DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1968

THURSDAY, MARCH 9, 1967

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met at 10:30 a.m., in room 1223, New Senate Office Building, Hon. Carl Hayden (chairman) presiding.

Present: Chairman Hayden, and Senators Bible, Mundt, and Young.

HISTORICAL AND MEMORIAL COMMISSIONS

LEWIS AND CLARK TRAIL COMMISSION

SALARIES AND EXPENSES

STATEMENT OF EDWARD C. CRAFTS, EXECUTIVE OFFICER

JUSTIFICATION

Chairman HAYDEN. The subcommittee will be in order.

There will be placed in the record a justification statement for an appropriation of $35,000 for the Lewis and Clark Trail Commission in fiscal year 1968. This is $10,000 more than has been made available in either of the 2 previous years during which this Commission has existed.

(The information follows:)

Appropriation, 1965	0
Appropriation, 1966	$25, 000
Appropriation, 1967	25, 000
Budget estimate, 1968	35, 000

JUSTIFICATION

The estimate of $35,000 for 1968 covers the third full fiscal year of operations of the Commission which was established by Public Law 88–630, approved October 6, 1964. Subsequently in June of 1966, Public Law 89–475 was enacted which added the State of Illinois to the membership and also increased the appropriation authority for the operation of the Commission to a total of $35,000 annually.

The Commission was established for a five-year period to advise on and coordinate activities of Federal, State, and other public and private agencies and individuals interested in preserving and marking the route followed by the Lewis and Clark Expedition of 1804–06 from Saint Louis, Missouri, to the Pacific coast, to encourage conservation of the resources of this region, and to encourage public use of the recreation benefits therefrom. The Commission is also authorized to encourage the development of a suitable network of roads following the general route of the Lewis and Clark Trail with appropriate markers for such roads. This law supplements a resolution approved in 1963 expressing the sense of the Congress that the route traversed by these two explorers should be marked and kept available for the inspiration and enjoyment of the American people.

The Commission is composed of members on behalf of the 11 States involved; four members each from the House of Representatives and the Senate; four members to be appointed by the J. N. "Ding" Darling Foundation; and the Secretaries of the Interior; Agriculture; Defense; Health, Education and Welfare; and Commerce, or their designated representatives. The Director, Bureau of Outdoor Recreation was designated to serve on the Commission as the representative of the Secretary of the Interior.

The members of the Commission serve without compensation; however, upon approval of the Chairman they are entitled to reimbursement for travel, subsistence, and other necessary expenses incurred in the performance of their duties as members of the Commission.

During fiscal year 1967 the Lewis and Clark Trail Commission issued its interim report to the President and the Congress on its many activities. The report proposed additional actions to be taken by public and private agencies to protect the scenic resources along the Trail and enhance the available recreation facilities. The Commission will continue to work with the State Lewis and Clark Trail Committees and Federal and State agencies to further development of the Trail following the accepted Lewis and Clark Trail program.

The Commission has held two meetings in fiscal year 1967 and will hold a third in April of 1967 to discuss the implementation of the Commission's future program as outlined in the Commission's interim report to the President and the Congress.

The estimate for 1968 provides for staff assistance to the Commission and for allowable reimbursable expenses of the members in the continuation of their work in furthering the objectives and purposes of the Commission.

ITEMIZATION OF ESTIMATE

Lewis and Clark Trail Commission

	1966 actual	1967 estimate	1968 estimate
Obligations by objects:			
11.1 Personnel compensation	$8,007	$8,225	$8,488
12.0 Personnel benefits	590	610	640
21.0 Travel and transportation of persons	7,739	13,965	14,572
23.0 Rent, communications, and utilities	324	1,000	
24.0 Printing and reproduction	1,140	1,000	8,000
25.1 Other services	2,746		
25.2 Services of other agencies	3,680		3,000
26.0 Supplies and materials	41	200	300
31.0 Equipment	468		
Total obligations	24,735	25,000	35,000

PREPARED STATEMENT

Chairman HAYDEN. Mr. Crafts, would you please present your statement indicating the activities of the Commission during the past fiscal year and its plans for the coming year?

(The statement follows:)

The $35,000 for fiscal year 1968 will provide for the third full year of operations for this Commission, which was established by Public Law 88–630 for a five-year period. In June 1966, Public Law 89–475 was enacted to add the State of Illinois to the membership of the Commission and this also increased the appropriation authority from $25,000 to $35,000 annually.

The increase of $10,000 requested will provide $7,000 for printing and reproduction costs of which $5,000 will be used to finance the reprinting of the study report "The Lewis and Clark Trail—A Proposal for Development." Three thousand dollars of the increase will be used for preliminary work toward the making of a movie to be produced by Metro-Goldwyn-Mayer Studios.

The purpose of the Commission is to advise and coordinate activities of Federal agencies, States, and others interested in preserving, marking, and making available for public enjoyment as much as possible of the route followed by Lewis and Clark in 1804–06.

Five meetings have been held by the Commission since it was authorized. At the second meeting, in September of 1965, the Bureau of Outdoor Recreation presented to the Commission a report entitled "The Lewis and Clark Trail—A Proposal for Development." The Commission took action to implement the program proposed in the report.

In February 1966, the Commission considered reports from each State along the Trail and from certain Federal agencies concerning activities planned or accomplishments in implementing trail recommendations. The Commission also approved the official Lewis and Clark Trail symbol which will mark the designated highways along the route.

In July 1966, the Commission concurred in action taken by the 11 States to designate the highway routes within their borders generally following the route of the two explorers.

The fifth meeting was held in October 1966, at which time the Commission encouraged the States to assist in the preparation of a travel folder showing the location of the Lewis and Clark Trail and highways to promote the Commission's program. The Commission also adopted resolutions urging the States to make use of the Federal-Aid Highway program and the Highway Beautification Act to enhance development of the Lewis and Clark Trail highways.

Another meeting is scheduled for April 29–May 2, 1967, to discuss the implementation of the Commission's future program as outlined in the Commission's interim report to the President and the Congress which was released in December 1966.

1967 COMMISSION MEETINGS AND REPORT TO THE PRESIDENT

Mr. CRAFTS. Thank you. I will be happy to, Senator Hayden. The Lewis and Clark Trail Commission in the third year of its existence held three meetings, one in Portland, Oreg., one in Billings, Mont., and one in Leavenworth, Kans.

In accordance with the law establishing the Commission it was required to report to the President and to the Congress in October of last year. I have here a copy of the Commission's report which I would like to make available to the committee.

COMMISSION MEMBERSHIP AND SYMBOL MARKING TRAIL

The membership of the Commission is made up of representatives of both House and Senate and the Governors or their representatives of the 11 States involved and several of the executive agencies. The four Senators who are members are Senator Burdick, Senator Church, Senator Jordan and Senator Hansen. The basic accomplishment of the Commission was the inauguration of a symbol marking the Lewis and Clark Trail. It was successful in getting each State to establish its own Lewis and Clark committees. It adopted most of the recommendations that were in this report on the Lewis and Clark Trail that was prepared partly for the Commission.

It also stimulated considerable activity by the counties, the cities as well as the States and the Federal agencies. As a matter of fact, partly as a result of the Commission's activities, there was something in the neighborhood of nearly $5 million of the Federal, local and State money spent in the development of recreation facilities along the trail during the past year.

That summarizes what the Commission accomplished during the past year.

I would like to submit this report, entitled "The Lewis and Clark Trail—A Proposal for Development" not for inclusion in the record but for the committee's files. I will be glad to also make this report available to you, Senator Young.

Senator YOUNG. Who are the minority party representatives from the Senate?

Mr. Crafts. Senator Jordan and Senator Hansen.

This completes my statement on the Lewis and Clark Trail Commission, Senator Hayden, unless you have some questions.

REPRODUCTION OF REPORT AND MOTION PICTURE PREPARATION

Chairman Hayden. Why is an additional $10,000 needed?

Mr. Crafts. The $10,000 is requested basically for two reasons. This report entitled "The Lewis and Clark Trail—A Proposal for Development," of which there were 750 copies originally prepared has proven quite popular. The Commission would like to republish this report and update it. Of that $10,000, $7,000 is planned for this purpose. The $3,000 of the $10,000 is planned to initiate cooperation with "MGM" in the preparation of a motion picture commemorating the Lewis and Clark Trail and Expedition.

Chairman Hayden. You stated that you will spend $7,000 to update and reproduce the report. Of what will the updating consist?

Mr. Crafts. This will cover the printing of about 5,000 copies of this report, changed a little bit in format. It will be put in the form of a road atlas type of publication. In this report there are maps of the individual sections of the trail.

The Commission would like to put this out in a more utilitarian form and to make it more generally available.

SERVICES OF OTHER AGENCIES

Chairman Hayden. You are also intend to spend $3,000 for services of other agencies.

Which agencies are these and what are the services?

Mr. Crafts. The services are those that I referred to which would be to assemble from the States and the Federal agencies and any other sources, public or private, existing filmstrips or portions of film that are applicable to the Lewis and Clark trail, edit this material, cooperate with "M.G.M." in some script preparation, and give, in effect, technical service and cooperation with them in the development of a motion picture which would memorialize and commemorate the trail. This is what the Commission would like to do.

Senator Young. May I ask a question? What real advantage would there be in spending this $3,000 for a film? Isn't that beyond the objective of the Commission as laid out in the law?

Mr. Crafts. I don't think, Senator Young, that it is beyond the objective. This question of a motion picture was discussed by the Commission at at least two of its meetings. I think the record will show that the members of the Commission unanimously supported this idea.

The law which I have here in front of me is very broad.

It says—

> In order to supplement awareness of the Lewis and Clark expedition and appreciation of the great resources of the region—

and so on, to encourage desirable long-term conservation objectives, the Commission is authorized to review proposals prepared at the request of the Commission or other agencies to carry out the purposes of the act and make recommendations to agencies, other public and private agencies, and so forth and so on.

COMMEMORATING AND MEMORIALIZING THE TRAIL

Its basic purpose is to commemorate and memorialize the trail and promote local interest in the trail and in the expedition. I think the Commission felt that with the expenditure of a few thousand dollars it could induce "MGM" to do a really professional job on this, that this would receive very favorable response along the trail by the States and cities, and that this would be an informational device that would further the objectives of the act.

PAMPHLET PUBLICATION

Senator YOUNG. How many pamphlets do you expect for this $7,000 additional?

Mr. CRAFTS. We expect to get about 5,000. In addition it is our hope—and we would plan to so recommend—that this be made available for sale by the Government Printing Office.

Senator YOUNG. Do you have an added expense? They cost over a dollar apiece.

Mr. CRAFTS. Yes, this is quite expensive. There is no question about it. These maps in here are quite expensive.

Senator YOUNG. Mr. Chairman, I can't see the justification for spending that much money for a pamphlet. That is all.

THURSDAY, MARCH 9, 1967.

DEPARTMENT OF THE INTERIOR

BUREAU OF OUTDOOR RECREATION

STATEMENT OF EDWARD C. CRAFTS, DIRECTOR, ACCOMPANIED BY LAWRENCE N. STEVENS, ASSOCIATE DIRECTOR; WILLIAM C. DENT, ASSISTANT DIRECTOR; DANIEL M. OGDEN, JR., ASSISTANT DIRECTOR; HARRY W. RICE, ASSISTANT DIRECTOR; JOHN F. SHANKLIN, ASSISTANT DIRECTOR; A. HEATON UNDERHILL, ASSISTANT DIRECTOR; H. ROY ROUTT JR., BUDGET OFFICER; HARTHON L. BILL, ASSISTANT DIRECTOR; PHILIP O. STEWART, CHIEF OF LANDS; RITO NEGRON-RODRIGUEZ, CHIEF, BRANCH OF COORDINATION CONTROL; CHARLES E. WATSON, BUDGET OFFICER; M. M. NELSON, DEPUTY CHIEF; R. F. DROEGE, ASSOCIATE DEPUTY CHIEF; RUSSELL P. McROREY, DIRECTOR, DIVISION OF LAND ADJUSTMENT; RICHARD L. HARRIS, CHIEF, BRANCH OF ACQUISITION AND EXCHANGE; JOHN S. GOTTSCHALK, DIRECTOR; HARRY A. GOODWIN, CHIEF, OFFICE OF ENDANGERED SPECIES; GEORGE F. SPODEN, JR., DIVISION OF REALTY; KENNETH F. SIPPEL, CHIEF, DIVISION OF PROGRAM ANALYSIS; CARL V. FERMANICH, ACTING CHIEF, DIVISION OF WILDLIFE REFUGES; SIDNEY D. LARSON, DIRECTOR OF BUDGET, OFFICE OF THE SECRETARY

SALARIES AND EXPENSES

Chairman HAYDEN. Now we will take up the Bureau of Outdoor Recreation.

For fiscal year 1968 the Bureau of Outdoor Recreation proposes an appropriation of $4,240,000 for salaries and expenses. This is $330,000 more than was appropriated in the last fiscal year.

However, it is expected that $80,000 will be requested as a supplemental appropriation to cover increased pay costs. The justification for this estimate will be placed in the record.

(The justification follows:)

HIGHLIGHT STATEMENT

The budget estimates presented for fiscal year 1968 will finance operations of this Bureau conducted under authority of the Act of May 28, 1963 (Public Law 88-29) and the Federal Water Project Recreation Act (Public Law 89-72). Under this appropriation the Bureau is requesting a total of $4,240,000, an increase of $250,000 needed to finance new special area studies and to provide additional funds, for staff services the Bureau provides the President's Council and the Citizens' Advisory Committee on Recreation and Natural Beauty.

Programs of the Bureau relating to the Land and Water Conservation Fund Act are discussed in a separate section of this document.

There follows a table comparing fiscal year 1967 and 1968 estimates by subactivities:

	Fiscal years		Increase
	1967	1968	
Nationwide planning	$1,612,000	$1,612,000	----------
Water resources and special area studies	929,000	1,079,000	$150,000
Research and education	105,000	105,000	----------
Federal coordination	812,000	912,000	100,000
Technical assistance	532,000	532,000	----------
Total	3,990,000	4,240,000	250,000

The total funds requested for 1968 will provide for:

(1) The completion and publication of the first Nationwide Outdoor Recreation Plan as required by Public Law 88-29.

(2) The continuation of studies concerning the recreation potential of water resource project areas and major river basins.

(3) Studies of "special areas" of the Nation that have the potential for providing regional or national outdoor recreation opportunities—an increase of $150,000 is requested to conduct special studies of:

(*a*) The Connecticut River Valley, as a possible National Recreation Area (see page 14).

(*b*) American coastal and inland islands, including river islands, for possible outdoor recreation use (see page 14).

(4) A small research and education program designated to stimulate and coordinate outdoor recreation research will be continued.

(5) A Federal program review effort will be continued in furthernace of achieving better coordination among the Federal agencies having recreation and related programs.

(6) Increased services to the President's Council on Recreation and Natural Beauty which was established by Executive Order 11278, dated May 4, 1966, and which supersedes the former Recreation Advisory Council—an increase of $100,000 is requested to finance this expanded workload (see page 21), and support liaison services for the new Citizens' Advisory Committee on Recreation and Natural Beauty, also established by Executive Order 11278.

(7) Continuation of a technical assistance program to provide advice and assistance to States, Federal and local agencies and the private sector regarding outdoor recreation projects and problems.

All of these programs are designed to help meet the national needs for outdoor recreation opportunities and to improve the quality of the environment. In the past 25 years this Nation has experienced a tremendous population and economic growth which has led more people to spend more time out of doors. The rate of increase in visitations to outdoor recreation areas over the past decade has far exceeded the rate of the population growth, but recreation resources have not been developed proportionately. A primary objective is to balance recreation needs with supply of recreation resources and to provide recreation opportunities for future generations. The above mentioned programs will help achieve this objective.

Some of the significant accomplishments made during the past year are listed below:

(a) Developed a functional organizational unit, prepared issue papers and other materials relating to the President's Council on Recreation and Natural Beauty. Have provided staff services to the Citizens' Advisory Committee and have underway a Report to the Nation on Natural Beauty.

(b) Made substantial progress in accumulating data and materials for the Nationwide Plan. Conducted a nationwide household survey on peoples preferences for recreation by activities and developed an outline for the Nationwide Plan. Have developed operating procedures for pin-pointing policy matters, and for completing the plan within the time imposed by law.

(c) Instituted a field study of the Missouri River area from Fort Benton, Montana to Yankton, South Dakota for possible consideration as a National Recreation Area pursuant to a directive from the Senate Interior and Insular Affairs Committee.

(d) Participated in the Potomac Valley Study and contributed to the drafting of an interim report to the President made in January 1966. Also participated in the preparation of the report "Potomac Valley—A Model of Scenic and Recreation Values," which was issued in June 1966.

(e) Chaired an interagency committee which conducted field studies and issued a comprehensive report supporting a Nationwide System of Trails.

(f) Prepared a report on the protection and development of the scenic, historic recreation, and other resources of the Hudson River corridor. The Bureau is presently developing plans for carrying out the provisions of Public Law 89-605 which directs the Secretary of the Interior to negotiate with the States of New York and New Jersey for the purpose of entering into a compact relating to the preservation, restoration and development of the Hudson River Basin.

(g) Have underway preliminary field studies of the Connecticut River Valley as authorized by the Act of October 3, 1966, (80 Stat. 867).

(h) Have underway the development of a plan for inventorying all coastal and inland islands of the Nation to determine whether undeveloped portions are suitable for public protection and use for outdoor recreation.

(i) Reviewed and prepared comments on 180 reports from Federal water resources agencies to evaluate their recreational potential; participated in in the studies of 21 major river basins and a large number of individual water resources projects.

(j) Prepared extensive materials and background data for use at hearings before the Senate Committee on Interior and Insular Affairs relating to various wild rivers bills.

(k) In cooperation with the Departmental Library, the Bureau compiled a draft thesaurus of terms for indexing outdoor recreation literature looking to the publication of an index of outdoor recreation literature. Arrangements have been made with the Government of Canada for an exchange of comparable index material which will greatly expand coverage.

(l) Instituted contractual arrangements for a pilot study of the recreation importance of vacation homes in northern New England States, supervised the study and analyzed the results.

(m) Completed the first phase of a study of credit available for outdoor recreation. The main objective of the study is to determine whether there is sufficient private credit available and whether additional Federal assistance is needed.

(n) A study has been made and a draft report prepared on the segments of the fiscal year 1967 Federal budget which relate to outdoor recreation. The study disclosed by census divisions where imbalances in recreation resources exist and identified the census divisions where allocations of Federal funds appear to be needed.

(o) Provided numerous instances of technical assistance to States, Federal and local agencies, and the private sector.

(p) Inaugurated and published the first issues of "Outdoor Recreation Action," a technical assistance information publication designed to give widespread circulation on new techniques, new approaches and new sources of financing to assist those seeking solutions to similar problems. Additional issues are scheduled for 1967.

(q) Entered into a contractual arrangement with the National Association of Counties to develop community action guides for outdoor recreation. The objective is to present information designed to assist public officials, community leaders, business groups and others in making decisions regarding outdoor recreation projects and problems. This is a cost sharing contract.

(r) A technical assistance bulletin, "Outdoor Recreation Planning for the handicapped" was developed by the Bureau.

(s) In cooperation with the Science Information Exchange of the Smithsonian Institution, compiled and published a catalog of current recreation research.

Appropriation, 1966	$3, 398, 000
Pay cost supplemental	68, 000
Total appropriation, 1966	3, 466, 000

Total	2, 060, 084	2, 646, 000	2, 796, 000	+150, 000

(*a*) *Nationwide planning.*—F.Y. 1967, $1,612,000; F.Y. 1968, $1,612,000; "No change."

Plan of work.—In accordance with Public Law 88–29, the Bureau is developing a Nationwide Outdoor Recreation Plan to identify the outdoor recreation needs of the Nation and to recommend ways of meeting these needs. Funds for this subactivity in fiscal year 1968 will provide for the completion and publication of the first plan.

The Nationwide Outdoor Recreation Plan is intended fundamentally as a guide to sound public policy in outdoor recreation to insure that the variety of recreation opportunities desired by the American people will be available in the general locations they desire and in sufficient quantity and quality to serve them adequately within the range of available resources. Under the provisions of Public Law 88–29, all Federal agencies are to carry out their future outdoor recreation and related programs in general conformance with the Plan. The Plan will also provide a framework for regional, State, local, and private outdoor recreation programs.

The Plan will project outdoor recreation demand into the future to the years 1980 and 2000. It will also appraise the present and potential supply of outdoor recreation resources in terms of location, variety, quantity, and quality and will disclose imbalances between supply and demand. The Plan will be the most important and wide sweeping document concerning outdoor recreation that has ever been prepared.

Demand and supply data will be analyzed to establish outdoor recreation needs. Based upon these findings, the Plan will identify critical outdoor recreation problems and recommend actions to solve these problems. Particular emphasis and study will be given to:

1. The availability of outdoor recreation opportunities to all income groups,
2. The quality of the natural environment, particularly the country's rivers and streams and will encompass natural beauty as a significant aspect.
3. The needs of people in the densely populated urban areas for opportunities to enjoy and participate in outdoor recreation, and
4. The capabilities of public and private entities to meet the evergrowing outdoor recreation needs.

The first Plan, by statutory requirement, must be completed by May 1968. In fiscal year 1968, major emphasis will be given by the Bureau to the final preparation of the Plan and its publication. This will involve decisions on many major points. For example, the contents of the Plan will be determined, major policies and legislative proposals will be considered and dealt with, and specific attention will be given to the recommendations to be included in the Plan which will form a five-year action program.

In the latter part of fiscal year 1968, work will also begin on the development of the next five-year Plan which is due in 1973. Time will be devoted to the initiation of procedures for updating information on the supply of existing resources and on procedures for obtaining such data on Federal, State, local, and private recreation areas in detail not sufficiently available at the present time.

While working toward the second five-year Plan, consideration will be given to the development of new methods to study and identify public demand for outdoor recreation opportunities. Current planning tools will be improved and new techniques will be devised to identify current and future socioeconomic characteristics of people that affect demand. New methods of survey and analysis will be employed to improve understanding of the relationship of the supply of resources to public demand for use of resources so that current and future public needs can be accurately identified and ways and means found to meet these needs.

Status of program.—The Bureau has done a substantial amount of work in developing the Nationwide Outdoor Recreation Plan. Some of the substantive actions are listed:

(a) Obtained from Federal, State, county and city agencies an inventory and description of the recreation resources under their jurisdiction and have programed these data into automatic data processing equipment for retrieval and analysis.

(b) Completed by contract an inventory and description of the recreation resources of the private sector. These data also are stored in a data bank for retrieval as needed.

(c) Have completed, through the Bureau of the Census, a survey of 8,000 households to determine on a Nationwide sampling basis the participation rates and preferences by types of outdoor activities of the American people. This demand data is essential in determining the degree to which available recreation resources satisfy the overall needs.

In addition, many special analyses have been prepared and much attention has been given to the concepts, principles, and policy considerations bearing on the Plan. The significance and importance of the Plan is recognized by the Bureau. The Director of the Bureau has taken over the direction of this program personally and intends to spend a major part of his time toward the culmination of this project.

(*b*) *Water resources and special area studies.*—F.Y. 1967, $929,000; F.Y. 1968, $1,079,000; Increase, $150,000.

	1967	1968	Increase
Water resources studies	$676,000	$676,000	
Special area studies	253,000	403,000	$150,000
Total	929,000	1,079,000	150,000

Need for increase.—The Bureau's workload has increased to such an extent that it lacks financing to handle newly assigned studies. These new studies, in addition to the Missouri River Basin Study, involve:

1. The entire Connecticut River Valley through New Hampshire, Vermont, Massachusetts and Connecticut for possible designation as a National Recreation Area $75,000
2. An inventory and reconnaissance study of American coastal and inland islands which are still undeveloped to determine whether such areas should be recommended for public protection and recreation use $75,000

Plan of work.—The Bureau will be heavily involved in conducting broad water resources studies in major river basins and in the study and review of individual water resources projects. It will likewise be involved in the study of other significant or "special" areas that offer regional or national recreation potential. The Bureau's work plans for fiscal year 1968 are set forth in more detail below:

(a) *Plan of work—Water resources studies.*—The Bureau's activities in the field of Federal water resources planning and development stem primarily from:

1. The Federal Water Project Recreation Act of 1965 (Public Law 89-72).
2. The Bureau's Organic Act of 1963 (Public Law 88-29).

The Bureau of Outdoor Recreation has been required to assume heavy responsibilities under these Acts. In general, these responsibilities include for the Federal Water Project Recreation Act:

An investigation or review of each project area to determine its recreation potential and the preparation of a report thereon.

A determination as to the extent to which proposed recreation developments conform to and are in accord with the appropriate Statewide Comprehensive Plan developed pursuant to Section 5(d) of the Land and Water Conservation Fund Act of 1965.

Carrying out Federal coordinating responsibilities involving interagency coordination procedures, assessing the impact of providing recreation areas at water projects, and distinguishing between Federal and non-Federal responsibilities.

The Bureau conducts framework and detailed comprehensive river basin studies under the authority of its Organic Act of 1963 and as requested by the Water Resources Council. Such studies are designed to assure that outdoor recreation and protection of natural beauty are adequately considered in the basin plans. Insofar as Interior responsibilities are concerned, the studies are carried out in conformance with memoranda of understanding between this Bureau and the National Park Service and the Bureau of Sport Fisheries and Wildlife, and with guidelines mutually agreed upon by this Bureau, the Corps of Engineers, and the Bureau of Reclamation.

The work plans for fiscal year 1968 are as follows:

(a) The Bureau will participate in approximately 100 studies of individual water resources development projects proposed by the Bureau of Reclamation, the Corps of Engineers, Public Health Service, Bureau of Indian Affairs, and the Bureau of Land Management to evaluate their recreation aspects. The Bureau will determine the recreation supply, demand, and needs in the affected area; consider the preservation of natural or scenic resources; and assist the planning agency in the formulation of the recreation component of the project plan.

(b) The Bureau expects to review about 200 selected reports of Federal agencies responsible for constructing or licensing water resources development projects to determine whether or not full consideration has been given to opportunities which the project development may provide for meeting outdoor recreation needs and to determine the extent to which the proposed recreation and fish and wildlife aspects conform to and are in accord with the Nationwide and appropriate Statewide Outdoor Recreation Plans.

(c) In its comprehensive river basin studies, the Bureau will be engaged in 11 framework studies (Type 1)—Continuation of seven studies and starting four new studies, Great Basin, Great Lakes, Souris Red, and South Atlantic Gulf—These studies—framework studies (Type 1) are of broad scope designed to furnish a general appraisal of overall water and related land resource development needs and serve as a guide to further planning. Bureau tasks involve the inventorying of existing and potential recreation resources and facilities projections of demand for recreation opportunities, and the translation of unsatisfied demand into needs needs for resources and facilities.

Work will continue on nine detailed studies (Type 2). These studies comprise overall water and related land resource development similar to (Type 1) studies and in addition define and evaluate projects for which Federal authorization will be required to permit necessary construction to be initiated. Bureau tasks involve evaluation of the recreation use benefits and costs of selected projects and identification of other Federal and non-Federal actions which should be taken to complement or supplement the recreation values of the area.

A report on each study is prepared for submission to the lead agency, usually the Bureau of Reclamation or the Corps of Engineers

(b) *Plan of work—Special area studies.*—The Bureau will be involved in 1968 in conducting studies of special areas to determine whether they are suitable for outdoor recreation purposes whether they should be managed for public outdoor recreation purposes and if so to recommend the type of development that should be undertaken and the proper agency to administer the areas.

These special studies involve areas that appear worthy of consideration as National Recreation Areas as National Seashore Areas as additions to the proposed Wild Rivers System, as a part of the proposed Nationwide System of Trails, or in some instances as National Parks or monuments. They also involve the recreation or conservation values of excess military lands and other areas such as the Hudson, the Connecticut and Missouri River areas. These studies are undertaken upon request from various sources including the President, Secretary of the Interior, members of Congress, and in some instances through legislative mandate.

The workload under this program is difficult to project in a reliable manner because conditions and circumstances change rapidly. The current interest in natural beauty, in the island inventory, and in the Hudson, Connecticut and Missouri River studies could not have been foreseen clearly a year ago, yet these items have imposed a heavy workload on the Bureau.

Following are examples of the more important projects that will receive attention in fiscal year 1968.

American Islands Study.
Connecticut River Study—Possible National Recreation Area.
Wild or Scenic Rivers.
Nationwide System of Trails.
Hudson River Basin Study.

In addition, the Bureau expects to give attention to the following areas, many of which have received preliminary study.

Name	Probable area designation	State
Amistad	National recreation area	Texas.
Apostle Islands	National lakeshore	Wisconsin.
Big Thicket	National recreation area, monument, or park.	Texas.
Cape Kennedy (Cape Canaveral)	National recreation area	Florida.
Channel Islands	National recreation area or park	California.
Cumberland Island	National recreation area	Georgia.
Curecanti	do	Colorado.
Flaming Gorge	do	Utah and Wyoming.
Glen Canyon	do	Arizona and Utah.
Gulf Islands	National seashore	Mississippi and Florida.
Kauai	do	Hawaii.
Lincoln Homestead	National recreation area	Illinois.
North Cascades	do	Washington.
Ohio Canal	do	Ohio.
Olympic Park	National park (boundary adjustment).	Washington.
Paramore Island	National seashore	Virginia.
Potomac Valley Park	National park-recreation area	Virginia, Maryland, and West Virginia.
Raystown	National recreation area	Pennsylvania.
Redwoods	National park	California.
Sawtooth	National recreation area	Idaho.
Sleeping Bear Dunes	National lakeshore	Michigan.
Badlands	National recreation area	South Dakota.

AMERICAN ISLANDS STUDY

The development of the first Nationwide inventory of the recreation, scenic, natural, and historical values of America's Islands was directed by the President. The Bureau of Outdoor Recreation will conduct the study leading to the inventory.

All recent studies of public preferences in outdoor recreation have shown a strong attraction to locations near water for swimming, fishing, boating, other water sports, nature study, hiking, camping, picnicking and ordinary relaxing. By definition, islands offer ready access to these opportunities.

The study will determine which islands have been developed, which ones remain largely unspoiled, and which are already protected in local, State or National ownership. Primary attention will be given to islands having outstanding recreation qualities. In addition to the other features, the study will suggest conservation principles and guidelines to help State, local and private efforts to save islands from destruction of their unique advantages. A report will be prepared by the Bureau in time for consideration by the 91st Congress, early in 1969.

All 50 States plus Puerto Rico, the Virgin Islands and a number of Federal agencies with responsibilities for public lands and waters will be asked to suggest and describe islands offering the best possibilities for conservation.

Early action on compiling the inventory is necessary because rapid commercial development, unrestricted dredging, water pollution and similar incursions are threatening the survival of many islands in their present state. The scope of this study is of such magnitude that $75,000 will be needed to do an adequate job in fiscal year 1968.

CONNECTICUT RIVER STUDY

The Act of October 3, 1966 (80 Stat. 867) authorized the Secretary of Interior to study the feasibility and desirability of a Connecticut River National Recreation Area in the States of Connecticut, Massachusetts, Vermont and New Hampshire. The Bureau of Outdoor Recreation is charged with conducting the study. The Bureau will consult with interested Federal, State and local bodies and officials and will prepare a report on the study together with appropriate recommendations. The Act provides that a report shall be submitted to the President within two years after the date of the Act—or by October 1968.

The study will evaluate the recreation potential of the area and set forth the type of Federal programs that appear desirable to preserve and develop the recreation values of the area. The Act authorizes an appropriation of $100,000 for the study or such part of this amount as is needed.

In view of the other pressing workload on the Bureau and considering the area to be covered and the scope of the study, $75,000 will be required in fiscal year 1968.

MISSOURI RIVER STUDY

The Senate Committee on Interior and Insular Affairs on February 17, 1966, adopted the following resolution:

"*Resolved by the Committee on Interior and Insular Affairs of the United States Senate,* that the Secretary of the Interior be, and is hereby, requested to direct the Bureau of Outdoor Recreation to conduct a study of the Missouri River from Yankton, South Dakota, to Fort Benton, Montana, with a view to enhancing the recreation resources of this area by its possible designation as a National Recreation Area. The Bureau of Outdoor Recreation will cooperate, as appropriate, with other Federal and State agencies."

The study area involves a 600-mile stretch of the Missouri River encompassing varied topographic conditions. The area is so vast that it will require considerable time and manpower to conduct a physical review. Considerable field work has already been performed.

WILD OR SCENIC RIVERS

In view of the fact that the Wild Rivers bill passed the Senate by 71 to 1 and considering the widespread interest in the program, a wild or scenic river bill undoubtedly will be introduced in the 90th Congress. Several of the rivers named in the Senate-passed bill have not received detailed study. In order to provide sufficient information about these rivers, additional studies will have to be made. Studies will be needed on the following:

Cacapon—West Virginia.
Shenandoah—West Virginia.
Klamath—California.
Missouri River—from Yankton, South Dakota, to Fort Benton, Montana (covered by on-going study).
Skagit—Washington.
Flathead—Montana.
Hudson—New York.
Wolf—Wisconsin.
Buffalo—Tennessee.
Guadalupe—Texas.
Kern—California.
Mannistee—Michigan.
Niobrara—Nebraska.
Salt—Arizona.
Susquehanna—Pennsylvania and New York.
Yellowstone—Wyoming and Montana.
Pine Creek—Pennsylvania.

NATIONWIDE SYSTEM OF TRAILS

Secretary Udall recently announced that one of the major legislative proposals to be brought before the 90th Congress would be the Nationwide System of Trails. The Bureau will have the primary responsibility for studies of the following trails:

Appalachian Trail.
Chisholm.
Continental Divide.
Lewis and Clark.
Natchez Trace.
North Country.
Oregon.
Pacific Crest.
Potomac Heritage.
Santa Fe.
Mormon.
Mississippi River.
Gold Rush.
Metropolitan Area Trails.

HUDSON RIVER BASIN STUDY

Another major assignment of the Bureau in fiscal year 1968 is the Hudson River Basin study. Public Law 89-605 directs the Secretary of the Interior to negotiate with the States of New York and New Jersey for the purpose of entering into a compact relating to the preservation, restoration, and development of the resources of the Hudson River Basin, and to submit a report to the President on the results of these negotiations no later than July 1, 1968. It also requires that all Federal departments and agencies shall consult with the Secretary concerning any plans, programs, projects, and grants under their jurisdiction within or affecting the Hudson Riverway.

The remainder of fiscal year 1967 and fiscal year 1968 will be devoted to collecting, summarizing and analyzing basic data and information on the resources of the Hudson River, conducting meetings and briefings on the negotiations, reviewing Federal projects under Section 5 of the Act, and preparing basic data and other materials to be included in the report to the President.

With the increase provided by Congress for fiscal year 1967 the Bureau has been able to handle the most important water and special area studies. Care has been taken to avoid studies that were not of high priority and to perform those that offered the greatest opportunities for outdoor recreation. The following paragraphs include information on the status of work under the water resources and special area studies programs.

(a) *Status of program—Water resources studies.*—The Bureau participated in planning, evaluating, and coordinating the recreation component of 76 individual Federal water programs or projects in fiscal year 1966.

The work of the Bureau is illustrated by its report on the Bureau of Reclamation's Southwest Water Plan, Garden Valley Reservoir, in which the Bureau of Outdoor Recreation planned the recreation component consisting of the proposed acquisition of 2,000 acres of land for development of public recreation facilities, which would be cost shared and be administered and maintained by the Forest Service and Idaho Department of Parks, pursuant to the provisions of the Federal Water Project Recreation Act.

During the past year the Bureau reviewed and prepared comments on 180 reports of other Federal agencies including 77 Corps of Engineers' projects, eight Bureau of Reclamation projects, and 95 applications (most including recreation plans) for Federal licenses to construct or maintain hydroelectric projects.

Examples of results of the work of the Bureau are illustrated by the following specific achievements which were accomplished in cooperation with other Federal agencies and/or non-Federal interests.

1. The Bureau, through its review of Duke Power Company's Keowee-Toxaway Project, South Carolina, and its recommendations to the Federal Power Commission and the company was able to obtain the inclusion of a provision, as a modification of the company's proposal, for an adequate recreation plan which will involve the expenditure of over $1,250,000 for recreation facilities in order to meet public needs.

2. As a result of the Bureau's review of the Corps of Engineers' Rowlesburg Reservoir Project report, Cheat River, West Virginia, the Corps has requested the Bureau's assistance in developing a pattern of flows below the dam which would provide improved boating opportunities for the public.

The Bureau participated in 21 interdepartmental comprehensive river basin studies in fiscal year 1966. Field studies were completed on the Sabin River Basin, Louisiana, and the Ohio River Basin.

The Bureau's studies in the Appalachian Region have only recently been initiated. Work is well underway toward determining outdoor recreation needs in Appalachia and recreation opportunities that water resources development would provide toward meeting these needs.

(b) *Status of program.—Special area studies.*—Work plans have been developed and some field reviews have commenced on the study of the Missouri River area from Yankton, South Dakota to Fort Benton, Montana; on the Connecticut River Study and on the Island inventory. The Bureau also is involved in developing back-up data on Scenic Rivers and Trails in anticipation of early legislative hearings and in the final preparation of technical reports on studies yet to be published.

It is noteworthy that the Bureau played an important role in conducting studies of several areas that received Congressional action in the 89th Congress. The following are some of the authorizations by the 89th Congress that were based largely on studies in which the Bureau participated:

Indiana Dunes National Lakeshore, Indiana, P.L. 89-761.

Pictured Rocks National Lakeshore, Michigan, P.L. 89-668.

Bighorn Canyon National Recreation Area, Wyoming and Montana, P.L. 89-664.

Delaware Water Gap (Tocks Island) National Recreation Area, Pennsylvania and New Jersey, P.L. 89-158.

Whiskeytown-Shasta-Trinity National Recreation Area, California, P.L. 89-336.

Authorize the Secretary of the Interior and States of New York and New Jersey to formulate program regarding the Hudson River, P.L. 89-605.

Assateague Island National Seashore, Maryland and Virginia, P.L. 89-195.

(c) *Research and education.*—F.Y. 1967, $105,000; F.Y. 1968, $105,000; "No change."

Plan of work.—The Bureau's research efforts will be devoted in large part to assisting in developing the Nationwide Outdoor Recreation Plan by evaluating the data that has been accumulated and by the preparation of statistical analyses which will assist Bureau management in determining action programs.

Greater efforts will be devoted to reviewing and evaluating outdoor recreation research being conducted by Federal agencies. There is a need to consider the effectiveness of on-going research, to insure that research results are distributed among concerned agencies and to avoid duplication of research efforts. The Bureau will work toward the objective of formulating an overall research program on problems relating to outdoor recreation which will determine the major areas of priority, outline some of the research procedures which will be necessary to solve the problems, and will identify specific research projects which would fit into a coordinated research effort.

Publications will be issued which deal with various types of statistical data relating to Federal and State outdoor recreation programs and problems. These publications are to be a substitute for a previous publication issued by the Bureau concerning State Park statistics.

Status of program.—Although the research efforts of the Bureau are limited, significant progress has been made by the small staff engaged in this activity. Following are some of the actions taken:

A Northern New England vacation homes contract study has been completed to determine the economic impact of vacation homes in the States of Maine, New Hampshire and Vermont. This study was coordinated with a related study which the Corps of Engineers had undertaken in the Connecticut River Valley. Arrangements were made for the Corps of Engineers to use the questionnaire developed by this Bureau and to combine the results of the Corps of Engineers survey with that of the Bureau thus avoiding needless duplication of effort. The study results will be helpful in developing the Nationwide Plan analysis of the supply and demand for recreation resources and facilities in the Northeast.

A prospectus for a survey of recreation visitors to the Lower Colorado River was developed for the use of the Lower Colorado River Land Use Office. The Bureau also provided advice on the statistical procedures to be used in designing the sample and developed various cost alternatives for consideration of the Land USE Office.

The first edition of a periodic catalog of current research projects related to outdoor recreation was prepared in a cooperative effort with the Science Information Exchange. Brief summaries of more than 180 projects are included in the first volume.

Compilation of a draft thesaurus of terms for indexing outdoor recreation literature was completed and indexing of current outdoor recreation literature, involving the systematic scanning of more than 300 periodicals and other current documents, was initiated. Abstracts were prepared on the more significant items indexed and a sufficient number have now been prepared to justify publication of the first abstract journal of current literature on outdoor recreation. Arrangements have been made with the government of Canada for exchange of comparable indexes of literature. The Canadian work will greatly expand the coverage of the service for it will scan all pertinent periodicals and publications available in the British Commonwealth.

Planning for the third National Conference on Policy Issues in Outdoor Recreation was done in cooperation with Utah State University in preparation for the meeting held in September 1966. The conferences brought together the administrators of land managing agencies, educators and research workers from the universities and government for mutual exchange of ideas relating to problems and methods of solving current issues in recreation policy.

The Bureau's small research staff is continuing to serve as a focal point for outdoor recreation research. By analysing current efforts and pointing up gaps on weaknesses in our knowledge, it can direct government, university and private efforts to projects designed to correct these differences.

2. Federal Coordination

Activity	Amount available, 1966	Amount available, 1967	Estimate, 1968	Increase (+) or decrease (−) compared with 1967
Federal coordination	$809,005	$812,000	$912,000	+$100,000

2. *Federal coordination.*—F.Y. 1967, $812,000; F.Y. 1968, $912,000; Increase, $100,000.

Need for increase.—The major portion of the increase is to provide funds directly to the Bureau for financing staff and related services to the Citizens' Advisory Committee and to pay travel expenses of committee members. During the current fiscal year these expenses are being shared by the Federal agencies represented on the Council. This proposal, in essence, requires no greater amount of funds but simplifies administration by providing direct financing.

The remainder of the increase is needed to finance on a full year basis, the salaries of the existing staff of the Bureau assigned to assit the Recreation and Natural Beauty Council.

Plan of work.—The program of work under the activity Federal Coordination for fiscal year 1968 is discussed under two principal elements: Federal Program Review and Studies and Services for the President's Council and Citizens' Advisory Committee on Recreation and Natural Beauty.

(a) *Federal program review.*—The primary purpose of this program is to promote a unified, comprehensive Federal outdoor recreation effort designed to efficiently and economically meet the Nation's recreation needs.

The Federal program review staff directs its efforts to broad policy or substantive program aspects of outdoor recreation in the Federal Government. Studies are made of problems that are generally applicable on a Government-wide basis. These studies involve continuing contacts with many Goverment agencies and the reports prepared on the studies are made available to the concerned agencies for information and guidance. The Federal program review function is conducted pursuant to Section 2(g) of the Act of May 28, 1963 (Public Law 88-29), the Bureau's "Organic Act." That section provides for *promoting coordination of Federal plans and activities generally relating to outdoor recreation.*

There is a vast field wherein studies should be fruitful. The Department's own programs, the Government-wide Planning, Programing and Budgeting System and the budget for 1969 will warrant special attention.

In addition, selected studies on Federal grant programs for outdoor recreation, concessioner operated recreation areas, recreation financial grants, and operations and technical assistance programs should yield knowledge useful to furthering a more effective and coordinated effort in this field.

The following items are typical of the studies that are planned for fiscal year 1968:

1. The outdoor recreation elements of the President's budget will be analyzed and reported on, as directed in Recreation Advisory Council Circular No. 5. The report will bring into focus the total allocation of Federal funds by purpose and geographical location with recommendations in regard to meeting deficits in outdoor recreation opportunities. The results of the study will also be provided to the Bureau of the Budget for use in consideration of budget levels for Federal Outdoor Recreation programs.

2. Participate in the development and review of the outdoor recreation Planning, Programing, and Budgeting Systems for recreation in Interior and, ultimately, all agencies. This involves long-range planning of outdoor recreation programs.

3. Continue on-going studies of Federal programs relating to outdoor recreation to determine overlaps and duplications and gaps in recreation programs and recommend necessary adjustments. Studies may be made of concessioner operations, grant programs and technical assistance. The Bureau also will maintain current information on Federal programs and agreements, memorandum of understanding, and executive orders and maintain relations necessary to achieve better interagency coordination.

4. Conduct a demonstration study of a major regional complex of interrelated land and water areas with great recreational resources for which the development planning is presently under many Federal, State, and local public agencies. This

case study may be included as a special appendix to the Nationwide Outdoor Recreation Plan. The study would consider the need to protect national significant sites and at the same time provide for the coordinated development or recreational facilities. The location and need for roads, concessioner operations, and similar developments would be included in the study. It would review the expected visitor load in the region, the need of overnight and day use accommodations, the means of transporting recreational users, land use and development plans, and other basic problems including the participation by private interests.

Determination of the practicability of establishing a regional pattern of recreation resources use will also result from the study.

(b) *Legislative review.*—Because of the broad scope of the Bureau's functions in the field of outdoor recreation and conservation generally, the relationship to other Federal agencies in this field, and the cooperative work with the States, the Bureau is necessarily concerned with a large segment of legislative proposals that originate in the Congress or that are suggested by the Executive agencies. The increased activity in outdoor recreation and related legislation during the past several years is expected to continue during fiscal year 1968, with more bills being introduced in the Congress.

The Bureau provides an impartial review and analysis of proposed legislation in the outdoor recreation field, making recommendations to the Secretary or to the Bureau of the Budget regarding the effect of such legislation, whether it should be supported, and suggested amendments, if considered appropriate.

Under the legislative review services program, substantive and policy positions of the Bureau have been developed and prepared covering a wide range of conservation, resource development, fish and wildlife, and outdoor recreation legislation. Such work includes legislative research into the history of existing laws and programs that may be affected, and also includes the preparation of testimony for use at congressional hearings.

(c) *Studies and services for the President's Council, and Citizens' Advisory Committee, on Recreation and Natural Beauty.*—On May 4, 1966, the President signed Executive Order 11278 establishing the President's Council on Recreation and Natural Beauty. This Council supersedes the former Recreation Advisory Council. The first chairman of the new council is the Secretary of Commerce. The Executive Order also established a Citizens' Advisory Committee on Recreation and Natural Beauty. The first chairman of the Citizens' Advisory Committee, named by the President, is Mr. Laurance S. Rockefeller. The Executive Order significantly expanded the scope of the former Recreation Advisory Council by assigning responsibility for natural beauty to the President's Council. The words "natural beauty" have been construed to mean "the quality of man's environment." Since the order directs that the Council's Executive Director shall be from the Bureau of Outdoor Recreation, a substantial increase in responsibility and workload has been placed upon the Bureau.

The Council provides a Cabinet-level body whereby policy evolution and problem solutions can be worked out in an orderly fashion, a high degree of coordination can be achieved, and the President can be kept currently informed on important aspects of this program.

The Executive Order assigns to the Council broad functions by directing that "The Council *shall* review plans and programs of Federal agencies for or affecting outdoor recreation and natural beauty. The Council *shall* make recommendations to the President on matters of policy in the fields of outdoor recreation and natural beauty. The Council may conduct studies in those fields and *shall* encourage and assist Federal agencies to accomplish effective coordination in such fields." Regarding the first assigned function, the order is quite specific in directing the Council to ". . . advise Federal agencies with respect to the effect of their respective plans and programs on recreation and natural beauty, and may suggest to such agencies procedures to better accomplish the purposes of this order."

The Executive Order charges the Citizens' Advisory Committee with certain duties relating to both the private and public sectors. It states: "(a) The Committee *shall* advise both the President and the Council on matters relating to (1) outdoor recreation and the beautification of our Nation's cities and countryside, (2) the correlation of natural beauty and outdoor recreation activities by Federal agencies and bureaus, and (3) local, State, and private outdoor recreation and natural beauty activities, (b) the Committee *shall* advise and assist the Council in the evaluation of the progress made in carrying out the functions of the Council and recommend to the Council, as necessary, action to accelerate such progress, (c) the Committee may, on its own motion, request information relating to the functions and initiate consideration of items which relate to those functions."

The Bureau has established two divisions, the Division of Council Studies and the Division of Council Services which provide the staff services necessary for the efficient and effective operation of the President's Council. Within the limits of their capabilities, the divisions also provide assistance and services to the Citizens' Advisory Committee.

The Divisions of Council Studies and Council Services within the Bureau operate as a staff arm of the Council and receive their work assignments and direction from the Council's Executive Director (the Director of the Bureau of Outdoor Recreation). The Executive Director receives general guidance and supervision from the Council and its chairman.

The two divisions provide staff services necessary to conduct in-depth studies, correlate all pertinent information, obtain assistance from other Federal agencies as necessary, and provide the Council with adequate documentation on which it may base its decisions. In addition to simply reacting to Council guidance, they carry on a continuing review of policies for or affecting outdoor recreation and natural beauty, identify problems requiring Council consideration, and submit action proposals to the Council.

For fiscal year 1968, it is anticipated that the two divisions will be involved in the following projects:

1. *Report to the Nation on natural beauty.*—This report will concern the restoration, enhancement, and protection of the Natural Beauty (environmental quality) of America, and will include: (a) a report on progress in this field since the President's 1965 Natural Beauty Message, (b) recommendations for necessary future actions, and (c) practical action-oriented information for citizens and communities interested in pressing for action. The Report will also serve as a comprehensive response by the Executive Branch to the recommendations of the White House Conference on Natural Beauty. The Report was authorized by the Council in October 1966. It is expected to be completed, published and distributed during calendar year 1967.

2. *More effective use and disposition of federally-administered lands and waters for the enhancement of natural beauty and to meet public recreation needs.*—This study, directed to be undertaken by the Council, will result in a report from the Council to the President focusing on the improvement of present methods and procedures to assure that recreation, natural beauty, and other conservation potentials will receive adequate consideration in the use and disposition of Federal lands. The study will also encompass the question of public use of lands for recreation and natural beauty which are "temporarily excess" to the needs of administering agencies.

3. *Relationships between highway location and parks, urban open-space, historic sites, and other recreation areas.*—This study will review existing procedures for selecting the location of highway projects and recommend modifications to mitigate their impact on parks, urban open space, historic sites, and other recreation and natural beauty areas. Passage by the 89th Congress of the Highway Beautification Act of 1965 (Public Law 89–285), the Federal-aid Highway Act of 1966 (Public Law 89–574), and the Department of Transportation Act (Public Law 89–670) provides new statements of national policy and may expand this study to include more than highway location questions, or precipitate other studies aimed at adverse impacts on parks, urban open space, historic sites, and other recreation and natural beauty areas by other forms of transportation.

4. *Price escalation for lands to be acquired for recreation and natural beauty.*—Such a study was initiated by the Bureau in fiscal year 1967. The Bureau Director, in his capacity as Executive Director of the Council, has suggested to the Council Chairman that the problen of escalating land prices is a critical question which the Council should consider with a view to making appropriate recommendations to the President regarding administrative or legislative proposals which would best protect the Government's interests. The Bureau study would be the basis for Council review of the problem. This review would broaden the base of the over-all study by bringing to it the views and concerns of several land-acquiring agencies.

5. *National program of scenic roads and parkways.*—The objective of this study will be to develop a legislative program for a National Program of Scenic Roads and Parkways. A good deal of background material is available from the report on the subject prepared by the Department of Commerce for the former Recreation Advisory Council.

In addition to the above specific studies and projects to be conducted in fiscal year 1968, the Bureau will (a) follow-up to assure that Council decisions are being adequately implemented, (b) review previous Council actions to assure that they continue to be meaningful in the face of changing situations, (c) assure adequate continuing liaison with Council agencies, (d) operate a distribution system to assure that materials are transmitted in an orderly fashion, (e) make all arrangements for Council meetings, (f) assure that complete records of Council activities are maintained, and (g) provide a focal point for communication and liaison between the President's Council and the Citizens' Advisory Committee. These continuing functions will expand as the President's Council on Recreation and Natural Beauty releases additional policy recommendations and directives.

Status of program.—In the Federal Program Review Area, the Bureau has: (1) completed its study and prepared a report on its review of the outdoor recreation elements of the Federal budget for fiscal year 1967. This document was submitted to the Chairman of the President's Council on Recreation and Natural Beauty, and was also submitted to the Bureau of the Budget for use in determining the best allocations of Federal outdoor recreation funds.

(2) Completed a study of and a report on the availability of credit at the Federal level for outdoor recreation. The study will be supplemented with information on the availability of private credit for outdoor recreation enterprises before the end of the fiscal year after the results of a countrywide mail survey of financial institutions has been tabulated and analyzed.

(3) Completed a comprehensive report covering Federal outdoor recreation programs. The study sets forth in digest form the objectives, functions and authorities of all Federal programs related to outdoor recreation.

In providing services to the President's Council on Recreation and Natural Beauty the Bureau prepares background documentation necessary for the Council Chairman to determine agenda items for Council meetings; program back-up documentation, issue papers, and related data and has provided liaison and an information focal point for Council affairs. The Bureau has conducted or chaired the studies on which many policy decisions are based.

As the Council approves more policy and guideline issuances (seven have already been released); a continuing review and evaluation is made to keep the issuance up-to-date and accurate in the light of policy and program changes, and new or amended legislative authorities. The seven circulars published by the Recreation Advisory Council are:

Circular No. 1: Federal Executive Branch Policy Governing the Selection, Establishment, and Administration of National Recreation Areas.

Circular No. 2: General Policy Guidelines for Outdoor Recreation.

Circular No. 3: Policy Governing the Water Pollution and Public Health Aspects of Outdoor Recreation.

Circular No. 4: A National Program of Scenic Roads and Parkways.

Circular No. 5: Guides for Federal Outdoor Recreation Investment.

Circular No. 6: Federal Executive Policy Governing the Reporting of Recreation Use of Federal Recreation Areas.

Circular No. 7: Non-Federal Management of Recreational Facilities on Federal Lands and Waters.

Policy and related actions of the Council, upon Council approval, become the policies of the Council-member agencies. The policy and procedure issuances also are recommended for adoption by other Federal agencies. On a continuing basis, reviews are conducted of Federal agencies to evaluate the extent to which Council policies are being implemented, how successful the policies have been in terms of established objectives and what actions might be taken to make the policies more effective.

Within its capabilities, the Bureau has provided the Citizens' Advisory Committee with similar kinds of services. Also, travel and per diem expenses of the Citizens' Advisory Committee, as authorized in Sec. 203 of Executive Order No. 11278, have been paid from funds appropriated under this activity.

3. TECHNICAL ASSISTANCE

Activity	Amount available, 1966	Amount available, 1967	Estimate, 1968	Increase (+) or decrease (−) compared with 1967
Technical assistance	$503,076	$532,000	$532,000	------------

3. *Technical assistance.*—F.Y. 1967, $532,000; F.Y. 1968, $532,000; "No change."

Plan of work.—During fiscal year 1968 the Bureau will provide direct advisory assistance to State and local agencies regarding outdoor recreation and also provide advisory assistance and technical review services to other Federal agencies to help them carry out their responsibilities relating to outdoor recreation. The work expected to be performed is discussed:

(a) *Technical assistance to Federal, State, and local agencies, and private interests.*—1. Based on past experience the Bureau expects to respond to 1,000 requests for assistance by participating in conferences; regional, State and local meetings; workshops; training sessions; and individual consultations. In addition the Bureau provides information on a wide variety of outdoor recreation matters by correspondence and telephone responses to specific requests.

2. Four technical assistance bulletins will be completed dealing with such subjects as Recreation Demand Participation Rates, Hiking and Riding Trails, Encroachment and Impairment of Recreation Areas, and Protection of Natural Areas.

3. To stimulate action in outdoor recreation at the local level, ten *Community Action Guides* are to be published under a contractual arrangement with the National Association of Counties Research Foundation. Topics are: (a) Enabling Legislation, (b) Financing Local Outdoor Recreation Programs, (c) Organization, (d) Staffing and Use of Consultants, (e) Areawide and Multi-Governmental Opportunities, (f) Comprehensive Outdoor Recreation Planning, (g) Land Acquisition, (h) Water-Based Recreation, (i) Technical and Financial Assistance, and (j) Citizen Action and Public Support.

4. To provide an information clearinghouse function on outdoor recreation actions of interest to other Federal agencies, local governments, private organizations, and individuals, the Bureau will continue the quarterly publications of *Outdoor Recreation Action.* Copies are printed of each issue and are distributed to individuals and agencies involved in outdoor recreation programs.

5. Applications by State and local public agencies for park and recreation use of public domain lands are reviewed for the Bureau of Land Management. At least 80 such applications are anticipated, but the number can be expected to increase as Bureau of Land Management completes its classification inventory during this fiscal year.

6. Department of Housing and Urban Development grant applications relating to outdoor recreation will be reviewed. Both Urban Planning Assistance applications (701 program) for comprehensive State planning grants where a recreation element is involved, and Open-space Land Acquisition applications will be reviewed to determine compatability with State outdoor recreation plans.

7. Perform reviews of 50 Federal water development projects reports to determine the extent to which recreation portions of these projects are in accord with the State comprehensive outdoor recreation plans.

(b) *Surplus property applications.*—A 50% increase in applications for the transfer of surplus property for park, recreation, or historical monument purposes is expected as the result of publicity being given to State and local outdoor recreation needs through State outdoor recreation plans. The Bureau has the responsibility of investigating all such applications and making recommendations to General Services Administration on them. In 1968, the Bureau anticipates making on-site investigations and preparing reports on 50 applications covering Federal surplus properties.

(c) *Surplus property compliance actions.*—The Bureau will inspect surplus properties disposed of in prior years for park and recreation purposes. This is to insure that the properties are being devoted to the use contemplated at the time of transfer. A change in compliance review necessitated by the Civil Rights Act of 1964 (Public Law 88-352) and the Department's implementing regulations (43 CFR 17) will result in a 100% increase in compliance review and on-site inspection responsibilities in 1968.

It is anticipated that there will be 350 on-site inspection trips and reports necessitated by new requirements. One hundred seventy-five biennial compliance reports due from property recipients are anticipated in 1968. Each report received must be reviewed, acknowledged, and compliance problems acted upon. Although the workload is increasing, no increase in funds is requested. Bureau staff are better trained and are in a position to handle the increased workload.

(d) *Conservation inventory of military lands.*—Lands expected to be surplus to military needs are being screened and inventoried so that conservation and recreation agencies (Federal, State, and local) may move expeditiously to acquire the properties when they reach excess or surplus status. Projected accomplishments for 1968 include:

> . . . Initial screening of 500 surplus military properties. These will require limited investigations and the preparation of an initial screening report.
>
> . . . Detailed investigation and the preparation of interagency land use reports for approximately 35 military properties.
>
> . . . Review Department of Defense inventory data on 1,900 military installations and accumulate additional inventory data as necessary.

Status of program.—A technical assistance information series has been inaugurated and the initial issue of "Outdoor Recreation Action" was published in August of 1966. The publication is designed as a clearinghouse to report actions taken throughout the Nation that will be of interest to States, local governments, and private individuals. It covers legislative actions on financing, zoning, etc. at the State and local levels and sets forth Federal legislation and other actions in the outdoor recreation field. In addition it is a useful means of informing the State and local levels of actions being taken by other State and local levels of government.

Negotiations have been completed with the National Association of Counties for the development of 10 community action guides for outdoor recreation. The contract with NACO is on about a 50–50 cost/sharing basis since both agencies will benefit from the results. The guides will be extremely valuable to State local, and private groups in developing sound outdoor recreation programs.

The Bureau is on schedule in its review of military lands that are to be released from military requirements. Over 1,000 actions have been reviewed since the beginning of the program about a year ago and over 100 properties have been converted or are planned for conversion to conservation/recreation uses.

The Bureau has been able to maintain on a current basis its compliance reviews on Federal properties deeded to State and local agencies for parks, recreation, or historic monument purposes. Over 300 properties involving about 45,000 acres are involved.

ITEMIZATION OF ESTIMATE

Salaries and expenses

	Actual, 1966	Estimate, 1967	Estimate, 1968	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$3,372,165	$3,990,000	$4,240,000	+$250,000
Unobligated balance lapsing	91,832			
Transferred to General Services Administration	2,003			
Appropriation	3,466,000	3,910,000	4,240,000	+330,000
Proposed supplemental appropriation		80,000		−80,000
Obligations by objects:				
11.0 Personnel compensation	2,248,792	2,780,000	2,824,000	+44,000
12.0 Personnel benefits	168,024	220,000	223,000	+3,000
21.0 Travel and transportation of persons	168,956	197,000	241,000	+44,000
22.0 Transportation of things	15,746	22,000	18,000	−4,000
23.0 Rent, communications, and utilities	97,526	73,000	54,000	−19,000
24.0 Printing and reproduction	111,795	88,000	431,000	+343,000
25.1 Other services	173,398	270,000	214,000	−56,000
25.2 Services of other agencies	317,310	250,000	155,000	−95,000
26.0 Supplies and materials	32,187	56,000	60,000	+4,000
31.0 Equipment	38,431	34,000	20,000	−14,000
Total obligations	3,372,165	3,990,000	4,240,000	+250,000

PREPARED STATEMENT

Chairman HAYDEN. Mr. Crafts, would you please present your statement indicating the activities of the Bureau during the past fiscal year and its plans for the coming year?

(The statement follows:)

Mr. Chairman and members of the committee, we appreciate the opportunity to appear before this committee to explain the need for the funds requested for fiscal year 1968 to carry on Bureau of Outdoor Recreation programs.

This Bureau has been in existence for about five years. Our activities are divided into two main segments: (1) Those authorized by the Act of May 28, 1962 (P.L. 88–29) and the Federal Water Projects Recreation Act of 1965 (P.L. 89–72) for which we are requesting $4,240,000 for fiscal year 1968, and (2) those authorized by the Land and Water Conservation Fund Act of 1965 (P.L. 88–578) for which we are requesting $142,000,000.

These two segments are covered under the captions "Salaries and Expenses" and "Land and Water Conservation Fund" in the following paragraphs. The details of the budget are shown in the tables attached to this statement.

SALARIES AND EXPENSES

The request of $4,240,000 for fiscal year 1968 is an increase of $250,000 over the amount available for fiscal year 1967. The increase will be applied as follows: $100,000 will assist in financing expenses related to the work of the President's Council and the Citizens' Advisory Committee on Recreation and Natural Beauty; $75,000 will be utilized in financing a study of the Connecticut River Valley as authorized by the Act of October 3, 1966 (80 Stat. 867); and $75,000 will be utilized in financing a Nationwide inventory to determine the recreation potential of coastal and inland islands as directed by the President.

The programs for which increases are requested and the on-going programs for which no increases are requested are mainly the Nationwide Plan, Water Resources, Special Area Studies, and Federal Coordination.

Nationwide planning.—Under this program the Bureau is responsible for developing a Nationwide outdoor recreation plan by May 1968 and at periodic intervals thereafter. We are requesting an appropriation of $1,612,000 for fiscal year 1968—the same amount appropriated for fiscal year 1967. The final 12 months leading to the due date of the first plan is a crucial period. It is during this time that major decisions will have to be made on content, policies, and recommendations.

This will be in effect a State of the Union Message on outdoor recreation in its broadest aspects. It should supersede the ORRRC report. It will contain an action program that hopefully should guide Federal, State and local agencies and be of substantial use to the private sector for the next five years.

It is without question the most consequential single and ambitious undertaking before the Bureau at the present time, and is being carried out in fulfillment of the directive of the Organic Act that established the Bureau. It is scheduled for submission by the Secretary to the President and in turn by the President to the governors of the States and the Congress. It will offer a program to the Nation hopefully in a proper prospective. Like most such undertakings the concluding phases probably will be somewhat of a desperate and crash effort with much controversy in arriving at policy recommendations.

Water resources.—The purpose of the Bureau's participation in Federal water resources planning is to insure that recreation opportunities are given proper consideration at the time water resource development projects are prepared. In carrying out this purpose, the Bureau performs three kinds of work.

First, the Bureau participates in comprehensive river basin studies in the following ways: (a) Reconnaissance surveys of the recreation aspects of over-all water and land resources development needs of a basin, and (b) more detailed appraisals which evaluate possible alternative projects within the basin. The Bureau's participation takes the form of reports and recommendations to the construction agencies, namely, the Corps of Engineers and the Bureau of Reclamation.

Second, in connection with preparation of individual project proposals for Congressional consideration, we evaluate the recreation potential of such projects and recommend the proper allocation of project costs to recreation. This is done for projects sponsored by the Bureau of Reclamation, the Corps of Engineers, the Federal Water Pollution Control Administration, the Bureau of Land Management, and the Bureau of Indian Affairs.

Third, for those proposed projects which the Bureau does not have the capacity to handle itself, it reviews the recreation recommendations and allocations as proposed by construction agencies.

The second and third functions described above are handled under authority of the Federal Water Projects Recreation Act. A substantial portion of the authority in that act which was vested in the Secretary of the Interior has been delegated to the Bureau of Outdoor Recreation.

Following is a tabulation which summarizes the Bureau's water resources work this year and prospective assignments next year:

	Fiscal year 1967	Fiscal year 1968
1. Basin studies (both reconnaissance type and the more detailed type)	21	20
2. Projects appraisals (individual)	167	100
3. Review project studies made by construction agencies	180	200

No additional funds are being requested for water resource planning work in fiscal year 1968.

Special area studies.—A total of $403,000 is requested to finance studies of special areas of the Nation that offer potential for recreation development. This is an increase of $150,000 over the current year.

These studies involve areas of national or regional importance and in many instances culminate in the passage of legislation designating an area as a National Recreation Area, National Lakeshore, or National Seashore, as for example, Indiana Dunes National Lakeshore, Indiana; Pictured Rocks National Lakeshore, Michigan; Assateague Island National Seashore, Maryland and Virginia; Fire Island National Seashore, New York; Delaware Water Gap National Recreation Area, Pennsylvania and New Jersey; and Whiskeytown-Shasta-Trinity National Recreation Area, California. These are areas on which the Bureau of Outdoor Recreation had prepared a detailed study and recommendations.

Sometimes Bureau studies culminate in action by State governments rather than the Federal. This is demonstrated by the passage by the Maine State legislature of the Allagash Wilderness Waterway Act in 1966. The acquisition and development of this nationally important area will be financed jointly by the Federal government and the State of Maine with the administration remaining with the State.

Of the $150,000 increase, $75,000 is requested for an inventory of all islands over 10 acres in the United States, including Puerto Rico and the Virgin Islands. This study will determine which islands have been developed, which remain largely unspoiled, and which are already protected by public agencies. The data accumulated will be valuable in deciding which islands should be given further consideration for public protection in the interests of outdoor recreation or quality of environment. The President on November 11, 1966, directed that this study be made. It will be a two-year study.

The other $75,000 is requested to determine the feasibility and desirability of establishing a Connecticut River National Recreation Area in the States of Connecticut, Massachusetts, Vermont and New Hampshire. The Act of October 3, 1966, P.L. 89-616, which directed that this study be made authorized an appropriation of $100,000. This is also a two year study.

The Wilderness Act of 1964 established a National Wildlife Preservation System composed of federally owned areas designated by Congress as Wilderness Areas. In addition to the areas on national forest lands established as wilderness areas by the Act, primitive and roadless areas in the national forest, national park, or wildlife refuge systems may be subsequently established by an Act of Congress.

The Bureau of Outdoor Recreation, in order to fulfill its coordination functions as specified in the Organic Act (P.L. 88-29) will assist in considerations relating to the establishment of new wilderness areas being proposed by the several land management agencies involved (Forest Service, National Park Service, and Bureau of Sport Fisheries and Wildlife.) This involves study of about 175 separate areas over the next six years.

Other studies now under way may require additional work in fiscal year 1968 and additional studies may be required by Congress or by the Executive Branch. Examples include an appraisal of 1200 miles of the Missouri River from Yankton to Fort Benton as directed by the Senate Interior Committee, the basic studies prerequisite to a National Scenic River system, a National Trails system, a North Cascades National Park, and a redwoods national park. We are deeply involved in all of these undertakings, the last four of which have been recommended to this Congress by the President for legislative establishment.

Federal coordination.—A total of $912,000 is requested for this activity for fiscal year 1968—an increase of $100,000. The Bureau's Federal Coordination responsibilities are exercised through its Federal programs review responsibility, through its review of legislation, and through the President's Council on Recreation and Natural Beauty for which the Bureau provides staff services.

On May 4, 1966, the President signed E.O. 11278, establishing the President's Council on Recreation and Natural Beauty. This order provided for the following basic changes: (1) It broadened the scope of the President's Council to include natural beauty as well as recreation, (2) it added to the Council the Federal Power Commission and the General Services Administration, (3) it established an additional group; namely, a Citizens' Advisory Committee on Recreation and Natural Beauty to advise both the President and his Council. This Committee is composed of 12 distinguished citizens appointed by the President. It is chaired by Laurence Rockefeller. (4) the Bureau of Outdoor Recreation was directed to provide an executive director to the Council. It also provides staff services.

The Council is preparing a comprehensive report to the President and the Nation on natural beauty, including what has happened since the White House Conference 2 years ago and proposing citizen action. It is also investigating the potential for recreation and natural beauty of surplus Federal lands with a view to recommending to the President any desirable legislation or administrative adjustments.

The Bureau of Outdoor Recreation also assists in the staffing of the Citizens' Advisory Committee which is concentrating its attention at the moment on the undergrounding of utility lines, the disposal of solid wastes, more effective education at all levels in recreation and natural beauty, and the resolving of potential conflicts between highways and recreation, parks, and other open spaces.

It is expected that the Department of Transportation will be added to the Council shortly.

The requested increase of $100 thousand is entirely to provide more adequate staff services to the President's Council and the Citizens' Committee on Recreation and Natural Beauty.

Bureau of Outdoor Recreation—Estimated appropriation distribution—Submission to Congress including supplemental for 1967 pay cost

[Dollar amounts in thousands]

	1967		1968		Increase or decrease

[2] Not including positions in National Park Service, Forest Service, and Bureau of Sport Fisheries and Wildlife.

PERSONNEL POSITIONS

Chairman HAYDEN. How many new positions are included in your fiscal year 1968 budget?

Mr. CRAFTS. Ten new positions.

Chairman HAYDEN. Would you place in the record a table showing these positions by grades and titles, and the particular activity in the Bureau in which the holders of them will participate?

Mr. CRAFTS. I will be happy to.

(The information follows:)

The increase of ten positions requested in the Salaries and Expenses appropriation will be utilized in newly assigned special area studies. Five of these positions will be assigned to the Connecticut River Study to determine the suitability of this area as a possible National Recreation Area. The other five positions requested will be used in preparing an inventory and study of American Coastal and Inland Islands which are still undeveloped to determine whether such areas should be recommended for recreation use.

Summary of position increase

GS-13 Recreation Resource Specialist	1
GS-12 Recreation Resource Specialist	6
GS-9 Recreation Resource Specialist	1
GS-5 Clerk Stenographer	1
GS-4 Clerk-Typist	1

NATIONWIDE OUTDOOR RECREATION PLAN

Chairman HAYDEN. The justification statement indicates that the funds to be provided in the coming fiscal year will complete and publish the first nationwide outdoor recreation plan.

Would you please describe briefly how this plan will be used?

Mr. CRAFTS. Several years ago, about five now, the Outdoor Recreation Resources Review Commission published its report with which I think all of you are familiar. Out of that Commission grew a great deal of the recreation conservation action which has occurred in the States and Federal Government in the last five years, including creation of this small Bureau, establishment of the land and water conservation fund and a number of other activities. In the Act that the Congress passed at the time this Bureau was created we were directed to prepare at five-year intervals a nationwide outdoor recreation plan. We have been working on this. It is due for submission to the President and through the President to the Congress and the Governors a year from this coming May.

It will be a policy report. It will cover the supply and demand presently and prospectively in outdoor recreation in a broad sense. It will include recommendations for action, public and private, and our expectation will be that it will serve as a policy guideline as the basis for program actions for the next five years ahead.

SECOND OUTDOOR RECREATION PLAN

Chairman HAYDEN. You also indicate in your justification statement that during the latter part of fiscal year 1968 work will begin on developing the next five-year plan which is to be completed by 1973. How does this plan differ from the one about which we just spoke?

Mr. CRAFTS. It will be, in effect, the next installment. It is hard to look six years ahead and say just how it will differ but there are rapid changes going on and I am sure it will be substantially different.

One of the things that we will be doing initially is in trying to plan the second 5-year planning a more efficient way. We have learned some lessons in this first 5-year period. My hope is that we can have less lost motion in the preparation the next time.

SPECIAL AREA STUDIES

Chairman HAYDEN. For the coming fiscal year you are proposing an appropriation of $403,000 for the special area studies, which is $150,000 more than was appropriated in this fiscal year.

How do you determine a study that is to be designated as special area study?

Mr. CRAFTS. These studies, Senator Hayden, and the term is not a very adequate term, are usually, I think, almost without exception, assigned to us either by the Congress, by a committee of the Congress, by the President, or by the Secretary.

They are studies that quite often culminate in legislative action of one sort or another. I could give you a few illustrations. One that is underway now is a study of the recreation potential of the Connecticut River Valley. This is the result of an act of Congress last year. Another is a similar type study of the Missouri River from

Fort Benton down to Yankton. This is the result of a directive of the Senate Interior Committee. We have activities underway to carry out an act last year passed by the Congress to negotiate an interstate compact on the Hudson. We have underway an island inventory that we were directed to do by the President.

I could go on and list several others but this is illustrative of the type of thing I am talking about.

Senator BIBLE. Might I ask a question at that point, Mr. Chairman.

Chairman HAYDEN. Certainly.

AUTHORIZATION FOR AREA STUDIES

Senator BIBLE. Are you required to have specific authorization to make this special area study?

Mr. CRAFTS. No.

Senator BIBLE. You mentioned the Connecticut River and I am familiar with that. You were directed to do it. But can you pick out areas around the United States under your broad powers and make a special area study?

Mr. CRAFTS. Yes, we can. We can do this under the Organic Act of the Bureau.

Senator BIBLE. Are you making that type of study?

Mr. CRAFTS. No, we do not normally. The island inventory, for example, was not undertaken by reason of a congressional directive. This is being done under the broad authority of the Bureau. We did not initiate it. This was initiated by a directive from the White House. We have made studies in the past on our own initiative, like the Assateague Island one. We were deeply involved in that one.

Senator BIBLE. I remember.

Mr. CRAFTS. Fire Island, we were involved in. Whiskeytown-Shasta-Trinity is one we were involved in. A number of those we initiated. But in the last year or two the impact on us from higher authority, so to speak, has been sufficient to utilize all the capacity that we have in this area.

Senator BIBLE. The main purpose of my question, Mr. Chairman, was to try to indicate these tremendous costs that are involved and will become more apparent as Mr. Craft testifies. It seems to me that it might be well to somewhat await a congressional directive before you get into this. I simply make that by way of suggestion. Maybe you would like to comment on it. Maybe you will develop it further. You know what these costs are as well as I do.

We are almost pricing ourselves out of business in my judgement.

Mr. CRAFTS. When we get into the land and water fund I could comment on that a little more.

Senator BIBLE. I wish you would remember and comment on that as you go along.

Mr. CRAFTS. I will.

AMERICAN ISLANDS AND CONNECTICUT RIVER STUDIES PERSONNEL

Chairman HAYDEN. The American Islands study and the Connecticut River study are proposed for the coming year and you are asking $75,000 for each of them. Do you have the necessary personnel now on the rolls or will you be required to recruit additional personnel for these studies?

Mr. CRAFTS. There are 10 more personnel contemplated for those two studies, Senator.

MISSOURI RIVER AREA RECREATIONAL OPPORTUNITIES

Chairman HAYDEN. Last year Congress directed that you utilize $50,000 to survey recreational opportunities and to recommend development of the Missouri River area between Yankton, S. Dak., and Fort Benton, Mont.

What is the status of your work on this project?

Mr. CRAFTS. The field work on this study has been largely done. The contacts and cooperation established with the Federal agencies involved of which there are a considerable number and with the States and local governments is underway. We are in what you might call the initial analytical phases of it now. I think I should say to this committee or in some manner perhaps advise the Senate Interior Committee that I am concerned as to whether we are going to be able to fully complete the job within the July 1, 1967, deadline that was given. We were given 1 year to do this. We are doing our best and we are going to come close to it but we may be a little bit late.

PRESIDENT'S COUNCIL AND CITIZENS' ADVISORY COMMITTEE ON RECREATION AND NATURAL BEAUTY

Chairman HAYDEN. The increase which you request for Federal coordination is to provide financing for staff and related services for the Citizens' Advisory Committee and to pay travel expenses of those Committee members. You indicate that during the fiscal year these expenses have been met by Federal agencies represented on the Council. Would you please submit for the record a breakdown of the contributions to the Council by each of the agencies involved?

Mr. CRAFTS. I will be glad to do that.

(The information follows:)

Expenses involved during fiscal year 1967

Citizens'Advisory Committee	$56, 400
Printing Natural Beauty Report	90, 000
Total	146, 400

Contributions by Federal agencies

Department of Commerce	20, 000
Department of the Interior	20, 000
Department of Agriculture	20, 000
Department of Defense	20, 000
Department of Health, Education, and Welfare	20, 000
Department of Housing and Urban Development	20, 000
Tennessee Valley Authority	8, 800
Federal Power Commission	8, 800
General Services Administration	8, 800
Total	[1] 146, 400

[1] Includes a one-time cost of $90,000 for printing the Natural Beauty Report.

AGENCY CONTRIBUTIONS

Chairman HAYDEN. If your budget estimate is approved then there will be no financing by any of these agencies of the Advisory Committee; is that correct?

Mr. CRAFTS. This is correct. There will be no further assessment against the other agencies.

Senator BIBLE. Might I ask a question at that point, Mr. Chairman. I am wondering why you just don't continue that practice. Why don't you continue having the Federal agencies make their payments as they do now.

Mr. CRAFTS. This could be done. It is really a half dozen of one or six of the other. When the President by executive order created the present Council and established the new Citizens Committee there was no provision made for financing the expenses of the Citizens Committee. The Committee came into existence last May and therefore the question was who is going to pay them.

Senator BIBLE. So the Federal agencies paid it. What is wrong with that?

Mr. CRAFTS. This was taken up with the Bureau of the Budget and arrangements made to assess the member agencies of the Council this year and this was done. I think it was the preference of both the member agencies and the Bureau of the Budget, instead of continuing this practice, to locate the financing in one place and they located it in the Bureau of Outdoor Recreation because under the terms of the Executive Order the Director of the Bureau is designated as Executive Director of the Council. So this seemed to be a convenient and proper place to do it.

BUDGET REQUEST

Senator BIBLE. How much money are we talking about?

Mr. CRAFTS. We are talking next year of $100,000.

Mr. RICE. Half of it would be for the Citizens' Advisory Committee and the rest of it would be for Council activities. We are talking this year of about $56,000 for the Council activities.

Senator Bible. In fiscal year 1968?

Mr. RICE. Fiscal year 1967.

Senator BIBLE. In fiscal year 1967 it was $56,000. In 1968 it will be $100,000?

Mr. RICE. No, sir; for the Citizens' Advisory Committee for the next fiscal year it will be the same as this year. The additional amount of $100,000 is also to provide additional staffing service for the Council. There are two bodies. One is the Citizens' Advisory Committee and the other is President's Council on Recreation and Natural Beauty.

Senator BIBLE. It seems to me, we have more advisory bodies and study commissions and groups to advise groups than I have ever seen. I was interested in what this embraced. You are talking about the $100,000 item.

Mr. RICE. That is correct.

Senator BIBLE. Thank you.

CONTRACT WITH NATIONAL ASSOCIATION OF COUNTIES

Chairman HAYDEN. A cooperative program with the National Association of Counties Research Foundation has been announced by the Secretary of the Interior.

What is this program and what is its status now?

Mr. CRAFTS. This is a contract that we entered into on a matching fund basis with the National Association of Counties. It is $200,000 of Federal money and an equal amount put up by the county organization over a 2-year period. They will prepare and issue about 10 publications, a list of which I can supply you, aimed primarily at being of assistance to local governmental officials and citizens who want to promote recreation at this level of government. Also, they are planning to hold what they call about 30 recreation institutes. These are meetings, working type meetings of officials in different States.

Chairman HAYDEN. Are there any additional funds for this program needed for the fiscal year 1968?

Mr. CRAFTS. No, sir, no additional funds.

Senator BIBLE. What is the annual cost of this particular activity? $100,000?

Mr. CRAFTS. It is for 2 years, we have contracted for $200,000. So that is $100,000 for each of the 2 years but we are obligating this year's money for it. So we will not use any of the 1968 money for it. They are putting in an equal amount of money.

Senator BIBLE. The money you are using is still Federal money and it is costing the Federal Government $100,000 a year. Is that correct?

Mr. CRAFTS. That is right.

THURSDAY, MARCH 9, 1957.

LAND AND WATER CONSERVATION FUND

BUDGET REQUEST

Chairman HAYDEN. The budget estimate for the Land and Water Conservation Fund in fiscal year 1968 is $142 million. Of this amount, $110 million is expected to be derived from the various receipts set up for the fund, and $32 million is to be obtained as an advance from the general fund of the Treasury as provided in the basic Land and Water Conservation Fund Act.

JUSTIFICATION

The justification for the estimates will be printed in the record.
(The justification follows:)

HIGHLIGHT STATEMENT

This program is authorized by Public Law 88–578, the Land and Water Conservation Fund Act of 1965, which was approved on September 3, 1964. The Act created a receipt account from which appropriations can be made to provide outdoor recreation facilities and opportunities at State, local, and Federal levels. It became effective on January 1, 1965, and has a terminable life of 25 years. Funds made available will provide a means of helping to bring the national outdoor recreation supply of public facilities and areas more nearly in line with the need. This will be done in two ways; (1) assisting States and their political subdivisions on a 50 percent matching basis to plan, acquire, and develop areas with high recreation potential before such lands are diverted to other uses or the cost of both land and development increases to a point where such an investment would not be economically wise and; (2) by providing funds for authorized acquisition by the National Park Service, Forest Service, and Bureau of Sport Fisheries and Wildlife.

For fiscal year 1968, the request for appropriations from the fund totals $142 million. This will provide $65.0 million for grants-in-aid to States; $69.2 million to three Federal agencies to acquire lands; $5.0 million to the Bureau of Outdoor Recreation for emergency planning and for acquisition of priority tracts of land; and $2.8 million to the Bureau of Outdoor Recreation for coordinating and administering the program. Excluding the administrative expenses, the State share of the 1968 estimate is 47 percent and the Federal program is 53 percent.

A comparison of 1967 appropriations with estimates for fiscal year 1968 is shown below:

[In thousands of dollars]

Item	Fiscal year 1967 appropriated	Fiscal year 1968 estimate	Fiscal year 1968 increase
Assistance to States	65,703	65,000	−703
Federal programs:			
National Park Service	23,471	48,225	24,754
Forest Service	18,093	18,000	−93
Bureau of Sport Fisheries and Wildlife	173	3,000	2,827
Bureau of Outdoor Recreation	----------	5,000	5,000
Subtotal	41,737	74,225	32,488
Administrative expenses	2,560	2,775	215
Total	110,000	142,000	32,000

The increase in the request for Federal purposes (National Park Service) is to acquire lands in newly authorized areas before land price escalation has made the lands prohibitively expensive. While the States have a land price increase problem, the situation is particularly acute to the Federal Government because of the publicity that is generated by a Congressional action authorizing a new area. Increased funds also are requested to acquire lands for endangered species of fish and wildlife to preserve these species from extinction. Forest Service acquisitions are contemplated at the 1967 level. The estimate for fiscal year 1968, for the first time, includes funds for emergency planning and acquisition. An amount of $5,000,000 is requested for the Bureau of Outdoor Recreation to allocate funds to Federal land acquiring agencies making it possible for them to move immediately into newly authorized areas to make preliminary surveys, title searches and conduct appraisal work. Some of these funds may be used to purchase tracts where unusually favorable terms to the Government can be arranged or where key tracts should be purchased to forestall adverse development.

The major portion of the appropriations requested will be funded from receipts covered into a special account in the Treasury, the Land and Water Conservation Fund. The receipts will be derived from the following sources:

a. The sale of the annual entrance permit and other admission and user fees at designated Federal recreation areas,

b. Net proceeds from the sale of Federal surplus real and related personal property, and

c. Existing Federal taxes on motorboat fuels.

The remainder, or $32 million, will be obtained as an advance from the general fund of the Treasury. There is a provision in the authorizing act for appropriations to be made from the general fund up to an average of $60 million annually during an eight year period beginning in fiscal year 1968. Any advance appropriation from the general fund will be repaid from receipts in the Land and Water Conservation Fund beginning in 1976, the eleventh year of the program. Also, any receipts in the Fund which are not appropriated within two years following the fiscal year in which they are received shall be transferred to miscellaneous receipts of the Treasury.

Revenues from the sales of the annual recreation permit were a disappointment in fiscal year 1965 and 1966. Although sales in fiscal year 1966 increased by some 53 percent over sales during fiscal year 1965, they fell short of the Bureau's original estimates. There are several reasons for the low returns from Federal recreation fees. First, our original estimates on the number of families who would purchase the annual permit were too high. Second, it took longer to get the program moving than originally anticipated. Third, enforcement of the fee regulations in too many cases has been weak. A contract survey of recreationists at pre-selected designated recreation areas revealed many of the visitors to designated areas who should have paid did not pay. The Bureau is working closely with the administering agencies and the Department of Justice to see how we can achieve the best possible enforcement system.

Revenues from the sale of Federal surplus property have exceeded the estimates. Had it not been for the revenues from these sales, the program through 1966 would have been seriously underfunded. Revenues to the Land and Water Conservation Fund for fiscal year 1968 are expected to range between $110 and $120 million dollars. Surplus property receipts will amount to about $70 million and motorboat fuel taxes and entrance, admission, and user fees will account for the remainder.

STATUS OF PROGRAM

1. The States have participated fully in this program. Each of the 50 States and five territories or possessions have submitted initial Statewide outdoor recreation plans. Fifty-four of these have been found adequate for a limited period. Fourteen States have updated and revised their initial plans and about seventeen additional States are expected to submit revised plans before June 30, 1967.

2. The following tabulation shows the volume of projects and/or amendments received by the Bureau as of December 31, 1966, and the progress made in processing them:

	Number	Amount
Total received	1,937	$176,575,456
Withdrawn or disapproved	−208	−20,121,132
Found to be in order technically	−1,152	−94,346,096
Total funded or obligated	(1,034)	(51,655,640)
Balance to be reviewed	577	62,108,228

3. The Federal agencies had obligated or committed $40,348,124 as of November 30, 1966, last reporting date, as shown:

	Cash available to date	Purchase commitments	Obligations incurred	Uncommitted balance
National Park Service	$38,467,605	$5,032,609	$16,202,698	$17,232,298
Forest Service	27,117,336	704,659	18,404,334	8,008,343
Bureau of Sport Fisheries and Wildlife	90,004		3,824	86,180
Total	65,674,945	5,737,268	34,610,856	25,326,821

4. The Bureau has developed an inspection program covering grants-in-aid projects and has made on site inspections on 837 projects as of December 31, 1966.

5. The Bureau also has reviewed and acted on audit reports covering audits of 16 States participating in the Land and Water Conservation Fund Program.

6. Authority to take final approving or disapproving action (within specific limits) on grants-in-aid projects has been delegated to the Regional Directors and to the Assistant Director in charge of the program. This action should help to expedite the processing of project proposals.

