermore, use by wildlife on all lands has to be carefully correlated with livestock grazing. Superimposed on top of this, particularly in the West, is the fact that nearly every forest range acre is of importance as watershed, either as a producer of water or as a potential producer of debilitating sediment.

Methods of management must be found to allow the forage to continuously renew itself in keeping with other uses. Also sorely needed are sure-footed but less costly methods of range-watershed rehabilitation and sharper criteria and methods for use by the range administrator and rancher in judging trends in range improvement or deterioration. Range research must be planned and carried out so that its results can be coordinated with and add to the findings of other Forest Service research on wildlife, timber production, watershed management, and recreation. The results are needed to harmonize multiple use management.

It is intended to move ahead on the highest priority studies in 1965. These include: Increased emphasis on ecology and physiology of forest range vegetation as a basis for improved range management; studies of improved management systems and grazing intensities for the high mountain ranges of the intermountain West, the forested ranges of California and the Pacific Northwest, the annual plant ranges of California, and in Idaho the cheatgrass and grass-herb types on steep granitic soils; conversion and management of the woodland and chaparral type in California and Arizona; studies of gophers and other range pests in the Rockies; comparison of pellet seeding with success and costs of other seeding methods in New Mexico and Arizona; rehabilitation of mountainous livestock and elk ranges of the northern Rockies; range site evaluation, management, and type conversion in the Ozarks; integration of cattle grazing, timber production, and wildlife in the South; publication of a westernwide evaluation of range

forbs; studies of range inventory-analysis techniques required in public land administration.

(17) *Wildlife habitat research, $595,000*

No program increase is proposed for fiscal year 1965.

Wildlife habitat research is concerned with the development of management and improvement practices for supporting optimum populations of game and fish in harmony with production of timber, water, and livestock on forest and related rangelands. Management and improvement of wildlife habitat is complex as each kind of animal has specific habitat requirements that must be balanced against requirements for production of water, timber, and forage for livestock. Research involves studies of forage utilization and environmental factors on seedling establishment and survival. Special practices are developed for increasing food and cover for both big and small game by seeding, planting, burning, spraying, and fertilizing. As a basis for successful integration of wildlife, livestock, and timber production, the nature and degree of competition between wildlife and livestock are determined for various types of forest and rangelands, as well as effects of silvicultural and timber harvesting practices on food and cover plants and reciprocal effects of forage production and wildlife grazing on timber reproduction and growth. Research on fish habitat improvement includes studies of regulating shade and water temperatures through manipulation of streamside vegetation, creation of gravel spawning beds, and stabilization of channels.

Forest and related rangelands provide the main habitat for an estimated 10 million big game animals as well as for countless numbers of other species of wildlife. These lands also contain over a hundred thousand miles of fishing streams and more than 2 million acres of lakes. Demands on these resources are continually increasing, and will have to be met in large measure by the public lands. But game, particularly small game, can be an important source of income for private ownerships, including the small farm woodland owner. In the Southeast, for example, it is not unusual to lease quail hunting privileges for $1 per acre per year. A farmer with good bird dogs and good hunting can realize as much as $50 for a party of two men per day. Information on ways and means to manage and increase habitat productivity for upland game is needed by small woodland owners as well as large forest industry landholders and public land administrators. The wildlife habitat research program involves active cooperation with Federal (particularly the Fish and Wildlife Service and State fish and game agencies and educational institutions.

Although habitat conditions on some areas are suitable for supporting high wildlife and fish populations, the capacity of most forest and related rangelands can be greatly increased. Some of the low-producing areas are the result of damage from logging, fire, or overuse by livestock or big game, whereas others are due to the natural development of vegetation that is unproductive for wildlife. In some areas deterioration of the vegetation cover and accelerated soil erosion have resulted in unfavorable water temperatures, excessive stream siltation, unstable channels, and exposed banks. Consequently, many streams flowing through these lands are below their potential for fish production. In some western mountain streams dense shade from riparian vegetation maintains water temperatures too cold for trout.

In the West, emphasis is placed on studies concerned with rehabilitation of big game winter ranges; integration of wildlife and timber production, competition and resolution of conflicts between big game and livestock, and habitat management to improve game distribution and allow efficient utilization of available forage and cover, and manipulating livestock range improvement practices such as sagebrush and juniper control to provide for food and cover plant needs of big and small game. In the South, and Southeast, studies include the integration of deer and small game with timber and livestock production. In the Northeast and the Lake States major emphasis is on studies to improve habitat and reduce wildlife damage to northern hardwood species through modification of silvicultural practices. In the Central States studies are concerned mainly with small upland game habitat management and revegetation of forest openings with suitable food and cover plants. In the Applachian States research will include management and habitat improvement for turkey, grouse, and deer. In the Northern Lake States, research will be undertaken on upland game habitat in the northern hardwoods and related swamp types. In the Missouri Ozarks, research will be focused on wildlife habitat evaluation, improvement and management of upland game, and integration of wildlife and timber production. On national forests and other public lands research will emphasize how best to improve habitat and at the same time to integrate wildlife use with use of the land for timber and livestock production.

(18) Forest recreation research, $421,000

No program increase is proposed for fiscal year 1965.

Forest recreation, once considered a minor use of the forest, has become a major use and has created many problems that cannot be solved quickly and efficiently without supporting studies that are soundly organized and carried out. In 1940, the national forests received 16 million visits. Last year this number increased to 113 million. Millions more are visiting other public and privately owned forest recreation areas—and the upward trend will continue. This buildup must be fitted into increasing demands for water, timber products, wildlife, forage, and other forest resources. As part of the Department of Agriculture's program to aid farmers, especially in economically depressed rural areas, research hastens identification and evaluation of opportunities to develop income-producing recreation by the small woodland owners.

Forest recreation research is underway at 8 of the 10 forest experiment stations. Current studies are pointed toward (*a*) the management of the recreation site—to determine how campgrounds, picnic areas, and other developed areas receiving heavy use may best be planned and managed to prevent damage to soils and vegetation and be maintained without costly rehabilitation of wornout sites, (*b*) to better understand the essential requirements for recreational habitat and developments of those who use the recreation sites; and (*c*) to identify and explore the economic opportunities for developing income-producing recreation enterprises on privately owned (often farmer owned) woodlands—with particular emphasis on economically depressed rural areas.

Further emphasis is needed to strengthen established projects of highest priority including: (*a*) studies of the demand for, and income opportunities from, fee-operated small woodland recreation enterprises in the Midwest, northern California, northern Great Lakes, and Appalachian regions; (*b*) studies of forest recreation visitors' wants and needs, their attitudes in integrating recreation use with other forest uses and of ways to properly integrate these uses; (*c*) related studies of wilderness area visitors and use and essential management practices to preserve wilderness conditions, and (*d*) studies of forest recreation site soils and vegetation aimed at improving methods of selecting new sites for development, restoration of wornout sites, and management of sites to prevent damage from heavy use.

(19) Forest fire research, $1,848,000

No program increase is proposed for fiscal year 1965.

A major element in conserving and managing the natural resources of forest, brush, and grasslands is to protect them from wild fire. In 1962 the cost of this effort nationally rose to $140 million for 115,345 fires that burned 4,078,894 acres. Damages are estimated at $100 to $300 million. In the last 10 years, both numbers of fires and area burned have been reduced significantly, but the damage done each year has declined only slightly and suppression costs have risen sharply. The rapid increase in population and use of forest resources has greatly increased the size and complexity of the fire protection problem. Each year these resources become more vital to the public need so more adequate means of fire protection must be developed.

Research on forest fires is directed toward reducing fire losses, improving efficiency of fire prevention and control measures, and toward better techniques for using fire beneficially in forest and range management. Human attitude and behavior studies are laying the groundwork for improved fire prevention methods. Studies of thunderstorms and ways to reduce their fire-starting lightning discharges are continuing. How to predict fire behavior more reliably for better and safer firefighting is being developed through intensive study of environmental factors that control the way fires burn. New chemicals and other additives to water that improve its firefighting efficiency are being developed and tested. Also under study are fire effects and how to achieve best results from fire use for hazard reduction—including slash disposal, modification or control of vegetation, seed bed preparation, and other purposes.

The frequency of wild fires in the Southern States must be drastically reduced if the forest products industry is to continue to serve as a primary industrial base. Since 1956 the Southern State conservation agencies have expended much effort toward stronger law enforcement and faster attack on fires, but the number of fires, the area burned, and the losses suffered have increased. In Alaska the State forester is faced with taking over management of 100 million acres of forest land to be protected and managed by the State. To convert a skeleton system of protection developed by the Department of the Interior to a State system of protection of managed forests for the future is a bold and difficult undertaking.

Conventional measures will not suffice. State officials and those charged with protecting hundreds of millions of acres of Federal lands need greatly advanced technology and improved guidelines for the careful planning necessary to the development of an extensive but practical system.

The forest fire research program is attacking problems of reducing the numbers of fires that start, in finding out how to organize every step of preparedness action most efficiently, and how to combat fires rapidly and successfully—especially those of conflagration potential. In fiscal year 1965 emphasis will be given to research aimed at the more troublesome high priority problems. An example of this is the lightning prevention project in the northern Rockies where results so far suggest lightning may be reduced 38 percent and therefore numbers of fires may be cut.

Firefighters still cannot determine unerringly which of several small fires starting about the same time is going to develop into a major conflagration because of lack of fire behavior knowledge. Fuel-weather-topography studies will attempt to categorize the extremely dangerous combinations of conditions. Studies of thermal energy relations produced by fires, winds, and mountain slopes will be directed toward a better understanding of mass fire behavior. The relation of man, who starts 90 percent of our fires, to the whole fire control problem will be examined with the hope that new ways may be found to successfully break careless, thoughtless, or deliberate actions that lead to serious resource damage, loss of life, and heavy fire suppression costs.

In both the East and West, various fire retardants developed by research have been pressed into service in aerial attack by Federal and State agencies. The potential of aerial attack to limit aggressive fires to small size in otherwise inaccessible areas has proved increasingly valid, and the method is being extended rapidly. However, aerial attack is potentially a costly and dangerous method unless skillfully planned and applied. To provide the most effective retardant for the purpose, to adapt it to both aerial and ground applications, and to supply adequate guidelines for skillful use, requires a more aggressive research program to again bring research findings in advance of practice.

(20) *Forest insect research, $2,241,000*

An increase of $200,000 would be used to intensify the search for pest control methods that will reduce the hazards at present associated with chemical control. All phases of indirect biological approaches will be strengthened including studies of parasites, predators, and pathogens of western and southern barkbeetles and eastern and western defoliators; use of systemic materials or improved chemical formulations to substitute for more hazardous methods; and research on the biology and ecology of insects so that their behavior in relation to silvicultural control may be understood and applied broadly in timber cutting operations.

Research on forest insects is directed toward the prevention or control of destructive insect attack on forests and forest products. Damage by insects enters into all phases of forest management from the seed to the mature forest. The development of effective and economical methods of direct and indirect control is dependent upon thorough knowledge of life histories and habits of forest insects, including the interrelationships between the insects and their environments. Control of forest insects by indirect methods such as the use of natural or introduced predators and diseases of insects, by silvicultural practices designed to prevent the buildup of insect epidemics, and by radiation and chemosterilization techniques, offers promise and is being given major emphasis in the research program. Investigations on direct control methods involve mechanical and chemical methods, including development of safer chemical controls.

Insect research is concerned with the development of safe, effective, and economical methods of preventing or controlling destructive infestations of forest and shade tree insects, and insects affecting browse plants on forest-related ranges. Included among these insects are those that kill trees outright, such as the barkbeetles that cause heavy losses in the West and South. Included also are (*a*) a wide variety of species that feed on the foliage of trees and either kill them outright or reduce their vigor and growth; (*b*) insects that damage or destroy the flowers, seeds, and cones of trees; (*c*) borers that tunnel into the wood and reduce its value through degrade; (*d*) borers that damage or destroy valuable forest products, such as logs, lumber, and pulpwood; and (*e*) various insects that damage or destroy young trees in forest plantations. No part of the country is immune to the ravages of these insects, and no year passes without one or more of them occurring in the form of outbreaks.

During an average year insects kill enough commercial sawtimber to build some 600,000 average-size homes; during periods of outbreak, which occur at

frequent but unpredictable intervals, these losses are much more severe, often bordering on the catastrophic. In addition, insects kill a billion cubic feet of timber below sawtimber size and cause a growth loss of three-quarters of a billion cubic feet each year. Forest insect outbreaks also result in increased fire danger and often set the stage for destructive fires which impair valuable watersheds and wildlife habitats. They jeopardize the success of seed orchards and tree-planting programs; they destroy enormous volumes of forest products, such as logs, lumber, and pulpwood; and they reduce the carrying capacities of forest-related ranges for livestock and big game. Insect-caused losses such as these show no signs of decreasing. Instead they seem to be increasing in severity year by year. Public demands for relief from them are becoming increasingly insistent.

The program for fiscal year 1965 will deal with research on the causes of outbreaks of some of the most destructive forest insect pets as a basis for developing safer, cheaper, and longer lasting methods of preventive control. In this connection special emphasis will be placed on studies of biological control factors, such as insect parasites, predators, and disease pathogens. Increased emphasis will likewise be placed on (*a*) studies of other environmental factors affecting insect populations, such as stand age, condition, and density; (*b*) on determining factors of tree resistance to insects as a basis for developing resistant strains or hybrids for use in planting programs; and (*c*) on exploring possibilities of control through the use of chemosterilants, and gamma irradiation, and attractants and repellents, and for the development through genetic manipulation of more effective strains of insect parasites and predators. Studies in chemical control will be strengthened, with emphasis on determining modes of action of chemicals on and in both insect pests and their host trees, as a basis for developing (*a*) safer and more selective materials and formulations, and (*b*) safer and more effective means of application.

(*21*) *Forest disease research, $1,767,000*

An increase of $41,000 would be used to strengthen research on the serious diseases that are doing extensive damage in young natural stands and plantations, and to valuable natural hardwood forests. In the West the work would emphasize study of soil microbiology with the aim of developing the basis for biological rather than chemical control. Particular attention would be given to exploring new leads for using naturally occurring antagonistic fungi found where root rots are common. Elsewhere the emphasis would be on finding more effective controls for diseases that damage high-value hardwoods by determining the biological stage in the development of fungi that may make them vulnerable to effective control through biological or indirect silvicultural methods.

Research on diseases in forests, forest tree nurseries, and on decays and stains of forest products provides the basic information on the causes of diseases and on practicable and effective methods of combating them. Studies are underway on the identification and life history of the pathogens that cause disease, on the environmental conditions that result in disease epidemics in forests, on direct control by chemical and mechanical methods, on indirect control through silvicultural practices and genetic resistance, and on the improvement of disease survey techniques. In the products field, research is directed to the determination of methods of handling logs and lumber to prevent fungus infection; of the proper use of naturally durable or treated wood in high-hazard locations; and of improved structural design to reduce decay of wood in service.

Forest disease research develops the scientific knowledge on which the control of a wide variety of pathogens rests. Detailed knowledge of tree diseases, their preferred hosts and favored environments, permits several sound approaches to control; development of cultural practices favorable to forest trees but unfavorable to disease; selection and breeding amongst the hosts for genetic resistance; recognition of potentially dangerous foreign pathogens that they may be excluded by effective quarantines thus avoiding another disaster or costly control program such as the chestnut blight or white pine blister rust; and direct preventive or curative treatments. Emphasis is placed on cultural practices that can be incorporated at minimum cost into daily stand management practices, but all approaches are explored where appropriate. For example, research has shown that prevention of fire, reduction of logging wounds, and lowered ages at which timber is harvested will drastically reduce losses from heart rots, the No. 1 disease problem; that ribes eradication will control white pine blister rust, and more recently that proper recognition of climatic influences will drastically reduce the needed control area in the Lake States and in California; biologic and economic studies show where thinning and pruning for dwarf mistletoe control can best be combined with other timber stand improvement measures to improve future

yields; good progress has been made in selecting and breeding for genetic resistance to white pine blister rust, fusiform rust, and chestnut blight; and direct application of chemicals has tremendously reduced losses in forest tree nurseries.

In spite of substantial progress in lessening the impact of diseases on forests, we still lose billions of board feet of timber each year to an array of organisms such as bacteria, fungi, viruses, nematodes, and even flowering plants. In some situations, we are committed to long-continuing high annual disease control expenditures, such as for white pine blister rust, until better methods are found. Intensive forestry, now gaining in the South and West especially, is continuously harassed with disease problems. Soil-borne diseases and related root rots are presently less understood than any other category of forest tree diseases. Yet, the upsurge in reforestation and afforestation, often by planting a single species over extensive areas, is intensifying these and other plantation diseases.

The program for 1965 will emphasize the search for sounder and more effective controls of forest tree diseases based on better knowledge of the organisms and how they are affected by various environments, how antibiotics suppress fungus infections in trees, and how soil organisms interrelate and operate to cause root rots. Work will continue on developing an understanding and control of heartrots, vascular diseases such as oak wilt, rusts, leaf-destroying fungi, and the dwarf-mistletoes of Western conifers. Research on preventing decay to wood used in structures also will be emphasized.

(22) Forest products utilization research, $5,069,000

No program increase is proposed for fiscal year 1965.

The aim of the forest products research program centered at the Forest Products Laboratory and with field projects at the various regional forest and range experiment stations is to contribute to the solution of national, regional, and local utilization problems of all types, especially to problems of rural area development that often are related to improved utilization of the timber resource; to reduce unused woods and mill residues to a minimum by finding uses for present residues; to develop new products; and to improve the serviceability and lower the costs of existing products. Its broad aim, in brief, is to develop new utilization outlets for thinnings, unpopular and little-used species of timber, logging and milling residues, and to make the whole timber crop on farms and other forest lands go further and give better service in a wide variety of uses for lumber, paper, chemicals, and other products derived from wood.

The timber-using industry is an important part of our present economy. In 1959 the total value of shipments from timber-based primary manufacturing industries amounted to over $10 billion. About 5 percent of the gross national product originated in timber-based industries. One out of every twenty people employed in the United States worked in these industries. A raw material base for a greatly expanded industry is available in little used species, in low-value timber, and in logging and milling residues. Research in forest products utilization is needed not only to give stability to the present industry but also to develop a technical basis for new industries.

The Federal Government has a strong interest and responsibility in forest products utilization research. The industry in general is a complex of many small companies. Even the largest are small in comparison to those of other basic industries with whom they compete, i.e., aluminum, steel, plastics, and petroleum. One single large petroleum-using company employs more researchers than the entire timber-using industry. There are very few forest products companies who can finance a research program. Those that do are largely interested in product developments which will give them a competitive advantage; they pay little attention to finding uses for the poorer species and sizes of trees often in abundance.

The future of forestry in the United States will be jeopardized unless profitable use can be made of all of the forest crop. The problem is especially acute on the considerable acreage of timber in small ownership. Here the continued "creaming off" of the better timber has resulted in a residual stand of low value under present use standards. Research is needed to develop uses for this presently unmarketable timber. Many of the areas currently experiencing severe economic distress must look to full and effective use of their timber resources as the primary means for permanent improvement of their economic situation. The Federal Government itself markets over $150 million worth of timber each year. The value of this timber can be greatly enhanced by the development of more profitable uses. Also proper forest management will be facilitated by developing markets for thinnings and other low-value timber.

The 1965 program will support basic and applied research in forest products utilization, aimed at furthering intelligent and profitable use of the timber crop. The work involves the development of new and improved processes and uses, the improvement in the serviceability of wood in use, and characterization of timber and timber products for specific end uses. Attention will be focused on the problems of developing new and improved industries for areas now experiencing economic distress. Emphasis will be given to the utilization of hardwoods which are abundant in most of these depressed rural areas. More attention will be given to applied and developmental research which would result in the early establishment of new industries.

(23) Forest engineering research, $300,000

An increase of $75,000 would be used to develop new engineering systems for harvesting and transporting timber in situations where (*a*) low quality, small volume, or small size of timber leads to marginal operations, (*b*) national forest timber is now inaccessible and inoperable because of excessive road building costs, and (*c*) new systems of logging are required on steep ground or high value watersheds.

Forest engineering research involves developing new systems and techniques of forest resource production, protection, and utilization that will lower costs and improve the efficiency of operations. It is concerned with better engineered performance and mechanization in the more complex aspects of multiple-use practices. Multiple-use requirements dictate that new and sometimes revolutionary systems be developed to facilitate protection and optimum production for all uses of the forest under intensive management practices.

Vastly improved transport and harvesting methods are needed to assure protection of soil and water resources, to harmonize timber harvesting with other multiple-use requirements such as recreation, and to avoid loss of timber-growing areas to road rights-of-way. Industrial research in engineering has been confined to specific equipment for scattered unrelated projects with relatively limited objectives in contrast to research on coordinated systems required by multiple-use considerations. The Forest Service's engineering research program is designed to fill this latter need. The relative inaccessibility of many national forest lands and their high values for recreation, watersheds, wildlife, and timber require strong engineering advances.

It is estimated that in Oregon and Washington alone there are at least 28 billion board feet of timber characterized by low volumes per acre, steep terrain, or costly road access which will require special harvesting and removal techniques, such as by helicopter or other systems and machines specially developed to accomplish harvesting of this timber. In Alaska, there are an estimated 61 billion board feet of timber which cannot be successfully logged with conventional systems because they are either too costly to the operators or too damaging to soil, water, and scenic values. Logging systems and equipment specially designed for economical timber harvesting and cultural operations on small woodland ownerships are nearly nonexistent. Specialized equipment is urgently needed. In eastern hardwoods, some 74 percent of the total volume is considered low grade and culls. Vastly cheaper harvesting methods must be developed if such low-quality timber is to be removed economically and the sites replanted to better species. Sharply reduced nursery and planting costs are needed to accelerate the job of replanting 50 million acres of idle or poorly stocked commercial forest land.

In fiscal year 1965, emphasis will be placed on evaluation and adaptation of helicopter logging systems in the Pacific Northwest and Alaska; low-cost transport of woodpulp chips by pipeline or other methods that will permit economic utilization of small-sized timber; better engineered systems of harvesting low-grade timber on small forest properties and mechanization of harvesting and site conversion.

(24) Forest survey, $1,854,000

An increase of $150,000 would be used to accelerate and strengthen survey activities to make available essential forest resource information needed for planning major forestry programs and forest industrial development. Survey activities would be intensified especially in the Lake States, Pacific, and Southern regions where the need for up-to-date resource information is most pressing.

The forest survey provides a continuing inventory of the Nation's important forest land and timber resources including the area, location, and condition of forest resources, timber volumes available, rates of timber growth, cut, and mortality, and trends in timber supplies. The forest resources of the Nation, comprising some 775 million acres, vary greatly in productivity and availability for

industrial use and show widely divergent trends in growth and depletion. Federal, State, and local forestry agencies need up-to-date knowledge of the changing trends in timber supplies to provide an evaluation of the effectiveness of and need for forestry programs, including programs for redevelopment of rural areas where timber resources are important. Because of increasing pressures among the various uses of forest land, and rapidly changing resource and industrial conditions, forest industries rely more and more upon the forest survey for resource information essential to business decisions regarding land acquisition, wood procurement programs, and the feasibility and locations of new or expanded industrial plants.

The proposed budget will make possible increased survey efforts to more adequately meet needs for forest resource information in regions where timber supports a major segment of the economy. Special attention would be given to appraising the availability of timber resources for rural areas where timber is the primary resource available on which to base additional economic activity and employment. Surveys also would be accelerated in the Pacific and Southern States where rapid changes occur in timber resources due to growth, heavy industrial cutting, and changes in land use. As a result of inflationary factors and increased needs for resource data, the area surveyed annually has declined from about 53 million acres in 1949 to 43 million acres at present. Coverage of about 55 million acres annually, or an average resurvey cycle of about 10 years for the country as a whole, is deemed desirable to meet essential needs for resource data. Amendment of forestry survey legislation in 1962 raised the annual authorization for the forest survey from $1,500,000 to $2,500,000 to permit faster progress on this important research project. The requested increase will not permit meeting the goal of surveying 55 million acres annually but will reverse the downward trend of the last few years.

(25) Forest products marketing research, $1,016,000

No program increase is proposed for fiscal year 1965.

Forest products marketing research includes a wide variety of studies aimed at expanding uses of wood through development of more efficient arrangements and practices for harvesting, processing, selling, and distributing forest products. Marketing research also includes studies to appraise the feasibility of new or expanded timber industries, particularly plants based on low-quality timber of little-used species and the available resources in economic problem areas. Other research involves comprehensive analyses of trends in consumption and potential future demands for lumber, pulp and paper, and other wood products for construction, manufacturing, shipping, and other end uses, and the relation of prospective markets and timber supplies.

Many forest landowners fail to realize full returns from timber management and harvesting because of lack of market knowledge and ineffective timber marketing systems. Inefficient processing and marketing of timber products results in low returns to many wood-processing industries and difficulties in competing with nonwood materials in many consumer markets. Development of new or expanded markets for wood products is of importance to several million landowners and is especially needed in low-income rural areas in need of economic development. Research to appraise the outlook for future timber requirements and prospective markets is of particular importance both to wood-using industries and to Federal and State forestry agencies in guiding formulation of forestry policies and programs.

Emphasis will be given studies of possible methods for increasing efficiency and lowering costs in the harvesting, processing, and marketing of forest products in the major timber-producing regions. Market development studies will determine the quantity, location, and kinds of timber available in specific areas, and the economic feasibility of establishing new or expanded wood-using industries, especially in heavily forested low-income areas. Research on timber valuation and pricing procedures will include methods for estimating logging and milling costs, end-product values, and profit allowances as a basis for improved appraisals in marketing both public and private timber. Studies will be continued of nationwide trends in present and prospective demands for wood products and competing materials and the outlook for wood in various markets. Such information, together with projections of timber supplies, is vitally needed for judging the Nation's timber situation and outlook and the need for major forestry programs.

(26) Forest economics research, $540,000

No program increase is proposed for fiscal year 1965.

Forest economics research provides information on income, prices, costs, and investment guides relating to use of the 4.5 million individual forest ownerships

that make up some 60 percent of the Nation's commercial forest land, to the management of more than 60 million acres of industrial forests, and to the administration of 130 million acres of national forests and other public lands. This research includes studies involving the economic benefits from establishing, managing, protecting, and harvesting of timber crops; the development of principles and guides for the coordinated management of timber and other land uses for water, recreation, livestock, and wildlife; and the evaluation of alternative public and private forestry programs on various classes of ownership.

Pressures on both public and private forest lands for production of timber, recreational services, and other products of the land are steadily increasing, and problems of achieving efficient allocation of capital and administration of forest land have correspondingly intensified. Forest economics research serves to guide actions to achieve increased benefits from the most efficient forest enterprises, and to provide an objective basis for resolving problems and conflicts in an expanding forest economy.

Research must identify the most promising opportunities for improving forest income and employment and determine possible adjustments in public forestry programs or new measures for improving the level of management and productivity on the vast forest area in small forest holdings. Research will be continued in all important forest regions to appraise the benefits realizable from investments in planting, timber stand improvement, and other land treatment measures as influenced by site, accessibility, markets, and other factors. Studies of the economic aspects of insect and disease control programs relating to white pine blister rust and dwarf mistletoe, for example, will be continued in the West and Northeast as a guide to size and intensity of programs. Research on critical problems of multiple-use management will also be continued in the West to help resolve conflicts among recreation, timber, and other forest land uses in problem areas where there is need for improved economics criteria to guide the management of forest land.

(27) *Forest research construction, $3,800,000*

An increase of $3,165,000 would be used for construction of an addition to the Forest Products Laboratory, Madison, Wis. In fiscal year 1963 Congress appropriated funds for the architectural and engineering planning of this Laboratory so construction could be started early in fiscal year 1965. The proposed construction is an addition to the existing Laboratory built in 1932 which is now entirely inadequate. The added space would accommodate research emphasizing the development of new uses and improvement of existing uses for wood and fiber products. Also, space would be provided for research in wood chemistry, wood engineering, and wood quality. The proposed facility is essential to speed research on problems confronting a countrywide distressed domestic lumber industry. This work will directly benefit many of the rural areas currently experiencing economic distress where the lower quality timber and the sizes and species now little used predominate. Finding ways to effectively utilize these timber resources is basic to the development and operation of permanent timber-based industries which will provide stable employment, markets for existing forest products, and improved local economies. Such utilization will also materially add to the usable timber resources of the Nation for meeting future forest products needs.

No other major construction is provided for in 1965. However, approximately $60,000 of other research project funds will be used in connection with the planning and design of a combined regional office and research station headquarters at Philadelphia, Pa.

The 1964 appropriation provided for the following nonrecurring construction items:

Alexandria, La	$450,000
Designs and specifications for the following:	
Morgantown, W. Va	31,500
Fort Collins, Colo	79,000
Sewanee, Tenn	18,500
Missoula, Mont	28,000
Houghton, Mich	28,000
Total	635,000

(28) Cooperation in forest fire control, $12,758,000

An increase of $250,000 would be used to strengthen this program which covers about 440 million acres of forest land and nonforest watersheds in 49 States. These State and private forest lands produce 85 percent of all our forest products and play a key role in the Nation's economy. The annual burn on these lands is being reduced, but still far too much is burning each year. Over the past 10 years the annual burn has averaged almost 6 million acres, an area the size of Vermont. The direct losses during this same period averaged $80 million each year, including damage and costs. This reported loss does not include indirect losses to timber due to decay following a forest fire, replacement of desirable species by less valuable ones; or site deterioration and erosion, uncertain streamflow; or the destruction of fish and game habitat, and recreational resources.

The Forest Service cooperates with the States to secure permanent and adequate fire protection for State and private forest and watershed lands Each State exercises direct supervision and administration of the fire job within the State but Federal guidance, leadership, and financial assistance are necessary for nationally correlated permanent and adequate fire protection. State forestry agencies are doing much to reduce fire losses. Single forest fires that burned 3 million acres were not uncommon in the early 1900's. Losses to forest resources were severe and lasting As a result of State-Federal efforts large fires are now uncommon and resource losses have been greatly reduced. The most recent study shows that it would cost $83.5 million annually to provide adequate protection to 435 million acres of forest and watershed lands. In fiscal year 1962 total Federal-State expenditures were over $64 million. The Federal contribution to this program was $12.5 million. In spite of this progress, fire protection effort is only about 75 percent of that needed. Not all of the acres in need of organized protection is now getting it. Some 24 million acres are unprotected and over 200 million acres are not well enough protected to prevent excessive fire losses during hazardous seasons.

The 1964 appropriation is $12.5 million. Annual State and private expenditures during the past 10 years have increased by over $26 million. During the same period, Federal funds increased but $3 million.

Fifteen years ago Federal financial assistance in cooperative forest fire control was 40 percent of the total cost; 10 years ago it was 25 percent; and now it is 18 percent. The Clarke-McNary Act authorizes a 50–50 sharing of the costs and an annual appropriation of $20 million.

Adequate forest fire protection is particularly important to the economically distressed areas as their future economy is so greatly dependent upon their timber, recreation, wildlife, and water resources Due to the nature of the fire problem, such protection must be provided through the States, as it is impossible for the individual small landowner to provide adequate fire protection for his lands Failure to provide such fire protection can result in the destruction of these resources with a resulting serious immediate and long-term economic impact.

The proposed 1965 program would make possible some intensification of protection on lands now under organized protection but where serious fires occur during hazardous fire weather due to protection inadequacies. The increase would be used to add fire protection manpower and equipment. Fire prevention work would be stepped up by using more manpower and educational equipment to reduce the mounting number of fires. With more and more people using the forested areas, the chances of fire starting has increased. There has been an average of 112,000 fires each year over the past 10 years. The number of wildfire starts has not been in a steady decline as has the area burned. Ninety-seven percent of these fires are man-caused.

Cooperative Forest Fire Control Program

The following table shows fiscal year 1964 tentative allotments to States and the fiscal year 1963 expenditures for the State and private cooperative forest fire control program.

	State and private funds expended, fiscal year 1963	Federal allotments, fiscal year 1964 [1]		State and private funds expended, fiscal year 1963	Federal allotments, fiscal year 1964 [1]
Alabama	$1,134,546	$390,500	New Hampshire	$239,633	$85,200
Alaska	188,569	47,000	New Jersey	503,713	130,100
Arkansas	1,103,773	375,500	New Mexico	141,371	47,000
California	16,537,366	1,112,000	New York	828,397	289,700
Colorado	123,891	48,200	North Carolina	1,591,100	451,900
Connecticut	311,514	61,200	North Dakota	9,235	14,000
Delaware	15,264	15,500	Ohio	322,755	120,400
Florida	3,231,441	571,200	Oklahoma	203,428	168,800
Georgia	3,035,464	575,200	Oregon	2,436,856	544,200
Hawaii	33,065	30,000	Pennsylvania	1,159,609	255,700
Idaho	449,555	201,500	Rhode Island	118,797	47,000
Illinois	135,888	68,100	South Carolina	1,408,155	387,700
Indiana	114,825	51,900	South Dakota	65,832	47,000
Iowa	81,328	47,000	Tennessee	1,158,529	355,200
Kansas	8,908	15,000	Texas	869,450	338,100
Kentucky	791,423	246,400	Utah	117,491	47,000
Louisiana	1,704,659	477,100	Vermont	55,545	47,000
Maine	981,953	330,300	Virginia	1,155,517	355,600
Maryland	451,061	149,800	Washington	2,940,095	553,500
Massachusetts	387,369	133,500	West Virginia	366,697	167,200
Michigan	1,964,735	480,300	Wisconsin	1,641,810	423,800
Minnesota	751,900	302,900	Wyoming	41,384	47,000
Mississippi	1,868,567	457,700	Administration, inspection, prevention, and special services to States	865,500	914,500
Missouri	823,679	274,700			
Montana	372,929	137,300			
Nebraska	15,909	25,000			
Nevada	250,015	52,100	Grand total	55,110,495	12,514,500

[1] While the amount available to a State may, if the allotment is small, exceed previously computed expenditures by that State, the actual payment to a State never exceeds State and private funds expended by or expended under the control of the State.

(29) Cooperation in forest tree planting, $300,000.

No program increase is proposed for fiscal year 1965.

The Forest Service cooperates with the States through financial assistance and technical and other services in the production, acquisition, and distribution of forest and windbarrier planting stock to assure an adequate supply for planting at a reasonable price that will encourage forest tree planting on private and non-Federal public lands. Current estimates indicate that there are 70 million acres of unproductive lands in these ownerships in need of forestation by planting and seeding. At the current forestation rate, it would take over 70 years to accomplish this forestation work. Most estimates of future needs for timber indicate that the rate of forestation needs to be at least doubled or possibly tripled. Federal leadership and financial participation is necessary to restore these unproductive lands to productivity and meet the Nation's timber resource needs and strengthen the basis for stronger local economic stability. This cooperative forest tree planting program also provides, from State-owned forest tree nurseries or by purchase from commercial nurseries, planting stock needed for Federal conservation programs under authority of the (*a*) agricultural conservation program, (*b*) Flood Control Acts of 1936 and 1944, (*c*) title IV of the Agricultural Act of 1956, (*d*) Watershed Protection and Flood Prevention Act of 1954, (*e*) Great Plains conservation program, and (*f*) Food and Agricultural Act of 1962.

Program objectives are, through cooperation with 48 States and Puerto Rico, to maintain in efficient operating condition more than 100 State forest and windbarrier planting stock nurseries and packing, distribution, seed processing and seed and seedling storage facilities, and to use effectively these facilities to grow and distribute windbarrier trees for planting on non-Federal land. The Federal financial contribution cannot exceed in any State the net State expenditures. Of particular importance is the support to be provided the States in the improvement of nursery facilities and operation, planting stock storage and transportation facilities, seed acquisition, production, processing, and storage in addition to financial help in growing and delivering the planting stock to landowners at reasonable prices. A strong nationwide State tree planting stock production and distribution program will be maintained to meet on short notice increases in demand for trees which could develop from the tree planting incentives in the Food and Agricultural Act of 1962, public works acceleration or other programs.

The 1965 objective is to assist the States in production of 800 million high quality seedlings for distribution to private landowners for reforestation of approximately 1 million acres.

(30) Cooperation in forest management and processing, $3,018,000

An increase of $500,000 would be used to provide technical assistance to an additional 18,000 of the owners of the Nation's 4.5 million small private forests and to 1,000 of the 50,000 operators of small sawmills and plants processing primary forest products. The owners to be served do not have the necessary technical skills to manage their forest lands or market specialized products. The processors of primary forest products to be served through whom small woodland owners find markets need technical assistance in processing and marketing timber and other forest products. These technical services will derive from the affected local forest resources the benefits for the rural community that these resources are potentially able to contribute.

The objectives of the program are to help as many of the owners and the loggers and processors serving them as is feasible to produce a greater volume, variety, and value of products from the 257 million acres of small private forests. Local economies in particular and the national economy in general will be benefited by improved returns to the small woodland owner. Improved management of these small forest ownerships will contribute to the solving of rural area and community problems of underemployment and low income and to the general economic and social well-being of rural areas.

To accomplish these objectives the Forest Service cooperates with 49 States and Puerto Rico. Through this program the States employ Service foresters to provide technical advice and service to woodland owners in multiple use management which includes tree planting and seeding; natural regeneration of timber stands; protection from fire, diseases, insects, and animals; timber stand improvement; timber harvesting; marketing of timber and special forest products; erosion control on woodland and logging roads; watershed protection; woodland grazing and recreation and wildlife management. These Service foresters or other specialists employed by the State foresters also give technical advice to loggers and processors on improved techniques, making more complete and better utilization of the timber, reducing costs, and making better products. They also assist in locating markets, determining market demands, improving marketing procedures, and scheduling production to meet market needs.

The Service foresters directly support other related national programs including rural areas development, area redevelopment, civil defense, agricultural conservation, soil conservation districts, and the Farmers Home Administration forest credit program.

The proposed fiscal year 1965 financing, when matched with State funds, would make it possible to provide assistance to 111,000 forest landowners and 10,000 processors of primary forest products.

(31) General forestry assistance, $879,000

An increase of $250,000 would be used to provide specialized technical forestry assistance in planning and activating programs involving the use of forest lands and the available industrial wood which will improve the economic and social well-being of communities and people largely dependent for employment and other financial benefits from the use and management of forest land and the processing of its products.

With the above increase, an additional 15 forest specialists would be employed largely to provide specialized technical services to State and local groups in support of the Department of Agriculture rural areas development program by giving assistance primarily to local committees and groups on timber inventory, markets for timber products, plant layout, economic aspects of timber industries, forest recreation possibilities, and other information concerning forests and products of forests. More than half of the States have large undeveloped rural areas. Most of these areas contain privately owned woodland resources that are not contributing their share or potential to the economic welfare of the community. Profitable uses must be found for these land, water, and timber capabilities. Recreational opportunities hold great promise. Markets must be found for the quality of timber available, and the timber must be processed as far as possible within the area to create employment for local labor. These areas need much greater and rapid help in recognizing and developing opportunities for multiple use of these resource potentials.

The objective of this program is to provide specialized technical services not available through other programs or authorities to stimulate interest in and to

help guide forest landowners, forest products processors, forest products marketing agencies, State and local planners, financing organizations and others in more adequately managing and utilizing the forest land resources for the benefit of the land resource, the landowners, the processors, the local labor resource and the local, State. and National economies.

To accomplish this objective the Forest Service provides specialized technical assistance to State forestry organizations, universities, industrial and consulting foresters, private owners of large forest properties, other Federal forest property managers such as Atomic Energy Commission and military agencies, and to forest products processors. It also works with other Federal, State, and local groups in servicing the rural areas development program. It performs the forest management work in the Virgin Islands formerly carried on by the Virgin Islands Corporation. Work is also performed in cooperation with defense agencies in connection with emergency supplies of timber and other forest products.

The proposed 1965 financing would make it possible to more effectively serve the rural areas development groups and to stimulate improved forest management on 8 million acres of large private and industrial, State and local public and other Federal forest ownerships, and to assist forest products processors.

(32) Increased pay costs (Public Law 87-793), $2,338,000

An increase of $2,338,000 for pay costs pursuant to Public Law 87-793 for fiscal year 1965 costs of the additional increase effective January 5, 1964. The 1964 appropriation includes costs related to the second step of the pay increase for approximately one-half year. In order to continue all programs financed from this appropriation at the 1964 program levels, the additional salary cost impact for a full year must be provided. Failure to provide for this additional cost would seriously curtail these programs as it would not be possible to accomplish the full amount of work planned under these budget estimates.

Forest land management	$1, 829, 000
Forest research	471, 000
State and private forestry cooperation	38, 000
Total	2, 338, 000

In evaluating the importance of providing for this increase, it must be recognized that major pay cost absorptions are being made in other programs which are directly related to the forest land management subappropriation activities. The total estimated 1965 cost absorption impacts are:

Expenses, brush disposal	$390, 000
Cooperative work, Forest Service (sale area betterment)	785, 000
Working capital fund	475, 000
Total absorptions	1, 650, 000

NURSERIES

Chairman HAYDEN. I note that a part of your proposed reforestation and stand improvement program involves development and improvement of nurseries at 10 locations. Would you please insert in the record a table showing the locations of each of these nurseries?

Mr. CLIFF. Yes, sir. We will be glad to do that.

(The statement referred to follows:)

LOCATION OF NURSERIES

The locations of the 10 Forest Service nurseries scheduled for improvement in fiscal year 1965 are:

Arcata, Calif. (Humboldt Nursery).
McCloud, Calif. (Mount Shasta Nursery).
Placerville, Calif. (Placerville Nursery).
Boise, Idaho (Lucky Peak Nursery).
Watersmeet, Mich. (Toumey Nursery).
Wellston, Mich. (Chittenden Nursery).
Eveleth, Minn. (Eveleth Nursery).
Brooklyn, Miss. (Ashe Nursery).
Bend, Oreg. (Bend Nursery).
Carson, Wash. (Wind River Nursery).

ACCELERATED PUBLIC WORKS PROJECTS

Chairman HAYDEN. It would be well at this point to insert in the record a table showing, probably by regions, the Accelerated Public Works Projects accomplished during the past year. Include in the tabulation those projects which will be accomplished during the remainder of this fiscal year. I think that the table should indicate the types of public works and the number of each type, as well as the total cost of the projects. If other than Federal money was used, indicate the contributor and the amount of the contribution for each project which was a cooperative one.

Mr. CLIFF. We will be glad to furnish that for the record, Mr. Chairman.

(The tables referred to follow:)

Summary of major accomplishments, Federal projects, by regions, fiscal years 1963 and 1964

Project description	R-1	R-2	R-3	R-4	R-5	R-6	R-7	R-8	R-9	R-10	Total
Camp and picnic area family units, construction	842	251	122	605	524	305	834	1,248	2,236	----------	6,967

RECREATION—PUBLIC USE

Chairman HAYDEN. Will you please comment upon the proposed use of the $26,010,000 requested for operation of recreation areas and facilities?

Mr. CLIFF. Yes, Mr. Chairman. I am going to ask Mr. Greeley, who is in charge of that activity, to respond.

Mr. GREELEY. Senator Hayden, the request for fiscal year 1965, $26,010,000 is an increase of $800,000. You have had called to your attention that our recreation business keeps on booming. The number of recreation visitors to the national forests has been increasing each year at 10, or 11, or 12 percent, right about that general area. And we see nothing in the immediate future to change this.

We have asked for this increase in order to have more funds to use, primarily for cleanup, maintenance, and the general policing of the areas that are being used by the increasing number of people.

Now the balance of the $26 million that has been requested will about maintain the same level of program as we have been operating on before, with the construction of about the same number of family units, something like 5,550 family units, and the carrying on of the management planning, the visitor information service, and rehabilitation of about 600 campgrounds that have not yet been covered in our efforts to rehabilitate.

Chairman HAYDEN. You will ease up the situation, but still not meet the need completely?

Mr. GREELEY. We are still going to run about 60 percent overuse of our facilities.

VISITOR INFORMATION CENTERS

Chairman HAYDEN. On page 19 of your explanatory notes you indicate that visitor information centers will be constructed at a number of locations. Would you please place in the record a table showing the locations and the proposed expenditure at each of them.

Mr. CLIFF. Yes, sir.

(The information referred to follows:)

CONSTRUCTION, FISCAL YEAR 1965

(a) *Primary visitor centers*

Madison River Earthquake Area, Gallatin National Forest, Mont.:	
Plans, specifications, and supervision of contract	$5,500
Contract construction	81,500
Other related facilities including exhibits and other equipment items	8,000
Subtotal	95,000
Cradle of American Forestry, Pisgah National Forest, N.C.:	
Plans, specifications, and supervision of contract	5,000
Contract construction	70,000
Other related facilities including exhibits and other equipment items	5,000
Subtotal	80,000
Total	175,000

(b) *Secondary units*

Small information centers and orientation buildings will be built at the following locations:

Name	Location	Cost
Lochsa Visitor Center	Clearwater National Forest, Idaho	$13,000
Idaho Springs Visitor and Information Center	Arapaho National Forest, Colo	23,500
Big Lake Visitor Center	Apache National Forest, Ariz	17,000
Lost Trail Pass Mobile Visitor Center	Salmon National Forest, Idaho	11,000
Sherando Lake Visitor Center	George Washington National Forest, Va	14,000
Hickory Nut Visitor Information Center	Ouachita National Forest, Ark	12,500
Oganz Visitor Information Center	Hiawatha National Forest, Mich	11,500
Ketchikan Mobile Visitor Center	South Tongass National Forest, Alaska	9,000
Total		111,500

(c) *Guided and self-guided facilities*

Name	Location	Cost
DeVoto Memorial trail	Clearwater National Forest, Idaho	$1,200
Beaver Creek trail	Gallatin National Forest, Mont	1,200
Pikes Peak Nature trail	Pike National Forest, Colo	2,000
Mount Evans trail	Arapaho National Forest, Colo	2,000
Apache Trail auto tour	Tonto National Forest, Ariz	1,500
Santa Catalina auto tour	Coronado National Forest, Ariz	1,500
Gros Vente trail	Teton National Forest, Wyo	1,000
Cottonwood Canyon trail	Wasatch National Forest, Utah	1,000
Lake Valley trail	Eldorado National Forest, Calif	1,500
Hot Creek trail	Inyo National Forest, Calif	1,300
Kulsan Ridge trail	Mount Baker National Forest, Wash	1,200
Diamond Lake trail	Umpaqua National Forest, Oreg	2,000
Sherwood Lake trail	Monongahela National Forest, W. Va	1,200
Twin Lakes trail	Allegheny National Forest, Pa	1,200
2000 B.C. Shell Mount trail	Francis Marion National Forest, S.C	1,500
Saline Bayou boat tour	Kistachie National Forest, La	1,000
Parsons Mountain trail	Sumter National Forest, S.C	500
Cut Foot Sioux trail	Chippewa National Forest, Minn	1,200
Silver Mines auto tour	Clark National Forest, Mo	1,000
Portage Glacier trail	Chugach National Forest, Alaska	1,000
Total		26,000

(d) *Other facilities and services*

Name	Location	Cost
Overlook, Beartooth Highway	Custer National Forest, Mont	$2,500
Wayside exhibit, Beartooth Highway	do	1,800
Wayside exhibit, Pass Creek Highway 160	Rio Grande National Forest, Colo	1,700
Interpretive sign, Wolf Creek Pass	San Juan National Forest, Colo	600
Interpretive facilities, Desert Vista area	Tonto National Forest, Ariz	2,600
Headquarters exhibit, Lakeside ranger station	Sitgreaves National Forest, Ariz	1,000
Headquarters exhibit, Santa Fe S.O	Santa Fe National Forest, N. Mex	1,200
Overlook, Lower Mesa Falls	Targhee National Forest, Idaho	1,300
Interpretive facilities, Red Canyon	Ashley National Forest, Utah	4,900
Wayside exhibit, Primitive Caves area	Manti-Lasal National Forest, Utah	1,000
Interpretive sign	Sawtooth National Forest, Idaho	500
Interpretive equipment and facilities, Trinity Center Visitor Center.	Shasta-Trinity National Forest, Calif	12,500
Exhibits and trail, Heather Meadows-Kulsan Ridge.	Mount Baker National Forest, Wash	3,200
Overlook, Cape Perpetua	Siuslaw National Forest, Oreg	4,000
Overlook and trail, Spirit Lake area	Gifford Pinchot National Forest, Wash	2,000
Interpretive signs and trails, ice caves and lake area.	Deschutes National Forest, Oreg	4,800
Overlook, Jakes Rocks	Allegheny National Forest, Pa	1,800
Overlook, Lake Cumberland	Cumberland National Forest, Ky	1,500
Wayside exhibit, Houlstan	Jefferson National Forest, Va	1,200
Wayside exhibit, Rock Springs	Cherokee National Forest, Tenn	2,400
Wayside exhibit, Cliffside Lake	Nantahala National Forest, N.C	2,300
Interpretive exhibits, Juniper Springs	Ocala National Forest, Fla	3,700
Wayside exhibit, Fremont tower	Mark Twain National Forest, Mo	1,300
Wayside exhibit, Gorham	Shawnee National Forest, Ill	1,200
Interpretive exhibits, Gunflint ranger district	Superior National Forest, Minn	1,500
Total		62,500

RECREATION AT CHARLESTON MT., NEV.

Senator BIBLE. May I ask a question at that point, Mr. Chairman?

Chairman HAYDEN. Certainly.

Senator BIBLE. I do not want to lengthen the record unduly and I think this might be supplied for the record. I am very much interested in your facility at Mount Charleston in Clark County. I do not know if you can tell me what you have done to that and propose to do or whether you would like to supply that for the record, Mr. Cliff.

Mr. CLIFF. I would like to supply that for the record, Senator Bible. Maybe Mr. Greeley or Mr. Hendee will have a comment on that. I might say that Charleston Mountain is an unusual area in that it is a forested mountain in a desert. It is an oasis in the desert, and people from Las Vegas and southern California and many visitors who go into that area in the summer are attracted to the higher elevation for climatic relief and forest recreation.

Chairman HAYDEN. What is the altitude of the campground?

Mr. CLIFF. At about 8,000 or 9,000 or maybe up to 10,000.

Chairman HAYDEN. That would be very cool.

Senator BIBLE. The amazing part is that it overlooks Death Valley, and you can ski. It has a fine ski lift and lots of people will not believe this is true, but it it correct. They have beautiful mountains where you can ski and look at one of the hottest spots in the world.

Mr. CLIFF. That is correct. It is quite similar in climatic characteristics to the Catalina Mountains in Arizona. You know how people go up there in the summertime, Senator Hayden.

ANNUAL VISITATION AND PROGRAM STATUS

Senator BIBLE. Do you have any idea of the annual visitation that can be supplied?

Mr. CLIFF. We do have that, but I do not have it in mind.

Senator BIBLE. I would like to have that supplied for the record, as well as how far along you are on your program for recreational facilities there and what you plan on doing this next year. If you would supply that for the record.

Mr. CLIFF. We would be glad to, Senator Bible.

(The information referred to follows:)

CHARLESTON MT., TOIYABE NATIONAL FOREST, NEV.

1. Recreation use in 1963 in the Charleston Mt. area amounted to 198,000 visits, representing 225,000 visitor-days use. There were 188,900 visits made to campgrounds and picnic sites.

2. Facilities:

(*a*)	Presently developed:	
	Camp and picnic sites	7
	Family camp and picnic units	235
	Organization sites	3
	Summer homes	31
	Winter sports sites	1
	Observation (vista) sites	1
(*b*)	Planned new developments to year 1972 (estimated cost, $1,200,000):	
	Camp and picnic sites	19
	Family camp and picnic units	967
	Organization sites	4
	Observation sites	4
(*c*)	Planned developments for fiscal year 1964:	
	Construction of family camp and picnic units	25
	Development of roads (miles)	4
	Maintenance and cleanup of present facilities and areas.	
(*d*)	Planned developments for fiscal year 1965:	
	Betterment of family camp and picnic units	50
	Maintenance and cleanup of present facilities and areas.	

3. Special items of interest:

(*a*) Prospectus for enlargement of the existing ski area has been prepared covering a new warming hut and ski tow to be built in calendar year 1964.

(*b*) Elevation of Charleston Mt. is 11,918 feet. Most recreation activities are enjoyed at 7,000 to 9,000 foot elevation.

RECREATION AT GREAT BASIN, NEV.

Senator BIBLE. I would like to have you supply information on what you are doing in the Great Basin. As I recall, there was a conflict in two Government agencies with reference to that. I do not know how much money you have spent there in recent years.

Mr. CLIFF. Do you mean the proposed Great Basin National Park?

Senator BIBLE. As you know, Chet Olson, who was a very fine man, was an advocate of developing this as a forest project. There were others who had the theory it should be developed as a national park. So I would be interested in your furnishing for the record exactly what you have done there in the past 2 years and what you propose to do in the next couple years. It can be supplied for the record.

Mr. CLIFF. We will be glad to do that, Senator Bible.

(The information referred to follows:)

GREAT BASIN, NEVADA NATIONAL FOREST, NEV.

1. Recreation use in 1963 amounted to 70,000 visits, representing 150,000 visitor-days use.
2. Facilities:

(a) Presently developed:	
Camp and picnic sites	4
Family camp and picnic units	78
Water developments for domestic livestock	27
Drift fences (miles)	43
(b) Planned new developments to year 1972 (estimated cost, $550,000):	
Camp and picnic sites	7
Family camp and picnic units	316
Visitor information station	1
Organization site	1
Observation sites	3
Cleanup and maintenance of existing areas and facilities.	
(c) Planned developments for fiscal year 1964:	
Betterment of existing recreation facilities	$14,000
Road surveys, Stella Lake (miles)	5.2
Trails, Baker Creek construction (miles)	6.5
(d) Planned developments for fiscal year 1965:	
Betterment of existing recreation facilities	$5,000
Construction, family camp and picnic units	12
Trails, Bristlecone construction (miles)	3.5
Road construction (miles)	5.2

3. Special items of interest:
(a) In 1963 there were 700 deer killed in the Great Basin area. Over 4,000 fishermen-days were spent catching over 2,600 pounds of fish.
(b) Forest Service is presently considering two applications for ski area developments—one is proposed for financing through RAD—and one through private financing.
(c) Sixteen special use permits in the area consist of (1) five road rights-of-way, (2) seven water transmissions, (3) one telephone line, (4) one irrigation reservoir, and (5) two range facilities.
(d) There are six grazing allotments within the area involving nine permittees. Grazing permits cover 937 sheep for 2,800 animal months, and 1,023 cattle for 3,729 animal months. On the allotments are 27 water developments and 43 miles of fence.
(e) There is a proposed sale of 50,000 feet of bug-killed timber in the area. It is planned to spend $2,000 this year to make a survey of the extent of bug-killed timber.

Chairman HAYDEN. Do you do the construction yourself at this place?

Mr. CLIFF. Yes, we either do it ourselves or contract to have it done. We use both methods.

RECREATION AT MOUNT GRAHAM, ARIZ.

Chairman HAYDEN. We have a similar situation in Arizona with Mount Graham where the Bureau of Prisons is cooperating in furnishing labor. You might make a statement for the record of the status of that project, as far as your contribution is concerned.

Mr. CLIFF. We will be very glad to do that, Senator Hayden.

Chairman HAYDEN. I would also like to have you place in the record the information on the highest altitude where you are camping.

Mr. CLIFF. Yes, sir; we will be glad to do that.

(The information referred to follows:)

MOUNT GRAHAM, CORONADO NATIONAL FOREST, ARIZ.

1. Recreation use in 1963 in the Mount Graham area amounted to 70,000 visits, representing 100,000 visitor-days use.
2. Facilities:

(a) Presently developed:		
Camp and picnic sites		9
Family camp and picnic units		121
Organization sites		4
Summer homes		99
Commercial public service sites		1
Recreation reservoirs (Riggs Flats)		1
(b) Planned new developments to year 1972 (estimated cost, $820,000 based on projected use prepared in the national forest recreation survey of 1961):		
Camp and picnic sites		6
Family camp and picnic units		315
Organization sites		1
Summer homes		---
Observation sites (vista points)		4
Visitor information station		1
Commercial public service site (includes 1 winter sports site)		2
Recreation reservoirs		2
Trails	miles	20
Roads	miles	6
Cleanup and maintenance of existing areas and facilities.		
(c) Planned developments for fiscal year 1964:		
Rehabilitate Soldier Creek campground, family units		18
Site preparation (thinning, cleanup, etc.) of future camp and picnic sites, acres		350
Betterment of Swift Creek trail, miles		2
Thinning for betterment of wildlife habitat, acres		40
Maintenance and cleanup of existing facilities and areas.		
(d) Planned developments for fiscal year 1965:		
Betterment of Riggs Flat campground, family units		30
Site preparation (thinning, cleanup, etc., of future camp and picnic sites acres		275
Betterment of Swift Creek trail, miles		2
Thinning for betterment of wildlife habitat, acres		40
Maintenance and cleanup of existing facilities and areas.		

3. Special items of interest.

(a) The projections of recreation use in the Mount Graham area, prepared during the national forest recreation survey, for the year 1972, have already been exceeded. New projections of recreation use in this area are 150,000 visits by 1972 or more than twice the original figure and the current use.

(b) Highest elevation of recreation developments, 9,000 feet. (Most of the recreation developments are between 7,000 and 9,000 feet.) Visitors climb to the top of Mount Graham and go to the top of Heliograph fire lookout tower (10,028 foot elevation).

(c) Wildlife consists of whitetail deer, desert mule deer, bear, and wild turkeys. There are three trout streams which attract fishermen.

FOREST FIRE PROTECTION

Chairman HAYDEN. For forest fire protection, your request is $23,011,000. Would you please discuss just what you propose to do with this money, indicating examples of the practices which you may install.

Mr. CLIFF. I am going to ask Deputy Chief Nelson to respond to that question.

Mr. NELSON. Yes, Senator Hayden. We break that down into several different categories, and I might run through them.

First, as Mr. Cliff mentioned, we are very concerned about our fire prevention, because a fire that is prevented is one that does not get started and destroy valuable resources.

We expect to spend $3,300,000 of this amount for fire prevention work. We just held a very special training school out in New Mexico, a servicewide training school to help stipulate this program and get it going more efficiently.

Another important phase is the detection of fires and we expect to spend $3,200,000 for this. This is our lookout system. Many of our fires, of course, are caused by lightning and are not preventable and we must detect those as early as possible.

Fire Attack Force

The largest sum we expect to put in the fire attack force, $13 million. That is the group of men with their equipment, trucks, other types of equipment, that do the attacking on fires. An important thing there is to be able to attack the fires and keep them small after they once start.

Use of Indians

Chairman Hayden. Is that where you use the Indians in Arizona and New Mexico?

Mr. Nelson. We use a few Indians with our regular protection attack force. A major part of the Indians used in Arizona and New Mexico are organized groups that we use on the larger fires, Senator.

Chairman Hayden. They stand ready to go anytime you call them?

Mr. Nelson. That is right. After we get a larger fire and need larger crews, they are called, they are very well organized. That organization is carried on by the Forest Service in cooperation with the Park Service and others that use these Indians. The Bureau of Land Management also uses them. That is a very fine aid to us when a fire gets large enough to have to use larger crews.

Our hope is to catch the fires small with the smaller crews that are located in strategic locations in order that we do not have a large costly fire.

Air Attack Program

Another phase is one where we expect to spend $2,100,000 this year, and that is our air attack program. That has grown in the past few years as the knowledge and techniques have improved for using aircraft.

Smokejumpers have been used since 1941, but about 1956 we started using aircraft for dropping water and chemicals. We practically use all chemicals now and that has proven very satisfactory, both in some of our large fires and in holding some of these small ones in a small state, until we can get the manpower into them.

Fuel Modification or Fuel Break

Then we expect to use $300,000 for a project we call fuel modification or fuel break. We find that in some of our areas we have hazardous fuels that continue to grow up. We have had some very bad drought years in some areas which have changed fuel conditions. And that program uses some of this fire control money, but it also coordinates the management in the area to do the best job of making fuel breaks that will keep us from having some of these large disastrous

fires even though we have some fires that may get away from the initial attack stage.

Fire Control Equipment Development

As you know, we have also put some money into equipment development in the fire control field. That is how we developed some of the air attack equipment. We expected to use $600,000 this year in improving our equipment. There are a number of things that are in progress in that field.

Then we expect to spend $511,000 in what we call studies, plans, special training, that type of thing. We are working at the present time with some of the latest training methods, training machines, so that we can train five crews faster and at less cost.

It also includes the type of studies that we do to make sure that we put our right forces in the right places. You may be interested in hearing a little bit about our trends in fire control. This committee has increased our fire protection money over the past few years, and we have a chart that will show the benefits better than anything else.

As Mr. Cliff mentioned, we have an increased use of the forests, and when we have increased use we have increased numbers of fires. This additional amount has given increased protection from fires.

You see on this chart that the potential burned area line is going up from 1955 to last year. That shows our expected burned area. Actually, because of the increased protection effort and improved techniques, made possible with the money that this committee has allowed us over the past few years, our trend in fire losses is going down materially.

So the part in between is what was saved in the actual resources. We estimate that for every additional dollar spent in fire protection during the period of 1956 to 1963 there was a resource damage savings of $5.

We certainly appreciate the committee making it possible for us to do a better job of preventing resource loss from fire.

Forest Fire Prevention

Now, as Mr. Cliff mentioned, in our fire prevention it is a little different story. Our expected number of fires, as indicated on the chart goes up rather rapidly, because there is more use, both in timber and other uses, and general recreation use.

We have been able to keep our actual number of man-caused fires down below the number that might be expected, which indicates that we are doing a reasonable job. But what really bothers us is that our man-caused fire rate has gone up in the last few years, and we feel that we have a problem in connection with prevention that we must do some more work on.

Educating the Public

Chairman Hayden. There is a problem of educating the public. That is, people who go into the forests to camp do not appreciate what it means to leave live coals. They just do not understand about the importance of putting every spark out before they go away.

Mr. Nelson. That certainly is a problem, Senator. We do have, as you know, the Smoky Bear campaign carried with the State forest-

ers and other agencies. We have fine cooperation with the National Advertising Council. That is one of their favorite programs, I understand—what they are doing with us in the forest-fire-prevention program.

But the increased number of people and the increased pressures on communities close to the forests is one of the major causes. We find, for example, kids playing with matches, is one of the types of fire causes that has increased very rapidly in the last few years.

I think you can understand that down in Arizona where there are more people in those communities that are in the forests, or close to the forests; southern California is another place where we have a very serious problem; and the same thing applies in Utah, where people are getting close to the forests. It just increases the risks tremendously.

Gifford Pinchot Conservation Institute, Pennsylvania

Chairman Hayden. Thank you for your statement.

You have budgeted $200,000 to repair and remodel the Gifford Pinchot Conservation Institute in Pennsylvania. I wish you would advise the committee fully regarding this structure, indicating how it came into possession of the Forest Service, and the use to which it will be put.

Mr. Cliff. This is the ancestral home of Gifford Pinchot. It is located at Milford, Pa. It is a very substantial stone building and has a lot of historical significance. Several years ago the heirs of the Pinchot estate inquired as to whether or not the Forest Service would be interested in taking this over for some purpose, a research center or some other public service.

We looked into it to see what use might be made of it. We finally decided that it would make an excellent place for a National Conservation Education Training Center where schoolteachers and conservationists and educators from all over the country and, indeed, from all over the world, could assemble for study, for course work, and conferences.

Cooperation With Conservation Foundation of New York

Then we started looking for a partner in this venture, and the Conservation Foundation of New York, which is one of the outstanding conservation agencies in the country, agreed to come in with us to help finance this training program.

We worked out a plan and an agreement with them wherein they will staff and finance the training work, the management of the conferences, and that sort of thing at this institute.

The Forest Service will maintain the buildings, and it is necessary to do some rehabilitation to make them suitable for the purpose. We would maintain the building and the grounds and work with the Conservation Foundation in developing and carrying forward the program on conservation education.

We have the title to the property now and have done some rehabilitation work on it. The program is being developed and we are ready to go forward with, but we do need this $200,000 for rehabilitation work.

You may recall that President Kennedy dedicated this Conservation Center last September. We feel very proud and very fortunate that this could be done before the recent tragedy. This was the first stop on the President's conservation tour at which he personnally dedicated the Center.

We want to move ahead with it.

Chairman HAYDEN. You want a plan that will really put this to good use?

Mr. CLIFF. That is correct.

WEEKS ACT PURCHASES

Chairman HAYDEN. Last year the Congress added unbudgeted funds to your appropriations request for purchase of lands on the Chattahoochee National Forest in Georgia, and on the Ouachita National Forest in Oklahoma and Arkansas. Have you yet been able to consummate the purchases?

Mr. CLIFF. Mr. Nelson will tell you the status of those purchases, Mr. Chairman.

CHATTAHOOCHEE NATIONAL FOREST

Mr. NELSON. The purchases on the Chattahoochee National Forest concern land where a scenic highway will eventually be built. We have voluntary agreements from all landowners to sell their property except one. This one tract is 35 acres, which will cost about $6,000. The owners refuse to sell as yet. We may have to condemn that one.

The others are moving along fine.

Chairman HAYDEN. What is the total area in that forest?

Mr. NELSON. In the purchases for which the funds were made available in fiscal year 1964 we expect to buy 1,300 acres.

OUACHITA NATIONAL FOREST

Now, for the Ouachita National Forest: that purchase program involves about 140 separate owners of land. That would be for purchase along the scenic highway for which the funds have been appropriated. The program is moving along very well. We have appraised each one of the 140 properties. The owners have been contacted. They have been sent options to sign. We have just started to get the signed options back during the last few days. We have set the middle of next month as that is the time for all options to be returned.

We find that the people are very cooperative and the program is moving along very well, but we may have to condemn some tracts.

At the time the $262,000 was made available last year, we had not yet made appraisals. We did find that when we got in and made the appraisals, and we have had some commercial appraisers help us, that we were going to be a little short on money for the program.

It looks at the present time as though we will not be able to buy all of the land that is needed for this project. Fiscal year 1964 funds will fall short by about $80,000.

Chairman HAYDEN. You can put in the record your estimate of what the ultimate cost is in each of these cases.

Mr. NELSON. Yes, we will. Fund appropriated in fiscal year 1964 will be sufficient for the Chatahoochee National Forest. For the Ouachita National Forest the total need will be $342,000, $262,000 has been appropriated, $80,000 is still needed.

STATUS OF THE WEEKS LAW PURCHASE PROGRAM

Chairman HAYDEN. I note that your explanatory notes contain a statement that the development program for the national forests provides for the purchase and use of about 1,450,000 acres for recreation development and resource management purposes during the period 1963 to 1972. What is the status of this program?

Mr. NELSON. The Weeks law purchase program is moving along well considering the small part of the national forest program that is financed. We find that we have a great many owners of small tracts that come to us and ask us to buy their property.

We have right at the present time many tracts that people would like to sell. Actually we expect to use this $500,000 for tracts that have been offered to us for about a year with the owners hoping we could purchase soon. They are located in about 16 national forests.

At present we know of a sizable number of very desirable tracts within the Eastern National Forest that are for sale. The total cost of these tracts, tracts where the owner has indicated an unsolicited willingness to sell, is about $4,460,000. So the 1965 appropriation will buy a rather small part of what the people would like to sell.

Mr. CLIFF. Mr. Chairman, if I might supplement that. You asked the status of the land purchase part of the program for the national forests. The rate of accomplishment of this activity is at the lowest of any of the activities included in the program for the national forests.

For fiscal year 1965 the rate of accomplishment would be about 14.2 percent of that proposed under the program for the national forests.

Chairman HAYDEN. It is just giving it a kind of a start and that is about all.

PROPOSED LAND AND WATER CONSERVATION FUND

Also in the notes is a statement that there is an urgent need to acquire certain inholdings for expansion of public recreation areas. When the Land and Water Conservation Act becomes law will it then be necessary for you to acquire such lands as these through appropriations made to that fund?

Mr. CLIFF. The Land and Water Conservation Act will provide funds for purchasing key inholdings primarily valuable for recreation in the national forests. The bill, as it is written would provide that this money for acquisition would have to be appropriated by Congress before it is available. It would be used for purchase of lands where recreation is a key value. These are areas which would not normally be purchased under the Weeks law purchase program using Weeks law money that has been included in this budget. So it would be over and above the program that is planned under the program for the national forests.

There may be some overlapping but generally it will be over and above.

EFFECT OF ACQUISITIONS ON LOCAL ECONOMY

Chairman HAYDEN. What effects and relationships are there between the Forest Service land acquisition program and the local economy of these purchase areas?

Mr. CLIFF. This works in several different directions. We feel that in the places where we have bought forest land and rehabilitated it, there has been a very beneficial effect on the economy generally.

MONONGAHELA NATIONAL FOREST, W. VA.

One example that we might point to is the Monongahela National Forest in West Virginia where we acquired depleted forest land. It is being restored and it is now a major factor in the economy.

We are increasing our timber output there and the quality of the timber is much better than is generally true in the surrounding country.

The recreation values have improved very greatly. One interesting point is that I saw a map the other day showing the private recreation facilities in West Virginia, showing the location of privately owned resorts and other enterprises that provide services for fishermen, hunters, and tourists, and it is quite noticeable that a great majority of them are clustered around the Monongahela National Forest.

This is also happening in other parts of the country.

INHOLDING PURCHASES

We have situations where the local counties are urging us to buy inholdings in order to remove the necessity for expensive school bus transportation to remote families and to remove the pressure for year-long maintenance of roads to those private holdings. We have had instances in Arkansas, for example, where the counties have urged us to pick up these inholdings to reduce the local costs of the government.

On the other hand, there may be an adverse impact, when private land is removed from the tax rolls, and the counties look at these impacts, too. They scrutinize these proposed purchases. You know that the law requires that we advertise our acquisition proposals, and give the local people, including local government, a chance to comment or protest. And we have been able to get concurrence or approval of all of the Weeks law purchases that we have been able to finance.

So while there is some impact both ways, we think that the program we are carrying on is, on the whole, very beneficial.

MARKHAM SPRINGS TRACT

Chairman HAYDEN. Senators Symington and Long have written to me urging that an area known as the Markham Springs tract, which lies within the Clark National Forest in southeast Missouri, be purchased by the Forest Service. Their letter will be printed in the record.

(The letter referred to follows:)

U.S. SENATE,
Washington, D.C., February 20, 1964.

Hon. CARL HAYDEN
Chairman, Senate Committee on Appropriations
Senate Office Building, Washington, D.C.

DEAR MR. CHAIRMAN: It is our understanding that the Subcommittee on the Department of Interior and Related Agencies is presently considering the fiscal year 1965 budget requests for the U.S. Forest Service.

In your deliberations, we would be most appreciative if consideration could be given to appropriating sufficient funds to allow the U.S. Forest Service to acquire the Markham Springs tract in southeast Missouri.

This tract consists of approximately 315 acres with about 1½ miles of frontage on the Black River in Wayne County, Mo., and is within the Clark National Forest. Because of its location and many natural wonders, the property is well suited for a large-scale recreational development.

It is estimated that 3½ million people live within 100 to 150 miles of this locality, and development of the tract would bring a much needed boost to the economy of local and adjacent communities.

At the present time, the owner of this property is offering to sell it to the Government for $100,000 and the Forest Service in a preliminary appraisal has confirmed that this is a reasonable price. There is no assurance, however, that this land will remain on the market for any length of time.

Since there is an unusual opportunity to acquire superior land for the National Forest purposes and recreational developments which are badly needed in this locality, we respectfully request that $100,000 be appropriated for purchase of the Markham Springs tract.

Sincerely,

STUART SYMINGTON.
EDWARD V. LONG.

Chairman HAYDEN. Would this be a desirable tract to be added to the national forests, and could it be purchased within the $500,000 proposed in this budget?

Mr. CLIFF. I would like Mr. Nelson to comment on that one.

Mr. NELSON. Senator, that tract would be a most desirable tract to add to the Clark National Forest. It lies near the center of the Poplar Bluffs ranger district, a little north of Poplar Bluffs. This particular tract consists of 315 acres.

It has about 1½ miles of fine river frontage on the Black River. It also has, as a major attraction, a very large spring. The spring runs about 3 million gallons a day. It is one of those large springs that come from limestone formation in that area.

RECREATION DEVELOPMENT

This particular district has no really good land for development of recreation at the present time. So from that standpoint, it would be well to have a tract of this type that could be developed for good recreation.

Besides that, it is within about 150 miles of about 1½ million people in that general area. It is served by two good major highways which would make it very desirable.

BALD EAGLE HABITATS

In addition to that, a lot of people, like the Audubon Society, are very interested in preserving the bald eagle habitat and this particular tract has some very fine bald eagle habitats. Under Forest Service management, we could help preserve this species.

As far as being able to purchase it under the $500,000 that is available in this budget, it would cost $100,000. We do not see that we can do it at this time. As I mentioned, the $500,000 is pretty well all committed at the present time on about 16 national forests east of the Great Plains.

WEEKS ACT PURCHASES

Chairman HAYDEN. Would you please place in the record a statement indicating the Weeks Act purchases during the past 2 fiscal

years. Prepare this to show the number of acres, the forests to which they were added, and the amount expended for them.

(The statement referred to follows:)

Weeks law obligations, fiscal year 1963

Forest	State	Number of options accepted	Acres	Obligation
Allegheny	Pennsylvania	3	1,363.60	$36,350.00
Cumberland	Kentucky	2	325.00	4,750.00
George Washington	Virginia	1	1,500.00	20,550.00
George Washington	West Virginia	2	274.00	2,043.00
Green Mountain	Vermont	1	77.00	928.70
Jefferson	Virginia	3	302.00	6,721.46
Ozark-St. Francis	Arkansas	21	3,413.59	98,480.50
Chippewa	Minnesota	2	280.00	7,247.74
Lower Michigan	Michigan	15	2,068.55	191,075.16
Clark	Missouri	1	80.36	4,500.00
Nicolet	Wisconsin	2	129.48	18,393.87
Ottawa	Michigan	3	842.00	8,326.48

Hoosier	Indiana	6	360	26,000
Total		182	25,920	902,000
Surveys and related acquisition expenses.				60,000
Total estimated obligation				962,000

National Forestry Research Program

Chairman Hayden. For the past 2 years you have reported that the forestry research program was in the process of review. What is its present status and can you suggest when it might be available for the information of this committee?

Mr. Cliff. Mr. Chairman, I have to tell you that it is still in the process of review in the administration. It has moved forward some just in the last few weeks, and we are hopeful that this review will be completed in a short period of time, and we will then be able to release it to the Congress and to the public.

We are more encouraged now than we were a month or so ago. But it is moving forward. It is still under review.

Timber Management Research

Chairman Hayden. Your proposed budget for timber management research is slightly below the amount appropriated in fiscal year 1964. With the $6,619,000 which you are requesting what will be your primary objectives?

Mr. Cliff. With reference to research, Mr. Chairman, Dr. Harper will respond to that question.

Dr. Harper. Mr. Chairman, the reason that we have a minus quantity at this time under timber management research is because of the program adjustments we made in order to take care of some high-priority problems in other related but currently lagging research activities.

One of them was for watershed research in Alaska. I think that is where most of the adjustment went. Another was for problems of forest insect research.

The primary objectives of the $6,619,000 requested are to reduce costs of timber production and increase the quality and yields of timber involving more than 100 species of trees that grow in the various forest types of the major forest regions of the United States. Each species and situation involves different and particular sets of problems. The timber management research constitutes the backbone of forest production research and includes silviculture, forest genetics, forest mensuration, and such timber-related crops as naval stores and maple sap.

Restoration of Strip Mined Land

Chairman Hayden. Last year $150,000 additional was added to your budget for expansion of research on restoration of strip mined land in the Appalachian region. Would you please place in the record a statement indicating the total funds which were available to you for this purpose in fiscal year 1964 and the amount which you propose to use during fiscal year 1965?

Mr. Cliff. We will be glad to do that, Mr. Chairman.

(The information referred to follows:)

The forestry research funds available for strip mine research in fiscal year 1964 and included in the fiscal year 1965 budget are:

Fiscal year 1964	$170,000
Fiscal year 1965	175,000

STATUS OF THE PROGRAM

Chairman Hayden. What luck are you really having with this strip mining problem? Is it possible to do much good?

Dr. Harper. Yes, I would say so. Of course, the expanded program is just getting underway at the present time, but we feel quite confident that we will be able to devise improved methods of making the excavations and depositing the overburden, such that the watershed values will not be impaired to the extent that they have been in the past and rehabilitation of the disturbed areas made easier.

We have excellent cooperation of industry on this work. We just recently had a conference in which State and local agencies and the mining industry, itself, had representatives present to discuss the plans that we have for research, including the possibility of changes that could be made. And I believe everyone came away from this meeting feeling much encouraged by what could be done.

Chairman HAYDEN. Some of the areas that I have seen look like it is impossible that anything could ever be done with them.

Dr. HARPER. It is a bad sight at best, but these areas, I think, can be rehabilitated and if it is properly done, I believe that we can prevent the erosion, the sediment getting down into the streams, and even more important than that, prevent acid pollution in the streams.

Chairman HAYDEN. And develop a stand of timber?

Dr. HARPER. Oh, yes.

WATERSHED MANAGEMENT RESEARCH—BEAVER CREEK, ARIZ.

Chairman HAYDEN. Watershed management research, as you know, is one of my prime interests. I have followed closely the Beaver Creek project in Arizona which is providing the answers to many questions of watershed management in the Southwest and intermountain region. I have had recent correspondence from the Arizona Water Resources Committee in which it requested additional financing for the watershed and related research programs in Arizona.

Will you supply for the record a summary of some of the more important results of the work you have done there, indicating the amounts available for each phase of the research, as well as additional funds needed to bring the project up to a balanced and adequate effort?

Mr. CLIFF. We will be glad to do that, sir.

(The summary referred to follows:)

Status of the project

Phases of the research in the Beaver Creek project	Funds available in fiscal year 1964 and proposed in 1965 budget	Increase required for balanced and adequate program
Evaluation of watershed treatments	$100,000	$45,000
Use of fire as watershed measure	15,000	45,000
Estimated increase required		90,000

The status of the Beaver Creek project and explanation of the estimated increase of funds required for a balanced and adequate program of research is as follows:

On the Beaver Creek project, the instrumentation for measuring streamflow (24 stations) and precipitation (49 stations) has been completed and data are being prepared for analysis. Four installations for measuring sediment in streams are in operation and three others are yet to be installed. Range inventory plots are established and forage production and utilization estimates are taken each year. Four of the Beaver Creek experimental watersheds have been inventoried for timber volume and growth, but at least another year will be needed to inventory the remaining watersheds. Wildlife use of the watersheds is being determined as well as the use of the watersheds by hunters. All of these physical data are being collected to give a basis for an economic analysis and evaluation of watershed treatments, including use of fire, and results in terms of production. The first treatment of an experimental watershed to alter water yields has been completed with complete removal of the existing juniper cover and replacement with grass.

Relevant economic data are now being gathered. A report on the downstream value of water for agriculture is nearing completion. This will provide some reference figures for a datum in establishing the value of water in the watershed. Field measurements and compilation and analysis of data are now at high levels for this project and will be expanded further in the next 2 to 3 years as instrumentation and treatments of the watersheds are completed. Greatest attention will be given to the economic evaluation of treatments and uses of this pilot area.

Progress on analysis of data and publication of first results is seriously hampered by a lack of subprofessional and clerical personnel to make field measurements and compile the data. These additional personnel will permit needed time of the professional staff required to develop suitable physical and mathematical models for the analysis of data and subsequent evaluation. The physical aspects of the Beaver Creek project are well ahead of the evaluation work, and emphasis needs to be given to stepping up the evaluation effort. A further need is to strengthen research on the use of fire as a tool for watershed treatments and on the reduction of wildfire hazards. Prescribed burning offers promise as a means of controlling undesirable vegetation at reduced costs but much needs to be learned about the interrelationships between fuels, weather, and fire behavior before fire can be used safely and effectively in this region.

We are working with the Salt River Water Users' Association to develop a cooperative agreement which, if we can work it out, would result in extending to appropriate parts of the watersheds of the Salt and Verde Rivers watershed treatment measures which have been tested on the Beaver Creek project. The objective of the work would be to improve water yields from the national forest lands in harmony with other multiple use objectives. If the agreement is worked out, the association would contribute funds to finance some of the watershed treatment work, and the Forest Service would also finance treatment work now called for by the 10-year development program for the national forests. The association is anxious to see the work proceed at a rate faster than available financing will permit.

If we are successful in working out a program of cooperative financing, we will want to review this proposal for an expanded program with the committee.

Research Laboratory, Tempe, Ariz.

Chairman Hayden. What is the status of the laboratory at Tempe for which construction funds were appropriated in fiscal year 1963?

Dr. Harper. That laboratory is nearing completion and it should be occupied shortly, Mr. Chairman. This was one that was financed in 1963.

Chairman Hayden. How much money is allotted to it for fiscal year 1965; and what can you accomplish with it?

Dr. Harper. This is for the research program?

Chairman Hayden. Yes, how much money is allocated for that program there?

Dr. Harper. I do not have that figure right before me. Could I furnish that for the record?

Chairman Hayden. Yes. What personnel will this permit you to employ? Is this sufficient to staff the laboratory at the level planned so that all of the work for which the laboratory was constructed can be accomplished? And that, again, you may furnish for the record.

Dr. Harper. If I may, please.

Chairman Hayden. If not, how much more money would be needed and how would you expend it? I would also like that for the record.

Dr. Harper. Yes, sir.

(The information referred to follows:)

STATUS OF THE PROGRAM

The $450,000 that was made available for construction in 1963 has provided an excellent laboratory facility. This Forest Hydrology Laboratory, located on the campus of Arizona State University at Tempe, will be completed and ready for occupancy late this spring. The laboratory and office space thus provided

will supply the needs of the program people now employed and those needed to bring research programs up to planned strength.

The funds available for research at the Tempe laboratory in fiscal year 1964 and proposed without change in the fiscal year 1965 budget are $220,000 for watershed management studies and $22,000 for related wildlife habitat studies, making a total of $242,000 in fiscal year 1965. The present staffing is 15, including scientists, technicians, subprofessional, and clerical personnel.

The additional funds required to implement the research planned at this laboratory are $360,000. This would be comprised of $210,000 additional for water yield improvement projects and $150,000 for the related wildlife habitat studies. These additional funds would allow full and efficient use of the new research facilities. They would provide for about 24 additional people.

The research program at Tempe is investigating ways of improving water yields from the chaparral, spruce-fir, and riparian forest zones. The wildfire that burned over the Three-Bar experimental watersheds in the Tonto drainage showed clearly that removal of chaparral would produce greater streamflow, but some means had to be found to prevent the tremendous increase in erosion that followed denudation by wildfire. Strip burning of chaparral following spraying to kill the tops of the bushes, leaves unburned protective strips to prevent erosion. This technique has been successfully applied on an experimental basis and offers promise of being a practical measure. On the nearby Sierra Ancha experimental forest removal of timber from the deep soil moist site areas in the north fork of Workman Creek followed by planting to grass also produced significant increases in streamflow. Other watersheds in the Apache National Forest are being calibrated prior to extension of vegetative treatments for water yield improvement in other forest types. In the past 2 years more than 15 publications and papers have come from this research program.

Other studies at Tempe are aimed at determining how wildlife habitat, particularly for big game, may be improved and maintained in harmony with other uses such as timber production, domestic livestock grazing, and water production. Recent results show that selective cutting in ponderosa pine may improve deer habitat for as long as 15 years following cutting. Also it has been determined that elk prefer natural openings in a ponderosa pine stand over either the forest border or adjacent selectively cut areas, whereas deer used all three habitats about equally.

Additional work to be undertaken would strengthen and permit additional studies designed to improve water yields in the various forest types ranging from chaparral to the mixed conifers, including work on control of phreatophytes. This work covers a broad span of highly important problems of regional and national significance and the additional program planned at this laboratory will permit a balanced and adequate series of studies.

Also, to be undertaken with additional funds is the related work on developing improved wildlife habitat on the watersheds involved. This work would be strengthened to bring it to an adequate level to serve as a principal center for such research in the Southwestern States.

Utilization Laboratory, Alexandria, La.

Chairman Hayden. It is my understanding that no additional funds have been provided in the budget for staffing of the new utilization Laboratory in Alexandria, La., although this Laboratory is scheduled for completion in early September. The present funds allocated for the utilization project will allow for the employment of only one research man. It is also my understanding that an additional $150,000 for fiscal year 1965 would finance the research of one-half of the capability of this Laboratory. I have been informed by local people that they feel only one-half of the personnel should be hired at this time to insure that properly trained personnel are employed. Can you adequately use these funds at the research center in Alexandria during the coming fiscal year?

Mr. Harper. The Forestry Sciences Laboratory at Alexandria will be completed in September and will then adequately house our research program in forest products utilization, forest fire, forest insects, silviculture, and range management. The fiscal year 1965 budget

provides $50,000 for forest products utilization research—enough to employ one senior scientist and finance some contract research with the forest products industry and a cooperative project at Louisiana State University.

An additional $150,000 for utilization research could be effectively used in fiscal year 1965 to implement the program already planned and developed by the scientist presently employed as the project leader.