7. The Bureau has taken an active role in the coordination of areas designated for fee application during calendar year 1966. During the past year, the Bureau in close cooperation with the administering agencies has been evaluating the Federal recreation fee aspects of the Land and Water Conservation Fund with the view of maximizing fee collections through a uniform system of designating areas and application of fee schedules. In 1966 there was a net increase of 414 designated areas, or 20 percent above those areas or management units where fees were collected in 1965.

8. The Bureau worked with administering agencies in developing criteria supplemental to those of Executive Order 11200 for determining when a Federal recreation area should be designated as an area associated with Federal water resource development projects.

9. The Bureau initiated "Golden Eagle" information and education efforts to further explain the Federal fee program to all segments of the public and designed, printed, and distributed the "Golden Eagle" permit to agencies participating in the sale of annual permits. These activities included arrangements with the Newspaper Comics Council, travel associations, and with petroleum firms and airlines. This effort, combined with accelerated activities of Federal agencies and States, resulted in an overall increase in revenues above those collected in 1965.

10. The Bureau contracted for a private survey of user reactions at a series of randomly selected designated Federal outdoor recreation areas throughout the Nation. This survey will also give a measure of public demand for use of Federal recreation areas.

11. The Bureau prepared and distributed educational material to the administering agencies to assist in the training of personnel contacting the public at designated areas. The goal of this training is to enable Federal fee collection personnel to better explain to the public the need for recreation fees and the use made of them.

BUREAU OF OUTDOOR RECREATION

Land and water conservation

Appropriation, 1967	$110,000,000
Transferred to "Operating Expenses, Public Buildings Service," General Services Administration (building rent)	−34,914
Appropriation (adjusted)	109,965,086
Unobligated balance from prior years	107,148,046

3. Administrative expenses	2,534,686	2,775,000		2,775,000	+240,314
Total	217,113,132	234,426,132	92,426,132	142,000,000	+17,313,000

1. ASSISTANCE TO STATES, $65,000,000

Funds requested in 1968 will be used for grants-in-aid to States to finance 50 percent of the cost of preparing and maintaining outdoor recreation plans, acquiring land and water areas, and developing areas for outdoor recreation purposes.

2. FEDERAL PROGRAMS, $74,255,000

Funds requested in 1968 will provide for acquisition of land and water areas by the National Park Service ($48,225,000); Forest Service ($18,000,000); and Bureau of Sport Fisheries and Wildlife ($3,000,000). Funds are also requested for the Bureau of Outdoor Recreation ($5,000,000) to be allocated to the land acquiring agencies, for emergency planning of newly authorized areas and for possible acquisition of prime tracts.

3. ADMINISTRATIVE EXPENSES, $2,775,000

Funds requested in 1968 will finance the cost of administering the Federal and State programs under the Land and Water Conservation Fund Act.

1. Assistance to States

Activity	Amount available, 1966	Amount available, 1967	Estimate, 1968	Increase (+) or decrease (−) compared with 1967
Assistance to States	$92, 579, 550	$65, 703, 000	$65, 000, 000	−$703, 000

1. *Assistance to States.*—A total of $65 million is requested for grants-in-aid to States to finance 50 percent of the cost of preparing and maintaining outdoor recreation plans, acquiring land and water areas, and developing areas for outdoor recreation purposes.

Needs for funds requested.—These funds will be used to match costs incurred in providing needed outdoor recreation areas and facilities at State and local levels. The need for recreation opportunities at the State and local levels is increasing at a higher rate than the increase in the population growth. Most States and political subdivisions do not have adequate financial resources to handle this problem. The funds requested under this activity will help provide a part of the needed financial resources.

Plan of work.—The States are being urged by the Bureau to utilize a greater portion of their financial resources in acquiring recreation lands. Land price escalation is a problem for the States as well as for the Federal Government. Furthermore, desirable outdoor recreation areas throughout the Nation are being preempted for other purposes and action is needed to obtain as much of these lands as possible before they are lost forever.

The States also are expected to give greater attention to the development of basic outdoor recreation facilities insofar as the use of grants-in-aid funds is concerned. The Bureau has advised the States that fund moneys will not be used for luxury type cabins and cottages and for motels and lodges. While these facilities are undoubtedly needed, the Bureau believes that other sources of financing rather than Land and Water Conservation Fund moneys should be used.

The grants-in-aid program is now operating at a high level. The States have their outdoor recreation plans approved, understand the Bureau's operating regulations and generally are staffed to handle the work.

Status of program.—From inception of the program in January 1965 through December 1966 the States had submitted 1,937 projects and amendments to the Bureau in an aggregate of $176.6 million. The breakdown of these projects is shown:

Type of project	Number	Amount
Planning	99	$3, 004, 230
Acquisition	588	71, 440, 410
Development	1, 250	102, 130, 816
Total	1, 937	176, 575, 456

The volume varies considerably by States. Some States have submitted projects in excess of apportionments while others are just beginning to submit projects. A State-by-State breakdown as of December 31, 1966, showing the status of funds apportioned from inception through fiscal year 1967 follows:

	Amount of apportionment	Total requests received		Total qualified		Total obligated	
		Number	Amount	Number	Amount	Number	Amount
STATE							
Alabama	$2,567,034	5	$1,025,781	2	$196,799	2	$196,799
Alaska	1,430,017	31	3,090,270	17	1,253,170	15	834,950

---

[1] Includes $830,000 special apportionment to territories.

Funds made available to States may be used for planning, for acquisition of land and water areas and for developing recreation areas. Of the $65 million requested for States in fiscal year 1968, it is estimated that one million dollars will be used for planning, $30 million will be used for land acquisition and $34 million will be used for development. These estimates reflect a greater use of funds for land acquisition than has been the case up to the present time. The funds requested for fiscal year 1968, if approved, will be apportioned to States in the approximate amounts shown:

State	*Amount*
Alabama	$1, 062. 7
Alaska	594. 2
Arizona	828. 9
Arkansas	799. 4
California	3, 476. 7
Colorado	879. 3
Connecticut	1, 061. 1
Delaware	610. 1
Florida	1, 590. 7
Georgia	1, 151. 7
Hawaii	727. 3
Idaho	648. 3
Illinois	2, 412. 8
Indiana	1, 363. 6
Iowa	1, 089. 0
Kansas	915. 1
Kentucky	1, 169. 6
Louisiana	1, 132. 9
Maine	719. 9
Maryland	1, 317. 5
Massachusetts	1, 439. 5
Michigan	2, 081. 9
Minnesota	1, 167. 6
Mississippi	824. 8
Missouri	1, 479. 4
Montana	739. 0

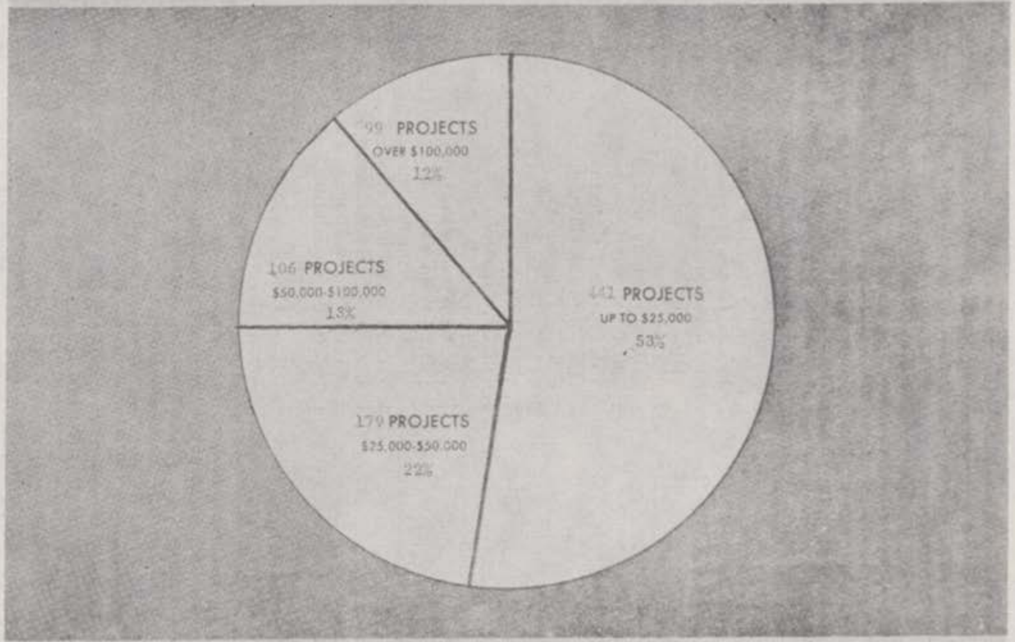
STATE AND LOCAL FUNDED PROJECTS

(Number, Amount and Percent of Total)



The above pie chart shows for projects heretofore approved the numbers of projects by dollar size that have been approved, cumulative to December 15, 1966.

2. FEDERAL PROGRAM

Activity	Amount available, 1966	Amount available, 1967	Estimate, 1968	Increase (+) or decrease (−) compared with 1967
Federal program	$42,358,431	$41,737,000	$74,225,000	+$32,488,000

2. *Federal program.*—A total of $74,225,000 is requested for fiscal year 1968 to provide funds for the acquisition of land and water areas by the National Park Service, Forest Service and the Bureau of Sport Fisheries and Wildlife. Funds also are requested for the Bureau of Outdoor Recreation to be allocated to the land acquiring agencies for emergency planning of newly authorized areas and for possible acquisition of prime tracts of land.

National Park Service	$48,225,000
Forest Service	18,000,000
Bureau of Sport Fisheries and Wildlife	3,000,000
Bureau of Outdoor Recreation	5,000,000
Total	74,225,000

Need for funds requested.—The funds requested for acquiring land and water areas are to assist in meeting the needs of an increasingly heavy visitor load on Federal recreation areas and to acquire areas suitable for preserving certain species of fish or wildlife threatened with extinction.

One of the best indicators of need for additional Federal recreation lands is the overcrowded conditions of existing areas. The visitor load increases markedly each year making it difficult to overcome these overcrowded conditions. Furthermore, public access to the recreation lands and to the lakes, streams and the ocean beaches has diminished by reason of such areas being acquired by private interests or converted to other than recreation purposes. All of these facts lend support to the proposed acquisition of additional lands for public use.

Sec. 6(a) of the Land and Water Conservation Fund Act of 1965 authorizes the use of moneys appropriated from the Fund for acquisition of land, waters, or interests in land or waters. There are quoted below provisions of the Act related to the acquisition of such areas:

"*National Park System; Recreation Areas.*—Within the exterior boundaries of areas of the national park system now or hereafter authorized or established and of areas now or hereafter authorized to be administered by the Secretary of the Interior for outdoor recreation purposes.

"*National Forest System.*—Inholdings within (a) wilderness areas of the National Forest System, and (b) other areas of national forests as the boundaries of those forests exist on the effective date of this Act which other areas are primarily of value for outdoor recreation purposes: Provided, that lands outside of but adjacent to an existing national forest boundary, not to exceed five hundred acres in the case of any one forest, which would comprise an integral part of a forest recreational management area may also be acquired with moneys appropriated from this fund: Provided further, that not more than 15 percentum of the acreage added to the National Forest pursuant to this section shall be west of the 100th meridian.

"*Threatened Species.*—For any national area which may be authorized for the preservation of species of fish and wildlife that are threatened with extinction.

"*Recreation at Refuges.*—For the incidental recreation purposes of Section 2 of the Act of September 28, 1962 (76 Stat. 653; 16 U.S.C. 460 K–1)."

Section 6(a) also provides for payment into miscellaneous receipts as a partial offset of those capital costs, if any, of Federal water development projects hereafter (from January 1, 1965) authorized to be constructed by or pursuant to an Act of Congress which are allocated to public recreation and the enhancement of fish and wildlife values and financed through appropriations to water resource agencies. This provision will not become effective until such time as projects authorized after the date of the Land and Water Conservation Fund Act have been developed and have been designated as areas where fees may be charged. Therefore, no funds are included in this estimate for payment into miscellaneous receipts.

Plan of work.—Land and water areas scheduled to be acquired during fiscal year 1968 are priority acquisitions for meeting recreation needs or preserving endangered species. Proposed acquisitions have been scheduled to the extent possible in those areas of the Nation which show the greatest deficit in recreation resources. Proposed acquisitions by the Forest Service, for example, are mainly in the eastern half of the country. This is where the need is greatest and also is in conformance with the above quoted provisions of the Land and Water Conservation Fund Act that not more than 15 percentum of the acreage acquired by the Forest Service shall be west of the 100th meridian. The estimate for National Park Service involves significant acquisitions in the eastern portion of the country for newly authorized areas.

The estimate for the Bureau of Sport Fisheries and Wildlife is mainly for lands to preserve the Key Deer in Florida and the Columbia Whitetailed deer in Washington.

The need for the funds by each agency is identified below:

NATIONAL PARK SERVICE, $48,225,000

The request of $48,225,000 is an increase of $24,754,000 over the amount appropriated for fiscal year 1967. This relatively large increase is requested for the deliberate purpose of obtaining sufficient funds to begin an effective program of combating land price escalation. It has been determined that one of the best ways of overcoming spiraling land costs is to buy as much of the lands as possible as soon as an area has been authorized by Congress. This action allows the Government to establish a land price pattern and decreases the chances of major speculations. With this purpose in mind, the acquisition program of the National Park Service for fiscal year 1968, contemplates utilizing about $43.9 million of the $48.2 million requested to purchase lands in newly authorized areas.

The newly authorized areas and inholdings in which most of these funds will be utilized and the amount programed for each are listed below:

NEWLY AUTHORIZED AREAS

	Amount
Whiskeytown-Shasta National Recreation Area	$6,000,000
Lake Mead National Recreation Area	783,000
Indiana Dunes National Lakeshore	6,500,000
Assateague Island National Seashore	6,439,100
Piscataway Park, Maryland	2,738,900
Pictured Rock National Lakeshore	800,000
Delaware Water Gap National Recreation Area	11,000,000
Fire Island National Seashore	3,864,900
Guadalupe Mountain National Park	1,800,000
San Juan Island National Historic Park	1,750,000
All other proposed acquisitions, less than $500,000 per unit	2,247,700
Subtotal	43,923,600

INHOLDINGS

Everglades National Park	1,048,000
Virgin Islands	511,300
Grand Teton National Park	870,200
All other proposed acquisitions, less than $500,000 per unit	1,871,900
Subtotal	4,301,400
Total amount programed	48,225,000

The need to buy lands in newly authorized areas before speculation occurs is the primary purpose of seeking an advance of $32 million to the Land and Water Conservation Fund from the general fund of the Treasury.

With the increase in staff requested for fiscal year 1968, the National Park Service will be able to utilize effectively the increased funds requested and should move ahead in acquiring these lands in an orderly manner.

FOREST SERVICE, $18,000,000

Public recreation use of the National Forest System reached a new high in calendar year 1965 with an estimated 160,000,000 visitor-days. Recreation use is increasing at an annual rate of 10 percent. This places increased urgency to acquire additional recreation lands suitable for recreation development and enjoyment. For example, the National Forest Recreation Survey shows that 16,900 additional recreation sites are needed in order to provide projects required at one time capacity for 2,500,000 visitors.

The Land and Water Conservation Fund provides the necessary financing to acquire lands for new recreation facilities, for expansion of existing campgrounds and other facilities, protection of the wilderness system, and for other recreation uses. Acquisition of many of the required lands will provide an additional benefit through a practical program for recreation development in economically depressed rural areas with increased growth of ourist and other recreation use industries in these areas.

In the recommended fiscal year 1968 program for the Forest Service, there is continued emphasis to acquire recreation lands serving the population centers of the Eastern United States. Under the $18,000,000 program, the Forest Service proposes to acquire 91.7 percent of the acreage east of the 100 meridian at a cost of $13,377,800; with 8.3 percent of the acreage in the western United States at a cost of $4,622,200. All of the lands in the east are within three (3) hours driving time of at least one major population center of 50,000 people and are within a day's driving time of at least one of the eighteen (18) largest population centers of the east.

The program in the western part of the United States includes 2,601 acres located in the wilderness system or in primitive areas under study for possible inclusion in the wilderness system. Subdivision or other adverse use of these lands would severely damage the purposes for which the areas were established. Failure to acquire these properties as they are available will also result in continued escalation of land prices in the future.

Any appropriation made available to the Forest Service from the Land and Water Conservation Fund will be expended for the acquisition of lands, waters, or interests therein under authorities of the Act of March 1, 1911, as amended (16 U.S.C. 513–519), the Act of August 3, 1956 (7 U.S.C. 428a), and/or the special acts creating National Recreation Areas.

BUREAU OF SPORT FISHERIES AND WILDLIFE

The estimate of $3,000,000 is for land acquisition for propagation and preservation of endangered species of native wildlife. The Endangered Species Preservation Act (80 Stat. 926) authorizes the use of Land and Water Conservation Fund moneys to buy land for restoration and propagation of threatened species. It also amends the Key Deer Refuge Act by removing the limitation of 1,000 acres on acquired land and by removing the prohibition against condemnation of lands traversed by U.S. Highway No. 1, except for lands within 1,000 feet of either side of the Highway; and changes the limitation on appropriated funds that may be used for the acquisition of lands for the refuge from $35,000 to $2,035,000. The Land and Water Conservation Fund Act authorizes the use of "Fund" moneys to buy land for the preservation of threatened species if otherwise authorized by law. Funds requested for fiscal year 1968 will be used to acquire lands to preserve the Key Deer and the Columbia White-tailed Deer and to acquire lands for an endangered species research center.

Key Deer.—The proposed acquisition is in Monroe County, Florida, comprising 1,854 acres at an estimated cost of $1,900,000. The diminutive Key Deer is limited to a specific habitat found in the lower Florida Keys. The existing National Key Deer Refuge includes 835 acres acquired or withdrawn under special legislation. An additional 465 acres have been withdrawn within the Great White Heron Refuge. In addition, some lands are leased for Key Deer management and protection, but these can be terminated on 90 day's notice. The proposed acquisition is to preserve enough habitat to maintain a minimum herd to assure survival of the population in a natural environment. Though the Key Deer population has increased from less than 50 in 1950 to about 400 animals at present, the trends and patterns of real estate development point to very serious problems in the future. Real estate developments, built in response to an increasing demand for weekend and vacation facilities on the Keys, are encroaching on the Key Deer habitat and forcing land prices to skyrocket. The lease program is beginning to lose its effectiveness and is destined to fail, as a continuing program. Outright purchase in fee before the land is cleared and drained is the only means of assuring the preservation of Key Deer habitat.

Columbia White-tailed Deer.—The proposed acquisition is in Wahkiakum County, Washington, comprising an area of about 2,000 acres, of which 970 acres are proposed for acquisition in fiscal year 1968 at a cost of $350,000. The Columbia White-tailed Deer is threatened with extinction from loss to intensive agricultural development of its selected and limited habitat. Elimination of normal annual floods, as well as periodic floods of disastrous proportions, has made it economically feasible to clear, level, and plant the river bottom lands historically occupied by the Columbia White-tailed Deer. At one time the deer were widely distributed in the Lower Columbia River Basin from the Dalles to Astoria, and along the lower reaches of the Willamette and Lewis Rivers. The last of the Columbia White-tailed Deer habitat is being cleared at a rapid rate. The deer are very restricted in range and highly selective in habitat and it has been found that they cannot adapt to available coastal range woodlands occupied by the Columbia Black-tailed Deer.

Patuxent Endangered Species Research Center.—The proposed acquisition is in Prince Georges County, Maryland, 15 miles northeast of Washington, D.C. The proposal includes about 470 acres of which 253 acres are included in the fiscal year 1968 program. The estimated cost of the 253 acres is $750,000. Since this is the maximum amount allowed by the Endangered Species Preservation Act for acquisition of any one area, specific authority must be obtained for the additional land needed.

Detailed research is prerequisite to a full program to preserve endangered species. The limiting biological factors must be determined for each species before a realistic program can be developed. The Endangered Species Research Center which is an addition to the Patuxent Wildlife Research Center will provide laboratory facilities for research in nutritional requirements, genetics, disease, propagation, and behavior. The station will hold a variety of species to serve as breeding stock for testing, captive propagation, imprinting, and release. One of the major objectives of the station is to develop techniques for propagating certain species in captivity, and reintroducing the resulting stock into the wild.

BUREAU OF OUTDOOR RECREATION

An amount of $5 million is requested for the Bureau of Outdoor Recreation for emergency planning and for acquisition of priority tracts of land. The purpose of seeking such sum is to allow the Federal Government to move ahead immediately after the enactment of authorizing legislation to perform all of the preliminary surveys and investigations that are associated with land acquisitions and to acquire key tracts of lands that appear to be most significant for recreation needs in the particular area. The Bureau believes that through such a procedure significant benefits will accrue to the Federal Government because (1) actions can be taken to acquire lands before speculators have moved into the area or to stop subdivision work underway and (2) the initial purchase by the Federal Government may establish a price pattern that will be helpful in future purchase negotiations or in establishing values in the event an action is taken to the courts.

The funds requested would be utilized in establishing land ownership data, topographic and photogrammetric mapping and preparing the necessary legal descriptions. Also included will be the initial needs for tract appraisals and title evidence. Normally several months are involved in contracting for and obtaining the delivery of the complete mapping and surveying required in land purchases and for assembling other basic legal and engineering information. With funding available immediately upon authorization much time can be saved.

The major portion of the funds is expected to be utilized in acquiring those tracts which are the most desirable in meeting the recreation needs or in instances where willing sellers offer their lands at very attractive prices.

The amount of funds proposed for this purpose is less than five percent of the total Land and Water Conservation Fund budget. It is believed that this is a very reasonable request in view of the potential benefits to the Federal Government through such a program.

The Bureau would not perform the preliminary land work or purchase tracts. It would allocate funds to the Federal land acquiring agencies on a case by case basis to provide these agencies with the financial resources needed to move ahead promptly.

In accordance with directives contained in the House and Senate Reports on the Interior and Related Agencies Appropriations Bill, 1966 the Bureau has reviewed and evaluated the lands proposed to be acquired with funds requested in 1968.

The areas proposed for purchase and descriptive data thereon are included in a separate document made available to the committee.

Status of program.—Funds available and those requested for 1968 for purchasing land and water areas are listed:

[In thousands of dollars]

	National Park Service	Forest Service	Bureau of Sport Fisheries and Wildlife	Total
Fiscal year 1965—Appropriated	$4,805.0	$750.0	----------	$5,555.0
Fiscal year 1966—Appropriated	21,371.5	16,894.4	----------	38,265.9
Fiscal year 1967—Appropriated	23,471.5	18,093.0	$172.5	41,737.0
Fiscal year 1968—Budget request	48,225.0	18,000.0	3,000.0	69,225.0
Total	97,873.0	53,737.4	3,172.5	154,782.9

Of the funds appropriated through fiscal year 1967 the Federal agencies had obligations and purchase commitments totaling more than $40 million as of November 30, 1966. The amount by agency is shown:

	Obligations	Purchase commitments
National Park Service	$16,202,698	$5,032,609
Forest Service	18,404,334	704,659
Bureau of Sport Fisheries and Wildlife	3,824	----------
Total	34,610,856	5,737,268

Although the land acquisition program has been accelerated substantially in recent months, funds are not obligated until purchase agreements have been signed. Thus, obligations do not reflect a true picture of progress.

3. ADMINISTRATIVE EXPENSES

Activity	Amount available, 1966	Amount available, 1967	Estimate, 1968	Increase (+) or decrease (−) compared with 1967
Administrative expenses	$1,440,000	$2,560,000	$2,775,000	+$215,000

3. *Administrative expenses.*—A total of $2,775,000 is requested to finance the cost of administering the Federal and State programs under the Land and Water Conservation Fund Act. These funds also finance the cost of printing and selling the Federal Recreation Area entrance permits and the development and overview of the admission and user fees program applicable to designated Federal recreation areas.

Need for funds requested.—The increase requested will provide the funds to finance additional staff to conduct inspections of grants projects and to administer provisions of Title VI of the Civil Rights Act of 1964. Present staff available to the Bureau is not adequate to process the large number of project proposals and also do the necessary compliance and inspection work that needs to be done. The Bureau is also guided by the House Appropriations Committee directive that it be more aggressive in informing the public on the Federal Recreation Area Entrance Permit. Funds are needed for entering into sales agreements with a variety of organizations and agencies and for preparing materials informing the public of areas designated as fee areas and for preparing related informational materials.

Plan of work.—The major activities of the Bureau in fiscal year 1968 in administering the State and Federal programs under this fund include:

(a) Reviewing, evaluating and approving Statewide Outdoor Recreation Plans. State plans will be reviewed to determine their adequacy for continued eligibility of the State to receive financial assistance from the Land and Water Conservation Fund for the acquisition and development of outdoor recreation areas and facilities.

Greater emphasis is being placed on State Plans as the coordinating instrument of all outdoor recreation plans and programs within the States. Consequently, the revised and updated plans which will be submitted to the Bureau in the future are expected to be more comprehensive.

The Bureau will expect the updated plans to be more specific in setting forth the resources and needs of the State and in reflecting demands for outdoor recreation. Particular attention will be given to the State's proposals for sharing the benefits of the Fund with local governments, for enhancing the natural environment and for meeting urban needs. Approximately 26 revised plans are expected to be reviewed during fiscal year 1968.

(b) Providing assistance to States in developing Statewide Plans.

The Bureau expects an increasingly heavy load of requests as the States prepare their updated and revised plans in order to continue their eligibility. States must be engaged in a continuous planning program in order to keep their plans updated to qualify for extended periods of eligibility. Many States may continue to get short periods of eligibility, requiring additional refinements and updating of material until they have a plan which is complete in all respects. Such fully comprehensive plans must be qualified within five years from date of approval of their first plan. Frequently the States just do not have the technical skills to take full advantage of the opportunities offered under the Land and Water Conservation Fund Act. If the Bureau is unable to provide this needed planning assistance, there is a possibility that many of the States' programs will be seriously delayed. In addition, only the Bureau is in a position to coordinate State plans adequately with those of various Federal agencies.

(c) Reviewing, evaluating and processing an estimated 2,500 grants submitted by States.

Project proposals will be reviewed to determine the manner and degree to which they conform to the Statewide outdoor recreation plans.

After it has been determined that projects are in accordance with the State plans, it is necessary to further review the proposals for conformance to program criteria and policy. Care must be given to see that proposals seek to improve the quality of the environment and will enhance the capacity of the State to provide a significant outdoor recreation opportunities. Consultations may be held with representatives of other Federal, State and local agencies, and on occasion with private groups and individuals. In many instances it may be necessary to visit the site. The Bureau must also ascertain the effectiveness of the practices, procedures, and past performance of the applicant.

The number of proposals to be received is estimated to increase from 1,750 in fiscal year 1967 to 2,500 in fiscal year 1968. Also, the quality of the proposals will be given greater consideration as the grantees gain experience. Experience has shown that the individual projects have been larger than expected, with corresponding increases in complexity and in the time required to review the projects.

(d) Administration of on-going projects.

It will be necessary in 1968 to supervise an estimated 2,621 projects underway. This function represents a major part of the total workload under the grants-in-aid program.

Project progress reports must be reviewed, and on-site inspections will be made, as necessary, to check for compliance with terms of the project agreement and for compliance with civil rights laws and regulations.

Title VI of the Civil Rights Act places a burden on the Bureau that was not contemplated at the outset of the program. Under this Act and based on instructions issued thereunder, the Bureau must (1) assure that States agree to comply; (2) obtain reports periodically on compliance and review these reports; (3) make on-site reviews to assure compliance and check with local sources; (4) investigate complaints, hold hearings, issue requests thereon, and take corrective action; and (5) report weekly and monthly to the Office of the Secretary on this activity.

Without more experience, an accurate workload pattern cannot be projected, but it seems reasonable that Title VI reviews will run as high as 1,000 projects annually and considerable travel will be involved.

The rate of progress on the project will also be measured. Proposed amendments of projects must be reviewed and negotiations will be conducted on changes which involve significant deviations from the scope of the original agreement or in the amount of assistance required. Requests for payments will be reviewed, comparing the amounts requested with the rate of progress accomplished before payments are made. The volume of reports and correspondence on specific projects will be considerable, and files and records must be set up and adequately maintained for proper administration.

It is estimated that engineering and appraisal review and action in 1968 will be required on approximately 600 complicated appraisals, plans, and specifications. The size of individual projects is larger than expected making it necessary to review appraisals and plans and specifications on a larger proportion of projects.

(e) Audit of grants-in-aid projects.

The estimate of $2,775,000 includes funds for auditing State financial records which relate to expenditures in connection with approved projects. This function will be performed by auditors in the Office of the Secretary. Audit reports are submitted to the Bureau and the Bureau must provide the staff to follow up on audit findings and insure that corrective actions are taken. This requires a careful review of the audit reports, a determination of what action, if any, is to be taken on audit finding, the preparation of letters to States setting forth corrective actions needed and obtaining assurances from States that corrective action has been taken. On many occasions, the Bureau provides advisory assistance to the States in developing adequate accounts to meet Federal requirements.

(f) Development of long-range program—Federal land acquisition.

In fiscal year 1968, emphasis will be placed on assisting the Federal land acquiring agencies in developing long-range land use and recreation development plan for each management unit. Such plans will enable the agencies and the Bureau of Outdoor Recreation to make meaningful judgment as to the lands needed for optimum recreational utilization of the management unit and the establishment of acquisition priorities. The immediate goal is a Federal land acquisition program coordinated with local, State, regional, and national recreation plans and needs. This will require a considerable degree of coordination and the establishment of working arrangements at all Government levels.

(g) Reviews of proposed Federal land acquisitions.

The Bureau is charged with the responsibility for reviewing on-site or otherwise the lands programed by Federal agencies for acquisition from the Land and Water Conservation Fund. The heaviest workload arises from on-site reviews which the Bureau conducts under the following guidelines:

1. *On-site review of management units.*—The Bureau conducts an on-site review of the agency five year management unit land acquisition program if one or more of the following conditions exist.

(a) The total estimated cost of acquisition during the budget year is $300,000 or more.

(b) The total estimated cost of improvements to be acquired in the budget year is $100,000 or more.

(c) Estimated land acquisition costs are estimated to total $1,000,000 or more during the five-year program

2. *On-site review of tracts.*—The Bureau conducts an on-site review of individual tracts proposed for acquisition if one or more of the following conditions exist:

(a) Total estimated cost of the tract exceeds $25,000.

(b) Total estimated value of improvements exceeds $10,000.

(c) Total estimated cost of tract exceeds $300 per acre; except unimproved lots in subdivisions with values in excess of $300 per acre may be inspected on a sample basis or grouped together and covered in a single report.

(d) Total area of tract exceeds 1,000 acres.

(h) Reprograming—Federal land acquisition.

Because of the numerous properties involved, the escalation of land values, the time lag between budget estimates and acquisition, the impracticability of appraising and securing options in advance of budgeting and the need to acquire high priority tracts that become available, program adjustments will continue to be a big factor in the land acquisition workload.

Tracks proposed for substitution for those in the program must be inspected and checked for conformance with overall plans and for adherence to criteria, as well as for the basis used in establishing the estimated costs.

(i) Coordination of the administration of recreation entrance and user fees and the designation of Federal charge areas.

This function has a direct effect on the revenues collected from recreation fees deposited in the Land and Water Conservation Fund and it is vital that the Bureau's efforts in this area be expanded. The Bureau has taken a more active role in this field but has not been able to devote adequate efforts at the field level to study the comparisons of fees charged at Federal, State, and private recreation areas and the possible expansion of the fee system to additional Federal areas.

Also, even though this program is almost two years old, there is a general lack of public awareness about the purpose of the Land and Water Conservation Fund Act program, particularly with regard to knowledge about the fees and the designated Federal charge areas. This situation was called to the Bureau's attention and was discussed in hearings before the House Subcommittee on Appropriations early this year. Efforts have been instituted to overcome this situation and continued efforts will be made in fiscal year 1968.

Status of program.—Although the Land and Water Conservation Act became effective two years ago (January 1, 1965), an extended tooling-up period was necessary. The Federal land acquiring agencies had never before experienced a workload of this magnitude and the States in many instances were not staffed to get the grant program underway promptly, particularly as it affects local units of government. Furthermore, the Bureau of Outdoor Recreation had to staff up and develop the detailed regulations and procedures for administering the program.

Each State was required, under the Act, to prepare a Statewide Outdoor Recreation Plan as a prerequisite to obtaining financial assistance for land acquisition and development projects. As a consequence it was about October 1965 before the first project proposals were received by the Bureau.

The volume was low at first but increased to such an extent that the Bureau had a backlog of 695 projects or amendments amounting to $72,800,000 as of August 31, 1966. Some gains are being made in overcoming the backlog and as of December 31, 1966, 577 projects or amendments amounting to $62,108,228 were on hand. The Bureau has processed an average of 157 projects or amendments averaging $12.2 million each month during the period September–December 1966.

The Bureau has undertaken to mesh its grants-in-aid program with those grants programs being undertaken by other Federal agencies to avoid duplication of Federal efforts. Consultations have been undertaken with several agencies of the Department of Housing and Urban Development, the Economic Development Administration, the Office of Regional Economic Development, the Soil Conservation Service, Agriculture Stabilization and Conservation Service, the Office of Economic Opportunity, Office of Education, Appalachian Regional Commission, and the Bureau of Sport Fisheries and Wildlife. In some cases, formal agreements have been worked out, notably those required under Executive Order 11237 relating to coordination between the Fund program and the Open Space Program of DHUD. Others have resulted in some procedural arrangements and in tentative proposals to undertake more formal arrangements when staff time would allow such action.

To facilitate the development of the Federal program, the following coordination memorandums have been promulgated in consultation with the land acquiring agencies:

1. Coordination Memorandum No. 5—"Request for Federal Land Acquisition Programs": This memorandum established the policy and procedural quidelines to be followed in the development of the coordinated Federal land acquisition program.

2. Coordination Memorandum No. 7—"Reprograming for Federal Outdoor Recreation Land Acquisition." The purpose of this coordination memorandum was to set forth the guidelines governing the reprograming of funds appropriated for Federal land acquisition from the Land and Water Conservation Fund and the procedures to be followed by participating Federal agencies in submitting reprograming proposals to the Bureau of Outdoor Recreation for processing and approval within the authorities established by the House and Senate Appropriations Committees. Among other things this memorandum established guidelines and criteria for the deletion of tracts from approved programs, addition of new tracts, maintenance of records and preparation of reports, including semiannual reports of accomplishments and quarterly reprograming reports.

A systematic review of long-range recreation land acquisition and development programs as planned for each management unit (a National Park or Forest) by the acquiring agency has been undertaken by the Bureau of Outdoor Recreation. This type of review is essential if meaningful evaluations are to be made of the individual tracts proposed for acquisition.

This Bureau has strongly urged the land acquiring agencies to improve their techniques in the preparation of land cost estimates so that these estimates will reflect fair market value *at the time funds become available to purchase the land.* Recognizing that this lag will be at a minimum of 12 months, acquiring agencies are also being encouraged to determine, as far as possible, whether the owners of a tract to be included in the budget request will be willing to sell at a fair market value, when funds are available. The goal is to have cost estimates prepared so that they will accurately reflect for each tract the fair market value of the land, improvements, if any, and other interests to be acquired. However, it is realized that because of varying and unforeseen upward trends in real estate prices or other factors which cannot be determined without an expensive full appraisal and time-consuming detailed inspection, the estimated cost of some individual tracts may vary from final purchase price.

The following table shows the status of the Land and Water Conservation Fund Programs as of November 30, 1966:

	Forest Service	Park Service	States
Revenues accrued and allotted	$27,117,336	$38,467,605	$127,181,992
Deduct:			
Obligations through Nov. 30, 1966	18,404,334	16,202,698	[1] 51,665,000
Purchases underway but title not yet passed to Government	704,659	5,032,609	
Projects approved as technically adequate but funds not yet obligated [2]			42,681,000
Remainder of uncommitted funds	8,008,343	17,232,298	32,835,992

[1] As of Dec. 31, 1966.

[2] States have not requested that funds be obligated. All of these projects may not be financed from available funds.

Itemization of estimate

	Actual, 1966	Estimate, 1967	Estimate, 1968	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$29,072,804	$124,687,000	$164,460,000	+$39,773,000
Transferred to "Operating expenses, Public Buildings Services," General Services administration	4,457	34,914		−34,914
Unobligated balance lapsing	157,131			
Unobligated balance available, start of year	14,267,790	107,148,046	92,426,132	+14,721,914
Unobligated balance available, end of year	107,148,046	92,426,132	69,966,132	−22,460,000

Forest Service	7,339,478	20,980,000	18,500,000	−2,480,000

PREPARED STATEMENT

Chairman HAYDEN. Mr. Crafts, would you please present your statement indicating the activities of the fund during the past fiscal year and its plans for the coming year?

(The statement follows:)

We now turn to the Land and Water Conservation Fund program authorized under Public Law 88-578. This program has been in operation slightly over two years. Its first appropriation was received in May 1965. Through fiscal year 1967, a total of $251 million has been appropriated to the Fund by Congress.

Of this amount, about $90 million has been allocated to the Forest Service, the National Park Service, and the Bureau of Sport Fisheries and Wildlife for acquisition of authorized Federal areas and to the Bureau of Outdoor Recreation for administration. About $160 million has been allocated for matching grants to the States.

The appropriations have been made on the premise that revenues will accrue to the Fund in amounts sufficient to cover the appropriation authorization. In the event that revenues are not sufficient, a proportionate reduction is made in the allocations to the Federal agencies and States. For the fiscal year 1966, revenues were short of financing the full appropriation authorization by less than two per cent.

During the current fiscal year, revenues have accrued at a rate which will be adequate to fully fund the appropriation authorization if collections continue as indicated.

Since the inception of the program and through December 31, 1966, collections have amounted to $202 million. This amount was derived from the following sources:

Status of revenues, as of Dec. 31, 1966 (covers all deposits since inception of fund)

Annual recreation permits	$5, 405, 476. 49
Surplus real property	130, 427, 926. 09
Motorboat fuel taxes	56, 203, 912. 84
Other admission and user fees	10, 259, 180. 18
Total	202, 296, 495. 60

The following table summarizes the distribution of appropriations and estimated revenues to the Fund by sources from the inception of the program through F.Y. 1967.

[In millions of dollars]

	Total, 1965-67	1965	1966	1967
Estimated Federal needs:				
National Park Service	50. 1	4. 8	21. 9	23. 4
Forest Service	36. 1	. 7	17. 3	18. 1
Bureau of Sport Fisheries and Wildlife	. 2			. 2
Administration and contingency	4. 1	. 1	1. 4	2. 6
Total, Federal needs	90. 5	5. 6	40. 6	44. 3
Estimated State needs (Federal portion only on 50-50 basis)	160. 5	10. 4	84. 4	65. 7
Estimated total Federal and State needs	251. 0	16. 0	125. 0	110. 0
Estimated revenues to the fund from existing sources:				
Annual permit	8. 5	. 7	2. 8	5. 0
Other admission and user fees	13. 3	1. 3	5. 0	7. 0
Motoboat fuel tax	61. 0	4. 4	27. 6	29. 0
Surplus real property	170. 3	16. 8	79. 5	74. 0
Total estimated revenue from existing sources	253. 1	23. 2	114. 9	115. 0

State Aspects.—A total of about $160 million has been appropriated for matching grants to the States for the F.Y.'s 1965, 1966, and 1967. Our FY 1968 budget request is $65 million for this purpose. This is almost identical with the amount appropriated for this purpose in FY 1967.

Where do we stand on this program. First, under the terms of the Land and Water Conservation Fund Act, each State must prepare a statewide comprehensive outdoor recreation plan which the Secretary finds adequate before the State is eligible for acquisition or development grants. Most States required a considerable amount of time to prepare plans that were adequate. It was only last month that the last State became eligible to participate. Now, however, all States are actively sharing in the program and as of February 1 we had received 1,822 requests for a total of $181,911,701.

Of this total, we have qualified 1,104 projects for $101,676,897, and have actually signed contracts with the States for 996 projects and 199 project amendments totaling $57,725,225.

The program is now in high gear and for the past four months we have been obligating funds at a rate in excess of $5 million a month. This rate not only will utilize the appropriated backlog but also will utilize the requested appropriation during the 1968 fiscal year. In considering State progress it is important to remember that under the terms of the Act, the money apportioned to the States is available for three fiscal years. This has made it possible for the States to plan their program to mesh with State legislatures, bond issues, and other State actions.

An analysis of the State plans show that future needs are several times present levels of expenditure, but programs have been curtailed by the availability of funds at both Federal and non-Federal levels.

In general, the States are satisfied with our performance. There are some sore spots and policy problems to be worked out. The ability of the Bureau to handle the workload is a key factor. We had a backlog of project applications and were dropping further behind at this time last year. During our appearance before this Committee, we indicated that if the several thousand submittals expected materialized, we would be completely swamped.

Since about August 1965, the States have submitted about 2,000 applications to the Bureau. As expected, this volume was so great and came so suddenly that we were unable to process them in an orderly manner and by August 31, 1966, a backlog of 695 projects, totaling $72.8 million, was on hand. Since that time, we have kept pace with the current monthly volume of about 130 applications and have reduced the backlog to 577 projects amounting to $62 million as of December 31, 1966.

Question has been raised concerning the percentage of development projects as opposed to those for acquisition. About 60 per cent of the dollar value of projects qualified has been for development and 40 per cent for acquisition. The most important reason is that the States and local governments are under heavy pressure from a recreation-minded public that wants to use existing areas now and demands that they be developed to a usable state.

It also reflects the fact that a number of States have earmarked substantial sums of State money for acquisition only. To mention a few where there were bond acquisition issues—New York $125 million, New Jersey $60 million, Pennsylvania $70 million, Rhode Island $5 million and California $80 million. The States in this category have naturally concentrated Federal funds on development. There are other States that are already rich in public lands and thus devote a greater share to development.

The following table summarizes the distribution of the program between State and local governments.

Projects qualified and obligated, by State, county, city, and other agencies as of Dec. 30, 1966

Level of government agency	Projects					
	Qualified			Obligated		
	Number	Amount (thousands)	Percent [1]	Number	Amount (thousands)	Percent [1]
State	480	$70,194	74	412	$35,530	69
Local:						
County	109	3,854	4	98	2,473	5
City	337	12,801	14	301	10,416	20
Other	59	7,497	8	56	3,237	6
All local	505	24,152	26	455	16,126	31
Total	985	94,346	100	867	51,656	100

[1] Based on dollar volume.

In summarizing the State program, let me say that I know of no single action taken by the Federal Government which has done more than the Land and Water Conservation Act to encourage States and local governments to analyze their outdoor recreation needs and to initiate realistic programs to meet them. The planning requirements presented time consuming difficulties initially; but they have been tremendously valuable and now that they have been met, the grant program is accelerating to the level anticipated by the Congress and this Committee in their previous appropriations.

The amount that is being requested this year is considerably less than the States are now in a position to match, but it was purposely held at last year's figure until the States had actually shown by their expenditures that their programs really were in high gear.

Federal Aspects of Program.—Land and Water Conservation Fund amounts requested for fiscal year 1968 for Federal agencies will be used for the acqujsition of land and water areas for outdoor recreation purposes and for the preservation of endangered species of wildlife. The request of $74,225,000 will be allocated as shown:

National Park Service	$48, 225, 000
Forest Service	18, 000, 000
Bureau of Sport Fisheries and Wildlife	3, 000, 000
Bureau of Outdoor Recreation	5, 000, 000
Total	74, 225, 000

Of the allocations to the Federal agencies, $32 million will be derived as an advance from the general fund of the Treasury and $42,225,000 will be derived from revenues from entrance and user fees, taxes on motorboat fuels and sales of surplus property. The latter amount represents approximately 40 per cent of total revenues expected to accrue to the Fund during the fiscal year—the remaining 60 per cent as previously discussed, will be allocated to the States.

The full $32 million advance will be used by the Federal agencies, primarily the National Park Service, as a first step in alleviating the price escalation of recreation lands. This it will do by providing funds to purchase some of these lands before the spiralling prices have made them prohibitively expensive.

In order to overcome the escalating costs of land insofar as possible, the $32 million will be devoted to land acquisition within the newly authorized National Park System areas such as Delaware Water Gap National Recreation Area, Pennsylvania and New Jersey; Fire Island National Seashore, New York; Assateague Island National Seashore, Maryland; Indiana Dunes National Lakeshore, Indiana; and Whiskeytown National Recreation Area, California.

The Forest Service allocation will be used mainly for acquiring recreation lands in the eastern part of the country—about 92 per cent of the acreage acquired will be east of the 100th meridian.

The funds for the Bureau of Sport Fisheries and Wildlife will finance lands for the Florida key deer, the Columbia (Washington) White-tailed deer and for a threatened species research station at Patuxent, Maryland.

As another step in combating land price increases, the Bureau of Outdoor Recreation is requesting $5,000,000. This is to be allocated to Federal agencies so that they can begin verification of property lines, mapping, development of ownership data, and appraisals immediately in areas where land acquisition is newly authorized. The funds also would be used to acquire quickly key tracts in the newly authorized areas which are exceptionally desirable for meeting outdoor recreation needs or where willing sellers offer their lands at very attractive prices.

The Bureau of Outdoor Recreation has published a report entitled "Recreation Land Price Escalation." I shall be glad to discuss that report with you, especially its recommendations. I call your particular attention to the long range 10-year program of estimated needs, revenues, and possible new sources of income, as tabulated on page 16 of the report. This long-range program, for convenience, is attached to my testimony today.

The prospective needs, revenues, and deficits and potential sources of revenue to overcome the deficits ard summarized below:

[In billions]

	Fiscal year 1968–77 needs	Fiscal year 1968–77 revenues	Deficit
Federal	$1.1	$0.4	−$0.7
State	2.5	.5	−2.0
Total	3.6	.9	−2.7

Additional revenues to the Land and Water Conservation Fund would overcome the ten-year deficit between outdoor recreation needs and prospective revenues and are summarized as follows:

	Billions
Estimated total deficit, fiscal year 1968–77	−$2.7
Proposals for overcoming deficit, fiscal year 1968–77:	
(1) Advance appropriation now authorized	+.5
(2) Unearmarked Interior mineral receipts	+1.5
(3) Unearmarked Forest Service receipts	+.7
Total	+2.7

Returning to the current situation, the status of funds appropriated to the Land and Water Conservation Fund through December of this year is summarized below.

	Appropriated, 1965–67	Cash allocated as of Dec. 31, 1966	Amount obligated as of Dec. 31, 1966	Portion of cash allocated that is obligated (percent)
National Park Service	$49,647,980.27	$39,677,319.45	$26,654,211	67
Forest Service	35,737,450.82	28,049,674.25	19,835,767	71
Sports Fisheries	172,500.00	98,861.97	4,336	4
States	158,486,717.54	[1] 130,567,530.62	51,655,640	40
BOR 1965–66	1,500,240.15	1,343,109.31	1,356,449	
BOR 1967	2,560,000.00	2,560,000.00	1,219,984	48
Total	[2] 248,104,888.78	202,296,495.60	[3] 100,726,387	50

[1] As of Feb. 10, 1967, the amount obligated was $57,725,225.

[2] Due to an underrun of revenues to the fund of $2,900,000 in fiscal year 1966, this amount is less than the summation of the appropriated amounts shown in the appropriations acts for fiscal year 1965 through fiscal year 1967 of $251,000,000.

[3] Includes options accepted.

It is apparent that both the National Park Service and the Forest Service had obligated about 70 percent of the moneys available to them as of December 31. Both agencies are increasing their rates of obligation and by the end of this fiscal year, it is expected that obligations will nearly equal allocations.

With the moneys expended through December, the Forest Service had purchased about 130 thousand acres and the Park Service about 21 thousand acreas.

As in previous years, you have already been furnished both a summary and individual tract listing of the 1968 recommended program for the National Park Service, Forest Service and the Bureau of Sport Fisheries and Wildlife. We and the agencies are prepared to answer questions that you may have on those detailed schedules as you may wish.

In the administration of the Federal aspects of the Land and Water Conservation Fund, as with the State aspects, numerous policy questions have arisen. There have been problems associated with recreation admission and user fees. Both this Bureau and the acquisition agencies have been concerned over the extent of reprogramming that has occurred over the past two years. Some of this doubtless is inevitable but if it becomes too extensive, questions of good faith and competence of the agencies involved are at stake. Similarly we are being confronted now with court awards in eminent domain cases that are running substantially over the original desposits.

Accordingly, there have been prepared with the cooperation of the agencies concerned two reports, one on each of these subjects; namely, the reprogramming of tracts approved by the Appropriations Committee, and the effect on available funds of court awards through eminent domain. I am submitting at this time each of these reports to the Committee for its information and would welcome any policy guidance that the Committee would care to express after it has had an opportunity to consider them. We shall we glad to summarize these reports in any detail you may wish.

Mr. Chairman, this concludes my prepared testimony. I appreciate deeply the courtesy, patience, and responsiveness of this Committee in past years in activating the Land and Water Conservation Fund and the Organic Act of the Bureau of Outdoor Recreation. We do our best to comply with your oversight guidelines, to administer the program efficiently, to be forthright in explaining it, and to answer your questions to the best of our ability.

Estimated Federal and State outdoor recreation needs, revenues to the land and water conservation fund from presently authorized sources, and amounts from proposed new sources, by years, during period, fiscal years 1968–77

[In millions of dollars]

	Fiscal years										
	1968	1969	1970	1971	1972	1973	1974	1975	1976	1977	1968–77

Estimated total revenues from existing and proposed sources	198	375	400	440	425	380	355	345	335	335	3,588

---

[1] Based on authorization of a Redwood National Park and a supplemental appropriation of $56,000,000 (utilizing the advance appropriation authority) for land acquisitions in the park.

[2] Under existing law, taxes relating to motorboat fuels will expire on Sept. 30, 1972. Hence, revenues to the fund from that source for fiscal year 1973 will be about $13,000,000 and, for subsequent years, there will be no revenues from this source.

[3] This amount would be about $192,000,000 more if the tax on motorboat fuels is extended beyond the present expiration date of Sept. 30, 1972.

[4] Under existing law, any advance appropriations made in earlier years would be repaid beginning with fiscal year 1976 by utilizing ½ of the annual revenues to the fund. Hence, only half of the amounts shown for fiscal year 1976 and 1977 would be available for appropriation for outdoor recreation purposes, or a combined total of $73,000,000 less than the amount shown.

[5] There is no way to determine now how much of the $800,000,000 of the revenues that have been collected from the Outer Continental Shelf and presently held in escrow pending court decision may be released in the future to the United States and how much to Louisiana. The amount which may be released to the United States may be larger or smaller than shown which is the additional amount needed to meet outdoor recreation needs.

RECEIPTS FROM FISCAL YEARS 1967-68

Chairman HAYDEN. Will you please place in the record a statement of the estimated receipts to the Land and Water Conservation fund from the various sources established by law?

Show these for fiscal years 1967 and 1968.

Mr. CRAFTS. Yes, sir, I will do that. They are in the statement which I am submitting for the record.

(The information follows:)

[In millions of dollars]

	Fiscal year 1967	Fiscal year 1968
Estimated revenues to the fund from existing sources:		
Annual permit	5	5
Other admission and user fees	7	7
Motorboat fuel tax	29	31
Surplus real property	74	72
Total estimated revenues from existing sources	115	115

RECREATION PERMIT SALES

Chairman HAYDEN. I note that the estimate of income from the annual recreation permit is still below its expectations and that one of the reasons is a low estimate on the number of families who would purchase the permit.

Is the lower number of families a result of inability to afford the permit or a smaller number of those who are interested in purchasing a year's entrance to Federal areas?

Mr. CRAFTS. I think really the answer to that is neither. The visitations to the Federal areas in general have gone up. We do not have evidence that the $7 is a prohibitive price. I think we are coming to the conclusion on the other hand that in some respects it is too good a bargain. Among the basic reasons for the permit not being sold in larger numbers includes the decision on the part of some of the participating agencies not to designate areas which might be designated.

There are problems of lack of authority for enforcement. There are problems as to the length of the year to which it is feasible to apply these fees. There are many other problems. But I do not think it goes to the question of the price of the permit or the fact that there are small numbers of people using the recreation areas.

Senator BIBLE. Might I ask a question at that point, Mr. Chairman.

Chairman HAYDEN. Certainly.

PERMIT REVENUES

Senator BIBLE. At the time that the land and water conservation fund was established it was estimated, if my memory is right, that you would receive something in the neighborhood of $15 million per year from the sale of these $7 permits.

Is that right or wrong?

Mr. CRAFTS. I think you are a little low, Senator Bible. We made estimates but I think the estimate was around $25 million a year that we expected to get from the sale of the permit.

Senator BIBLE. How much actually was received in the first year of its operation?

Mr. CRAFTS. We got about $1 million in 1965, which was a partial year. We got $3 million in 1966. We are getting $5 million this year, as nearly as we can judge in 1967. It is gradually going up. You see it is very substantially underrunning the estimates.

Of course in addition to the revenues from the permit there are revenues from user fees.

Senator BIBLE. I am just talking about the permit.

Mr. CRAFTS. The permit itself, last year it was $3 million, this year it is about $5 million.

Senator BIBLE. When you say this year you are using that on a calendar basis?

Mr. CRAFTS. Fiscal 1967.

Senator BIBLE. Your fiscal 1967 will bring you about $5 million?

Mr. CRAFTS. That is right.

Senator BIBLE. You are estimating fiscal 1968 will bring you about $7 million or $8 million?

Mr. CRAFTS. Yes.

Senator BIBLE. It is still way below your best judgment at the time we passed the Land and Water Conservation Act?

RECREATION LAND COSTS STUDY

Mr. CRAFTS. Yes, that is right. I don't know whether this is the time to introduce it or not but we have prepared here and we have just received them this morning, as a matter of fact, a study of what is happening to the price of recreation land. This is the recreation land price escalation report which was requested of us by the House. I would like to make it available to the committee members. We have in here a 10-year program in which we price out both the estimated needs of the agencies and the States and we also price out the prospect of revenues and the source of revenues.

This is the latest and best long-range program that the Department has. I would like to submit it to the committee.

Senator BIBLE. Mr. Chairman, I am very anxious to follow this study. It was my intention at a later time and possibly after you concluded your questions, to try to go into this in depth. I might even ask Mr. Crafts to come back at a later time after I have had the benefit of reading the study which I have not seen but the purpose of my question was to try to pinpoint one single facet of it and that was to find out how much he receives from the permits per year, the so-called $7 permit.

He has answered it very well. He received $3 million last year. He anticipates he will receive $5 million this year and he hopes to receive $7 million next year but this is still below the $25 million which is the predicate on which we established the land and water conservation fund.

Chairman HAYDEN. You are speaking as a member of the committee that authorized it.

Senator BIBLE. More particularly as a member of both committees but I think this is a very critical part in the creation of new parks because of the accelerated land cost. I don't want to go into that at this time. I just wanted to cover the revenue part with these preliminary questions.

ASSISTANCE TO STATES

Chairman **HAYDEN**. For assistance to States you propose a $65 million appropriation, of which $3,250,000 will be withheld from apportionment and will be used as a contingency reserve.

Would you please explain the use of this fund?

Mr. **CRAFTS**. The contingency reserve is a portion of the allocation to the States. It is not specifically authorized but it is within the framework of the authorization for the apportionment of funds to States in the basic Land and Water Conservation Fund Act. It specifies that 40 percent should be allocated equally to the different States and the balance distributed in accordance with need, and that population and Federal programs and out-of-State visitor use and so on be considered.

In connection with the apportionment to the States the formula has been submitted to this committee and to the House committee in earlier hearings. The formula contains provisions for holding back 5 percent of what is called a contingency reserve for unusually meritorious and unforeseeable needs.

I think in retrospect this has proved to be useful. This is the amount of money that the States could qualify for over and above their normal apportionment. I give you a few examples of how this money has been used. A substantial sum was made available to the State of Nevada to help finance a State park on Lake Tahoe. A substantial sum has been made available to the State of Maine to preserve the Allagash River under the administration of the State of Maine. A sum has been made available to California for additional State parks to preserve the redwoods. Some for a State wilderness river in Wisconsin, the Wolf River. We use this money for especially meritorious projects that have come up, that are more than can be handled in the normal State allocation.

This is what this fund is for.

Chairman **HAYDEN**. How did you determine the size of the contingency fund?

DETERMINATION OF FUNDS TO BE ALLOCATED TO STATES

Mr. **CRAFTS**. The $65 million is the total amount that will be allocated among the States next year under the budget request. The contingency portion of that $65 million is 5 percent.

Chairman **HAYDEN**. How did you determine the amount of $65 million?

Mr. **CRAFTS**. The $65 million is the amount that was determined in making the initial breakdown between the States and Federal agencies. Last year the States received about the same amount. This year the administration has recommended an increase in the total fund from $110 million to $142 million. It further recommends that that increase be made available to the National Park Service for the purpose of moving forward on some of the recent authorizations that have been supported by the administration and passed by the Congress. It recommends that the States continue next year at their present level of this year.

Chairman **HAYDEN**. What is the statutory authority for establishing the contingency fund?

Mr. CRAFTS. This comes out of the Land and Water Conservation Fund Act of 1965.

Chairman HAYDEN. Are grants from the contingency fund an amount in addition to the normal allotment so that a State's allotment may be increased above the amount indicated by the allotted funds?

Mr. CRAFTS. Yes, sir.

Chairman HAYDEN. Is a Federal grant to a State made before the State's matching amount is actually available?

Mr. CRAFTS. The allocation is made to the State at the beginning of each fiscal year. The moneys are not actually paid to the State until the State has submitted a project, had it approved, has State money available and has proceeded to carry out the project. The actual check writing, the transfer of cash to the State is in practically all cases on a reimbursable basis.

Senator YOUNG. Could I ask a question at this point?

Chairman HAYDEN. Yes.

NUMBER OF STATE GRANTS, PURPOSE AND LOCATION

Senator YOUNG. I would like to have you submit for the record, and send a copy to my office, every grant you have made, what project it was for and in what State.

Mr. CRAFTS. We can do that, Senator. We have made about 1,000 grants. We can do that.

Senator YOUNG. I want the amount of each grant and the location.

Mr. CRAFTS. We can do that.

(The information follows:)

QUARTERLY REPORT
December 30, 1966

	Number	Amount
Qualified and Unfunded (Estimated)	118	$ 19,308,597
Future unfunded phases of active projects	-	$ 23,381,859
Active and Funded	802	$ 47,860,762
Completed	65	$ 3,794,878
TOTAL ASSISTANCE AMOUNTS	985	$ 94,346,096

Meaning of Terms Used:

1/ Type of Project (P - Planning; A - Acquisition; D - Development; C - Combined Acquisition and Development)

2/ Assistance Amounts - Amount of Land & Water Conservation Fund money for support of an outdoor recreation project.
Qualified - Estimated financial assistance for projects found technically eligible for a grant.
Awarded - The amount of assistance granted from the Land and Water Conservation Fund.
Active - Projects underway.
Completed - Projects on which final payment has been made.

TIME LAPSE BETWEEN ALLOCATION AND AVAILABILITY OF FUNDS

Chairman HAYDEN. How much time elapses between the time an allocation is made to a State and the time the funds are actually made available?

Mr. CRAFTS. This can be anywhere from about a month to 3 years because under the terms of the act, when the money is appropriated by the Congress we then allocate the funds to the States and this money is available to the States for 3 years.

So sometimes it is obligated immediately, the State has money, they have approved projects pending, on the waiting shelf. Other times it can rest for 3 years before the State utilizes it.

Chairman HAYDEN. Does the State or the Federal Government expend the Federal grant?

Mr. CRAFTS. The State expends it.

Chairman HAYDEN. Once an apportionment has been made to a State, how long does it remain available?

Mr. CRAFTS. For 3 years.

BASIC FACILITIES

Chairman HAYDEN. The information furnished in your justification shows that of the amount apportioned to the States approximately 58 percent is for development and somewhat less than this is for actual land acquisition. Other portions of your narrative indicate that the States are to give attention to basic outdoor recreation facilities.

How do you define "basic"?

Mr. CRAFTS. This is a judgment interpretation. There is no legal definition of basic. I know of no legislative history definition of basic. Our general concept of what is meant by basic facilities is that these are the simpler and more common type of recreational facilities and generally do not encompass luxury-type facilities, complex facilities, large hotels, resorts, this type of thing. They are the simpler type of thing like recreation, picnicking, development of swimming areas, boat launching ramps, this type of thing.

Chairman HAYDEN. Would the developments approved include such construction as ski lodges, swimming pools, and golf courses? If so, what is the justification of paying for such facilities as these?

FUNDING OF PROJECTS WITH TENNIS COURTS

Mr. CRAFTS. They could. Under the terms of the law they could cover all those things. We have financed quite a number of swimming pools, mostly public pools in small communities, often in the arid portions of the country. We have financed or aided in the improvement of some public golf courses. You did not ask, but we have done the same thing with respect to some tennis courts. We can submit for you, if you would like it, a record of what we have done to this type of project.

Chairman HAYDEN. I think it might be well to do that.

Mr. CRAFTS. All right.

(The information follows:)

Roughly, the Bureau has funded 56 projects that contained tennis courts. Fifty-two of these projects were multi-purpose with the tennis court portion of the cost varying in percentage. Construction costs for tennis courts varies substantially from a low of about $2,000 to a high of $8 to $10 thousand per individual court. The higher figure would include courts with lighting to permit playing at night.

SKI LIFTS

Senator BIBLE. Might I ask a question at this point, Mr. Chairman? You mentioned ski lodges. How about ski lifts?

Mr. CRAFTS. We can finance ski lifts. Lodges, I don't know whether we have or not. Normally, I would say we would not because this would come within the types of facility that we do not look with favor on. A basic ski facility to house the lift or a simple type of facility for the skiers to get started would better qualify. But a fancy lodge, with overnight facilities and dining rooms and this sort of thing; no, we would not normally do this.

Senator BIBLE. Let me ask you a specific question. I was in Ely, Nev., just 2 weeks ago. There is a group of skiing enthusiasts there that are very interested in developing a ski facility. The local chamber of commerce and the junior chamber of commerce in this area. Now, if I understand you correctly they could go to the Department of Natural Resources in the State of Nevada, and if the State agency would authorize it as a project in eastern Nevada for $100,000, say, the land water conservation fund would participate in that?

Mr. CRAFTS. It could participate in it if the sponsorship was by a public body, by the town.

If the sponsorship was by a private body, we are not authorized to give matching aid to private corporations or businesses. Our matching assistance is to the States or to instrumentalities of the States.

Senator BIBLE. If $100,000 is the price tag for the development of a ski lift in eastern Nevada and the State department of natural resources has $100,000, you make available how much on $100,000?

Mr. CRAFTS. We make available $100,000, 50–50.

Senator BIBLE. You make available $50,000 to the State of Nevada?

Mr. CRAFTS. If it was a $200,000 job and they had $100,000 we could make available $100,000.

Senator BIBLE. After you make the $100,000 available to the State of Nevada, the State of Nevada in turn can match $100,000 and can participate in the building of the ski lift, is that correct?

Mr. CRAFTS. Yes, sir.

CONTROL OF ALLOCATED FUNDS

Senator BIBLE. How far do you trace it after you turn the $100,000 over to the State of Nevada?

Mr. CRAFTS. We have a system of both program inspections and fiscal audits. This came up last year. We inspect—I think I am right on this—we inspect every project at various stages during its development. Projects above a certain size we always inspect upon completion. We have going on continually, not under our immediate direction but under the direction of the Office of the Secretary auditing of the State books and the fiscal records. The State of Nevada has been audited.

So this is going on constantly, both fiscal inspections and program inspections.

PARTICIPATION BY NEW PUBLIC BODY

Senator BIBLE, I doubt if I asked the question correctly. Once you make the $100,000 available to the State of Nevada as its share, then the State of Nevada says to the White Pine County Ski Club "We will make $200,000 available to you for building the ski lift," how far do you as an agency of the Federal Government go to see whether that is a public body or whether this is a private club?

Mr. CRAFTS. I would like to ask Mr. Underhill, who is handling this part of the program, to answer that for me, if I may, Senator.

Senator BIBLE. Certainly.

Mr. UNDERHILL. Senator, we would make that determination actually before the grant is made. That is, we would not give $100,000 to Nevada just because they said they were going to develop a ski lift. The project would have to show who was going to administer the ski lift, on whose land it was located, and whether or not it was a public agency that was actually going to expend the money.

Senator BIBLE. That answers my question. If it was then proved that the White Pine County Ski Club was a private club of local skiing enthusiasts, then you would not make the $100,000 available to them?

Mr. UNDERHILL. That is correct.

Senator BIBLE. But if they said this is a White Pine County recreational activity and the White Pine County——

Mr. UNDERHILL. And the recreation commission will run it and it will.

Senator BIBLE. And it will be run by the recreational commission of the White County Board of County Commissioners, then you would make it available, other things being met?

Mr. UNDERHILL. Yes, sir.

Senator BIBLE. Thank you. You have given me my answer.

AMOUNTS ALLOCATED FOR ACQUISITION AND DEVELOPMENT

Chairman HAYDEN. Of the total projects approved through February 1967, how much has been allotted for acquisition and how much for development?

Mr. CRAFTS. You are referring to the State aspects of the program, I believe, because all of the Federal moneys are for acquisition. With respect to the State aspect about two-thirds or $36.9 million of it has gone for development and about one-third or $20 million for acquisition.

Chairman HAYDEN. What, in your opinion, is the reason for the States submitting such a high percentage of projects for development?

Mr. CRAFTS. There are several reasons for this. One is that the States are under pressure from the citizens of the State to develop areas that are under their jurisdiction, that have heretofore been undeveloped or underdeveloped.

Another reason is that the States often find it easier to move on development projects than to go through the process of acquiring new areas. In the Western States where there is a lot of public land and Alaska, Nevada and so on, you get a feeling that they do not want more land in public ownership. So, some of those States are reluctant to move in the direction of acquisition. The fourth reason is that a number of the Eastern States have passed bond issues which are entirely for acquisition purposes and which they finance completely on their own and do not ask for Federal participation.

These are the four basic reasons.

Chairman HAYDEN. Wasn't the principal objective of the land and water conservation fund act to make moneys available to buy needed recreation lands before such lands are lost forever, rather than the extensive use being made of the fund for development?

Mr. CRAFTS. I think in general that is correct, Senator, that the basic and most fundamental purpose was to obtain lands, either for present or future development before they were either committed to other uses or priced out of the market.

POLICY ON USE OF LAND AND WATER CONSERVATION FUNDS

Chairman HAYDEN. What guidelines have been issued to the States by the Bureau of Outdoor Recreation concerning priorities and use of land and water conservation moneys?

Mr. CRAFTS. I could submit those for the recrod. We have our manual. We have strongly urged the States to give more emphasis to acquisition than they have been to development in the past. There has been some response to that.

(The information follows:)

PRIORITIES

Guidelines have been issued both for program formulation and the submission of specific projects:

1. Part 630 of the Outdoor Recreation Grants-in-Aid Manual contains guidelines on the development of State Outdoor Recreation Plans. Several sections in Part 630 directly concern priorities. 630.2.6 contains a summary of ORRRC recommendations, many of which directly affect overall program priorities. 630.4.3H cites several specific areas to which priority attention should be given. Numerous other sections also influence priority in smaller degrees. Using the broad guidelines of Part 630, the States are expected to develop their own specific program priorities.
2. Guidelines on types of projects have been issued in both Manual and memorandum form. These emphasize that the intent of the Act is to first provide for land acquisition, and consequently that acquisition projects should generally be given top priority. 600.3.10 of the *Manual* summarizes the principal priority guides. Priority should be given to:
    - Acquisition over development where there is a scarcity of recreation lands.
    - Activities of the general public over those of a limited group.
    - Meeting urban needs.
    - Basic over elaborate facilities.
    - Active over spectator type facilities.
    - Projects for which other funds are not available.

Using these guidelines, the State assigns specific priorities to projects using the following procedures:

Priority A—Includes all projects for which action is needed immediately.

Priority B—Includes those projects on which action must be taken in the near future or an opportunity to preserve a valuable resource will be lost or the needs of a broad segment of the public will not be met.

Priority C—Includes those projects on which action must be taken in the future to meet needs that exist now.

Priority D—Includes those projects for which, although immediate action is desirable, financing can be deferred for a period. Such projects would generally be designed to meet foreseeable future needs that do not fully exist at the time of submission of a proposal.

The priorities assigned individual proposals are subject to concurrence by the Bureau.

OBLIGATION RATE

Chairman HAYDEN. The information which you furnished with your justification indicates that $147,500,000 has been apportioned to the several States and territories. Of this amount, $51,500,000 approximately has been obligated and $94 million has been qualified on the basis of applications made by the States.

Have the $51,500,000 which you show as obligated actually been matched by State funds?

Mr. CRAFTS. The answer is "Yes."

Chairman HAYDEN. How much, if any, of the $94 million has been matched by the States?

Mr. RICE. Senator, the same amount $51.5 million. The projects are qualified first and then they are obligated. So, the $51 million is a part of the $94 million which has been qualified.

Chairman HAYDEN. How much of the unmatched portion allocated to the States do you expect the States to match during the coming fiscal year?

Mr. CRAFTS. Well, the States are really just beginning to get into high gear. I would expect, and it is only a judgment estimate, that they would greatly accelerate their activity and that they would match most or all of this money during the coming fiscal year.

Chairman HAYDEN. All of the above questions have been based upon apportionments made through fiscal year 1967. Of the approximately $62 million to be apportioned in the coming fiscal year, how much of that do you expect to be matched by the States?

Mr. CRAFTS. I would say, maybe half of that. Here again this is a judgment estimate. I say not more than half of it because in fairness to the States we should bear in mind that the money that becomes available next July to those States under the law is available to those States for 3 years. They won't necessarily allocate it all in the initial year.

FEDERAL PROGRAM

Chairman HAYDEN. For the Federal program, you propose a sum of $74,225,000 to be divided among the National Park Service, the Forest Service, and the Bureau of Sport Fisheries and Wildlife.

Would you please discuss briefly the needs of the three Federal land acquiring services?

NATIONAL PARK SERVICE PROGRAM

Mr. CRAFTS. With the National Park Service first, we have made available to the committee the details of how that money would be spent by individual units of the park system. Most of it would be spent to implement recent authorizations of the Congress, such as the acts that have been passed since 1961 for new areas. The Park Service needs this money urgently because of the escalation in the price of recreation land that is going on about the country.

Senator BIBLE. Might I ask at that point, Mr. Chairman, where that is broken down, Mr. Craft? I can't seem to put my hand on it. Is it in this justification?

Mr. CRAFT. No; I think Mr. Eaton has it.

Senator BIBLE. This shows how much money you will make available for acquisition at each of the various parks?

Mr. CRAFTS. For the Park Service, Forest Service, and Sport Fisheries and Wildlife. You can look on page 45 of this green book.

Senator BIBLE. Thank you, Mr. Chairman.

FOREST SERVICE PROGRAM

Mr. CRAFTS. In the material that I have just supplied you the details of the Forest Service acquisitions are likewise shown although they are not spelled out in the green justification that you have. Basically the Forest Service recommendations are a continuation of the same level as last year. They involve several hundred individual tracts that are proposed for authorization all of which recreation is a primary purpose.

BUREAU OF SPORT FISHERIES AND WILDLIFE PROGRAM

For the Bureau of Sport Fisheries and Wildlife, the recommendation is for a small amount of money, $3 million for three purposes.

Mr. Gottschalk, Director of the Bureau is here, and he could give you the details better than I can but they are for land acquisition of the Key deer refuge in Florida, for development of a research facility for endangered species at Patuxent, Md., and for the purchase of land in connection with the preservation of the Columbia white tailed deer in the State of Washington.

SUPPLEMENTARY FUNDS FOR FEDERAL PROGRAMS

The $5 million that is shown for the Bureau of Outdoor Recreation is for a fund that can be used for immediate land appraisals, immediate planning, and some emergency acquisition following new authorizations of the Congress. This is an amount that would be transferred by us to the Park Service and the Forest Service, to allow these agencies to move more rapidly than they heretofore have been able to rather than having to wait the normal 18 months for funds to become available.

ACQUISITION OF LAND AT PATUXENT

Senator MUNDT. Mr. Chairman, while we are talking about Patuxent, I am very much interested in that as you know because it was my amendment of 2 years ago which set up the research facilities at Patuxent. I have visited it. I think the Bureau is doing a fine job at Patuxent.

It seems to me that it is very critical at this time that the land be made available to round out that project because you are in an area where prices are escalating pretty fast, not only because of inflation which tends to raise property values generally but because it is an area of the country people are beginning to develop.

I want to ask you, do you have any details which you can supply for the record which may have come up since the justification was prepared in terms of rounding this out?

Mr. CRAFTS. If it is all right with you, Senator, I would like to have Mr. Gottschalk answer that. This comes under his jurisdiction.

Mr. GOTTSCHALK. Mr. Chairman and Senators, there are two parcels of land that are currently available for immediate purchase through negotiations with the owners at Patuxent which have come into the picture as far as availability is concerned in the last few weeks, as a matter of fact. If we are able to move now I think that we can proceed with the completion of contracts with these people and acquire at least two of these tracts with a great deal of dispatch.

USE OF OPTION FOR LAND PURCHASES

Senator MUNDT. I suppose you are like all other agencies. You have to have the money to buy it, you don't have an option program where you can buy an option land and hold it?

Mr. GOTTSCHALK. Yes, as a matter of fact we do take options wherever we can. We are negotiating with these two principal owners for an option at the present time. We have to approach them however with sort of an empty pocketbook when we talk in terms of options. As you have already suggested, the escalation in real estate values is such that every month that this is postponed the more difficult it becomes to complete.

Senator MUNDT. There can't conceivably be any economy about delaying the purchase of land in that area which you ultimately are going to need. Are you discussing it? Since my name has been identified with it I get quite a little mail from my people based on some misunderstanding which maybe we can clear up for the record. They say, this facility for endangered species is a great idea but why pick a place like Patuxent where land is so expensive, why not pick an isolated area where land is cheaper? Will you please discuss this?

REASON FOR SELECTING PATUXENT AREA FOR RESEARCH CENTER

Mr. GOTTSCHALK. Thank you. Before we decided to establish this headquarters for research on endangered species at Patuxent we made a thorough survey of the possibility throughout the country with respect to the principal factors that are involved.

These include climate, soil, particularly in relation to its permeability, so that we will have good drainage to dispose of the sanitary problems, take care of the sanitary problems where we are raising a large number of different kinds of animals. We investigated the water possibilities so that we would have water for the ponds for the species that require water in their habitat.

Taking these things into consideration we finally narrowed our choice down to an area out on the west coast, in Willamette Valley, and Patuxent. But there are other things favoring Patuxent. It fits the physical criteria that we established precisely but in addition to that it is favored by virtue of the fact that we have concentrated at Patuxent perhaps the greatest single collection of professional scientific talent in the general field of wildlife management that there is in the world. In addition, we are neighbors with the Agricultural Research Center at Beltsville where perhaps the same thing could be said with respect to the general area of animal disease and animal behavior.

We feel that because of all these factors Patuxent is just a natural for this location.

Now there is the economy standpoint as well. We looked into the cost of trying to transfer this activity out to this other second alternative in the Willamette Valley and found that it would actually be less expensive to acquire this more expensive land here than to try to move all of our facilities out there and start anew with a completely new program there.

COLUMBIA WHITE-TAILED DEER

Senator MUNDT. Thank you. That certainly is a very persuasive and sound justification. I wanted to get it in the record so that if correspondence comes in on it we can point to the facts as they are.

Is the Columbia white-tailed deer hunted at present?

Mr. GOTTSCHALK. I beg your pardon.

Senator MUNDT. Is the Columbia white-tailed deer hunted at present?

Mr. GOTTSCHALK. Yes, it is.

Senator MUNDT. Will it continue to be hunted if the refuge is established?

Mr. GOTTSCHALK. The management plan for the Columbia white-tailed deer area involves a careful management program which would put hunting into the picture only when it becomes necessary to reduce the size of the herd to the carrying capacity of the range that might exist at any point in the future.

Senator MUNDT. How many deer do you expect to have there?

Mr. GOTTSCHALK. We would expect to have in the order of 400 deer in the area. Now the normal increase might be on the order of 20 percent. Obviously, if this continues year after year there comes a time when something has to be done. They are protected. So, our first recommendation would be to trap, live trap, the animals; and the first action we would take would be to live trap the animals.

Senator MUNDT. Instead of by hunting?

Mr. GOTTSCHALK. Instead of by hunting. Then these animals would be given or sold to agencies or institutions that might have a need or desire for this particular species. If that did not remove the entire excess, then we would have a very carefully controlled hunting in which the number of hunters would be limited and the number of deer taken would be very carefully limited, so that there would be no such thing as any wanton slaughter or any foolhardy management program with respect to this deer herd.

Senator MUNDT. You do not intend to inject hunting into the refuge except insofar as it is necessary to control the herd after the trapping operation has been tried?

Mr. GOTTSCHALK. That is correct.

Senator MUNDT. Thank you.

FACILITY AUTHORIZATIONS

Chairman HAYDEN. Place in the record, please, the total amounts authorized for appropriation for each of the facilities listed on page BOR–45 of your justifications.

Mr. CRAFTS. I will be happy to do so, Senator.

(The information follows:)

The newly authorized areas and inholdings in which most of these funds will be utilized and the amount authorized for each are listed below:

	Amount authorized to be appropriated
Newly authorized areas:	
Whiskeytown-Shasta National Recreation area	$18, 000, 000
Lake Mead National Recreation Area	1, 200, 000
Indiana Dunes National Lakeshore	27, 900, 000
Assateague Island National Seashore	16, 250, 000
Piscataway Park-Maryland	4, 132, 000
Pictured Rock National Lakeshore	6, 873, 000
Delaware Water Gap National Recreation Area	37, 412, 000
Fire Island National Seashore	16, 000, 000
Guadalupe Mountain National Park	1, 800, 000
San Juan Island National Historic Park	1, 873, 000
All other proposed acquisitions, less than $500,000 per unit	19, 366, 650
Subtotal	150, 806, 650
Inholdings:	
Everglades National Park	2, 000, 000
Virgin Islands	1, 250, 000
Grand Teton National Park	
All other proposed acquisitions, less than $500,000 per unit	782, 000
Subtotal	4, 032, 000
Total amount authorized	154, 838, 650

AVAILABLE AUTHORIZATION

Chairman HAYDEN. For each of these areas, how much of the authorization remains available for appropriation without considering the amount proposed for fiscal year 1968?

Mr. CRAFTS. I would like to put that in the record, too, if I could, Senator.

(The information follows:)

	Authorization remaining available for appropriation
Newly authorized areas:	
Whiskeytown-Shasta National Recreation Area	$16, 550, 000
Lake Mead National Recreation Area	783, 000
Indiana Dunes National Lakeshore	27, 900, 000
Assateague Island National Seashore	12, 290, 000
Piscataway Park—Maryland	2, 738, 900
Pictured Rock National Lakeshore	6, 873, 000
Delaware Water Gap National Recreation Area	30, 823, 000
Fire Island National Seashore	7, 330, 000
Guadalupe Mountain National Park	1, 800, 000
San Juan Island National Historic Park	1, 873, 000
All other proposed acquisitions, less than $500,000 per unit	2, 257, 450
Subtotal	111, 218, 350
Inholdings:	
Everglades National Park	1, 048, 000
Virgin Islands	511, 300
Grand Teton National Park	
All other proposed acquisitions, less than $500,000 per unit	236, 350
Subtotal	1, 795, 650
Total	113, 014, 000

PREPARED STATEMENTS

Mr. CRAFTS. If I could interject at this moment. Each of the agencies involved, Bureau of Sports Fisheries and Wildlife, Forest Service, and National Park Service, has prepared statements. I would like an opportunity for them to insert those statements in the record. They are here to answer any questions that may come up.

Chairman HAYDEN. That may be done.

Mr. CRAFTS. Thank you.

(The statements follow:)

BUREAU OF SPORT FISHERIES AND WILDLIFE

LAND AND WATER CONSERVATION FUND

STATEMENT OF JOHN S. GOTTSCHALK, DIRECTOR

This year we appear before you with clear authority to use money from the Land and Water Conservation Fund to acquire land for species threatened with extinction. The Endangered Species Preservation Act, P.L. 89-669, which became law on October 15, 1966, removed any uncertainty.

Enactment of this legislation was in response to the suggestion of the Appropriations Committee of the House of Representatives that new authorizing legislation should be obtained for acquisition of lands for endangered fish and wildlife before any funds were appropriated.

The Senate Committee concurred, and sustained the deletion of 3.1 million dollars which had been recommended in the President's budget for the fiscal year 1966—to be appropriated pursuant to the Land and Water Conservation Fund Act.

No monies have yet been appropriated from that fund to acquire land for endangered species. $172,500 was appropriated to our Bureau for the fiscal year 1967 to acquire land to serve the increasing visitor load at our National Wildlife Refuges and Fish Hatcheries.

Our request for 3 million dollars this year is entirely for endangered species. It would provide an appropriation from the Land and Water Conservation Fund to complete the acquisition of habitat needed to save the Key Deer from extinction; to commence acquisition of land needed for an Endangered Species Research Station; and to commence acquisition of land needed to save the threatened Columbia white-tailed deer from extinction.

Many species of fish and wildlife now prosper under enlightened game management, and their preservation seems assured. Other species do not enjoy so fortunate a circumstance. Some of them are now threatened with extinction.

Endangered species of fish and wildlife are valuable elelments of our native fauna. They are members of the community of living things that are essential parts of our total environment. Like other forms of fish and wildlife, they generate business based on healthy outdoor recreation of many types; they provide opportunity for education in an out-of-doors classroom; opportunity for scientific research; and give pleasure and an inner satisfaction to a broad segment of the public.

The program authorized by the Endangered Species Preservation Act is designed to prevent the extinction of any animal in our time. It is not solely a land acquisition program. Emphasis will be placed on research and administration of existing Federal and State areas. Because of varied requirements, each threatened species must receive distinct and separate consideration. No single solution can be applied to all threatened species. There is reason to look forward, however, to the continued existence of many animals which, without the support of this effort, would disappear.

The proposed acquisition for the endangered Key deer is in Monroe County, Florida, comprising 1,854 acres at an estimated cost of $1,900,000. The existing National Key Deer Refuge includes 835 acres acquired or withdrawn under special legislation. An additional 465 acres have been withdrawn within the Great White Heron Refuge. In addition, some lands are leased for Key Deer management and protection, but these can be terminated on 90 days' notice. The proposed acquisition is to preserve enough habitat to assure survival of the population in a natural environment. Though the Key deer has responded remarkably to past efforts in its behalf, the trends and patterns of real estate development point to very serious problems in the future. Development is gobbling up vast acreages of habitat. The lease program is beginning to fade in importance and effectiveness. Outright purchase in fee before the land is cleared and drained is the only means of assuring the preservation of Key deer habitat.

Since the acquisition includes generally the poorer habitat, the proposed management will include:

1. Improvement of refuge habitat to compensate as much as possible for future losses;
2. the provision of water holes where none now exists;
3. the development of elevated areas for sanctuary during storm tides;
4. the use of controlled burning and other techniques to increase the quantity and availability of preferred foods; and
5. continued protection.

The proposed acquisition for an Endangered Species Research Station is in Prince Georges County, Maryland, 15 miles northeast of Washington, D.C. The proposal includes about 470 acres, of which 253 acres are included in the fiscal year 1968 program. The estimated cost of the 253 acres is $750,000. Since this is the maximum amount allowed by the Endangered Species Preservation Act for acquisition of any one area, specific authority will be sought for the additional land needed.

The proposed area is needed for the rare and endangered species program. The Patuxent Wildlife Research Center has been determined to be the most effective center for this research program. The lands desired are in the metropolitan influence of Washington, D.C.—one of the nation's fastest growing areas. The demand and value of land are high and rapidly rising. Unless the land is acquired now, rezoning to higher density use would forestall any feasible acquisition program.

The proposed area contains five ownerships, four owner-occupied. The uplands have been used for agricultural crops and as pasture. The lands within the flood plain of the Patuxent River have been used for timber production. The uplands are in rapid transition to residential development.

Land values in the project area have increased by approximately 230 percent since 1960. This is based on actual sales which have occurred in the area. In 1960 these lands were selling for $700–$1,000 per acre. Today, most of the upland tracts suitable for residential development have a value of $2,000–$3,000 per acre.

The proposed area is needed to establish an Endangered Species Research Station. The limiting biological factors must be determined for each species before a realistic program can be developed. The Endangered Species Research Station will provide laboratory facilities for research in nutritional requirements, genetics, disease, propagation, and behavior. The Station will hold a variety of species to serve as breeding stock for testing, captive propagation, imprinting, and release. One of the major objectives of the Station is to develop techniques for propagating certain species in captivity, and reintroducing the resulting stock into the wild.

The proposed acquisition for the endangered Columbia white-tailed deer is in Wahkiakum County, Washington. It includes an area of about 2,000 acres of which 970 acres are proposed for acquisition in fiscal year 1968 at a cost of $350,000.

The range of this species is limited to the Columbia River lowlands in the vicinity of Cathlamet, Washington, and Clatskanie, Oregon. Little migrational movement of white-tails away from this bottomland habitat occurs.

Estimates of total acreage used by Columbia white-tailed deer have been made by wildlife managers. Estimates in 1940 indicate 9,000 acres of habitat in Washington and 14,000 in Oregon. Current estimates are considerably lower. The total acreage of quality white-tail habitat remaining is less than 2,000 acres. Land above the 100′ countour is not considered natural habitat for the species. White-tails which range above this level lose their identitity as a species through hybridization with black-tails. White-tails in the Roseburg, Oregon, vicinity show much evidence of hybridization.

Agricultural development in the Columbia River lowlands has had a substantial effect upon the Columbia white-tailed deer. Diking has been accomplished on most of the original white-tail habitat to prevent seasonal flooding and brush clearing and drainage have followed. A varied pattern of timber, brush and cropland seems to provide optimum habitat. The species benefits from presence of pasturelands near brushy cover since they feed extensively on clover and grasses.

However, as the percentage of timber and brush dimishes, so do the number of white-tails.

Only one area within the Columbia white-tail deer zone continues to provide good quality habitat. This area lies between Cathlamet and Skamakowa, Washington. All of the good quality habitat is within a diked area designated as Diking District 4. Total acreage within the dike is approximately 2,300 acres. Land clearing is being accomplished at an alarmingly rapid rate. Perhaps the last opportunity to preserve the endangered white-tailed deer in its natural habitat exists on this area. The present herd of about 150 white-tails present within Diking District 4 was until recently a prospering healthy herd of 300 individuals which produced a harvestable increment each year.

Preservation of the endangered Columbia white-tailed deer is dependent upon a special management program which will preserve a segment of the original habitat in optimum condition and balance for use by the species. The limited range of the species provides a unique opportunity to actually preserve and manage an endangered big game species on a tract of land only 2,000 acres in size. Possibilities of introducing this species to suitable habitat in nearby refuges will be considered. Intensified agricultural development is rapidly destroying the last remaining vestige of good habitat. Only by procuring and managing these lands specifically to benefit the species may the future of Columbia white-tailed deer be assured.

The area to be acquired is primarily important for preservation of an endangered wildlife species, the Columbia white-tailed deer.

FOREST SERVICE

STATEMENT OF M. M. NELSON, DEPUTY CHIEF

Mr. Chairman and members of the committee, the Forest Service, as this Committee knows, manages the National Forest System on the basis of multiple use, in which recreation plays an important role. As a matter of fact, the National Forests are truly the Nation's favorite outdoor playgrounds. Statistics provided to the House Appropriations Committee on February 27, 1967, by the Bureau of Outdoor Recreation, shows that in calendar year 1966 there was a total of slightly more than 375 million visitor-days' use on all of the lands and waters of the seven Federal agencies reporting. Almost one-half or 173 million of this 375 million visitor-days' use of Federal areas was on the National Forests. The use of the National Forests in 1966 increased 13 million visitor-days above the use in 1965. More such use has occurred in the last five years than in the entire previous history of the National Forests. We can see no let up in the increasing numbers of the American public using the National Forest System for recreation.

A careful analysis of needs for developed recreation sites and the person-at-one-time capacity of the National Forest System recreation areas has been made. This analysis shows that by 1972, a person-at-one-time capacity of 2.5 million in 26,400 developed sites will be required. At the beginning of fiscal year 1968, we will have only 9,500 developed sites that can accommodate only 626,500 persons-at-one-time. Additional recreation lands must be acquired for the expansion of existing recreation installations and for new areas. The Congress has recognized the ability of the Forest Service for managing recreation areas by their action in establishing the Spruce Knob-Seneca Rocks and Mt. Rogers National Recreation Areas under Forest Service administration and the Shasta-Trinity-Whiskeytown National Recreation Area in which the Forest Service has a major role in recreation. A bill for a Flaming Gorge National Recreation Area in Wyoming and Utah to be managed by the forest Service has been introduced in this Congress.

The Land and Water Conservation Fund Act provides the means of acquiring the needed recreation land to meet the growing recreation demands. The National Forests in the Eastern United States are uniquely located in relation to the major population centers but generally the best recreation lands within these forests are not now publicly owned. The Outdoor Recreation Review Commission pointed out the most urgent need for more land for recreation opportunities is in the east.

Twenty-nine units of the National Forest System have been established in the Eastern United States. All are within three hours' driving time of at least one major population center of 50,000 population or larger. Within these management units are many urgent needs for land acquisition. For example, they include two of the new National Recreation Areas, the Massanutten Mountain Area of Virginia, the proposed Eleven Point Scenic River, along with numerous opportunities for scenic highways, and many reservoir developments with fine recreation potential. All of these and many more require special attention. Particularly urgent, of course, are the needs in the areas where the land prices are continuing to escalate. Rural lands throughout the nation are continuing to sell at higher and higher prices and have increased about 50% since a base period of 1957–59. Recreation type lands are increasing in cost at even a higher rate. We have found instances where the cost has doubled or more than doubled during the last 5 years. Sharp increases in land costs occur, for example, where special areas are set up with considerable publicity. Good examples of this can be found around almost any new major recreation complex. Further delay in the land purchase program will mean increased costs and fewer acres acquired.

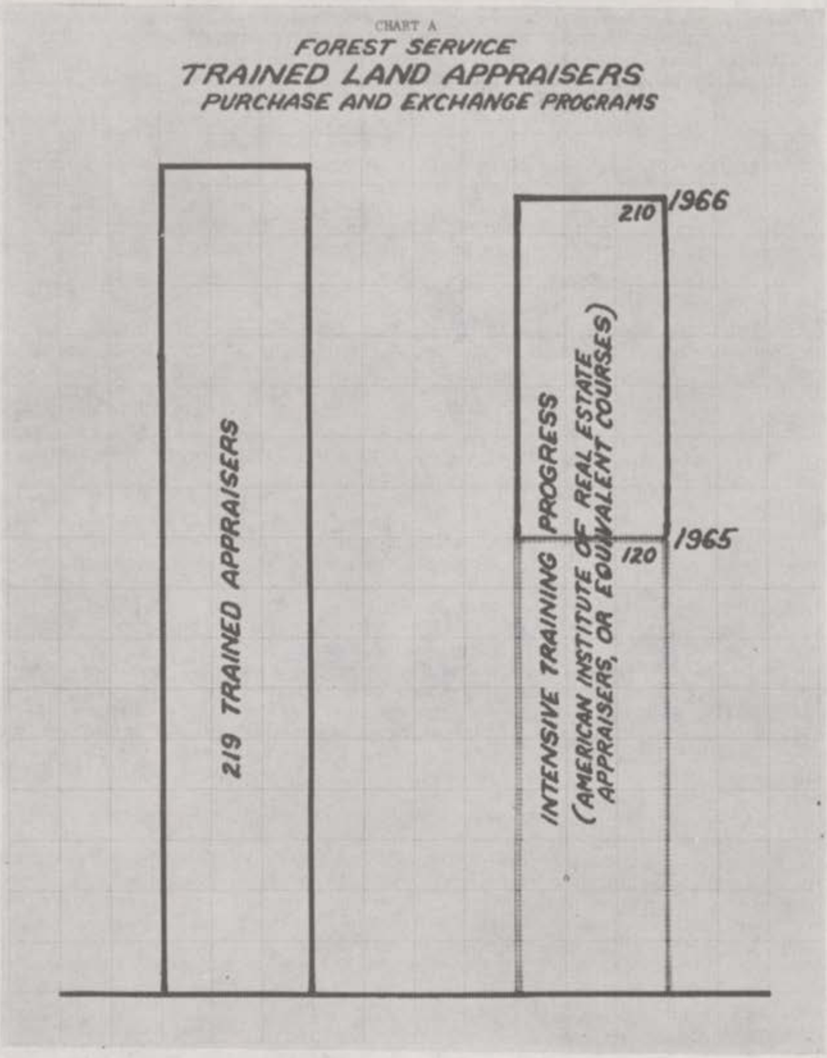
LAND APPRAISING

The Forest Service has the necessary skills in trained personnel to perform a quality acquisition program.

The need for trained land appraisers is readily apparent. The Forest Service, with the accelerating land exchange program, the Weeks Law purchase program, and the Land and Water Conservation Fund purchase program, has been quite aware of this need. Better appraisers mean better program cost estimates, higher efficiency and higher productivity.

Chart A illustrates the present status of our training program for land appraisers.

CHART A



FOREST SERVICE

INTENSIVE TRAINING PROGRESS
(AMERICAN INSTITUTE OF REAL ESTATE APPRAISERS, OR EQUIVALENT COURSES)
210
1966
120
1965

In the past, most of our staff appraisers have been men who became skilled wildland appraisers by the practical experience route. Most were involved in the Weeks Law purchase programs of the 30's. Largely as a part of the increased land exchange program beginning in the early 1960's, the Forest Service initiated an intensive training program to sharpen the skills of the practical-experience men and to train new appraisers. In 1965, as a part of our budget presentation, we reported that 38% of our appraisers had received special training under the American Institute of Real Estate Appraisers or similar courses. These training programs have continued. Today, of the 219 trained appraisers currently making land appraisals for purchase or exchange cases, all but 9 have received this special training. Many have taken several of the courses offered and some all. The training program will be continued and our appraiser's skills further developed.

FOREST SERVICE PROGRAMING

All of the properties included in the recommended F.Y. 1968 budget submission are properties carefully reviewed and selected to help meet the rapidly increasing demands for recreation use and enjoyment. They are priority properties recognized as desirable for acquisition to permit orderly and sound development and management of the recreation resource. Their selection for inclusion in the budget was based upon the public recreation demand—present and future—and available supply of recreation lands, in the various National Forest management units coordinated with State and other federal agency plans.

We consider that such management unit planning—keyed to accomplishment—is vital to future success in meeting the goals of the Land and Water Conservation Fund Act. This is the approach used during the 55 years of regular Weeks Law purchases. In the Weeks Law program, alternative priority acquisitions are considered. If an owner has inflated ideas of value, we shift to an equal priority alternative tract. If an owner changes his mind and decides not to sell, we can shift to an equally desirable tract. This results in the most economical buy of priority properties for National Forest administration.

For the Forest Service, the same situation exists in the Land and Water Conservation Fund Act purchase program. We prepare a five-year program. It consists of our best estimates of properties on the market or expected to be on the market, plus a minor number of "must" acquisitions during that period. Actual selection of an individual property for a particular budget year depends on a number of factors. Normally, its selection on a priority basis over an alternative high priority tract is difficult.

This five-year plan is reviewed by the Bureau of Outdoor Recreation as a part of their program review and coordination. It is reviewed to insure conformity with the criteria for qualification under the Land and Water Conservation Fund Act and with consideration of regional and national priorities in both State and Federal recreation programs and program needs. We believe that once this plan has been reviewed and approved, it seems reasonable that latitude might be given to the federal agency in accomplishing this plan. The tracts of land purchased would be equally desirable, would help achieve the recreation management objectives for the management unit and the land would be purchased at a lower total cost to the Federal Government.

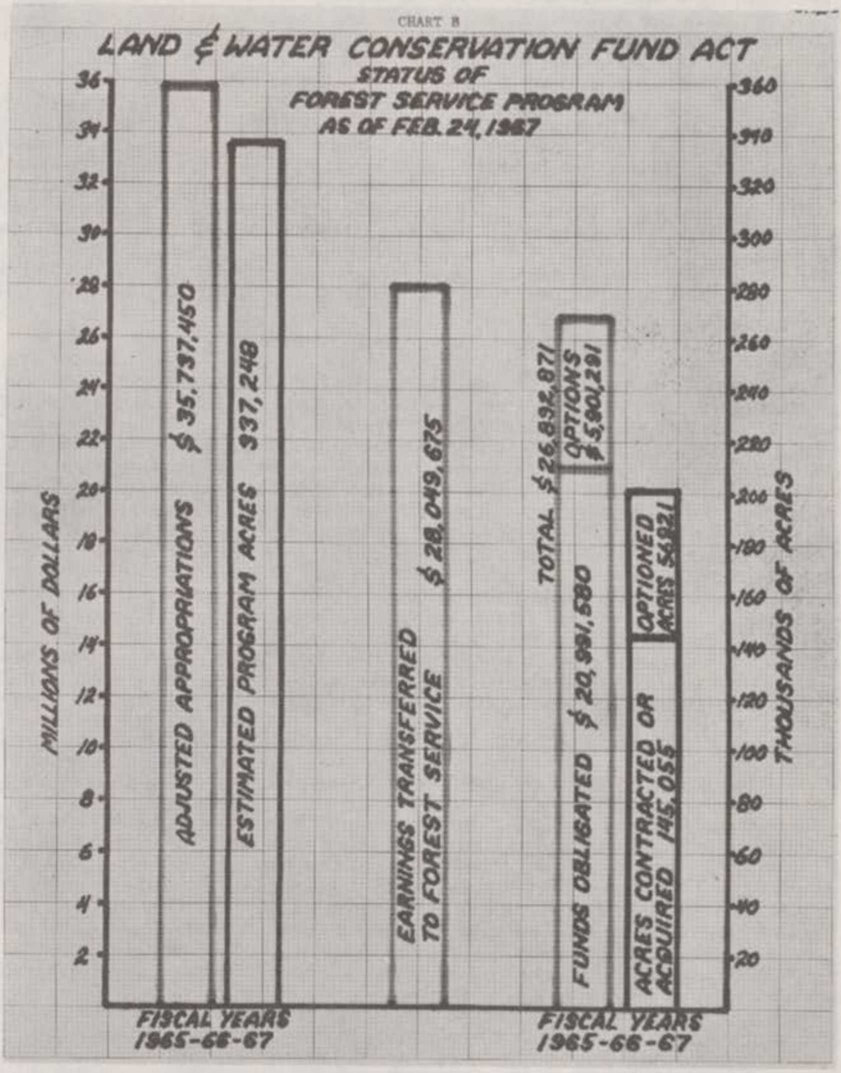
PROGRAM COST ESTIMATES

Concern has been expressed at various times about the "increased costs" for individual tracts that have occurred in the previous budgets. In view of this concern, we have summarized what has actually happened. This summary shows that of the 363 tracts acquired as of December 31, 1966, exclusive of Sylvania, 62 had increased costs over the original estimates totaling $353,365. On the other hand, 123 tracts were purchased for less than the original estimates with a total savings of $562,074. The net difference in the original cost estimates and final costs amounts to a savings of $208,709. This bears out the conclusion that when all cost estimates are taken into consideration, rather than individual tracts, the estimates are reasonably accurate. If program estimates were on a management units basis, the same results could be expected.

FOREST SERVICE ACCOMPLISHMENTS

I am pleased to report that the Forest Service has made substantial progress in meeting the objectives of the Land and Water Conservation Fund Act. This Committee has authorized a total of $35,737,450, as shown on Chart B, for use of the Forest Service in acquiring recreation lands to help meet the present and future needs. As you know, the appropriations are made available to the Forest Service only as earnings come into the Fund and are transferred to us. As of February 24, 1967, a total of $28,049,675 had been transferred to the Forest Service. Recreation lands costing $26,892,871 have already been acquired, placed under contract, or we have a firm option to acquire.

CHART B



Obligations total $20,991,580 in which 145,055 acres have been acquired or under firm contract to acquire. Purchase options are in hand totaling an additional $5,901,291 for 56,821 acres.

FOREST SERVICE LAND ACQUISITION AUTHORITY

The Land and Water Conservation Fund Act gave no new land acquisition authorities. Existing or new land acquisition authorities of each agency must be used. The Forest Service has several acquisition authorities:

1. *Weeks law.*—Since most of the purchases, by law, must be in the Eastern United States, the primary authority to be used is the Weeks Law of March 1, 1911. Each case under this authority is reviewed and must be approved by the National Forest Reservation Commission. The Commission is made up of the Secretaries of Agriculture, Army, and Interior, two Senators and two Congressmen.

2. *USDA Organic Act of August 3, 1956.*—Examples where this act will be used to acquire lands are in those States that have not passed an enabling act making the Weeks Law applicable (Arizona, Colorado, and Wyoming); lands located in watersheds of non-navigable streams such as in the Great Salt Lake Basin; lands located in designated wilderness and primitive areas; and interests in lands. This 1956 act provides acquisition authority when implemented by the appropriation process. We will use the 1956 act authority in F.Y. 1968 to acquire interests in land by purchases, exchange or otherwise, such as (a) scenic easements, (b) mineral interests needed to protect natural beauty in such projects as the Highlands Scenic Drive in West Virginia, and (c) timber cutting rights. Timber cutting rights, for example, may be outstanding on tracts of land we are acquiring for recreation purposes. We could grant timber cutting rights on other National Forest lands for these outstanding rights.

3. *Special acts.*—Examples are the Seneca Rocks-Spruce Knob, Mt. Rogers and the Shasta-Trinity-Whiskeytown National Recreation Area Acts.

PROPOSED FOREST SERVICE 1968 PROGRAM

The Forest Service and the Bureau of Outdoor Recreation have worked closely in developing programs for Forest Service acquisition. The program before you contains $18 million dollars for the Forest Service.

In F.Y. 1968, the Forest Service objective under this program is to acquire approximately 120,000 acres of recreation lands. Ninety-three percent of this will be in the Eastern United States. Included in the program are such key projects as: Seneca Rocks-Spruce Knob National Recreation Area, West Virginia 5,823 acres; Mt. Rogers National Recreation Area, Virginia, 7,436 acres; Wilderness and Primitive Areas, 2,365 acres; and the Eleven Point and Current Rivers, Missouri, 2,282 acres.

All of the properties planned for purchase are desirable lands—many will be permanently lost if prompt action is not taken. Because of this urgency, we have already optioned about 15% of the properties included in the proposed program and have started negotiating for many others. With the consent of Congress, we intend to meet our obligation of providing the necessary recreation lands for present and future generations.

SUPPLEMENTARY STATEMENT

Recreation is certainly an important part of our business now. There were over 173 million visitor-days' use of the many types of recreation in the National Forests last year. A report by the Bureau of Outdoor Recreation released this month shows that the Forest Service handled more than three times as many recreation visitor-days than any other Federal agency—and nearly one-half of all such agencies. In fact, during the past five years we have taken care of as much use as we had in the entire history of National Forests before this period. You will be interested in knowing that the National Forests of Arizona received almost 7,000,000 visitor-days' use last year.

Earlier, questions were raised about the ability of the agencies to make better cost estimates. We firmly believe that we are better situated now to make better cost estimates, appraisals, and to do a better land acquisition job. My statement points out how we have continued to use American Institute of Real Estate Appraisers and similar organizations and universities to train our people. Practically all of our 219 appraisers have had this type of training. We believe the estimates for this program are sound.

Earlier questions seemed to indicate that agencies normally underestimate the cost of lands they are acquiring. We haven't found this to be true in the Forest Service. Analysis of the 363 tracts we purchased up to the first of this year shows that only 62 tracts cost more than the amount estimated. We were able to purchase twice as many tracts for an amount less than the original estimates. Of the total dollars obligated through 1966 the value of tracts paid above the original estimate was $353,000 or less than 2 percent. We also saved $562,000 or about 3 percent on tracts on which our cost estimates were too high. Taking the program as a whole, our purchases underran our estimates by $209,000. These dollars were available to buy more land.

I am sure you will be interested in the chart in my initial statement indicating our progress in this program. This is more up to date than the Bureau of Outdoor Recreation had available when they presented their submission. Congress has authorized $36,000,000 for the Forest Service. The actual cash that has been made available to February 24, 1967, was $28,000,000. As of the same date, funds fully obligated were $21,000,000, and in addition to this we have options in hand for an additional $6,000,000. We have, therefore, only $1,000,000 uncommitted.

Earlier questioning of the Committee indicated concern about such things as condemnation, excess awards, escalating land prices, deferring purchases when prices are out of line, buying promptly when the market is right or when adverse development is imminent. These very things are also of great concern to us. I have in my statement a suggestion as to the way program planning and congressional committee review might be handled to get at some of these problems. Briefly, we suggest a programing procedure based upon a five-year acquisition plan for each of our management units keyed to the recreation resource plans for the units. These five-year plans would be prepared by the agencies and reviewed and approved by the Bureau of Outdoor Recreation. The annual budget submission to Congress would be based on these five-year plans and would indicate the level of financing planned for each of the management units for the budget year. When funds are appropriated, agencies would be allowed to acquire with funds available for each management unit any of the tracts included in the five-year plan for that unit. This will allow agencies to most economically meet the objectives of the Land and Water Conservation Fund Act.

The National Forest Reservation Commission must approve each individual tract purchased by the Forest Service under authority of the Weeks Act of March 1, 1911, as amended. This Commission is made up of two Senators, two Congressmen and the Secretaries of the Army, Interior, and Agriculture. Nearly all of the Land and Water Conservation Fund purchases are made under Weeks Act authority. For example, our proposed program for F.Y. 1968 includes 738 tracts of lands. Over 95 percent of these tracts must be reviewed and approved by the National Forest Reservation Commission prior to purchase.

The three-year limitation that Dr. Crafts suggested earlier in regard to the Forest Service land purchase program appears to be one that would be helpful. We should certainly be reconsidering our acquisition program for cases that are over three years old, keeping in mind changing priorities, land price escalation and other matters that affect our purchase program. This would help solve some of the problems we have now and certainly would eliminate much bookkeeping.

Insofar as charging for recreation use and putting money in the Land and Water Conservation Fund we think we have done very well. In 1966 we had 2,046 sites which were designated as charge areas. We collected $1,778,000; $1,263,000 of this was from the sale of the annual Golden Eagle Passport.

In 1967 we expect to add about 400 additional designated charge areas. This will put 55 percent of our developed recreation capacity under the charge system.

With respect to the wisdom of using Land and Water Conservation Fund monies to purchase State-owned lands, I agree that the acquisition provisions of the Land and Water Conservation Fund Act are intended to put private lands in public ownership rather than to just change jurisdiction from one public agency to another. There are, though, a number of different types of State lands. For example, there are State Park Lands, State Forest Lands, State Highway Lands, State School Lands, State Fish and Game Lands, State Waterboard Lands, and various types of State Administrative Site Lands. In some instances there is no legislative authority for the States to dispose of lands of some types by other than sale. They cannot be donated to other agencies Also, for some of the lands no authorities or funds are available to permit development for outdoor recreation. In summary, it is difficult to generalize a policy on such a complex subject as this. I believe there have been and there will continue to be instances in which it will be wise for the Federal Agencies to purchase State-owned lands but these instances will be few and far between. They would very rarely include lands that are being managed in a manner similar to the management they would receive if ownership passed to a Federal Agency.

Mr. Chairman, I would like to give you just one example of a purchase from a State that I think was wise. This involved a tract of 1,548 acres on the Chequamegon National Forest in Wisconsin. This tract of State school land was surrounded by National Forest land. By State law school lands, such as this tract, had to be managed for school income or sold and the funds received invested for income purposes. They could not be donated. In this case a decision was made that the lands would be sold. The State was confronted with two alternatives: (1) The lands could be sold at auction; in which case they would have become private lands and could have been developed in a manner adverse to public recreation needs; or (2) they could be sold to the Forest Service at fair market value with subsequent management in line with the recreation resources of the adjacent National Forest lands, resulting in enhancement of both. We believe the State made the proper decision in selling these lands to the Forest Service, and that this Committee and the Bureau of Outdoor Recreation acted wisely, in this case, when they agreed to the purchase of this tract of State land in our 1967 program.

NATIONAL PARK SERVICE

LAND AND WATER CONSERVATION FUND

STATEMENT OF ASSISTANT DIRECTOR HARTHON L. BILL

Mr. Chairman and members of the committee, thank you very much for this opportunity to review with you today the programs and funding requirements of the National Park Service in land acquisition for the coming year. My associates and I come to this meeting today with a genuine feeling that this Committee shares our enthusiasm and desire to solve the problems of land requirements for preserving and interpreting America's outstanding natural and cultural heritage and providing healthful outdoor recreation for the American people.

The Congress has given emphasis to the acquisition of lands in the recently authorized areas, but there are a variety of problems and circumstances of growing concern to us as we undertake the establishment of the new areas in the National Park System. The estimates before you reflect an approach to the meeting of the public desires and needs.

Increased use of facilities of the National Park Service by the public has kept pace with the overall increased demand for recreational opportunities. Visitation to park areas has increased by leaps and bounds in recent years and is expected to exceed a total of 147 million visits in 1967.

Facilities of the National Park Service will be strained to the utmost in meeting the greatly increased demand for recreation that is bound to occur in future years. Some of this demand can be met by improved planning and administration and by more intensive development and use of existing areas. Especially there is a need for recreational areas within easy reach of our great centers of population to provide for active outdoor activities to our urban millions. Of equal or greater importance from the standpoint of the assigned role of the National Park Service is the need to acquire the few remaining unspoiled sites of primitive beauty to preserve them for the generations yet to come.

The program we have before you today covers 35 different areas in 24 different states and the Virgin Islands. It is a program which gives emphasis upon the acquisition of lands in recently authorized areas as the Congress has requested nearly $44,000,000 of the requested $48,225,000 for this purpose.

It is of the approximately $4,000,000 for inholdings to which I want to address my particular remarks.

In our zeal to acquire recreational lands in these newly authorized areas, we should not overlook the granting of equal priority to the acquisition of inholdings in our older national parks.

Land acquisition should not be measured acre for acre parkland and recreation land. Natural beauty and healthful outdoor recreation are not synonymous terms.

National parklands cannot be all things to all people and Federal land acquisition priorities should be developed accordingly. A small lot with a growing trash pile and unsightly shack located like a festering sore within the boundaries of one of our beautiful natural areas, if acquired will add insignificantly to the total recreation lands of our Nation. But, if acquired and the instrusion removed, it will add most significantly to the integrity of the existing national park or monument.

In the almost 100 years in which the Congress has been evolving our National Park System, it has included within the System three distinct categories of areas: natural, historical and recreational.

At the natural areas, such as Yellowstone, Yosemite, Rocky Mountain, Great Smoky Mountains, Grand Canyon and Glacier, one may observe the slow processes that have carved and shaped our earth and clothed it with plant and animal life.

In the historical parks of our nation, we may learn of people who lived on this land long before the coming of the first Europeans. The panorama of our colonial and national history may be read on the face of our continent in the Spanish Forts of Florida; the Spanish Missions of the Southwest; Fort Raleigh, where English settlement was first attempted; Jamestown, where English settlement first succeeded; Independence National Historical Park, where our nation was born; St. Louis, Scotts Bluff, Fort Clatsop, Homestead, Edison, and other areas tell of the epic of westward expansion, the settlement and the development of our Nation and our technology. At more than 150 of these national historical parks our citizens may relive the tragedies and triumphs, the hardships and the victories, of the people who claimed this land and created a new way of life.

Assateague, Delaware Water Gap, Bighorn Canyon, Lake Mead—these, and many more national seashores, recreation areas, and scenic riverways, provide opportunities for healthful outdoor recreation for our burgeoning, largely urban populations.

Each category of areas is of prime importance in preserving the natural and cultural heritage of our land and assuring this and future generations of an opportunity for healthful, outdoor recreation. The special needs of each of these categories of areas need to be carefully weighed in the balance in establishing land acquisition priorities.

PATUXENT ENDANGERED SPECIES RESEARCH CENTER

Chairman HAYDEN. With respect to the Patuxent Endangered Species Research Center, which will cost about $1,000 an acre, what species and what quantities are to be protected in this area?

Mr. CRAFTS. Mr. Gottschalk will answer that.

Mr. GOTTSCHALK. It is very difficult to predict what may happen with respect to our animals and our animal populations in the future, but our planning involves from 70 to 100 different species that we feel we might expect to have to take care of through this facility. The number of individual animals would reach a peak at somewhere between 7,000 and, say, 10,000. But we are so far from this point now that this is a sort of crude guess.

EMERGENCY PLANNING AND ACQUISITION

Chairman HAYDEN. Included in your budget for the first time is a request for $5 million to be made available to the Bureau of Outdoor Recreation for emergency planning and for acquisition of priority tracts of land. Will you please discuss this fully?

PRICE ESCALATION PROGRAM

Mr. CRAFTS. This is an item which, as you say, is in the budget for the first time. Its purpose is to help solve in a small way the escalation problem. It would be available for areas authorized by the Congress to move immediately on land appraisals, on detailed planning, and on the actual purchase of particularly attractive areas or areas that are subject to competitive development. It would let us move on key parcels and on key areas immediately following authorization without having to wait the normal time lag of 18 months.

We have found that the price escalation seems to be most pronounced between the time that Congress authorized Federal activity and the time that appropriations normally become available. So this is the reason for this fund.

TRANSFER OF FUNDS TO ACQUIRING AGENCIES

Chairman HAYDEN. Will the Bureau of Outdoor Recreation acquire the lands, or will they be transferred to the acquiring agency?

Mr. CRAFTS. The money will be transferred to the acquiring agencies.

STATUTORY AUTHORITIES

Chairman HAYDEN. Will you please cite the statutory authority for use of this $5 million?

Mr. CRAFTS. The use of the $5 million is in the statutes of the various Federal agencies that acquire land. The specific authorities are with respect to the individual units for the National Park Service. The Week's law and other authorities that the Forest Service has would be the statutory basis.

OBLIGATIONS AND PURCHASE COMMITMENTS DIFFERENTIATED

Chairman HAYDEN. On page 49 of your justifications there is a table which shows obligations for each of the three land-acquiring agencies and purchase commitments for each of them. Would you please distinguish between these two terms?

Mr. RICE. Mr. Chairman, the term "obligation" refers to money which has actually been obligated on the books of the Federal Government, purchase contracts have been signed. The purchase commitment means that the acquiring agencies have accepted options to buy the land, but the fiscal records haven't reflected that transaction. That is the distinction between the two.

REPROGRAMING PROPOSALS

Chairman HAYDEN. In the past year there have been submitted to the committee a number of reprograming proposals made necessary because of greatly increased costs over the estimates submitted to Congress. Various reasons for the increased costs were given; such as, no on-site evaluation having been made, existence of improvements which were not known when the estimate was made, and visual examination rather than measurement of a property. The committee has approved most of your reprograming requests; however, it seems reasonable that your fiscal year 1968 programing should have taken into consideration these greatly increased costs and a portion of the fiscal year 1968 funds should have been allocated to some of the previously programed tracts which it is known will cost much more than the estimates submitted to Congress. Is it possible for the agencies to recast some of their programing to take care of those properties which have greatly increased in cost and which they still desire to acquire?

Mr. CRAFTS. I think, Senator, on the question of reprograming, which has been of concern to the agencies and at considerable personal concern to me because it goes to the heart of the ability of the agencies and the ability of the Bureau of Outdoor Recreation to present effective estimates to the Congress, is one on which we perhaps need a little policy guidance from the committees. We have endeavored in the 1968 program to reflect our best estimate of the costs of the tracts that are proposed. However, looking back over the past two and a half years for the 1966 and 1967 program, also 1965, the record shows that for both the Park Service and to a lesser extent for the Forest Service, that a greater percentage of the money has been obligated for parcels of land than originally estimated.

SUGGESTED 2- OR 3-YEAR REPROGRAMING CYCLE

This is a reflection, either that the most expensive tracts were acquired first, or that the estimates have not been very good. And there has been a great deal of reprograming. I personally think that we ought to give the agencies, the Federal agencies, either 2 years or 3 years to try to effectuate the program they have put before you, just as the States receive 3 years under the terms of the act. And then, starting, say, next July, the end of the fiscal year, that for the third year back and each subsequent July thereafter, that we should wipe the slate clean for that year that is 3 years old that has not been effectuated with respect to approved tracts. In effect, wipe those tracts out.

The residual money that is there then would be reprogramed for the tracts that are still eligible and approved and for which we know the price has gone up.

If this type of policy is acceptable, we would then submit to the committees the reprograming of the year that is 3 years old, come the first of July. In that way we would keep reasonably current.

I don't know whether I have made this clear but we have a problem. The agencies of course in submitting their estimate to you now for fiscal year 1968, do not in most cases have detailed appraisals. They make the appraisals after the money is appropriated. So what you have is judgment estimates. You also have a rising trend in land prices. There is going to be some continuing reprograming but I think we can reduce it, and I think we should systematize it by not letting too many years pile up on us. I suggest either a 2-year or a 3-year reprograming cycle.

POINT REYES AUTHORIZATION

Senator BIBLE. Mr. Chairman, might I ask a question at that point?

Would you illustrate what you say with a specific instance? Take Point Reyes or Cape Cod or any one of the parks and give us the authorized amount. Point Reyes is a can of worms.

Mr. CRAFTS. For Point Reyes the authorization is exhausted.

ASSATEAGUE AS EXAMPLE

Senator BIBLE. Take an example and tell me how it works. Take Assateague.

Mr. CRAFTS. I can take Assateague. Suppose 3 years ago there had been an approved amount of $1 million for Assateague and say in 1966 another million dollars, in 1967 another million dollars. Then suppose that when the third year comes around that all of the first million dollars had not been spent. Suppose there was $250,000 of it left. In the meantime the price has gone up. We and the Park Service working together would then decide for that $250,000 that is left, whether the greatest need for that is still at Assateague or whether by that time it is needed more critically at Whiskeytown or some other area. Then we would recommend to the committee that its 3-year-old approval for Assateague be lapsed and we would recommend that that money be reapproved for Assateague, or be approved to be transferred to another area.

Possible Nonpurchase of Inholdings

Senator Bible. This might be of some help. The question that sticks in my mind is the $250,000 that you have in fiscal year 1966 and you are going to reprogram 3 years later. If you defer Assateague it is still going to cost you that much in 1969 or 1970, is it not?

Mr. Crafts. I think in the case of Assateague there is very little question but what on that one you would recommend that you continue to spend it right at Assateague, because you would not have the job done there. But we have the situation on inholdings in parks. That is the common situation in the Forest Service on inholdings. Now it might happen that you would have inholdings which had been approved 3 years ago but which, for reasons of lack of availability or lack of price had not been purchased. And there was, say, a million dollars left for inholdings for the National Park Service. Then we would come to you and say, "Well, now, we want so much of that to continue to be available for what you originally approved," or we would recommend that the urgency is greater for the purchase of an inholding in another unit.

We would propose to either reaffirm or reprogram.

Senator Bible. I can understand that in the case of inholdings, because the inholding has been there a good many years and could probably exist for several more without the terrific acceleration in cost. What you do is hope for a better day at the bargaining table.

Mr. Crafts. Yes, or we would know that some tracts are available then that weren't before, or a tract we had estimated a year ago for a hundred thousand, we know by then it would cost $115,000 and we would ask to use $15,000 of that money from the preceding year for this.

Senator Bible. Or if an inholding estimated at $100,000 had gone up to a million dollars, you might say in balancing out our Park Service programs and forest service program and fisheries program we would leave that $1 million inholding there at the present time.

Mr. Crafts. That is right. We might not proceed. We are far enough along now. We are in the fourth fiscal year that these Federal moneys are available to these agencies. Now we are about at the time, in my judgment, where you can't have your books going back ad infinitum. By 1975 we will have books 10 years old. There has to be a cutoff date.

I am suggesting either a 2- or 3-year cutoff date and then reprograming.

Senator Bible. Mr. Chairman, this sounds to me like it might have tremendous possibilities.

Senator Mundt. Mr. Chairman, I have about four questions.

Chairman Hayden. All right, go ahead.

MISSOURI RIVER FIELD STUDY

Senator MUNDT. I would appreciate if you would send to my office a complete report on the status of the Missouri River field study discussed on page 3 of the justifications. You also mentioned the Missouri River field study on page 13. Is this the same study?

Mr. CRAFTS. The same study.

Senator MUNDT. Will you send that to me?

Mr. CRAFTS. We will be happy to do that.

BADLANDS STUDY

Senator MUNDT. Just what do you envision your results will be of the study of the Badlands mentioned on page 13 of your justification?

Mr. UNDERHILL. Senator, we have made a preliminary study of the Badlands as part of the surplus military inventory that the President asked Secretary Udall and Secretary McNamara to make. It obviously has high recreational potential. The Fish and Wildlife Service is interested in the northeast corner in connection with their preservation of the Blackfoot ferret. The Park Service is interested in the possibility of extending the Badlands National Monument into that area. As you know, the Indians are very much concerned with the return of that property and possible use both for grazing and for recreation under their auspices.

So, we met last week with Congressman Berry at his request and it was agreed that this spring when the weather is suitable the area would be restudied on the ground to try to determine whether or not the Badlands portion could be delineated and perhaps authorized for addition to the National Monument and the usable grazing land and agricultural land returned or made available for the Indians or former owners and at the same time to consider the other interests that are involved in the proposal, and then make a report and suggest legislation if this is needed.

RECREATIONAL PROPOSALS AFFECTING SOUTH DAKOTA

Senator MUNDT. Thank you. That was very informative.

Mr. Crafts, you discussed your plan of assistance to the States to give 50 percent grants-in-aid for costs of preparing and maintaining outdoor recreational plants. You mention that on page 36. Then on page 40 you have a table showing requests received from States, number qualified, and amount obligated. Will you please have sent to my office a breakdown for South Dakota of all the requests received, the amounts which are qualified, which have been obligated, and for what amount? I would also like some indication of when action might be taken on those that have not yet been qualified.

Mr. CRAFTS. We will be happy to do that.

CONSERVATION SHOWCASES

Senator MUNDT. My final question is this. Two years ago I was able, working through our Agricultural Appropriations Subcommittee, to get a study made by the Soil Conservation Service on the possibility of establishing what we alluded to as conservation showcases, here and there around the country, where people can really come and see what we have done in this business of soil conservation.

I have a copy of this report with me. I will give this to you. Then will you please have someone in your shop look into this matter and confer with the Soil Conservation Service and after that provide the committee with a report on the possibility that you might be able or might not be able, what you can do to help provide funding for such showcases and whether you feel there is any cooperative effort which should be made?

Mr. CRAFTS. We will be happy to do that.

Senator MUNDT. Thank you.

Thank you, Mr. Chairman.

TIME ALLOWANCE FOR COMMITTEE APPROVAL OF REPROGRAMING PROPOSALS

Chairman HAYDEN. The committee has been asked to approve reprograming submissions which have been brought to the attention of the committee within a matter of days in some instances before options to purchase the subject properties will expire. An adequate length of time should be made available for committee consideration of reprograming proposals and I will appreciate your assurance that such time will be afforded.

Mr. CRAFTS. Senator Hayden, I know exactly what you are referring to. I regret it. I can assure you that we will make every effort to prevent this sort of thing happening. I should say, however, that the complete control of this is not in my hands, but I will do the best I can.

Chairman HAYDEN. That is all anybody can do.

Mr. CRAFTS. Thank you, sir.

"NEWLY AUTHORIZED AREAS" DEFINED

Chairman HAYDEN. A portion of the National Park Service allotment is for acquisition in newly authorized areas. Would you please define the term "newly authorized areas," indicating how far back in time you would go?

Mr. CRAFTS. Normally, by newly authorized areas we mean areas that have been authorized since 1961. The last 5 years is our normal terminology.

OBLIGATION CAPABILITY IN EXCESS OF LAND ACQUISITION REQUESTS

Chairman HAYDEN. Are the amounts that have been requested for each of the land-acquiring services the maximum amount that they can obligate during fiscal year 1968 for each of the areas where purchases are planned?

Mr. CRAFTS. I think the answer in the judgment of the agencies would be, "No."

Chairman HAYDEN. If not, how much more can be used in each of the areas?

Mr. CRAFTS. May I go on to say, however, that the apportionment between the agencies is the most equitable that I think can be made within the overall budget request. But I would cite you an example. Part of the answer to this depends on what new authorizations Congress might pass. If, for example, Congress were to enact a Redwood National Park authorization, I am quite sure that the Park Service could obligate substantially additional moneys and effectively do so, and should do so. I think for some of these other recent authorizations in the last 5 years that the agencies are getting tooled up to the point where they could move faster. The Federal agencies as of December 31 had obligated about 70 percent of the moneys then available to them. By the end of this fiscal year I think they will be just about current. So the answer is that I think they could move faster; and, to get on top of the escalation problem, this would be desirable.

Administration Considerations

On the other hand, this is the administration's budget and its recommendation was considered in the light of all the other demands on the national capacity, and I think it is an equitable budget.

AGENCY LAND CONDEMNATIONS

Chairman Hayden. Please place in the record information showing the cases of land condemnation by each of the agencies, the amounts deposited with the court for each, and the awards made in each case. In those cases, if any, where a declaration of taking was not filed, please so indicate.

Mr. Crafts. Yes, sir; I will do that. We have prepared for the committee, and I will submit to you at this point, a record of the situation with respect to condemnations which covers all of these things.

(The information follows:)

A Report on the Exercise of Eminent Domain in the Acquisition of Lands for Outdoor Recreation and Related Public Purposes, December 31, 1966

There are pending before the Federal Courts thirty-six condemnation actions involving 114,158 acres of land. At the time the Declaration of Takings were filed, a total of $9,661,650 was deposited with the courts. Based on final awards in previous condemnation actions, it is estimated that the final awards in these cases plus interest may well exceed the amounts deposited with the courts by $30,000,000 or more. Thirteen of the thirty-six cases were filed prior to the enactment of the Land and Water Conservation Fund Act (P.L. 88-578) of September 3, 1964.

POLICY

The problems relating to the use of Condemnation Authority to acquire certain lands and interest in lands within authorized limits of National Parks, National Forests, and National Wildlife Refuges have been discussed with the Appropriations Committee on several occasions.

The National Park Service, Forest Service, and the Bureau of Sport Fisheries and Wildlife exercise the authority of Eminent Domain sparingly. Every effort is made to negotiate voluntary sales and only as the last resort are condemnation proceedings instituted. The National Park Service, due to its extra heavy acquisition program and the nature of the lands it is authorized to acquire, uses the authority more frequently than the other agencies who acquire lands with Land and Water Conservation Funds.

SETTLEMENT OF RECENT AWARDS

Two of the cases for which the courts recently made final awards can be settled within existing authorized statutory limits. Actions have been initiated to reprogram unobligated F.Y. 1967 funds to settle these cases and stop the interest which accrues on the deficiency from date of filing until settlement. The court awards in these two cases (see Part 1 Table I) were $1,486,270 or $1,416,820 in excess of the amount deposited with the court at the time the Declarations of Taking were filed. The awards shown above do not include the accumulated interest which amounts to approximately $108,000 and must also be deposited with the courts to fully satisfy the judgments.

INCREASE IN STATUTORY CEILING REQUIRED

Five of the cases for which final court awards or commissioners recommendations have been made cannot be settled without an increase in the statutory ceilings covering the management units (see Part 2 Table I). The court awards in these five cases were $7,459,676 or $5,438,020 in excess of the amount deposited with the courts at the time the Declarations of Taking were filed. This does not include interest which is accruing at the rate of approximately $27,000 per month, and must be paid before the judgment is fully satisfied.

The awards for the two Cape Hatteras cases are based on commissioners recommendations which are usually accepted by the court.

In addition, ten of the twenty-one cases listed in Table II for which court awards are expected in fiscal year 1968 are in management units which wil require an increase in the statutory funding ceiling before all pending cases can be settled (see Table IV).

AWARDS EXPECTED IN FISCAL YEAR 1968

There are twenty-one (21) cases pending before the Federal Courts for which final court awards are expected to be rendered before the end of fiscal year 1968 (see Table II). These cases involve 84,047.68 acres of land and $7,441,120 deposited in the courts at the time the Declaration of Takings were filed.

PRESENT SITUATION

Of the thirty-six cases pending before the Federal Courts, twenty-six cases are expected to be ready for final settlement before the end of fiscal year 1968 (see Part 2 Table I and Table II). This includes the five cases shown in Part 2 of Table I, three of which have final court awards and two cases with commissioner's findings and recommendations. The total amount deposited in the courts for the twenty-six (26) cases when Declaration of Takings were filed is $9,462,776.

Based on recent court awards and the history of other condemnation cases, it is estimated that the awards plus interest on the twenty-six pending cases that are likely to be decided and need funding in fiscal year 1968 may exceed the amounts deposited in the courts by approximately $25,000,000.

In addition, there are eight relatively small cases (see Table III) that are not expected to be finalized before the end of fiscal year 1968. The amount deposited in the court for these cases totaled $129,425.

UNEXPECTED DRAIN ON LAND AND WATER CONSERVATION FUND

Eleven of the pending condemnation cases initiated by the National Park Service and the two cases that are in progress of being settled through reprograming of F.Y. 1967 funds were initiated prior to the enactment of the Land and Water Conservation Fund Act. The estimated deficit award plus interest on these cases may exceed $12,500,000.

PROBLEMS

It is realized that judicious use of Condemnation Authority will continue to be necessary if lands needed for public use are to be acquired in the future.

We are seeking an equitable solution to the following problems:

1. A procedure that will make funds available for immediate settlement of court awards that will not require reprograming of funds and disruption of approved programs.
2. The source of the $25,000,000 that will probably be needed in fiscal year 1968 to settle condemnation cases that may be finally adjudicated.
3. A special provision to permit payment of court awards. If the authority to condemn is used judiciously in the future, this problem should be minimized.

It is proposed:

1. That the Department of the Interior would seek a 1968 F.Y. supplement appropriation of $25,000,000 to be funded through an advance to the Land

and Water Conservation Fund under the authority of Sec. 4(b) P.L. 88–578. Such funds would be used only to satisfy court awards.

2. That to satisfy future court awards on properties acquired through condemnation, a line item be carried in fiscal year 1969 and beyond. The amounts requested each fiscal year would be the estimated needs to cover anticipated excess awards during the year taking into consideration balances left over from previous appropriations.

Summary of condemnation cases pending in courts

Case status	Number	Court deposit	Court awards
1. Cases in process of settlement through reprograming of fiscal year 1967 funds	2	$69,450	$1,486,270
2. Cases for which court awards have been made but settlement requires increases in statutory ceilings	5	2,021,656	7,459,676
3. Cases that are expected to be handled by the courts in fiscal year 1968	21	7,441,119	(1)
4. Cases on which no court action expected in fiscal year 1968	8	129,425	(1)
Total cases pending	36	9,661,650	[2] 8,945,946

[1] Pending court action.

[2] Represents court award on 7 cases exclusive of interest.

COURT AWARDS IN CONDEMNATION CASES

Chairman HAYDEN. In condemnation cases where court awards are larger than the amount of appropriated funds or of authorized funds, what do you do about meeting the amount of the judgment?

Mr. CRAFTS. If the judgment exceeds the authorization, the legislative authorization, then of course you can't meet the judgment until or unless Congress raises the authorization. If the award exceeds the deposit but is within the limit of any overall authorization, then it must be programed out of the land and water conservation fund.

PURCHASE OF LAND OWNED BY STATES

Chairman HAYDEN. A number of tracts proposed for acquisition are owned by States or other public bodies. Why should the United States purchase land from such owners when large annual allocations are made to the States for land and water conservation fund?

Mr. CRAFTS. I think there are certain circumstances, where there are inholdings, where they are completely surrounded by Federal land or their management is integrated one way or the other with the activity of Federal agencies, where it is to the interest of both the State and local governments and Federal agencies for this to occur. Sometimes this is to be done on a land exchange basis, sometimes on a purchase basis. And occasionally I think it should be expected that the State or local governments would donate these lands. This has occurred upon occasions.

Again I cite the Redwood Park proposal, where it is hoped that the State of California would donate the State park. But in general, I would say that the thrust, the acquisition thrust of the Land and Water Conservation Fund Act, insofar as the Federal agencies go, should be directed toward the acquisition not of other public lands but of private lands.

Senator BIBLE. Without extending this hearing this morning, Mr. Crafts, would you furnish for the record the public lands that you have acquired since the creation of the land and water conservation fund?

Mr. CRAFTS. By the Federal agencies?

SUGGESTED REQUIREMENT OF STATE LAND DONATIONS

Senator BIBLE. Yes.

I thoroughly agree, that as we move into this area of outdoor recreation, be it a national park or a seashore or a Forest Service project, and we have State lands involved, it seems to me that before you would create that park you should have a requirement that they donate their State land. Because it certainly is greatly to their benefit, since it minimizes the burden that is placed on the State for recreational purposes. I would like to have you detail that for the record, if you will.

Mr. CRAFTS. We will, sir. And also we can furnish a listing of such tracts which have not yet been purchased.

(The information follows:)

List of tracts purchased by Forest Service from States and other public bodies with land and water conservation funds since inception to Dec. 31, 1966

State management unit	Acres	Cost
New Mexico: Cibola National Forest—State game commission	240	$30,000

FOREST SERVICE

Publicly owned tracts proposed for acquisition fiscal year 1968 land and water conservation fund budget

State, management unit tract identification	Acres	Total cost
California: Inyo National Forest, 68-1 Inyo County	92	$19,250
Colorado:		
Grand Mesa-Uncompahgre National Forest, 04002 (68) State of Colorado [1]	160	78,000
San Juan National Forest, 13009 (68) State of Colorado [1]	160	120,000

[1] These tracts are to be acquired through an agreement whereby the States exchange land with a private owner and the Forest Service, in turn, purchases the land from the 3d party.

LAND AND WATER CONSERVATION FUND, NATIONAL PARK SERVICE

Publicly owned tracts in the approved land acquisition programs for fiscal years 1965–67 that have not been purchased

State, management unit tract identification	Acres	Cost
Colorado: Dinosaur National Monument, State of Colorado (1966)	2,957	$69,850
Minnesota: Pipestone National Monument, city of Pipestone (1966)	.317	10,000

LAND AND WATER CONSERVATION FUND, BUREAU OF SPORT FISHERIES AND WILDLIFE

Publicly owned tracts in the approved land acquisition programs for fiscal year 1967 that have not been purchased

State, management unit, and tract identification	Acres	Total cost
WISCONSIN		
Upper Mississippi National Wild River: Wisconsin State Islands 88, 91, and 93 (1967)	100	$3,500
There are no tracts in the fiscal year 1968 programs of the National Park Service or Bureau of Sport Fisheries and Wildlife which can be identified as belonging to public agencies.		

Chairman HAYDEN. In this connection, I wonder why these tracts should not be conveyed to the United States as a gift or even by irrevocable use permit?

Mr. CRAFTS. They can in some instances. I might say some of these tracts, particularly of the Forest Service, are in-holdings inside the national forest. And you sometimes have a different situation.

ADMINISTRATIVE EXPENSES

Chairman HAYDEN. For administrative expenses you propose a total of $2,775,000. Would you please discuss the proposed use of this amount?

Mr. RICE. Mr. Chairman, these funds will be used to pay the salaries and expenses of the Bureau of Outdoor Recreation staff that administers the grants-in-aid program to the States, reviews the State outdoor recreation plans, reviews the Federal land acquisitions that are to be purchased by the Federal land-acquiring agencies, and performs the accounting functions that go along with this work.

These funds also will be used to pay for the printing and distribution of the permits and for the cost of auditing State records.

PERSONNEL GRADES AND ASSIGNMENTS

Chairman HAYDEN. Please place in the record a table showing the number of employees of the Bureau of Outdoor Recreation in fiscal year 1967 by grades and assignment, and the same information for fiscal year 1968.

Mr. CRAFTS. We will do that, sir.

(The information follows:)

Land and water conservations positions by grade and assignment, fiscal years 1967 and 1968

CIVIL RIGHTS COMPLIANCE PERSONNEL ACTIVITIES

Chairman HAYDEN. How many personnel do you propose to place in compliance with title VI of the Civil Rights Act?

Mr. RICE. Mr. Chairman, we are asking for an increase of 10 positions. These 10 positions would be used to handle the civil rights compliance activities as well as inspect physical performance of the projects.

IMPROVED LAND COST ESTIMATES

Chairman HAYDEN. I note that the Bureau of Outdoor Recreation is urging the land-acquiring agencies to prepare better cost estimates. What progress are you making?

Mr. CRAFTS. I think we are making good progress, Senator. I think the estimate for 1968 will prove better than the estimate for 1967.

EFFECT OF DEFERRING STATE-GRANT PROGRAMS TO 1968

Chairman HAYDEN. The Bureau of the Budget has advised the committee that the Bureau of Outdoor Recreation has been directed to defer $20 million in the State-grant program during fiscal year 1967, and to defer $21,500,000 in the program level. What effect, if any, will this have on your operations?

Mr. CRAFTS. I think for 1967 it will not hurt us, because the States have obligated only 40 percent of the money that has been apportioned to them and for the reasons that I have previously discussed. As the States obligations step up if this withholding continues in effect it will curtail the State activities.

Chairman HAYDEN. I want to thank you for your appearance. We have discussed a very interesting subject.

Mr. CRAFTS. Thank you, Senator Hayden, very much. It is always a pleasure to appear before you.

Chairman HAYDEN. Are there any more questions?

BUREAU AND PARK SERVICE LAND ACQUISITION ESTIMATE VARIANCE

Senator BIBLE. I have three short ones, Mr. Chairman, if I might.

When Mr. Hartzog appeared before our committee, Mr. Crafts, in his response to a question which I asked, estimated that a total of $697 million would be needed to carry out an optimum program of land acquisition. He divided the figure as follows: First, purchase of land for parks and other types of recreation areas which have already been authorized, $375 million. Second, purchase the lands for as yet unauthorized areas, assuming they are authorized, $252 million. Third, payments of judgments arising from condemnation suits, $28 million. Fourth, to provide a national system of trails and wild rivers, $42 million. Now that totals $697 million.

I note on your table at the end of your statement that you estimate the cost between 1968 and 1977 to be $617 million. I just wish for the record you would reconcile those. Maybe you can do it right off the top of your head. Or you might want to study it. I don't know what the difference is.

Mr. CRAFTS. There are what I think you would call minor differences. We are continually making estimates, Senator Bible, we and the Park Service. I sent you not long ago a preliminary draft of this. I sent you a copy of the material that Congressman Aspinall had requested, which broke down the Park Service estimates. These were preparded jointly by the Park Service and us, and we were in agreement at that time. As to the material that Mr. Hartzog submitted to this committee a few days ago—I have been out of town, and I did not catch up on it until yesterday—I don't know what the differences are. But if there are differences they are very minor differences.

But we will explain to you what the differences are.

Senator BIBLE. I don't know whether they are so minor. If my arithmatic is right, there is $80 million difference.

Mr. CRAFTS. It could well be that he has a Point Reyes figure in his estimate which is not in our estimate. This could be a substantial part of the difference.

Senator BIBLE. Yes. Why don't you check it out and furnish it for the record?

Mr. CRAFTS. All right.

(The information follows:)

Our Recreation Land Price Escalation Report estimates the total needs for land acquisition for the National Park Service at $617 million, to be expended over the next ten years. This estimate was based upon costs agreed to between the Bureau of Outdoor Recreation and the National Park Service at the time the report was prepared. The report was released in January 1967 with the concurrence of the Secretary of the Interior.

The estimate of $697 million which Mr. Hartzog presented last week incorporates many minor adjustments of costs at some 50 separate areas. This Bureau has not had the opportunity to review these new estimates. Mr. Hartzog's estimate does carry an additional amount for Point Reyes National Seashore of some $40 million. The Bureau of Outdoor Recreation estimate does not include any additional money for Point Reyes as it reflects the decision of the Secretary of the Interior and the Administration not to move ahead on this area at this time.

Desirability of Statutory Shrinkage of Authorized Areas

Senator Bible. Have you ever given any thought to the desirability of statutorily shrinking some of the areas that Congress has authorized?

Mr. Crafts. Yes, we have thought about it. We have also thought about not raising authorizations where you run out. I think there may be cases where this might be desirable. I can't be specific with you. I don't wish to be. But I think if this situation continues to get out of hand—and it is, in a sense, getting out of hand—that this may be something that may need to be done in certain instances.

Senator Bible. I am suggesting the question, because it is my intention, Mr. Chairman, as chairman of the Park Subcommittee of the full Interior Committee to have a hearing within a month directed specifically to working out statutory remedies, if that is indicated, to try to meet this ever-rising land cost.

LAND VALUE ACCELERATION

The problem is particularly accentuated by the Point Reyes example, which was authorized at $14 million, then it went to $19 million, then we were told it would be $27 million. The last figure I have heard it would be $57 million. Part of the answer there has been, undoubtedly, the failure of the county involved to pass necessary zoning ordinances.

STATE CONTRIBUTIONS

Now it seems to me in situations of this kind we might very well consider shrinking the area, maybe even completely deauthorizing it. I suppose anything that Uncle Sam has ever created in the way of parks has never been deauthorized, but this might set a precedent. If this is to the advantage very largely, as I see it, to a State such as California, it seems to me there ought to be certain quid pro quo where they should likewise do certain things.

I intend, Mr. Chairman, to go into this in depth. I have not had the opportunity of reading this bulletin "Recreational Land Price Escalation." I think it would be better to read the bulletin and then ask the questions, rather than ask the questions and then read the bulletin.

Mr. Crafts. Some of these we have answered. There is suggested legislation in here.

Senator Bible. I think it would be more orderly for me to do my homework before I ask the questions. With your permission, I will go into this in the legislative committee rather than in the Appropriations Committee.

Chairman Hayden. That is fine.

RECREATION DEVELOPMENT

Senator BIBLE. How much does the Bureau of Land Management spend on recreation development?

Mr. CRAFTS. The Bureau had actual obligations amounting to $718,000 in fiscal year 1966 and is estimating $1,451,000 for fiscal year 1967 and $1,350,000 for fiscal year 1968.

Senator BIBLE. Thank you very much, Mr. Crafts.

Mr. CRAFTS. Thank you, Senator.

WEST VIRGINIA GRANTS AND PROJECTS

Chairman HAYDEN. Here are a series of questions by Senator Byrd. Please supply the answers for the record.

(The questions and answers follow:)

Question. How much of the 1968 appropriation request will be available to West Virginia?

Answer. Grants to West Virginia from the Land and Water Conservation Fund will total about $838,000 based on the request of $65,000,000 for assistance to States. West Virginia has been allocated $2,015,000 from 1965–66–67 appropriations. Of this sum about $496,000 has been obligated.

Question. Where will recreation fees be charged in West Virginia during the coming recreation season?

Answer. The list of designated areas at which fees will be charged is under preparation. We cannot list at this time the specific areas at which fees will be charged.

Question. What projects are in the budget for West Virginia?

Answer. About $1,641,000 will be available from the Land and Water Conservation Fund for acquisition of recreation lands in West Virginia by the Forest Service in fiscal year 1968. The details on these acquisitions are shown in the attachment. We do not know what grants-in-aid projects the State will submit with the $838,000 expected to be appropriated in F.Y. 1968. The States have the prerogative of determining which projects will be submitted.

Proposed acquisitions of lands in West Virginia from land and water conservation fund

	Acres	Cost
George Washington National Forest	57	$13,700
Jefferson National Forest	1,925	100,000
Monongahela National Forest	569	[1] 205,000
Spruce Knob National Recreation Area	5,823	[2] 1,322,359
Total West Virginia	8,374	1,641,059

[1] Includes improvements valued at $91 700.

[2] Includes improvements valued at $193,982.

SUBCOMMITTEE RECESS

Chairman HAYDEN. We thank you for your appearance.

The subcommittee will stand in recess until 10 a.m. Friday, March 10, when the Federal Coal Mine Safety Board of Review Office of Saline Water, and Federal Development Planning Committees for Alaska will be heard.

(Whereupon, at 12:13 p.m., Thursday, March 9, 1967, the subcommittee was recessed, to reconvene at 10 a.m., Friday, March 10, 1967.)

DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1968

FRIDAY, MARCH 10, 1967

U.S. Senate,
Subcommittee of the Committee on Appropriations,
Washington, D.C.

The subcommittee met at 10 a.m., in room 1223, New Senate Office Building, Hon. Carl Hayden (chairman) presiding.

Present: Chairman Hayden and Senators Byrd and Bartlett.

FEDERAL COAL MINE SAFETY BOARD OF REVIEW

Salaries and Expenses

STATEMENT OF HARRY R. PAULEY, MEMBER; ACCOMPANIED BY GEORGE C. TREVORROW, MEMBER; AND ROBERT J. FREEHLING, GENERAL COUNSEL.

BUDGET REQUEST

Chairman Hayden. The subcommittee will be in order. There will be placed in the record the statement in justification of the budget estimate for the Federal Coal Mine Safety Board of Review for fiscal year 1968. The Board proposes an appropriation of $162,000, an amount $16,400 less than the appropriation for last year.

(The justification follows:)

Requirements for 1968.—The Board is requesting an appropriation of $162 thousand, of which $76 thousand is for personnel compensation and $86 thousand is for other obligations. This amount is approximately $16 thousand less than that appropriated for 1967.

Establishment of Board.—The Board is an independent, quasi-judicial agency, created by Title II of the Federal Coal Mine Safety Act (30 U.S.C. 471–483). Under section 205(a) of that act, as originally adopted on July 16, 1952, the Board was composed of three members, appointed by the President, by and with the advice and consent of the Senate. However, under the recent "Federal Coal Mine Safety Act Amendments of 1965", approved on March 26, 1966 (P.L. 89–376; 80 Stat. 84), the Board was reconstituted to consist of five members, instead of three, with the members continuing to be appointed by the President, by and with the advice and consent of the Senate.

The membership of the Board is tripartite in nature, that is, two members serve as the large and small coal mine operators representatives, respectively; two, as the large and small coal mine workers representatives, respectively; and the Chairman, who is required to be an engineer experienced in the coal mining industry and without recent connection with the groups concerned, serves in effect as the public representative.

Briefly, Title II, as amended, provides mandatory safety standards which are detailed in the act and which are now applicable to all underground coal mines engaged in interstate commerce. Enforcement of these standards is initiated through findings and mine closing or classification orders, issued by representatives of the U.S. Bureau of Mines. It is the principal function of the Board, as established by the act, to determine the propriety of such orders upon requests for relief submitted to the Board, by coal mine operators affected by those orders.

Adjudicatory duties and workload of the Board.—The adjudicatory duties of the Board, in docketed cases, involve the hearing and determination of applications filed by coal mine operators seeking annulment or revision of, and temporary relief from, orders issued by the Bureau of Mines under sections 203 and 206 of the Federal Coal Mine Safety Act. Appeals from final Board orders may, in turn, be taken to the U.S. Courts of Appeals, and then to the U.S. Supreme Court. In performing these adjudicatory functions, in litigated cases, the Board is required to conduct public hearings (which, under the amended act, must generally be held close to the mine involved); to resolve interlocutory matters; to render final decisions and orders; and to certify records on appeals to the courts. All such actions of the Board, under the specific mandate of the Congress, must be taken "as rapidly as practicable" in order to minimize economic loss and to effectuate the underlying safety purposes of the act.

The adjudicatory duties of the Board also include the resolution of informal, or "advice", cases, in which disputes are settled by the voluntary actions of the parties and without the docketing and processing of formal appeals. These activities of the Board are extremely diverse, depending on the circumstances involved, and seek to avoid, whenever possible, the need to resort to time-consuming and disruptive litigation.

As to workload, from July 16, 1952, the effective date of the original act, through September 30, 1966, the Bureau of Mines issued approximately 1900 orders subject to appeal to the Board, a number of which remain outstanding. During this period, the Board received 33 formal applications for review of orders, and hearings extending from 1 to 12 days were required in each litigated case. Also, during this period, the Board handled a large number of advice matters which were settled by the informal, voluntary actions of the parties concerned.

Under the "Federal Coal Mine Safety Act Amendments of 1965," adopted on March 26, 1966, the number of findings and orders issuable by the Bureau, and, therefore, the potential workload of the agency, were very substantially expanded, as were the adjudicatory procedures required to be followed by the Board in litigated cases. In this connection, the amendments increased more than sixfold the number of coal mines subject to the Board's jurisdiction; a new category of mine closing orders, referred to as "reinspection closing orders", was added to the imminent danger and elapsed-time closing orders and gassy classification orders, already subject to appeal to the Board; hearings on requests for temporary relief, and on the merits, and other Board proceedings, must be conducted, upon request of the operator, at the county seat of the county in which the mine is located, or at some other place mutually agreed to by the operator and the Board chairman; three members, instead of two, are required to constitute a quorum; and, in cases heard by less than the full Board, a copy of the transcript must be made available to the parties and an opportunity to appear before the full Board must be afforded the parties, before final Board action.

The impact of the substantive amendments did not become fully operative until October 1, 1966, and the Board is unable to estimate with any degree of precision the number of orders likely to be issued by the Bureau of Mines in 1968. However, based on past experience under the original act and on other available data, it is anticipated that more than 300 such orders will issue, during 1968, subject to appeal to the Board.

Other duties of the Board. Apart from its adjudicatory functions, the Board must perform the broad range of activities of any independent, quasi-judicial agency in the executive branch of the Government. Such activities include, among others, the preparation and adoption of administrative orders and regulations; the maintenance of records, files and supporting data; the submission of administrative reports to other executive departments and agencies, and to the Congress; the prompt handling of inquiries and correspondence; the analysis of, and detailed reporting on, proposed and pending legislation relating directly or indirectly to the Board; the participation in hearings before committees of Congress; and the discharge of other advisory and information responsibilities.

Personnel complement. In addition to the five members of the Board, who are compensated on a WAE basis, the Board anticipates the continued performance of its varied legal and administrative duties with a staff of only four full-time employees. These employees consist of a general counsel (who, besides serving as chief legal officer, performs the work of executive secretary), and three office employees. This is the absolute minimum number of employees required by the Board to handle its projected workload, and to fulfill its substantially increased assignments, under Title II of the Federal Coal Mine Safety Act, as amended.

PROGRAM AND PERFORMANCE

Coal mine operators, affected by orders issued by Federal coal mine inspectors, may appeal to the Board for annulment or revision of, and temporary relief from, such orders. When operators appeal, hearings are held, and the Board rules upon the applications. It is estimated that the number of orders subject to appeal to the Board will increase to at least 300 in 1968, due to the extension of coverage, and the expansion of categories of orders, provided in the Federal Coal Mine Safety Act Amendments of 1965, approved on March 26, 1966. The recommended appropriation includes an amount estimated to be sufficient to cover necessary administrative expenses, and to handle an expected threefold increase in the caseload, estimated on the basis of experience under the Federal Coal Mine Safety Act, prior to its amendment.

DETAILED STATEMENT

12. *Personnel benefits.* It is estimated that $6 thousand will be required under this object to cover the Government's contribution, in accordance with existing legislation, to employees' group life insurance, group health benefits, retirement, and FICA taxes.

21. *Travel and transportation of persons.*—It is estimated that $40 thousand will be required for this object, principally for the conduct of anticipated proceedings in the field.

23. *Rent, communications, and utilities.*—It is estimated that $5 thousand will be required under this object to cover the cost of hearing room rent, local and long distance telephone services, telegraph service, and postage.

24. *Printing and reproduction.*—It is estimated that $2 thousand will be required for this object to cover the printing and reproduction cost of administrative forms, rules, letterheads, and findings and orders and other issuances of the Board.

25.1 *Other services.*—It is estimated that $22 thousand will be required for this object principally to cover the cost of court reporter services for the projected caseload.

25.2 *Services of other agencies.*—It is estimated that $9 thousand will be required for this object to cover the cost of budgeting, and complete payroll, accounting and fiscal reporting services performed for the Board by General Services Administration. Also included in this object are the estimated costs of employee health services provided by the Public Health Service, etc.

26. *Supplies and materials.*—It is estimated that $1 thousand will be required to cover the cost of all supplies that are normally used in an office.

31. *Equipment.*—It is estimated that $1 thousand will be required for incidental equipment as needed, and repairs to equipment.

PREPARED STATEMENT

Chairman HAYDEN. Mr. Pauley, will you please place your prepared statement in the record for printing in full, and then summarize it for the committee?

(The prepared statement follows:)

The Board is requesting an appropriation of $162,000 for fiscal year 1968. This amount is a reduction of approximately $16,000 from that appropriated for the current fiscal year.

As you know, the Board is an independent, quasi-judicial agency, engaged in the adjudication of appeals, and in a broad range of administrative activities, under Title II of the Federal Coal Mine Safety Act, as amended. Its five members, who are appointed by the President, with the advice and consent of the Senate, respectively represent the viewpoints of management, labor, and the general public. More particularly, one member represents the view point of the large coal mine operators; one, the small coal mine operators; one, the large coal mine workers; one, the small coal mine workers; and the chairman in effect represents the general public.

The duties and responsibilities of the Board are described in the budget justification already before your Committee. However, for your assistance, some further information regarding the Board's operations will be provided in this statement.

ADJUDICATION DUTIES OF BOARD

As to the adjudication of appeals, the Board serves essentially as a buffer between the U.S. Bureau of Mines and the coal industry, in determining the propriety of orders issued under Title II of the Federal Coal Mine Safety Act. That act, which was originally adopted in 1952 and substantially amended in 1966, establishes a comprehensive and closely integrated program designed to reduce the incidence of explosions, fires, inundations, and man-trip and man-hoist accidents, in underground coal mines. To accomplish this goal, the act empowers the Bureau of Mines to order mines classified as gassy; and to order all or parts of mines closed because of imminent danger of disaster, or because of the failure to correct specific violations of the act within the time provided therefor, or because of certain repeated violations of the mandatory safety requirements set forth in the act. In addition, Title II delegates broad authority to the Board to resolve conflicts regarding these orders, and, under designated conditions, to grant interim relief to the mine operators. Moreover, in so-called "State plan" areas, the Board alone is granted the primary jurisdiction to annul or revise closing orders issued by the Federal, or the joint Federal and State, inspectors.

Appeals may be submitted to the Board formally or informally for decision and settlement. In a formal or "docketed" case, the Bureau of Mines must first actually close the mine or classify it as gassy. Then, the Board, upon appeal, is required immediately to hear and determine any request for temporary relief; to dispose of intermediate matters; to conduct a public hearing on the merits; to prepare and issue a final decision and order; and, if review is sought, to certify the record to the U.S. court of appeals. Further appeal may also be taken to the Supreme Court of the United States.

In the informal or "advice" cases, which, in general, are submitted before the closing orders issue, the Board seeks, through a variety of measures, to resolve the disputes by the voluntary conduct of the parties, and without the closing of the mines or the disruption of protracted litigation.

RECENT AMENDMENTS OF ACT

As indicated in the justification, the amendments to Title II, approved March 26, 1966, substantially increased the jurisdiction, composition and functions of the Board. Among other things, these amendments extended the jurisdiction of the Board to cover approximately 6000 additional coal mines regularly employing fewer than 15 men underground, which were previously exempt from the safety requirements of the act. Furthermore, a new category of mine closing orders, known as "reinspection closing orders", was added to the gassy classification orders, and to the imminent danger and elapsed-time closing orders, already subject to appeal to this agency.

With respect to the composition and functions of the Board itself, the amendments expanded the size of the Board from three to five members, in order to afford representation to the newly covered mines. Moreover, hearings and other Board proceedings, which the Board previously had the option to conduct in Washington, D.C., are now expressly required by the amendments to be held, upon the request of the operator, at a location in the immediate vicinity of the mine involved. Also, the quorum for Board action was increased from two to three members. And in any case heard by less than the full Board, the amendments direct that a copy of the transcript be made available to the parties; that an opportunity to appear before the full Board be granted; and that the parties may be afforded an opportunity to submit additional evidence to the full Board. As in the original act, the Board is under a statutory mandate to take all its actions "promptly", in order to avert unnecessary economic hardship, and to prevent the devastating loss of lives and property from an underground coal mine disaster.

ANTICIPATION OF WORKLOAD

The substantive requirements of the amendments were not fully operative until October 1, 1966, and the complete reconstitution of the Board itself has been delayed. Therefore, it is extremely difficult at this time to predict with exactness the number of appeals which will be submitted under the amended act, and the applicable costs which will be incurred in resolving such appeals. These appeals and expenses will necessarily depend on the rate at which orders are issued by the Bureau; the wishes of the coal mine operators; the locations from which appeals are taken; the availability of hearing facilities; the complexity of the issues raised; and the like.

While the costs of adjudication cannot be estimated with precision at this early stage of the amended act, the Board has assessed the impact of the amendments and has carefully projected its expenses for 1968, as reflected in the schedules submitted to your Committee, on the basis of its related experience under the original law. It need hardly be emphasized that, if the caseload and the applicable expenses prove less than anticipated, the requested funds will not be fully expended and will revert to the Treasury.

Aside from its duties connected with the adjudication of appeals, the Board is also responsible as an independent, quasi-judicial agency, for the many other legal and administrative activities of any such agency in the Federal government. These duties, which are more fully adverted to in the justification, will in all probability be further increased in 1968 by the need to assist in the organization of the Federal Metal and Nonmetallic Mine Safety Board of Review, which is closely patterned after this agency in its composition and procedures.

PERSONNEL COMPLEMENT

The Board proposes to carry out its statutory duties and operations with a personnel complement consisting of the five Board members, who are compensated on a WAE basis, and a full-time staff limited to four employees. No increase in personnel is being sought for the next fiscal year. This is the minimum staff required by the Board to perform its assigned duties and to accomplish its mission of safeguarding lives and property under the amended act.

IMPACT OF PROGRAM

Before concluding, it may interest your Committee to note the impact of the law which the Board assists in effectuating. During the period since the adoption of the original act in July 1952, major disasters have been reduced by almost 70 per cent, and the number of men killed in such disasters has been reduced by almost 80 per cent, compared with a similar period before the act was passed. While this record is impressive, the Board is confident that even more will be accomplished with the determined enforcement of the recent amendments to the act, adopted by Congress in March 1966.

To repeat, the budget of $162,000 for 1968 represents a reduction of approximately $16,000 from that appropriated for the current fiscal year. You are assured that, consistent with the established policy of this agency since its inception, the Board will strictly confine its expenditures to the least amount necessary to meet its increased responsibilities under the Federal Coal Mine Safety Act, as amended.

BOARD MEMBERSHIP AND JURISDICTION

Mr. PAULEY. Thank you, Mr. Chairman. I have a prepared summary statement which, with your permission, I will read.

The appropriation request of the Board for fiscal year 1968 is in the amount of $162,000. This request is about $16,000 less than that appropriated for the current year.

The Board, as you know, is an independent agency, composed of five members appointed by the President, with Senate approval. It is engaged in a broad range of both quasi-judicial and administrative activities under title II of the Federal Coal Mine Safety Act, as amended.

1966 AMENDMENTS

The amendments to title II, which were adopted by Congress in March 1966, substantially increased the membership, jurisdiction, and functions of the Board. Without going into detail regarding these amendments, the size of the Board was expanded from three to five members; jurisdiction was extended to all underground coal mines engaged in commerce; and a new category of mine closing orders was added to those already subject to appeal to this agency. Furthermore, extensive procedural changes were made, such as those requiring that the parties be granted the right to appear before the full Board, that copies of transcripts be made available to the parties, and that the Board conduct its hearings and other proceedings at locations near the mines involved.

PROJECTION OF COST DIFFICULTY

For a number of reasons, including the fact that these amendments did not become fully operative until October 1, 1966, it is extremely difficult, at this time, to predict the exact amount of the Board's expenses in 1968. However, the Board has carefully projected its costs, to the best of its ability, on the basis of its related experience under the original act, and these estimates are reflected in the schedules now before your committee.

You are again assured that, as in the past, this agency will strictly confine its expenditures to the least amount required to perform its statutory duties.

That concludes our summary statement.

BOARD MEMBERSHIP

Chairman HAYDEN. Are all five of the authorized members of your Board now appointed?

Mr. PAULEY. No, sir; one member is lacking. He was confirmed by the Senate, I think, this week. I think I am correct in saying that he will be installed next Thursday.

OUTSTANDING BUREAU OF MINES ORDERS

Chairman HAYDEN. How many of the 1,900 orders issued by the Bureau of Mines, which are still subject to appeal by the Board, are still outstanding?

Mr. PAULEY. I will refer that to Mr. Freehling, General Counsel.

Mr. FREEHLING. As to the orders issued by the Bureau of Mines, the Board has no way of knowing how many are outstanding, although the Board itself is current in its workload on appeals from those orders.

UNCHANGED PERSONNEL

Chairman HAYDEN. I judge from your statement that you do not propose any change in the number of personnel to be employed by the Board?

Mr. PAULEY. That is correct.

TRAVEL EXPENSES

Chairman HAYDEN. In your justification, you have stated that the hearings which you hold must be held in the immediate vicinity of the mine involved. This would indicate that more travel is required under the 1965 amendments than theretofore. In fiscal year 1967, $43,000 was in your budget for travel. This has been reduced to $40,000 in fiscal year 1968. What is the reason for this?

Mr. PAULEY. I will state it briefly, and then I think Mr. Freehling can answer that, Mr. Chairman.

The budget for 1967, both the regular and supplemental budget, was projected on the expenses that we figured were reasonable in projecting, but which in no way could be accurate. Mr. Freehling is a little closer to that than I am. I will refer the question to him.

Mr. FREEHLING. The Board projected its travel expenses on the basis of an estimated workload. This workload in turn was based on the experience under the original act. The Board sees a possible leveling out toward the end of the next fiscal year, and therefore there may be a slight decrease in what is anticipated as the travel cost.

AMENDMENT EFFECT ON PERSONNEL FUNDING

Chairman HAYDEN. In the material submitted with your justification statement it is indicated that three full-time equivalent of other positions are included in your personnel. Are these the Board members who are paid on a WAE basis, or are these other personnel such as consultants?

Mr. PAULEY. Mr. Freehling, the General Counsel, I think can answer that, Mr. Chairman.

Mr. FREEHLING. That figure includes only the Board members, who are paid on a WAE basis. The reason why the figure went up from one to three, or appears to go up, is because this is based on their anticipated compensation; and that figure would be higher, due to the amended act.

Chairman HAYDEN. Thank you for your appearance.

Senator Byrd, do you have any questions?

RECOGNITION OF MR. PAULEY AS NEW BOARD MEMBER

Senator BYRD. Yes, Mr. Chairman.

Permit me to say that I am very happy this morning to be present. Particularly am I grateful for the attendance and the testimony of one of my West Virginia constituents, Mr. Pauley, a new member of the Federal Coal Mine Safety Board and a former member of the West Virginia Legislature. He is a former speaker of the West Virginia House of Delegates. He has lived in McDowell County, W. Va., I believe all of his life. McDowell County is one of the foremost counties , if not the leading coal-mining county, in the United States. I know at times it has been the county with the greatest production of any county in the United States.

So, he is very knowledgeable by virtue of his experience, very knowledgeable of the needs of the industry. He is presently engaged, I believe, in operating some coal mines. I am very honored that a member of the Federal Coal Mine Safety Board comes from my State of West Virginia. I want to compliment him on his testimony this morning. I would like to ask a few questions.

ANTICIPATED BUREAU ACTIONS

I note that your potential workload depends on the findings and orders issued by the Bureau of Mines. How many findings and orders do you now anticipate that the Bureau will issue in 1968?

Mr. PAULEY. Is that directed to me, Senator?

Senator BYRD. To you or whomever you would like to call on.

Mr. PAULEY. The adjudicatory workload of the Board depends largely on the findings and orders issued by the Bureau of Mines. The Board expects between 2,500 and 3,000 findings will be issued in 1968, and about 500 closing and classification orders.

RULES OF PROCEDURE

Senator BYRD. In handling appeals, is the Board guided by any published rules of procedure?

Mr. PAULEY. Yes. We have rules formulated and, since I am comparatively new on the Board, I will refer that question to Mr. Freehling, who put the rules in the form that they are.

Senator BYRD. Very well.

Mr. FREEHLING. Under the authority of the act, the Board has the power to issue rules of procedure. With the amended act, the Board completely revised and simplified its rules to make them particularly helpful to the new mines that came within the Board's jurisdiction.

APPEAL FROM BOARD DECISION

Senator BYRD. Where and under what conditions may a party appeal from the Board's decision?

Mr. PAULEY. The act permits any party to appeal from a Board order to the U.S. court of appeals for the circuit in which the mine affected is located. From the circuit court, the party may also appeal to the U.S. Supreme Court. The decision of the Board is reviewed by the circuit court, under the substantial evidence rule. The court may also grant temporary relief pending a determination of the appeal. As to the initial Board hearing—I think it is in the act, it is in the act, as amended—the hearing must generally be held at the county seat of the county in which the dispute or the grievance arises.

However, it can be held closer to the mine, by mutual agreement.

EFFECT OF AMENDMENTS ON SAFETY

Senator BYRD. I realize that the amendments to the Federal Coal Mine Safety Act have been effective for only a very short time. However, in this brief period have the amendments appeared to improve the safety conditions in the mines?

Mr. PAULEY. In my opinion, viewing it both as a member of the Board of some 4 or 5, months standing, and as an operator of small mines, I would say that safety has improved and the potential of further improvement is very good.

BOARD OPERATIONS UNDER AMENDMENTS

Senator BYRD. Does the Board anticipate any major difficulties in operating under the amendments to the act?

Mr. PAULEY. I believe Mr. Freehling could summarize that better, in the broad view.

Mr. FREEHLING. The Board does not anticipate any major difficulties. One of the principal problems with which the Board was faced was the delay in the appointment of the fifth Board member who would represent the small-mine workers' point of view. That problem arose because the amended act requires that the representatives of the viewpoint of the particular mine involved must participate in official actions concerning such mine.

But with the confirmation of the fifth member last Tuesday, the Board no longer anticipates any major difficulties.

LOCATIONS OF BOARD HEARINGS

Senator BYRD. Under the amended act, your hearings must now be held near the mines involved. You indicated that. How is the location of the hearing place determined?

Mr. PAULEY. I think I am correct on this. In the amended act it says the hearing or other proceeding shall be held, upon request of the operator, at the county seat of the county in which the grievance arises. It is flexible enough that by mutual agreement between the mineowner and the Board chairman, we can put it closer, or at any other point mutually agreed upon.

Senator BYRD. Mr. Chairman, I again want to say that I am grateful for the presence of my constituent, the very able Board member, Mr. Pauley. I again want to congratulate him on a very fine presentation. I think his testimony will be helpful to the committee. In my judgment, he now ranks as a veteran in having appeared before our committee this morning.

Mr. PAULEY. Thank you. I am very gratified to be here. I have always been an admirer of the distinguished chairman. It was worth my trip up here to meet him.

Chairman HAYDEN. Thank you, sir.

DEPARTMENT OF THE INTERIOR

Office of Saline Water

STATEMENT OF DR. JACK HUNTER, DIRECTOR

RESEARCH AND DEVELOPMENT AND DEMONSTRATION PLANT PROGRAMS

Chairman Hayden. Now we will hear the Office of Saline Water.

There will be placed in the record a highlight statement concerning the Office of Saline Water, summarizing the proposals for the research and development program and the demonstration plant program in fiscal year 1968.

(The statement follows:)

Highlight Statement

The Secretary of the Interior, through the Office of Saline Water, is conducting a research and development program aimed at the development of low cost methods for producing water from saline and brackish waters so that it can then be used for beneficial and consumptive purposes. The program is operated under two basic Congressional authorization acts. The Saline Water Act of July 3, 1952 (66 Stat. 328), as amended (42 U.S.C. 1951 et seq.), provides the Department of the Interior with the basic program authorization to carry on the current research and development program.

The Saline Water Act currently authorizes the program to have $90,000.000 appropriated for the fiscal years 1962 through 1972. A request is being made to the House and Senate Interior and Insular Affairs Committees to increase this authorization by $13,482,000 in order to cover the program proposed for FY 1968.

The other Congressional act, Public Law 85–883, which was passed on September 2, 1958, authorized the Department to construct, operate and maintain several plants in order to demonstrate the production of water for agricultural, industrial, municipal and other consumptive purposes from saline or brackish waters. Since their construction, these plants have been a vital part of the program's research and development effort and have been the "proving ground" or test bed for many of the new developments in the desalting field.

The Office of Saline Water program is funded under two separate appropriations, the "Salaries and Expenses" or research and development appropriation, and the "Operation and Maintenance" appropriation that funds the operating, maintenance and modification of the program's demonstration plants or test beds. Both appropriations provide Administration and Coordination funds to cover the salaries and related expenses of the OSW employees who are associated with the programs covered by the two appropriations.

The Office of Saline Water budget request, including both appropriations, amounts to $23,282,000 for Fiscal Year 1968 and represents a decrease of $7,195,000 below the total amount available for FY 1967 of $30,477,000. Added to the FY 1968 budget request, however, is a carryover from FY 1967 of $3,500,000. This carryover brings the total FY 1968 program budget to $26,782,000, a decrease of $3,695 below the amount available for FY 1967.

RESEARCH AND DEVELOPMENT PROGRAM

The budget request for the FY 1968 Salaries and Expenses, or research and development program, is $20,982,000 or a decrease of $7,144,000 below the amount available for FY 1967 of $28,126,000. The total program for FY 1968 includes a carryover from FY 1967 of $3,500,000 which brings the total funds available in FY 1968 to $24,482,000, a decrease of $3,644,000 below the amount available for FY 1967.

This decrease in the program is due primarily to the change in program emphasis from construction of major facilities in FY 1967 to that of operation, test and evaluation in FY 1968. Funding of construction of test facilities and a module, etc., West Coast Test Facility, Brackish Water Test Facility and a 17 million gpd Multistage Flash Module of a 50 million gpd plant, will be completed in FY 1967, allowing commencement of operation and extensive test and evaluation during FY 1968. Test and evaluation work on the Module will increase the present technology related to this process and will develop valuable information needed in the planning of large-scale distillation plants in the 150 million gpd size and larger.

Construction of test vehicles and equipment during FY 1968 is being kept to a minimum so that test results can be obtained from the facilities provided in past years. Several pilot plants are needed to test out technological advances. A 250,000 gpd Reverse Osmosis Test Bed Plant and the modification of a brackish water pilot plant for operation on sea water are planned for FY 1968. The design and procurement of certain long lead time items for a Long Tube Vertical Distillation Module will also be done during FY 1968. Tests are currently being made on several reverse osmosis pilot plants to evaluate their economics for operation on brackish water. It is anticipated that these tests will be completed in the latter part of FY 1968 and it is planned to modify the pilot plant which shows the most promise for adaptation to sea water test operation. The FY 1968 program includes the continued operation of the research and development contract and grant programs including basic and applied research and development activities.

DEMONSTRATION PLANT PROGRAM

The budget request for the FY 1968 Operation and Maintenance Appropriation of $2,300,000 is a decrease of $51,000 below that appropriated for FY 1967. This decrease is the result of a substantial decrease in the planned modifications to the demonstration plants and a smaller increase for operating costs.

The request includes the necessary funds to cover the normal operation and maintenance costs of the demonstration plants located at Freeport, Texas; San Diego, California; Webster, South Dakota and Roswell, New Mexico, and the necessary modifications to these plants to increase their usefulness to the program. Operating costs for FY 1968 are estimated to increase over FY 1967 by $460,000 and is due primarily to the new 1-million gpd advanced technology Clair Engle Desalting Plant located at San Diego, California. Construction of this plant is scheduled for completion during the last quarter of FY 1967 and will require a full year's operating funds for FY 1968.

In line with the over-all research and development program emphasis in FY 1968 to primarily one of operation, test and evaluation and away from construction, the modification costs of the demonstration plants have been reduced to a minimum. Modification of demonstration plants in FY 1968 has been estimated at $278,000 or a reduction of $511,000 from the FY 1967 amount of $789,000. The modification funds requested in FY 1968 will be used to make the necessary modifications so that the test beds or demonstration plants can be utilized for the purpose of testing experimental hardware, materials and techniques under actual plant operation conditions.

PREPARED STATEMENTS

Chairman HAYDEN. We will be glad Dr. Hunter to have you place your written statement in the record and highlight it for the committee.

Dr. HUNTER. Thank you, Mr. Chairman, and members of the committee, we have two statements we would like to enter into the record. One by Assistant Secretary DiLuzio who has asked me to express his regrets that a last-minute problem came up and he had to cancel his appearance; but he has submitted his prepared statement and we would like it in the record.

Chairman HAYDEN. That may be done.

(The statements follow:)

STATEMENT OF FRANK C. DILUZIO, ASSISTANT SECRETARY FOR WATER POLLUTION CONTROL

Mr. Chairman and members of the committee, I appreciate this opportunity to appear before you to discuss the activities of the Office of Saline Water and to outline the program of work we have developed for fiscal year 1968.

I shall only touch on the high points of the program. Director Hunter is here to provide you with program details and to provide other information as the Committee may desire. As you know, during the past year there have been several significant changes in the administration of the Office of Saline Water.

On July 5, 1966, I was singularly honored by President Johnson who nominated me to be the first Assistant Secretary for Water Pollution Control. My nomination was confirmed by the Senate on July 20, and I undertook immediately my new responsibilities which include the operations of the Office of Saline Water and the Federal Water Pollution Control Administration. One of my first official acts as Assistant Secretary was to name Dr. Jack Hunter to be the acting director of the Office of Saline Water. I was particularly pleased when, on January 31, 1967, the Secretary of the Interior appointed Dr. Hunter to be the new director of the Office.

In my opinion, Dr. Hunter is eminently qualified to serve in this capacity. When I was Director of the Office, I recruited Dr. Hunter from industry to serve as assistant director for engineering and development, a difficult assignment in which he has served with distinction. Before he joined the Office of Saline Water, Dr. Hunter was employed for ten years by the Martin Company of Baltimore, Maryland, where he served as chief engineer of the Nuclear Division, engineer manager of the Nuclear Division, director of research in the headquarters office, and director of concepts in the headquarters office.