This amount would provide for five additional utilization scientists and necessary supporting personnel. We believe fully qualified scientists are available for such a program in fiscal year 1965. The space for utilization research in the new Laboratory at Alexandria was planned to accommodate 10 scientists.

FOREST INSECT RESEARCH

Chairman HAYDEN. It has been brought to my attention by a number of my Louisiana constituents that a serious problem in Louisiana has been the increase of insects which prey upon the southern pine. It is my further understanding that the President's fiscal year 1965 budget request includes a slight increase for forest insect research nationwide; however, do you believe that the Forest Service could use an additional $50,000 for employment of two additional insect research technicians at the Alexandria Research Center?

Mr. HARPER. The problems of protecting southern pine forests against insect pests have increased greatly in recent years. Damages have been excessive. Some progress has been made through research but more effective, cheaper, and more permanent controls are needed if losses are to be reduced to acceptable proportions. The Forest Service would be unable to increase the insect research program at Alexandria out of the program increase carried in the fiscal year 1965 budget because of the critical nature of other insect problems elsewhere in the Nation that need attention also. An additional $50,000 could be used effectively at Alexandria to strengthen research on bark beetles and insects that attack southern pine. The new Laboratory would adequately house this research.

FORESTRY SCIENCES LABORATORY, ATHENS, GA.

Chairman HAYDEN. In fiscal year 1964, the Forest Service received an increase of $250,000 for staffing the Forestry Sciences Laboratory at Athens, Ga., in forest insect and disease research and in forest products utilization studies. What progress has been made in building up these research programs?

Mr. HARPER. The staffing of the Forestry Sciences Laboratory at Athens, Ga., provided for by the $250,000 increase has proceeded satisfactorily and will be accomplished during fiscal year 1964. The funds and personnel, both scientists and supporting staff such as clerks, technicians, and other subprofessionals are as follows for each research activity:

Research activity	Increase	Staffing added		
		Scientists	Other	Total
Forest insect	$100,000	3	4	7
Forest disease	60,000	3	2	5
Forest products utilization	90,000	3	3	6
Total	250,000	9	9	18

1965 BUDGET REQUESTS

Chairman HAYDEN. What additional sums and numbers of workers will be required to bring the programs at the Athens Laboratory to the most effective full working level? Are these increases in this budget? Please indicate how these increases would be used.

Mr. HARPER. This budget does not provide for program increases for the Athens Laboratory. The additional funds and personnel required to bring insect, disease, and forest products utilization research to the most effective working level and to fully utilize the new laboratory facilities at Athens are:

Research activity	Increase	Additional personnel	
		Scientists	Other
Forest insect	$40,000	2	1
Forest disease	60,000	1	2
Forest products utilization	50,000	2	2
Total	150,000	5	5

These increases for insects, diseases, and utilization research along with what is now available, including timber management research, would bring the staffing at Athens to a strength of 25 scientists and 23 supporting personnel—48 in all and to the full capacity of the present laboratory.

The increases for forest insect and disease research would strengthen the work underway on serious pests that are doing widespread damage to the plantations and natural forest stands. Emphasis would be creased on the study of biological control measures as a substitute for chemical control that sometimes causes a residue hazard. Research would stress elm spanworm and black turpentine and Ips bark beetle controls. Studies would be intensified on fusiform rust disease and soil-borne diseases such as annosus root rot and little leaf.

The utilization research increases would be used to widen the use of Piedmont hardwoods now in good supply but sometimes lacking ready markets. Work would also be done on southern pine utilization problems in the Southeast. The problems of manufacturing, seasoning, fabricating improved products, and other measures to enhance the product and reduce unit cost of manufacture would all be attacked.

FORESTRY RESEARCH IN OREGON

Chairman HAYDEN. Will you place in the record a statement describing briefly the forestry research the Forest Service has underway that deals with timber, watershed, range, and wildlife habitat manage-

ment problems in northeastern Oregon? Show where the work is being done and what additional finances may be needed over those carried in the fiscal year 1965 budget. Will you do that, please.

Mr. CLIFF. We will.

(The information referred to follows:)

RESEARCH PROGRAMS

The Forest Service research program dealing with timber management problems in northeastern Oregon is centered at Bend, Oreg., where research is underway on problems of regenerating, improving, and harvesting lodgepole pine, ponderosa pine, and the mixed coniferous forests of the Blue Mountains and adjacent areas.

Although the watershed research is headquartered at Wenatchee, Wash., the findings apply to or are adapted to the conditions found in northeastern Oregon. Expansion of the program in the future will more adequately cover such necessary interpolations and modifications. The research involves two major aspects: (1) finding ways to stabilize soil and prevent erosion on forest and adjacent ranges while the areas are being used for timber or range forage production, wildlife habitat, or recreation, and (2) to learn how water yield may be improved through modification of vegetation.

Range management and wildlife habitat research, centered at La Grande, Oreg., deals with methods to improve and manage livestock ranges to better their condition and increase carrying capacity. Also included is research on establishing game browse and learning how to manage food and cover for deer, elk, and other forms of wildlife.

Present finances available for these programs in the fiscal year 1965 budget are as follows:

Timber management research, Bend, Oreg	$66,000
Watershed management research, Wenatchee, Wash	89,000
Range and wildlife habitat reserch, La Grande, Oreg	150,000

Additional finances that could be used effectively when the budget situation permits are:

Bend, Oreg	$100,000
Wenatchee, Wash	130,000

Newly constructed laboratories are available at both Bend and Wenatchee to accommodate the program increases indicated.

At La Grande, for range and wildlife habitat research the Forest Service does not have laboratory facilities adequate for the present program. A facility for this research is included in the 10-year program at La Grande and is estimated to cost $350,000.

MAPLE SUGAR RESEARCH

Chairman HAYDEN. Senator Aiken has asked me to inquire of you concerning maple sugar research. His first question is, What has been done to date by the researchers in Vermont and how might their efforts be implemented?

Mr. HARPER. Our research program that deals with problems of maple sap production is centered at Burlington, Vt. This program, carried on in cooperation with the University of Vermont, serves not only the maple sap producers of Vermont but those from Maine across to the Lake States. We have made good progress on some phases of important problems. For example, we have identified individual trees that yield a sap of unusually high sugar content. We have learned some of the factors in the tree and about its environment that seem to control or affect sap flow. We have laid some of the groundwork for techniques of tree breeding and propagation so that a superior race of high yielders can be established. This work, of course, is pointed to lowering unit production costs. We have also made some progress in working out the tree nursery and planting techniques for sugar maple.

These research accomplishments are noteworthy considering the small effort we have been able to put into the program. More work needs to be done on techniques and systems of sap extraction and collection to minimize labor costs per gallon of syrup produced. Tap hole preparation methods and studies of more effective techniques for mechanical tapping should be made. The research on developing high-yielding races of trees needs to be speeded up. Then there are many other problems of improving the culture and management of sugar bush, improving marketing systems, and so on, that need attention.

Chairman HAYDEN. Is the present maple production research staff at the University of Vermont adequate to do the job that needs to be done?

FOREST SERVICE RESEARCH STAFF AT BURLINGTON, VT.

Mr. HARPER. The Forest Service research staff at Burlington is making progress on some of the problems as I have indicated. We cannot include in our program work on a number of important aspects. Progress is slow on others. So, I would have to say that the present staff is not able to do an adequate job on what needs to be done.

Chairman HAYDEN. Would a national maple center, along the lines recommended by the Vermont Maple Industry Council, be effective?

VERMONT MAPLE INDUSTRY COUNCIL

Mr. HARPER. The Vermont Maple Industry Council sent us a copy of their recommendations some time ago and we have worked with them in the past to gain a better understanding of the problems facing the maple sirup producers. Our program at Burlington does represent what the council refers to as a "national center" inasmuch as it is the place where all our research on maple sirup production is concentrated. We agree that this is an effective way to organize the research and get the most values from the research expenditures.

Chairman HAYDEN. Would $180,000 as suggested by the industry council provide adequate staffing for broadened research so as to reach full capability in fiscal year 1965?

Mr. HARPER. Yes, an increase of $180,000 over the amount carried in the fiscal year 1965 budget would provide for adequate staffing for a broadened research program if such an increase were fiscally feasible. This would provide for accelerated research on problems now being studied and work on other important phases not in the current program.

NAVAL STORES AND TIMBER PRODUCTION LABORATORY AT OLUSTEE, FLA.

Chairman HAYDEN. The Naval Stores and Timber Production Laboratory at Olustee, Fla., has an excellent research program underway which has been finding ways to reduce naval stores production costs. If this program were expanded, could faster progress be made in solving production problems? What would a reasonable expansion require?

Mr. HARPER. You are correct, Mr. Chairman, in pointing out that the naval stores production research program at Olustee, Fla, has been helpful in reducing the production costs for pine gum. Chemical formulations have been developed which appear to extend the period of gum flow from 2 to 3 weeks. Modifications of traditional tech-

niques of applying the turpentine streak to the tree have been shown to speed up the operation, give slightly increased gum yields, and permit improved timber utilization. A new, noncorrosive substitute for sulfuric acid, which is highly adaptable to slash pine plantations, has greatly improved the quality of the gum in exploratory studies. These new developments represent the most promising breakthrough for the gum naval stores industry in three decades.

GUM TREE RESEARCH

When the financial situation permits an expansion of the naval stores research program, we think faster progress would result. Some of the more promising leads we have recently uncovered need to be confirmed through more exhaustive and thorough trials and evaluations before the development of additional laborsaving techniques can be assured and passed along to farmers and other gum producers. We need to do much more research on how gum is formed in the tree, how it is chemically transformed, and how it moves out of the tree. Such information will help us avoid costly trial and error approaches in the research.

We estimate that an increase of $70,000 over the funds carried in the fiscal year 1965 budget would be a feasible addition to the program when such an amount could be made available.

FOREST SERVICE RESEARCH LABORATORY NEAR FORT MYERS, FLA.

Chairman HAYDEN. It is our understanding that omitted from the budget were funds requested by the Department for a proposed U.S. Forest Service research laboratory to be located near Fort Myers, Fla.

If such funds are not appropriated, will the forestry program be seriously crippled?

Mr. HARPER. Mr. Chairman, you are correct that funds are not included in this budget for the laboratory at Fort Myers. Within the overall financial situation it was not possible for the Department to include this item, which would have required $200,000, in the fiscal year 1965 budget request. Without these funds, of course, we will not be able to build a laboratory at Fort Myers. The program there does need a laboratory facility. Scientists there do not have adequate space, instruments, and other facilities they need.

WILDLIFE HABITAT RESEARCH IN MIDWESTERN STATES

Chairman HAYDEN. Senators Symington and Long have written to me as chairman of the subcommittee asking that funds be added to the Forest Service budget to undertake cooperative wildlife habitat research in Missouri and other Midwestern States. Their letter will be printed in the record.

(The letter referred to follows:)

U.S. SENATE,
Washington, D.C., February 26, 1964.

Senator CARL HAYDEN,
Chairman, Subcommittee on Appropriations for the Department of Interior and Related Agencies, U.S. Senate, Washington, D.C.

DEAR MR. CHAIRMAN: You will recall that last year a request for appropriations was made to your committee to permit the U.S. Forest Service to undertake cooperative forest wildlife habitat research in Missouri and other Midwestern States.

We are taking this opportunity to again stress the need to make funds available for this most worthwhile project. Only through research will we be able to establish sound management of timber and game resources in the Central States. This area contains approximately 100 million acres of oak-hickory forest which is inhabited by a wide variety of upland game birds and animals. The increasing use of these resources makes it imperative that research be undertaken so that sound management programs will be developed for both timber and wildlife to meet present demands on them as well as their future use.

We therefore strongly urge the committee's favorable consideration of this request to provide the necessary funds to undertake cooperative forest wildlife habitat research by the U.S. Forest Service in Missouri and other Midwestern States. In addition, we respectfully request this program be headquartered in Missouri. The Missouri Conservation Commission, long interested in this field, has both the personnel and facilities to succeesfully carry forward this project.

Sincerely,

STUART SYMINGTON.
EDWARD V. LONG.

Chairman HAYDEN. Also at this point I will include a statement on this same subject by William E. Towell, director of the Missouri Conservation Commission.

(The statement referred to follows:)

NECESSITY FOR THE RESEARCH PROGRAM

Mr. Hayden and members of the Senate Subcommittee on Appropriations for the Department of the Interior and related agencies, I am Director William E. Towell of the Missouri Conservation Commission, and my purpose in appearing before you is to recommend that you provide additional funds for the U.S. Forest Service so that it may undertake cooperative forest wildlife habitat research in Missouri and other Midwestern States.

It was my privilege to appear before this committee last year in support of this urgently needed research project. No action was taken, however; thus, I have returned to urge you once more to consider the merits of this case. I respectfully submit that delay in financing this worthy project could be false economy in the long run. The need for this research already exists and will continue to mount. As the President recently stated, "We must keep our air clean, our water pure, our forests green, our birdlife abundant, and our wildlife plentiful. * * * We must also be sure that through wise use and foreseeing policies that the enjoyment of these endowments is opened to all the people * * *."

Our Central States contain 100 million acres of oak-hickory forests. These combined hardwoods form the dominant forest type in Missouri, Iowa, Illinois, Indiana, Ohio, Kentucky, and other States adjacent to this central region. These oak-hickory forests supply food, cover, and breeding grounds for many upland game birds and animals—they are home for a good share of our wildlife in the Eastern and Central United States.

There are many gunners in this great geographical center, where the 1960 National Survey of Fishing and Hunting showed 4,694,000 persons over 12 years of age who hunt. This is 28 percent of all gunners in the United States. From this same survey, the average annual expenditure of a gunner in 1960 was $79.34, a total of $375 million spent each year on hunting activities in the central region. The hunting members are still increasing. In Missouri, for example, our deer hunters increased from 30,000 in 1951 to 102,500 in 1962, and the take increased from 5,500 in 1951 to 16,500 in 1962. Much of the hunting and the game had to come from our forests, which are more and more intensively managed for timber.

More than a million deer, 25,000 wild turkey, untold numbers of squirrel, quail, and grouse now live in the Midwest oak-hickory forests. But these forests can support many times these wildlife numbers if game and habitat are skillfully manipulated. In these timbered areas lie space, the badly needed, much-demanded "room for freedom." But it cannot properly provide wider opportunities for sportsmen without sound, intelligent—and sometimes expensive—game management.

Whether game will be abundant or scarce, and the degree of satisfaction of both hunter and timber group, depend on how this great oak-hickory forest of the Central United States is managed. And only research can furnish sound knowledge of relations between game populations and the timber resource.

Little research has been done on how to coordinate timber-wildlife production, yet the demand for products of this forest is mounting, while the land available is diminishing.

Research findings we now have indicate a tremendous opportunity to make our forests produce more game without reducing the timber potential. We have considerable evidence that both timber and game management can be adjusted to meet the demands, but we have not had the detailed research programs necessary to provide practical long-term guidelines. We need forest management which permits maximum production of wildlife, timber, watershed control, and other basic resources. We want to know how heavy a stand to leave for timber and game, how thinning, clear cutting, prescribed burning, and other measures affect wildlife. We need to know how to modify present practices to obtain the best habitat for game animals and birds without harming timber production; we need basic information on the ecology, physiology, and production of food plants and seeds.

To complement the proposed program of the U.S. Forest Service in wildlife habitat research, the Missouri Conservation Commission will provide its research facilities and personnel toward the goal of forest habitat management. Right now my State's research staff is studying forest game birds and mammals, with principal attention directed toward the game species, their current and long-term production and habitat needs. If the Forest Service is furnished funds to conduct wildlife habitat research in Missouri and other Central States, we pledge eager cooperation.

In fact, for many years we have cooperated with the Forest Service research program of the Central States Forest Experiment Station. We assist in financing fire research and join in timber production research conducted by the Forest Service. We have a long, proud history of productive relationship between the Missouri Conservation Commission and the U.S. Forest Service—and we'd like very much to extend this cooperative work to research in wildlife habitat.

Such research done in Missouri would be of equal value to other States having similar conditions: the Ozarks of Arkansas and southern Illinois, the hills of Indiana and Ohio, the mountains of Kentucky. Since Missouri has a strong wildlife research and management program, with good personnel, equipment and lands, and since all of this would be available to a cooperative research program with the Forest Service, we recommend this program be headquartered in Missouri.

Thus, for your consideration, I recommend that you add for this purpose a minimum of $160,000 to Forest Service research programs for next year. This would enable the Central States Forest Experimental Station to conduct wildlife habitat research in Missouri, studies of great value to every one of the Central States.

The $160,000 requested for forest wildlife habitat research in the Central States region would provide for the salaries of six scientists, as well as student trainees, nonprofessional assistants, scientific equipment, costs of conducting laboratory, and field research and other essential services.

Approximately three-fourths of the $160,000 requested would be used for research to determine how to obtain the optimum forest wildlife habitat production under a variety of environmental conditions. The broad environmental factors that influence the production of wildlife food and cover plants include length of growing season, temperature extremes, pattern and amount of precipitation, soil and topography, and existing vegetation. The influence of these factors upon the growth of native and introduced plants would be determined. Also, research would be done to find practical ways to increase wildlife carrying capacity, improve distribution of wildlife, restore game food plants on depleted areas, and replace less valuable wildlife plants with more productive species.

The remaining one-fourth, or $40,000, of the funds needed, would be used to determine forest management systems permitting optimum yields of both timber and wildlife habitat in hardwood forests. This would involve research to develop: (1) Timber cutting practices compatible with wildlife food and cover production; (2) timing and intensity of timber stand improvement measures to most nearly meet the requirements of wood and wildlife production; (3) method of reproducing timber stands in harmony with wildlife populations; and (4) ways of making other related adjustments in timber growing and wildlife management practices to their mutual benefit.

The Missouri Conservation Commission will continue its wildlife management activities on the national forests of Missouri. In the current fiscal year $40,875 is budgeted for this purpose. The principal activity of the conservation commission in this cooperative effort will be work with wildlife itself, while efforts of the

U.S. Forest Service will be directed toward the habitat as it provides food and cover for game animals.

I appreciate this time on your crowded schedule, gentlemen, and hope that you can provide the funds we have recommended, as well as others needed to strengthen forestry research across the Nation.

OPPORTUNITIES OF IMPROVING WILDLIFE HABITAT

Chairman HAYDEN. Will you examine these documents and provide for the record a statement of your ability to use an additional $160,000, indicating just what you would do with it, and where it would be expended?

Mr. CLIFF. We will do that, sir.

(The statement referred to follows:)

"The documents referred to correctly describe the forest situation in Missouri, Iowa, and Illinois—and other Midwestern States—with respect to the opportunities of improving wildlife habitat and the game, birds, and all other forms of wildlife the forest supports. The Forest Service has in its short-term plans program increases of at least $160,000 when the fiscal situation is such that funds can be included in the budget for a comprehensive and practical wildlife habitat research program. We have plans for effective use of this amount.

The 100 million acres of mixed hardwood forests of the Central States basically contain most of the food and cover requirements for a large variety of birds and animals including deer, squirrel, turkey, quail, and grouse. The number of hunters that harvest every year a portion of the wildlife crop and who make up an important and growing recreational group, contribute substantially to rural areas where they hunt and recreate. In fact, the economic potential of hunting, based on abundant wildlife, and the creation of local employment in service activities has barely been realized.

There are significant problems yet to be solved, however, before wildlife numbers increase to the capacity of the forest land to support them. Past timber cutting practices have been detrimental to some trees that supply food and habitat required. Research would be undertaken to determine the best ways to restore habitat. Studies elsewhere have shown that when this is done, game animals and birds multiply with astonishing rapidity. Thus, the research contemplated would lay the basis for additional hunting opportunity and all of the economic benefits to the rural economy that accrue from increased recreational activities.

The program, to be centered at Columbia, Mo., would develop wildlife habitat management practices that would apply widely throughout adjacent States. Laboratory facilities are available for the research.

FEBRUARY 28, 1964.

FOREST RESEARCH

Chairman HAYDEN. Senator Bartlett has handed me a most interesting letter received by him discussing the forest research office in the fiscal 1965 budget. This letter is written by an old friend of his, Hon. B. Frank Heintzleman, who, before becoming Governor of Alaska in territorial days, served for many years as regional forester.

The strong support he gives to the increased funds for forest research is most persuasive and should, the Senator feels, be made a part of the hearing record.

(The letter referred to follows:)

WASHINGTON, D.C., *February 20, 1964.*

Hon. E. L. BARTLETT,
U.S. Senate, Washington, D.C.

DEAR SENATOR BARTLETT: The recommended increases in certain forest research items contained in the President's budget for 1965 deal with features of great importance to improved management of the forests of our country.

Of special interest to Alaskans is the provision for studies of better means to overcome the tendency of soil on the steep hillsides of southeastern Alaska to slide

following logging operations which support our extension timber-using industries. We are, of course, also interested in research which could be expected to supply answers to the control of forest insect infestations and tree diseases which now cut severely into the quantity and value of our timber crops.

Having spent many years in the administration of the national forests of Alaska I have a good knowledge of the seriousness of the above problems and am confident that the answers can be found in expanded research.

I hope you can find time to give special attention to these research items when the appropriations bill containing them reaches the Senate.

Cordially,

(Signed) B. FRANK HEINTZLEMAN.

AERIAL LOGGING

Chairman HAYDEN. I seem to note in your justifications this year a greater enthusiasm for the possibilities of logging by helicopter. Have your research efforts along this line progressed to a point where it appears that this will be an economical and practical method of logging in difficult to reach areas?

Mr. CLIFF. Dr. Harper will answer that. I would first like to comment, myself, that logging with helicopters shows some promise, especially in areas that are rough and that are difficult to get into by other means.

BALLOON USE

There are some problems, and one of them is getting the expense down so that it is competitive. We are now engaged in experimenting with the use of balloons to increase the efficiency of getting logs out of rough terrain at less cost and less damage to the ground and other vegetation.

This, likewise, shows a great deal of promise. But Dr. Harper can elaborate on that.

Dr. HARPER. I think that is a very good story that Chief Cliff has given you. We are working with really two concepts shown here on this chart to enable us to do a better job to preserve watershed values and at the same time to reduce costs of logging.

HELICOPTER USE

One of them is by helicopter and the other is by balloon. I think maybe the helicopter may have more limited opportunities than the balloon. We have carried the research on helicopters to the point where we feel that for some situations, as for short hauls such as for stranded logs and particularly those stranded along streamways, that this method would be a very efficient and cheap way of transporting logs.

One of the new developments for the helicopter has been this hook here that works automatically from the machine with less danger to the logging crew below, which was one of our big problems in the past. Also, it speeds up the operation, and this lowers the cost of helicopter use.

Now, here is even a newer concept about which there is great enthusiasm in the lumber industry because it may develop into the cheapest way of logging.

Essentially what this does is elaborate on the old system of cable logging by using the lifting power of a balloon. There have been new developments in fabrics of balloons recently that permits what we think will be a feasible operation.

FEASIBILITY STUDY FOR BALLOON USE

We now have some feasibility studies underway on this. Some of our work is being done through contract with Goodyear Aerospace Corp., which has made new developments in the balloon. I should say that the armed services use balloons now for quite a few jobs, and there is no reason why we could not do the same thing for forestry.

Senator MUNDT. Has it been tried in the field, or is this still some artist's concept?

Dr. HARPER. It has been demonstrated in Canada. It was not really a study. They just wanted to see how it would work. We have not yet put it on a pilot scale basis, because we want to finish all of the theoretical calculations first.

We could waste money by trying it out in the field before we have discovered and corrected the limitations it may have through calculations and through what we call feasibility studies.

PILOT DEMONSTRATION

Senator MUNDT. Has Goodyear demonstrated their willingness to give you a pilot demonstration for free, looking forward to building up a business if it works?

Dr. HARPER. It might come later. Right at the present time we have had a number of discussions with them, and they feel very strongly, as we do, that it is too early yet to try to put on a pilot operation until we know more about the size of balloons required, how you would hook them on, what it would cost, how much of a haul could you get, could you go back a mile with cables, or 2 miles, or half a mile, and that sort of thing.

BALLOON USE CONCEPT

Senator MUNDT. Have they gone far enough to indicate how they are going to control the direction in which the balloon flies? You can steer a helicopter. Suppose you want to move the log against the wind? How are you going to do that against the wind with a free balloon?

Dr. HARPER. The principle is rather simple. You attach one end of the cable system to something solid, say at the top of a mountain. You have a winch down here and you can pull the balloon back and forth on a cable.

Mr. CLIFF. The balloon lifts the weight of the log off the ground. You can log that way, the theory is, with lighter equipment.

Senator MUNDT. It lifts it off the ground and you hook it on a cable?

Mr. CLIFF. You just partially lift it so as to reduce the drag against the line. And the theory is, the log is less damaged with lighter equipment and can be hauled from greater distances and this balloon remains attached to the cable so you can control the movement of the balloon by the movement of the cable.

Dr. HAPER. It is a new concept, as we say. It was tried out briefly in Sweden about 2 years ago with an old balloon. They found a lot of problems. But since that time there have been some new developments in fabrics, shapes, and sizes of balloons that should make them much more practical.

FOREST SURVEY

Chairman HAYDEN. Your forest survey activity provides the basis for keeping track of the timber situation. You have requested $150,000 increase in the fiscal year 1965 budget to accelerate the forest survey. What will this increase accomplish and how much money will be required to bring this activity to an adequate schedule of forest resurveys within the amounts authorized for this purpose by legislation? You may supply this information for the record.

Mr. CLIFF. We will be glad to do that, Senator.

(The information referred to follows:)

STATUS OF THE PROGRAM

With the funds now available, our most recent estimate for the forest survey is about 43 million acres of commercial forest land each year. This includes both field work to collect the basic data and the compilation of State and local reports describing the forest resources, the rate of timber growth and rate of removal including a detailed explanation of the timber supply situation, and timber management needs. Current progress is somewhat less than 80 percent of that required; namely, 55 million acres of commercial forest land a year which the Forest Service together with State and industry cooperators believe to be essential in order to maintain an adequate schedule of resurveys.

The budget increase of $150,000 for fiscal year 1965 would raise survey progress to approximately 48 million acres a year, still materially below the 55 million acres required annually but enough to reverse the steady downward trend over the last several years resulting from steadily rising costs.

We believe that acceleration of the forest survey is highly important to measure the rapid changes taking place in the Nation's timber resources, to provide public agencies with guides for forestry programs, and to provide industry with basic facts on raw materials supplies available for new or expanded wood-using plants. Moreover, the forest survey provides essential data on the available timber resources so important to the Department's rural areas development program.

An increase of $200,000 more than the budget estimate of fiscal year 1965 could be effectively used. This would represent a total increase of $350,000 over the 1964 level of financing, and would raise the rate of progress to an estimated 53 million acres annually. The need for further increases to achieve the survey goal of 55 million acres annually could be better appraised at a later date based on experience in the next year or two. The funds authorized for resurveys, the amounts appropriated, and the areas surveyed are shown below for 1949 and for 1964 and 1965.

Forest survey funds and progress

Fiscal year	Funds authorized for resurveys	Survey funds available		Required to keep fully up to date	Actual
		Total	Percent of resurvey funds authorized		
	Thousands	*Thousands*	*Percent*	*Million acres*	*Million acres*
1949	$1,500	$824	54.9	55	53
1964	2,500	1,676	67.0	55	43
1965	2,500	[1] 1,854	74.2	55	[2] 48

[1] Included in the fiscal year 1965 budget.
[2] Estimated.

RESEARCH CONSTRUCTION

Chairman HAYDEN. Last year instead of providing construction money for forest research laboratories, the Congress provided planning funds. Money was made available for planning five laboratories. What is the present status of the planning? Generally, would it be feasible to construct these laboratories during the next year?

Mr. CLIFF. Dr. Harper will respond to that.

Dr. HARPER. Mr. Chairman, the status of the projects is that all of them have had contracts awarded for the specifications and drawings, except the one at Morgantown, W. Va., which, I understand a meeting has been set next week to award the contract.

The scheduled dates of completion of the planning for each of these laboratories are as follows: Sewanee, Tenn., March 1964. That is next month.

Houghton, Mich., the date for that will be October 1964.

Missoula, Mont., the date for that is October 1964.

Morgantown, W. Va., the date for that is November 1964.

Fort Collins, Colo., the date for that is December 1964.

In other words, all of these five laboratories would have plans and specifications ready during the first part of the fiscal year. It would be feasible to award contracts for construction of all of them during the next fiscal year, 1965, if funds were available for this purpose. Such funds are not in the 1965 budget estimate.

CONSTRUCTION AT ALEXANDRIA, LA.

Chairman HAYDEN. Money was appropriated last year for a second increment on the Laboratory at Alexandria, La. Has a contract for that Laboratory been let yet?

Dr. HARPER. Yes, sir; it has. The construction is going along on schedule. That project should be completed by September of this year.

FOREST SCIENCES LABORATORY, MISSOULA, MONT.

Chairman HAYDEN. Senator Mansfield has addressed a letter to me urging appropriation of necessary funds to construct the Forestry Sciences Laboratory in Missoula, Mont. Last year Congress approved $28,000 to prepare plans for this Laboratory. The Senator's letter and the attachment thereto will be placed in the record.

(The letter referred to follows:)

U.S. SENATE,
OFFICE OF THE MAJORITY LEADER,
Washington, D.C., February 21, 1964.

Hon. CARL HAYDEN,
Chairman, Appropriations Committee,
U.S. Senate, Washington, D.C.

DEAR MR. CHAIRMAN: Enclosed is a detailed letter I have received from Arnold W. Bolle, dean of the School of Forestry at Montana State University in Missoula, Mont., discussing two items of particular interest to the Montana congressional delegation.

As you may recall, the Congress appropriated $28,000 to begin planning and architectural work on the new forestry research laboratory which is proposed for Montana State University campus. This Forest Service research facility would be a major step forward in the expanding cooperative research program between the Federal Government and the university. It is my understanding that the construction of this new building will require an appropriation of some $400,000. I was indeed sorry to learn that the administration's budget request did not include this item. I do hope that the Forest Service officials will be questioned on this project and I would hope that the Congress will see fit to appropriate the necessary funds for the construction of this important research facility in fiscal year 1965.

Also I thought you and the other members of the committee might appreciate having Dr. Bolle's general discussion of forest research. Dr. Bolle is quite familiar with these programs and his views are generally held in high regard.

With best personal wishes, I am,

Sincerely yours,

MIKE MANSFIELD.

MONTANA STATE UNIVERSITY,
Missoula, Mont., February 17, 1964.

Hon. MIKE MANSFIELD,
U.S. Senate,
Washington, D.C.

DEAR MIKE: I understand that the appropriation hearings for Interior and Forestry are being held this week. Two items of special interest to us are, (1) the proposed forestry research laboratory on the Montana State University campus, and, (2) the amount of the appropriation for forestry research in Montana.

The proposed U.S. Forest Service Research Laboratory will be a great boon to both the university and the Forest Service. We at the university are moving into a rapidly expanding research program in forestry with stronger support from the State and industry as well as new Federal matching funds under the McIntyre-Stennis Act. We are coordinating our program with that of the Forest Service in all fields and we look to this new laboratory as the focal point for such coordination. The Forest Service will have available to it the full facilities of the university and the staff of the university can work with Forest Service scientists in Service facilities. We hope that funds for the construction of this laboratory can be made available for the next fiscal year. From a selfish standpoint, we recognize that the authorization of this laboratory will give impetus to the construction of a new building for the school of forestry in the near future.

The research program of the U.S. Forest Service in Montana needs greater financial support. We are lagging in knowledge of spruce reproduction, management of our important timber species, forest products, marketing and fire control. In fire control for example, we have an outstanding laboratory, thanks to your efforts, but we have not been able to fully capitalize on the facilities because there have not been sufficient funds to fully staff the laboratory or provide the equipment needed. In all these fields we at the university are closely cooperating with the Forest Service and coordinating our work with theirs. This teamwork is paying off in better research results as well as providing better opportunities for our students. The Forest Service research work is of considerable importance to our program. Many of our graduate students work on Forest Service research projects and this work is a great help in keeping them going. A number of our undergraduates also find work during the summers as well as part-time during the school year on Forest Service research projects. This is a mutually advantageous arrangement. We also do some contract research work on Forest Service projects. We regard the Forest Service research program as a great adjunct to our own.

Another item of direct concern to us in forestry research is the amount of the proposed appropriation under the McIntyre-Stennis Act. This is in the Department of Agriculture appropriations, not Interior and Forestry. As you know, the McIntyre-Stennis Act passed in October 1962 received its first appropriation for $1 million this year. It was anticipated that the amount would be increased to $5 million for the next fiscal year. It now appears reasonable that the amount should be increased to at least $3 million to help provide the funds for research needs. This valuable piece of legislation was strongly supported by industries, agencies, and universities in Montana as well as nationally. It is the basis for increasing the State appropriation for forestry research as well as financial support from industry. Without stronger national support we will not be able to undertake the programs we have proposed. Support from the State and industry may also be reduced. By law the upper limit of funds for this program is about one-half the appropriation for Federal forestry research or about $12 million. I will try and give you additional information on the value of this program in Montana before the hearings are held.

As you know, almost all forestry research in Montana is conducted by the U.S. Forest Service and the university. This pattern is true nationally. While individual industries do carry on some research and contract with us and other schools for some research, they generally have to rely on the Federal Government and the universities for this research. Part of the problem lies in the wide dispersion of the industry into many plants most of them relatively small and not financially able to afford large research departments. Only a few of the largest companies are engaged in any significant amount of research and almost none of these are represented in Montana. While we cannot hope to resolve all of industries' problems through research, the only real hope for working toward long-run solutions lies in research.

We are all sympathetic with the need for economy in the Federal budget. In the face of the proposed cutbacks in this budget many needs of individual States and groups will not be met. However, even without increasing the budget

there are sure to be many changes made. In the course of these changes I hope that due consideration will be given to needs such as ours. The total money involved is relatively small but it is of intense interest to us. We feel that in each case the appropriations requested are in the form of investments which will be repaid many times over in the future.

If I can provide you with any additional information in regard to these items, I will be pleased to do so.

Sincerely,

ARNOLD W. BOLLE, *Dean.*

CONSTRUCTION OF THE LABORATORY

Chairman HAYDEN. What is the outlook for completion of these plans and what additional funds will be needed to construct the laboratory? Include in your reply a brief description of the program to be housed in this facility. Will you do that for the record?

Dr. HARPER. Yes, sir.

(The information referred to follows:)

STATUS OF THE PROGRAM

We anticipate that architectural and engineering plans and specifications will be finished by late fall or early winter, well ahead of the spring construction season at Missoula. We estimate that $372,000 will be needed to construct the laboratory.

The laboratory will accommodate research on three problems, (1) growth and culture of western larch and Englemann spruce, (2) improved utilization of northern Rocky Mountain timber species, and (3) management of wildlife habitat. All of these problems have an important bearing on the economy and well-being of the region where timber-based industry and recreation, including hunting and fishing are two of the greatest sources of economic growth.

The program in timber management research would work to improve growth through better cultural measures, reduce delays in regeneration of cutover areas, and solve problems of maintaining preferred species. All of these measures would reduce unit production costs and make national forest and private timber operations more profitable.

Forest products utilization research would attack problems of air seasoning to make lumber a better, more salable product; problems to improve utilization of transmission poles; and otherwise develop local adaptations of improved utilization practices of benefit to all aspects of the timber-based industry. The utilization studied would be carried out in cooperation with the Forest Products Laboratory at Madison, Wis.

Wildlife habitat problems to be worked on include ways to increase game food and cover and to insure that timber cutting or other forest land use practices properly integrate the requirements of wildlife. Winter range for elk and deer is especially critical in Idaho and Montana. Ways will be sought to extend this food supply and thus alleviate game management problems as well as the impact of game on the timber and water resource.

The Forestry Sciences Laboratory at Missoula would be built on a site made available by Montana State University.

FOREST SERVICE LABORATORY AT ST. PAUL, MINN.

Chairman HAYDEN. Does the Forest Service budget provide for completion of the laboratory at St. Paul, including the fixtures and equipment? What amount will be needed for this item?

Mr. HARPER. No, there are still a few items which are needed to make this new laboratory fully operational. Our estimate is that $150,000 will be required. This will provide for the purchase and installation of laboratory fixtures, scientific equipment and the completion of the air ventilation system. Now that the laboratory building is being occupied and our scientists are ready to use the new facility, it is desirable that these items be available shortly. Later on we will need

greenhouses and other auxiliary facilities estimated to cost approximately $300,000.

Marketing Program at Duluth, Minn.

Chairman Hayden. I understand a small forest products marketing program is underway at Duluth, Minn. Could you tell me what the short-term plans are for this program, and what funds are needed for the program and the facilities?

Mr. Harper. Yes, we do have a forest products marketing program underway at Duluth. We have a small staff of two located in temporary offices on the campus of the University of Minnesota at Duluth. The research there involves studies of timber markets and possibilities for increasing the use of local timber. We have a rapidly increasing supply of timber in the northern Lake States and it is important that we find ways to market and use this timber. In fact, greater use of this timber resource is one way which the natural resource in this distressed area can be a significant factor in overcoming the critical unemployment and contribute substantially to economic growth of this forest region.

Our short-term plans for this project are to develop at Duluth a center for timber marketing research to serve the area. We plan to place emphasis on market studies for the large supply of aspen and the second growth hardwoods. We estimate that an increase of $200,000 would be needed when the overall financial situation is such that this additional amount could be budgeted. Because of the growing scarcity of space on the university campus and the need for specialized facilities for marketing research, we have in our plans a marketing laboratory which we estimate will cost $375,000.

Spruce Budworm Insect Problem

Chairman Hayden. What are you doing about the spruce budworm insect problem in northeastern Minnesota, and what do you think we should be doing?

Mr. Harper. We have had a spruce budworm epidemic in northeastern Minnesota for about 10 years. This epidemic has killed a substantial volume of balsam fir timber and has extended over some million acres of merchantable timber. It is continuing.

Since 1956 we have had a small research team studying this insect and how to control it. Certain phases of these studies have been completed. We now know the life history and feeding habits, we know how the insect moves from one area to another and we know that it can be controlled for limited periods by the aerial application of DDT. We have a study underway now which indicates silvicultural control is possible in some stands.

In the long range though the most promising control may be by biological methods. It is in this area we believe it is desirable to intensify the spruce budworm research program. We would like to see studies made of parasites which might be used to keep down such infestations. This might eliminate the use of insecticides in future control operations.

RESEARCH PROGRAM AT LA GRANDE, OREG.

Chairman HAYDEN. What are the Forest Service plans for the research program at La Grande, Oreg., as they relate to research facilities and development of the research work?

Mr. HARPER. The Forest Service research program at La Grande deals with two important problems (1) improving the grazing management of forest and related ranges and (2) improving and managing wildlife habitat. Research on both problems is underway. We have approximately $150,000 included in the fiscal year 1965 budget for the work, the same amount as fiscal year 1964. Our short-term plans call for at least doubling this research when we are able to budget for it. Our greatest need for the immediate future is a laboratory to house the current and planned program. This we also plan to include in future budgets when the overall financial situation permits.

Chairman HAYDEN. Senator Morse is particularly interested in this. Congressman Ullman also has written to me about this, and I will place his letter in the record.

(The letter referred to follows:)

HOUSE OF REPRESENTATIVES,
Washington, D.C., February 27, 1964.

Hon. CARL HAYDEN,
U.S. Senate, Washington, D.C.

DEAR SENATOR HAYDEN: In the Interior Appropriations Subcommittee hearings with the Forest Service tomorrow morning, I am hopeful that there will be some discussion of the badly needed research laboratory facility for livestock range and wildlife habitat.

While not in the budget, I am reliably informed that this important project is classified in the highest priority category by the Forest Service. The amount of $28,000 is needed this year for architectural design and construction planning.

I would deeply appreciate any effort which might be made to have that amount for the La Grande laboratory included in this year's appropriations bill. Anything which you could do would be a personal favor to me.

Sincerely,

AL ULLMAN,
Member of Congress.

SILVICULTURE LABORATORY AT SEWANEE, TENN.

Chairman HAYDEN. Senator Gore has asked the subcommittee to provide funds to construct a silviculture laboratory at the University of the South at Sewanee, Tenn. His letter will be printed in the record.

(The letter referred to follows:)

U.S. SENATE,
COMMITTEE ON FOREIGN RELATIONS,
February 18, 1964.

Hon. CARL HAYDEN,
Chairman, Interior Subcommittee, Appropriations Committee, Senate Office Building, Washington, D.C.

DEAR MR. CHAIRMAN: Enclosed is a statement concerning the need for construction of a silviculture research laboratory building at the University of the South at Sewanee, Tenn. I hope funds for construction of this facility can be included in the 1965 appropriation bill.

Sincerely yours,

ALBERT GORE.

THE SEWANEE FOREST MANAGEMENT RESEARCH PROJECT

Headquarters for this U.S. Forest Service project are at Sewanee, Tenn., on the campus of the University of the South, a major cooperator. Major experimental areas are the 10,000 acres of university land surrounding Sewanee and the 2,600-acre Flat Top Experimental Forest near Birmingham, Ala. Cooperative studies are also installed on industry and other private lands, State and National forests, and other public lands in central Tennessee and northern Alabama.

The Sewanee project is responsible for silvicultural research on commercially important pines and hardwoods of the Cumberland Plateau and Highland Rim. These highlands extend across more than 18 million acres of central Tennessee and north Alabama, and nearly 60 percent, or about 10¾ million acres, are commercial forest land. The plateau is the more heavily forested with three-quarters of the Tennessee and two-thirds of the Alabama portions in woodland. Forest lands are a major economic resource of this great region and contribute substantially to its economy. Recent forest survey data show gratifying improvements in Tennessee forests, but the land is still producing but one-third of its potential.

Research began early in 1957 near Sewanee with pine regeneration studies aimed primarily at developing seeding and planting techniques for restoring the extensive areas of understocked land. Methods for direct seeding pine have now been developed, but additional investigation and pilot plant studies are needed. Pine-planting studies and owner experience have shown that early survival exceeds and growth compares favorably with that of the Coastal Plain. Soil studies are in progress for loblolly pine plantations and for the commercially valuable hardwoods. Research results based on work at the Sewanee project have been reported in 31 publications since 1957. These findings also benefit similar highland regions throughout the South.

The objective of the Sewanee research program is to provide information that will enable the landowner and forest manager to select and establish tree species capable of yielding the greatest returns on the various soil situations. Because of the mountainous nature of the land, conditions for establishment and growth of trees vary greatly, from the thin-soiled ridgetops to the deep coves and hollows. To provide this knowledge, particularly for hardwoods, will require not only field experiments but also intensive study of seed collection, processing, storage, treatment, protection, and germination; methods of seeding and planting; and the effect of soils on germination of seeds, survival of seedlings, and growth of trees. Such research involves complex problems of seed physiology and the physical and chemical properties of soils. It requires laboratory facilities and equipment, greenhouses, and office space for forest scientists.

The Sewanee project has made an excellent beginning but vitally needs a modern soils and silviculture laboratory and greenhouse for continued progress toward solution of regional forest problems. In 1963 Congress provided planning money, and a set of architect's plans and specifications have now been drawn up. An excellent location for such facilities is available on the University of the South campus. Through increased and more intensive research the potential contribution of this great but largely underdeveloped forest resource can be realized.

STATUS OF RESEARCH CONSTRUCTION

Chairman HAYDEN. For the past several years, we have appropriated funds for building a number of laboratories. Some of these were to be complete structures, others first stages to take care of immediate needs. I also understand you will not need any construction at some locations where you do research. Would you supply for the record a summary table of research construction to show where we stand with respect to these various situations involving facilities and what yet needs to be done? Also, summarize recent expenditures for construction and give your estimate of funds required to complete the job.

Mr. CLIFF. We will be glad to do so.

(The information referred to follows:)

Laboratory facilities at permanent forestry research locations

	Number of locations
Locations where facilities are adequate, no construction required	13
Locations where facilities have been added by recent construction, no further construction required	9
Locations where laboratory needs have been partially met by recent 1st stage of construction planned, further construction required	[1] 25
Locations where facilities are inadequate, no construction provided to date, construction required	[2] 33
Total locations	80

[1] Includes 1 location, Missoula, Mont., for which architectural and engineering planning funds were made available in fiscal year 1964. This building will be for a forestry sciences laboratory to house timber management, wildlife habitat, and forest products utilization studies. The first stage construction at Missoula was a forest fire laboratory provided for in fiscal year 1959.

[2] Includes 5 locations for which A. & E. planning funds were made available as follows:
1963: Madison, Wis., Forest Products Laboratory addition.
1964: Sewanee, Tenn., Silvicultural Laboratory.
1964: Morgantown, W.Va., Forestry Sciences Laboratory.
1964: Houghton, Mich., Forest Engineering Laboratory.
1964: Fort Collins, Colo., Rocky Mountain Forest Experiment Station, laboratories and main office.

Recent expenditures for research construction by fiscal year, and estimated funds required to complete the construction program as planned through fiscal year 1972 are as follows:

Fiscal year:	*Amount*
1959	$2,500,000
1960	None
1961	1,075,000
1962	5,195,000
1963	2,550,000
1964	635,000
Subtotal, expended	11,955,000
1965 (in present budget estimate)	[1] 3,800,000
Subtotal	15,755,000
Additional funds required to complete the construction as planned through 1972	41,600,000
Total	57,355,000

[1] Forest Products Laboratory addition at Madison, Wis.

FIRE CONTROL RESEARCH

Chairman HAYDEN. How did the 1963 fire season compare with previous years?

Mr. CLIFF. Mr. Chairman, I commented on that in my opening statement. It was more severe than normal, especially in the South and East. We did have an increase of burned acreage in the number of fires when you consider all forest lands.

Our record in the national forests is somewhat better than the 5-year average.

Chairman HAYDEN. What is the Forest Service doing to improve efficiency in fire control?

Mr. CLIFF. We have the two-pronged program. There is one in fire control research which I would like Dr. Harper to comment on, and Mr. Nelson has already discussed what we are doing in the administration of the fire control fund.

So if Dr. Harper would like to comment on what we are doing in fire control research, I would appreciate it.

Chairman HAYDEN. I am interested in efficiency in fire control.

USE OF CHEMICALS

Dr. HARPER. I would say that probably our greatest research development over the last few years has been in the use of chemicals in airplane support of ground firefighters. We have a number of chemicals that we have screened, tested, and put into practice. One of the best that has been most recently developed is diammonium phosphate, which also has fertilizer value, by the way. This, along with some kind of a jellylike agent that makes the chemical fire retardant stick to the vegetation has been very effective, particularly for use in the South.

FIRE DETECTION

We have also made considerable progress in detection of fires through a new device, an infrared scanning system, which permits seeing the outlines of a fire from an airplane, even at night, through clouds, smoke, and haze. This, I believe, will be a big achievement in increasing efficiency in fire control. Research has got to the stage now where we are making pilot tests of the new method, in cooperation with the firefighting organization of the national forests. There have been a number of other developments, Mr. Chairman. If you would like, I could add to this for the record.

Chairman HAYDEN. You may do that.

(The information referred to follows:)

PROGRESS IN FOREST FIRE CONTROL RESEARCH

In recent years forest fire research has contributed to more efficient fire control by improving forest fire danger measurement techniques. Systems of danger measurement are now widely used by almost all public and private fire control organizations to gage the day-to-day fluctuations in forest fire weather conditions so that they can vary their preparedness measures in accordance with the danger. This means that the maximum degree of preparation can be made on days of extreme danger. Savings are possible on low-danger days because firefighters can be safely used on other work. The Forest Service has recently completed a national fire danger rating system now under extensive trial, that standardizes methods of measurement and broadens the usefulness of danger rating.

The Forest Service scientists at Macon, Ga., have recently developed a laboratory model for a "fire whirl." Fire whirls are dangerous, sometimes violent winds that develop over some forest fires. These blow the fires out of control and endanger the lives of firefighters. Now that a way has been found to create fire whirls in the laboratory, the factors that cause them can be studied and evaluated and ways to predict their occurrence can be developed. This information will be of value to firefighters in predicting the occurrence of whirls and avoiding the hazards they create.

Progress has been made in identifying the underlying causes of some types of man-caused fires. In California, for example, studies of hunter activities and awareness of fire problems showed that fire prevention information was not understood by large numbers of hunters. Many were ignorant of forest fire regulations. Changes in fire prevention programs are correcting this situation.

Substantial progress in research on forest fuels—the dead and living materials that carry fire—has given the firefighters a better basis for developing the strategy and tactics for successful control. Recent studies have helped evaluate the seasonal changes in highly combustible volatile oils that occur in certain types of brush. Rates of deterioration in logging slash, hence its flammability, have been established. This information aids fire control officials to plan more accurately in advance where the greatest fuel hazards will be found and how they are changing.

Better forecasts of local winds are now aiding firefighters in some areas as a result of research on "topometeorology." These studies evaluate the effect of local topography on wind and weather in relation to the broader regional weather systems. Thus, fire forces know what to expect in each mountain canyon and can prepare their plans for combating fire with greater effectiveness and with less risk to human life.

Progress in the development of prescribed burning techniques in the South, Southwest, Pacific coast, and northern Rocky Mountains, has aided in forest fuel reduction programs. These programs are lessening the risk of fires starting and are reducing the likelihood of intense, hard-to-handle fires if blazes do occur. The research is providing the technical guides for the safe use of controlled fire in many situations.

Rural Area Development

Chairman Hayden. How do State and private cooperative forestry activities tie in with and contribute to rural areas development—especially for the cooperative fire, forest management and processing, and general forestry assistance items for which increases are requested?

Mr. Cliff. Mr. Chairman, I am sure that this committee appreciates the vital place that the private forest lands play in the forest economy of this country and the vital place that forestry generally plays.

Correlation Between Commercial Forest Lands and Unemployment

About 60 percent of the privately owned commercial forest lands in this country are owned by small woodland owners. Generally speaking, the small woodland ownerships generally are in poorer condition than the industrial ownerships, or the publicly owned forest lands. It is here that the big problem lies in getting better forestry practices. Now if I had my map with me that shows the incidence of this commercial forest land and the incidence of chronic unemployment in this country, it would show that there is a close correlation between the commercial forest lands in the country and the areas of chronic unemployment. Part of this is due to the poor condition, the undeveloped condition of much of our private forest land, and the major problems of the small forest ownerships. So I think there is an opportunity to make a real contribution in furnishing work, and by building up basic resources, to get at this unemployment and the poverty program through sound forestry programs. We are working with and through the States in trying to promote better management on this private forest land, particularly the small ownerships. As you know, we provide funds on a matching basis for fire control and we still have a big job to do to get adequate fire control on private forest lands.

There are still about 24 million acres that do not get any organized protection and we have a large amount more that needs more intensive protection. This is basic.

Assistance Programs

We also have a program for giving assistance through State foresters to owners of private lands in advising them how to better manage their lands and finding better markets for their timber. This budget would provide some more money to expand this cooperative program.

Then, we also provide general technical assistance to the States and to the private land owners where they need specialists. Let me say it this way: We have marketing specialists. We have specialists in seeding and planting that work on problems of concern to several States. Our general forestry assistance program provides these technicians and their services are made available to a number of States. We can strengthen and broaden our technical assistance in this manner.

We have had a change, Mr. Chairman, in our leadership for State and private forestry. Mr. W. S. (Bill) Swingler, who has been appearing before this committee for about 11 years now and who was in charge of our State and private forestry activities, retired at the end of 1963. He has been replaced by Boyd Rasmussen, who we brought in from the regional forester position at Missoula Mont. Mr. Rasmussen is not here today, but his deputy, Mr. Arthur Spillers, is here and he is qualified to answer any detailed questions you might have on State and private forestry programs.

Forest Roads and Trails

Chairman Hayden. For forest roads and trails you are asking $72,300,000 in fiscal year 1965 to liquidate contract authorizations. This is $9,100,000 more than was appropriated in fiscal year 1964. The justifications for this request will be printed in the record.

(The justification statement referred to follows:)

Forest Roads and Trails

Appropriation Act, 1964, and base for 1965	$63, 200, 000
Budget estimate, 1965	72, 300, 000
Increase	+9, 100, 000

This appropriation provides for the liquidation of obligations incurred for the construction and maintenance of forest roads and trails (and the purchase of access roads) pursuant to the authorization contained in the Federal Highway Act of 1962. An appropriation of $72,300,000 for 1965 will provide sufficient cash to liquidate prior year obligations and obligations planned for fiscal year 1965 which must be paid by June 30, 1965.

Analysis of cash requirements by activities [1]

	Actual, 1963	Estimated, 1964	Estimated, 1965	Increase or decrease
Construction of roads and trails	$29, 140, 194	$60, 848, 606	$60, 700, 000	−$148, 606
Maintenance of roads and trails	10, 250, 000	11, 500, 000	11, 600, 000	+100, 000
Total	39, 390, 194	72, 348, 606	72, 300, 000	−48, 606

[1] The annual appropriation language and these explanatory notes combine the appropriation for "Forest roads and trails" made pursuant to 23 U.S.C. 205 and the appropriation of 10 percent of forest receipts for construction and maintenance of roads and trails pursuant to 16 U.S.C. 501. This merger of funds is made in order to simplify the programing, allotment, and accounting of funds at the field level. Since the accounts for these 2 funds are merged, it is not practicable to distribute obligations and expenditures between the 2 appropriations on a precise basis. The amounts shown for the "Forest roads and trails" appropriation are a proration based on the percentage that contract authorization used under the appropriated funds is of total available funds. Expenditure amounts for maintenance are based on all such obligations requiring cash payment during the fiscal year.

Authorizations for appropriations [1]

Fiscal year	Construction	Maintenance	Total	Funded	Unfunded
1963	$41,000,000	$9,000,000	$50,000,000	$50,000,000	
1964	58,000,000	12,000,000	70,000,000	[2] 47,036,000	[3] $22,964,000
1965	72,900,000	12,100,000	85,000,000	72,300,000	[4] 12,700,000
Total	171,900,000	33,100,000	205,000,000	169,336,000	[5] 35,664,000

[1] The annual appropriation language and these explanatory notes combine the appropriation for "Forest roads and trails" made pursuant to 23 U.S.C. 205 and the appropriation of 10 percent of forest receipts for construction and maintenance of roads and trails pursuant to 16 U.S.C. 501. This merger of funds is made in order to simplify the programing, allotment, and accounting of funds at the field level. Since the accounts for these 2 funds are merged, it is not practicable to distribute obligations and expenditures between the 2 appropriations on a precise basis. The amounts shown for the "Forest roads and trails" appropriation are a proration based on the percentage that contract authorization used under the appropriated funds is of total available funds. Expenditure amounts for maintenance are based on all such obligations requiring cash payment during the fiscal year.

[2] The 1964 appropriation of $63,200,000 less prior year unfunded authorization of $16,164,000 provides $47,036,000 for funding of the $70,000,000 authorization for 1964.

[3] Includes $5,000,000 of the 1964 authorization which will not be obligated in 1964.

[4] Includes $12,500,000 of the 1965 authorization which will not be obligated in 1965.

[5] Net unfunded obligations is $18,164,000.

Status of unfunded authorizations

Unfunded contract authorizations beginning of 1964	$86,164,000
Appropriation, 1964	−63,200,000
New contract authorization, 1964 (1965 authorization available in 1964—Federal Highway Act of 1962, approved Oct. 23, 1962)	85,000,000
1964 administrative cancellation of obligating authority	−5,000,000
1965 administrative cancellation of obligating authority	−12,500,000
Total unfunded beginning of 1965	90,464,000
1965 budget estimate (cash requirements)	−72,300,000
Balance to remain unfunded as of June 30, 1965	[1] 18,164,000

[1] Total unfunded under Highway Act authorities, including the cancellation, is estimated to be $35,664,000

Analysis of cash requirements

1.	Unliquidated obligations, June 30, 1963		$24,851,209
2.	Estimated cash requirements to finance 1964 program		[1] 47,497,397
3.	Total cash requirements by June 30, 1964		72,348,606
4.	Less cash on hand 1964:		
	Balance from 1963	$9,148,606	
	Appropriated 1964	63,200,000	
			72,348,606
5.	Cash balance from 1964 available for use in 1965		
6.	Obligations in 1964 for which cash was not provided in item 2		17,964,000
7.	Estimated cash required to finance 1965 program		[2] 54,336,000
8.	Total cash required for 1965		72,300,000

[1] An estimated 73 percent of the $65,461,396 of new obligations will require cash payments during the fiscal year.

[2] An estimated 75 percent of $72,500,000 of new obligations will require cash payments during the fiscal year.

The following table reflects the total program for the construction and maintenance of roads and trails on the national forests for combining the funds available under the appropriation forest roads and trails with the permanent appropriation of 10 percent of national forest receipts. This permanent appropriation for roads and trails for States (10 percent fund) is estimated at $12,400,000 for 1965 compared with $12,000,882 for 1964, an increase of $399,118.

Project statement

Project	1963	1964 (estimated)	Increases and decreases		1965 (estimated)
			Increased pay costs (Public Law 87-793)	Other	
1. Construction of roads and trails	$47,823,235	$63,462,278	+$345,000	+$6,907,722	$70,715,000
2. Maintenance of roads and trails	12,777,409	14,000,000	+185,000	----------	14,185,000
Total obligations	60,600,644	77,462,278	+530,000	+6,907,722	84,900,000
Transfer from roads and trails for States	−10,900,118	−12,000,882	----------	−399,118	−12,400,000
Program under forest roads and trails contract authorization	49,700,526	65,461,396	+530,000	+6,508,604	72,500,000
Change in unfunded obligations	−5,200,526	−2,261,396	----------	+2,061,396	−200,000
Subtotal	44,500,000	63,200,000	+530,000	+8,570,000	72,300,000
Total increased pay costs on second step of pay increase (Public Law 87-793)	----------	(488,000)	(+530,000)	(+60,000)	(1,078,000)
Total available or estimate	44,500,000	63,200,000	+530,000	+8,570,000	72,300,000

An increase of $9,100,000 ($8,570,000 program and $530,000 pay cost) is needed to meet cash requirements for liquidation of contract authorization. This appropriation provides for the liquidation of obligations incurred for the construction and maintenance of forest roads and trails pursuant to the authorization contained in the Federal Highway Act of 1962. An appropriation of $72,300,000 for 1965 is required to:

(*a*) Pay for obligations of the prior year which will be due for payment in fiscal year 1965, and

(*b*) Pay the portion of 1965 obligations of $72,500,000 contract authorization which will require cash payment in that year.

The presence or lack of access by road or trail has a direct and controlling influence on all aspects of forest management, protection, utilization, and development. An adequate system of forest development roads and trails must be installed and maintained to facilitate the maximum practicable yield and use of all forest resources on a sound sustained-yield basis.

The road and trail needs are estimated on the basis of requirements for access in the year 2000 for major needs such as the protection of watersheds producing 200 million acre-feet of water annually, recreation and wildlife use by 635 million visitors a year, an annual timber cut of 21 billion board feet, and grazing use on 60 million acres of rangeland. It is estimated that this will require the construction of 380,000 miles of new roads, 6,000 miles of trails, and the reconstruction of 105,000 miles of existing roads and 10,500 miles of existing trails.

During the period 1963–72, 46,400 miles of multipurpose roads and 8,000 miles of trails should be constructed by the Forest Service at a total cost of $1.3 billion. At the 1964 construction level of $63.5 million, it would take over 20 years to provide the transportation system that should be in place by 1972.

The Federal Highway Act of 1962 provides forest development road and trail authorizations of $70 million for 1964 and $85 million for 1965. The 1964 appropriation provides for utilization of only $65 million of the $70 million authority with $5 million subject to administrative cancellation. The 1965 budget proposal contemplates use of $72.5 million of the $85 million authority with $12.5 million subject to administrative cancellation.

Pay act costs for fiscal years 1963 and 1964 have been absorbed within the available obligating authorities:

1963	$862,000
1964	1,800,000

The total cumulative pay act costs for fiscal year 1965 are estimated to be $2,330,000 of which $1,800,000 was previously absorbed in the 1964 appropriation. Cumulatively, for the period 1963–65, a total of $4,462,000 of such costs will have been absorbed.

The $530,000 shown for 1965 represents the cost of the additional increase effective January 5, 1964, pursuant to Public Law 87-793, that must be absorbed within the obligating authority authorized for use. The 1964 appropriation included the costs related to the second step of the pay increase for approximately one-half year. In order to continue all programs financed from this appropriation at the 1964 program levels, the additional salary cost impact for the full year must be provided.

Following is a summary of the road program proposed for 1965:

	Units	Estimated cost
Construction and reconstruction:		
Bridges	280	$5,000,000
Roads	[1] 1,900	38,915,000
Trails	[1] 687	2,000,000
Surveys, plans, and supervision for timber purchaser roads	[1] 4,900	19,300,000
Federal cost for timber purchaser construction	[1] 1,200	4,500,000
Road purchase		1,000,000
Subtotal, construction and reconstruction		70,715,000
Maintenance		14,185,000
Total		84,900,000

[1] Miles.

Access roads—Project statement

Project	1963	1964 (estimated)	1965 (estimated)
Access roads	$1,972,337	$1,121,243	
Unobligated balance brought forward	−1,128,629	−1,121,243	
Unobligated balance carried forward	1,121,243		
Unobligated balance lapsing	35,049		
Total available or estimate	2,000,000		

An unobligated balance of $1,121,243 from the fiscal year 1962 appropriation will be fully obligated during fiscal year 1964. During fiscal year 1963, 750 cases were obtained involving 558 miles of new land easements or rights-of-way over existing roads or interests in existing roads. A total of 29 road rights-of-way condemantion cases were filed. An estimated 1,000 miles will be obtained in fiscal year 1964.

Effective with fiscal year 1964, this appropriation was eliminated and future access road purchase, beyond that to be accomplished with the balance remaining in this appropriation, will be accomplished under the "Forest roads and trails" appropriation.

1965 Proposed Program

Chairman Hayden. Would you please comment on your proposed program during the coming year?

Mr. Cliff. Mr. Nelson will respond to that.

Mr. Nelson. We proposed to continue with our multiple use road and trail programs which will include for next year the construction of about 280 bridges, 1,900 miles of roads, about 687 miles of trails, and in addition, we have the planning and surveying not only for those roads, but for the roads that are built by timber sale operators as a part of their timber sale. We expect to do surveys and planning on 4,900 miles of roads this coming fiscal year. In connection with these roads which are constructed in relation with the timber sale contracts, we find that it is nececcssary and desirable to have them constructed often to a higher standard than can be justified for the timber sale. The reason is to give us a multiple-purpose road to be used for recreation and for other forest uses.

We expect to supplement timber purchase construction on about 1,200 miles with dollars. In addition to that, we do some purchasing of roads already constructed on private lands, roads that are needed for the national forest program, hauling the timber and public use. We expect to spend about $1 million for purchase of those types of roads that are already constructed.

IMPORTANCE OF MAINTAINING ROAD PROGRAM SCHEDULE

This program, in relation to the national forest program, puts us about 68 percent of what was planned for 1965 for the national forest program, whereas the overall is about 67 percent. We think it is real important to keep our road program even with the national forest, especially because one of the items that is financed more than the average is timber sales and timber sales account for about 70 percent of our needs for roads. So it is essential that the road program keep abreast of the rest of the development. Otherwise, we get ourselves in a position where we cannot get the sales made or we have money for recreation development and cannot get the roads to the recreation areas.

Chairman HAYDEN. Are you satisfied with the progress that you have made?

Mr. CLIFF. I would be less than honest, Senator, to say that we are satisfied. We are not satisfied when we are not meeting the goals that have been set and which we feel are truly justified. However, we feel we are making progress. When you compare where we were just a few years ago, we have made real good progress.

Chairman HAYDEN. This committee has been trying to help out in every way it could.

Mr. CLIFF. We are moving ahead. We think there is a need for this work even beyond what the budget provides for, but considering the overall budget situation, this is all that could be included for next year. The Federal Highway Act provides for new obligations for 1965 of $85 million but only $72.5 million is authorized for use in this budget request.

SOUTH DAKOTA FOREST ROADS AND TRAILS PROGRAM

Senator MUNDT. Mr. Chairman, I have a question on this point. I understand it correctly, I believe, that you have appropriated or planned to spend about $530,000 for forest roads and trails in the next fiscal year in South Dakota. The question, No. 1, is my information correct?

Question No. 2. How and where do you plan to spend it?

Mr. NELSON. Senator, I do not have my table here on the breakdown between the States. May I supply it for the record?

Senator MUNDT. Very well, and send a copy to my office.

Senator BIBLE. May I interpose a request, Mr. Chairman, and have the same type of breakdown provided for the State of Nevada?

Senator HAYDEN. You may also do that for the State of Arizona.

Mr. NELSON. Yes, sir.

(The table referred to follows:)

CONSTRUCTION AND MAINTENANCE PROGRAM

For Arizona we expect to obligate $3,407,000 for both construction and maintenance. The major road projects we expect to construct are—

Apache National Forest: Willow, Cole, Mexican Hay, and Big Lake roads.

Coconino National Forest: Cave Spring and Jones Mountain roads.
Coronado National Forest: Parker Lake road and Sabino Canyon trail.
Kaibab National Forest: Rosilda Springs, Twin Springs, and west side roads.
Prescott National Forest: Walker and Walker Big Bug roads.
Sitgreaves National Forest: Wallace road.
Tonto National Forest: Tortilla, Ponderosa, P. Perhatchery, Diamond Lookout, and Dutchman roads.

For Nevada we expect to obligate $748,000 for construction and maintenance. The major road projects we expect to construct are on the Humboldt National Forest known as the Lehman Creek and the McCarran Way roads.

For South Dakota we expect to obligate $530,000 for construction and maintenance. The major road projects will all be on the Black Hills National Forest known as the Savoy Tinton, Flag Mountain, Handy, Long Draw, White Tail, Parkerville Campground roads, and two bridges.

Acquisition of Lands for National Forests, Special Acts

Chairman Haydfn: There will be placed in the record justification for your estimate of $70,000 needed for acquisition of lands in various national forests as authorized by special acts of Congress.

(The justification statement referred to follows.)

Appropriation Act, 1964 and base for 1965	$70, 000
Budget estimate, 1965	70, 000

Project statement

Project	1963	1964 (estimated)	1965 (estimated)
1. Cache National Forest, Utah	$10, 000	$10, 000	$10, 000
2. Uinta and Wasatch National Forests, Utah	9, 569	20, 000	20, 000
3. Toiyabe National Forest, Nev		8, 000	8, 000
4. Angeles National Forest, Calif		8, 000	8, 000
5. Cleveland National Forest, San Diego County, Calif		8, 000	8, 000
6. San Bernardino-Cleveland National Forests, Riverside County, Calif		8, 000	8, 000
7. Sequoia National Forest, Calif		8, 000	8, 000
Unobligated balance reverted to national forests fund	10, 431		
Increased pay costs on second step of pay increase (Public Law 87-793)		(125)	(250)
Total available or estimate	30, 000	70, 000	70, 000

The Congress has enacted several special laws which authorize appropriation from the receipts of certain specified national forests for the purchase of lands to minimize erosion and flood damage. Appropriations under seven of these special acts for 1964 are:

Forest and act

Cache (Utah), act of May 11, 1938, as amended	$10, 000
Uinta-Wasatch (Utah), act of Aug. 26, 1935, as amended	20, 000
Toiyabe (Nevada), act of June 25, 1938, as amended	8, 000
Angeles (California), act of June 11, 1940	8, 000
Cleveland, San Diego County, Calif., act of June 11, 1940	8, 000
San Bernardino-Cleveland, Riverside County, Calif., act of June 15, 1938, as amended	8, 000
Sequoia (California), act of June 17, 1940	8, 000
Total	70, 000

There are within each of the above national forests, areas of critical watershed lands where the soil must be stabilized and vegetative cover restored if serious erosion and damaging floods are to be avoided. Necessary land treatment measures must be applied to all lands in the critical positions of these waterhseds if corrective action is to be fully effective. To assure that this will be done, intermingled private ownership must be acquired by the Federal Government.

During fiscal year 1963 field examination was completed on 16,000 acres, and 1,262 acres of land were purchased under the special purchase authorities applying

to the Cache, Uinta, and Wasatch National Forests in Utah. Figure V–1 shows a portion of one of the upper drainages in the American Fork Canyon Watershed, Uinta National Forest, in which such purchases are being made. It is typical of the type of country which if misused or improperly protected can funnel floodwaters into main channels with disasterous downstream effects.

Cache National Forest

In fiscal year 1963 funds were available from two sources for purchase of lands within the Cache National Forest in Utah.

1. The Receipts Act of May 11, 1938, as amended—$10,000. This is an annual appropriation.

2. The act of July 24, 1956—$200,000 appropriated under this authority in fiscal years 1957 through 1960. These funds remain available until expended. Through fiscal year 1963 $148,896 has been obligated from this appropriation.

These funds are used to acquire key tracts of lands in the steep, rough, and highly important watershed areas lying north of the Ogden River, along the Wasatch front, and on the Wellesville Mountain of the Cache National Forest. These are tracts of land in the rugged mountain area above the river valley which through forest fires or overgrazing have been damaged and their watershed functions impaired. In this condition they contribute to excessive runoff of rainfall, are subject to erosion, and are potential sources of floods and mudrock flows. Many of them are located in the north fork of Ogden River and drain into the Pineview Reservoir, a Federal reclamation project. Others are within the watersheds of the city of Ogden and of the other small towns along the Wasatch front. Public ownership of these lands to restore and protect their vegetative cover is a highly important part of a vigorous cooperative program to protect and stabilize the watersheds of the local communities and the area draining into this expensive Federal project.

The 1956 act requires that expenditures of Federal funds be matched by contributions by local agencies or people. This requirement has been met through donations of lands to the extent of some $184,000. Additional contributions are expected in fiscal year 1964. The appropriation of $10,000 under the act of May 11, 1938 is from receipts of the Cache National Forest. In the absence of this appropriation, the local counties would receive 25 percent of these receipts for roads and school purposes.

Therefore, the local counties, in effect, are contributing one-fourth of the amount of this appropriation. These appropriations are extremely important to the continuation of a vital and worthwhile program extending over 20 years and shared in by both the local agencies and the Federal Government through the national forests.

Through fiscal year 1963, 28,011 acres have been approved for purchase pursuant to the Receipts Act of 1938, and 14,120 acres under the Special Act of 1956. The 1964 objective is to acquire 2,300 additional acres of these critical watershed lands.

Uinta-Wasatch

In fiscal years 1963 and 1964 an appropriation of $20,000 was made under the Uinta-Wasatch Receipts Act of August 26, 1935, for acquiring critical watershed lands in the American Fork Canyon watershed. Some 555 acres were approved for purchase in fiscal year 1963 and an estimated 700 acres will be acquired during 1964. It is estimated that it will take from 4 to 5 years to complete the necessary American Fork acquisitions.

Toiyabe, Angeles, Cleveland, San Bernardino, and Sequoia National Forests

In fiscal year 1964, $8,000 was appropriated under each of these special acts to begin a program of acquiring critical watershed lands in these national forests. It is estimated that approximately 700 acres will be purchased during 1964.

WASATCH NATIONAL FOREST

Chairman HAYDEN. Also, I will insert in the record your justification of an estimate of $150,000 for fiscal year 1965 for acquisition of lands for the Wasatch National Forest. I believe that this is the total amount authorized for this purpose.

(The justification statement requested follows:)

ACQUISITION OF LANDS FOR WASATCH NATIONAL FOREST

Appropriation, 1964, and base for 1965	$250,000
Budget estimate, 1965	150,000
Decrease	−100,000

Project statement

Project	1963	1964 (estimated)	Decrease	1965 (estimated)
Acquisition of lands for Wasatch National Forest (total available or estimate)		$250,000	−$100,000	$150,000
Total increased pay costs on 2d step of pay increase (Public Law 87-793)		(375)	(−375)	

(1) Public Law 87-661, approved September 14, 1962, added some 24,000 acres of land to the Wasatch National Forest in Utah, of which only approximately 5,000 acres in scattered tracts are now in Federal ownership. This act authorizes the appropriation of $400,000 for the purchase of privately owned lands in this area. The fiscal year 1964 appropriation of $250,000 leaves a balance of $150,000 yet to be provided within this authorization.

Federal acquisition of these lands is imperative to aid in the control of floods and the reduction of soil erosion, and to permit management under principles of multiple use and sustained yield. The primary value of these lands is for watershed purposes. Presently most of the land is in a depleted condition from the standpoint of forage production and watershed capability. Sheet erosion is conspicuous on the steep upper slopes and drainages and the higher elevations are deeply gullied. On the benchlands the better forage and watershed plants have been largely replaced by annual plants of lesser value, and sheet erosion and gullying are beginning. These conditions, combined with the precipitous topography. pose threats of serious flood damage to properties below. Seven miles of the Gateway Canal are vulnerable to disrupting damage from excessive runoff or mudflows. This canal, a unit of the Weber Basin reclamation project, delivers vital supplies of water for distribution to heavily populated areas. Portions of the Union Pacific Railroad mainline and of Interstate Highway No. 40, as well as farmlands, also are vulnerable to damage originating on these lands. Public control of large contiguous areas comprising the watershed is essential in order that rehabilitation and land management measures may be undertaken to correct these unsatisfactory conditions. The $150,000 requested would be used to complete the acquisition of key tracts in the area.

Approximately 15,000 acres of land will be purchased in 1964. Some 14,000 acres of this is in a single private ownership. The additional $150,000 proposed for fiscal year 1965 will permit acquisition of the remaining key tracts of private lands within this area.

TREE PLANTING

Chairman HAYDEN. The budget justification in support of your request for $1 million to assist States in their tree-planting programs will be printed in the record.

(The justification statement referred to follows:)

Appropriation act, 1964 and base for 1965	$1,000,000
Budget estimate, 1965	1,000,000

Project statement

Project	1963	1964 (estimated)	Increases and decreases	1965 (estimated)
Tree planting assistance	$992,121	$1,015,365		$1,000,000
Unobligated balance brought forward	−7,486	−15,365		
Unobligated balance carried forward	15,365			
Total increased pay costs on second step of pay increase (Public Law 87-793)		(3,000)	(+3,000)	(6,000)
Total available or estimate	1,000,000	1,000,000		1,000,000

This program's objective is to encourage and help finance the forestation of the 70 million acres of private and non-Federal public land. At the present rate of planting it will take over 70 years to complete this job. A substantial increase in the rate of forestation is required to help meet future national anticipated needs for industrial wood. It is also needed to provide additional employment in depressed rural areas and assist in the immediate and future economic development of these rural areas through more intensive multiple use and development of the forest land resource, and through the forest and other industries these lands can help support. The activities and industries to be stimulated and in part supported by the forestation work include forest-based timber industry, forest-based recreation industry, recreation and forest industry-based transportation and the supplying of services to these by individuals and organizations.

The States continue to show increased interest in reforestation under the authority of title IV of the Agricultural Act of 1956. Thirty-three States now participate in the program. They have plans approved for forestation work on over 1,220,000 acres mostly in State and county ownerships. The total estimated cost is $41,524,000.

This program is making valuable contribution to the future production of industrial wood. It affords the States an opportunity to accelerate their forestation work on unproductive areas. In addition to production of timber, there are benefits to soil conservation, watershed protection, wildlife habitat, and esthetic and recreation values. It also is affording needed employment in many rural areas.

PROGRESS OF THE PLANTING PROGRAM

Chairman HAYDEN. Would you care to comment on the progress that you have made with the funds that you had last year for this purpose?

Mr. NELSON. I will ask Mr. Spillers to respond to that.

Mr. SPILLERS. Of course, I will be very happy to comment on that, Mr. Chairman. This has been one of our most popular programs. It is tied in with the Agriculture Act of 1956, but we did not get money for it until fiscal year 1958. Last year and the year before we received $1 million. So far, 33 States have come in with 42 projects. So, you see, it has been a very popular program and very well received.

The States are now planning to plant over a million acres under this program. The States are matching us more than 3 to 1, so that indicates their interest, Senator.

Chairman HAYDEN. I have also considered that to be some of the best money we can spend.

MISCELLANEOUS STATEMENTS AND JUSTIFICATIONS

Also, there will be printed in the record, the statement regarding cooperative range improvements, proposed language changes, your justification for purchase of automotive equipment and aircraft, as well as the statements regarding permanent appropriations, payments to be made under various acts, the working capital fund, and the cooperative trust fund.

(The statements referred to follow:)

Cooperative Range Improvements

Appropriation Act, 1964 and base for 1965	$700,000
Budget estimate, 1965	700,000

Part of the grazing fees from the national forests, when appropriated, are used to protect or improve the productivity of the range, mainly by construction and maintenance of fences, stock-watering facilities, bridges, corrals, and driveways. These funds are advanced to and merged with the appropriation forest protection and utilization, subappropriation forest land management.

FORMULA FOR APPROPRIATION

Section 12 of the act of April 24, 1950 (Granger-Thye Act) provides that of the moneys received from grazing fees by the Treasury from each national forest during each fiscal year there shall be available at the end thereof when appropriated by Congress an amount equivalent to 2 cents per animal-month for sheep and goats and 10 cents per animal-month for other kinds of livestock under permit on such national forest during the calendar year in which the fiscal year begins.

The appropriation for this item since fiscal year 1951 has been $700,000, except for fiscal years 1954 and 1955 when $531,000 and $400,000 were appropriated. Since the actual use figures are not available until after more than one-half of the fiscal year for which funds are appropriated has elapsed, the 1965 appropriation request of $700,000 necessarily represents the best current approximation of the amount which will become available in the calendar year 1964 under the animal-months-of-use formula.

For calendar year 1962, the latest available figures, use amounted to 5,491,911 animal-months for cattle and horses; 6,283,040 animal-months for sheep and goats and 494 for swine. This use under the 2- and 10-cents formula calculated to $674,901.

Changes in Language

Changes in the language of this item are proposed as follows (new language italic; deleted matter enclosed in brackets):

Appropriations available to the Forest Service for the current fiscal year shall be available for: (a) purchase of not to exceed one hundred and [thirty-six] *fifty-five* passenger motor vehicles of which one hundred and [twenty-six] *fourteen* shall be for replacement only, and hire of such vehicles; operation and maintenance of aircraft and the purchase of not to exceed [five of which three shall be] *six* for replacement only; (b) employment pursuant to the second sentence of section 706(a) of the Organic Act of 1944 (5 U.S.C. 574), as amended by section 15 of the Act of August 2, 1946 (5 U.S.C. 55a), in an amount not to exceed $25,000; (c) uniforms, or allowances therefor, as authorized by the Act of September 1, 1954, as amended (5 U.S.C. 2131); (d) purchase, erection, and alteration of buildings and other public improvements (5 U.S.C. 565a); (e) expenses of the National Forest Reservation Commission as authorized by section 14 of the Act of March 1, 1911 (16 U.S.C. 514); and (f) acquisition of land and interests therein for sites for administrative purposes [and acquisition of such outstanding interests in lands administered by the Forest Service in the northeast Georgia land utilization project], pursuant to the Act of August 3, 1956 (7 U.S.C. 428a).

The first and second changes in language would provide authority for the Forest Service to purchase 155 passenger motor vehicles of which 114 will be replacements.

The third change in language would provide authority for the Forest Service to purchase six aircraft which will be replacements. It is also proposed to transfer four aircraft from other agencies as available.

The fourth change deletes the special authorization for acquisition of outstanding interests in lands administered by the Forest Service in the State of Georgia. This will be accomplished during fiscal year 1964 so the authority need not be continued.

Passenger Motor Vehicles

PURCHASE OF PASSENGER MOTOR VEHICLES

During fiscal year 1965 it is proposed to replace 114 passenger cars, 11 of which are station wagons, all of which will meet replacement standards. It is also proposed to purchase 41 additional passenger cars. In some instances, due to actual program needs, it may be necessary to substitute a sedan for a station wagon or vice versa at the time orders are placed which could make a minor change in the relative number of sedans and station wagons shown, but this would not change the total number of passenger motor vehicles scheduled for replacement and addition.

Based on the planned schedule of replacements and purchase of additions, the Forest Service would have a total of 687 passenger vehicles, excluding 4 busses, in fiscal year 1965. On analysis of vehicle use and age pattern, the fleet is expected to include 114 units which will meet or exceed replacement standards before replacements are received.

USE OF VEHICLES

Passenger motor vehicles are used by (1) forest officers in the protection, utilization, management, and development of the national forests and land utilization projects and in the program for control of forest pests; (2) research technicians on experimental forests and ranges, on field research projects and forest surveys; foresters engaged in carrying out the laws providing for State and private forestry cooperation; and (4) regional office field-going administrative personnel in performing, directing, and inspecting fieldwork.

The Forest Service is essentially a field organization and its passenger motor vehicles are located mainly at regional, national forest, and ranger district headquarters, and experimental forests and ranges. There are over 232 million acres within the exterior boundaries of the national forests. About 435 million acres of State and private forest land are included within the areas which benefit from Federal participation in the cooperative forest program. Much of this area is without common carrier service, and most forest areas and research centers are remote from commercial travel routes, requiring extensive use of motor vehicles as a means of transportation. The major portion of transportation needs, particularly at forest regional and supervisor levels and at other larger headquarters involves multiple-passenger use and can be more expeditiously and economically met by use of sedans and station wagons than by other types of vehicles.

JUSTIFICATION OF REPLACEMENTS

Dependability of passenger vehicles is an important factor in keeping work programs on schedule and in meeting emergencies. Vehicle breakdowns while on field travel cause disruptions and delays in fieldwork as well as loss of effective worktime of employees. The continued use of overage equipment is undesirable from a safety standpoint since most of it is operated over rough, narrow, winding roads in mountainous country under adverse conditions. This use generally results in excessive operating and repair expenses when vehicles reach or exceed replacement standards.

In order to maintain passenger cars in a safe and satisfactory operating condition, it is the policy of the Forest Service to schedule periodic preventive maintenance inspections, services, and tuneups to reduce the necessity for costly repairs and major overhauls, and to minimize lost time resulting from field breakdowns.

It is desirable to maintain a reasonable balance in the age class of the passenger vehicle inventory. The age class distribution is based upon conforming with replacement standards which recognize that some units will be retired under the age standard and others under the use standard. Prescribed replacement standards, although applicable, are not always appropriate for all Forest Service vehicles because of the wide range of operating conditions and the comparatively short field season in many of the national forests at higher elevations. Decision on replacement of passenger vehicles which reach replacement age is based on an appraisal of each unit. This involves a review of the history record combined with a mechanical inspection of the vehicle's condition and repair liability. When such appraisal indicates that the vehicle is satisfactory for further service without unreasonable repair expenditures, it is retained and assigned to lighter work, even though such action tends to upset the age standards for the fleet inventory.

The vehicles selected for replacement are those which cannot be operated another season without excessive repair expense. They are unsatisfactory for further use both as to safety and mechanical condition. The replacement authorization requested is within the normal annual replacement standards prescribed by General Services Administration (i.e., a maximum of 60,000 miles or 6 years, whichever occurs first).

Essentially all passenger vehicles are pooled for use by all activities with replacement of pooled units financed from a working capital fund. All appropriations reimburse this fund in ratio to use of vehicles on activities financed by the respective appropriations.

None of the replacements requested will be assigned to areas served or scheduled to be served by Interagency Motor Pools.

JUSTIFICATION OF ADDITIONAL VEHICLES

The Forest Service analyzes current work plans and programs in determining its overall passenger car requirements. This analysis includes a careful study of the number of vehicles needed at each field station, using as a guiding principle the ownership of only the minimum number of dependable units required to serve programs for which funds are budgeted. Also, it is Forest Service policy to utilize interagency motor pools or commercial car rental services to the fullest practicable extent. Passenger car use is restricted and is integrated with various activities so as to attain good utilization of all vehicles. Expanding activities in research, timber sales, public use of recreational facilities, fire protection, and other land management activities are increasing the need for more passenger cars. These increasing needs are being met in some areas through greater use of interagency motor pool vehicles. These pools, however, serve only very small parts of the total land area administered by the Forest Service; therefore, increasing requirements for passenger car transportation in several areas cannot be fully met except through purchase of additional units for the Forest Service fleet. None of the additions requested will be assigned to areas served or scheduled to be served by interagency motor pools.

Additions are financed from program funds in direct relationship to the anticipated use of the equipment. Distribution of costs to appropriations is based on analysis of use of the equipment fleet for the past 3 years and the estimated use for the budget year.

AIRCRAFT

REPLACEMENT AND ADDITION OF AIRCRAFT

The 1965 estimates propose replacement of six aircraft by purchase and four by transfer from other agencies as available. The Forest Service currently has 60 aircraft:

Single engine reconnaissance and transport airplanes	12
Light twin-engine reconnaissance and transport airplanes	4
Medium and heavy cargo and transport airplanes (10 medium, 6 heavy)	16
T-34B lead airplanes (2-place scout)	25
Forest spray airplanes (Stearman and TBM)	2
Helicopter	1

The single and light twin-engine reconnaissance and transport aircraft are used primarily to transport firefighters, smokejumpers, administrative personnel, equipment, and supplies to remote and inaccessible areas where commercial service is inadequate, or not available for detection and suppression of forest fires. They are also used to locate and survey timber stand and vegetation conditions, such as insect infestations, blowdown, diseased areas, undesirable species, and to appraise resources and damage, and evaluate effectiveness of control.