A native of Ohio, Dr. Hunter received his bachelor of science degree in engineering physics from Ohio State University in 1942, and his doctorate in nuclear physics from Ohio State University in 1950. He worked on the Manhattan Project from 1942 through 1946 and held an AEC fellowship from 1948 to 1950. Until 1951, he was a senior physicist with the Nuclear Experiment Unit of the Fairchild Engine and Airplane Corporation, and from 1951 to 1955, was a supervisor in the Nuclear Experimental Unit of the General Electric Company.

Dr. Hunter has been president of the Maryland Academy of Sciences since 1962, chairman of the N2.4 Committee on Nuclear Terminology for the American Standards Association since 1960, and chairman of a subcommittee working group of Technical Committee 85 of the International Standards Organization since 1960.

Over the past several years, the Office of Saline Water has become increasingly involved in the planning, construction, and operation of physical facilities related to the desalting program. This activity has grown significantly over the past two years and we expect it to continue to grow as technology developed under the program reaches the point where construction of test beds, prototype plants, and other facilities is justified. In order to best manage this important phase of our program, we have reorganized the Office by providing for an assistant director for Project Management and Plant Engineering. This action divides the operation of the Office under three assistant directors: Research, Engineering and Development, and Project Management and Plant Engineering.

The new assistant director will have the responsibility of overseeing construction, operation, and maintenance of OSW field facilities, and for two large projects in which the Office is currently involved—the 150-million gallon-per-day dual purpose desalting and electric power plant to be constructed by the Metropolitan Water District of Southern California, and the construction of a desalting plant in Jidda, Saudi Arabia, as well as for other large projects that may soon come about.

John W. Heintz, whom I was also able to entice from industry, has served as chief of the Special Projects Division for the OSW since July 1965, has now been named acting assistant director for Project Management and Plant Engineering.

A native of Ogden, Utah, Mr. Heintz received his B.S. degree from the U.S. Naval Academy in 1940, his Naval Engineer degree from MIT in 1949, and also from MIT his M.S. degree in physics in 1952. After completing over twenty years of service with the U.S. Navy he voluntarily retired in 1961 with the rank of Commander. Prior to joining the OSW, he was the assistant to the vice-president, Davison Chemical Division of W. R. Grace Company.

We believe the reorganization of the OSW will enable us to expedite the management of our programs and will provide a close interface between the operational and construction engineers of plant engineering and the individual project engineers assigned to specific projects. It will also strengthen the ability of the OSW to work more closely and more cooperatively with American industry in helping private industry to more quickly and more easily develop its own technical abilities.

One very important aspect of our plans for fiscal year 1968 is contained in authorizing legislation now before the Congress for consideration. S. 270 has passed the Senate and hearings are scheduled for February 27 and 28 by the House Interior and Insular Affairs Committee on this legislative proposal which will provide for the participation of the Department of the Interior in the construction and operation of the 150-million gallons-per-day desalting plant to be constructed by the Metropolitan Water District of Southern California.

The engineering study of this plant, which was jointly sponsored by the Metropolitan Water District, the Atomic Energy Commission and the Department of the Interior, indicates the cost of desalted water from this plant to be 21.9 cents per 1000 gallons. The Atomic Energy Commission already has received an authorization of $15 million for participation in the project.

Subject to the enactment of the authorizing legislation now before the Congress, we will provide this committee with full details and justification of our planned participation, but I should like to emphasize at this time that participation by the Office of Saline Water in this project will permit us to purchase the information and operating experience we so sorely need to advance large plant technology at a cost below that which would be necessary, and in a more practical manner, than if we were to construct the entire plant and operate it ourselves. Construction and operations of a plant of this size will represent a major milestone in the desalting program, since it will provide the know-how of plant design in the size range needed by large metropolitan areas.

While the news media have given great attention to our plans for the development of desalting technology for application in large plants, I want to make it perfectly clear that this phase of our program is in no way detracting from our efforts to develop new and improved technology for application to small plants. We intend to continue to maintain a balanced program for large and small plants as well as for sea water and brackish waters. Dr. Hunter's report to the Committee will show that we are vigorously continuing our efforts on the reverse osmosis which shows great promise for desalting brackish waters, including water containing municipal and industrial wastes; to improve the potential of the electrodialysis process which has already found considerable commercial application for desalting brackish waters; and freezing processes, which continue to show promise in smaller plant applications for desalting both sea and brackish waters.

The Government of Israel has under consideration a report which indicates the feasibility of a dual purpose desalting and electric power plant to help solve that nation's almost desperate water supply situation. This report was sponsored jointly by the Government of Israel and the United States, with the latter being represented by the Office of Saline Water and the Atomic Energy Commission. It shows that a plant capable of producing 100 million gallons of fresh water daily along with 200 megawatts of electric power is feasible, with total capital costs estimated at $200 million. The plant would have a nuclear reactor as an energy source.

We have made no commitment of financial support for the construction and operation of this plant. We have recently learned that the Government of Israel is considering the feasibility of increasing the size of this plant, particularly the electric generating capacity and delaying the construction schedule to the mid-70's.

Fossil fuels are not being forgotten in the construction of desalting plants. For example, oil will be used in a dual-purpose plant to be constructed at Jidda in Saudi Arabia. This plant will produce five million gallons of fresh water daily along with 36,000 kilowatts of electric power. Nuclear energy does not appear to be competitive with fossil fuels for desalting plants of 50 million gallons-per-day or smaller except in dual purpose plants where there is a large demand for energy to produce electric power. It is obvious that there is a role for both fossil fuel and nuclear energy in desalting plant applications, depending on the size of the plant and its location.

Under agreement with the Government of Saudi Arabia, the Office of Saline Water will provide from its ongoing program the universal design of a 2.5 million gallons-per-day desalting plant, with this design adapted to local conditions at Jidda. At the same time, using funds provided by the Government of Saudi Arabia, the Office of Saline Water will act as the contracting and supervising office for the construction of the plant. We expect to gain a considerable amount of data and information from the plant operation to further our development of desalting technology.

At the request of the Department of State, I recently visited Saudi Arabia, Kuwait, Iran, Italy and Malta. During that visit I found high interest in the potential of the desalting technology being developed by the Office of Saline Water to solve many local water supply problems. By exporting the technology we are developing, I am convinced we will do much to further improve our relations with these nations and demonstrate in a practical manner President Johnson's pledge to make this information available to the thirsty nations of the world.

The Saline Water Act of 1952, as amended, was approved by the Congress with the objective of increasing the water resources of the Nation through the development of practicable low-cost means of producing from sea water, brackish water, or from other saline waters which include mineralized or chemically charged waters, water of a quality suitable for beneficial consumptive purposes. It is becoming increasingly clear that the processes developed for desalting have had, and will continue to have, a much wider application than originally intended. The rapid changes in the amount and form of pollution which we now discharge into our waterways have taxed the effectiveness of the pollution treatment methods that only a few years ago were perfectly adequate. The pollution treatment systems that are available are satisfactory for primary and secondary treatment, and for these purposes they will continue to be satisfactory for a number of years, but desalting processes will be required to provide tertiary treatment to reclaim waters polluted by municipal and industrial wastes and irrigation return flows.

Some of the wastes that are now finding their way into our streams and rivers, such as nutrients, detergents, insecticides, chemicals, and other "exotic" wastes that have resulted from our "advanced" industrial development, simply cannot be reclaimed by what once were considered normal treatment methods. We must develop advanced waste treatment processes which can economically recover fresh water from waste water, brackish waters, acid mine waters, or other waters defiled by pollutants.

The processes developed by the Office of Saline Water not only offer a method of providing an incremental supply of fresh water to add to our national water inventory by producing fresh water from sea water; it is now evident that these processes will be needed to reclaim fresh water from the flowing garbage cans we once called sparkling rivers. They will find an application in resolving the problems of municipal waste disposal agricultural return flows, acid mine waters, and in many types of industrial applications, particularly in those industries that require high quality water for processing or for boiler feed water.

While the reports we have obtained are still incomplete, it is obvious that the tempo of commercial sales of desalting plants sharply increased during 1966, and the market should even be better in 1967. U.S. industry had its best year in this highly competitive field. About two-thirds of the 30-million gallons per day total installed capacity awarded in 1966 will be constructed by U.S. firms. The largest contract awarded during this past year was for the construction of a 9.6 million gallons per day of desalting equipment for Kuwait. This $10,752,000 contract was awarded to Ishikawajima-Harima. The award of this contract is noteworthy because it marks the first entry into the large scale distillation plant field by a Japanese firm.

While Dr. Hunter will be expected to carry the load of the day to day operation of the Office of Saline Water, I shall continue to give a fair share of my time to provide policy guidelines and technical direction to the program. Having served as Director, I am sympathetically aware of the problems which Dr. Hunter must face and the types of decisions he must make. I will continue to be intimately involved in program activities, although I will now be involved on both sides of the coin. My interest now must center on pollution abatement, and reclaiming polluted waters, but since in a practical sense of the word, sea and brackish waters are polluted waters and since desalting processes will find application in reclaiming polluted waters, I couldn't divide my interest between the two programs even if I wanted to.

Thank you for your kind attention. I shall be pleased to respond to any questions the Committee may wish to ask.

STATEMENT OF DR. JACK HUNTER, DIRECTOR OF THE OFFICE OF SALINE WATER

Mr. Chairman and members of the committee, I want to start off by saying that it gives me a great deal of pleasure to be here today in my first official appearance before this distinguished group as Director of the Office of Saline Water to explain to you the program we plan to carry out in fiscal year 1968.

At the same time, I want to emphasize that we are aware that we are appearing here today to make these requests without yet having received an authorization for our fiscal year 1968 appropriation. As you may recall, Public Law 89-118, approved by President Johnson on August 11, 1965, requires us to return to the Congress this year for both an authorization and an appropriation, and the budget requests we are making today is being made subject to whatever authorization we may later receive. Legislation to authorize our 1968 fiscal year activities has been prepared by the Department and forwarded for the consideration of the Congress.

The Saline Water Act of 1952 authorizes the Secretary of the Interior to conduct, through the Office of Saline Water, a research and development program "for the development of practicable low cost means of producing from sea water or from other saline water, water of a quality suitable for agriculture, industrial, municipal, and other beneficial consumptive uses" and that this shall be "on a large scale basis for the purpose of conserving and increasing the water resources of the nation".

The original Act was amended in 1955, in 1961 by passage of the Anderson-Aspinall Act, and again in 1965 so that our authorization currently extends through 1972. A separate act passed in 1958 provided for the construction and operation of not less than 5 plants which were to demonstrate the reliability, engineering, operating and economic potentials of the sea or brackish water conversion processes which appear to be most promising. Under the authority of these acts, and the related appropriations, our program has continued to expand and significant progress has been made in the development of technology.

The 1952 Act, as amended, currently authorizes an appropriation of $90 million during the fiscal years 1962-1972, inclusively, plus such additional sums as the Congress may authorize and appropriate but not to exceed $185,000,000. Our appropriations under this authorization have totaled $82,500,000, which leaves an unappropriated balance in our existing authorization for research and development of only $7,500,000. A request is being made, therefore, to increase this authorization by $13,482,000 which will permit an appropriation of $20,982,000 to cover the "salaries and expense" program we propose to undertake in the next fiscal year.

Shown separately in the budget justification, we are also requesting $2.3 million in fiscal year 1968 for the operation and maintenance of the plants constructed under the provisions of P.L. 85-883, a decrease of $51,000 from funds currently available. This decline results from an increase in actual operating costs combined with a substantial drop in projected modifications.

The request covers the funds we anticipate will be needed to cover normal maintenance and operation of our plants at Freeport, Texas; San Diego, California; Webster, South Dakota; and Roswell, New Mexico. Modification costs will be held to that which is necessary in order that these plants may be utilized for testing experimental hardware, materials, and techniques under actual operating conditions in a desalting plant.

Our total program appropriation request for fiscal year 1968, including appropriations under both of these authorizations, amounts to $23,282,000, which is $7,195,000 less than the total amount of money we had available during the current fiscal year. Added to this budget request, however, is a $3.5 million carryover from the current-year funds that will be available for program obligations in FY 1968. Including this carryover, our total FY 1968 program budget totals $26,782,000 or $3,695,000 below the amount of money available to us for the current year.

Although the request for funds is lower than last year, it will enable us to carry on the advancement of desalting technology. There is no change in program emphasis, but the schedule of construction of major facilities during the current year is considerably higher than that programmed for fiscal year 1968. The operation, testing and evaluation of these new facilities in the coming year will be far less expensive than their cost of construction. We will complete the funding during the current year of such projects as the San Diego Saline Water Test Facility, the 1-million gallons-per-day Clair Engle plant, the large module we plan for San Diego, and major modifications to the 1-million gallons-per-day plant at Freeport, Texas. The extensive testing and operating program we have scheduled for these facilities will provide the advanced technology we so sorely need to enable us to push forward the accelerated program President Johnson has directed us to undertake.

Test and evaluation work we have scheduled for the multistage flash distillation process module at San Diego, for example, will advance our present technology in this process and will provide the information we must have to proceed with the final engineering designs of desalting plants in the 50-150 million gallons-per-day size range and larger. In our earlier planning for fiscal year 1968 we had considered the construction of a long-tube vertical multi-effect distillation process module, but we now see that this work should be deferred until the results from the modifications of the Freeport plant become available.

We will, of course, continue our program of basic and applied research and engineering development activities. These cannot be ignored if we are to extend the frontiers of knowledge and develop new or improved processes and better operating techniques that will be necessary to reach the long-range goals that we have established.

Before I go into a detailed breakdown of our budget estimates for the coming year, Mr. Chairman, there is one other point I would like to emphasize and that is that in the conduct of our program, we have developed a close relationship with private industry because, as we see it, our job is to develop technology to the point where private industry can apply it to the construction of production plants which will alleviate the world's water shortages. We are consistently striving to strengthen and expand this association and to encourage private industry *to apply its own technological abilities.* Of major interest in this respect is the patent policy of the Office of Saline Water. We have endeavored to the maximum extent possible, compatible with our authorization, to preserve for industry the rights and protection which they are entitled and deserve under the law. We are required, by our authorization, to bring the results of the work we pay for into the public domain. This is appropriate to the purpose of the Office and to its source of funds. While we have had a few firms that have been unwilling to accept our patent policy, our general relations with industry in this area have been excellent.

The major expenditures planned for fiscal year 1968 are as follows:

Research ($5,000,000)

The research program is responsible for generating new concepts, new ideas, and new scientific knowledge upon which engineering and development activity can build the technology required for economic water desalting. The research program covers a wide range of activities designed to fulfill four major program objectives:

(1) studies to provide basic understanding of water and aqueous solutions which are the focus of our entire program and its processes.

(2) careful examination and investigation of ideas applicable to new and different desalting processes.

(3) quantitative study and evaluation of promising new processes as a basis for process development.

(4) providing better understanding of how processes work and making available better materials.

In our budget for fiscal year 1968 these objectives are covered under three basic headings: nature of water; water supply augmentation and conservation; and water quality management and protection. I will outline these one at a time.

Nature of water.—In this category we include studies of the properties of water both in its pure state and when it is contaminated by chemicals and minerals. The study of the properties of water is a basic search for new knowledge which would give us a better understanding of water itself. We need to know, for example, just how water boils, how an ice crystal is formed and excludes salt, how salt or water pass through membranes, what happens at a liquid surface, how can we best inhibit corrosion of materials by sea water. We hope these studies will bring us data and information from which we will be able to develop new concepts as well as more efficient designs of current desalting processes.

Water supply augmentation and conservation.—Research efforts in this category are related to making additional water available by desalting processes and to the use by desalting processes of water of particularly impaired quality.

Specific activities in this area include (a) research on distillation processes with the objective of reducing resistance to mass and energy transport at the interface of the liquid and the vapor. Progress in this area would improve distillation processes by increasing efficiency and reducing costs; (b) research leading to new or improved membranes for the electrodialysis and the reverse osmosis processes; (c) basic studies on the formation and growth of crystals and the application of this knowledge to the freezing and hydrate processes; and (d) investigation of the problems and means of using unusually contaminated waters as potential feed streams for desalting processes. For economic reasons, desalting plants producing water for cities must be located near the cities they serve and these plants will frequently have only polluted saline water upon which to operate.

Water quality Management and protection.—The research program under this category is concerned with the identification of pollutants that may be found in feed water and their effect on the various processes, the ultimate disposal of wastes, and the identification of improved methods of pretreatment of feed water to make them more amendable for use in desalting plants.

We have found through our investigation to date dependent upon the processes involved, particular forms of pollution may have significant adverse effects on the operation or service life of desalting equipment. For example, in feed water near large cities or industrial plants, the saline water source will in all probability contain organic pollutants, detergents, and corrosive chemicals. The organics have to be identified since they may pass through the distillation process into the product water. The corrosive chemicals may limit the life of the plant components and the detergents may cause the water to foam, making the process inoperative. In the membrane process certain pollutants may encourage the growth of algae on the surface of the membrane thus blocking the flow of water and limiting the effective operation of the process.

In the area of ultimate disposal of wastes, we are concerned particularly with the disposal of the waste brine, inherent in any desalting process, in a manner such that it will not contaminate or further degrade available water supplies and aquifers, and, in the case of sea water plants, in a manner that will not interfere with marine life and other uses of our shore areas.

In the water treatment area, we are very concerned with learning the effect of particular chemicals upon the operation and lifetime of the equipment. As an example, the presence of iron or manganese seriously impairs the performance of membranes in both reverse osmosis and electrodialysis plants. The formation of scale is a limiting factor to the temperature and concentrations which may be successfully employed at distillation plants. Since the cost of pretreatment is significant in terms of the total cost of a desalting process, it is important that we find both more effective and less expensive means of removing or modifying the troublesome components of our source water.

Engineering and development

It is the role of engineering to take the knowledge developed by research and apply it in a manner to achieve economic and practical technology as is the basis of design for production plants. The program of development for each process must include a series of stages progressively carrying the development from the laboratory phase to the point at which successful production plants can be built. These various activities may be described in general as follows: construction and test operation of pilot plants, development through test bed plant operations, construction and operation of large modules, component and materials development, and advanced process studies.

Pilot plants are the work horses of any process development program and are utilized to try out new ideas and to improve the technology of existing processes. In general, pilot plants are small and by far less money is involved in their construction than in their operation to develop the necessary data.

Test beds are the first point where a process is tested in a size sufficient that practical plant problems and economics can be determined. Obviously, test beds are not built until pilot plants have done their job of establishing the basic feasibility of the designs and technology involved. Test beds bring together as a complete plant the process technology and the necessary components to permit the operation of a process to be studied as an integrated plant and to permit the performance of the process to be optimized.

A module is a segment of a complete large plant. The components and sections involved are for the first time operated under full-scale large plant conditions. This operation serves the valuable role of verifying that the design made by theoretical extrapolation from smaller units is sound and it further permits the necessary "fine tuning" modifications to be made before a complete large plant is committed to hardware.

Component and materials development takes particular pieces of hardware involved in any process and permits their refinement to the stage of a reliable item both from their design and their materials of construction. Through such tests a complete understanding of how major components operate is acquired in order that their costs may be reduced and their overall reliability can be extended to the point that practical production plants could be designed and built.

Advanced process studies play a very important role in establishing the program direction for the processes involved. These studies develop a picture of what plants could look like depending upon technology that might exist. By these studies, then, we can determine which technology is most important to be developed from the viewpoint of making technically possible desirable future plants. Such conceptual plants are also a valuable input in resolving the question of what particular plant characteristics will be most useful in a practical application to satisfy real incremental water requirements.

The development of these various processes is carried out by three divisions: the Membrane Division, the Distillation Division, and the Special Projects Division. I will describe the activities of each in turn.

Distillation Division ($4,365,000)

The work of the Distillation Division is concentrated on three basic processes: the verticle-tube-multi-effect evaporators, the multi-stage flash evaporators, and the vapor compression process. Each of these processes has its unique advantages dependent upon the plant size, type of water being treated and other parameters such as energy costs, fixed-charge rates, and water purity required. The Distillation Division has several pilot plants in operation or under construction for the following purposes: to test new condensation surfaces where the condensed vapor forms water droplets so that the overall rate of condensation is greater; to prove the usefulness of aluminum as a replacement for expensive and scarce copper alloys; to control the formation of scale so that plants can be operated at higher temperatures where the efficiency of performance is greater; to demonstrate newly developed high efficiency evaporation surfaces which would result in significant cost savings to the overall plant, and to provide information on evaporator performance where sea or brackish waters also contain pollutants such as municipal or industrial wastes.

This Division is responsible for the development program carried out in the distillation plants at Roswell, New Mexico; Freeport, Texas; and the Clair Engle Plant at San Diego, California. In these plants we are putting to the test new methods of water pretreatment for scale control, performance tests under actual plant conditions of improved transfer surfaces, improved materials and corrosion-prevention techniques and overall system optimization. In the Freeport plant, new configurations of the evaporator effects are being evaluated. The Clair Engle plant will operate at higher temperatures and higher performance ratios than have been before possible. The plant at Roswell is developing important data on the ability to treat extremely difficult brackish waters.

This Division expects in the very near future to award a contract for the construction of a multi-stage flash module to be located at the San Diego test center. This module will establish a technical basis and verify the design appropriate to the construction of large plants. The first application of this technology is expected to be in the 150 mgpd desalting plant which will supply water to the MWD of Southern California.

In the area of component and materials development, a full-scale test chamber is being operated at our Wrightsville Beach Test Station which is expected to lead to improvements in high performance flash chamber design. Large pumps capable of handling hot brine are under development in cooperation with the Bureau of Reclamation. The Bureau of Reclamation is also investigating the potential of concrete as a low-cost material for construction of evaporator vessels. Through the use of the ORNL, we are carrying out a broad investigation of improved materials and components.

We have previously mentioned the performance of 15 conceptual designs for 50 mgpd plants. The results of these studies have been incorporated into our designs and we are now investigating larger concepts ranging from 250 mgpd to as large as 1 bgpd. As I have said, these investigations are basic in providing perspective to the direction of development that the distillation program should take.

Membrane Division ($4,300,000)

Efforts of the Membrane Division are concentrated on development of two desalting processes which appear economical for converting brackish waters to fresh—electrodialysis and reverse osmosis. The attractive features of these processes are low energy requirements and operation without significant temperature change. The latter permits use of low-cost materials for plant construction.

Although current technology restricts use of reverse osmosis to brackish water conversion, we are making progress toward the goal of sea water conversion and increased emphasis will be placed on this effort during the coming year.

Significant progress has been made in our efforts to bring this very promising process over the past several years from the laboratory stage to the point where it can find practical application in water supply.

Principal fiscal year 1968 objectives to advance the reverse osmosis program include: (1) development of design data needed to construct a 250,000 gallons-per-day test bed plant by operation of 10,000 to 50,000 gallons-per-day pilot plants; (2) development of economic brackish water pretreatment methods to obtain longer membrane life and thus reduce maintenance costs; (3) development of new more rugged membranes with longer life and improved desalting properties; (4) development of efficient systems to recover hydraulic energy from waste brine streams; and (5) development of new and novel design concepts to reduce capital costs.

Fiscal year 1968 program activities in electrodialysis will be concentrated in two areas: (1) economic evaluation of the transport depletion process, which is a variation of the electrodialysis process that offers the potential of treating much greater quantities of water in a given size plant, by field testing a 10,000 gallons-per-day pilot plant on brackish waters; and (2) improvement of electrodialysis process economics by developing techniques and materials to permit process operation at temperatures up to 180 degrees. Our studies indicate that success in these areas would significantly lower costs of desalting brackish waters.

Finally, we plan to investigate, in a joint program with the Federal Water Pollution Control Administration and the Bureau of Mines, the potential application of membrane technology to water pollution control, with particular regard to acid mine water drainage and irrigation return flows.

These processes will be tested in our aggressive field test programs which I will describe later.

Special Projects Division ($3,515,000)

This division will continue to develop and evaluate the freezing, hydrate and ion exchange desalting processes, and to conduct engineering investigations pertaining to brine disposal and the recovery of by-products from the brines.

Crystallization processes, which include freezing and hydrates, have been attractive because the low temperatures involved minimize problems of corrosion or scale formation and because they have the potential of operating with less energy per unit of water produced. Studies based on results obtained to date indicate that crystallization processes have a potential economic advantage over other processes in plants of the one to five million gallons-per-day size range, especially for desalting sea or very brackish waters.

The principal work to be done in crystallization during fiscal year 1968 will include: (1) continued operation, development, and evaluation of four different crystallization pilot plants at the Research and Development Test Station in Wrightsville Beach, North Carolina; (2) construction and operation of a small mobile secondary refrigerant pilot plant incorporating the latest engineering features; (3) operate a freezing process pilot plant on brackish waters; (4) design studies, development, and evaluation of new or improved components including heat exchangers, compressors, filtration systems, and devices for separating and washing the brine from crystals; and (5) design and evaluation of methods for continuous detection of contaminants in the feed water for crystallization processes, analytical studies of the dynamics of the processes, and engineering and feasibility studies for larger plants.

At the same time, we plan to investigate and evaluate the technical feasibility and economic potential of other new processes for desalting. Laboratory and bench scale studies indicate that two ion exchange processes may have economic and technical advantages over other processes using brackish waters of high hardness and low salinity. These will be evaluated at the pilot plant level.

The practical problems associated with the disposal of the brine effluent from desalting plants require further investigation. While Research looks at basic techniques, it is our engineering job to bring these techniques to the point of practical economic application. In all processes the brine effluent will be at a higher concentration, and in most cases, at a higher temperature. It may also be of a slightly different composition due to corrosion products and pre-treatment than the incoming feed water. We will study and determine the effects of discharging the brine effluent of large coastal and inland desalting plants upon the local environment, and will investigate and evaluate effective and economic methods for disposing of this effluent.

Recent studies have shown some of the ion exchange processes to be effective in the treatment of acid mine drainage for the production of potable water. We will conduct pilot plant studies and evaluate one or more of these processes with acid mine drainage.

Project management and plant engineering

Salaries and expenses ($1,600,000)—Maintenance and operation ($2,088,000)

Progress in our research and development has brought us to the point of an increasing involvement with hardware of significant size. In recognition of the necessity of dealing with this hardware in an effective manner and that concern with procurement of hardware could be a distraction to the management of an effective development program, I have within the last few weeks added this third assistant director to be responsible for these activities. This new assistant directorate for project management and plant engineering will provide a means for effectively overseeing the construction, operation, and maintenance of our field facilities; supervision of the two large projects, the proposed 150 MGPD plant and the Saudi Arabia desalting plant; and the necessary non-process supporting design effort. Any additional large projects with which we may become involved will be likewise the responsibility of this assistant director.

Maintenance and operation funds requested in this budget will be used for management, operation, and modification of the plants at Freeport, Texas; San Diego, California; Roswell, New Mexico; and Webster, South Dakota.

Some plant modifications are planned to increase the usefulness of these plants to our program. Modifications planned at San Diego include initiation of design and engineering for equipment necessary for the flash distillation process to operate at high temperatures. At Webster, we are modifying the pretreatment system to avoid fouling of the membrane stacks to reduce maintenance costs. Roswell modifications include changes in the deaeration system and the heat exchange system.

The proposed budget provides the funds needed for the operation and maintenance of the Research and Development Test Station at Wrightsville Beach, North Carolina; the San Diego Saline Water Test Facility, and construction of a Brackish Water Test Facility at Roswell, New Mexico. Additionally, we plan to provide facilities at Freeport, Texas, for the testing of materials of construction.

We will also provide funds for evaluation of in-plant corrosion testing, preparation of additional sections of the engineering data book, and support engineering work as required at the test facilities.

We are now preparing for important investigations on irrigation return flows with Federal Water Pollution Control Administration and on acid mine water in cooperation with Federal Water Pollution Control and the Bureau of Mines. We are also planning and expect to initiate early in the next fiscal year a broad field testing program on brackish water processes where we have divided the endless varieties of brackish waters into a limited number of classes having potential as important sources of brackish water supply. These tests, which we hope to conduct at existing government installations, will provide us with the optimum operating parameters and comparative economics for each of the brackish water processes under comparable conditions. The results of these tests should be a major contribution toward determining which of these processes truly have economic potential for further development.

Program analysis ($652,000)

This division conducts engineering feasibility and economic studies to determine the potential of desalting as a practical source of incremental water supply. These studies must consider plant size, cost and availability of fuel, type of water to be desalted, seasonal demand, storage capacity, specific problems related to geographical areas such as brine disposal, power requirements to ascertain the potential of dual purpose operations, etc.

They examine in detail all aspects of the possible use of a desalting plant with regard to future needs for incremental supplies of fresh water, including the choice of the best desalting process for the particular circumstances and the best mode of operation. Proposals for Federal participation in prototype desalting plants also are evaluated.

These feasibility studies provide real goals for the program and assist in determining the performance requirements that must be achieved for the practical use of desalting technology.

In assessing the potential applications of desalting, and in making feasibility studies for specific applications, it is necessary to compare desalting costs with fresh water supplied from other sources. In the recent study we supported with the State of Texas on the Potential Contribution of Desalting to Future Water Supply in Texas, the development of alternative costs was a part of the contract. We provided the Texas Water Development Board with recommended guidelines to be used for developing unit cost of desalting. For alternative fresh water supplies from ground water or surface water imports, the experience of the TWDB was drawn upon and we worked closely with them to arrive at procedures for equitable comparison of costs. The procedures adopted for use were of sufficient accuracy for these preliminary studies and they were reviewed with representatives of the Assistant Secretary for Water and Power and the Bureau of Reclamation. The cost procedures were applied to each of thirty-seven Texas cities selected from the 586 communities in the State with population of 1,000 or more which had been identified by a screening procedure as likely candidate communities for the application of desalting procedure to their available water supplies.

The costs for desalting and conventional water include the costs of raw water, water transportation, water treatment, amortization of the capital debt and for desalting, the cost of brine disposal. Such comparative costs, as noted previously, are considered preliminary pending the performance of more detailed engineering cost estimates.

We are also performing a complete review of the cost accounting procedures for desalting plants in order to make sure we have a system that fairly compares the various desalting processes.

Just over a year ago we began, in cooperation with the Government of Mexico and the International Atomic Energy Agency, a study of the feasibility of construction of one or more desalting plants large enough to serve portions of the states of California and Arizona as well as portions of the Mexican states of Sonora and Baja California. This study is of a special interest because it deals with larger plants that we have previously constructed and because it will test the question of continued improvement in economics with increasing size and because it will explore in depth all facets of the economics of water for all purposes including agricultural uses. This study which covers the period through 1995 will encompass an examination of the water requirements and the potential technical solutions which could be available at various points through this time period. For the purpose of examining the economic parameters, we are looking at a basic plant size of 1 BGPD. We are also examining in cooperation with the Bureau of Reclamation the corollary question of the true economic value of desalted water in relation to its use in upgrading existing low-quality waters, the lower quantities of water required for irrigation with high quality water and the impact upon crop yields. While we have always recognized that high quality water has an intrinsic value greater than low-quality water, we expect this study with Bureau of Reclamation will be a step toward quantilization of this value increment.

OSW participated as a member of the Northeast Desalting Team in the study completed last year on Potentialities and Possibilities of Desalting for Northern New Jersey and New York City. Comparison of the alternatives to desalting was made in cooperation with local water supply authorities. Their report indicates that although fresh water from the Hudson River currently provides the most economic interim source to meet the water shortages of the area, engineering advances in desalting technology expected with the development of large scale desalting plants could eliminate present cost disadvantges. Desalting must, therefore, be given serious consideration in any future surface water development in that area. Follow-on studies in areas recommended by the Northeast Desalting Team are being planned with both New Jersey and New York City authorities. Our future plans include additional studies with other State agencies with an interest in desalting and in working closely with Federal Government agencies having a responsibility for future water supply planning. These studies would provide information on possible applications of desalting technology developed through the saline water conversion program and development of procedures for comparison of desalting with other supply methods.

Administration and coordination ($1,762,000)

Salaries and expenses ($1,550,000)—Operation and maintenance ($212,000)

We think, and hope you concur, that the program we are currently administering and the activities we propose for FY 1968 is a vigorous effort toward the goal of supplementing our water resources through practical application of desalting. This program is made up of almost 300 contracts covering a wide range of technical fields and types of activities going all the way from basic research through applied research and development to the construction of test bed plants and modules. The total obligational authority of this program has expanded from FY 1965 to FY 1967 by 110%. In the same time period, the OSW staff was increased by only 21%. We then find ourselves in a position where further increases in staff would materially assist us in effectively managing a program that continues to grow in complexity and importance. Keeping in mind that the role of the OSW staff is not the actual performance of the laboratory and fieldwork, but of providing its direction and planning the most effective and expeditious means of attaining its goals, there is a premium on the higher qualified personnel. People with experience and mature judgment can increase the effectiveness of our expenditures far more than the costs of their salaries. Our FY 1968 request for Administration and Coordination of $1,762,000 represents an increase of $65,000 over the amount available for this purpose in FY 1967. This increase will permit the addition of 5 new positions during FY 1968. With this increase, the total staff of the OSW including our field engineers would be 137.

In this presentation, we have endeavored to provide the Committee with a complete picture of the operations in which we are now engaged as well as the work we plan to conduct in the coming fiscal year. We know that many of our processes and much of our terminology is difficult to assimilate. In order to provide you with a better understanding of our programs, we would like to invite the Members of this Committee to visit our research and development facility at Wrightsville Beach, North Carolina, or if your travels bring you near any of our other installations we would be more than happy to arrange for an on-site briefing of our activities.

We would be pleased to answer any questions you may have concerning our program for it is our intention to provide you with complete and readily understandable information concerning our operations.

AUTHORIZATION BILL UNAPPROVED

Dr. Hunter. I would like to begin by saying that I am pleased to be here in my first appearance before this committee. I would also like at this time to emphasize that we are aware that we are appearing here today making this request for appropriation before having received approval of our authorization bill. We recognize that the action today will be subject to whatever authorization we may later receive.

MERGING OF PRIOR SEPARATE AUTHORIZATIONS AND APPROPRIATIONS

Since the time that we submitted our budget breakdown to you, there have been several changes I would like to deal with in our authorization program. As you know, we have in the past operated under two separate authorizations and two separate appropriations; one for our basic program, and one for the demonstration plant program. In our authorization this year, we are requesting that these separate authorizations be merged into a single authorization, and we would like to request that in reviewing our program you consider making a single appropriation in the event we do receive such authorization. This will materially simplify our problems of operation and will recognize the fact that the demonstration plant program has fulfilled its objectives as a demonstration plant program and further recognize that these facilities have become an extremely important part of our research and development program. They are invaluable in the performance of experiments to advance our technology.

BUDGET REQUEST

In the material submitted to you under the two separate requests, we had asked for an increase in authorization of $13,482,000 for our basic program, and a separate request for $2.3 million for the operation and maintenance of our demonstration plant. Under the amended authorization, these would be totaled as a single item. That would bring us to a fiscal year 1968 program requesting appropriation under these authorizations in an amount of $23,282,000, which is just over $7 million less than the total amount of money we had available last year, or this current year.

TOTAL OBLIGATIONAL AUTHORITY AND CONSTRUCTION DEFERRAL

However, I would like to point out that in the fiscal year 1967 certain contingencies of our program have meant that we could not properly program the expenditure of $3.5 million, and this is expected to become a carryover and would give us then a total obligating authority for 1968 of $26,782,000. The primary factors that are changed in the program to account for this decrease are such items as the fact that a major construction program for a vertical tube evaporator module has been deferred until 1969 fiscal year. This is deferred because the experimental program we had been carrying on on this process will not have produced sufficient data to permit us to effectively design the module until that time.

OFFICE RELATIONSHIP WITH INDUSTRY

There is one other item that I would like to emphasize before I begin a more detailed discussion of our program, and that is our relationship with industry. I would like to emphasize that in the conduct of our program we have developed a close relationship with industry because, as we see it, our job is to develop technology to the point where private industry can apply it successfully to the construction of production plants as required by the world's water shortage problems. We will continue to strengthen this association and expand it in order to produce an effective working relationship with industry.

RESEARCH PROGRAM BALANCE

As to our detailed program, within the total budget request we are requesting a sum of $5 million for research. We continue to believe that an aggressive and strong research program is necessary if we are to meet our eventual cost objectives. This research program is balanced between the matter of solving short-term problems in support of the engineering activities and its more important task of developing long-term solutions that will eventually permit us to reach the economic target we have set.

DISTILLATION DIVISION: DETERMINATION OF PROCESS HAVING GREATEST ECONOMIC POTENTIAL

In the Distillation Division, one of our engineering divisions, we are requesting for 1968 the sum of $4,365,000. The principal objectives of this Division are to develop the technology that will eventually give us the capability for very large plants suitable for major metropolitan water supplies. And in this area we are very much interested at the present time in the economic competition between two processes; the vertical evaporator process, and multistage flash process. The objective here in the next two years is to determine which of the processes has the greatest economic potential, and then obviously eliminate the loser.

HIGHER TEMPERATURE OPERATION GOAL

We are also making excellent progress on developing more heat transfer services. We are initiating a program on materials which may have a major impact on the cost of equipment. We are pursuing an objective of higher temperature operation which will improve the efficiency of our plant operation and provide lower cost product water.

As a corollary to this, we have had to carry out an intensive research on water pretreatment techniques, in order to prevent scale formation and to minimize the effect of corrosion.

MEMBRANE DIVISION: ELECTRODIALYSIS AND REVERSE OSMOSIS PROCESS

In our Membrane Division, we are requesting the sum of $4,300,000. This will be applied to two basic processes; the electrodialysis process, and reverse osmosis process.

The electrodialysis process has been used commerically for production of speciality waters, operating with rather mild salt waters, on a very small scale. It is not now, in our opinion, economic for large-scale municipal application for desalting brackish waters. However, the program we are carrying out now is beginning to improve the technology and reduce the costs. By developing better pre-treatment methods, we are widening the type of waters that can be sucessfully treated by the process.

In the reverse osmosis process, we have a system which, in our opinion, offers a unique opportunity in that it is the most flexible process we know. It can treat brackish waters of little salt content. We are now becoming more successful with more heavily salted waters, and we eventually expect to apply it to seawater. This is also a promising process for treatment of especially difficult waters, such as acid mine water and irrigation return-flow waters. It has, in fact, even been applied to the treatment of sewage; and in this case has produced potable water which is remarkably free of bacteria and virus, something very few other treatment systems can offer.

Our objective in this process is to demonstrate the applicability to small municipal supplies within approximately 2 years when we are treating reasonably brackish water, and then to progressively extend its applicability to more difficult waters. The primary emphasis of the research program is on developing improved membranes, because these are the key to economic operation of the process.

SPECIAL PROJECTS DIVISION: FREEZING AND OTHER PROCESSES

In the Special Projects Division, we are requesting a sum of $3,515,000. This is the division which deals with the freezing processes, the hydrate process, and other newer processes. For example, electro-absorption and ion exchange. Now ion exchange itself is not a new process, but it is newly considered as a potential on an economic basis for treating large quantities of water.

In the vacuum freeze process, which is one of the two freezing processes, we have demonstrated operation of a small pilot plant that produced potable water and delivered it to a community where it was consumed. This process is progressing satisfactorily. We have expectations that this will find real application in small sea water plants and in more difficult brackish waters.

Refrigerant Process

The refrigerant process has been difficult. This process has not developed smoothly, and we have had to back up and start again. The second start is now based upon much greater knowledge of the process that has been developed over the past 2 years by extensive work with pilot plants. In spite of the difficulties we still believe this process has potential for economic application, and it has special advantages under certain circumstances.

Ion Exchange Process

I mentioned the ion exchange process. This process looks extremely interesting for lightly salted brackish waters. It may also have application in the treatment of acid mine water. We will be initiating tests this summer, a second series of tests, on acid mine water. The location will be in West Virginia. This is a cooperative program with the Federal Water Pollution Control Administration and with the Bureau of Mines.

Brine Disposal

Another problem this division deals with is the matter of brine disposal. I think we are all familiar with the problem of disposing of warm brine and its effect on the ecology of the area in which it is disposed. For seawater plants, the process has a fairly ready solution, although we are required to exercise great care in how we dispose of it. In the inland situation, the problem is a great deal more difficult and we are now accelerating our work in this area in order to find an economic solution that will permit effective utilization of desalting plants by inland cities.

PROJECT MANAGEMENT AND PLANT ENGINEERING

We have initiated or established recently a new organizational component of the Office. This is called Project Management and Plant Engineering. As we have progressed in our program, we have come to the point where to carry on our development work we must become involved in a growing scale of hardware items. We have felt that it was appropriate and would increase our efficiency by putting together this particular problem into a separate organizational component and thus relieve the Research and Engineering Divisions of the necessity of being concerned with the matter of constructing routine facilities.

Responsibilities

This unit, then, operates as a service to research and the engineering divisions in seeing that the hardware is efficiently erected and, for the larger plants, they are also responsible for the operation and maintenance. This permits the other divisions to concern themselves with their primary objectives, that of research and engineering development.

This division is also responsible for providing the management of our current two large programs, the Metropolitan Water District, Bolser Island Desalting Plant. This is the large 150-million-gallon-per-day plant that we are now requesting authorization and appropriation to participate with a group of utilities in the Metropolitan Water District of Southern California. They are also responsible for managing our program with Saudi Arabia which involves the construction of a plant in the city of Jidda. Incidentally, the construction of that plant is funded by the Saudi Arabian Government.

INTENSIVE FIELD TEST ON BRACKISH WATER SYSTEMS

Also, under the general management of this division strike this coming year we will initiate an intensive field test program on brackish water systems. The several brackish water processes have now come to the point where it is necessary to operate them under real conditions in order to finally determine the optimum operating conditions, the appropriate pre-treatment techniques, and the economics of each process under each particular type of water. In this program we will select out of the infinite series of brackish waters a limited number of waters that typify water types important in small municipal supplies, and we will then develop operating techniques and economics, and thus permit the choice of the most appropriate process to each type water.

This field test program will also include, as I mentioned, additional work in the area of acid mine water and irrigation return-flows.

PROGRAM ANALYSIS DIVISION: ENGINEERING FEASIBILITY AND ECONOMIC STUDIES

In our Program Analysis activity, we are requesting $652,000. This division conducts engineering feasibility and economic studies. These studies are an important guide to our program, in that they develop the true economics of each process as it stands now and its potential economics if we are successful in continuing the development. You must recognize in this question that, for each particular type of water and each economic situation, different processes are the best solution. For example, distillation is the best solution at the current time when we are dealing with seawater plants of rather large size. Even these distillation plants will look different if we are in an area where the energy cost is either high or low, and also dependent upon whether the interest charges and tax charges for money are large or small.

FEASIBILITY STUDIES

Feasibility studies are an examination of a particular circumstance, such as our participation in the recent Northeast Study where you have the problem of determining the optimum type of process and the optimum manner of operation to produce low-cost water for that particular problem.

TEXAS WATER RESOURCES STUDY

I might also point out that we have just recently completed a first phase program with the Texas Water Development Board in which we have examined a number of cities in Texas as part of their long-range water plan to determine the prospects for desalting and supplying incremental water requirements. As a corollary to this study, we have undertaken further work to determine practical means of comparing costs of water from different sources, including the natural sources, and the various types of desalting processes.

MEXICAN STUDY

Just over a year ago we began, in cooperation with the Government of Mexico and the International Atomic Energy Agency, a study of the feasibility of construction and operation of very large plants for the area in the Southwest comprised of southeast California, southwest Arizona, northwest Sonora and northeast Baja, Calif. This study is of special interest to us because it allows us to examine in a real circumstance the feasibility and economics of very large plants. You undoubtedly know, increasing plant size has brought about dramatic improvements in the cost of water. We are interested in determining if this trend toward lower cost water continues to be achieved with increasing plant size. In this particular study, we will examine, in the preliminary sense, plant sizes of the order of 1 billion gallons per day and determine what technical problems would be faced in their design and construction, and what would be the economics of their operation.

Chairman HAYDEN. 1 billion gallons a day?

Dr. HUNTER. 1 billion.

Chairman HAYDEN. How many acre feet is that?

Dr. HUNTER. That is a million acre feet a year, approximately.

ADMINISTRATION AND COORDINATION

In the area of administration and coordination, we have programed a figure of $1,762,000. I have given you a very brief summary of our program. I hope you will agree that this is an aggressive and vigorous effort to achieve our goal of low-cost desalted water. I would like to point out that this program is made up of almost 300 active contracts at the current time. These contracts cover a wide range of technical fields and economic studies. On the average, they are rather small in value, but it is a complex management problem. In the period from the fiscal year 1965 to 1967, the obligational authority of the program increased by an amount of 110 percent. In the same time period, the OSW staff was increased by 21 percent. We are obviously, then, in a position where additional staff will materially assist us in managing and continuing to properly plan this program.

RESEARCH CONTRACTS AND STAFF INCREASE

It should be kept in mind that we do not do the actual work in-house. We are a management operation. We do the work under contract to universities, industries, individuals, associations, and so on. Accordingly, in our 1968 request we have an increase of $65,000 over the previous year, and we are requesting five new positions, bringing our total authorized staff to 137.

In this presentation I have attempted to provide a very brief but complete picture of our activities. I shall be very happy to supplement this by answering any questions you may wish to ask.

Thank you very much.

SALARIES AND EXPENSES

Chairman HAYDEN. There will be placed in the record the budget justification for a fiscal year 1968 appropriation of $20,982,000 for salaries and expenses. This is a decrease of $6,518,000 under the amount appropriated in fiscal year 1967.

(The justification follows:)

Appropriation, 1966		$20,000,000
Unobligated balance, prior year	$1,182,110	
Recovery prior year obligations	403,367	
		1,585,477
Total available, 1966		21,585,477
Appropriation, 1967		27,500,000
Unobligated balance, prior year		4,156,991
Transfer to Salaries and expenses, Office of the Secretary, Department of the Interior	−$31,000	
Program deferral to fiscal year 1968	−3,500,000	
		−3,531,000
Total available, 1967		28,125,991

SUMMARY OF INCREASES AND DECREASES, 1968

Research and development:		
Increase in research program	+$360,000	
Decrease in program analysis and engineering feasibility and economic studies	−148,000	
Decrease in engineering and development program	−3,920,991	
		−3,708,991
Administration and coordination: Increase in administration and coordination		+65,000
Net decrease, 1968		−3,643,991
Total available, 1968		24,482,000
Less unobligated balance from 1967		−3,500,000
Budget estimate, 1968		20,982,000

Analysis by activity

Activity	Amount available 1967	Fiscal year 1968			Total available 1968 compared to total available 1967	Budget estimate 1968 compared to available 1967
		Estimated total available	Unobligated balance from 1967	Budget estimate		
1. Research and development:						
(*a*) Contracts and grants (non-Federal)	$26, 320, 991	$22, 137, 000	$3, 500, 000	$18, 637, 000	−$4, 183, 991	−$7, 683, 991

2. Administration and coordination	1, 485, 000	1, 550, 000	------------	1, 550, 000	+65, 000	+65, 000
Total	28, 125, 991	24, 482, 000	3, 500, 000	20, 982, 000	3, 643, 991	−7, 143, 991

JUSTIFICATION SALARIES AND EXPENSES APPROPRIATION

This appropriation provides the Department of the Interior's Office of Saline Water with the necessary funds to conduct the research and development portion of the Saline Water Program. Included in the appropriation are funds needed to support the Office of Saline Water's research and development contract and grant programs. The work covered includes (1) basic and applied research and development activities, and the construction, operation and maintenance of pilot plants, modules, test beds, and other experimental research equipment, (2) the construction, operation and maintenance of the Office of Saline Water's test facilities, e.g., San Diego Test Facility, Brackish Water Test Facility, East Coast Test Facility, etc., (3) the salaries and expenses of OSW employees associated with the above program activities.

The Budget request for $20,982,000 is a decrease of $7,144,000 below the amount available for fiscal year 1967 of $28,126,000. The total program for fiscal year 1968 is $24,482,000 including $3,500,000 financed by carryover from fiscal year 1967. The resultant decrease in the total program of $3,644,000 below fiscal year 1967 ($28,126,000 vs $24,482,000) results largely from the change of program emphasis from construction in fiscal year 1967 to operation, test and evaluation programed for fiscal year 1968.

A detailed analysis of the Program follows.

(a) *Research*

The Research program is responsible for the generation of new concepts, new ideas and new scientific knowledge upon which the Engineering and Development activity can build its technology applicable to the development of processes for saline water conversion. The Research Program covers a wide range of activities designed to fulfill four major program objectives: (1) careful examination and investigation of ideas applicable to new and different desalting processes, (2) quantitative study and evaluation of promising new processes as a basis for preliminary plant designs, (3) studies to provide basic data required for the improvement of existing processes, and (4) studies to provide basic information on water and aqueous solutions and their behavior.

The Research program for fiscal year 1968 totals $5,850,000. Of this amount, $850,000 represents prior year appropriations carried over into 1968 for items deferred to the budget year. Analysis of the proposed funding compared to fiscal year 1967 availability is shown below:

[In thousands of dollars]

Program	Amount available, 1967	Fiscal year 1968			Total available, 1968 compared to total available 1967	Budget estimate, fiscal year 1968 compared to available 1967
		Estimated total available	Unobligated balance from 1967	Budget estimate		
1. Nature of water	1,561	1,569	170	1,399	+8	−162
Properties of water	326	393	120	273	+67	−53
Aqueous solutions and suspensions	1,235	1,176	50	1,126	−59	−109
2. Water supply augmentation and conservation	3,267	3,536	650	2,886	+269	−381
Saline water conversion	3,267	3,503	650	2,853	+236	−414
Use of water of impaired quality	----------	33	----------	33	+33	+33
3. Water quality management and protection	662	745	30	715	+83	+53
Identification of pollutants	----------	112	----------	112	+112	+112
Ultimate disposal of wastes	114	124	30	94	+10	−20
Water treatment	548	509	0	509	−39	−39
Total	5,490	5,850	850	5,000	+360	−490

The new funds requested in FY 1968 of $5,000,000 represents a decrease of $490,000 below the amount available in FY 1967 of $5,490,000. The total program for FY 1968 is $5,850,000, including $850,000 carried over from the previous year.

1. *Nature of water*

Funds available fiscal year 1967	$1, 561, 000
Funds requested fiscal year 1968	1, 399, 000
Decrease	162, 000

Request for FY 1968 is $1,399,000 or a reduction of $162,000 below FY 1967. The total program is $1,569,000 including $170,000 carried over from the previous year.

a. Properties of water

Request for FY 1968 is $273,000 or a reduction of $53,000 below FY 1967. The total program is $393,000 including $120,000 carried over from the previous year.

This portion of the program constitutes a basic quest for new knowledge concerning a better understanding of water itself. It is designed to meet the long-range objectives of the Office by supplying new data and insight upon which revolutionary new concepts may be founded that would lead to a "break-through" in desalination technology.

b. Aqueous solutions and suspensions

Request for FY 1968 is $1,126,000 or a reduction of $109,000 below FY 1967. The total program is $1,176,000 including $50,000 carried over from the previous year.

This portion of the program fulfills both the long-range objective of supplying new data and information from which new concepts will hopefully arise, and the short-range objective of supplying needed thermodynamic, kinetic, and transport data necessary for more efficient design of current desalting processes.

2. *Water supply augmentation and conservation*

Funds available fiscal year 1967	$3, 267, 000
Funds requested fiscal year 1968	2, 886, 000
Decrease	381, 000

Request for FY 1968 is $2,886,000 or a reduction of $381,000 below FY 1967. The total program is $3,536,000 including $650,000 carried over from the previous year.

a. Saline water conversion

Request for FY 1968 is $2,853,000 or a reduction of $414,000 below FY 1967. The total program is $3,503,000 including $650,000 carried over from the previous year.

This effort is designed to provide new information relevant to separation processes. New data, new techniques for vaporization, crystallization, membrane, and ion-adsorption processes are included in this category.

b. Use of water of impaired quality

Request for FY 1968 is $33,000 or an increase of $33,000 over FY 1967.

This effort is concerned with the use of unusually contaminated waters as potential feed streams of desalination processes, and the suitability of partially desalted water for specific applications.

3. *Water quality management and protection*

Funds available fiscal year 1967	$662,000
Funds requested fiscal year 1968	715,000
Increase	53,000

Request for FY 1968 is $715,000 or an increase of $53,000 over FY 1967. The total program is $745,000 including $30,000 carried over from the previous year.

a. Identification of pollutants

Request for FY 1968 is $112,000 or an increase of $122,000 over FY 1967.

Certain pollutants markedly affect the performance of desalination processes. In many instances even the nature of these pollutants is unknown. This effort is to develop means to identify and monitor these pollutants.

b. Ultimate disposal of wastes

Request for FY 1968 is $94,000 or a reduction of $20,000 below FY 1967. The total program is $124,000 including $30,000 carried over from the previous year.

The waste stream of any desalting process must be disposed of in a way that will not contaminate available water supplies and aquifers. This effort is concerned with basic studies on the utilization and disposal of these waste streams, particularly as they relate to inland sites.

c. Water treatment

Request for FY 1968 is $509,000 or a reduction of $39,000 below FY 1967.

This effort is concerned with pretreatment of specific saline waters to make them more amenable for desalting processes and other applications.

The Research activity embraces studies in all relevant areas of basic and applied science. A substantial effort is devoted to a better understanding of the kinetics and mechanisms by which heat, water molecules, and ions are transported to and across boundaries. Studies of a more applied nature relate to the development and testing of new separation processes, the investigation of means of preventing or mitigating the effects of scale and corrosion, the improvement of heat transfer, development of improved materials of construction, byproduct recovery, etc. The FY 1968 Program will consist of approximately 70 separate projects.

A few examples of recent accomplishments that have been achieved and may be expected from the ongoing program are given below.

1. Promising methods of electrically regenerating ion-exchange materials have been developed. This offers the potential of substantially reducing the cost of desalination by ion-exchange methods.

2. A comprehensive analysis of heat and mass transfer phenomena which occur in the freezing process has been made. This will eventually permit design of more efficient crystallizers for freezing processes, and cost-reduction for this important desalting process.

3. The nucleus of a facility for study of corrosion in sea water was established. This will make possible the comprehensive study of materials and their behavior under conditions typical of those found in desalination plants.

4. A new class of reverse osmosis desalination membranes, namely, polysaccharide acetates, has been discovered which shows salt rejections on sea water exceeding 99%.

5. Ultra-thin films of cellulose acetate have now been prepared which show 99.5% salt rejection or better, and offer the potential of development into a new system for the desalination of sea water.

6. A quantitative account and a general theory of evaporation and condensation coefficients of water and other liquids have been made.

7. Encouraging progress has been made on the fundamental question as to whether or not liquid water consists of a mixture of distinguishable species. From novel calculations, neutron scattering and infra-red absorption spectra, new evidence has been found indicating that more than one kind of clustering exists in liquid water.

(b) *Program analysis and engineering feasibility and economic studies*

Funds available fiscal year 1967	$800, 000
Funds requested fiscal year 1968	652, 000
Decrease	148, 000

This activity provides for the conduct of engineering feasibility and economic studies to investigate the potential application of desalting technology. This funding estimate provides for the contract support required for this activity. The staff functions and in-house responsibilities for this activity that are carried out by OSW personnel are included under the Administration and Coordination justifications.

The estimate for fiscal year 1968 is $652,000 a decrease of $148,000 below the amount available for fiscal year 1967. The decrease is due largely to unobligated funds from 1966 that were carried over into fiscal year 1967.

A. Engineering feasibility studies, $352,000

These funds are to pay the cost of participation in national and international feasibility studies of the potential applications of desalting technology related to specific geographical areas or locations. In addition they are an important source of valuable information used in determining future program direction. These studies examine in detail, for an area which has saline water sources available, all aspects of the possible use of a desalting plant in regard to future needs for incremental fresh water. It includes determination of the economics of the several desalting processes to a particular situation and the economics of all other alternate sources for incremental water. In these types of projects an in-house preliminary Departmental study usually precedes any contracts for detailed feasibility studies, which normally would be jointly financed with the interested water user agencies. Also included is the evaluation of specific proposals for Federal participation in prototype desalting plants. Engineering feasibility studies must first be undertaken to determine in advance the magnitude of desalting technology gain which could be expected as a result of that participation. This is necessary as the particular plant must offer a specific opportunity to advance the science and technology in the desalting field, and contribute materially to low-cost desalting.

B. Engineering economic studies, $300,000

Engineering economic studies and surveys are performed to determine the characteristics of a particular process to a large variety of situations. The size of plant required, energy sources and comparative costs, different modes of operation are all examined covering a wide variety of economic parameters relating to the application of a particular process. This category includes the further correlation of the economics of various saline water conversion processes to other available means of incremental water supply. These studies may also relate to ongoing process development efforts or deal with evaluation of future desalting opportunities. In addition, the funds requested will support economic studies leading to the development of methods that will provide the cost of water for alternate sources of water supply on a common basis.

(c) *Engineering and development*

The Engineering and Development activity is comprised of four major Divisions concerned with the program management of engineering and development effort on promising processes used to desalinate water and with the operations of engineer facilities for the conduct of this work.

The Engineering and Development program for FY 1968 totals $16,430,000. Of this amount $2,650,000 represents prior year appropriations carried over into 1968 for items deferred to the budget year. Analysis of the proposed funding compared to FY 1967 availability is shown below:

[In thousands of dollars]

Program	Amount available, 1967	Fiscal year 1968			Total available, 1968 compared to total available, 1967	Budget estimate, fiscal year 1968 compared to available 1967
		Estimated total available	Unobligated balance from 1967	Budget estimate		
Distillation	10, 162	5, 605	1, 240	4, 365	−4, 557	−5, 797
Membrane	4, 292	4, 830	530	4, 300	+538	+8
Special projects	3, 420	3, 945	430	3, 515	+525	+95
Plant engineering	2, 477	2, 050	450	1, 600	−427	−877

Distillation Division

Funds available fiscal year 1967	$10, 162, 000
Funds requested fiscal year 1968	4, 365, 000
Decrease	5, 797, 000

Request for FY 1968 is $4,365,000 or a reduction of $5,797,000 below FY 1967. The total program is $5,605,000 including $1,240,000 carried over from the previous year.

The reduction in the Distillation budget estimate and the total program (including carryover) for FY 1968 is due primarily to a decrease in the requirement for module funds resulting from the completion of the funding of construction of the MSF Module in FY 1967.

[In thousands of dollars]

Program	Amount available 1967	Fiscal year 1968			Total available 1968 compared to total available 1967	Budget estimate fiscal year 1968 compared to available 1967
		Estimated total available	Unobligated balance from 1967	Budget estimate		
I. Pilot plants	1,492	1,189	50	1,139	−303	−353

V. Special research and development	440	243		243	−197	−197
Total	10,162	5,605	1,240	4,365	−4,557	−5,797

The Distillation Program for FY 1968 provides for the continued engineering and development of the distillation process with concentration on the following major activities:

Close liaison with contractors on the MSF module, including the approval of drawings, inspection of equipment and construction, initial startup, and operation.

Investigation, design and procurement of long lead items for a large LTV module.

Testing and evaluation, and dissemination of data derived from the new 1.2 million gpd Senator Clair Engle (multistage, multieffect flash) Distillation Plant which is now being built at the San Diego Saline Water Test Facility. This plant will be in operation by the end of calendar year 1967.

Pilot Plants—Construction, operation, and testing of MSF, LTV and miscellaneous pilot plants.

A stepped-up program in heat transfer, design and component studies that will lead to the design and construction of small and medium size prototype plants, 5 to 15 million gpd.

Studies of advanced distillation plants which are expected to effect a major decrease in water costs up to 50 percent by the years 1975–80.

Conceptual studies of plant design and economics in sizes up to one million gpd including multiprocess plants.

I. PILOT PLANTS

Request for FY 1968 is $1,139,000 or a reduction of $353,000 below FY 1967. The total program is $1,189,000 including $50,000 carried over from the previous year.

The development work in pilot plants breaks down into two categories:

a. operation and investigations on previously funded and constructed pilot plants,

b. the design and construction of new pilot plants and submodules of presently operating plants.

The decrease in the estimate for FY 1968 over FY 1967 results from the fact that the requirements for new pilot plants have been held to a minimum until the results of pilot plants now in operation or projected for operation by FY 1968 can be evaluated. It is also estimated that the pilot plant program will be able to save approximately $108,000 in FY 1968 by converting from visual/manual operation of the pilot plants at Wrightsville Beach to automated instrumentation, and thus reducing the number of contractor employees needed for operators.

Pilot plant operation

Operation of the 25,000 gpd pilot plant at Wrightsville Beach will be continued by Baldwin-Lima-Hamilton. This plant is giving valuable information on scale control methods and limitations. New instrumentation is being added to the plant to increase the value of the data obtained.

The skid-mounted pilot plant will be put into operation in the New York Metropolitan area to determine the feasibility of operating in highly polluted waters.

The aluminum pilot plant will go in service at Wrightsville Beach for a minimum of two-year extended operation. This pilot plant is expected to test the feasibility of using aluminum tubes in distillation plants at an expected savings in capital cost.

The two-stage flash module at the Millstone Point Test Facility of American Machine and Foundry will be continued in operation during FY 1968. It has contributed much valuable knowledge which is now being utilized in the design of the module to be built at San Diego Saline Water Test Facility. Work on this unit will be phased out at the end of this period as the new and more sophisticated, high-capacity, flash test device will be put into operation by Baldwin-Lima-Hamilton at Wrightsville Beach. This unit will be better instrumented and will have more than twice the capacity of the AMF flash test device.

New pilot plants

An LTV pilot plant, comprising five effects, will be set up in FY 1968 and operated at Wrightsville Beach. This pilot plant will incorporate the General Electric-type, high performance, fluted tubes which have shown excellent promise in the laboratory and in a two-effect pilot plant. This pilot plant will have a capacity of approximately 20,000 gpd.

A pretreatment unit to be added to the 25,000 gpd MSF plant will be developed during FY 1968 incorporating a fluidized bed preheater. This system now being developed in bench scale tests at Brookhaven Laboratory shows excellent promise for scale prevention at high temperatures.

A system developed by Allis-Chalmers for the use of direct contact heaters shows excellent promise. It is expected that the system will be moved and operated at Wrightsville Beach to prove out the techniques developed on synthetic brines. It is proposed to design and install a pilot plant incorporating the secondary heat pump principle adapted for the LTV system. This system shows excellent promise for single purpose small and medium size plants.

II. MODULES

Request for FY 1968 is $1,000,000 or a reduction of $5,000,000 below FY 1967. The total program is $2,190,000 including $1,190,000 carried over from the previous year.

The program for FY 1968 provides for investigation, design, and procurement of long lead items for a large LTV module, and for operation of the MSF module. The developments from the modified Freeport demonstration plant, the 250 million gpd conceptual design studies now in process, and the operation of a multieffect LTV pilot plant at Wrightsville Beach featuring high performance heat transfer surfaces are all expected to prove out the appreciable savings inherent in this system. However, before the LTV process can be considered ready for industry's acceptance and for large scale municipal and regional water supplies, a module or test bed must be constructed and operated. Funds are requested for the investigation, design, and purchase of long lead items of an LTV module at the San Diego Saline Water Test Facility in the amount of $1,190,000. The cost of the module is estimated to be less than the MSF module when it is designed and constructed.

III. COMPONENTS AND SUPPORT STUDIES

Request for FY 1968 is $1,122,000 or an increase of $135,000 over FY 1967.

Components, $575,000

This activity provides for development studies that will result in more economical performance and reduce the cost of components of large plants including those which may be funded or programmed in the immediate future.

A major cost factor of a distillation plant is the heat transfer surface. Intensive efforts are continuing in cooperation with industry to develop economical heat transfer surface involving new methods of fabrication and new configurations. The increased funds for 1968 are requested to continue this development which has shown promise in tubes incorporating dropwise condensing promotors, fluted tubes, extended surface tubes, and tubes incorporating turbulance promotors. Increases in heat transfer characteristics of heat exchange surfaces can materially decrease the surface required, and therefore result in significant decreases in plant cost.

A considerably widened scope of materials testing and development is required to develop the most economical plant. The major effort will be in the development of new materials for the particular environmental conditions and the evaluation of materials presently available.

Support studies, $547,000

The Oak Ridge National Laboratory has been used for technical assistance and as consultants on a variety of matters such as the literature searches, evaluation of long tubes, evaluation of flash chamber design, corrosion problems, evaluation of product water treatment, preparation of specifications for new tube concepts, and evaluations of proposals. Funding in FY 1968 is requested to continue this type of assistance. The Oak Ridge National Laboratory has a wide range of professional personnel in many disciplines and can give expert advice in many fields.

IV. ADVANCED STUDIES

Request for FY 1968 is $861,000 or a reduction of $382,000 below FY 1967.

Conceptual designs, for the design of a large (250 mgd) plant of the vapor compression type employing long vertical tubes, will be made under FY 1968 funding. A number of other conceptual designs will also be included. Other studies include a definitive small single-purpose plant and conceptual designs made in conjunction with siting studies.

Funding in FY 1968 is also requested for a minimal effort in solar distillation to keep abreast of the art, and for preparation of a number of manuals for operation, computer codes, value engineering, and maintenance studies. An investigation will be made of hybrid plants combining several of the distillation processes.

V. SPECIAL RESEARCH AND DEVELOPMENT

Request for FY 1968 is $243, 000 or a reduction of $197,000 below FY 1967.

The funds requested under this item are minimal to support and investigate, in the early stages, instrumentation and the possibilities of the desulfating process for water treatment. It also provides a minimal funding for consultants for special projects as they arise.

Membrane Division

Funds available fiscal year 1967	$4, 292, 000
Funds requested fiscal year 1968	4, 300, 000
Increase	8, 000

Request for FY 1968 is $4,300,000 or an increase of $8,000 over FY 1967. The total program is $4,830,000 including $530,000 carried over from the previous year.

The Membrane program for FY 1968 provides for the continued engineering and development of the two most promising membrane programs, namely, reverse osmosis and electrodialysis. The variations of electrodialysis, transport depletion and electrosorption, will also be developed. The increase in the budget estimate and the total FY 1968 program (including carryover) is due to increased emphasis placed on the reverse osmosis process during the budget year.

[In thousands of dollars]

Program	Amount available, 1967	Fiscal year 1968			Total available, 1968, compared to total available, 1967	Budget estimate, fiscal year 1968, compared to available, 1967

Total	4,292	4,830	530	4,300	+538	+8

I. REVERSE OSMOSIS

Request for FY 1968 is $3,150,000 or an increase of $89,000 over FY 1967. The total program is $3,500,000 including $350,000 carried over from the previous year.

The funds provide for the development of reverse osmosis process which has strong potential as a low-cost desalting process. Considerable progress will have been made in the development of membrane modules of different configurations including plate and frame, spiral, and shell and tube. Construction of pilot plants based on all these module design concepts should be completed by the end of FY 1967. Feedwater pretreatment methods to remove contaminants (iron, manganese, organics) that cause membrane fouling during reverse osmosis unit operation will also have been established in FY 1967. In FY 1968, it is planned to field test these pilot plants with natural brackish waters, acid mine waters, irrigation return waters and other highly polluted waters. Construction of one 250,000 gpd test bed plant and additional 10,000–20,000 gpd pilot plants based on one or more new design concepts and membranes now under research and engineering study are also planned. Other programs continued in FY 1968 are: (1) optimization of feed water pretreatment methods to achieve economic operation of reverse osmosis units with brackish and sea waters, (2) development of systems to recover energy from process waste brine.

Major portions of the reverse osmosis development are detailed below:

Pilot Plants

Request for FY 1968 is $800,000 or a reduction of $84,000 below FY 1967. The total program is $1,050,000 including $250,000 carried over from the previous year.

This program provides for continuation of testing and evaluation of existing pilot plants and others scheduled for completion in FY 1967; design and construction of a 10,000 gpd unit based on tubular configuration; design and construction of additional pilot plants of 1,000 gpd to 10,000 gpd capacity, based on: (a) new membranes (inorganic membranes, glass membranes, ultra-thin film cellulose acetate membranes); (b) new design concepts (rectangular plates, hollow fine fibers). Finally in FY 1968, the best brackish water tested pilot plant will be modified for sea water opearation.

Test bed plants

Request for FY 1968 is $300,000 or an increase of $300,000 over FY 1967.

The reverse osmosis process is expected to advance to the test bed phase of development by FY 1968. Sufficient data will be available from the plate and frame, spiral module and tubular design pilot plants to allow selection of one of these plant configurations for scale-up and evaluation of a larger second generation reverse osmosis plant with a product water capacity up to 250,000 gpd.

Process development

Request for FY 1968 is $950,000 or a reduction of $277,000 below FY 1967.

The decrease in the estimate for FY 1968 below FY 1967 results from the progression of the reverse osmosis process towards the test bed phase of development. Process development efforts in FY 1968 will be centered on long-term testing of the present designs and one or more new basic designs in small pilot plants (1000 gpd capacity) for the purpose of determining membrane and other components life, their physical and chemical stability and other performance parameters in extended service. It is planned to develop suitable techniques to eliminate membrane fouling and compaction which significantly reduce flux rates in long-term operation.

The economics of using a combination of ion-exchange resin and reverse osmosis processes (at moderate pressures) for desalting sea waters to public health standard quality will be investigated in pilot plant tests.

Membrane development

Request for FY 1968 is $300,000 or an increase of $95,000 over FY 1967. The total program is $400,000 including $100,000 carried over from the previous year.

The increased funding for FY 1968 is required for an accelerated program for development of thin films and suitable support materials for these films. Basic research studies have shown that thin films of cellulose acetate, polysaccharides, polyelectrolytes, porous glass films and modified ion-exchange membranes hold promise for reverse osmosis application. Laboratory test data indicate higher flux rates for some of these films compared to conventional cellulose acetate membranes. The performance characteristics of these films and membranes will be evaluated in small pilot plants using natural saline waters. Because of the extreme thinness of these films, they require rigid porous supports to withstand high pressures typical of reverse osmosis process operation. Efforts will be continued to improve the fabrication techniques and performance characteristics of the conventional cellulose acetate membranes.

System optimization

Request for FY 1968 is $175,000 or an increase of $95,000 over FY 1967.

The increased funding for FY 1968 is required to perform thorough engineering and economic analysis of different membrane module designs (plate and frame, spiral, shell and tube, and narrow channel) and of other components of reverse osmosis systems to aid selection of the most economical and practical designs and components required for construction of 1–10 mgd capacity plants. Process development and field evaluation of these design concepts will have been advanced sufficiently in FY 1967. As part of this effort, tentative design specifications for the construction of a 1 mgd capacity plant on the best design concept will be prepared.

Another effort under this activity will be the projection of product water costs in different capacity plants.

Field tests and pretreatment studies

Request for FY 1968 is $500,000 or a reduction of $65,000 below FY 1967.

The decrease in the estimate for FY 1968 below FY 1967 results from the use of some pretreatment equipment purchased in FY 1967 for laboratory studies in the field test program.

A major obstacle to the development of a practical reverse osmosis system for economic desalting of natural brackish and sea waters is the influence of certain constituents in the feed waters such as carbonates and sulfates of calcium and magnesium, iron, manganese, silica, Boron, organics, etc., on the performance characteristics (membrane life, hydraulics, etc.) of the system components in extended service. In processing many waters by the reverse osmosis process, these constituents reach supersaturation levels or oxidize to insoluble forms. The deposition of these materials on membrane surfaces and brine flow channels cause significant reductions in flux rates.

Laboratory studies on pretreatment systems and methods that permit maximum removal of these precipitate-forming constituents in feed waters will have been completed in FY 1967. The laboratory-proven methods will be field tested in FY 1968 on a wide variety of natural waters (brackish, acid mine drainage, and irrigation return flows).

Energy recovery systems

Request for FY 1968 is $125,000 or an increase of $25,000 over FY 1967.

The increased funding for FY 1968 is needed to purchase high pressure pumps and other equipment.

Significant reduction in product water cost will result in larger plants if energy is recovered from process wastes. Development programs (work exchangers, turbines, etc.) initiated during FY 1967 to recover energy from waste brines will be continued in FY 1968 at about the same level with emphasis on the design, construction and operation of a small demonstration unit.

II. ELECTRODIALYSIS AND OTHER RELATED MEMBRANE PROCESSES

Request for FY 1968 is $1,150,000 or a decrease of $81,000 below FY 1967 The total program is $1,330,000 including $180,000 carried over from the previous year.

This request for funds provides for the development of the electrodialysis process and other related membrane processes including transport depletion and electrosorption. The FY 1968 development program for electrodialysis is based on an investigation to increase operating current densities largely through pilot plant studies and testing. Work in membrane and process development to improve the performance and economics of electrodialysis systems is also emphasized. In FY 1968, it is planned to continue the evaluation of the transport depletion process and to extend the development of the electrosorption process to a larger plant size. Finally, pretreatment studies and techniques will be extended to incude additional field tests on representative brackish and acid mine waters.

Pilot plants

Request for FY 1968 is $455,000 or a reduction of $30,000 below FY 1967. The total program is $535,000 including $80,000 carried over from the previous year.

The program for FY 1968 provides for design and construction of two pilot plants (a 50,000 gpd Nellen Stack and a 25,000 gpd electrodialysis unit to operate on low salinity, high hardness brackish water); evaluation of two 10,000 gpd transport depletion plants of alternate designs completed in FY 1967; and the evaluation of operational characteristics of promising pilot plant designs indicated in the supporting and continuing R&D programs. The electrosorption process will be ready for further development to a larger plant of 25,000 gpd capacity and funds are provided within this category for this purpose.

Process development

Request for FY 1968 is $155,000 or a reduction of $35,000 below FY 1967.

Process development work in FY 1968 will be principally a continuation of the development of electrodialysis stack components suitable for high temperature operation. Emphasis is placed on this area of investigation since developing the capability of operating electrodialysis plants at high temperatures can significantly lower the cost of desalted water by reducing both power consumption and required membrane area. Work initiated in FY 1967 will form the basis for this program and permit a slight reduction of funding in FY 1968.

Membrane development

Request for FY 1968 is $210,000 or a reduction of $21,000 below FY 1967. The total program is $260,000 including $50,000 carried over from the previous year.

Work in membrane development will consist of a continuation of studies to develop low cost membranes. Efforts to improve membrane evaluation techniques will be continued at the Bureau of Reclamation Engineering Laboratories, Denver, Colorado. A major effort in this field will be the evaluation of inorganic membranes for electrodialysis systems. Inorganic membranes have better chemical and physical stability and offer the potential of longer membrane service life than conventional organic membranes presently used. This effort, initiated in FY 1967, will be continued in FY 1968 to include evaluation of these membranes on different brackish waters.

System optimization

Request for FY 1968 is $75,000 or a reduction of $25,000 below FY 1967.

These studies, which comprise a continuing review program, will consist of an engineering and economic analysis of data resulting from separate investigations on electrodialysis and related membrane processes development. A decrease in funds requested is due to the completion of a major portion of electrodialysis process optimization studies in FY 1967.

Field tests and pretreatment studies

Request for FY 1968 is $255,000 or an increase of $30,000 over FY 1967. The total program is $305,000 including $50,000 carried over from the previous year.

The increase in funds is requested in this activity for FY 1968 to undertake a detailed survey of the existing electrodialysis plants to determine long term operating experience and cost-effectiveness of the feed pretreatment on product water costs.

One of the OSW objectives is to evaluate the feasibility of extending the electrodialysis process to treat acid mine drainage waters, irrigation return flows, and other special classes of chemically charged waters. In FY 1967, the economics of demineralizing acid mine waters for beneficial uses by electrodialysis will be determined in the field through a cooperative effort with the Bureau of Mines and the Federal Water Pollution Control Administration. Subsequent field tests will be conducted on other types of special waters at about the same level of funding as FY 1967. Additional pilot plant field tests evaluating different pretreatment systems will be intensified in FY 1968.

Special projects division

Funds available fiscal year 1967	$3, 420, 000
Funds requested fiscal year 1968	3, 515, 000
Increase	95, 000

Request for FY 1968 is $3,515,000 or an increase of $95,000 over FY 1967. The total program is $3,945,000 including $430,000 carried over from the previous year.

The Special Projects Program for FY 1968 provides for (1) the continued development of the crystallization processes, (2) the development of new or improved components for the crystallization processes, (3) design studies for a test bed plant, investigation of new promising processes at the bench scale and pilot plant level (particularly ion exchange) for the conversion of brackish waters and for the disposal of the effluent brines from coastal and inland desalination plants, and (4) evaluation of processes in the demineralization of acid mine drainage.

Major construction involved with the crystallization processes is being funded in FY 1967. Operation, maintenance, and modifications of these plants are scheduled for FY 1968. The resultant decrease in fund requirements for crystallization process in FY 1968 is offset by the increased emphasis on development of more reliable components with higher performance.

[In thousands of dollars]

Program	Amount available, 1967	Fiscal year 1968			Total available, 1968, compared to total available, 1967	Budget estimate, fiscal year 1968, compared to available, 1967
		Estimated total available	Unobligated balance from 1967	Budget estimate		
I. Crystallization process development	2, 170	1, 700	100	1, 600	−470	−570
II. Component development	265	700		700	+435	+435
III. Application engineering	285	535		535	+250	+250
IV. New Processes	350	460	130	330	+110	−20
V. Brine disposal	250	450	200	250	+200	
VI. Pollution	100	100		100		
Total	3, 420	3, 945	430	3, 515	+525	+95

I. CRYSTALLIZATION PROCESS DEVELOPMENT

Request for FY 1968 is $1,600,000 or a reduction of $570,000 below FY 1967. The total program is $1,700,000 including $100,000 carried over from the previous year.

The vacuum freeze vapor compression process pilot plant at Wrightsville Beach Test Station has performed most satisfactorily to date, yielding engineering information on areas where improvement can be made. These improvements will be made in FY 1967 and a new mobile plant will be constructed for evaluation with brackish water. Funding required in FY 1968 will be to provide for operation and evaluation of these plants.

Detailed examination of the experimental data obtained from previous secondary refrigerant freezing process pilot plant operations points to the necessity for extensive modification or construction of a new pilot plant in FY 1967 to accelerate the development and evaluation of this process. Operation, test and evaluation will commence in FY 1968.

Development of the hydrate process in the pilot plants at Wrightsville Beach will continue, but at a somewhat lower level of effort than in FY 1967.

II. COMPONENT DEVELOPMENT

Request for FY 1968 is $700,000 or an increase of $435,000 over FY 1967.

The increase of $435,000 will be required to investigate further improvements in the efficiency of the vapor compressor, new devices for wash and separation of crystals and brine, and improved performance and reliability, and reduced costs for other components such as heat exchangers, debutanizers, and crystallizers.

III. APPLICATION ENGINEERING

Request for FY 1968 is $535,000 or an increase of $250,000 over FY 1967.

The increase of $250,000 will be chiefly for design studies for a test bed plant of the most advanced crystallization process.

IV. NEW PROCESSES

Request for FY 1968 is $330,000 or a reduction of $20,000 below FY 1967. The total program is $460,000 including $130,000 carried over from the previous year.

Funding required in FY 1968 is for laboratory and pilot plant field studies and evaluation of four new ion-exchange processes under investigation for use with brackish waters.

V. BRINE DISPOSAL

Request for FY 1968 is $250,000 or the same amount as FY 1967. The total program is $450,000 including $200,000 carried over from the previous year.

The program for FY 1968 covers studies of improved ponding techniques and underground disposal for brines from 6 large inland plants; continuation of work on brine disposal from large coastal plants; and applied research in support of engineering studies for the inland plants.

VI. POLLUTION

Request for FY 1968 is $100,000 or the same amount as FY 1967.

Funds required for FY 1968 will be used to support field testing with ion-exchange processes for the desalination of acid mine drainage. Other processes under the cognizance of Special Projects Division will not be available for application problems such as acid mine drainage and irrigation return flows until FY 1969.

Plant engineering division

Funds available fiscal year 1967	$2,477,000
Funds requested fiscal year 1968	1,600,000
Decrease	877,000

Request for FY 1968 is $1,600,000 or a reduction of $877,000 below FY 1967. The total program is $2,050,000 including $450,000 carried over from the previous year.

The OSW Plant Engineering Division (formerly "Engineering Services") program provides for (1) the construction, operation and maintenance of test facilities where pilot plants and other test programs can be conducted, and (2) the conduct of general engineering support services to the other program areas, including the development and preparation of designs, drawings and specifications and reports based upon the construction and operation of pilot plants and larger size plants.

The decrease in the budget estimate and the total FY 1968 program (including carryover) is due primarily to the reduction in construction activity at the West Coast Test Facility and the Brackish Water Test Facility.

[In thousands of dollars]

Program	Amount available, 1967	Fiscal year 1968			Total available, 1968 compared to total available, 1967	Budget estimate, fiscal year 1968 compared to available 1967
		Estimated total available	Unobligated balance from 1967	Budget estimate		
I. East coast test facility	400	410	----------	410	+10	+10
II. West coast test facility	1,465	510	----------	510	−955	−955

I. EAST COAST TEST FACILITY

Request for FY 1968 is $410,000 or an increase of $10,000 over FY 1967.

The FY 1968 fund requirement is to provide for maintenance operation, and modifications to the site. The increase is due primarily to the need to purchase analytical laboratory equipment. Maintenance and operation expense is expected to be approximately the same as for FY 1967, with nine (9) pilot plants located at the facility and with the increased laboratory services being supplied to the contractors working at the facility.

The pilot plant development of sea water conversion processes by OSW is concentrated at this location in order to achieve economy of operation, better communication of results and to avoid duplication of activities. This site, which was donated to the Government by the State of North Carolina, is ideally suited for the purpose because of the availability of clean sea water, ease of accessibility to the site, and its protection from Atlantic Ocean storms and high tides by virtue of its being located approximately one mile from the Ocean itself.

II. WEST COAST TEST FACILITY

Request for FY 1968 is $510,000 or a reduction of $955,000 below FY 1967.

The large reduction in fund requirements is due to the fact that design and construction of the facilities ($1,291,000) will be essentially completed by the end of FY 1967. The estimate of $510,000 for FY 1968 is the expected cost for operation and maintenance during the budget year. This test facility, located on land leased from the San Diego Gas & Electric Company, provides a location for operating the 1,000,000 gpd advanced design distillation (Clair Engle) plant and the 17 mgd module and for testing other large plant modules and equipment.

III. BRACKISH WATER TEST FACILITY

Request for FY 1968 is $160,000 or a reduction of $404,000 below FY 1967 The total program is $510,000 including $350,000 carried over from the previous year.

This test facility will permit the concentration of OSW pilot plant testing of brackish waters with accompanying economy and efficiency of operations similar to those for sea water testing at Wrightsville Beach, North Carolina. It is planned to locate this facility at the Walker Air Force Base near Roswell, New Mexico. The FY 1968 program provides for completion of construction, partially funded in FY 1967, and the expected cost for operation and maintenance during the budget year. Reverse osmosis, vacuum freezing, electrodialysis, vapor compression, and multistage flash distillation pilot plants are scheduled for testing at the facility during FY 1968.

IV. IN-PLANT CORROSION

Request for FY 1968 is $40,000 or a reduction of $8,000 below FY 1967.

This is a continuing program of collecting, evaluating, and studying corrosion data from operating plants. A knowledge of in-plant corrosion is essential for selecting materials for future desalting plants and for a better understanding of present operating problems.

V. FREEPORT TEST FACILITY

Request for FY 1968 is $400,000 or an increase of $400,000 over FY 1967.

The FY 1968 estimate of $400,000 provides for operation of the Freeport Test Facility in FY 1968. This facility is expected to be constructed and completed in FY 1967. Design of the facility is included as a part of the O&M budget in FY 1967 since the facilities to be constructed are integrally related to the existing plant at Freeport and must be scheduled with the Freeport plants' scheduled downtime for maintenance and modifications.

The estimate of $400,000 provides for operation and maintenance of the facilities during FY 1968 which will implement the Oak Ridge National Laboratory's program that is aimed at the investigation and development of distillation processes. These funds will provide for on-site development of deaerator equipment, a falling-film evaporator pilot plant (high temperature operation, fluted tube designs, ect.), and sea water pretreatment units. Corrosion investigations, economical methods of treating product water to make it compatible with municipal distribution systems, and other related problems will also be tested at the facility during FY 1968.

VI. WEBSTER TEST FACILITY

Request for FY 1968 is $80,000 or an increase of $80,000 over FY 1967.

The FY 1968 estimate of $80,000 provides for the operation of the Webster Test Facility during the budget year. This facility is expected to be constructed and completed in FY 1967. Construction of the pretreatment test facility was included as a part of the O&M budget in FY 1967 since the facilities being constructed are integrally related to the existing plant maintenance and operation program and must be scheduled with the Webster plant's scheduled downtime for maintenance and modifications.

VII. SEA WATER CONVERSION DATA BOOK

While no funds are requested in FY 1968, the total program is $60,000 which represents the amount carried over from the previous year.

This provides for accumulation and incorporation of technical and design data into the Sea Water Conversion Data Book. The Data Book is a continuing effort to provide essential data and reference aids to designers and engineers; however, due to priorities established within the program in FY 1967, funds were not available for this work, thus resulting in the deferral of this effort to FY 1968.

VIII. ENGINEERING DEVELOPMENT PROGRAM

While no funds are requested in FY 1968, the total program is $40,000 which represents the amount carried over from the previous year.

This provides for contingencies arising from the operation of the test facilities. The pilot plant program is generally not definitive at the beginning of the fiscal year; hence, funds are required for additional services which arise during the year. This amount is considered a modest sum for this purpose.

(*d*) *Administration and coordination*

Funds available fiscal year 1967	$1, 485, 000
Funds requested fiscal year 1968	1, 550, 000
Increase	65, 000

This budget activity provides for (1) the necessary planning, supervision, and administration of the Office of Saline Water's research and development contract and grant program, (2) the planning, supervision and administration of the program analysis activities and feasibility studies and water economics investigations carried on by the OSW program, and (3) the necessary financial, procurement and administrative staffs that support the technical activities and insure that sound business management principles are applied.

The FY 1968 estimate of $1,550,000 represents an increase of $65,000 over the amount available in FY 1967 for this purpose. The increase results from the addition of four new positions during FY 1968 and an increase in the average salary to allow for higher grade positions. Despite the fact that the FY 1968 program budget is below the level of the FY 1967 estimate, the program has a critical need for the new positions requested in FY 1968. Over the past several years the Saline Water Program has received significant increases in its program while the personnel provided through the Administration and Coordination Budget have increased at a much lower rate. The program has, therefore, had difficulty in obtaining the technical and administrative support to manage the expanded programs.

The total obligational authority in FY 1967 (including carryover from FY 1966) is 109.9% higher than the amount provided in FY 1965. On the other hand, the personnel positions available to the program in FY 1967 over FY 1965 have only increased by 21.1%.

The four positions requested in FY 1968 are therefore required to enable the program staffing to catch up with the recent increases in program funding.

Regarding OSW's request for higher grade positions, past experience in recruiting for the positions has indicated that if OSW is to compete for the talent that is needed to initiate, plan and direct the expanding OSW activities, it must have the capability to offer qualified personnel higher salaries than it has been able to in the past and to promote and retain those individuals in the present OSW staff who are most worthy and qualified.

Itemization of estimate

	Actual 1966	Estimate 1967	Estimate 1968	Increase (+) or decrease (−)
Program and financing:				
Total obligations	$17,428,486	$28,125,991	$24,482,000	−$3,643,991
Recovery of prior year obligations	−403,367			
Unobligated balance available, start of year	−1,182,110	−4,156,991	−3,500,000	+656,991
Unobligated balance available, end of year	+4,156,991	+3,500,000		−3,500,000
New obligational authority	20,000,000	27,469,000	20,982,000	−6,487,000
Appropriation	20,000,000	27,500,000	20,982,000	−6,518,000
Transfer to salaries and expenses, Office of the Secretary, Department of Interior		−31,000		+31,000
Adjusted appropriation	20,000,000	27,469,000	20,982,000	−6,487,000
Obligations by objects:				
11 Personnel compensation	994,336	1,293,000	1,323,000	+30,000
12 Personnel benefits	68,923	93,000	98,000	+5,000
21 Travel and transportation of persons	62,712	105,000	115,000	+10,000
22 Transportation of things	7,667	11,000	8,000	−3,000
23 Rent, communications, and utilities	44,374	50,000	50,000	
24 Printing and reproduction	231,401	85,000	85,000	
25 Other services	9,639,361	16,398,991	15,726,000	−672,991
Services of other agencies	4,250,633	4,950,000	4,537,000	−413,000
26 Supplies and materials	23,457	20,000	20,000	
31 Equipment	31,721	20,000	20,000	
32 Lands and structures		2,100,000		−2,100,000
41 Grants, subsidies, and contributions	2,073,901	3,000,000	2,500,000	−500,000
Total obligations	17,428,486	28,125,991	24,482,000	−3,643,991

TOTAL OBLIGATIONAL AUTHORITY AND CONSTRUCTION DEFERRAL

Chairman HAYDEN. The committee will be glad to have your specific comments on your "Salaries and expenses" item.

Dr. HUNTER. If I understand you correctly, you would like more detail on why our total authorization has been reduced, our request is less than last year.

Chairman HAYDEN. Yes.

Dr. HUNTER. In carrying out such a program, you do not always find everthing progressing at a smooth rate. In 1967 we provided the principal sum for the construction of a major module, of the order of a total investment of approximately $5 million. This module has now been funded and is under design and will be constructed within a year's period. In 1968 we had originally planned construction of a second module for the vertical evaporator process. In the budget we had a sum of approximately $6 million in the program for this purpose. In reviewing the progress on the vertical evaporator process, we find that we are not quite ready to make the design. We are, for example, just now modifying our Freeport, Tex., plant which is based on the vertical evaporator process, to add additional effects, that represents the current state of technology.

Before we initiate the design and construction of the vertical evaporator module, we would like to have the benefit of completing that construction and operating the plant under these conditions. So, we have deferred this item, which is a major item.

Recognizing the deferral of this item, you can see that the remaining items in the program actually have had a small increase, except for that one item.

COOPERATION WITH FEDERAL WATER POLLUTION CONTROL ADMINISTRATION

Chairman HAYDEN. I assume that you do work closely with the Federal Water Pollution Control Administration, in connection with the identification and treatment of pollutants in the water with which you deal.

Dr. HUNTER. Yes, sir; we are carrying out cooperative programs with the Federal Water Pollution Control Administration. I mentioned the acid mine water program, which is jointly funded and jointly staffed. I also mentioned the irrigation return-flow program, which is again jointly funded and jointly staffed. In the area of research, we do have a committee which includes Dr. Gillam, of our office, and a representative of the Federal Water Pollution Control Administration, as well as other Interior research agencies, in which they compare their research plans in order to avoid duplication and in order to take advantage of the work conducted by the other agencies.

So, we are working very closely together.

WASTE MATERIAL DISPOSAL

Chairman HAYDEN. What progress are you making in disposing of waste materials resulting from your desalting processes?

SEASHORE AND INLAND PLANTS

Dr. HUNTER. In the area of seashore plants, this problem is now within the range of solution by careful analysis. The remaining problem is in the area of inland plants. There are several different means by which you can dispose of wastes. There are three basic approaches.

EVAPORATION PONDS

One is that you can use evaporation ponds which evaporate the water and leave behind the salts. This is an expensive approach, because it ties up—for reasonable size plants, it ties up fairly good areas of land and it costs something to build and maintain such ponds. We are carrying out investigation of means of enhancing the evaporation rate from such ponds as a means of reducing their cost.

UNDERGROUND INJECTION OF BRINES

The second approach that can be taken is underground injection of the brines. This problem is very difficult, technically, because in many cases the permeability of the underground soils is not sufficient to allow injection to be made under economic costs. Moreover, there is always the danger that by injecting brines you will disturb the water balance and thus contaminate some fresh-water aquifer. We are beginning to look seriously into this problem in cooperation with other Interior agencies.

BRINE VOLUME REDUCTION AND CONVEYANCE

The third approach would be to reduce the volume of the brine to the point that we could effectively dispose of it by transporting it away. In order to do this, it would be necessary to greatly improve our technology. We find at the present time that the most economical range of operation is to produce brines that are still well below the point of effectively transporting them away. We are beginning to look more seriously at improving our technology so that we can go to greater concentration factors which would reduce the volume of the brine. It would also begin to make it possible to consider extracting viable byproducts from the brine, which is not currently the case. I think this problem will take us some time to resolve. I can only say that we will continue to devote considerable attention to it.

MEMBRANE PROGRAMS: ELECTRODIALYSIS AND REVERSE OSMOSIS PROCESSES

Chairman HAYDEN. What progress are you making on development of your membrane programs?

Dr. HUNTER. In the membrane program, there are two different processes; electrodialysis and reverse osmosis. We have just initiated the early pilot plant test on a variation of the electrodialysis process which we believe may offer very interesting economic potential. This is a variation we call a "transport depletion." In this process we replace the most troublesome membrane with a modified membrane type which permits us to operate a given plant with much greater through-put. It does have slightly less energy efficiency, and by means of the current pilot plant tests and a second series of pilot plant tests, we hope to determine if this will materially improve the cost.

In reverse osmosis, we are carrying on a number of research programs and a number of development programs seeking to improve these membranes. We are having significant success. This process is continually becoming more interesting because of the improvement in these membranes.

ENERGY RECOVERY SYSTEMS

Chairman HAYDEN. What success are you having in your programs to recover energy from waste brines?

Dr. **Hunter**. This, I believe, refers to the reverse osmosis process, where the brine stream is discharged at high pressure. In the fiscal 1968 program we are proposing to initiate investigation of energy-recovery systems. We have already performed a limited amount of work in this area, but have not yet been able to devote extensive funds. We will, in 1968.

Research at Webster, S. Dak.

Chairman **Hayden**. Where are you experimenting with your electrodialysis process to treat acid mine drainage waters, irrigation return flows, and other chemically charged waters?

Dr. **Hunter**. In Webster, S. Dak., we have our basic facility for the electrodialysis process. At that facility the last 2 years we have conducted extensive work on pretreatment to prevent damage to the process by handling difficult waters. This is the basis of our work.

ACID MINE WATER SITE TEST

We now have a contract with a company to simulate, in their laboratories, acid mine water and operate electrodialysis plants. If this is successful we will then take a pilot plant to an actual acid mine water site and operate it on real water. The site that this will be conducted at is in West Virginia, where the Federal Water Pollution Control Administration and Bureau of Mines have a facility.

IRRIGATION RETURN FLOW SITE TEST

The irrigation return flow water problem we will operate at a site in California on irrigation return flow, and this will include use of electrodialysis. The site in West Virginia is Elkins. The California site on irrigation return flow is Firebaugh, near Fresno.

PROJECT MANAGEMENT AND PLANT ENGINEERING

Chairman **Hayden**. Will you describe briefly your plan of work in connection with the Plant Engineering Division in fiscal year 1968?

Dr. **Hunter**. The Plant Engineering Division has two functions. One is the plant engineering per se; the other is the project manager of the MWD project and the Saudi Arabian project. In the plant engineering portion of this group, they have the responsibility for the operation and maintenance of each of our major test beds and each of our test stations. That includes the Wrightsville Beach, N.C., test station. It will include the test station at San Diego, which is now under construction. It will include the operation and maintenance of the plants at Webster, S. Dak.; Roswell, N. Mex.; and Freeport, Tex. In the event that we are involved in the construction of a major program, as in the case of the Metropolitan Water District plant and in Saudi Arabia, this would also come under this division. This unit also is responsible for providing the non-water-desalting engineering design. That is, in the case of Saudi Arabia, they will be responsible for the design of the plant buildings, the boilers, the generators, turbines, all the switch gear. The Developmental Division would be responsible for the design of the desalting train itself.

1967 PROGRAM DEFERRALS

Chairman HAYDEN. The Bureau of the Budget has advised the committee that $3 million in expenditures and $3½ million in your program level are to be deferred or cut back. The description is that there will be a slower pace of research and development. Specifically, what have you had to defer, and in what amounts?

Dr. HUNTER. This deferral was distributed between our various divisions. In the area of research approximately $850,000 of research activity has been deferred; in the Distillation Division, just over $1,200,000; in the membrane area, just over a half million dollars; in special projects, just over $400,000; and plant engineering has been about $450,000.

These programs that are deferred mean that things that we would probably have initiated late in this year will be carried over into the beginning of 1968. From our own viewpoint, I would like to comment that because of our limited staff it is highly questionable that we could have effectively contracted out this money, even without the request.

NONDISRUPTION OF PROGRAMS

Chairman HAYDEN. What effect will these deferrals have on your fiscal year 1968 and future programs?

Dr. HUNTER. As I pointed out, including these deferrals our 1968 program will be just over $26 million. I think this will allow us to continue effectively in our efforts to develop economic water. I do not think that we will have any serious disruption of the program.

ADMINISTRATION AND COORDINATION INCREASE

Chairman HAYDEN. For "Administration and coordination," you propose an appropriation of $1,550,000, which is $65,000 more than you had last year.

ADDITIONAL POSITIONS

You indicate that this amount will be for four new positions. Would you please explain why it is necessary that you bring four new employees aboard?

Dr. HUNTER. Sir, we are requesting five new positions; four of those are under our salaries and expenses authorization, one of them is under the operation and maintenance authorization. So, if we put these together, we would then have a total of five new positions. I pointed out that the rate of growth of our total obligation authority has been much greater than the rate of growth of our staff. At the same time, the complexities of the program have increased.

TECHNIQUES DEVELOPMENT

We are now facing some of the real problems. We are trying to develop techniques to solve real field operation problems. I think the proper management of this program will require at least these additional positions.

ECONOMIC ANALYSIS INVOLVEMENT

I have also emphasized that in order to effectively guide this program we are becoming more and more involved in economic analysis and we are now trying to initiate an automation of our calculations by use of computers, so that we will be able to conduct a true economic cost effectiveness study. This will be used to guide our program.

I think the addition of these new positions will be returned many times over in the effectiveness of the program.

1967 AND 1968 PERSONNEL INCREASES

Chairman Hayden. How many employees did you add in the fiscal year 1967 to your fiscal year 1966 rolls?

Dr. Hunter. Our total authorization in 1966 was 110.

Chairman Hayden. I want the actual number of employees.

Dr. Hunter. In 1966 the actual number authorized was 116. We had on board 110. In 1967 our authorization is 132. I do not know exactly how many we have on board now. We have a number of actions in process. The number changes almost daily. We are then asking to go to 137 in 1968. So there was an addition of 16 between 1966 and 1967, and an addition of five between 1967 and 1968.

OPERATION AND MAINTENANCE

Chairman Hayden. I will place in the record the justification statement in support of your request for $2,300,000 for "Operation and maintenance" activities in fiscal year 1968. This is $51,000 less than was appropriated in the prior fiscal year.

(The justification follows:)

Appropriation and total available, 1966	$2, 485, 000
Appropriation and total available, 1967	2, 351, 000

SUMMARY OF INCREASES AND DECREASES, 1968

Operation and Maintenance:	
Increase in operation and maintenance costs	+$460, 000
Decrease in plant modifications	−511, 000
Net decrease, 1968	−51, 000
Budget estimate, 1968	2, 300, 000

Analysis by activities

Activity	Fiscal year 1966 amount available	Fiscal year 1967 appropriation and available	Fiscal year 1968 estimate	Increase (+), or decrease (−) over 1967
1. Operation and maintenance	$1, 817, 799	$2, 139, 000	$2, 088, 000	−$51, 000
2. Administration	206, 406	212, 000	212, 000	
Unobligated balance lapsing	460, 795			
Total	2, 485, 000	2, 351, 000	2, 300, 000	−51, 000

Justification Operation and Maintenance Appropriation

This appropriation provides the Department of the Interior's Office of Saline Water with the necessary funds for the operation, maintenance and modification of the Office of Saline Water's demonstration plants that were constructed and are operated under authority contained in Public Law 85–883 (as amended by

Public Law 87–295). Included in this FY 1968 request for appropriations are: (1) funds to cover the normal operation and maintenance costs of the demonstration plants located at Freeport, Texas; San Diego, California; Webster, South Dakota; and Roswell, New Mexico, (2) funds to cover necessary modifications to these plants to increase their usefulness to the program, and (3) the salaries and expenses of OSW employees associated with the above program activities.

The FY 1968 estimate of $2,300,000 is a decrease of $51,000 below the amount available for FY 1967 of $2,351,000. The decrease is the result of a substantial decrease in modifications and a smaller increase for operating costs, principally for the Clair Engle plant.

A detailed analysis of the Program follows.

	Available, fiscal year 1967	Requested, fiscal year 1968	Increase or decrease
(*a*) Operating costs:			
Freeport, Tex	$500,000	$535,000	+$35,000
San Diego, Calif	150,000	550,000	+400,000
Webster, S. Dak	200,000	200,000	
Roswell, N. Mex	500,000	525,000	+25,000
Total, operating costs	1,350,000	1,810,000	+460,000
(*b*) Modifications:			
Freeport, Tex	250,000		−250,000
San Diego, Calif	160,000	109,000	−51,000
Webster, S. Dak	204,000	120,000	−84,000
Roswell, N. Mex	175,000	49,000	−126,000
Total, modifications	789,000	278,000	−511,000
(*c*) Administration	212,000	212,000	
Grand total	2,351,000	2,300,000	−51,000

(*a*) *Operation and maintenance*

The estimate for FY 1968 is $1,810,000 an increase of $460,000 over FY 1967. This increase in operating costs is due to the following factors:

I. *Freeport, Tex.*

Funds available fiscal year 1967	$500,000
Funds requested fiscal year 1968	535,000
Increase	35,000

The increase of $35,000 in FY 1968 reflects the increased emphasis placed on the process development and materials studies being carried out at this plant. Improved instrumentation has been added to the plant that will provide the program with more detailed information on the plant's performance. The increased cost results from the assignment of two additional contractor personnel associated with this effort.

II. *San Diego, Calif.*

Funds available fiscal year 1967	$150,000
Funds requested fiscal year 1968	550,000
Increase	400,000

The replacement plant for the Point Loma Distillation Plant is currently under construction and is expected to be completed during the last quarter of FY 1967. The increase of $400,000 in FY 1968 reflects the funding requirement to cover a full year's operation and maintenance program for the plant.

III. *Webster, S. Dak.*

Funds available fiscal year 1967	$200,000
Funds requested fiscal year 1968	200,000
No change	0

The operating and maintenance program for the Webster Plant is expected to require the same funding in FY 1968 as it received in FY 1967.

IV. *Roswell, N. Mex.*

Funds available fiscal year 1967	$500, 000
Funds requested fiscal year 1968	525, 000
Increase	25, 000

The increase of $25,000 in FY 1968 reflects increased emphasis that will be placed on the development program and materials studies conducted at Roswell. The increase reflects the addition of one contractor position to handle the program.

(*b*) *Plant modifications*

The estimate for FY 1968 is $278,000 a decrease of $511,000 below the FY 1967 program. Plant modifications planned for FY 1968 as compared to FY 1967 are as follows:

I. *Freeport, Tex.*

Funds available fiscal year 1967	$250, 000
Funds requested fiscal year 1968	0
Decrease	250, 000

There are no modifications planned to the Freeport Plant in FY 1968 after expansion of the plant to 17 effects and the construction associated with the test facility at Freeport are completed in FY 1967.

II. *San Diego, Calif.*

Funds available fiscal year 1967	$160, 000
Funds requested fiscal year 1968	109, 000
Decrease	51, 000

The decrease of $51,000 in FY 1968 represents a reduction in modification activity associated with the new Clair Engle Desalting Plant. The funds in FY 1968 are required to initiate the design and engineering of equipment needed for high temperature operation and for the testing of alternate methods of feed water pretreatment to remove scale forming compounds.

III. *Webster, S. Dak.*

Funds available fiscal year 1967	$204, 000
Funds requested fiscal year 1968	120, 000
Decrease	84, 000

Many minor changes are planned in FY 1968 for the Webster Plant that will total $120,000. These include changes in the pretreatment system to keep fouling materials out of the membrane stacks. The FY 1968 development program for this plant will consist of sustained production runs to test several feed water pretreatment methods.

IV. *Rosewell, N. Mex.*

Funds available fiscal year 1967	$175, 000
Funds requested fiscal year 1968	49, 000
Decrease	126, 000

The decrease of $126,000 in FY 1968 is due to expected completion in FY 1967 of modifications in a deaeration system and addition of a cold lime-soda pretreatment system. Minor modifications to major items of equipment are planned for FY 1968.

(*c*) *Administration*

Funds available fiscal year 1967	$212, 000
Funds requested fiscal year 1968	212, 000
No change	0

This budget activity provides for the necessary technical and administrative planning, supervision and management of the Office of Saline Water's demonstration plant program.

The FY 1968 estimate of $212,000 is the same as the amount available for FY 1967 and reflects planned economies that will absorb the costs of an additional position in FY 1968 to handle the increased activity associated with the expanded operating and test programs of the four demonstration plants expected to be in operation during FY 1968. In FY 1967 only three plants were in operation for the full year.

Itemization of estimate

	Actual, 1966	Estimate, 1967	Estimate, 1968	Increase (+) or decrease(−)
Program and financing:				
Total obligations	$2,024,205	$2,351,000	$2,300,000	−$51,000
Unobligated balance lapsing	+460,795	----------	----------	----------
New obligational authority (appropriation)	2,485,000	2,351,000	2,300,000	−51,000
Obligations by objects:				
11 Personnel compensation	215,024	210,000	224,000	+14,000
12 Personnel benefits	15,660	15,000	17,000	+2,000
21 Travel and transportation of persons	5,436	5,000	3,000	−2,000
22 Transportation of things	241	1,000	1,000	----------
23 Rent, communications, and utilities	204,299	238,000	235,000	−3,000
24 Printing and reproduction	290	8,000	8,000	----------
25 Other services	1,579,767	1,267,000	1,207,000	−60,000
Services of other agencies	3,113	5,000	3,000	−2,000
26 Supplies and materials	375	1,000	1,000	----------
31 Equipment	----------	1,000	1,000	----------
32 Lands and structures	----------	600,000	600,000	----------
Total obligations	2,024,205	2,351,000	2,300,000	−51,000

Clair Engle Plant, San Diego, Calif.

Chairman Hayden. Do you have any particular comment on the operation and maintenance program for the coming year?

Dr. Hunter. The operation and maintenance program for the coming year will face the additional burden of supporting the operation of our Clair Engle plant near San Diego. You will recall the plant we originally had there was moved to Guantanamo, Cuba, and we are now constructing a replacement which will be a very advanced distillation plant. So, in 1968 that plant will be in operation and we will have to provide funds to carry out its operation and maintenance. This will require some addition in the operation burden out of this budget.

Modification Reduction

On the other side, to balance this, however, we are making in 1967 extensive modifications to our field test facilities which come out of the same appropriation. In 1968 we have relatively few modifications programed. So the combination of the additional operating expense with the reduction of modification costs has produced a slight change that you have commented on.

Chairman Hayden. Do you have any questions, Senator Bartlett?

EMPLOYMENT DIFFICULTIES

Senator Bartlett. Do you have trouble, Dr. Hunter, in recruiting people technically qualified?

Dr. Hunter. Yes, sir, we do. I think our position is no different than almost anyone else's I know of. Highly qualified people are in short supply. We also have difficulty because of the limitation in senior grades. As you know, we always work against a ceiling on the higher grades because we do not have in-house laboratories and extensive facilities. Even our field test facilities are operated under contract. We end up with somewhat higher percents of our positions being in the senior grades. We do not have need for many technicians and such people.

Yes, we do have a problem there.

PROFESSIONAL AND NONPROFESSIONAL PERSONNEL

Senator BARTLETT. Of your total staff, how many are on the professional level and how many on the clerical? You may put it in the record.

Dr. Hunter. Yes, sir; we will be happy to.

(The information follows:)

Actual permanent personnel as of Feb. 28, 1967

Professional	59
Stenographic and clerical	36
Operation and maintenance [1]	10
Total	105

[1] East Coast Test Facility, Wrightsville Beach, N.C.

POTENTIAL BRINE BYPRODUCTS

Senator BARTLETT. You mentioned a while back the potential that exists in respect to isolating valuable byproducts from brine. What would some of those be?

Dr. HUNTER. Of course, there is a great deal of salt in it. Chlorine would be a valuable byproduct. If we had a great enough concentration ratio we could also extract profitably, I think, bromine, sulfuric acid, magnesium, potassium. You see, water is quite rich in chemicals. As you know, the Dow Co. uses sea water to provide a source of magnesium for a large magnesium plant down in Texas.

Senator BARTLETT. A goodly array?

Dr. HUNTER. Yes, there are quite a few things to be done if we can achieve practical operation at good concentration ratios.

SAUDI ARABIA PLANT OPERATION

Senator BARTLETT. Did you say Saudi Arabia intends to finance the plant that is to be built there on its own?

Dr. HUNTER. Yes, sir. I would like to give you a little more history of that operation. We believe that people who want to buy plants are interested in buying water. They are not particularly interested in buying an experiment. So we feel that as well as discovering technology we must reduce this to a point of practical demonstration so that a prospective owner can buy with confidence that he will get water. We have then undertaken what we call a universal 2½ million-gallon-per-day plant design. This is designed so that it can be procured with alternative selection to optimize it for a great many locations.

The first practical demonstration of this will be the Saudi Arabian plant. In other words, we have proposed a method of design which is rather complex because it allows you to make selections to optimize to your particular circumstances.

Plant Size and Water Source

Senator Bartlett. How big will that one be?

Dr. Hunter. That is a basic stream of two and a half million gallons.

Chairman Hayden. May I inquire? Do you get the water out of the Persian Gulf?

Dr. Hunter. Yes, sir. So then in order to test that, we have properly taken into account all of the factors, we welcome the opportunity of working with the Saudi Arabian Government where we will apply the design procedures developed under this universal design to a real plant. We therefore are contributing the design of the water train. The Saudi Arabian Government is providing all of the money for design of the nonwater train and erection construction, procurement, and everything else. They are putting in approximately $18 million into the plant of their own money.

U.S. Plant Expenditures

Senator Bartlett. How much have we put in so far?

Dr. Hunter. I think to modify that design and adapt it to the particular circumstances in Saudi Arabia cost us approximately $25,000 to $30,000.

Senator Bartlett. That is all we have invested?

Dr. Hunter. We have also invested the time of some of our staff, currently one man and part-time of a secretary. We will very soon have to add a field engineer at the site to observe the construction.

Senator Bartlett. There would be no reimbursement for any of these charges?

Dr. Hunter. No. We will bear the expense of our own staff. I would like to comment that I think the benefit we have received in better understanding what actual field requirements for such a plant are have more than outweighed any expense we will encounter.

WATER FOR CITY OF JIDDA

Senator Bartlett. Where will they use this water? Two and a half million gallons a day won't make the desert bloom.

Dr. Hunter. They are going to build two streams so that they will have a total capacity of 5 million gallons per day. They do plan a series of additions at intervals in the future. The water will go to the city of Jidda. Currently the city is supplied by water from two separate waddies. These are rivers that are dry part of the year. That water has been obtained at the expense of taking out of production some agricultural areas.

So, the Saudi Arabians are very interested in finding alternative supplies for the city which is growing rapidly, and allowing the water from the waddies to again be used for the earlier purpose of agriculture.

Senator Bartlett. Will this two and a half million gallons be enough to supply the city?

Dr. Hunter. It will be enough to solve their immediate problems and they will, as I say, by a series of progressive procurement of desalting equipment take care of additional requirements as they come along.

COOPERATIVE EFFORT IN ISRAEL

Senator BARTLETT. In his prepared statement Assistant Secretary DiLuzio mentioned cooperative effort that has been taking place in Israel. He said:

> We have made no commitment of financial support for the construction and operation of this plant.

This leads me to ask if negotiations looking toward that end have been undertaken?

Dr. HUNTER. As you know, Ambassador Bunker made a trip to Israel recently where he was examining the general requirements for such a plant. I do not know of any commitments that were made—I know that no commitments have been made by the Department of the Interior to participate in the construction. I also do not know of any commitments that he has made. I do not know what will happen in the future.

Senator BARTLETT. You do not know whether Israel has asked for this?

Dr. HUNTER. I do not know whether they have asked or not. I certainly have not heard of any request.

PLANT PROCESS VARIANCES

Senator BARTLETT. Now your plants at Freeport, Tex.; San Diego, Calif.; Webster, S. Dak.; and Roswell, N. Mex., do each of these seek to use a different process?

Dr. HUNTER. Yes, sir. The plant at Webster, is an electrodialysis plant. We also operate at that facility some small pilot plants and will on different processes. The Roswell plant is a distillation plant of a variety known as vapor compression. The Freeport plant is a vertical evaporator distillation plant. The plant under construction at the San Diego location is a multistage flash plant which will permit very high temperature operation.

Chairman HAYDEN. Will that duplicate the plant you had before?

Dr. HUNTER. Duplicate is not quite a strong enough word. It will more than duplicate it. It will be considerably advanced. It replaces it in our program, but technically it is not a duplicate. It is an advance.

Chairman HAYDEN. It will produce a greater quantity of water?

Dr. HUNTER. It will be designed to produce the same normal quantity of water. It is simply of a more advanced technical design. It will produce this water using approximately half as much energy input. It will operate at a significantly higher temperature and thus will be quite a contribution in the technology.

FEASIBILITY STUDY

Senator BARTLETT. You spoke about the possibility of a plant capable of supplying a billion gallons a day. How would that compare in size with the plant proposed for Los Angeles?

Dr. HUNTER. First, I spoke of a billion-gallon-per-day plant as a feasibility study.

Senator BARTLETT. Yes.

Dr. HUNTER. There are no plans at this time to construct it. I personally think it will be technically possible some day to do so. Such a plant would be approximately seven times larger than the Bolser Island MWD plant.

Senator BARTLETT. Seven times?

Dr. HUNTER. Yes.

QUANTITATIVE STUDY AND NEW PROCESS EVALUATION

Senator BARTLETT. You spoke on page 4 of the quantitative study and evaluation of promising new processes. Are you hopeful that they can be brought into existence?

Dr. HUNTER. I think we must realize that the prospect of finding a truly significant new process is small but the necessity of searching for it, I think, is real. We have in the course of our history initiated the reverse osmosis process, which is at the time a brandnew process. It is now becoming a very important part of our program. Industry has taken this process up with great enthusiasm. The chance of doing this again, I think, is real. We certainly hope to do it.

I do not think that we can base a program on the firm expectation that we will invent something.

Senator BARTLETT. But you cannot deny yourself and the country opportunities for discovery of new methods?

Dr. HUNTER. The opportunity is real. We have done it before. There is no reason why we can't do it again.

Senator BARTLETT. That is one reason why your office is where it is?

Dr. HUNTER. That is right.

SIMILAR RESEARCH BY OTHER NATIONS

Senator BARTLETT. Tell me, are there any other nations engaged in similar research and activity?

Dr. HUNTER. Yes; a number of nations are engaged and the number is growing rapidly. The English actually were in this in an extensive manner before we were. They are continuing and accelerating their program. Russia, of course, has a great many areas within their country which have drastic water problems, and they are now mounting an extensive program. We get some information on their program, not as much as I would like to have, but we are making efforts to increase the exchange.

France is carrying on a somewhat smaller program, but rather aggressive. They are very much interested in this primarily from the viewpoint of exporting the technology. Israel is extremely active in the field. Especially when you consider it in relation to their natural resources, they are mounting a very aggressive program. Germany is now in it and with the expectation primarily of selling plants. The Dutch are in it and are selling plants. The Japanese are in it and have sold plants. The Italians are now trying to establish a national program. They have just created a national center for such activity and are beginning to procure experimental equipment.

At the International Desalting Symposium in 1965 the Egyptians expressed interest in establishing a national program. Of course, the Greeks have been interested in this primarily in smaller plants.

They are now becoming interested in larger plants. So this is something that a great many countries are vitally interested in and most of them are moving rapidly to establish national programs.

EARLIEST KNOWN DISTILLATION STUDIES

Senator BARTLETT. How old is the art, if I could so term it?

Dr. HUNTER. I think the earliest reference I heard of this was back in approximately 2000 B.C. where in the Indus Valley there was a discussion of means of purifying bad water I think they discussed distillation. Early Greek philosophers taught the principles of distillation. I believe that Caesar, in some of his siege armies used crude distillation stills to provide fresh water. So this is quite an old art. The problem has been to make it economic. I would like to point out that this whole problem is a matter of economics.

ECONOMIC PROBLEM

We certainly know many ways to desalt water. But to understand the economics, if you look at most process industries they produce a product for a few pennies per pound. We have as a goal to produce our product for 1 to 5 cents per ton. This is an economic objective that has never been faced before by any process industry. So this is our problem.

CONTROL OF SALT CRYSTALLIZATION IN FREEZING PROCESS

Senator BARTLETT. You mentioned as one of your requirements the need to know how an ice crystal is formed and excludes salt. Will you explain that a little bit to me?

Dr. HUNTER. When an ice crystal is formed by virtue of its molecular structure it tends to exclude salt. If we know exactly how this process occurs, how does a crystal decide to form at this point, around this particular molecule, we will then have the possible means of better controlling the growth of crystals in the freezing process. We may be able to control the shape that they take, which has a major effect upon our ability to wash the brine from the surface. We find, for example, that if we get too many crystals started in a crystallizer that they will not grow to a large size, and we cannot effectively wash them. If they grow in the wrong manner, they will be either spongy and include pockets of brine and we can't wash them, or they will have a shape that is difficult to wash.

So we must know exactly how they form in order to be able to control their formation and growth.

ICEBERG SALT CONTENT AND FORMATION

Senator BARTLETT. Let us assume an iceberg is floating around the North Atlantic, and the assumption is probably correct. Is it free of salt?

Dr. HUNTER. It is essentially free of salt, but this is a process that occurs—first off, they generally don't freeze out of the seawater. They are formed by precipitation. To the extent that they are formed by freezing seawater, it is a very slow process and would be entirely uneconomic to try to duplicate nature. So, we cannot afford such a leisurely production of ice.

Senator BARTLETT. We can't afford to go out there and hoist them aboard and let them melt?

Dr. HUNTER. It has been proposed at various times, for example, to tow icebergs from either the North Pole or the South Pole and bring them up to southern California and melt them in order to get fresh water. It is not quite as ridiculous as it sounds, but it does not really quite meet the test of economic practicality.

Senator BARTLETT. I am in a geographical situation to suggest a closer source of supply than either the North or South Pole. I have no more questions.

Thank you.

Chairman HAYDEN. We thank you for your appearance, sir.

Dr. HUNTER. Thank you very much.

FRIDAY, MARCH 10, 1967.

FEDERAL DEVELOPMENT PLANNING COMMITTEES FOR ALASKA

SALARIES AND EXPENSES

STATEMENTS OF HON. ROSS DAVIS, ASSISTANT SECRETARY FOR ECONOMIC DEVELOPMENT, DEPARTMENT OF COMMERCE; AND JOSEPH H. FITZGERALD, CHAIRMAN, FEDERAL FIELD COMMITTEE FOR DEVELOPMENT PLANNING IN ALASKA; ACCOMPANIED BY JOHN W. WALKER, BUDGET OFFICER, ECONOMIC DEVELOPMENT ADMINISTRATION; DR. DOUGLAS JONES, CHIEF ECONOMIST FOR FEDERAL FIELD COMMITTEE FOR DEVELOPMENT PLANNING IN ALASKA; DAVID HICKOK, NATURAL RESOURCES OFFICER, OFFICE OF REGIONAL DEVELOPMENT PLANNING, ECONOMIC DEVELOPMENT ADMINISTRATION; AND HARRY G. KIRST, ASSISTANT CHIEF, BUDGET COORDINATION DIVISION, OFFICE OF BUDGET AND FINANCE

BUDGET REQUEST

Chairman HAYDEN. We will next hear from the Federal Development Planning Committees for Alaska.

Senator BARTLETT (presiding). The proposed appropriation for the Federal Development Planning Committees for Alaska in fiscal year 1968 is $325,000, an increase of $135,000 over the amount appropriated for fiscal year 1967. The justification statement for this appropriation request will be printed in the record.

(The justification follows:)

An appropriation of $325,000 is requested in fiscal year 1968 for the Federal Development Planning Committees for Alaska. This is an increase of $135,000 over the 1967 base. Specifically, an increase of $159,000 is requested for the Federal Field Committee for Development Planning in Alaska which is partially offset by a decrease of $24,000 for the President's Review Committee for Development Planning in Alaska.

The two Committees were established by Executive Order 11182 of October 2, 1964. They superseded the Federal Reconstruction and Development Planning Commission for Alaska, which had been set up to handle the reconstruction necessitated by the March 27, 1964 earthquake. When the reconstruction task was largely over, the Commission chairman, Senator Anderson, recommended development planning arrangements more suitable for the longer run, and Executive Order 11182 was issued to carry the recommendation out.

Federal Field Committee

The Executive Order stipulated that the Federal Field Committee shall consist of a chairman and two public members, each a Presidential appointee, plus field representatives of the following Federal Departments and agencies: Departments of Defense; Interior; Agriculture; Commerce; Labor; Health, Education and

Welfare; Housing and Home Finance Agency; Federal Aviation Agency; Small Business Administration; and Federal Power Commission. Personnel from these Departments and agencies were subsequently designated, and the chairman of the Field Committee was appointed and installed in office. A small initial professional staff was assembled to assist the chairman in discharging the Committee's responsibilities.

The Committee undertook a general overview of the economic condition of the State as a basis of future systematic planning. Accordingly, it surveyed the economic development potential of the State, the major fields of economic activity and pointed out the areas in which Federal and State programs could assist in achieving that potential. A conceptual report entitled "Alaska Economic Development and Public Policy" was completed and sent to the President in October 1966 jointly by the Field Committee and the President's Review Committee.

President's Review Committee

The Review Committee is composed of the heads of the Federal Departments and agencies represented on the Field Committee. The Committee provides general direction and guidance to the Field Committee. It also reviews and comments on tentative plans or recommendations of the Field Committee, considers the final plans and recommendations of the Field Committee, and transmits them, together with its own comments, to the President and the heads of interested Federal agencies.

Staff support for the Review Committee has been performed by a staff assistant and his secretary. However, during fiscal year 1967 the Economic Development Administration in the Department of Commerce will assume the responsibility of providing the necessary staff services.

Fiscal year 1967 activities

Transmittal of the above-mentioned report, "Alaska Economic Development and Public Policy," to the President initiated the second phase of the Field Committee's activities—the task of initiating functional, specific and detailed planning in priority areas. Objectives will be to plan detailed programs and policies in the following areas:

a. Economic programs to assist Native groups;
b. Alaska recreation and tourism;
c. Transportation and analysis—tying transportation development to priority economic opportunities;
d. Resources development with emphasis on minerals; and
e. Trade relations analysis between Japan and Alaska and Canada and Alaska.

Complementing these efforts have been research and surveys in a number of other areas including analysis of the Alaska Communications System, the State's tax incentive program, and a survey of State power development potential.

Since the Field Committee staff is not large enough to engage in all areas of planning and program need effectively, some research needs will be met under other Federal agencies' programs cooperating with the Field Committee, by short detail assignments of Federal personnel and through consultants. The scope of such available aid is, however, too little for the development of functional detail planning in depth, and further monetary assistance during fiscal year 1967 is being given to the Field Committee by the Economic Development Administration in the form of technical assistance grants and contracts.

ANALYSIS OF PROGRAM REQUIREMENTS BY ACTIVITY AND OBJECT OF EXPENDITURE, FISCAL YEARS 1967 AND 1968

Program by activity

[Dollar amounts in thousands]

Activity	Fiscal year 1967		Fiscal year 1968		Increase	
	Positions	Amount	Positions	Amount	Positions	Amount
Field committee	7	$166	14	$325	+7	+$159
Review committee		24				−24
Total	7	190	14	325	+7	+135

Program by object of expenditure

[Dollar amounts in thousands]

Activity	Fiscal year 1967		Fiscal year 1968		Increase	
	Positions	Amount	Positions	Amount	Positions	Amount
Object Classification						
Personnel compensation:						
Permanent positions	7	$98	14	$161	+7	+$63
Positions other than permanent		18		20		+2
Other personnel compensation		21		40		+19
Total personnel compensation	7	137	14	221	+7	+84
Personnel benefits		8		13		+5
Travel and transportation of persons		21		49		+28
Transportation of things		3		5		+2
Rent, communications, and utilities		10		15		+5
Printing and reproduction		3		4		+1
Other services		4		6		+2
Payment to working capital fund		2		4		+2
Supplies and materials		1		2		+1
Equipment		1		6		+5
Total obligations	7	190	14	325	+7	+135

JUSTIFICATION OF REQUIREMENTS

Federal Field Committee

Fiscal year 1968 will see the completion of the Field Committee's second-phase transitional operations (i.e., getting from the broad, strategic area of planning to the specific, detailed study of functional problems). The five program planning areas beginning in FY 1967 will require assimilation and implementation—i.e., detail staff work with Federal and State agencies to forge the means whereby policies developed in each study area may be implemented for the enhancement of the State's long-term economy. In addition, other functional areas of program concern must be subjected to review and planning scrutiny. This evolution into a third phase of Field Committee activity—policy implementation and inhouse capacity for continuing studies—will require additional staff and dollar resources.

Under this concept, development planning is considered to be not a one-time effort, but a continuous process. The staff of the Field Committee represents a permanent capability for relating, on a continuing basis, public policies with the needs of economic and resource development.

The fiscal year 1967 staff consisting of a Federal Chairman, three professional assistants, and three secretaries should be increased so that the staff complement includes the Federal Chairman, a planning director and six professional specialists in the following areas: (1) Native affairs, (2) natural resources, (3) economic analysis, (4) recreation and tourism, (5) industrial development, and (6) transportation and power. Three additional secretaries will also be required. This will permit full-time professional coverage in each of the major functional areas.

Staff travel expenses, office rents and communications systems costs, agency salary reimbursements and travel costs for people on detail to the Federal Field Committee, printing and reproduction costs, supplies and materials, and equipment, all need to be proportionately increased in accordance with the basic staff increase.

President's Review Committee

Partially offsetting the additional Field Committee needs is a decrease of $24,000 in Review Committee requirements for 1968. The Economic Development Administration (EDA) in the Department of Commerce provides staff support for regional economic planning as authorized under Title V of the Public Works and Economic Development Act of 1965. In order to provide uniformity in staff support and services between various regional planning endeavors, EDA has been delegated the additional duty of providing staff services to the President's Review Committee. EDA has not required additional resources for this function, and the funds required to finance a staff assistant and secretary to the Review Committee for the last half of fiscal year 1967 will be transferred to the Field Committee.

Requirements by object classification

[In thousands of dollars]

	1967	1968	Increase (+) or decrease (−)
Personnel compensation:			
Permanent positions	98	161	+63
Consultants and public service members	18	20	+2
Cost-of-living allowance	21	40	+19
Total	137	221	+84

The increase of $84,000 is required to provide for the additional staff requested for 1968. Of this amount, $63,000 is needed for salary payments of permanent employees and $19,000 for increased cost of living allowance (25% of annual salaries) given employees stationed in Alaska. An additional $2,000 is requested for expenses of public member to be assigned to committees and for other consultants.

[In thousands of dollars]

	1967	1968	Increase (+) or decrease (−)
Personnel benefits	8	13	+5

This classification covers the Government's share of the Civil Service Retirement Fund, Social Security tax, Group Life Insurance, and Health Benefits program. Employee benefit estimates are based on wage compensation. They approximate 7.3% of the compensation costs, exclusive of the cost-of-living allowance shown above.

[In thousands of dollars]

	1967	1968	Increase (+) or decrease (−)
Travel and transportation of persons	21	49	+28

An estimated $41,000 will be needed in 1968 for the transportation and per diem expenses of the chairman of the Field Committee and his professional staff assistants when they travel to Washington, D.C., to consult with the Review Committee and other Government officials in the furtherance of program objectives. It also covers their travel in Alaska. The remaining $8,000 is required for the travel of consultants and public service members.

[In thousands of dollars]

	1967	1968	Increase (+) or decrease (−)
Transportation of things	3	5	+2

The estimate covers the cost of transportation of materials, supplies, equipment, etc.; including household goods of Government personnel transferred to Alaska. The increase of $2,000 is predicated on the increase in staff for the Federal Field Committee in 1968.

[In thousands of dollars]

	1967	1968	Increase (+) or decrease (−)
Rent, communications, and utilities	10	15	+5

The estimates include the cost of various communication facilities such as local and long distance telephone service, teletype, and penalty mail charges, as well as the cost of renting commercial office space in Alaska. Increased needs for these charges result from the additional staff requested for 1968.

[In thousands of dollars]

	1967	1968	Increase (+) or decrease (−)
Printing and reproduction	3	4	+1

The estimate covers expenses of reproducing reports and informational and administrative material required to support program operations. Additional costs will result from the increased staff level in 1968.

[In thousands of dollars]

	1967	1968	Increase (+) or decrease (−)
Other services	4	6	+2

This estimate covers contracts with educational institutions in Alaska. The University of Alaska is the center of advanced studies in the State presently engaged in major scientific research in areas affecting economic development. In addition, Alaska Methodist University has recently established a college of business and economics. The Field Committee plans to take advantage of these capabilities to accomplish its program objectives.

[In thousands of dollars]

	1967	1968	Increase (+) or decrease (−)
Payment to working capital fund	2	4	+2

Payments to the Department of Commerce's Working Capital Fund cover the cost of administrative support such as accounting, personnel, and administrative services.

[In thousands of dollars]

	1967	1968	Increase (+) or decrease (−)
Supplies and materials	1	2	+1

The estimates provide for miscellaneous expendable office supplies and materials required in the normal course of program operations. The amounts shown are based on an annual expenditure of approximately $150 per employee.

[In thousands of dollars]

	1967	1968	Increase (+) or decrease (−)
Equipment	1	6	+5

This item is a one-time expense of procuring the necessary office equipment and furnishings for the additional employees requested in 1968.

Analysis of staffing requirements, fiscal years 1967 and 1968

	Fiscal year 1967		Fiscal year 1968		Increase	
	Positions	Annual Salary	Positions	Annual Salary	Positions	Annual Salary
Position title and grade:						
Field committee:						
Chairman (GS-18)	1	$25,890	1	$25,890		
Staff assistant (GS-15)	3	55,078	5	94,524	+2	+$39,446
Staff assistant (GS-14)			2	30,212	+2	+30,212
Secretary (GS-7)	1	6,664	1	6,877		+213
Secretary (GS-6)	1	5,867	1	6,065		+198
Secretary (GS-5)	1	5,683	4	21,852	+3	+16,169
Total permanent positions	7	99,182	14	185,420	+7	+86,238
Pay above stated annual rate		381				−381
Less lapses		−16,446		−24,315		−7,869
Positions abolished during the year		14,737				−14,737
Permanent positions		97,854		161,105		+63,251
Intermittent employment		18,000		20,000		+2,000
Cost-of-living allowance		20,775		40,351		+19,576
Total personnel compensation		136,629		221,456		+84,827

PREPARED STATEMENT

Mr. Davis. Mr. Chairman, I have a short statement which I will, with your permission, put into the record.

(The statement follows:)

Mr. Chairman, I am the alternate for the Chairman of the *President's Review Committee for Development Planning* in Alaska. It is my privilege to appear before you today to discuss the activities of the Review Committee. Mr. FitzGerald, Chairman of the *Federal Field Committee*, who is also appearing before you today, will make a statement covering the Field Committee's programs.

REVIEW COMMITTEE

Both committees for development planning in Alaska were established by Executive Order 11182 on October 2, 1964. Subsection 12 of this order cites the function of the Review Committee, to wit:

"The Review Committee shall provide general direction and guidance to the Field Committee; receive, review, and comment on the tentative plans or recommendations of the Field Committee; and receive and consider the final plans and recommendations of the Field Committee and transmit them, together with its own comments, to the President and the heads of interested Federal agencies."

Members of the Review Committee are: the Secretaries of Commerce (who is the Chairman), Defense, Interior, Agriculture, Labor, HEW and HUD; the administrators of the Federal Aviation Agency and the Small Business Administration; the Chairman of the Federal Power Commission; and two public members. Each of the Federal members may designate an alternate to represent him at the Committee's meetings.

CALENDAR YEAR 1966 ACTIVITIES

The Review Committee met twice in calendar year 1966, in January and November. On these occasions it offered guidance to the formative efforts of the Field Committee and endorsed its planning program. The Committee's major effort during the past year has been to review and make recommendations on the Field Committee's first annual report. This report entitled "Economic Development in Alaska" was transmitted to the President in August 1966.

CURRENT ACTIVITIES

The present work of the Field Committee is directed toward analysis and planning pertinent to specific development subject areas. These efforts will produce highly specific program and policy recommendations for consideration of the Review Committee and the President. No money is requested for activities of the Review Committee in fiscal year 1968.

Alaska has much of the Nation's store of untapped natural resources. She can become one of the greater contributors to our growing National economy.

FUTURE COMMITTEES' CONTRIBUTIONS

I feel that the contributions which these Committees can make toward formulating effective Federal-State action in Alaska are substantial and should be continued. The Field Committee has already developed the basic guidelines for a comprehensive and coordinated development program. This budget request is a limited budget for marshalling Governmental resources to accomplish Alaskan development in a sensible manner. The Federal Government now makes substantial investments in Alaska. By using these existing amounts effectively through planning, we can lessen the need to spend additional sums for programs designed to cure symptoms rather than to provide solutions. This means that the small Federal input in this Budget can result in large outputs in terms of increases in both the State and National economies.

Mr. FitzGerald can tell you more about this, and we will be glad to answer any questions the Subcommittee may have.

STATE SUPPORT

Mr. DAVIS. I would like to make just two comments and then turn the testimony over to Mr. FitzGerald.

The first is that it seems clear to me that the success of our planning effort in Alaska, the significance of it, is dependent upon the participation of the State and people of Alaska. Therefore, in Mr. Fitzgerald's efforts we are looking to, and I believe we are receiving, the participation and support of the people from Alaska.

CURRENT AND FUTURE BUDGET REQUESTS

The second point has to do with what we are buying with this budget we are requesting today and budgets which we will request in the future.

What we are looking for is not just a plan but a method of achieving better utilization of resources. Federal resources, of course, are our primary responsibility but all resources are of interest in achieving the potentials, which are many, of the State of Alaska. With that, Mr. FitzGerald will give you a little more detail about what we are doing.

FEDERAL INTEREST

Senator BARTLETT. Thank you, Mr. Davis. Let me ask you if you have found in Washington an interest in this activity and a desire to make it successful. I will add as a postscript that the members of the Federal Review Committee in Washington are the Secretary of Commerce, as Chairman, and the Secretaries of Defense, Interior, Agriculture, Labor, HEW, and HUD, and the Administrator of the Federal Aviation Agency, the Administrator of the Small Business Administration, and the Chairman of the Federal Power Commission on the Federal level. Do you discover an interest in this activity on the part of the several agencies?

Mr. DAVIS. Yes, Mr. Chairman, I think there is an interest.

At the risk of sounding facetious I think we in the Federal Establishment, and I am a longtime civil servant, as perhaps you know, are really trying to do a job. The question that is always before us, particularly for cooperative efforts where a number of agencies are involved, is what is the job and how do you do it? What is lacking, in my judgment, in present-day efforts among the agencies to mount a cooperative program in a place, in this case Alaska, is some common language to discuss the total problem. If you can get this common language then the efforts of the agencies will tend to fall into place and, in total, represent a comprehensive and sensible, cooperative effort to achieve something. The problem, as I see it, is that the various agencies have rather parochial interests and no common language to relate these interests in a larger pattern.

Take the problems of the natives. Somebody sees housing as the problem. Somebody sees education as the problem. Somebody sees health as the problem. These are all problems but somehow we have to get a large enough perspective so that we do not devote all our efforts to treating symptoms instead of finding fundamental solutions.

INTERAGENCY COOPERATION

Now, in my judgment, efforts such as those represented by Mr. FitzGerald and the Federal fieldmen are extremely important and may be a kind of sleeper because if, through this effort, we can come up with a comprehensive and sensible program which can be costed out and roles assigned to each of the appropriate agencies, these roles will then start to develop the kind of Federal-State relationship and participation that I think all of us would like to have. So, the common language, if you will, is not a static thing, it is a dynamic thing. It really identifies problems, it identifies and states what the people want, what the Federal Government wants. It proposes certain courses of action which move toward solutions. It also carries with it, and this is extremely important, a good sense of priority, what should be done first.

If all the people sitting around the table looking at the plan agree in a general way as to the course of action it proposes and the priority that it proposes, we start to see something that is comprehensible as well as comprehensive, and some efficient movement toward the goal.

Senator BARTLETT. I think your two points are absolutely valid. I do see a difficulty on the Federal level of having the Defense Department coordinate its plans and activities with those of the Agriculture Department, for example. Nevertheless, this must be done if a rounded Federal program can be evolved. I am particularly glad to hear you make reference to the native problem. All of us, of course, know that the underlying key is to improve the natives' economic lot and we have not moved forward in a considered manner on this.

As a result, we treat their housing problems separately. We try to improve their health as a separate project. Education is off by itself. I think all who are familiar with these matters know that these separated programs do not constitute the answer. It just constitutes an opportunity for them to live a little longer, a little better until we come to grips with that account, the improvement in their economy. I would like to ask you this, Mr. Secretary: Can it be said that, in spending whatever money it spends on the Federal Committee, the Federal Government is making a unique contribution to Alaska, that this is doing something that perhaps ought not to be done because it is so unique?

PLANNING COMMITTEES

My idea there is that perhaps in a broad sense this activity might be comparable to the river commissions which have had planning duties, which have been established in several different regions of the United States over the years and upon which large sums of Federal money have been expended.

Mr. DAVIS. Certainly this kind of effort is not unique. We are doing it in many different ways but you have to go no further than the kind of activity involved in setting up regional commissions such as Appalachia. So this in my judgment represents nothing new and perhaps a rather modest effort in terms of Alaska. But I think it is an effort that is commensurate with our capabilities at this time.

Senator BARTLETT. I am glad to hear you say that. Thank you. Mr. Davis.

Mr. FitzGerald.

FEDERAL FIELD COMMITTEE FOR DEVELOPMENT PLANNING IN ALASKA

PREPARED STATEMENT

Mr. FITZGERALD. Mr. Chairman, I do have a statement. I will be very happy to submit it for the r cord.

Senator BARTLETT. It will be included in the record.

(The statement follows:)

Mr. Chairman and Members of the Subcommittee, may I express my appreciation for the opportunity to appear before you and testify in support of the budget request of the Federal Field Committee for Development Planning in Alaska for Fiscal Year 1968 in the amount of $325,000.

Fiscal 1968 will mark the third full year of operations by the Federal Field Committee, and our programs and activities will represent the logical extension of the development planning and programming accomplished during the prior two years.

Initial Accomplishments

The challenge of economic development in Alaska is great. While the State has extensive resources (timber, fisheries, oil, gas, minerals), their full development depends on the solution of complex production, transportation, and cost problems. Recognizing the nature of the challenge, we concentrated, in our first year, on a broad evaluation of the economic potential of the State, the steps which government could usefully take to encourage development, and the basic problems which would have to be solved in each field before the State could achieve a broad industrial base. This work was done largely through a state-federal task force arrangement in which the principal agencies of the two governments assisted. The results of this effort are now available to the public in a report submitted to the President by former Secretary of Commerce John T. Connor as Chairman of the President's Review Committee for Development Planning in Alaska and myself as Chairman of the Federal Field Committee.

Current Activities

With the broad outline of the development task accomplished, the Federal Field Committee, in its second year of operations, turned its attention to a series of specific projects in selected areas that showed promise of significant economic development or presented problems which could impede development. In selecting this course, we recognized that detailed research and planning projects would impose a heavy workload beyond the capability of the small staff of the Federal Field Committee. Accordingly, after receiving endorsement of our general program from the President's Review Committee in Washington, last November, arrangements were made with the Economic Development Administration for grants of research funds to be used during the remainder of Fiscal 1967. These funds have enabled us to launch the following studies:

Planning and Research Projects Being Sponsored by or Participated in by the Federal Field Committee, Fiscal 1967]

I. INTERNATIONAL TRADE AND ECONOMIC RELATIONS

1. Alaska-Japan Trade Relations.
2. Alaska-Canadian Economic Relations.

II. DEVELOPMENT OF BASIC RESOURCES

1. Fisheries Marketing Practices.
2. Minerals and Mining Laws and Practices.
3. Recreation and Government Programs.
4. Study of the Public Land Laws affecting Alaska. A joint project with the Public Land Law Review Commission.
5. Agriculture's Future in Alaska. A study by the University of Alaska for the U.S. Department of Agriculture with limited participation by the Federal Field Committee.

III. BASIC SERVICES

1. Transportation and Economic Development.
2. Federal Power Commission's Alaska Power Survey. Participation by the Federal Field Committee staff on task force assignments.
3. Sale of the Alaska Communication System. Economic Analysis of the system and participation in planning for disposal.

IV. FINANCE AND ECONOMIC INFORMATION

1. Aggregate Income Model.
2. Taxation and Economic Development.

3. Technical advice on study by state of basic data gathering and processing system (Lockheed Contract).

As Alaska is entering a period of intensive resource development with both domestic and international markets for its products, the current planning and research program is designed to explore both the problems of production—including essential services such as transportation and power—and the problems of marketing, internationally and domestically. These studies will be completed this summer; and the results will, in good measure, dictate the direction and content of our specific projects in fiscal year 1968. In a sense, these studies are the essential bridge between the overview of our first year and the comprehensive and integrated planning of our third year.

FISCAL YEAR 1968 ACTIVITIES

Accordingly, as we move into fiscal year 1968, we will pull together the threads of our major projects and begin to develop a comprehensive program for the economic development of the State. Our goal is at once to achieve a practical program based on what State and Federal agencies are now authorized to do and can be expected to accomplish and also to functionally integrate Federal and State programs in a timely way so that they contribute the maximum amount to economic growth within the funds available. We believe that the new budgeting techniques now being applied throughout the Federal government provide a very useful tool for this purpose, and we will be extending the application of these techniques on an interagency basis.

STAFFING REQUEST

Our goal is ambitious, and its accomplishment will involve a very major effort by all of the Federal agencies which are members of the Federal Field Committee. We have, therefore, given extensive consideration to the work procedures that should be employed and how this can best be done while keeping the staff of the Federal Field Committee to the smallest number practical. In our joint efforts with the State, we work through task forces composed of all interested State and Federal agencies; and this practice will be continued. To make this procedure fully effective and to keep our work on a tight time schedule, we believe that there should be a first-rate professional analyst assigned in each major area of economic development. Therefore, we are requesting that our present authorized staff of seven be increased to fourteen in fiscal year 1968. Our present staff level consists of a Federal Chairman, three professional assistants, and three secretaries. We feel, in order to coordinate agency work and assure that completed plans will be of the highest quality and produced on time, that we will need four additional professionals and three additional secretaries.

Therefore, in 1968 our chief economist will be the planning director with responsibility for overall economic analysis and the design, monitorship, and preparation of contractual and staff studies and reports. Working directly with each State-Federal task force in the major functional areas will be a specialist from the staff of the Federal Field Committee. Specialists will be assigned in the following six areas: (1) Native Affairs, (2) Natural Resources, (3) Economic Analysis, (4) Recreation and Tourism, (5) Industrial Development, and (6) Transportation, Communications and Power.

As the principal agency for coordinated Federal-State planning in Alaska, a very important, legitimate, but time-consuming activity for us is dealing with day-to-day and week-to-week coordination of existing or imminent programs of the many agencies operating in the State. This aspect of our task increases in size as we gather a momentum of confidence and competence. This "constructive clearinghouse" function is working very well and, it is fair to say, results in enhancing the success of many government programs which cut across agency lines. Specialists in the several named fields will greatly contribute to this dimension of our activity as well.

FEDERAL-STATE RELATIONS

I would like to say a final word about the machinery which we and the state administration have established for joint research and development planning in Alaska. Joint State and Federal planning on a large scale is a comparatively recent development, and we are frankly experimenting with the most effective way to achieve the results which both the Federal and State governments desire. The initial machinery which we described in our appearance before this Committee last year is generally considered to be successful. As there has been a recent change of administration in Alaska, it is necessary to reestablish relations with the various levels of State government; and this work is now in process. We believe that we are making good progress and that we have the full and enthusiastic support of the new Governor and his administration.

I will try to answer any questions which you may have concerning the Federal Field Committee's program and our request for an increase in fiscal year 1968.

Mr. FitzGerald. I should like to say that the Secretary has, in a very eloquent manner, put his finger on the core of our activities and the job which we are trying to do in Alaska.

FEDERAL FIELD COMMITTEE ACTIVITIES

Executive Order 11182, dated October 2, 1964, sets forth in two short paragraphs the very heart of this matter.

(1) "The Federal Field Committee is the principal instrumentality for developing coordinated plans for Federal programs which contribute to economic and resources development in Alaska and for recommending appropriate action by the Federal Government to carry out these plans"—this being done through the President's Review Committee.

(2) "The Federal Field Committee (also cooperates) with representatives designated by the Governor of Alaska in making and fostering surveys and studies to provide data for the development of plans and programs for economic and resources development in Alaska."

The Federal Field Committee members were appointed in 1965, and we are, therefore, completing our second year of existence. It is, as has been stated, an interagency committee composed of representatives of the nine principal Federal agencies operating in the State of Alaska and a representative from the Federal Power Commission. As an interagency group we act collectively and as equals, attempting to harness all of the programs of the Federal Government which can be used for economic development.

FEDERAL-STATE INPUTS

The Federal input in Alaska is high and where we can make it contribute to economic growth we are, it seems to me, making an extremely wise use of Federal funds.

I would also like to stress that the agencies are equal partners in our efforts and what they do constitute voluntary actions. This procedure has produced a very high degree of cooperation and we do not have interagency cooperation problems.

ECONOMIC DEVELOPMENT ADMINISTRATION

I would further like to say that we have had the greatest amount of support from the Economic Development Administration of the Department of Commerce. Without them our work this year would have been seriously impeded. They understood our problems. They have helped us directly. I think we could not have a better working relationship.

In addition to the work which we do within the Federal Government, it is also part of our mission to work with the State to achieve a full State and Federal participation in development planning so that what is ultimately developed are truly joint plans, conceived in pursuit of the joint goals of the Federal and State governments in Alaska, and, hopefully, these joint plans will be translated by the two governments into programs of their various agencies.

INITIAL ACCOMPLISHMENTS

In our first year we took a broad look at the economy of Alaska, its potential for development, its problems, and the areas in which Government can and should take action to assist in economic development. We have summarized our findings in a public document in the form of a report to the President, Mr. Chairman.

Briefly stated, we view Alaska as a development problem. The State, as you know, is largely undeveloped at this time. The landmass is by far the largest of our States. Yet it has by the latest estimate only 273,000 people.

Senator BARTLETT. Does that include the military?

Mr. FITZGERALD. It does include the military, Mr. Chairman.

ALASKA POTENTIAL

But very fortunately, or so it seems to me, Alaska has vast potential in fields which are of great importance to the United States as a whole. At this time Alaska is in the process of becoming one of the largest oil and gas producers in the United States. The direct and immediate benefits of this production are for the whole of the country. We consume virtually none of this fuel in Alaska. It goes to other parts of the United States.

In the field of minerals we have hardly begun to exploit our potential but we are in a position to exploit it. Today we have moved from a nation with surplus stockpile problems to a nation in search of additional supplies. Our self-sufficiency in minerals has dropped from 80 percent to a low 50 percent. Thus the contribution which Alaska can make in the field of minerals is very, very great.

A similar contribution obviously can be made by our recreational resources. As the last undeveloped land in the United States, Alaska's recreational potential is virtually unlimited. I would like also to point out what may be a real sleeper in terms of economic development of benefit to the United States, and that is the Continental Shelf which lies off Alaska. Over 50 percent of the entire Continental Shelf of the United States is off the Alaska coast. The square mile area of that shelf is actually greater than the square mile land area of all of Alaska.

CONTINENTAL SHELF

Now, we know that the Continental Shelf can be one of our best sources for minerals. It is also true that as we move into the Arctic and it becomes more difficult to do things on the land, we may not find a corresponding increase in difficulty in working under the water.

Accordingly the Continental Shelf off Alaska may prove to be one of our greatest mineral producing areas. It is equally true that the Continental Shelf can be the primary source of many fishery products. We can look forward in the future, assuming that the resources are well and properly managed, to the fishery resources of the Alaskan waters being developed in a very broad way. For example, it can in accordance with your own bill, Mr. Chairman, be the location for the production of fish protein concentrates which are so badly needed in this world.

NATIVE PROBLEM

Thus we know that Alaska has not only things that are good for its own development but it has what America needs, and the development of Alaska in this context is a real challenge to the United States as a nation. But just as we see that we have great resources, I think we must recognize that we also have great problems in Alaska. There is, first, the one you briefly alluded to, Mr. Chairman, the problem of natives. This is largely confined to western Alaska. I say "largely" only in the sense that the greatest proportion of the needy people live there. But in this area we have virtually no development today. Hardly a road. Very few ports. No industry other than some Government research, FAA installations, and things of that sort, a little fishing, but not nearly enough. So we find as we get into the problem that these people are not only largely unemployed but have never been employed; that possibly 80 percent of the people are unemployed, at any one time. This is intolerable and poses a real development problem for the United States. It is one to which we are, of course, giving the highest priority at this time.

HIGH COSTS IN ALASKA

Also, being a small State in terms of population, we lack the cost advantages that size affords. You will find in Alaska that things tend to cost far more than they do in the rest of the United States. This is in part the result of smallness. It also is a common phenomenon of any effort to settle and operate in the Arctic and sub-Arctic areas of the world. The same phenomenon can be observed in northern Canada, Greenland, northern Norway, northern Russia, and Alaska.

So, in a sense one of the overriding problems in development will always be the cost problem, with the consequence that the Government must concentrate on the provision of basic services, transportation, power, and so forth, at the lowest possible cost.

LEADTIME FOR DEVELOPMENT

I also must say on the problem of development that we must never overlook the leadtime factor. We wish to open up the minerals. We wish to develop the north. But we cannot do this overnight or in a few years. There is a definite leadtime involved. We regard this as one of the critical problems which we must work with, and also a frustrating problem in an impatient world.

MACHINERY FOR RESOURCE DEVELOPMENT

The point on which I want to conclude this discussion is that the United States can program, through the machinery that we have set up, the roads, the railroads, the power, and other things needed for resource development, and that, if we do this frankly and specifically on a developmental basis, the capital costs which the U.S. Government will invest will come back in full. It will be an economically sound venture from the standpoint of the United States.

ADDITIONAL PERSONNEL

Mr. Chairman, I have strayed a bit from justifying our budget. We have asked for an increase in personnel this year and an increase in funds. I would like to say a few words about our request.

As I mentioned before, in our first year we did a general survey of the economic potential and the roadblocks to development. This task could be done with relatively few people, and this is the way it was done. In our second year, as we moved into more specific problems, attempting to get at some of the fundamentals that we needed in our planning, we found that this type of work required additional personnel. The Economic Development Administration assisted us, allocating funds under Title 3 of the Economic Development Act, which covers technical assistance and some funds under Title 5 which deals with regional planning commissions. These funds have enabled us to carry on a series of specific projects.

In the coming year we do not expect to have funds from Title 5 available to us. We intend, instead, to be substituting personnel on our own staff. We believe this will be the most efficient way to operate. What we specifically propose to do is to have six professionals under a planning director. As specialists, they will be dealing in the following areas: Native affairs, natural resources, economic analysis, recreation and tourism, industrial development, and finally transportation, communications and power.

These people will be working full time in their assigned areas, coordinating State and Federal task force activities and producing what we hope will be the foundation for a comprehensive long-range development program for Alaska.

Senator BARTLETT. Does that conclude your statement, Mr. Chairman?

Mr. FITZGERALD. It does.

FEDERAL REVIEW COMMITTEE

Senator BARTLETT. We note that appropriations are not requested for the coming fiscal year for the Federal Review Committee. Will you explain the reason for this?

Mr. DAVIS. We are going to pick up the expenses of that in our regular Commerce Department budget.

Senator BARTLETT. How much will that amount to approximately?

Mr. DAVIS. It was $24,000. I assume it will be something analogous to that in our 1968 budget.

DEPARTMENT OF COMMERCE FINANCING

Senator BARTLETT. Did you reimburse the Economic Development Administration for services which it has performed?

Mr. FITZGERALD. The arrangement which we have is that we pay 2 percent of our budget to the Department of Commerce for general administrative services, Mr. Chairman. The Economic Development

Administration has given us research assistance funds, but we have not transferred funds of any kind to it.

Senator BARTLETT. It is a grant by them to you?

Mr. FITZGERALD. Yes.

Senator BARTLETT. How much does that amount to in this fiscal year?

Mr. FITZGERALD. We were allocated $93,000 under Title 5. Then there was approximately $60,000 for a Japanese-Alaskan trade study. There will be a further allocation of approximately $200,000 to be used by the Public Land Law Review Commission, in a review of Alaskan land problems. These funds are in the process of being transferred at the present time.

NEW POSITIONS

Senator BARTLETT. Now you asked for these additional people for the next fiscal year. Will they be brand new? By that I mean will they replace people who have been on your staff and who have been paid for by grants from other agencies?

Mr. FITZGERALD. The appropriation will permit us to pick up on our budget several people who are already working for us, but under funds which are being transferred to us from EDA.

Senator BARTLETT. Actually then it will not be an added cost to the Federal Government?

Mr. FITZGERALD. There will be some.

Senator BARTLETT. How much? How many people will be involved and how much money? You can put that in the record later.

(The information follows:)

The Economic Development Administration has transferred $93,000 from Title V funds for use by the Federal Field Committee in fiscal year 1967.

In addition to using these funds for contractual research projects, the Federal Field Committee has employed seven professionals on a full-time or part-time basis. Present plans contemplate the use of three of these professional positions on the Field Committee's payroll in 1968.

The Title V funds transferred to the Field Committee in 1967 will be used by the Economic Development Administration in 1968 for other facets of its regional development program.

RESIDENT FIELD COMMITTEE EMPLOYEES

Senator BARTLETT. Are any of the employees of the field committee residents of Alaska?

Mr. FITZGERALD. They are all residents of Alaska. Some of us also consider ourselves voting citizens of the State. I am. I was in Alaska when I was appointed. Mr. Arnold is. Mrs. Wonnecke is. I would say that we are entirely Alaskans.

Senator BARTLETT. There will be no objection to that from me.

Whether or not residents of Alaska, the Federal cost of living allowance is paid; is that right?

Mr. FITZGERALD. Yes. The difference is this—if personnel are appointed from the 48 contiguous States, when they come up, they are entitled to a trip every 2 years back to their original home at Government expense. This includes their families, too.

Senator BARTLETT. And it comes out of the regular appropriation?

Mr. FITZGERALD. Yes.

Senator BARTLETT. For each agency?

Mr. FitzGerald. But if a person is appointed in Alaska, as, for example, I was, he has no such right.

Senator Bartlett. You pay for your own trip if you take one?

Mr. FitzGerald. Yes.

Senator Bartlett. I remember in that connection the anguish displayed by the head of an agency up there one time, who was not too well-funded, when an employee and his wife were going out and they had nine children.

TRAVEL FUNDS

Will you please explain the need for the $28,000 increase in your travel allowance for the coming year?

Mr. FitzGerald. Yes. One of the things we find is that in working with problems such as the native problem, people have to get our and travel. In Alaska this involves considerable distances and a fairly large expenditure of funds. We feel that this kind of expenditure is absolutely essential to the efficient accomplishment of our work.

Senator Bartlett. For one reason or another, I was required to do considrable traveling about Alaska in the year 1966, and also 1965. I will agree with you that travel is somewhat more costly there. What is your travel budget now?

Mr. FitzGerald. $21,000.

Senator Bartlett. So you need to more than double it? Are you facing difficulties now?

Mr. FitzGerald. No. My last reading on our budget, which was in December, indicated that we were almost exactly on a month-to-month basis in accordance with our appropriations.

Senator Bartlett. Then the committee should infer that, although you have held the line in respect to travel, you see an imperative need for stepping it up so that your people can get out in the field?

Mr. FitzGerald. I believe that with new people on board dealing with specific problems they will have to get out in the field and that they will spend a higher proportion of their time in the field, than I do, for example.

LOCKHEED CONTRACT

Senator Bartlett. You mention here in your prepared statement which has been placed in the record, under the heading, "Finance and Economic Information," a point which you number three and label in this manner: "Technical Advice on Studies by State of Basic Data Gathering and Processing System, Lockheed Contract." What is this?

Mr. FitzGerald. Mr. Chairman, the State of Alaska has a contract with Lockheed to study its data-gathering systems and to help devise a completely effective, modern system. We put that down because we are doing certain work which brings us very close to the data-gathering problem, and we have on an informal advisory basis discussed this in great detail with the State people and with the Lockheed people.

STUDY OF AGRICULTURE IN ALASKA

Senator Bartlett. You mentioned a study of agriculture's future in Alaska being made by the University of Alaska for the Department of Agriculture with limited participation by the Federal Field committee. Is that participation in the form of manpower and money, or just one of them?

Mr. FitzGerald. It would only be in the form of manpower. At the present time we do not have anybody aboard or in sight who would be a specialist in this area. While we naturally want to assist them in any way that is possible for us to do, we believe that under the circumstances our input will have to be limited. That is why we stated it that way.

Federal-State Cooperation

Senator Bartlett. You mentioned, and so did Secretary Davis' that this is a cooperative effort involving the Federal Government and the State government. Will you tell us something about the measure of cooperation being accorded by the State and how your relationships are with the State?

Mr. FitzGerald. When the committee was first established in 1965, I wrote to Governor Egan and we set up a joint meeting between State and Federal people to review the manner in which we should operate. We agreed at that meeting to establish a series of joint State-Federal task forces, each task force being assigned to a specific field of resource development. When we did this, we also agreed that the task forces should be chaired roughly 50 percent of the time by Federal people, and 50 percent by State people. To prevent any one task force from becoming either federally dominated or State dominated, we also provided for a change in the chairmanship each year. Thus if a task force was chaired 1 year by a Federal employee, it would be chaired by a State employee the next year, and so on.

These task forces worked in their specific fields and produced a number of reports. They have also been of great assistance in the general work that we are doing and in addition they have contributed to projects which, while part of our general program, came under the direction of a single agency. For example, the Federal Power Commission made a specific Alaska power study. Both State and Federal agencies have contributed to this.

Last year was an election year and we had a change of State administration which, of course, requires us in a sense to restructure our task force organization. This we are in the process of doing. The Governor has given us assurance of the State's full cooperation, and has expressed his great interest in development planning. We anticipate that we will be able to work with the State and proceed towards the general goals which we share.

State Planning Agency

Senator Bartlett. Yours, of course, is essentially a planning agency. Does the State have a comparable agency?

Mr. FitzGerald. It has a Commissioner for Planning. He is in the process of organizing his office. In addition there has been an EDA grant to the State for planning districts—economic districts—in Alaska. The administration has indicated its desire to establish these immediately, and they are in the process of being set up.

ALASKA COMMUNICATION SYSTEM

Senator BARTLETT. Thank you. I have no further questions, but before we conclude, Mr. Secretary, I want to make a comment regarding one statement made by Mr. FitzGerald in his prepared report. This relates to the proposed sale of the Alaska Communication System, the economic analysis of the system and participation in planning for its disposal. I want you particularly to know that in preparation of the bill prior to being considered by the Armed Services Committee last year, a bill which I introduced, Mr. FitzGerald delegated Dr. Jones, who is in the room now, to come to Washington to assist in making studies essential to the committee when it considered the bill. I will simply say that his work here was invaluable. I have a feeling that the bill would not have been approved by the committee as it was had he not been assigned to this task and had he not done so very well.

As a result of the Federal Field committee's activity in this regard, we hopefully look forward to passage of the bill by the Senate this year without further committee hearings. We got it over to the House so late last year that we didn't have time to have it taken up by the corresponding committee there. I think it is a very interesting footnote to history that this was the first piece of legislation ever considered by the Preparedness Subcommittee of the Senate Armed Services Committee. Heretofore all their work was in connection with investigations, but this time is the first time they considered legislation. You may not be surprised when I add in a more general way that I think that under Mr. FitzGerald's leadership within Alaska and the leadership of those of you here, we have already made notable achievements on behalf of the future development of Alaska.

SUBCOMMITTEE RECESS

The subcommittee will adjourn until 10 o'clock, Monday, March 13, 1967, when the Forest Service will be heard.

(Whereupon, at 12 noon, Friday, March 10, 1967, the subcommittee was recessed, to reconvene at 10 a.m., Monday, March 13, 1967.)

DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1968

MONDAY, MARCH 13, 1967

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met at 10 a.m., in room 1223, New Senate Office Building, Hon. Carl Hayden (chairman) presiding.

Present: Chairman Hayden and Senators Byrd, Bartlett, Proxmire, Mundt, and Young.

U.S. DEPARTMENT OF AGRICULTURE

FOREST SERVICE

STATEMENT OF JOHN A. BAKER, ASSISTANT SECRETARY OF AGRICULTURE; ACCOMPANIED BY E. P. CLIFF, CHIEF, FOREST SERVICE; A. W. GREELEY, ASSOCIATE CHIEF, FOREST SERVICE; C. W. HENDEE, DEPUTY CHIEF, FOREST SERVICE; M. M. NELSON, DEPUTY CHIEF, FOREST SERVICE; G. M. JEMISON, DEPUTY CHIEF, FOREST SERVICE; J. R. McGUIRE, DIRECTOR, PACIFIC SOUTHWEST STATION, FOREST SERVICE; R. F. DROEGE, ASSOCIATE DEPUTY CHIEF, FOREST SERVICE; B. H. PAYNE, ASSOCIATE DEPUTY CHIEF, FOREST SERVICE; G. D. FOX, ASSOCIATE DEPUTY CHIEF, FOREST SERVICE; A. R. SPILLERS, ASSOCIATE DEPUTY CHIEF, FOREST SERVICE; M. B. DICKERMAN, ASSOCIATE DEPUTY CHIEF, FOREST SERVICE; AND R. J. COSTLEY, DIRECTOR, DIVISION OF RECREATION AND LAND USES, FOREST SERVICE; AND J. J. BYRNE, DIRECTOR, DIVISION OF ENGINEERING, FOREST SERVICE; R. Z. CALLAHAM, ASSISTANT TO DEPUTY CHIEF, FOREST SERVICE; R. L. YOUNGS, ASSISTANT TO DEPUTY CHIEF, FOREST SERVICE; W. M. IRBY, BUDGET OFFICER, FOREST SERVICE; AND CHARLES L. GRANT, DIRECTOR OF FINANCE, DEPARTMENT OF AGRICULTURE

BUDGET REQUEST

Chairman HAYDEN. The subcommittee will be in order.

Again, today, Assistant Secretary of Agriculture John A. Baker is here to begin the Forest Service presentation of its fiscal year 1968 budget.

Mr. Secretary, we will be glad to hear your statement at this time.

EXPRESSION OF APPRECIATION TO COMMITTEE

Mr. BAKER. Thank you, Mr. Chairman. It is also a pleasure to appear before your committee to consider the proposed budget for the fiscal year 1968 for the Forest Service in the Department of Agriculture.

If I may, Mr. Chairman, without embarrassment to you, I would like at this time to just say a strong and firm word, sir, for the great contributions that we feel that you have made to the field of conservation, in preservation, use and development of the Nation's natural resources, not just in the forest itself, but across the whole field of the relationship of man to his environment, and the building for a good environment for man, now and in the future.

Chairman HAYDEN. Somebody who knew about that had to point it out to me.

Mr. BAKER. I want to just introduce our testimony this morning by saying that, Mr. Chairman, because it has been a grand, public-spirited contribution that you and your committee have made and I wanted to put that in the record at this time.

BUDGETARY DELIBERATIONS

These budget estimates that we present this morning reflect two basic facts. The first is that we are trying to do our part to fight inflation as well as to avoid deficits. The second fact is that Forest Service programs, in conservation, in research, in the advancement of human welfare, are of such importance to an expanding population and economy that we must carry them on at a high level of intensity and efficiency.

SERVICE PERSONNEL

Mr. Chairman, as you well know, the Forest Service and the men and women of the Forest Service are a highly capable, highly competent group of people. They are dedicated to the public service, and to the efficiency and effectiveness of their organizational structure and their administrative devices.

The Department's total program of conservation has found the work of the Forest Service to be an integral part of the Department's rural areas development program and its resource conservation and development program for both public and private lands, which in very many, many cases are intermingled. The very effectiveness, dedication, and capability of the people in the Forest Service makes a contribution through their work to the broad aims of the Department of Agriculture in these fields.

PROGRESS

In recent years, particularly in those areas and on the forests where public use has materially increased, management activities and investments have had to keep pace. More timber is being sold. Receipts have increased. New recreation sites are being developed. Range allotments are being revegetated and structural improvements added. Water quality and yield are being improved. Resource protection has been stepped up. Research has been accelerated and small gains have been made in State and private forestry activities.

All these things and more have been made possible with the help of this committee in recent years.

In the years ahead, similar attention will be necessary if the Nation's forests are to withstand increasing pressures to provide the resources and services they are capable of providing, and for which there is a growing public demand.

1968 PROGRAM INCREASES

For the immediate present, we believe the budget proposed will permit maintenance of a level of activity which is adequate, although the backlog of deferred work continues to grow. This budget will permit continued progress. Specifically it proposes the following program increases: $7,850,000 for forest land management; $1,573,000 for forest research; $100,000 for State and private forestry cooperation; $14,192,000 for forest roads and trails under authorization of the Federal-Aid Highway Act.

Part of the proposed increase will enable us to make an additional 280 million board feet of timber available to meet industry needs. You know the story of outdoor recreation pressures and related water pollution problems. Part of the increase will be used for development of recreation facilities at national recreation areas, and similar sites, and for upgrading waste treatment systems at heavily used recreation areas. Another part will finance acceleration of the land exchange program to reduce costs and improve management. Many other examples are in the material before you.

Forest Roads and Trails

The largest increase proposed is for the forest roads and trails appropriation. Our estimates include a request to obligate $120 million of the $170 million contract authorization made available by the Federal-Aid Highway Act of 1966. We can handle such an increase efficiently and effectively.

This increase is vitally needed, not only to get on with the job of providing access to national forest resources as contemplated by the 10-year development program but also for meeting demands imposed by the many new programs such as Appalachia, national recreation areas, land and water conservation fund, new reservoir construction.

We believe that this proposed program increase represents a wise investment of public money at this time. Roads that give access to national forest resources pay their way over a period of years through greater revenues and at the same time facilitate expanded uses. The existence of a more complete road system will permit an intensity of protection, management, and use that would not otherwise be possible.

FOREST LAND MANAGEMENT

In addition, we have proposed some adjustments in the forest land management appropriation as a result of changes in our blister rust program in Montana as outlined on a separate statement furnished to you.

FOREST RESEARCH

Completion in 1966 of a "National Program of Research for Agriculture" provides a new guide for development of future forestry research. The program increases proposed in this budget follow recommendations of the national program to accelerate high priority research.

Included is more research to produce genetically superior trees, to increase water yield and reduce erosion, to improve recreation planning and management, to protect forests from insects, diseases, and fire, and find new uses for low-quality timber.

Of especially high priority in needed research expansion are: Outdoor recreation, greater attention to beauty and esthetics, and the relationship of forests to a more prosperous rural America and a more rapid rate of economic growth in rural areas.

RESEARCH LABORATORY, FOREST PRODUCTS LABORATORY, MADISON, WIS.

The estimates also include funds for the wood chemistry building at the Forest Products Laboratory in Madison, Wis., which has been deferred since fiscal year 1966. This facility, as noted by the Senate Appropriations Committee last year is essential to progress in control of air and water pollution from pulp and paper manufacture.

FORESTRY SCIENCES LABORATORY, ALBUQUERQUE, N. MEX.

Funds are also included for construction of a Forestry Sciences Laboratory at Albuquerque, N. Mex. This laboratory will provide modern equipment for research on the management and rehabilitation of eroded forests and range watersheds and on controls for destructive forest insects and diseases in the Southwest.

ACCELERATION OF FORESTRY RESEARCH

Because research supports all forest resource programs and other forestry programs on both private and public lands, the research effort must keep pace with or preferably lead action programs. Forestry portions of the new long-range study of agricultural research need to be implemented promptly if the rural forested areas and the Nation's economy are to benefit fully.

We need to continue and accelerate the impressive advances in forestry knowledge obtained through systematic research. As you know, much of our research is done cooperatively with States, universities, industries, institutions, or individuals.

STATE AND PRIVATE FORESTRY COOPERATION

Cooperative forestry programs are increasingly important, and we are pleased with our relations with the States, and with private forestry generally. Yet there is a great residual need remaining on non-Federal lands to accelerate fire control, to promote forest management, and to find commercial outlets for presently unusable or low-value species.

We're not doing as well on this front as we should. This work has a high priority for strengthening.

Better protection against loss of life and property from forest fire and improved forest management of State and private lands are essential if we are to even come close to meeting the broad range of growing demands upon all forest land resources.

About three-fourths of the Nation's commercial forest land is in State, industrial, farm, and other non-Federal ownership. These lands supply about three-fourths of the Nation's cut of pulpwood, sawtimber, and other industrial forest products. These are high quality lands that can be, and should be, protected and developed adequately. We must depend on them to produce a major share of the Nation's output of timber, special forest products, water, forage, recreation, and wildlife.

Federal dollars in these programs stimulate non-Federal sectors of the economy to assume a major role in meeting forestry needs.

Again here, the high priority of research in action education programs is needed, to encourage greater attention to outdoor recreation, esthetics and beauty and rural areas development on the privately owned forest lands of America, particularly those in small ownership.

JOB CORPS

I would like to comment, Mr. Chairman, on our part of the Job Corps program. We are quite pleased with the overall progress to date. Our centers are now in full swing, even though the job of getting them established turned out to be larger and to take longer than we expected. Much of the work, such as, landscaping, sidewalks, roadways, and utility buildings was accomplished by the corpsmen.

Administration of the centers is settling down into a more routine operation. Corpsmen incidents are fewer. Community acceptance appears to be on the upswing. About 113 Job Corps graduates have been employed full time by the Forest Service in such positions as engineer aid, fire control aid, resident worker, cook helper, and forest worker. Corpsmen graduates are consistently being placed in better jobs than those they previously held, enlisting in the military or reentering school. In most cases, by the time an enrollee becomes a corpsman he is making significant personal improvement. On January 31, 1967, there were 7,287 corpsmen in centers administered by the Forest Service.

I have asked Mr. Cliff, Chief of the Forest Service, to comment briefly on a few significant accomplishments during the past fiscal year. He and his staff will be glad to answer any questions that you may have.

Thank you for the opportunity to present this statement.

FEDERAL HIGHWAY FUNDS

Chairman HAYDEN. You just said of the forest highway money that the amount was satisfactory. Did you ask for any more than you obtained?

Mr. BAKER. You mean the $120 million as compared to the $170 million?

Chairman HAYDEN. Yes.

Mr. BAKER. The $120 million, Mr. Chairman, was our estimate of what we could afford within the budgetary guidelines given us by the Department, for the total budgetary guidelines given to the Department.

Then we tried to establish our priority rankings, within the overall guidelines that were given us.

Chairman HAYDEN. I ask the question because the States have very bitterly complained about the reduction in Federal highway funds.

Mr. BAKER. In the need for forest roads and trails, Mr. Chairman, the backlog is building up, if that helps answer your question.

PURPOSE STATEMENT

Chairman HAYDEN. Well, I thank you, sir, for your statement. The Forest Service has again furnished with its "Justification" a purpose statement which I will place in the record at this point.

(The statement follows:)

The Forest Service is responsible for promoting the conservation and wise use of the country's forest and related watershed lands, which comprise one-third of the total land area of the United States. To meet its responsibility the Forest Service engages in three main lines of work, as follows:

1. *Management, protection, and development of the National Forests and National Grasslands.*—The National Forests and National Grasslands are managed under multiple use and for sustained yield. Under these principles natural resources of outdoor recreation, range, timber, watershed, and wildlife are utilized in a planned combination that will best meet the needs of the Nation without impairing the productivity of the land. Gross area within unit boundaries encompasses about 226 million acres in 44 States and Puerto Rico, of which some 186 million acres are under Forest Service administration.

In managing the National Forests, technical forestry is applied to the growing and harvesting of timber crops. Grazing use is managed to obtain proper range conservation along with utilization of the annual growth of forage. Watersheds are managed to regulate stream flow, prevent floods, and provide water for power, irrigation, navigation, and municipalities. Management includes the handling of the millions of people who visit the National Forests each year for recreation purposes. Wildlife habitat is managed to provide a suitable land and water environment for both game and non-game wildlife.

Under the multiple use principles most areas are used for, or serve, more than one purpose or objective. For example, about 50% of the area within the National Forests serves five different purposes:

(a) Timber production
(b) Watershed protection
(c) Forage production
(d) Wildlife production
(e) Recreation

An additional 28% serves four purposes in varying combinations. Of the remainder, 21% of the total serves three purposes with only 1% of the total reserved exclusively for a single purpose, mainly campgrounds and special use areas, such as summer homesites, pastures, and corrals. The varied interests which frequently conflict and which must be reconciled, and the vast areas covered, clearly require careful planning and skillful management of the National Forest properties.

The protection of the National Forests includes the control of forest fires, the control of tree disease and insect epidemics, and the prevention of trespass.

The major development activities of the National Forests are reforestation; timber stand improvement; revegetation; construction of roads, recreational facilities, range and other necessary improvements; and land acquisition and exchanges.

The economic importance of the National Forests and National Grasslands is evident when it is considered that:

(a) They produced a cash income in fiscal year 1966 of over $175.6 million. Approximately 65% of this amount is credited to the general fund in the Federal Treasury (miscellaneous receipts). The remainder is distributed in accordance with special acts of Congress, including 25% to the States or counties in which lands are located, and 10% made available for construction and maintenance of the Forest Service system of roads and trails. In addition to these cash receipts, there are the even greater economic values which result from the processing of end products derived from this utilization of National Forest timber, forage, and minerals. There are also the important values of water, recreation, and wildlife which cannot be readily expressed in monetary terms.