The T-34B "lead" airplanes are used primarly by air tanker bosses to direct and control the dropping of fire retardants on forest fires by more than 200 tanker aircraft usually contracted from private owners.

The helicopter is used for training forest personnel in tactical use of helicopters and experimental development of techniques and equipment for direct tactical suppression of forest fires.

The six replacements requested will be single and light twin-engine airplanes. They will be utility airplanes that may be used for several purposes, such as lead planes for air tankers, small paracargo dropping, reconnaissance, and transporting freight and passengers. These will be new standard manufactured airplanes to upgrade old surplus T-34B's and single-engine reconnaissance airplanes which have reached an age in total number of flying hours where it is uneconomical to overhaul or modernize them to meet civil airworthiness requirements. These replacements will provide a more effective operation, with a wider safety margin. Forest Service aircraft are operated to a large extent over a rough, mountainous terrain where landing fields are poor and few. It is especially important that these aircraft be maintained for maximum performance and dependability to provide an adequate standard of safety.

Other aircraft currently in use may be replaced as newer and more suitable models and types become available from military services as excess property. They would be obtained on transfer without reimbursement and would not increase the fleet beyond 60 aircraft. When aircraft are partially or completely destroyed in a crash accident they may be replaced out of the appropriate available funds. The majority of current Forest Service aircraft was manufactured

during World War II, and obtained from military surplus. Most of these planes have nearly reached their limit of useful age. The military services now have aircraft which have more potential suitability for Forest Service work that may become surplus in the near future. At present one medium and a large cargo and personnel transport have reached the limit of economical usefulness.

ROADS AND TRAILS FOR STATES, NATIONAL FORESTS FUND

Appropriation, 1964 and base for 1965	$12,000,882
Budget estimate, 1965	12,400,000
Increase (due to an estimated increase in national forest receipts in fiscal year 1964)	+399,118

The permanent appropriation of 10 percent of national forest receipts pursuant to the act of March 4, 1913 (16 U.S.C. 501) is transferred to and merged with the annual appropriation for forest roads and trails. The explanation of the use of these funds is included in the justification for that appropriation item.

The increase of $399,118 results from an estimated increase in receipts from sale of timber for fiscal year 1964.

EXPENSES, BRUSH DISPOSAL

Appropriation, 1964 and base for 1965	$9,000,000
Budget estimate, 1965	9,200,000
Increase	+200,000

Project statement

Project	1963	1964 (estimated)	Increase or decrease	1965 (estimated)
Brush disposal	$7,695,991	$9,000,000	+$200,000	$9,200,000
Unobligated balance brought forward	−6,569,022	−7,630,984		−7,630,984
Unobligated balance carried forward	7,630,984	7,630,984		7,630,984
Total increased pay costs on second step of pay increase (Public Law 87-793)		(80,000)	(+100,000)	(180,000)
Total available or estimate	8,757,953	9,000,000	+200,000	9,200,000

The increase of $200,000 reflects the additional work to be done as a result of the 11-percent increase in timber harvest which was 10 billion board feet during fiscal year 1963.

Timber cutting normally increases the fire hazard because of dry fuel increase in the form of logging slash. This slash may also contribute to the buildup of insect populations, increase certain disease infestations, and cause damage to stream channels.

National forest timber sale contracts require treatment of debris from cutting operations or deposit of funds to pay for the work. When economical and expedient the work is performed by the timber purchaser. If it is not feasible for the purchaser to do the work, it is done by the Government using deposits made by the timber purchaser to cover costs of the work as authorized under section 6 of the act of April 24, 1960 (16 U.S.C. 490).

The effect of timber cutting and the manner of treating slash vary widely among regions. In the three eastern regions, volume cut per acre is relatively low, utilization is high, and generally humid atmospheric conditions result in rapid decomposition of debris so little slash disposal work is necessary. An exception occurs in some sales where a heavier cut per acre is made, such as the jack pine stands of Minnesota. In such areas, slash is broken up and mixed with mineral soil by disking with heavy equipment. This reduces the hazard and provides a good seedbed to aid regeneration. Treatment of slash to prevent insect epidemics is sometimes necessary in these areas.

In contrast, the cost of slash abatement on most sale areas of the West is high, High volumes per acre generally produce heavy slash. Long dry periods with much lightning and man-caused fire risk result in extremely hazardous fire potential. The warm, humid condition necessary for rapid slash deterioration seldom occurs so more intense slash disposal is required. Treatment varies

greatly with different methods of cutting. Clearcut areas are broadcast burned. In selectively cut areas, debris may be piled for burning over the whole area or in strips which serve as firebreaks.

While slash disposal follows general prescriptions within regions, individual needs of each sale offering are planned and appraised prior to advertisement and appropriate specific requirements are incorporated into each timber sale contract. In each instance the method used is the one which will attain adequate protection of the area at the least expense. In some instances adequate protection from fire is attained by providing additional protection until the slash hazard reverts to near normal. Logging debris which may move into watercourses under these conditions must be removed. Greater intensity of fire protection for several years and occasional stream clearance may be less costly than complete slash disposal immediately after cutting. In such cases brush disposal funds are used to provide the needed manpower and facilities.

Forest Fire Prevention

Appropriation, 1964 and base for 1965	$45,000
Budget estimate, 1965	25,000
Decrease	−20,000

Project statement

Project	1963	1964 (estimated)	Increase	1965 (estimated)
Forest fire prevention	$12,543	$30,000		$30,000
Unobligated balance brought forward	−1,800	−16,900	−$15,000	−31,900
Unobligated balance carried forward	16,900	31,900	−5,000	26,900
Total available or estimate	27,643	45,000	−20,000	25,000

The decrease of $20,000 reflects the change in anticipated revenues for this year. The large increase in receipts in 1964 was due to a major sales program that was a one-time transaction. The actual obligations to be incurred in 1964 and 1965 will be at approximately the same level ($30,000).

The Smokey Bear licensing program is an important part of the cooperative forest fire prevention campaign which has been in effect for 22 years. The campaign itself has been conducted each year since 1942 as a cooperative project of the State foresters and the Forest Service, U.S. Department of Agriculture, and is a public service program of the Advertising Council. The campaign utilizes the free public service resources of the various national advertising channels such as car cards, poster display systems, radio and television networks, and magazine and newspaper allocation plans in developing public cooperation in the prevention of man-caused forest fires. Since 1945, this campaign has been built around Smokey Bear who has become recognized and accepted by the public as a nationwide symbol of forest fire prevention.

Under authorization of Public Law 359 of the 82d Congress, the Secretary of Agriculture has issued rules and regulations governing the licensing program. These licenses specify payment of royalties (usually 5 percent) and set up certain controls for administering the program and collecting the royalties including advance deposits to protect the Government's interest. Such collections, along with appropriated funds, are used to finance the cooperative forest fire prevention campaign.

The licensing program provides about one-tenth of the total funds required for the cooperative forest fire prevention program.

The purpose of the project is public education on the need for the prevention of man-caused wildfires on all the Nation's forests and rangelands. Its goal is the further reduction of man-caused forest fires on all ownerships to the point where their impact on natural resource management programs is negligible.

This project is accomplishing its purpose in two ways:

1. By the dissemination to the public of Smokey Bear's forest fire prevention messages on commercial products licensed by the Chief of the Forest Service.

2. By support of the Smokey Bear Junior Forest Rangers and of the Smokey Bear Awards program through the contribution of fees and royalties by licensees.

Commercial support for the Smokey Bear program is increasing. Receipts have risen about 35 percent in each of the past 2 fiscal years. Retail sales volume

of Smokey Bear items for fiscal year 1963 is estimated at $1,100,000 returning approximately $27,600 to the program.

RESTORATION OF FOREST LANDS AND IMPROVEMENTS

Appropriation, 1964 and base for 1965	$100,000
Budget estimate, 1965	100,000

Project statement

Project	1963	1964 (estimated)	Increase or decrease	1965 (estimated)
Restoration of forest lands and improvements	$6,849	$121,480	−$21,480	$100,000
Unobligated balance brought forward	−7,400	−21,480	21,480	
Unobligated balance carried forward	21,480			
Total increased pay costs on second step of pay increase (Public Law 87-793)	(-----)	(1,000)	(+1,200)	(2,200)
Total available or estimate	20,929	100,000		100,000

Recoveries from cash bonds or forfeitures under surety bonds by permittees or timber purchasers, who fail to complete performance, are used to complete improvement, protection, or rehabilitation work on lands under Forest Service administration. Funds received as settlement of a claim are used for improvement, protection, or rehabilitation made necessary by the action which led to the cash settlement (act of June 20, 1958, 16 U.S.C. 579c).

PAYMENT TO MINNESOTA (COOK, LAKE, AND ST. LOUIS COUNTIES) FROM THE NATIONAL FORESTS FUND

Appropriation, 1964 and base for 1965	$130,986
Budget estimate, 1965	133,000
Increase	+2,014

Project statement

Project	1963	1964 (estimated)	Increase	1965 (estimated)
Payment to Minnesota (total available or estimate)	$125,432	$130,986	+$2,014	$133,000

The act of June 22, 1948, as amended (16 U.S.C. 577c–577h) provides that the Secretary of the Treasury, upon certification of the Secretary of Agriculture, shall pay to the State of Minnesota at the close of each fiscal year an amount equivalent to three-fourths of 1 percent of the fair appraised value of certain national forest lands in the counties of Cook, Lake, and St. Louis situated within the Superior National Forest. The act further provides that payment to the State shall be distributed to each of these counties in conformity with the fair appraised value of such national forest lands in each county.

PAYMENTS TO COUNTIES, NATIONAL GRASSLANDS

Appropriation, 1964 and base for 1965	$437,500
Budget estimate, 1965	450,000
Increase (due to an estimated increase in national grasslands receipts for fiscal year 1964)	+12,500

Project statement

Project	1963	1964 (estimated)	Increase	1965 (estimated)
Payments to counties, national grasslands (total available or estimate)	$389,506	$437,500	+$12,500	$450,000

At the end of each calendar year, 25 percent of the revenues from the use of submarginal lands are paid to counties under the provisions of title III of the Bankhead-Jones Farm Tenant Act, approved July 22, 1937 (7 U.S.C. 1012).

PAYMENTS TO SCHOOL FUNDS, ARIZONA AND NEW MEXICO, ACT OF JUNE 20, 1910

Appropriation, 1964, and base for 1965	$100,413
Budget estimate, 1965	110,000
Increase (due to an estimated increase in national forest receipts for fiscal year 1964)	+9,587

Project statement

Project	1963	1964 (estimated)	Increase	1965 (estimated)
Payments to school funds (total available or estimate)	$80,462	$100,413	+$9,587	$110,000

Under provisions of the act of June 20, 1910 (36 Stat. 562, 573) certain areas within national forests were granted to the States for school purposes. The percentage that these lands are of the total national forest area within the State is used in determining payments to the States. The receipts from all national forest land within the State are used as the basis for applying the percentage. For example, if total receipts for the State are $100,000 and if 10 percent of lands are in the "granted for school purposes" category, the payment to the State would be $10,000. The amounts so paid are deducted from the net receipts before computing the 25-percent payments to States.

As soon after the close of the fiscal year as the receipts from national forests and the area of school lands in the States of Arizona and New Mexico are determined, the payments are made to the States. Estimated payments in fiscal year 1964 to Arizona will be $100,033 and to New Mexico $380.

PAYMENTS TO STATES, NATIONAL FORESTS FUND

Appropriation, 1964, and base for 1965	$29,993,959
Budget estimate, 1965	31,100,000
Increase (due to an estimated increase in national forest receipts for fiscal year 1964)	+1,106,041

Project statement

Project	1963	1964 (estimated)	Increase	1965 (estimated)
Payments to States (total available or estimate)	$27,235,140	$29,993,959	+$1,106,041	$31,100,000

The act of May 23, 1908, as amended (16 U.S.C. 500) requires, with a few exceptions, that 25 percent of all money received from the national forests during any fiscal year be paid to the States in which the forests are located, for the benefit of public schools and public roads of the county or counties in which such national forests are situated. The amount of this appropriation varies each year in direct proportion to national forest receipts during the previous fiscal year.

The amounts set aside from receipts collected for the sale of national forest timber, grazing and special use permits, etc., before the 25 percent is applied are listed below:

1. Payment to the State of Minnesota covering certain national forest lands in the counties of Cook, Lake, and St. Louis situated within the Superior National Forest is made under the terms of the act of June 22, 1948, Public Law 733. Receipts collected from the areas covered by this act are excluded when the 25-percent payment to the State of Minnesota is computed.

2. For lands in certain counties in Utah, Nevada, and California, the States receive 25 percent of receipts only after funds, if made available by Congress,

have been set aside for the acquisition of national forest lands within the specified national forests under the terms of special acts authorizing appropriations from forest receipts for this purpose.

3. Payments to the States of Arizona and New Mexico under the provisions of the act of June 20, 1910, of shares of the gross receipts from the national forests in those States which are proportionate to the areas of land granted to the States for school purposes within the national forests.

Working Capital Fund, Forest Service

This fund finances on a reimbursable basis various services such as repairing and replacing equipment, including aircraft, stocking and issuing supplies, operation of subsistence camps, operation of photographic and reproduction facilities, and tree nurseries in support of programs of the Forest Service (16 U.S.C. 579b, as amended). These service operations serve programs of fire protection, timber utilization, construction and maintenance of roads and other improvements, reforestation, grazing, watershed, forest and forest products research, and kindred conservation activities of the Forest Service, including cooperative assistance with other Federal agencies, States, counties, and individuals engaged in the same objectives.

OPERATING RESULTS AND FINANCIAL CONDITION

Government investment in the fund as of June 30, 1963, including donated assets and retained earnings for fiscal year 1963, is $28,574,000. By the end of 1965 the investment is anticipated to be $35,349,000, an increase of $6,775,000, which represents estimated earnings and donations during 1964 and 1965.

Receipts, nonoperating income, and retained earnings include an estimated $2,809,000 as of June 30, 1965, identified as "Income provision for increased cost of equipment replacements" to be used only for financing the increased cost of equipment replacement; i.e., the difference between the cost of the replacement unit and the cost at time of acquisition of the unit being replaced. This increased cost is due to inflation and model improvement, and must be financed if the fleet strength is to be maintained and not depleted through the gradual attrition of price increases for replacements. The earnings for the provision for increased cost of replacements are derived from a factor which is included for this purpose in rental rates charged to program appropriations for equipment use and credited to the working capital fund.

Retained earnings as of June 30, 1965, will total an estimated $8,019,000 which will consist of $2,426,000 gain on sale of equipment, $2,784,000 profit from operations, and $2,809,000 for provision for increased cost of replacement of equipment. Retained earnings have been applied toward increased cost of equipment replacements, purchase of fleet additions, and to furnish adequate working capital.

Cooperative Work, Forest Service (Trust Fund)

Contributions are received from cooperators, including counties, States, timber sale operators, individuals, and associations, and are expended by the Forest Service in accordance with the terms of the applicable cooperative agreements. The work consists of protection and improvement of the national forests, work performed for national forest users, and forest investigations and protection, reforestation, and administration of private forest lands.

The major programs conducted under the account "Cooperative work, Forest Service" are described below in terms of the projects reflected in the statement at the end of this section.

1. Construction and maintenance of road and trails, and

2. Construction and maintenance of other improvements

Under the acts of June 30, 1914 (16 U.S.C. 498), and March 3, 1925, and April 24, 1950 (16 U.S.C. 572), deposits for cooperative work are accepted from State and local government agencies, associations, Federal timber purchasers, and others for the construction and maintenance of roads, trails, and other improvements and for performing work which is the national forest users' responsibility, this method of performance of the work being of mutual benefit or of benefit to the public at large. Cooperative deposits received for wildlife habitat improvement for States from their hunting and fishing fees are included in this activity.

3. Protection of national forests and adjacent private lands

The act of June 30, 1914 (16 U.S.C. 498), authorizes the acceptance of deposits for the protection of the national forests and the act of March 3, 1925, as amended by section 5, act of April 24, 1950 (16 U.S.C. 572), authorizes the acceptance of contributions for the protection of private lands in or near the national forests. The major portion of the obligations is for the protection of private lands from fire. This arrangement helps both parties since there are millions of acres of private forest land intermingled with Federal ownership on the national forests. The lands in private ownership are usually in small tracts. It would be uneconomical for the owner to set up a fire control organization for the protection of his land. The advantage to the Government is that in many cases it would be necessary to suppress the fires on the private land without reimbursement in order to protect the adjoining Federal land.

4. Sale area betterment (including reforestation)

Section 3 of the act of June 9, 1930 (16 U.S.C. 576b), provides for deposits of funds by timber sale purchasers to cover the cost of reforestation and special cultural measures to improve the future stand of timber on the areas cutover by the purchaser. Deposits in fiscal year 1963 under this authorization totaled $18.6 million. Fiscal year 1963 accomplishments under this program are reported under the "Forest land management" subappropriation along with accomplishments for reforestation and stand improvement for that subappropriation.

5. Scaling

Under provisions of the act of April 24, 1950 (16 U.S.C. 572), and of section 210 of the act of September 21, 1944 (16 U.S.C. 572a), acceptance of deposits from timber purchasers for cooperative scaling service is authorized. Such arrangements are established only when requested by the operator and when the operator pays the extra cost of such services.

Subsection (c), section 5, act of April 24, 1950 (16 U.S.C. 572), provides broad authority to reimburse appropriations initially charged for expenses for cooperative services performed. The justification given in requesting this authority in the legislative history in House Report 1189 and Senate Report 1069, 81st Congress, is limited to emergency situations. It would be convenient and economical to use this broad authority to furnish cooperative scaling services to timber purchasers by charging appropriations available for this type of work. Collections would be made later from the purchaser whenever he has arranged to pay for stumpage and other related charges after such charges have been determined. Comptroller General's decision B–150466, dated January 14, 1963, clarified the authority in section 5 of the act of April 24, 1950 (64 Stat. 82; 16 U.S.C. 572), to make collections in arrears for elective cooperative deposits related to timber sales applicable to payment bond procedures. In summary, the Comptroller General stated that he would have no legal objection to the Forest Service rendering services authorized by section 5 on a reimbursable basis in instances where (1) it has been administratively determined to be advantageous to the Government, and (2) necessary precautions have been taken to insure the recovery of all costs involved, including payment bond procedures: *Provided:* (1) Deposits to appropriations do not exceed the amount of costs incurred, and (2) appropriate congressional committees be advised of our plans to use section 5c in situations other than the emergencies contemplated by the Congress at the time the law was enacted. Beginning in fiscal year 1964, the Forest Service plans to use this procedure when appropriate.

6. Research investigations

The acts of June 30, 1914 (16 U.S.C. 498), and May 22, 1928 (16 U.S.C. 581i–1), authorize the acceptance of deposits for forestry research. Deposits are received from State and other public agencies, and from industrial, association, and other private agencies to finance research projects of mutual interest and benefit to both parties. The deposits may be made either in a single sum or on a continuing basis, and may either partially or wholly cover the cost of the research. The cooperative research projects may involve any aspect of forestry and vary widely as to scope and duration. A very common example of such cooperation is for a State to make a deposit to the cooperative work fund in order to intensify or to speed up completion of a comprehensive survey of the forest resources of the State. Other examples are State contributions toward forest fire research. The results of such cooperative investigations are made available to the general public as well as to the depositor.

7. Administration of private lands

The act of March 3, 1925, as amended by section 5, act of April 24, 1950 (16 U.S.C. 572), authorizes the acceptance of contributions for the management of private lands. These contributions are made by private owners having land intermingled with or adjacent to national forests who wish these lands managed in accordance with good forest management practices. Their holdings are usually too small to warrant the employment of professional foresters to administer such tracts. The advantages to the Government include the avoidance of possible high fire hazard areas resulting from improper cutting practices, the elimination of the necessity of precisely marking the boundaries of the private land, and additional private forest land handled under proper forest practices.

8. Reforestation (private lands)

The act of March 3, 1925, as amended by section 5, act of April 24, 1950 (16 U.S.C. 572), authorizes the acceptance of contributions for reforestation of private lands situated within or near a national forest. This work is limited to areas of private land within a planting project on the national forests or to areas in which certain civic and other public-spirited organizations have taken an interest.

9. Statement on utilization of funds

Following is a statement of funds received and obligated and balances available by major activities:

Cooperative work, Forest Service trust fund

Project	Balance available, June 30, 1962	Actual, fiscal year 1963			Estimate, fiscal year 1964			Estimate, fiscal year 1965		
		Funds received	Obligations	Balance	Funds received	Obligations	Balance	Funds received	Obligations	Balance
1. Construction and maintenance of roads and trails	$793,570	$1,513,841	$1,435,582	$871,829	$1,500,000	$1,500,000	$871,829	$1,400,000	$1,450,000	$821,829
2. Construction and maintenance of other improvements [1]	383,842	552,851	413,796	522,897	550,000	550,000	522,897	450,000	500,000	472,897
3. Protection on national forests and adjacent private land:										
(a) Fire	408,213	1,870,220	1,812,244	466,189	1,900,000	1,900,000	466,189	1,900,000	1,900,000	466,189
(b) Other	1,012,834	1,328,032	1,136,806	1,204,060	1,350,000	1,350,000	1,204,060	1,200,000	1,250,000	1,154,060
4. Sale area betterment on national forest lands (including reforestation)	20,098,755	18,609,957	14,233,184	24,475,528	20,000,000	16,500,000	27,975,528	20,200,000	16,000,000	32,175,528
5. Scaling of timber	234,338	742,729	746,087	230,980	800,000	800,000	230,980	750,000	750,000	230,980
6. Research investigations	362,930	955,396	972,056	346,270	1,000,000	1,000,000	346,270	950,000	950,000	346,270
7. Administration of private lands	13,317	45,374	43,290	15,401	50,000	50,000	15,401	40,000	40,000	15,401
8. Reforestation (private lands)	100,724	17,784	26,369	92,139	25,000	30,000	87,139	20,000	30,000	77,139
Subtotal	23,408,523	[2] 25,636,184	20,819,414	28,225,293	27,175,000	23,680,000	31,720,293	26,910,000	22,870,000	35,760,293
Advanced to "Forest protection and utilization" for fighting forest fires [3]			1,400,000	−1,400,000		−1,400,000				
Total	23,408,523	[2] 25,636,184	22,219,414	26,825,293	27,175,000	22,280,000	31,720,293	26,910,000	22,870,000	35,760,293

[1] Includes approximately $130,000 State hunting and fishing cooperative deposits.
[2] Includes $1,175 reimbursed to appropriation.
[3] Reflects obligations in 1963 for fighting forest fires which were recovered from the 1964 appropriation for fighting forest fires.

NOTE.—Balances carried forward are due primarily to necessity of deferring work for which funds are deposited until the most practicable time. For instance, funds for sale area betterment are received in advance of cutting, but work cannot be started until cutting operations are completed. The timelag sometimes extends for several years, depending on the amount of preparatory work required in the sale area, weather conditions, etc.

Above obligations for 1963 include:

(1) Transfers to national forests fund of earned sale area betterment deposits in excess of obligations for sale area betterment work	$252,753
(2) Refunds to cooperators	125,724
Total	378,477

Chairman HAYDEN. Are there any questions?

GRAZING PERMITS

Senator BIBLE. Might I ask just a couple, Mr. Chairman? On page 23 of your justifications, you get into one of your very important functions and that is the management of your range resources and your granting of permits for the grazing of livestock. This is one area where I receive many, many complaints about the cutback in allotments and permits.

First, simply so that I am properly oriented, in reading from page 23, Mr. Cliff, it says, about the sixth line down from the top:

To achieve this objective in addition to recurrent workload associated with administration of about 11,400 separate allotments involving over 22,000 permits, special attention must be given.

and so forth. Dropping down to the bottom of the page, you say:

In addition to the 38,306 permits covering the grazing of livestock under paid and free permits.

What is the difference between the item of 22,000 and the 38,306?

Mr. CLIFF. Well, the 22,000 permits, Senator Bible, refer to those permits that are issued to establish permittees for which they pay fees. In addition to that, we issue free permits for small numbers of livestock to local residents. This is not a very big item from the standpoint of numbers of livestock, but there is a large number of permits in this category. There is a provision in the regulations for free use to local residents.

PAID PERMITS

Senator BIBLE. So the 22,000 permits are paid permits?

Mr. CLIFF. Yes. Then, in addition, we issue what we call private land permits. There is a considerable amount of private land intermingled with the national forest land and there is a procedure whereby the private landowner can waive the grazing privileges on his private land in exchange for comparable privileges on national forest lands. We have several thousand of these permits which is a method devised for coordinating the use of private land and public land.

CUTBACK ON ALLOTMENTS AND PERMITS

Senator BIBLE. I appreciate the clarification. You indicate that you have permits outstanding for some 6 million livestock. How would that compare with 1961 and 1960 and possibly for a 5-year range? Could that be supplied for the record?

The purpose of my question is to determine how severe a cutback you have made on allotments and permits.

Mr. CLIFF. We will be glad to supply that for the record. I think the record will show that permitted livestock use has leveled off and has become pretty well stabilized. We are actually increasing permits in some areas where we have been able to restore the range through range improvement and better range management. This is one of the efforts that we are trying to make, to develop the full potential of these rangelands and to get the most out of them under good sound management programs.

RANGE IMPROVEMENTS AND REVEGETATION

We are getting good cooperation from the industry generally. We are spending, as you know, rather substantial sums for range improvements and revegetation. And in many places the downward trend in grazing use has leveled off and actually the curve has tipped up. We still have some areas, however, where the situation is not good and where we are making some additional adjustments. We tried to combine that with a development program to minimize the adjustments to get on a program so that we can look forward to an increase in grazing where it can be supported.

Senator BIBLE. I never hear from the permittees where you increase their allotment. But I do hear from them when you decrease their allotment. You can supply that information for the record.

(The information referred to follows:)

Animal months permitted to graze on all Forest Service administered lands

	Cattle and horses animal months	Sheep and goats animal months	Total animal unit months[1]
1962	7,079,437	7,383,640	8,556,165
1961	7,119,747	7,702,319	8,660,211
1960	7,190,880	7,913,263	8,773,533
1959	7,201,081	8,138,012	8,828,683
1958	7,652,545	8,539,158	9,360,376
Decrease in 1962 over 1958	−573,108	−1,155,518	−804,211
Percent decrease in 1962 over 1958	−7	−14	−9

[1] An animal unit month represents 1 cow for 1 month. Sheep months have been converted to animal months using a ratio of 5 sheep equals 1 animal unit month.

DYE MARKING OR TAGGING FOR TRESPASS CONTROL

Senator BIBLE. We have a troublesome problem in Elko County. I understand you are painting the cattle up in Elko County and I suppose the purpose is to find whether they have permits. There has been some criticism of that and I would like to have your comment.

Mr. CLIFF. We have heard these complaints, too. The dye marking we are doing is rather extensively applied in many places in the West. We have had relatively few complaints. There have been some local complaints in a few places, and one is in Elko County. The purpose is to get control of trespass.

Senator BIBLE. It seems to me it is a reasonable program, but I want to know how to answer my complaints.

Mr. CLIFF. We have been in touch with the complainants and I think we are reaching a better position of understanding most all over. I attended the American National meeting at Memphis this last month and there was no complaint voiced there over our dye marking or our tagging for trespass control. Actually, it is in the interest of the permittee to control trespass, because if there is trespass on the range, which we cannot condone, the permittee is getting blamed for any condition of the range that develops as a result of this increased stocking by trespass livestock. We have a responsibility to control trespass. The dye marking is one device we have used to identify permitted livestock.

AMERICAN NATIONAL CATTLEMEN'S ASSOCIATION

Senator BIBLE. You said the American National at Memphis. Did you mean the American National Cattlemen's Association?

Mr. CLIFF. That is correct.

Senator BIBLE. Did they pass a resolution commending you in this field?

Mr. CLIFF. No, they did not pass a resolution condemning us, either.

Senator BIBLE. I realize you have a difficult problem there and I would say you are not without allies in this field, because the fish and game people think this is a wonderful thing you are doing. So this is one of the conflicts we have.

Chairman HAYDEN. Senator Mundt?

RESEARCH IN SOUTH DAKOTA

Senator MUNDT. Like the Senator from Nevada, I find these hearings are a wonderful place to get information to answer my mail and I have quite a little bit of correspondence, so I have more questions than usual. Some of the information you can simply supply to my office or for the record. I would like to have you send to my office, first of all, a rundown on forest research in South Dakota for fiscal years 1964 and 1965.

Mr. CLIFF. We will be glad to do that, Senator MUNDT.

GRAZING PERMITS IN SOUTH DAKOTA

Senator MUNDT. Second, does the grazing district out in Perkins County, S. Dak., come under the jurisdiction of the Forest Service?

Mr. CLIFF. Where is that?

Senator MUNDT. It is not really a forest county. It is in western South Dakota.

Mr. CLIFF. We have several national grasslands in South Dakota. One of them lies south of the Black Hills, adjoining the Indian reservation. One surrounds the Badlands.

Senator MUNDT. This is north of the Badlands.

Mr. CLIFF. Then, there is another one against the river near Fort Pierre and still another one up in the northwest corner near Lemmon.

Senator MUNDT. Lemmon is the biggest city in Perkins County. Maybe we had better just say this: Why do you not send me a record of the grazing districts you have in South Dakota and a report from your angle as whether the ranchers are happy with their grazing allotments. I have been getting some complaints which I have been led to believe deal with the Forest Service, and I am not sure.

Mr. CLIFF. We will be glad to do that, sir. I do not recall any recent correspondence or complaints from that area.

Senator MUNDT. You have a lot of different types of public domain land out there and it may be they are not even shooting at you. If you will send me that, then we will have it.

Mr. CLIFF. We will be glad to do it.

RANGE ALLOTMENT ANALYSIS

Senator MUNDT. On page 23 of your justifications, you discuss the range allotment analysis work. Could you give me a little bit more

detail on this and provide to my office the progress by States where you are doing the work?

Mr. CLIFF. We will be glad to do it and I will ask Mr. Greeley to respond to your question.

Mr. GREELEY. Senator Mundt, we can develop an approximation of development by States, but we may have a little difficulty getting precise figures in the time that would be necessary to get a response back.

Senator MUNDT. I do not want you to assume an astronomical load, but I would appreciate something to give me a sample picture.

Mr. GREELEY. This is an ongoing part of a program which we carry on all of the time. It is financed from a part of this appropriation, range resource, which is referred to as range management, and it is the means by which we obtain the basic system and the particular data on which we attempt to work out our plans and management and our programs for improvement.

(The information referred to follows:)

Status and accomplishment of analysis by States (includes national forests, national grasslands, and land utilization projects)

State	Allotments, 1963, number	Allotment equivalents[1] complete		Accomplishment, fiscal year 1964, (allotment equivalent)
		June 30, 1963	June 30, 1964	
Arizona	720	452	511	59
California	975	658	736	78
Colorado	1,685	1,452	1,467	15
Idaho	1,301	354	449	95
Kansas	69	62	64	2
Missouri	91	7	16	9
Montana	1,095	589	712	123
Nebraska	172	136	146	10
Nevada	343	55	77	22
New Mexico	648	426	436	10
New York	41	29	29	0
North Dakota	553	112	127	15
Oregon	621	418	471	53
South Dakota	524	383	410	27
Texas	521	67	182	115
Utah	751	243	311	68
Washington	210	156	167	11
West Virginia	38	19	23	4
Wyoming	762	486	498	12
Subtotal	11,120	6,104	6,832	728
Southern States	304	120	120	(2)
Total	11,424	6,224	6,952	728

[1] 1 allotment equivalent represents all of the work needed to do a complete job of range inventory or analysis and management planning on 1 grazing allotment.

[2] Does not include rangework directed at control of livestock grazing in Southern States including east Texas.

MARKETING RESEARCH

Senator MUNDT. On page 93 I read in your justification your discussion of the marketing research which has been outlining opportunities for increased efficiency in sawmills. I have a lot of correspondence from a number of small sawmill operators out in the Black Hills of South Dakota where they process mostly ponderosa pine and I think such a study as you outline would be most helpful and valuable to our operators.

I would think it could be undertaken at a small cost. Could you provide for the record, with a copy to my office, your thoughts on the

feasibility of doing this type of research and with an estimate of the cost involved?

Mr. CLIFF. We will be glad to do that, Senator Mundt.

(The information referred to follows:)

PROBLEMS WITH THE BLACK HILLS TIMBER INDUSTRIES

Processing and marketing problems associated with the timber industries of the Black Hills have received some study in the past few years. For example, sawing practices in relation to log grades have been studied with the view of finding how to raise the quality of the end product. Supplies of wood residues at sawmills, suitable for pulp chip production, have been determined. Studies of fencepost durability under different conditions of use are adding to the knowledge basic to an expanded post industry. The Forest Service believes its present research staff at Rapid City could explore further the opportunities to aid the timber industry by improving production practices and market outlets. This will be included in the Forest Service research program under the funds provided in the fiscal year 1965 budget.

Senator MUNDT. Do you agree with my hypothesis that this might be of real value to the operators?

Mr. CLIFF. We certainly do. There is a lot of room for improvement in sawmills and particularly the smaller mills.

COOPERATION IN FOREST FIRE CONTROL

Senator MUNDT. You know, we have had a lot of joint conferences with those operators out there and you have kept them alive but you have not kept them always happy. We want to keep them alive and happy if we can.

I notice your allocation for $47,000 for forest fire control in South Dakota in fiscal year 1964. Would this be the same for next year? You also point out that payments to the State have never exceeded the State and private funds expended. So are your funds adequate?

Mr. CLIFF. The States are spending several times the amount that the Forest Service is contributing. On page 101 of the justification, the tabulation indicates that the States, in fiscal year 1963 spent about $55 million, and the Federal Government is contributing $12.5 million so we are getting matched by over 4 to 1 by State contributions.

The States are way ahead of the requirements of the law. The law requires at least 50–50 matching. The authorization in the act would provide for up to $20 million of Federal funds as a top figure, and the appropriation is about $12.5 million. The States have been gradually increasing these contributions. I think they will continue to do this, but we feel that they need some additional help. The money asked for in this budget, a small amount for fire protection we think, would stimulate further State response.

Senator MUNDT. I have page 101 before me. Now would you say, on the basis of your experience, Mr. Cliff, that those funds are adequate to meet the contingency you have had out there?

FIRE PROTECTION

Mr. CLIFF. No. As a general proposition, we feel that the fire protection on State and private lands needs to be improved. I said, earlier, that there is still about 24 million acres that is not getting any organized protection and there is a considerable acreage that needs

more intensive protection. But this is about as far as we have been able to go under the present budget situation.

Senator MUNDT. Is the 1965 budget the same amount as 1964?

Mr. CLIFF. No, sir. There is a program increase in 1965 of $250,000 for this activity. So there will be some small increase to the various States. By the time we spread that to 50 States, it is not going to be very much to any 1 State, but it will be helpful and we think it will generate some additional activity.

REHABILITATION OF BURN AT DEADWOOD, S. DAK.

Senator MUNDT. We have been questioned about that and particularly that terribly bad fire around Deadwood. Could I get a little report from you on what has been done to rehabilitate the devastated area around Deadwood?

Mr. CLIFF. Yes, sir. We will do that, because that is one project we have been proud of and we will be glad to supply that for the record.

(The information referred to follows:)

HIGHLIGHT STATEMENT

The Deadwood forest fire of September 8, 1959, burned 4,500 acres on the Black Hills National Forest in South Dakota. By use of funds included in the first appropriation for burn rehabilitation made available through the interest of the Senate Appropriations Committee, this burn has been completely treated. Emergency watershed restoration work was done to prevent possible downstream flood damage and to protect and restore site productivity.

Thirty-one miles of contour ditches were installed on 430 acres of critical slopes on national forest land. Nine hundred and seventy-five acres of national forest land were seeded with legumes and grasses. Fire lines and fire roads were treated to prevent soil erosion. Trees were planted on 975 acres. Usable timber was salvaged from the burned area through an accelerated timber sale program.

SEED PRODUCTION

Senator MUNDT. You have done a good job and the community is very pleased. I was interested in your discussion of seed planting on page 17. This reminded me of the many letters I have received from constituents in the Black Hills area who have been interested in the establishment of some type of tree plantation, or seed-production area, for improving ponderosa pine and other tree varieties which are adaptable to the Black Hills. Can you send to my office your thoughts as to the possibility of beginning this important work and an estimate as to what the cost might be and your evaluation of its need and desirability?

Mr. CLIFF. We will be glad to supply that, but right now I would like to make this comment. We are paying a lot of attention to getting seed from the better trees. We are pursuing several lines in accomplishing this. We are conducting research in genetics to improve the trees that we plant in the forest. But these seed-production areas you refer to are sort of an interim measure. We try to collect seed from some of the best trees that we have, instead of collecting our seed from any old scrub tree. We are trying to find the better stands and then we pick out the best trees in those stands and remove the other trees and protect these best trees for seed production. And we are collecting most of the seeds we use from the best trees in the seed production areas. It is this seed we

plant in the nurseries and then we plant the seedlings out in the forest. We have been moving ahead with this. I would be surprised if we do not already have some seed production areas in the Black Hills as we set ourselves an objective of getting these seed-production areas in all of our major forest areas . I will be glad to supply for the record just what we are doing in South Dakota. Eventually, we hope through research, to develop genetically superior trees and through our tree orchard program to even further improve on the native stock.

Seed Research

Senator Mundt. Does your scientific research indicate pretty clearly that a seed from a good straight tree, produces that kind of progeny and a seed from a crooked tree gives a crooked tree?

Mr. Cliff. There are some strong indications that that is true. They do not always breed true, but some of the crooked trees and the forked trees show these inheritable characteristics. It is quite interesting.

Senator Mundt. You will be able to report on the Black Hills situation and give an answer to the question?

Mr. Greeley. Yes, sir.

(The information referred to follows:)

Black Hills Seed Production Area

There are 2,000 acres of seed production area in process of development on the Black Hills National Forest in South Dakota. This will be the largest single seed production area on any national forest when development is completed. Only the best quality seed-producing trees will be retained in the area, and these are expected to produce better quality ponderosa pine seed than is presently available for reforestation purposes in the Black Hills.

Jewel Cave Land Exchange

Senator Mundt. We had a National Park Service group here the other day and were discussing the new discoveries out in the Jewel Cave of some new formations. They told us they were working with you in an exchange of land agreements so that the part of the new cave which is in the Forest Service land might be traded to you for some part of the National Park Service lands which has beautiful trees on it but no caves under it. They said it was necessary to have an arriving at a meeting of minds. I would like to have that confirmed for the record.

Mr. Cliff. Mr. Nelson will respond to that.

Mr. Nelson. Some work has been done on that. This new area of caves is about three-fourths of a mile outside the present national monument and, as you say, the monument contains some lands not needed for park purposes. The Park Service would like to establish, we understand, a new entrance. We will work out something with them through agreement or adjustment in lands.

Senator Mundt. This you will be able to do without any legislative process?

Mr. Nelson. I am quite sure we will. At the present time the monument is under Forest Service ownership, but administered by the Park Service. I do not think there is any legislation needed.

BARK BEETLES

Senator MUNDT. I want to talk a little bit about bark beetles. Who is the bark beetles man?

Mr. CLIFF. Mr. Spillers.

Senator MUNDT. In my visitations out to the Black Hills forest area, and from my correspondence, I know that the infestation in South Dakota is a most serious threat to our valuable timber resources, including those in the Forest Service lands. So it is my hope that your allocation of money for control of beetle infestation is sufficient to do the eradication job in those areas under your control. And if it is not and this epidemic or disease is a threat, as I have been led to believe, then I want to do what I can, as a member of this committee, to see that you do have funds enough to wage a successful war against the bark beetle. Now, with that background, what can you tell me on the bark beetle?

Mr. SPILLERS. Thank you very much for your interest, Senator. We're also very much interested in all the lands that might be infested by the beetle, and not just national forest lands.

As you know, the Black Hills beetle loomed up with gigantic proportions last fall. We hope to jump on those things before they get out of hand.

CONTROL OF THE BEETLE

We are going to watch it very carefully. We will not know until later in the year just how big it is going to be, but, of course, we are going to work on it. That is typical of a number of these insects building up. We hope to be able to control them with funds we have, but if we cannot, it might be necessary to request consideration of supplemental financing.

Senator MUNDT. Is there anything you think we should do that you would like to see us do in this committee, in this bill, to better equip you to handle this pest?

Mr. SPILLERS. Senator, it is one of a number of forest pests that are confronting us throughout the Nation. We will not know the total picture of all the pest control situation until next fall. As I say, we are working on it now and we will work with our present funds up to the end of this fiscal year. But we do not know now what the financial needs for next year may be.

Senator MUNDT. I happen to feel when you get a pest of that kind, whether it is in hogs, or cattle, or valuable timber, or whatnot, the best way is to hit it hard before it gets too far ahead of you.

Mr. SPILLERS. Absolutely, Senator. It is just like a fire. If you jump on a small fire, you have a chance to put it out with less cost. That is what we are trying to do with the insects and disease epidemics.

COOPERATION WITH THE STATES ON CONTROL

You might be interested to know we are working on a cooperative arrangement with the States on this. We are allowing States that come in agreement with us, $15,000 a year. And a number of States have already signed up with that. We match up to $15,000 which provides up to $30,000 for that work. You have probably noted our table on page 46 where we have increased detection and evaluation expenditures from $1 to $1.7 million, because it is just in line with

your thought, Senator, the quicker we discover and jump on these outbreaks, the greater chance we have of suppressing them.

Senator MUNDT. I interpret your remarks, and correct me if I am wrong, to mean that you are asking for adequate funds to attack the bark beetle and other pests or diseases. Do you feel that you are asking for sufficient funds, but that you may feel it necessary to come back for a supplemental request if it gets worse than you anticipate?

Mr. SPILLERS. That is correct, Senator. We hope we will have enough funds but we do not know at this time of the year.

REQUESTED FUNDS DEPEND ON COMPLETION OF SURVEYS

Mr. CLIFF. The problem is that we are talking about something that is subject to future developments. We will not know until the 1964 fall surveys are completed how much we will need for the total 1965 fiscal year.

Senator MUNDT. You are considering doing something, I hope, about the beetle, except just watching it, until next fall.

Mr. CLIFF. We are working on it right now with fiscal year 1964 money and we are going to do all we can in fiscal 1964 to attack this.

Any beetles not controlled this year will be emerging from the infested trees in early July and attacking new trees and we do not know how much this attack might spread or how successful our efforts are or will be until we can make the survey after the emergence of the beetles. So this is a very difficult area in which to make estimates.

The same thing is true of other insects. They move and we either are successful or need to take further steps. We are hoping that we will be able to put enough muscle in the Black Hills this spring to get the epidemic on the downhill pull. The surveys next fall, or after the summer flights, will give us a sizeup of just what the situation is for the balance of fiscal year 1965.

CHRIST ON THE MOUNTAIN PROJECT

Senator MUNDT. I think my next question might be more directed toward Mr. Nelson. You will recall that the late Senator Francis Case, Congressman E. Y. Berry, and I have had a lot of contacts with you concerning a projected project in the northern Black Hills which we referred to as the "Christ on the Mountain" project. I think this is a matter of land transfer involved and I wonder if you could give me an up-to-date report on the status of that.

LAND EXCHANGE

Mr. NELSON. The last report that we had indicated our field people had some meetings with the Home Stake Mining Co., who will furnish the lands, we were making an exchange for, and they resulted in an arrangement whereby they would have sufficient land on top of the mountain to carry on their project and we would have a good substantial exchange proposition. We do not have the exchange in this office at this time, but I understand that they did work it out with the company.

Senator MUNDT. It looks as though you are working out a meeting of the minds?

Mr. NELSON. Yes, sir.

Senator MUNDT. I talked with some of the officials of the company and it looks like they are giving good land.

Mr. NELSON. We will be getting more acreage than we will be giving them, but in considering values and the public good, we believe it will make a good substantial exchange.

Senator MUNDT. I guess this one goes to you, too?

You must be quite a horse trader out in that area. I am sure that you are familiar with the Mount Roosevelt area and the latest report I have from the regional office on its progress indicated that it is complicated by some 10-year-old unpatented mining claims. Now Mount Roosevelt was the first national memorial to Teddy Roosevelt and the citizens of our area are anxious to see that the land surrounding it is acquired. Teddy Roosevelt comes from our general area. We do not produce many Presidents in that area, and we are kind of proud of the fact that he came from there. What is the present status of that situation?

Mr. NELSON. Senator, that is one I do not have the information on here and I will have to supply it for you.

Senator MUNDT. I will give you a copy of the last letter and then you can write to me.

RESEARCH CONSTRUCTION AT FORT COLLINS, COLO.

I have one question submitted by Senator Allott who asked me to propound some questions concerning a project in his State for which the committee included some moneys last year. He tells me that the architectural and engineering plans are being prepared for the Forest Research Laboratory at Colorado State and that the space situation at Colorado State is extremely tight and that the laboratory is a high priority project as far as the Forest Service is concerned. Now these are the questions he would like to have me propound:

ESTIMATED COST

What would you estimate would be the cost of this laboratory?

Mr. CLIFF. Dr. Harper would respond to that.

Dr. HARPER. The cost of that facility is $1,300,000. We have, as you may recall, planning funds in the 1964 budget of $79,000. As you indicated, the design of the building is going forward now. Plans and specifications will be completed by December of 1964.

Senator MUNDT. Is it true, as Senator Allott believes, that you would save almost a year in getting this vitally needed new building if the funds are available?

Dr. HARPER. That is substantially correct.

PLANNED CONSTRUCTION SCHEDULE

That country is very cold and the usual building season starts in the spring. This building will have its design completed by December so that there would be ample time to get the specifications and plans out to prospective builders and bids awarded by early spring.

Senator MUNDT. Then comes the inevitable question. That being true, what would be an optimum amount for this committee to make available for the next fiscal year, assuming we decided to expedite the progress in this manner in which you have outlined?

Dr. HARPER. Well, the estimated total cost is $1,300,000, Senator Mundt. We have now expended $79,000 for planning the structure. So the figure needed would be the $1,300,000 less the $79,000.

Senator MUNDT. Could it be done in phases, or would you need the whole lump sum?

Dr. HARPER. That might be possible, Senator Mundt, however we are very bad off on the campus of the university there at Fort Collins for space. I should mention that the $1,300,000 structure will not house all of our people that we now have in that location. We did go into that rather carefully in a study that we made about 2 years ago and it developed that this would be the first stage of a three-stage building construction program at this location.

Senator MUNDT. In other words, you particularly have to have this million odd-thousand dollars to make any reasonable alleviation of the problem?

Dr. HARPER. I would say, yes.

Senator MUNDT. That is all, Mr. Chairman.

MOUNTAINEER UNIT, MONONGAHELA NATIONAL FOREST, W. VA.

Senator BYRD (presiding). Mr. Cliff, I would like to begin by asking some questions concerning the proposed Mountaineer Unit. I assume I would direct these questions to Mr. Nelson.

Mr. CLIFF. Yes, sir.

Senator BYRD. The year before last, Mr. Nelson, this committee included in the appropriations bill, $250,000, at my request, for the initiation of the proposed Mountaineer Unit in West Virginia. That money was stricken in conference with the House. Last year, again, the committee included $200,000, for the same purpose, and, again the item was stricken in conference with the House. It would be my desire, this year, when we mark up this bill, to again include this item if sufficient justification can be shown for it. For the purpose of the record, how many acres would be included in this new unit?

SIZE OF THE UNIT

Mr. NELSON. The study, Senator, that we prepared, at your request, on this Mountaineer Unit, showed that within the total boundaries that we set up, there would be 550,000 acres that would be desirable for purchase for the national forest. That does not include purchasing of all the lands. We feel very strongly that the good farmland should stay in farming. It is better for the economics of that part of the country. There is also some of the high productive timberland that we would feel would be desirable to be owned by industrial operators, provided they would be willing to operate it on good forest management basis.

The figure that you asked for was 550,000 and there has been more interest, I believe, Senator, since you asked for that study, by some of the industrial forestry people and some of that land is within the 550,000 acres that could be, we believe, owned by progressive industrial owners. I presume that the type of land that they could not possibly profitably own, and that should be under Federal ownership under any case, if it is going to help the economy, is at least 100,000 to 150,000 acres. That is the type of land that is now of a low production quality and the type of land that we do not believe that any

industrial owner could put the investment in and operate it to an advantage.

Senator BYRD. Am I to understand that the land to which you have just alluded, the 150,000 acres, would be included within the overall 550,000-acre program?

Mr. NELSON. Yes; that is correct.

YEARS TO COMPLETE FEDERAL PURCHASE

Senator BYRD. Over how many years would you envision this purchase?

Mr. NELSON. It would be very desirable to, once we started purchasing a new unit of that type, to do the purchasing within about 7 years. We feel that there is not much use in going with too small a program. I think I told you last year that we thought we should have at least, $200,000, in order to justify going in and starting this the first year.

Senator BYRD. Do you still stand by this figure of $200,000 for the first year?

Mr. NELSON. Yes; we do, Senator.

ESTIMATED COST

Senator BYRD. What would be the overall estimated cost of this unit?

Mr. NELSON. The overall estimated cost of the 550,000 acres was $12 million.

Now if industrial owners, purchasers, would come in and take on and buy some of that better land that could be logically in an industrial unit of that type, our total cost would be reduced proportionally.

Senator BYRD. The land which the industrial owners might purchase would come out of the 550,000 acres?

Mr. NELSON. Yes.

Senator BYRD. So that in the final analysis you might end up purchasing 400,000 acres, rather than 550,000 acres?

Mr. NELSON. It would depend on what they did. If they would actually come in and purchase all of the land there that they might logically operate as an industrial forest, it might reduce the total area that we would need to purchase to about 150,000 acres. There is at least 150,000 acres that we do not see any way an industrial operator could take that land on and justify it as an industrial proposition.

ACRES OF SUBMARGINAL PRODUCTION

Senator BYRD. So you foresee that there are 150,000 acres of the submarginal production type?

Mr. NELSON. That is correct.

Senator BYRD. Which, in any event, would not be desired by private forest owners, or industrial owners, and the entire unit might very well end up involving 550,000 acres, of which a hundred thousand acres or more may be owned by private industry?

Mr. NELSON. It could be possible. We do not see that it will, Senator. I was in this part of West Virginia last year and looked at a tract of land of some hundred-or-so-thousand acres immediately west of the Mountaineer Unit that is on the market and we have not seen

any of the industrial operators come in and buy that land. It is owned by a coal company that has closed down its operations. It is the same type of land.

Mr. CLIFF. Could I interject a comment?

Senator BYRD. Yes, Chief.

REHABILITATING ENTIRE AREA

Mr. CLIFF. Our study has indicated that this whole area is in poor condition and is not contributing to the economy. It has been cut over and has been abused. The whole area needs to be rehabilitated and put under management. If the industrial forestry people would do that, that would be fine. The extent to which the public should enter into it depends on the progress that these other people make. They say they are interested. Perhaps the time has come when they should act rather than merely object. Somebody ought to do something to that land to make it contribute to the economy of that part of the country. It needs it. A lot of it is good forest land that can produce continuous forest crops, but we need to get on with the job and either industry ought to do it on the acreage that seems susceptible for industrial investment or the Federal Government or the State government or somebody ought to do it, because it is a drag on the economy the way it is now.

Now the extent to which the public agencies should enter this would depend partly upon how serious the industry is about doing it.

PROCEDURE FOR ACQUIRING MOUNTAINEER UNIT

Senator BYRD. Chief Cliff, suppose we appropriated the $200,000 and you were to initiate the program. What would be the procedure whereby the private forest owners and industrial operators could come in and select their areas for purchase?

Mr. CLIFF. They are at liberty to go in at any time and negotiate the purchase of any land that may be for sale. If they really move in that direction, I think we would try to concentrate our efforts, first, on picking up those parts of the area which are less likely to move under firm private management, leaving them an opportunity to block up some industrial units. If they fail to do it, I think we would have to take another look and decide, then, where we would go from there.

INITIAL STEP

Senator BYRD. So your first step, if I understand it, would be to purchase those less-desirable lands which would not likely be of interest to the other groups?

Mr. CLIFF. I think that is our present thinking as long as the other groups are indicating some interest in doing something. If they do not do something positive and constructive, I think we would have to reassess the situation and decide what needed to be done from here on out.

AREA INVOLVES TIMBER-PRODUCING LAND

Senator BYRD. Is it true that much of the area involved is, in fact, prime timber-producing land?

Mr. CLIFF. It is my understanding that most of this land has produced good timber and that it is capable of producing high-

quality timber again. Of course, the land varies in quality as is the case in any mountain area. There is some that is less productive and some that is less amenable to management than others.

Senator BYRD. How much do you estimate the cost per acre of this land to be, Mr. Nelson?

Mr. NELSON. At the time the study was made it was estimated that the average cost per acre would run about $22. If we were to concentrate our purchase on the less productive lands, the cost per acre would be well under that figure.

LUMBER HARVESTED IN MONONGAHELA NATIONAL FOREST

Senator BYRD. All right. How many million feet of lumber was harvested last year in the Monongahela National Forest?

Mr. CLIFF. Do you have that, Art?

Mr. GREELEY. I am sorry, Senator, I do not have that figure. Could I supply that for the record?

Senator BYRD. Yes. Let us say you did not harvest the potential last year. What do you estimate you can harvest annually in that forest?

(The information referred to follows:)

TIMBER CUT AND SOLD

In fiscal year 1963 the annual allowable timber cut on the Monongahela National Forest was 68 million board feet. The actual cut during that year was 26.8 million board feet. In addition 35.5 million board feet of timber were sold. Total receipts from all sources were $561.959, including $438,993 derived from the sale of timber. In fiscal year 1960 total receipts from the Monongahela National Forest reached a record high of $684,513.

1960 TIMBER HARVESTED AND VALUE

Mr. GREELEY. I would like to have the opportunity to correct this for the record, sir, but our figures were for 1960 about 27 million board feet harvested and was valued at $442,000.

Senator BYRD. That was for fiscal 1960?

Mr. GREELEY. That is right.

We should be above that now.

Senator BYRD. What were the total U.S. Treasury receipts for that year?

Mr. CLIFF. From the Monongahela National Forest?

Senator BYRD. Yes, sir.

Mr. GREELEY. The dollar value of the timber that was harvested was $442,000. Those were the receipts for the Treasury. We should now be running above 27 million feet but this is the figure I need to verify it for you, sir.

Senator BYRD. It seems to me I recall a figure of somewhere above $600,000 for 1 year.

1963 TIMBER HARVEST VALUE

Mr. NELSON. Senator, I have the figure for 1963 and it is some $561,000 of revenue from timber, forest, minerals, and other uses.

Senator BYRD. Do you have the figures for other years previous?

Mr. NELSON. No, I do not.

Senator BYRD. Well, this $600,000 figure still remains with me. How much per acre, would you say, is being paid to the counties involved

Mr. NELSON. Last year it was 17.4 cents per acre.

LOSS OF TAX REVENUES BY FEDERAL PURCHASE

Senator BYRD. How would this compare to the tax revenues per acre if the land were not included in the forest?

Mr. NELSON. In the counties in the Monongahela National Forest, for example, Senator, it varies by counties, but the average is 12.9 cents. The low rate was 4.1 cents and the highest was 27 cents. Thus over half of the counties would have a tax return less than the current per acre return from the national forest.

Senator BYRD. Did you say in over half of them?

Mr. NELSON. In over half of them.

Senator BYRD. So, in the beginning, as I understand you, some of the counties would withstand a loss of tax revenues which would not equal the income gained from the forest lands.

Mr. NELSON. That could be true. It happens in some counties. Although, over the long period in the last 10 years, the receipts in the Monongahela National Forest have tripled and we expect that trend to continue. So with those counties it should not be over too long a period.

OPPOSITION TO PROPOSED MOUNTAINEER UNIT

Senator BYRD. Well, there seems to be some objection on the part of some of our people to this proposed unit. The objection may be engendered by industrial groups such as you have mentioned earlier. I would like to give to you, Mr. Nelson, one or more clippings from certain West Virginia newspapers which have reference to the proposed Mountaineer Unit. These news stories mention some of the objections that have been raised. I wish you would, for the record, respond to the objections raised in the news stories, so that in my effort to include the money this year, I might have the whole picture before me and be able to answer questions in conference which might emanate from the newspaper stories.

Mr. NELSON. We will be glad to do that, Senator.

(The information referred to follows:)

HIGHLIGHT STATEMENT

This opposition to the Mountaineer Unit expressed in the news clipping stems generally from forest industry's reaction to the President's Appalachian Regional Commission draft proposal to have the Federal Government acquire lands within the Mountaineer Unit for national forest purposes. The Governor's utilization committee objects to large areas going into Federal ownership where private industry could manage these lands profitably. The President's Appalachian Regional Commission generally agreed with this and it is understood the proposed bill will probably provide that the Federal Government acquire those lands for national forest purposes that are primarily depleted or unproductive.

These criteria would reduce the acreage in the Mountaineer Unit that we could acquire under the President's Appalachian Regional Commission proposal—possibly to 150,000 acres rather than the original proposal of some 550,000.

We could agree with the Governor's utilization committee that certain "wild" lands to the north and northeast of the Monongahela more properly fit the criteria of "depleted and unproductive forest lands."

The question of how long it will be before industry can afford, or feels it desirable, to move in and acquire the more productive lands for management purposes

is a difficult one to answer but it is very pertinent to the economy and well-being of the residents in the Mountaineer Unit.

Desirability of the Mountaineer Unit

Senator Byrd. Is it still the feeling of the Forest Service that the acquisition of the new unit would be highly desirable?

Mr. Nelson. Yes, it is.

Senator Byrd. You do not view this program with any less enthusiasm than you have in the past 2 years?

Mr. Nelson. No, I do not think that we do or should. We could point out, Senator, though, that there is other land in the vicinity of the Monongahela National Forest where more of it, a higher percentage of that land, is of this primary depleted or unproductive land. I think I have seen these newspaper articles and I believe they refer to lands east of the Monongahela. I believe that is correct that there is more of this depleted and unproductive land in that vicinity. In that area, we also have, as you know, the possibility of a national recreation area.

Senator Byrd. In the area of Spruce Knob?

Mr. Nelson. Yes.

Senator Byrd. Now would you include these lands to the eastward in the Mountaineer Unit, the land to which these organizations have referred and which are not presently encompassed in your planned program?

Mr. Nelson. We have not made any study of an area, a large unit as a separate unit, outside to the east. We can look into that a little bit more. A preliminary look, indicates, based on their indication, and the news item indicates, that there is quite a lot of that land in that area.

Counties Involved in the Proposed Mountaineer Unit

Senator Byrd. Can you indicate for the record those counties out of the eight which are involved in this proposed expansion which in your judgment would suffer a tax loss in the beginning?

Mr. Nelson. We have that information in relation to some of these counties and will be glad to provide it for the record.

(The information referred to follows:)

Relation of National Forest Contributions to Counties to Estimated Taxes if Lands Were Taxed

Three-fourths of the lands in the Mountaineer Unit are in four counties—Greenbrier, Nicholas, Randolph, and Webster. There also are lands in these counties now part of the present national forest. Based on estimated tax returns if the national forest lands were assessed and taxed by the counties, the distributive share of the 25 percent of national forest receipts paid the State would, on an average per acre basis, exceed estimated local taxes in two of the four counties. If other forms of contributions by the Federal Government through protection and management of the national forest, such as road and highway construction and maintenance and fire protection, are added the contribution would exceed taxes in three of the four counties. All four counties obtained additional revenue from taxes on minerals retained in private ownership under national forest lands. If these are added to Federal contributions, the aggregate per acre would exceed estimated taxes on the national forest lands in all of the four counties.

Similar information has not been completed for the counties wherein the remaining quarter of the Mountaineer Unit is located. The probabilities are, however, that contributions to governmental cost from the national forest would substan-

tially replace tax loss due to national forest purchases, considering that in many lands the minerals would remain privately owned and taxable.

PRESIDENT'S APPALACHIAN REGIONAL COMMISSION REPORT

Senator BYRD. I believe you stated that certain of the eight counties would not suffer a loss in revenue; is that correct?

Mr. NELSON. Yes.

Senator BYRD. Is it possible that some of the opposition may stem from the forest industries' reaction to the draft of the President's Appalachian Regional Commission Report?

Mr. NELSON. I talked to Deputy Chief Pyles this morning before I came up here and that is why I happen to have these news items. It is our feeling that most of that opposition did stem from the President's Appalachian Regional Commission Report.

Senator BYRD. That report does not refer to the Mountaineer Unit as such, does it?

Mr. NELSON. I do not believe it does. I think it refers to 550,000 acres, as I recall it.

PROPOSED MOUNTAINEER UNIT TO MONONGAHELA NATIONAL FOREST

Senator BYRD. Do you feel, Mr. Nelson, that you can present to the committee a résumé which will present the objectives and the anticipated benefits in support of this proposed Mountaineer Unit so that we can, if we do add this item, in committee, go into conference feeling that we really have a strong justification for this?

Mr. NELSON. I believe we can give you a rather strong justification, Senator, yes.

(The information referred to follows:)

OBJECTIVES AND PURPOSES OF THE UNIT

The Mountaineer Unit comprises 1,050,000 acres of rough, forested, important watershed land adjoining the present national forest in the upper watersheds of the Gauley, Elk, and Little Kanawha Rivers, tributaries of the Ohio—95 percent of the area is privately owned, 86 percent of the land is forested, 14 percent is cleared and used for cropland or pasture purposes. Farming, however, is mostly on a subsistence basis and is decreasing as a land use and as an economic factor. The Mountaineer Unit is in an area of severe unemployment and a depressed economy brought about by decline in mining employment and depletion of forests.

Forest land here is basic and can be a major economic resource. However, employment in forest industries has been drastically reduced due to declining supplies of quality timber. Over a long period of years, the timber stand on much of this area has deteriorated through repeated logging and in some places through forest fires. Forest lands are not furnishing either the quantity or quality of wood they are capable of growing to sustain local wood-based industries. Forestry practices necessary to restore these lands to optimum timber production will require investments of time and money over many years. Only a small part of the forested area is being improved and used effectively to supply the quality raw forest materials adequate to attract and sustain an expanded forest industry. Progressive abandonment of small farms is adding to the area that will require and warrant forest management.

Watersheds also have deteriorated, particularly in the headwaters of streams. Streams in the narrower valleys frequently overflow and heavy silt loads adversely affect fish habitat and depreciate water quality for domestic and recreation use. The deteriorated condition of forest cover and watersheds in turn has an adverse effect on wildlife and fish populations which generally are low.

The counties that would be affected by the Mountaineer Unit have been classed as areas of substantial and persistent labor surpluses, averaging 22 percent for many years. Primary causes are lack of employment opportunities in agricul-

tural, forest, and mining industries. The area has supported a substantial mining industry, but employment opportunities have been sharply reduced as a result of changing methods of production and for other reasons, and this trend continues. Agriculture is becoming increasingly submarginal. This situation results in a high ratio of unemployment, a low per capita income, and increased public financial assistance and other welfare requirements.

The Mountaineer Unit has, notwithstanding, potentials for substantial economic contributions based upon renewable surface resources. It has varied and unique natural features, an attractive forest environment, pleasing scenery, and other features which could be the foundation for a large and potentially valuable recreation industry. Some 27 million people live within 150 miles of the area. It has high potential for wildlife production which in turn would attract people for hunting and fishing. The timber resource again can be the basis for a substantial and productive industry utilizing forest products. Minerals will remain a substantial part of the economy and their exploitation is compatible with sound management of the renewable resources if properly coordinated.

The possibilities for a new industry in this area oriented to development of the recreation and scenic attractions is promising. Such an industry could effectively add to the economic well-being and the opportunities for local employment. Its feasibility, however, will depend upon a public land base adequate to meet the public demands for hunting, fishing, hiking, riding, touring and other pursuits, and upon clean streams, managed watersheds, adequate supplies of fish and game, and a pleasing forest environment. Similarly, forest products can form the basis of an expanded industry provided the basic resource is restored and an expanding supply of quality timber assured.

To realize these possibilities will require a vigorous, accelerated program of natural resources development and conservation. National forest multiple-use management can contribute to such program. Such management would seek to develop all resources in harmony so that not only timber but water, recreation and wildlife resources would be enhanced and production increased.

The program for the Mountaineer Unit contemplates the acquisition by the United States over a period of years, through voluntary sale, of approximately 50 percent of the lands therein. This acreage is about 5 percent of the commercial forest land in West Virginia. The remaining 50 percent of lands in the unit would remain in private ownership and be used for residences, farms, or private forest management as the owners may find feasible and desirable.

Lands that would be acquired would be those where national forest administration would best promote expanded public recreation, with its concomitant local economic benefits, restoration of depleted forest stands—a longtime endeavor—and the sustained-yield production of crops of high-quality forest products therefrom as a basis of stable industries, and the needed improvement of watershed conditions, stream pollution abatement, and quality water production in the interest of both the local area and the downstream waterflow regulation. Development and improvement of lands so purchased would provide useful work of lasting national benefit to people in the area who are particularly qualified to do this type of work, and new industries and businesses should flow from improved forests and watersheds.

ESTIMATED COST

Senator BYRD. And do you feel pretty safe in your outside estimate of $12 million?

Mr. NELSON. Reasonably safe; yes, sir.

Senator BYRD. You feel that, in reality, the costs might be less, because the amount of acres purchased might be less?

Mr. NELSON. That is correct, on the basis, as Mr. Cliff explained, if the industrial owners will come in and buy some of that land and put it under some type of management, that will preclude the need for it being in the national forest.

Senator BYRD. For the record, I wish to state that the Senate Committee on Agriculture has been contacted by me several weeks ago in regard to this proposal and has indicated that it has no objections to the going ahead by the Forest Service with the purchase of lands and the creation of the unit.

WATERSHED MANAGEMENT LABORATORY, PARSONS, W. VA.

Now let us talk just a moment about the Watershed Management Laboratory at Parsons. How are we getting along? What is the status of the laboratory?

Mr. Harper?

Dr. HARPER. We are getting along very well, Senator Byrd. The construction is nearly completed. This building will be occupied probably sometime this spring.

Senator BYRD. Do you have any requests in this budget for that laboratory?

RESEARCH PROGRAM EXPANSION

Dr. HARPER. No, sir; we do not. The construction has been completed. However, we do have plans that after the laboratory is completed that we would like to expand the research program. We were not able to allow any increase in the 1965 budget for this purpose, however.

Senator BYRD. Was the request submitted for this?

Dr. HARPER. In our original request; yes. This was along with the staffing of several of the laboratories that were being completed about the same time. These are laboratories that were financed in 1963 and would have available space for an expanded program.

LABORATORY CONSTRUCTION AND STAFFING

Senator BYRD. Did you have any request for construction money?

Dr. HARPER. No, sir. Not at Parsons.

Our construction at Parsons is completed.

Senator BYRD. Are there any moneys in the budget for the staffing of that laboratory?

Dr. HARPER. No, sir.

Senator BYRD. There are no moneys for staffing?

Dr. HARPER. Well, now, let me make this clear. There is money in the 1965 budget to carry on the program that has been in existence at Parsons. There is no money in the 1965 budget, however, for expansion of the program.

Senator BYRD. So the staffing needs, as you envisage them, will not be met by the moneys in the 1965 budget?

Dr. HARPER. That is correct.

THE 1965 REQUESTED BUDGET

Senator BYRD. How much is in the 1965 budget for this laboratory?

Dr. HARPER. $100,000 of which $60,000 is for timber management research and $40,000 for watershed research.

Senator BYRD. How many persons do you presently have at the laboratory?

LABORATORY STAFFING

Dr. HARPER. Presently, we have seven people at the laboratory of which three are scientists and four are subprofessional; this latter includes clerks, technicians, and other subprofessionals.

Senator BYRD. How many persons could you effectively and efficiently use at the laboratory, once construction is completed?

Dr. HARPER. Well, this laboratory was built to accommodate the program that we had planned at Parsons; namely, for 17 people. In other words, there is a capacity there for 10 more people than we now have.

Senator BYRD. Could you use those 10 additional people in the latter part of fiscal year 1964, or could you use them beginning with fiscal year 1965?

That is, if the moneys were forthcoming?

Dr. HARPER. Yes; that is correct, because the building is virtually completed now and we will move into this new building prior to the beginning of fiscal year 1965.

Senator BYRD. So actually if you had the moneys you could staff or at least begin the recruitment of the 10 additional personnel even before the beginning of fiscal year 1965?

Dr. HARPER. Yes; that is correct.

BUDGET REQUEST FOR FULL STAFFING

Senator BYRD. But we are talking in terms of fiscal year 1965 moneys. How much additional money would you have to have to add the 10 persons to round out your full staff of 17?

Dr. HARPER. That additional cost is $150,000.

Senator BYRD. So there is $100,000 in the budget for Parsons and $150,000 additionally is needed to enable you to reach your full staff contemplated?

Dr. HARPER. That is correct; yes.

Senator BYRD. Do I understand you to say, Dr. Harper, that there was a request for this additional $150,000?

Dr. HARPER. There was a substantial request in our original agency request. We did request some additional money to staff this and other laboratories that we were completing.

Senator BYRD. So it would be desirable, as I understand it, to have this additional money. The work is there, the research needs are there, and the recruitment of additional personnel would not pose a problem. If you had the $150,000 you could move forward and get into the work that is envisioned for that laboratory?

PROBLEM IN TIMBER AND WATERSHED MANAGEMENT

Dr. HARPER. That is correct. Of course, we have a real problem in the field of timber management and in watershed management research that we feel that we should get ahead with as fast as possible. It was mentioned a while ago that much of this land in the Appalachian area is in poor productive condition. That is correct. Some of this land probably should be converted to conifers. It was originally in conifers, but now it has come into hardwoods. Some of it has what you would call weak soils. It will never support good stands of hardwoods, so there is the matter of how one would economically convert these particular stands to conifers. In general, there is the big problem of delineating the soils with respect to choice of species that should be favored in the forest management programs. Some of the land is excellent for hardwoods. And then, of course, along with that, watershed problems are extremely important in this mountainous area.

Senator BYRD. If you do not have the additional staff, it just means you have a facility there that is not being fully utilized?

Dr. HARPER. That is correct. The laboratory was constructed to accommodate a planned program that we want to go ahead with as soon as the budget situation will permit.

AVOIDING DELAY IN RESEARCH PROGRAM

Senator BYRD. Additionally and more importantly you are being delayed in getting into the research program which would be of so much benefit to the area and perhaps to the region; is that not true?

Dr. HARPER. I would say that is true; yes, sir.

Senator BYRD. And it is your objective, ultimately, if you do not get this money, to fully staff that laboratory, and consequently, in my judgment, if I might express it as I see it, we seem to be penny wise and pound foolish if we do not appropriate this money now and begin to get the full utilization of the laboratory and at the same time get the research program moving forward. You would have no problem with recruitment and you could use this money, if it were appropriated?

Dr. HARPER. That is correct.

PRINCETON LABORATORY

Senator BYRD. Now let us talk for a moment about the Princeton laboratory. Let me say, Dr. Harper, with regard to the Parsons laboratory, that you know, I was instrumental in getting this laboratory started by virtue of the amendment which I offered to add $150,000 to the bill making appropriations for the fiscal year 1963. I am intensely interested in this, and I think you have made a good case for it, this morning. The money, of course, will be hard to get, perhaps harder than is normally the case, but I shall certainly endeavor to press this case and try to get some additional money for it. If we cannot get the full $150,000, $75,000 would be helpful, would it not?

Dr. HARPER. That is correct.

CONSTRUCTION COMPLETED AND DEDICATION

Senator BYRD. Now let's talk about the Princeton laboratory. This laboratory was initiated as a result of an amendment which I offered adding $450,000 for fiscal year 1962. The laboratory was completed last year and we had a very fine dedicatory ceremony at the laboratory and you and Dr. Marquis were present.

Dr. HARPER. Yes; I was there.

Senator BYRD. And we had a very fine and enthusiastic turnout of citizens, not only of Princeton and Bluefield but also from surrounding counties and adjoining States. I think it is a very handsome structure that you have there and I am intensely proud of it and our people in West Virginia are exceedingly thankful for that facility.

Last year, I was successful in adding $250,000 to the budget request of $100,000 and we lost $50,000 in conference but this gave you $300,000 for fiscal year 1964. I was a conferee. This was to enable you to beef up the operation and move forward. Have you been able to spend that money, thus far, pretty effectively?

Dr. HARPER. Yes, we have, Senator Byrd.

We will have it fully staffed to the level of the $350,000 that we have available in 1964 for the program. That involves a total of 23 people in the laboratory at work before the end of this year.

Senator BYRD. The director of the laboratory there is Mr. Longwood. He is joining in the civic activities of the community and he is very well received by the citizens. He is doing a good job and he has caught the admiration of the population there and I often see stories and pictures in the Bluefield Sunset News-Observer which indicate that Mr. Longwood is providing real leadership in that area. Our people are tremendously happy about this laboratory and I think it is going to be of great and enduring benefit to the region. Our timber and lumber people are excited about it and they are giving it their support. I think we have something that is really going to be good for West Virginia and the other States in the whole northeastern region.

1965 BUDGET REQUEST

Dr. Harper, how much is in the budget this year for Princeton?

Dr. HARPER. There is $350,000 in the 1965 budget which is the same as we had in 1964.

Senator BYRD. How much do you actually need at Princeton in fiscal year 1965?

Dr. HARPER. This laboratory was built to a certain capacity to handle the planned program. The level of that program would be $700,000. We have $350,000 now. That would mean we would have to have $350,000 for an additional program when the financial situation permits.

REQUESTED ADDITIONAL PERSONNEL

Senator BYRD. How many additional scientists and supporting personnel would the added $350,000 provide?

Dr. HARPER. It would provide 23 additional. I have a breakdown on that. It is the same as we have now. You see, we now have $350,000 for the research program at Princeton. We have 23 personnel. Another $350,000 would add 23 people to it. The capacity of the laboratory is 46.

Senator BYRD. So this would enable you to reach your planned capacity?

Dr. HARPER. That is correct.

Senator BYRD. Do you feel that if this committee and the Congress were to appropriate $700,000 for 1965 you could move forward and use that money economically and get a dollar's value for a dollar spent? You could recruit the additional personnel and fully utilize this money?

IMPROVING FOREST PRODUCT MARKETS

Dr. HARPER. I would say, Senator Byrd, we could. I think we undertook a much harder job this past year in getting the leaders for the program and once you have the leaders for the projects, it is much easier to get the understructure, the junior members. I would say this: that I know of very few activities in forestry research that are more needed at the present time than marketing unless it is utilization research and we have already said our Forest Products Laboratory construction at Madison is our highest need. But marketing research is important. More utilization outlets, better market-

ing procedures, cheaper cost of production of forest products, and improving the marketability of the products are extremely important. I'm sure we could move ahead in this program. I appreciate what you said a while ago about the program at Princeton and what the people locally think about it. I think that is true and I think it is a real tribute to our people who are carrying on this program and to the progress they are making.

The industry, generally, I would say, is enthusiastic about the outcome of some of the studies so far undertaken and are more than willing to help in a cooperative effort to improve forest product markets.

Senator BYRD. I take it that a request was submitted to the Bureau of the Budget for the $700,000?

Dr. HARPER. A substantial increase was included in our original estimates. We wanted to implement this program to the fullest extent feasible, not only because of the nature of the urgent problems but because they are in an area that is economically depressed, where more industry and employment is needed for economic growth.

Senator BYRD. Dr. Harper, I shall certainly do everything I can to promote the cause in which you and I both are interested and I will do whatever I can to get this money for you.

Dr. HARPER. I might say, Senator Byrd, that we appreciated very much your participation in the dedication of the new laboratory. It was a very large affair and I heard very favorable comments from all the people that attended.

Senator BYRD. I think it was a fine program. Dr. Marquis did an excellent job in moving forward and keeping it on schedule, and you made a fine contribution, as I recall.

SPRUCE KNOB, W. VA.

Now, Spruce Knob is the highest point in West Virginia. It is an outstanding scenic attraction and is receiving more and more tourist interest every year. Located at the head of the Potomac River, it has a special attraction not only for the residents of my State, but also for the eastern seaboard area. It is an important attraction for tourism in this portion of the State and in my opinion could be developed as a much greater asset to a local economy badly in need of assistance.

PLANS FOR THE AREA

What plans do you have for the Spruce Knob area?

Mr. HENDEE. Senator Byrd, we have in our long-range plans, the proposed observatory on top of Spruce Knob. We have recently built a road near the summit of this knob, and we would have an observatory there that would be manned to point out the local attractions and bring out the various things that vistors to the area could enjoy.

Senator BYRD. Did I understand you to say you plan a motor road or that you have completed a motor road to a point just below Spruce Knob Summit?

SPRUCE KNOB-SENECA ROCK NATIONAL RECREATION AREA

Mr. CLIFF. There is a road there now, Senator. The approach roads leading to the new road on Spruce Knob are to accommodate

heavy recreation traffic. A year ago on Labor Day, I took my family to the top of Spruce Knob and it is everything you say it is. It is a beautiful area and was just swarming with people on Labor Day. It is quite an experience to get up there and see the vegetation and the beautiful scenery. It is getting a lot of use already and, of course, this is an area that, if the proposed Spruce Knob-Seneca Rock National Recreation Area materialized, would be a key part of that recreation area which is proposed in the legislation which you have sponsored.

But even under our present program, we are trying to accommodate the growing recreation use. Spruce Knob is getting a lot of use and it is an outstanding attraction and can be developed into an even greater attraction.

Senator BYRD. Chief Cliff, I hope you will try some of our ramps when you are over in that area.

Mr. CLIFF. I have tried them, but at a different season of the year.

OBSERVATION TOWER—SPRUCE KNOB

Senator BYRD. You think it is necessary to construct a special observation tower so the viewing public will be above the timber and the land?

Mr. CLIFF. I think it would be an added asset, yes. Although you can get a pretty good view of the country from what is there now. We have been building some additional trails, including a main trail for foot traffic up to the top. I think, eventually, we will need some visitor information facilities, but that would have to come along later after some of the more fundamental development work is completed.

Senator BYRD. What would be the estimated cost of the tower?

Mr. CLIFF. Do you have that?

PLANNING AND ESTIMATED COST

Mr. HENDEE. Yes. We have done some preliminary planning along with the other planning for developments in that area, Senator Byrd, and our tentative estimate on this, what we have done so far, is it will cost somewhere around $50,000 to $75,000 to develop an appropriate observation tower. This would envision using appropriate materials, probably local materials that fit in the other developments in the area.

Senator BYRD. I take it that money is not included in the budget?

Mr. HENDEE. No; it is not. That is correct.

Senator BYRD. Could you utilize this money in fiscal year 1965, if it were forthcoming?

Mr. CLIFF. I am sure we could if it were added to the budget, but we have not, under the tight budget ceiling that we have been working, requested it as we did not think this should be included this year.

Senator BYRD. But you could use it, if Congress appropriated it?

Mr. CLIFF. I am sure we could, effectively.

MONONGAHELA SCENIC DRIVE

Senator BYRD. Now that the State of West Virginia, the Bureau of Public Roads, and the Forest Service are engaged in planning to construct the Monongahela Scenic Drive, I am concerned about the visitor facilities. We talked about this last year. The first section

of the drive would be from Highway 39 to Highway 219, passing through some very beautiful country. It would seem to me that at the interchange where the scenic drive crosses Route 39 at Cranberry Mountain between Richwood and Marlinton, visitor facilities will be needed to permit people of my State and visitors from surrounding States to enjoy and learn about the unusual geographical, biological, and botanical features of this area.

Visitor Information Centers

One of the features needed for recreation development in addition to campgrounds and picnic areas, is a visitor center where visitors can be motivated to learn more about the forests, wildlife, and other resources and the management thereof.

I feel that a visitor center with related structures will do much to foster tourism in this area of West Virginia with important benefits to the economy and provide services to the visiting public.

Does your survey of the recreation complex recommend a visitor center near this location?

Plans for Development

Mr. Hendee. Senator Byrd, you mentioned that we discussed this last year and, as we said then, our plans for long-range development of the recreation complex in this area is that somewhere in the intersection of these two highways we would envisage a visitor center. This would be used, as you point out, to explain to the visitor the many, many things that are there available for him to see and appreciate.

Cranberry Glades Area

They have in the Cranberry area a very unusual vegetation and so forth. This cranberry glades would be one of the main features which would enhance a visitor center in that area. We would not be limited to this. There are many other points of educational interest that we would want to bring out in a visitor center.

This will be, is now, and will continue to be, increasingly used, we think, in this whole recreational complex, including a resort area in this vicinity, along with other recreation facilities.

Senator Byrd. What is the estimated cost of this facility?

Estimated Cost of the Center

Mr. Hendee. Our plans to date envision a recreation visitors center that will cost in the vicinity of $100,000. I think last year we stated this would be the estimated cost of this visitor center.

Senator Byrd. Does this include the cost of plans and specifications, the construction and the equipment?

Mr. Hendee. Yes, sir.

Senator Byrd. Could you give us a breakdown of these various item costs?

Mr. Hendee. We will be very glad to supply that for the record.

PLANS AND SPECIFICATIONS COSTS ESTIMATES

Mr. CLIFF. I think it would have to be pretty much of a guess estimate, because we have not gotten to the point of developing blueprints. So it would have to be a rather broad guess.

Senator BYRD. You could give us a pretty firm estimate of the plans and specifications costs?

Mr. CLIFF. Based on our experience in construction of other visitor centers, I am sure we could do that.

(The information referred to follows:)

Cost estimate for Cranberry Glades visitor information center, Monongahela National Forest, W. Va.

1. Plans and specifications and supervision of contract	$7,000
2. Contract construction	70,000
3. Other related facilities including exhibits and other equipment items (includes exhibit room and audiovisual room)	23,000
Total	100,000

Senator BYRD. If the $100,000 were to be appropriated, could you plan and construct and equip this facility during fiscal year 1965?

Mr. HENDEE. I believe we could, Senator Byrd. We have, over the past year or two, as a result of setting priorities in the visitor information program, done some preliminary work on this, so we are not without some general plans. They are quite specific plans, in fact.

Senator BYRD. So this item is a desirable item and, I take it, it is included in your plans for the future?

Mr. HENDEE. For the future, not in this fiscal year.

Senator BYRD. Not in this budget?

Mr. HENDEE. Yes.

PRIVATELY FINANCED RESORT

Mr. CLIFF. You are familiar, I am sure, with the plans we have for attempting to get a privately financed resort in this Cranberry Mountain area. We have just issued a prospectus for a high-quality resort lodge and other recreation facilities, to be developed on national forest land by private capital under a special use permit.

Senator BYRD. That is the old Mill Point Prison site, is it not?

Mr. CLIFF. That is correct. We are hopeful that this will materialize. It would be a fine asset and it would complement the plans we have for the development of the whole area.

Senator BYRD. If that development would materialize, would it interfere with the planned service, that is, the visitor center?

Mr. CLIFF. No, sir. It would make it even more desirable to have the visitor center there to give proper orientation to the public in our total multiple-use program.

SPRUCE KNOB OBSERVATION TOWER, WEST VIRGINIA

Senator BYRD. I would like to refer again to the Spruce Knob Observation Tower. The total cost, I believe you said, would be between $50,000 and $75,000.

Mr. HENDEE. Yes, sir.

Senator BYRD. Can you give us some breakdown on this cost?

Mr. HENDEE. Yes, I am sure we can.

Senator BYRD. Indicate in the breakdown to the committee what the cost of planning would be, construction, and so on. You could do all of this within fiscal year 1965 if you had the money?

Mr. HENDE. Yes, sir.

(The information referred to follows:)

	Estimated cost
1. Plans, specifications, and supervision of contract	$3,000 to $5,000
2. Contract construction	42,000 to 55,000
3. Other related facilities including exhibits and other equipment items	5,000 to 15,000
Total	50,000 to 75,000

A $50,000 project would be primarily an observatory. The $75,000 plan would provide for more complete interpretive facilities.

WATER IMPROVEMENTS

Senator BYRD. I hate to impose upon you, Chief Cliff, and upon your associates, but if I might ask a few additional questions, we will be able to finish.

I am sure you are aware of the heavy use which occurs at impoundments, such as at Spruce Knob and at Sherwood Lake, which have been built in the national forests in West Virginia. It is my understanding that the construction of these impoundments has been paid for from the proceeds of special State fishing licenses and other funds available to the West Virginia Conservation Commission. In view of their popularity, I am wondering why the Forest Service does not construct some of these from Federal funds?

Mr. GREELEY. Senator Byrd, if I may answer that question, you have mentioned two areas that are popular areas and those are good projects. We have not built impoundments such as the two you referred to since a few that we built during the period of the CCC program. That was primarily because we simply have had more pressing needs for the available dollars, sir.

We have just simply had to take care of situations where there were people coming to the forests and needing space for recreational pursuits, needing facilities for campgrounds and picnic grounds and improvement of old campgrounds and picnic grounds. We continue to be faced with these problems and, as I indicated, our facilities are overused to the extent of around 60 percent. Yet, in spite of this, visitors increase in number. There are additional large reservoirs; for example, the Federal Power Commission licenses, that create additional problems of this sort.