(b) The area within National Forests boundaries is equivalent to some 10% of the area of the continental United States. Over 40% of this land is within areas now experiencing economic distress. Proper management, development, and utilization of these lands are important factors in permanent improvement of these local economies. Millions of people who live in and near the National Forests are supported in whole or in part through the economic development arising from the forests and their resources.

(c) The National Forests supplied 12.1 billion board feet of timber in fiscal year 1966 to the Nation's forest products industries. This is expected to increase to 12.5 billion board feet in 1967. Dependence of the forest products industries on National Forest timber continues to increase as the result of depletion of good quality timber on private lands.

(d) About 7 million head of domestic livestock (including calves and lambs) are grazed on the National Forests and Grasslands.

(e) These lands provide protection to municipal water supplies for nearly all western cities and towns and many in the east, to irrigation water used on about 20 million acres of western lands, and to many streams with water power developments. They provide flood protection to thousands of acres of rich valley lands and help to prevent more rapid siltation of reservoirs and stream channels.

(f) They provide a habitat for a large part of the big game animal population, for birds, for millions of small game animals and furbearers, and for fish.

(g) They provide opportunities for healthful outdoor recreation, with a minimum of restrictions.

2. *Forestry research.*—The Forest Service conducts research in the entire field of forestry and the management of forest and related ranges. This includes the growth and harvesting of timber, its protection from fire, insects, and diseases, the protection and management of watersheds, and improved methods for development and management of recreation resources. It conducts studies in forest economics, marketing of forest products, and a survey of the present extent and potential growth and use of the Nation's forest resources. It also conducts research to develop new and improved products from wood, to increase efficiency of utilizing forest products, and to advance the efficiency and mechanization of forestry operations.

The research program has a two-fold objective:

(a) To backstop the National Forest development program by devising more efficient practices for protecting, managing, and utilizing forest resources.

(b) To develop new and improved practices that will lead to sounder uses of forests in other public and private ownerships and more efficient and profitable utilization and marketing of forest products.

The Forest Service also cooperates with the Agricultural Research Service of the Department by reviewing and appraising for technical adequacy forest research projects beneficial to the United States which are conducted abroad.

These projects are carried out with foreign currencies under Section 104(b) (3) of Public Law 480, as amended, and the dollar expenses of the Forest Service in connection with this work are paid from the appropriation "Forest Protection and Utilization."

Results of research are made available to owners of private forest and range lands, to public agencies which administer such lands, to forest product industries, and to consumers.

3. *Cooperation with State and private forest landowners.*—The Forest Service cooperates with State agencies and private forest owners to:

(a) Better protect the 446 million acres of State and privately owned forests and critical watersheds against fires, insects, and diseases.

(b) Encourage better forest practices, both for resource conservation and profit, on the 367 million acres of private forest land.

(c) Aid in the distribution of planting stock for forests, shelterbelts, and wood lots.

(d) Stimulate development and proper management of State, county, and community forests.

(e) Assist the harvesters, processors, and marketers of forest products in doing a better job and thereby bring about greater use of forest products and increased income and employment for rural people.

(f) The Forest Service also provides assistance to States for tree planting under Section 401 of the Agricultural Act of 1956 (16 USC 568e), through the State forester or equivalent State official, including advice, technical assistance, and financial contributions for increased tree planting and reforestation work, in accordance with plans submitted by the State and approved by the Secretary of Agriculture.

Other work related to forestry includes:

4. *Insect and disease control.*—Activities to suppress and control destructive insects and diseases that threaten timber areas include two types of work carried on jointly by Federal, State, and private agencies:

(a) Surveys on forest lands to detect and evaluate infestations of forest insects and infections of tree diseases and determination of protective measures to be taken.

(b) Control operations to suppress or eradicate forest insects and diseases, including white pine blister rust.

5. *Flood prevention and watershed protection.*—The Forest Service cooperates with the Soil Conservation Service, appropriate State agencies and the local organizations sponsoring small watershed protection projects initiated under the Watershed Protection and Flood Prevention Act of 1954, as amended, (PL 83–566) in planning and installing forestry and related land resource measures on the watersheds. The Forest Service also collaborates with the Soil Conservation Service, other Federal and State agencies in the conduct of comprehensive river basin studies relating to the development of water and related land resources under authority of PL 89–80 and section 6, PL 83–566.

On National Forest lands and on non-Federal forest lands within the watersheds authorized for treatment by the Department of Agriculture under the Flood Control Act of December 22, 1944, the Forest Service plans and installs watershed improvement measures, in the form of minor physical structures, cultural measures, and intensified fire control, to retard runoff and reduce flood water and sediment damage. Work on non-Federal land is carried on in cooperation with the Soil Conservation Service and the appropriate State and local agencies.

This work is performed with funds allotted to the Forest Service by the Soil Conservation Service.

6. *Job Corps Conservation Centers.*—The Forest Service operates 47 Job Corps Conservation Centers on National Forests throughout the United States under agreement with the Office of Economic Opportunity. The Forest Service provides the staffing, administration and logistical support to physically operate and maintain the Centers and conduct the basic education, plan and supervise the recreation, and fully implement the vocational training of corpsmen. The funds for this program are transferred from OEO. There are 32 to 64 permanent staff assigned to each Center based upon enrollee capacity of 112 to 256. Total capacity of all Centers is 8,388 corpsmen and Centers operate on a 24-hour, seven-day week basis. Both human and natural resources are being up-

graded through these Conservation Centers, as young men improve their education and job skills in preparation for a more productive life.

7. *Timber stand improvement.*—Funds collected from timber purchasers in connection with timber sales, under authority of the Knutson-Vandenberg Act, make possible some timber stand improvement work on cut-over areas each year looking to the establishment of natural tree growth and protecting it through the critical period of early growth. This work also helps to obtain stocking of tree of desirable species, form and quality. Timber stand improvement in promising young growth not associated with timber sale cuttings is done with funds directly appropriated by Congress.

8. *Brush disposal.*—National Forest timber sale contracts require treatment of debris from cutting operations or deposit of funds to pay for the work. If it is not feasible for the timber purchaser to dispose of the logging slash, which is the case in most sales, it is done by the Forest Service using deposits made by the purchaser. This work is essential because logging slash increases the fire hazard and may contribute to the buildup of insect populations, increase certain disease infestations, and cause damage to stream channels.

9. *Land and Water Conservation Fund.*—This fund, transferred from the appropriation made to the Department of the Interior, finances the acquisition of lands, waters, or interests in lands or waters by the Forest Service as well as certain other Federal agencies. The Act creating the fund from which appropriations are made requires that the lands and waters acquired be primarily of value for outdoor recreation. The fund derives revenues from admission and user fees, sales of surplus real property, and motor boat fuel tax. The first purchase of recreation land made by the Forest Service was on October 19, 1965.

10. *Rural fire defense.*—The Forest Service, as a part of its regular programs, also directs Federal activities and provides technical guidance and training to States concerned with the prevention and control of fires which might be caused by an enemy attack in rural areas of the United States.

11. *Timber development organization loans and technical assistance.*—Under Section 204 of the Appalachian Regional Development Act of 1965, the Forest Service provides technical assistance and loans to timber development organizations to improve development and utilization of timber stands in the Appalachian region.

ORGANIZATIONAL STRUCTURE

The Forest Service maintains its central office in Washington, with program activities decentralized to 9 regional offices, 130 forest supervisors' offices, 817 district rangers' offices, 2 State and private forestry area offices, 8 forest and range experiment stations, the Institute of Tropical Forestry, and the Forest Products Laboratory. Location of headquarters offices:

Regional offices: Missoula, Montana; Denver, Colorado; Albuquerque, New Mexico; Ogden, Utah; San Francisco, California; Portland, Oregon; Atlanta, Georgia; Milwaukee, Wisconsin; Juneau, Alaska.

State and private forestry area offices: Upper Darby, Pennsylvania; Atlanta, Georgia.

Experiment stations: Ogden, Utah; St. Paul, Minnesota; Upper Darby, Pennsylvania; Portland, Oregon; Berkeley, California; Fort Collins, Colorado; Asheville, North Carolina; New Orleans, Louisiana.

Forest Products Laboratory: Madison, Wisconsin.

Institute of Tropical Forestry: Rio Piedras, Puerto Rico.

PROGRAM DATA

Chairman HAYDEN. Then the following data which has been supplied will be printed in the record: A summary of estimated appropriations and receipts for fiscal years 1966 through 1968, the development program for the national forests, the Forest Service activities related to the Office of Economic Opportunity, and the amounts programed for Appalachia.

(The documents follow:)

Summary of estimated appropriations and receipts

Item	Available, 1966	Estimated available, 1967	Budget estimates, 1968	Increase or decrease, 1968 over 1967
APPROPRIATED FUNDS				
Forest protection and utilization:				
Forest land management	$171,652,000	$178,388,000	$186,238,000	+$7,850,000
Forest research	37,372,000	38,459,000	40,032,000	+1,573,000
State and private forestry cooperation	17,558,000	18,151,000	18,251,000	+100,000
Total, forest protection and utilization [1]	[2] 226,582,000	[3] 234,998,000	244,521,000	+9,523,000
Forest roads and trails [2]	102,136,000	101,230,000	110,500,000	+9,270,000
Acquisition of lands for national forests, special Acts	80,000	80,000	80,000	
Acquisition of lands for Uinta National Forest		300,000		−300,000
Cooperative range improvements	700,000	700,000	700,000	
Assistance to States for tree planting [1]	1,000,000	1,000,000	1,000,000	
PERMANENT APPROPRIATIONS				
Expenses, brush disposal [2]	10,195,672	10,200,000	10,300,000	+100,000
Roads and trails for States, national forests fund	14,203,671	16,778,480	17,160,000	+381,520
Forest fire prevention [2]	43,046	45,000	45,000	
Restoration of forest lands and improvements [2]	19,795	25,000	25,000	
Payment to Minnesota (Cook, Lake, and St. Louis Counties) from the national forests fund	140,619	144,815	145,000	+185
Payments to counties, national grasslands	429,041	431,250	431,250	
Payments to school funds, Arizona and New Mexico	112,130	102,931	105,000	+2,069
Payments to States, national forests fund	35,504,367	41,942,319	42,900,000	+957,681
Total	391,146,341	407,977,795	427,912,250	+19,934,455
Deduct permanent appropriations shown above	60,648,341	69,669,795	71,111,250	+1,441,455
Total (excluding permanent appropriations)	330,498,000	338,308,000	356,801,000	+18,493,000
RECEIPTS [4]				
Timber sales	164,936,546	168,700,000	171,500,000	+2,800,000
Grazing and power	3,431,808	3,510,000	3,515,000	+5,000
Recreation	1,917,394	1,925,000	1,950,000	+25,000
Land uses	3,119,609	3,220,000	3,310,000	+90,000
Admission and user fees	495,741	425,000	425,000	
National grasslands and land utiliaztion	1,715,330	1,725,000	1,725,000	
Total receipts	175,616,428	179,505,000	182,425,000	+2,920,000

---

[1] Includes following: Fighting forest fires—1966, $7,500,000 provided in Second Supplemental Appropriation Act, 1966, Public Law 89-426; excludes following: Fighting forest fires—1967, $25,000,000; proposed supplemental space transfers to General Services Administration—1966, $303,000; 1967, $427,000.

[2] In addition, prior-year balances are available.

[3] Includes following: Supplemental Appropriation Act, 1967—$2,300,000, forest land management, sales administration, and management; $200,000, State and private forestry cooperation, general forestry assistance; proposed supplemental, 1967—$3,357,000 for increased pay costs, Public Law 89-504.

[4] Amounts include:

	1966	1967	1968
Suspense account, Alaska [a]	$1,091,494	$1,100,000	$1,100,000
Suspense account, Oregon and California lands [b]	5,966,117	6,000,000	6,000,000

[a] Account established pending settlement of Indian rights on Tongass National Forest, Alaska.

[b] Account established for Oregon and California railroad grant lands, for which receipts are transferred to Department of the Interior for distribution under the acts of Aug. 28, 1937, June 24, 1954, and Aug. 3, 1961 (43 USC 1181f-g).

Status of financing development program for the national forests, cumulative fiscal years 1963–67

(The planned levels indicated in this table were developed by the Forest Service and were not specifically indicated in the program submitted by the President on September 21, 1961. This program stated that it would "be carried out as rapidly as possible within overall budgetary requirements and financial resources of the Federal Government.")

[In thousands of dollars]

	1963–67 planned level	1963–67 available			Difference	Percent financed
		Forest Service appropriation	Public works	Total		
FOREST LAND MANAGEMENT						
National forest protection and management:						
Timber resource management:

[3] Includes proposed supplemental of $3,357,000 for pay costs.

SOCIETY OF AMERICAN FORESTERS' SPECIAL CITATION

Chairman HAYDEN. Mr. Cliff, may we hear from you now?

Mr. CLIFF. Mr. Chairman, it is always a pleasure to appear before this committee, and I am glad to have an opportunity to present some of the highlights of our recent accomplishments. First, I would like to say that when Mr. Baker commended you for your outstanding contribution to conservation in its broadest sense, I am sure he was not aware that the Society of American Foresters is going to confer a special citation on you on the 22d day of March for distinguished service to forestry. I want to congratulate you for this special recognition.

PREPARED STATEMENT

Chairman HAYDEN. If you have a prepared statement, you may put it in the record and then summarize it.

Mr. CLIFF. I do have a prepared statement, Mr. Chairman, which I will be glad to submit for the record. I have a couple of additions to this statement that I would like to make.

Chairman HAYDEN. Yes, sir.

(The statement follows:)

It is a pleasure for me to highlight for you some of our recent accomplishments and items of interest but, first, I would like to introduce to you a new member of my staff. He is Mr. E. M. Bacon, who is now in charge of our State and Private Forestry Programs. Mr. Bacon replaced Mr. Boyd Rasmussen, who transferred to the Department of the Interior as Director of the Bureau of Land Management.

The financing you provided enabled us to make some very significant accomplishments during the past fiscal year.

CASH RECEIPTS

Cash receipts from the sale and use of National Forest resources amounted to a record $173.9 million in fiscal year 1966. This is an increase of $26.5 million over the preceding year, a record year also. For fiscal year 1968 receipts are estimated at $180.7 million. During 1966 the second billionth dollar in cash receipts was received by the Forest Service. The first billion dollar point was reached in 1958 and required 53 years to collect. The second billion, attained within the past seven years, indicates rising use and intensified management of the resources. With continued normal growth of our programs, the three billion mark may be reached within five or six years.

TIMBER CUT

National Forest timber cut keeps going up. It was 12.1 billion board feet for the fiscal year ending June 30, 1966, an increase of 900 million board feet over the preceding year and 3.1 billion over the 9 billion board feet cut in 1962. This is an increase of over 34% during the four-year interval.

OUTDOOR RECREATION

Outdoor recreation is still one of our fastest growing activities. In calendar year 1965, 160 million visitor-days were tallied on the National Forest. Camping and picnicking were the most popular and accounted for 49.5 million visitor-days. Fishing and hunting accounted for 30.3 million, and recreation travel was next in popularity with a total of 29.3 million visitor-days. Winter sports, boating, swimming, water skiing and other water sports accounted for the remainder.

FIRE CONTROL

Last year we reported an all time low in acreage burned within National Forest protection areas. I wish I could say the same for the 1966 fire season but, unfortunately, this is not the case. The 1966 season was one of the driest on record and fires took a serious toll of National Forest resources. By the close of the year, 11,230 fires burned 337,566 acres, the largest area since 1960. Of these fires 5,374 were man-caused. One of these fires, in California, took the lives of twelve men who were caught in a brief flare-up. This tragedy has spurred efforts to examine firefighting methods, training and capabilities so as to insure safe, as well as effective, fire suppression action.

Though a serious loss, the 1966 burned acreage is not large in comparison with what might have happened. Time after time, prompt detection and aggressive initial attack stopped fires from making destructive runs. Ninety-three percent (10,436) of the fires were controlled at less than ten acres. The use of infra-red detection devices was made operational on a small scale. This infra-red principle uses heat sensing equipment carried on aircraft for detection and location of fires. As this is expanded we can expect further benefits from its use. From these successes can be seen the savings gained by having flexible, hard-hitting forces available under severe burning conditions.

FORESTRY RESEARCH ACCOMPLISHMENTS

Forestry research has made new discoveries during the year past and contributed important new knowledge which should strengthen the technology used in efficiently managing the public and private forest lands of the Nation. Research breakthroughs provided new tools for predicting and improving water yield, reducing sedimentation, and preventing pollution of our water resources. Advances in forest insect and disease control have been significant. Development of sex attractants means that less spraying of chemicals may be needed in the future as we learn to control forest insects by synthetic compounds that will lure destructive forest insects to their deaths. Fire control should be less costly and more effective as a result of recent payoffs from research on prevention of man-caused fires and aerial fire suppression.

Our research on forest products shows how we can economize in the amount of wood used in construction and otherwise use wood more effectively. At the same time, our scientists have developed new uses and markets for wood, as in the mushrooming program of urban renewal. These new markets should substantially expand the demand for timber products from the regions of relatively low economic activity and provide jobs for those who need a boost in income. The nationwide survey completed timber resource inventories on 49 million acres of forest land in 10 States. Comprehensive appraisals showing the present status of the timber resource, trends, and industrial use were completed for eight States or portions of States.

Land managers are being supplied new economic guides for maximizing returns from forest resource management as a result of our research. These guides cover timber growing, pest control operations, and management of ranges for domestic animals and wildlife. Our recreation research has helped to identify the desires of forest recreationists and has shown ways to meet the pressures they exert upon recreation facilities. It is more helpful in guiding National Forest and other agency recreation programs and thus has a prompt payoff in relation to proposed expenditures for various types of facilities, partly because it does not require substantial laboratory facilities. Unfortunately forest recreation research has not kept pace with other research programs. Our recreation research is well coordinated with programs of other agencies. The composite of our research outputs improves the management of wild lands for their multiple uses and strengthens the economic opportunities in rural communities.

STATE AND PRIVATE FORESTRY ACHIEVEMENTS

We are proud to be partners with the State Foresters—incidentally we now have 50—in the cooperative programs involving protection, tree planting, management, and marketing.

In 1965, organized fire protection was extended about 25 million acres bringing the total protected to 472 million acres.

In 1966, three additional States, making a total of 23, entered into cooperative agreements to share the cost of forest insect and disease control on non-Federal lands. About 575 million seedlings were produced by State foresters, enough to plant about 800 thousand acres. Over 100,000 woodland owners and 10,000 processors—mostly small—were given professional advice in the management of woodland, the techniques of utilization and marketing of forest products.

With the funds available, we have made adjustments in the programs to bring about the most effective assistance possible to all the States. Yet, in many places our protection is not as effective as it should be. With the rapidly increasing use of private forests by both the public and industry, the States reported during the 1961–1965 period an average each year of about 110,000 fires which burned over 4 million acres.

Our losses from insects and diseases are still much too high. We are concerned that our planting, management, and marketing efforts are not keeping pace with increasing needs. Our growth of large high-quality trees is not keeping up with the cutting. The immensity of the overall problem in State and private forestry is indicated by the fact that there are about 4 million woodland owners and 35,000 processors, mostly small. Most large industrial owners are doing a good job of management but progress with the small woodland ownerships is slow.

The States are urging private landowners to adopt the multiple use principle which Congress has recognized as essential to the management of National Forests. Encouragement is given to the development of private capabilities in recreation, wildlife, special forest products, forage and water, as well as timber. These activities are directly related to improving the economic, social, and general well-being of rural people. The supplemental appropriation provided funds to initiate a new hardwood improvement program. The program is well under way on a pilot basis. Deputy Chief Bacon will tell you more about this later.

Thank you for this opportunity to make a few introductory comments. We will be pleased to answer any questions that you may have.

1966 VISITOR DAYS USE ON NATIONAL FORESTS

Mr. CLIFF. One is in the nature of a correction. On the second page of my statement, under the heading "Outdoor Recreation," we gave you the figures for the calendar year 1965, 160 million visitor days of recreation use were tallied on the national forests. Since this statement was prepared, figures have become available on recreation use for calendar year 1966.

On February 27, of this year, the Bureau of Outdoor Recreation provided the House Appropriations Committee with a report on total visitor days use on Federal lands and waters for all of the seven Federal agencies reporting. This report shows that the total visitor days use on all Federal areas in 1966 was slightly over 375 million.

Of this 375 million, almost one-half or 173 million visitor days was on the national forests. This 173 million is 13 million over the 1965 use that my prepared statement shows.

I think those figures are quite significant. When we are talking about recreation on the national forest, we are talking about nearly half of the total recreation on all Federal land areas.

BLISTER RUST CONTROL REPROGRAMING

One additional comment I would like to make is about the change in the blister rust control program. Mr. Baker mentioned this. We are proposing a reprograming action of some of the blister rust funds. This does not involve additional funds. It means a shift between our line items in the forest land management appropriation.

I will describe this in general and the specific changes can be considered along with the total amounts for each one of the line projects involved.

We are proposing a change in our fiscal year 1968 white pine blister rust control program in Idaho, western Montana, and eastern Washington. This is based on a recent hard look at the effectiveness of our program to eradicate currant and gooseberry bushes, which are the alternate hosts to a disease which kills the white pine. The rate of infection on the young white pine stands below 20 years of age is still high, even under the best control methods we have been able to devise.

We have decided that it is not feasible under present economic conditions to continue to eradicate the ribes and gooseberries bushes, and so we are proposing to reduce the amount for blister rust control in white pine stands in northern Idaho, eastern Washington, and western Montana by $1,416,200. Reprograming of this amount is requested for several high priority items, including control of a greatly expanded beetle infestation on the Targhee National Forest in Idaho, on which we did not have data available at the time the estimates were made. Three 25-man forest fire crews, which will replace the labor that would otherwise have been available under the blister rust program, will be funded. Funds will be provided for a grazing fee study which the Budget Bureau is coordinating with all interested agencies. Two high-priority wildlife development projects will be funded and a small amount will be used to help bring recreation facilities development closer to last year's level.

MOUNTAIN PINE BARK BEETLE CONTROL

As a separate consideration, we also desire to reprogram about $700,000 of 1967 blister rust funds planned for this same white pine area, to help meet the bark beetle epidemic emergency on the Targhee National Forest and Teton National Forest in southern Idaho and western Wyoming.

As we reach these functional items, more detail will be added by my staff, who are handling these line projects, and we will be glad to answer questions on them.

We thank you very much, Mr. Chairman.

Chairman HAYDEN. Please place in the record a statement on the fiscal year 1967 reprogramming.

(The information follows:)

We propose to reprogram fiscal year 1967 funds in the amount of $365,000 to the Targhee National Forest bark beetle control project. We also propose reprograming of $339,000 to other bark beetle control projects of which the project on the Teton National Forest is the major one. These funds are needed to control an increasing serious explosion of Mountain Pine bark beetles populations in these areas.

TRANSFERS FROM FOREST SERVICE FUNDS TO INTERGOVERNMENTAL COMMISSIONS, COMMITTEES, AND AGENCIES

Chairman HAYDEN. Before we get into the estimate, will you please place into the record a table indicating transfers to be effected from the Forest Service funds to intergovernmental commissions, committees, and agencies? It would be well to show this information for fiscal years 1966, 1967, and 1968.

Mr. CLIFF. We will be glad to supply that for the record, Mr. Chairman.

(The table follows:)

Forest Service funds, transferred to intergovernmental commissions, committees, and other agencies

	Fiscal year 1966, actual	Fiscal year 1967, estimate	Fiscal year 1968, estimate
National Advisory Commission on Rural Poverty		$12,000	$4,100
National Advisory Commission on Food and Fiber	$12,000		
Citizens' Advisory Committee on Recreation and Natural Beauty		6,000	
President's Committee on Equal Employment Opportunity	4,935	(1)	(1)
Citizens' Advisory Committee on Civil Rights	292	(1)	(1)
President's Commission on the Status of Women	3,800	(1)	(1)
Interdepartmental Committee on Status of Women	394	(1)	(1)
Interagency Committee on Water Resources:			
Subcommittee on Hydrology	250		
Subcommittee on Sedimentation	17,000	15,000	15,000
Total	38,671	33,000	19,100
Forest Service also helps:			
International Hydrological Decade Program of UNESCO (Department of State)	1,875	1,875	
31st Congress of the International Federation for Documentation (National Science Foundation)	2,000		
Interagency Boards of Examiners, Civil Service Commission	26,511	117,800	120,000
Pilot Federal Information Center, Atlanta, Ga. (GSA)		2,000	
Total	30,386	121,675	120,000

(1) No request for funds received as of Mar. 17, 1967.

FOREST PROTECTION AND UTILIZATION

Chairman HAYDEN. There will be printed in the record the justifications supplied in support of your budget estimate of $244,521,000 for "Forest protection and utilization." This is an increase of $12,453,000 over the amount appropriated to you last year. However, it is expected that a supplemental appropriation estimate to meet increased pay costs will be submitted then in the amount of $3,357,000.

(The justifications follow:)

Forest protection and utilization

	Forest land management	Forest research	State and private forestry cooperation	Total
Appropriation Act, 1967 [1]	$176,150,000	$37,821,000	$18,097,000	$232,068,000
Proposed supplemental, 1967, for increased pay costs	+2,557,000	+746,000	+54,000	+3,357,000
Transferred to "Operating expenses, Public Building Service, General Services Administration" for space rental	−319,000	−108,000		−427,000
Base for 1968	178,388,000	38,459,000	18,151,000	234,998,000
Budget estimate, 1968	186,238,000	40,032,000	18,251,000	244,521,000
Increase	+7,850,000	+1,573,000	+100,000	+9,523,000

[1] In addition, $700,000 is available by transfer from cooperative range improvements.

Summary of increases and decreases

	1967 available	1968 estimate	Increase or decrease
FOREST LAND MANAGEMENT			
Prepare and sell 280 million board feet and administer harvest of 210 million board feet of commercial thinnings and salvage material	$34, 463, 000	$35, 900, 000	+$1, 437, 000
Upgrade present waste treatment systems at 25 recreation sites for water pollution control purposes, develop recreation facilities at national recreation areas, and step-up operation, maintenance, and cleanup of existing recreation sites and their facilities	31, 139, 000	34, 638, 000	+3, 499, 000
Develop wetlands in the Chippewa National Forest, Minn., and develop gravel cleaner for salmon spawnbeds	3, 971, 000	4, 301, 000	+330, 000
Finance implementation of grazing fee adjustments	5, 527, 000	5, 682, 000	+155, 000
Accelerate classification surveys of defined subareas in national forests and national grasslands; accelerate examination, appraisal, and evaluation of offered and selected lands in exchange proposals; shorten time required in land lines work and conversion to new status records system; accelerate photogrammetric surveys to provide terrain data, resource inventory data, and general management maps for multiple-use management in problem areas	5, 725, 000	6, 349, 000	+624, 000
Provide better fire protection in line with increasing land and resource values, and more nearly assure standard of protection adequate for successful management of national forest resources	25, 487, 000	26, 172, 000	+685, 000
To control severe bark beetle outbreak on the Targhee National Forest in Idaho	8, 676, 000	9, 292, 200	+616, 200
Additional payments to employees' compensation fund	733, 000	759, 000	+26, 000
Help meet national forest system management and development needs resulting from water development projects proposed and constructed by other agencies	6, 766, 000	8, 660, 000	+1, 894, 000
Reduction in white pine blister rust control program due to limited success of the ribes eradication programs and rising costs	3, 687, 000	2, 270, 800	−1, 416, 200
All other	52, 214, 000	52, 214, 000	------------
Total, forest land mangement	178, 388, 000	186, 238, 000	+7, 850, 000
FOREST RESEARCH			
Accelerate forest genetics research to develop high-quality, pest-resistant types of conifers, preferred species of hardwoods, and southern pine	8, 377, 000	8, 937, 000	+560, 000
To supply a stronger technical basis for management of national forest watersheds and similar water-producing mountain lands	3, 439, 000	3, 650, 000	+211, 000
Strengthen research on ecology, protection, and management of areas and measurement of recreation use and trends	479, 000	811, 000	+332, 000
Intensify research on electronic fire detection system and new fire control technology to reduce forest fire losses	2, 912, 000	3, 112, 000	+200, 000
Strengthen research on bark beetles and defoliators	3, 998, 000	4, 103, 000	+105, 000
Speed up research to develop biological control organisms and genetic host resistance for major diseases of trees and strengthen research to develop more effective preventive and control measures for disease killing and injuring trees	2, 171, 000	2, 358, 000	+187, 000
To hasten solution of critical utilization problems, including expansion and acceleration of wood fiber products and related chemical research	6, 493, 000	6, 863, 000	+370, 000
Expand and accelerate research on aerial logging systems, fully mechanized production line pulpwood harvesting systems to meet increased productivity requirements, and harvesting equipment, machines and tools to meet needs of small timberland operators	583, 000	798, 000	+215, 000
Accelerate timber inventories, provide more local information on industrial development opportunities, and strengthen appraisals of timber supply and demand	2, 100, 000	2, 203, 000	+103, 000
Evaluate costs and benefits of forestry investments, evaluate effectiveness of forestry programs for small forest owners, and develop principles and guides for planning multiple-use management of forest resources	791, 000	1, 088, 000	+297, 000
Reduction for nonrecurring forest research construction projects	3, 285, 000	2, 278, 000	−1, 007, 000
All other	3, 831, 000	3, 831, 000	------------
Total forest research	38, 459, 000	40, 032, 000	+1, 573, 000
STATE AND PRIVATE FORESTRY COOPERATION			
To provide professional services for increasing hardwood lumber output	1, 471, 000	1, 571, 000	+100, 000
All other	16, 680, 000	16, 680, 000	------------
Total State and private forestry cooperation	18, 151, 000	18, 251, 000	100, 000
Total forest protection and utilization	234, 998, 000	244, 521, 000	+9, 523, 000

See footnotes at end of table, p. 1642.

Project statement—Continued

Project	1966	1967 estimate	1968 estimate	Increase or decrease
STATE AND PRIVATE FORESTRY COOPERATION				
(29) Cooperation in forest fire control	$12,825,070	$12,834,000	$12,834,000	
(30) Cooperation in forest tree planting	277,884	300,000	300,000	
(31) Cooperation in forest management and processing	3,478,986	3,546,000	3,546,000	
(32) General forestry assistance	929,655	1,471,000	1,571,000	+$100,000
Total, State and private forestry cooperation [4]	17,511,595	18,151,000	18,251,000	+100,000
Unobligated balance	899,139			
Total, available or estimate [6]	230,382,009	234,998,000	244,521,000	+9,523,000
Proposed supplemental		−3,357,000		
Transferred to "Operating expenses, Public Building Service, General Services Administration"	302,991	427,000		
Advance from cooperative work, Forest Service (trust fund) for fighting forest fires	−3,800,000			
Total appropriation	226,885,000	232,068,000		

[1] Includes allocation to the Department of the Interior, Geological Survey—1966, $255,000; 1967, $285,000; and 1968, $285,000.

[2] Excludes proposed supplemental for fighting forest fires, $25,000,000.

[3] Includes allocation to the Department of the Interior, Bureau of Land Management—1966, $349,000 1967, $386,000; and 1968, $384,000.

[4] Includes allocation to the Department of the Interior, Bureau of Land Management—1966, $853,700; 1967, $763,000; and 1968, $507,000.

[5] Excludes obligations of $7,048,047 incurred in 1966 against funds provided by Second Supplemental Appropriation Act, 1965 (Public Law 89-16). Summary follows:

	Pacific Northwest flood damages	Appalachian region
Obligations, fiscal year 1965	$353,280	$175,521
Obligations, fiscal year 1966	3,765,689	3,282,358
Unobligated balance lapsing	81,031	117,121
Total appropriated	4,200,000	3,575,000

[6] Represents obligations as follows:

Obligated fiscal year 1966	$230,182,870
Obligations, fiscal year 1966, per footnote 5 above	7,048,047
Total obligations	237,230,917
Applied costs, fiscal year 1966	227,307,436

The difference of $9,923,481 reflects, primarily, contracts made and orders placed in 1966 over contractual services and equipment received in that year.

FOREST LAND MANAGEMENT

Timber resource management: Sales administration and management

1966	$30,809,000
1967	34,463,000
1968	35,900,000
Increase	+1,437,000

An increase of $1,437,000 is needed primarily to cover the cost of preparing and selling 280 million board feet and administering the harvest of 210 million board feet of commercial thinnings and salvage material.

The total program for fiscal 1968, as compared with 1967, follows:

[In thousands]

	1967	1968	Increase or decrease
Regular program:			
Harvest	$23,955	$23,950	−$5
Sale preparation	8,615	8,601	−14
Advance sale preparation	275	305	+30
Thinning and salvage:			
Harvest	----------	676	+676
Sale preparation	----------	748	+748
Timber inventories and management plans	1,618	1,620	+2
Total	34,463	35,900	+1,437

Additional workload and cost information for fiscal 1966 through 1968

	1966	1967	1968
1. Regular program:			
a. Harvest:			
Million board feet	12,138	12,500	12,500
Cost per thousand board feet	$1.69	$1.92	$1.92
Total cost (in thousands)	$20,525	$23,955	$23,950
b. Sale preparation:			
Million board feet	11,244	12,000	12,000
Cost per thousand board feet	$.75	$.72	$.72
Total cost (in thousands)	$8,450	$8,615	$8,601
c. Advance sale preparation:			
Million board feet	1,500	2,200	1,500
Cost per thousand board feet	$.20	$.13	$.20
Total cost (in thousands)	$304	$275	$305
2. Thinning and salvage:			
a. Harvest:			
Million board feet	----------	----------	210
Cost per thousand board feet	----------	----------	$3.22
Total cost (in thousands)	----------	----------	$676
b. Sale preparation:			
Million board feet	----------	----------	280
Cost per thousand board feet	----------	----------	$2.67
Total cost (in thousands)	----------	----------	$748
3. Timber inventories and management plans:			
Thousands of acres	8,530	9,400	9,500
Cost per acre	$.18	$.17	$.17
Total cost (in thousands)	$1,530	$1,618	$1,620

The proposed program is necessary to meet national needs for timber products including both domestic and defense requirements. Alternate sources of timber cannot provide the necessary increase in volume. Such sources are either being overcut or are producing at or close to capacity. To meet national needs in 1968, a program of expanded thinnings and salvage cutting is needed in addition to the regular harvest cutting. This program is to offer 280 million board feet of thinnings from young overstocked stands and other salvage material. The total harvest program includes the cutting of 210 million board feet of the thinnings and salvage material for a total of 12.71 billion board feet and will cost $24,626,000, or $671,000 over fiscal year 1967.

The harvest program requires that 12.28 billion board feet of new sales be offered in 1968. The proposed sale program, including advance sale preparation, will cost $9,654,000, or $764,000 over fiscal year 1967.

Returns to the Treasury from the timber harvest program continue to increase. The following tabulation shows receipts from the sale of National Forest timber:

[In millions]

Fiscal year:	*Receipts*
1962	$106.2
1963	117.4
1964	128.0
1965	138.8
1966	164.9
1967 (estimated)	168.7
1968 (estimated)	171.5

Based on the above tabulation, each dollar of program cost for 1968 will return over $4.75 to the United States Treasury in the form of receipts.

The program for timber inventories and management plans is at about the same level as in fiscal year 1967, or $1,620,000—up to $2,000 over fiscal year 1967. This work is essential in establishing the allowable annual cut and is basic to the timber harvest program. Working circles are inventoried, and new management plans developed on the basis of current inventory data at about decade intervals. Program costs vary somewhat from year to year based on the size of the working circles involved. Improved techniques have made it possible to keep unit costs nearly constant, despite higher costs.

Examples of Recent Accomplishments

Sales administration.—A record high volume was harvested from the National Forests for the fourth consecutive year. During fiscal year 1966, 12.1 billion board feet were harvested—an increase of 900 million board feet over the previous year. Receipts to the Treasury from this record harvest amounted to $164.9 million, up $26.1 million over the preceding year. A total of 11.3 billion board feet of timber was sold on the National Forests in fiscal year 1966. In addition, preliminary award was made in a long term sale of 8.75 billion board feet in Alaska. The contract requires that primary manufacturing of the timber involved will be in Alaska.

Real progress has been made in automating customer accounts in timber sale. It is expected that such accounts on the heavy timber forests in the Western United States will be fully automated during fiscal year 1967.

Progress in meeting the sustained yield allowable cut objectives during the past five years is shown on the following table. A comparison between the volume actually cut and the annual allowable cut is shown below.

[Volumes in billions of board feet]

Fiscal year	Annual allowable cut [1]	Actual volume cut	Percent of allowable cut harvested	Actual volume sold	Percent of allowable cut sold
1962	10.5	9.0	86	10.3	98
1963	11.3	10.0	88	12.2	108
1964	12.0	11.0	92	11.7	98
1965	12.0	11.2	93	11.5	96
1966	12.4	12.1	97	11.3	91

[1] As of Jan. 1 preceding the fiscal year. Annual allowable cut includes only sawtimber for national forests west of the Great Plains and in Alaska, and sawtimber and convertible products for national forests in the eastern half of the United States.

Timber resource management: Reforestation and timber stand improvement

1966	$17,360,000
1967	17,640,000
1968	17,640,000

No program increase is proposed.

The program for fiscal year 1968 is needed to increase timber growth and quality on the National Forests to supply the Nation's requirements for industrial wood. Other values such as water, wildlife, and natural beauty will also benefit from the work. The supply and demand for timber on which the program is based has been estimated on the basis of gross national product and population projections. They show deficits in timber supply and growing stock by the year 2000 and beyond, at current levels of management. Because of the time required for trees to grow to usable size, a major part of the total needed reforestation and stand improvement work must be done in the next decade to be effective when the timber shortages will occur.

Proposed use of 1968 appropriation and comparison with 1967 and 1966

	1966, actual		1967, estimate		1968, estimate	
		Acres		*Acres*		*Acres*
Reforestation	$10,330,000	114,600	$10,700,000	118,000	$11,000,000	125,000
Timber stand improvement	5,308,000	187,927	5,525,000	190,000	5,275,000	180,000
Genetic tree improvement	950,000		910,000		1,010,000	
Nursery development	772,000		505,000		355,000	
Total	17,360,000	302,527	17,640,000	308,000	17,640,000	305,000

The following summary is for the total 1968 reforestation and timber stand improvement program Projections of timber growth and timber values are based on data obtained by economic analysis.

Increase realized from reforestation of 125,000 acres in 1968

	Year 2000	Year 2020	Year 2040
Volume (thousands of board feet)	2,438,070	3,961,935	5,485,731
Value	$47,973,798	$110,936,364	$189,896,730

Increase from 180,000 acres timber stand improvement in 1968

	Year 2000	Year 2020	Year 2040
Volume (thousands of board feet)	1,626,532	2,643,110	
Value	$39,329,552	$80,271,238	

The $355,000 for nursery development is for enlargement and modernization of existing nurseries. Replacement of old buildings is still needed at some of the nurseries that were constructed under the CCC program. The major development work is tapering off and should be completed in the next two or three years. The $150,000 reduction in nursery development below 1967 expenditures will be used for genetic tree improvement and to reforest 600 acres of timber productivity sites 1 and 2 in important commercial timber types.

The genetic tree improvement program is for the purpose of producing improved tree seed in seed orchards for project reforestation work. Results obtained with small quantities of seed already produced in seed orchards and by research projects show marked improvement in disease resistance of white pine, increased gum yields in slash pine and increased growth and quality of other species including the southern pines, Douglas-fir, and ponderosa pine. Orchards are also being established for other important tree species including black walnut and black cherry.

Examples of Recent Accomplishments

Reforestation.—An area of 114,600 acres of National Forest land was reforested with appropriated funds in 1966—95,033 acres by planting and 19,567 acres by seeding.

In addition, 10,979 acres were reforested by cultivating the ground to regenerate from natural seed fall.

Other reforestation accomplishments include:

(1) Procurement of 87,003 pounds of clean tree seed. 41,329 pounds were purchased from commercial seed dealers, and 45,674 pounds were processed in Forest Service seed extractories.

(2) Production of 99 million trees in 14 Forest Service nurseries.

(3) Major modernization and expansion at two Forest Service nurseries and minor improvements at eight others.

(4) Progress on genetic improvement of forest trees consisting of locating superior trees and propogating them in seed orchards and development work to enlarge and improve seed orchards and seed production areas at 160 locations. Production of improved seed for important hardwood timber trees was started with work on black cherry and black walnut.

In addition to reforestation accomplished with appropriated funds, the following work was done with funds collected under authority of the Knutson-Vandenberg Act:

	Acres
Reforested by tree planting	100, 867
Reforested by seeding	19, 652
Reforested by cultivating the ground to regenerate from natural seed fall	40, 112
Total	160, 631

The total area of National Forest land reforested in 1966 with appropriated funds and Knutson-Vandenberg funds by planting, seeding, and natural regeneration on prepared sites in 1966 is 286,210 acres. This exceeds last year's record by 27,396 acres.

An estimated area of 118,000 acres will be reforested by planting and seeding with appropriated funds in fiscal year 1967. Planting and seeding with Knutson-Vandenberg funds in 1967 is expected to be 150,000 acres.

Timber stand improvement.—An area of 187,927 acres of young growth was treated by the following cultural measures with appropriated funds in 1966 to increase timber growth and improve timber quality:

	Acres
Thinning	69, 218
Release	114, 136
Pruning	4, 573

An additional area of 68,812 acres was lightly burned over by controlled fires in the southern pine types to increase timber growth and timber quality by reducing competition of understory brush and destroying host plants for tree diseases.

Timber stand improvement work was also done for the same purposes with Knutson-Vandenberg funds on the following acreages in 1966:

	Acres
Thinning	76, 600
Release	152, 946
Pruning	5, 194

In addition, 82,623 acres in the southern pine types were treated by controlled burning with Knutson-Vandenberg funds.

An estimated area of 190,000 acres will be treated by stand improvement measures (exclusive of controlled burning) with appropriated funds and an estimated area of 260,000 acres with Knutson-Vandenberg funds in fiscal year 1967.

Recreation—Public use

1966	$28, 604, 000
1967	31, 139, 0000
1968	34, 638, 000
Increase	+3, 499, 000

An increase of $3,499,000 is needed as follows:

(1) $1,951,000 for upgrading waste treatment systems at 25 recreation sites for purposes of water pollution abatement in response to Executive Order 11258 dated November 17, 1965.

(2) $1,548,000 for development of recreation facilities in National Recreation Areas and similar sites and for stepping up operation, maintenance, and cleanup of the existing 9,500 recreation sites and their facilities.

The following tabulation shows by major program segments total planned financing for fiscal year 1968 as compared with fiscal years 1966 and 1967 (in thousands of dollars):

	1966	1967	1968	Changes between 1967 and 1968
Operation and maintenance:				
Cleanup of undeveloped sites	------------	$308	$1,250	+$942
Cleanup of developed sites	$8,708	9,580	10,849	+1,269
Maintenance of developed sites	7,861	8,725	10,077	+1,352
Administration of wilderness	------------	604	1,000	+396
Development:				
New construction and quality improvement of existing facilities	12,035	11,922	11,462	−460
Program total	28,604	31,139	34,638	+3,499

As indicated above, a decrease is made in the development item to provide for adequate operation and maintenance of existing facilities. Steadily increasing use of such facilities places serious soil and vegetation impacts at both developed and undeveloped sites. This heavy use requires more intensive cleanup, maintenance, and people-control to assure visitors a valuable recreation experience and protect the sites. Amounts shown for development of facilities include projects of national significance, such as National Recreation Areas, Blanchard Springs Caverns in Arkansas, Boundary Waters Canoe Area in Minnesota, and Sylvania Tract in Michigan.

OPERATION AND MAINTENANCE

Cleanup and administer undeveloped areas, roadsides, and trails.—$1,250,000 will be used to clean up areas of concentrated use on more than 300,000 miles of roads and trails, 90,000 miles of fishing streams, and 30,000 miles of lake and reservoir shores within the National Forests. Concentrated public use at undeveloped areas is a pollution hazard. Shortage of facilities at many developed sites has intensified the problem, especially during holidays and peak weekend periods when overflow crowds are forced to camp and utilize undeveloped areas. Special precautions are essential for public safety and prevention of contamination of water bodies. Measures to provide for public safety by regulation of use at hazardous swimming areas and winter avalanche hazard areas are also a must. More road and trailside cleanup is necessary to maintain acceptable landscapes along travel routes.

Cleanup of developed sites.—$10,849,000 will be used to more adequately finance an acceptable cleanup job. People are demanding higher sanitation and cleanliness standards. Because of increasing use at all developed areas, many even beyond their planned capacity, it was necessary last fiscal year to use recreation funds badly needed elsewhere to accomplish the cleanup job. There are about 9,500 developed sites requiring an expenditure of approximately $1,150 annually to clean up each site. These sites will accommodate 626,500 persons at one time.

Maintenance of developed sites.—$10,077,000 will be used to protect and maintain all types of recreation facilities at developed sites and information centers in a safe and usable condition. Continually increasing use is putting exceptional wear and tear on improvements and the sites on which they are located. Soil, vegetation, and the "hardware" at many sites demand increased maintenence.

Administration of National Forest wilderness and primitive areas.—$1,000,000 will be used to administer the National Forest wilderness and primitive areas in order to meet the most pressing needs resulting from increased public awareness and use. Sanitation and cleanup; providing information, maps, and instruction to users; and marking of wilderness boundaries where necessary to assure conformance with the Wilderness Act will all require a substantial increase in management effort. Estimated annual cost of National Forest wilderness management averages over 12¢ per acre per year for 14.5 million acres, or $1.8 million annually.

DEVELOPMENT

Construction of campgrounds, picnic, swimming, boating, observation sites, and interpretive facilities.—$11,462,000 will be used to develop additional recreation capacity that is desperately needed. The lack of adequate developed site capacity is forcing people to use undeveloped areas and creating major sanitation and public safety problems at such places. The program level indicated will finance development of 298 new sites, with a capacity of 19,588 persons at one time. Including the financing available for water resources related activities, approximately 416 sites will be constructed in fiscal year 1968. If this level is maintained until 1972, there will be 11,155 developed sites with a capacity of 793,120 persons at one time. Based upon needs projected in the National Forest Recreation Survey, by 1972 26,400 sites with a capacity of 2.5 million persons at one time will be needed (Figure 2). At the beginning of fiscal year 1968 there will be 9,500 such sites. Development funds are also used to raise the standard of existing facilities at sites that are not meeting present day demands. An example of such work planned to be done in 1968 is the upgrading of waste treatment systems at 25 recreation sites for purposes of water pollution abatement.

Examples of Recent Accomplishments

Recreation use of the National Forest System reached a new high in calendar year 1965, with an estimated total of 160,336,100 visitor-days being reported. The visitor-day unit is now used by all Federal agencies responsibile for administration of recreation use on public lands. Although there is no predictable relationship between these quantities and past estimates which were based on different concepts, evidence indicates that the rate of increasing demand continues unabated.

Camping and picnicking were the most popular activities in 1965 and accounted for 49.5 million visitor-days. Fishing and hunting use totaled 30.3 million and recreation travel (mechanized) was next in popularity with a total of 29.3 million visitor-days. Winter sports of all kinds amounted to 5.4 million visitor-days of which 4.3 million was skiing use. Boating accounted for 4.5 million; swimming, waterskiing and other water sports 4.0 million for a total of 8.5 million visitor-days of water-oriented recreation use other than fishing.

Activities associated with resorts, organization camps, and recreation residences accounted for a record 18.5 million visitor-days.

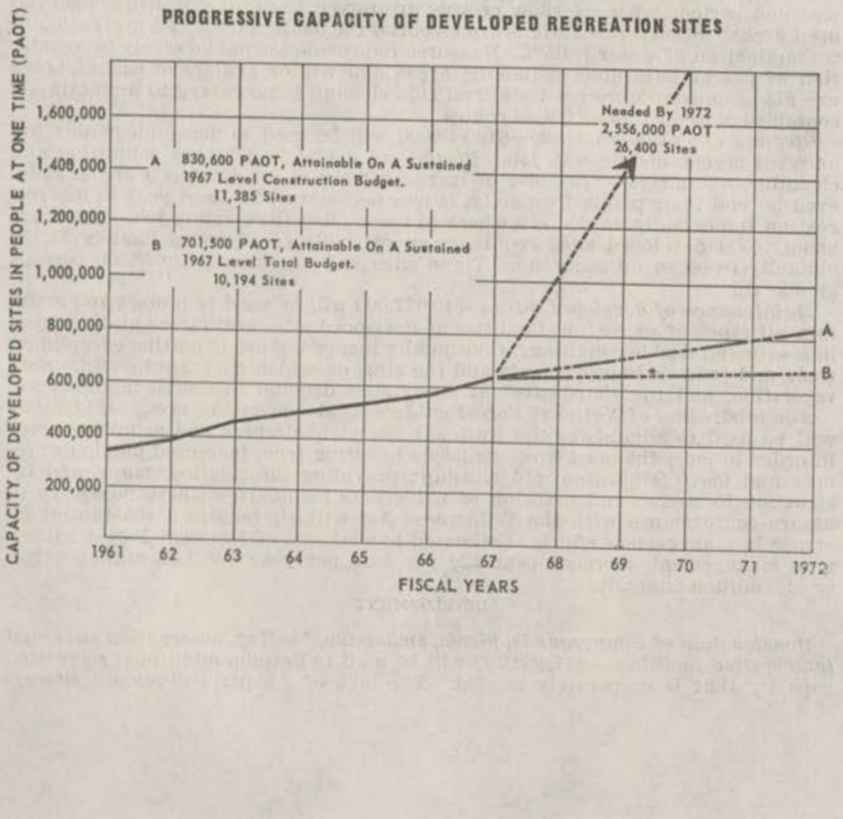

FIGURE 2

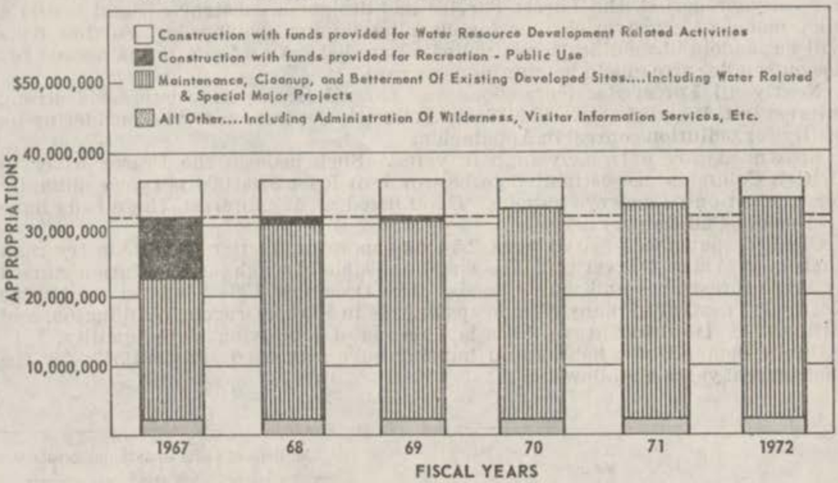
IMPACT OF RECURRENT WORK ON POSSIBLE EXPANSION OF RECREATION FACILITIES IF APPROPRIATIONS WERE TO REMAIN AT THE 1967 LEVEL



Wildlife habitat management

1966	$3,872,000
1967	3,971,000
1968	4,301,000
Increase	+330,000

An increase of $330,000 is needed as follows:

(1) *$175,000 for development of wetlands in the Chippewa National Forest, Minnesota.*—A development plan for these wetland resources was recently completed in cooperation with the Bureau of Sport Fisheries and Wildlife and the Minnesota Department of Conservation. The plan indicates substantial benefits for the relatively low per-acre costs, as follows:

(a) Increase annual waterfowl use by 25,000 pairs to produce 75,000 ducklings.

(b) Flood control. Storage of surface water in the 33,000 acres of potholes and impoundments.

(c) Increase wild rice production, valued at $1 per pound.

(d) Provide pike spawning areas.

It is estimated the total project of 50,000 acres will cost $1,340,000 to develop, or $27 per acre.

The Chippewa National Forest occupies an important position in the Mississippi Flyway. It lies immediately adjacent to the prairie pothole region and is characterized by a great variety and abundance of lakes and wetlands. Many of these wetlands are now unattractive to waterfowl. They can be substantially improved through management and development.

The various types of development techniques include:

(a) Construction of low head, low hazard dams to convert sedge meadows and shrub swamps to productive marshes. In many cases abandoned beaver flowages can be economically reclaimed with a simple spillway or a dike.

(b) Blasting potholes with Ammonium nitrate-fuel oil mixture. This is an economical and effective method of producing surface water for waterfowl breeding and brood-rearing purposes.

(c) Constructing economical nesting islands and platforms to provide predator-free nesting sites for waterfowl of various species.

Wetland development improves other resources and activities. Chief among these are recreation, flood control, wild rice production, fisheries, furbearers and the aesthetic value associated with wildlife of all kinds.

(2) *$155,000 for development of a gravel cleaner for salmon spawnbeds.*—Over a three-year period, the Forest Service has designed, constructed, and tested a pilot model of a gravel cleaner for cleaning salmon spawnbeds. Further tests will be made and modifications applied as needed. An adaptation is needed for use on smaller streams in mountainous terrain.

Nearly all Forest Service regions and several States have expressed strong interest in this equipment. The Water Pollution Control agency is considering its utility for pollution control in Appalachia.

Spawnbeds are extremely high in value. Such beds in the Fraser River in British Columbia are estimated to be worth at least $160,000 per acre annually for production of sockeye salmon. Capitalized at 4% interest, these beds have a value of $4 million per acre.

Cleaned spawnbeds are at least 2.5 times more productive of salmon fry than unclean gravels. Gravel beds are made unusable through sedimentation caused by large forest fires and major floods. The December 1964 floods in the Pacific Northwest destroyed many salmon spawnbeds in Idaho, Oregon, Washington, and California. Desilting gravel beds is a means of improving water quality.

Public demands for fishing and hunting have increased substantially for the past several years as follows:

Year	Millions of visits to national forests		
	Fishermen	Hunters	Total
1950	3.2	2.0	5.2
1955	7.6	3.7	11.3
1960	13.3	6.8	20.1
1965	19.4	10.8	30.2

This rate of increase is expected to continue. Fishermen and hunters account for about 25% of the total recreation visits to these public lands. The enjoyment of all kinds of wildlife, including rare and endangered and other nongame forms, is important to many of the additional users. An estimated 50 million man-hours of employment is generated annually in rural areas as a result of hunting and fishing on National Forests.

To accommodate this increasing public need, a progressive wildlife program must be maintained involving the following classes of activity:

(1) Providing qualified technical supervision over wildlife and its habitat to prevent damage from other resource activities.

(2) Participating with the respective States in cooperative management and development programs. States are recognized to have regulatory authority over resident species of fish and game which necessitates a cooperative approach. About 40% of the wildlife development work on National Forests is financed by the respective States under cooperative work agreements.

(3) Improving wildlife habitat through direct project work to increase wildlife production and hunting and fishing opportunities.

Nearly all resource activities on the National Forests have direct effects on wildlife habitat. For example, timber harvesting, livestock grazing, and road building can be very damaging to wildlife unless special precautions are prescribed and followed in implementing management plans for these resources. The coordination of wildlife with other resource uses is one of the major demands on the time of wildlife specialists in the Forest Service organization. Unless this phase of the job is effective damage to wildlife can far exceed the benefits from direct habitat improvement projects.

Habitat for fish, game birds and animals, and nongame species, including rare and endangered forms can be improved to increase productive capacity. The recently completed wetlands development plan for the Chippewa National Forest in Minnesota shows the substantial wildlife benefits which will accrue on one National Forest from a modest investment.

The National Grasslands have great potential for increasing wildlife production for the enjoyment of people. To date, little has been done for wildlife on these lands except in a few localities. Rare and endangered species occurring on National Grasslands include lesser and greater prairie chickens and blackfooted ferrets. Various upland game birds, waterfowl, antelope, and deer are the principal huntable game populations occurring here.

Range resource management

1966	$5,362,000
1967	5,527,000
1968	5,682,000
Increase	+155,000

An increase of $155,000 is needed to finance implementation of grazing fee adjustments in accordance with commitment to the Bureau of the Budget.

Funds will be used to meet added costs for:

(1) Meetings with range users, through livestock associations and advisory boards, to explain and discuss changes in fees.

(2) Special studies on the National Grasslands to determine and incorporate costs incurred by grazing associations for administration and conservation into a revised fee base.

(3) Development and implementation of an automatic data processing program to fully automate annual fee determination and billing for fee collection under a revised fee structure.

Program Objectives

The immediate objective of the range management program is to help meet the current demands of the American public by providing grazing for food and fibre producing animals and for horses and mules used by recreationists. A corollary objective is to improve the rangelands of the National Forest System to economically feasible levels of production and maintain those levels under good management and conservation practices. Along with this is the objective to provide a continued and necessary source of livestock grazing for the 20,000 family-size ranch units which depend in whole or in part on the National Forest System range resource. The Nation is dependent on such free enterprises as these range livestock ranches to meet the expanding demand for food. Ranchers grazing livestock upon National Forest System lands produce fat lambs and stocker and feeder cattle which grow out on these lands and then are moved to grain-producing areas for finishing.

A far reaching objective of this program is to provide a practical demonstration of applied range management science under a wide variety of conditions and thereby favorably influence the management of 600 million acres of privately owned rangeland in the United States.

Even more far reaching is the objective to provide leadership in the management of the world's natural rangelands through practical demonstration and assistance in training of Nationals from countries with range based economies. Our work under this helps meet the Nation's commitments under such international programs as "Food for Freedom" and the "Alliance for Progress." Second perhaps only to staple grains, meat is more in demand than any other item of food in an underfed world.

The goal is to attain optimum productivity of the range resource on National Forest System lands by the year 2000. Interim goals are:

(1) To complete a range analysis and develop a plan of management for each of the 11,600 range allotments in the National Forest System by 1972; the average allotment contains 9,000 acres. Analysis is a project job. After the initial job of range analysis and planning is accomplished, funding needs and effort will settle down to what is required to periodically maintain management information current and to update the allotment management plans.

(2) To have all 11,600 allotments under intensive management by 1973. This jobload and the cost of doing it are cumulative. When an additional 1,000 allotments are placed under intensive management, a new program level is established. To maintain the new program level requires sustained funding commensurate with the new need. If more allotments are placed under intensive man-

agement, additional funding is required. For this reason, intensive systems of management are expected to be initiated on only a nominal number of allotments in 1968 (see below). The effort will be directed at providing adequate management to the 4,000 or so allotments which have been placed under intensive management in previous years. The 7,600 remaining allotments will receive only extensive management.

Examples of Recent and Projected Accomplishments

Management of Ranges—National Forest System Lands

Item	1966	Estimated, 1967	Estimated, 1968
Allotments analyzed (allotment units)	605	607	607
Additional allotments placed under intensive management	1,000	1,000	100
Allotments established in the South	80	100	120
Number of livestock placed under permit in the South [1]	6,260	8,000	10,000

---

[1] Also in the South, trespassing livestock have been reduced by 20,000 cattle and horses and 8,500 sheep since 1960.

Program Benefits

(1) The 11.1 million animal unit months of grazing provided by the National Forest and National Grassland program produce food and fibre with a gross estimated value of $75,000,000 annually (Figure 4a, right).

(2) The 20,000 family size ranch units which operate on National Forest System ranges provide 30,000 man-years of direct employment annually. Other rural employment is generated by the demand for services and supplies created by these 20,000 enterprises.

(3) Some 600 rural communities, with livestock raising as their principal, economic base, are dependent in whole or in part upon National Forest System lands for their range resources.

(4) The private land, improvements, equipment, and livestock connected with the 20,000 ranch units which operate on National Forest System lands form a total tax base with an estimated value of over two billion dollars (Figure 4a, left).

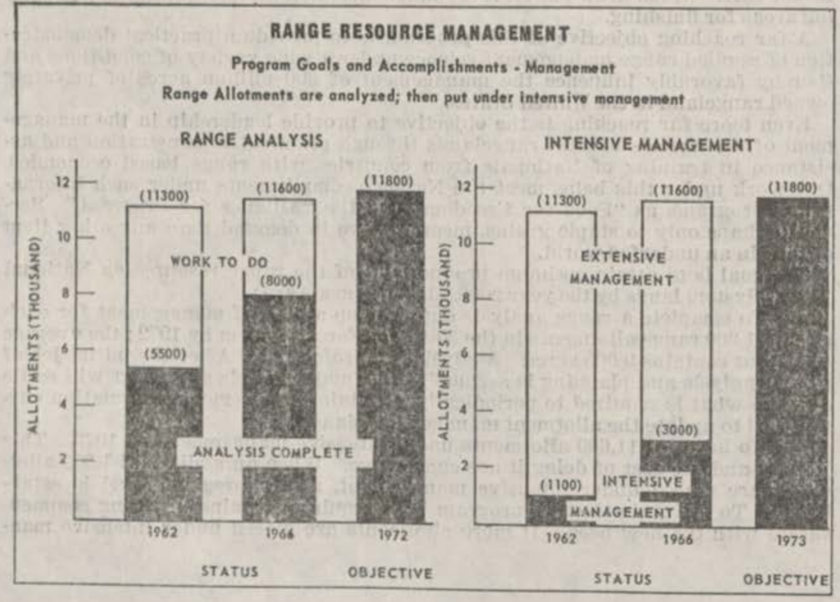


FIGURE 4A

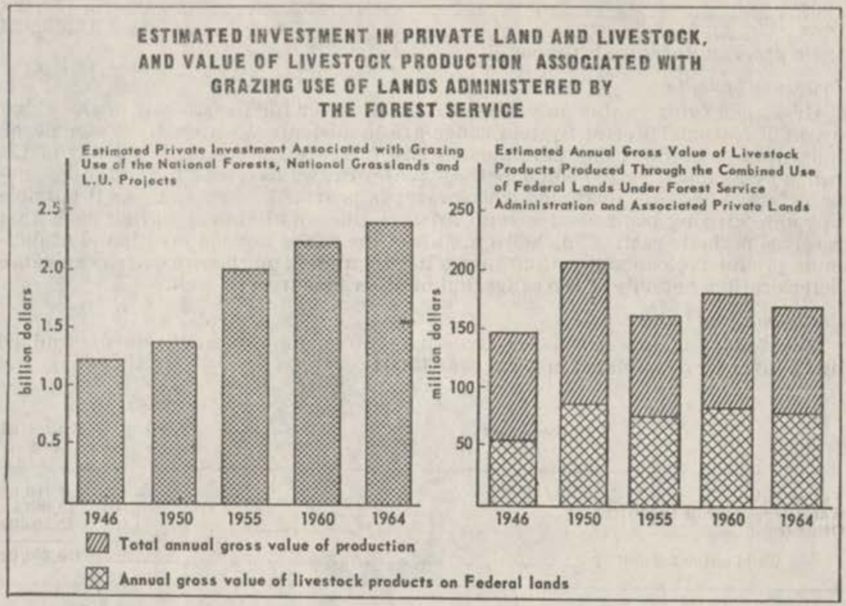

Range revegetation

1966	$2,810,000
1967	2,854,000
1968	2,854,000

No program increase is proposed.

Range revegetation is a vital part of the overall management program for any allotment where the forage cover is severely depleted. Depleted range areas are often key areas which affect the management of the entire allotment. They have been depleted because livestock naturally like to use them and have concentrated there. They are areas where the natural vegetation will not recover within a reasonable time; they must be helped through revegetation treatment, followed by careful management.

Two million acres have been treated. An inventory completed in fiscal year 1966 revealed that previous estimates of the amount of depleted range needing revegetation treatment were much too conservative. The new inventory shows that an additional 7.5 million acres of severely depleted rangeland in the National Forest System needs revegetation treatment.

Revegetation of these ranges may be accomplished by the year 2000 at approximately the current level of financing and the current rate of permittee contribution. Because the soil and vegetation resources continue to deteriorate on these depleted ranges, there is an urgency to getting them rehabilitated.

Examples of Recent and Projected Accomplishments

Revegetation on National Forest System lands

[In acres]

Fund source	1966	1967	1968
Government funds	199,700	199,700	199,700
Permittee contribution	25,000	25,000	25,000
Total	224,700	224,700	224,700

Range improvements

1966	$3,379,000
1967	3,442,000
1968	3,442,000

No program increase is proposed.

Program benefits

Grass has forage value only when drinking water for livestock is near. Many areas of National Forest System range are inadequately watered. Water developments are needed; one development can increase the grazing capacity of the range by as much as 100 cow months. Water draws livestock to the forage; unused forage becomes available when water is provided. Fences make it possible to rotate grazing use among several areas within an allotment so that each area receives periodic rest. This helps maintain the range in good health and at optimum productive capacity. Continuous heavy grazing on the same area can cause deterioration, not only of the range, but of other resources as well.

Program Needs and Goals

The following are needs for structural range improvements as determined by an inventory completed in fiscal year 1966:

Improvement	Number	Estimated cost
Fences (miles)	60,000	$81,500,000
Water developments (each)	37,000	53,300,000
Other (each)	14,000	15,700,000
Total estimated cost	--------	150,500,000

In addition, current maintenance need for existing improvements is $2,600,000 annually. This will increase to $5,200,000 annually when all improvements are in place. Current permittee contribution is about 50% of the maintenance and 20% of the construction. Costs of water developments to be installed in the future will be considerably higher per unit than current costs. At present, most of the water developments being put in are simple and relatively inexpensive. However, opportunities for getting water so cheaply will soon be less common. Costs per unit will increase as management intensifies and needs for deep wells and pipelines materialize.

Recent and projected accomplishments

[Dollar amounts in thousands]

Soil and water management

1966	$5,722,000
1967	6,361,000
1968	6,361,000

No program increase is proposed.

The watershed management program consists of two inseparable main activities. The first deals with prevention or restoration of damage to the soil and water resources. The second consists of action programs for maximizing benefits to be derived from the water resource. Scientific soil and hydrologic surveys and analyses provide the basic information upon which detailed plans and action programs are developed and carried out. The present field activity is limited to that which can be accomplished by about 60 soil scientists and 60 watershed scientists. The end products are measured in terms of maintenance or improvement of water quality, increased water yield, improved timing of water yield, maintenance and improvement of soil productivity, and assurance of the availability of water for National Forest purposes. The detail of the survey and analysis—whether reconnaissance or comprehensive—depends upon the complexity of the individual watershed situation. Positive water yield improvement programs are always based upon the detailed, comprehensive surveys and analyses which relate the composite interrelationship of climate, vegetation, soil, and underlying geology of the watershed to its behavior in terms of water production.

Major watershed action programs will be continued with water quality monitoring receiving some additional emphasis, as follows:

(1) *Water quality.*—Detailed management plans will be developed for 30 municipal supply or other high value watersheds. Return flow monitoring will be initiated at 20 locations where the threat of serious water pollution exists. The monitoring will allow early action to be taken to correct any unsatisfactory water quality condition. The composite result of these actions will provide continued assurance of quality water yields essential to continued economic welfare and public health for many thousands of people.

(2) *Water use requirements.*—Inventories of water available and needed for present and foreseeable National Forest System development and administration will be made for 12 watersheds. The Western States involved will be notified of these needs under the reservation principle. Assurance of an adequate water supply is prerequisite to continued and expanded public use and enjoyment of the National Forest resources.

(3) *Water yield improvement.*—Programs will be underway on six watersheds. The programs, consisting of measures such as snowpack management and/or improve timing of water available to streamflow, will increase usable vegetation manipulation to increase quantities and/or water supplies significantly. This added supply furnished to installed systems serving water-short areas provides a means of continuing or improving the long-term economic stability of the downstream users and at the same time enhances the transitory values such as aesthetics and fisheries.

(4) *Barometer watersheds.*—Three additional watersheds will be equipped for inclusion in the system of barometer watersheds, bringing the total to 17. These barometer watersheds, carefully selected to be representative of their hydrologic province, are instrumented to measure all the factors influencing the production of a sustained water supply, including the effects of management programs within the watershed on water quantity and quality. The measured findings from the barometer system will provide the factual data needed to accurately prescribe treatment programs in the other watersheds within the same hydrologic province.

(5) *Coordination and protection prescription.*—It is estimated that detailed prescriptions will be developed by soil and watershed scientists for over 400 development projects. Time has proven these prevention efforts to be most valuable in minimizing soil erosion, stream sedimentation, and other forms of water pollution—thus preventing a corresponding decline in aesthetic values and in deterioration of water quality with its adverse effect on downstream users. Paralleling these benefits is the reduction in maintenance costs for the development facility. Planned fiscal year 1968 efforts are expected to benefit the water yielding capacity of over one million acres of National Forest System lands.

(6) *Watershed restoration.*—Watershed restoration projects, based upon complete watershed plans, will be completed on 15 watersheds to prevent further site deterioration, water quality impairment, and in some cases downstream flood damage.

Mineral claims, leases, and special uses

1966	$3,976,000
1967	4,097,000
1968	4,097,000

No program increase is proposed.

This program provides for supervision, administration, regulation, and control of mineral disposal and special land uses on National Forest System lands, while ensuring adequate protection of water quality and other surface resources.

The work involves:

(1) Mineral examination of mining claims included in patent applications.
(2) Determination of surface rights.
(3) Mining claim occupancy and occupancy trespass action.
(4) Mineral leasing and permits.
(5) Mineral reservation and outstanding rights administration.
(6) Special uses other than recreation.

Orderly development and disposal of minerals requires careful supervision to protect other forest resources from unnecessary damage during mining operations and to make sure disturbed areas are placed in condition to contribute to sustained beneficial use and production.

Mineral examination of claims under patent application is necessarily on a current basis. Valid mining claims must be recognized and clear-listed for patent when all requirements of the mining laws have been met. Equally important is the detection and elimination of unauthorized use of public land on claims which fail to meet the requirements of the mining laws. This is necessary to release this land for the public uses for which National Forest System lands are managed. It is estimated there are 8,000 occupancy trespass cases on mining claims. Examination under PL 84–167 revealed over 5,300 residential-type structures on mining claims. Actions clearing up less than 1,000 of these cases have been completed. Applications under the Church-Johnson Act will legalize some of these occupancy cases.

Prospecting in wilderness areas can be expected to increase as mining companies attempt to complete their mineral exploration work prior to the 1983 terminal date established in the Wilderness Act. Orderly and supervised exploration, now necessary for coordination with public values of soil, water, and other surface resources, will be even more essential and demanding when assuring harmonization with wilderness concepts.

Mineral leasing activities require similar managerial measures. This includes reviewing applications for mineral permits and leases filed with the Bureau of Land Management to determine whether mineral exploration and development can be carried on in harmony with National Forest objectives to protect soil and water, recreation, and other purposes, and to provide stipulations and guidelines for assuring coordination with surface resource requirements. It includes on-the-ground administration to make sure the stipulations are understood and applied in harmony with other surface use and management, and to make sure that facilities which are a part of mineral permits and leases, such as roads and pipelines, are properly installed and maintained.

Surface mining requires protection and supervision before, during, and after the operation to prevent deleterious effects and provide adequate reclamation. Surface mining of coal has an added hazard of acid pollution of streams. Recent expansion of steam generating capacity using coal will give new impetus to the coal strip mining industry, which has been on the increase each year. Several large surface coal mines have been opened in the West—notable in the Craig-Steamboat Springs area in Colorado and the Four Corners area of Colorado, New Mexico, Arizona, and Utah. Other operations are taking place in Wyoming. Some of these operations will include coal deposits in the National Forests and Grasslands. New methods of processing and upgrading iron ore and taconite have now made it economically feasible to mine low-grade deposits. Demands for both coal and iron have resulted in increased leasing and mining of both public and privately owned minerals on acquired lands as well as public domain National Forest System lands.

Mineral reservations and outstanding rights administration concern the protection of the public's interest in the surface and future interest in mineral rights and resolving questions of present mineral ownership and surface use rights. Because of the increasing interest in mineral activity on acquired lands, knowledge of mineral ownership will ultimately result in significantly increased revenues to the United States while adding to the economic base of local communities and States. Abstracting of mineral titles was not required with purchase of the land. This program needs to be completed at an early date for all acquired lands within the National Forest System.

Special use permits and easements (other than recreation) for the use of National Forest lands have increased materially within the past few years. In addition, there is a turnover of about 10%, or 4,000 permits, a year caused by changes in ownership. The permits and easements presently being administered cover in excess of 5,000,000 acres and over 57,000 miles of rights-of-way.

Failure to properly supervise and administer these uses could result in serious damage to National Forest resources and a direct monetary loss to the Government. The protection of natural beauty, the health and safety of millions of people, and the control of water and air pollution are all serious factors that must be considered.

Examples of Recent Accomplishments

Mining claims.—Determination of surface rights under PL 84–167 begun in 1956 is now about 85% complete. There is remaining, however, on-the-ground examination of nearly 2,300 claims on 22,000,000 acres. As of July 1, 1966, over 114,000,000 acres had been examined. The Government has thus far recognized the validity of 2,033 claims, amounting to 50,000 acres. About 1,000 claims are yet to be examined to complete the complex and difficult task. The following table shows progress for two years and the estimated accomplishments for fiscal years 1967 and 1968:

Year	Acres examined	Claims examined	Asserted rights valid	
			Claims	Acres [1]
1965	6,636,900	1,246	147	2,940
1966	4,795,600	1,169	111	2,220
1967 estimated	6,000,000	1,200	130	2,600
1968 estimated	6,000,000	1,200	130	2,600

[1] Computed using 20 acres per claim.

Petitions filed under PL 87-851 (Church-Johnson) as of January 1, 1966, resulted in the examination to determine the validity of 164 mining claims on 40 forests. Of 154 applications filed, there were 83 qualified applicants and 40 unqualified. The Bureau of Land Management rejected 31 applications. Fee simple title was offered in 15 cases, 30 were offered life estate, and one was limited to a specific number of years. A total of 60 cases have been consummated under the Act.

Mineral permits and leases.—There are over 17,000 mineral leases and permits on 15 million acres within the National Forest System. Mining and prospecting permits issued and administered by the Forest Service directly during fiscal year 1967 covered nearly three-fourths million acres. Included were some 1,040 permits for common varieties of mineral materials and nearly 1,100 permits for borrow pits for highways and construction purposes. Total revenues from mineral leasing and oil and gas exploration and development on National Forest System acquired lands and common variety sales from all National Forest System lands, amounted to $3,752,760 for fiscal year 1966. In addition, an estimated $16 million in revenues were received from rents and royalties for leases on National Forest and National Grasslands reserved from the public domain.

A significant agreement (two leases) was recently negotiated with International Nickel Company to mine copper, nickel, and associated minerals from approximately 5,100 acres in the Superior National Forest, Minnesota. If the initial exploration and development of metallurgical processes proves economically feasible, it will provide an economic boon to the community of Ely and to northern Minnesota, which will suffer with the closing of the Pioneer mine, which is being phased out. Special provisions have been included for the protection of soil, water, and recreation resources, including natural beauty.

In addition to the above, there are 140 active operations on some acquired lands in which the owner retained mineral rights when the land was purchased by the Government.

Special uses.—National Forest land and other land administered by the Forest Service may be used for special purposes when such uses are in the public interest. About 40,000 special use permits covering 51 different purposes such as archaeological research, hay cutting, electronic installations, reservoirs, water supplies, and many other desirable uses are now in effect. Fiscal year 1966 receipts for special land uses were:

Power	$104, 073
Other land uses, not associated with recreation	534, 745
Total	638, 818

This is an increase of $40,363 over the previous year.

Land classification, adjustments, and surveys

1966	$4, 345, 000
1967	5, 725, 000
1968	6, 349, 000
Increase	+624, 000

An increase of $624,000 is needed for the following purposes:

(1) $23,000 for land classification.
(2) $416,000 for land exchange.
(3) $139,000 for land line location and land status records.
(4) $46,000 for photogrammetric surveys.

These increases are further explained under each item below:

Land classification.—An increase of $23,000 is needed to:

(1) Accelerate classification surveys of defined subareas in National Forests and National Grasslands as basis for programing expanding land exchange and land consolidation programs and National Forest boundary adjustments—taking into account land ownership, management situations, land use, and public values.

(2) Accelerate cooperative planning efforts at communities in Alaska to facilitate State applications for National Forest lands—a matter of State and local concern.

The requested increase will bring the total amount available for this activity to $369,000.

The function of land classification is to make analyses and recommended programs concerning the scope, location and composition of the National Forest System.

Current and prospective growths in population, increased leisure, demands of urban people for outdoor space, crises in water supplies relative to expanding needs, and increased national needs for forest products bring mounting pressures on available land. Land area is fixed; demands constantly increase; these factors give urgency and complexity to National Forest System planning.

Changing public interests require reexamination of the boundaries of National Forest units relative to needs of the public for water, recreation, wood, and living space. Areas where more effective and economical administration of the National Forests for conservation purposes might be achieved by consolidations of landownership through exchange procedures must be defined and critically evaluated. This is necessary to provide a firm basis for planning advantageous land consolidation programs, establishing priorities, and scheduling timing. Areas where transfers between public agencies will promote economy in the management of public properties also must be defined, analyzed, and evaluated.

Additions to the National Forest System are based upon adequate analyses of all factors involved to assure that the public advantages are high and justified permanent National Forest programs. The continuing and growing public use of lands at and near large Federal reservoirs require land jurisdiction and management arrangements that promote optimum public use and efficiency of administration. National Forest programs tie in directly with national programs for improved rural economies, increased forest resources, reduced stream pollution, adequate outdoor space for public use, and enhancement of the scenic values of rural lands.

Consolidation problems that affect public programs in National Forests and National Grasslands will require more consideration and accelerated action as use pressures on land intensify. Interdepartmental agreement on management of land at Department of the Army reservoirs and legislation enacted in 1965 to enable transfer of lands at Bureau of Reclamation projects have stepped up action for consolidation of land jurisdictions at Corps and Bureau reservoir projects located within or adjoining National Forests. Joint studies with the Bureau of Land Management or the National Park Service are underway or completed which concern proposals for substantial adjustments in land jurisdiction. Additional consideration is being given to possible enlargement of National Forest programs in Appalachia. The public interest in other rural areas where forestlands predominate but local economies are at a low ebb needs consideration. Now underway is a survey of the potentials for National Forest programs in the Potomac Basin that would provide effective assistance in the attainment of national objectives for that area.

The land classification program for fiscal year 1968 will be concerned with some 5 million acres of forest, watershed, and recreation lands, largely in the eastern United States but including public domain—National Forest and National Park-National Forest areas in the western part of the Nation. This concern will be from the standpoints of National Forest land consolidation; National Forest boundary adjustments to exclude lands where National Forest programs are no longer justified and include lands where such programs will be nationally and locally desirable; national recreation area proposals; and interagency adjustments in land management and jurisdiction.

Examples of Recent Accomplishments

Cooperative studies in Montana by the Forest Service and Bureau of Land Management resulted in an interchange of jurisdictions involving nearly 66,000 acres of public lands. Lands transferred to the Bureau consisted of an isolated block of National Forest lands remote from the forest supervisor's and district ranger's offices and surrounded by lands administered by the Bureau of Land Management. Lands transferred to the National Forest System approximated 38,000 acres in scattered tracts of vacant public domain that were distant from other lands administered by the Bureau but adjacent to comparable lands administered by the Forest Service. A similar effort in Colorado brought about consolidations of National Forest and scattered public domain at Dillon Reservoir. This will permit integrated development of public recreation on such lands in the interest of efficient and economical public land management. An intensive analysis of areas in Colorado National Forests wherein private lands stemming from mineral patents and many small intermingled tracts of National Forest lands give rise to difficult management and use problems is well underway to give direction to exchange and consolidation programs.

Land exchange. An increase of $416,000 will be used to:

(1) Examine an estimated 150,000 acres of offered and selected lands in highly desirable exchange proposals.

(2) Prepare appraisals and valuation reports including supplemental studies as necessary for 100,000 acres of offered and selected lands. These are cases already in process which are in urgent need of early completion.

The proposed increase will bring the total amount available for this activity to $2,908,000.

Overall fiscal year 1968 plans for this program are to implement a 5-year crash program of land exchanges recommended by a Joint Management Review Task Force, comprised of people in the Bureau of the Budget, USDA, and CSC. This effort will enable the Forest Service to update and perfect present land adjustment plans for all areas. It will involve the examination and appraisal of 650,000 acres involving an estimated 475 exchanges. The land the Government gives and receives in exchanges must be examined and appraised.

Properly conceived exchanges can result in obviating the construction of certain road segments, and the locating and marking of property lines. The issuance of certain special use permits and other management costs can also be avoided. Substantial program costs can be avoided as a result of these effects.

For example, the estimated 10-year cost avoidance to be achieved with the $2,908,000 programed for fiscal year 1968 is $16,200,000 (Figure 7a). Selected examples of estimated savings which will result during the next ten years from the fiscal year 1968 exchange program:

Reductions	Units	Amount
(1) Property lines and corners	[1] 4,170	$4,500,000
(2) Road construction and maintenance	[1] 540	7,900,000
(3) Use permits and occupancy trespass	[2] 1,180	700,000
(4) Road rights-of-way needs	[2] 800	3,100,000
Total		16,200,000

[1] Miles.
[2] Cases.

Material revenue increases to the United States Treasury can also result through well planned exchanges. Access road problems can be eliminated and make heretofore inaccessible mature timber stands available for harvest to the mutual benefit of the United States and timber companies in need of log supplies. Significant benefits can be derived for both the United States and private owners engaged in livestock operations through the consolidation of ownerships, thus reducing costs and improving management of the ranges.

An example of a recent exchange approved in the State of Oregon: The United States will grant a heavily timbered 80-acre parcel surrounded by private lands. In return, the United States will acquire six parcels totaling 1,188 acres. 1,111 acres of the land being acquired is good timber-producing land which will increase the allowable cut by approximately 1,000,000 board feet. The exchange will result in a net reduction of 11¾ miles of property line and will reduce road right-of-way needs and road construction.

In fiscal year 1966, 127 land exchanges were consummated. In these exchanges the United States acquired 166,150 acres valued at $16,075,028 and granted 148,631 acres valued at $15,325,763. The net increase in National Forest acreage was 17,519 acres.

Land line location and land status records.—An increase of $139,000 or a total program of $2,140,000, is needed to establish funding levels that will shorten the time required to complete the initial phases of these programs, namely:

(1) Corner search and identification phase in land lines work. At present program levels this phase will require more than 25 years to complete. The increase for 1968 is the first step toward shortening this span to ten years or less.

(2) Conversion to new status records system. Present program levels will only assure having this project one-half completed by 1970. This is much too short a span and the increase for 1968 will be a start toward the objective of getting the entire project completed by the end of 1972.

The Joint Management Review Task Force recommended that these two projects be drastically stepped up and pushed to completion. The total job is the task of getting land ownership lines defined on the ground by proper corners and clearly marked boundary lines and installing a complete, easily understood ownership record of all lands in the National Forest System including the encumbrances and outstanding rights and interests that limit or restrict management.

This money will have to be spent either in a planwise program or to handle trespass and claims cases that are sure to occur. A general description of each of these programs follows:

Land line location.—Lands in the National Forest System are bounded by 281,168 miles of property lines and 1,132,353 property corners. The corners were established by surveyors from 50 to over 150 years ago (average over 100 years ago). A continuing program for finding, marking, and maintaining these corners and lines was started in 1958. Before this, there was no provision for this work. Little was done and many corners have been lost. It is estimated that 10,000 corners disappear yearly. This program needs to be speeded up to meet the demands for development and public use of all National Forest System resources, to prosecute and prevent trespass, and to carry on general administration with full confidence and a minimum of conflicts and ill will.

In fiscal year 1966 $255,000 of the Forest Service appropriation for land line work was transferred to the Bureau of Land Management to finance part of this program. A similar transfer ($285,000) was made in fiscal year 1967. This level will be maintained in fiscal year 1968.

Preliminary reports show that the Bureau established 995 corners by cadastral survey on lands administered by the Forest Service during 1966, the first year of this cooperative program. It is estimated that 80% of the established corners are property corners and 20% are corners off National Forest property lines but needed to control the corners on the property lines. This is an outstanding accomplishment considering that the work must be scattered to meet pressing needs.

Work proposed for 1968 as compared with 1967 and 1966

Job	Fiscal year 1966, accomplished	Fiscal year 1967, planned	Total planned, fiscal year 1968	Fiscal year 1968, planned increase
Corners:				
Search	22,000	26,000	27,000	+1,000
Remonument	10,500	11,000	11,750	+750
Establish	-----	700	750	+50
Maintenance	-----	200	400	+200
Miles:				
Identify, survey and mark:				
To full standard	1,350	1,000	1,050	+50
To partial standard	-----	1,500	1,600	+100
Maintenance	-----	1,500	1,625	+125

Examples of accomplishment since 1958

Corners (1,132,353 in the National Forest System):

1. Search for corners:	
a. Corners searched	128,560
b. Corners found	69,600
c. Corners lost	59,000
2. Establish and perpetuate corners:	
a. Found corners remonumented	57,100
b. Corners established	1,900
c. Mounmented corners maintained	500

Property Lines (281,168 miles in National Forest System):

1. Identify, survey, and mark:	
a. To full standard	7,870
b. To partial standard	23,100
2. Maintain lines previously identified, surveyed, and marked	8,750

Land status records.—This is a job of converting to a new status record system. In the process all records affecting title and restricting use of lands in the National Forest System are reviewed. Many discrepancies and previously unknown interests are being found and corrected. The new system will provide current central posting of records and a complete atlas record for all Forest Service administrative field units (about 1,100).

WORK PROPOSED FOR 1968

Townships completed

1966 Actual	1,500
1967 Planned	1,700
1968 Estimated	1,850
Increase	+150

(Total townships in program—17,000. Completed through 1966—5,900)

Examples of Program Benefits

The systematic research of records and conversion to the new system continues to identify many parcels and general areas which have previously been misunderstood, identified inaccurately or overlooked in administration due to poor identifying ties between records and ground location. This project goes "hand-in-glove" with the land line location program.

Partial completion of the National Grasslands and Land Utilization projects has revealed several parcels of public domain land previously considered to be private. Major acreage discrepancies continue to be found on several National Forests. Trespasses continue to be revealed.

A major accomplishment is the assembly of many complex mineral ownerships, platted as individual mineral surveys, on base maps to show their proper location with respect to lands of the United States. These for the first time give field people sorely needed details of situations to help in preventing trespass and in solving administrative problems.

Photogrammetric surveys.—An increase of $46,000 is requested to bring the total for this project to $932,000. There is an urgent need to accelerate photogrammetric surveys to provide terrain data, resource inventory data, and general management maps for multiple use management in problem areas. The increase is proposed to meet the minimum needs of 200 square miles of terrain data.

At the present time our lack of terrain data on land in the National Forest System seriously hinders and restricts multiple use planning and resource management and protection. Many thousands of man-hours are lost because of nonexistent, inadequate, or incomplete photographic and terrain information for such functions as designing roads, laying out timber sales, developing recreation areas, and general planning. Moreover, lack of these data prevents the preparation of standard multiple use plans, limits the use of modern terrain data techniques in National Forest management activities, and fosters poor judgments and questionable decisions. Plans have to be remade whenever more adequate data become available, thus further aggravating the situation by duplication of effort and added cost.