So we have simply been too hard pressed in trying to keep up with the existing usage, to get on with the businesses of making new impoundments. But we do believe it would be a good project to undertake.

ESTIMATED COSTS OF POTENTIAL IMPOUNDMENT SITES

Senator BYRD. A few months ago I asked some of your people to furnish me with a list of potential impoundment sites in the national forest areas of West Virginia. About 100 sites were listed. These included particularly good opportunities in Pocahontas, Nicholas, Webster, Greenbrier, Tucker, Pendleton, and Grant Counties. I

know the Forest Service recognizes that the small mountain lakes draw people from quite a distance and that these people spend money in the local communities. They do a lot to meet the recreation needs of people and they contribute substantially in these economically distressed areas. What is your estimate of the cost of these impoundments?

WEST BRANCH OF THE GREENBRIER RIVER

I am sure that you would have to submit this information for the record. I would appreciate your submitting an estimate on the cost of the site of the West Branch of the Greenbrier River which could provide fishing and related recreation with a lake having a surface area of 15 acres.

That is No. 1.

DESERT BRANCH, NORTH FORK OF THE CHERRY RIVER

No. 2 would be the cost of a site on Desert Branch, North Fork of the Cherry River, which could be impounded to create a surface area of approximately 10 acres.

This body of water would provide fishing and camping and add to the attractiveness of the surrounding area for recreation and use.

BIG LAUREL CREEK, GAULEY RIVER BRANCH

No. 3 is in Webster County. What would be the cost of a site on Big Laurel Creek, Gauley River Branch, which could be developed to provide approximately 5 acres of fishing water?

SLAB CAMP RUN, GREENBRIER RIVER DRAINAGE

No. 4 would be in Greenbrier County, a site on Slab Camp Run in the Greenbrier River drainage to be developed to provide about 15 surface acres. This site would provide fishing and attract tourists for other forms of outdoor recreation.

BRANCH OF BLACKWATER RIVER

No. 5 would be in Tucker County, a site on the branch of Blackwater River to be developed to provide 20 surface acres of fishing, boating, camping, and related outdoor recreation.

PENDLETON COUNTY

Finally, No. 6, would be in Pendleton County. While there are impoundment opportunities on the headwaters of the streams in Pendleton County, most of them are better suited to large structures costing in excess of $60,000 and I urge strongly that planning be initiated for construction of one of these during the next fiscal year.

I have six requests there and if it is not asking too much, would you please supply the answers for the record?

Mr. GREELEY. Yes, sir. We will do that.

Could I get a copy of that from you?

Senator BYRD. Yes, I will supply you with a copy.

(The information referred to follows:)

HIGHLIGHT STATEMENT

Based on past experience we would judge that impoundments of the size contemplated in West Virginia would cost at least $50,000 each. This estimate does not include recreation facilities, roads, and similar items which would be needed to make them suitable for fishing and recreation use.

A field survey is necessary to determine the cost of impounding water at a specific site. The main elements of cost and the ones which must be based on field survey are:

1. The size and design of the dam that can be installed.
2. The underlying geology of the selected damsite.
3. Locating a suitable source of material for the dam.
4. Evaluating the hydrologic capabilities of the tributary watershed lands.

We lack specific information on the six sites about which you ask. For purposes of this discussion, we would estimate that on the average these projects would entail investments of $50,000 to $75,000 for the dam and reservoir, plus probably $50,000 to $60,000 for swimming facilities and recreation improvements. In addition, there would be the cost of whatever length of road would be needed to provide suitable access to the site.

NORMAL COST OF IMPOUNDMENT

Senator BYRD. What would be the normal cost of an impoundment of the size we are talking about, 10 to 25 surface acres?

Mr. GREELEY. A 10- to 25-surface-acre facility would cost from $75,000 to $100,000 and it could run over that if there was very much road construction involved.

Senator BYRD. But you would be including the cost of the road system and construction of minimum facilities?

Mr. GREELEY. The $75,000 to $100,000 would be including minimum facilities, but not necessarily the road.

Senator BYRD. But the cost of the impoundment, itself, would be how much, $50,000 or $40,000?

Mr. GREELEY. $50,000. It could be that.

Mr. CLIFF. That is difficult to say in a general way, because the cost of building dams varies a great deal with the nature of the damsites, the amount of excavation, the foundation system.

Mr. GREELEY. And the amount of reservoir clearing.

Mr. CLIFF. It varies a great deal, Senator, as you can appreciate. Some reservoirs can be built cheaply and others more expensively in comparison of acreages of the lakes to be formed.

ACCOMMODATIONS AT EACH SITE

Senator BYRD. Again, depending on the situation, would you say that an area of this size could accommodate 200 to 500 people at one time, for a total of 30,000 or 40,000 man-days of use per year?

Mr. GREELEY. The larger acreages you referred to of 25 to 30 acres water, a facility that size could undoubtedly accommodate in the neighborhood of what you are talking about and, again, the number of people that would be accommodated in the course of a tourist season would be pretty much a function of how good the roads were.

Senator BYRD. It seems to me that projects of this kind are in the nature of an investment in the resource values of the national forest but more particularly in building up the economic base of the general areas.

As an illustration, if you have a place where about 40,000 people are using it per year and if half of this were used by people coming into the area and if these persons spent only $2 a day for supplies and

services, this could make quite a difference to the local business community. It would help create jobs.

Estimated Recreation Improvement Construction Costs

Chief Cliff, do you suppose we could find a way to provide the investment figures you apparently need to get started on the construction of recreation improvements on national forests particularly in areas such as West Virginia where we have such a shortage of natural lakes?

Mr. Cliff. I am sure we could take the list that has already been provided to you at your request and make some estimates as to what would be required to develop such a program. The matter of financing it would have to fit in with our needs for other activities and for other recreational activities. As Mr. Greeley has pointed out, we have been pressed so hard in trying to accommodate the people that are already coming in, we have not been in a position to move forward in this particular activity.

Senator Byrd. Well, if you have any additional thoughts on this last item, as to the feasibility and advisability of moving forward in these areas, I would like to have your suggestions as to how I might be helpful, if such thoughts occur to you, Chief Cliff.

Mr. Cliff. Thank you.

Research on Restoration of Strip-Mined Areas

Senator Byrd. You say you are moving ahead with the strip-mining program satisfactorily, Dr. Harper?

Dr. Harper. Yes. This work as you know, is headquartered at Berea, Ky. However, the problems extend through a good bit of the Appalachian Range. It involves West Virginia, Kentucky, Tennessee, and quite a number of the States. I think we are making pretty good progress on it. Of course, the program is still young, just getting started in its expanded state, but I have high hopes for it.

Senator Byrd. How much did Congress appropriate last year for this program?

Dr. Harper. $150,000 increase for strip-mining research.

Senator Byrd. Is there anything in the budget this year for this item?

Dr. Harper. We carry the same amount in the 1965 budget that we had in 1964.

Senator Byrd. Which is $150,000?

Dr. Harper. That is not the total program. I do not have that figure with me, but I could obtain it for the record. It is $175,000.

Senator Byrd. That was the increase last year?

Dr. Harper. Yes. The increase was $150,000.

Mr. Cliff. We have had some of this work going on for a number of years, Senator, up in the Central States, in Ohio, and Indiana and they have developed methods for restoration of lands under those conditions.

This work in the Appalachians would be an extension of the strip-mining rehabilitation work we have had underway.

Senator Byrd. I almost forgot. One important item.

MORGANTOWN LABORATORY

Dr. Harper, last year I was able to get $31,500 included for the plans and specifications concerning the research laboratory at Morgantown. What is the status of this? You mentioned it a little earlier in testimony today. Are you ready to move forward with construction?

Dr. HARPER. We would be ready by the spring of 1965. I am sure with the negotiations being carried on now by the General Services Administration the award will soon be made for the contract on design, and the design and specifications will be completed on a schedule set for December 1964.

Senator BYRD. I assume you have no money in the budget for construction?

Dr. HARPER. We do not have.

Senator BYRD. Could money be utilized if an appropriation were forthcoming?

1965 BUDGET FOR RESEARCH CONSTRUCTION

Dr. HARPER. I think we are in the same position here that we are in some of the other projects for which we had planning funds in fiscal year 1964. It would be feasible to award contracts for construction in fiscal year 1965. However, as you know, we do not have funds for research construction in the 1965 budget except for the addition to the Forest Products Laboratory at Madison which we deem a very high-priority project.

Senator BYRD. What would be the estimate of the cost of construction?

Dr. HARPER. It would be—you see, this is a $450,000 laboratory. The planning cost is $31,500. I would say, $418,500 for construction. We are designing a $450,000 laboratory and usually the total cost includes the planning as well as the construction.

Senator BYRD. Was a request submitted to the Bureau of the Budget for the construction moneys?

Dr. HARPER. Yes, in our original estimate we did include this construction item in our request.

LABORATORY PERSONNEL

Senator BYRD. How many persons would be employed at this laboratory upon its completion?

Dr. HARPER. I do not recall the exact figure. We have done some studies on that. I wonder if I may supply that for the record?

(The information referred to follows:)

The Forestry Sciences Laboratory planned for Morgantown, W. Va., will have a capacity of 16 scientists and 16 technicians, clerks, and other supporting personnel.

LABORATORY CONSTRUCTION

Senator BYRD. Yes, please do. Do you feel that if you had the money you could construct this Laboratory and begin the operation of your research program in fiscal year 1965?

Dr. HARPER. I doubt if we could complete the Laboratory in fiscal year 1965. We could get the construction started; it would probably

be the fall of the following year before the Laboratory would be completed.

In other words, there would be about a half a year available for its occupancy.

Senator BYRD. Does this mean you could move forward with the construction of the Laboratory if you had, say, $200,000 appropriation or would you have to have all the money in hand before you let a contract?

Dr. HARPER. I would think, yes. I do not believe it would be possible to award the contract, unless we were absolutely sure the rest of the money would be forthcoming.

Senator BYRD. So you would have to have $418,500 appropriation in this fiscal year?

Dr. HARPER. That is correct.

Senator BYRD. And I think it goes without saying that your answer would be that this would be a very desirable piece of money to have so that you could get started on construction?

Dr. HARPER. Yes. It is like a lot of other things, Senator Byrd, we would like to get going as quickly as we can but they all depend upon priorities and the financial situation as you understand, I am sure.

Senator BYRD. There are no roadblocks other than the need for the appropriation?

Dr. HARPER. That is correct.

LABORATORY SITE

Senator BYRD. Do you have the site?

Dr. HARPER. We have the site. It is a site that is being made available by long-term lease by the university. One reason we got delayed a bit in the awarding of the contract for the design and specification was that the original site that the university offered did not prove to be desirable after we made a site survey and so we had to select another one. However, a site survey of this new location has been made by our engineers and it proves to be an excellent one. It is near if not on the campus. It is a new area I believe that is being added to the campus.

Senator BYRD. "A man's reach should exceed his grasp, else what's a Heaven for?" I will try to reach and get the money for you so we can get that construction started, Dr. Harper.

COOPERATION ON BETTER UTILIZATION OF FORESTRY RESOURCES

We are very desirous of getting this and we appreciate, Dr. Harper, in West Virginia, the fine cooperation, the great interest, the good work, and the encouragement and vision that you and Dr. Marquis and Mr. Pyles and Chief McArdle and Chief Cliff and the others are bringing to bear upon our economic needs and our problems through the better utilization of our forestry resources. Such utilization resulting from these additional laboratories, and programs, that you folks have engendered and promoted. I personally am very grateful to you and to the others in the Forest Service for your excellent help and keen interest.

Dr. HARPER. Thank you, sir.

Senator BYRD. I apologize, again, for keeping you so long, Chief Cliff.

Mr. CLIFF. That is perfectly all right. We will be willing to stay here as long as you have questions for us to answer.

Senator BYRD. Chairman Hayden has received a number of statements and letters which he has asked me to place in the record at the end of today's hearing. This material will be printed at this point.

(The material referred to follows:)

STATEMENT BY SENATOR CLINTON P. ANDERSON REQUESTING CONSTRUCTION FUNDS FOR A FOREST SCIENCES LABORATORY AT ALBUQUERQUE, N. MEX.

Mr. Chairman, last year I appeared before your committee supporting a request for funds with which to construct on the campus of the University of New Mexico a forestry sciences office-laboratory. The estimated total cost was $632,000. This would have provided a much-needed office-laboratory, greenhouses, headhouses, and necessary workshop facilities. Your committee approved sufficient funds for planning and architect fees with the hope that this would be done in fiscal year 1964 and that we could proceed with construction in fiscal year 1965. These funds were cut out in conference between the House and the Senate.

Mr. Chairman, I am appearing again today to renew my request because this laboratory and related facilities are of great importance to the U.S. Forest Service in their western watershed and range management programs. Delay in carrying out the necessary research and experimentation only retards advancement in solving the many complicated range and forestry problems. The new laboratory should greatly accelerate the solving of these difficulties.

To review briefly, I want to remind the committee that I have worked closely with the U.S. Forest Service for many years on the pressing western watershed and range management problems. In 1952 I testified in behalf of the funds approved for establishment of the forest research unit in New Mexico. They have been doing a fine job but they are hampered by the lack of facilities and because their personnel is scattered over the city of Albuquerque. Part of the staff has been located at the University of New Mexico but because of the ever-increasing need for space it has become imperative that the university claim the space now being occupied by the Forest Science Office-Laboratory. I understand that the Forest Service has already moved some of its research equipment to free some of the space needed by the university.

The work of this experiment and research station in developing and making available information regarding the best use and management of our watersheds, range, timber, wildlife, and recreation resources is urgent. Destructive insects and diseases are causing heavy losses in valuable stands of ponderosa pine, Douglas-fir, and white fir which make up an important part of the natural base resource of the region. It has been estimated that the loss in this area alone for the past 10 years has amounted to $10 million.

Some of the research at Albuquerque is associated with management of rangelands and improvement of techniques for maintaining high yields of forage from seeded acreage. Protection of watershed values and development of means for controlling erosion are important related areas of study. The present field research needs to be supplemented with Laboratory investigations which supply the fundamental basis for improved practices.

Most of the Forest Service programs are running behind schedule now and the solving of many problems related to their work is impaired by the present temporary housing of the Laboratory and related facilities. The University of New Mexico has offered to donate sufficient land on the university campus on which to build the Laboratory. Funds sufficient for planning and construction would amount to approximately $632,000. Preliminary planning for the structure would require about $50,000 of this amount. I strongly urge that sufficient moneys be appropriated for beginning this project during this 1965 fiscal year so that it can be completed by 1966. Thank you very much for your consideration.

STATEMENT BY SENATOR GAYLORD NELSON URGING APPROVAL OF FUNDS FOR EXPANSION OF THE FOREST PRODUCTS LABORATORY

Mr. Chairman and members of the subcommittee, last year, the Senate approved the appropriation of $3,800,000 to expand the U.S. Forest Products Laboratory at Madison, Wis. However, this appropriation was removed at the request of House members of the Senate-House conference committee.

This year, the appropriation has been included in the budget request, and it is my earnest hope that it will now have the enthusiastic support of the House as well as the Senate. I have already appeared before a House Appropriations subcommittee in support of this request, and Congressman Kirwan has made the statement that the appropriation is in a different category this year because it is included in the budget request whereas last year it was not.

There are several reasons why the appropriation is all the more urgent, and all the more justified, this year than last. First, this appropriation will be of real help to all our forest products industries. It just so happens that this kind of help would be of real value in the administration's war on poverty and on regional recessions. The President has cited the Appalachia area and the northern Great Lakes region as areas requiring special help in facing serious economic problems. These, along with some sections of the South, are the very areas which would experience the long-range benefits from expanded research into the use of forest products.

Second, the Forest Products Laboratory is one of those unique institutions which more than pays its own way. We have established the Laboratory; our forest products industries are dependent on it; and we are committed to its expansion. Therefore the way to get the maximum benefit out of this investment, the way to use it to earn the greatest possible dividends, is to complete as soon as possible this long-planned and long-overdue expansion, which is absolutely necessary if this unique institution is to make its maximum contribution to our economy.

DESCRIPTION OF THE LABORATORY

The National Forest Products Laboratory, a research arm of the U.S. Forest Service, was established in Madison in 1932, on 10 acres of land adjacent to the University of Wisconsin, the first institution of its kind. The work of this central Laboratory is coordinated throughout the United States by Forest Service experiment stations in 11 areas.

The staff now works in space designed for half as many persons. Facilities are obsolete, makeshift, and badly crowded. The nature of research has changed greatly since 1932. The nature of the timber industry has changed just as dramatically.

This is one of those relatively rare public programs which has the enthusiastic support of the business community because it pays for itself many times over. The forest products industries are clamoring for expansion of this Laboratory to provide research facilities which are so vital to their industry.

This Laboratory developed waterproof plywood, laminated roof beams, prefabricated housing, moldable paper plastic for countertops, sandwich partitions, cold soda pulping, wood-preservative techniques, stablization of wood to prevent swelling, prestressed wooden beams, plywood nose fairings for Polaris missiles, and new uses for all manner of forest products. The Laboratory is working on new techniques for the paper industry, how to make paint last better on houses, and how to build cheaper and longer lasting homes.

It is seeking to find better use for small, second-growth trees which form the bulk of our future forests; how to make profitable use of the many types of trees that now are used little if at all; how to use the waste products in timber production; and how to control and modify wood products to get the greatest possible service and economy from them.

This work is invaluable. The wood industry is in a serious decline. In many areas, timber-based activity is the greatest employer of labor. Many of the troubles of the vast depressed area which includes northern Michigan, Wisconsin, and Minnesota (which the late President Kennedy rallied into action at a Land and People Conference at Duluth on September 24, 1963), are traceable to troubles in timber-based industries.

The industry has structural troubles. There are some 40,000 lumbering establishments, 6,000 wholesale distributors, and 35,000 retail lumberyards. These widely dispersed fragments of the industry operate at a low level of technology and they themselves cannot conduct the research program which is necessary to understand their raw materials adequately and develop and improve new products.

Only continuing and intensive research can keep wood competitive in the modern industrial world.

THE EXPANSION PROPOSAL

The proposed expansion of the Laboratory will provide space for pulp and paper and wood chemistry research, making more of the existing, 30-year-old space available for activities connected with engineering, solid wood products, and wood quality.

The University of Wisconsin has made 12 additional acres of land available for the expansion.

In fiscal 1963, $200,000 was appropriated for architectural and engineering plans. These plans are ready to be submitted to bids next May.

The Senate Appropriations Committee inserted the necessary $3,800,000 in the fiscal 1964 budget but this was removed in a conference committee report which drastically reduced additions made by the Senate.

The Congress is committed to the expansion of this world-famed research Laboratory. It is going to be built sooner or later. Inasmuch as the expenditure of this relatively modest amount of money will actually earn far more money and strengthen our economy, especially in some of its most depressed areas, it makes no sense at all to continue to delay.

HOPE FOR DEPRESSED AREAS

Forest products utilization research has potential for developing new industrie based on wood. Such industries could do much to provide jobs and provide a better economic base for rural America. The present timber-based industry is said to now provide jobs for 1 out of every 20 people employed in the United States. Even a small percentage increase in this industry could do much to relieve our unemployment problems.

Economically depressed areas, such as the upper Lake States and the Appalachia, have an abundance of hardwood forests. These forests now are not being utilized or developed to their full potential. The reason for this is that present wood-using plants cannot profitably use the lower value trees which constitute over 75 percent of these timber stands. It is conceivable that high-tonnage industries, based on these presently considered low-quality trees, could not only provide jobs but also permit the proper management of these forests to provide trees of higher value. Profitable use is essential to good forest management.

The Forest Products Laboratory has done an outstanding job in the past to expand the raw material base for forest industries, to improve present practices and to develop new processes. High-yield pulping processes for hardwoods, improved seasoning methods, technical bases for design of wood-based structures, and preservative and fire-retardant treatments for wood are a few of these accomplishments. In addition a considerable knowledge has been developed of the basic anatomical structure of wood and its chemical and physical properties.

The easier things have been done and further substantial progress requires a deeper understanding of the fundamental properties of wood and its reaction to physical, chemical, and biological agents. It is highly important therefore that new facilities and modern equipment be provided to speed up and make possible the development of new products and processes.

The utilization of hardwoods for fiber and chemical products could be greatly advanced by the proposed facilities. Some completely new approaches will be developed. One objective is to develop pulping processes that do not constitute a water or air pollution hazard and which use all of the wood substance. Another objective is to develop the bases for establishing a major wood-chemical industry to complement the present petro-chemical industry.

The Government's interest in an adequate program of forest products utilization research might be listed as follows:

1. The practice of good forest management is highly dependent on use of the lower valued parts of timber stands and this valuable resource will continue to be depleted unless an adequate utilization industry is available.

2. New timber industries can do much to relieve unemployment and add to the tax base.

3. Direct income from Federal forests, now estimated to be $150 million per year, can be substantially increased.

4. Assistance to developing countries who generally have an abundance of wood and who can utilize wood for their shelter, food, and fiber needs.

The construction of this facility is in line with the long-range plans of the Department of Agriculture for forestry research. This program contemplates

a major laboratory at Madison, Wis., together with smaller research groups in the various regions. Ordinarily, these smaller groups will be housed with other forestry research projects. These groups will carry findings of the Forest Products Laboratory to their respective regions and extend them in the solution of specific problems of the region.

SOUTHERN PINE PLYWOOD—A NEW INDUSTRY

Several studies at the Forest Products Laboratory, made in recent years, have provided the technical background needed for the development of a new industry to make southern pine plywood. These developments are particularly timely because recent forest survey data have shown an increasing volume of sawtimber-size logs, coming at a time when current lumber markets could not absorb more of the lumber product. Plywood manufacture also provides the opportunity to establish markets that have so far been unattainable to southern manufacturers.

Manufacturers hoping to go into southern pine plywood production have recently been conducting their own pilot-plant evaluations, relying heavily on laboratory research and guidance with respect to log selection, log heating, veneer cutting, drying, and gluing. As a result, amazingly successful results have been reported for those pilot studies already completed, and in every case those manufacturers that have sought out FPL cooperation have concluded that the process looks promising both from the technical and economic standpoint.

LETTER FROM UNDER SECRETARY OF COMMERCE REGARDING IMPORTANCE OF FOREST PRODUCTS LABORATORY

THE UNDER SECRETARY OF COMMERCE,
Washington, D.C., February 20, 1964.

Hon. GAYLORD NELSON,
U.S. Senate, Washington, D.C.

DEAR MR. NELSON. You have requested a statement from the President's Appalachian Regional Commission concerning its position on proposed construction expenditures for expansion of the Forest Products Laboratory in Madison, Wis. These expenditures will enable the Laboratory to do basic wood chemistry and wood fiber research, and offer the possibility of greatly increased uses for low-grade hardwoods.

Over three-fifths of the land of Appalachia is forest, and 80 of the species in this forest are hardwoods. A substantial part of this is low grade. The Commission, after consultation with State, Federal, and private groups interested in forestry is recommending an action program which we think will help make Appalachian hardwoods a much more important source of employment and income to the region than they are today.

When conferring with industry and examining the timber situation on our own, we became aware of the great need for forest product research, partly because of the inroads of competitive substitutes for hardwoods and partly because of the fact that development of uses for the standing timber could constitute a tremendous contribution to the revitalization of the region.

Our budget contains sums set aside for research through the Forest Service laboratories at Madison, Wis., Princeton, W. Va., and through outside contractors. Both you and the Forest Service indicate a major breakthrough could come in the utilization of low-grade hardwoods, from the research at Madison, if the needed facilities are constructed. The Commission wholeheartedly sponsors this expenditure, for we recognize what a tremendous multiplier of jobs and income timber can be.

Sincerely yours,

FRANKLIN D. ROOSEVELT, Jr.

STATEMENT BY SENATOR WALLACE F. BENNETT URGING INCREASED APPROPRIATIONS FOR THE FOREST SERVICE

WATERSHED MANAGEMENT RESEARCH

Mr. Chairman, it is a privilege to testify before this distinguished subcommittee. Today I would like to direct the subcommittee's attention to the current need for strengthening the watershed research program of the Forest Service at Logan, Utah, and to urge the appropriation of additional funds for this purpose.

Water from the forested high mountain areas and intermingled rangelands of Utah and adjacent States is a vital resource of great importance to the economy and well-being of residents throughout the region. It is impossible to overstate the importance of these national forest watersheds. They are the principle source of water for irrigation, domestic, and industrial use in the Great Basin. These same lands provide summer forage for the livestock industry, a significant segment of the region's economy. Also, in the past several years recreation has become an increasingly important activity on these mountain lands.

In the face of increasing demands for the products from our mountain watersheds, the actual productivity, under present practices, falls short of the potential. Water supplies are frequently critical, and effective methods of increasing yields of good quality water would be of great value. These high mountain areas also contain much depleted rangeland which is a source of destructive runoff and sedimentation. Because of the rapid runoff when high-intensity rainstorms strike these high mountains, it is very difficult to establish vegetation by usual means. The clamor for increased water yields, the necessity of reducing grazing permits, expensive treatments to stabilize watersheds, and the deteriorated conditions of many recreation areas are indicative of present watershed problems.

These problems strike at the root of the livestock industry and recreational activity by reducing the value and utility of their resources. They affect adversely our water supply, which is the limiting factor in economic development in our State. Further impairment of amount and quality of water yields would threaten the existence of some of our communities.

Continuing demands for products from our watersheds require that they be given the best intensive management possible, based on more scientific knowledge than is now available. The Forest Service now conducts a limited program of research on watershed management problems in cooperation with the Utah State University at Logan, Utah. However, the present program is far from adequate. Additional effort is urgently needed to develop watershed management techniques for improving water yields and timing of yield, and to determine ways of reducing destructive storm runoff, erosion, and sedimentation from deteriorated rangelands through restoration of plant cover and supplementary structural measures. Scientists and technicians are needed to intensify vitally needed research on these problems.

In the fiscal year 1965 budget, approximately $252,000 is provided for all of the Forest Service research underway at Logan, essentially the same as last year. This amount finances small programs of insect and disease research and recreation studies as well as the important forest and range watershed program.

The subcommittee will recall that 2 years ago it wisely approved funds for the first phase of a new Forestry Sciences Laboratory at Logan, Utah. The Laboratory, which was recently completed, appropriately is designed to carry out research on mountain watersheds and will benefit the large intermountain area of Utah, Idaho, Montana, Nevada, and western Wyoming.

However, no additional funds are included in the fiscal year 1965 budget to carry out the expanded research program which is now possible—and required—with the construction of this new facility. An increase of $250,000 is needed now as a minimum for strengthening this research sufficiently to make reasonable progress commensurate with the importance of good management of the forage and water-producing lands in Utah. This work will be done in cooperation with the Utah State University from the new Forestry Sciences Laboratory of the Forest Service located on the university campus.

This facility and the research program planned for it will do much to solve the problems of watershed management. Because of the urgent need for early solutions and improved management practices, I respectfully urge the appropriation of an additional $250,000 to accelerate the modest research program now underway.

An intensified research program on watershed problems in Utah will benefit the entire region.

LAND ACQUISITIONS FOR WATERSHED PROTECTION

In addition I would like to call the committee's attention to an item included in the fiscal year 1965 budget for the purchase of certain lands for watershed treatment purposes.

In the last Congress I had the privilege to sponsor a bill, which became Public Law 87-661, allowing the addition of some 24,000 acres of land to the Wasatch National Forest so erosion control measures might be carried out to protect the existing national forest area and permit a more complete program of watershed protection. The bill named an estimated cost of $400,000 for the purchase of 18,114 acres which were in private ownership. Last year the committee wisely approved $250,000 so the Forest Service could negotiate with the owner of one large tract of 14,000 acres.

This year the budget includes $150,000 to complete this purchase of the privately owned lands.

These are important watershed lands and must be protected. I respectfully urge the committee's approval of the budgeted funds to complete their acquisition.

NEWSPAPER STORY SUBMITTED BY SENATOR THOMAS H. KUCHEL REGARDING FOREST FIRE PROBLEM IN SOUTHERN CALIFORNIA

[From the Los Angeles Times, Jan. 27, 1964]

SOUTHLAND FIRE PROBLEM CALLED MOST DIFFICULT—MOTHER NATURE, TOO MANY PEOPLE, COMBINE TO MAKE REGION TINDERBOX, PARLEY SAYS

(By Jerry Gillam, Times staff writer)

SACRAMENTO.—No other place in the world has a fire control problem as complex and as difficult to solve as the one which exists in the southern California metropolitan area.

Mother Nature and too many people have combined to make the 10-county region a gigantic tinderbox just waiting for a spark. These are the conclusions of the Southern California Regional Association of County Supervisors, now working on a long-range program to develop a master plan for fire safety and wildland usage.

SAFETY STANDARDS

The association has adopted a series of fire safety standards and member counties have done likewise.

These standards deal with safe access routes, identification of roads and buildings, clearance of brush from around structures, building spacing, community firebreaks, adequate water facilities, construction requirements, refuse disposal, and land division approval.

The State division of forestry, under the direction of Francis H. Raymond, is offering its encouragement and guidance in implementing the plan. The magnitude of the southern California fire control problem is summed up by the association as follows: "The mild climate, rugged mountain profiles, and picturesque chaparral cover, which make the area a most desirable place to live, combine to create one of the most difficult fire suppression efforts.

"People added in great numbers during the past 20 years have multiplied this difficulty."

LITTLE RAIN

It notes the local climate consists of mild winters, hot, dry summers, and little or no rain between April and October.

During the fall and winter months, so-called Santa Ana winds up to 70 miles per hour are experienced. These winds, the association points out, lower moistures and relative humidity to minimal levels.

The drying effects thus create a fire weather condition comparable to that of the summer months.

The population of southern California has nearly tripled since 1904 increasing from 3.6 to 9 million, and will hit an estimated 13 million by 1970.

As a result of this population boom, the association emphasizes there has been an increasing intrusion of urban development into watershed, forest, and wildland areas.

It says, "There have been located within high fire hazard areas numerous individual homes and cabins, subdivisions, resorts and recreation areas, organizational camps, businesses and industries."

The magnitude of the southern California fire control problem is summed up by the association as follows:

"The increasing demand for recreation places great numbers of pleasure-seeking people on the highways and in recreational areas on holidays, weekends, and vacations."

DENSE GROWTH

Chaparral, or dense growth of many species of shrubs, covers 70 percent of the mountains and foothills.

The association says, "Although esthetically pleasing as a recreational environment and as surroundings for a homesite and valuable as a watershed cover and game habitat, it is highly flammable.

"In its dormant state, chaparral can survive long periods of drought and becomes almost explosive in its flammability." The division of forestry recognizes the seriousness of the fire control problem and is offering its help.

A recent report by DeWitt Nelson, director of the department of conservation, stated, "Population explosions in areas of the State have led to multimillion-dollar developments in wild-land areas with little or no fire protection.

"In some of the areas, State government has no financial responsibility. In others, existing law places financial responsibility at the State level for forest and watershed protection with local authorities responsible for protection of lives and capital improvements.

"County boards of supervisors, and other responsible local officials are requesting and receiving assistance in rural fire protection planning to cope with these situations from fire protection experts in the department's division of forestry."

The January meeting of the State forestry board featured a presentation of a cooperative planning program at the Federal-State-county levels designed to protect resources, lives, and property in southern California mountain areas.

Much of the success of this type of planning, however, is dependent on how much attention is paid to it. In other words, the individual not only must be made aware of the fire hazards in his own environment but he also must take steps to remove them for his own protection.

All of the planning in the world, the experts agree, can't do this for him.

LETTER FROM WESTERN FORESTRY AND CONSERVATION ASSOCIATION URGING APPROVAL OF THE FOREST SERVICE BUDGET

FEBRUARY 24, 1964.

Hon. CARL HAYDEN,
Chairman, Senate Appropriations Subcommittee on Interior and Related Agencies, Senate Office Building, Washington, D.C.

DEAR SENATOR HAYDEN: Western Forestry and Conservation Association commends the administration for the foresight shown by the presentation of a budget which has been judiciously examined for economy yet has seen fit to include provisions for modest but very important strengthening of research in forestry throughout the Nation. We respectfully request that the following remarks in justification of these forest research items be included in the record of the subcommittee's hearings on the proposed Forest Service budget for fiscal year 1965.

The forests of this country are important for their multiple uses. Just the value of the timber cut each year is now over $1 billion and all timber-based economic activities contribute about $25 billion annually, nearly 6 percent, to the entire gross national product. One-fifth of this originates in 11 Western States and one-sixth comes from the 3 Pacific Coast States.

Forests are dominant aspects of these Western States. For example, commercial forest land covers over 40 percent of Oregon and Washington. These forests produce over 25 percent of the Nation's lumber, 15 percent of its woodpulp and over 80 percent of its softwood plywood. A high percentage of all western forest land is federally owned.

The protection and maintenance of this tremendous wealth-producing asset is of vital concern to the West and to the Nation. It in turn depends upon knowledge developed from a continuing strong program of forestry research.

Diseases are a very important factor impairing forest productivity. Yet forest disease problems have been given only a minute fraction of the effort needed to develop efficient controls. These problems are complex and their solutions are necessarily laborious. But the alternative to an adequate level of disease research is to suffer increasing losses to our forest resource.

Effective control measures have been devised for some of our most troublesome diseases. In several other instances, research has found ways of reducing the economic impact of disease—for example, by appropriate changes in cutting practices—even where actual control is not yet possible. But progress is far too slow to meet current needs, let alone demands for information that must be expected in the near future as forest management becomes more intensive. We cannot afford to wait for information to be accumulated at the present rate. Neither can we afford to base management decisions on guesswork, since mistakes that we make today may be felt for a century or more. Until disease problems can be given attention proportionate to their importance, forest management will be badly handicapped by lack of essential knowledge.

Insects are another forest pest that cause us to lose part of the basic source of economic activity. Within the past 20 years, synthetic organic insecticides have made it possible to protect extensive forests against some of their most damaging insect enemies. Their use gave promise of being able to halt for a while the destruction by insects that exacts an annual toll from the Nation's forests in excess of the total log production from all the forests of Oregon, the leading timber-producing State of the Union. Then it was found that the use of some of these insecticides posed certain hazards. Their use had to be reexamined and still greater care taken in some instances. The need for alternative means of control became urgent and efforts were accelerated to develop them.

Chemicals still are the only available means for controlling outbreaks of many forest insects. Foresters are doing an outstanding job of forest protection with chemical insecticides. We of Western Forestry & Conservation Association are sure that this essential job must continue so that our forests will be able to meet the increasing demands upon them. We are likewise sure that this job must be done without impairing health and other resources. We are pleased that the Forest Service has recently undertaken a project in California to screen the products of the chemical industry and make them available to foresters in safe and effective form, to find better ways of using the chemicals already available, and to help develop new and better chemicals. This project, the only one of its kind in American forestry, fills a long-standing need. We hope that it will be adequately staffed, equipped, and financed to carry out its important assignment.

Western Forestry & Conservation Association is convinced that chemicals will long continue to serve an important role in forest protection. We are likewise convinced that control by natural means is the goal toward which foresters must continue to work, and work increasingly, to attain. The natural means to which we refer are manipulation of forests to make them more vigorous and more resistant to insects, encouragement of beneficial insects that feed upon harmful ones, and use of organisms that cause diseases in insects.

We are encouraged by the progress being made to develop and use these means and by the emphasis being placed upon this kind of research by the Forest Service throughout the country. Specifically, the development of such outstanding facilities as the Forestry Sciences Laboratory on the campus of Oregon State University in Corvallis is most encouraging. This research needs to be speeded up to effect long-lasting control and to minimize the use of chemicals in situations where their use is potentially hazardous.

Another problem of very real concern to forest industries of the West and conservationists is the increasing forest damage that animals and wildlife are causing each year. These losses take many forms. Rodents such as mice, shrews, chipmunks, and ground squirrels consume vast quantities of tree seed that are vitally necessary to start a new forest crop. Even after seedlings are started, all too frequently they are killed or maimed by clipping of rodents, rabbits, or mountain beaver, and, as they get larger, by browsing and rebrowsing of deer and elk. Even trees of pole size or larger are killed or crippled by the nibbling, gnawing, or clawing of animals such as porcupine and black bear.

Estimated damages to the forests from such animal activity total $15 million yearly in Oregon and Washington alone. This includes the direct losses of wasted investments in planting and seeding operations as well as the indirect losses represented by thousands of forest acres made less productive. Inevitably, the results are reduced timber growth, a longer period of years for maturing a timber crop, reduced timber yields regionally and nationally, and a substantial increase in costs of growing timber. This means less timber available for cutting this year and next and fewer jobs in the timber-harvesting and wood-using industries.

For these compelling reasons, our association has for several years consistently endeavored to bring about better recognition of the importance of the animal damage problem. We have strongly supported research aimed toward the de-

velopment of workable methods of control. We are, therefore, deeply gratified that a modest increase for the animal damage research project at Olympia, Wash., was included in the President's budget for the U.S. Forest Service. Scientists at the Olympia Laboratory, though too few in number, are working on forest wildlife problems of concern throughout the West. Progress in this research program will directly benefit timber-growing efforts in all the Western States.

Basic information relative to the acreage, volume, growth, use, and loss of the forest resources is necessary for the orderly planning of the best use and management of these resources. Many major problems have plagued the forest economy during the past few years. Solutions to these problems are often dependent upon an understanding of forest resource conditions. Knowledge of these conditions, public and private, has been inadequate or outdated.

For example, the comprehensive report "Timber Resources for America's Future" is over 10 years old. The new timber appraisal in the making at this time will have to be made up for some States and counties from inventories that are well over 10 years old. Estimates of growth, cut, and mortality especially need strengthening. These are becoming more and more directly responsible for the allowable cut levels as the excess of virgin sawtimber stands is reduced and replaced with young stands. The responsibilities of the nationwide Forest Survey are such that an expanded program is much needed to provide better, more current information on both public and private lands. The Western Forestry and Conservation Association commends the Administration for recently removing the budget ceiling on this project and heartily endorses the proposed increase.

The association is pleased with the foresight shown in proposing each of these modest but badly-needed budget increases for research in forestry. We urge that this research be further strengthened whenever budgetary circumstances will permit the necessary increases. We in the West are fully aware of the increasing demands that our growing Nation will place upon our forest resources. Research must play the key role in providing the basis for intensive management of both public and private forest lands.

Sincerely,

(S) Hardy Glascock
H. R. Glascock, Jr.
Forest Counsel.

Statement by Assistant Commissioner, Kentucky Department of Conservation, Urging Increased Appropriations for Timber Management Research

Senator Hayden, members of the Senate Subcommittee on Appropriations for the Department of Interior and Related Agencies, I am Robert Montgomery, assistant commissioner of the Kentucky Department of Conservation.

I would like to recommend a $175,000 additional appropriation this year for the Forest Service to strengthen their research in Kentucky on the management of our timber resources. In 1954 the Congress made a small appropriation for this work which is headquartered at Berea, Ky. The funds made available then, $50,000, have remained the same and are adequate for only a very small program of research in timber management methods. The problems involved are numerous, complex, and immense—far beyond the capacity of the small group of scientists the Forest Service is able to support at Berea.

Kentucky has a large and important forest resource. Some 11,500,000 acres, or 45 percent of our State, is in forests. Eastern Kentucky is truly a land of forests. Here we have 6 million acres in timber land; this is 75 percent of the entire area. Quite probably eastern Kentucky will, because of the mountainous terrain, continue to be the most heavily forested section of our State.

Here, too, we have the most economically depressed part of the State. There is presently an oversupply of labor and the prospects are that this situation will become more acute in the future. Eastern Kentucky is a significant and typical part of Appalachia, designated by President Johnson as our Nation's most distressed region.

In his recent agriculture message to the Congress, President Johnson stated that: "Almost one-half of our Nation's poor live in rural areas." He further stated that: "Economically distressed areas often exist where there are heavy concentrations of forest land." And he went on to say: "I am directing the Department of Agriculture to—accelerate forest research to find—better timber management techniques—." Our situation in eastern Kentucky certainly is typical of the conditions President Johnson recognizes. Furthermore, the in-

crease in research appropriations that I am recommending is exactly the same as one of those contained in his directive to the Department of Agriculture.

Presently the forests of eastern Kentucky are producing only a small part of their high potential. They have been overcut, damaged by fire and pests, and abused. Consequently, 85 percent of the timber is in small trees and poor species that do not have a good commercial market. Even so, these forests are producing about $20 million worth of logs, bolts, staves and other products every year. Their capacity to produce is much higher. The soils and the climate are excellent for forestry—95 percent of the area is classed as good to excellent for timber growth. If given proper protection and management, production from these forests could, within a reasonable period, be quadrupled in volume. At the same time, better quality trees of preferred species would be grown, bringing a much higher income to the owner and providing a supply of raw material more attractive to wood-using industries.

So, if our forests are brought into full timber production they will absorb a substantial part of the oversupply of labor. Our forests are living plant communities that can be cured of their present ills, nurtured and developed into full vigor, and made fully productive. They are renewable and an economy built upon the development and use of our renewable timber resources is a healthy, secure, and permanent economy. In addition to improving the economy of depressed rural communities, a well managed, productive forest is an unexcelled protector of watersheds, provider of many forms of recreation and supplier of game and fish.

Before we can efficiently and fully reap the many economic and social benefits of our forest resources, we must have two basic programs:

First. We must have research that gives us the knowledge and methods required to properly manage and produce high quality timber and other forest crops in the shortest possible time. We need to determine the best species of trees to grow on the soils we have. We need to develop improved methods for increasing the growth and quality of the timber stands now existing and for cutting these forests to obtain the best new timber stands possible. And we need to find out the number of trees to grow per acre to obtain the most rapid production of wood on the best trees.

Furthermore, we need research to determine how timber-related crops can be grown at a profit in the same forest that is growing valuable hardwood timber. Some of these crops are, for example, Christmas trees, fruits, nuts, and berries, and medicinal, edible, and decorative plants. These crops may offer splendid opportunities for woodland owners to obtain supplementary income from their properties. Research in cultural methods for these nontimber but forest associated crops may well pay early dividends in distressed areas such as eastern Kentucky.

Second. The second necessary basic program is the application of research results. Until the results of research are put to work, they have little practical value.

The State of Kentucky has recognized this need and has strengthened substantially its work in assisting timberland owners to protect and manage their properties. Today, my department employs 35 trained foresters to work directly with woodland owners. These men are applying the results of past and current research in their day-to-day activities. But they sorely need better knowledge about timber management so that they can better solve the modern-day problems they now encounter. So, we have the men and the organization to put new methods into practice but we do not have adequate research backing for our program.

I am firmly convinced that a stronger timber management research effort by the Forest Service will strengthen greatly the forestry assistance program we have underway. And I am just as firmly convinced that, together, these two programs will give us better forests and lead to a more permanent prosperity, especially in the depressed areas of eastern Kentucky. Therefore, I recommend without reservation that you add $175,000 to the Forest Service budget to strengthen timber management research at their office at Berea, Ky.

LETTER FROM NATIONAL ARBORIST ASSOCIATION URGING APPROVAL OF FUNDS FOR RESEARCH ON DUTCH ELM DISEASE

FEBRUARY 18, 1964.

Hon. CARL HAYDEN,
Chairman, Subcommittee on Department of the Interior and Related Agencies, Senate Committee on Appropriations, U.S. Senate, Washington, D.C.

DEAR SENATOR HAYDEN: The National Arborist Association is composed of over 200 commercial shade tree service companies distributed in 35 states. These companies provide tree service to home owners, municipalities, institutions, etc. An important part of the arborist's work in the 29 States where the Dutch elm disease occurs is in connection with efforts to control this disease.

The Dutch elm disease is caused by a fungus that is transmitted from tree to tree by elm bark beetles. Present control measures consist of spraying the elm trees with insecticides to prevent the beetles from chewing into the bark and inoculating the tree with spores of the disease-producing fungus. A second important part of control is to remove and destroy elms which do become diseased so that they will not serve as sources from which beetles will emerge and carry the disease to healthy trees. When carried out thoroughly these measures will hold the losses of elms from Dutch elm disease to 2 percent or less. While this control is good, there are some problems involved in conducting such a program in cities with thousands of elms and as a result many communities have not carried on effective programs.

It is very possible that with the large number of new chemicals available today, adequate research in the field of systemic treatments will develop a more simple and more effective control for this disease. An effective treatment for the Dutch elm disease that could be applied through the roots or bark is entirely possible and certainly would be preferred to the present control by sanitation and spraying. Research carried on at the University of Wisconsin has shown that a product called "Bidrin," when injected into elms, is somewhat effective in preventing inoculation with the Dutch elm fungus by the bark beetle.

There is a need for a thorough study and evaluation of different systemic insecticides as possible controls for the Dutch elm disease. From such a study, an effective and entirely safe treatment for this serious disease is a good possibility. This work could be carried on by the Division of Forest Insects, U.S. Forest Service, at the Central States Forest Experiment Station, Delaware, Ohio.

The National Arborist Association respectfully asks that the Committee on Appropriations give consideration to adequate provision in the Forest Service budget sufficient to carry out this research.

We also ask that this letter be included in the printed record of the hearings on this item.

Sincerely yours,

PAUL E. TILFORD,
Executive Secretary.

LETTER FROM MR. OLIVER D. DILLER URGING APPROVAL OF FUNDS FOR RESEARCH ON DUTCH ELM DISEASE

WOOSTER, OHIO, *February 19, 1964.*

Hon. CARL HAYDEN,
Senate Subcommittee on Appropriations for the Department of Interior and Related Agencies, Senate Office Building, Washington, D.C.

DEAR SIR: As chairman of the Wooster, Ohio, Citizens Dutch Elm Disease Control Committee, I am writing to respectfully request that you and your subcommittee strengthen sharply U.S. Forest Service research in the control of Dutch elm disease.

In my town of Wooster we have conducted a Dutch elm disease control program since 1959. This program has consisted of annually spraying all healthy elms and promptly removing and destroying all elms killed by Dutch elm disease. These are the recommendations made by scientists at the Delaware, Ohio, laboratories of the Forest Service. We have succeeded in holding our losses from this disease to an average of 2 percent per year, but we still are faced with several serious problems. Some of these problems are the difficulty of adequately spraying all elms at the correct time; the inherent hazard to birds and wildlife from the use of highly concentrated insecticides; and, of course, the high cost of such a program that must go on year after year. I am certain that with adequate support

the U.S. Forest Service research people at Delaware can and will develop much more effective and efficient methods for protecting our elms.

From my close association with Dutch elm disease control I have become very well acquainted with the seriousness of this problem. Perhaps a few figures will illustrate the enormity of this problem in the United States. Already this disease occurs in 29 States and the District of Columbia. Hundreds of towns and cities are yearly faced with the heavy expense of either attempting control or merely removing dead trees. Published information shows that losses from Dutch elm disease in some communities can and have run as high as 30 percent of the trees per year. For example, the city of Urbana, Ill., after some 10 years has less than 6 percent of its original elm population. Cost of removing dead trees in many cities runs into millions of dollars to say nothing of the lost esthetic value of many elms that were 50 to over 100 years of age.

With the many recent advances in the development of new and more effective chemicals, along with safer methods of their use, it is my opinion that an expanded research program on Dutch elm disease control is timely. Such a program should produce control methods that will result in great savings to the citizens of many Ohio towns and cities where this disease occurs or surely will occur in a few years.

A part of my duties as chairman of our citizens committee involves keeping up to date on new research in control of Dutch elm disease. Thus, I am well acquainted with the work the Forest Service is doing at their Delaware, Ohio, laboratories. In my opinion, this work should be expanded four or five times over its present size.

Since research in the control of Dutch elm disease is so important to so many people and communities in Ohio and other Eastern States, I hope that you and your subcommittee will provide increased funds for this Forest Service research program.

I had hoped to present a detailed statement during your public hearings this year but obligations here prevent my doing so. Thus, I would greatly appreciate your making this letter a part of the hearing record.

Please call on me if you would like further information about my request for an expanded Forest Service research program in the control of Dutch elm disease.

Very truly yours,

OLIVER D. DILLER,
Chairman, Wooster Citizens Dutch Elm Disease Control Committee.

STATEMENT BY CHARLES H. LEWIS, JR., LOUISIANA FORESTRY ASSOCIATION, REGARDING STAFFING OF ALEXANDRIA, LA., FOREST PRODUCTS RESEARCH LABORATORY

Mr. Chairman, members of the committee, my name is Charles H. Lewis, Jr. I am executive director of the Louisiana Forestry Association, which was formed in 1947. Our membership numbers some 2,700, and is composed of timber-land owners, forest products manufacturers, and businessmen from all walks of life who are concerned with forest resources and their conversion into consumer goods. More than 1,000 of our members are certified tree farmers who are growing a crop of timber on more than 3 million acres of land.

Last year I appeared before your committee to present a request for funds to complete phase 2 construction of the Forest Products Research Laboratory in Alexandria, La., designed to serve the southern pine region. Construction funds ($450,000) for phase 1 of the laboratory were authorized by the Congress in the fiscal year 1963 budget. This was a two-stage construction project, begun in 1963, scheduled for completion in September 1964.

The funds ($450,000) we requested in February 1963 for phase 2 construction of the laboratory were later made available in the budget for fiscal year 1964, and we wish to express our thanks to you at this time.

We were disappointed to learn that no operational funds have been provided in the President's budget for fiscal year 1965 to activate this facility. The laboratory was designed to accommodate 10 forest products research scientists. Thus far, only one man has been employed. His name is Dr. Peter Kock, who is the project leader. This man is immensely capable. We have spent considerable time studying his initial research in wood lamination and drying. We have also reviewed his proposed work plan for 1964 and 1965. We feel this program is properly oriented and goes directly to the heart of the most pressing problems facing the southern pine industry. Needless to say, we are most anxious that these plans be implemented as quickly as possible.

Recruiting timber scientists who are capable of conducting high-level research in the fields of adhesives, wood lamination, drying, fabrication, and engineering is a difficult task. Men of this caliber are scarce. It will take time to locate them. We don't believe this can or should be done overnight. We do feel it is important to start this search immediately.

The Chief of the Forest Service estimates that $250,000 in operating funds will be required to finance the research of these 10 men. It is our recommendation that the complete staffing job be spread over a 2-year period. We are therefore requesting that this committee authorize operational funds of $150,000 for fiscal year 1965 to begin staffing the Forest Products Research Laboratory at Alexandria. It will then be possible to move ahead with the purchase of essential machinery and equipment. It will also permit the employment of scientists as quickly as they can be located during the next 12 months.

It is our hope that this committee will consider operational funds for this laboratory in the same light you considered the original project—as a two-stage affair, with a substantial portion of the funds being provided for fiscal year 1965 and the remainder in 1966.

Mr. Chairman and members of the committee, I wish time would permit a review of significant changes which are taking place in the forest products industry today. I would like to tell you of the development of the southern pine plywood industry, which is being spawned by pioneers of this industry from the Pacific Northwest. Recent research in the fields of glues and lamination, conducted by the U.S. Forest Products Laboratory at Madison, Wis., in 1960 and 1961, have made this possible. The softwood plywood industry is the fastest growing nondefense industry in the United States. The manufacture of particleboard, and laminated wood arches and beams are only a step behind.

Southern pine has strength qualities which, in some respects, make it the most desirable species for all three purposes, in the United States.

We now have in the South, especially in the central and western gulf region, a real abundance of new forests suitable for these purposes. This, indeed, has become, as the Chief of the Forest Service has often said, the woodpile of America for the next generation.

The economic progress of this entire area is largely dependent upon the progress of research in the field of wood products, especially as it relates to adhesives, lamination, and engineering.

We sincerely hope this committee will provide the U.S. Forest Service with sufficient funds to move ahead with this program at the new southern Forest Products Laboratory at Alexandria, La.

Mr. Chairman, members of the committee, we wish to especially point out that we in no way wish to detract from the excellent work being done by the U.S. Forest Products Laboratory at Madison, Wis., and we are pleased to see that the President has included in his budget sufficient funds to expand the operations of that facility. This is good. The laboratory at Alexandria will complement findings of the Madison laboratory and orient them to the specific problems relating to expanded uses for southern pine.

STATEMENT OF MR. WARREN E. DIETRICH, LOUISIANA FORESTRY ASSOCIATION, URGING STAFFING OF ALEXANDRIA, LA., FOREST PRODUCTS RESEARCH LABORATORY

Gentlemen, my name is Warren E. Dietrich, I am general manager of the Pardee Co., owner of 61,000 acres of southern pine and hardwood timberland.

We are entirely dependent upon the forest products industry for income from our investments in timberland. We completely endorse the need for additional funds to staff the Forest Products Research Laboratory at Alexandria, La., as presented by C. H. Lewis, Jr., in behalf of the Louisiana Forestry Association.

Mr. Chairman, members of the committee, there are five research units now stationed at Alexandria. They are: Forest Management Research, Forest Fire Research, Forest Range Research, Forest Insect Research, and Forest Products Research. All have regional responsibilities.

Insect Research and Forest Products Research are new divisions which have been established recently at Alexandria. Neither is adequately staffed to accomplish the mission for which they have been created.

The needs for the Forest Products Research division have been adequately presented by my colleague, Mr. Lewis. I would like to bring to your attention the need for operational funds of the other new division, Forest Insects.

The Louisiana Forestry Association maintains a research committee which annually reviews the performance and needs of each of these five divisions. Timberland owners and forest products manufacturers are active cooperators in research projects of all these units.

Through our association magazine, Forests & People, we publicize the results of each of these research units (we present reprints of 18 such articles to indicate our sincere interest in the work of this station). As a consequence, the findings of the Alexandria Research Center are quickly applied by forest-land owners and the forest industry in the region served by this institution.

We consider ourselves partners in the research effort of this station. We also consider ourselves "watchdogs" over this station, to see that (1) research is properly oriented, and (2) research is efficiently and effectively conducted. For these reasons, we believe the Alexandria, La., Research Center is the most productive of all such U.S. Forest Service installations.

The staff of the Forest Insect Research unit consists of five scientists, with two helpers and one clerk. With the regional responsibilities assigned to this section, the scientists are on the road constantly, checking insect outbreaks in the southern pine region, from Texas through Florida. The two technicians are insufficient to conduct the necessary laboratory work, and record the findings of these scientists as they explore new outbreaks and possible control measures.

The central and west gulf region is currently experiencing its second consecutive dry cycle. We are at least 30 inches deficient in rainfall, over a 24-month period. As a result, the spread of the southern pine beetle has reached near-epidemic proportions. As yet, no satisfactory control has been developed. About all we can do, at present, is salvage timber which has been killed by the southern pine beetle.

For several years now, losses to insects and disease in the southern pine region have exceeded forest fire losses to a considerable degree.

There is no comparable area in the world in which a more intensive forestry effort has been conducted than in the southern gulf region. It is, indeed, in this area that the raw material requirements for the timber industry over the next four decades must be met. It is imperative therefore that we intensify our efforts to find a satisfactory means of controlling insect predators of the southern pine forests. Although the southern pine beetle, at the moment, appears to be the most serious menace, there are others which have been equally as damaging, and at any time could reach epidemic proportions, as has the southern pine beetle. I refer specifically to the Ips beetle and the sawfly.

At the moment, it is our feeling that the five scientists are sufficient to provide direction to the control effort now underway at the Alexandria Research Center. It is the need for supporting assistance to make these scientists productive that we ask you to consider.

Although the President's fiscal year 1965 budget does include a slight increase for forest insect research, nationwide, we do not feel there are sufficient funds available to provide for the employment of the two additional insect research technicians needed at the Alexandria Research Center.

We therefore ask that your committee recommend the appropriation of an additional $50,000 to the Alexandria Research Center, for this purpose.

A LETTER FROM MR. LYNN SANDBERG, UPPER PENINSULA COMMITTEE ON AREA PROBLEMS, SUPPORTING THE BUDGET ESTIMATE FOR FOREST SURVEY

FEBRUARY 24, 1964.

Hon. CARL HAYDEN,
U.S. Senator, Senate Office Building,
Washington, D.C.

DEAR MR. HAYDEN: Last year we supported an increased authorization for forest resource investigations of the U.S. Forest Service. I am glad to see that this became law even though no extra funds were appropriated. In the Upper Peninsula of Michigan, we urgently need a resurvey of our timber, to replace the present statistics that date back to 1946.

This year the Federal budget has a small increase for this work. I am hoping that it will be approved and that a good part of it will be assigned to our area. The Forest Service is starting a new timber inventory in the Upper Peninsula this year, but the pace is slow and the need for new statistics is acute. Our planning for industrial development and our efforts to attract more industries both are stymied by lack of reliable data on our timber supplies.

We will have new aerial photographs this year for the whole Upper Peninsula, which includes some 9 million acres of commercial forest land. Timber is one of our prime sources of wealth here. We want these new aerial photos to be used while they are new, to give us a new forest inventory.

I would like to support the increased amount for forest resource investigations and suggest that it is needed now in Michigan. I would be glad if you would make my statement a part of the record of your hearings on the bill.

Very truly yours,

UPPER PENINSULA COMMITTEE ON AREA PROBLEMS,
LYNN SANDBERG, *Chairman.*

LETTER FROM MR. DONALD LINVILLE, AMERICAN HARDBOARD ASSOCIATION, SUPPORTING THE BUDGET ESTIMATE FOR EXPANSION OF THE FOREST PRODUCTS LABORATORY

FEBRUARY 3, 1964.

Hon. CARL HAYDEN,
Senate Office Building, Washington, D.C.

DEAR SENATOR HAYDEN: A subcommittee of the Appropriations Committee will shortly review budget items to be presented by the Department of Agriculture. In the recommended budget is an item of $3,800,000 for the Forest Products Laboratory, Madison, Wis., for the construction of a building to be devoted to research in the area of pulp, paper, and wood chemistry.

This association, which represents 12 of the 15 domestic manufacturers of hardboard who produce approximately 97 percent of the domestic production of this wood product, wishes to support the request of this agency for this appropriation, and it is our hope that this item will be retained in the budget. The Forest Products Laboratory at Madison has in the past and continues to perform an outstanding service to the entire industry in the field of research and it is for this reason that I most earnestly ask your support.

Sincerely,

AMERICAN HARDBOARD ASSOCIATION,
DONALD LINVILLE,
Executive Secretary.

PRESIDENTIAL MESSAGE (H. DOC. 240)

CLERK'S NOTE.—On March 9, 1964, the President transmitted to the Congress proposed reductions in the fiscal year 1965 budget (H. Doc. 240, 88th Cong., 2d sess.). It is proposed that forest protection and utilization, forest land management be reduced by $500,000; and that forest roads and trails (liquidation of contract authorization) be reduced by $300,000.

The effect of these reductions is set forth below.

Forest protection and utilization (forest land management):	
(*a*) Reforestation and timber stand improvement	−$300,000
(*b*) Recreation public use	−100,000
(*c*) Structural improvements for fire and general purposes	−100,000
Subtotal, forest protection and utilization	−500,000
(*d*) Forest roads and trails	−300,000
Total, all appropriations	−800,000

(*a*) Reforestation reduced 4,000 acres.
(*b*) Number of family camp and picnic units to be constructed reduced by 100.
(*c*) Elimination of construction of a barracks at Redmond Air Base, Oreg.
(*d*) Planned road construction reduced by 20 miles.

The related employment reductions are:

	Permanent	Other	Total
Man-years:			
Forest protection and utilization	−20	−25	−45
Forest roads and trails	−10	−8	−18
Total	−30	−33	−63
End-of-year employment:			
Forest protection and utilization	−20	−101	−121
Forest roads and trails	−15	−25	−40
Total	−35	−126	−161

COMMITTEE RECESS

Senator BYRD. The committee will recess until 10 o'clock, Monday morning, March 2, at which time the remainder of the Department of Interior agencies and a number of small independent agencies will appear before the subcommittee and present testimony on behalf of the fiscal year 1965 budget requests.

(Whereupon, at 1:15 p.m., Friday, February 28, 1964, the subcommittee adjourned to reconvene Monday, March 2, 1964, at 10 a.m.)

DEPARTMENT OF INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR 1965

MONDAY, MARCH 2, 1964

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met at 10 a.m., pursuant to recess, in room 1223, New Senate Office Building, Hon. Alan Bible temporarily presiding.
Present: Chairman Hayden, Senators Bible, McGee, and Bartlett.

DEPARTMENT OF THE INTERIOR

OFFICE OF THE SECRETARY

STATEMENTS OF D. OTIS BEASLEY, ADMINISTRATIVE ASSISTANT SECRETARY, OFFICE OF THE SECRETARY; SIDNEY D. LARSON, DIRECTOR OF BUDGET; AND DALE L. ROTHROCK, FINANCE OFFICER

1965 BUDGET REQUEST

Senator BIBLE. The subcommittee will come to order.
Our first item this morning is for the Office of the Secretary.
The justification material will be placed in the record.
(The justification statement referred to follows:)

JUSTIFICATION STATEMENT

The estimate for the fiscal year 1965 for the Office of the Secretary is $4,125,000 an increase of $269,975 over 1964. The increase includes $82,000 for increased pay costs under the Federal Employees Act of 1962, and $187,975 for general strengthening in certain areas.

The appropriation for the Office of the Secretary finances the salaries and expenses of the Secretary, the Under Secretary, the assistant secretaries, the administrative assistant secretary, the resources program staff and the Division of Information, with their supporting staffs. The Secretary and the supporting staffs provide general direction, guidance, coordination, and service to all the bureaus and offices of the Department. The programs carried on in the Department are many and diversified. They have grown in size and importance during the past several years. New responsibilities have been placed on the Department. Certain of the central staff and service functions of the Office of the Secretary have not kept pace with the growth in activities and responsibilities of the Department. Some increases, although small, are requested for the purpose of strengthening a few of the areas where additional help is urgently needed.

In a special effort to obtain better management and provide improved service without a major increase in personnel, some reorganization in the administrative management area, which is under the Administrative Assistant Secretary, has been effected. In the main, this involved the establishment of the Office of Survey and Review and the Office of Management Operations with the transfer of the functions of the Division of Inspection, the Division of Administrative Services, and the Division of Security to the new offices.

During the past several years certain of the positions which had previously been authorized have had to be held vacant because of increased salary costs resulting from within-grade promotions and reallocations of positions. Of the increase, therefore, $107,200 is requested to make up a portion of the funds needed to fill currently established positions. The remainder of the increase, $80,775, is requested for seven new positions and for personnel benefits and other expenses.

Appropriation, 1963	$3,482,050
Transferred to "Operating expenses, Public Buildings Service," General Services Administration	2,037
Total available, 1963	3,480,013
Appropriation, 1964	3,858,400
Transferred to "Operating expenses, Public Buildings Service," General Services Administration	3,375
Total available, 1964	3,855,025

SUMMARY OF INCREASES AND DECREASES, 1965

To provide for increased pay costs for fiscal year 1964 positions	82,000
Additional assistance in Office of Under Secretary	16,000
To provide for strengthening of staffs in program areas of water and power and mineral resources	26,975
To provide for increased emphasis on management analysis, guidance, improvement and services	130,000
For replacement of equipment	15,000
Net increase, 1965	269,975
Budget estimate, 1965	4,125,000

Analysis by activities

DEPARTMENTAL DIRECTION

Analysis by subactivities

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Office of the Secretary	$436,401	$360,700	$366,300	+$5,600	+$5,600	
(b) Office of the Under Secretary	93,443	86,200	103,200	+17,000	+1,000	+$16,000
(c) Division of Information	122,895	143,500	146,800	+3,300	+3,300	
Total	652,739	590,400	616,300	+25,900	+9,900	+16,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

(a) *Office of the Secretary, $366,300*

The estimate for 1965 is $366,300, an increase of $5,600 over 1964. This increase is for pay costs. This estimate provides for the salary and expenses of the Secretary and a staff of 32 employees in his immediate office. Included is the Assistant to the Secretary for Research who is responsible for policy direction, administration, and development of complex research programs throughout the Department. Other assistants to the Secretary serve as personal aides and confidential advisers to the Secretary, and may act on behalf of the Secretary on specific matters referred to them for disposition, or represent the Secretary in various executive office and interagency groups.

(b) *Office of the Under Secretary, $103,200*

The estimate includes an increase of $17,000 over the amount available for the current year, and provides for the salary and expenses of the Under Secretary and a staff of six employees. The Under Secretary assists the Secretary in the discharge of his duties and, in the absence of the latter, performs his duties. The increase provides $1,000 for pay costs and $16,000 to permit filling a GS–16 assistant position. As a result of some adjustment in lower grade positions, no increase in total positions is necessary because of this, but the available funds are insufficient to permit filling the position at present. It is necessary however, that the Under Secretary have top level staff assistance and the estimate provides for a deputy and a GS–16 assistant for this purpose.

During the past several years the workload in the Under Secretary's Office has increased considerably, particularly in those areas for which the Under Secretary is directly responsible. The assistant would provide top staff assistance on continuing and specific assignments, and be available to represent the Under Secretary at meetings and conferences as required.

(c) *Division of Information, $146,800*

The estimate for 1965 is $146,800, an increase of $3,300 over 1964 for pay costs on current positions.

The small staff of the Division of Information is responsible for technical and general functional supervision over all information activities of the Department. This includes providing basic information services for the Secretariat and other officers; directing the coordination, review and distribution of special information developed for all types of media; initiating information programs of a department-wide nature involving more than a score of bureaus and offices; and guiding and assisting the many bureaus and offices of the Department in their informational activities.

The estimate for 1965 will permit continuation of a minimum program of informational activities.

PROGRAM DIRECTION AND COORDINATION

Analysis of subactivities

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Assistant Secretary for Water and Power	$248,293	$283,000	$301,900	+$18,900	+$4,400	+$14,500
(b) Assistant Secretary for Mineral Resources	155,032	202,500	219,275	+16,775	+4,300	+12,475

(d) Assistant Secretary for Fish and Wildlife	87,880	102,600	104,100	+1,500	+1,500	----------
(e) Resources program staff	413,580	533,825	545,425	+11,600	+11,600	----------
Total	1,088,722	1,354,525	1,407,600	+53,075	+26,100	+26,975

[1] To provide for increased pay costs for fiscal year 1964 positions.

(a) *Assistant Secretary for Water and Power, $301,900*

The estimate for 1965 is $301,900, an increase of $18,900 over 1964. The increase includes $4,400 for increased pay costs and $14,500 which is required primarily for water and power studies. This estimate covers the salaries and expenses of the Assistant Secretary for Water and Power and a staff of 21 employees in his Office. The Assistant Secretary discharges the duties of the Secretary with respect to the development of water and power. He exercises secretarial direction and supervision over the Bureau of Reclamation, Bonneville Power Administration, Southeastern Power Administration, Southwestern Power Administration, and the Office of Saline Water. He is also responsible for carrying out the defense functions of the Secretary with respect to electric power.

The increase of $14,500 is requested for the purpose of providing funds for filling one GS–14 engineer position with related personnel benefits and a small amount for travel. This engineer is needed for conducting engineering and economic studies relating to marketing activities which the Department may have in the development of water and power resources in areas, primarily outside the areas presently served by the four power marketing agencies. No increase in total positions is necessary for this, but because of within grade promotions and some changes in organization in this area, funds are insufficient to fill all positions authorized.

As requested by the Corps of Engineers in response to a resolution of the Public Works Committee of the Senate, full-time employees were assigned during the current fiscal year to begin coordinated planning efforts to assist in its conduct of comprehensive investigations of water and land resource development in the Ohio River Basin.

Indications are that the Department will be called upon to perform similar studies for the Susquehanna, the Hudson, the Connecticut, and possibly other river basin areas where potential power developments exist and which may involve marketing responsibilities by the Secretary of the Interior. These studies will embrace participation in meetings, review of land and resources studies prepared in the area, suggestions of additional studies which might be required, consideration of design characteristics involved in development of power resources in the area, surveys of load requirements, and miscellaneous studies as required from time to time. The studies will be of a comprehensive and broad nature and are essential in early participation in the power and water resource development functions during the initial planning stages to eliminate and avoid changes in plans that could prove costly at later stages of development. Funds to initiate this program were appropriated in the current fiscal year. The progress of these studies clearly demonstrates the need for filling this position in order that these responsibilities can be adequately implemented.

In view of the importance of this program and the increase in workload incident thereto, it is felt that the requested increase in the Office of the Assistant Secretary is both warranted and essential.

(b) *Assistant Secretary for Mineral Resources, $219,275*

The estimate for the Assistant Secretary for Mineral Resources includes an increase of $16,775 which consists of $4,300 for pay costs and $12,475 for one additional position with expenses. The total estimate provides for the salary and expenses of the Assistant Secretary and a staff of 17 employees. The Assistant Secretary discharges the duties of the Secretary with respect to the development and utilization of minerals and fuels, including defense minerals activities. The Assistant Secretary exercises secretarial direction and supervision over the Bureau of Mines, Geological Survey, Office of Geography, Office of Minerals and Solid Fuels, Office of Oil and Gas, Office of Minerals Exploration, Office of Coal Research and the Oil Import Administration.

The increase will provide for the addition of a GS–13 economist, personnel benefits, and a small amount for other costs.

The staff economist is needed to perform staff service with special reference to the economic factors involved in existing or proposed mineral policies and programs of the Department. These duties were formerly performed by a staff member who has been assigned numerous additional high-level staff duties in the nature of liaison with other departments and participating in committee groups coordinating the increasing responsibilities of the Department in many fields, including energy, for example; this severely limiting his availability for staff economist functions.

(c) *Assistant Secretary for Public Land Management, $236,900*

The estimate includes an increase of $4,300 for pay costs but otherwise is the same as for 1964. It provides for the salary and expenses of the Assistant Secretary for Public Land Management and a staff of 17 employees assigned to his Office. The Assistant Secretary discharges the duties of the Secretary with respect to land utilization and management, territorial affairs, and Indian affairs. The Assistant Secretary exercises secretarial direction and supervision over the Bureau of Land Management, National Park Service, Bureau of Indian Affairs, Office of Territories, the Alaska Railroad, and the Bureau of Outdoor Recreation.

(d) *Assistant Secretary for Fish and Wildlife, $104,100*

The estimate for the salary and expenses of the Assistant Secretary for Fish and Wildlife and a staff of nine employees is the same as for 1964 except for an increase of $1,500 for pay costs. The Assistant Secretary for Fish and Wildlife discharges the duties of the Secretary with respect to the development, conservation, and utilization of the fish and wildlife resources of the Nation. The Assistant Secretary exercises secretarial direction and supervision over the Fish and Wildlife Service.

(e) *Resources program staff, $545,425*

The estimate for the fiscal year 1965 is the same as for 1964 except for $11,600 for pay costs.

The resources program staff provides a coordinating function unique to Interior: (1) specialized advisory staff service on new problems and technical advice to the Secretariat; (2) central staff service to the Secretary and Under Secretary in program planning; and (3) coordination of five principal activities of the various Department bureaus in the field and in Washington and activities of the Department with those of other departments and agencies.

The staff consists of highly qualified professional employees with varied backgrounds of training and experience in economics, engineering, political science, international affairs, forestry, soil conservation, fish and wildlife, water, power, and public lands who have a broad familiarity with field programs, policies, and procedures of the Department in addition to specialized knowledge of one or more particular fields.

In addition to serving as a central staff in the Office of the Secretary, the staff performs a coordinating role in five departmentwide and interdepartmental areas—international affairs, resource economics, program planning, field coordination, and area redevelopment. In the central staff function, the staff provides specialized advisory and consultative services to the Secretariat upon the request and provides central staff service to the Secreatry and Under Secretary in program planning. Also, the staff services which the resources program staff provides, involving assembly of data, preparation of necessary reports and briefing.

FIELD COORDINATION, RIVER BASIN PLANNING

Operating through regional field committees made up of representatives of all bureaus, regional coordinators act as departmental coordinators on program and

policy matters affecting more than one bureau. The regional coordinators chair the field committees and also serve as the Department representatives on interagency river basin committees comprised of Federal and State members.

PROGRAM PLANNING

Assists bureau program officers in developing long-range programs related to expected future natural resources requirements through establishment of comparable standards, criteria, and projections. Relates long-range planning reports to annual budget requests.

INTERNATIONAL ACTIVITIES

Coordinates Department's position on foreign trade in natural resource commodities; develops procedures for systematically providing technical assistance personnel to AID missions in underdeveloped countries. Prepares position papers for Secretariat.

RESOURCE ECONOMICS

Conducts special studies in natural resources economics, public works, investment, and returns; maintains liaison with Council of Economic Advisers, serves on Consumer Council and coordinates Interior's economic research functions.

AREA REDEVELOPMENT

Coordinates Interior's responsibilities under this new program through the bureaus on requests for project feasibility analysis and gives leadership to area and regional studies used as a basis for economic development.

In addition to serving as subject matter specialists to each of the above, RPS gives leadership in program development and special studies on new and unsolved problems facing the Secretary and the Department. Close liaison is maintained with the Science Adviser and the Interior Committee on Research and Development.

ADMINISTRATIVE MANAGEMENT SERVICES

Analysis by subactivities

Subactivity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
(a) Administrative Assistant Secretary	$65,434	$67,700	$68,300	+$600	+$600	----------
(b) Office of Survey and Review	190,401	339,400	426,800	+87,400	+8,400	+$79,000
(c) Office of Management Operations	620,455	658,400	702,200	+43,800	+15,800	+28,000

(g) Correspondence Management Control	37,455	30,400	31,000	+600	+600	----------
Total	1,522,187	1,780,400	1,954,000	+173,600	+43,600	+130,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

(a) *Administrative Assistant Secretary, $68,300*

The estimate for the fiscal year 1965 includes an increase of $600 for pay costs. Provision is made in this estimate for the salary and expenses of the Administrative Assistant Secretary and a small staff of four employees in his office. The Administrative Assistant Secretary discharges the duties of the Secretary with respect to administrative management functions in the Department, and directs and supervises the offices and divisions listed above.

(b) *Office of Survey and Review, $426,800*

The estimate for the Office of Survey and Review includes an increase of $87,400 of which $8,400 represents Pay Reform Act costs on current positions and $79,000 represents the additional requirement for 1964 lapses nonrecurring in fiscal year 1965.

The Office of Survey and Review was established late in fiscal year 1964 to strengthen management at the Department level. The functions and responsibilities of the former Division of Inspection, including the investigative activity; the contract review and procurement policy functions formerly in the now abolished Division of Property Management; responsibility for financial policies and methods have all been concentrated in this Office. Additionally, the Office of Survey and Review has been made responsible for more dynamic Department leadership in the areas of automatic data processing and internal auditing. This office provides an instrument of top level review and analyses to the Secretariat thus affording more precise bases for decisionmaking and progressive development in financial and management processes. The Office is staffed with carefully selected professional personnel and is equipped to offer expert advisory assistance in the important management areas described.

The new office has been created mainly by transfers and mergers of functions heretofore assigned elsewhere in the Department. In this process, however, meticulous selectivity of personnel and representative grading of positions has required some adjustment. Funds for support of authorized positions are required to complete this new and important arm of management.

In relation to the benefits, current and potential, which will accrue to the Department, this salary investment is wise and prudent. The office will provide more incisive final review of proposed contract commitments in such sensitive areas as helium supply, saline water, and loan programs. It will provide a more precise and reliable clearinghouse for important issues raised in congressional reports; e.g., the Appropriations and Government Operations Committees and in General Accounting Office audits. By its analysis and review the office will also aid the Department in seeking out and correcting incipient weak spots in our operations and methods.

While the Office of Survey and Review does not embody an audit staff as such, it is empowered to mobilize and direct technical audit activity throughout the Department and for this purpose the staffing provides for professional personnel of acknowledged expertness in financial policy and practices and management fact finding. Through this office the Department can insure sustained followup through special audits and other reviews on programs for manpower conservation, economy of method and maximum productivity. The office provides competent, informed direction of the Department's efforts to adopt the advantages of computer technology and to relate such adaptation to manpower savings.

The Office of Survey and Review needs the funds requested so that it may move aggressively in these objectives so vitally essential in Department management. It is confidently expected that this activity will to a very real degree pay for itself through avoidance of some of the costly mistakes of the past, through discovery and correction of areas where the possibility of waste may exist, and by general improvement in management capability at the Department level.

In effecting the reorganization which established the Office of Survey and Review, 32 authorized positions were established by transfer from existing activities in the administrative management area. Funds available, however, are insufficient to fill all positions and a lapse of approximately 6 man-years will be necessary during the current year. The staff represented by this lapse is urgently needed and the increase in funds is requested for this purpose.

(c) *Office of Management Operations, $702,200*

The estimate provides for the salaries and expenses of 84 employees, and an increase of $43,800 over 1964. The increase consists of $15,800 for pay costs and $28,000 for strengthening of staff. The Office of Management Operations is a new unit established in August 1963 and comprises all staff responsibilities and operations of the Division of Administrative Services; all staff responsibilities and functions of the Division of Property Management, exclusive of contract review, related policies and contract compliance under the nondiscrimination policy of the Federal Government; and the administrative staff functions pertaining to the emergency preparedness for defense responsibilities delegated to the Department of the Interior. This resulted in the abolishment of the Division of Administrative Services, Division of Property Management, and Division of Security.

The Office of Management Operations formulates and develops policies and procedures and provides coordination for a program of administrative services for the Department, and administers centralized services for the Department on such matters as space, printing, duplicating, library, health, communications and storage and shipping of office supplies and forms. The Office also provides administrative services, such as fiscal, personnel, mail, file, messenger, and procurement for the Office of the Secretary, Office of the Solicitor, Office of Oil and Gas,

Oil Import Administration, Oil Import Appeals Board, Office of Minerals and Solid Fuels, Office of Saline Water, Office of Geography, Office of Minerals Exploration, and Office of Coal Research.

In addition, the Office has primary staff responsibility for all property management activities of the Department. These include development of policy standards and objectives, providing staff guidance and direction, review and appraisal of the procedures and activities of the bureaus of the Department relating to procurement, utilization and disposition of real and personal property, quarters and subsistence, records and forms management, and radio frequency assignment and use. Staff members of the Office of Management Services represent the Secretary and the Department before committees of the Congress, the Bureau of the Budget, General Services Administration, Treasury Department and other Government agencies and on interagency Committees in regard to property management, radio communication, records management, space management, and emergency preparedness matters.

Despite the better utilization of manpower and the savings resulting from the consolidation of functions, it is necessary to request an increase in funds for this office due to a condition that developed over a period of years in the former Division of Administrative Services. The considerable increase in program activity in the Department and particularly in the other departmental offices resulted in a gradual increase in the workload of that area without any increase in funds. Every effort was made to hold the line on personnel, but the situation has reached the critical stage. The records indicate that the number of offices and personnel serviced is approximately double that of a decade ago, yet the number of personnel in this area has decreased. Over the years, the rising costs of operations, including promotions, have been absorbed. The situation has worsened to the point where the work cannot be currently maintained even with an abnormal amount of overtime being performed.

The increase of $28,000 is requested to help alleviate this situation and permit this office to provide adequate and prompt service. The requested funds would provide for four additional positions, $6,000 to permit full employment in currently authorized positions, and $1,000 for other operating expenses. The additional positions consist of a GS–9 accountant, a GS–5 personnel clerk, a GS–4 clerk, and a GS–2 laborer.

One of these positions, the GS–5 personnel clerk is for the Branch of Personnel. During the past 10 years the volume of work and the responsibilities carried on by the Branch, or required of it, has increased tremendously. The number of personnel serviced has increased over 50 percent. Numerous other responsibilities in the field of personnel management and relations have been added. Yet the increase in personnel available for this work has been approximately 1 man-year. Additional help is urgently needed to meet the responsibilities that have been placed on this Branch.

In the fiscal section, the number of employees serviced has increased from approximately 600 to over 1,100. The funds accounted for has increased by approximately 750 percent. Other requirements have been added which increase the accounting load, such as additional deductions for payroll purposes, accrued cost accounting, Treasury reports 224 and 225, and control accounting and reporting on interagency transactions. Yet, there has been an increase of only 3 or 14 percent in the number of employees available for this work. One additional GS–9 accountant is requested for the purpose of assisting in the preparation of the many reports required, and in the more complicated phases of the accounting work.

The GS–4 clerk-typist is requested for the Office of the Director. At the present time there is only one secretarial employee available to handle the typing and clerical work for four administrative or professional employees, with the result that their work is not as productive and efficient as it should be.

The laborer is requested for moving furniture, handling shipments, et cetera.

(*d*) *Division of Budget, $179,200*

The estimate for the Division of Budget includes an increase of $5,100 which is for the increased pay costs. Provision is made here for the salaries and expenses of 14 employees. The Division has primary staff responsibility for the budget activities of the Department. It performs a liaison function with the Bureau of the Budget and the Appropriation Committees of the Congress on all appropriation matters for the Department. It also has general direction of the development, preparation, and execution of the Department's budget and participates in determinations relating to Department programs and evaluations of the programs in terms of budget requirements.

(e) *Division of Management Research, $189,600*

The estimate for 1965 is $189,600 which is an increase of $27,200 over 1964. This increase consists of $4,200 for increased pay costs, $23,000 for additional staffing and expenses for management activities.

This increase will finance the addition of two management analysts and related increases in personnel benefits and other expenses. The Division is responsible for providing leadership and staff assistance to programs for the improvement of management and organization throughout the Department. Specific assignments include: the conduct of organization and management surveys, incentive awards programs, committee management, work improvement programs, directives management including coordination of the departmental manual, Secretary's orders, proposed Executive orders, Federal Register documents, Code of Federal Regulations, and other written instructional materials; and a management consulting service to the bureaus and offices on the above subjects as well as other problems of organization and management of operations, efficient utilization of manpower, and application of new techniques and equipment in carrying out Interior's programs.

The requirements for new and expanding activities in the various resource programs of the Department should be matched by increased emphasis from the Office of the Administrative Assistant Secretary on more efficient and economical management of these programs. More effective management data is needed and newer management-science techniques involving systems analysis, quantification of work elements, operations research, and other developments in this field should be applied in the analysis and performance of these operations. To provide this added emphasis and the supporting staff skills and capability for analysis, an increase of $23,000 is requested. A GS–14 management analyst position will provide a senior position to plan and give departmentwide leadership to efforts for measuring productivity of administrative and program operations of the Department, relating manpower requirements to the workload and the end products and results of bureau programs. A GS–12 management analyst will provide additional staff support for the paperwork management program and for the development of training materials in the Department's work-improvement and work-simplification programs and assisting the bureaus in the implementation of these programs.

(f) *Division of Personnel Management, $356,900*

The estimate for this activity reflects an increase of $8,900 over the amount available for the current fiscal year. The increase is all for pay costs on current positions.

The Division provides departmental leadership and staff guidance in the development and maintenance of a comprehensive personnel management program throughout the Department; develops policies, standards, objectives, and programs designed to establish and maintain an adequate, qualified, and efficient working force; provides general direction of a comprehensive program of personnel administration including position classification, labor relations, wage administration, employment, training, employee relations, inspection, personnel standards, procedures and records, and safety and health; coordinates bureau personnel programs, and plans and stimulates studies of personnel management improvement, including executive development and training.

The Pay Reform Act of 1962 contains several important provisions which require implementation, establishment of new policy, procedures, and regulations and standards for which this office is responsible. There has also been increased emphasis in several other personnel activities such as, employee management relations and equal employment opportunites in the Government, without regard to sex, color, race, religion, or national origin. Also considerable work has been required as a result of the Public Works Acceleration Act. This new legislation and the increased emphasis which has been given to these facets of personnel management increases the requirement for personnel program review and evaluation.

(g) *Correspondence management, $31,000*

The estimate includes an increase of $600 for pay costs and provides for three employees and some expenses. This unit was established for the purpose of improving the handling of important correspondence in the Department and to avoid delays in replying. It provides a means for facilitating the handling of correspondence directed to the Secretary, and for review of correspondence and other documents prepared for the signature of the Secretary. The departmental correspondence control officer is a staff assistant to the Administrative Assistant

Secretary, and is responsible for compliance with deadlines on controlled correspondence at all levels.

GENERAL SERVICES

Analysis by subactivities

Subactivity	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−), 1965 compared with 1964		
				Total	Pay cost [1]	Program
General services	$133,896	$129,700	$147,100	+$17,400	+$2,400	+$15,000

[1] To provide for increased pay costs on payments to other agencies.

General services, $147,100

The estimate for this activity includes an increase of $17,400, of which $2,400 is for increased costs on payments to other agencies as a result of the pay increase and $15,000 is for replacement of equipment.

This activity covers general expenses of the Office of the Secretary where it is not practicable to distribute to the various activities under this appropriation. Included are printing and binding, telephone, library, and dispensary services, postage, travel of Members of Congress in connection with examination of field activities of the Department, and certain other general expenses.

The increase requested for replacement of equipment consists of approximately $12,000 required for the replacement of a bookkeeping machine, and $3,000 for replacement of other office equipment, primarily electric typewriters, calculators, and reproduction equipment. The bookkeeping machine to be replaced is over 10 years old and it is essential also that we have a machine with punchcard or tape attachment, so that the information recorded can be processed further to provide information required for cost, objective class, and other reports required for management, budget use, and the Treasury Department. Modern office equipment is essential for efficient operation. No specific provision is made elsewhere in the budget for the purchase and replacement of this equipment. The life of these machines is limited and the maintenance and repair can become quite expensive. It is essential that funds be provided for this purpose.