Multiple use planning requires a particular knowledge of the terrain, the extent and location of the natural resources, such as timber and range and how these resources are related and tied in with existing and planned transportation and recreational facilities. Elevational information is essential in the planning of transportation systems, timber sales and recreational facilities. Aerial photographs and photogrammetric surveys are the most modern tools for use in procuring data needed to determine the extent and location of National Forest resources, for improving and extending the management of them and related facilities, and for recording multiple use plans and activities.

These data are needed on some 617,000 square miles of area within the National Forests for general planning of transportation systems, and planning timber sales. Approximately 44% of this area is adequately covered. The funds programed for fiscal year 1968 would be used to procure aerial photographs, establish horizontal and vertical control and procure elevational terrain information by photogrammetric methods for 0.5% or an equivalent of 3,200 square miles of the areas for which these data are needed.

The scale, format, and accuracy of this material would be such that it can be released to the U.S. Geological Survey and form an integral part of the standard topographic mapping program of the United States. Thus, duplication of effort is avoided, costs are reduced, and the availability of standard topographic maps is speeded up.

In addition, the funds would be used to prepare, from existing terrain data, bases on the scale and format needed for showing the interrelationship of all National Forest resources—timber, water, forage, fish and wildlife, and recreation—affecting the multiple use management of the National Forest System. The scale and format of the prepared material must be compatible with the scale of the aerial photographs used in the execution of resource inventory surveys. These data are transferred to the multiple use management plans by photogrammetric means. The area of coverage of the plans to be prepared with the requested funds is about 0.5% or 4,000 square miles of the total requirement, or a decrease of 11,000 square miles for which funds were available in fiscal year 1966.

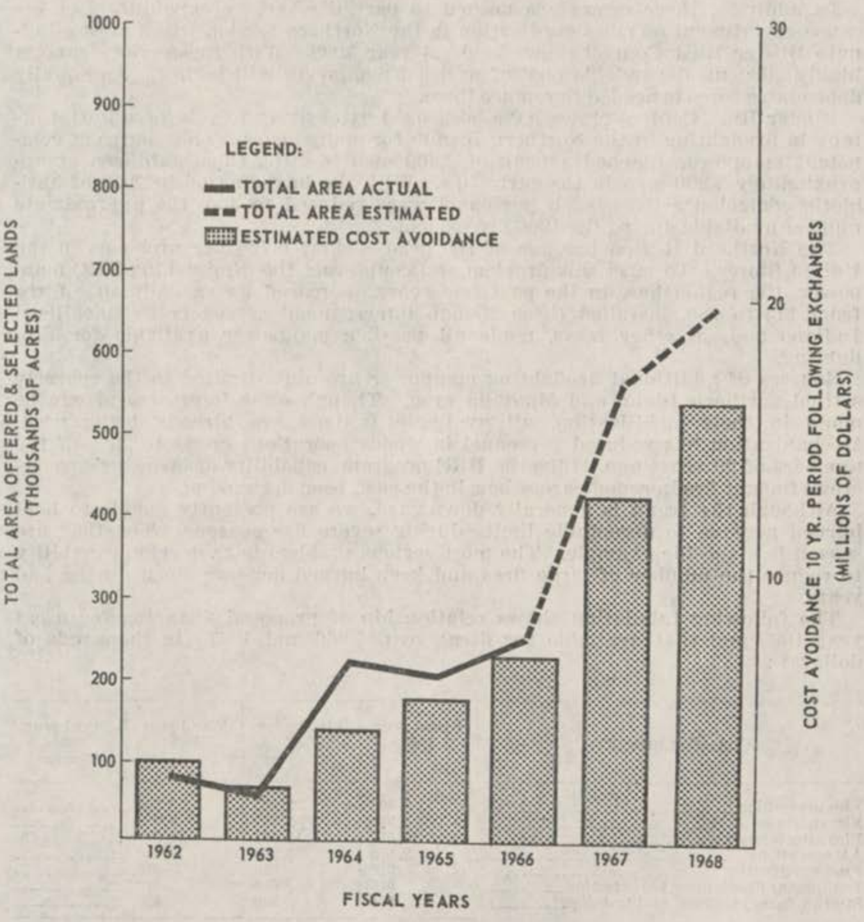
Utilizing the terrain data and resource inventory data procured through photogrammetric procedures, it is proposed to prepare general management bases on an adequate scale and format for approximately 15 National Forests. This represents new bases for approximately 5% of those needed but makes no provision for needed revision to bring others up to date.

The following table shows comparison of the actual or planned accomplishments under approved or requested financing:

	Fiscal year		
	1966	1967	1968
Terrain data (square miles)	3,800	3,000	3,200
Resource inventory data (square miles)	15,000	4,000	4,000
General management base (forests)	15	15	15

FIGURE 7A

TRENDS IN FOREST SERVICE LAND EXCHANGES



Forest fire protection

1966	$24, 454, 000
1967	25, 487, 000
1968	26, 172, 000
Increase	+685, 000

An increase of $685,000 is needed to:

(1) Provide better fire protection in line with increasing land and resource values.

(2) More nearly assure a standard of protection adequate for successful management of National Forest resources.

Although large, damaging fires occur in many rural areas in the United States, historically most of them are in central and southwestern Idaho, northeastern Oregon, northern Utah, southeastern Arizona, and throughout the mountains of California, particularly in the southern part of the state. In an attempt to further reduce the damage from these large fires in fiscal year 1968, local initial attack forces would be strengthened and six additional mobile 25-man crews would be placed in the western regions. These specialized suppression crews would be based to provide coverage for the historically critical fire areas, but would be shifted throughout the west as needed to meet seasonal fire danger conditions. Eight similar crews were used extensively during the 1966 fire season and were instrumental in combating many medium-sized fires before they became large conflagrations.

In addition, three crews are needed to partially replace capability loss because curtailment of ribes eradication in the Northern Region will almost eliminate Blister Rust Control crews in fiscal year 1968. With these crews gone, a highly efficient, dependable pool of well led manpower will be lost. An equally dependable force is needed to replace them.

Blister Rust Control crews have been used extensively to reinforce initial attack in firefighting in the Northern Region for many years. This source of competent manpower reached a peak of 2,400 men in 1946, then stabilized at approximately 1,200 men in the early 50's. With the introduction in 1959 of antibiotic control practices, such personnel were reduced to 450, the approximate number available during the 1966 fire season.

The Northern Region has one of the most serious large fire problems in the United States. To meet this problem and counteract the diminishing BRC manpower, the region has, in the past few years, increased its smokejumper force from 135 to 180, installed three 25-man interregional attack crews, mobilized Indians and, in other ways, made all possible manpower available for firefighting.

Sources of additional firefighting manpower are quite limited in the sparsely settled northern Idaho and Montana area. Though some improvement can be made in their mobilization, all available Indians are already being used. Mechanization has reduced personnel in woods operations crews to 25% of the numbers of 20 years ago. Like the BRC program, capability of operator's woods crews to fight fire in remote areas has, in the past, been decreasing.

Although the trend is generally downward, we are presently unable to hold burned acreage to acceptable limits during severe fire seasons. The 1966 fire season is a specific example. The most serious problem is to develop capability to reduce the number of large fires and keep burned acreage down during bad years.

The following tabulation shows relationship of proposed financing for fiscal year 1968 and that available for fiscal years 1966 and 1967 (in thousands of dollars):

Protection measures	Fiscal year 1966	Fiscal year 1967	Fiscal year 1968	Fiscal year 1968, increase
Fire prevention	3, 490	3, 565	3, 565	----------
Fire detection	3, 310	3, 380	3, 380	----------
Fire attack forces	13, 550	13, 862	14, 547	+685
Air operations	2, 670	3, 240	3, 240	----------
Fuel modification	310	310	310	----------
Equipment development and testing	610	610	610	----------
Studies, surveys, plans, and training	514	520	520	----------
Total	24, 454	25, 487	26, 172	+685

Program Objectives

Forest fires cause serious damage to water, soil, timber, recreation, and forage resources. The overall objectives of fire protection are to achieve, at reasonable cost, an acceptable degree of protection from loss by fire of these valuable resources, as well as to protect property and human lives.

Reduction in area burned has been achieved in most years through:

(1) Increased fire prevention and law enforcement.

(2) Better training of fire control personnel.

(3) Expansion of air operations for rapid delivery of firefighting equipment and men and dropping of fire retardants.

(4) Improved predictions of burning conditions.

(5) Improved fire equipment and better understanding of fire behavior.

Cooperative efforts with other Federal agencies, States, and municipal fire control organizations have been expanded and strengthened. These efforts have resulted in a more effective overall fire control job.

The specific goals for fiscal year 1968 are as follows:

(1) Accelerate the fire prevention program to reduce man-caused fires to the goal of 3,500 annually by 1970.

(2) Cut down the heavy losses occasioned by the few but disastrous "conflagration fires" by strengthening forces for more effective initial attack, particularly in the high risk and high hazard areas where these fires occur.

(3) Continue to improve cooperative efforts with other Federal agencies, States, and municipalities with the objectives of developing more available "total strength" when major fire emergencies develop. An interagency fire center at Boise, Idaho, is being developed jointly with the Department of the Interior. Joint planning is being done in fiscal year 1967 with construction funds included in Bureau of Land Management requests for fiscal year 1968.

(4) Improve fire management through better training of fire control personnel; developing more effective fire equipment; and expanding its operational use.

(5) Accelerate safety and related efforts to reduce the chances of men being burned while fighting fires.

Examples of Recent Accomplishments

Air attack progress.—Night helicopter operations offer great possibilities to get firefighters on the fireline quickly and efficiently when they are most needed. Favorable results from current tests in progress under actual forest fire conditions should provide guidelines for limited night operations in 1967. Many additional heliports and helispots which tie to plans for ground attack have been developed for more efficient and economical firefighting. Additional airplane patrols for detection of forest fires were organized recently.

Fire training and development.—Fire training is doing much to assure competent supervision and efficient work in all fire control activities. Completion of fire control training and development guides established new benchmarks for fire training needed by all Forest Service personnel, and by personnel specializing in fire control. Careers in fire work are given more definite direction by the guides. *The Fireman's Handbook* was revised and reissued. It was written especially for use by non-professional firemen and crew bosses.

The Progressive Referral Method was developed for fire training and first used in 1966. With PRM the trainee is progressively referred to explanatory materials when his knowledge is lacking, or to new subject matter when he finds himself adequate. This new method promises to save much of the cost of linearly programed texts and of retraining when it is unnecessary.

Other fire training in 1966 included pilot testing of Edex, a response-demanding audio-visual device, and training of 70 Forest Service and cooperating agency personnel in fire generalship. A new training film, "Fire vs. Fire," has been produced to help identify training needs and reasons for using backfiring and burning-out in firefighting.

Fire prevention and law enforcement.—Emphasis during the past year has been on preparation for additional public use pressures. This was highlighted by a servicewide staff work conference where a new national action plan was drafted. The plan recognizes both on-the-ground and far-reaching prevention actions taken by home unit fire personnel and resource managers. Emphasis in prevention has been placed on all fire agencies working cooperatively.

Most noteworthy of new day-to-day prevention work has been the use of a helicopter as a prevention tool in a high frequency escape-fire and incendiary area. More attention has been given to spark arrestor and inspections to reduce fires from equipment.

Safety.—An improved Belt-Kit Fire Shelter has been given initial field distribution. This shelter is carried by the fireman and is for last-chance-only use. It is constructed of better fire-resistant materials and is intended as an extra measure of protection for individuals working in critical conditions.

Through September 30, one firefighter was killed as the result of a rolling rock. Then on November 1, a flareup on the Loop Fire, Angeles National Forest, California, burned to death 10 men and severely injured 12 others. Two of the injured men died in the hospital later. A group of fire experts analyzed this tragedy. In early 1967, a task force will prepare a program for carrying out the analysis goup's recommendations to prevent similar disasters.

Air safety has been strengthened by improving upon inspection of contract aircraft. Safety-oriented training materials have been prepared which are directed toward helicopter users.

Fire-weather and fire-danger rating.—Fire-weather reporting and forecasting services have been improved in many areas. Working in close cooperation with the U.S. Weather Bureau, fire managers are supporting field forces with better fire-weather information and forecasts. A new meter for determining fire-danger rating has been developed and is undergoing field tests. Early trials indicate the device will speed up and improve accuracy of fire-danger calculations.

Fuel modification.—This work is modest in extent but highly important in providing results for application on a broad scale when an expanded fuel modification program is possible. The work is being integrated in the overall fire planning process to provide, in addition to hazard reduction in heavy fuel concentrations, a preplanned system of firebreaks and accessways that will enhance overall fire control effectiveness and multiple use values.

Rural fire defense.—The National Fire Coordination Study made the last two years for the Office of Civil Defense showed that fire will be a serious but manageable threat to human lives if a nuclear attack is launched upon the United States. Using the findings of pertinent research and administrative studies, the comprehensive report of this study describes programs to counter the fire threat and presents guidance materials, plans, methods and equipment with which nationwide preparations for defense from nuclear fire can be started. This report is a "State of the Nation" treatment of the nuclear fire problem. Rural fire defense plans and preparations of the Forest Service are being geared to the findings of this report.

Structural improvements for fire and general purposes

1966	$10,865,000
1967	11,040,000
1968	11,040,000

No program increase is proposed.

This program provides for the construction, reconstruction, and maintenance of buildings, utilities, airstrips, communications systems, and other facilities throughout the National Forests and National Grasslands.

Amounts estimated for fiscal year 1968, compared with 1966 and 1967, are as follows:

[Dollar amounts in thousands]

	Fiscal year 1966		Available, fiscal year 1967		Estimated, fiscal year 1968	
	Number of units	Amount available	Number of units	Amount available	Number of units	Amount estimated
Construction:						
Dwellings and barracks	53	$1,150	50	$1,056	45	$1,525
Fire lookouts	12	200	12	155	10	216
Service and storage buildings (including offices)	44	1,792	60	1,843	39	1,082
Airstrips and helispots	166	305	300	294	260	254
Communication facilities (radio and telephone)		1,050		1,012		1,012
Site acquisition		100		174		116
Major structures [1]	3	360	2	318	3	436
Total construction		4,957		4,852		4,641
Betterment:						
Upgrade existing structures, site improvements, landscaping and other miscellaneous construction		615		564		578
Raise standard of existing water and sanitary systems	38	515	23	465	60	662
Total betterment		1,130		1,029		1,240
Maintenance: Maintenance of existing improvements		4,778		5,159		5,159
Total, construction, betterment, and maintenance		10,865		11,040		11,040

[1] The three major structures planned for construction in 1968 are—

(1) Barracks, Angeles National Forest, Calif. $128,000

This is a 2-story barracks (dormitory and dining facilities) to house the Dalton 25-man hot-shot fire crew. This crew had been housed in buildings constructed during the CCC program. Because of their deteriorated condition they were torn down in 1965. The crew is temporarily housed in buildings on the San Dimas Experimental Forest, an arrangement that is not satisfactory due to location and the need of the space by the experimental forest. The fire crew is a key part of the fire organization of the Angeles National Forest and they need to be housed at the Dalton location. Otherwise, it would be impossible to meet fire control standards.

(2) Ranger station for 2 rangers in the Stanley Basin-Sawtooth Valley area, Challis an Sawtooth National Forests, Idaho 184,000

Facilities to be constructed at this site include 2 dwellings with basement and garage, a dual ranger's office, and the necessary site development and utilities. The office will provide space for 2 district rangers and their staff. Since recreation use on the national forests in this area is above ½ million visits per year, adequate space is needed in the office building to serve the public as well as to administer the national forest lands. The present facilities are of substandard log construction and provide inadequate space for current and future needs.

(3) Office for Ketchikan Ranger District, Ketchikan, Alaska 124,000

A combined ranger office and visitor center is planned to be constructed at a location convenient for forest administration and use by forest users and tourists. This combination will result in reduced total building costs and more efficient use of the personnel in administering the district and serving the public. The present office is in rented quarters in downtown Ketchikan where parking for visitors is very difficult.

Construction

Many ranger headquarters and field projects are located in remote areas or small communities where adequate housing is not available. Unless adequate housing is provided, it would not be possible to headquarter needed personnel at these work locations. Program costs would be increased excessively and the job of managing the lands and serving the public would suffer severely. There is also a great need for additional fire control structures, service buildings, and offices in outlying locations, as well as adequate communications facilities for National Forest protection and administration.

Landing fields, helispots, and heliports are essential to the effectiveness of the fire control program and multiple use management of the National Forests to make the best use of aerial operations and air equipment. They greatly facilitate rapid initial attack on forest fires, thereby increasing the chance for early control at small size which would result in a reduction of both suppression costs and resource losses. Construction and reconstruction of airport facilities such as airfields, heliports, and helispots are urgently needed.

Betterment

Existing facilities must be upgraded in order to continue their useful life. Many were constructed back in the 1930's with CCC labor and funds and require modernization. Some of these needs involve critical deficiencies in water and sewage disposal systems and in unsafe building foundations and electric wiring systems. Modern heating units are needed to replace those that are outmoded. In some instances addition of a room to a small dwelling, cabin, or office would accommodate expanding needs for many years. Some mountain airstrips and helispots have been made unsafe and inadequate for the increased use of large modern aircraft. Obsolete telephone systems are being converted to radio networks. Inadequate radio systems are being improved to meet communications needs.

Maintenance

It is essential in the interest of management economy to keep in reasonable repair the physical plant on which all National Forest activities depend. This plant in the main consists of about:

1,800 fire lookout towers and observatories
5,300 dwellings, cabins and barracks at field headquarters
800 field offices
6,300 storage and service buildings
3,100 water and sewage systems
20,000 radio units
1,200 landing fields and helispots
16,000 miles, telephone lines

These improvements are dispersed over the National Forests and National Grasslands. They are an integral and essential part of the management and protection of this large land area, involving forest fire protection, timber harvest, watershed protection, and other land use activities.

Maintenance funds are distributed to field units based on the number of improvements by classes currently justified by program utilization and an analyzed unit costs of maintenance. Priorities of maintenance are established at forest, and sometimes regional, levels so that structural improvements vital to protection of the resources will receive an appropriate degree of maintenance.

Examples of Recent Accomplishments

Emphasis has continued on construction of dwellings and barracks to provide housing and crew quarters at locations where private rentals are not available. Field headquarters offices are being provided and obsolete offices replaced to provide adequate working space. Construction of service buildings such as warehouses, shops and storage buildings at ranger stations has proceeded to fill the most urgent program needs. Following is a list of major structures on which construction started in fiscal year 1966:

Region 1:	West Yellowstone Interagency Fire Control Center, Gallatin National Forest, Mont	$152,000
Region 5:	Arcadia (San Dimas) Equipment Development Center, Calif.	130,000
Region 6:	Redmond Air Center, Deschutes National Forest, Oreg	105,000

The present rate of construction is providing new buildings and facilities to meet the most urgent needs. Maintenance was accomplished for the high priority needs, but the available funds are inadequate to keep the existing physical plant up to our maintenance standards.

Payments to employees' compensation fund

1966	$668,586
1967	733,000
1968	759,000
Increase	+26,000

An increase of $26,000 is required to reimburse the Employees' Compensation Fund, Department of Labor, in accordance with PL 86–767 (5 USC 785), which was enacted September 13, 1960, for benefit payments made from that fund to employees of the Forest Service who are injured while in the performance of duty. The 1968 payment will be $758,847. The payment for 1967 was $733,381.

Water resource development related activities

1966	$4,770,000
1967	6,766,000
1968	8,660,000
Increase	+1,894,000

An increase of $1,894,000 is needed to help meet Forest Service responsibilities resulting from installation of water development projects by other agencies. An increasing number of such developments for power, flood control, reclamation and general water supply purposes are being constructed in and adjacent to National Forests and National Grasslands by Federal, State and local agencies, and private groups.

The construction agencies initiate the projects and schedule the performance. The Forest Service cooperates in the planning, development, and management of the water and related resource developments associated with National Forest System lands.

Each project poses resource problems and opportunities peculiar to the individual site under consideration. This requires a comprehensive impact survey by the Forest Service to determine the effect of each water resource development proposal on all the resources and facilities affected by the project. These surveys prescribe the best pattern of multiple use management of the land and identify the resource management adjustments needed to attain maximum benefits from the water project.

The work performed under this program, in addition to impact surveys includes:

(1) Liaison with the construction agency.

(2) Development of public use and management facilities.

(3) Treatment of lands tributary to or within the project area to provide water flow which will better serve operating requirements of reservoirs and to provide for public safety and enjoyment.

Work and financing planned for fiscal year 1968 is compared with that for fiscal years 1966–1967:

[Dollar amounts in thousands]

	Fiscal year 1966		Fiscal year 1967		Fiscal year 1968	
	Number of units	Cost	Number of units	Cost	Number of units	Cost
Impact surveys and construction liaison	227	$767	175	$955	250	$1,455
Public use, access, and management facilities	7	3,856	23	5,324	30	6,004
Land treatment, soil stabilization, and cover improvement	3	147	6	487	25	1,201
Totals	237	4,770	204	6,766	305	8,660

Impact surveys and construction liaison, $1,455,000

Impact surveys are surveys which delineate the effect, define the mitigating measures and enhancement opportunities of water resource developments upon the protection, administration, and management of the National Forests and National Grasslands. Reports resulting from such surveys document items which are essential to the attainment of multiple use objectives when National Forest System lands are related to the project. To be effective, the surveys and reports must be concurrent with the construction agency's preliminary planning and must precede licensing or authorization.

Liaison with the construction agency is necessary during the construction period to facilitate coordination between the construction agency and the Forest Service. Protection of the land and resources, minimizing interference with regular protection and management activities, and facilitating construction agency operations are direct economic dividends derived from this program.

Fiscal year 1968 plans and justification.—Experience has shown that without adequate analysis and liaison effort such as is provided by this activity, natural resources often suffer from enormous waste and misuse. Natural beauty and high quality water are among those resources most susceptible to loss. The rising value of forest resources and constant increase in demands against the declining resource base requires increased perception, imagination and thoroughness in the preparation of impact surveys. A continuing program of impact surveys and construction liaison would go forward on about 250 projects.

Fiscal year 1966 accomplishment included impact survey preparation or construction liaison work for 227 projects. Among the projects for which the Forest Service prepared impact surveys during fiscal year 1966 are: West Divide, Bostwick Park, Little Dell, Smokey Range, Palisades, Lynn Crandall and Clark Ranch, Loss Valley, Takatz Creek, Johns Creek, Louden Ditch, Sullivan Creek, Warm River, Lake Winnibigoshish, Chewalla Creek, Houlka Creek, Stampede, Wynoochee, Garden Valley, Doniphan, and Blair Creek.

Examples of impact survey recommendations resulting in specific and meaningful contributions to natural resource values are:

a. A water development proponent desired to build an earthfill dam. Borrow material would have to come from adjacent areas of the surrounding forest and, in this case, would have resulted in massive scars and irreparable damage to the natural beauty of the area. On the basis of the impact survey findings the construction agency redesigned the project to use a concrete dam, thus increasing its multipurpose values.

b. A water development proponent desired to restrict natural channel streamflow releases in connection with a complex water diversion system proposal to the extent that downstream fishery, aesthetic and recreation values would be greately reduced. A reconnaissance hydrologic survey of tributary National Forest land, made as a part of the project impact survey, indicated a potential for increased water yield through appropriate land treatment measures. Because such additional yields will be available, agreement to the release of adequate minimum flows in the streams was forthcoming without difficulty.

Public use, access, and management facilities, $6,004,000

Fiscal year 1968 plans and justification.—The Forest Service is responsible for providing camping and picnic sites, swimming beaches, boat ramps, sanitation facilities, and other public use and information facilities on National Forest System lands at and adjacent to project reservoirs. These facilities, to serve their intended purpose should, whenever possible, be installed in time to meet the initial impact of visitor use when a new reservoir fills. Installation during the construction period is generally less expensive than after completion of the project. Failure to provide such facilities not only reduces the opportunity for public recreation enjoyment but, also, results in damage to prime recreation sites, destruction of natural beauty, pollution of streams and reservoirs, and conditions hazardous to the health and safety of the using public.

The fiscal year 1968 level of financing would provide needed public access, use and management facilities at 36 projects. The projects are:

Continuation of previous year's starts.—Libby, Hungry Horse, Fryingpan-Arkansas, Flaming Gorge, Joe's Valley, Mason, Cougar, Sam Rayburn, Chewalla, Toledo Bend, Allegheny, Monroe, and Middle Fork Anderson.

New starts in fiscal year 1968.—Pondere Lake, Boundary, Homesteak, Ashurst, Lyman, Tibble Fork, Lost Valley, Union Valley, Wishon, Courtright, Frenchman, Blue River, Kachees-Cle Elum, Cross Florida Canal, Bayou Boeff, Upper North River, South Branch North Fork, South River, Cave Run, Laurel River, Lewis Smith, Basin Brook, and Silvis Lake.

Fiscal year 1966 accomplishment included construction of facilities at seven projects—Ruedi, Mogollon Rim, Flaming Gorge, Shasta-Trinity, Allegheny, Sam Rayburn, and Monroe.

Land treatment, soil stabilization, and cover improvement, $1,201,000

Fiscal year 1968 plans and justification.—Treatment of lands tributary to water resource development projects to reduce sediment yield or to modify the pattern of runoff lengthens the life and increases the utility of the water control structures. This work is done on National Forest System lands tributary to the project, only where hydrologic analysis determines that such work is needed and the benefits to the project purpose are clearly established. Treatment programs include the following:

(1) Modifying the vegetation to decrease erosion, to reduce flood peaks and to increase the annual quantity of water yielded from the tributary lands.

(2) Clearing reservoir areas, where not done as a part of construction, and keeping the reservoir free of debris to make the area safe for recreation use and to maintain scenic beauty.

(3) Land treatment measures such as contour terracing, gully plugs, headwaters debris and flow retarding structures, and streambank and shoreline stabilization measures.

Fiscal year 1966 accomplishment included land treatment measures at three projects—Shasta Lake, Wickiup, and Detroit.

Fighting forest fires

1966	$12,500,000
1967	5,000,000
1968	5,000,000

No program increase is proposed.

The fighting of forest fires on National Forests and Grasslands is provided by this program. In addition to the regular fire protection organization, emergency forces may be employed when fire weather conditions are critical. Experience shows substantial savings are made by having a strengthened force ready to discover and attack fast-spreading fires. Reduction in damage and suppression costs is realized in relation to what might be expected from normal crew strength and normal procedures.

CALENDAR YEAR 1965 FIRE SEASON

The lowest burned area in the history of the Forest Service was recorded in 1965—75,150 acres. The previous low was in 1962 when 85,457 acres burned. Normal or below normal weather conditions in many places were helpful in attaining this record although several units had periods when fire danger was extreme. Due to dry lightning storms accompanied by strong winds, large fires occurred in late June in Arizona and New Mexico. The critical period of fire weather in mid-September in southern Oregon and northern California produced only a few fires and low burned areas on the National Forests. Fire weather was above normal in Oregon and Washington west of the Cascades. The record low burn area compares well with the five-year average of 208,974 acres. Fast, aggressive action on all fires made this record possible.

Fire occurrence down.—The number of fires as well as burned area was down for 1965. There were 9,365 fires reported for 1965 compared with 9,749 in 1964 and a five-year average of 12,393. Lightning fires were 5,243 in 1965, which is above the 1964 figure of 4,617 but well below the five-year average of 7,125. Man-caused fires dropped significantly again in 1965 to 4,122. This is well below the 1964 figure and the five-year average of 5,132 and 5,268 respectively. The 1970 goal of 3,500 man-caused fires seems within reach.

Major fires.—Large fires were few in number in 1965. Thirty-six fires over 300 acres were reported, which is a modern day low, and compares favorably with 61 such fires in 1964, and a five-year average of 83. One of the largest fires on the National Forests in 1965 was the Plum Fire on the Nebraska National Forest. It started from lightning on May 5, and burned almost 20,000 acres before it was controlled the next day. Burned area included 11,000 acres of tree plantations. The area had no forests until Dr. Charles E. Bessey, a University of Nebraska botanist, encouraged plantings begun about 1902. The burned area is part of the largest man-made forest in the United States.

CALENDAR YEAR 1966 FIRE SEASON

Throughout most National Forests and Grasslands, the 1966 fire season was the worst in many years. In the moisture deficient Eastern forests, where the time lag between rain and drought is short, April and May were critical months. By the end of May, dry weather in the West had pushed burning conditions in many areas to the danger point normally experienced in late July. In May, fires had already begun to escape initial attack, "blowup", and require large numbers of men and equipment to control.

Beginning with snowpack deficiencies, fire hazards in much of the West built up steadily from a dry spring through a virtually rainless summer. For example, in the Intermountain Region's Payette National Forest, fire dangers from mid-June to September ranged consistently higher than any experienced in many years—including the severe 1960 season. Annual rainfall recorded at Boise, Idaho through August 31 was only 3.15 inches, a record low, compared with an expected average of 7.68 inches. By late June, fire danger was extreme in Southern California. July, August and early September saw worse-than-normal-burning conditions throughout California, across the Northern Rockies, and the Pacific Northwest. Only in the Southwestern region did rain dampen an unusually severe May and June fire season. And even here, normal summer rains came late to Arizona and New Mexico, so their fire season was extended to mid-July.

To counter the serious burning conditions, several extraordinary measures were taken on a forest, regional, and national basis. Fire prevention efforts were intensified. In the California region, initial attack crews were manned to increased strength. When not fighting fires, the specially trained suppression crews were held on standby near the most critical areas. Crews of Southwest and Montana Indians were similarly used. Cooperative arrangements were strengthened with the Bureau of Land Management, Park Service, and State and local protective associations. Fires were mapped from the air using infrared techniques and equipment. In line with normal practice, detection and initial attack forces, including air tankers, maintained a high degree of surveillance and readiness.

Despite energetic efforts by available prevention and control forces, fire took a serious toll of National Forest resources in 1966. Fuels became so dry that once ignited, many fires spread immediately and rapidly. In the Southwest, the area burned during May and June reached some 31,000 acres, three times the 1961–65 annual average for the area. An airplane crash in mid-June on the Los Padres Forest caused the Wellman Fire—the season's largest—which spread over 93,000 acres of the San Raphael Wilderness before being controlled. From the first of July until mid-September, when rains finally came to lower fire danger over much of the area, crews battled 79 large (over 100 acres) fires in Forest Service protection areas in the western regions. Extreme fire danger continued into early November in Southern California, where the 1,900 acre Loop fire on the Angeles National Forest took the lives of twelve men who were caught in a brief flare-up. While this incident was the only one where lives were lost on the fire lines during a long and critical season, the tragedy has spurred renewed and even more vigorous efforts to examine firefighting methods, training, and capabilities so as to insure safe, as well as effective, fire suppression action.

In all, by October 31, 10,672 fires burned 331,435 acres, the largest area since 1960. Of these fires, 4,809 were man-caused. Though a serious loss, the 1966 burned acreage is not large in comparison with what might have happened. Time after time, prompt detection and aggressive initial attack stopped fires from making destructive runs, with 9,952 (93%) of the fires controlled at less than 10 acres. From these successes can be seen the savings gained by having flexible, hard-hitting forces available under very severe burning conditions.

Insect and disease control

1966	$12, 175, 000
1967	12, 363, 000
1968	11, 563, 000
Decrease	−800, 000

A net decrease of $800,000 is proposed.

(1) White pine blister rust control, $1,416,200 decrease

Recent evalution of the effectiveness of ribes eradication as a method of control of White Pine blister rust in northern Idaho, western Montana, and eastern Washington showed the rust in this region is infecting stands below 20 years old, at an average rate of 3% per year. This means there is no longer hope economically to carry those young stands through to merchantable size. Accordingly, the limited success of the ribes eradication programs, coupled with rising costs, led to the decision to terminate them.

Curtailment of ribes eradication as a means of controlling the disease in young stands in this region will result in a reduction of program funding by $1,416,200. Other parts of the blister rust control program, however, will be continued in this region at an estimated cost of $502,300.

It is planned to continue the blister rust control program for all other sections of the country at the budgeted level of $1,768,500 for fiscal year 1968.

(2) Other pest control, $616,200 increase

These funds will be used for control of a severe bark beetle outbreak on the Targhee National Forest in Idaho. Recent surveys show a rapid buildup of the number of infested trees in the areas now being treated. Surveys in October 1966 indicated there were 383,000 infested trees in the treatment area and the project was geared for funding at that level. As work progressed through the fall many additional infested trees were found.

January revised estimates show the number of infested trees increased 205,000 in the high priority area and that now 473,500 trees remain to be treated. This greatly increased workload will require acceleration of the project and its extension into fiscal year 1968.

Accelerated, continuing action is needed to successfully control the present bark beetle infestation that literally threatens the loss of nearly all the commercial timber on the Targhee National Forest. Industry and community stability are highly dependent on this timber. Loss of this timber would also have catastrophic effects on the prime recreation areas adjacent to Yellowstone National Park.

Insects and diseases have a greater impact on the Nation's forests than any other destructive agent Examples of the damage they do in an average year are:

(1) They kill 2.4 billion cubic feet of growing stock, including 9.2 billion board feet of commercial sawtimber. This is enough lumber to plank a boardwalk two inches thick and three feet wide from the earth to the moon.

(2) They seriously reduce timber yield by—

  (a) Retarding growth.
  (b) Stunting and deforming trees.
  (c) Delaying stocking.
  (d) Killing seedlings and reproduction.

(3) They can prevent the reestablishment of the most suitable and desirable tree species on certain sites. For example:

  (a) The chestnut blight not only wiped out the American chestnut, it also prevents the reestablishment of this valuable hardwood over the entire Appalachian Range.

  (b) White pines, one of the most desirable softwoods, cannot be grown on some sites because of the white pine blister rust.

  (c) The balsam woolly aphid is threatening to sharply limit areas where some species of fir can be grown.

  (d) Matsucoccus scale and the scleroderris disease pose a like threat to stands of red pine in the Northeast and North Central States.

(4) Insects and diseases seriously damage recreational areas, mar the scenic attractiveness of forest vistas, and kill and weaken trees that become hazards which must be removed at considerable cost to protect users of recreation areas and other public places.

(5) Insect and disease-killed trees increase forest fire hazard, the intensity with which fires burn, and the extent of damage they cause.

(6) When not promptly detected and controlled, insect and disease outbreaks can assume catastrophic dimensions that destroy all forest resources over entire drainages.

The objective of the pest protection program is to reduce by preventive measures and direct control action the huge damage and losses that pests inflict on forest resources. The program goal is to hold pest-caused damage and losses to levels commensurate with the uses and values for which specific forest areas of any ownership are managed, so that future national needs for wood products, recreation, and other forest uses can be met.

The pest control effort for fiscal years 1967 and 1968 must, of necessity, be estimated. This is because the onset, severity, frequency, and scope of pest outbreaks fluctuate widely, and reliable predictions of specific needs cannot be made one and two years in advance. The estimated pest control effort for the 1966–1968 period is:

[In thousands]

Item	1966	1967	1968
(1) For surveying forest lands of all ownerships to detect, delineate, and evaluate pest outbreaks, and to provide experienced leadership in planning and directing control operations	$2,671	$2,773	$2,890
The expansion over the 3-year period indicated for this item, which is made by corresponding reductions in other items, is to strengthen the national program of pest detection and evaluation. Experience has shown that the sooner control action can be taken, once need for control has been determined, the less the ensuing damage and cost.			
(2) For controlling bark beetles by logging or treating infested trees, cull logs, and stumps	$2,045	$2,427	$3,246
Trees to be treated	974	1,156	1,666
(3) To control insects that feed on foliage, shoots, buds, and seeds	$2,614	$2,326	$2,006
Acres to be treated	1,300	1,000	900
Costs of controlling pests for this item, which is largely done by aerially applied pesticides, have risen in recent years due to modifications in spraying methods to provide a wider margin of safety to fish and wildlife. Modifications entail (*a*) greater use of helicopters; (*b*) use of more costly pesticides; and (*c*) a more elaborate monitoring program to check pesticide impacts on the forest environment.			
(4) To control tree diseases such as blister rust, oak wilt, dwarf mistletoe, and root rots	$4,000	$3,992	$2,576
Acres surveyed to locate infected trees	40,000	40,000	40,000
Acres to be treated	500	500	480
(5) For methods improvement and developing and testing new equipment and pesticides	$845	$845	$845
Total	$12,175	$12,363	$11,563

From this input of effort will result an annual output in timber and forests protected estimated to be—

(1) Some 5⅓ billion board feet of timber saved.

(a) In terms of stumpage, this volume of timber would carry a price tag of about $42 million.

(b) In terms of lumber and other wood products, it would carry a price tag of $420 million.

(c) It represents enough lumber saved to build 512,000 average-sized homes.

(d) To harvest this volume of timber and convert the logs into manufactured wood products would require 80,000 man-years of employment.

(2) If but one of the 82 outbreaks usually controlled annually should go unattended and get out of hand, the ensuing epidemic could disrupt the economy of an entire lumbering community.

(3) Timely control also protects recreation areas from the unsightliness and hazards arising from a forest of snags, along with the heavy expense of snag removal around dwellings and campsites to safeguard people and property.

Examples of recent accomplishments

Prompt action in suppressing bark beetles prevents widescale loss of commercial timber.—Bark beetles kill huge volumes of sawtimber throughout the Nation each year. The losses they cause approximate one-sixth of the total timber harvested. During periods of outbreak, losses are greatly increased, occasionally bordering on the catastrophic, at which time they approach a quarter of the average annual cut. An example of the latter was the epidemic of Engelmann spruce beetle which, in the early 1940's, killed an additional four billion board feet of spruce and one-half billion board feet of lodgepole pine on one-half million acres of forest land in Colorado. The outbreak built up in windthrown timber that masked its real potential until it had developed into an epidemic of fantastic proportions, enveloping all trees in its path. The epidemic was finally brought under control by a massive and costly control campaign, plus the help of prolonged subzero temperatures.

Prompt action to suppress incipient infestations prevents intensification and spread and protects the commercial and aesthetic value of the resource. In 1966, 82 outbreaks of bark beetles were detected and suppressed in the early stages of their build-up. The value of timber saved by control action is estimated at $16.4 million.

Non-persistent insecticide found promising for controlling spruce budworm, an important forest defoliator.—DDT, a persistent pesticide, long used for successful and inexpensive control of spruce budworm, may soon be replaced by a newly found non-persistent chemical that in tests to date show little, if any, adverse effects to fish and wildlife. The new insecticide appears to be highly effective against the spruce budworm, a major pest of spruce and fir timber from coast to coast. Testing and analysis of results are continuing.

Monitoring aerial insect spraying projects intensified to determine possible adverse effects to fish and wildlife.—In conjunction with field testing of nonpersistent insecticides to control forest defoliating insects, a greatly increased effort was made to determine their possible adverse effects on fish and wildlife. Biologists in Federal and State governments monitored effects on beneficial insects, fish, fish-food organisms, birds, and small mammals. Results of monitoring information to date indicate little, if any, harmful side effects of the spray.

Federal-State cooperative insect and disease control program expanded.—In 1966 three additional States, making a total of 23, entered into cooperative agreements with the Forest Service to share the cost of forest insect and disease control on non-Federal lands. The intensification of surveys on non-Federal forest lands is expected to result in improved detection and suppression of pest outbreaks.

Little known insect erupts in outbreak numbers at new locations in California and Arizona.—The white fir needle miner, a pest insect heretofore restricted to parts of southern Utah, appeared in outbreak numbers in fir stands of the central Sierra Nevada Mountains in California and in northern Arizona. Surveys are being intensified to delineate areas of infestations and to determine whether or not there is need for control.

Timber values saved by white pine blister rust control.—Uncontrolled white pine blister rust would reduce white pine timber in eastern United States by 50%, in Idaho and Montana by 90%, and in Oregon and California by 70%. This would amount to a yearly loss of 113.5 million cubic feet currently valued at $12.3 million. Accomplishments to prevent such losses in 1966 were:

(a) Maintaining control previously established on 1.8 million acres;

(b) Establishing maintenance control on 94,000 acres;

(c) Establishing control practices on 194,000 acres; and

(d) Testing and streamlining a method for determining on any specific area and cost-benefit ratio involved in controlling blister rust in Eastern States, and work on a similar procedure in Idaho and Montana.

Acquisition of land, Weeks Act

1966	$680,000
1967	2,480,000
1968	2,480,000

No program increase is proposed.

Acquisition of key inholdings within the National Forests and National Forest purchase units becomes increasingly urgent. The Development Program for the National Forests recognized the need to ultimately acquire about 7,000,000 acres of private inholdings in need of land rehabilitation. Included are lands depleted by repeated fires, poor logging practices, clearing and cultivation of steep and erodible mountain lands, and disturbed mineral exploitation areas. Many of the lands in need of rehabilitation are located in economically depressed areas and/or are within a working radius of Job Corps Centers. Their acquisition will provide additional lands which will contribute to a healthful working environment for the Corpsmen.

The objective of the present 10-year program (1963–1972) is to purchase 967,000 acres of key inholdings of land for National Forest purposes. These are lands valuable for watershed and timber production purposes and having only secondary value for recreation. Lands primarily valuable for recreation are not included. Recreation type lands are included under the Land and Water Conservation Fund Act program.

The fiscal year 1968 estimate will permit further progress toward acquiring the 967,000 acres.

Included in the amount shown is $1,800,000 for the acquisition of land in the Redbird Purchase Unit in eastern Kentucky (a part of the Appalachia program). An estimated 51,400 acres will be acquired with these funds. These lands, when acquired, will permit an immediate management program of land rehabilitation, recreation development, fire protection and road construction employing local residents in an economically depressed area. Floods originating from this area have in past years caused multi-million dollar downstream damage.

The remaining $680,000 will be used to continue the regular Weeks Act program at its present level. This will permit the acquisition of an additional 22,520 acres of key inholdings.

See tabulation on page 1677 for more detailed information on actual and planned accomplishments for fiscal years 1966–1968.

Examples of Recent Accomplishments

In 1966 a total of 190 tracts were contracted for purchase under authority of the Weeks Act using regular appropriated Weeks Act funds. These cases involved the acquisition of 23,452 acres at a total cost of $678,509. These transactions involve lands suited to timber production and watershed protection in areas where National Forest ownership needs to be consolidated or extended to facilitate these programs. Many of the smaller parcels, 20–40–80 acres in size, are purchases made at a price equal to or nearly equal to the cost that would otherwise have been incurred to survey, post, and mark the National Forest boundary surrounding the property.

Cost Avoidance Attributable to Weeks Act Purchases (except Redbird)

Through purchase of the 190 tracts contracted in 1966, the Forest Service will avoid constructing some segments of roads and locating and/or posting property lines. In addition, processing costs of land trespass cases and other management costs are also avoided through the regular Weeks Act purchases. Studies made in previous years have shown substantial savings through cost-avoidance as a result of the purchase program. The estimated 10-year cost-avoidance attributable to the tracts purchased in 1966 is $313,500.

The estimated 10-year cost-avoidance with purchase of the tracts proposed in 1968 is $360,000. Involved are an estimated 240 cases totaling 22,520 acres.

FOREST RESEARCH

Timber management research

1966	$8,027,000
1967	8,377,000
1968	8,937,000
Increase	+560,000

An increase of $560,000 is needed for research in forest genetics. Forest genetics research will be accelerated to develop high-quality, pest-resistant types of conifers, preferred species of hardwoods, and southern pine. Research will be intensified on techniques for selection of superior types of trees, hybridizing within and between species, testing the offspring, and reproducing the improved types for large-scale use.

Timber management research develops cheaper and more reliable methods of establishing and tending forests to produce timber and timber-related products. It deals with reproducing forests both naturally and artificially, with intensive cultural measures for increasing the yield and improving the quality of forest stands, with methods for evaluating and increasing the productive capacity of forest soils, and with stand treatments to perpetuate valuable species. It includes breeding trees for rapid growth, good form, desirable wood qualities, and pest resistance. It includes research in such timber-related crops as maple sap, naval stores, Christmas trees, and decorative, medicinal, and edible plants. The program develops better techniques of measuring forest trees and stands, more reliable predictions of future growth and quality of forest products, and improved techniques to weigh alternative in management of large public and private timber holdings. It includes modifying timber production practice to accommodate the use of forest land for wildlife, range, water, and recreation. It includes developing more effective methods of planting and tending shelterbelts and other special purpose tree plantings to ameliorate the local climate. These improve the quality and appearance of urban and rural environments. It also includes research to develop fundamental knowledge of tree physiology, mineral nutrition, soil-site relationships, variation and inheritance of trees, and forest ecology.

Examples of Recent Accomplishments

New reference book on important forest trees of the United States.—The first comprehensive summary of information on life histories of the major commercial forest tree species in this country was issued as USDA Handbook 271. This 762-page, illustrated book, "Silvics of Forest Trees of the United States," compiles reports prepared by Forest Service scientists in all parts of the country. Each of the 125 most important native forest trees of the United States is described in terms of its distribution, growth requirements, seed production, natural regeneration, tree size, varieties, and hybrids. Forest managers, students, and scientists consider the book a valuable reference and have nearly exhausted the initial printing of 16,000 copies.

A hybrid pine for Christmas trees.—Christmas tree growers are interested in a hybrid pine developed at Berkeley, California. The tree, a hybrid between two races of lodgepole pine, has desirable Christmas tree traits—good form and color, rapid growth, and early production of persistent cones. Little is known about the growth of this hybrid outside California, but plantings are being made in the East, Pacific Northwest, and other regions to test its suitability.

Straight-grained sweetgums may produce better lumber and veneer.—The most obvious fault of sweetgum for lumber manufacture is the warping thought to be related to "interlocked grain." Studies of 225 sweetgums growing in seven southeastern States indicate this undesirable feature of sweetgum may be genetically controlled. Thus, choosing straight-grained seed parents may eliminate troublesome problems in processing sweetgum lumber and veneer.

Jack pines differ in susceptibility to the needle cast fungus.—After 10 growing seasons, 29 seed sources from northeastern Minnesota had only about 25% infection. Trees from a lower Michigan source showed 95% infection. Since these differences remain constant from year to year and from environment to environment, they are genetically controlled. Selected trees from these seed-source tests provide geneticists with breeding material to develop strains of jack pine resistant to the needle-cast fungus.

Paper mill effluent used to irrigate pines.—Three years of study in Louisiana showed that paper mill effluent may safely be used to irrigate pines. If strong wastes are avoided, as much as 20 to 40 area inches of effluent can be disposed of in this way. Trees benefit, and a major source of pollution is kept out of streams.

Warm nights make better seedlings.—Night temperature in the nursery influences the vigor of ponderosa pine seedling roots. In California, ponderosa pine transplants from a nursery with warm nights produced more and longer roots than transplants from another nursery with cold nights. Nights warmer than 40° F., but 19 to 26 degrees cooler than day temperatures gave the greatest root production. This day-night temperature difference may prove to be important in selecting nursery sites for ponderosa pine.

Size of openings determines hardwood species in next crop.—Different management systems were compared in Appalachian hardwoods in West Virginia. When trees were harvested singly to maintain a continuous forest cover:

(1) The proportion of sugar maple increased.

(2) The proportion of yellow-poplar, red oak, and black cherry decreased.

Thus, species composition can be controlled by varying the size of opening made in harvest cuts. These findings indicate the degree of flexibility possible in managing forests to meet multiple use objectives.

Redwood reseeds itself dependably.—Seed production of redwood was consistently high during 5 years after harvest cutting. Many seedlings became established on favorable seedbeds, and sprouts grew to 15 feet in height, assuring the start of a new forest. Natural regeneration is much cheaper than planting. With the rapid establishment and fast growth of redwood, prospects for profits are very good.

Variation in peatland productivity explained.—Black spruce in Minnesota bogs grew fastest along channels of flowing water. These "water tracks" support a great variety of bog plants. The more distant "muskegs" have fewer species and slower tree growth. Chemical analyses showed that "water tracks" carry nutrients into the bog from mineral soils, but "muskegs" have no source of nutrient replenishment except rain.

Rectangular plantation spacing saves money.—Rectangular spacing was better than square spacing in a slash pine plantation in Georgia. This means that far fewer rows need to be planted. Hand or machine planting costs can be reduced, and access to the plantation is easier.

One cord of pine pulpwood removes 5.46 pounds of minerals.—In the Southeast, one cord (5,000 pounds) of loblolly pine pulpwood contains 0.25 pounds of phosphorus, 1.52 pounds of potassium, 1.69 pounds of calcium, 0.56 pounds of magnesium and 1.44 pounds of nitrogen, or a total of 5.46 pounds of these nutrients. The harvest of several successive crops of trees could result in deficiencies of mineral nutrients in poorer soils.

Acid paste reduces gum production costs.—The naval stores industry could save $5,000,000 each year from the use of sulfuric acid paste. The paste is better than a water solution of acid now used to stimulate the flow of gum. Chipping labor costs can be cut as much as $4 per barrel of gum. Better grades of gum, worth $2 to $4 more per barrel, are recovered because acid contamination is reduced. Prolonged flow of gum requires larger cups, but it lengthens collection intervals to four weeks. The result is an additional cost saving up to $2 per barrel.

Watershed management research

1966	$3, 280, 000
1967	3, 439, 000
1968	3, 650, 000
Increase	+211, 000

An increase of $211,000 is needed to supply a stronger technical basis for management of National Forest watersheds and similar water-producing mountain lands. The proposed increase will strengthen research on—

(1) Water yield improvement from eastern slopes of the Cascade Mountains of Washington and Oregon.

(2) Rehabilitation of gullied forest lands in the south coastal plains.

(3) Increased recharge of groundwater in south by vegetation manipulation.

(4) Reduction of erosion and sedimentation from granitic areas of Idaho and Montana.

(5) Methods of watershed analysis, correlation, and synthesis to provide a more precise method of predicting results of management measures and to extend research results to larger areas.

(6) Improvement of hydrologic and productive characteristics of bog and swamp forests of the Lake States.

The dollar input in watershed management research during the past 7 years has averaged $2,348,371 annually. Research to date indicates that if studies are continued and if improved watershed pratices are suitably applied, high quality usable water can be increased by 14 million acre-feet annually. This additional water has an estimated primary delivered value of $734 million annually. Costs of producing the additional water are expected to be less than $10 per acre-foot, leaving a net annual value of approximately $600 million. In addition, management methods to be developed by research can conceivably prevent up to 80% of the direct flood and sediment damages that would otherwise occur due to overuse or improper use on presently undamaged watersheds. Direct benefits should exceed $275 million annually, plus side benefits of nearly $50 million. Furthermore, it is estimated that about 100 million tons of sediment are coming from deteriorated forest and rangelands. Rehabilitation of the sediment producing lands, based on research-derived techniques, could result in annual savings of approximately $75 million.

Watershed management research consists of both basic and applied studies designed to develop methods and techniques for managing forest and related range watersheds to—

(1) Increase water yields or improve timing of water yield to streamflow.

(2) Give adequate protection to forest soil and water resources while other productive resources of the forest are being used.

(3) Rehabilitate watersheds that yield damaging flood runoff and sediments.

(4) Aid forest soil development and improvement.

One-third of the area of the United States is forested. These forests, with associated range and alpine areas, yield about three-fourths of the Nation's streamflow. Management of our forests, more than any other lands, is important to the quantity and quality of water produced.

Examples of Recent Accomplishments

Breakthrough in snowpack measurement.—A breakthrough in technique for measuring snow for predicting summer water supplies has been made in California. The new system may eliminate or greatly reduce the need for snow survey crews to make dangerous monthly treks into the mountains. A nuclear instrument that measures the depth and density of snow has been adapted to the needs of snow surveys. The measurements do not destroy the sampling site, as other methods do, so it can be sampled again and again. In addition, the motorized gage can be operated by radio from an office miles away, with the measurements transmitted back by radio. The system can be used in glacier research in Alaska and snow research on the Continental Divide. As it can sense high rate of snowmelt from rain-on-snow storms, it will be invaluable in flood forecasting.

Soil erosion in logging areas is directly related to roads.—Studies of logging systems on watersheds with granitic soils show that road building should be avoided wherever possible, or kept to a minimum. Dams on an experimental watershed caught 20 thousand tons of sediment per square mile when logging roads were 300 to 400 feet apart. Most of this sediment was deposited immediately after road building and after a large storm several years later. On a watershed with few logging roads spaced at 1,000- to 1,500-foot intervals, only 43 tons of sediment per square mile were deposited—0.2% of the sediment from the area of closely spaced roads. Where erosion hazards are high, logging systems that require few roads should be utilized.

Squaw carpet has high potential for rehabilitating damaged rangelands.—A little-known ground cover shrub called "squaw carpet" holds considerable promise for rehabilitating damaged watersheds. Many single plants grow to 10′ in diameter and even larger. Every branch of this prostrate shrub is abundantly rooted, giving the plant exceptionally good soil-holding capability. The native range of squaw carpet is limited to the Sierra Nevada and Cascade Mountains of the far West. Outplantings in Idaho and Utah survived better than a control planting in its native range. Furthermore, in Idaho the greatest survival was found on the most severe site—a steep, unstable, infertile road fill of decomposed granite. The extension of the range of this useful plant will be most valuable in rehabilitation work.

Detergents reduce erosion from burned chaparral watersheds.—Treatment of water-repellent soils with a detergent resulted in a 95% reduction in debris movement, a fourfold increase in grass establishment on burned chaparral watersheds in southern California. The water-repellent characteristic means that rain falling on these soils does not soak in but runs off rapidly, eroding the soil as it goes. Detergents tend to counteract the water-repellent nature of these soils, allowing the water to penetrate. Under normal rainfall the wetting agent will remain effective for about one year. Detergent sprays to hold soil in place on steep, newly burned slopes may be useful to prevent excessive damage to densely populated areas below.

Water use determined by the production of vegetation.—Water yield increased as newly established grass cover declined on an experimental watershed at the Coweeta Hydrologic Laboratory in western North Carolina. In the first year after removing the original forest cover, seeding grass, and fertilizing, the grass was tall and deep-rooted. It used as much water as the forest it replaced although the water use occurred earlier in the growing season. Without subsequent fertilization in succeeding years, grass production decreased and water yield increased. After five years water yields were over 5″ greater per year than with the original tree cover. Then fertilizer was again applied. Grass production went up, and water yield decreased to original levels. This showed the direct relationship between herbage production and water use. For maximum water yields through vegetation change, watershed managers should aim for a grass cover having shallow roots, low vigor, and just enough density to hold the soil and prevent erosion.

Forest cutting provides more water during droughts.—Complete clearing of the forest by cutting and use of herbicides prevented any vegetative growth and increased water yield by 6″ during the dry summer of 1965. This period was by far the driest in the 15 years of record on the Fernow Experimental Forest in West Virginia. Six inches more water amounts to 900 gallons per day from each treated acre—enough to meet the daily needs of 15 people during the drought period.

Streamwater showed no residue after spraying with DDT.—No significant amount of DDT was found in streamwater before or after spraying to control the Douglas-fir tussock moth in Oregon. A general increase of DDT in the food chain did appear after spraying. Cooperators from the Oregon State University Department of Fisheries and Wildlife found traces of DDT in animal life even before the spraying was done, and these traces increased after spraying. The highest DDT residue—1.2 parts per million—was found in trout while the lowest was 0.002 parts per million in herbivores. Careful spraying of DDT to avoid watercourses can control insects effectively without hazard to streams.

Range management research

1966	$1,258,000
1967	1,294,000
1968	1,294,000

No program increase is proposed.

The key to continued use of nearly 900 million acres of public and private range and pasture land lies in the development of sound principles of management from firmly established research findings. Grazing on this vast area is the largest single use of land in the United States but new increasing demands from related uses on the resource must be recognized and to which research must be oriented.

Range management research is seeking the best, most practical and most rapid means to manage and improve the productivity of forested and related ranges in full recognition and alignment with other coordinate uses. Toward this end the program will move ahead on the highest priority studies which are underway. New research will be undertaken as opportunity is presented through completion of current studies. On-going research will stress increased emphasis on the fundamental ecology and physiology relations of forest range vegetation in order to provide a basis for improved range management; designing and implementation of new systems of management, conversion, improvement and accompanying management particularly of woodland and chaparral ranges will be given high priority.

Demands on rangelands will increase for additional meat and other livestock products as well as for less tangible products offered by a properly managed resource. For example, projections indicate that beef cattle will increase from approximately 60 million head in 1960 to 105 million in 1980.

During the same period, big-game hunters will probably increase from 6.3 million to 12 million. Pressures to produce forage for more big game will be substantial. Water needs may increase from 345 to 560 billion gallons per day, demands for timber products may increase 45%, and demands for outdoor recreation will intensify rapidly. Therefore, range research must not only provide maximum production and utilization of forage, but also maintain or improve other values of the basic natural resource.

Because of the immense area of rangeland, even small per acre increases in yield or reduction in management costs can have substantial effects. For example, research conducted at Alexandria, Louisiana, is applicable to some 50 million acres of southern pine forest range. Past research has shown that returns from this area can be increased from $1 to $3 per acre through improved management. At Dubois, Idaho, research demonstrated that sagebrush can be effectively eliminated through planned burning. Costs are less than $1 per acre vs. $3 to $5 or higher for chemical or mechanical control. Sagebrush control is currently needed on about half of the sagebrush-grass type, covering about 95 million acres.

Grazing is now and will continue to be the dominant land use on vast areas of public and private lands. Range management research provides the necessary guides for attaining maximum economic returns to ranchers.

Examples of Recent Accomplishments

Burroweed competes strongly with grasses for limited soil moisture.—Grass yields were reduced as much as 50% in southern Arizona by competition from burroweed, a shrub with little or no forage value. Measurements showed that winter accumulation of soil moisture was completely expended to a depth of two feet or more before summer rains began. Since grasses did not start using moisture until spring and summer, from 30 to 100% of the soil moisture was not put to beneficial use. Studies are now underway to determine possibilities of making more efficient use of winter-spring moisture by desirable forage plants.

Simulated grazing damages weeds more than grasses.—Clipping studies on mountain grasslands in Utah showed a wide variation in reaction of range plants to herbage removal. Plants such as tall bluebell, aster, and cinquefoil were severely damaged by top removal, particularly during flowering. Grasses generally benefitted from reduced weed competition and conspicuously increased in yield. Such studies provide guides for manipulation of grazing to allow the most desirable composition of vegetation for maximum livestock production.

Weeds and shrubs supply sufficient protein for minimum requirements of grazing cattle.—Bluestem ranges of the Ozark region are thought to be deficient in several nutrients during most of the season. However, a study in Missouri showed that cattle would acquire enough protein to satisfy minimum requirements throughout the season by selectively grazing forage supplied by weeds and shrubs. This study also showed that minimum phosphorus requirements could not be supplied. This strongly emphasized the need for providing livestock with a phosphorus supplement on these ranges.

Increased profits from improved grazing management.—Beef production was increased by more than $1 per acre per year in Arizona through improved management. Intensity of use was reduced, and yearlong grazing was changed to alternate-year summer deferment. Similar increases could be obtained by applying these practices to 6 million acres of high-potential semi-desert range in Arizona alone. Most of this area has been grazed on a yearlong basis. No provision has been made for the periodic rest needed to restore plant vigor.

Invasion of halogeton can be prevented by proper grazing.—Invasion of the poisonous weed, halogeton, into stands of crested wheatgrass in central Utah was associated with intensity of grazing, season of grazing, precipitation patterns, and soil disturbance. Heavy infestations were particularly correlated with heavy spring and early summer grazing. Maintenance of desirable vegetation by proper grazing management can prevent establishment of this weed.

Requirements for grazing Arizona ranges determined.—Ample green forage is supplied by pinyon-juniper ranges in northern Arizona from April 1 to September 30. Some also is produced during the entire winter. Cool-season grasses reached peak growth in June and remained partly green all year. Warm-season grasses were green only in summer and fall, and they reached peak growth in September. The amount of growth of each grass species was influenced mostly by precipitation prior to and during the period of active growth. Grazing systems should provide for occasional rest during these periods. Warm-season species can be favored most by resting between July 15 and October 15, and cool-season species by resting during April, May, and June.

Helicopter useful for range fertilization.—Additional acreage in California's annual-plant ranges might be fertilized if better methods of application were available. Ground application is impractical on much of the steep, rocky, foothill range. Fertilizing this kind of range with fixed-wing aircraft may also be impractical. At the San Joaquin Experimental Range, a helicopter has been used successfully to make two applications of sulfur on a steep, rocky foothill range. Rate and distribution of fertilizer were good, and the average cost of $2.85 per acre for each application was reasonable. Helicopters may be the answer for practical application of fertilizer on foothill rangelands.

Reduced rates of range seeding prove to be adequate.—Crested wheatgrass stands in New Mexico achieved their maximum development wtihin 5 to 8 years, regardless of rate of seeding or drill-row spacing. Herbage yields were essentially the same for 2-, 4-, and 6-pound per acre seeding rates and for 6-, 12-, and 18-inch row spacings. The results showed that seeding rates could be reduced thereby reducing seed costs. The 4-pound rate would save nearly $1 per acre in seeding costs over the usual 6-pound rate.

Wildlife habitat research

1966	$730, 000
1967	912, 000
1968	912, 000

No program increase in proposed.

Wildlife habitat research develops better management practices to support optimum game and fish populations. Special practices are developed for increasing game food and cover by seeding, planting, burning, spraying, and fertilizing. Competition between wildlife and livestock is determined on various types of forest and rangelands in order to integrate wildlife, livestock, and timber production. Likewise, effects of silviculture and timber harvesting on food and cover plants used by wildlife must be known. Research is conducted to improve fish habitat through regulation of water temperatures, creation of gravel spawning beds, and stabilization of stream channels.

The Nation's forest and related rangelands provide the main habitat for an estimated ten million big-game animals and countless other species of wildlife. These lands also provide important fish habitat. All are a source of interest and beauty. Demands by hunters, fishermen, and nature enthusiasts are ever increasing. National Forests alone contain over 80 thousand miles of fishing streams and nearly two million acres of lakes. Although habitat conditions on some areas are suitable for supporting high wildlife and fish populations, the capacity of most forest and related rangelands can be materially increased through research. Some low-producing areas are ugly pictures of land abuse. They result from poor logging practices, fire, or overuse by livestock or big game.

Information on ways and means to increase habitat productivity is needed by small woodland owners, as well as by managers of large forest properties. Wildlife resources are ever increasing in monetary value to private landowners through sale or lease of hunting and fishing privileges. The wildlife habitat research program involves active cooperation with Federal and State fish and game agencies and educational institutions.

Examples of Recent Accomplishments

Juniper-pinyon range restoration increases forage for deer and livestock.—Closed stands of juniper-pinyon in Utah often produce less than 100 pounds of forage annually per acre. However, eradicating trees and seeding desirable plants increased forage production to over 700 pounds per acre. Deer use in untreated juniper-pinyon stands averaged only 4 deer-days per acre as compared to 83 deer-days per acre on seeded stands—a twenty-fold increase. Such treatment also benefits livestock because 4 acres of treated range will support one cow without interfering with use by deer. Watershed values are also greatly improved by these restoration treatments. Ground cover increases from 25% on untreated areas to 73% on seeded areas. Such restoration treatments can be applied to 13 million acres in Utah alone.

Browse shrubs can be improved by selection and breeding.—Striking variations have been found in populations of several native shrubs. Individual plants of big sagebrush growing side by side differ markedly in palatability to deer. Palatable and unpalatable strains of rubber rabbitbrush have been isolated. Several other shrubs show great promise for improving browse characteritics by selection and hybridization. These offer exciting and profitable possibilities for "tailoring" shrubs to fit various wildlife habitats and uses.

Moist heat speeds germination of legume seeds.—In the Southeast fire may benefit several species of leguminous plants. Laboratory treatments applied to seeds of partridge pea indicated that moist heat is most effective in increasing germination. This helps to explain why legumes vary in occurrence in flatwoods pine stands burned annually. It also suggests how time of burning can be modified to assure maximum yield of legumes important for wildlife food.

Land use influences spawning of anadromous fish.—Cooperative studies in California have shown that—

(1) Shading decreased growth of algae and greatly increased the population of fingerling steelhead and silver salmon.

(2) Water temperatures varied with stream depth and degree of exposure to sunlight—as much as 15° over a distance of 600 feet.

(3) Terrestrial as well as aquatic insects contributed considerably to supply of fish food.

These studies show the importance of streamside vegetation management to spawning and rearing of fish.

Forage yield in southern forests governed by timber density.—Forage is a harvestable product on 58 million acres of loblolly-shortleaf pine-hardwood forests of the South. In east Texas, herbage yields per acre were 800 pounds or more in the open, but they decreased to about 100 pounds per acre with increasing tree cover. Pinehill bluestem, one of the most important cattle forage species, contributed most to herbage where trees were sparse. It gave way to unpalatable grasses as timber stand density increased. Two-eyed berry, a good winter deer forage plant, was scarce in the open but was the most frequent herb beneath dense timber. Consequently, reduction in grazing values as timber density increases may be more critical for cattle but less critical for deer. Data on timber stand density now can be used to predict forage yields and to determine carrying capacity for livestock and game.

Forest recreation research

1966	$516,000
1967	479,000
1968	811,000
Increase	+332,000

An increase of $332,000 is needed to strengthen research on—

(1) Ecology and use of the unique Boundary Waters Canoe Area in the Lake States.

(2) Ecology, protection, and management of western wilderness areas.

(3) Forest recreation in the Pacific Northwest as the basis for understanding visitor requirements, enriching recreation experiences, lessening user-resource conflicts, and aiding resource management.

(4) Approaches and criteria for forest landscape design and fitting landscape management to intensive resource use in California.

(5) Measuring recreation use and trends.

(6) Opportunities for recreation on small and industrial forest properties in the Piedmont and Coastal Plain.

Only a few years ago recreation was a minor use of the forest resource. Conflicts between uses were few and management costs were low. Today recreation and its management is big business. The overall research task is to help insure that recreation planning and management funds are used effectively and efficiently to enhance the use of America's forests and woodlands for increasing millions of recreation visitors.

Examples of Recent Accomplishments

Hazardous trees numerous on heavily used recreation sites.—Many old picturesque lodgepole pines, prominent in western mountain campgrounds, are defective. A study of five Sierra Nevada campsites showed that one-third of all the trees had butt rot, and one-half of these were rated potentially hazardous to recreationists. Furthermore, potential hazard increased as much as three and four times on heavily used sites. Fire scars were the most common abnormality associated with decay and hazard. Lodgepole pines must be carefully inspected in recreation areas where trees are fire scarred, often overmature, and exempt from commercial cutting.

Fertilizers and irrigation help maintain heavily used recreation sites.—A Utah study showed that fertilization increased the vigor of campground vegetation, especially if nutrients that were previously lacking were supplied. Trees were helped when fertilizer was placed in holes drilled in the soil at the root zone.

Broadcast spreading of fertilizer aided ground cover plants more than trees. Timing of watering was very important. Watering just before heavy use softened soils, made vegetation turgid, and increased the possibility of damage. Watering after heavy use, however, aided survival by keeping bruised vegetation moist until it had a chance to heal.

Boundary Waters Canoe Area—a problem of maintaining aesthetic values with heavy use.—Minnesota's Boundary Waters Canoe Area sustained 250,000 visits in 1965, and more are expected each year. The area's soils are thin and fragile. Even lightly used campsites have lost 50 to 99% of their ground cover. Tree reproduction on these sites is absent; erosion, compaction, and root exposure are prevalent. Canoeists do not realize they are unintentionally damaging the camping sites. Educational programs are needed. Outfitters who rent canoes, tents, and supplies also can help by suggesting travel routes that effect better distribution of users.

Visitors helpful in planning visitor information programs.—Most campers on lower Michigan National Forests were family groups staying about five days. This suggested the need for variety in visitor information programs from day to day, but not between weeks. Programs must be directed to the interests of both children and adults. The opportunity and need to inform adults is not met by pointing all information programs at a child's level of understanding, but one answer is to aim daytime presentations at children and night presentations at adults.

Who are the customers for privately owned campgrounds?—Profitable private campground operation depends upon—

(1) How well the entrepreneur anticipates the facilities and services wanted by campers.

(2) How well he estimates his potential market.

(3) How well he understands the kinds of campers he hopes to serve.

Private forest campground users in the Ohio River Valley generally camp as family groups. For many, this was their first year of camping. The majority came from urban areas. Families camping out for just a weekend usually camped with another family. They participated in several other outdoor activities, traveled less than 100 miles to the campground, and used either a travel trailer or tent trailer. Families camping while on a major vacation tended to camp alone. They participated in very few other outdoor activities, often traveled more than 100 miles to the campground, and used a tent more often than any other type of shelter. These vacationers were more interested in conveniences such as showers and laundry facilities than were the weekenders.

Forest fire research

1966	$2, 860, 000
1967	2, 912, 000
1968	3, 112, 000
Increase	+200, 000

An increase of $200,000 is needed to intensify research on—

(1) An electronic fire detection system utilizing an airborne infrared scanner and a telemetering link to provide fast, accurate fire information to forest fire control centers.

(2) New fire control technology to reduce forest fire losses in the eastern United States.

(3) Improved technology for reducing fire hazards in northwestern forests with special attention to methods which reduce air pollution in logging slash disposal operations.

Forest research develops methods and systems for both wildfire control and intentional use of fire in land management. It also develops basic knowledge needed to protect resources adequately from forest fires. The program includes investigations of fire physics and chemistry, atmospheric conditions that affect forest fire combustion rates, fuels and fire behavior, and fire prevention. Those phases of research requiring highly sophisticated equipment and techniques are conducted at three forest fire laboratories: Missoula, Montana; Macon, Georgia; and Riverside, California. Specialized field studies are conducted at seven other locations.

Every five minutes someone is guilty of starting a forest fire somewhere in the United States. Each year Federal, State and private forest protection agencies spend more than $150 million to fight some 100,000 forest fires.

The forest fire problem is becoming increasingly complex as summer homes, suburban developments, and extensive plantations intermingle with wild forest lands. Traditional firefighting methods are no longer adequate to protect the vastly increased values at stake. Much progress has already been made in developing new and improved fire control methods, such as aerially delivered fire retardant chemicals. More research is needed if forest fire control is to take advantage of several technological advances. For example, recent improvements in helicopter performance open up possibilities for radically new initial attack systems. Advances in computer technology make automated fire danger rating and dispatching systems potentially feasible. Cost effectiveness studies show that past investments in forest fire research have paid off at better than 13 to 1 in reduced costs and losses.

Examples of Recent Accomplishments

Fewer lightning strokes come from seeded clouds.—Research aimed at modifying lightning storms showed that storms heavily seeded with silver iodide produced one-third fewer cloud-to-ground lightning strokes than did untreated storms. Success in lightning prevention depends on seeding particular cloud forms with specific amounts of silver iodide at just the right time. Further research to develop operational cloud seeding techniques may prevent 2,000 to 3,000 lightning fires annually.

Fire prevention studies have paid off.—A fire prevention study in northern California identified a small segment of the population that caused a disproportionately large number of fires. They were younger rural residents, both male and female, with part-time jobs. They had very little knowledge about the fire problem and no strong feelings one way or the other about fire prevention. On the basis of these findings the State of California is increasing its expenditures on fire prevention contacts with this high risk group and greatly reducing its expenditures on the other 90% of the population. The result will be a savings of $2 million annually and a potential increase in prevention effectiveness.

Airborne infrared fire detections are technically feasible.—Forest fire research scientists have recently designed an improved high resolution infrared scanner capable of detecting small heat sources from high flying aircraft. This instrument has now been test flown over all of the major forest types in the United States, including Alaska. This was done to determine the possible extent to which different kinds and densities of forest canopies might limit the scanner capabilities for detecting small fires on the ground. Performance was found to be adequate in all instances during both day and night operations. These basic findings now open the way for the more extensive job of developing operational fire detection systems based on optimum combinations of ground-based visual detectors and airborne infrared scanners. The objectives are to—

(1) Extend the needed area of detection coverage beyond that possible with ground detectors.

(2) Replace visual detection in critical areas when visibility is reduced by smoke or haze. Accuracy of fire location as well as speed of detection is an essential criterion.

Choosing the right fire retardant can reduce costs.—The number of available forest firefighting chemicals has multiplied rapidly, and fire control managers and dispatchers are often confused about what type to use. Studies at the fire laboratories have determined the relative effectiveness of fire retardants according to temperature-humidity-wind conditions, the amount of chemical applied to the fuel bed, and the length of time the retardant must remain effective. Using these guidelines, fire dispatchers can specify the type of chemical required for use on a particular fire by either fixed wing aircraft or helicopters. About 16 million gallons of fire retardant chemicals are used every year by forest fire control agencies. Retardant chemicals vary in price from less than 1¢ per gallon to more than 16¢ per gallon, and significant cost savings can be achieved by fitting the proper chemical to each fire need.

Forest insect research

1966	$3,856,000
1967	3,998,000
1968	4,103,000
Increase	+105,000

An increase of $105,000 is needed for strengthening research on bark beetles and defoliators. Bark beetles are the most destructive group of forest insects in the United States and a part of the increase would be used for on-going studies in the South and West to find out how to reduce heavy annual losses which they cause. This would permit greater emphasis on biological and ecological studies. Followup on new leads in biological control, development of trees resistant to bark beetles, sex lures, male sterilization, and more effective chemical control techniques would also be possible.

Some of the increase would be used for high priority research on defoliating insects in the West, Lake States, and Northeast. The spruce budworm, a typical serious defoliator of forest trees, would receive the most attention. Better chemical control of the budworm is the subject of an intensive research program currently underway; however, alternative approaches such as biological control, control through forest management, and new techniques such as male sterilization also need added investigation.

Forest Service insect research is aimed at the prevention and control of insect-caused losses. Control through indirect means offers the best long-run approach. Major emphasis in the research program is being given to the use of insect parasites, predators, and diseases; silvicultural practices designed to prevent insect outbreaks; attractants; and male sterilization techniques. Investigations on direct control methods seek safer and less persistent insecticides, tailored to kill the pest insects and to have a minimum impact on other elements of the environment.

Examples of Recent Accomplishments

Bark beetle sex attractant synthesized.—The sex attractant for the bark beetle, *Ips confusus*, isolated and identified last year, has recently been synthesized in the laboratory. Researchers at the University of California and Stanford Research Institute, working together under Forest Service grants, produced the material and proved its attractiveness. The synthetic attractant is as effective in luring the beetles as is the natural material produced by the male beetles. This is a major step toward attracting destructive bark beetles into places where they may be sterilized, poisoned or otherwise destroyed.

Parasites established to help control Dutch elm disease.—Dutch elm disease, the most serious pest of American elms, is transmitted from infested to healthy trees by bark beetles. The only practical way to control the disease is to control the beetles. Insecticides while effective are expensive, and some have undesirable side effects. A species of parasitic wasp was recently introduced from Europe as a biological control for the beetles that spread the disease. The parasite appears to be well established and, if successful, will effectively augment present chemical controls or actually replace them.

Larch casebearer parasites established in Northwest.—The larch casebearer, an insect accidentally introduced into the eastern United States from Europe, has spread as far west as northeastern Washington. It is a serious pest of larch trees, and its control with chemicals is not practicable. A parasite of the casebearer, introduced from Europe, now appears to be well established. Entomologists believe that it will aid in checking the casebearer's westward spread.

Habits of wood-boring insects revealed.—In the West large volumes of fire-killed and windthrown timber are salvaged. Often logs from such timber are attacked by insects before they are removed from the woods. The offspring of the attacking insects develop in the wood after the trees are manufactured into lumber, and they emerge after the lumber has been used in construction. The insects bore through wallboard, expensive interior paneling, wallpaper or roofing. The result: costly repair bills for the building owner. Work underway in California revealed details of the life histories and habits of many of these wood borers. This information points to control techniques that will limit the activities of these insects and minimize the damage they cause.

Mass produced European pine shoot moth.—Cooperative studies between the Forest Service and Washington State University developed techniques for rearing and sterilizing large numbers of male European pine shoot moths. A novel "dummy tree" was designed to help get moths to mate and produce eggs under laboratory conditions. These eggs are required for a mass rearing program essential to developing a new control technique.

Breeding strains of more potent insect pathogens.—Use of disease organisms is one of the promising new approaches to control of destructive insects. However, microbial control of most pests has not progressed as rapidly as had been hoped for. The causes for some of these difficulties have been identified in the case of certain forest insects. Researchers have discovered that foliage of some kinds of trees contains toxic substances for certain pathogens. For example, a substance in Douglas-fir foliage inhibits the effectiveness of *Bacillus thuringiensis*, a potentially highly effective microbial insecticide. Research shows that we can increase the virulence of the bacillus by developing strains that will resist these anti-bacterial substances. Advances like this may lead to insect control without the use of chemicals.

Forest disease research

1966	$2,081,000
1967	2,171,000
1968	2,358,000
Increase	+187,000

An increase of $187,000 is needed to—

(1) Strengthen research underway to develop more effective preventive and control measures for diseases killing and injuring trees in shelterbelts, outdoor recreation areas, and forest stands.

(2) Speed up research to develop biological control organisms and genetic host resistance for major diseases of forest trees.

The increase would be used to—

(1) Strengthen research on the control of diseases of shelterbelt trees in the Great Plains.

(2) Develop controls for diseases affecting the utility of outdoor recreation areas and roadside trees in the Southwest, Northwest, Rocky Mountains, North Central and Northeastern States.

(3) Accelerate research on the control of pine and aspen cankers reducing the productivity of pulpwood stands in the North Central States.

(4) Support research underway on the diebacks and declines of hardwood trees in the Northeast.

The disease research program will be strengthened in California, Oregon, Idaho, New Mexico, Colorado, Nebraska, Minnesota, Michigan, Ohio, and Connecticut.

Diseases kill and deform trees, discolor foliage, retard growth rate, reduce quality of product, delay regeneration, cause heart rots, and destroy wood in processing and use. They reduce the utility of trees for timber production, for game habitat and food, and for outdoor beauty and social amenities. Annual disease losses to wood production alone are estimated at 20 billion board feet, worth $200 million on the stump and several billion dollars after manufacture. It is the equivalent of enough lumber to build 2 million 5-room houses. Disease losses to other values equal or exceed timber losses.

The objective of disease research is to provide the information needed to maintain and enhance forest land productivity. Research needs increase with intensive management and with environmental changes such as air pollution, droughts, warming climatic trends, and greater public use. Past research has sharply curtailed losses in nursery seedling diseases, heart rots, stem rusts, and dwarf-mistletoes. It has developed measures to prevent stain in green lumber and to lessen decay in wooden structures. These successes indicate that a greater effort can solve today's magnified disease problems.

Examples of Recent Accomplishments

Beneficial fungi on tree roots produce antibiotics.—In the Southeast, a beneficial root fungus produced a compound new to science. It is a potent antibiotic and protects tree roots from infection by soil organisms. At 50 to 70 parts per billion concentration it inhibits a virulent root pathogen, *Phytophthora cinnamomi*, the cause of the littleleaf disease of shortleaf pine. Another beneficial tree-root fungus produced a different antibiotic found to be more potent against human pathogenic bacteria than commercially available antibiotics. High priority is being given to studies of the usefulness of these antibiotics in controlling diseases of plants, animals, and man.

Toxic substance may be secret of rapid kill by oak wilt fungus.—Oak wilt kills mature oaks in a few weeks after infection, possibly through the action of a powerful toxin it produces in minute amounts. This compound has been partially purified and is now under study to determine its nature and mode of action. This research may indicate a new approach to oak wilt control through toxin inactivation.

Cut pines in hot weather to reduce root rot infections.—Infection of freshly-cut slash pine stumps in south Georgia by the annosus root rot fungus is least from March through September. During this period stump top temperatures reach or exceed 104° F. on several consecutive days. To the extent possible, thinning and harvest cuts should be made during these months.

Site factors indicate hazard from annosus root rot.—Southern pine plantations with severe annosus root rot infections have less organic matter, more sand or clay, a higher soil pH, and less grass than stands with no detectable infection. Analysis of these factors may permit classification of plantation sites by hazard classes and selection of low-risk areas for planting—an excellent disease prevention measure. In addition, infection hazard may be reduced on high-hazard areas by prescribed burning before thinning to reduce organic litter on the soil.

Effective controls developed for two Great Plains tree diseases.—Phomopsis blight of eastern redcedar and Dothistroma blight of Austrian and ponderosa pines are two of the most destructive tree diseases in the Great Plains. Phomopsis blight commonly infects seedlings in nursery beds but rarely occurs on older trees in windbreaks and shelterbelts. Nursery infections can be prevented by weekly applications of a fungicide from May to September, thereby providing disease-free seedlings for outplanting. Dothistroma blight causes defoliation and death of older pines in established windbreak, shelterbelt, and Christmas tree plantings. Two applications per year of a fungicide prevent infection and subsequent losses.

Soil fumigation controls diseases in California forest nurseries.—Sugar pine seedling losses in California nurseries averaged 50% in recent years. Soil fumigation prior to sowing has cut these losses to less than 10%, and at the same time it has increased seed germination and seedling vigor. Also fumigation has reduced nursery weeding costs, improved survival of seedlings after outplanting, and lessened the chances of introducing new diseases into outplanting sites.

Dwarfmistletoe infection directly related to tree size and age.—Understory red firs in dwarfmistletoe-infested stands in California are essentially free of infection up to a height of 3′ and an age of 20 years. By the time they are 10′ tall and up to 50 years of age, over 50% are infected and worthless as potential crop trees. Thinning or harvest cuts in dwarfmistletoe-infested stands should be scheduled before advance regeneration is more than 3′ tall. In all such operations infected overstory trees should be removed to prevent subsequent infestation of the young stand.

Forest products utilization research

1966	$6,077,000
1967	6,493,000
1968	6,863,000
Increase	+370,000

An increase of $370,000 is needed primarily at Madison, Wisconsin, to hasten solution of critical utilization problems. Included is expansion and acceleration of wood fiber products and related chemical research. Emphasis will be given to new pulping processes aimed at higher yields and broader utilization of low-quality timber. The increase also will accelerate research on the efficiency of existing methods for nondestructive evaluation of wood and wood-base materials. It will expand research to seek new and more effective inter-property relations and to develop basic data needed for more efficient industrial and structural utilization of wood, including broadened and accelerated studies of wood conversion systems and the development of models for evaluating alternative processes.

Forest products utilization research is aimed at providing a sound basis for—

(1) Maximum possible contribution of the forest products industries to the Nation's economy.

(2) Maintenance of industrial stability and healthy development within the industry.

(3) Improved resource conservation through wise use.

The timber-using industries of the United States employ about 3.3 million people and annually contribute about $25 billion to the gross national product. With an adequate forest products utilization research effort, it is estimated that an annual growth rate of about 7.5% is attainable in the forest products industries. Thus, with the aid of research the industry's contribution to the gross national product can be increased by as much as $2 billion next year. Despite its large size and impressive economic contributions, a major characteristic of the forest products industry is its fragmentation into many thousands of small manufacturing units, many in rural and depressed areas. The vast majority of these are not able to conduct private research that can improve their competitive position with more advanced industries.

Past Forest Service research on wood and related products area has played a major part in strengthening the industry's position. For example, about $50,000 worth of research specific to the use of southern yellow pine for manufacture of plywood had a major bearing on the current explosion in southern pine plywood industry. In 1964 the first three plants built represented an annual product value of $6 million. In 1966 the plants totaled 30, with product value of $90 million, and they had created 5,200 jobs. Similarly, about $600,000 expended on research involved in the development of the neutral sulfite semichemical pulping process made possible greatly broadened use of hardwood timber for pulp and paper. The market value of the 3 million tons of pulp now produced annually by this process is estimated at over $1 billion.

Examples of Recent Accomplishments

Determining multiproduct potential in standing timber.—There is a need to estimate potential value of timber for products other than lumber; e.g., poles, pulpwood, or veneer. A promising inventory technique has been developed for determining suitability and potential yields for multiproducts. Subjective estimates by field men are eliminated. Data on basic tree characteristics can be reanalyzed to meet any one of several inventory needs. Resource management agencies will save money and manpower by—

(1) Making maximum use of a single set of data.

(2) Eliminating need for reinventories.

Wood-stringer bridges.—Laboratory and field studies of forest-road bridges led to a recommendation for change in design criteria to the American Association of State Highway Officials. For maximum efficiency and economy interior stringer sizes may be reduced without changing existing design criteria for outside stringers. A saving of 25% in the volume of bridge timbers is possible where shear is the limiting factor.

Pulpwood chip storage.—Production of pulp chips from sawmill and veneer mill residues has increased rapidly in recent years. In 1963 it amounted to about

11 million cords, or 24% of all pulpwood consumed at United States mills in that year. Economic advantages in the transport, storage, and handling of chips in comparison to roundwood are attractive if pulp yields and quality are not sacrificed during chip storage. In kraft pulping, pile storage of pine chips presents no problem except for some loss in yield of tall oil and turpentine. However, hardwood chips show different reactions. In maple, birch, and beech chip piles the common wood rotting fungi find satisfactory growth conditions in the cooler portions of the pile. They cause loss in wood substance, loss of wood extractives, and discoloration of the chips. Hence, a definite decrease was found in sulfite pulp yield and in pulp brightness. Now, with the problem identified further research to control the fungi or to minimize their harmful effects will be feasible.

Ceiling tile with unique acoustical properties.—Wood chips can now be made into attractive ceiling tile with unique acoustical properties. The random alignment of the ⅝″ chips creates a rough surface. Sound is absorbed regardless of the frequency of the sound waves. In this respect the material differs from many conventional sound-insulating materials which absorb the higher frequencies most effectively. The board-type ceiling tile is easily made in a typical press. Designed to span supports 2′ apart, the 2- by 4-foot panels are ¾″ thick. One surface is sanded and painted with a flat, interior paint. Panels retain their rigidity in damp and humid areas.

Flashover of combustible gases.—New insight into how fire progresses in buildings may have a strong bearing on the acceptability of wood and other combustible materials. Heretofore, the sudden leaping of flames, called "flashover", was thought to be spontaneous ignition of combustibles with rising temperatures. Current evidence is that fire progresses by flashovers as hot combustible gases reach new sources of oxygen, regardless of the combustibility of wall and floor covering materials.

Yield of clear-cuttings from hardwood lumber grades.—A new computerized system eliminates the guesswork in maple lumber procurement by the wood fabricating industry. For each order, some combination of grades leads to the most efficient and profitable utilization of lumber. The computer calculates the lumber grades to purchase for a given set of cuttings, and instructs whether to rip or crosscut first.

Lignin formation.—Laboratory experiments were successful in duplicating nature's process by which the living tree uses simple chemical compounds derived from the soil and air to produce lignin, the complex compound that binds wood cells together. These experiments contributed greatly to further understanding the nature and behavior of lignin as it exists in the living tree. They added another stepping stone to improve pulping techniques, better solutions to the waste problem, and new uses of this abundant product of nature.

Heat conduction values of wood-base panel products.—As new wood-base building materials are developed, a key property important to their acceptance is thermal conductivity, or insulating value. Research to establish basic values for typical panel products has been completed, and the results will be included in industry's engineering guides, now being revised.