ITEMIZATION OF ESTIMATE

Salaries and expenses, Office of the Secretary

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)

HIGHLIGHT STATEMENT

Senator BIBLE. We have Mr. Beasley and Mr. Larson and Mr Rothrock to present the testimony in support of the budget.

We have your statement, Mr. Beasley, and it will be incorporated in full in the record, as given, and why do you not highlight it?

Mr. BEASLEY. I will do that, Mr. Chairman.

(The statement referred to follows:)

STATEMENT BY D. OTIS BEASLEY, ADMINISTRATIVE ASSISTANT SECRETARY

Mr. Chairman and members of the committee, the Office of the Secretary is submitting a request for the fiscal year 1965 of $4,125,000. This is an increase of $269,975 over the adjusted appropriation for 1964. Of the increase, $82,000 is required to cover additional pay costs under the Federal Employees Salary Act of 1962. The remainder of the increase, or $187,975, is for required general strengthening in certain areas.

The Secretary and supporting staffs provide general guidance, coordination, and administrative services to all the bureaus and offices of the Department. The Department's responsibilities have increased in complexity and scope in response to demands for more effective resource conservation and development.

The Department is pursuing technological advances in the centralization of data gathering, programing, and dissemination in order to meet these growing demands and at the same time conserve manpower. To further this end and to provide better administrative services, the staffs in six offices must be strengthened. The requested increases are needed to implement this program.

The offices which require additional staffing are the Office of the Under Secretary, the Offices for the Assistant Secretaries for Water and Power and for Mineral Resources, and the Office of Survey and Review, Office of Management Operations, and the Division of Management Research under the Administrative Assistant Secretary. A concise breakdown of the increases for each of these offices is provided in the budget request. The limited increases are considered very important and it is believed they will significantly contribute to an improvement in the overall management and efficiency of the Department.

One assistant is required in the Office of the Under Secretary. During the past several years the workload in the Under Secretary's Office has increased considerably, particularly in those areas for which the Under Secretary is directly responsible. The assistant would provide top staff assistance on continuing and specific assignments, and be available to represent the Under Secretary at meetings and conferences as required. The assistant will be grade GS–16.

The Assistant Secretary for Water and Power requires an increased appropriation for one GS–14 engineer. This engineer is needed for conducting engineering and economic studies relative to marketing activities which the Department may have in the development of water and power resources in areas, primarily outside the areas presently served by the four power marketing agencies. Because of changes in organization there will be no increase in the total number of positions here.

One GS–13 economist must be added to the staff of the Assistant Secretary for Mineral Resources. The economist will perform staff service with reference to the economic factors involved in existing or proposed mineral policies and programs of the Department. The staff member formerly performing these duties has been assigned numerous additional high-level staff duties in the nature of liaison with other departments, participation in committee groups, and coordination of increasing responsibilities of the Department in many fields; including energy; for example. This has severely limited his availability for staff economist functions.

The Office of Survey and Review was established late in fiscal year 1964 to strengthen management at the Department level. The Office assumed the responsibilities and functions of the former Division of Inspection and certain functions of the Division of Property Management. Additionally, the Office of Survey and Review has been made responsible for more dynamic departmental leadership in the areas of automatic data processing and internal auditing. The Office will provide more incisive final review of proposed contract commitments in such sensitive areas as helium supply, saline water, and loan programs. It will provide a more precise and reliable clearinghouse for important issues raised in congressional reports; e.g., the Appropriations and Government Operations Committees and in General Accounting Office audits. The Office is empowered to

mobilize and direct technical audit activity throughout the Department. It is confidently expected that this activity will, to a very real degree, pay for itself through avoidance of costly mistakes of the past and by general improvement in management capability at the Department level.

The increased appropriation in this Office is to cover 1964 lapses nonrecurring in 1965. The present funds available are insufficient to fill an urgently needed staff represented by a lapse of approximately 6 man-years.

The Office of Management Operations was established in August 1963 to consolidate all the functions of the Division of Administrative Services, the Division of Security, and the Division of Property Management, exclusive of contract review and contract compliance under the nondiscrimination policy of the Federal Government.

The Office of Management Operations formulates and develops policies and procedures and provides coordination for a program of administrative services for the Department and administers centralized services for the Department on such matters as space, printing, duplicating, library, health, communications, and storage and shipping of office supplies and forms. The Office also provides administrative services, such as fiscal, personnel, mail, file, messenger, and procurement for the Office of the Secretary and other offices of the Department.

Despite the better utilization of manpower and the savings resulting from the consolidation of functions, it is necessary to request an increase in funds for this Office due to a condition that developed over a period of years in the former Division of Administrative Services. The considerable increase in program activity in the Department has resulted in a gradual increase in workload in this Division without any increase in funds. The number of offices and personnel serviced in the past decade has approximately doubled while the number of personnel in this area has decreased. The situation is such that the work cannot be currently maintained even with an abnormal amount of overtime being performed.

The increase is required to help alleviate the situation by providing four additional positions. One GS–5 personnel clerk is needed to accomplish the increased volume of work undertaken in the Branch of Personnel. One additional GS–9 accountant is needed in the Fiscal Section to assist in the preparation of the many reports required, and in the more complicated phases of the accounting work.

One GS–4 clerk-typist is required in the Office of the Director. Presently one secretarial employee handles the typing and clerical work for four professional and administrative personnel, with the result that their work is not as productive and efficient as it should be. The final position requested is a GS–2 laborer required for moving furniture and handling shipments.

The Division of Management Research requires an increase in appropriations to provide the addition of two management analysts. A GS–14 management analyst position will provide a senior position to plan and give Department-wide leadership for studies measuring production in relation to manpower requirements and workload. A GS–12 management analyst will provide additional staff support for paperwork management and for development of training materials in the Department's work-improvement and work-simplification programs.

Mr. BEASLEY. This item, "Office of the Secretary," includes the Secretary, the Assistant Secretaries, and the supporting staffs for the general direction, supervision, coordination, and general administrative services of the Department.

BUDGET INCREASES

The estimate for 1965 is $4,125,000, an increase of $269,975 over the current appropriation. Of the increase, $82,000 is for increased pay cost under the Federal Employees Act of 1962, and $187,975 is for general strengthening in certain areas of the Office of the Secretary.

PERSONNEL

For the purposes of strengthening the Office of the Secretary, we are requesting a $107,200 increase, to make up a portion of the funds needed to fill currently established positions. The remainder of the increase, $80,775, is for seven new positions and for personnel benefits and other expenses.

The new positions are identified as follows: One is for the Assistant Secretary for Mineral Resources, an economist. There are also four positions asked for the Office of Management Operations, a total of $19,000; two positions for the Office of Management Research, one of which would be concerned with studying productivity with a view to increasing manpower utilization. A second position requested for that Office is to make studies of paperwork, and to try to find ways and means of improving the paperwork flow in the Department, curtailing it wherever possible.

EQUIPMENT

This explains generally the increases, except for $15,000, which is requested for equipment, most of which would be used to replace a bookkeeping machine, which is now 12 years old and is not capable of performing the type of work that we need today.

POSITION FOR GS–14 ENGINEER

Senator BIBLE. My attention is directed to one position, and I am not sure whether it is an unfilled position or a new position. That is the position in Secretary Holum's office, calling for a GS–14 engineer. Now is that a new position, or is that an old one?

Mr. BEASLEY. It is an old position, which we do not have funds to finance at the present time because of increased cost and within-grade promotions and upgrading.

This position, as is indicated in the justification, is to enable this Office to work with the Corps of Engineers in river basins not now covered by one of the power marketing agencies, and is for the purpose of coordinating the power studies of the Corps of Engineers in these basins, such as the Ohio and the New England area.

Senator BIBLE. This is an old position that you did not have funded?

Mr. BEASLEY. That is correct.

Senator BIBLE. This is within that $100,000 you described of the $187,000?

Mr. BEASLEY. That is correct.

Senator BIBLE. How many positions were not funded, in that?

NEW POSITIONS REQUESTED

Mr. BEASLEY. About nine positions.

Senator BIBLE. In other words, you are asking for funds for nine positions for which you did not have a sufficient appropriation. You are asking for seven new positions.

Mr. BEASLEY. That is correct.

Senator BIBLE. And in your justification, is there detail as to what each of these positions will do?

Mr. BEASLEY. Yes, sir.

Senator BIBLE. Justifying all of the nine, as well as the seven new ones?

Mr. BEASLEY. Yes.

River Investigations in Ohio Basin

Senator Bible. Now, has your work on the comprehensive river investigations in the Ohio Basin been concluded?

Mr. Beasley. No, they have not been concluded. This is a study that is expected to be completed in 1966. The study is underway now, and is on schedule, and we contemplate it will be finished by 1966.

Senator Bible. It has, then, about 2 years to run?

Mr. Beasley. That is correct.

Accelerated Public Works Program

Senator Bible. What do you estimate has been the cost to the Department for its participation in the Accelerated Public Works program, broken down to show the amount transferred to the Department from the Area Redevelopment Administration, and the amount for which funds have not been specifically appropriated?

Mr. Beasley. We had a total of $63 million transferred under the Accelerated Public Works program. In addition, we were provided $485,000 for administrative expenses. But in addition to that, we estimate that it cost us $718,000 in administrative expenses to administer this program over and above that allocated, making a total of about $1,200,000 administrative cost for the $63 million program, a little under 2 percent cost for administrative expenses.

Senator Bible. That is very fine, Mr. Beasley.

It is always good to see you, and I have no further questions. You made a very fine statement as to justification.

Office of the Solicitor

STATEMENTS OF FRANK J. BARRY, SOLICITOR; EDWARD WEINBERG, DEPUTY SOLICITOR; EDITH A. MAHON, ADMINISTRATIVE OFFICER; DALE L. ROTHROCK, FINANCE OFFICER; AND WALLACE L. DUNCAN, SPECIAL ASSISTANT

1965 Budget Request

Senator Bible. The next office that we will consider is the Office of the Solicitor. Mr. Barry, Mr. Weinberg, and Mr. Rothrock are present.

Mr. Barry. Good morning, Senator.

I also have with me Mr. Duncan and Miss Mahon.

Senator Bible. Very well. We are very happy to have them.

Your office shows a request for $4,173,000 for fiscal 1965. This is an increase of $173,000 over the amount appropriated in the fiscal year 1964.

The justification for this request will be printed in the record.

(The justification statement referred to follows:)

SALARIES AND EXPENSES

Appropriation, 1963	$3,852,650
Transferred to "Operating expenses, Public Buildings Service," General Services Administration	−1,155
Total available, 1963	3,851,495
Appropriation, 1964	4,000,000
Transferred to "Operating expenses, Public Buildings Service," General Services Administration	−1,000
Total available, 1964	3,999,000

SUMMARY OF INCREASES AND DECREASES, 1965

To provide for increased pay costs for fiscal year 1964 positions	87,000
Increase to permit filling a limited portion of vacancies in established positions	37,000
Increase for within-grade promotions	50,000
Net increase, 1965	174,000
Budget estimate, 1965	4,173,000

Analysis by activities

Activity	Amount available, 1963	Fiscal year 1964		
		Total appropriation	Transfers [1]	Amount available
Legal services	$3,700,543	$4,000,000	$1,000	$3,999,000
Unolbigated balance lapsing	150,952			
Total	3,851,495	4,000,000	1,000	3,999,000

[1] Represents transfers to General Services Administration unless otherwise footnoted.

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
Legal services	$3,700,543	$3,999,000	$4,173,000	+$174,000	+$87,000	+$87,000
Unobligated balance lapsing	150,952					
Total	3,851,495	3,999,000	4,173,000	+174,000	+87,000	+87,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

JUSTIFICATION

The 1965 estimate for the legal services of the Department provides for a total increase of $174,000 over the appropriation for the 1964 fiscal year. This increase is made up of:

For salary increases provided in the 1962 amendments to the Classification Act, effective Jan. 5, 1964	$81,000
To permit filling a limited portion of vacancies in established positions	37,000
To apply to within-grade advancements	50,000
To apply to the increase in personnel benefits resulting from increased pay rates	6,000

Owing to the salary increases payable under the Classification Act Amendments of 1962, continuance of the increase first made in fiscal year 1963 of $12,000 in allowable reimbursements to the Office of the Solicitor from other accounts avail-

able to the Department is requested in this estimate also so that it would continue at a total of $142,000.

It is the duty of the Solicitor to provide legal services for the entire Department of the Interior, its bureaus and offices, its many field establishments, and the Secretariat. Year by year the scope and type of transactions handled by the Department has increased. This has brought with it a steadily increasing demand for legal services, but the legal staff has decreased rather than increased since 1952, although it is estimated that in the same period, the number of separate legal matters handled by the Office has almost doubled—from 1955 to 1963 alone it increased by 70 percent.

These increases in departmental work with resultant increases in demand for legal services have extended to all areas of the Department's work. For example:

(1) The Office of Saline Water is engaged in an accelerated research and development program. This is effected through negotiated research and development contracts. At the close of the fiscal year 1963 there were 121 research and development contracts in effect. It is estimated that by the close of fiscal 1964 there will be a total of 142 and by the close of fiscal 1965 there will be approximately 180 such contracts in effect. Each such contract requires much legal assistance, as no two negotiated contracts are identical and each contract at some stage is expected to require legal advice. One problem is the rights of disclosure of information and results of research. Another problem requiring much legal advice is in connection with patents.

(2) New reclamation projects and other similar legislative authorizations issue each year in steadily increasing amounts (for fiscal 1962 the expenditure on the development of land and water resources was $332 million; for fiscal 1963 it is $344 million; for fiscal 1964 it will be $335 million, and for fiscal 1965 it will be $323.6 million) with related legal demands. The Central Valley project is a good example. It poses problems such as the water diverters on the Sacramento River and Federal-State relationships in connection with the construction of the San Luis Dam. These require substantial legal work.

(3) Enrollment appeals by Indians in connection with judgments recovered against the United States are rapidly increasing coincident with an increase in the number of judgments and related distribution statutes. Thus the Omaha Indian statute now on the books has produced 65 appeals, with consequent legal work, and other similar statutes are pending.

(4) There are a number of legislative and treaty proposals now pending which if enacted would substantially increase the legal work of the Department—in some cases by a large amount. Many of these proposals require extensive legal work during the legislative or authorizing stage, even if they should not ripen into actual projects. A few of the more significant of these proposed laws are:

(*a*) The Pacific Southwest water plan, including the central Arizona project.

(*b*) The proposed land and water conservation fund involving grant-in-aid programs to the States for the planning and development of recreation areas.

(*c*) The Pacific-Northwest-Southwest intertie.

(*d*) The Passamaquoddy project.

(*e*) The Columbia River power disposal problems resulting from the Canadian treaty.

(5) The continuing effort to reduce the backlog of pending land and mineral appeals.

(6) Public Law 88-29 authorizes planning and research into our recreational resources—with related statutory interpretation, review of regulations, etc.

(7) The recent creation of the Bureau of Outdoor Recreation and its continuing expansion continue to pose new and broadened legal problems.

(8) The recent establishments of national seashore areas such as Point Reyes, Cape Cod, and Padre Island.

(9) Since 1959 alone, the number of cases involving tort litigation has increased by 50 percent and the number of tort claims has grown by 25 percent. This upward trend appears to be continuing.

(10) Legislation for the rehabilitation of Guam.

(11) The patent work of the office is increasing sharply as a result of major increases in the number of research contracts let by the Office of Coal Research and the Office of Saline Water, and in the inhouse research work of the Bureau of Mines, resulting in more patents, more inventor reports, etc. Not only have the appropriations of the Office of Coal Research and of Saline Water been increased by the Congress, but Congress has required the Government to retain

patent rights in connection with Government-financed research under these programs. The result has been further major demands for legal services.

(12) The controversies over the Outer Continental Shelf areas on the Pacific and gulf coasts are producing both an expanding number of negotiations and disputes with the States, and increasing possibilities of litigation.

(13) The leasing for oil and gas of considerable Federal lands on the Outer Continental Shelf off the coasts of California, Alaska, Washington, and Oregon will generate a demand for additional legal services.

(14) The recent Supreme Court decision in *Arizona* v. *California* will not only itself project new legal problems, but has opened the way to the resolution of many problems and projects whose disposition has been held up awaiting that decision.

(15) Increased construction, and procurement contracting by organizations such as Bonneville Power Administration, Southwestern Power Administration, et al., for which the Office of the Solicitor furnishes legal services.

(16) The workload of the Legislative Division of this Office is intensified by the fact that the reports on legislation pending before Congress have tended to become more complex and time consuming, and as the Department ventures into new areas such as water resources research and planning and general recreation, or attempts to solve old problems such as Indian heirship and coal mine safety.

(17) The problems created both within the United States and with Mexico, by the lower Colorado River salinity problem—including acquisitions of rights-of-way for construction and international legal problems.

(18) The continuing problems of title to land along the lower Colorado River, including questions of trespass, of accretion and avulsion, and of water rights.

(19) There is a substantial increase proposed in the work of the Bureau of Mines dealing with helium. This will increase legal work in such areas as contracting authority, etc.

The instances just cited may seem numerous. Actually, they are but a highlight sampling of the many areas of new and increased departmental activity requiring legal services. Furthermore, these are primarily events which signalize the regular and continued annual growth of demands for legal services from the Office of the Solicitor.

In addition, there are many individual events of a sudden or unexpected character which each year pose heavy demands for legal service. Representative of such events are the recent mine disasters, the recent group of slant drilling cases under the Connally Hot Oil Act, natural disasters such as the windstorms in the Northwest with their related problems created by widespread damage to timber, much of which had already been sold and the recent congressional proposals for a thorough review of the Public Land laws. The last mentioned items will necessarily place substantial demands on this Office even though an independent commission makes the basic inquiries. And were a Civilian Youth Conservation Corps to be set up, the demands would be manifold.

The varied instances cited above of the growth in demand for legal services lend color and meaning to statistics which reveal that in 1955, with a staff of 192 attorneys, the Solicitor's Office handled less than 99,000 distinct legal matters, while in fiscal 1963, with a staff of 196 attorneys, the Office handled more than 159,000 matters for a major Cabinet agency.

The Interior Department is custodian of the public lands and natural resources of the United States, many of which, such as oil leases, may involve transactions in the billions of dollars as do the broad reclamation and construction projects of the Department. And this does not include its guardianship of the Indians and many other important public trusts.

In further explanation of the request to fill the 18 established positions which are currently vacant due to lack of funds, 418 positions were provided in the 1964 budget. At the time of the 1964 budget hearings there were 36 previously exis'ing vacancies listed and 5 were established in 1963 making a total of 41 vacancies. Since the 1964 hearings 23 positions have been filled, leaving 18 unfilled vacancies.

These vacancies resulted from the fact that the Office was threatened with the necessity of meeting a portion of the pay increases and was required to absorb costs of in-grade promotions and of terminal leave payments. The costs thus absorbed considerably exceeded the cost of the 18 positions requested. As a consequence, funds were not available to fill these vacancies, particularly in the absence of such knowledge as what funds the Congress would provide for pay act increases, etc., which information was not disclosed until late in the 1963 fiscal year. It should also be pointed out that the funds requested to fill these vacancies assume they will be filled during only a portion of the fiscal year, as the full annual cost would require a total of $112,728.

The full requirements of within-grade advancements, likewise, are not reflected in the funds requested for the purpose. Obligations of this nature are expected to reach a total of $94,898 in 1965 and thus will overrun the requested $50,000 by the large amount of $44,898. A still further absorption necessity must be faced in the form of terminal leave payments to departing employees. For possible retirements alone, the leave payments are likely to be in excess of $52,000. Together, the obligations will cut into 1965 funds by the substantial amount of $96,898 and to this extent reduce the level of personnel that can be maintained for the legal services of the Department.

The many increasing burdens cited above suggest that the Office of the Solicitor has been more than modest in not seeking additional positions and in limiting its request to additional funding for existing vacancies. The workload of the Office has been carefully examined and, as itemized above, the substantial increases in legal work require far more than the filling of 18 vacancies. The request for funds to at least fill the vacancies is therefore an absolutely essential minimum.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$3,828,140	$4,141,000	$4,315,000	+174,000
Advances and reimbursements from other accounts	−127,597	−142,000	−142,000

INCREASED PAY COSTS

Senator BIBLE. In addition to funds necessary to meet the increased pay costs of fiscal year 1964 positions, you ask $37,000 to fill 18 vacancies which are now authorized.

Please comment on this need, as well as upon your request for $50,000 to meet the costs of within-grade promotions.

Mr. BARRY. Well, first, with respect to the $37,000: These are positions which have been vacated by virtue of attrition, and the funds have not been available in the budget to fill these positions, because of within-grade advancements, and other absorbed costs.

VACANCIES

These 18 positions I can supply the committee with a list of, but unfortunately, when I reviewed the files of all those who come up this morning, not one of us had a copy of it.

Senator BIBLE. It may be supplied.

(The information referred to follows:)

Vacancies (8 attorneys, 10 clericals), $99,680

	October 1962 rate	January 1964 rate
Attorneys:		
GS-13 Hearing examiner, Gallup	$11,150	$11,725
GS-13 Hearing examiner, Gallup	11,150	11,725

Grand total (18)	108,410	112,995
Budget Bureau allowance		37,000
Lapse		75,995

PERSONNEL

Mr. BARRY. These positions include lawyers and clerical positions, which, as I say, have been vacant. We now have—I think the figure at least a week ago was 386—employees in the Office of the Solicitor.

We do all of the legal work for the Department, including the work that is done in the field, in the various regional and field offices, serving all of the bureaus and agencies in the Department, and this budget for which we are making our request includes the compensation, personal services, and costs and expenses in connection with the legal work in the Department.

The justification, first of all, for filling these vacancies is that the burden of work, I can assure the committee, is so great that everyone has got some sort of a backlog—every office in the Department, so far as I know. Perhaps there may be an exception someplace, but I have not found it.

Senator BIBLE. How many lawyers do you have, again?

Mr. BARRY. The total number of employees we have in the office is 386.

Now, how many lawyers are there, Miss Mahon?

Miss MAHON. 201.

Senator BIBLE. 386, and of that number 201 are lawyers.

Now, can you supply for the record—or you can testify right now or have one of your staff furnish the information—their grades and their length of service with the Federal Government?

Mr. BARRY. I do not know if we have that information right now.

Senator BIBLE. That may be supplied for the record.

[1] As of Mar. 1, 1964.

RECRUITING ATTORNEYS

Senator BIBLE. My purpose is this. And as a lawyer, I am very much interested in seeing that we get the highest possible legal talent in each of our departments. I know that sometimes the grades are insufficient to attract topnotch lawyers, and more particularly to hold them once they have come into service.

So I would be very happy to have you supply for the record this information, if you will, if you are clear on what I am asking.

Mr. BARRY. I might say this, with respect to the problem of attracting lawyers: We can get young lawyers, but we have been in competition with other departments, and we have recently introduced an honors program. Most of our hirings are now under that honors program.

In other words, instead of hiring at grade 7, we are now hiring at grade 9, for the most part.

Senator BIBLE. What is the grade 9, beginning?

Mr. DUNCAN. $7,030.

Mr. BARRY. The difficulty is, of course, that many of these regional and field offices—while they are not autonomous since they are still under the Solicitor's office—must give day to day advice on very important programs of the United States, and we frequently have to staff those offices with lawyers of considerable experience.

It is a good deal more difficult to get lawyers at grade 9 or 7 for such jobs, and we run into a problem. It is important to get topnotch legal assistance in those offices, and finding the experience, without having to disrupt their family roots by moving them from one locality to another, is quite difficult.

ATTORNEYS IN WASHINGTON, D.C., AREA

Senator BIBLE. How many of the 201 lawyers are assigned in Washington, and how many are in the field?

This may be in your prepared statement.

Mr. BARRY. Eighty-one positions in Washington. This does not represent the number of lawyers, however. That is on a basis of 220 positions, which are not filled. There are only 201 lawyers that we have actually working for us.

Senator BIBLE. I see.

Mr. BARRY. But that is about the proportion.

Senator BIBLE. Eighty-one are in Washington, and the balance are in the field?

Mr. BARRY. Correct.

TENURE OF SERVICE

Senator BIBLE. Also supply for the record the length of service of these various lawyers. I do not know whether I made that clear or not.

The thing I am driving at is to make sure the young man you take in on the grade 9 stays with you. My experience would be that he probably stays for awhile and then leaves.

Mr. BARRY. This is not true as much as I expected, Senator, because there is a certain attraction in Federal service.

Senator BIBLE. There are certain benefits you do not get from private practice.

Mr. BARRY. Besides economic benefits, you have the best client in the world, and most like to work for the Government.

Senator BIBLE. I imagine the work is pretty steady. You would be in trouble if it were not.

But you supply that for the record, Mr. Barry.

I have already inserted your justification. You can highlight that in any additional way that you like.

PARTIALLY FILLING AUTHORIZED VACANCIES

Mr. BARRY. Well, I would only like to point out that this sum of $37,000 is not going to take care of our 18——

Senator BIBLE. That misleads me. You asked for $37,000 to fill 18 vacancies which are now authorized. I do not see how you can fill them with $37,000.

Mr. BARRY. These are the existing vacancies, and this is the only sum that is available in our presentation. It is to fill those vacancies.

Senator BIBLE. That is rather misleading. What you are saying is that you are going to fill as many of 18 vacancies as you can with $37,000?

Mr. BARRY. That is correct.

Senator BIBLE. It occurs to me this may be only four positions.

Mr. BARRY. This is what we think we will be limited to, unless we include some clerical help.

Let me say it is almost impossible to predict which of the 18 we will fill if we get this appropriation, because workload pressures vary and change from time to time in the Department.

The budget which is finally approved and adopted for the Department of the Interior will determine in large part where the legal work is going to fall heaviest, and also various emergencies come up.

For example, on the west coast; that is, in the Northwest, there was a terrific blowdown of timber which required a large amount of legal services a couple of years ago, and there came to be a demand right in that area which could not have been anticipated in the preceding budget hearings by the Solicitor's Office.

Accordingly, we use the money where we can for lawyers and clerical help.

Senator BIBLE. Well, as I understand it, you would like to fill the 18 vacancies, but because of budgetary restrictions, you are only asking for $37,000.

Mr. BARRY. That is correct.

COMPLETELY FILLING AUTHORIZED VACANCIES

Senator BIBLE. If you were to fill the 18 vacancies which are now authorized, how much would it cost you?

Miss MAHON. $112,995.

Senator BIBLE. An additional $112,995, or a total——

Miss MAHON. A total?

Senator BIBLE. A total of $112,995 would fill the vacancies that are now authorized?

Miss MAHON. Mr. Chairman, that would be on an annual basis.

Senator BIBLE. Pro rata to include parts of the fiscal year? Is that what you mean?

Miss MAHON. No, for the full fiscal year. For the full 12 months of occupancy of these positions, $112,995.

Mr. BARRY. If we could fill them all on July 1, it would cost approximately that much.

TOTAL AUTHORIZED POSITIONS

Mr. WEINBERG. Ten of these positions are clerical, Mr. Chairman.

Senator BIBLE. You are only talking about eight lawyers?

Mr. WEINBERG. Eight lawyers.

Senator BIBLE. Of course, you do not include in lawyers the people who work independently for the Bureau of Land Management?

Mr. BARRY. No. These are the lawyers in the Solicitor's Office. Of course, there are many lawyers in Government who are not assigned to legal positions. But all of the legal work in the Department is done in the Solicitor's Office. All of the legal clearances must be given in the Solicitor's Office.

Senator BIBLE. This I understand, but does not the Bureau of Land Management as such employ lawyers who act as lawyers?

Mr. BARRY. They are lawyers. I suppose you would say they act as lawyers. They handle the appeals to the Director of the Bureau of Land Management, primarily.

Senator BIBLE. As lawyers?

HEARING EXAMINERS

Mr. BARRY. I suppose as lawyers. They are not hearing examiners. They are reviewing officers or land law examiners. In the field a hearing will be held. Now, these lawyers are not in our budget; that is, the hearing examiners in BLM that actually hold the hearings.

Senator BIBLE. Are within your budget?

Mr. BARRY. Are they included or excluded?

Senator BIBLE. They are not in your budget. They are in the Bureau of Land Management budget.

Mr. BARRY. If the applicant is aggrieved at the decision that is made in the local office, the land office, it is appealed to the Director of the Bureau of Land Management, and he decides the appeal within his bureau. There are a number of people in BLM who have legal training.

Some of them have had legal training and are not members of the bar, but they do the work and process and prepare the Director's decisions on appeal.

If the applicant is still aggrieved, he appeals to the Secretary, and there is a branch in the Office of the Solicitor that handles land appeals.

BACKLOG OF WORK

Senator BIBLE. How much backlog is there within your Department, if you could answer that question?

Maybe we should define it a little more closely. How many opinions do you have, or requests for opinions that have not been finalized? How many legal decisions are before you for your final consideration that have not been finalized?

Mr. BARRY. Well, let me answer that in two parts.

Of course, you know that the Department is a manifold organization. It is a large organization. And there are a great number of legal

problems presented to us. We have a large number of offices operating in different areas.

Now, each of these offices may have a backlog. This would make it impossible to tell at any minute what the current state of the backlog is.

Branch of Land Appeals

We also have a sort of an administrative quasi-judicial proceeding in the Department. We have the Branch of Land Appeals. In January of 1962, the backlog in the Branch of Land Appeals was 793 cases.

We have introduced a number of devices and reforms and shortcuts which are justified, and which do not impair any of the litigants' rights, and we have reduced the backlog to 419 cases, and we expect further improvement, because we are still working on this problem.

The backlog of 700 cases meant that some applicant, or someone who had a land appeal pending, might have to wait for 2 or 3 years for a final administrative decision on his land appeal. He must exhaust his administrative remedy before going to the courts in cases in which the departmental decision is adverse to him.

Additional Personnel and Shortcuts

Since 1962, we have added two people to our land appeals staff and that has helped somewhat. But we have also taken other shortcuts. We have had an almost inflexible rule, for example, that these appeals are taken up in order. We feel it is perhaps not good public relations if we take them up in order, and we delay 3 years for a decision, and then tell the unfortunate applicant that he waited 1 day too g to file his application for appeal.

So we have decided we are going to go through and get those cases out of the way. Where procedural grounds exist for disposing of an appeal, we will dispose of them early, so that the appellants can go ahead and take their cases to court.

We have also found that a large number of appeals do not turn on well-settled issues, and the facts that have been established at hearings are decisive. Now, those are cases where we have delegated authority to Assistant Solicitor Ernest Hom to sign the appeals in that area.

Memorandum Opinions

We have also introduced memorandum opinions in appropriate cases to eliminate the various backlogs that have been accumulating because of multiple review. We have also eliminated the requirement that the Deputy Solicitor or the Solicitor sign each and every opinion prepared by the Branch of Land Appeals. This requirement meant that as busy as they were, their desks were piled actually 2 or 3 feet high with cases that were pending when Mr. Edward W. Fisher took over as the Deputy Solicitor in 1961.

Bureau of Land Management Appeals Backlog

So that is the status. That is what we have been doing with our land appeals.

We have Indian appeals——

Senator BIBLE. May I interrupt there to ask whether it is not true that most of your backlog on appeals lies in this land area, within the area of the Bureau of Land Management? Is that correct?

Mr. BARRY. Yes, I think that is correct.

Senator BIBLE. I know this is the one area where I receive the most complaints, and I am sure my good friend from Alaska receives a good many complaints in this processing of land appeals.

Mr. BARTLETT. I will testify that that is correct.

SHORTENING APPEALS TIME

Senator BIBLE. And this is a thing we have been repeatedly trying to improve. There is a bill before the Legislative Committee, as you know, in which we have asked for comments as to some method of shortening up the time which it takes this applicant.

There are these 3 weary years before they can even get into court. We would like to see them get into court at the earliest possible moment.

Both of the Alaska Senators have shown great interest in this. We have not come up with a foolproof legal method of shortening the time materially, but we are still working on it.

Mr. BARRY. Well, to be a little facetious about it, it looked like it was going to become necessary to establish a separate branch to answer legislative correspondence and explain why we had been delaying so long in the Branch of Land Appeals.

But I think that the situation has shown very distinct improvement. I am much encouraged by it, and I think it will be very much improved.

Senator BIBLE. If you had another two lawyers, could you shorten up this backlog very much? How many lawyers would it take to cut this backlog down?

Mr. BARRY. Well, I would hesitate to say that that is the problem right now.

RECOMMENDED STUDY OF BACKLOG PROBLEM

I just would not want the committee to think that all we need is more lawyers, when many of the problems arise because of the practices and procedures that have been followed in the office from time immemorial. Many of these practices were set up at a time when the volume was not anything like what it is today—with the number of appeals coming to us from Bureau of Land Management decisions and the number of applications being made in the field.

I would prefer to wait until we have had an opportunity to study that situation.

There is a request for funds to fill one additional attorney position in that office.

Senator BIBLE. How long would it take you to complete the study, so that you would be in a position to make recommendations that would be timesaving to the land applicant?

We are all driving at the same thing. You say that you could not indicate it now. When could you indicate it? You say it is under study. When would you be in a position to make recommendations?

Mr. BARRY. Let me tell the committee what I have been doing in the last year.

SPACE PROBLEM

I became convinced, after the budget hearings before the committees last year in both Houses, that we could not expect to solve our problems just by asking for more money. For one thing, we have problems of space. We do not have any place to house these people. If we separated them and put some of them in another building, that would complicate the situation far too much.

So I undertook to use some of the management experts that we have in the Office of the Secretary. Mr. Beasley, I think just testified with respect to some items in the budget relating to management experts, and we have had them come in to assist in the study of the operation, organization and management of the Solicitor's Office. The lawyers have invited these experts in to look at the way the lawyers do their work, and see if any improvement can be made.

MANAGEMENT EXPERTS STUDY

Now, this is not a task force program. We do not expect a report out of them, but they have already made a large number of excellent suggestions that have saved time for lawyers and which have shortened the work. We expect further improvements.

Now, I would say to the committee that we are going to continue to survey and study this office, both in Washington and in the field. It is doubtful there will be ever a time when we will have completed the study. This is a continuing project.

I think we will be able to show further improvements to the committee next year in the backlog situation, but I hesitate to predict that in a month or 2 months we will have some specific thing to report, because that would mean we would have to stop these experts who are working in the entire office and tell them to concentrate on that to meet a deadline.

Senator BIBLE. I am not suggesting that you be put on deadline. I understand that a study of this kind is a continuing study, and that you are continually looking for improvements in administrative procedure. Is that not true?

BACKLOG CUT IN HALF

Mr. BARRY. Yes. We have nearly cut this backlog in half, and I think it shows sufficient promise so that we can expect to improve it even more, because as it goes down, the burden will be less heavy.

Approximately 430 cases come into the land branch each year. You see, our 700 case backlog represented a 3-year backlog, almost. If we could cut it down to where there was only a 1-year backlog, then we could look intelligently at the question as to whether we could use any more people.

Sometimes, if you have too many people, they get in each other's way and you have a multiple review system. I think we might work it out for another year on the basis of improved administration.

UPDATING LAND LAWS

Senator BIBLE. I recognize that the Congress must share a lot of the responsibilities, because we certainly have not updated our land

laws. They are much in need of working over, and we are going to attempt to do something about it. But that is a tough task in itself.

Mr. BARRY. We have been working on it. I would hate for anyone to give us a deadline on that.

Senator BIBLE. As you know, we have a land commission bill that is presently pending in the House, and maybe this will offer part of the answer.

PROPOSED PAY INCREASES

I do not know whether you have had adequate opportunity to cover the $50,000 request that you make to meet the cost of within-grade promotions. You may have covered that in your justification. You can go ahead and highlight it.

Mr. BARRY. These are almost the same as pay increases. Without a negative report on somebody, they come almost as a matter of course.

Of course, we do not have very many lawyers where we would refuse a within-grade increase when they become eligible. We do have some, and we do refuse them sometimes, but the only way we could save on that $50,000 is to be just unreasonably brutal, where people have done a good job, and simply say that their level of competence is not sufficiently high to justify the within-grade increase that Congress has authorized.

Senator BIBLE. Well, this $50,000, then, is almost mandatory on your part?

Mr. BARRY. I would say the $50,000 and the $6,000 for personnel benefits——

PERSONNEL BENEFITS

Senator BARTLETT. What do you mean by that? I was intrigued by that statement. Is $6,000 for benefits attributable to the pay raise?

Mr. BARRY. All right. The personnel benefits include retirement and such.

What are all the items that are included, Miss Mahon?

Miss MAHON. Insurance, health benefits, and retirement.

Mr. BARRY. These are based on the amount of money we get.

Senator BIBLE. That is the $6,000 item?

Mr. BARRY. That is correct.

Senator BIBLE. The Senator from Alaska?

Senator BARTLETT. I would like to refer to these appeals just for a moment or two, Mr. Chairman.

You are to be congratulated very warmly, Mr. Barry, for reducing the backlog by almost 50 percent.

If there is such a thing as an average—and there is not in this instance, I realize, how long does it take to process an appeal?

LENGTH OF TIME TO PROCESS AN APPEAL

Mr. BARRY. If you are thinking about the time that it takes for a lawyer to pick up a file with which he is completely unfamiliar, the facts he is completely unfamiliar with, and work through the file, I imagine it would not take more than—well, at the outside, maybe 6 or 8 weeks, where some very difficult question is presented, which requires a great deal of research, and it is presented for the first time.

The delay, frankly, is due to the fact that the number of cases which are coming to us are quite a great deal larger than they had been in the past. In 1 year we got 600 cases.

Now, the reason for that was that evidently there was some pressure on the Bureau of Land Management to get rid of a lot of cases, and they processed over a thousand cases that year, and of those, 600 people appealed from the Director's decision to us, so that it is quite difficult.

I am giving these figures round, and I am trying to give you the impression, in broad strokes, of what the situation is, rather than give you exact and precise figures.

Eliminating Intermediate Appeal

One of the suggestions has been made that in order to shorten the time, we eliminate the intermediate appeal. I think this would be a good idea, but it has got to be done with caution, and I think with a good deal of preparation.

They get a large number of appeals in the Bureau of Land Management every year, something in the order of 1,200, so that if there was no intermediate court, as it were, to screen those cases out and limit us, we would be completely bogged down, we would get more of a backlog in 1 year than we have altogether now, you see.

I have just got a note from Mr. Duncan that the average is 11 months on land appeals from the time they arrive in the Office of the Solicitor.

Normal Case-Handling Procedure

Senator Bartlett. You spoke about having delegated some authority. With reference to those cases that are not delegated, are you required finally to review the file and make a determination?

Mr. Barry. Well, let me tell you what happens. A decision is written in the Branch of Land Appeals, that carries the surname of the author of the opinion, the man who did the work, and of Mr. Hom, the Chief of the Branch, and is then sent up to my office, and either Mr. Weinberg or I will then read the opinion.

If we have any questions about it, we will call in the people who worked on it, and we will ask them some questions, and if necessary, it will be revised and rewritten in accordance with our requirements, and then it is signed.

Senator Bartlett. I think Mr. Barry is to be complimented for not informing the committee, as so many might in a similar situation, that solutions could be arrived at by the addition of more personnel.

This shows, among other things, that you are exploring every possible means to shorten the time for disposition of these land appeals and to reduce the backlog.

Attorneys and Starting Salary

How many attorneys do you have in the Office of the Solicitor?

Mr. Barry. 201, now.

Senator Bartlett. What is the salary for the attorney who enters upon duty initially?

Mr. Barry. A little over $7,000 a year. This would be a grade 9.

Senator Bartlett. What is the top grade?

Mr. Barry. The top grade is 17.

I am talking about the highest grade in the office besides the Solicitor. The highest grade in the office is that of the Deputy Solicitor, Mr. Weinberg, grade 17. We have two 17's. We have Mr. Max Edwards, who is the Legislative Counsel. We have five associate solicitors who are grade 16's.

Recruiting Attorneys in the Field

Senator Bartlett. Do you have difficulty in recruiting lawyers at that entrance salary?

Mr. Barry. I have not had a great deal of difficulty in Washington. In the field, I think they have more difficulty. But this is a problem which is handled pretty much by the regional solicitors.

Regional Solicitors

We have a meeting of all regional solicitors, at which time we determine what part of our appropriation is going to be used in the Washington office and what will be used in each regional office. And they come in with their requests, and we divide our funds up, as it were, as soon as the budget has been settled and the appropriation bill have been passed.

Senator Bartlett. Are the regional solicitors all of the same grade?

Mr. Barry. They are all grade 15's.

Senator Bartlett. Thank you.

That is all, Mr. Chairman.

State Office in Wyoming

Senator McGee. I have been concerned for quite some time now about the fact that the Solicitor's office does not yet have a State office in Wyoming. The need for a Solicitor's office in Wyoming has been brought to my attention on numerous occasions in the past and I don't think that anyone questions the need and justification for the establishment of such an office. As you probably are well aware, the Bureau of Land Management field office in Cheyenne, Wyo., processes more lease applications than any other field office. This BLM office is probably one of the busiest State offices now operating. Naturally this great volume of business gives rise to a significant amount of legal business, and yet there is no Solicitor's office in Wyoming to handle this legal business. I am advised that at the present time an attorney from the Denver Solicitor's office is required to journey to Cheyenne quite frequently—three or four times a month, as a matter of fact—to take care of this business.

How many personnel would be required to staff a Solicitor's field office in Wyoming to do the work that needs to be done out there?

Mr. Barry. We would expect to staff the office with a field solicitor and one stenographer. Once in full operation, we would anticipate the need of an additional attorney.

Senator McGee. What are the grades and salaries of these personnel?

Mr. Barry. Field Solicitor, GS–14, $13,615; attorney-adviser, GS–9, $7,030; stenographer, GS–5, $4,690; total, $25,735.

OPERATING COSTS OF STATE OFFICE

Senator McGEE. What other costs would arise in connection with the establishment of this Solicitor's field office?

Mr. BARRY. The approximate costs involved in opening and operating such an office are as follows:

21	Travel	$500
22	Transportation of things	100
23	Rent, communications, and utilities	4,500
24	Printing and reproduction	25
25	Other services	100
26	Supplies and materials	200
31	Equipment	1,500
	Total	6,925

Senator McGEE. How much money would be needed to establish an operating Solicitor's field office in Wyoming this year?

Mr. BARRY. The establishment and operation of a field office at full strength, that is, with a field solicitor, an attorney adviser and a stenographer, for the entire fiscal year 1965, would cost approximately $32,660.

Senator McGEE. Isn't it true that the present arrangement requiring an attorney to commute frequently from Denver to Cheyenne results in a considerable among of administrative and travel expense, not to mention the personal inconvenience involved?

ADVANTAGES OF A STATE OFFICE

Mr. BARRY. Yes. It is true that the present arrangement does require fairly frequent trips from Denver to Cheyenne. A great deal of business is handled through the mails which is less expeditious and probably less effective than personal consultation. While it is doubtful that the establishment of the Cheyenne office would result in any monetary savings to the Department, it would be a more convenient and effective means of providing legal services to the bureaus and agencies served in this area.

Senator McGEE. Would not the people of Wyoming who deal with the BLM office be much better served with an operating Solicitor's office in the State?

Mr. BARRY. It is our observation that, under the present arrangement, the Denver regional office has been able to provide adequate legal services to the bureaus and agencies in Wyoming and specifically, in the Cheyenne area. However, without a field office in that State, delays are inevitable. Personal, on-the-spot legal advice is, of course, a much more preferable arrangement. I can say, therefore, that we could expect improvements in providing legal services in these areas if we had an operating field office.

Senator McGEE. Were funds requested this year to set up this office in Wyoming?

Mr. BARRY. Not specifically. We requested sufficient funds to fill 8 attorney vacancies and 10 clerical positions. The list heretofore placed in the record is illustrative of where, at the time it was compiled, these positions would be located. By staffing the Denver positions indicated on the list, the senior attorney who has been handling the Cheyenne work would have been freed for transfer to Cheyenne,

However, final decision on the placing of these positions would only be made after funds became available and in consideration of the needs of the service as they then appeared.

Senator McGEE. Are these funds presently in the budget estimates?

Mr. BARRY. No.

Senator McGEE. Did the Bureau of the Budget delete the required funds to establish this office?

Mr. BARRY. Not with regard to any specific positions or locations. However, the funds allowed by the Budget Bureau for filling positions in the Solicitor's Office will not be sufficient to encompass the costs of filling all the vacancies mentioned in the list which has been inserted in the record. Since we can fill only a small number of the existing vacancies with the funds allowed for this purpose by the Bureau of the Budget, we must fill them according to priorities as they appear following the passage of the 1965 appropriation bill. These priorities will be determined at that time on the basis of personnel needs in our entire office.

Senator BIBLE. That was a very fine statement, Mr. Barry, and we will work very closely with you in attempting to make progress in a very difficult field.

Thank you very much.

Mr. BARRY. Thank you.

INDIAN CLAIMS COMMISSION

STATEMENTS OF ARTHUR V. WATKINS, CHIEF COMMISSIONER, AND JEAN R. HANNA, ADMINISTRATIVE OFFICER

BUDGET REQUEST FOR 1965

Senator BIBLE. Our next hearing is on the Indian Claims Commission, and we are very happy to welcome back a former colleague of ours, the very distinguished Senator from Utah, now wearing the hat of a judge.

I am very happy to see you, Senator Watkins.

Mr. WATKINS. I am delighted to be here, and I am glad you are glad I am here, when we start to ask for some money.

Senator BIBLE. And you are accompanied by Mrs. Jean R. Hanna, the administrative officer.

I am always glad to see you, too.

Mrs. HANNA. Thank you.

Senator BIBLE. The Indian Claims Commission presents a proposed budget of $313,000 for fiscal year 1965, an increase of $16,000 over the amount appropriated in fiscal year 1964. The statement in justification of this request will be printed in the record.

(The justification referred to follows:)

PURPOSE STATEMENT

The Indian Claims Commission was organized on April 10, 1947, under the act approved August 13, 1946 (25 U.S.C. 70).

The duties of the Commission are to hear and determine all causes arising under section 2 of the act, up to and including August 13, 1946, on behalf of any Indian tribe, band, or other identifiable group of American Indians residing within the territorial limits of the United States. The act provides that the claims may be heard notwithstanding any statute of limitations or laches, but all other defenses shall be available to the United States.

Of the 596 claims filed, 152 have been completed. Payments of awards are dependent upon subsequent appropriations made through the claims, judgments, and private relief acts appropriation to the Treasury Department. Final awards through December 1963 total $94,914,641.

Salaries and expenses

Appropriation, 1963	$297,000
Appropriation, 1964	297,000

SUMMARY OF INCREASE AND DECREASE, 1965

Personal services	+10,000
Personal benefits	+2,000
Travel	−1,000
Communication	+1,000
Printing and reproduction	+1,000
Supplies and materials	+2,000
Equipment	+1,000
Total	+16,000
Budget estimate, 1965	313,000

Analysis by activities

Activities	Amount available, 1963	Amount available, 1964	Estimate, 1965	Increase (+) or decrease (−)
Hearing and adjudication of Indian claims	$274,000	$297,000	$313,000	+$16,000
Unobligated balance no longer available	23,000			
Total	297,000	297,000	313,000	+16,000

REQUIREMENTS FOR FISCAL YEAR 1965

The estimate for funds needed to operate the Indian Claims Commission in fiscal year 1965 is $313,000.

JUSTIFICATION FOR PERSONAL SERVICES

The following summary table presents the essential facts with respect to this item.

	1964 estimate	1965 estimate	Estimated change in 1965 from 1964
1. Number of positions	22	22	0
2. Annual salary cost of permanent positions	$262,000	$272,000	+$10,000
Total personal services	262,000	272,000	+10,000

Increase in personal services and related benefits due to full-time financing of eight attorney positions at increased rate and higher pay scale for part of 1964 for all positions, also, other small increases as shown.

DETAILED STATEMENT

12. *Personal benefits.*—Section 4(a) of the civil service retirement amendments of 1956 (70 Stat. (747)) requires agencies to match the 6½-percent contribution of employees. This also covers FICA, employees' group life insurance, and employees' group health contributions. This is a $1,000 increase due to increased rates of pay.

21. *Travel expense.*—$5,000 is requested for travel. The principal provision of the Indian Claims Commission Act requiring expenditures for travel by the Commission and members of its staff are contained in 25 U.S.C. 70p, 709.

23. *Communications.*—$4,000 is requested to cover the cost of telephone facilities, long-distance calls, and postage. This represents an increase of $1,000 to, cover higher rates of telephone service.

24. *Printing and reproduction.*—The estimate for printing and reproduction for 1964 is $3,000, and is to cover the printing of stationery and envelopes, miscellaneous forms, and binding repairs to old books in use by the Commission and reproduction of the opinions rendered by the Commission.

25. *Other services.*—The amount of $3,000 is to cover the cost of maintenance of office machines, premiums on surety bond for two certifying officers, and miscellaneous services by other agencies, including the Commission's pro rata share (approximately $300) for emergency service in the health unit in the building in which we are located.

26. *Supplies and materials.*—$4,000 is requested and is to cover the cost of blank paper, binders, lackets, folders, stencils, carbons, and miscellaneous office supplies.

31. *Equipment.*—The estimate for this year is $2,000 and is to cover the cost of additional file cases, incidental equipment, as needed, and repairs to furniture.

Object classification

		1963 actual	1964 estimate	Estimated change in 1964 from 1963	1965 estimate	Estimated change in 1965 from 1964
11	Personnel compensations: Permanent positions	$242,000	$262,000	+$20,000	$272,000	+$10,000
12	Personal benefits	18,000	19,000	1,000	21,000	+2,000
21	Travel and transportation of persons	2,000	6,000	4,000	5,000	−1,000
23	Rent, communications, and utilities	2,000	3,000	1,000	4,000	+1,000
24	Printing and reproduction		2,000	2,000	3,000	+1,000
25	Other services	2,000	2,000		2,000	
26	Supplies and materials	4,000	−2,000	2,000	4,000	+2,000
31	Equipment	4,000	−1,000	3,000	2,000	+1,000
	Total obligations	274,000	297,000	+23,000	313,000	+16,000

JUSTIFICATION STATEMENT

Senator BIBLE. Your statement appears to be very brief, refreshingly brief, and I think you might as well read it in full, if you like, Senator.

Mr. WATKINS. I would like to. Thereby I will keep to the subject and get out of your way.

Senator BIBLE. It tells the story. I think you should read it. It is a very short statement.

Mr. WATKINS. Mr. Chairman, our detailed statement, prepared by our clerk, is submitted as a part of our presentation. We asked for an appropriation of $325,000, and were allowed $313,000 by the Bureau of the Budget.

PERSONNEL

New employees to be added were cut, so that we will have 22 employees, instead of 24, as requested.

We have assured the President that all of these are needed, and until our accelerated program of adjudication is in full operation, we shall not need more than 22 employees; that is, of course, including the three members of the Commission.

IMPECUNIOUS INDIAN CLAIMANTS AND PUBLIC LAW 88–168

Our activities have been slowed down materially by the inability of impecunious Indian claimants to present their cases because they were unable to employ and pay needed expert witnesses.

To remedy this situation, Congress, at our request, enacted Public Law 88–168, which became effective on November 4, 1963. A revolving loan fund of $900,000 was authorized, from which the Secretary of the Interior could make loans to Indian litigants so that they could secure expert witnesses and researchers to aid them in the presentation of their claims to the Commission.

We are advised that the Secretary of the Interior has made a supplemental request for an appropriation of $900,000 to activate this act, and that request is now before you as a part of a supplemental appropriation.

Senator BIBLE. That is true, Senator Watkins. In addition to that, the Department of Indian Affairs has already testified as to the need for the supplemental request for $900,000. We have already had a hearing on that amount of money.

DELAYED PROGRAM

Mr. WATKINS. We are very glad they did that, because this program has been too long delayed already.

It is over 2 years ago since we were invited by the chairman of the Interior Committee to meet with him and explain our operations, and in that meeting, we explained very definitely this probem of impecunious Indian tribes and the necessity for them getting some help to hire their witnesses, their expert witnesses, particularly.

And we could not find any opposition in the Congress. Everybody seemed to be for it the first year it was introduced, but nothing happened. The hearings were held, and no reports were made, and so we didi not get it.

Then we came back the next year, last year, and presented it again. Some opposition developed, based upon misunderstandings as to what it was intended to do, and after some work here in the Congress, I was able to convince those who were opposed that they should not be opposed, and it finally passed unanimously in both Houses.

We were very grateful that the act was adopted, even though it had been delayed.

IMPLEMENTING MONEY NOT RECEIVED

Senator BIBLE. But to date, you have never received one single solitary cent?

Mr. WATKINS. Oh, no.

Senator BIBLE. You have an act without the implementing money to go with it.

Mr. WATKINS. That is right. Not only that, but we are advised that there are applications filed now by these tribes, who need this financial help, to the extent that all of the $900,000 is already applied for, and there are many Indian tribes that are still outside, needing help.

Senator BIBLE. Does any of that go to lawyers?

Mr. WATKINS. No.

Senator BIBLE. This is for witnesses and the researchers?

Mr. WATKINS. That is right. The lawyers do not get any of it. It may help them to earn their fee a little sooner than they otherwise would.

ATTORNEYS' FEES

Senator BIBLE. Their fee would be by the consent of the Indian Claims Commission as to the percentage to be allowed upon recovery?

Mr. WATKINS. Yes; unless the contract itself, which has been approved, or which should be approved, by the Interior Department, makes it specific as to the percentage they are to get. There are some contracts of that kind, and they cannot go above 10 percent in the contract.

PERCENTAGE FIXED BY LAW

Senator BARTLETT. In that connection, is that 10-percent ceiling fixed by law? Or by regulation?

Mr. WATKINS. It is fixed by law. And an award may be made by the Commission. Unless the contract fixes it specifically, then we have the obligation and the job of determining how much the attorney fees shall be.

We have had quite a number where the fee has already been fixed at a certain percentage. We have quite a lot of activity in connection with these attorney fees. The attorneys, of course—this has been going on for a good many years, and sometimes it is their fault that they have not pushed the cases faster than they have, and sometimes they have had to advance some costs to help the Indians.

That is not a good situation, as a matter of fact, and they are entitled to claim, as the expenses of these suits, the money they advance to help the Indians in these cases.

FEES CONTINGENT ON JUDGMENT

Senator BIBLE. Are all these fees contingent upon a judgment?

Mr. WATKINS. The attorney fees are, yes, completely contingent.

Senator BIBLE. And if an attorney takes an Indian claimant's case, and your decision is adverse, the lawyer is taking that risk?

Mr. WATKINS. Yes. He is taking that risk. But they did not have any difficulty finding lawyers to accept the business.

Senator BIBLE. I think we both know of lawyers who have done pretty well in this field.

Mr. WATKINS. They have not done badly. I will say that.

Senator BIBLE. Thank you, Senator.

Mr. WATKINS. To finish my statement, here——

BUDGET REQUEST AND SUPPLEMENTAL REQUEST

Senator BIBLE. Pardon my interruption, but it seemed to be appropriate as to the $900,000. It seemed to me you have made an excellent case legislativewise.

Mr. WATKINS. And we need it all now, and we will have to come back and ask for further authorizations, I assume.

Senator BIBLE. The $900,000 was the ceiling?

Mr. WATKINS. That is right. But the House bill had an item for $3 million.

Senator BIBLE. I see.

Mr. WATKINS. And then the Senate insisted on cutting it down, and rather than have the bill defeated, because we wanted more money, we thought, "Well, go ahead, and fix the $900,000, fix it at $900,000, and then we will find out whether it is enough."

LOAN REPAID INTO REVOLVING FUND

Senator BIBLE. Of course, should these claims be prosecuted to successful judgment, then the loan can be repaid into the revolving fund?

Mr. WATKINS. That is correct.

Senator BIBLE. With interest, as I understand.

Mr. WATKINS. Yes, with interest.

Senator BIBLE. Thank you, Senator.

I think you were down to the last sentence on the first page.

Mr. WATKINS. Yes.

APPLICATIONS EQUAL TO BUDGET REQUEST FILED

We are also advised that applications for practically all of this sum have already been filed, or will be shortly. We urge this committee to approve the sum requested by the Interior Department, and we urge that this item should be in the first appropriation made this year, whether it is the supplemental or whether it is the regular appropriation bill for the Department.

Senator BIBLE. I, too, would hope that would be done, and without delay.

Mr. WATKINS. We have noted the President's program to better the economic situation of the American Indians. We are in full accord, and point out that much help can come to many of the tribes out of the awards this Commission may make as our adjudications come to final judgment, wherein the Indians are victors. And of course they do not always win.

MARGINAL CLAIMS

There are many claims filed which are marginal, as a matter of fact, and of course, many of those have been weeded out, so that the statement we have at the bottom of this page, for instance, shows that 108 cases were dismissed. Part of those were fringe cases. Only 50 tribes actually got awards.

We are in full accord and point out that much help can come to many of the tribes out of the awards this Commission may make as our adjudications come to final judgment wherein the Indians are victors.

STATUS OF INDIAN CLAIMS

In this connection, I submit a statement of the status of the Indian claims now pending before this Commission as of January 1, 1964.

Senator BIBLE. That will be incorporated in full in the record. I think it is worthy of note that the total awards made by the Indian Claims Commission to date are $94,914,641.

(The statement referred to follows:)

Claims pending, dismissed, and awarded

Pending on title (including some accounting cases)	231
Pending on value	32
Pending on offsets	6
Awaiting briefs and findings	78
Assigned for decision	29
On appeal, U.S. Court of Claims	18
Pending on motion to dismiss, and summary judgment	20
Pending on motion to rehear	3
Dismissed	108
Pending compromise settlement	13
Final awards	50
Total	588
Total awards to date	$94,914,641

LENGTH OF TIME TO ADJUDICATE ALL INDIAN CLAIMS

Senator BIBLE. Now, is there any way that you can determine as to the length of time that it will take completely to adjudicate all Indian claims in the United States?

Mr. WATKINS. I wish I could make a fairly accurate estimate, but I think it is quite impossible.

You see, all of these claims—when we make an adjudication, the Indians have a right of appeal to the Court of Claims, or the Government also has a right of appeal. These are adversary proceedings, fought sometimes rather vigorously, and when they go up to the Court of Claims, it takes some time for them to get around to deciding the questions appealed.

APPEALS AND FURTHER ACTIONS

Only about, as I remember, 1 claim a month gets on the calendar for argument, and we have something like 18 or 19 appeals pending there now.

But if the adjudication is for considerably less money than the Indians think they ought to get, they always insist on an appeal, and the attorneys under contract are bound to appeal if the Indians want an appeal, though they personally feel an appeal is not justified.

That is one of the things we have to take care of. And sometimes the Court of Claims sends them back for further action. And there have been times that the court has reversed itself after we have gone ahead with a long line of cases based on previous rulings, and then we have to remodel all those cases again to carry out the new rulings.

Senator BIBLE. Then there are many, many Indian tribes throughout the United States who still do not have their claims adjudicated?

Mr. WATKINS. Oh, yes; the majority of the claims are still left.

ACCELERATED PROGRAM TO ADJUDICATE CASES

We have been trying, with an accelerated program, to get more and more of these cases adjudicated each year, but then we ran into this problem about impecunious Indians and their lack of money to properly prepare their cases.

Senator BIBLE. Is there a time limit set within which they must file these claims?

Mr. WATKINS. They have all been filed. In 1951, August 13, 1951, they had to have them all filed, and there have been no claims filed since.

BACKLOG OF CASES

But, you see, we immediately had a backlog of around 852-some-odd causes of action contained in maybe 370 docket numbers. And then some of those docket numbers had 15 or 20 or 25 causes of action in each docket number.

So we had to break those down, because it is obviously impossible to try one of those cases with all of those causes of action in a single docket number. We would never get through with it.

And it takes many, many years to prepare these cases—as many as 10 years in preparing them—so when we get them, with three judges there to have to be brought—at least two of them—into agreement, before we can issue a decision, it slows things down.

And cases that have been worked on for 10 years in preparation, we cannot be expected to adjudicate them in 3 or 4 months. Sometimes it will take a year and a half or 2 years, because you can only assign one staff man to work with the Commission in each case, and new hearings must go on in the meantime.

Senator BIBLE. The number of Indian claims that must go to final adjudication are already known, because they had to be filed before 1951?

Mr. WATKINS. That is right. We are working against a backlog that was given us in the beginning, and sometimes it gets an increase by the activities of the appellate court and mistakes we have made, or else they would not have reversed us.

And almost anything can happen in these claims cases, as we are finding out from time to time. No matter how hard we try to speed up our activities, we find something happens that makes our efforts somewhat ineffectual.

But we are doing our level best. We have adopted an accelerated program, and we hope to make it work.

Senator BIBLE. Thank you very much, Senator.

Senator Bartlett?

LOCATION OF COMMISSION

Senator BARTLETT. Where does the Indian Claims Commission live officially?

Mr. WATKINS. In the General Accounting Office on G Street, 441 G Street.

ORGANIC ACT REVISION

Senator BARTLETT. Do you see any need at this time for revision in any way of your organic Act?

Mr. WATKINS. We do not. I think a revision would probably create more problems for us, because we have now interpreted and got a working legal setup that might have to be revised, if we started tinkering with the act.

Senator BARTLETT. I suspect that something like that may lie ahead of us, because although I do not know whether the claims would go to the Indian Claims Commission, it is certain that there will be further claims originating in Alaska in the days to come.

CLAIMS ORIGINATING IN ALASKA

You, particularly, Senator, are aware of the situation there, because of your service in the Senate, when you took such a special part in the determination of the Tongas National Forest resolution.

Our difficulty then, you will recall, as it is today, is that these claims may be there in all validity, but there has been no actual taking, as was the case in the 48 States.

Mr. WATKINS. Senator, let me point out to you that that is all provided for.

Any claim that comes into existence since August 13, 1946—and of course it cannot come into existence until there is a taking—can be filed in the Federal district courts or the Court of Claims.

Senator BARTLETT. Does this except the Claims Commission from any necessity for making the determination?

Mr. WATKINS. Yes. The claims we have all had to have come into being prior to August 13, 1946.

Senator BARTLETT. Unless there should be a revision of the basic law.

Mr. WATKINS. Oh, yes. But I would say we have plenty of work to be done for years to come, and we would not want anything to be added to it.

Senator BARTLETT. You are not asking for the Alaska cases?

Mr. WATKINS. No, sir; not the new ones. We have some of the old ones.

Senator BARTLETT. Yes, I understand that.

ATTORNEYS WITHDRAWING FROM CASES

Mr. WATKINS. And we find that attorneys who signed up in those old cases have withdrawn from the cases, or the contracts of employment with those Indians in Alaska have not been renewed, and we find quite a number of your constituents up there without an attorney.

Senator BARTLETT. I realize that, and regret it.

Mr. WATKINS. And the attorneys who signed originally do not want to have anything more to do with it.

Senator BARTLETT. I would be willing, Mr. Chairman, to look for a more definitive answer than Senator Watkins will make for a determination of all these claims.

FINAL DETERMINATION OF ALL INDIAN CLAIMS

Mr. WATKINS. I hope with some support in the adjudication it can be finished in 10 years, and we were trying to do it in less time than that.

Senator BARTLETT. In saying that, I was not intending to make any remark derogatory in any sense of the work being performed by the Indian Claims Commission.

It was only that these issues are so complex, there are so many of them, they are so interminable, so difficult of proper judgment, that we seem to go on forever.

Mr. WATKINS. Of course, you cannot take away the right of appeal from the Indians. That would be improper, and I would not suggest it. But if they did not take these appeals, we probably could go a lot faster.

Senator BARTLETT. I think you are going pretty fast, if you think you might be able to wind it up in 10 years.

Senator BIBLE Thank you very much, Senator Watkins. It is always nice to see you and hear from you.

CIVIL WAR CENTENNIAL COMMISSION

STATEMENTS OF HON. FRED SCHWENGEL, VICE CHAIRMAN, AND DR. JAMES ROBERTSON, EXECUTIVE DIRECTOR

1965 BUDGET REQUEST

Senator BIBLE. Our next group will be the Civil War Centennial Commission.

Mr. Schwengel is with us, this morning, and Dr. Robertson, and Mr. Gass.

In the fiscal year 1965, the Civil War Centennial Commission proposes a budget of $100,000, the same amount appropriated in fiscal year 1964.

The justification for the request will be printed in the record.

(The justification statement referred to follows:)

Appropriations and budget estimate

Appropriation, 1963	$100,000
Appropriation, 1964	100,000
Budget estimate, 1965	100,000

Analysis by activities

Activity	Fiscal year 1963, amount available	Fiscal year 1964, amount available	Fiscal year 1965, estimate
Planning the commemoration	$99,940	$100,000	$100,000
Unobligated balance lapsing	60		
Total	100,000	100,000	100,000

JUSTIFICATION

CIVIL WAR CENTENNIAL COMMISSION

The estimate of $100,000 for 1965 is the same as the 1964 appropriation.

The 1965 fiscal year will be the most critical and the most productive in the Commission's life, for it will witness the first major fruition of the Commission's program of historical publications.

1. The "Impact Series" will move from plan to reality. A number of the volumes in this series will be published during 1965. All others will be in the press.

This means that the Commission's staff (and some of its uncompensated members, as well) will be heavily engaged in reviewing and editing final drafts of the "Impact Series" typescripts, in verifying data and citations, and in clearing matters of content, form, and style with the authors and the publisher, Alfred A. Knopf, Inc.

2. At the same time the Commission expects to have in preparation a bibliography of Civil War books. Its purpose will be to guide the serious student to the massive Civil War literature already in print.

As this project is too large for the staff to undertake alone, the Commission plans to seek the help of rising scholars who will work on segments of the bibliography at their various universities in return for modest fees.

In addition to these two major publishing endeavors—the "Impact Series" and the bibliography—the Commission will continue its other activities. These include the preparation and distribution of its monthly newsletter, cooperation

with State and local centennial organizations, the awards program, and the campaign of urging State libraries and historical societies to collect and preserve Civil War documents hitherto reposing, unused, in private hands.

Although the projects and activities sketched above will command most of the Commission's attention—indeed, they will tax the energies of its small staff—public ceremonial events will by no means be neglected. The Commission expects to take part, in the spring of 1965, in selected commemorative ceremonies marking the centennial of the termination of the Civil War hostilities. In these cases the Commission will do all in its power to impart to the cermonies a tone of dignity and to emphasize the spirit of concord and national unity.

Itemization of estimate

	Actual, 1963	Available, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$99,940	$100,000	$100,000	
Unobligated balance	60			
Appropriation	100,000	100,000	100,000	
Obligations by objects:				
11 Personnel compensation	56,319	53,000	55,100	+$2,100
12 Personnel benefits	2,503	2,700	2,800	+100
21 Travel and transportation of persons	8,221	9,000	8,100	−900
22 Transportation of things	12			
23 Rent, communications, and utilities	2,046	3,000	3,000	
24 Printing and reproduction	14,753	15,000	15,000	
25 Other services	15,540	16,300	15,000	−1,300
26 Supplies and materials	451	1,000	1,000	
31 Equipment	5			
Total obligations	99,940	100,000	100,000	

ACCOMPLISHMENTS AND PLANS OF THE COMMISSION

Senator BIBLE. We will be glad to have your statement on your accomplishments during the past year, and the plans you may have for the coming fiscal year.

Mr. SCHWENGEL. First I want to say that I am speaking for Dr. Allan Nevins, who is chairman of our Commission, who lives in California, and who felt that his coming here today would be an unjustifiable expense, maybe, in view of the fact that others could testify for him.

I want to say, before the committee, and about him, that we are fortunate in having a man like this as chairman of this Commission. Rarely do we find a man so knowledgeable and so highly respected in the historical field of his time to serve in this way.

CONTRIBUTIONS AND APPRECIATION

I for one am indeed grateful, and I am sure the Members of Congress are, also.

And, of course, I speak also for the Commission. There are several Members of Congress on both sides of the aisle who are members of the Commission and who in various ways are making a very fine contribution to the Commission.

I want to express a word of appreciation to you, Senator, because I remind myself and you must be reminded that together we serve in different Houses on committees that deal with matters here in the District.

We have been wrestling with difficult problems, and I am thankful to have someone like you interested in this, because only as we have people who have a sympathetic interest can we find a solution to these problems. I am grateful for that.

I was hopeful that I could speak in the presence of a great man that I am sure all of you respect as we do, and have in the past—Mr. Hayden, who has been so encouraging in many ways as we dealt with things historical around here.

U.S. Capitol Historical Society

I want to publicly commend the part he played in the creation of the U.S. Capitol Historical Society.

Senator Bible. We will convey those sentiments to him. He has been here every morning with the exception of this morning, but he had a conflict that he could not avoid.

Mr. Schwengel. I am interested in history, because I think I realize the truth of Sandburg's statement that wherever a people or a nation forget their hard beginnings, they are beginning to decay, and also because I realize that the more attention and consideration we give to the history of America, and the understanding we get therefrom, the surer we are of the virtues of our system.

And besides that, I think the more we reflect on this, the less likely we are to make mistakes in this very complex and difficult time in which we live.

Congressional Interest in the Commission

In spite of the fact that the Commission has had some difficult times, we are coming out of them with a fine record, because first of all, there was a genuine and sympathetic interest in the Congress in what we are trying to do.

We have a fine Commission, dedicated people, and fine employees, of whom I have spoken before.

Assistant Director of the Commission

There is one man, however, who has not appeared in the record, and over his objection I want to say something in behalf of him. His name is Ed Gass. He is the Assistant Director of this Commission. And in critical times and difficult times he has been very, very helpful.

He comes to us with 16 years of experience in Government. He is a former teacher of history. He has had fine training in some important colleges and universities, like the University of Tennessee and the University of North Carolina.

And he comes to us from the Interior Department, after having served on the Woodrow Wilson Commission, that has made a very fine contribution, the John Marshall Bicentennial Commission, and now as an Assistant Director of the Civil War Centennial Commission.

Director of the Commission

Previously, I have spoken about the man who sits to my right before this committee. His name is Dr. James Robertson, one of the finest young historians in America, who already has made quite a

reputation for himself. We were indeed fortunate to be able to get him to serve as a Director of the Commission.

I have quite a long statement, which I will not go into in detail. It deals with his contribution and the other contributions to the Commission.

Senator BIBLE. It will be incorporated in full in the record.

(The statement referred to follows:)

ACTIVITIES OF THE CIVIL WAR CENTENNIAL COMMISSION

Again I state, it is a pleasure and a privilege to come before this committee in behalf of the Civil War Centennial Commission.

By commenting briefly on a few specific activities of the Civil War Centennial Commission, I believe I can give you useful information about the Commission in a few words.

First, there is the booklet, "The Civil War," published by the Commission last October. Copies of it are before you. This splendid little volume was written by Dr. Robertson, our executive director.

Because it was prepared primarily for the Nation's high school students, it meets a pressing need. I am confident that you are aware of this need; for years high school pupils and teachers have requested such a work. By the thousands their requests have come, not only to the Commission but also to other Federal agencies.

Now, at last, this vast need has been partially met. During the few months since the booklet came from the press, the Commission has mailed out nearly 100,000 copies of it, without charge—practically all of them in response to high school students' requests, which continue to pour in.

While this demand for the booklet has been immensely gratifying, it has also been overwhelming. It quickly became evident that we would not pay the costs of printing and mailing additional copies. We therefore turned the entire project over to the Superintendent of Documents, who sells the brochure for 25 cents per copy. That is a practical solution to the problem. Our only regret is that we were not able to mail copies without charge to all of the rural and smalltown high schools—the ones that most need it because they are not served by adequate libraries.

It seems to me that in preparing and publishing this student booklet, the Commission has rendered a valuable service, not only to the Nation's schools but to the Nation itself. And please bear in mind that "The Civil War" is but one of a number of highly informative booklets the Commission has prepared for the interested and intelligent layman, as distinguished from the professional scholar. Other titles, in our "layman's series" are listed in Dr. Nevins' statement.

But we are also producing two great works of scholarship, although both of them will serve the informed laystudent as well as the professional historian.

One of these scholarly works will comprise an entire series of volumes. This is the "Impact Series," about which we have previously testified. Each of its 15 volumes will carefully assess the impact of the Civil War on a major phase of American life, e.g., agriculture, business enterprise, science and technology, population, medicine and health, the arts, law, government. Each volume is underway. Each is being prepared by a man who is both a first-rate scholar and a competent writer. Let me remind you that authors' fees and publication costs will not fall on the Commission but will be borne by Alfred A. Knopf, Inc., although the project is a Commission project. Some of the Impact volumes are nearly ready for publication.

Our second scholarly work is a bibliography of books about the Civil War. This will not only list but will critically assess some 10,000 to 12,000 titles. This broad although selective listing, together with the succinct assessment of each title, will be a boon to all students of the war.

Each segment of the bibliography is being prepared by a scholar of demonstrated competence. The Commission will pay each of them a small fee—one so modest as to be little more than a token payment. We are seeking a publisher who is willing to assume the cost of printing the bibliography. If we do not find one, the Commission itself will have to bear that cost, although in that case we shall do everything in our power to keep that cost as low as possible.

From this point forward, the staff will devote nearly all of its energies to the "Impact Series" and the bibliography—assisting authors and compilers, helping them find needed materials, verifying data against original sources, reviewing drafts.

One observation is appropriate at this point. We are fortunate beyond measure in having the services of Dr. Nevins as Chairman and Dr. Robertson as Executive Director. Through their skills, their energy and their extraordinary talents, the Commission is making invaluable contributions to the study and the better understanding of a momentous segment of the Nation's history.

The Commission's remaining national assemblies will be held in Atlanta, Ga. (June 12 to 14, 1964), and in Springfield, Ill. (May 1965).

Finally, the Commission will take part in some major commemorative ceremonies. We expect the most notable of these to be ceremonies held during the spring of 1965, marking the termination of the war. Our aim in all cases will be to stress the theme of national unity. As our Chairman, Dr. Nevins, stated more than 2 years ago, we shall treat the end of hostilities "not as victory or defeat, but as a beginning—the beginning of a century of increasing concord, mutual understanding, and fraternal affection among all the sections and social groups of the Republic."

"THE CIVIL WAR" BOOKLET

Mr. SCHWENGEL. May I speak just briefly about the booklet, "The Civil War," which Dr. Robertson wrote for the Commission. Copies are before you and have been distributed already to a hundred thousand different people in the United States, including a great number of high school students.

He can tell you a little bit about that. I just want to say that it is a very successful venture; has been very well received, and with it we are getting across a very worthwhile and necessary story, and also a better understanding of what the Civil War was all about, and some of the good things that have come out of it.

THE IMPACT SERIES

In addition, the Commission thankfully, and largely because of Dr. Allan Nevins' leadership, is producing two great works of scholarship, and both will serve the informed lay student as well as the professional historian.

One of the scholarly works will comprise an entire series of volumes. This is called the inpact series, about which we have testified earlier. Each of its 15 volumes will carefully assess the impact of the Civil War on major phases of American life, such things as agriculture, business enterprise, science, technology, population, medicine, health, the arts, law, and government, and each volume is underway.

AUTHORS' FEES AND PUBLICATION COSTS

And let me remind you that the authors' fees—and this is very important to the committee to note, and I wish the public would appreciate it more—the authors' fees and publication costs will not fall on the Commission, but will be borne by Alfred A. Knopf, Inc., although the project is a Commission project.

And I think this is the first time something like this has happened in Government, and it is going to be a real contribution, a real monument to the efforts of the Commission, and all of us will be happy about that.

BIBLIOGRAPHY OF CIVIL WAR BOOKS

The Commission's other scholarly work is to be a bibliography of Civil War books. This I also think will be a great contribution.

These are my statements, and now I will yield to this gentleman.

Senator BIBLE. I appreciate your statement very much, Congressman Schwengel. We certainly know of your intense interest in this field, as well as your intense efforts for the District. I certainly commend you on this score.

EXISTENCE OF THE COMMISSION

I think Dr. Robertson would be the responsive witness as to a few questions I would like to ask.

How many more years will this Commission remain in existence? Is this set by the statute?

Dr. ROBERTSON. Two more years, sir.

Senator BIBLE. That will be fiscal 1965 and fiscal 1966?

Dr. ROBERTSON. The last year being devoted to drafting of the final report.

PERSONNEL

Senator BIBLE. And you are asking for the statutory amount of $100,000?

Dr. ROBERTSON. Yes, sir; absorbing our own salary increases and other expenses.

Senator BIBLE. How many people under personnel compensation do you employ?

Dr. ROBERTSON. We have five.

Senator BIBLE. There are five of you. Are you all historians? Or is that two historians?

Dr. ROBERTSON. Two historians and three staff members.

Senator BIBLE. What do the staff members do?

Dr. ROBERTSON. They are secretaries and administrative assistants.

Senator BIBLE. Then there is Mr. Gass and yourself, and three secretaries?

Dr. ROBERTSON. Yes.

Senator BIBLE. It is a five-member staff. Well, that is a modest staff.

And what will you be doing this year, starting July 1, 1964, for 1965?

COMMEMORATIONS OF THE CENTENNIAL

Dr. ROBERTSON. We are working, in addition to the publications program which Congressman Schwengel has described, on the final commemorations of the centennial itself, the surrenders at Appomattox, at Durham Station, and in Texas.

PROGRAM COMMEMORATING DEATH AND FUNERAL OF PRESIDENT LINCOLN

In addition, we also have a program commemorating the death of President Lincoln and his funeral procession to Springfield, Ill. They are to be public ceremonies.

And of course we will continue to assist the various State and local centennial committees in their respective work.

NEVADA CENTENNIAL PROGRAM

Senator BIBLE. Has my own State of Nevada asked you for help in this field? This is its centennial year.

Dr. ROBERTSON. Yes; it is one of the States which has no centennial commission.

Senator BIBLE. Oh, yes.

Dr. ROBERTSON. A State centennial commission; not a Civil War Centennial Commission.

Senator BIBLE. That is right. They have a State centennial commission, because this year we are commemorating our 100th anniversary.

We have also looked upon Abraham Lincoln as the father of the State of Nevada, for various reasons, both because he needed some gold and silver we happened to have in our hills, and because he needed a little help on the 13th, 14th, and 15th amendments.

Interestingly enough, the 15th amendment was drafted by the first U.S. Senator from my State, William Morris Stewart.

So I would hope that they would get the benefit of your views and your suggestions in their commemoration of the 100th birthday. And I will ask them to get in touch with you.

I do not know whether you have material that can be helpful to them or not, but maybe you do.

WEST VIRGINIA CENTENNIAL PROGRAM

Dr. ROBERTSON. We just finished helping West Virginia with its State centennial program last year.

Senator BIBLE. Yes. We are contemporaries, almost, in that field.

I want to commend you for the work you have been doing.

You will, then, have a wrap-up operation in the following fiscal year?

Dr. ROBERTSON. Yes, sir.

FINAL REPORT

Senator BIBLE. How do you finalize this? What do you do? Do you come out with a final report?

Dr. ROBERTSON. Yes, sir; we will draft up everything that has been done since 1958, relative to the Civil War centennial.

Senator BIBLE. And that is a report?

Dr. ROBERTSON. A report to the Congress.

Senator BIBLE. That is called for by the statute, is it?

Dr. ROBERTSON. By the statute; yes, sir.

Senator BIBLE. Your written statement will appear at this point in the record.

(The statement referred to follows:)

STATEMENT BY JAMES I. ROBERTSON, JR., EXECUTIVE DIRECTOR, CIVIL WAR CENTENNIAL COMMISSION

Since my colleagues, Dr. Nevins and Congressman Schwengel, have covered rather fully the historical activities of this Commission, I wish only to underscore some of the points which they have brought to your attention.

We of the Commission feel that we are now on the brink of this agency's most productive period. In addition to our student handbook of the Civil War—which has enjoyed a popularity unprecedented in the history of this Commission—we have made marked strides in our larger, more comprehensive publication programs. At present 15 of the Nation's outstanding scholars are laboring on as many volumes for our "Impact Series." The first of these studies, treating of the impact of the

Civil War on nonmilitary aspects of American life, is scheduled for publication early next year.

A few weeks ago we sent out to another 15 historians the basic materials and guides for the first comprehensive critical bibliography of Civil War titles. Our hope is to select 10,000 to 15,000 volumes, appraise each pointedly, and publish the whole with a thorough and cross-referenced index. Our plan, and our goal, is to carry this bibliography far beyond the physical makeup of such respected bibliographies as the "Harvard Guide to American History," published more than a decade ago. We feel this pending compilation will be one of paramount importance to a better study of American history.

As Executive Director of the Commission, let me add, too, that the Commission staff will assist and work closely with our 15 bibliographers and our 15 "Impact Series" authors. We will be a liaison for their concerted efforts, will provide research assistance and stenographic aid, and will strive to coordinate the internal workings of these two large undertakings. Without such a coordinating agency, neither could succeed.

We of the National Commission are proud of the fact that a sizable number of State and local Centennial committees have followed our example and undertaken scholarly studies of local communities and military units and their roles in the Civil War. The States of Ohio, Indiana, North Carolina, and Louisiana have made exceptional progress in these endeavors. They and other agencies, similar to theirs rely on the National Commission for counsel, suggestions, and nonmonetary assistance in such publications programs. Insofar as possible, we assist them to the fullest degree.

The Seventh National Assembly will be held June 10–12 of this year in Atlanta, Ga. At that time we will receive reports and recommendations on the various publications programs, as well as summaries of those Centennial commemorations yet to be held. The Eighth and final National Assembly will be held in May 1965, at Springfield, Ill., in conjunction with the centennial of the funeral of President Abraham Lincoln.

The U.S. Civil War Centennial Commission is deeply indebted to the Congress for its advice and assistance to date. In these final 2 years of the Centennial, we rely more heavily than ever on the continued support of the Congress in carrying our national—and, indirectly, the State and local—programs to fruition and success.

COOPERATION WITH THE STATE OF NEVADA

Senator BIBLE. Mr. Gass, did you have anything you would care to add?

Mr. GASS. No, sir; but we will certainly be happy to work with the people of your State and be of any assistance we can, especially if there is gold and silver still left out there.

Senator BIBLE. I wish there were more. They have rather exhausted that in these hundred years. But I will pass that message along.

I have nothing I care to add, unless you care to say something else.

Thank you very much, and I assure you I will read this pamphlet.

AVAILABILITY OF BOOKLET "THE CIVIL WAR"

That is obtainable for a cost of 25 cents?

Dr. ROBERTSON. From the Government Printing Office. We have some still left we could give to individual Senators free of charge.

Senator BIBLE. I am going to read this, because this is a fascinating part of our American history.

I will place Dr. Allan Nevins' statement in the record.

(The statement referred to follows:)

STATEMENT BY ALLAN NEVINS, CHAIRMAN, CIVIL WAR CENTENNIAL COMMISSION

WORK OF THE CIVIL WAR CENTENNIAL COMMISSION, 1963–64

The year 1863 was in important respects the most critical of the Civil War, and in 1963 the National Civil War Centennial Commission was busily occupied in assisting State and local agencies to commemorate many of the war's noteworthy events. In important ways, the Executive Director, Dr. James I. Robertson, and the Washington office, gave practical aid to the Mississippi and Pennsylvania organizations in commemorating Vicksburg and Gettysburg. Dr. Robertson spoke on both battlefields. The Commission also held its own ceremony in Washington to mark the centennial of Lincoln's Gettysburg Address and his third state of the Union message to Congress. Planned by the Chairman, Dr. Allan Nevins, this program brought five eminent men upon the platform of the Interior Department auditorium to deliver excerpts from essays they had prepared. They were Senator Paul Douglas, of Illinois; Mr. John Dos Passos, the novelist; Mr. Robert Lowell, the poet; Dr. Reinhold Niebuhr, the theologian; and Mr. Arthur L. Goodhart, long master of University College, Oxford, and expert upon Anglo-American law. The Commission plans to publish the five essays in book form.

In May 1963, the Commission held its annual national assembly in Boston. Members of numerous State centennial commissions, writers, university scholars, publishers, and others attended a highly successful series of panel discussions. Governor Endicott Peabody of Massachusetts was present to deliver a stirring dinner address. On the following day the Commission assisted at the ceremonies held at the St. Gaudens Monument to Robert Gould Shaw on Boston Common to marke the centenary of Colonel Shaw's death at Fort Wagner, and to honor the Negro regiment, the 54th Massachusetts, which he led. Mr. Bruce Catton of the National Commission and Governor Peabody spoke from the steps of the State House to a large audience.

The National Commission continued to throw its heaviest energies into the production of printed materials on the Civil War in two categories, brochures useful to schools and the general public, and scholarly works of permanent value to serious students of the conflict. In the first category its most important publication was a 64-page manual, "The Civil War," fully illustrated, treating 11 aspects of the upheaval, from causes of the struggle to the legacy of the war, in simple language for the particular benefit of young people. The demand soon exhausted printings of 100,000 copies, offered free of charge, and the Commission found it necessary to place further distribution in the hands of the Government Printing Office. The Commission continued to circulate earlier publications, including its pamphlets "Free Homesteads for All Americans: The Homestead Act of 1862," by Paul W. Gates; "The Origins of Land-Grant Colleges and State Universities," by Allan Nevins; "Our Women of the Sixties," by Sylvia G. L. Dannett and Katharine M. Jones; and "Emancipation Centennial, 1962: A Brief Anthology of the Preliminary Proclamation."

In its second category of publications, scholarly works of permanent value, the National Commission continued to press ahead with its 15-volume "Impact Series" planned and edited by Chairman Allan Nevins, which Alfred A. Knopf, Inc., is to publish without cost to the Commission. These volumes, of 100,000 to 140,000 words each, are being written by scholars of recognized standing as authors. They treat of the impact of the war upon agriculture North and South; upon medicine, public health, and nursing in both sections; upon science and invention; upon the development of industrial enterprise and organization; upon government, local and State as well as Federal and Confederate; upon education and culture; upon women; and upon other aspects of economic and social life. This series, the Commission is confident, will open up large and important aspects of the war hitherto neglected in favor of military and naval studies.

Meanwhile, the National Commission, despite limited resources, has carried forward its project for a comprehensive bibliography of books and pamphlets upon the sectional struggle 1860–65, a work badly needed by general readers and scholars alike. It has enlisted 15 scholars, each responsible for a single segment of the bibliography, who contribute their services for a mere token stipend. During the year 1964–65 the Commission expects to complete this selective list of perhaps 10,000 titles, with brief critical comment on each, and have it ready for publication. Throughout the past year the Commission has given all the aid and encouragement in its power to the Ulysses S. Grant Association, which

is preparing the complete writings of General and President Grant for publication by the Ohio State University Press, and the Jefferson Davis Association which is preparing for the full publication of Mr. Davis' correspondence, with the University of Texas as the intended publisher. To assist these two organizations in their important undertakings, the Chairman, Dr. Nevins, has traveled to Columbus, Ohio, and Houston, Tex. Both enterprises have received financial support from interested bodies, public and private, and both seem assured of successful completion.

Senator BIBLE. We will keep the record open for the purpose of allowing other Senators and Congressmen to file such statements as they care to file in support of this budget. It will be open until Friday of this week.

(The following statement by Representative Elliott was subsequently submitted:)

STATEMENT BY HON. CARL ELLIOTT, REPRESENTATIVE FROM THE STATE OF ALABAMA IN SUPPORT OF CIVIL WAR CENTENNIAL COMMISSION'S REQUEST FOR FUNDS FOR FISCAL YEAR 1965

Since my membership on the Civil War Centennial Commission began in 1963, I have made a careful study of its program. In my judgment that program is an excellent one.

For one thing, the National Commission works closely with the various State commissions that are commemorating the centennial. Specifically, I have in mind the record of splendid cooperation between the National Commission and the Alabama Civil War Centennial Commission, whose executive director is Dean A. B. Moore, of the University of Alabama. But this is no isolated case; the National Commission has worked in the same friendly and helpful way with the other 40-odd State commissions.

Another feature of the National Commission's program is its balance and variety. Let me list a few examples.

1. Through its monthly newsletter the Commission keeps a nationwide readership abreast of current and forthcoming centennial events of all kinds. This not only publicizes the important work of State and local organizations but encourages others to assist in it and to develop useful projects of their own;

2. The Commission sponsors some splendid public commemorative programs. These programs have been not only inspirational but have also included thoughtful addresses, original musical compositions and poetry;

3. Then there are the Commission's annual national assemblies. These meetings are attended by professional historians, high school teachers, archivists, members of State commissions, writers and publishers, and by representatives of civic and patriotic organizations. Those who attend are keenly interested in the Civil War and its centennial. At the assembly meetings these people engage not only in practical "shop talk" but also in stimulating panel discussions of Civil War history;

4. Finally, there is the Commission's publications program. From time to time the Commission prepares and distributes highly useful pamphlets or booklets that are written for the high school student or the adult layman. In addition, the Commission is sponsoring two scholarly projects—the "Impact Series" and the bibliography.

It seems to me that even when considered singly these are valuable and useful activities. But in combination their value is far greater than the simple aggregate of the separate parts. I am confident that the Commission is rendering a lasting service to the Nation.

That is why I hope that we will continue to have your support, as in the past.

OFFICE OF SALINE WATER

STATEMENTS OF CHARLES F. MacGOWAN, DIRECTOR; D. H. MILLER, CHIEF, DIVISION OF CONTRACTS AND ADMINISTRATION; J. W. O'MEARA, STAFF ASSISTANT; AND DALE L. ROTHROCK, FINANCE OFFICER

1965 BUDGET REQUEST

Senator BIBLE. Office of Saline Water, Mr. MacGowan. You bring up as many members of your staff as you desire.

Mr. MACGOWAN. I have with me Mr. O'Meara and Mr. Miller.

Senator BIBLE. We are happy to have you here.

The budget request for the Office of Saline Water for salaries and expenses in fiscal year 1965; $10,650,000. This is an increase of $650,000 over the amount appropriated in fiscal year 1964.

The justification for this request will be printed in the record at this point.

(The justification referred to follows:)

HIGHLIGHT STATEMENT

The Saline Water Act of 1952, as last amended in 1961 (Public Law 87–295) authorizes a research and development and demonstration plant program to provide practical means for the economical production of water suitable for beneficial consumptive uses from sea, brackish, and other mineralized or chemically charged waters. This act authorizes $75 million to carry out its provisions during the fiscal years 1962–67, inclusive, and to finance such subsequent activities as may be required to correlate, coordinate, and round out the results of the studies of research undertaken. The primary purposes of the act are being accomplished by—

(*a*) Encouraging and promoting fundamental scientific research and basic studies;

(*b*) Conducting engineering research and technical development work in laboratory and pilot plant installations;

(*c*) Studies relating to the feasibility of proposed new demonstration or production plants in water-short areas;

(*d*) Determining the potentials for economic recovery of commercially valuable byproducts resulting from conversion of saline water;

(*e*) Sponsoring studies and surveys of areas and communities in the United States where water conversion processes are now or may soon become competitive with commercial water supply costs; and

(*f*) Assemble, maintain, and disseminate pertinent scientific literature and information; investigate promising new projects; and sponsor and participate in regional, national, and international conferences.

The basic research activities in the Office of Saline Water are concerned primarily with the exploration of new concepts, ideas and attainment of scientific knowledge, all of which may be applicable to any desalination process from its inception to its engineering development. The broad scope of the program encompasses the following areas:

I. Composition, structure, and properties of water and aqueous systems.
II. Kinetics, thermodynamics and transport phenomena.
III. Phase transitions including nucleation and crystal growth.
IV. Surface chemistry and physics.
V. Biological and organic systems.
VI. Materials.
VII. Economic studies.

Six branches were established in the Division of Research in order to competently handle the highly technical research involved. Those branches are responsible for investigations in the fields of inorganic chemistry, physical chemistry, physics and surface chemistry, organic and biological chemistry, materials and water supply economics. It is believed that the basic research being performed in these areas will enable the development of better methods of desalination. Nearly all present processes are thermodynamically inefficient and require more than thirty times the work energy needed for reversible separation. Present

processes have interfaces between phases, e.g. (liquid-vapor, liquid-solid, liquid-liquid) or employ semipermeable membranes with many boundary surfaces. Such processes involve mass transport and in general transport is the principal source of energy degradation. Basic research now underway can provide wider knowledge of both the transport processes and the thermodynamic losses thereby contributing to the discovery and development of new or improved processes.

Engineering research and technical development work is now underway under a number of contracts for the purpose of translating research data and results into laboratory bench-scale equipment, pilot units, and complete pilot plants. The Division of Processes Development (applied research) is staffed to perform and supervise engineering unit operations and processes applied to water conversion. It employs results and data obtained from basic research—it develops recommendations on processes that can be considered feasible in the construction of demonstration or production water conversion plants. Applied research activities are specifically directed toward lowering costs of conversion through the development of new processes or the improvement of existing processes with more efficient use of energy, reductions in equipment costs, reduction in operating costs or a combination of these. The specialized fields of operations within the Division are as follows: distillation processes, membrane processes, special projects, process analyses, and evaluations and heat transfer. The work of this Division has included the establishment and construction of a research and development test station at Wrightsville Beach, N.C.: It was completed in 1963. It provides a single location where testing, evaluation, and further development of various conversion processes can be conducted at a seacoast site where a constant supply of clean sea water is available. It is anticipated that 10 or more projects will be active at the center during 1965, at which time operation will begin under a field staff of saline water employees. It has been determined that operation of this station by Government employees will result in significant economies through improved supervision of contractor operations, more effective control over Government-owned property and consolidated purchasing of equipment and materials for pilot plant maintenance.

At the close of the fiscal year 1964 there will be in operation four demonstration plants originally authorized by Public Law 85-883, approved September 2, 1958, as follows:

Location	Process	Design capacity (gallons per day)	Activated	Capital cost	Annual operating cost
Freeport, Tex	Long-tube, vertical, multiple-effect distillation.	1,000,000	June 21, 1961	$1,372,662	$400,000
San Diego, Calif	Multistage flash distillation	[1] 1,000,000	Mar. 10, 1962	1,771,529	465,000
Webster, S. Dak	Electrodialysis	250,000	Oct. 20, 1961	535,800	125,000
Roswell, N. Mex	Forced circulation vapor compression.	1,000,000	July 1, 1963	1,890,700	385,000

[1] Has been operated for short test periods at 1,400,000 gallons per day.

The highly successful demonstration plant operations to date have generated interest in the development of proposals for cooperative construction of water production plants in several water shortage areas. The budget estimates for 1965 provide funds with which to study, explore, and report on such future applications, including recommendations as to the processes, size, location and estimated costs of such proposed plants. In this connection, the Interior Department and the Office of Saline Water are working jointly with the Atomic Energy Commission with respect to the feasibility of using nuclear energy, and with the Department of Defense and other Federal agencies in connection with water supplies required to service military or naval installations. In addition there has been great interest displayed toward the potential use of water conversion knowledge as a useful tool in our diplomatic international relationships and in the industrial development of water-deficient foreign areas.

The Office of Saline Water is recognized in the United States and internationally as a focal point for assembly and distribution of scientific material and data involving desalination processes and progress of the research and development programs. In 1963 the Office of Saline Water was designated by the NATO Parliamentarians Conference as the central point for receipt and redistribution of technical data concerning desalination. Since that time it has developed

information and data for that organization as well as for the International Atomic Energy Agency. The department has been represented at two IAEA meetings by the Under Secretary of the Interior. Liaison has been established with the Department of State relating to a proposed international conference on water conversion problems. In its activities connected with the domestic problems concerning water deficient areas, the Office of Saline Water is developing current statistics and data on the costs of conventional water supplies.

In the fiscal year 1964 there was appropriated a total of $11,850,000, which included $10 million for basic and applied research and general administration of the program with $1,850,000 for coordination and operation and maintenance costs related to the water conversion demonstration plants. The estimate for 1965 is $12,950,000 consisting of $10,650,000 for research and development and $2,300,000 for operation and maintenance of four demonstration plants. This represents increases in the amounts appropriated of $650,000 for research and development and $450,000 for the operation of demonstration plants. An explanation of the amounts requested for each major activity with comparisons to the amounts available in 1964 appears on the following pages.

Salaries and expenses

Appropriation, 1963	$7,600,000
Transfer to "Operating expenses, Public Buildings Service," General Services Administration	−43,000
Unobligated balance brought forward	+77,176
Total available, 1963	7,634,176
Appropriation, 1964	10,000,000
Unobligated balance brought forward	1,353,052
Total available, 1964	11,353,052

SUMMARY OF INCREASES AND DECREASES, 1965

To provide for increased pay costs for fiscal year 1964 positions	13,000
Net decrease in estimate for research program due to prior-year carryover	−716,052
Net decrease, 1965	−703,052
Budget estimate, 1965	10,650,000

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964		
		Total appropriation	Unobligated balance, prior year	Amount available
1. Administration and coordination	$533,165	$690,000		$690,000

Research and Development Program

SALARIES AND EXPENSES

(a) *Basic research, $5,080,000*

The objective of the Division of Research, Office of Saline Water, is to increase knowledge and understanding in scientific fields relevant to the recovery of pure water and valuable byproducts from saline waters. This Division is conducting exploratory research in support of the efforts of the Processes Development and Demonstration Plants Division. Further, it maintains liaison with the scientific community and other agencies to insure that significant advances in the improvement of water resources and the obtaining of minerals from saline water are integrated with Department of the Interior interests. The Office of Saline Water bibliography and reference services are carried out in the Division of Research.

The six branches of the Division, Inorganic Chemistry, Physical Chemistry, Organic and Biological Chemistry, Physics and Surface Chemistry, Materials, and Economics establish, evaluate, and administer programs in their respective fields to meet Office of Saline Water and Department of the Interior needs for scientific information and analysis of water and desalination problems. Support of projects by contract or grant is given in order to make available scientific knowledge generally applicable to any process of saline water conversion and, moreover, provide the basis for entirely new approaches for obtaining water of a quality suitable for municipal, industrial and agricultural uses from saline water.

The basic research program for 1965 is detailed in the next page and is a decrease of $237,500 below the amount available for 1964. The general areas are related to processes for the recovery of potable water, minerals, and byproducts.

Basic research

	Available, fiscal year 1964	Estimate, fiscal year 1965
1. Properties of water and solutions	$1,207,000	$1,300,000
2. Separation processes	2,100,000	1,780,000
Vapor: Distillation, evaporation. Liquid: Reverse osmosis, electrodialysis, solvent extraction, controlled diffusion, membranes. Solid: Freezing, hydrates, ion exchange, adsorption. Biological systems. Energy sources.		
3. Interactions at boundaries of water systems	760,000	800,000
4. Properties of salts, brine, and by products	750,000	800,000
5. Economics	500,000	400,000
Total	5,317,000	5,080,000

Properties of water and solutions, $1,300,000.—The Office of Saline Water is seeking a comprehensive theoretical understanding of water and its solutions. This includes investigations in the following areas relevant to the recovery of water: ions, aqueous systems, chelates, hydrates, crystalline and polymeric materials, and the chemistry and kinetics of water systems.

Although a large body of information is available on the properties of water and water solutions, its applicability and pertinence to desalination is surprisingly restricted. Much of the available data relate to relatively simple, dilute, two-component systems near room temperature. The need is for an understanding of concentrated multicomponent systems over a wide temperature range. The funds requested for 1965 will permit continuation and necessary expansion of these studies and additional effort to establish the intermolecular forces between water and other substances, the mechanism of salt transport in water, ice, and across membranes, and studies of ions and salt species in solutions.

Separation processes, $1,780,000.—There is good reason to believe that basic research can lead to the practical development of low-cost desalination processes, as nearly all of the present processes require more than 30 times the minimum theoretical energy for completely reversible separation. Research during fiscal years 1963 and 1964 dealt with the fundamental mechanisms and phenomena of separation processes. The objective of those studies was the improvement of known separation processes and the development of entirely new and novel methods for the desalination of sea, brackish, and minerally charged water. Progress has been made in defining and correcting deficiencies in existing systems and basic research has led to the discovery of an entirely new membrane separation process that is now in the pilot plant stage of development. The funds requested will provide only for continuation of a limited amount of the present program. It will include investigations of the kinetics of the hydrate process, transport across biological membranes, energy sources, and crystallization and properties of ice.

Interactions at boundaries of water systems, $800,000.—Existing desalination processes require quantities of energy far in excess of theoretical requirements. Those thermodynamic inefficiencies arise largely from the transport of energy or matter at surfaces or phase boundaries. The Division of Research is giving attention to the theory of the liquid state, and gas, liquid, and solid phase transitions. Special emphasis is being given to physical processes on surfaces and interfaces. The funds requested will allow continuation of those projects and limited additional investigations on the corrosion of materials in sea water at elevated temperatures, transport of water and salts across boundary layers, adsorption of salts, and removal of salts from solids by washing.

Properties of salts, brine, and byproducts, $800,000.—There are important opportunities for investigations leading to improved separation processes for minerals and byproducts from sea water and brackish water. Benefits can be obtained from research leading to the integration of saline water conversion with one or more of the following endeavors—mineral recovery, use of low temperature energy, power generation, and integration with existing water systems. Specific investigations now in progress involve the removal of specific elements from sea water by ion exchange resins, chemical removal of scale-forming elements, and recovery of fertilizer elements and other minerals from sea water. The funds requested will allow for additional effort in integrated system development to lower the cost of producing desalinated water and investigations of the recovery of potash and other minerals from sea water and brines.

Economics, $400,000.—The economic research program is designed to predict where in the United States, when, and to what extent, unlimited quantities of sea water and considerable reserves of brackish water can profitably be tapped to meet growing fresh water requirements through various desalination processes. Planned studies will include analyses of economic and other factors influencing the supply and demand of potable water in the coming decades. Studies now in progress involve the revision of the Office of Saline Water's "Standardized Procedure for Estimating Costs of Saline Water Conversion" originally published in 1956 and the development of procedures for determining the costs of developing naturally occurring water supplies. These procedures will result in the establishment of more accurate cost comparisons between desalinized and conventional water supplies.

(*b*) *Applied research, $4,650,000*

The Division of Processes Development is engaged in applied research activities, all of which are specifically directed toward lower costs in converting saline water to fresh water. This involves the development of new processes or the

improvement of processes with more efficient use of energy, reductions in equipment and operating costs, or a combination of these. For the same goal of lower conversion costs, the Division develops practical uses of scientific knowledge to produce devices, systems, materials, or processes. It translates research data and results into laboratory bench-scale equipment, pilot units, and complete pilot plants. Applied research and engineering development reduces to practice the ideas, concepts and scientific advances emerging from the laboratory; it bridges the gap between basic research and demonstration or commercial conversion plants; it serves to feed back problems requiring solution through fundamental research. The technical problems associated with operating conversion plants can often be solved more economically by use of smaller pilot plants or experimental units and equipment.

Advanced development information is used in several ways. First, it is applied to existing demonstration plants. Second, it provides basis for recommendations for the construction of plants to demonstrate new processes, for example, development information obtained previously was used in the design of present demonstration plants. Third, development results are applied to commercial equipment and activities, which is encouraged by means of publishing the results. The activities of the Division are carried out through five branches: distillation processes, membrane processes, special projects, engineering analyses and evaluations, and heat transfer. In addition, the Processes Development Division has responsibility for management and operation of the Research and Development Test Station, Wrightsville Beach, N.C. Five research and development contractors were in operation there at the beginning of fiscal year 1964. It is expected that during fiscal year 1965, 10 research and development projects will be underway there.

It is important to emphasize that different processes are needed for particular applications; i.e., a process developed for use on sea water at a coastal location would not necessarily be the lowest cost means of obtaining converted water from brackish water sources in an inland area. The wide difference in the composition of brackish waters means that one process can be more useful at a certain inland location than several others would be. The size of the plant is also an important factor.

The applied research and development program for 1965 is detailed in the following table and is a decrease of $696,000 below the level for 1964.

	Available, fiscal year 1964	Estimate, fiscal year 1965
1. Distillation processes: Multistage flash; vapor reheat multiflash and liquid-liquid heat exchange; thin film (includes vapor compression and multiple-effect applications); mobile and portable units; heat pump combination concentrator; heat recovery systems, compression cycles, and transfer media	$1,411,000	$900,000
2. Freezing processes: Direct freezing flash; secondary refrigerant; new refrigerant evaluation; hydrate combination; new freezing and washing procedures	657,000	650,000
3. Membrane and related processes: Electrodialysis; reverse osmosis; combination processes; ion migration; ion exchange and electrode processes	578,000	950,000
4. Humidification processes: Solar stills; diffusion stills: humidification systems (solar heated, heat recovery cycles, etc.)	188,000	400,000
5. Other processes: Hydrates; solvent extraction; pretreatment (descaling, ion exchange softening water conditioning); absorption	1,436,000	750,000
6. Other applied research and development: Scale control; heat transfer; materials evaluations; byproducts; special equipment; brine disposal; data development and process cost studies and process analyses	735,000	600,000
7. Pilot plants test facilities	341,000	400,000
Total	5,346,000	4,650,000

Distillation processes, $900,000.—The fiscal year 1965 program contemplates continuation of pilot plant development for further improvement of distillation techniques. These include thin-film evaporation, new approaches to utilize vapor compression, vapor reheat, and liquid-liquid heat exchange systems. In addition, pilot plant and laboratory operations will study and evaluate other new systems of film evaporation, and evaluation of proposed improvements in multistage flash distillation. The possible advantages of combination multieffect and multistage flash distillation processes will also be investigated.

Work initiated in fiscal year 1964 on the feasibility of high capacity portable units may be implemented in cooperation with other agencies. Stimulation of

interest in small household units will also be maintained. A new project will be utilization of heat pump principles combined with scale control to make possible high concentrations of the waste brine streams. Laboratory work and evaluation studies of unit operations of various kinds will be conducted to make possible operations at elevated temperatures. New concepts, combinations of processes, and optimization of designs, including thermodynamic considerations, will also be investigated.

Freezing processes, $650,000.—Evaluation of a 15,000-gallon-per-day freezing process pilot plant designed to produce large-size ice crystals will be continued. Operation studies on a 200,000-gallon-per-day pilot plant will be initiated in an effort to establish the economics of the freezing process. Funds being requested will be applied to continue pilot studies and to perform additional laboratory work and unit operations relative to ice washing, separation techniques, ice particle distribution tests, evaluation of secondary refrigerants, studies of vapor compression systems, development of improved heat transfer methods, development of methods for removal of hydrocarbons from water and brines, and a study of new techniques of freezing and melting. Concentration of the research and development efforts on freezing processes is directed toward the obtaining of sufficient engineering and cost data to permit extrapolation to large plants. Thus, if the pilot plant and other studies now underway are successful, it is anticipated that recommendations can be made for demonstration of a freezing process on a large scale.

Membrane and related processes, $950,000.—Work will continue on electrodialysis, transport depletion, and reverse osmosis as processes most suitable to conversion of brackish waters. New membrane and cell designs will be tested and evaluated at the Bureau of Reclamation laboratory in Denver. The program will include further investigation of polarization effects, operation at various temperatures, possible reduction in the cost of membranes, operation on sea water as well as brackish waters, prevention of scale by the reversal of electrodes and the use of additives, the effect of water quality on unit operations and the need for pretreatment. Some new concepts in utilizing the principles of electrodialysis appear worthy of further investigation. Studies and investigations of combined advanced electrodialysis stack design with other conversion systems, such as distillation, are scheduled. Also, studies of possible combinations of power production with electrodialysis water conversion are planned. Practical experience through the operation of the electrodialysis demonstration plant has indicated possibilities of lower cost operations through design improvements; these will be evaluated as funds become available. Applied research on reverse osmosis, in view of recent developments in the process, will include additional studies on membranes, cell designs and water quality as they affect process performance. It is expected that operation of the small 1,000-gallon-per-day reverse osmosis pilot plant during 1964 will lead to expansion of the efforts to bring this new process closer to practical and economical use.

Humidification processes, $400,000.—These processes which formerly covered only solar distillation now include diffusion stills and other air-water distillation systems using heat recovery cycles, analogous to flash distillation. Based on the results obtained from the tests of a household diffusion still in fiscal year 1964, the merits of this design will be further explored. Based on the results of pilot plant and other applied research in fiscal year 1964, further test work will be conducted on humidification or air-water distillation systems designed for heat recovery and using either solar heat or other energy sources. Operation of a small pilot plant using solar heated saline water in combination with an air-humidification dehumidification system will be conducted to evaluate this approach to practical use of solar energy. Studies are planned toward improving the use of solar evaporation in solving problems of saline water disposal at inland conversion plants.

Other processes, $750,000.—Major processes not included in specific categories are hydrate formation, liquid-liquid extraction, absorption, etc. Hydrate processes have advanced to the pilot plant stage of development. The testing of a 20,000-gallon-per-day pilot plant using a cyclone-type wash separator will be continued. A second pilot plant of 10,000-gallon-per-day capacity using propane will be evaluated. The testing of a 2,000-gallon-per-day solvent extraction pilot unit will be continued. Also included are pretreatments of saline feed waters which involve conversion plant operations, and the descaling procedure which removes the scale-forming calcium and magnesium ions and utilizes these elements as byproducts for fertilizer production. The ion exchange softening procedure as a pretreatment to prevent scale formation will have undergone its first large-scale

operation in a demonstration plant in fiscal year 1964. Based on these results further applied research may be desirable.

Other applied research and development, $600,000.—Other applied research includes studies which do not necessarily constitute a complete process for removing salts from the saline waters but are vital to many process operations. These include scale prevention methods, heat transfer studies, waste brine disposal, byproduct recovery, dropwise condensation techniques, data development, materials evaluation, process analyses, and cost studies. It is expected that projects now underway in improving the techniques of engineering analysis and evaluation will be continued. In this way, it is anticipated that optimization of certain unit operations or phases of a conversion process can be more readily obtained. Applications of such techniques may make possible the reduction or elimination of certain pilot plant experimentation. Another area of technology being explored and which is expected to increase during fiscal year 1965 is the effect of pollution in saline water supplies on conversion plants; also the application of conversion processes to saline water in the categories of mineralized or chemically charged waters is of increasing interest.

Pilot plants test facilities, $400,000.—A research and development test station recently completed at Wrightsville Beach, N.C., commenced operations in fiscal year 1964. This station is located so that pilot plant testing, evaluation and further development of various conversion processes can be conducted at a sea coast site where a constant supply of clean sea water is available and which has the added advantage of concentrating these activities. In addition, a laboratory and other necessary facilities are available at the site for other research and development studies. The research and development test station is located on a portion of a 25-acre tract of property donated to the U.S. Government by the State of North Carolina. The station provides reinforced concrete slab areas for installation by research and development contractors of as many as 12 small experimental pilot plants or units plus the necessary utility services, maintenance, and administrative services. Such experimental pilot units or equipment are of a temporary nature and are used for the testing or developing of different processes or process improvements and to collect engineering data which will be applicable to demonstration or commercial conversion equipment or plants. Thus, when certain equipment is installed, it is used for a particular development project. When that project is completed, it may be modified, removed, or replaced with a new experimental project.

Following construction of the Wrightsville Beach Facility, the initial period of operation through fiscal year 1964 is being carried out under a management and operation contract. The estimates shown below are based on the actual costs for the first 8 months operation of the test station. These estimates indicate a definite cost advantage for Government operation in lieu of a management and operation contract. In addition to the cost advantages, other advantages relate to improved administration of the facility. A comparative cost estimate on an annual basis is as follows:

	Contract operation	OSW operation
Personnel compensation	$118,000	$125,000
Overhead	48,000	
Personnel benefits		9,000
Travel	22,700	5,000
Rent, communications, and utilities [1]	82,300	80,000
Printing and reproduction		1,000
Other services	1,500	1,500
Supplies and materials	30,400	35,000
Land and structures	25,000	25,000
Fixed fee	24,375	
Total	352,275	281,500
Additional technical and supervisory personnel	34,000	34,000
Total costs	386,275	315,500

[1] Includes fuel and lubricants for operation of steamplant and other utilities.

(c) *Engineering and feasibility studies, $100,000*

Public Law 87-295, approved September 22, 1961, directs the Secretary of the Interior to recommend to the Congress from time to time proposals for authorizations for additional demonstration plants for any process he determines as having great promise of accomplishing the purposes of the act.

The engineering feasibility studies are to implement this directive and are related primarily to the development of the program to develop the potential value of larger plants. Engineering work is required for the justification of construction of second-generation large-scale plants, increasing the size in two or more steps to 50-million-gallons-per-day plants. In addition, the freezing and hydrate processes may be ready by fiscal 1965 for demonstration plant programing, in the million-gallon-per-day or larger plant size. Studies related to brine disposal, energy sources and costs for specific site locations, and evaluation of construction methods not now used will also be undertaken as required.

(*d*) *Contracts and administration*

This Division centralizes the business management aspects of contracting and general administration. It has responsibility for financial and administrative phases of contract negotiation and financial activities in the Office of Saline Water. This includes advising other officials of the Office of Saline Water in the development of contractural and cooperative agreements and the administration of the nonengineering or nonscientific phases. Guidance, advice and recommendations are furnished as to policy interpretation on matters pertinent to contract formulation, contract analysis, contract supervision, and related phases of contract administration. The Division works closely with the departmental staff.

The Division is responsible for internal management functions of the Office of Saline Water, including personnel records, buduget and fiscal control, management reporting, office services, and audit functions relating to contracts. Improvement of accounting, auditing, property controls, and contract administration will be made possible with additional staff and it is anticipated that increased efficiency will result from better control over the steadily increasing amounts of Government-owned property in use at field stations and in the possession of research contractors.

(*e*) *Organization expense (administration and coordination), $820,000*

The estimate of $820,000 for 1965 is an increase of $130,000 over 1964 and includes $13,000 for increased pay costs. The amount requested provides for executive direction, planning, supervision, and administration of the research and development program.

Accomplishment of the desired program objectives and realization of the benefits to be obtained from water conversion research and development warrants an increase in the number of scientific, engineering, and supporting personnel. Several studies made of the Federal Government research and development contracting programs have emphasized the importance of adequate technical and administrative supervision of grantees and contractors. To accomplish this it is necessary to have a staff of well-qualified scientists and engineers who are able to (*a*) stimulate interest in the program, (*b*) evaluate research and development proposals, (*c*) assist in the planning and procedures of the research and development projects, (*d*) negotiate the technical portions of the contracts, and (*e*) administer the techniel work so that funds are expended prudently and so that worthwhile results are obtained to advance the objectives of the saline water conversion program. An important step in the supervision of contract research is on-site supervision of the organizations carrying out the work. This function of the program will be increased to insure proper performance and contract execution and determine that full value is received. In addition, the staff must evaluate results, including consideration of patent matters, and plan future work. Of equal importance, the scientific activities must be supported by capable financial, legal, and administrative staffs to insure that sound business management principles are applied.

In addition to its contracted research and development activity the Office of Saline Water conducts a number of related programs in scientific and technical fields. This includes the evaluation, assembly, and maintenance of important current scientific literature, the making of inspections of proposed water conversion projects, and fostering or sponsoring regional, national, and international conferences to encourage scientific participation in saline water conversion. It also has the responsibility to coordinate and correlate available information in advancing the development of low-cost conversion projects, as well as to cooperate with other governmental and private organizations interested in saline water conversion.

Of the additional 35 positions requested, 10 are to be assigned to the Washington, D.C., office and 25 to operation of the Wrightsville Beach, North Carolina Experimental Test Station. The need for the 25 positions at the experimental test station is discussed under (b) of this justification.

The additional positions to be located in the Washington, D.C., office will be assigned as follows:

	Total	Basic research	Applied research	Contracts and administration
Scientific and technical	3	2	1	
Contract administration, accounting and budget	3			3
Stenographic and clerical support of technical staff	4		1	3
Total	10	2	2	6

The increase in the scientific and technical staff is necessary to handle the increase in research proposals, contracts, and grants. This includes the evaluation of proposals, selection of worthwhile projects, and the technical administration and supervision over contractors and grantees. The additional personnel in contract administration is needed to handle the additional work generated by the increased program including contract negotiation, examination of progress payments, and contractor audits. Additional emphasis will also be placed on improvement and standardization of contract terms and conditions. Personnel is needed to improve accounting control over demonstration plants, pilot plants, and other Government-owned property and to furnish adequate administrative and housekeeping services to the program staff. The work in this area has been increased by the gradual transfer of functions previously performed as a service by the Office of the Secretary but no longer available. This includes certain personnel service functions, accounting and budgeting operations, and property management.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$6,281,124	$11,353,052	$10,650,000	−$703,052
Unobligated balance brought forward	−77,176	−1,353,052		+1,353,052
Unobligated balance carried forward	+1,353,052			
New obligational authority	7,557,000	10,000,000	10,650,000	+650,000
Appropriation	7,600,000	10,000,000	10,650,000	+650,000
Transfer to "Operating expenses, public building services," General Services Administration	−43,000			
Adjusted appropriation	7,557,000	10,000,000	10,650,000	+650,000
Obligations by objects:				
11 Personnel compensation	393,283	517,000	767,000	+250,000
12 Personnel benefits	29,045	38,000	56,000	+18,000
21 Travel and transportation of persons	17,060	30,000	40,000	+10,000
22 Transportation of things	1,439	1,000	4,000	+3,000
23 Rent, communications, and utilities	22,886	23,000	63,000	+40,000
24 Printing and reproduction	22,782	28,000	31,000	+3,000
25 Other services	5,009,583	9,171,052	8,316,000	−855,052
Services of other agencies	182,382	320,000	222,000	−98,000
26 Supplies and materials	6,312	10,000	96,000	+86,000
31 Equipment	6,998	5,000	5,000	
32 Lands and structures	118,000	210,000	50,000	−160,000
41 Grants, subsidies, and contributions	471,354	1,000,000	1,000,000	
Total obligations	6,281,124	11,353,052	10,650,000	−703,052

Senator BIBLE. Your statement will be incorporated in full and made a part of the record. I suggest that you highlight your statement in any manner that you want, Mr. MacGowan.

(The statement referred to follows:)

STATEMENT OF CHARLES F. MACGOWAN, DIRECTOR, OFFICE OF SALINE WATER

Mr. Chairman and members of the committee, it is a pleasure to again have the opportunity to appear before you and present the program budget of the Office of Saline Water for fiscal year 1965.

Before I present the explanation of the work we propose to undertake next year, I would like to briefly review the activities currently underway. I propose to do this for two reasons. First, because this committee has always expressed a deep interest in the saline water conversion program, and, second, because much of the work we are now doing will have a direct bearing on the activities we have programed for fiscal year 1965.

Following the enactment of Public Law 87–295 in 1961, the research and development activities of the Office of Saline Water were expanded and accelerated with heavy emphasis being placed on basic research. During the current fiscal year we have continued to emphasize fundamental research. We are convinced that this is essential if we are to develop truly low-cost methods of converting saline water to fresh.

To convert sea or brackish water to fresh is relatively simple, but to do it at low cost is extraordinarily difficult. The demonstration plant at San Diego, Calif., has produced fresh water in the range of $1 to $1.25 per 1,000 gallons. At this cost we are beginning to approach a competitive cost for fresh water in some areas of the country.

The committee is aware that we have transferred the San Diego plant to the Navy Department. The transfer is one of the steps being taken to alleviate the water shortage problem at Guantanamo Bay. The plant is now being dismantled and will be reassembled at the naval base. We are pleased that we could make our plant available to ease a grave emergency and thus contribute to the national security. We feel that this is a prime example of the many diversified benefits that may be derived from this program.

We should also like to report to the committee that we completed a preliminary study of the feasibility of utilizing a sea water conversion plant to provide municipal and industrial water for the Florida Keys.

The preliminary study revealed an apparent competitive advantage for a desalting plant combined with an electric powerplant. A detailed engineering and financial feasibility study has now been completed and, at the same time, the opportunity to use a nuclear reactor as the power source for the combination plant has been carefully considered.

As soon as our engineers complete their evaluation of the report and if other necessary details can be worked out, we expect to recommend to the Congress an authorization to participate in the construction of this water supply facility that will make fresh water from the ocean available at a cost less than can be obtained from natural sources of supply.

As a result of the transfer of the San Diego demonstration plant to the Navy, the following table has been prepared to revise the amount shown for operating costs of demonstration plants on page 3, and the amounts requested for operation and maintenance of existing demonstration plants on pages 22 to 27 of the justification.

Operation and maintenance appropriation, revised estimate fiscal year 1965

	President's budget	Revised estimate	Reduction
Operation and maintenance:			
Freeport, Tex.	$400,000	$400,000	
San Diego, Calif.	465,000	30,000	$435,000
Webster, S. Dak.	125,000	125,000	
Roswell, N. Mex.	385,000	385,000	
Subtotal	1,375,000	940,000	435,000
Minor process changes and improvements	275,000	230,000	45,000
Total	1,650,000	1,170,000	480,000
Major process improvements and changes:			
Freeport, Tex.	130,000	130,000	
San Diego, Calif.	270,000		270,000
Administration	250,000	250,000	
Appropriation total	2,300,000	1,550,000	750,000

While we are pleased with the progress we have made to date to lower the cost of conversion, we are not satisfied because we are convinced that better and more efficient processes can be developed. Before such processes can be developed we need to know more, much more, about the basic properties of solutions, transport phenomena, liquid-liquid transitions, nonbiological membranes, liquid-vapor transitions, ion exchange and electrochemical separation methods, biology, and liquid-liquid transitions. To obtain this type of information, our Division of Research currently has in effect over 55 contracts designed to develop a comprehensive theoretical understanding of water and its solutions. The Division is also supporting an active study of water economics.

The Division of Processes Development also has in effect over 35 contracts for the development of practical uses of scientific knowledge for application to the production of devices, systems, materials, or processes for converting saline water to fresh water.

During the year we completed construction of the world's only saline water research and development test station at Wrightsville Beach, N.C. The property for this station was donated to the Department of the Interior by the State of North Carolina. With this station in operation, we have a central location for testing and evaluating new processes that have reached the pilot plant level of development. We are equipped to provide the support facilities necessary for pilot plant operation, such as a sea water intake line, a steamplant, electricity, compressed air (for instruments), an overhead crane to facilitate erection, modification, and dismantling of pilot plants, a laboratory, machine shop, and office space for contractors. Four pilot plants are already operating at the station.

I would like to take this opportunity to invite the members of this committee to visit this facility. We are sure that a visit would give you a far better understanding of the work we are conducting there than any word description I am able to provide.

In April we expect to complete construction of a 200,000-gallon-per-day pilot plant which will utilize a new freezing process. Contracts have been awarded for four additional pilot plants which will be located at Wrightsville Beach. One will test a radically new liquid-liquid heat transfer system; two will utilize the new and promising hydrate conversion method of desalination; and one will operate to recover byproducts from sea water and at the same time provide a descaled sea water.

In addition to the work at Wrightsville Beach, the Division of Processes Development is operating a 45,000-gallon-per-day freezing process pilot plant at St. Petersburg, Fla. (This plant was erected before the Wrightsville Beach Test Station was constructed.) Small solar distillation test units are being evaluated at Daytona Beach, Fla., and through a cooperative agreement between the University of Arizona and the University of Sonora a solar distillation pilot plant has been erected and placed in operation at Puerto Penasco, Mexico. A contract has also been awarded for a small pilot plant which will use a new and very promising process called reverse osmosis. Electrodialysis pilot plants are being operated near Denver, Colo.

We have established a Division of Contracts and Administration to centralize and improve contract management and general administration. It has been assigned responsibility for the financial and administrative phase of contract negotiation and financial activities of the office as well as internal management functions including personnel records, budget and fiscal control, office services, and audit functions relating to contracts.

The Division of Demonstration Plants has completed and placed in operation our fourth demonstration plant. This plant, located at Roswell, N. Mex., uses a forced-circulation vapor-compression process to produce 1 million gallons of fresh water per day from very brackish well water. This is the fourth and final plant to be constructed under the authorization provided by Public Law 85–883. You will recall that the Demonstration Plant Act authorized the construction and operation of five such plants, but with the concurrence of this and other appropriate committees of the Congress, the fifth plant is being constructed as a pilot plant. It is the freezing process pilot plant I mentioned earlier that is under construction at Wrightsville Beach, N.C.

The Division of Demonstration Plants, with the assistance of personnel from other bureaus and agencies of the Department of the Interior conducted a preliminary feasibility study of a saline water conversion plant to supply fresh water to the lower Florida Keys. The preliminary appraisal report justified a more detailed engineering and financial feasibility study of a combination thermal-electric and sea water desalting plant to supply both electricity and fresh water

to the area. This study, which is just now being completed, will serve as the basis for a cooperative agreement for the construction and operation of a 10 million gallons per day sea water conversion plant. When we have completed our review, we may ask the Congress for authorization to participate in the construction of this plant as set forth in section 2(c) of Public Law 87-295. You will be interested to know that the studies conducted to date indicate that a 10 million gallons per day sea water conversion plant in the Florida Keys would produce fresh water in the range of 65 to 70 cents per thousand gallons. Our studies also reveal that the cost of water from a new pipeline to provide an equal volume of fresh water would cost about $1 to $1.05.

At the request of the Government of Mexico we examined the acute water supply situation at Tijuana, Mexico. Our participation will assist Mexican officials in reaching a decision as to the most economical method of providing additional fresh water for that water-destitute city, including the possibility of constructing a sea water conversion plant.

As a part of the Department's Pacific southwest water plan we completed an engineering study of a 150 million gallons per day sea water conversion plant. The extrapolations for this plant were based on presently available technology. Our study indicated that a plant of this size would produce fresh water in the range of 30 to 35 cents per thousand gallons.

To conclude this review of our current operations, I would like to give just one specific example of the progress we are making toward the attainment of our goal. The San Diego demonstration plant, which was placed in operation less than 2 years ago, utilized the latest available technological information in its design. Using a multistage flash distillation process, it was designed to operate at 190° F. and produce 1 million gallons of fresh water per day. The plant not only met its design characteristics, but by incorporating newly developed information we were able to increase the operating temperatures to 250° F. At this higher operating temperature, which was achieved with a slight increase in operating expenses (for increased pumping and higher temperature steam), with virtually no increase in capital investment we were operating this plant at 20 percent above its designed capacity on special test runs and actually produced 1,400,000 gallons of fresh water from this plant in a single day. We were planning some minor modifications to the plant which we believed would double its original capacity.

Time has permitted me only to touch on the highlights of the progress that has been achieved by the Office of Saline Water during the past year. The impact of the expanded program requested by President Kennedy, approved by the Congress and supported by this committee, is rapidly becoming more and more apparent.

Cities and communities throughout the United States are beginning to consider desalted water as a supplemental source of supply. Using technology developed through the saline water conversion program, the city of Buckeye, Ariz., has installed a 650,000 gallons-per-day conversion plant and now can provide its citizens, for the first time, water that will meet Public Health standards for good drinking water. Correspondence is increasing as is the number of visitors from many nations of the world who seek to obtain information on the latest developments as they search for ways to provide more water to meet ever growing demands. At least a dozen plants are now under construction in arid world locations.

Turning now to the budget request for fiscal year 1965, the estimate is $12,200,000 consisting of $10,650,000 for research and development and $1,550,000 for operating and maintenance for three demonstration plants. This represents an increase in the amount appropriated for fiscal year 1964 of $650,000 for research and development and a decrease of $300,000 for the operation of demonstration plants.

While the $10,650,000 requested for research and development represents an increase of $650,000 over the 1964 appropriation, because of an unobligated balance of $1,353,052 forwarded from fiscal year 1963, the funds requested for fiscal year 1965 will represent an actual decrease of $703,052. We do not anticipate a carryover of 1964 funds to fiscal year 1965.

The major expenditures planned for the funds are as follows:

Administration and coordination, $820,000

The estimate of $820,000 for 1965 is an increase of $130,000 over 1964 and includes $13,000 for increased pay costs. The amount requested provides for executive direction, planning, supervision, and administration of the research and development program. Several studies of the Federal Government research and development contracting programs have emphasized the importance of adequate

technical and administrative supervision of grantees and contractors. In order effectively to accomplish this supervision which now includes well over 100 contracts and grants, it is neceassry to have a staff of well-qualified scientists and engineers who are able to evaluate research and development proposals, assist in the planning and programing of the research and development projects, negotiate the technical portions of the contracts, and administer the technical work so that funds are expended prudently. In addition, the staff must evaluate results, including consideration of patent matters, and plan future work. Of equal importance, the scientific activities must be supported by capable financial, legal, and administrative staffs to insure the application of sound business management principles.

In addition to its contracted research and development activity, the Office of Saline Water conducts a number of related programs in scientific and technical fields. These include the evaluation, assembly, and maintenance of important current scientific literature, inspections of proposed water conversion projects, fostering, sponsoring, or participating in regional, national, and international conferences to encourage scientific participation in saline water conversion; publishing, coordinating and correlating available information to advance the development of low-cost conversion projects, and extending cooperation to other governmental and private organizations interested in saline water conversion.

The request covers 35 new positions, 10 of these will be assigned to the Washington, D.C., office and 25 to Wrightsville Beach, N.C., for the operation and maintenance of the research and development test station. The positions requested for the Washington office are necessary to handle the increase in research and development proposals, contracts, and grants, as well as additional staff in contract administration to handle personnel service functions, accounting, and budgeting operations and property management that were previously performed as a service by the Office of the Secretary. The staff increases requested, I can assure you, are minimum: Three scientific and technical, three contract and administration, and four stenographic and clerical for support of the technical staff.

Basic research, $5,080,000

The objective of the Division of Research is to increase knowledge and understanding in scientific fields relevant to the recovery of pure water and valuable byproducts from saline waters. This Division is conducting exploratory research in support of the efforts of the Processes Development and Demonstration Plants Divisions. It maintains liaison with the scientific community and other agencies to insure that significant advances in the improvement of water resources and obtaining of minerals from saline water are integrated with Department of the Interior interests.

The six Branches of the Division: Inorganic Chemistry, Physical Chemistry, Organic and Biological Chemistry, Physics and Surface Chemistry, Materials, and Economics establish, evaluate, and administer programs in their respective fields to provide scientific information on desalination problems.

The basic research program for 1965 is a decrease of $237,000 below the amount available for 1964 if we include the funds carried over. The program planned for fiscal year 1965, detailed in the justification, includes studies of the properties of water and solutions, separation processes, interactions at boundaries of water systems, properties of salts, brine, and byproducts, and economics.

Applied research, $4,650,000

The Division of Processes Development is engaged in applied research activities, all of which are specifically directed toward lower costs in converting saline water to fresh water. The Division develops practical uses of scientific knowledge to produce devices, systems, materials, or processes. The activities of the Division are carried out through five Branches: Distillation Processes, Membrane Processes, Special Projects, Engineering Analyses and Evaluations, and Heat Transfer. In addition the Processes Development Division has responsibility for management and operation of the Research and Development Test Station at Wrightsville Beach, N.C.

The management and operation of the test station is currently being carried out by contract. Our studies of the cost of operating the station clearly show a cost advantage for Government opertion in lieu of a management and operation contract. Because of the cost advantage as well as improved administration of the facility, we have 25 new positions for the operation and maintenance of the station. Even though 25 new positions are involved, we believe that better management at lower cost to the Government is good business.

DEMONSTRATION PLANTS

Public Law 85–883 authorized $10 million for the construction of large plants to demonstrate the reliability, engineering, and economic potentials of the most promising of the presently known processes, together with such additional funds as may be necessary for their maintenance and operation. The following plants have been constructed and placed in operation. They complete our construction authorization provided by Public Law 85–883.

Location	Process	Design capacity, gallons per day	Activated	Capital cost
Freeport Tex	Long-tube, vertical, and multiple-effect distillation.	1,000,000	June 21, 1961	$1,372,662
San Diego, Calif.[1]	Multistage flash distillation	1,000,000	Mar. 10, 1962	1,771,529
Webster, S. Dak	Electrodialysis	250,000	Oct. 20, 1961	535,800
Roswell, N. Mex	Forced circulation, vapor, and compression	1,000,000	July 1, 1963	1,890,700

[1] Transferred to Navy Department, Feb. 1964.

The estimate for the demonstration plant program for fiscal year 1965 is $1,550,000, a decrease of $300,000 over fiscal year 1964. The estimate includes:

Operation and maintenance, $1,170,000

The estimate of $1,170,000 represents a decrease of $130,000 over the fiscal year 1964 level to cover the energy, operation, and maintenance charges of the three plants currently in operation and for usual process improvements and changes. This decrease represents the net of saving in normal operation of the San Diego plant of $360,000 and an increase amounting to $230,000 to cover minor process changes and improvements at two plants.

Major process improvement and plant change, $130,000

Major process improvement and plant change consists of an estimate of $130,000 and covers the installation of one liquid-to-liquid heat exchanger at the Freeport, Tex., plant. It is anticipated that operating costs will be reduced and productively increased after completion of this installation.

Administration, $250,000

The estimate of $250,000 is an increase of $25,000 over 1964. It includes $5,000 for increased pay costs. The estimate provides for the administration of the demonstration plant program which includes operating and determining the engineering potential of the four plants under operation and personnel required to supervise the architectural, engineering and construction work of much larger plants now under consideration. Two additional positions to those referred to earlier are requested in 1965 to handle work connected with feasibility studies on new plants, design changes, improvements and alterations to existing demonstration plants and to assist in the performance of the steadily increasing engineering workload.

We have endeavored to provide the committee with a complete statement of our present and proposed activities as well as our past achievements and further objectives. We welcome any questions members of the committee may have concerning the saline water conversion program. On behalf of the entire staff of the Office of Saline Water, I would like to conclude my remarks by thanking the members of this committee for the interest and support they have provided to nurture and foster the saline water conversion program. We hope the progress we have achieved in the past will merit your continued cooperation and support.

In conclusion I should like to remind the committee that President Johnson has said, "there is no newer or more vital frontier for any of us than the one we must cross to a lasting abundance of fresh water for all mankind." To this end we devote our total effort.

1964 REVIEW

Mr. MACGOWAN. Thank you, Mr. Chairman.

I would like to begin again by extending Secretary Holum's personal and official regrets that he could not be here. He very much planned on it, and looked forward to appearing before you.

It therefore is my pleasure to appear before you at this time, with our Senate statement for the current budget.

I would like to briefly review what has transpired in the last year, if I may.

PUBLIC LAW 87-295

This is in direct relationship to Public Law 87-295, which you so ably handled on the floor of the Senate, sir.

Senator BIBLE. I have always taken an interest in saline water, and so I will be very interested in your report.

Mr. MACGOWAN. The bill, as you recall, required, and gave us a mandate, we thought, to greatly accelerate the program, with very heavy emphasis upon the research aspects of saline water conversion.

DESALINATION PLANT MOVED TO GUANTANAMO

The research is going on apace, and one of the plants which was built and dedicated in 1961 is being transferred to Guantanamo in an effort to alleviate the critical water problem down there. The plant is at this moment under dismantling and will shortly be placed aboard ships to take it to Cuba.

Senator BIBLE. This was the desalination plant that was located at San Diego?

Mr. MACGOWAN. Yes, sir; this is the picture of it.

Senator BIBLE. What was the total cost of that plant?

ORIGINAL COST OF PLANT

Mr. MACGOWAN. The total original cost was approximately $1,770,000. Actually $1,800,000, if some modifications were involved.

Senator BIBLE. Thank you. We will keep this. Do you have extra prints of this?

Mr. MACGOWAN. Yes, sir; we do.

Senator BIBLE. Well, we will keep one of these for the use and reference of the committee.

First, where is this located?

PREVIOUS LOCATION OF PLANT

Mr. MACGOWAN. This is on Point Loma, just immediately outside San Diego proper. It is within the metropolitan area of San Diego, but it is out on the point which has the Cabrillo Monument.

Senator BIBLE. And it takes water from the Pacific Ocean?

Mr. MACGOWAN. From the Pacific.

Senator BIBLE. And this plant cost how much; did you say $1,800,000?

Mr. MACGOWAN. Yes, sir.

CAPACITY OF THE PLANT

Senator BIBLE. And what was its capacity?

Mr. MACGOWAN. This is an interesting thing. The design capacity of the plant at 190 degrees operation was 1 million gallons a day. Because of the rapid developments in the field, we were able to increase temperature to 250 degrees. And this, by the way, is not simply a matter of increasing the heat. At that rate of heat, the plant pro-

duced 1,400,000 gallons per day, almost 40 percent over design capacity.

Senator BIBLE. At what cost per thousand gallons?

Mr. MACGOWAN. We believe that at the higher figure, the 1,400,000-gallon figure, it was about a dollar or slightly under.

PROCESS USED BY THE PLANT

Senator BIBLE. And what process do you use?

Mr. MACGOWAN. This is multistage flash evaporation. It is a distillation process.

OTHER DESALINATION PLANTS

Senator BIBLE. And how many other desalination plants do you have? You have one on the Atlantic coast in North Carolina?

Mr. MACGOWAN. This is under construction.

Senator BIBLE. And you have one on the Gulf?

FREEPORT, TEX., PLANT

Mr. MACGOWAN. At Freeport, Tex.

Senator BIBLE. Is that operational?

Mr. MACGOWAN. Yes, it is; and I have here a picture of that.

Senator BIBLE. This may likewise be received and incorporated by reference for the information of the committee.

How large is this?

CAPACITY, COST, AND PROCESS OF THE PLANT

Mr. MACGOWAN. This is a million gallon plant also, sir.

Senator BIBLE. A million gallons, and was built at what cost?

Mr. MACGOWAN. At a cost of $1,372,000.

Senator BIBLE. And what process is used?

Mr. MACGOWAN. Long tube vertical, a distillation, falling film process. The seawater falls from above.

Senator BIBLE. And what is the cost per thousand gallons at the Freeport plant?

Mr. MACGOWAN. Approximately $1.25.

INLAND DESALINATION PLANTS

Senator BIBLE. Do you have two inland plants, as well?

Mr. MACGOWAN. Yes; sir; we do.

ROSWELL, N. MEX., PLANT

One dedicated last July at Roswell, N. Mex., and it again is a distillation process, a million gallons per day, operating on brackish water. The plant has undergone some extensive revisions, because the water for which it was designed was not available, and some redesign was necessary.

The city dug the well, and despite careful testing, we found that the water which was delivered was significantly different than the water for which the plant was designed.

Senator BIBLE. What type of process?

Mr. MACGOWAN. Vapor compression. The heat is added by the compression of the vapor in the compressor.

Senator BIBLE. And this was located at Roswell, N. Mex. It takes its water from where?

Mr. MACGOWAN. From wells.

Senator BIBLE. Oh, from underground wells?

Mr. MACGOWAN. Yes, sir.

Senator BIBLE. How deep do you go underground?

Mr. MACGOWAN. About 500 feet, if I am not mistaken.

Senator BIBLE. And you produce water there at what cost per thousand gallons?

Mr. MACGOWAN. We do not know, yet, but we think it will be in the $1 to $1.25 range, preferably shading toward the dollar side.

WEBSTER, S. DAK., PLANT

Senator BIBLE. Now, there is another in South Dakota, isn't there?

Mr. MACGOWAN. Yes, sir, in Webster, S. Dak. And we unfortunately do not have a picture of it, but it uses a membrane process. That is 250,000 gallons per day.

Senator BIBLE. These others were million gallons?

Mr. MACGOWAN. Million gallons.

Senator BIBLE. This is one-fourth the size?

Mr. MACGOWAN. Yes, sir.

Senator BIBLE. And it has been operational for how long a period?

Mr. MACGOWAN. For nearly 3 years, and the results are excellent.

Senator BIBLE. And you are producing water there at what cost per thousand gallons?

Mr. MACGOWAN. Costs are approximately 80 cents to $1.

Senator BIBLE. And where do you get the water for that?

Mr. MACGOWAN. Again, wells.

Senator BIBLE. This is an underground operation?

Mr. MACGOWAN. Yes.

Senator BIBLE. Is it a different type of brackish water from the brackish water in New Mexico?

Mr. MACGOWAN. Very much different.

DESIGN OF THE ROSWELL, N. MEX., PLANT

I perhaps should have been more specific when I discussed Roswell. The wells were carefully tapped, and several tests were made of various wells in the neighborhood, and we found that we were getting 25,000 part water, and so the plant was designed for this constituency. A well drilled right in the middle of it, however, developed 15,000 part water that was saturated with some of the scale forming elements that give the plant trouble.

SALINE WATER ACT

Senator BIBLE. Now, as I recall the 1952 Saline Water Act, as amended in the 87th Congress, it was indicated that the act authorized an appropriation of $75 million between fiscal years 1962 and 1967. Including this estimate, how much of the authorization has been appropriated to you thus far? You are using about $10,650,000 this year?

Mr. MacGowan. $10 million this year, and approximately $10 million last year. It was $7 million the year before that. A total to date about $33 million.

Senator Bible. You have used about $33 million?

Mr. MacGowan. Including this.

Senator Bible. Including this, assuming you are granted this request. You have used $33 million, and you are authorized $75 million through 1967, so that you still have about $40 million left, or $42 million?

Mr. MacGowan. Approximately, yes, sir.

Rate of Development of Desalination Program

Senator Bible. Now, is it contemplated that you are going to ask for that amount of money in the next 2 fiscal years?

Mr. MacGowan. I think I can safely say that the rate of development is such that unless the program is greatly augmented, I do not think so, sir. But on the other hand, our rate of development was such that we had predicted that we would approach that figure when we originally testified before the Senate.

The numbers which we utilize now, namely, the $10½ million that we are talking about for research and development this year, will probably be about the last step. There will be one step beyond this, in scaling up to size. However, it may be decided by the Congress, when we come back to them for larger plants, that they may wish to use some of this appropriation for such plants.

And so I am really giving you two answers, sir. One is that for research and development it seems doubtful that we would utilize the entire $75 million by 1967, unless it is decided by the House and the Senate to include the larger plants, which we will recommend.

Senator Bible. If I recall correctly—and I must confess my memory is a little hazy on it, the 87th Congress pretty much mandated you to limit your work to research, did it not?

Mr. MacGowan. Yes, sir.

Building of Plants

Senator Bible. And not to build any more plants?

Mr. MacGowan. Right.

Senator Bible. You could not build another plant, if you wanted to, could you?

Mr. MacGowan. No, sir. Your memory is excellent.

Senator Bible. The five locations were set down in the 1958 act, is that it?

Mr. MacGowan. That is right. There were five plants. Now, with one transferred to the Navy, we will probably handle its replacement from the 1958 authorization, but the act to which you are now referring, sir, was—you are correct—research and development, and if any further new plants are to be built, we would need to come to Congress again for specific authorization.

Senator Bible. For specific authorization. I am happy to have that cleared up.

COMPENSATION FOR GUANTANAMO OPERATION

Does DOD compensate you for the cost of the Guantanamo operation?

Mr. MACGOWAN. Compensation is planned, yes, sir, and the discussions are underway at this time.

Senator BIBLE. And the money that you would receive from the transfer to Guantanamo would be used, I assume, in the building of another Pacific coast plant?

BUILDING ANOTHER PACIFIC COAST PLANT

Mr. MACGOWAN. We would hope to build another plant. This again, is contingent upon approval.

Senator BIBLE. Would you have to come back to Congress and get authorization for a saline water plant?

Mr. MACGOWAN. It would have to be with the consent of the committees.

Senator BIBLE. Because you already have the specific authorization in the basic act?

Mr. MACGOWAN. Yes, sir.

Senator BIBLE. There is an item that I read with interest in your prepared statement, and that is that knowledge of water conversion would be a useful tool in diplomatic international relationships.

USE OF WATER CONSERVATION IN DIPLOMACY

Would you care to comment on that? How is this a useful tool in diplomatic international relationships?

Mr. MACGOWAN. I think President Johnson has mentioned this. We have been for years in open and friendly negotiation and discussions with Israel, and many other countries, including Arabia, England, Canada, and Australia. Most of these are through the State Department. As a matter of fact, the Office of Saline Water has been designated by the NATO parliamentarians as the clearinghouse for all information regarding water conversion throughout the free world; that is, the part that impinges on the NATO nations.

We were invited to the Athens Conference, and we did indeed meet with the Greeks. The Under Secretary had planned a trip to Greece, except that he was stricken ill this year. There are many other illustrations.

Senator BIBLE. I think that suffices for the record.

LARGER SALINE WATER PLANTS

Tell me, in answer to one of my earlier questions, you said: "We will be coming back to the Congress for authorization for the construction of larger saline water plants."

Mr. MACGOWAN. Yes, sir.

Senator BIBLE. Could you comment and develop that a little?

Mr. MACGOWAN. I will be pleased to.

Public Law 87-295 clearly says that the Secretary may recommend from time to time for construction such plants as he thinks would be necessary, based upon the research and development done under the act.

Section 2(c) of the bill refers specifically to this item, and it makes it quite clear that no plants may be built except with the express authorization of the House and Senate committees.

STUDY COMPLETED

Now, one of the important things in developing low-cost water is to increase the size of the plants. A study which we have just done, and which has been reinforced by a consulting engineer indicates that there are places in the United States, such as Key West, where converted water may be competitive with natural resources.

Senator BIBLE. At what cost would that be? Would it be 25 or 30 cents?

Mr. MACGOWAN. No, sir. The 10 million size would be about double that, 50 or 60 cents, perhaps incrementally higher, but not much. We think under 70 cents.

Senator BIBLE. Is that competitive?

Mr. MACGOWAN. Yes, sir.

Senator BIBLE. Competitive in that area?

Mr. MACGOWAN. In that area.

KEY WEST, FLA., AREA

Senator BIBLE. Because of their high cost of producing. Where do they get water now?

Mr. MACGOWAN. For Key West it arises on the mainland, brought down on a pipeline 130 miles long. So obviously there is a competitive advantage, and if this plant goes forward, and if agreement with the local people is achieved, we would present to the Congress the plans for such a plant, together with that part that the Department feels it would be to its benefit to contribute to the plant, if any.

The bill further makes it clear, I am sure you remember, Senator, that no such plant may be supported to in excess of 50 percent of the total cost.

Senator BIBLE. You say this is projected as a 10-million-gallon plant?

Mr. MACGOWAN. Yes, sir.

Senator BIBLE. And you hope to reach a production cost of somewhere in the range of 50 cents per thousand gallons?

Mr. MACGOWAN. 50 to 70 cents would be the range.

ATTAINABLE GOALS IN LOW RATES FOR DESALINATION

Senator BIBLE. To date are you in position to forecast the lowest cost that you can achieve in saline water plants?

Mr. MACGOWAN. I think with confidence we can state that larger plants and perhaps using nuclear heat, 30 to 35 cents is an attainable goal.

As a matter of fact, for the Pacific Southwest water plan, we assisted in the conceptual design of a 150-million-gallon-per-day plant.

Senator BIBLE. I think I will take this, because I think the chairman of this committee will be interested. He has shown quite a bit of interest.

ONE HUNDRED AND FIFTY-MILLION-GALLON SEAWATER CONVERSION PLANT

This is a conception of 150 million gallons per day, a seawater conversion plant?

Mr. MACGOWAN. This was deleted in the most recent study. This is the basis of a plan which is in the appendix to the southwest water plan.

Senator BIBLE. How much would a 150-million-gallon-per-day seawater conversion plant cost?

Mr. MACGOWAN. Unfortunately, we are guessing, but we are guessing it is under $100 million.

Senator BIBLE. And you are also projecting, based upon the research that you have done to date, and the development that you have had in these other plants, that you would produce water from the Pacific Ocean at a cost somewhere in the range of 35 cents to 45 cents?

Mr. MACGOWAN. Perhaps; per thousand gallons. This is our best estimate at this point.

Senator BIBLE. And what you are saying is that even with the research, you actually do not know what a smaller plant will do until you get the big plant? Is this correct?

Mr. MACGOWAN. Precisely correct. And this is the reason why I am hedging, because we think there are steps to be made in this. With each step, we can predict the next one, and predict with much more sanguinity and confidence.

PROCESSES UNDER CONSIDERATION

Senator BIBLE. As I recall, at one time there were three or four or five different processes under consideration. Have you arrived at the process now that you think is the best and the most economical?

Mr. MACGOWAN. At this time we think multistage flash is, and this plant epitomizes that.

Senator BIBLE. Have you pretty much eliminated the membrane processes?

Mr. MACGOWAN. No, sir, we have not, but we know much more about the multistage flash, and our confidence, therefore, is much greater in things that we are more familiar with than with the membranes.

But we are continuing to develop membranes as quickly as we possibly can.

ISRAEL AND THE ZARKIN METHOD

Senator BIBLE. Tell me what other countries in the world do in the field of sea water conversion plants. I know we are always pointing to Israel and the work they are doing there. What is the largest plant they have there?

Mr. MACGOWAN. Israel at this point is beginning a quarter-million-gallon freezing process, utilizing the Zarkin method. I think you have some familiarity with this.

Senator BIBLE. Yes, I do.

Mr. MACGOWAN. And this plant was shipped from Beloit, Wis. It arrived on the scene, and at this time, my information was, last week, that the first unit has begun a pilot run.

Senator BIBLE. This is a quarter of a million plant?

Mr. MACGOWAN. A quarter of a million—freezing.

Senator BIBLE. It is one-fifth the size, I guess, of the San Diego plant. Is that correct?

Mr. MACGOWAN. Yes. And approximately the size of the freezing plant which we are building in North Carolina.

Senator BIBLE. I see.

ONE-MILLION-GALLON SEAWATER CONVERSION PLANT ON ORDER

Mr. MACGOWAN. The Israelis also have on order in this country a 1-million-gallon-per-day distillation plant. It is being built by Baldwin-Lima-Hamilton, and is ready for shipment, if not shipped now.

This plant will be built in conjunction with a power generator, and they expect some relatively low costs from it.

Likewise, the Israelis are working very hard on membranes and are very sophisticated in this.

Senator BIBLE. Do they have any desalination plants in operation?

Mr. MACGOWAN. I think there is a membrane plant in operation.

Senator BIBLE. Do you have a price tag on that?

Mr. MACGOWAN. No, sir.

Senator BIBLE. Do you know what they are able to produce water for, per thousand gallons a day?

DETERMINING COST OF DESALTING WATER

Mr. MACGOWAN. Mr. O'Meara reminds me that the cost of desalting brackish water relates directly to the kind of water used, because of the wide range, and the difficulty that we have in relating costs there to costs here is that we would have to get in exactly identical water and put it in their machine in order to get identical costs.

Senator BIBLE. So you have really no sound basis of comparison?

Mr. MACGOWAN. No, sir.

Senator BIBLE. What other countries have desalination plants?

SHEIKDOM OF KUWAIT

Mr. MACGOWAN. The Sheikdom of Kuwait. Then there is the island of Aruba.

Senator BIBLE. Well, Kuwait has done what? Have they got an operational plant?

Mr. MACGOWAN. Yes; they have, and it is about 3 million gallons per day, made up of segments. I do not mean that they have one 1-million-gallon-per-day plant. They have segments which total a capacity of about 3 million gallons per day.

Senator BIBLE. Is that brackish water?

Mr. MACGOWAN. That is seawater.

Senator BIBLE. Do you know what they produce at?

Mr. MACGOWAN. They say $1.70. This is our last information.

Senator BIBLE. Per thousand gallons?

Mr. MACGOWAN. Yes, sir.

ISLAND OF ARUBA

Senator BIBLE. And how about Aruba? What is the experience in Aruba?

Mr. MACGOWAN. Aruba is very good. They also have a capacity slightly in excess of 3 million gallons per day, again, incremental plants totaling 3 million gallons. Their costs—it is very difficult to get these costs, Senator, in terms in which we can utilize them, but again our best guess is that this is about $1.75 per thousand gallons.

Senator BIBLE. Are there any other countries in the world which have operational desalination plants?

THE VIRGIN ISLANDS

Mr. MACGOWAN. The Virgin Islands. This is a relatively small plant, under 300,000 gallons per day.

Senator BIBLE. Yes. I think we heard testimony on that earlier, where the Virgin Islands government is attempting to take over this plant. Is this not correct? But is is a fairly high cost production, I think, is it not?

Mr. MACGOWAN. Their costs are under $2, and this compares favorably with the cost of barging water in, which is their only alternative.

Senator BIBLE. Do you have any reading at all on any of the countries behind the Iron Curtain, Russia included?

COUNTRIES BEHIND THE IRON CURTAIN

Mr. MACGOWAN. No, sir. We know that Russia was active in it, that Russia did display a knowledge of a membrane process, that it attempted, I understand, on a ship in the Black Sea. But the results of this are indefinite.

There is a study group requested by the Soviet Union, an interchange of technical people from the Soviets with the U.S. people. We have had correspondence with the Soviets to no definite conclusion.

Senator BIBLE. If I understand your testimony correctly, then, apparently the United States is the leader in the desalination world.

Mr. MACGOWAN. This is definite, sir.

Senator BIBLE. Both as to the number of plants and as to breaking the barriers of economics and making them more feasible.

Now let me just ask a few questions as to your budget.

ADMINISTRATIVE EXPENSE INCREASE

Your estimate of need for limitation of administrative expense is increased by $130,000 over the fiscal year 1964 authorization. This will give you $820,000 during fiscal year 1965.

Would you please explain to the committee the need for this increase?

Mr. MACGOWAN. It is almost entirely in manpower, sir.

The Office of Saline Water has—and I do not mean in any way to be disrespectful to another group at this time, but the Office of Saline Water is exactly the same size in terms of people as the heraldic branch of the U.S. Army.

Senator BIBLE. Which branch of the U.S. Army?

Mr. MACGOWAN. The heraldic branch, the art group.

Senator BIBLE. The art group. I see.

Mr. MACGOWAN. And with 61 people on board as of this moment it is required that we administer judiciously and correctly the $10½

million that we have had up to this point, $11 million including the carryover.

We think we need at least 10 more people, sir, for this, most of which would be in the supporting area of contracts and administration.

Senator BIBLE. Those are 10 that you would use here in the Washington office?

Mr. MACGOWAN. Yes, sir.

WRIGHTSVILLE BEACH, N.C., FACILITY

Senator BIBLE. Now, I note here that you are asking for 35 positions, and the additional 25, as I understand it, would be assigned to Wrightsville Beach.

Mr. MACGOWAN. Correct.

Senator BIBLE. What would be the need of the 25? What will they do at Wrightsville Beach?

Mr. MACGOWAN. This is the Wrightsville Beach test facility.

Senator BIBLE. This is the North Carolina facility?

Mr. MACGOWAN. Yes, sir; this is our test facility, not to be confused with the demonstration plant. This is the facility in which we test the pilot plants only, meaning plants of the 10,000- to 15,000-gallon-per-day size.

At this time, at this point, there are five such plants there.

Senator BIBLE. In the 10,000- to 15,000-gallon size?

Mr. MACGOWAN. Yes, sir; the largest of which is 30,000 gallons.

Senator BIBLE. You use this as a test area?

Mr. MACGOWAN. This is our test area.

Senator BIBLE. In addition to that, you have a demonstration plant?

Mr. MACGOWAN. Yes, sir; which is immediately to the top.

Senator BIBLE. Your demonstration plant is at the top of that picture?

Mr. MACGOWAN. Yes, sir.

Senator BIBLE. Again, what do you use the additional 25 men for here?

KOPPERS CO. OPERATING THE FACILITY

Mr. MACGOWAN. This plant at the moment is maintained and operated by the Koppers Co. The Koppers Co. is doing this as a favor to us, quite frankly, because this is not their normal business.

We have asked GSA to operate this plant for us, and they have rejected us. We have checked local and other international contractors and have determined that to have a contractor operate this plant will result in a cost to the Government of about $50,000 per year more than we can operate it for ourselves.

These 25 people about which we are speaking here are entirely those people that would be required to operate and maintain the Wrightsville Beach Test Facility, including guards, boiler firemen, maintenance people, and supervision.

BREAKTHROUGH IN DESALINATION

Senator BIBLE. Tell me this: Is the $10,650,000 budget which you are requesting this year, and which your are now justifying—is that a sufficient budget to make the earliest possible breakthrough in this field of desalination?

Mr. MACGOWAN. I think my best approach to an answer to that, sir: This is the program which we can sustain at this time because as Solicitor Barry said earlier, it is not just a question of having money. It is a question of getting interested and capable researchers to do the work.

We have been able to attract the better people, we think, in the country, perhaps in the world, to the program, to get them to do the work, but making more money available would not bring more people from the outside to do the work.

At this moment, sir, this looks like the program which we can support and can justify in terms of good fiscal and technical progress.

Senator BIBLE. Well, I was not suggesting that we give you more money, if you could not adequately spend it and make a real showing on it.

Mr. MACGOWAN. I am sure of that.

Senator BIBLE. I have had a great interest in this program, and I have always felt it could be hurried along a bit more.

I would take your answer to indicate that you are going at just about the level which you think you can adequately absorb at the present time, and do an effective job.

CRASH PROGRAM

Mr. MACGOWAN. That is right, sir.

I would like to point out that this is not today a crash program.

Senator BIBLE. I understand it is not a crash program. Is there anything to be gained by making it a crash program, in view of the fact that we have so many areas in this country where water is in short supply?

I can go to my own State, southern Nevada, where they are simply running out of water. Thank goodness, we have an allotment coming from Lake Mead, but it will not be long before we run out of that.

In many areas of the country, there is an acutely short supply now. Are we going to be geared up to meet that shortage, which is going to happen inevitably, I think, within the next 5 or 10 years?

Mr. MACGOWAN. We are trying very hard to prepare for that, sir.

As you have correctly stated, we do not think that we are the alpha and omega of solving water shortages, but where brackish water or sea water is a potential resource, we think we are prepared, or will be prepared, as the need develops, to assist in the solution of the problem.

What I mean by that is: There are other means of getting water. For instance, the California plan, bringing water 700 miles.

Senator BIBLE. From the north.

Mr. MACGOWAN. And I think it is purely a matter of technique, technology, and economics, as to whether you import water or convert it.

BUCKEYE, ARIZ., CONVERSION PLANT

When a conversion is decided upon—Buckeye, Ariz., I think, is a good illustration of this, where the city of Buckeye bought and entirely supports a conversion plant. Buckeye, Ariz., has met the problem of brackish water by simply building its own plant. But this

technology has been supported by the OSW, and it was because the OSW was alive that Buckeye was able to do this.

We do not think we have the answers. We think that we have a very good answer in the very near future, and we are crossing our fingers on reversed osmosis. But it is moving, and we think well, sir.

Sea Water Conversion Plant of 150 Million Gallons

Senator Bible. Just one or two final questions, and maybe you testified to this earlier, and I missed the answer. When will your technology and your research be to the point where you are able to "greenlight" this 150-million-gallon-per-day desalination plant?

Mr. MacGowan. We have talked of this plant, sir, in 7 to 10 years.

Senator Bible. You do not feel that you would be prepared to build it short of 7 to 10 years. Do you have much more research and technology to do?

Mr. MacGowan. The principal thing is to begin with incremental plants, a small one growing to a larger plant. And if we got to the 10-, 25-, or 50-million-gallon size, sir, we would predict with confidence the 150-million-gallon plant.

Senator Bible. Now, will you repeat that? I got to woolgathering. Will you repeat your answer?

Incrementally Increasing Sizes of Plants

Mr. MacGowan. Your question as to the 150 million gallon plants would be predicated upon incrementally increasing our size. We may suggest Key West as a 10 million gallon per day plant. Following this, there may be a 25 million per day plant available somewhere, and perhaps following that a 50 million gallon per day plant.

At this point, at the 50 million gallon size, we would be quite sanguine about the facts of the 150 million gallon size.

Senator Bible. But you have to get almost up to the 150-million-gallon size before you can be fairly accurate as to what the 150 million gallon will do?

Mr. MacGowan. I have chosen these numbers only for reference, sir. It could range from 25 to 50. It may be 35 million gallons. But this is the size range that we would like to be in before we can do it.

Now, there are alternatives, as I mentioned just briefly before—a crash program, where we could be a little less careful about costs, meaning this in the general sense, meaning that we would not have to know precisely what it was, but we would know where we were going.

We could do it, I think, in 7 years.

Research and Study Required

Senator Bible. I want to do a little more research and study on this.

As I was suggesting to Mr. MacGowan, Mr. Chairman, we are in short water supply out in the Southwest, as you and I know all too well, and the sooner we can make some breakthrough in large gallonage conversion plants, the better off we will be in solving many of our problems.

And Mr. MacGowan has given us an encouraging outlook on it, though if I understand them correctly, at their present level, it is going to take them 5 to 8 or 9 to 10 years to get to a point where they will be able to say for how much they can produce water from a plant this size.

Mr. MACGOWAN. We think we can say with confidence that it would be in the range which I gave you, sir.

Senator BIBLE. Between 35 and 50 cents?

Mr. MACGOWAN. Thirty-five cents or less.

Senator BIBLE. But you will not know, though, until you have a big plant and try it?

Mr. MACGOWAN. Right. We have got to have a range, sir.

COST PER ACRE-FOOT

Chairman HAYDEN. Could they put that in acre-feet?

Mr. MACGOWAN. One million gallons are 3 acre-feet, sir, so that would be approximately 500 acre-feet.

Chairman HAYDEN. And how much per acre-foot?

Mr. O'MEARA. $102 an acre-foot.

Senator BIBLE. Your statement is that it would be somewhere in the neighborhood of 35 cents. He is going to translate that into acre-feet, assuming this plant will do what they think it will do. They do not know yet.

Chairman HAYDEN. What is the lowest cost per acre-foot that water has been produced up to now for any plant?

Mr. MACGOWAN. Over a hundred an acre-foot, sir. If my mathematics are correct——

Senator BIBLE. You can reverify those figures, because you have been using it in thousand gallons per day.

Mr. O'MEARA. A dollar a thousand gallons, of course, is $326 per acre-foot.

Mr. MACGOWAN. It is about $300 an acre-foot now, sir, and it would be reduced by large plants to about $100 per acre-foot.

Chairman HAYDEN. That is about 10 times as much as some figures that I have seen. I thought it was down to $30 to $50 an acre-foot now.

Mr. MACGOWAN. No, sir.

Senator BIBLE. I think the figure he uses is 30 to 50 cents per thousand gallons per day, which is the most optimistic guess they can get, even if this plant will work, and they do not know that it will work yet.

ACRE-FEET IS USED AS MEASUREMENT IN WEST

Mr. MACGOWAN. Water produced by that plant would perhaps cost 35 cents.

Senator BIBLE. Thirty-five cents per thousand gallons a day.

I wish you would check the figures to translate that into acre-feet, because we in the West use acre-feet as a measurement a lot more than a thousand gallons per day.

Mr. MACGOWAN. It is about $325 per acre-foot today.

Senator BIBLE. And you think if you have a plant of this size and can make it operational, then it would still be in the neighborhood of $100 per acre-foot?

Mr. MACGOWAN. Yes, sir. Almost out of the question for irrigation at that cost.

Senator BIBLE. Yes. I was not thinking of it in terms of irrigation.

USES OF DESALINATION WATER

It seems to me for the foreseeable future, the most you can use desalination for is for potable uses, domestic uses, industrial uses.

Mr. MACGOWAN. One other aspect, Senator. It may be possible to utilize water conversion for municipal and industrial uses at the same time you use untreated river water for the irrigation, so that the conversion of water would free relatively large quantities of ground water for further irrigation use, because this does not have to be treated in any way.

WATER FOR THE CITY OF LOS ANGELES, CALIF.

Chairman HAYDEN. Take, for example, the city of Los Angeles. If a rate for the production of fresh water from sea water was such that for all municipal purposes, in that great city, you would get water from the Pacific Ocean, then they would not have to use water from the Colorado River.

Mr. MACGOWAN. Correct. It would take 8 to 10 of these plants to do that, Senator.

Senator BIBLE. I think they have said, Mr. Chairman, that they estimated that this plant would cost something under $100 million, with the best estimate they can make now.

Would you have any idea what the cost of domestic and industrial water is in the city of Los Angeles now?

Would you supply that for the record, both on a thousand gallons per day basis and on an acre-foot basis? Because water is our lifeblood.

Mr. MACGOWAN. Right.

(The information referred to follows:)

Consumer water rates of the Metropolitan Water District of Southern California

Rate Jan. 1, 1963, to Jan. 1, 1964	Normal use		Agricultural use	
	Treated	Untreated	Treated	Untreated
Per acre foot	$29.00	$21.00	$22.25	$14.25
Per 1,000 gallons	.089	.064	.068	.044

Source: Information derived from 1962 Annual Report o fthe Metropolitan Water District of Southern California.

TIJUANA, MEXICO

Senator BIBLE. This estimate of yours, Mr. MacGowan—as optimistic as it is, I do not know how much good it is going to do us at that price. That is what we are trying to find out.

I have asked you about Guantanamo. I have one further suggested question.

We have received reports that Mexico, or the city of Tijuana, has indicated an interest in the saline water conversion plant in Baja California. Have you been involved in any conversations concerning such a possibility?

Mr. MACGOWAN. Yes, sir. At the request of the Mexican Government, the Office of Saline Water and the Department of Interior did what we call a preliminary appraisal study. We went down and looked at it, and it appeared that saline water conversion was practical there.

The report has been written. It is in the process of discussion with the Mexicans. And this is exactly where it stands now. No conclusion has been reached.

STUDY ON VERY LARGE PLANTS

I would like to add that there is a study, a joint study, between the Office of Saline Water, and the AEC, relative to very large plants, meaning 500 million or larger. At this moment, the results are inconclusive, but they appear to be more favorable than the 25 to 35 cents I mentioned to you.

COST OF DESALINATION WATER

Chairman HAYDEN. At what cost is water being delivered by the plant in San Diego, now, for municipal use?

Mr. MACGOWAN. At about a dollar, sir. Just fractionally over a dollar.

Chairman HAYDEN. That is how much per acre-foot?

Mr. MACGOWAN. That is $325.

Senator BIBLE. It is still $325 per acre-foot, Mr. Chairman.

Chairman HAYDEN. And this is the cheapest water?

Mr. O'MEARA. From seawater, that is true.

Senator BIBLE. I guess your South Dakota one is 80 cents.

PROGRESS IN DESALINATING WATER PROGRAM

Mr. MACGOWAN. I would like to point out that these plants, while they are intended to be tests of production, are indeed only to serve as indicators, and I think the dollar final figure that we are using should not be utilized as a dollar barrier, which seems to exist in many areas. This dollar is no real thing to break. We can break that simply by going to a larger plant or using higher temperatures. What I am trying to be is a little more encouraging about that dollar figure, because these plants were designed 3 and 4 years ago. If we were to design one today, we would design one for very much higher temperatures, very much higher pressures and very much more efficient. The conversion ratio in the Point Loma plant, which was the best in the world, was 15 to 1. We are confident that we can get a 20 or 22 to 1 plant if we were to replace Point Loma.

Senator BIBLE. I have always been a strong advocate of your program. I think you men are in a challenging and intriguing field, and I think you are making real progress and I hope you will make even more.

OPERATIONS AND MAINTENANCE

Let me ask you some questions on "Operation and maintenance." You indicate a need for $2,300,000 in fiscal year 1965, an increase of $450,000 over the amount appropriated in fiscal year 1964. The justification for the request will be included in this point in the record.

(The justification statement referred to follows:)

Operation and maintenance

Appropriation, 1963	$2,000,000
Comparative transfer from other account	+39,000
Transfer to "Operating expenses, public buildings service," General Services Administration	−14,800
Total available, 1963	2,024,200
Appropriation, 1964	1,850,000

SUMMARY OF INCREASES AND DECREASES, 1965

To provide for increased pay costs for fiscal year 1964 positions	5,000
Increases in cost of operating and maintaining demonstration plants	445,000
Net increase, 1965	+450,000
Budget estimate, 1965	$2,300,000

Analysis by activities

Activity	Fiscal year 1963 amount available	Fiscal year 1964 amount available	Fiscal year 1965 estimate	Increase (+) or decrease (−) 1965 compared with 1964		
				Total	Pay cost [1]	Program
Demonstration plants	$1,184,633	$1,850,000	$2,300,000	+$450,000	+$5,000	+$445,000
Unobligated balance lapsing	839,567					
Total	2,024,200	1,850,000	2,300,000	+450,000	+5,000	+445,000

[1] To provide for increased pay costs for fiscal year 1964 positions.

JUSTIFICATION, DEMONSTRATION PLANT PROGRAM

OPERATION AND MAINTENANCE

(a) *Operation and maintenance, $1,650,000*

The estimate of $1,650,000 represents an increase of $350,000 over the 1964 level to cover the energy, operation, and maintenance charges of the four plants currently in operation and for minor process improvements and changes.

This increase over the fiscal year 1964 level consists of two factors. The first involves operation of the San Diego plant at elevated temperatures. The evaporator at this plant have been operated for test purposes on an intermittent basis at temperatures above the original design ratings which in turn has increased production and operating costs, with a net reduction in the cost of product water. Indications are that operating temperatures can be increased further and it is intended to increase operating temperatures on an intermittent test basis through fiscal year 1964 for evaluation of possible plant changes necessary for conversion to still higher operating temperatures on a continuous basis during fiscal year 1965. Operation at this higher temperature level on a continuous basis will increase energy costs by an estimated $75,000.

The second factor consists of minor process changes and improvements in three plants amounting to $275,000. The proposed changes will involve the installation of plate-type heat exchangers at the Roswell, N. Mex., plant estimated to cost $160,000, the installation for test and evaluation of one thin film evaporator at Freeport, Tex., at an approximate cost of $70,000, and the installation of a horizontal split case pump in place of the present vertical submerged pump estimated at $45,000 at San Diego, Calif.

(b) *Major process improvement and plant change, $400,000*

Major process improvements and plant changes consists of two separate items. The major process improvement estimate is $130,000 and covers the installation of one liquid-to-liquid heat exchanger at the Freeport, Tex., plant. It is anticipated that operating costs will be reduced and productivity increased after completion of this installation.

The major plant change consists of $270,000, representing the initial stage of changes estimated to eventually cost a total of $750,000 at the San Diego plant. This change involves the installation of and incorporation into the system of a slurry technique in order to expand the plant to high temperature operation on a permanent basis. The remaining plant changes necessitated by this changeover, amounting to $480,000, is not being requested at this time. The remaining changes will consist of the installation of additional brine heaters, evaporator stages, heat reject stages, recycle pumps, and the necessary instrumentation and piping.

(c) *Administration, $250,000*

The estimate of $250,000 is an increase of $25,000 over 1964 which includes $5,000 for increased pay costs. The estimate provides for the administration of the demonstration plant program which includes operating and determining the engineering potential of the four plants under operation and personnel required to supervise the architectural, engineering, and construction work of much larger plants now under consideration. The two additional positions are requested in 1965. This personnel will be required to handle work connected with feasibility studies on new plants, design changes, improvements and alterations to existing demonstration plants, and to assist in the performance of the steadily increasing engineering workload.

Itemization of estimate

	Actual, 1963	Estimate, 1964	Estimate, 1965	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$1,184,633	$1,850,000	$2,300,000	+$450,000
Comparative transfer from other account	−39,000			
Unobligated balance lapsing	+839,567			
New obligational authority	1,985,200	1,850,000	2,300,000	+450,000
Appropriation	2,000,000	1,850,000	2,300,000	+450,000
Transfer to "Operating expenses, public building services," General Services Administration	−14,800			
Adjusted appropriation	1,985,200	1,850,000	2,300,000	+450,000
Obligations by objects:				
11 Personnel compensation	134,449	169,000	207,000	+38,000
12 Personnel benefits	9,936	12,000	15,000	+3,000
21 Travel and transportation of persons	12,001	23,000	30,000	+7,000
22 Transportation of things	926	2,000	5,000	+3,000
23 Rent, communications, and utilities	235,731	408,000	443,000	+35,000
24 Printing and reproduction	6,522	12,000	13,000	+1,000
25 Other services	778,851	1,212,000	1,571,000	+359,000
Services of other agencies	2,261	5,000	3,000	−2,000
26 Supplies and materials	2,767	4,000	7,000	+3,000
31 Equipment	1,189	3,000	6,000	+3,000
Total obligations	1,184,633	1,850,000	2,300,000	+450,000

PROPOSED BUDGET FOR DEMONSTRATION PLANTS

Senator BIBLE. I think it would be well for you to discuss the proposed division of this money among the various activities and the demonstration plants.

Mr. MACGOWAN. Yes, sir.

GUANTANAMO PLANT

The plant that we are considering moving at Guantanamo was in this originally. So if it is all right with you, sir, I would like to supply for the record a correction, because these numbers will be slightly modified.

But based on the original request, we had programed $1,375,000 for the physical operation of the plants, meaning the usual pipefittings, labor, power, and fuel.

The revised estimate now is $940,000 which is a reduction of $750,000 just the amount that was for the San Diego plant.

Senator BIBLE. That comes about because of the transfer to Guantanamo.

Mr. MCGOWAN. Correct. And the improvements and changes, meaning the technical improvements in the process, we had programed for $675,000, including a major job at San Diego, in which we were going to completely revise the sea intake and the processing. The new figure would be $360,000.

As far as administration is concerned, the administration is $250,000 in both cases, which provides for two more people, because of the added studies which we are doing.

SAN DIEGO POINT LOMA REPLACEMENT PLANT

Senator BIBLE. All right.

Now, one further question and I do not know whether I covered it sufficiently in earlier questioning or not. You again will build a demonstration plant on the Pacific coast. Will you go back to Point Loma? I assume you possibly will go right back there for your new site location?

Mr. MACGOWAN. This is our plan; yes, sir.

Senator BIBLE. Will it be a million-gallon plant, or will you go into a larger plant, or into a different type of plant, when you rebuild that?

Mr. MACGOWAN. At this point, may I get just a little bit detailed?

Senator BIBLE. Surely.

Mr. MACGOWAN. The plant at San Diego, which originally started about 4 years ago, in the site selection, or the process selection, was designed to operate at 190°. We now wish to make the replacement plant, if such a plant is granted, to begin operating at 250°. The interval of 60° seems relatively unimportant, but I would like to point out that when we built that plant, no one in the world knew how to handle scale at these relatively higher temperatures.

HANDLING SCALE

Senator BIBLE. What do you mean by "scale"?

Mr. MACGOWAN. This is the scale that forms in the tubes and reduces the heat transfer and increases the cost.

We were able to successfully handle scale at 200°, at 210°, 220°, until we got to 250°. As a result of this, sir, and this has been within the past year, all of the plants designed by the major American suppliers have been based upon the fact that they would design them at 250°. And we think this is a major step.

We wish to take one more step. We would like to design the replacement plant to begin at 250°, with a possibility of going to 350° ranges. Again, the economies and the construction features would be very attractive, we think, to a great lowering of the costs.

Senator BIBLE. Surely. Well, then, as unfortunate an incident as this was it might have been a real blessing in disguise, because Guantanamo will be self-sufficient now, No. 1, and No. 2, you will

have the opportunity of moving the art along a further step. Will it still be a million gallons? In that range?

Mr. MACGOWAN. A million gallons at 250°, possibly a million and a half at 350°, but certainly the same size range of plant.

LARGER CAPACITY PLANTS

Senator BIBLE. Why do you not go into a bigger plant down there now? Why do you not go into a 5 million one, for example?

Mr. MACGOWAN. We have considered this, and at this highly experimental level, it may be too much of a gamble—too much money. We could get the same answers from a 1-million-gallon plant as we could from a 5-million-gallon plant.

Senator BIBLE. Would that be true of a 10-million-gallon plant?

Mr. MACGOWAN. More true. We would hesitate to gamble on $10 million as opposed to a million dollars.

Senator BIBLE. I see.

Mr. MACGOWAN. And we would like very much to get the good solid answers out of the million-gallon plant.

Senator BIBLE. You could do that for far less cost than getting into the bigger plants, I understand.

INTERNATIONAL CONFERENCES ON DESALINATION OF WATER

Mr. MACGOWAN. The question you asked earlier about the international aspects of this: The bill which you so ably handled also gave provisions for international conferences.

Senator BIBLE. Yes; I recall that.

Mr. MACGOWAN. Such a conference is now planned for October of next year, October of 1965, fiscal 1966, and you may be interested to know that it will be held here in Washington?

Senator BIBLE. Splendid.

Mr. Chairman, did you have any questions of Mr. MacGowan?

Senator HAYDEN. No questions.

Senator BIBLE. Thank you very much, Mr. MacGowan, Mr. O'Meara, and Mr. Miller. We appreciate your appearances.

(CLERK'S NOTE.—Subsequent to the hearings the Department asked that the operation and maintenance estimate not be reduced. The letter of request follows:)

U.S. DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D.C., March 4, 1964.

Hon. CARL HAYDEN,
Chairman, Committee on Appropriations,
U.S. Senate, Washington, D.C.

DEAR MR. CHAIRMAN: At the time of his appearance before your committee on March 2, 1964, Director Charles F. MacGowan, of the Office of Saline Water, presented a statement in connection with the estimate of $2,300,000 for operation and maintenance of saline water conversion demonstration plants for the fiscal year 1965. On page 2 of this statement your committee was informed of plans for the transfer of the San Diego demonstration plant to the Navy and was advised of a reduction of $750,000 in the requirements for operation and maintenance of demonstration plants in 1965, which had previously been set forth on pages 22 to 27 of the justification for the 1965 estimates. It has now been determined that there will be a firm requirement for appropriation of the $750,000 item for replacements at San Diego. This will cover a portion of the cost of the replacement plant.

The Department of the Navy will take over a substantial portion of the equipment in the San Diego plant on a reimbursable basis. That portion of the plant will be transported by the Navy to its base at Guantanamo, Cuba, for installation there to meet its immediate fresh water requirements. The dismantling and transfer of the San Diego plant will give the Office of Saline Water an opportunity to replace the flash distillation equipment as originally built with a new advanced design flash distillation equipment which will be designed for an output of 1 million gallons per day when operating at a basic temperature of 250° F. (brine heater temperature) with a potential maximum capacity of 1.5 million gallons per day at the highest maximum temperature of 350° F.

The new plant size will be commensurate with the facilities of the city of San Diego to handle the product water. The vested interests of the State of California and the city of San Diego in the original plant will be continued in the new plant. The advancement of the saline water program in developing the distillation process will be carried out to the utmost in the new plant.

The cost of the replacement plant is expected to be as follows:

Engineering and specifications	$150,000
Plant construction	2,260,000
Performance test operation	90,000
Total	2,500,000

As soon as is practical, invitations for proposals covering the design and preparation of specifications will be issued by the Office of Saline Water, preliminary to selection of a design contractor. Upon completion of this initial phase, steps will be taken to initiate the construction of the replacement plant at San Diego so that further research and development may be continued on the flash distillation process at high temperature.

The appropriation "Construction, operation, and maintenance, Office of Saline Water," has a current balance of $700,000 in a reserve category, and can be made available for use in meeting San Diego replacement costs with the approval of the appropriate congressional committees and the Bureau of the Budget. In addition, it is expected that an appropriation reimbursement will be obtained from the Navy in the amount of approximately $1,050,000 to cover the value of that portion of the San Diego plant which is transferred to the Guantanamo Bay Naval Base. The 1965 estimates for the appropriation, "Operation and maintenance, Office of Saline Water," now include $780,000 for the San Diego plant, of which it is anticipated that $750,000 will not be required due to the plant shutdown. It is therefore requested that your committee appropriate the $750,000 estimate for 1965, authorize its use for plant replacement, and also approve use of the $700,000 existing balance in construction funds to meet the financial requirement for replacement of the San Diego water conversion demonstration plant.

In the event that the committee concurs with our proposed program, we shall be glad to supply any further details which may be required.

Sincerely yours,

D. Otis Beasley,
Assistant Secretary of the Interior.

Federal Coal Mine Safety Board of Review

STATEMENTS OF CHARLES R. FERGUSON AND GEORGE C. TREVORROW, MEMBERS, FEDERAL COAL MINE SAFETY BOARD OF REVIEW; TROY L. BACK, EXECUTIVE SECRETARY, AND ROBERT J. FREEHLING, GENERAL COUNSEL

1965 Budget Request

Senator Bible. Our next hearing will be on the Federal Coal Mine Safety Board of Review. We have as our witnesses Mr. Ferguson, Mr. Trevorrow, Mr. Back, and Mr. Freehling.

The proposed budget of the Coal Mine Safety Board of Review for fiscal year 1965 is $70,000; that is, an increase of $5,000 over the amount appropriated in fiscal year 1964.

The increase is required for meeting the cost of employee legislation. There was no increase in the number of employees. The justification will be printed in the record.

(The justification referred to follows:)

JUSTIFICATION STATEMENT

REQUIREMENTS FOR 1965

This request is in the amount of $70,000, of which $59,538 is for personal services and $10,462 is for other obligations. This sum is an increase of $5,000 over the amount appropriated for fiscal year 1964. The major part of the increase would afford funds for schedule step increases and basic salary increases, as provided by law, for the present staff of the Board.

CREATION OF THE BOARD

The creation of the Federal Coal Mine Safety Board of Review is provided for in title II of the Federal Coal Mine Safety Act, Public Law 552, 82d Congress, which act became effective on July 16, 1952, and reads in pertinent part, as follows:

"SEC. 205. (a) An agency is hereby created to be known as the Federal Coal Mine Safety Board of Review, which shall be composed of three members who shall be appointed by the President, by and with the advice and consent of the Senate."

In brief, the present act amends the Federal Coal Mine Inspection and Investigation Act of May 7, 1941, Public Law 49, 77th Congress, by authorizing representatives of the Bureau of Mines to control certain dangerous conditions and practices which might result in major coal mine disasters, and by creating the Board to which operators may apply for relief from orders issued under the act.

ORGANIZATION OF THE BOARD

The original Board was appointed by the President on August 21, 1952. It opened its offices on September 24, 1952, in Washington, D.C.

ADJUDICATORY DUTIES AND WORKLOAD OF THE BOARD

It is the duty of the Board to hear and determine applications filed with it by coal mine operators seeking annulment or revision of, and temporary relief from, orders issued by the Bureau of Mines, pursuant to section 203 or 206 of the Federal Coal Mine Safety Act. In performing its adjudicatory functions, the Board is required, in docketed cases, to conduct public hearings (which are generally held close to the mines involved); to resolve interlocutory matters; to render final decisions and orders; and to certify records on appeals to the courts. All such actions of the Board, under the specific mandate of the statute, must be taken "as rapidly as practicable" in order to effectuate the underlying safety purposes of the act.

As to workload, from July 16, 1952, the effective date of the act, through July 31, 1963, the Bureau of Mines issued over 1,400 orders subject to appeal to the Board, an undetermined number of which are still outstanding. During this period, the Board received 26 formal applications for review of orders, and hearings on each application were conducted, requiring from 1 to 12 days. Also during this period, the Board handled a substantial number of disputes which were settled by voluntary actions of the parties, rather than by the filing and litigation of formal appeals. The Board estimates that from 100 to 125 additional orders subject to appeal to this agency will be issued by the Bureau of Mines in fiscal year 1965.

OTHER DUTIES OF THE BOARD

Apart from its adjudicatory functions, the Board must perform the broad range of activities of any independent, quasi-judicial agency in the executive branch of the Government. Such activities include, among others, the preparation and adoption of administrative orders and regulations; the maintenance of records,

files, and supporting data; the submission of administrative reports to other executive departments and agencies, and to the Congress; the prompt handling of inquiries and correspondence; the analysis of, and detailed reporting on, proposed and pending legislation; the participation in hearings before committees of the Congress; and the discharge of other advisory and information responsibilities.

PERSONNEL COMPLEMENT

In addition to the three members of the Board, who are employed on a w.a.e. basis, the Board is currently operating with a limited staff of only four full-time employees; namely, an executive secretary, a general counsel, and two office employees. These full-time personnel must be particularly qualified to assist the Board in fulfilling its adjudicatory duties and in performing, responsibly and without close supervision, the many and varied administrative and legal tasks of this independent agency. The amount requested in the budget for fiscal year 1965 would restrict the Board to its current staff level, which is the bare minimum required by the Board to discharge its responsibilities under the act and to accomplish its statutory mission. As mentioned hereinbefore, the additional appropriation for fiscal year 1965, would be devoted in substantial part to defraying the increased benefits, as provided by law, for the present minimal staff.

PROGRAM AND PERFORMANCE

Coal mine operators, affected by orders issued by Federal coal mine inspectors may appeal to the Board for annulment or revision of, and temporary relief from, such orders. During 1963, a total of 107 orders were issued. When operators appeal, hearings are held, and the Board rules upon the applications. It is estimated that there will be 100 to 125 orders subject to appeal to the Board in 1965. The recommended appropriation includes an amount estimated to be sufficient to cover necessary administrative expenses and to handle an expected caseload estimated on the basis of the average actual annual caseload for the past 10 years.

SALARIES AND EXPENSES

Statement relating 1963, 1964, and 1965 programs

[In thousands of dollars]

1963 program (total costs)	59
Maintenance of past year employment level	+5
Other increases	+1
1964 program (total costs)	65
1965 program (total costs)	70

Analysis by activities

[In thousands of dollars]

Activities	1963	Decreases	Increases	1964	Decreases	Increases	1965
Administration and adjudication (total program costs)	$59		$6	$65		$5	$70

Requirements for 1965. This request is in the amount of $70,000, of which $59,538 is for personnel compensation and $10,462 is for other obligations.

Justification for Personnel Compensation

The following summary table and statement present the essential facts with respect to this item:

	1963 actual	1964 estimate	1965 estimate	Estimated change in 1965 from 1964
1. Number of permanent positions	4	4	4	0
2. Annual salary cost of permanent positions	$46,617	$49,867	$52,335	+$2,468
3. Other personnel compensation		397	203	−194
4. Positions other than permanent (3 Board members)	5,100	6,000	7,000	+1,000
Total personnel compensation	51,717	56,264	59,538	+3,274

The four permanent positions listed represent the minimum staff required to carry out the statutory duties of the Board.

Justification for Other Obligations

A total of $10,462 is requested for "Other obligations" in budget year 1965. The following summary table and statements present the essential facts with respect to these items:

	1963 actual	1964 estimate	1965 estimate	Estimated change in 1965 from 1964
12 Personnel benefits	$3,593	$3,887	$4,112	+$225
21 Travel and transportation of persons	1,697	2,500	3,500	+1,000
22 Transportation of things		10	10	0
23 Rent, communications, and utilities	867	900	1,000	+100
24 Printing and reproduction	210	300	300	0
25 Other services	119	200	250	+50
26 Supplies and materials	585	600	700	+100
31 Equipment	701	339	590	+251
Total	7,772	8,736	10,462	+1,726

Detailed Statement

12 Personnel benefits.—The $4,112 requested for this item will be required to defray the aggregate costs to the agency resulting from various laws enacted in the interest of Federal employees, as follows: Employer's share of cost of employees' life insurance, $176; health benefits, $231; retirement, $3,415; and Federal Insurance Contributions Act taxes, $290.

21 Travel and transportation of persons.—The $3,500 requested for this item includes $2,500 for travel expenses for Board members and $1,000 for transportation and subsistence for the executive secretary and the General Counsel of the Board.

22 Transportation of things.—This small sum of $10 is requested to defray any costs that may rise in connection with the shipment of files, records, or other documents required in connection with hearings held outside of the District of Columbia.

23 Rent, communications, and utilities.—The $1,000 requested for this item includes $750 for local telephone costs; $150 for long distance telephone calls; $50 for airmail, special delivery, and other postage stamps; and $50 for telegraph service.

24 Printing and reproduction.—The $300 requested for this item includes the cost of administrative forms, letterheads, envelopes, etc.; and the printing of regulations and issuances of the Board.

25 Other services.—The $250 requested for this item will provide $155 for the maintenance of equipment used in day-to-day operations, and $95 for health services provided by the Public Health Service.

26 Supplies and materials.—The $700 requested for this item includes the cost of all office supplies and commodities normally required in an agency of this kind.

31 Equipment.—The $590 requested for this item will provide funds for the purchase of such equipment as may be required.

ACTIVITIES OF THE BOARD

Senator BIBLE. The Board is required by law to hear and determine applications filed with it by coal mine operators in accordance with the provisions of the Federal Coal Mine Safety Act. The committee will be glad to receive from you a statement of the activities of the Board during the past year.

And who is testifying? Mr. Ferguson? Very fine.

Mr. FERGUSON. We have a prepared statement.

Senator BIBLE. That will be incorporated in full in the record, and you may highlight it in your own way.

(The statement referred to follows:)

STATEMENT OF FEDERAL COAL MINE SAFETY BOARD OF REVIEW

The Federal Coal Mine Safety Board of Review is requesting an appropriation of $70,000 for fiscal year 1965, which is $5,000 over the amount appropriated for the current year. This slight increase reflects no proposed expansion in either the personnel or program of the agency. Rather, it is intended, primarily, to cover the basic salary and automatic schedule step additions now provided by law, for the present full-time staff.

As you will recall, the Board is a completely independent, quasi-judicial agency, engaged in a broad range of adjudicative and administrative activities under title II of the Federal Coal Mine Safety Act. The agency is tripartite in nature and its members are appointed by the President, with the approval of the Senate.

The present Board members are Edward Steidle, dean emertius, College of Mineral Industries, Pennsylvania State University, serving as public representative and Chairman; George C. Trevorrow, safety director, Bituminous Coal Operators' Association, representing the coal mine operators; and Charles R., Ferguson, director, safety division, international union, United Mine Workers of America, representing the coal mine workers.

The total personnel of the agency consists of the three Board members, who serve on an intermittent basis, and a reduced complement of only four full-time employees. The duties performed by the Board are outlined in the budget estimate submitted to your committee. However, for your assistance, some further details regarding the operations of the Board will be provided here.

As to adjudicative duties, the Board serves as a buffer between the Bureau of Mines and the coal industry, principally to resolve disputes concerning orders issued by the Bureau, under the Federal Coal Mine Safety Act. That act, as you will recall, was adopted by Congress, in 1952, in a determined effort to reduce the incidence of major coal mine disasters from explosions, fires, inundations and man-trip and man-hoist accidents. To this end, the act vests enforcible authority in the Bureau to order mines classified as "gassy," and ot order mines closed because of imminent danger of disaster, or failure to correct specific violations of the act, within the time provided therefor. It further provides for the authority in the Board to resolve conflicts with regard to such orders: and, in so-called State plan areas, it delegates power to the Board alone to annul mine closing orders posted by the joint inspectors.

Almost 1,500 orders, and over 20,000 related findings of violations, have been issued by the Bureau under the act, including 145 new orders, and over 1,100 new findings of violations, issued during the last calendar year. These orders and related findings are the sources of controversies which are presented formally or informally to the Board for settlement. And, under specific requirements of the law, the Board must be prepared, at all times, to act promptly in resolving such disputes, in order to prevent serious economic hardship and to avert the devastation of a major coal mine disaster.

As previously mentioned, disputes may be presented formally or informally to the Board for settlement. In a formal, docketed case, the Bureau of Mines must first actually close the mine or classify it as "gassy." Then, the Board, upon appeal, is required immediately to hear and determine any request for temporary

relief; to conduct de novo hearings on the merits; to dispose of interlocutory questions; to prepare and issue a final decision and order; and, if review of Board action is sought by the Government or an operator, to certify the record to the U.S. Court of Appeals.

However, such formal litigation, while unavoidable in certain instances, is obviously time consuming and disrupts not only the mine operations but also the enforcement of the act and the strict compliance with its provisions. Therefore, the Board members, as a matter of policy, seek to minimize the need for resort to litigation, and devote their efforts most frequently to resolving disputes by the voluntary actions of the parties, without the docketing and required processing of formal appeals. These actions in nondocketed matters take a variety of forms, including, for example, extended meetings with counsel and the parties on decided cases and alternate procedures; serving as intermediary with the Bureau to resolve misunderstandings; devising and suggesting new work programs; anticipating conflicts or areas of disagreement; expediting changes in operations; and, by an expressed readiness to redress sound grievances, aborting the issuance of unreasonable or arbitrary orders. In the Board's opinion, such activities constitute a more productive exercise of its adjudicative authority and facilitate the successful operation of the act.

At this point, the Board would call to the committee's attention that the mine-safety program, under which the Board serves in a critical role, has reduced the number of men killed in major coal mine disasters by over 72 percent since the adoption of the Federal Coal Mine Safety Act. Much still can be done, particularly if certain statutory amendments now pending before Congress are enacted. But this record amply confirms that the Board's efforts are properly directed and are contributing substantially to reaching the goals sought to be accomplished by the present act.

Besides its adjudicative duties, the Board is responsible, as an independent, quasi-judicial agency, for a wide range of administrative and related activities. For instance, the Board must prepare numerous administrative orders and reports; draft rules, regulations, and procedural forms; maintain records and supporting data; perform diverse accounting operations; promptly answer inquires and correspondence; and fulfill other information requests.

Moreover, the Board must attend congressional hearings; submit regular reports to Congress; and, upon request, analyze and report and make recommendations on, proposed and pending legislation. In the latter regard, the Board, during the last calendar year alone, was required to analyze and report on over 800 pages of legislative matters. Also, during this period, the agency was called upon to consider, and assist in drafting, extensive amendments to the Federal Coal Mine Safety Act, which would substantially expand both the jurisdiction and functions of the Board. That proposed legislation was favorably reported out of the House Education and Labor Committee on November 19, 1963, and is now pending before the House Rules Committee. (See H. Rept. 936 on H.R. 9000, dated Dec. 2, 1963.)

In addition to such activities, the Board is required to perform various special assignments for the industry and for other offices, departments, and agencies in the Government. Of particular significance in this connection, the Board, during the last year, assisted two other agencies in establishing their appeals systems; participated, at the special request of the industry and the Bureau, in a national first aid and mine rescue training program; and worked intensively and directly with the Office of the President, on major coal-mine disaster problems.

As previously indicated, the Board has carried out its many duties and responsibilities with a full-time staff of only four employees. Since the Board members are employed on an intermittent basis, these employees are required to be particularly experienced and well-trained, and must responsibly assist the Board, in the performance of its adjudicative and administrative duties, without day-to-day supervision and with a wide latitude of authority. The staff has already been reduced to the minimum necessary to maintain the operations of the Board and to insure that this agency can continue to fulfill its grave responsibilities under the act. No increase in personnel is sought for the next fiscal year.

As your committee is undoubtedly aware, the Board, since its very inception in 1952, has rigidly confined its staff and other expenses to the least amount required to perform its statutory duties and functions. The budget of $70,000 for fiscal year 1965, submitted for your approval, reflects a strict adherence to this policy, and you are assured that the Board will continue to limit its expenditures to the bare minimum needed to accomplish its mission in the field of coal-mine safety.

HIGHLIGHT STATEMENT

Mr. FERGUSON. Well, of course, our justification goes into all details of the required $70,000, and the Federal Coal Mine Safety Board of Review is a unique agency. It has one principal function and that is to act on appeals filed by coal-mine operators from orders issued by the U.S. Bureau of Mines in accordance with the provisions of Public Law 552.

The Board is a completely independent agency, of course, and has no connection with any other governmental agency and is one of the smallest, if not the smallest, agency in government.

It is composed of three board members, who are part time or rather who are paid only when they are actively engaged in work of the Board, and four full-time employees, composed of a general counsel, an executive secretary, and two clerical or stenographic employees.

CASE LOAD

In addition to the hearing of cases, we believe that the Board has many other functions and our caseload is no indication, in our opinion, of what the Board actually does, insofar as coal-mine safety is concerned.

It has been the policy of the Board, and is the policy, that, if we can prevent a case coming to an actual hearing, by consultation, conference, and joint action with the parties concerned—and we carry this on, almost on a daily basis—we believe that we are serving the purpose of the act and the intent of Congress. Therefore, our caseload is not indicative of our activity.

You will understand, of course, that each order issued by the Bureau of Mines is a potential case before the Board. Each finding may result eventually in an order by the Bureau of Mines. So we are not able at any time to tell you just what the caseload may be.

The Board, I might say, is dedicated to operating with a minimum of expense. We believe, $70,000 is the minimum that we will need under out past experience and what we believe will be necessary for the next fiscal year, taking into consideration that there are certain salary increases, wage adjustments, that are a matter of congressional action, over which the Board has no jurisdiction.

We will, as we have in the past, continue to operate at a minimum of expense, subject of course to our carrying out our duties as required by the act.

If our caseload does not indicate that we will need all this money now, we will follow our past practice, as we did in the 1963 budget, wherein $10,000 of the Board's funds were unused or unallocated. That has been the history of the Board.

I happen to have served on the Board since its inception in 1952, when the act was first passed, and I know that policy will continue.

PERSONNEL

Senator BIBLE. This is certainly a modest Board. As I understand it, you have three Board members.

Mr. FERGUSON. That is correct.

Senator BIBLE. You two gentlemen here, and Mr. Steidle?

Mr. FERGUSON. Dean Steidle, who cannot be here today.

Senator BIBLE. And you are the three Board members? You serve on an intermittent basis?

Mr. FERGUSON. That is correct.

Senator BIBLE. And then you have four full-time employees, that is the extent of your personnel.

Mr. FERGUSON. That is correct.

APPEALING BOARD FINDINGS

Senator BIBLE. Now, tell me this, just for information. After you make a finding, is that reviewable? Can they take you to court?

Mr. FERGUSON. Oh, yes. To the court of appeals and to the Supreme Court, if necessary.

Senator BIBLE. They party who is not satisfied with your decision can appeal even to the circuit court of appeals or to the U.S. Supreme Court?

Mr. FERGUSON. That is right. They have that right.

Senator BIBLE. I mean they cannot go to the Supreme Court originally?

Mr. FERGUSON. They go to the court of appeals first. Then they can go to the Supreme Court, if need be.

Senator BIBLE. They can appeal the court of appeals decision?

Mr. FERGUSON. That is right.

Senator BIBLE. I have no further questions.

Mr. Chairman?

Chairman HAYDEN. I do not have any.

Senator BIBLE. Thank you very much, gentlemen.

Our next hearing is on the Corregidor-Bataan Memorial Commission.

CORREGIDOR-BATAAN MEMORIAL COMMISSION AND VETERANS' ADMINISTRATION

STATEMENTS OF EMMET O'NEAL, CHAIRMAN, AND SAMUEL G. KELLY, EXECUTIVE DIRECTOR, CORREGIDOR-BATAAN MEMORIAL COMMISSION, ACCOMPANIED BY V. P. MILLER, DIRECTOR, BUDGET SERVICE, AND L. G. SCHWEICKART, EXECUTIVE ASSISTANT, OFFICE OF ASSISTANT ADMINISTRATOR FOR CONSTRUCTION, VETERANS' ADMINISTRATION

1965 BUDGET REQUEST

Senator BIBLE. Gentlemen, if you would, please identify yourselves for the record.

Mr. O'NEAL. Emmet O'Neal, Chairman of the Commission; Captain Kelly, the Executive Director; serving without pay for a long time. Senator McGee, over there, is a member of the Commission.

Captain KELLY. Mr. Schweickart from the Construction Division of the Veterans' Administration, and Mr. Miller, who is the Director of the Budget Service of the Veterans' Administration, are also here.

We are housed in the Veterans' Administration, and that is why these gentlemen are here, sir; and the appropriation is to them also.

Senator BIBLE. Very fine, gentlemen. The budget estimate for the fiscal year 1965 for expenses of the Corregidor-Bataan Memorial Commission is $25,000. The statement and justification of this request will be included in the record at this point.

JUSTIFICATION STATEMENT FOR 1965 BUDGET ESTIMATE

The Corregidor-Bataan Memorial Commission was created by an act of Congress in 1953 (Public Law 193, 83d Cong., approved August 5, 1953). Its mission is to plan a memorial to be erected on Corregidor Island to commemorate veterans who fought under the American Flag in the Pacific area during World War II. The enabling legislation authorizes appropriations of not to exceed $200,000 for necessary expenses of the Commission. $100,000 has been appropriated for this purpose in prior years. A recent amendment to the basic legislation (Public Law 88–240) authorized appropriation of $1,500,000 to the Veterans' Administration for construction of the memorial. The $25,000 requested under this heading will provide for administrative expenses of the Commission incurred in performing the following tasks:

1. Developing a study (The Memorial Study) in cooperation with the Philippines National Shrine Commission, for the location and erection of the memorial components, and assisting the VA in the preliminary phase of construction of these components described in subparagraph "i" of Public Law 88–240. This study will include—

(*a*) The site location of the twin flagpoles, and their height, size, composition, and design.

(*b*) The site location of the building, or buildings, for use as an auditorium and tourist center; and the dimensions, style, design, and interior arrangements and the furnishings.

(*c*) The site and boundaries of the contiguous battlefield park with the locations of its walks and roadways to the various points of historical interest.

(*d*) Determination of the type of war mementos and their location in the battlefield park.

(*e*) Determination of the location of historic markers and inscriptions thereon.

(*f*) Determination of the scope and content of the documentary films commemorating the Pacific phase of World War II, including the story of Bataan and Corregidor Island.

2. Preparing policy directives to guide the Veterans' Administration in carrying out all phases of the authorized construction.

3. Carrying out necessary liaison with the Veterans' Administration during the contractual and construction phases to the end that the Veterans' Administration may obtain such policy guidance as it may desire.

4. Developing plans for raising additional funds by public subscription for the erection of the memorial and to place into effect such of the plans as may be deemed practicable.

Program and financing

[In thousands of dollars]

	1963 actual	1964 estimate	1965 estimate
Program by activities: Planning the memorial (costs, obligations)	----------	$11	$25
Financing: New obligational authority (appropriation)	----------	11	25

25	Other contractual services	----------	----------	----------
	Total obligations	----------	11	25

Senator BIBLE. Also there will be placed in the record the fiscal year 1964 supplemental estimate in the amount of $11,000, for the same purpose, and the supplemental estimate of $1,500,000 to the

Veterans' Administration for planning and constructing a memorial on Corregidor Island.

Those will be inserted at this point in the record.

(The statements referred to follow:)

JUSTIFICATION STATEMENT FOR 1964 SUPPLEMENTAL ESTIMATE

The Corregidor-Bataan Memorial Commission was created by an act of Congress in 1953 (Public Law 193, 83d Cong., approved Aug. 5, 1953). Its mission is to plan a memorial to be errected on Corregidor Island to commemorate veterans who fought under the American flag in the Pacific area during World War II. The enabling legislation authorizes appropriations of not to exceed $200,000 for necessary expenses of the Commission; $100,000 has been appropriated for this purpose in prior years. The $11,000 requested under this heading will provide for administrative expenses of the Commission incurred in performing the following tasks:

1. Developing a study (the memorial study) in cooperation with the Philippines National Shrine Commission, for the location and erection of the memorial components described in subparagraph "i" of H.R. 7044. This study will include—

(*a*) The site location of the twin flagpoles, and their height, size, composition and design.

(*b*) The site location of the building, or buildings, for use as an auditorium and tourist center; and the dimensions, style, design, and interior arrangements and the furnishings.

(*c*) The site and boundaries of the contiguous battlefield park with the locations of its walks and roadways to the various points of historical interest.

(*d*) Determination of the type of war mementos and their location in the battlefield park.

(*e*) Determination of the location of historic markers and inscriptions thereon.

(*f*) Determination of the scope and content of the documentary films commemorating the Pacific phase of World War II, including the story of Bataan and Corregidor Island.

2. Preparing policy directives to guide the Veterans' Administration in carrying out all phases of the authorized construction.

3. Carrying out necessary liaison with the Veterans' Administration during the contractual and construction phases to the end that the Veterans' Administration may obtain such policy guidance as it may desire.

4. Developing plans for raising additional funds by public subscription for the erection of the memorial and to place into effect such of the plans as may be deemed practicable.

JUSTIFICATION STATEMENT FOR VETERANS' ADMINISTRATION CONSTRUCTION

Public Law 193, 83d Congress, establishing the Corregidor-Bataan Memorial Commission in 1953, was recently amended (36 U.S.C. 426) to authorize an appropriation of $1,500,000 to the Veterans' Administration for the construction of a battlefield-type memorial to veterans who served in the Pacific area during World War II. Appropriation of this amount will provide for necessary planning, design, and construction expenses in fiscal years 1964 and 1965, as follows:

[In thousands]

	Fiscal year 1964	Fiscal year 1965
Personnel compensation and benefits: 1 GS–12 for 8 months in fiscal year 1964 and for fiscal year 1965 to provide liaison with the architect-engineer selected and to supervise construction	$7,000	$11,000
Employee travel incident to the above	4,000	4,000
Contractual services and construction award:		
Surveys and site investigations	15,000	----------
Schematic plans for memorial (master plans, coordination of future site work, utilities, services, etc.)	15,000	----------
Preliminary plans	30,000	----------
Working drawings	54,000	----------
Supervision	----------	30,000
Construction and display of model	35,000	25,000
Construction funds	----------	[1] 1,200,000
Contingencies	----------	70,000
Total requirements	160,000	1,340,000

[1] Includes placement of historical markers and mementos in the battlefield park, and the preparation of a documentary film.

It may not be possible to complete the project in fiscal year 1965, in which case some of the 1965 amounts shown above would be required in fiscal year 1966 instead.

Program and financing

Senator BIBLE. And we have a statement from Mr. O'Neal. You may either read the statement or highlight it, Mr. O'Neal.

STATEMENT BY MR. EMMET O'NEAL, CHAIRMAN, CORREGIDOR-BATAAN MEMORIAL COMMISSION

Mr. O'NEAL. Mr. Chairman, it would take just about 6 minutes; I believe I could save time just by reading it, if I may.

Senator BIBLE. You may proceed.

Mr. O'NEAL. The three appropriations requests before Congress reflect the compromise arrived at by President Kennedy and Vice President Pelaez of the Philippine Republic in order to secure prompt action by both Governments on the World War II memorial on Corregidor Island. Prompt action by the U.S. Government depends on this Commission completing certain tasks at the earliest practicable date. As this Commission presently has no appropriation, the two requests—one for $11,000 and one for $25,000—are to permit the employment of a small staff, in order that the Commission can start to function. This compromise I have referred to represents a reduction from the prior estimate of $7.5 million down to the present figure of $1.5 million. This latter amount, which is the U.S. share, is approximately equal to the ₱4 million already authorized by the Philippine Congress. Their plans for the cleanup of Corregidor, the restoration of Malinta Tunnel, and repair of roads and piers are now being implemented and favorable progress is being made. As of now, there has been no U.S. effort, and the requests before you are to permit this Commission to initiate the necessary planning in accordance with Public Law 88–240, signed by President Johnson last December 23.

INITIATION OF MEMORIAL PROJECT

This lower compromise figure, while disappointing in some respects to members of the Commission, is, nevertheless, accepted wholeheartedly. Its authorization by the Congress was supported by the Commission, and it received unqualified endorsement by the American Legion and the Veterans of Foreign Wars and many others. The fact that early initiation of the memorial project, as envisaged by President Kennedy, is now a probability, is welcome news to many of the millions of veterans of the war in the Pacific and to members of their families. I am constantly receiving word to this effect.

Tasks and Responsibilities Under Public Law 88–240

The modest sums requested for the expenses of the Commission will enable us to proceed promptly to carry out our tasks and responsibilities under Public Law 88–240 and prior legislation. I append a list of these tasks to my statement. The first task of the highest urgency is for the Commission to decide on the design of the memorial project. The Veterans' Administration, as required by Public Law 88–240, will act as our construction agency and will be ready to act when we present this approved plan. Any undue delay in proceeding promptly will affect the present schedule of effort on the part of the Philippine Government. The budgeted expenses of the Commission are representative of our efforts to be frugal. Our record of past expenditures shows that we have been most economical in our operations.

Delay of Supplementary Appropriation Bill

In view of the probability of the first supplementary appropriation bill being delayed, the $11,000 request may now be reduced to $7,000, which will barely suffice for the Commission's expenses to June 30, 1964. I would urge that all funds be made either available until expended or that unused sums be carried over for reappropriation, in view of the fact that our present authorization balance of about $95,000 must last until 1967.

Personnel

Even though the Commission is now without funds for office expenses, correspondence is being received in increasing volume from many sources, including Members of Congress, which must be acted upon. There is also a requirement to draft budget requests, such as the ones before you, statements before the various committees of the Congress, and many other matters. As Chairman, it is my responsibility to see that all such duties are discharged. During the past year, the volume of work has not been too heavy and I have been able to carry it out with the patriotic and noncompensated assistance of former members of the Commission's staff. But the workload of the Commission under Public Law 88–240 now requires the full-time services of two staff members, and other additional services of a minor nature.

Planning and Technical Services

The request for $1.5 million to be appropriated to the Veterans' Administration, which will act as our construction agency, includes an amount of $160,000 for planning and technical services. There is no objection on our part if, in accordance with your policy, the request for $1.5 million is reduced to this figure of $160,000. Funds for construction will then be requested in next year's budget.

Commission Members and Compensation

The congressional members of this Commission include Senator McGee, Senator Case, and Senator Engle. As you probably know, no member of this Commission, including the Chairman, receives any compensation for his services.

APPRECIATION OF FILIPINO PEOPLE

Finally, Mr. Chairman, I would like to read a short cable sent by President Macapagal to President Johnson on December 23 last:

Please accept the grateful appreciation of the Filipino people for your prompt approval of the bill authorizing $1.5 million as the contribution of the U.S. Government toward the construction of the war memorial on Corregidor Island. This memorial will stand as an enduring monument to Filipino-American friendship and the historic ties that bind our two countries together in peace as in war. In agreeing to build this great memorial together, our two countries have once again, after a score of years, made of record their common resolve to live by the ideals that we tested upon the indestructible rock of Corregidor. My warmest greetings and best wishes for this New Year.

(Signed) MACAPAGAL.

APPRECIATION TO ASSOCIATES AND STAFF MEMBERS

I am accompanied by Capt. Samuel G. Kelly, U.S. Navy, retired, who has been acting as Executive Director without compensation. And I am also accompanied by Mr. V. P. Miller, Director of the Budget Service of the Veterans' Administration and the members of his staff. We will try to answer any questions you might have regarding this budget request.

I would be very glad to answer any questions and explain any more about the memorial if anyone desires an explanation.

Senator BIBLE. Thank you very much, Mr. O'Neal.

First, I want to thank you and Captain Kelly and the others around you for this noncompensated service that you are performing. This is a splendid statement. It is outlined very fully.

The appendix to Mr. O'Neal's statement will be incorporated at this point in the record.

(The appendix referred to follows:)

THE CORREGIDOR-BATAAN MEMORIAL COMMISSION

TASKS REQUIRED BY PUBLIC LAW 88–240 AND PREVIOUS LAWS

Task 1. To develop a study (the Memorial Study) in cooperation with the Philippine National Shrines Commission for the location and erection of the memorial components described in subparagraph "i" of Public Law 88–240. This study will include—

(*a*) The site location of the twin flagpoles, and their height, size, material, and design.

(*b*) The site location of the building, or buildings, for use as an auditorium and tourist center; and the dimensions, style and design, and the interior arrangements and furnishings.

(*c*) The site and boundaries of the contiguous battlefield park with the locations of its walkways and roadways to the various points of historical interest.

(*d*) Determination of the location of historic markers and inscriptions thereon.

(*e*) Determination of the class of war mementos and their location in the battlefield park.

Task 2. To reach agreement with the Philippine National Shrines Commission formalizing the points in the Memorial Study mutually acceptable to both Commissions. The Memorial Study will be a document which will be submitted to the Philippine National Shrines Commission for comment and eventual approval, and will thus comply with the requirement of paragraph (c) of Public Law 298 (84th Cong.) "to decide after consultation with a similar commission in the Philippines, as to the type of memorial, including all structures, repairs, roads, and improvements on Corregidor Island."

Task 3. To prepare policy directives to the Veterans' Administration which will include those parts of the Memorial Study, as well as other additional matters,

to enable the VA to carry out all phases of the authorized construction. Such directives will include, but not be limited to—

(*a*) Exact boundaries of the battlefield park area plus the exact location of all buildings and flagpoles.

(*b*) Preliminary drawings and final blueprints required for the authorized construction.

(*c*) Preliminary drawings of murals, paintings, and statuary as may be approved by the Commission for inclusion in the memorial project.

(*d*) Specific items to the VA include—

1. Assume general administrative and technical responsibility for construction of the memorial project.
2. Administer funds appropriated for the project in accordance with policies established by the Commission and agreed to by the VA.
3. Assist the Commission in developing preliminary requirements to permit negotiation of an A/E (architectural engineer) contract.
4. Negotiate and contract with the recommended A/E firm to perform necessary architectural services.
5. Assist the Commission and the A/E in developing preliminary plans for the memorial project.
6. Have any necessary topographic and subsurface surveys performed by contract based on proposals by qualified firms or request A/E to have this performed on a reimbursable basis.
7. Supervise and assist in the preparation of working drawings by arranging for and participating in intermediate and final review.
8. Authorize the architectural engineer to print the necessary working drawings.
9. Determine method of bidding procedures.
10. Open bids, evaluate and award construction contracts.
11. Supervise construction by having resident engineer on the site with necessary technical assistance from architectural engineer.
12. Make such changes during construction as required by special site conditions and requested by Commission.
13. Make final inspection of work in conjunction with architectural engineer.
14. Make necessary payments to architectural engineer and contractors as provided in their contracts.
15. Maintain liaison with Commission and make periodic and final accounting for appropriated funds.

Task 4. Carry out liaison with the VA during all phases of the memorial construction to insure that VA will obtain necessary policy guidance as it may request.

Task 5. Arrange, in cooperation with the Philippines National Shrine Commission for the selection and procurement of specific war mementos, and the preparation of documentary films which will depict the major historical events of the Pacific war as well as a film which will tell the story of Bataan and Corregidor.

Task 6. To arrange, in cooperation with the Philippines National Shrines Commission, appropriate dedication ceremonies for the completed memorial project, including preparation of a list of U.S. representatives to attend such ceremonies.

Task 7. To prepare the final report of the Corregidor-Bataan Memorial Commission as required by Public Law 193 (83d Cong.) and to transfer all records of the Commission to the National Archives.

Prior Appropriations

Senator Bible. I have just a few questions.

I note from your justifications that $100,000 has been appropriated to the Commission prior to this time. Would you please insert in the record a statement showing the fiscal years in which prior appropriations have been made, indicating the public laws and the amounts for each of the years.

Captain Kelly. Yes, sir; we will do that.

Senator Bible. Thank you, Captain Kelly.

(The statement referred to follows:)

STATEMENT OF PRIOR APPROPRIATIONS AND EXPENDITURES

Fiscal year 1956 appropriation (Public Law 533, 84th Cong.)	$56,000.00
Fiscal year 1957: Returned to U.S. Treasury	2,141.77
Net expenditures	53,853.23
Fiscal year 1958 appropriation (Public Law 85-48)	44,000.00
Fiscal year 1958: Returned to U.S. Treasury	17,563.20
Net expenditures	26,436.80
Fiscal year 1959: Continuing resolution for expenses (to Aug. 30, 1958) (Public Law 85-472, Public Law 85-572)	4,433.04
Net expenditures	4,433.04
Present authorization: Public Law 85-556 increased the original authorization of $100,000 to $200,000. Of the 2d $100,000 there now remains	95,566.96

NOTE.—Careful budgeting of the Commission's expenses resulted in returning to the U.S. Treasury $19,704.97 out of the total appropriated amount of $104,433.04.

EXISTENCE OF THE COMMISSION

Senator BIBLE. How long has the Commission been in existence?

Captain KELLY. Since 1953. In the first 3 years, very little progress was made until an appropriation was made in fiscal year 1957.

Senator BIBLE. How many permanent personnel are assigned to the Commission?

Captain KELLY. Two, sir.

ROLE OF VETERANS' ADMINISTRATION

Senator BIBLE. And Mr. O'Neal has covered this I think partly, in telling us about the role of the Veterans' Administration in the planning and construction of this memorial. Now, does this mean that it is the Commission which will arrange for the planning and designing and perhaps will negotiate a construction contract?

DESIGN OF MEMORIAL PROJECT

Captain KELLY. No, sir. The Commission will come up with a design—an artist's concept—of what the final memorial project will look like. This design, Mr. Chairman, will have to be approved by the members of the Corregidor-Bataan Memorial Commission, and it will also, as required by law, have to be accepted by the Philippine National Shrines Commission.

When these two bodies are in agreement as to the artist's concept, or rendition, of what the memorial project will look like, we will then turn this design over to the Veterans' Administration and they will proceed to carry out all phases of the construction, including the invitation for bids and the letting of contracts.

PLANNING AND TECHNICAL SERVICES COST

Senator BIBLE. As I understand Mr. O'Neal's statement here, the total overall price tag of the U.S. Government was $1,500,000.

Captain KELLY. That is correct.

Senator BIBLE. But of that, at this time, you are asking only for $160,000 for planning and technical services?

Captain KELLY. That is correct.

Senator BIBLE. Now, who performs those planning and technical services?

Captain KELLY. The initial step, which I have outlined, will be performed by the Commission, under the budget request that you have before you. This artist's design is not really a construction plan, Senator . From this artist's concept, the Veterans' Administration will develop further the preliminary blueprints and the actual construction plans.

TYPE OF MEMORIAL

Senator BIBLE. Do you have any idea at this time of the type of memorial to be constructed?

Captain KELLY. Only as indicated in Public Law 88-240, which says that it will be a battlefield type, similar to Gettysburg. It must have a building. It must have an area of about 15 to 20 acres on top of Corregidor. It must have the two flagpoles flying the flag of the United States and that of the Philippine Government. There will be an auditorium, a tourist rest center. The same building can easily accommodate records of the Pacific war, which the Filipinos now have.

Mr. O'NEAL. The building will also have a fireproof library, which is not found in the Philippines, to keep the records pertaining to the war and also a place in which the memorabilia of the war may be preserved. They are very loosely kept, and little of them have been gathered. We hope that much will be done along that line.

COST OF THE MEMORIAL PROJECT

Senator BIBLE. How much do you foresee as the total cost of the memorial? Do I understand this is approximately $3 million?

Captain KELLY. No, sir. Our limit is a million and a half.

Senator BIBLE. I mean the total cost.

Captain KELLY. That will be the total cost of the U.S. effort. The Filipinos on their own, have used 4 million pesos and they are now actively engaged in cleaning up the Manila Tunnel.

Mr. O'NEAL. We have an authorization unused of $100,000, which would increase the amount from $1,500,000 to $1,600,000, with another that we have already used of $100,000, making a total effort of $1,700,000.

Captain KELLY. Not more than that. And we hope it will be perhaps under that, sir.

Senator BIBLE. And the United States then, in your opinion, will not be asked to contribute more?

Captain KELLY. That is correct.

Senator BIBLE. Is there a ceiling in the legislation?

Captain KELLY. Yes sir; $1.5 million.

Senator BIBLE. A million and a half is all that you can expend?

Captain KELLY. Yes, sir. In addition, as Mr. O'Neal stated, we have an unused authorization of $100,000—$95,000 to be exact—for the expenses of the Commission.

Senator BIBLE. That can be used toward the memorial under the law?

Captain KELLY. No, sir. This will be for the expenses of the Commission. It will just barely stretch to 1967.

Senator BIBLE. And does this have to be completed by 1967?

EXPIRATION OF THE COMMISSION

Captain KELLY. The Commission's functions. Yes, sir. The Commission goes out of existence in 1967.

Senator BIBLE. Does the memorial have to be completed by then?

Captain KELLY. No, sir. It does not. There is no limiting date on construction.

Senator BIBLE. The functions of the Commission expire by law in 1967?

Captain KELLY. Yes, sir.

Mr. O'NEAL. That makes it so important for us to get started. They put the limitation in the bill and Captain Kelly prepared a schedule whereby we have to hurry, and we have to get some money to start on soon in order to complete by 1967.

TIME FOR PREPARATION AND CONSTRUCTION

Senator BIBLE. There is a period of about 13 months of preparation, is there not, Captain?

Captain KELLY. Yes, sir; and 22 months for construction. We are a half-year behind now, Senator.

Mr. O'NEAL. The Veterans' Administration would require a great deal of time to do the construction. So we must make all the speed we can.

Senator BIBLE. Mr. Chairman?

COMBINED COST OF MEMORIAL PROJECT

Senator HAYDEN. Just what will be the cost combined from the two Governments of the construction on Corregidor?

Captain KELLY. The U.S. cost, Senator Hayden, will total not more than $1,700,000. This is including the modest sums already spent. That will be for the American part of the project on the topside of Corregidor. The Filipino Government has authorized 4 million pesos which roughly is equal to our $1.7 million. They may spend more, but they have authorized that much, and they are now doing the work. And unhappily, they are ahead of us.

Senator BIBLE. We, of course, have a very distinguished colleague of ours that serves on this Commission.

Senator McGee, do you have anything you would like to ask?

MEMORIAL PROJECT SITE ORIGINALLY IN STATE OF NEGLECT

Senator McGEE. I would like to make one or two observations, Mr. Chairman: The first is, that I had my first and only chance to see the island just a year ago. Those on my committee were shocked at the state of neglect, of near abandonment, of the entire area. And we were shocked, not because we intend to maintain all the battlefields of the world in some rehabilitated form, but because if any place epitomized one of the great shrines for freedom around the world, it surely was Corregidor and Bataan.

In terms of our own national history, it would be likened, I would think, internationally, to our Bunker Hill or our Valley Forge, that we have preserved. And yet it has been surrendered to the snakes and the rapidly growing jungle undergrowth in general.

It was a great shock that so soon a people could forget.

COORDINATION BETWEEN PHILIPPINE AND U.S. GOVERNMENTS

When I learned more of the details; namely, about how difficult it had been to get the two governments to coordinate, just because of indifference—people who did not care, who thought they could do this next year or the following year, or by 1967, it became obvious that anything we could do to bring this to a head would be very helpful.

PHILIPPINE GOVERNMENT CONTRIBUTION

The Philippine Government, I think it is fair to say, has already spent a substantial sum of money on it, by borrowing from the labor of the bureaus in the Philippine Government, by getting volunteer groups to participate in other ways, so that they have gotten some of the area cleared.

But as yet, there has been no systematic approach to the creation of the kind of memorial that is needed there.

Mr. O'NEAL. Senator, may I mention one thing there? We have not mentioned this fact at all, but the contribution of the Philippines is implied by the fact that they have set aside Corregidor, an island 3½ miles at its widest and longest points. If it were to be used otherwise than as a memorial, if it were to be used for commercial purposes, I do not believe it is too much to evaluate Corregidor itself as a commercial enterprise would be worth $3½ million. And the Philippines are putting that in, in addition to this authorization of 4 million pesos.

Senator MCGEE. The fact that they are willing to go along with this now, I think, is of some considerable merit. Because what it does suggest is that this is not another white man's colonial enterprise, but symbolizes the standing together of these two peoples.

The pace at which we are going still disturbs me. I still think we are going much too slowly.

PARTICIPATION OF U.S. PATRIOTIC ORGANIZATIONS

I do think that we have failed likewise to utilize the resources available to us through some of our patriotic organizations in this country; I mean on a large scale. Such other embellishments of the memorial that our experience may recommend, I think, ought to lead us toward persuading the Veterans of Foreign Wars, the American Legion, and other patriotic groups, through their own solicitations and participation, to contribute to the development of this area in its most desirable way. I think we have been neglecting this aspect.

However, I would not detract from the importance of our putting in these appropriations. I think this is necessary. This is the hard part of it, in order to get the basic design going, the ground cleared and the basic concept of a memorial, that will come into being.

PARTICIPATION OF INDIVIDUAL AMERICANS

There is much more to be done there than just that phase of the memorial. I think there is a great deal to be done there if we could get the participation of a lot of individual Americans for strictly patriotic and commemorative reasons to join in on this with us, and I would hope that that would be possible.

Captain KELLY. Senator, you are familiar with the fact that our recent legislative act, Public Law 88–240, provides for just what you have been saying, that there is no bar to the Commission going out and amplifying the plans called for under the act in a much grander and more inspiring way by getting public subscriptions.

Senator MCGEE. Yes. What has disturbed me is that there has been no really organized effort to do that. I think time is running out. I think we ought to get going on it. Again, the memory of people is distressingly short. That is all I have to say, Mr. Chairman.

Thank you very much.

TIMETABLE FOR MEMORIAL PROJECT

Senator BIBLE. Do you have any timetable, Mr. O'Neal or Captain Kelly, assuming you get the money—and I cannot see any problem on that—I should think the Congress would readily make this money available to you at the earliest possible moment; certainly, that would be my position—as to when you would complete your design? What are we talking about? A year?

Captain KELLY. No, sir. Senator, if funds are made available in the supplemental, and that becomes effective on the first of June, it will take us from 6 to 8 months to get this design and get the approval of the two Commissions. So that, say, 8 months from now I can walk into Mr. Schweickart, here, and say, "This is the approved picture of what we want."

They estimate it might well be 22 months, to let the contracts and get the work completed. So we have 22 and 8, 30 months.

Senator BIBLE. 2½ years.

Captain KELLY. The target date we are shooting for is February 16, 1967, which is the 22d anniversary of the recapture of Corregidor Island. It seems to be a very appropriate date for our ribbon-cutting ceremonies. And if we can start on this in June or July, I feel sure that this can be carried out.

Senator BIBLE. I would certainly hope the money was made available to you before that. I think this year, as we are moving along, under the guidance of the Chairman of the Appropriations Committee, he is going to complete all of his hearings in 4 more days. So we are ready to move.

APPROVAL FOR DESIGN

Now, when you speak of the two Commissions, I am not clear on that. The design takes the approval of the American Commission and the Philippine Commission?

Captain KELLY. Yes, sir, and the acceptance. The Philippine Commission cannot veto it, but they have to agree to it.

Senator BIBLE. If they do not accept it, then what do you do?

Captain KELLY. We find that they are very cooperative, and I am sure they will take any reasonable design.

PHILIPPINE SHRINE COMMISSION

Mr. O'NEAL. Senator, when the Philippine Shrine Commission was organized, the American Commission at once contacted the Philippine Government, and the President appointed a Philippine

Shrines Commission to work on Corregidor with us. And they came over to this country. We had conferences. And they saw the design that we had originally. We had a design that was chosen after a competition of 41 architects. But the Federal Government, in the recent law, chose to reduce it to a million and a half from the seven and a half.

So we had to start over again.

Philippine Interest in the Memorial Project

But they not only created this Commission, for the distinct purpose of conferring with us, but then set aside Corregidor for this purpose and there is a tremendous amount of interest in this, not only in the Philippines—I think everybody in the Philippines has been tremendously interested—but many, many thousands of people in this country too.

There is nothing to be gained by lamenting the time that has been taken thus far. There were many reasons for it, many trials that we ran into, and other things. But the fact is that we are in a position now to do the job and do it properly, and in a manner that will be a credit to the United States. And if we get the money, I think we can do it promptly.

Senator Bible. Thank you very much, Mr. O'Neal.

You say you can do this in three and a half years; so I think you have a little margin.

Thank you very much.

We will be in recess until 10 o'clock tomorrow morning.

(Whereupon, at 12:35 p.m., Monday, March 2, 1964, a recess was taken until 10 a.m., Tuesday, March 3, 1964.)

DEPARTMENT OF INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR 1965

TUESDAY, MARCH 3, 1964

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met at 10 a.m., pursuant to recess, in room 1223 New Senate Office Building, Hon. Alan Bible temporarily presiding.

Present: Chairman Hayden, Senators Bible and Bartlett.

NATIONAL CAPITAL PLANNING COMMISSION

STATEMENT OF MRS. JAMES H. ROWE, JR., CHAIRMAN, NATIONAL CAPITAL PLANNING COMMISSION; ACCOMPANIED BY W. C. DUTTON, JR., DIRECTOR; CHARLES H. CONRAD, DEPUTY DIRECTOR; MISS MARY R. SMALL, SPECIAL ASSISTANT FOR COMMUNITY RELATIONS; DANIEL H. SHEAR, GENERAL COUNSEL AND SECRETARY; JOHN R. PRITCHARD, ASSISTANT DIRECTOR (ADMINISTRATION); JOHN K. PICKENS, CHAIRMAN, NATIONAL CAPITAL REGIONAL PLANNING COUNCIL; AND G. LOUIS HELLER, DIRECTOR, NATIONAL CAPITAL REGIONAL PLANNING COUNCIL

1965 BUDGET REQUEST

Senator BIBLE. The subcommittee will be in order.

The first hearing this morning will be on the presentation of the National Capital Planning Commission. We have with us today Mrs. Rowe, the Chairman of the Commission; Mr. W. C. Dutton, Jr., the Director; Mr. Conrad, the Deputy Director; Miss Small, Special Assistant for Community Relations; Mr. Shear, General Counsel and Secretary; Mr. Pritchard, the Assistant Director (Administration); Mr. John K. Pickens, Chairman, National Capital Regional Planning Council; and Mr. G. Louis Heller, Director, National Capital Regional Planning Council.

For fiscal year 1965 the National Capital Planning Commission requests an appropriation of $774,000, all for salaries and expenses. This is $124,000 more than the amount appropriated in fiscal year 1964, which included $75,000 for the Pennsylvania Avenue study, a nonrecurring item. Therefore, in effect, there is an increase of $199,000 requested in the coming fiscal year.

The justifications for this budget proposal will be printed in the record.

(The justification statement referred to follows:)

Justification statement

	Commission	Council	Total
Allowed, fiscal year 1964: Salaries and expenses appropriation	$554,700	$95,300	$650,000
Deduct nonrecurring items in fiscal year 1964 budget (Pennsylvania Avenue study)	−75,000		−75,000
Adjusted base, fiscal year 1965	479,700	95,300	575,000
Increases proposed for fiscal year 1965:			
Pay increase costs under Public Law 87-793	7,600	2,400	10,000
Increased travel costs, new Commission member	3,600		3,600
Other travel cost increases	1,000		1,000
Publication of 1985 plan and other publications	20,000	3,000	23,000
Completion of industrial survey	10,000		10,000
Increased costs for telephone system	4,500	500	5,000
Permanent positions (see attached list)	62,815	19,905	82,720
Reallocation of permanent positions (see attached)	7,065	5,640	12,705
Seasonal positions		3,000	3,000
Experts and consultants	25,000	3,000	28,000
Cost of personnel benefits related to above personnel increases	6,500	2,500	9,000
Supplies, materials, and contingencies	4,975	1,000	5,975
Statistics and data processing	4,000	1,000	5,000
Total increases requested	157,055	41,945	199,000
Total budget requested, salary and expense funds	636,755	137,245	774,000

Land acquisition, National Capital park, parkway, and playground system

No additional funds requested for fiscal year 1965.

New positions

Title and grade	Location	Salary
1. Editorial and technical writing aid, GS-12	Office of the Director	$9,980
2. Time, leave and payroll clerk, GS-5	Administrative services	5,170
3. Personnel management assistant, GS-7	do	5,795
4. Assistant highway planning engineer, GS-12	Technical services	9,980
5. Statistician, GS-9	do	7,030
6. Urban planner, GS-11	Federal projects planning	8,410
7. Clerk-stenographer, GS-5 [1]	do	5,810
8. Urban planner, GS-12	Urban renewal planning	10,640
Total, new positions, NCPC		62,815
9. Urban planner, GS-12	Regional Council	9,980
10. Stenographer, GS-6	do	5,235
11. Stenographer, GS-5	do	4,690
Total new positions (3), Regional Council		19,905
Grand total, new positions		82,720

[1] This position was authorized in fiscal year 1964 by transfer from the land acquisition appropriation but funds were not allowed. This is a request for funds, leaving a net increase of 7 new positions for NCPC, 3 for NCRPC, and 10 in total.

	Permanent positions		
	Fiscal year 1964	Increase	Fiscal year 1965
National Capital Planning Commission	38	7	45
National Capital Regional Planning Council	[1] 8	3	[1] 11
Totals	[2] 46	10	56

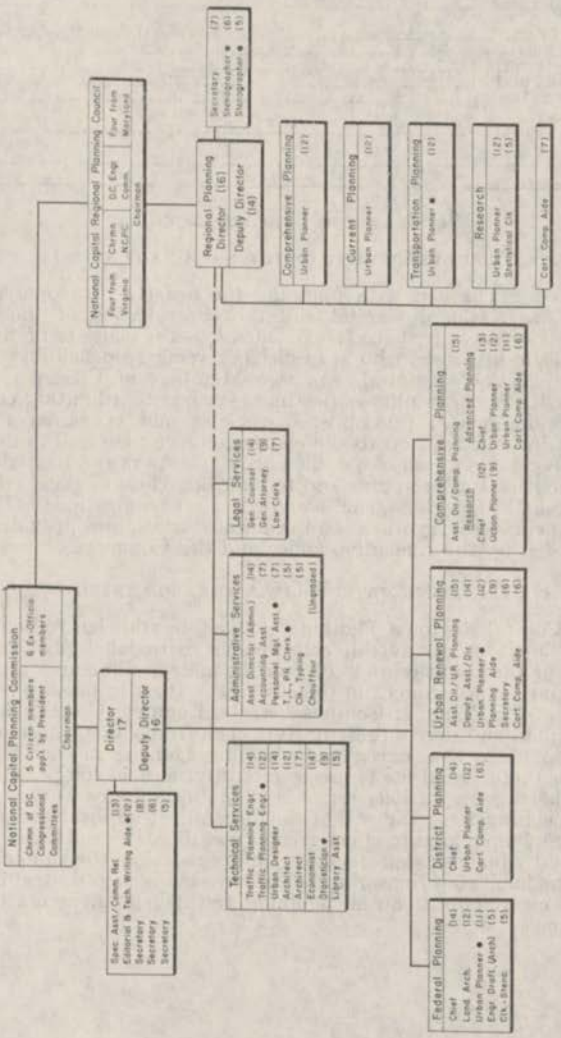
[1] Excludes attorney position financed from these funds but which is carried on organization chart under Legal Services Division of NCPC.

[2] Excludes 2 permanent positions under Pennsylvania Avenue project which were authorized for fiscal year 1964 only.

Reallocated positions

Title and grades	Location	Increase
1. Chief of Advanced Planning, GS–13 to GS–14	Comprehensive planning	$1,890
2. Social science analyst, GS–7 to urban planner, GS–9	do	1,235
3. General counsel, GS–14 to GS–15	Legal services	2,050
4. Economist, GS–13 to GS–14	Technical services	1,890
Total, NCPC (4)		7,065
5. Secretary, GS–6 to GS–7	Regional Council	560
6. Cartographic comp. aid, GS–6 GS–7	do	560
7. Urban planner, GS–11 to GS–12	do	1,570
8. Urban planner, GS–11 to GS–12	do	1,570
9. Attorney, GS–9 to GS–11	do	1,380
Total, Regional Council (5)		5,640
Grand total (9)		12,705

Program and Performance



PLANNING DEVELOPMENT OF THE NATIONAL CAPITAL

The Commission is charged with planning the orderly development and redevelopment of the National Capital and the conservation of the important natural and historic features thereof. Its membership consists of five private citizens, six ex-officio members who are officials having responsibility in the development of the Nation's Capital, and two Members of Congress. Through monthly Commission and committee meetings, various coordinating committees, and participation in special programs, it reviews and coordinates numerous programs and projects in relation to the comprehensive plan and desirable planning practices. It retains a staff of qualified urban planners and related specialists to carry out its policies and programs and to maintain close working relationships with many Federal and District agencies and citizens organizations. It contracts with District agencies to carry out urban renewal studies, and provides planning services as requested by the Executive Office and the Congress.

COORDINATING METROPOLITAN AREA PLANNING

The National Capital Regional Planning Council, in addition to being charged with the development of an overall comprehensive regional plan, coordinates planning in and for the counties and cities of the metropolitan area together with that of the Federal Establishment in the suburbs. Its membership is composed of the Chairman of the Planning Commission, the Engineer Commissioner of the District of Columbia, and four representatives each from Maryland and Virginia, who are nominated from the subregional planning agencies in each State. The Council retains a professional staff, meets monthly, and is composed of several committees specializing in various regional planning spheres and aspects. Its Director chairs a committee composed of the directors of all local and subregional planning agencies of the region to effect greater coordination and liaison. Within the limits imposed by budget, staff, facilities, and legislation, the Council attempts to function as a regional coordinator and catalyst serving as a central intelligence organization and clearinghouse on all planning and development matters having regional significance.

STAFF ORGANIZATION FOR PLANNING IN THE NATIONAL CAPITAL REGION
Fiscal Year 1965

General Introduction and Role of Planning Commission

POLICYMAKING BODY

The Commission is an active policymaking body composed of 13 members and 12 designated alternates. It meets 11 times in regular sessions throughout the year. There are five regular committees which meet prior to regular Commission meetings, and two special committees. These meetings average a total of 16 to 20 hours during the first week of each month.

In accordance with the National Capital Planning Act of 1952, the District of Columbia Redevelopment Act of 1945, as amended, and various other acts of Congress, the Planning Commission serves two basic responsibilities. It acts as the planning body for the District of Columbia and represents the Federal interest in the National Capital region.

The Commission strives to execute these functions in the preparation of plans in accordance with law and in continuing efforts to obtain decisions and actions reflecting those plans.

As an agency primarily involved in providing technical and professional services, and establishing policy objectives to be sought, the results of the Commission's efforts are a direct function of the personal and technical resources made available to it. The following describes present and proposed programs of the Commission.

PROFESSIONAL STAFF

The Commission employs a professional staff to prepare for and maintain records of its meetings, carry out general and special planning studies, prepare background information and recommendations on matters which are to come before the Commission, and carry out policies and instructions of the Commission. The staff participates actively in many coordinating groups, maintains liaison with numerous official agencies, and conducts an active community relations program in order to carry out the Commission's program.

EXPANSION AND REORGANIZATION

A general expansion and reorganization of the Commission's staff took place in fiscal year 1960. The reorganization generally was consistent with the proposals of an organizational and classification study made by the Civil Service Commission in fiscal year 1956. Subsequently, a three-phased effort for advancing the comprehensive planning program for the District and the Federal Government in the region was undertaken.

The first phase was the development of a series of policy proposals for future development of the National Capital region, the District, and metrocenter, in conjunction with the National Capital Regional Planning Council. These proposals were presented in the year 2000 plan. These policies are now being followed in evaluating proposals for various Federal activities in the region. Special studies as to the implications of these policies for Federal responsibility as to development of facilities in the region are to be started in fiscal year 1964 and will be carried on to fiscal year 1965.

The second phase has been initiated in the preparation of a comprehensive plan designed to meet the needs of the District in the year 1985. This plan will revise outdated previous plans and will meet the specifications called for in the National Capital Planning Act of 1952, under the section, "Comprehensive Plan for the National Capital." In the interim, the District of Columbia Commissioners have initiated a major study of urban renewal needs under the new community renewal program. The Commission has contracted to undertake major renewal planning studies and is coordinating these with the 1985 comprehensive plan studies.

A third phase will begin during fiscal year 1965 when both the 1985 comprehensive plan and the community renewal program recommendations have been released. It is anticipated that new programing and review techniques will be needed to insure the carrying out of planning objectives in the public works program of the District of Columbia, and the variation in approaches to urban renewal that can be expected. It also is to be anticipated the new proposals will be forthcoming for the programing of construction of new Federal facilities for the region. Comprehensive studies will be extended to a smaller (neighborhood) area, working with citizens groups, in order to translate plan objectives into specific private investment opportunities and proposals for precise public works.

COMMISSION PROGRAM OBJECTIVES FOR 1965

The Commission has the following major program objectives for fiscal year 1965, not to exclude other types of activities described elsewhere.

Continue Federal and District planning activities under responsibilities assigned by 1952 act.

Continue to undertake urban renewal planning.

Issue a comprehensive plan for the year 1985, combining a general plan proposal with a 20-year development (public and private investment) program.

Complete the physical planning aspects of a community renewal program, under a contract with the District of Columbia Commissioners, but supervised by the regular staff and coordinated with the comprehensive plan.

Establish a continuing comprehensive planning process which will update the comprehensive plan and development program every 5 years. This reformulation is seen to be necessary as a result of changes expected to take place as the urban growth of the region continues and the Federal establishment changes.

Maintain close liaison with executive agencies to insure development programs that are consistent with the comprehensive plan.

Special studies as are assigned or become necessary.

PROFESSIONAL PROGRAM ACTIVITIES

The professional program activities of the Commission are classified into three broad areas for administrative and budgeting purposes. They are Office of the Director, four planning divisions, and technical services.

OFFICE OF THE DIRECTOR

General

The staff activities of the Commission are directed by professional urban planners. A Director, Deputy Director, and several assistants (community relations, General Counsel, and administration), constitute the supervisory personnel of the Director's Office. The Director is responsible for all administrative functions, not specifically reserved for the Chairman as head of the agency, and for all professional work of the staff.

This Office formulates policy proposals to present to the Commission, represents the Commission in carrying out its policies and programs, and supervises, coordinates, and reviews the work of the staff. This Office provides staff leadership and direction to insure that the professional program is providing appropriate leadership to the community in urban planning and urban design.

Through the membership of the Commission itself, basic coordination is achieved with six Federal and District agencies having development programs in the District and the National Capital region. These agencies are the District of Columbia Engineer Commissioner's Office, National Capital Transportation Agency, Public Buildings Service of General Services Administration, National Park Service, Bureau of Public Roads, and Corps of Engineers. Other staff liaison and coordination is carried on through numbers of coordinating committees and special representations.

Liaison is maintained with the general public and community through a program of dissemination of information through the news media, mailings to citywide and neighborhood civic organizations, and presentations to groups when invited.

Full administrative and legal responsibilities are executed by the Commission as a separate Federal agency, through this Office.

Special projects are undertaken by this Office as they are assigned to the agency or liaison and assistance is requested. It is anticipated that these will increase in number as long as the present tempo of change and rebuilding continues in the District.

Administrative services are rendered to other programs besides the professional staff of the Planning Commission and Regional Planning Council. In fiscal years 1963 and 1964 these included the Pennsylvania Avenue Advisory Council, regional open space study, and land acquisition, including the site for the National Cultural Center.

In fiscal year 1964, the Director's Office was assigned 13 positions; for program direction, community relations and liaison, and legal and administrative services. The salaries for these positions, including all benefits established by law, totaled approximately $131,000 or 34 percent of the total personnel compensation and benefits.

Legal services, Commission secretariat

The Office of the General Counsel and secretary performs six basic activities for the Commission:

(*a*) Services as official secretariat for the Commission and its several committees at their monthly meetings, preparing meeting notices, agendas, and forms of resolutions and other actions, and maintaining official meeting records.

(*b*) Provides legal services on matters of agency administration, such as general administration, personnel, and procurement.

(*c*) Provides legal advice in the interpretation of the role and functions of the Commission and the Regional Planning Council under the several statutes extending authority and responsibility to these agencies.

(*d*) Provides legal advice on substantive questions involved in planning, urban renewal, etc., including advising on appropriate measures that may be developed to assist in the effectuation of comprehensive plans.

(*e*) Serves as legislative counsel in participating in review of proposed legislation coming under the Commission's purview, in the preparation of congressional testimony, and in statutory drafting, including aiding upon request in special projects of the Executive Office.

(*f*) Provides legal and related services for the land acquisition programs of the Commission, including the procuring of title evidence, appraisals, and conveyancing and the preparation of materials for submission to the Department of Justice in condemnation proceedings.

Administration

As an independent agency, all duties and functions required of a Federal agency are carried out by its own staff. Thus, personnel is required to administer financial and budget management, personnel, payroll, records and space management, property records and accountability, and general administrative routine. Most procurement is handled within the agency, with assistance from General Services Administration on major contracts.

Consideration will be given to possible economies that would be obtained by contracting for such services with other agencies. It is presently believed, however, that the agency is able to perform its functions more efficiently by having its own staff immediately available to process needed actions and subject to direct supervision.

In addition to the program and personnel authorized in regular salary and expenses, administrative services are provided to special projects such as urban renewal project contract studies, the Pennsylvania Avenue Advisory Council and its special staff, and others that arise from time to time. At the beginning of fiscal year 1964, 70 permanent and temporary employees were included in administration, with a turnover expected during the year customary to this type of agency. Some of the administrative overhead has been met by assigning personnel as required from special projects to administrative services. The Assistant Director (Administration) is expected to be an authority on and is assigned responsibility to carry out such Federal responsibilities as administrative officer, budget officer, finance officer, authorized certifying officer, personnel officer, procurement officer, property and supply officer, retirement officer, insurance officer, health benefits officer, and is designated as agency incentive awards administrator and secretary of the incentive awards committee.

The remainder of the staff consists primarily of professionals in urban planning and related fields, without specific administrative background and generally without background knowledge of Federal Government procedures, rules, and regulations. In order to gain maximum utilization of their special talents, administration is centralized.

Additional staff is needed to insure proper personnel functioning within regulations and procedures, as represented by the new "Federal Personnel Manual" and because the agency employs personnel in a very specialized field, with characteristic rapid turnover in shortage professions.

Community relations

Proper communication about the work of the Commission with the news media, neighborhood and citywide civic groups, interested citizens, visiting foreigners interested in city growth and planning, and in response to written requests from citizens across the country is coordinated by the special assistant for community relations. Numerous presentations and speeches are made by members of the Commission and the staff describing the planning problems and proposals of the agency. Assistance in developing resource material and contacting resource persons is given to writers and producers of significant national programs about Washington.

Editorials and technical writing

The responsibility to communicate the Commission's program and policies more effectively to the public and community than in the past leads to the need for more effective writing and editing of planning reports and documents. Although this service could be contracted for, there is sufficient demand for it to indicate savings in having a qualified staff person available full time. Such activity would contribute to the work of the planning divisions and would be coordinated with community relations work.

This talent is needed particularly with respect to the writing for the comprehensive plan for the year 1985, supporting documents, annual reports of planning progress within the District and Capital Region, and to assist with special projects.

COMPREHENSIVE PLANNING DIVISION

The development and publication of the 1985 comprehensive plan for the District of Columbia, initiated in fiscal year 1962, is scheduled for completion within fiscal year 1965. An intensive program of study is underway of neighborhood and community areas, and of needs in facilities and services in such "systems" as schools, play spaces, libraries, fire and police stations, utilities, etc. A major effort will be made to present problems that have been identified and that are proposed solutions to neighborhood groups as well as to District-wide civic organizations. A review process also will be followed with all affected District and Federal agencies concerned with physical development. This will be done at such time as to permit review and analysis of suggestions received for possible incorporation into Commission-adopted plans.

As this plan is being formulated, it is building upon significant findings of the series of area studies and is responding to the potentials unique to each section of the District. During fiscal year 1963, special emphasis was given to the areas having a high potential for improvement in character of development during the next two decades. This change is expected to result from private investment and intensive renewal by both public and private actions. These areas include the downtown business district and the older in-town residential sections immediately to the north and east of the downtown area. During fiscal year 1964, comprehensive analyses will be made of the needs of the more outlying, and more stable, residential sections within the District. Special studies are underway in connection with industrial and commercial area needs and their future development consistent with planning principles and objectives. Culmination of this process of formulating land use objectives for all of the District will be in the form of a plan for recommended use of land to be achieved by the year 1985 and will represent a major element of the comprehensive plan. As a statement of objectives to be achieved by the District by 1985, the plan will be an application and testing of the basic development policies proposed for the District and metrocenter in the year 2000 plan.

The 1985 plan also will propose a 20-year development program for the District. This program will consist of proposals for basic renewal strategy (public and private), standards established for systems of public facilities throughout the city, and presentation of financial priorities to permit carrying out of the plan.

One of the key roles of this development program will be to serve as an essential basis for the orderly coordination of public works to be scheduled for the District of Columbia during the next two decades. As such, it will be initiating a process of long-range programing which will be continually subject to review and updating. Formulation of the initial 20-year development program objectives as are to be incorporated in the 1985 plan also is scheduled for compeltion within fiscal year 1965. The process of comprehensive planning will not cease with the publication of this plan. It is intended at present to review and reformulate the comprehensive plan and development program every 5 years. This is the only way to gain from the rapid changes that occur in our culture in such areas as technology, productivity, standards of living, and physical design.

This Division draws heavily upon other staff members of the Commission for assistance in special elements of the plan, such as federal employment centers, throughfare and transit proposals, urban design considerations, zoning change recommendations, etc.

In fiscal year 1964, 7 positions were allocated to this Division. The salaries or these positions, including benefits, totaled approximately $71,000, or 19 percent of the total personnel compensation and benefits.

C. Urban Renewal Planning Division

The principal activities of the Urban Renewal Planning Division in the past year (fiscal year 1963), and the projected activities of the Division in fiscal years 1964 and 1965 fall into four major categories: (1) activities in connection with proposed modifications to previously approved urban renewal plans; (2) activities of a project planning nature involving the preparation of urban renewal plans for officially designated urban renewal areas in the District of Columbia supervised by the regular staff and carried out with separate staffs funded by special contracts; (3) activities involved in the review and study (and/or initiation and development) of proposals and recommendations for future possible urban renewal areas; and (4) activities relating to the Commission's responsibilities under the District of Columbia Alley Dwelling Act of 1934 for the review and approval of the general location and boundaries of proposed low-rent public housing developments of the National Capital Housing Authority.

MODIFICATIONS IN ADOPTED AND APPROVED URBAN RENEWAL PLANS

General

The Division staff has a continuing responsibility and workload resulting from the consideration, review, and study (and/or the development of) proposed modifications in previously adopted and approved urban renewal plans. Official urban renewal plans exist for each of the following areas of the District of Columbia:

(*a*) Southwest B,
(*b*) Southwest C,
(*c*) Southwest C–1,
(*d*) Northeast No. 1, and
(*e*) Columbia Plaza

Frequent proposals for plan modifications originate from the Redevelopment Land Agency, property owners in the areas involved, potential redevelopers, the District of Columbia government, or from the Commission staff. Staff studies are involved in each case prior to presentation for the Commission's consideration of each such proposed modification.

Southwest B, C, and C–1

The staff of the Division processed four separate proposed modifications in these Southwest urban renewal projects for Commission adoption during fiscal year 1963. The major plan changes involved:

(1) A revised plan for the Southwest waterfront along the Washington Channel. This was developed in conjunction with the Redevelopment Land Agency and its consultant, the Washington Channel Waterfront Corp.;

(2) A revised plan for the development of f.o.b. No. 5 permitting the new building, to be located on Independence Avenue across from the Smithsonian Institution, to bridge the 10th Street Mall; and

(3) A revised plan for the 10th Street Mall in the vicinity of the proposed L'Enfant Plaza, affecting building heights, underground parking facilities, and the treatment of the plaza itself.

Additional staff activity is anticipated in connection with further modifications during fiscal years 1964 and 1965 although progressively less activity is expected by the end of fiscal year 1965 due to the anticipated completion of planning for these projects as construction plans are finalized.

Proposed modification to the Northeast No. 1 urban renewal plan

The Commission's staff, in conjunction with the Redevelopment Land Agency, initiated a series of proposed changes in this plan which were adopted by the Commission and have been under study by the District Commissioners during fiscal year 1963. The development of the proposed modifications and the subsequent negotiations were a major effort on the part of the Division's staff and the legal staff of the Commission. It is anticipated that these proposals will be approved by the Board of Commissioners early in fiscal year 1964. Little additional staff activity is anticipated in connection with this area during fiscal years 1964 and 1965 in view of the anticipated completion of planning for this project during that period.

Columbia Plaza

The staff of the Division processed a proposed modification to the Columbia Plaza urban renewal plan that was adopted by the Commission on October 25,

1962. This modification was approved by the Board of Commissioners on August 6, 1963. The proposed new development is expected to begin construction in fiscal year 1964.

PROJECT PLANNING ACTIVITIES IN CONNECTION WITH THE PREPARATION OF URBAN RENEWAL PLANS

The Commission, in cooperation with the District of Columbia Redevelopment Land Agency, prepares urban renewal plans for the approval of the Board of Commissioners of the District of Columbia government and for execution by the Redevelopment Land Agency. The preparation of these plans is done by special staff personnel recruited by the Commission for this purpose with funds provided by RLA under the provisions of the Housing Act of 1949, as amended. This work is carried out under the direction and supervision of the Irban Renewal planning Division.

Adams-Morgan and Northwest No. 1

The preparation of these two urban renewal plans was completed by the Division staff in fiscal year 1963. These activities were carried out in cooperation with, and funded by, the Redevelopment Land Agency. They involved the preparation of the Division staff of an urban renewal plan for each of the respective areas. Said plans were adopted by the Commission on January 10, 1963, and March 7, 1963, respectively. Review and approval of these plans by the Board of Commissioners of the District of Columbia government is anticipated in fiscal year 1964. Following the approval of the plans by the Urban Renewal Administration, the Redevelopment Land Agency will also begin to carry out these two plans in fiscal year 1964. Staff activities by the Division in fiscal years 1964 and 1965 in conjunction with the Adams-Morgan and Northwest No. 1 areas will probably be limited to the review and study of possible modifications in said plans resulting from the Redevelopment Land Agency's experiences in the execution of each plan.

Anacostia-Bolling

The initiation of project planning on this project was anticipated during fiscal year 1963. However, it was delayed pending a determination by the Department of Defense and the Bureau of the Budget of the limits of the area that was expected to be declared surplus to military needs and in which urban renewal planning studies should be carried out. This question has since been resolved and on July 18, 1963, the Commission adopted a modified urban renewal area boundary for the area. Early approval of same is anticipated by the District Commissioners and it is now anticipated that project planning activities will be initiated in the second half of fiscal year 1964. The Commission will carry out the various studies involved in the preparation of an urban renewal plan for this area under an agreement with, and under contract to (an estimated $127,000) the Redevelopment Land Agency under the provisions of the Housing Act of 1949, as amended. A special technical staff of five (three professionals and two subprofessionals) will be recruited by the Commission in fiscal year 1964 to undertake this 2-year program of work which is expected to be completed in fiscal year 1966—permitting formal adoption of said plan by the Commission and approval of same by the Board of Commissioners at that time.

REVIEW AND STUDY OF PROPOSED URBAN RENEWAL ACTIVITIES

The regular staff of the Division is also responsible for reviewing proposals for possible future urban renewal projects, for undertaking urban renewal feasibility studies and, within the framework of the 1985 comprehensive plan and community renewal program studies, initiating and recommending specific urban renewal proposals for consideration of the Commission and the District Commissioners. Studies of this nature in the past have been initiated by the Commission or have been undertaken in response to requests by the Office of Urban Renewal of the District of Columbia, the Redevelopment Land Agency, or other groups or institutions.

The activities of the Division's staff in regard to future urban renewal activities or programs in the District of Columbia fall into two categories—the broader citywide study of renewal needs under the community renewal program study and several potential urban renewal project proposals that are under study at this time.

Community renewal program

During the fiscal year 1963, the staff assisted the District's Office of Urban Renewal in the development of the community renewal program agreement by and between the District of Columbia government and the National Capital Planning Commission, whereby the Commission would assist the District in the preparation of a community renewal program for the Nation's Capital. This agreement was executed on May 23, 1963, and the Commission, with funds supplied under this agreement by the District government, has initiated efforts to recruit the special nine-man technical staff that will carry out this work over an anticipated period of about 2 years. Over this period of time, the Commission is to receive a total of $140,000 for this work under the provisions of the agreement with the District government. Preliminary staff studies on the community renewal program were begun fiscal year 1963. These will be carried out throughout fiscal year 1964 and are expected to be completed during fiscal year 1965. This work is being carried out in close coordination with the 1985 comprehensive plan studies of the Comprehensive Planning Division. This work will also be coordinated with related CRP activities and studies of various District agencies, the Redevelopment Land Agency, the National Capital Housing Authority, and others—under the direction of the District's Office of Urban Renewal. The work of this special staff will constitute a major technical contribution to the final recommendations to the District of Columbia government on a 20-year community renewal program for the Nation's Capital. Completion of these special studies is anticipated by the end of the first half of fiscal year 1965.

Special area studies

The Division staff has been involved in three special area studies during fiscal year 1963 in relationship to potential future urban renewal programs in these areas. They are:

(1) *Howard University.*—In fiscal year 1963, the staff of the Division, working with the District of Columbia Office of Urban Renewal, the Redevelopment Land Agency, and officials of Howard University, continued joint consideration of the feasibility of urban renewal activities to aid in the improvement of that section of the city in and around Howard University as a part of its campus development program. The feasibility of such assistance, under the provision of section 112 of the Housing Act of 1949, as amended, and the priority or scheduling of same relates to current studies by Howard University. These studies are expected to be completed, at least in preliminary form, during the first half of fiscal year 1964. If feasibility is indicated by these and other sutudies, it is anticipated that the staff will assist the Redevelopment Land Agency in the preparation of an urban renewal plan for a yet-to-be-identified area in this section of the city. If the Division is called upon to prepare the urban renewal plan for the Redevelopment Land Agency, a special staff of approximately four persons, funded by the Redevelopment Land Agency, would be required.

(2) *Downtown renewal.*—The staff, in conjunction with the Office of Urban Renewal of the District government, the Redevelopment Land Agency, and the staff of Downtown Progress (the National Capital Downtown Committee) has been meeting on a regular basis during fiscal year 1963 in a technical review and evaluation of the "action plan" for downtown Washington. In anticipation of the passage of a further congressional amendment to the District of Columbia Redevelopment Act of 1945, as amended, clearly establishing the eligibility of the downtown area for renewal, the staff has been assisting the above-named agencies in the evaluation and development of the planning proposals and development standards that would eventually be incorporated in an urban renewal plan for the downtown area. It is anticipated that these activities will continue during fiscal year 1964 as a part of broader studies being undertaken at this same time in conjunction with the 1985 comprehensive plan and the community renewal program described above. No additional special staff will be required on the part of the Division.

(3) *Other areas.*—It is anticipated that other special studies or project planning activities may be initiated by the Commission prior to the end of fiscal year 1965. In all such cases, these studies would be carried out by special staff personnel with funds provided by either the Redevelopment Land Agency, the District of Columbia government, or the Housing and Home Finance Agency, under the provisions of the Housing Act of 1949, as amended.

As a part of these activities of the Commission, it is anticipated that project planning activities in the Northwest No. 2 area may be initiated in late fiscal year 1964 or early in fiscal year 1965. Although the boundaries of this area have not

as yet been determined, Northwest No. 2 is to be the second of a series of urban renewal activities, in what is known as the second precinct, initiated by the Board of Commissioners of the District of Columbia in 1961, at the time of the establishment of urban renewal area boundaries of the Northwest 1 area. It is anticipated that these studies will probably be prepared by a special staff of the Commission financed with funds provided by the Redevelopment Land Agency under the Housing Act of 1949, as amended. Under these circumstances, the completion of an urban renewal plan could be anticipated late in fiscal year 1966 or early in fiscal year 1967.

In fiscal years 1964 and 1965, continuing Division staff activities in regard to the study of potential urban renewal project areas are anticipated.

REVIEW AND APPROVAL OF LOW-RENT PUBLIC HOUSING SITES

In fiscal year 1963, the Division staff assisted the Office of Urban Renewal and the staff of the National Capital Housing Authority in a study of potential sites within the District of Columbia for such developments. In addition, the staff reviewed and made recommendations to the Commission regarding the general approval of specific locatons, boundaries, and site layouts for the following proposed developments of the National Capital Housing Authority:

Location	*Estimated number of housing units*
(*a*) Deanwood (general location only)	84
(*b*) 12th and I SE. (square 1020)	330
(*c*) Montana and W Street NE. (Lutheran Home)	150
(*d*) 4th and Edgewood NE. (St. Vincent's)	300
(*e*) 2d and M SE. (parks)	40
(*f*) 8th and Rhode Island NW	150
(*g*) 6th and H NW	80
(*h*) Adams-Morgan (part of the adopted urban renewal plan)	243
(*i*) Northwest No. 1 (part of the adopted urban renewal plan)	356
Total	1,733

During fiscal year 1964 and 1965, the staff of the Division will continue its activities in cooperation with the National Capital Housing Authority and the District of Columbia government in the search for, and the review and approval of, sites for the construction of low-rent public housing.

In fiscal year 1964, five positions were allocated to this Division. The salaries for these positions, including benefits, totaled approximately $52,000, or 13 percent of the total personnel compensation and benefits.

FEDERAL PROJECTS PLANNING DIVISION

This Division carries out a major portion of the Commission's responsibility for a liaison relationship to the various Federal and independent agencies toward the full implementation of the National Capital Planning Act of 1952. This act requires each Federal agency, prior to the preparation of construction plans originating by such agency for proposed developments and projects or to commitments for the acquisition of land, to advise and consult with the Commission in preliminary and successive stages of their planning in order to assure the orderly development of the National Capital. The amount of activity in this sector has grown steadily and is expected to increase with the strengthening of the planning process and the necessary adjustments and expansions of the Federal Government's physical plant in the National Capital region.

At the beginning of fiscal year 1964, the Planning Commission engaged in reviewing and assisting 36 projects originating from various Federal agencies, such as the Departments of State, Defense, Commerce, Interior, Agriculture, and Health, Education, and Welfare, as well as the General Services Administration and others pertaining to the development of master plans for Federal installations in the Washington metropolitan area.

In addition to the review of Federal agencies' projects, this Division is responsible for the review of sites for monuments and memorials and also the review for parkland developments. Much of this work is coordinated with the Fine Arts Commission. Staff studies and recommendations are submitted to the Planning Commission for their consideration and action.

The Division is also responsible for the staff review of Federal agencies' 6-year public works programs and their annual fiscal year budgets as they pertain to proposed capital improvements within the Washington metropolitan area. In carrying out this work liaison is necessary with each Federal agency, as well as the Bureau of the Budget, to which the Commission reports on these matters.

As a part of the work program of the Commission, and also in conformance with the request of the Bureau of the Budget, the Federal Projects Planning Division now is undertaking a program to review the existing Federal land holdings within the District of Columbia and the Washington metropolitan area within Maryland and Virginia. The purpose of this study is to gage the potential future use of these sites for Federal employment in light of the existing agencies occupying the site and its possible use for expansion of the same agency and/or new Federal agencies. Upon completion of this project, the maximum utilization of existing sites for future Federal employment needs can be recommended, within the framework of the policies of the year 2000 plan.

Besides analyzing the existing Federal landholdings within the metropolitan area, the Division is also studying areas most acceptable for new Federal employment sites, both within the District and the region. Coordination of this project with the Comprehensive Planning Division is essential in the preparation of the 1985 comprehensive plan for the Nation's Capital, as well as with other local governmental jurisdictions through the National Capital Regional Planning Council.

The Federal Projects Planning Division is responsible for administering the concluding phases of the Capper-Cramton Act, as originated in 1930. This includes the delineation of taking lines for the purchase of lands for the George Washington Memorial Parkway in Maryland and the stream valley lands in Maryland and Virginia. This work is done in coordination with the park authorities of the local jurisdictions, as well as the legislative bodies. This also includes the completion of the program for the acquisition of playgrounds and recreation space in the District of Columbia.

In fiscal year 1964, four positions were allocated to this Division. The salaries for these positions, including benefits, totaled approximately $35,000, or 9 percent of the total personnel compensation and benefits.

District Planning Division

In carrying out its part in the Planning Commission's role as the planning agency for the District government, the District Planning Division completed the following during fiscal year 1963:

Review of the District of Columbia public works program for 1964. This Division reviewed and prepared for review by the Commission the public works program for the District of Columbia. Preparation for this review required the coordinating of meetings between staffs of the District government and Planning Commission, preparation of maps, and review of past actions by the Planning Commission in regard to items in the program. Several staff meetings were held in order that all divisions of the staff were informed of the program. A staff report was then prepared by the District Division and presented to the public works committee of the Commission. After a presentation to the Commission of the program and committee report, the Planning Commission sent its report and recommendations on to the District Commissioners and the Bureau of the Budget.

Review of zoning matters and membership on Board of Zoning Adjustment and Zoning Advisory Council. As a member of BZA and ZAC, the Chief of the District Planning Division participated in review and action with respect to 505 appeals for exceptions and variances and 124 amendments to the zoning maps and regulations. This represented an increase of 14 percent in appeals for exceptions and variances and 50 percent in amendments to the zoning maps and regulations over the previous year. Review of these cases involves visiting the sites, attendance at public hearings, review of briefs submitted by applicants and attendance at executive sessions where action is taken on these matters.

This Division also wrote and presented at public hearings amendments to the zoning regulations suggested by the Planning Commission. Personnel of the Division serve on two special committees, one of which studies modifications to

the building code and zoning regulations, and the other, the District of Columbia-Maryland Zoning Advisory Committee, which reviews and reports on zoning changes in Maryland adjacent to the District line.

The Division processes through the Coordinating Committee of the Planning Commission and the Planning Commission itself, items relating to street and alley closings; transfers of jurisdiction; subdivision plats; and changes in the permanent system of highway plan.

The Division is responsible for preparing the agenda, writing the minutes and acting as secretary to the coordinating committee of the Planning Commission and serves in an advisory capacity to the other divisions of the Planning Commission on zoning regulations and the building code.

The work of this Division, with the exception of special studies, is of a continuing nature and it is expected that fiscal year 1965 work will be similar to the above. However, the number of appeals to both the BZA and the Zoning Commission have been increasing, and since work on the comprehensive plan is taking more staff time of all Divisions, it appears that the workload will increase. Legislation affecting District zoning has been introduced in Congress and if it is passed, it will require a study which will take considerable staff time.

In fiscal year 1964, three positions were allocated to this Division. The salaries for these positions, including benefits, totaled approximately $32,000, or 8 percent of the total personnel compensation and benefits.

Technical Services Division

GENERAL CONCEPT

A Technical Services Division has been established to bring a variety of special skills to the staff to supplement basic urban planning skills. Personnel in this Division are highly qualified in their own fields.

In general, they perform three basic functions: Consult with the four planning divisions as appropriate to the latter's programs, undertake special studies within their own area of competence, and maintain liaison between the Commission and related activities in other agencies and private organizations.

There are three special areas of skill involved: Traffic engineering, urban design, and economic and social analysis.

In fiscal year 1964, six positions were assigned to this division. The salaries for these positions, including benefits, totalled approximately $64,000 or 17 percent of the total personnel compensation and benefits.

TRANSPORTATION PLANNING

Traffic planning in fiscal year 1964 will concentrate mainly on completion of the thoroughfare plan, through the use of new travel forecasts based on 1985 land-use proposals and the recommended transit system, in conjunction with preparation of the 1985 comprehensive plan. This work is undertaken jointly with the Comprehensive Planning Division. Detailed studies and analyses will be carried out with regard to segments of the District of Columbia freeway system which are in controversy and on which consensus must be reached by various agencies.

Detailed arterial planning will be worked out in relation to the comprehensive renewal program planning studies in cooperation with the Urban Renewal Planning Division. Urban renewal projects will continue to require attention to transportation planning details in fiscal years 1964 and 1965. The sourthwest project will continue to need attention, and special studies will be necessary for the Anacostia-Bolling project. Circulation ans parking studies and planning proposals for downtown should be completed in fiscal year 1964.

As a part of the Federal employment site study now in progress by the Federal Planning Division in conjunction with the preparation of the 1985 comprehensive plan, the traffic planning engineer is analyzing transportation needs as well as station locations as planning for the rapid transit system develops.

The traffic planning engineer must rely on liaison with staff of the District of Columbia Department of Highways and Traffic in coordinating matters concerning traffic circulation in urban renewal project areas. He deals closely with the various State and county highway departments, as well as the National Capital Transportation Agency and Washington metropolitan area transportation study in work concerning the thoroughfare plan and Federal employment site studies. These agencies are the source of most of the statistical data which is used in all phases of transportation planning.

One of the most important fiscal year 1965 activities of the traffic planning staff will be participating in the organization and cooperation with the regional transportation planning process, which is required to be established by the 1962 Federal Aid Highway Act. It is expected that new origin-destination surveys, programed and undertaken by other agencies, and travel forecasts will have to be made in order to plan and program future transportation facilities within a truly regional framework.

URBAN DESIGN

The urban designer and architects work in conjunction with all divisions to develop the functional and three-dimensional aspects of all plans and proposals. In this capacity, they are responsible for clarifying esthetic objectives and principles for the National Capital as planning proposals evolve. Such objectives and principles are expressed in verbal and graphic terms and further developed in preliminary design studies for urban renewal areas, Federal projects, parks, streets, and public facilities which come under the aegis of the Commission.

This special staff also makes recommendations on comprehensive planning, feasibility studies, and other projects which come before the Commission in its review process. They are specifically charged with certain projects where design considerations are predominant. The most important current projects are the comprehensive design studies for the 1985 comprehensive plan; the skyline study, working in conjunction with the Fine Arts Commission; and area site-design studies in connection with general plans, such as downtown progress, and a study of esthetic considerations involved in development of freeways. The Pennsylvania Avenue study required staff liaison with the Advisory Council and staff review for the Commission, beginning in fiscal year 1963, and it is anticipated that some of this activity will continue.

ECONOMIC AND SOCIAL ANALYSIS

One position exists on the staff for a specialist in urban economic and social analysis. Primary emphasis is given to study of economic factors (housing market, employment, personal income, public finance) and social conditions (population, family characteristics), affecting the formulation and carrying out of the comprehensive plan.

It is intended to extend this activity to include a reporting system on economic conditions and changes in the District as they are affecting the carrying out of the comprehensive plan. It is hoped to provide this data not only to the Commission but to interested parties in the community and government agencies as well.

Special Studies

The nature of urban growth and change, the rapidity with which change is occurring, and the need to obtain specialized insights and experiences has led the Commission to utilize the services of experts on daily bases or through contract studies when this is to the economy and convenience of the Government. A limited provision to permit such studies in fiscal year 1965 is established in the budget request.

Publications

Funds will be required for the publication of the comprehensive plan for 1985. Publication will take the form of an official document, plus a number of supporting documents and interpretive documents for the public.

A periodic statement of planning accomplishment also is sought to report to the many organizations interested in the work of the Commission and to make the recommendations of the Commission more meaningful and effective.

Urban Renewal Contracting

The Commission expects to continue to serve as a contractor for specific urban renewal studies for the District of Columbia and the Redevelopment Land Agency.

It is apparent that these services are provided at a cost which represents a saving to the urban renewal program because they are performed on a nonprofit basis. Supervision is provided by the Commission staff, and close coordination is achieved with other planning programs.

NATIONAL CAPITAL REGIONAL PLANNING COUNCIL

The National Capital Regional Planning Council was established by act of Congress in 1952, embodied in Public Law 592. Its membership consists of 10 representatives of the planning agencies and local governing bodies which have jurisdiction in the National Capital region as defined in that law: 2 from the District of Columbia; 4 from the Mayrland counties of Montgomery and Prince Georges; and 4 from the Virginia counties of Arlington, Fairfax, Loudoun and Prince William, as well as the cities of Alexandria and Falls Church. The region comprises more than 2,390 square miles and has a present population of more than 2 million.

Under the law, the Regional Planning Council's primary responsibilities are to assemble and maintain a general plan for the development of the region and to reconcile the land-use requirements of the Federal installations beyond the District boundaries with the land-use requirements of and in each locality. Therefore, the Regional Planning Council's function is primarily that of a coordinator and catalyst serving as a central intelligence operation and clearinghouse on all planning and development matters having regional significance.

RELATIONSHIPS WITH OTHER AGENCIES IN THE NATIONAL CAPITAL REGION

To accomplish its purposes, the Regional Planning Council works primarily with and through the National Capital Planning Commission and the Maryland-National Capital Park and Planning Commission and the Northern Virginia Regional Planning and Economic Development Commission; and the various local planning agencies in the National Capital region, as well as various special operating agencies or study groups that have regionwide responsibilities. To date, the latter have included the National Capital Transportation Agency, the Washington Metropolitan Area Transportation Study, the Health and Welfare Council of the National Capital Area, and the Washington Center for Metropolitan Studies, as well as various ad hoc study groups established by Congress, by Federal agencies, or at the State or local level. It also works in close liaison with the various local governing bodies of the region.

SOURCES OF SUPPORT FOR REGIONAL PLANNING

Public Law 592 provides that the National Capital Planning Commission shall provide such technical and clerical assistance and such other services and facilities as may be necessary for the performance of the Regional Planning Council's functions. The Regional Planning Council may also accept such assistance, other than funds, as may be made available by any State or local governmental authority having jurisdiction in the National Capital region.

During the first several years of the Regional Planning Council's existence, only a very limited staff was provided from the budget of the National Capital Planning Commission, considering the vast scale of metropolitan growth problems in this region. However, this staff has gradually been expanded, and during the preparation of the year 2000 policies plan, consisting largely of regional policy recommendations, the effective regional planning staff was tripled by the addition of the National Capital Planning Commission's staff people on this project. Since its conclusion in 1961, there has been only occasional work required by the Commission's Comprehensive Planning Division on Regional Planning, but the Regional Planning Council continues to lean heavily upon the Commission's Technical Services Division, and the regular day-to-day cooperation between the two staffs continues, particularly in the exchange of stenographic assistance, when available, to the Council.

Local planning agency staff contributions have also been very important for the Regional Planning Council. During the preparation of the region's first general development plan in 1956, which later provided the land-use information needed for the 1980 transportation plan for the National Capital region, the information, data, and staff time contributed by the local planning agencies to the Council were key factors in the successful completion of this early effort.

It is primarily through the expansion of local contributions that the Regional Planning Council will be able to augment its resources materially. While Public Law 592 in its present form does not permit the Planning Council to receive moneys from other sources than the Federal Government, the Council is, nevertheless, attempting to increase participation and cooperation by the suburban jurisdictions and official planning agencies through amendments to Public Law

592 which, for the first time, would enable them to make direct financial contributions to the overall regional planning effort. These amendments will also permit such other regional agencies as the Metropolitan Washington Council of Governments to contribute directly to the Regional Planning Council to finance planning studies and services deemed necessary by the Council of Governments.

The combined program of administering the Council's affairs and operations, the development of an overall comprehensive regional plan, and the continued day-to-day coordination and liaison carried on with various local governing bodies, planning staffs, and the Federal Establishment necessitates the expansion of the professional staff of the Regional Planning Council to carry out effectively its function as outlined in Public Law 592. An internal staff reorganization along basic functional lines is necessary to begin at the latest by fiscal 1965. If local financial assistance can be obtained prior to this date it is hoped that these funds can provide at least partial support for the additional staff during fiscal 1964.

The present professional portion of the staff consisting of the Director, Acting Deputy Director, and three regional planners is proposed to be increased by one additional regional planner together with supporting stenographic personnel.

LONG-RANGE PROGRAM OBJECTIVES

1. To adopt and maintain a series of development policies for the National Capital region, based on the response of the several local governments to the year 2000 policies plan, and recognized as the regional development policies of all public agencies operating in the region.

2. To identify sound regional development goals which are acceptable to the Federal, District, and local governments and their planning agencies, and, so far as is possible, to keep the general public informed on the rationale used in making regional decisions.

3. To publish, adopt, and maintain the regional plan for 1980, embracing the current 1980 plans of all of the constituent jurisdictions for those fields in which the closest coordination of physical planning is necessary, including at least the following:

(*a*) Projected growth of total population in the region, with a breakdown of the estimates by age, sex, race, income, and number employed.

(*b*) General land-use plan for the entire region.

(*c*) The regional system of transportation arteries, primarily freeways and rapid transit lines.

(*d*) The trunk systems of the public utilities in the region, with initial emphasis on the sewer system.

4. To develop, adopt, publish, and promote regional action programs for those operations in which initiative by the regional planning agency is particularly needed in order to realize the year 2000 development policies, including, but not limited to, the following:

(*a*) Reservation of sites for future Federal employment centers—maintain file on potential future sites available throughout the entire region.

(*b*) Reservation of open spaces for the benefit of the residents of the region.

(*c*) Recommendations aimed at the alleviation of housing shortages for various segments of the metropolitan population.

(*d*) Alleviation of financial bottlenecks that might restrict the important capital investments in the regional plan for 1980.

(*e*) Promotion of the original development of a prototype suburban community in conformance to the corridor scheme of the year 2000 policies plan.

PROGRAM FOR FISCAL YEAR 1965

As stated previously, the Council proposes, for the first time since its inception to subdivide its staff into four basic, but functional, planning categories and, at the same time, to provide the increased professional complement with additional, supporting stenographic help. The four basic divisions are:

(*a*) Advanced or Comprehensive Planning Division: Prepare updated comprehensive plan.

(*b*) Current Planning Division: Develop regional coordination via review and liaison with Federal, District of Columbia, and local jurisdictions and their official planning agencies.

(*c*) Regional Transportation Planning Division: To work toward, and assist other agencies in the development of an overall balanced highway and transit system, acceptable by the various political bodies, and to assist in the establishment and maintenance of a continuning comprehensive regional transportation process as prescribed in the Federal Aid Highway Act of 1962

(*d*) Regional Research Division: To assemble and maintain up-to-date information, statistics and related projections on land use, economics, housing, population, etc., and to disseminate same.

With this expanded functional staff the Council hopes to carry out the following:

YEAR 2000 DEVELOPMENT POLICIES

Up to the present time, action on the policies developed in the year 2000 plan includes their adoption in a statement on development of the National Capital region by President Kennedy and their recommendation by the National Capital Regional Planning Council to all the local jurisdictions for their consideration in the preparation of their respective general plans. Beginning in July 1963, a 6-month program to develop a series of regional goals reflecting the desires of the inhabitants of the entire metropolitan area (based on statistical sampling techniques utilizing choices made by respondents following explanation of the alternatives available) is being pursued. This program, hopefully confirming the goals set forth in the year 2000 policies plan, will then be translated into guidelines for a 30-month program developing a revised and updated general development plan.

GENERAL DEVELOPMENT PLAN PREPARATION

Further development of the National Capital Region general development plan to the year 2000 will be carried out as a properly scheduled portion of the overall sequenced program of plan preparation. The scheduled portion of plan preparation for fiscal year 1965 involves two successive 6-month phases: identification of regional land use and transportation problems; and establishment of policies for solving these problems. Responsibility for executing both phases would be assigned to the Advanced Planning Division; identification of regional problems involves the Current Planning Division's liaison with local and other Federal agencies; careful coordination between the Current Planning Division, through the Council, and each cooperating agency is required for formulation of each regional plan policy. Responsibility for executing all portions of the general development plan dealing with regional transportation is assigned to the Regional Transportation Planning Division.

ACTION PROGRAMS

Continuing work on an action program for the selection and acquisition of open space within the National Capital region will be undertaken by the joint open space project staff. This cooperative program, supported financially by four Washington agencies, is administratively supervised by the Director of the National Capital Regional Planning Council through the project coordinator, who is responsible to the Director. Following the recent adoption by both the National Capital Planning Commission and the Regional Planning Council of a general procedure for the selection of sites for new Federal facilities in the National Capital region, the staff of the Regional Planning Council will attempt to establish a current inventory of available sites. The staff of the Council will, furthermore, maintain sufficient information on the planned highway and transit routes and construction programs, the growth of other Federal facilities planned in the area and the pattern of growth of residential areas within the region to allow the intelligent comparison and selection of sites to be made.

PLANNING RESEARCH

The Planning Research Division will support the assignments of the Advanced, Current, and the Transportation Planning Divisions by utilizing specialized skills and techniques of regional science. These techniques, which include very disciplined and closely correlated use of regional development and locational economics, sociology, and geography, are applied through research methods to all regional planning studies. Application of these research techniques will very greatly increase the validity and rationale of the general development plan in terms of land use and transportation location and economic development and projections. Planning research scheduled for the 1965 fiscal year includes application of regional scientific techniques to both scheduled phases of development of the general development plan; responsibility for coordinating regional research aspects of subregional and local governmental planning agencies; responsibility for gathering, sorting, and collecting statistical information of use for the Council; and coordinating and evaluating comparability of statistical data with local and subregional agencies.

REVIEW AND COORDINATION

During fiscal year 1964 the entire Regional Planning Council staff intensified its efforts to maintain liaison with other subregional and local planning agencies in the National Capital region, as well as with the various units of local government by attending their meetings, and providing advice and assistance where possible. In its capacity as creator and proponent of the general development plan and as the designated agency responsible for the coordination of all physical planning in the National Capital region, the Council will continue this important cutodial role of maintaining liaison with all current local planning operations.

JUSTIFICATION FOR INCREASES FOR NATIONAL CAPITAL PLANNING COMMISSION

1. Editorial and technical writing aid, GS–12, $9,980 per annum

A specialist in editing and technical writing is needed to improve the Commission's publication program which is now handled primarily by professional urban planners, whose talents should be utilized to the maximum extent on planning matters. This is especially emphasized in the presentation of the 1985 comprehensive plan, community renewal program and the continuing need for effective communication with the public and other agencies concerning the program and recommendations of the Commission.

2. Personnel management assistant, GS–7, $5,795 per annum

3. Time, leave and payroll clerk, GS–5, $5,170 per annum

Increases in the administrative staff have been deferred over the past several years in order to concentrate on expanding the professional staff for planning functions. As a result, although the staff financed under the "Salaries and expenses" appropriation has doubled since 1957, the administrative staff still consists of only an Assistant Director (Administration), a fiscal accounting assistant, and a general clerk. This staff needs to be augmented to assist the Assistant Director (Administration) in the proper performance of the heavy burden of financial management, budget, personnel, procurement and general office management.

The personnel management assistant is needed to assist in performing functions of recruiting, promotions, rewriting of position descriptions and routine records keeping, as well as handling personnel matters for the Assistant Director (Administration) in his absence.

The time, leave and payroll clerk is needed in light of the increased staff under "Salaries and expenses" and also increase of staff due to special projects and urban renewal programs.

4. Assistant highway planning engineer, GS–12, $9,980 per annum

An additional highway planner is required in order for the Commission to participate in meeting the new transportation planning requirements contained in the Federal Highway Act of 1962 and to become effective in 1965. The need for this position is also reflected in the preponderance of highway and transit issues which now face the District as well as the metropolitan region.

5. Statistician, GS–9, $7,030 per annum

This new position would be under the economist to assist in function of supplying data for the comprehensive planning program. This activity also will interpret available national and local population, economic and social data for the District, both for public and private use.

6. Urban planner, GS–11, $8,410 per annum

The Federal Planning Division has two professional employees on its staff, the Chief and his assistant. In view of this Division's essential participation on the preparation of the 1985 comprehensive plan, regarding the Federal Establishment, in the review of Federal agencies' annual and 6-year capital improvement programs in the Washington metropolitan area and in carrying out the year 2000 plan policies for location of Federal establishments as set forth in the President's memorandum dated November 27, 1962, this position is sorely needed.

7. Clerk-stenographer, GS–5, $5,810 per annum

This position is now in the Federal Planning Division and has been financed for the most part by the Capper-Cramton funds which are now terminating. As indicated above, the Federal Planning Division is now primarily concerned with the Federal Establishment and its capital improvement programs. As a result,

it is now necessary to finance this position through "Salaries and expenses." In addition, the Comprehensive Planning Division and Technical Services are to be served by this position.

8. Urban planner, GS–12, $10,640 per annum

The permanent professional staff of the Urban Renewal Planning Division supervises and coordinates the work of project planners and consultants, maintains liaison with other agencies involved in urban renewal, and provides continuity in a program consisting of many specialized studies and activities. At present, this program includes more than 10 urban renewal projects in planning or execution, as well as the citywide community renewal program, and staff services in connection with the planning of public housing.

For the past 3 years, this professional staff has comprised only two permanent positions. The increasing number and complexity of urban renewal activities in the District of Columbia, as well as the need to relate these activities to the guidelines being established by the community renewal program, now requires one additional professional position in this Division, financed from "Salaries and expenses" funds, in order to maintain the necessary level of staff services and assure effective program coordination.

Other increases are for seasonal personnel and the employment of experts as required in lieu of still further permanent staff increases. Nine positions are pending reallocation under Civil Service Commission allocation standards and additional funds will be required for this purpose.

A total of $10,000 for pay increase costs under Public Law 87–793 is requested. This increase resulted from legislation and cannot be absorbed without deleting one or more positions.

Travel costs have increased by the Presidential appointment of a new Commission member from Seattle, Wash. Additional travel expenses are requested for staff attendance at conferences and seminars, and for moving new professional employees to Washington. Telephone costs have increased in our new office space and the monthly rental costs cannot be absorbed within current funds.

Printing costs need to be increased considerably to allow for the publication of the 1985 plan, and other publications, and additional funds are requested for this purpose. An industrial survey and other special consultant studies are necessary to carry out our program.

JUSTIFICATION FOR INCREASES FOR REGIONAL PLANNING COUNCIL

The official general development plan of 1956, essentially unrevised since its adoption, is obsolete and needs complete revision because of a change in basic plan philosophy brought about by the year 2000 policies plan as adopted by the President and because of many revisions and new plans prepared by almost all of the local governments through their planning agencies. Newer local comprehensive plans, in fact, tend to ignore the official general development plan of 1956, much to the detriment of the logical and orderly growth of the National Capital region—in view of the impending impact of the proposed NCTA transit development program, the regional park and highway programs, the proposed NCPC 1985 plan, as well as plans now under preparation by the Maryland-National Capital Park and Planning Commission and the Northern Virginia Regional Planning and Economic Development Commission. Therefore, a program of revision and updating of the general development plan is in process and it is hoped that the basic plan can be completed by the fall of 1966. However, to produce a minimally acceptable plan within the legislative authority of the Council requires an increase of one professional planner and supporting stenographic services and updating of five other positions.

One professional position is programed as Chief of the Current Planning Division. This Division, with requisite responsibility assigned to the Division Chief, carries out the functions of regional coordination for the Council staff with Federal, District of Columbia, State, and all local governmental and subregional planning agencies and local civic associations, etc. Current coordination efforts occupy 20 to 30 percent of the time of the professional staff leaving very little time available to prepare a regional general development plan. Coordination efforts of the Council staff have grown considerably since 1956 when the last regional plan was prepared. This growth of information and coordination activity has resulted from the increasing activity by the Federal interstate highway program, NCTA proposed program, regional park activity in Maryland and Virginia, the proposed Corps of Engineers Potomac River Basin plan, and increasing problems of regional interest now being handled by local governments and their agencies together with local interest in implementation of the year

2000 policies plan. To recognize properly the Council's legislative charge to coordinate and exchange information with the region's local governments, as well as to augment present staff resources in order to prepare the regional plan, a position of Chief of Current Planning is programed. To obtain requisite quality of personnel through recruitment, in view of the nationwide scarcity of qualified professional planners, the position of Chief of Current Planning is recommended at GS–12.

9. Urban planner, GS–12, $9,980

A new professional position is programed and requested to head up the Transportation Planning Division. This Division, with requisite responsibility assigned to the Division Chief, assures that the very specialized needs and requirements of transportation planning and technology are properly recognized within the overall regional planning process. These duties utilize specialized skills and knowledge bridging transportation technology and the science and art or urban and regional planning. This Division, working with, advising, and supporting the Current and Advanced Planning Division, acts as a liasion with such local, regional, and Federal agencies as the local and State highway departments and planning commissions, the Washington Metropolitan Area Transit Commission, the Washington Metropolitan Area Transportation Study, the National Capital Planning Commission, the Northern Virginia Regional Planning and Economic Development Commission, the Maryland-National Capital Park and Planning Commission, and the National Capital Transportation Agency. The Regional Transportation Planning Division will work with and advise the Transportation Advisory Committee established under the Federal Aid Highyaw Act of 1962 (now in the organization stage). This Division prepares the technical portions of the general development plan related to transportation and overall land use planning. The combination of specialized engineering skills, thorough knowledge of planning principles, and skills of dealing with high-level officials requires that this new position and function be established at GS–12.

The Chief of Planning Research is programed to support the assignments of the Advanced Planning and the Transportation Planning Divisions by utilizing specialized skills and techniques of regional science. Just as daily coordinating activities have become a large portion of the regional planning staff's activities, so also professional techniques of plan preparation have now made mandatory programing of a regional scientist (urban planner, GS–12, with specialized training preferably in a curriculum leading to a master's or doctorate in regional science) for inclusion in the regional plan preparation functions of the Council. This position, which includes very disciplined and closely correlated use of mathematics, regional development and location economics, sociology, and geography, are applied through research methods to all regional planning studies. Application of these research techniques will very greatly increase the validity and rationale of the general development plan in terms of land use, transportation location, and economic development and projections. Also, the Chief of Planning Research is assigned, so far as is possible, the responsibility of coordinating, on a cooperative basis, the regional research activities of subregional and local governmental planning agencies, as well as the responsibility for gathering, sorting, and collecting statistical information of use for the Council. This position can be obtained for the Council by utilizing, at the end of fiscal year 1964, the position allocated to the joint open space project.

Five positions in the Council are requested for reallocation to higher grade at the beginning of fiscal year 1965 in accordance with the standards prescribed by the U.S. Civil Service Commission. Three of these positions are in the higher pay brackets. All the increases, in addition to being in keeping with established standards, are considered essential to fulfill the revised regional planning program which involves proportionately increased personnel responsibility as well as to retain the services of well-qualified individuals—in that the three professional positions are difficult to recruit due to a nationwide scarcity of qualified professional planners.

10. Stenographers, (2) GS–6 and GS–5

The normal increase in stenographic workload resulting from an increase in the professional staff and general program intensification necessitates the establishment of one additional position at the GS–6 level. The existing one secretary (GS–7) is spending too high a percentage of time handling the large routine workload necessitated by the greatly expanded role of the Council staff in coordination of the planning activities of local governments with the activities of the Regional Planning Council and other Federal agencies. These new activities necessitate

supporting stenographic skills as well as an annual increase of 20,000 items proposed to be mailed from the office to carefully prepared mailing lists of local governmental and civic officials to facilitate coordination and exchange of planning information.

At the present time, one secretary is servicing a total staff of five professionals causing from time to time many bottlenecks in getting out typing work, reports, drafts, minutes, etc. The GS–5 position is necessary to take over some of these duties now carried on by the secretary in order to expedite the general production and workload of the existing professional staff.

LAND ACQUISITION, NATIONAL CAPITAL PARK, PARKWAY, AND PLAYGROUND SYSTEM

No funds are being requested in fiscal year 1965 for this appropriation.

A record of unobligated balances as of December 31, 1963, follows:

George Washington Memorial Parkway:	
Arlington County, Va	$844
Fairfax County, Va	500
Montgomery County, Md	100,700
Total, George Washington Memorial Parkway	102,044
Maryland stream valley parks	12,345
Park, parkway, and playground system in the District of Columbia	876,044
Total, unobligated balance	990,433

EXPLANATION OF BALANCES

George Washington Memorial Parkway

Arlington County, Va.—This amount represents the balance of funds appropriated for the parkway and allotted to Arlington County but unmatched by the local jurisdiction. Unless required to meet deficiency awards in pending condemnation cases and matched by the local jurisdiction or reallotted, these funds will be returned to the Treasury.

Fairfax County, Va.—This amount represents the balance of funds appropriated for the parkway and allotted to Fairfax County but unmatched by the local jurisdiction. Unless required to meet deficiency awards in pending condemnation cases and matched by the local jurisdiction or reallotted, these funds will be returned to the Treasury.

Montgomery County, Md.—$100,000 of this amount was appropriated in the Department of the Interior and Related Agencies Appropriation Act, 1963, for the acquisition of portions of the D.C. Transit Co. Cabin John right-of-way and several other properties necessary for the connection of the George Washington Memorial Parkway with the Little Falls Branch Parkway. It is anticipated that an agreement with the Maryland-National Capital Park and Planning Commission, providing for the matching of this amount, will be negotiated and executed and the amount obligated during fiscal year 1964.

Maryland stream valley parks

This amount represents the balance of funds appropriated under section 1(b) of the Capper-Cramton Act and not covered by agreements with the Maryland-National Capital Park and Planning Commission.

Park, parkway, and playground system in the District of Columbia

The $16 million authorized to be appropriated under section 4 of the Capper-Cramton Act has heretofore been appropriated and the unobligated balance has been programed for expenditure by the Commission. The projects for which substantial amounts are unobligated are as follows:

1. *Palisades Park.*—$123,000 is available for obligation for acquisition of the remaining properties comprising this project. It is anticipated that a substantial portion of this amount will be obligated in fiscal year 1964.

2. *Western Recreation Center.*—$325,000 has been allotted for this project. Negotiations for the acquisition of a site at 39th Street and Reservoir Road NW., on a part of the Archbold Estate, have been underway for several years without success. At its meetings on July 19, 1962, and September 13, 1962, the Commission approved an alternate location on another part of the Archbold Estate adjacent to the Whitehaven Parkway and authorized negotiations for the establishment of a precise alternate site and acquisition of the alternate site. It is not

possible to estimate when such negotiations will be concluded and all or a substantial part of this amount will be obligated.

3. *Adams-Morgan Playground.*—$350,000 has been allotted for the acquisition of park and playground sites within the Adams-Morgan urban renewal project area identified in the urban renewal plan adopted by the National Capital Planning Commission at its meeting on January 10, 1963. It is anticipated that the urban renewal plan will be approved by the Board of Commissioners of the District of Columbia early in 1964. It is not possible to determine how much of the amount allotted will be required for such acquisition of the site until the District of Columbia Redevelopment Land Agency prepares its application to the Urban Renewal Administration for Federal funds to carry out the project. The application will indicate the amount or amounts and source or sources of funds for the acquisition of lands for parks and playgrounds. It is anticipated that such application will be made and the required amount obligated in calendar year 1964. The balance, if any, will be reallotted to other projects or placed in the reserve.

STATEMENT OF MRS. JAMES H. ROWE, CHAIRMAN, NATIONAL CAPITAL PLANNING COMMISSION, MARCH 3, 1964

Senator BIBLE. At this time, Mrs. Rowe, your written statement will be incorporated in the record in full, and you may highlight the statement to indicate, among other things, the activities of the National Capital Planning Commission during the past year and your plans for the present year.

(The statement referred to follows:)

Mr. Chairman, members of the committee, it is a pleasure to appear before you today. As you know, the National Capital Planning Commission is the agency which does the physical planning for the District of Columbia and for the Federal establishments within the National Capital region.

The Washington region is the fastest-growing metropolitan aea in the East. It is the job of the Commission and the Regional Planning Council to plan the physical development to accommodate the rapid growth in population—schools, playgrounds, parks, libraries, sewers, roads, mass transit, and public housing are some of the public facilities that must be planned and coordinated. In the heart of the city where the poor housing is found, where the war on poverty will be concentrated, plans need to be made to improve neighborhoods—through rehabilitation as well as through the classic urban renewal process.

All these physical plans touch intimately the lives of the people of the District and its suburbs. Physical planning cannot be divorced from social planning—from the people it affects. The Commission's staff spends countless hours talking with citizen groups and with the city's private welfare agencies who know the people's problems at firsthand.

The problems I have mentioned are problems faced by every metropolitan area in the country. Here in Washington we have unique problems as well—Washington, as the Nation's Capital, must preserve its natural, historic, and architectural beauty. New plans and new buildings should enhance that beauty, not diminish it. Plans must be made for the location of Federal employment centers in the area, once the Congress has decided that a Federal facility should be in the Washington area.

Our budget request today reflects the work required to help solve these many problems. We are mindful of the President's desire to hold the Federal budget to the barest minimum consistent with the efficient discharge of each agency's duties. After careful examination and reexamination by the Commission and the Bureau of the Budget, the President has supported an increase for the next fiscal year in our budget.

We believe there are sound reasons which justify an increase. For instance, the Commission is charged with planning an efficient and economic arrangement of Federal facilities and employment centers in the National Capital region; a very modest increase in its budget to permit planning for the optimum utilization of federally owned land, and the wise and farseeing reutilization of obsolete or excess facilities will facilitate the achievement of cost reductions many times larger by other executive branch agencies.

During the past few years the Commission has been called on with increasing frequency by Federal agencies and the District government. We have been asked for a number of special reports and studies. Being what President Johnson calls a "can do" agency, those reports have been made and often in record time.

This steadily mounting workload means that the Commission's small staff not only works intensively, but overtime. There has been no increase in the permanent staff for the past 2 years while the workload increases each month. I know of no more dedicated, hard working group of Federal employees than the staff of the Commission and the Council. The budget requested this year would permit the hiring of seven new staff members for the Commission and three for the Council.

In closing I would also like to remind the committee that the members of the Commission itself receive no compensation. Five of the members are appointed by the President and eight are ex officio. Traveling expenses, but no compensation, are paid to the two presidential appointees, who are out-of-town members: Paul Thiry, from Seattle, the architect who designed much of the World's Fair; and McKim Norton from New York, director of the Regional Plan Association. The three local members appointed by the President, Dean A. M. Woodruff of George Washington University; Mr. Walter Louchheim, and myself, give many hours each week to the Commission problems.

May I ask that the members of the committee give sympathetic consideration to the budget before you.

Washington as a Fast-Growing Area

Mrs. Rowe. I will just highlight it a bit, if I may, Senator.

Senator Bible. Develop it in your own way.

Mrs. Rowe. Washington, I state in the opening statement, is the fastest growing metropolitan area in the East——

Senator Bible. And second in the entire United States, if my statistics are correct.

Mrs. Rowe. And I think a look at the cranes on the city skyline indicate that there are great changes going on in the city as well.

Additional Personnel

It is because of this growth and change that the Planning Commission has been busier than ever. It does need desperately the extra positions that we attempt to justify in the budget before you. And that would account for the increase in the appropriation that we are requesting this year.

We are, as President Johnson says, a "can do" agency. We feel that when the District Building calls on us for assistance, when the Federal Government asks for a report or a review of the project, this can be and is done, and often done in record time.

With that general statement the staff and I would be prepared to answer any questions.

John F. Kennedy Center for the Performing Arts

I would ask at this time whether or not you want a presentation on the site acquisition for the Kennedy Center, or whether you prefer to do that after we take up the regular Planning Commission budget?

Senator Bible. I have questions covering those, and I think it might be well if we would develop our record by the questions which I am going to ask, and if there are areas that we haven't touched we will go into them at that time and try to build an adequate record.

I know of your work and I know of your devotion to this project of making this a more beautiful and better place in which to live,

and I commend you for the work that you and the other members of the Commission are doing. Much has been done. And obviously much remains to be done.

PERSONNEL

Now, how many positions do you have in the National Planning Commission at the present time? What is your present strength?

Mrs. ROWE. Forty-six, of which 38 are Commission and 8 Regional Council.

Senator BIBLE. You have 46. Now, you are requesting 10 new positions in the coming fiscal year, and 3 of them are in the Regional Planning Council. Now many personnel are employed by the Retional Planning Council?

Mrs. ROWE. The 46 figure includes the Commission and the Council.

Perhaps Mr. Heller or Mr. Pickens, the chairman, would like to speak on the present staff.

Mr. PICKENS. We have eight, Senator, and we are asking for three more.

Senator BIBLE. You apparently have an organizational chart before you that gives you the job positions of all of your present 46, is that correct?

CURRENT AND PROPOSED POSITIONS

Mr. DUTTON. Senator, that shows the current and the proposed positions, if you will notice the black dots, they indicate the positions requested.

Senator BIBLE. Is this included in the justification?

Mr. DUTTON. It is already in the justification.

Senator BIBLE. There is no need to duplicate it, it is already a part of the record.

This indicates your present 46 positions and where you will use your 10 new ones?

Mr. DUTTON. Right, sir.

Senator BIBLE. And these are grade numbers, 13, 14, 8, 6, 5?

Mr. DUTTON. Yes.

NEW POSITIONS

Senator BIBLE. I suppose this is a question that should be answered by both the Planning Commission first and the Regional Planning Council second, and that is, what is your need for the 11 positions? There are eight of them in the National Capital Planning Commission and three of them in the Regional Planning Council.

Mrs. ROWE. I think Mr. Dutton might speak to that. He could outline the activities that we are engaged in. I think that is the best answer we can give you, Senator, on the demand for the extra employees.

Senator BIBLE. Very well.

CLERK FOR CAPPER-CRAMTON PROGRAM

Mr. DUTTON. First, sir, I would like to point out that one of the eight positions is actually an authorized position that has not been funded in the past year. It was initially established to serve the Capper-Cramton program. It is a clerk-stenographer position which

we are carrying this year although it has not been funded, and we are asking funds for that.

The other seven, I would like to run through them in the order in which we list them in our justification for increase, if I may.

Senator BIBLE. Certainly.

EDITORIAL AND TECHNICAL WRITING AID

Mr. DUTTON. Initially on the chart in the upper left corner, the dot for editorial and technical writing aid is a position that we require in order to expedite our work of communication of the Commission's plans, and its studies and proposals to the community and to other agencies.

I brought a partial exhibit with me this morning, if you notice this pile of reports. The first half of the pile represents material that has been prepared for us by consultants and experts in specific fields or by the staff, work which the Commission has had prepared, but which is not available for release at this time, because we have not been able to perform the editorial writing on it. In order to add a new position to do that work we feel that we could most efficiently carry out the work by hiring a specialist, a trained writer to prepare this material for publication.

Senator BIBLE. What is the position just immediately above the editorial and technical writing aid entitled "Special Assistant in Community Relations"? What does the person who holds that do?

SPECIAL ASSISTANT IN COMMUNITY RELATIONS

Mr. DUTTON. Miss Small, who is here with us, has quite a variety of duties. She assists the Chairman and myself in correspondence and direct contact with people who call us for information, in preparing material for release to citizens' groups, and meeting with citizen organizations.

She has become quite a specialist in the field of historic preservation, and has published articles about the need for historic preservation of lands, parks, and architectural attractions in the National Capitol.

The editorial and technical writing aid would work closely with the special assistant and would have a major assignment in the coming year in preparing materials related to the 1985 comprehensive plan.

The second part of this stack in front of me is initial staff work being prepared for the comprehensive plan in 1985. It is prepared in the initial stage in rather technical jargon and for policy determination by our Commission. It needs a great deal of work if it is to be an effective document for the other public agencies, Federal and District, as well as for citizen groups.

MANAGEMENT ASSISTANT AND PAYROLL CLERK

The next two positions that are listed in our justification come under administrative services, a personnel management assistant, and a time-leave and payroll clerk. I would like to point out that we exist as a separate Federal agency, one of the 50 independent agencies, and we have a continuing and increasing workload with respect to managing the records, payroll, personnel, and so forth, of our agency.

In addition to the regular positions which we have been authorized, as you know, we have been carrying out work for the Pennsylvania Avenue Advisory Council, administrative work connected with that as well as for the open space project for the District, and have had in the past years other such responsibilities. In order to be sure that we are carrying out the proper performance in these various fields of management, we need to have additional assistance to be sure that we are fulfilling our responsibilities. We will be giving further consideration to the possibility that some of this work could be farmed out on a reimbursable basis, presumably to GSA, if it can be handled more economically on that basis.

Senator BIBLE. You have two new positions under technical services?

TRAFFIC ENGINEER

Mr. DUTTON. The traffic engineer, GS–12, request is responsive to the provisions in the Highway Act of 1962 in which the Congress has called for each metropolitan area to perform a continuing comprehensive transportation planning process in order to be eligible for continuing Federal funds, either from the interstate program or the 50–50 urban aid. The responsibility of our Commission with respect to Federal interest in the region, as well as the Municipal Planning Agency for the District is quite clear in the statutes, and we need to increase our ability to participate in this regional process for the area.

I might observe that there is a similar need in the Regional Planning Council to which I am sure the Council will address itself in a few minutes.

STATISTICIAN

The other position called statistician, under the economist, is concerned with our need to provide more of a clearinghouse, a central source of information on the activities and the growth in the District. Mrs. Rowe referred to the amount of private construction that is going on, as well as the public buildings. But there is no central source of data published that is of use to people who are concerned with urban development and making decisions about location in the area.

There is some partial data presented by private groups as well as by existing programs of Federal agencies. But we want to be sure that we are sensitive to the economic trends in the community, to the economic opportunities, and are able to suggest to private enterprise, private developers, how they can help us carry out our objectives for the National Capital.

CLERK FOR CAPPER-CRAMTON PROGRAM

The next position listed—I referred earlier to the clerk-stenographer as being a position that had been under the Capper-Cramton program but which has not been funded under previous budgets.

URBAN PLANNER

Another position to which I will speak is the urban planner, GS–11 under Federal Planning Division. I would like to point out that part of our response here is the fact that a few years ago the Congress

did determine that the Planning Commission staff should be reorganized and strengthened. We have increased our workload considerably as a result of past achievements of the Commission. The Federal Planning Division now is called upon as a result of the action by the Budget Bureau to review the plans of all Federal agencies concerned with capital improvements in the National Capital region, the area of 2,400 square miles. And this is causing an increasing workload.

We find that we get a great deal done by early consultation with these agencies on our plans and programs. But this does require a great deal of contact and followup work.

Federal Planning Division

This Federal Planning Division, at present, just has one full-time planner plus a landscape architect to assist on site planning design. The Division is assigned the responsibility at the present time for developing an inventory of all Federal landholdings in the region. We have been asked by the Bureau of the Budget to prepare development plans, site development plans for all of the areas owned by the Federal Government to indicate what their maximum potential development might be.

And after completing that phase of the study we hope to be able to develop some recommendations for consideration by the executive branch as to what might be the pattern of development, future development of planned sites by the Federal Government in this area, in order to get the most efficient and economical operation of the Federal Government business in the region, in order to maximize the gains in terms of congressional decisions with respect to site development, and advanced planned acquisition.

The other positions are on the Regional Planning Council.

Planning Agencies and Commissions in Metropolitan Area

Senator Bible. Without encumbering the record at too great a length—possibly it can be supplied for the record—I would like to have you comment on it briefly. How many planning agencies and commissions do we have in the metropolitan area? It always seemed to me that there is kind of a helter-skelter overall plan metropolitan-wise. We have the National Capital Planning Commission, and then we have the National Capital Regional Planning Council, and then we have the Fine Arts Commission.

Statutory Authority for Buildings

Mr. Dutton. Yes, sir. They are, of course, not charged with the responsibility of planning in the region. We have a specific responsibility with respect to special statutory authority for buildings within the District, Federal buildings and other private buildings in certain designated areas.

Senator Bible. After you plan a building do you have to clear it with them as to height and architectural beauty?

Mr. Dutton. Other agencies have to, we do not get involved in that directly, but the GSA does have to submit building programs to the Commission on Fine Arts.

THEODORE ROOSEVELT MEMORIAL BRIDGE

Senator BIBLE. The reason I asked the question is, I happened to have something to do with the Theodore Roosevelt Memorial Bridge. And I thought we would never become disentangled from the endless redtape. And I don't know whether you have supplied any of the redtape or not, but we found it in many of the other agencies. And we finally got it cleared—are they building the bridge?

Mrs. ROWE. It is built.

Senator BIBLE. I knew it was almost operational.

But I was just wondering if you would supply for the record——

Mr. DUTTON. I might say, as you know from your study of the problems of the National Capital area, the assignment of responsibilities is made to a number of different agencies, and our functions do not entirely overlap other agencies, but there are many agencies where there are partial overlaps.

OVERALL REGIONAL PLANNING COMMISSION

Senator BIBLE. It has seemed to me that somewhere along the way an overall regional planning commission—and maybe this National Capital Regional Planning Council partly fits the picture—but what I am trying to say is that where you have the fragmented government that we have here, Montgomery County and Prince Georges and Alexandria and Arlington and Falls Church and the rest, it seems to me that somewhere along the way we could conceive an implementing agency which would have the power to speak with authority on behalf of these various agencies.

Now, I am not going to replow the ground that we did in these many weeks of hearings on problems of the metropolitan area. But if you have any doubt about it I would be very happy to have you supply it for the record, if you understand what I am trying to ask.

Mr. DUTTON. I believe I do. The organization for planning in the region and the number of agencies——

IMPLEMENTING A RECOMMENDATION

Senator BIBLE. Plus one additional factor, and that is, I would like to know how you implement it after you come up with the recommendation. This is where we always seem to bog down. I am not critical of it, it is just a fact of life. But once we come up with any type problem we find that we have to go to the government agencies of these various municipalities and counties and governing boards—not that there is anything wrong with that, except that it is cumbersome.

And if we had some overall agency—and I realize you get the criticism of creating a supergovernment—but I would like to have your thoughts on this.

Mr. HELLER. I believe I could answer your question, if you would like.

Senator BIBLE. If you can answer it go right ahead.

SUBREGIONAL COMMISSIONS

Mr. HELLER. I believe this will answer your question.

We have what we term three "subregional commissions": the National Capital Planning Commission, the Maryland-National Capital Park and Planning Commission, and the Northern Virginia Regional Planning and Economic Division. These agencies serve the three basic jurisdictions; that is, the two State areas, and the District of Columbia and the Federal Establishment on the part of NCPC.

Senator BIBLE. Does Maryland come into that?

Mr. HELLER. Yes, sir.

Senator BIBLE. As a member of what?

REGIONAL PLANNING COUNCIL

Mr. HELLER. The Regional Planning Council. The Regional Planning Council is the thin line at the top trying to bring about, I trust, some coordination of the efforts of the three subregional agencies. Now, in addition to the Regional Planning Council and the three aforementioned agencies, there are seven other local planning agencies of the National Capital region which have their individual staffs and budgets, and five additional agencies that are just commissions lacking a resident staff and a specific annual budget.

Senator BIBLE. What is the name of the agency that Congressman Sickles headed up at one time? Was that a compact, part of a compact commission?

METROPOLITAN WASHINGTON COUNCIL OF GOVERNMENTS

Mr. HELLER. It was the Metropolitan Washington Council of Governments—he was chairman of the Conference.

Senator BIBLE. What is that?

Mr. HELLER. That is the bringing together of all of the elected representatives of the region to effect cooperation and mutual areawide problem solving. It is not a planning agency per se as we are.

Senator BIBLE. It is more or less an implementing agency, action agency?

Mr. HELLER. That is exactly correct. They represent the action end of things where the elected official has the prerogative and the powers to implement plans. We are the planning agency doing the planning and doing the advising, I trust, to these officials.

Senator BIBLE. I appreciate your consideration. And I would likewise invite you to supply anything that you would like for the record. I would like to have a little clearer picture as to how much headway we have made on some of the recommendations which were presented during our earlier hearings. I don't know whether these fragmentations can be pulled together more effectively or more efficiently or not, but I would like to have you give some thoughts to it.

YEAR 2000 PLAN REPORT

Mr. DUTTON. One other thought here. The National Capital Regional Planning Council and the National Planning Commission did do some regional study work recently that culminated in a "Year 2000 Plan Report." This report, I think, is an example of what can

be done by a planning agency that comes up with a good idea that is acceptable in the community, and it does then attract a great deal of support.

I might just show you the reference here to a letter signed by President Kennedy endorsing some of the basic objectives of the report. And we will supply for the record other information about the impact that it had on the planning programs of other agencies in the region.

Senator BIBLE. I would appreciate it if you did. All I want to do is give each of you the opportunity of giving your views on whether or not we are adequately planning for the metropolitan area, and having made the plans, are we properly set up to carry the plans into effect. These are about the two questions I had in mind.

COOPERATION OF PLANNING COMMISSION WITH AGENCIES AND CITIZENS GROUPS

I understand that Senator Mansfield has suggested two questions. They may possibly be somewhat similar to the ones I am suggesting. They are: To what extent does the Planning Commission work with other agencies and citizens groups in developing its planning recommendations?

You partly answered that. And if you care to amplify it, please do so for the record.

CITIZEN GROUPS

Mrs. ROWE. We might talk about working with the citizens groups, we have talked about the other agencies.

Mr. DUTTON. We do have a particularly strong responsibility in working with citizen groups in the District of Columbia, and particularly in reference to the "Comprehensive Plan for 1985" which is now due for publication the following June of 1965. We are preparing an intensive program of interchange with citizen groups. And we have a special consultant on problems of citizen participation who is preparing suggestions for the Commission as to how to really, in a meaningful way, contact the organized groups of the District of Columbia.

This will include organizations interested in citywide problems as well as the neighborhood and community groups.

FEDERAL OPERATING AGENCIES

Also at the same time we will be going through an intensive process of coordination with a number of Federal operating agencies concerned with problems in the District as well as the District of Columbia operating departments.

I would like to point out that the Commission itself has six ex officio representatives from Federal and District offices serving on the Commission. Presently I, or members of my staff representing me, serve on about 45 coordinating committees mostly composed of other operating officials. And I would like to repeat again that we are particularly concerned here about our ability to communicate with the public on the Planning Commission recommendations in order to insure that we do get effectuation of our proposals.

RELATION OF STUDIES TO ECONOMIC AND SOCIAL NEEDS

Senator BIBLE. One further question has been suggested by the majority leader, and that is, How does the Planning Commission relate its studies to private economic and social needs and to the operation of a private construction industry?

Mr. DUTTON. Sir, we have been particularly concerned to make sure that our proposals are sensitive to economic and social problems and not just physical planning or architectural solutions proposed. We have added to our staff in recent months a specially trained person in the economic and social analysis field who is assisting in an analysis of the 1985 plan as well as the community renewal program of the District, to be sure that we are aware of social and economic implications of that proposal.

We are anxious, as I indicated before, to be in a further position to add in a complex of relevant data to be sure that we are informed as to implications of proposals that then can be presented to the Planning Commission to assist them in their decisionmaking. We believe that this is a normal function of a municipal planning agency that we should be discharging as a part of the District government assignment that we have under our statute.

We believe that if we do present the information that is not available now in the community so that it will assist in the decisionmaking of private industry itself with respect to their location of office buildings, private residential development, and so forth. We have thus been trying to translate our planning proposals into some guide as to how private industry response can be made, and we are anxious to work with private enterprise.

TRANSPORTATION PROBLEM

Senator BIBLE. One of the real tough problems that we have in this area, I think we are all aware of it—we have the agency here before us—is the question of transportation, moving people in the metropolitan area. Of course, one of the real tough problems there on the highway level is what happens when you build the north leg of the interloop on problems of dislocation.

DISLOCATION PROBLEM

Now, are your views solicited by the Highway Department on that problem, questions of dislocations?

Mrs. ROWE. I think this is a very pertinent question. We in the last year hired the Health and Welfare Council of the city, the central agency of the private voluntary agencies of the city to make a report for the planning commission on the relocation problems of the north leg. This was a social aspect of planning that we thought was of the utmost importance.

Senator BIBLE. We have a lot of problems.

Mrs. ROWE. Indeed. But this was a private consultant's study that we have made on these very problems that you raised.

Senator BIBLE. But what happens after you have the study, what do you do with the study?

COOPERATION WITH DISTRICT HIGHWAY DEPARTMENT AND NATIONAL CAPITAL TRANSPORTATION AGENCY

Mr. DUTTON. We have been working closely with the District Highway Department on this study. There have been times in the past when the communication was not as close as it is now. We had a meeting last week all afternoon with consultants hired by the Highway Department to study the solution proposed for the north leg by the Policy Advisory Committee; that is, a maximum tunneling. We at present can say that we have very close working relationships with the District Highway Department. We also enjoy good working relationships with the National Capital Transportation Agency, and we are being asked for our opinion, and we expect that if our advice is good it will be followed.

Senator BIBLE. I am glad to hear that you are working very closely with both agencies, because this is a problem of high priority.

My own personal opinion is that somewhere along the way we are going to have to arrive at a balanced system, the sooner the better, because I think time runs against us costwise and problemwise.

RAPID RAIL TRANSIT SYSTEM

Mr. DUTTON. The Commission has recently reiterated its support of a rapid rail transit system for the area. And all of our planning is based on what we believe is the necessity for providing such a system.

Senator BIBLE. I am happy to hear you say that.

1985 COMPREHENSIVE PLAN FOR THE DISTRICT OF COLUMBIA

What is the status of the Pennsylvania Avenue study for the completion of which funds were made available last year?

Mrs. ROWE. The work on the project is completed. The report is in final form and is, I understand, either on its way or at the Government Printing Office. So it should be only a matter of weeks before the plan is presented to the public.

Senator BIBLE. And would you either describe—or I think possibly better supply for the record—the 1985 comprehensive plan for the District of Columbia?

Mrs. ROWE. Senator, I am afraid we can't put in the 1985 comprehensive plan. It is in sketch form now. I believe we would burden the record if we tried to submit that kind of raw material. This is what we are working on now. And it will be published next year.

PUBLICATION OF THE PLAN

Mr. DUTTON. I might add that our appropriations request does specifically ask for an additional $20,000 for us during the next fiscal year to enable publication of the plan report and its proposals for the public. So this is the publication we are talking about.

Senator BIBLE. What you are saying is that you have a year's work before you finalize the plan?

Mr. DUTTON. Yes, sir.

Senator BIBLE. And our request is a little premature, but you are making a request for another $20,000 to try to hurry it along?

Mr. DUTTON. That is correct, sir. And we will have something more specific for you next year.

ASSISTANCE ON FEDERAL GOVERNMENT OFFICE SPACE

Senator BIBLE. Senator Humphrey has suggested two questions. One is, what assistance do you give to the Federal Government on the location of new office space?

Mr. DUTTON. Sir, I have talked about that general question. I might just point to this one map behind me that is labeled, "Federal Installation, Regional Growth."

Senator BIBLE. I don't think you have mentioned that specifically. What do you do to give assistance to the Federal Government on the location of new office space?

Mr. DUTTON. Under current Budget Bureau procedures any agency requiring additional office space or other capital improvement in the National Capital region is required to consult with us in the early stages of the process. This comes under the budgetary procedures in the executive branch. We have just really instituted this procedure in the past couple of years, and this is why we are particularly needful of additional positions within our Federal Planning Division. This, of course, is being done on more or less of an ad hoc basis or day-to-day basis. But to anticipate this in the future we have begun this inventory of all Federal buildings in the area. The District of Columbia is indicated by these boundaries, Arlington County being the remainder—if you recall, this portion of the District of Columbia was given back to Virginia many years ago; it was decided that it wasn't necessary, because the District wasn't growing very large.

MASTER DEVELOPMENT PLANS

In the meantime the region has grown as indicated by these yellow patterns. This is not the current growth, but the projected growth in the future. The 35 large blue stars indicate the location of federally owned real estate in the region. And these are the sites that we are inventorying now, developing proposed master development plans for the sites to see what accommodation they can have in the future for Federal office buildings as well as studying and anticipating future needs that might suggest advance land acquisition procedures.

CAPITOL GROUNDS JURISDICTION

Senator BIBLE. Do you have jurisdiction on Capitol Hill, for example, if there is more space sought for a third new Senate office building? Do you have jurisdiction over this?

Mr. DUTTON. There is some question about the jurisdiction that we have as related to the Capitol grounds—that is the official title.

Mr. SHEAR. The Planning Commission has no jurisdiction over the Capitol grounds as such, Mr. Chairman. The National Capital Planning Act of 1952 reserves, out of the jurisdiction of the Commission over planning for the District of Columbia and Federal planning for the region, the Capitol grounds.

COOPERATION WITH THE ARCHITECT OF THE CAPITOL

Mr. DUTTON. I hasten to add, sir, that Mrs. Rowe and I recently have met with Architect of the Capitol Stewart and his staff to develop a procedure for close working relationships particularly in conjunction

with the 1985 plan. We have been assured of cooperation from his office and have offered ours. And we expect to have, within the 1985 plan, specific proposals that recognize the needs and interests as presented by the representatives of the Congress, and taking into consideration the surrounding areas of the Capitol grounds.

Mrs. ROWE. I think we have a good cooperative relationship.

Senator BIBLE. The Chairman of the full committee is the expert on this. And that is why I asked the question.

Senator Hayden.

Senator HAYDEN. I am simply thinking about the time when we decided to clear off all the old houses in the vicinity of the Capitol and make it available for parking space. My recollection was that Congress passed some kind of resolution of taking, and then it was handled by the Architect of the Capitol, and the appraisals were made by the District authorities. And I am glad to say that nobody asked more than the appraised price; and the property was acquired at a very reasonable rate.

Senator BIBLE. Did you have any questions on this point here, Senator Hayden?

Senator HAYDEN. No.

DISTRICT OF COLUMBIA PUBLIC WORKS PROGRAM

Senator BIBLE. The second question Senator Humphrey asks is, "What role does your Commission play in the planning of the District of Columbia public works program?"

Mr. DUTTON. Sir, that is a question that relates directly to the Planning Commission's interest for long-range programing of the expenditure of public funds in the District, and is a question that we are approaching through the study of the 1985 plan development. We did prepare for presentation to the Commission recently a map of the proposals that the District of Columbia Board of Commissioners has made for public improvement for the next 6 years in the District.

PROPOSED 6-YEAR PROGRAM

I would like to quote a financial figure here that there have been proposed for the next 6 years, fiscal 1965 through fiscal 1970, in the District of Columbia, projects which would cost in the neighborhood of $371 million, a total of 300 projects.

These are shown on this map behind me. The different stars and symbols indicate different projects for schools and playgrounds, libraries and health facilities, highways and so forth, as well as the different colors showing the different years in which these are programed.

Up until recently the District public work budget has been prepared primarily on a year-to-year basis and has been reviewed by the Planning Commission on that basis to see if we have supported or recommended against particular developments. This year, for the the first year, there was a 6-year program prepared by the Board of Commissioners in time for review by the Planning Commission, and we are able to make comments on the general allocation of funds for that period. During the preparation of the 1965 plan we will include a 20-year public works improvement program so that we will have dollar signs on the major proposals. The costs can be determinative

of the proposals that we are making; and this work will be coordinated closely with the operating departments of the District concerned.

Senator BIBLE. In all of this I assume you work very closely with the District Building.

Mr. DUTTON. Yes; particularly in this we work through the Engineer Commissioner's Office, the Assistant Engineer for Planning and Programing, and the Office for General Administration.

ANACOSTIA-BOLLING FACILITY

Senator BIBLE. Now, have you made any proposals for the use for Anacostia-Bolling?

Mr. DUTTON. We have not made a recommendation at this time. We are engaged with several other agencies in attempting to prepare a detailed study of the area. There have been some 25 proposals made for development of the facility or part of it by various public agencies for private uses. We are now working with the executive office, and the Redevelopment Planning Agency, in particular, to develop a complete planning and redevelopment study of the area. This has been delayed considerably from the time it was originally talked about, but we do believe it is going to go forward in the very near future.

Senator BIBLE. Who will finally make the decision as to what use is made of it? Where does the responsibility lie? Is the title still in the U.S. Air Force?

Mr. DUTTON. The title, I believe, is in the GSA; is that correct?

URBAN RENEWAL PORTION

Mr. CONRAD. There has been an agreement made as to what land would be retained by the Air Force. What portion would be turned over for urban renewal—I believe some 600 acres would be turned over for urban renewal.

As to where the exact transfer of land is under that agreement I do not know, I would imagine it is still within the Air Force's jurisdiction until such time as a plan for that 600-acre portion is prepared by the Planning Commission and disposed according to that plan. At that time I imagine a transfer would be made from the Air Force probably to GSA and then into whatever uses are proposed under the plan, some of which may be Federal and the rest of which may be private.

Senator BIBLE. The Air Force, then, is retaining part of the use of both; is what you are saying?

REDEVELOPMENT PROJECT

Mr. DUTTON. Yes, sir.

To answer your question more specifically about the decisionmaking that will be involved on the remainder of the property, the property eventually will be turned into a redevelopment project and become the property of the Redevelopment Land Agency, the local agency for carrying out renewal.

Our Planning Commission has the responsibility of approving the redevelopment plan which will indicate the uses. And the Board of Commissioners will approve the plan. So that really there are two levels of decisionmaking. So that the Planning Commission initiates the proposal and the Board of Commissioners has to concur with it before it becomes the plan under which the Redevelopment Land Agency will dispose of the property.

Senator BIBLE. Would you care to add anything to that?

Mr. SHEAR. No; that is correct.

CAPPER-CRAMTON ACT LAND ACQUISITION FUNDS

Senator BIBLE. Although you are not proposing appropriation of land acquisition funds, the material supplied with the justification for your fiscal year 1965 budget indicates an unobligated balance of $876,000 for Capper-Cramton Act appropriations for the park, parkway, and playground system for the District of Columbia. What is the total amount authorized for this purpose?

Mrs. ROWE. I believe Mr. Shear could answer that.

Mr. SHEAR. The total amount authorized under section 4 of the Capper-Cramton Act, Mr. Chairman, is $16 million. All of the funds authorized to be appropriated have been appropriated, obligated, or allocated to projects under that program in the District of Columbia. The remaining unobligated balance is, as you point out, $876,000.

Senator BIBLE. Would you please supply for the record a table showing the amounts requested and the amounts appropriated for land acquisition for the park and playground system in the District of Columbia for each of the fiscal years 1958 through 1964? Please show by footnote, or otherwise, the particular purpose or purposes for which each amount requested and appropriated was justified.

Mr. SHEAR. We will be happy to do that.

(The table referred to follows:)

District of Columbia park, parkway, and playground system: fiscal years 1958–65

Project	Amount requested	Amount appropriated
Fiscal year 1958:		
Watts Branch Park	$19,800	$19,800
Anacostia Park section G	31,900	31,900
Fort Drive, section B	154,715	154,715
Fort Drive, section J	1,100	1,100
Palisades Park	359,740	359,740
Buchanan Recreation Center	148,500	----------
Broad Branch rights-in-land	77,440	77,440
Cleveland Park Recreation Center	220,000	----------
Georgetown Recreation Center	165,000	165,000
Northeast playground, adjacent to Wheatley School	275,000	----------
Fairfax Village Playground	77,000	77,000
Neighborhood park, vicinity of New Hampshire Ave. and Park Rd. NW.	229,585	----------
Klingle Valley rights-in-land	46,310	46,310
Total	1,806,090	933,005
Land acquisition expenses	46,910	66,995
Grand total	1,853,000	1,000,000
Fiscal year 1959:		
Buchanan Recreation Center	98,500	----------
Cleveland Park Recreation Center	220,000	----------
Northeast Playground, adjacent to Wheatley School	275,000	----------
Neighborhood park, vicinity of New Hampshire Ave. and Park Rd. NW	225,800	----------
Fort Drive, section H	30,000	----------
Fort Dupont Park	55,000	----------
Rose Park Playground	20,200	----------
Hardy School Playground	47,000	----------
Neighborhood park, vicinity of Wisconsin and Massachusetts Ave.'s NW	85,000	----------
Total	1,056,500	----------
Land acquisition expenses	63,500	----------
Grand total	1,120,000	----------
Fiscal year 1960:		
Georgetown Recreation Center	250,000	250,000
Petworth Playground	120,000	120,000
Adams-Morgan demonstration project, area playground	400,000	400,000
Park-playground, vicinity of New Hampshire Ave. and Park Rd. NW	250,000	250,000
Northeast Playground, adjacent to Wheatley School	175,000	175,000
Rock Creek and Potomac Parkway (Sec. 1) (Cultural Center)	350,000	350,000
Palisades Park	31,000	31,000
Neighborhood park, square S of 104	243,000	243,000
Total	1,819,000	1,819,000
Land acquisition expenses	105,000	105,000
Grand total	1,924,000	[1] 1,924,000

[1] Completion of appropriations under $16,000,000 authorization under sec. 4 of the Capper-Cramton Act.

JOHN F. KENNEDY CENTER FOR THE PERFORMING ARTS

Senator BIBLE. There are pending two fiscal year 1964 supplemental budget estimates for land acquisition in the District of Columbia. One is for $2 million for the acquisition of lands in private ownership within the site on which the John F. Kennedy Center for the Performing Arts will be constructed. The justification statement for this estimate will be printed in the record.

(The justification statement referred to follows:)

LAND ACQUISITION, NATIONAL CULTURAL CENTER SITE

The Commission requests a supplemental appropriation in the amount of $2 million for the acquisition of the remaining lands in private ownership within the site on which the National Cultural Center may be constructed pursuant to section 3 of the National Cultural Center Act (September 2, 1958, 72 Stat. 1698), as amended.

The site contains approximately 7.7 acres, of which 1.8 acres was in private ownership on the date of enactment of the National Cultural Center Act. The Commission subsequently acquired 0.53 acres of the land in private ownership at a cost of $775,000 with funds appropriated to the Commission for the acquisition of lands for the park, parkway, and playground system of the District of Columbia under section 4 of the act of May 29, 1930 (46 Stat. 482), as amended (the Capper-Cramton Act), and allotted by the Commission, with the approval of the Board of Commissioners, to land acquisition for the site of the National Cultural Center.

All of the funds authorized to be appropriated by section 4 of the Capper-Cramton Act have been appropriated to and allotted by the Commission for land acquisition for various park, parkway, and playground projects in the District of Columbia. Accordingly, an appropriation for site acquisition under the authority of section 3 the National Cultural Center Act is essential to permit completion of the assembly of the site of the Center.

Rock Creek and Potomac Parkway

Senator Bible. The other is for $1,300,000 to acquire the remaining lands in private ownership in square 10 of the District of Columbia as an addition to the Rock Creek and Potomac Parkway to provide an appropriate park setting for the John F. Kennedy Center for the Performing Arts. The statement submitted in support of this estimate will also be included in the record.

Land Acquisition, National Capital Park, Parkway, and Playground System

The Commission requests a supplemental appropriation in the amount of $1,300,000, $500,000 of which is for the acquisition of the remaining lands in private ownership in square 10 in the District of Columbia as an addition to the Rock Creek and Potomac Parkway in order to provide an appropriate park setting for the National Cultural Center and related facilities.

The remaining $800,000 requested would replace an equal amount appropriated to the Commission for the acquisition of lands for the park, parkway, and playground system of the District of Columbia under section 4 of the Capper-Cramton Act and used for land acquisition for the site of the National Cultural Center. Since all of the funds authorized to be appropriated by section 4 of the Capper-Cramton Act have been appropriated and committed, the availability of additional land acquisition funds is essential to completion of park, parkway, and playground projects now underway and to be proposed in the 1985 comprehensive plan for the District of Columbia under preparation by the Commission.

National Cultural Center Act of 1958

Senator Bible. The $2 million request is for purchase of land within the area delineated by the National Cultural Center Act of 1958. Of the original 1.8 acres of privately owned land in that area how much remains to be acquired?

Mrs. Rowe. An acre and a half.

Senator Bible. Have negotiations proceeded to a point which indicate that this amount will be sufficient to acquire all of the designated property?

Mrs. Rowe. I think perhaps Mr. Shear can better answer that.

Mr. Shear. Mr. Chairman, we have not entered into negotiations at the present time. Our estimates are based upon two appraisals by competent, well-established real estate appraisers in the District of Columbia, and represent in our opinion a sufficient amount to permit acquisition within the amounts requested.

Senator Bible. What do you propose to do if this is not enough money? Will you ask for more?

Mr. Shear. I suppose that is what we would have to do, Mr. Chairman.

Senator BIBLE. I imagine that was the purpose of that question. It seems to me the answer is somewhat obvious.

JOHN F. KENNEDY CENTER FOR THE PERFORMING ARTS

At this point I will include in the record a memorandum signed by the Director of the National Capital Planning Commission in which is set forth allocations and appropriations for land acquisition for the Center site. Also, there will be printed the summary of private properties acquired and to be acquired.

(The information referred to follows:)

LAND ACQUISITION

NATIONAL CAPITAL PLANNING COMMISSION,
Washington, D.C., February 20, 1964.

Memorandum

To: Paul Eaton, Senate Committee on Appropriations.
From: W. C. Dutton, Jr., National Capital Planning Commission.
Subject: Land acquisition, John F. Kennedy Center for the Performing Arts and vicinity.

In accordance with your request there are transmitted herewith a schedule of the properties acquired and to be acquired for the site of the Kennedy Center and vicinity and a map thereof.

The John F. Kennedy Center Act (72 Stat. 1698), as amended, authorizes the construction of the Center on a site in the District of Columbia bounded by the inner loop freeway, the Theodore Roosevelt Bridge approaches, the Rock Creek Parkway, F Street NW., and New Hampshire Avenue NW., as selected by the National Capital Planning Commission, and directs the Commission to acquire land necessary for the Center and related facilities. The site was recommended for this purpose by the Commission on May 1, 1958. It contains approximately 7.7 acres, of which 1.8 acres were in private ownership.

Although the act contains no authorization for the appropriation of funds for the acquisition of the lands in private ownership, the Commission expressed its willingness, subject to the concurrence of the Board of Commissioners of the District of Columbia, to allocate for this purpose $300,000 of the funds theretofore appropriated to the Commission for the acquisition of lands for the park, parkway, and playground system of the District of Columbia under section 4 of the act of May 29, 1930 (46 Stat. 482), as amended (the Capper-Cramton Act) and to seek additional appropriations for this purpose under the Capper-Cramton Act. On June 3, 1958, the District Commissioners, who are required under the Capper-Cramton Act to repay to the U.S. Treasury funds appropriated for park, parkway, and playground land acquisition, approved the use of Capper-Cramton funds for Center site acquisition and the Commission at its meeting on September 4, 1958, allotted $300,000 in its fiscal year 1959 land acquisition program for the extension of the Rock Creek and Potomac Parkway as a site for the Center. In addition, the Commission included $350,000 for this purpose in its fiscal year 1960 budget estimates. Thereafter, the Commission increased the total amount of Capper-Cramton funds allotted for this purpose to $355,000 on February 5, 1959, to $705,000 on August 14, 1959, and to $800,000 on September 14, 1961.

On December 3, 1959, the Commission approved an enlarged site for the Center and the relocation of portions of the Rock Creek and Potomac Parkway required to permit the construction of the Center in accordance with Mr. Stone's preliminary designs, which were presented to the Commission at its November 5, 1959, meeting. The action of the Commission was based on its understanding that the trustees would seek enactment by the Congress of an amendment to the act to enlarge the site within which the Center may be constructed. Such legislation was introduced (S. 3381, S. 3409, and H.R. 11871), but not enacted in the 2d session of the 86th Congress nor in the 87th Congress (S. 516 and H.R. 988). In reporting on S. 3381, S. 3409, and H.R. 11871, the Bureau of the Budget and the Commission recommended that the legislation be amended to authorize the appropriation of $1.5 million for land acquisition for the Center.

When the Congress did not enact legislation enlarging the site in the 2d session of the 86th Congress, in order to permit planning and fund-raising activities for the Center to proceed without interruption, Mr. Stone prepared an alternative preliminary design for the Center, permitting its construction within the area

designated in the act, but requiring the relocation of portions of the Rock Creek and Potomac Parkway. At its meeting on September 8, 1960, the Commission approved the alternate site and the relocation of portions of the parkway, and the acquisition for this purpose of lots 800 and 807 and part of lot 808 in square 10. Because reconstruction and enlargement of the improvements on lots 800 and 807 (Waffle Shop) had begun, the Commission authorized negotiations for the acquisition of the properties and, after such negotiations were unsuccessful, the Commission acquired the properties as an addition to the Rock Creek and Potomac Parkway by condemnation at a total cost of $146,000 with funds contributed for this purpose, in accordance with section 4 of the Capper-Cramton Act, by the trustees of the Center. In order to prevent imminent development of the properties in square 20 in private ownership which had been assembled for such purpose, the Commission acquired by direct purchase in February 1963, at a total cost of $774,157.50, lots 10, 21, 22, 24, and 800 to 806, inclusive, in square 20. Together with title, appraisal, and related expenses, this purchase effectively exhausts the total amount alloted to this project by the Commission from funds appropriated under section 4 of the Capper-Cramton Act.

W. C. DUTTON, Jr., *Director.*

KENNEDY CENTER SITE

	Owner	Area (square feet)	Amount
1. Properties acquired: Square 20, lots 10, 21, 22, 24, and 800–806.	Landow and Brandt et al	22,942.5	[1] $774,157.50
2. Properties to be acquired:			
Square 11, lot 5	Heurich estate	22,926.0	[2] 2,000,000.00
Square 11, lot 802	Adele M. Ward	2,499.0	
Square 12, lots 1-3 and 8–12	Heurich estate	28,050.0	

ADDITION TO ROCK CREEK AND POTOMAC PARKWAY

1. Properties acquired:			
Square 10, lots 800 and 807	Blue Bell System, Inc	1,097.2	[3] $86,000.00
Square 10, part of lot 808	Mrs. Marjory Hendricks	2,244.4	[3] 60,000.00
Total, properties acquired			146,000.00
2. Properties to be acquired:			
Square 10, lot 804	Adele M. Ward	845.0	[4] 500,000.00
Square 10, lots 806 and 810	Watergate Inn	10,806.0	

[1] Acquired by direct purchase with funds appropriated under sec. 4 of the act of May 29, 1930 (46 Stat. 482), as amended (the Capper-Cramton Act) and allotted by the Commission, with the approval of the Board of Commissioners of the District of Columbia, for the acquisition of lands as additions to the Rock Creek and Potomac Parkway (Cultural Center site).
[2] Estimated.
[3] Acquired by condemnation with funds contributed by the trustees of the National Cultural Center.
[4] Estimated.

ALLOCATION FOR LAND PURCHASE AT CENTER SITE

Senator BIBLE. From this memorandum, I gather that since 1958 you have allocated at least $450,000 for purchase of property within the Kennedy Center site which you had justified to the committee as needed for other purposes. Is this correct?

Mrs. ROWE. I believe that the Commission has alloted $800,000 for the purchase of land in the Center site. This is the item for which we are asking restitution under the supplemental appropriation.

Mr. SHEAR. If I might amplify the chairman's response——

Senator BIBLE. I think the response was that the money wasn't specifically appropriated or earmarked for that—$450,000 of it was not specifically earmarked for that purpose.

REALLOCATION OF LAND ACQUISITION FUNDS FOR CENTER

Mr. SHEAR. Mr. Chairman, at the time the National Cultural Center Act, authorizing the construction of the Center and directing the Planning Commission to acquire the remaining lands in private ownership within the site of the Center, was pending before the Congress, the Commission, with the concurrence of the Board of Commissioners of the District of Columbia, indicated its willingness to the Congress to utilize funds appropriated for land acquisition for the park, parkway, and playground system of the District of Columbia, for purposes of Cultural Center land acquisition and initially allocated or reallocated $300,000 in funds previously appropriated and allocated to other projects for this purpose. That amount was subsequently increased in early 1959 to $355,000.

CAPPER-CRAMTON ACT FUNDS

In the Commission's fiscal year 1960 budget estimates an additional $350,000 was requested. At that time the Congress was advised of the earlier reallocation of $355,000 in accordance with the previously expressed willingness of the Commission and the District Commissioners to utilize Capper-Cramton funds for this purpose. With the appropriation of $350,000 in the fiscal year 1960 Appropriation Act, $705,000 in Capper-Cramton money was available for this purpose.

Subsequently, as a result of the completion of other projects within and below the funds allocated for those projects, the Commission was able to reallocate an additional $95,000, which brought to $800,000 the amount of money allocated for Cultural Center site acquisition.

AUTHORITY TO REPROGRAM OR REALLOCATE FUNDS

Senator BIBLE. Where do you get the authority to reprogram or reallocate, whichever you want to call it? Because you make a presentation to the Appropriations Committee that it is going to take x number of dollars to do this and then you find that that money isn't sufficient, and therefore you reprogram and you use other moneys.

Mr. SHEAR. I think, Mr. Chairman, it is fair to say that $705,000, $355,000 appropriated earlier and programed for other projects and reprogramed for the Center, and the $350,000 specifically appropriated in the fiscal year 1960 program for this purpose, was programed for Kennedy Center site acquisition with the knowledge of the Congress and of the Appropriations Committee.

The other $95,000 represented reprogramings not at the expense of other projects which had been completed, but represented savings from other projects which then became available out of the total authorization for this purpose.

ADVISING APPROPRIATIONS COMMITTEE OF REPROGRAMING OR REALLOCATING

Senator BIBLE. Were the Appropriations Committee advised of this reprograming or reallocation?

Mr. SHEAR. I do not believe so, sir, no.

Senator BIBLE. Are they required to be under the law?

Mr. SHEAR. No, sir; but, of course——

Senator BIBLE. The point is that we appropriated the money for one purpose and then it is used for another purpose, and what happens

to the purpose for which it was originally appropriated? Is that just deferred?

Mr. SHEAR. In the case of the $95,000, that purpose had been achieved within the amounts originally allocated.

Mrs. ROWE. Senator Bible, if you weren't going to ask another question on the $800,000, I would be pleased to make a statement about it.

Senator BIBLE. I would be happy to have you do it, because I am not sure that we have the record in quite as satisfactory a form as we would like it.

DISTRICT OF COLUMBIA GOVERNMENT PROVIDING CENTER SITE