Paneling and flooring from low-grade hardwood logs.—Wood cut from small, low-grade red oak logs can now be press-dried in a few hours by a process that greatly enhances color and appearance. This new drying system uses the concept of going directly from logs to products instead of first sawing lumber that must later be remanufactured. Low-quality wood with knots and other defects can be used for paneling and flooring. No installation allowance for shrinkage is necessary, and side- and end-matched panels and flooring can be installed with only a few carpenter's tools. This product can be made in the Northeast, North Central, and Appalachian regions where vast quantities of little-used hardwood timber are available. The processing technique eliminates costly steps in production, reduces waste, utilizes local machines and labor, and provides an attractive product from low-quality logs. An increase in product value at the mill of from $5 to $15 per MBF of logs over present conventional products can be expected.

Forest engineering research

1966	$416,000
1967	583,000
1968	798,000
Increase	+215,000

An increase of $215,000 is needed to expand and accelerate research on—

(1) Aerial logging systems using balloon and skylines for timber areas having difficult access or operational conflicts with recreation, water, and other multiple use values.

(2) Fully mechanized production line pulpwood harvesting systems to meet vastly increased productivity requirements.

(3) Harvesting equipment, machines, and tools to meet the specialized needs of small timberland operators.

Forestry operations have not kept pace with other basic industries in improving labor output, in mechanization and automation for improved efficiency, and in reducing the physical drudgery involved. The production process is faced with increasing restrictions due to competing forest interests such as recreation, water, wildlife, and livestock which tend to increase already high costs. Because forest industries are decentralized, only small studies have been made leading to piecemeal improvements. Relatively little systematic research has been conducted of the kind required to reach essential major goals—giant steps in cost reduction and improvement of forestry operations, working conditions, and safety. Radical breakthroughs in mechanization of harvesting systems are urgently needed to raise productivity and to maintain and increase raw material supplies at competitive prices.

The engineering research program is prepared to make rapid advances toward solution of harvesting and production problems. Foreseeable benefits include:

(1) At least a 20% reduction in costs of harvesting the Nation's timber crop at an annual saving of $320 million.

(2) Capture of 500 million board feet of annual allowable cut now lost on timberlands not loggable in the Douglas-fir region of the West.

(3) Capture of an additional 440 million board feet of annual allowable cut in Alaska on National Forest areas that cannot be logged by conventional methods.

(4) A $16.5 million saving annually from reduction in mileage of timber-haul roads by use of aerial logging systems in National Forests of the Douglas-fir subregion of the West.

(5) A 10% reduction in costs of regenerating intensively managed forests in the South.

(6) A 10% reduction in the costs of harvesting gum naval stores.

(7) A significant reduction in the logging accident frequency rate—one of the highest in industry.

Examples of Recent Accomplishments

Cutting characteristics of chain saw teeth.—Detailed study of a chain saw tooth cutting through green timber has resulted in a research breakthrough. The forces and energy consumed during cutting were measured. Improved design of chain saw teeth and other cutting devices are now possible. Potential annual savings to the logging industry through a 10% improvement in chain saw parts replacement and cost of maintenance is estimated at $1,850,000.

Design system for aerial cableways.—Analyses of aerial logging cableway operations indicated a need for an easily applied method of designing and operating single and multispan skylines. Such a method has been devised and results presented in a "Skyline Logging Handbook on Wire Rope Tensions and Deflections." Availability of the Handbook should result in more efficient and safer skylines. More use of aerial systems so urgently needed to gain difficult access and to protect watershed and aesthetic values is anticipated. It represents an important step in realizing the multimillion dollar annual benefits to be realized from reduced road mileages and added timber suppies.

Forest survey

1966	$1, 939, 000
1967	2, 100, 000
1968	2, 203, 000
Increase	+103, 000

An increase of $103,000 is needed to—

(1) Accelerate timber inventories.

(2) Provide more local information on industrial development opportunities.

(3) Strengthen appraisals of timber supply and demand.

The proposed increase would permit reinventories of each State on an average cycle of ten years. Periodic local and national appraisals provide a basis for judging the costs, benefits, and justifications of both public and private forestry programs. The survey would be strengthened in all regions, particularly in the South and the North. Forestry conditions are changing rapidly in these regions. Rapid industrial expansion is underway, and there are major questions as to size of present and future programs.

The forest survey provides continuing appraisals of the timber supply and demand situation and outlook in each State and the Nation. Periodic inventories furnish basic statistics on—

(1) Area and condition of forest lands.
(2) Volume and quality of standing timber.
(3) Rates of timber growth and mortality.
(4) Cut of timber for industrial use.
(5) Trends in ownership.

Knowledge of present and future timber supplies is of critical importance in judging the adequacy of existing forest policies and programs. Specifically, survey information is needed to evaluate and justify public appropriations and private investments to meet expanding demands for timber products. Federal and State forestry agencies rely on the survey to guide program planning and budgeting. Forest industries rely on the survey for resource information essential for business decisions relating to wood procurement, land management, and industrial expansion.

Examples of Recent Accomplishments

Continuing progress on State surveys.—During the past year field inventories of timber resources and industrial use of timber were completed on approximately 49 million acres of forest land in ten States—Alaska, Oregon, California, Montana, Michigan, Kentucky, Pennsylvania, Virginia, Mississippi, and Texas. Reports appraising the timber situation were issued for eight States or portions of States.

New comprehensive appraisal of the timber situation completed for the Pacific Northwest.—Forest lands of Washington, Oregon, Idaho, and western Montana contain 1,123 billion board feet of sawtimber—about 44% of the United States supply. Timber industries produce about 51% of the Nation's lumber, 87% of the softwood plywood, and 25% of the wood pulp. Projections of prospective timber supplies indicate that timber consumption will increase 22% by 1985. However, despite greater log production total timber-based employment is expected to decline because of continuing improvements in productivity. The prospective decline in employment is especially marked in the sawmill industry. Some increases are anticipated in other timber-based industries.

Softwood timber resources increasing in Louisiana.—During the past decade growth of softwood sawtimber in Louisiana was about double the cut. The resulting buildup in softwood sawtimber volumes provided the base for a substantial expansion of timber industries. The supply of hardwoods, in contrast, is relatively unfavorable. Heavy cutting and land clearing have reduced the total volume of hardwood sawtimber by 23% during the past decade.

First comprehensive survey of Utah completed.—The first survey of Utah's forests reveals a volume of 19.5 billion board feet of sawtimber, including a considerable amount of overmature timber. Current harvesting of this timber resource is considerably below the allowable cut. Management of the forest in this area for timber must take into account the fragility of soils, low values for timber, and the major importance of water, recreation, and forage uses.

Forest products marketing research

1966	$1,491,000
1967	1,625,000
1968	1,625,000

No program increase is proposed.

Marketing research includes studies of problems relating to consumption of wood products in construction, manufacturing, and shipping. Of particular importance is the evaluation of factors that influence use of wood products and competing materials in various markets. Methods to expand use of wood products also have major importance. These studies provide guidelines for adjustments of production and marketing practices within forest industries. They also provide a basis for appraising the Nation's timber supply and demand situation and outlook. Such evaluations of timber market prospects are essential for program planning and budgeting. Improvements in markets for wood products will increase returns to millions of forest landowners, operators of wood-using plants, and their employees. These increases in turn will benefit economies of rural areas that have timber resources.

Examples of Recent Accomplishments

Operations research shows way to higher sawmill profits.—Linear programing studies at a modern southern pine sawmill showed managers how to saw each class of logs for maximum net returns. Decisions must be based on—

(1) Amount, quality, and cost of logs.
(2) Possible sawing patterns and their yields.
(3) Time available on each piece of mill equipment.
(4) Structure of market prices.

Sawing each class of logs by its optimum sawing pattern yielded $1,647 per hour in total revenue above the cost of raw material. This revenue was derived from lumber, timbers, and chips. The analysis further showed how changes in operating procedures changed optimum sawing patterns for various classes of logs.

Reduction of logging costs possible through better management.—An analysis of costs and returns on logging operations in southeast Kentucky showed a cost distribution of 29% for stumpage, 31% for labor, and 40% for equipment. Total costs per thousand board feet amounted to $35.82. Profits amounted to 10.5% of receipts. Better planning and supervision of the logging could have resulted in a 25% increase in production and a doubling of the margin for profit and risk.

Standard hardwood log grades benefit buyers and sellers.—Local log grading systems at five Appalachian hardwood sawmills misclassified the quality of 42% of the volume in 1,164 sample logs. As a result operators underpaid suppliers for some of the logs purchased and overpaid others. Average net returns at the five sample mills could have been increased nearly $4 per thousand board feet by using the more accurate standard Forest Service log grades. Data taken at 13 sample mills indicate that the Forest Service log-grading system can be readily applied by the log scaler at an average cost of less than 30¢ per thousand board feet of logs.

Tomorrow's crosstie—wood or concrete.—Consumption of crossties dropped from over 48 million ties annually during the 1940's to 14.5 million ties in 1961, but consumption has risen sharply to a current level of about 20 million ties. Current demands cannot be met at conventional prices because many sawmills that formerly produced crossties have ceased operation or have shifted to other products. The shortage of wood crossties has encouraged testing of concrete ties in a number of tracks. Concrete ties probably will penerate this market. Therefore, we are determining possibilities for more efficient and profitable production of crossties. The practicability of using new designs of solid wood or laminated ties is also being investigated.

Log exports and the Pacific Northwest economy.—The average value of logs loaded aboard ship and ready for export to Japan was $99.70. The average value of the products that could have been obtained through domestic processing of the same logs was estimated at $95.24. Domestic processing of these logs into kiln-dried lumber would have generated approximately nine man-hours of employment per thousand board feet. This compares with about three man-hours of domestic employment in log exporting. More than 90% of recent log exports consisted of No. 2 and 3 sawlogs, and less than 4% were peeler and select grade logs. Over 80% of the logs exported were under 22″ in diameter, and more than 75% were low-value hemlock and white fir.

Promising opportunities for pulp and paper production in Illinois.—A substantial potential exists for new pulp and paper plants in southern Illinois. Available timber supplies could sustain additions to pulping capacity of up to 2,500 tons per day. Water supplies are adequate for most pulping processes; transportation facilities are favorable; and labor, power, and other factors are available at reasonable cost.

United States hardwood imports grow.—During the past 15 years imports of hardwood plywood increased forty-fold to 60% of total United States consumption. Imports of hardwood lumber from tropical countries and Canada also increased to about 5% of the United States market. Analysis of domestic markets and timber supplies indicates that the major reason for increasing imports has been a growing shortage of high-quality hardwoods. A rapid expansion in production of fine hardwoods in tropical areas of the world has been another contributing factor. These trends appear likely to continue, and increase in imports of hardwood plywood and lumber are to be expected in coming decades.

Forest economics

1966	$658,000
1967	791,000
1968	1,088,000
Increase	+297,000

An increase of $297,000 is needed to—

(1) Evaluate the costs and benefits of a variety of forestry investments.

(2) Evaluate effectiveness of forestry programs for owners of small forest properties.

(3) Develop principles and guides for planning multiple use management of forest resources.

Particular attention would be given to cost/benefit analyses of tree planting, thinning, pest control, timber salvage, and road development under different geographic conditions. Related studies would determine how forestry programs for the 4.5 million owners of private forest land could improve productivity. Special emphasis would be placed on computer oriented planning systems to increase efficiency of land management for all products and services.

Forest economics research provides guides for the investment of both public and private funds in all forestry activities. Outlays for forestry purposes have increased to several hundred million dollars annually. Efficient budgeting of these funds requires information on costs and benefits from alternative forestry programs on public and private lands. Timber growing opportunities vary widely through the Nation by site, forest type, ownership, market conditions, and land-use alternatives. Forest owners differ greatly in their response to forest investment opportunities and to assistance programs. Increasing pressures on forest resources and increasing competition among forest uses have intensified the need for economic evaluations to guide prudent allocation of funds to alternative forestry activities.

Examples of Recent Accomplishments

Economic guides for managing red pine stands.—Under most conditions investment returns are highest if red pine stands in the Lake States are thinned regularly to 90 square feet of basal area per acre. Financial rotations also are affected by stand conditions, investment alternatives, costs, and prices. Application of these findings on the several million acres of red pine in the East would add substantially to long-run sawtimber supplies. Possible increases in timber output from improved thinning practices would also reduce costs of growing red pine by $1 to $2 per thousand board feet. Related studies describe how to estimate present values of incomes and costs in growing red pine trees for sale as pulpwood or sawtimber. They also illustrate how to—

(1) Compare investment opportunities in growing red pine.

(2) Determine the amount one can afford to buy land, establish and maintain a stand, or pay annual taxes or other expenses.

(3) Estimate the cost of producing stumpage under specified conditions.

Economic guides for dwarfmistletoe control in the Pacific Northwest.—New economic guides for dwarfmistletoe control in ponderosa pine stands provide procedures for estimating costs and rates of return from control measures. These guides were based on time and cost studies of actual control operations. They provide practicing foresters with information needed to allocate available funds among management opportunities.

Gauging the potential output of forest resources in Appalachia.—An economic model has been developed for comparing returns from alternative investments in wood-growing on several classes of forest land. This model was applied to a part of Tennessee. Most of the forest land in this area was capable of returning 3% or more on the capital invested in forest restoration. Investments in forest restoration would increase timber production and provide employment and additional secondary benefits.

Computer-oriented systems help in allocating wildland resources.—A parametric linear programing system was developed to evaluate alternate policy decisions and land-improvement programs in the Southwest. A sequence of "Management Plans" affords the decision maker the opportunity to assess effects of decisions on a predetermined economic objective. This linear program and a map information assembly and display system program previously developed can be integrated to deal with large-scale, long-term wildland management problems.

Research construction

1966	$4,183,000
1967	3,285,000
1968	2,278,000
Decrease	−1,007,000

A decrease of $1,007,000 is proposed. The $2,278,000 estimated for 1968 would be used for construction of facilities where plans are available and for planning other needed facilities. New construction is urgently needed to provide facilities for scientists now employed at a number of locations.

A. Locations where plans are available and funds for construction are requested	$2,000,000
(1) Madison, Wis	1,300,000
(2) Albuquerque, N. Mex	700,000

(1) Madison, Wis., $1,300,000

Plans and specifications are available for a new Wood Chemistry Building to expand facilities at the Forest Products Laboratory. Due to high costs, this building could not be constructed with funds appropriated by the Congress in fiscal year 1965. This building is urgently needed to provide modern specialized facilities for wood chemistry and wood fiber products research. These activities must be moved from the old laboratory during its remodeling and renovation now being planned with funds appropriated in fiscal year 1967. The Senate Appropriation Committee urged "the Forest Service to consider carefully the inclusion of funds for construction of this building in the fiscal year 1968 budget." As noted by the Senate: "This facility is essential to progress in the control of air and water pollution from pulp and paper manufacture."

(2) Albuquerque, N. Mex., $700,000

In fiscal year 1965 Congress provided funds for design and plans which will be available, so construction can proceed in fiscal year 1968. The Forestry Sciences Laboratory will provide modern equipment for research on the management and rehabilitation of eroded forests and range watersheds and on the ecology, biology and control of forest insects and diseases in the Southwest. The University of New Mexico has provided a site on the campus.

B. Locations where funds for architectural and engineering planning are requested	$278,000
(1) Moscow, Idaho	45,000
(2) Research Triangle, North Carolina	95,000
(3) Franklin, North Carolina	57,000
(4) Rhinelander, Wisconsin	31,000
(5) Gulfport, Mississippi	50,000

(1) Moscow, Idaho, $45,000

To plan second-stage construction of the Forestry Sciences Laboratory. The existing laboratory at Moscow was the first of a three-stage facility. A second-stage, estimated to cost $600,000, is now urgently needed to provide facilities for research in the biology, ecology, and control of forest insects in the Northern Rocky Mountains, for research in the silviculture of western white pine, and associated species, and for development of blister-rust resistant strains of pines. Some of the existing research now located in inadequate quarters at scattered locations will be moved to the new facilities. The addition will also provide for urgently needed program expansion in connection with the pesticide problems. Greenhouse-headhouse facilities, for which plans are available, would be part of the construction at an additional estimated cost of $200,000. Sufficient land is leased from the University of Idaho for all structures.

(2) *Research Triangle, N.C., $95,000*

To plan a second-stage of construction for the Forestry Sciences Laboratory. The scientific effort here in the Research Triangle Park, adjacent to Raleigh, Durham, and Chapel Hill, concentrates on basic research leading to the control of important pests of southern pines. Some of these are bark beetles, defoliating insects, root rots, and forest weed species. Expanded pesticide research at this location requires additional laboratory space. The tract of land donated to the Government by the Research Triangle can accommodate this construction. The estimated cost is $1,200,000.

(3) *Franklin, N.C., $57,000*

To plan a Forest Hydrology Laboratory to facilitate the Coweeta watershed research program. Research at this laboratory has as its mission the improvement of quantity, quality, and timing of water yields in the southern Appalachians. Scientists investigate forest climatology, water relations of plants and soils, streamflow and ground water. Modern facilities are required for the expanding basic and applied research programs. The laboratory and auxiliary facilities are estimated to cost $650,000.

(4) *Rhinelander, Wis., $31,000*

To plan an expansion of existing Laboratory and greenhouse facilities at the Institute of Forest Genetics. The second-stage structure will cost an estimated $400,000. It will relieve current over-crowding and will enable more research in the genetics of northern tree species in relation to pest resistance. The Forest Genetics Institute here is one of the three main genetics centers of the Forest Service.

(5) *Gulfport, Miss., $50,000*

To plan additional laboratory facilities for insect and disease research. The first stage of construction at Gulfport was built in fiscal year 1959. Since that time resident research programs in forest genetics, entomology, and pathology have more than doubled in size. The new laboratory would provide adequate space for scientists searching for controls for insects and diseases destructive to forest trees and wood products. The laboratory addition would release space urgently needed for genetics research in the present building. The estimated cost of second-stage construction is $650,000. Space is available for the addition next to the present laboratory on Government-owned land.

Nonrecurring construction

The 1967 appropriation provided for the following non-recurring items:

Construction:	
Athens, Ga.	$1, 000, 000
Oxford, Miss.	450, 000
Olympia, Wash.	450, 000
Carbondale, Ill.	690, 000
Design and specifications:	
Delaware, Ohio	72, 000
Corvallis, Oreg.	170, 000
La Grande, Oreg.	28, 000
Provo, Utah	37, 000
Madison, Wis.	180, 000
Nacogdoches, Tex.	25, 000
Berea, Ky.	40, 000
Lincoln, Nebr.	28, 000
Burlington, Vt.	40, 000
Durham, N.H.	75, 000
Total	3, 285, 000

Examples of Recent Accomplishments

Construction is completed at Olustee, Florida and Sewanee, Tennessee and is underway for all other buildings provided in the 1966 appropriation. The 1967 appropriation provided for construction of laboratories at Athens, Georgia; Olympia, Washington; Carbondale, Illinois; and Oxford, Mississippi. Construction contracts will be let before the close of the fiscal year.

Plans are complete for the Wood Chemistry addition to the Forest Products Laboratory at Madison, Wisconsin and for laboratories at Albuquerque, New Mexico; Fort Myers, Florida; and State College, Mississippi. Planning of laboratories included in the 1967 appropriation is on schedule. Except for the large laboratory at Corvallis, Oregon and the remodeling at Madison, Wisconsin, detailed design and cost estimates will be available by March 1, 1967, and construction could proceed as soon as funds are available.

STATE AND PRIVATE FORESTRY COOPERATION

Cooperation in forest fire control

1966	$12,803,000
1967	12,834,000
1968	12,834,000

No program increase is proposed.

An effective, well-equipped fire organization is needed to protect the important natural resources on State and privately owned forest lands. In fiscal year 1966, States spent $85.1 million which included $12.8 million of Federal funds. During the 1961–1965 period, States reported an average of 110,820 fires which burned 3,992,590 acres each year.

Emphasis on fire prevention will be continued and expanded. Fire statistics show that over 96% of all fires occurring on non-Federal lands are man-caused. State fire prevention efforts at the local level will be intensified. Included will be the employment of additional technical specialists to cope with this man-caused fire problem. Federal funds will provide the stimulus to insure effective programs.

Adequate forest fire control is especially important to the economically distressed areas as their economy is closely tied to timber, recreation, water, and wildlife resources. The greatly increased use of forested areas by loggers, homeowners, campers, hunters, hikers, and others has caused an upward trend in the number of fires.

Fire prevention and suppression strength is not now sufficient to fully utilize the newer, more expensive technical equipment and techniques. During the period 1957 to 1965 the estimated cost of protection rose from $83 million to $123 million. State expenditures during this same period increased from $4 million to $64 million while the Federal appropriation rose from $10 million to $12.7 million.

Similarly, timberland values have increased rapidly during the last 25 years. A conservative estimate of the value per acre of protected, commercial forest land has risen from $5 in 1940 to $50 in 1965. During this same period, the cost to protect these lands had experienced only a modest increase from 3.99¢ per acre to 16.12¢.

In view of the high values at stake it is essential that we be prepared to effectively meet the threats that occur during drought periods or resulting from a high incidence of fires during a short period of time. These newer, more expensive, fire control techniques are necessary to provide the insurance needed to handle catastrophic fire situations as values being protected continue to increase. Fires, if allowed to burn, not only cause an economic loss of natural resources and the enjoyment they give, but also threaten destruction of valuable watershed, road, recreation, public utility, home and other improvements valued at many hundreds of millions of dollars. In addition, the natural beauty is destroyed for generations to come.

Examples of Recent Accomplishments

All 50 States are now cooperating in the forest fire control program. Arizona became a cooperating partner on July 1, 1966.

State foresters reported extending fire protection to 25 million previously unprotected acres. At the end of calendar year 1965 there were 472 million acres protected under the Clarke-McNary Program.

The allotment and expenditure table which follows shows State fiscal year 1966 expenditures and Federal fiscal years 1966 and 1967 allotments to States. The Federal distribution to each State is based on a formula which recognizes the program need and expenditure level in each State.

Cooperative forest fire control, C–M 2

State	State and private funds expended, fiscal year 1966	Federal allotments, fiscal year 1966	Federal allotments,[1] fiscal year 1967
Alabama	$1,177,983	$383,890	$370,454
Alaska	189,508	47,000	88,523
Arizona	----------	----------	21,050
Arkansas	1,381,151	394,080	377,392
California	25,458,114	1,073,080	1,035,522
Colorado	228,286	50,000	78,565

Washington	2,815,549	539,840	520,946
West Virginia	450,631	164,664	155,703
Wisconsin	1,948,455	412,520	398,082
Wyoming	53,405	47,000	69,461
Administration, inspection, prevention, and special services to States	----------	944,304	1,007,500
Grand total	72,249,427	12,803,000	12,834,000

---

[1] While the amount available to a State may, if the allotment is small, exceed previously computed expenditures by that State, the actual payment to a State never exceeds State and private funds expended by or under the control of the State.

Cooperation in forest tree planting

1966	$300,000
1967	300,000
1968	300,000

No program increase is proposed.

The Forest Service cooperates with 48 States and Puerto Rico through financial and technical assistance and other services in the production, acquisition, and distribution of tree planting stock for forest and windbarrier plantings on non-Federal land. To meet our timber goals, about 10 million acres of such land will require some form of Federal aid during the 10-year period beginning with fiscal year 1968. This program (authorized under Section 4 of Clarke-McNary Act of 1924) helps materially by providing planting stock for the Nation's needs for a wide variety of uses including:

Timber production
Wildlife habitat
Watershed protection
Recreation
Rural beautification
Special forest products

This program also assists the States in meeting increased costs for new equipment for extracting seeds, nursery operations, needed nursery maintenance and other related costs that continue to arise.

The War on Poverty needs trees for planting in impoverished rural counties to provide employment and develop timber resources in these areas. The 1968 objective is to assist the States in production of 600 million high quality seedlings for distribution to private landowners for reforestation of almost a million acres and shelterbelt planting on about 40,000 acres. This planting stock will, in many ways, aid in programs for:

Beautification
Cropland adjustment
Agricultural conservation
Watershed protection
Appalachian forestry
Rural areas development
Forestry-based recreation

These programs compliment private forestation programs that depend upon planting stock for reforestation and shelterbelt plantings.

The 1966 Federal-State cooperation in the production and distribution of forest and shelterbelt planting stock, for use on non-Federal land, continues at about the 1965 level. The 48 cooperating States operate 98 nurseries that produced over 500 million trees for forestation and shelterbelt planting last year.

Examples of Recent Accomplishments

Special technical and financial help was provided two States in designing and constructing modern forest tree seed extractories and storage facilities. These new plants provide cold storage facilities for seed and planting stock that are necessary for efficient nursery operations.

The usual technical and financial assistance was continued. Emphasis was on helping with such technical problems as:

Seeding
Soil management
Chemical weed control
Insect and disease control
Grading and packaging the planting stock
Handling stock while enroute to the planting site

Improvement in nursery techniques, along with better field planting practices, are resulting in better survival, more rapid growth, and reduced costs for establishing a stand of forest trees or shelterbelts.

Some States continue to provide private landowners with seed for direct seeding where research has developed such practical reforestation methods.

A special study of seed orchards and production areas was made during the past year. There are now 153 seed orchards with over 3,000 acres growing improved seed from hybrids and selected strains for reforestation purposes. Also 294 seed production areas with over 8,500 acres are managed for seed selected stands.

The number of trees shipped to landowners during each of the past five fiscal years in comparison with all forest and shelterbelt trees produced by public and private nurseries is as follows:

Year	Federal-State cooperative program	Other State distribution	Total output all nurseries
1962	670,000,000	28,000,000	1,100,000,000
1963	587,647,000	30,607,000	1,008,000,000
1964	535,429,000	43,174,000	948,312,000
1965	508,651,000	37,805,000	893,564,000
1966	521,000,000	50,530,000	864,705,000

Shipments for fiscal years 1967 and 1968 are expected to be about the same as those shown for 1966.

Cooperation in forest management and processing

1966	$3,535,000
1967	3,546,000
1968	3,546,000

No program increase is proposed.

This program is carried out in 49 participating States and Puerto Rico. It is aimed at rural areas and communities where forest resources provide an important part of the economic base on which the local people must rely for employment and income and on which industry must rely for needed present and future supplies of timber. The work is done in the woodlands owned by farmers and in other woodlands owned by miscellaneous, generally non-industry, private owners. Also, it is done at the small plants processing primary forest products. In addition to assistance on-the-ground, technical assistance is provided local community and area development groups.

Assistance is provided woodland owners in improving the management and utilization of their forest resources for timber, water, forage, recreation, fish, game, special products, and natural beauty. It includes such activities as—

(1) Making forest resource inventories.
(2) Planning for multiple use forest management.
(3) Tree planting and seeding.
(4) Improving timber stands.
(5) Protecting forests from fire, pests and animals.
(6) Harvesting and marketing forest products.

Assistance is also provided loggers and operators of small plants processing primary forest products. It includes harvesting equipment and methods, plant layout and operations, and marketing. Success in making full and effective use of existing forest resources depends largely on these activities. They are initial critical factors in obtaining the highest use and maximum value from forest products raw materials. They are especially important to areas supporting large volumes of low quality timber. They are of critical importance in supplying industry with sustained volumes of well manufactured lumber and other secondary products.

Assistance to community and rural area development groups includes such activities as—

(1) Helping them to assemble data and interpret it in terms of opportunities for development and utilization of their forest resources.
(2) Helping them to give appropriate attention to forest resources in preparing area development plans.
(3) Bringing them in contact with specialists when needed.
(4) Providing detailed information for feasibility studies.
(5) Providing technical assistance in connection with planned forestry measures and practices.

In addition, supporting forestry service and assistance is provided such programs and activities as—

(1) Agricultural conservation program
(2) Appalachian Regional Program
(3) Agricultural extension
(4) Cropland adjustment program
(5) Cropland conversion program
(6) Farmers Home Administration forestry loans
(7) National survey of recreational facilities
(8) Resource conservation and development projects
(9) Rural renewal projects
(10) Soil and water conservation needs inventory

To accomplish the work that needs to be done, on-the-ground technical assistance is provided by professional foresters employed by the States in cooperation with the Federal government.

The following table shows major benefits that have been, or will be, obtained from Federal appropriations when matched with State appropriations.

Major benefit	Fiscal year 1966	Fiscal year 1967	Fiscal year 1968
Woodland owners given woodland management assistance ... number	113,000	117,000	117,000
Forest products operators given assistance ... do	10,500	10,900	10,900
Area of woodland involved ... acres	7,028,000	7,275,000	7,275,000
Volume of timber products sold or harvested ... MBF	817,000	846,000	846,000
Value of timber products sold or harvested ... dollars	19,884,000	20,582,000	20,582,000
Owners referred to consulting and industrial foresters for additional assistance ... number	2,900	3,000	3,000
Volume increase in Nation's production and supply of quality timber ... cu. ft	457,548,000	472,836,000	472,836,000
Area of natural resource conservation improvements ... acres	4,022,000	4,157,000	4,157,000
Area of revegetation and improved range management ... do	77,000	80,000	80,000
Area of improved watershed conservation ... do	193,000	199,000	199,000
Area of improved wildlife habitat ... do	18,000	19,000	19,000
Area of forestry practices contributing to natural beauty ... do	2,500	2,600	2,600
Direct contributions to increased forest recreation availability and user capacity ... number	19,300	19,900	19,900
Employment resulting in rural areas ... man-day	3,268,000	3,377,000	3,377,000
Appropriation level:			
Federal	$3,535,000	$3,546,000	$3,546,000
State	4,600,000	4,900,000	4,900,000
Total	8,135,000	8,446,000	8,446,000

General forestry assistance

1966	$920,000
1967	1,471,000
1968	1,571,000
Increase	+100,000

An increase of $100,000 is needed to provide professional services for increasing hardwood lumber output.

A program to improve the hardwood situation is essential. Forecasts indicate that housing starts will make an upturn in 1967. This should stimulate demand for flooring, paneling, kitchen cabinets and other house components made largely from hardwood. Furniture, pallet and crosstie markets are strong. The long-term trend indicates an increasing demand for hardwood lumber.

The three Hardwood Improvement Projects undertaken as a result of the fiscal year 1967 supplemental appropriation will be continued. Through the State forester's organizations services will be offered to forest landowners in the multiple use management, marking, sale and harvest of their hardwood timber. Assistance will be provided to loggers upon request, in improving the efficiency of their operations and bucking for grade. Assistance will be offered to sawmill owners in improving their manufacturing and seasoning processes and in cost reduction.

Dissemination of research findings in the field of forest products and feedback industry problems to forest products researchers will be facilitated.

Hardwood workshops will be arranged to provide the latest information on hardwood management; harvesting and processing for quality to foresters, landowners, loggers and sawmill owners.

Appalachian Regional Program.—The objective in the Appalachian Regional Program through use of these funds is to improve social, economic and resource conditions in the region through providing:

(1) Professional management services to woodland owners.

(2) Professional assistance to loggers and processors of forest products in harvesting, manufacturing and marketing.

(3) Assistance in the establishment of timber development organizations.

(4) Program guidance and training.

These services are provided by the Forest Service and cooperating States and will directly and indirectly benefit the forest products industries, other related businesses and individuals throughout the Appalachian area. The cooperating States are reimbursed for part or all of the agreed upon costs which they incur in carrying out the stepped-up program of technical forestry assistance.

Regular Program.—The objective of the regular General Forestry Assistance Program is to develop, maintain and improve the continuous and efficient production and use of the Nation's forests through:

(1) Providing professional services in forest inventory, forest management, harvesting, processing and marketing to States, counties, other Federal agencies, forestry associations, economic development groups, forest products industries and operators and private owners of large forest properties who do not have professional people available to interpret and apply research findings.

(2) Providing training, assistance and advice for State forestry personnel, industrial foresters and consultants.

(3) Providing leadership and coordination to Forest Service efforts in national programs of social, economic and resource development.

Services provided through these funds lead to improvement of economic conditions and employment in rural communities.

The following table shows comparison of actual and estimated benefits from this program:

	Unit	Fiscal year 1966	Fiscal year 1967	Fiscal year 1968
Volume increase in Nation's supply of quality timber.	Million cubic feet	871	871	1,000
Area of natural resource conservation improvements.	Thousand acres	6,560	6,560	7,580
Employment resulting in rural areas	Thousand man-days	5,660	5,660	6,340
Assistance to marketing firms (cooperatives).	Number	20	20	20
	Thousand dollars	2,100	2,100	2,100
Forest products utilization assists	Number	525	550	600
New industry and business established or expanded.	do	92	92	100
	Dollar value added to employment.	6,760,000	6,900,000	8,000,000
	Million board feet	550,000	600,000	690,000

Examples of Recent Accomplishments

General forestry assistance work was increased in all States in fiscal year 1966. Assistance was provided to Rural Areas Development and other local and regional economic development groups in planning and carrying out programs to more fully utilize their forest resources for improving employment opportunities and income. Forest management and utilization work in Puerto Rico and the Virgin Islands was continued to help the people there make the fullest use of their forest resources.

The following tabulation shows accomplishments in fiscal year 1966:

	Unit	Estimated accomplishment
Program workshops	Number	394
Program publications	do	137
Program studies	do	95
Forest management assists to large forest ownerships	do	83
	Acre	38,725,000
Forest products utilization assists	Number	1,813
Inventories and surveys	do	43
	Acre	39,318,000
Economic and marketing investigations	Number	245
Rural areas development assists	do	459
Appalachian regional program:		
Woodland owners given management assistance	do	4,650
Area of woodland involved	Acre	300,000
Forest products operators and processors assists	Number	350

UNIFORM TIMBER SALE APPRAISAL PROCEDURE FOR FOREST SERVICE AND BUREAU OF LAND MANAGEMENT

Chairman HAYDEN. Last December, the Comptroller General of the United States prepared a report on a need for the Forest Service and the Bureau of Land Management to resolve their differences in procedures for appraising timber sale offerings. What comment do you have on this report?

Mr. CLIFF. I will ask Deputy Chief Nelson to comment on that, Mr. Chairman.

Mr. NELSON. Mr. Chairman, the two agencies, the Bureau of Land Management and the Forest Service, have been working out a uniform appraisal procedure, as was recommended by the GAO report. We have been working with the Bureau of the Budget. The procedures to do this are being developed with a goal of having the procedures all worked out by July 1, 1967, of this year.

And then the uniform procedure is proposed to be put in operation by July 1, 1968. This will provide 1 year for us to amend our instructions, train our people, and have meetings with the operators that will be affected and familiarize them with any new procedure in the program.

TIMBER SALES ADMINISTRATION AND MANAGEMENT

Chairman HAYDEN. Would you explain to the committee how you propose to use your increase of $1,437,000 for sales administration and management of your timber resources program?

Mr. NELSON. Yes, Mr. Chairman. We propose this year to put that entire increase into a program of increased sales of thinnings and salvage material. We propose to prepare and sell about 280 million board feet, and harvest about 210 million board feet of commercial thinnings and salvage work.

Most of this will be in the Pacific Northwest area. The cost per thousand is going to be a little heavier than our regular business because of the scattered nature and the smaller volumes that will be affected. All of this low value material is over and above the allowable cut of the regular timber sale program.

Chairman HAYDEN. I know that the timber resources program which you proposed is necessary to meet the national needs.

Do you define these "needs" as commercial demands or national security requirements, or both?

Mr. NELSON. Well, our timber production and allowable cut is based upon both the commercial needs and what is involved for national security. It involves both.

A great deal of material, of course, has been furnished for the Vietnam effort, and a good share of that comes from the national forests, because we supply a large part of the total cut for the United States.

About 20 percent of the total log supply in 1966 came from the national forests.

REFORESTATION VALUE BASIS

Chairman HAYDEN. With respect to the table on page 24 of your justifications, under "Reforestation and Timber Stand Improvement" are the values which you show for reforestation of 125,000 acres in 1968 based on 1967 prices or are they projected to the year of cutting?

Mr. NELSON. They were projected based upon the 1965 stumpage rates, which were then adjusted for the size of the material that we expected to be available when this material is available for cutting, and also adjusted for manufacturing capacity that we would expect to be involved in the years 2000 and 2020. They did not contain a factor for inflation adjustment, or anything of that sort.

TREE NURSEY DEVELOPMENT

Chairman HAYDEN. You are asking for $355,000 for enlargement and modernization of existing nurseries. Where do you plan to expend money?

Mr. NELSON. That, in the first place, I think, Senator, we did not make it clear in the notes that $110,000 of that amount is used for seed collections, and $75,000 of it will be used for a land purchase project for a seed orchard to be established in Wisconsin.

The remaining $170,000 will be used in eight different locations in seven different States for improvement of nurseries; Coeur d'Alene in Idaho, Mount Sopris in Colorado, Humboldt Nursery in northern California, Wind River Nursery in the State of Washington, the Ash Nursery in Mississippi, two nurseries in Michigan, the Chittenden and the Toumey, and the Eveleth Nursery in Minnesota.

It will be a relatively small amount spent on each one of them, no major projects, but we will carry on improvements needed for better nursery practices.

RECREATION SITES

WASTE TREATMENT SYSTEMS

Chairman HAYDEN. At which recreation sites and in what amounts do you propose to expend the $1,951,000 on waste treatment systems?

Mr. NELSON. I can supply that for the record, if you would rather, Senator. It is a rather extensive list. There are 25 areas.

Chairman HAYDEN. You will place it in the record?

Mr. NELSON. I would be glad to do that.

(The information follows:)

Proposed locations and expenditures for sewage treatment facilities needed at existing national forest recreation developments for fiscal year 1968

Facility and location	Forest	State	Estimated cost
Lake Tahoe area	Eldorado	California	$700,000
Nevada beach campground and picnic area	Toiyabe	Nevada	10,000
Garden's Bluff recreation area	Cherokee	Tennessee	33,000
Chilhowie recreation area	do	do	29,000
Parksville campground	do	do	35,000
Juniper Springs recreation area	Ocala	Florida	95,000
Fore Lake recreation area	do	do	35,000
Clearwater Lake recreation area	do	do	60,000
Mill Dam recreation area	do	do	15,000
Lake Dorr recreation area	do	do	36,000
Big Scrub hunt camp	do	do	30,000
Wright Lake recreation area	Appalachicola	do	15,000
Lake Russell recreation area	Chattahoochee	Georgia	12,500
Lake Winfield-Scott recreation area	do	do	12,500
Choctaw Lake recreation area	Tombigbee	Mississippi	93,700
Glen Ellis recreation area	White Mountain	New Hampshire	20,000
Dolly-Copp recreation area	do	do	60,000
Russell Pond	do	do	30,000
South Pond picnic and swimming area	do	do	35,000
Campton Pond	do	do	40,000
Hopgood Pond recreation area	Green Mountain	Vermont	30,000
Heather-Meadows project	Mount Baker	Washington	90,000
Diamond Lake	Umpqua	Oregon	270,000
Gull Lake campground, tract and station	Inyo	California	144,700
Shook Branch recreation area	Cherokee	Tennessee	19,900
Total			1,951,300

CONSTRUCTION AND IMPROVEMENT

Chairman HAYDEN. It is indicated that in the fiscal year 1968, you will expend $11,352,000 on new construction and improvement of existing facilities for public recreation use purposes.

Would you please explain in such detail as you can what will be accomplished by these funds?

Mr. NELSON. That is our major construction item in relation to the important recreation job that we have to do. Chief Cliff earlier explained that the Forest Service serves more recreation visitors than any other Federal agency—nearly half of the total.

A sum of $3,900,000 will be used for improving the quality of facilities on existing areas of special importance. These will involve some 348 different sites. A sum of $4,874,000 is scheduled for new sites building facilities at campgrounds, vista points, swimming areas, boat launching ramps, and so forth. This will be 177 different sites and will be new construction. It will provide a capacity of about 13,300 people at one time.

We expect to use about $578,000 at some 88 different areas for visitor information service, and this will include one new VIS building to serve Sylvania at Watersmeet, Mich.

Other visitor information services involve such items as guided nature trails, exhibits, interpretative signs, vista points, and such as that.

Then we propose to use $2 million in connection with areas of national significance, including Flaming Gorge, Sawtooth Mountain area, Timberline on Mount Hood, the Mount Rogers National Recreation Area, the Spruce Knob-Seneca Rocks National Recreation Area, the Shasta-Trinity National Recreation Area, the Sylvania tract, Cradle of Forestry, Trout Pond in West Virginia, Blanchard Springs in Arkansas, and the Lake Michigan development on the Lower Peninsula of Michigan.

The $2 million will be divided between those areas of national significance, and which we designate from here where we want those funds spent. The other funds for construction are designated for expenditure by the regional foresters, who are more in touch with the need to the particular region.

CLEANUP AND MAINTENANCE

Chairman HAYDEN. What is involved in cleanup of developed sites as distinguished from maintenance of the sites?

Mr. NELSON. I guess, Senator, the easiest way to explain, that is to say, the cleanup is somewhat like the janitorial service. It is what has to be done every day. It is emptying the garbage, the cleaning of the tables, the refurbishing of the recreation improvements, and the sanitation facilities. Maintenance is more like what is done by the plumber, the painter, and the carpenter on the bathhouses, boat ramps, water systems, barriers, signs, tables, vending ticket machines, and that type of thing.

GRAZING STUDY

Chairman HAYDEN. How does the Forest Service stand on the grazing study which is being coordinated by the Bureau of the Budget?

Mr. NELSON. I will ask Mr. Payne to answer that question.

Mr. PAYNE. The interdepartmental grazing fee committee has completed its report and recommendations for a uniform approach. The Forest Service and the BLM have gone on from there with additional analysis. The Statistical Reporting Service of the Department of Agriculture is doing contract work for the two agencies. We expect the contract work to be completed by July 1967, and this will give basic data needed to complete the study. We anticipate that this will let the Forest Service meet its previously announced target date of 1968 to start implementing the fee adjustments justified as a result of the completed study.

Mr. NELSON. Mr. Cliff has talked about the 1968 budget adjustment presented for your consideration. That would include the $155,000 to implement this study.

WILDERNESS SYSTEM

Chairman HAYDEN. Will you tell the committee of progress and problems in your expanding recreation business in relation to the Wilderness Act, to administration of the national recreation areas, and to providing regular camping, picnicking, and sanitation facilities?

Mr. NELSON. Yes, the Wilderness Act, gave the Forest Service a tremendously big job, because it required that all of the primitive areas be studied to determine whether or not they should be placed within the Wilderness Preservation System under the Wilderness Act.

The law requires that we study and report on one-third of them in the first 3 years. We have moved forward on those studies.

We have had nine public hearings. We have three more hearings that will be held in the next month or two.

We have completed a study and report on one area, the San Rafael Primitive Area. The report and recommendations have been sent to the President, and the President has transmitted that case to the Congress with a proposed bill for action by the Congress. These projects require an extensive study, not only by us, but also by the Geological Survey. The act requires us to hold public hearings, then we go through the process of studying what material comes up in the public hearings. Information gained in such hearings is used in making our final recommendation to the President. We expect that we will have all nine reported on schedule, and be submitted to the President by September 1967.

Mr. CLIFF. All 12?

Mr. NELSON. Twelve. I beg your pardon.

Mr. CLIFF. We have to have 12 submitted by September 3. Mr. Chairman, we will make that schedule, but it is really going to push us to get it all done.

Mr. NELSON. I might say in relationship to the wilderness, that the Wilderness Act has created more interest in wilderness and the use of wilderness has increased, and we will have to use more of our recreation funds for the supervision and management of wilderness areas in 1968 than we used in the years before.

NATIONAL RECREATION AREAS

Now I think you also asked about national recreation areas, too?

Mr. CLIFF. Yes.

Mr. NELSON. We are responsible for three national recreation areas that have been established by the Congress. One in West Virginia, one in Virginia, and one in California, where we have the responsibility for the two major lakes, and the Park Service has the smaller lake. We have been working and developing plans for these national recreation areas. We think they are vitally important, and we do a particularly good job of planning in relation to these national recreation areas. We are planning to take into account all of the various types of recreation that might be available within those areas, including scenery, because lots of people will come to these areas just to look and enjoy the scenery. We will give wildlife particular attention in the planning for these recreation areas, and also the maintenance of waterflow and the purity of the water.

We expect that the recreation visits on the national recreation areas will increase tremendously, and consequently, we feel it is necessary to put up a quality type recreation facility.

The cost per unit might be a little higher, because of the type of recreation facility that we will have, but they will be taking care of more visitors, and I think the cost per visitor will be in line with the rest of our recreation.

SOIL AND WATER MANAGEMENT ACCOMPLISHMENTS

Chairman HAYDEN. I observe that you are not proposing an increase in the amount requested for soil and water management. However, will you touch on what you have accomplished in the past year under this activity and indicate your expectations for the coming year?

Mr. NELSON. We consider this item a particularly important one in our budget especially as it affects the yield of water, giving more attention to the possibilities of increasing the yield of water. As you know, Senator, from the projects down in Arizona, this water yield business is very important in many areas of the West.

We had about 460 projects of various types, which were analyzed by either our soil scientists or our watershed scientists and prescriptions were prepared toward prevention of erosion, water pollution, or water yield.

We expect to install about 20 water quality monitoring stations, mostly in municipal water supply watersheds this year. Last year, we had two of these monitoring stations. This work is in line with the increased emphasis on water quality throughout all Federal management.

NATIONAL FOREST PROGRAMS IN APPALACHIA

Chairman HAYDEN. I note the statement on page 44 of your notes that additional consideration is being given to possible enlargement of national forest programs in Appalachia. Would you please explain this to the committee?

Mr. NELSON. Yes, part of our job in relation to our overall Forest Service responsibility deals not only with national forests, but with all forest lands in the United States. The Appalachia area is heavily forested, that is, a high percentage of the acreage in the Appalachia area is forested—about 80 percent.

The quality of timber is relatively poor. Some of the land is not too good, and we have been making some studies in relation to the overall forest land problem in the Appalachia area. Especially, as you will recall the President asked for a plan for the Potomac River Basin, to help make the Potomac River a better and cleaner stream, and we have been involved in one study of the forest lands in the Appalachia programs. This is somewhat similar to the study that we made in Kentucky, that resulted in the establishment of the Red Bird unit as part of the Daniel Boone National Forest, the study made with the State of Kentucky.

We are not saying that we are looking at areas necessarily for additions to the National Forest, but we do feel that all the facts on how the land is being managed, and what could be done in relation to better watershed condition and better timber producing condition should be studied, and consequently, we do carry out this type of study.

ALASKA STATE APPLICATIONS FOR NATIONAL FOREST LANDS

Chairman HAYDEN. What do you propose to do to accelerate cooperative efforts in Alaska with regard to State applications for national forest lands?

Mr. NELSON. The regional forester for Alaska is working with the Alaskan people, and he is establishing or initiating a program of preplanning, with the communities, for probable expansion of communities.

One of our difficulties in the past is that a community will just come in and say, "We want 5,000 acres," without very much planning having gone into the need for the property. Consequently, by initiation of this new program, we are working with the communities in advance of their applications, before possible transfer of Federal Forest Service lands to these communities.

We think that it will give them a chance to work out their problems in advance. We will furnish some help and the expertise to the communities and boroughs for their planning for the future, and we will also enlist the assistance of other public and private agencies.

We have had about 11 applications for additions to the communities or transfer of land to the States under the Statehood Act. Seven of these have been approved in whole or in part. Two or three were for new communities, where there was not any supporting evidence that there would be a community established.

One was for a private club that can better be handled under a different method than the transfer of land. We are working closely with the State of Alaska toward implementation of our part of the Statehood Act.

Mr. CLIFF. Mr. Chairman, I think the committee would be interested in that this Statehood Act for Alaska authorized the Secretary of Agriculture to transfer up to 400,000 acres of land to the State for community developments, and for community purposes, including recreation.

This is what we are talking about. The most of the communities in southeastern Alaska, where the national forests are, are located inside the national forests. In the past, we have made little exclusions of national forest land for community growth.

Now the Statehood Act provides for adding to these community areas, as the need arises, and this is what we are working on.

Chairman HAYDEN. Yes.

Mr. NELSON. We have also had a little trouble on the Chugach National Forest, which is north of the Tongass Forest, because of the Indian claims and assertion of aboriginal titles. Such Indian claims are having an effect upon the transfer of lands to the States, because of those Indian claims. In southeastern Alaska we do not have the same problem, because of the Tongass Timber Act.

LAND LINE LOCATION AND LAND STATUS RECORDS

Chairman HAYDEN. Can you break down the $2,140,000 for landline location and land status records into the amounts for each of these activities?

Mr. CLIFF. Mr. Nelson will handle that, too.

Mr. NELSON. Mr. Droege will handle that. He has the figures.

Mr. DROEGE. For the status work, it will be $528,000, and for landline locations, $1,612,000.

PHOTOGRAMMETRIC SURVEYS

Chairman HAYDEN. Do you accomplish your photogrammetric surveys for which you are proposing a total of $932,000 by use of private contractors or with your own air photographic equipment?

Mr. DROEGE. The photography is not a big part of the total job. We would do about 93 percent of the flying that is involved with contracts, and the balance with our own aircraft, when they are not used on something else.

FOREST FIRE PROTECTION

Chairman HAYDEN. You are proposing almost $26 million for forest fire protection. Would you please describe what you plan along this line in the coming year?

Mr. NELSON. With that amount of money, we will carry on our fire prevention program, about 401 man-years goes into that. That will require $3,565,000. We will also carry our fire detection program at the same level as the year before, and that will use $3,380,000. We intend to increase our fire attack crews, and will use the increase that is involved here for additions to our fire attack forces. That will supply 1,360 man-years, and will cost $14,342,000, which is the major part of our fire fund.

Also, in the 1968 budget adjustment, in the reprograming, it was proposed to increase this fire item by $205,000, to offset the crews that were used on blister rust. There will be some 400 less people hired on blister rust this summer, and we propose to add three 25-man fire attack crews to be stationed in Idaho where the blister rust crews will be eliminated.

There will be about $3,240,000 used in air activities, and $310,000 for fuel modification, some $610,000 for equipment development and testing, in our fire program activities, and about $520,000 will be used for studies, surveys, plans, and our training programs in fire control.

INTERAGENCY FIRE CENTER, BOISE, IDAHO

Chairman HAYDEN. The Interagency Fire Center at Boise will be constructed during the coming year. How is it planned that this facility will operate?

Mr. NELSON. Well, Senator, we consider that this is an excellent example of cooperation between two Government agencies. This Center is planned with the Bureau of Land Management. The Bureau of Land Management has in their budget the construction item needed for starting the Center. The Bureau of Land Management will have certain facilities there for their air business and it will be their fire center for Western States. The Forest Service will have an air attack facilities and support facilities for the adjoining national forests in southern Idaho, and will also have the backup support and the tool cache and that type of thing that will be available for all of the western national forests.

We also have a plan worked out with the Bureau of Land Management, so that when we get in a real tough fire situation, there will be one coordination area, and this will be at Boise for that part of the West. It will not be activated at all times, but it will be activated at the time that both we and the BLM have a lot of serious fires. We will both need equipment and firefighters; we will both need aircraft, and by this coordination, we will get the best results at the time and place where it is needed without duplication of efforts.

There was some of this coordination work done last year on the big fire situation in the West. We also have a joint fire center, on a smaller scale, at West Yellowstone working with the Park Service and the Bureau of Land Management.

INFRARED SENSING TECHNIQUE FOR DETECTION OF FOREST FIRES

Chairman HAYDEN. We have seen news articles on the use of infrared heat sensing techniques for detection of forest fires. Will you briefly explain this to the committee?

Mr. NELSON. Mr. Jemison is involved with the research in that, and I think he would like to explain that.

Mr. JEMISON. Mr. Chairman, the infrared sensing technique is one with which fires can be mapped or detected from instruments in high-flying aircraft. In the first respect, we have now developed the technique to a point where we are operational in mapping fires, either at night or through dense smoke, by using this technique. During the past summer, the method was used successfully in mapping about 25 major forest fires.

We aren't quite as far along with the development of the methods for detecting fires by this method, but we have enough good leads to suggest that this may be quite a revolutionary way of detecting fires. We need to develop, with the better sensing equipment we now have, a telemetering system to transfer the information from plane to ground, and readout systems for the firefighters in the central headquarters.

An airplane flying with this kind of equipment can cover about 4,000 square miles per hour, and we think this has great promise in the fire detection field.

Chairman HAYDEN. You will detect the small fire that way?

Mr. JEMISON. Yes, very small fires. You can even detect the heat of a small lantern from a high elevation.

Mr. NELSON. That would give us a chance to be ready in the morning following a lightning storm. Fires set by lightning during the night could be detected during the night. We would know where we were; at daylight, we could drop smokejumpers to the fires.

As an example of cost savings, on 1 of the 25 fires mentioned by Mr. Jemison we made a calculation of what the action to suppress the fire would have been without this surveillance and infrared map, and because of the changes that they made after having the infrared intelligence, we estimated that it saved us $212,000 on that 1 fire over what would have been spent without having this particular type of information. On another fire it was estimated that we saved about 9 million feet of timber because infrared intelligence helped plan better actions to control the fire.

We have one airplane equipped with that infrared equipment now in operational use.

AIR EQUIPMENT

Chairman HAYDEN. With respect to your fire control activities, how much air equipment does the Forest Service own, and how much of its work is done through private contract?

Mr. NELSON. Senator, by far, most of our work is done with private contractors. We actually own 57 airplanes. These vary from small lead planes used with the air tanker planes that are dropping chemicals on fires, to small planes used for transport, and also used for intelligence work on fires and in relation to bug epidemics and that type of work. On an average year, we use about 1,000 privately owned airplanes. This includes about 80 air tankers used for dropping fire retardants; about 700 small planes for fire detection and reconnaissance; about 175 small and 5 medium-sized helicopters; and about 100 lightweight twin engine and medium transport airplanes were used. All of those I have listed were private aircraft used under contact.

AIR TANKER FIRE CONTROL SERVICE CONTRACTS

Chairman HAYDEN. This committee included funds for the past 2 years for stabilizing the amounts paid to contractors of aerial fire retardant dropping operations. Will you tell the committee how this is working out and if there are any other equipment problems which need similar treatment to obtain better management?

Mr. CLIFF. Mr. Hendee will comment on that, Mr. Chairman.

Mr. HENDEE. Mr. Chairman, this help that the committee gave on aerial tankers was of great help to us in our fire control program. There is one other problem that we have in equipment. We have to have fire equipment in place; that is, certain specialized fire equipment in a location readily available. In the use of this specialized equipment the costs of maintaining it in place, what we speak of as the fixed cost, the way we handle the budgeting at the present time, we don't get the maximum use out of this equipment.

Specifically, what we would like to do is budget firefighting funds in advance, for the depreciation or fixed costs for this specialized fire equipment, so that we could get fuller use of the entire fleet. We think if we do this, then in the off seasons the equipment would be used in other programs that would pay only the cost per hour or per mile for operation and maintenance, and in this way, there would be a total overall savings in the use of this equipment, in the long run. It would result in a shift of obligations between appropriations to a more equitable and efficient arrangement.

FOREST FIRE FIGHTING SUPPLEMENTAL BUDGET REQUEST

Chairman HAYDEN. How much of a supplemental appropriation do you have to request in order to meet your forest firefighting costs?

Mr. NELSON. This year, it will be $25 million. It is an increase, of course, this year, because of the heavy fire season we have had in 1966.

WATER RESOURCE DEVELOPMENT

Chairman HAYDEN. For water resource development related activities, you are proposing an appropriation of $8,660,000; $1,894,000 more than was provided in last year's appropriation bill. Would you please, again, break down the projects on which you expect to expend your fiscal year 1968 funds? A table such as you submitted last year will do very well.

Mr. NELSON. We would be glad to do that, Senator.

(The information follows:)

TABLE I.—*Planned construction of public use, access, and management facilities—Fiscal year 1968 water resource development related activities*

Region	Continuation of projects underway in fiscal year 1967			Estimated cost
	State	Forest	Project	
1	Montana	Kootenai	Libby	$100,000
	do	Flathead	Hungry Horse	140,000
2	Colorado	San Isabel and White River.	Fryingpan-Arkansas	106,000
4	Utah	Ashley	Flaming Gorge	450,000
	do	Manti-LaSal	Joes Valley	20,000
5	California	Shasta-Trinity	Shasta Lake	164,000
	do	do	Clare Engle Lake	197,000
6	Oregon	Wallowa-Whitman	Mason	247,000
	do	Willamette	Cougar	65,000
8	Texas	Texas	Sam Rayburn	67,000
	Mississippi	Mississippi	Chewalla	53,000
	Texas	Texas	Toledo Bend	140,000
9	Pennsylvania	Allegheny	Allegheny	913,000
	Indiana	Wayne-Hoosier	Monroe	468,000
	do	do	Middle Fork Anderson	387,000
	Total, 15 projects			3,517,000

TABLE II.—*New project starts in fiscal year 1968*

Region	State	Forest	Project	Estimated cost
1	Washington	Colville	Boundary Reservoir	$61,000
	Idaho	Kaniksu	Pondere Lake	79,000
2	Colorado	White River—Pike-San Isabel.	Homestake	18,000
3	Arizona	Coconino	Ashurst Lake	100,000
	Do	Sitgreaves	Willow Canyon	40,000
4	Idaho	Payette	Lost Valley	11,000
	Utah	Uinta	Tibble Fork	25,000
	Do	Wasatch	Lyman	102,000
5	California	Eldorado	Union Valley	389,000
	Do	Sierra	Courtright	48,000
	Do	do	Wishon	44,000
	Do	Plumas	Frenchman	135,000
6	Washington	Wenatchee	Kachees-Cle Elum	379,000
	Oregon	Willamette	Blue River	100,000
8	Alabama	Alabama	Lewis Smith Lake	78,000
	Kentucky	Daniel Boone	Cave Run	172,000
	Do	do	Laurel River	72,000
	Florida	Florida	Cross-Florida Canal	139,000
	Virginia	George Washington	South Branch North Fork (Potomac).	15,000
	West Virginia	do	South River (Potomac)	11,000
	Virginia	do	Upper North River (Potomac).	58,000
	Louisiana	Kisatchie	Bayou Boeuf	83,000
9	New Hampshire	White Mountain	Basin Brook	66,000
10	Alaska	South Tongass	Silvis Lake	12,000
	Total, 24 projects			2,237,000

NOTE.—In addition to the above projects where facility construction is planned (tables I and II), preconstruction site planning is scheduled at 18 projects as follows: Alaska, 1; Arkansas, 2; Colorado, 1; Georgia, 1; Illinois, 1; Kentucky, 1; Oregon, 5; Texas, 1; Utah, 1; Washington, 2; West Virginia, 1; Wisconsin, 1. Scheduled expenditures for public use and access construction, including preconstruction site planning, total $6,004,000 for fiscal year 1968.

INSECT AND DISEASE CONTROL

KOREAN (FORMOSAN) TERMITE

Chairman HAYDEN. You are requesting exactly the same amount next year as last year for insect and disease control, explaining that within the amount greater emphasis is being given to determining outbreaks of pests and to controlling bark beetles. I have heard that a new invader is the Korean termite. How big a start has this insect gotten and what are the chances of keeping it under full control?

Mr. CLIFF. Mr. Chairman, Dr. Jemison will talk about that.

Mr. JEMISON. Mr. Chairman, the Korean termite, which is probably more commonly called the Formosan termite, in less than 2 years has established a very firm foothold in this country. It probably came into the country in the vicinity of Galveston, Tex. It is now well established there, in the vicinity of Houston and also in the neighborhood of New Orleans and Lake Charles, La.

This is a very aggressive insect. We have found, for example, that not only does it infest buildings, but even in living trees. We know that it is well established in several hundred dead cypress trees in the vicinity of Lake Charles, La. We have also found that it can successfully penetrate and establish itself through chemically treated soil in 3 months' time, which will serve as a barrier to our native termites for at least 3 years.

The facts are just that we don't know yet how to control it. We don't know its life habits, and it could pose a very serious threat to wood products and their use in this country.

BLISTER RUST CONTROL REPROGRAMING

1968 FUNDS

Chairman HAYDEN. We understand there are some changes in your white pine blister rust program for 1968. Will you comment on these changes, Mr. Cliff?

Mr. CLIFF. Yes, Mr. Chairman. I outlined briefly for you at the beginning the reason for the changes. We propose to reprogram $1,416,200, because we have concluded that we should relax on the method we have been following of grubbing out the ribes and the gooseberry. We are not getting the kind of protection needed to protect the young stands of western white pine. We are going to reemphasize and step up our work on trying to develop blight-resistant strains of white pine, through our genetics research program. For fiscal year 1968 we propose to reprogram $616,200 for bark beetle control on the Targhee National Forest in Idaho, $205,000 for establishing three 25-man forest fire crews to replace the men which will be taken off blister rust. We need to do this in order to make sure we will have trained fire crews available for initial attack. We will devote $155,000 for the grazing fee study which Mr. Nelson mentioned. Some $330,000 will be used for two high priority wildlife development projects, one of which is in the wetland of the Chippewa National Forest in Minnesota, and the other a development of a machine to desilt salmon and steelhead and trout spawning beds which have been silted up because of floods, and $110,000 to step up our recreation development work.

Chairman HAYDEN. Now, this proposed change is only for the program for Idaho and Montana. Why should not the same decision be made for white pine blister rust work for the rest of the country?

Mr. CLIFF. For the rest of the country, we feel that the program is more successful. In Idaho, Washington, and Montana, because of peculiar climatic conditions, we are getting reinfestation and reinvasion of the host plants; the gooseberries and currants. Even when they are carefully eradicated, they are coming back and reinfesting the young pine stands. We have taken a very hard and critical look at what we are accomplishing and have decided that we should terminate that particular phase of the work in these three States. We plan on carrying on the work in the other States, where the climatic conditions are different, and where we are getting much better results.

1967 FUNDS

Chairman HAYDEN. In view of the proposed program decreases for blister rust control work for fiscal year 1968, what effect will this have on the appropriation for this work in fiscal year 1967?

Mr. CLIFF. In fiscal year 1967, we propose to transfer $700,000 for the balance of this fiscal year. We will not spend it on the currant and gooseberry eradication, but propose to transfer that money to the very fast-running bark beetle epidemic in the Targhee and the Teton National Forests. This epidemic is larger and more virulent than we had anticipated. It is attacking the forests in the vicinity of Yellowstone and Grand Teton National Parks. In fact, it is in the Grand Teton now, and we want to step that program up, the rest of this fiscal year and next fiscal year, by transferring some of the blister rust money to it.

RED BIRD PURCHASE UNIT, KENTUCKY

Chairman HAYDEN. Your request for the acquisition of land under the Weeks Act is the same as last year; and as last year you plan to use $1,800,000 of the $2,480,000 to acquire land on the Red Bird purchase unit in eastern Kentucky. This purchase was begun with an appropriation in the Supplemental Act of fiscal year 1965, which means that you have had appropriations in 3 separate years and are requesting one in the fourth year. How far along are you toward completion of this purchase?

Mr. CLIFF. Mr. Nelson will give you a progress report on that work.

Mr. NELSON. We are moving right along. The total area within the Red Bird purchase unit as established is 591,000 acres. We would plan to purchase around 300,000 acres within this unit. We have purchased 57,754 acres to date. We have negotiations complete on an additional 10,863 acres. We are doing the timber cruising and field examination on two other properties of 17,000 and 16,000 acres, respectively. And, in addition, we have about 34,500 acres where we have received offers to sell. These are now pending investigation, inventory work and negotiation. By the end of this fiscal year, we will have purchased about 70,000 acres, which is about 20 percent of the total we planned to purchase within this purchase unit.

SYLVANIA TRACT, MICHIGAN

Chairman HAYDEN. Last year saw the culmination of several years of effort on the part of the Congress and the Forest Service to get the Sylvania tract in northern Michigan into public ownership. What are your plans for the area, and how are you moving to implement them?

Mr. NELSON. Last July, Senator, as you indicated, we culminated this effort by the Congress and the Forest Service by the actual transfer of the land to the Forest Service. Sylvania is that beautiful 18,000-acre tract of land, with some 37 lakes. It is one of the outstanding recreation opportunities in the country, and especially in the lake States. We have been doing a great deal of planning work on this property, and this coming fiscal year, we expect to start construction. We will construct three camp and picnic areas, including work on a water and sewer system, with a capacity of about 200 people at one time. We plan to spend about $300,000 for this work, which will include expenditures for additional planning work on the entire tract.

In addition, we will start the first road into the Sylvania area, with a planned expenditure of about $500,000. Earlier, I mentioned a visitor information center that is related to this. It is located just outside of the Sylvania property, and will serve as an entranceway to this fine property.

1967 LAND AND WATER CONSERVATION FUNDS DEFERMENT

Chairman HAYDEN. The Bureau of the Budget advises that $5 million of the funds provided for land acquisition under the land and water conservation fund are deferred in fiscal year 1967 insofar as expenditures are concerned. What has this done to your planned purchase program?

Mr. NELSON. Senator, I don't think that we would say that will have any particular adverse effect on the purchase program, because there is always a period of time that it takes even after the time that we actually finish negotiations for an acquisition before payment is made. There is often a lag of several months for the clearance of titles by the Justice Department, and many times we have to go back and get additional title work. So, we don't believe, really, that the deferral will have any particular effect on accomplishment of our program. These funds do carry over, too, as you know.

Mr. CLIFF. That is the point I wanted to make. The funds do carry over, and if we don't get them spent this year, they will be available to complete the purchases which are started, and we will complete them next fiscal year.

NATIONAL FOREST RESERVATION COMMISSION LAND PURCHASE APPROVALS

Chairman HAYDEN. Does the National Forest Reservation Commission approve and recommend purchases under the Land and Water Conservation Act?

Mr. NELSON. Yes, sir. The National Forest Reservation Commission approves all purchases that are made under the authority of the Weeks law, and about 95 percent of all cases that are purchased with funds of the land and water conservation fund use the purchase authority of the Weeks Act.

The areas where we can't purchase under the Weeks law is a place like Arizona, for example, where the Weeks law isn't implemented by State land, or lands within the Great Basin, where they are not on headwaters of a navigable stream.

LAND PURCHASE PROGRAM UPDATING

Chairman HAYDEN. Have you given any consideration to updating your prior programs, particularly those presented to Congress and approved in fiscal year 1965, in order to utilize 1968 funds more nearly to cover the costs of these earlier programs which are in so many instances extremely undervalued as is indicated by the number of reprograming actions requested because of costs so much greater than those presented to the Congress?

Mr. NELSON. Yes, sir; this was covered with this committee when Mr. Crafts was here on the land and water conservation fund, and in the material that I presented in my testimony and in my prepared statement. We indicated that we think it is very desirable to have a relook at some of those lands that were approved in an earlier program. I think the subject is pretty well covered in those hearings.

FLOOD DAMAGE REPAIRS

Chairman HAYDEN. What progress was made in repairing damages on the national forests from floods a year or so ago, and what was the extent of the flood damage on the west coast from floods in December and January this year, and how are you handling it?

Mr. NELSON. First, on the floods of 1964 and 1965, as you recall, that was a tremendously bad and disastrous flood condition, and we have been working on repairs constantly since that time. The Congress made available an additional $38 million worth of authorization, and this committee has funded that authorization. Progress has gone very well, and the last contracts will be let this fiscal year. There will be some cash needed in fiscal year 1968 to pay for the contract work that will be performed after July 1, 1967.

On the latest flood situation we had in California—it was really two, one in December and one last January—the total estimated damage was about $5.4 million. That is our preliminary estimate. About $4.6 million of this is in roads and trails. We have reprogramed some of our funds for this work. We have made $1 million available to the California region to get started on the road repair work, and smaller amounts of other funds for some of the other damages such as campgrounds, buildings, fences, water system and other improvements.

So we are moving forward on this latest flood. We don't plan to come to the Congress with request for a supplemental for this particular flood. We would plan to handle it within our existing budget for 1968.

10-YEAR DEVELOPMENT PROGRAM PROGRESS

Chairman HAYDEN. How is your progress in relation to the 10-year development program furnished the Congress?

Mr. CLIFF. Mr. Chairman, you have reference to the 10-year program for the development of the national forests which President Kennedy sent up to Congress in September of 1961. By the end of this current fiscal year, fiscal year 1967, we will have funded 71 percent of the proposed program. We haven't made uniform progress in all activities. Some have gone ahead faster than others.

The budget that we are discussing today for fiscal year 1968, while it provides some increases, will cause us to fall further behind our projected goals. The fiscal year 1968 budget if approved as submitted will fund our program at the rate of about 63.9 percent of the goals that we established and recommended for accomplishment.

Now, again, the progress is not uniform. For example, timber resource management will be funded at the rate of about 92.5 percent of the goal, whereas recreation will be 39.1 percent. Soil and water management will be 45.4 percent. The mineral claims and other land uses will be 83.7 percent. So you see, we are not proceeding on a uniform basis on all activities, but if we get the money that we are recommending in this fiscal year, in fiscal year 1968 budget, we will be at the level of 63.9 on the average of the program, as we expected, or as we had hoped that it would be at this period.

AGRICULTURE AND FORESTRY LONG-RANGE RESEARCH STUDY

Chairman HAYDEN. Last year you reported to us that a long-range study of agriculture and forestry research was underway. We have received copies of the general report. To what degree does this budget conform to the findings of that study?

Mr. CLIFF. I am going to ask Dr. Jemison to comment on that.

Mr. JEMISON. Mr. Chairman, the long-range study was sent to the Congress last October by the Secretary of Agriculture. It identified 91 problem areas, of which 31 relate to forestry. The long-range program projects ahead for 5 and 10 years the scientific manpower needed for each of these problem areas. The budget that we are discussing today falls well within the projections of this long-range study, which overall contemplates about doubling in 10 years the forestry research effort, and roughly trebling the outlay for forestry research 10 years from now.

FOREST GENETICS RESEARCH

Chairman HAYDEN. You are requesting $560,000 more in fiscal year 1968 than was appropriated in fiscal year 1967 for timber management research, indicating that the increase is to be used in forest genetics. What is the total of your forest genetics program?

Mr. JEMISON. The current total, Mr. Chairman, is approximately $1.4 million. We believe that research in forest genetics or tree improvement offers some of the greatest opportunities for meeting the future timber demand requirements of the country.

WATERSHED MANAGEMENT RESEARCH

Chairman HAYDEN. For watershed management research, you are asking $211,000 more than was appropriated to you last year. How do you propose to use this additional money?

Mr. JEMISON. Well, Mr. Chairman, we would propose to put about one-fourth of the increase in central Idaho, and adjacent areas, where we have a very critical erosion problem on granitic soils. Here roadbuilding, logging activities, and other land management practices are at the present time hazardous until we learn more about how to stabilize these soils.

We intend to increase research in the northeastern area on problems of increasing water yield on forested municipal watersheds. As you recall, the severe droughts in the Northeast of the last 5, 6, or 7 years have created very serious problems here. We have good leads to show that substantial increases in yields of water can be achieved if we learn how to manipulate the forest cover on these municipal watersheds. We also would use part of the increase to strengthen research on soil erosion problems in the southern Coastal Plain and would accelerate slightly the research in the eastern Cascades of the Northwest, where water yield and soil erosion problems in that area are also quite critical.

ARIZONA WATERSHED RESEARCH AND FOREST PROGRAM

Chairman HAYDEN. Please give the committee a brief report on the status of the Arizona watershed program—for both research and national forest administration.

Mr. CLIFF. Dr. Jemison will respond to that for research, and maybe also for administration, because he is familiar with both phases.

Mr. JEMISON. Mr. Chairman, we have made good progress in both the operational program on the national forests and in the research activities that provide the technical basis for this operational program.

The national forest program has been concentrated primarily in the chaparral type on the Tonto National Forest, and in the Beaver Creek drainage in Arizona, too. Eleven watersheds have undergone some phase of treatment.

The 1968 budget provides for about the same level of operational program for the coming year as in the past. There have been a number of high-priority projects elsewhere that have been identified but these cannot be included in the program at this time. In research, we are making good progress in finding the effects on water yield of various treatments of timber stands, such as thinning of removal of of chaparral by prescribed fire, and of converting pinyon-juniper type to grass followed by determining the effect of grazing on water yield. We also are getting good information on the costs associated with these various practices, so that we can put together a good, sound multiple-use analysis of the costs and benefits of various kinds of water yield improvement programs.

BALLOON LOGGING

Senator MUNDT. Mr. Chairman, may I ask a few questions on thinning while we have this on the budget?

Chairman HAYDEN. Certainly.

Senator MUNDT. You are aware, over on that side of the table, I think, all of you, of the efforts that the chairman of the committee and I made in a couple of Congresses in connection with the harvesting of timber to secure some additional funds to attempt a balloon logging research program. We have had money approved in the Senate a couple of times, and the House was not quite convinced at that time that this was practical or workable. I still think it has a lot of merit, and I wonder who should discuss that.

Mr. CLIFF. Well, this is still in the research stage, and it is being conducted by our division of engineering research, out in the Pacific Northwest. I think Mr. Jemison is in the best position to respond to your questions.

Senator MUNDT. I thought that would be right, but I did not want to ask you the questions, if it should be addressed to someone else.

Will you tell us, has anything happened in this field in the past few years to bring in any additional information?

I recall at one time, you brought in charts and we had some very interesting and informative testimony.

Mr. JEMISON. Well, Senator Mundt, the progress we have made shows very specifically that aerial logging—and you are referring, I believe, specifically to balloon logging——

Senator MUNDT. Right.

TECHNICAL WEAKNESSES

Mr. JEMISON (continuing). Is sound and practical from an engineering systems point of view. The problem we have now is making it economically sound. It is in this direction that our current efforts are headed. Now, we have made pilot tests of balloon logging on a practical scale that show there are still some weakness in the type of balloon that we are using. We need to make more studies of the balloon configuration, of how to harness the balloon and suspend loads under it, how to handle it from the standpoint of the ground equipment needed. We need a better, cheaper gas. We need deicing equipment. These are all technical refinements that would lead toward lower unit cost of logging that we think would make this a very practical system.

ESTIMATED SAVINGS AND INCREASED PRODUCTION

The payoff is likely to be large. We calculate, for example, that when we get an economical system of balloon logging, we will increase the allowable cut, on the west coast, by 500 million board feet per year, that will come off of what are now inaccessible areas, or areas that are so highly erodable that we would not dare put roads in and use conventional practices. We think that this system, when fully developed, may reduce our needed road mileage by about 11,000 miles, with a saving of about $335 million.

In Alaska, there is also something of the order of 400 million board feet that we could safely log per year that otherwise we might not be able to harvest.

INACCESSIBLE TIMBER

Senator MUNDT. Doctor, I have read somewhere, and I believe it was in the Forest Service literature, that there are about 29 million acres of inaccessible timber, or timber which cannot be handled with economic soundness at this time with conventional methods of logging. Would that figure, 29 million acres, be reasonably correct?

Mr. JEMISON. I could verify that for the record. I know it is a substantial figure, but I don't recall exactly whether it is 29 million.

Senator MUNDT. This is presumably in Alaska and in the Western United States.

Mr. JEMISON. Yes.

Senator MUNDT. And if you will verify it for the record, that will be fine.

Mr. JEMISON. Yes, we will do that.

(The information follows:)

The current estimate of timbered area in Western United States, including coastal Alaska that can be logged by aerial methods but not by conventional methods is 26 to 27 million acres.

AERIAL LOGGING RESEARCH

Senator MUNDT. How much do you have for aerial logging systems, using balloons and skylines, this past year; and how much do you propose to utilize in fiscal year 1968?

Mr. JEMISON. Senator Mundt, we have this current fiscal year, that is, fiscal year 1967, about $65,000 going into aerial logging research. The proposed budget contains an increase of $90,000 for this work which would then give us about $155,000.

Senator MUNDT. Is that the amount that you asked for from the Department? Did you get all you requested?

Mr. JEMISON. Well, the $90,000, as the budget notes show, is a portion of a larger amount which is $215,000 for our entire, countrywide engineering research program. Under the long-range study that was referred to a few moments ago, there was a larger amount proposed but in the structure of the budget, we were unable to include the total.

Senator MUNDT. Would you be free to tell us the amount that was requested for this purpose at that time?

Mr. JEMISON. The increase we requested was $500,000 for all engineering research, $200,000 of which was to increase aerial logging studies.

Senator MUNDT. It seems to me we are relating this to a tremendous asset. If I understood your figure correctly we can save $335 million, if this thing proves to be feasible. It is worth moving toward a decision on this question with as much diligence as possible. We should try to find an optimum, economically feasible method of balloon logging. Is that the figure that you gave us—a potential $335 million saving?

Mr. JEMISON. $335 million saving on roads, plus the other advantages from a higher usable timber yield, and savings through elimination of erosion and so on.

Senator MUNDT. Thank you very much, Mr. Chairman. I thought we might just put that in the record at this point.

WILDERNESS RECREATION RESEARCH PROGRAM

Chairman HAYDEN. Last year, the Senate committee asked the Forest Service to define a wilderness recreation research program, and to indicate its content, objectives, and proposed levels of funding. A report has been made to the committee, and I would ask you to furnish a copy of the report for the record, exclusive of the photographs, of course.

Mr. JEMISON. We will do that, sir.

(The information follows:)

Each year more and more Americans "discover" the American outdoors. Recreation has become a major forest use. Minor technical and managerial problems have become major. New problems continue to appear.

In 1956, the Forest Service with congressional approval launched a pioneer program of forest recreation research. Today, as emphasized in the Department of Agriculture's Long-Range Study of research needs in the natural resources field, the job is to make this forest-land recreation research program meet the needs of the times—to guide and strengthen the management of America's private and public forest lands for fullest possible use and enjoyment. Specific objectives of the research are—

1. To devise methods for projecting demand for forest-land recreation;
2. To measure and evaluate the impact of people on recreation environments; to devise practical methods for selecting and maintaining recreation sites and restoring those depleted by heavy use;
3. To gain a better understanding of the people seeking various forms of outdoor recreation so as to fit developments and management to the needs of users—and to the requirements of the resource; and
4. To determine the requirements for esthetic landscapes and means for producing and maintaining them.

To date the Forest Service, with about 17 scientific man-years assigned to forest recreation research, is the principal Federal agency with such a program. The research is done in cooperation with agencies having related interests such as the National Park Service and with private forest landowners. We cooperate with several colleges and universities which collectively have a modest effort going into forest recreation studies. The Bureau of Outdoor Recreation, which does no field research at present, is kept in touch with Forest Service recreation research.

The principal user of forest recreation research results in the Forest Service itself. This year, more than $31 million will be used on the National Forests and Grasslands for recreation administration and management. Research results aid in short- and long-term planning; in guiding location and design of facilities and improvements; in establishing policy for recreational use of the forest resources; and in fitting recreational development into multiple-use programs. One of our most important controversial resources is wilderness. The unique needs and uses of wilderness call for special and critical study.

A GREAT HERITAGE OF THIS COUNTRY IS ITS WILDERNESS

When Lewis and Clark and Jim Bridger challenged the West, "wilderness" had a different connotation than it has today. Wilderness then was a formidable unknown.

Over the past several centuries the wilderness has been challenged and conquered at an accelerating rate. Almost all of the 2 billion acres of this country has been conquered in the sense of being put to use and changed from its native state. Roads have been built, timber has been cut, fields plowed, vegetation grazed by livestock, streams dammed, mines dug, and the land modified otherwise as our Nation developed.

Today wilderness relates to a few priceless remnants, and the challenge is not to conquer but to maintain. With this in mind Congress in 1964 passed the Wilderness Act, Public Law 88–577, which states that wilderness areas—

> "* * * shall be administered for the use and enjoyment of the American people in such manner as will leave them unimpaired for future use and enjoyment as wilderness, and so as to provide for the protection of these areas, the preservation of their wilderness character, and for the gathering and dissemination of information regarding their use and enjoyment as wilderness * * *."

Wilderness varies dramatically in topography, vegetation, wildlife, and climate—from lowland brush to alpine gentian in Eagle Cap to golden trout and a thousand lakes in the Bridger. Each provides something different for the wilderness seeker, yet all provide "an area where the earth and its community of life are untrammeled by man, where man himself is a visitor who does not remain." There are 88 National Forest Wilderness and Primitive Areas totaling over 14½ million acres.

MANAGEMENT OF WILDERNESS POSES DIFFICULTY CHALLENGES

"If wilderness preservation includes maintenance of land conditions in as near a natural state as possible, then those activities of man, both inside and outside the boundaries of wilderness areas, which influence this natural state become wilderness preservation problems * * *."—Outdoor recreation Resources Review Commission.

Wilderness is never static. Seeds sprout. Trees die. There is constant change, and man continues to contribute to this change. The wilderness visitor himself has changed the wilderness. His horses have overgrazed mountain meadows. His use of hay has introduced non-native plants.

In the pursuit of solitude, physical and mental challenge, scientific study, inspiration, and primitive recreation, man has become a serious deteriorating force on the fragile soils, steep topography, and high elevations typical of wilderness areas.

How can visitor use be made less damaging?

How can already wornout trails and campsites be rehabilitated?

What must be done to maintain sanitary conditions, as use increases?

How can use by people be distributed more effectively to protect the wilderness resource and to enrich the visitor's wilderness experience?

No wilderness is an island. By controlling fire within and near wilderness area, man has drastically altered natural forces. Fire control has, of course, saved vast timbered landscapes. In some areas, however, fire control has resulated in vegetation unfavorable to big game. In others, it has resulted in a buildup of fuel that increases the danger of conflagrations.

What levels of fire control and what fire control procedures can be developed that are compatible with wilderness values?

Can fire, as a tool, be used in wilderness to create conditions favorable to maintaining natural sequences of development?

Insect and disease epidemics can change the wilderness landscape as drastically as fire. Some insects and diseases are native; others, such as white pine blister rust, were introduced by man. This disease continues to wipe out large and small stands of western white pine, limber pine, and whitebark pine. Man has also introduced the larch casebearer, a defoliating insect that has invaded vast stands of western larch.

What levels and procedures of insect and disease control can be developed to maintain wilderness values?

The dynamic nature of plant and animal life is a continuing challenge to the manager of wilderness. He must understand these communities and their interactions if he is to develop ways to meet the needs of the land and the visitor.

How do such forces as fire, insects, and diseases affect the natural development of plant and animal communities?

How may these forces be altered to achieve plant and animal development in harmony with the principles of wilderness management?

Wildlife populations are a major wilderness asset, but often a serious management problem. By his hunting and fishing regulations, by predator control, and by his land use in areas nearby, man has markedly affected wilderness wildlife populations. In several Wilderness and Primitive Areas, overpopulations of elk have overgrazed winter range with consequent serious erosion of soil.

What are the effects of natural changes in vegetation on the habitat for wildlife?

Conversely, what are the effects of wildlife on wilderness plant communities?

What steps are required to achieve and maintain a balance of wildlife with wilderness environment?

What management measures are needed outside of designated Wildernesses to maintain wilderness values inside?

Wilderness managers face many diverse and complex problems. They must decide priorities and the kind of action necessary to meet the responsibility placed on them by Congress, as well as the needs of the wilderness and of those who use and enjoy these scenic gems of our American landscape.

Very little research has been done in this field. The proposed program which follows fits logically and practically into the overall research activities of the Forest Service. Results will have widespread application.

Expanded Forestry Research Specifically Related to Wilderness Is Urgently Needed

The Wilderness Act broadens the responsibilities of the wild-land manager. To meet these added responsibilities the Forest Service and other land-managing agencies urgently need additional knowledge.

Proposed wilderness research program

Growing problems of use, protection, and management of wilderness call for research in four broad but closely interrelated subjects.

1. *The wilderness visitor.*—

Studies to learn how to—

Accommodate increased numbers of visitors without destroying the wilderness environment;

Enhance their enjoyment of wilderness; and

Develop trail, sanitary, and other needed facilities compatible with wilderness.

2. *Plant and animal ecology in the wilderness.*—

Studies designed to—

Determine plant and animal requirements;

Determine their interrelationships with each other and with fire, insects, and disease.

3. *Wildlife species in the wilderness.*—

Studies to determine how to achieve an acceptable balance between wildlife numbers and the wilderness environment.

4. *Protection of the wilderness.*—

Studies designed to determine the place of insect, fire, and disease control.

The research team would initially concentrate on the first three subjects. Protection research, which is dependent on a fuller understanding of plants and animals in the wilderness environment, would be accelerated later.

Proposed location

Missoula, Montana, is ideally located for a major concentration of wilderness research. Nearby are 7.3 million acres of existing or proposed wilderness. Within 200 miles are five designated Wilderness Areas totaling 2.5 million acres, four Primitive Areas totaling 1.6 million acres, and two National Parks containing 3.2 million acres proposed for inclusion in the Wilderness Preservation System.

The Forest Service has research facilities at Missoula and closely related research already underway. Projects at the Northern Forest Fire Laboratory and the new Forestry Sciences Laboratory can provide excellent scientific support for some of the proposed lines of research.

Missoula presents excellent opportunities for close association with University faculties and graduate students, and it has good library services. The University of Montana is located at Missoula; within 200 miles are three other major universities, all with demonstrated competence for research and training in wild-land management. Thus the Forest Service could develop strong cooperative research with these universities on critical wilderness resource problems.

The proposed research would be carried on by the Forest Service's Intermountain Forest and Range Experiment Station.

Estimated cost

This wilderness research program will require $300,000 annually to finance an interdisciplinary team of scientists and support staff necessary to meet the program's objectives.

AMOUNT OF FUNDS FOR RESEARCH

Chairman Hayden. The estimated cost of this program is $300,000. How much of the forest recreation budget estimate of $811,000 is to be devoted to wilderness research?

Mr. Jemison. We have in this budget we are considering $175,000 identified for wilderness recreation research.

Chairman Hayden. Well, in what areas would these funds be expended?

Mr. JEMISON. The principal areas where we are doing or will do wilderness research are in the Boundary Waters Canoe Area of the Lake States, and in the northern Rocky Mountain area, in Idaho and Montana.

Chairman HAYDEN. What are the amounts of money there involved?

Mr. JEMISON. We would propose to add $50,000 to the program in the Boundary Waters Canoe Area, $75,000 for the wilderness recreation research program at Missoula, Mont. We would also strengthen the program in the Pacific Northwest by $55,000. This would be directed toward improving our knowledge of visitor requirements and visitor preferences to put a sounder basis under the planning of recreational developments. $70,000 would go to California, where we are working on landscape management problems. You know, the Forest Service and other agencies, in the West particularly, are under heavy pressure to reduce or eliminate clear-cutting practices that some people don't understand, and that they think of as an eyesore on the landscape. What we are trying to do with this research program is incorporate into our timber harvesting techniques the know-how that will reduce the impact by managing the landscape in an effective way, and thereby relieve the pressure from those who want us to reduce timber utilization.

Finally, we would put about $40,000 into stepping up our recreation research on private properties, especially dealing with the ways to make recreational developments more a part of rural economic improvement. There also is, I think, a $42,000 balance here which would be used for grants to universities, particularly to study the small owner recreation problem.

CLOUD SEEDING TECHNIQUES

Chairman HAYDEN. I see. I note that a part of your forest fire research includes developing operational cloud-seeding techniques. How much do you propose to expend on this, and where will you do the research work?

Mr. JEMISON. The budget includes $180,000, Mr. Chairman, for this work, the same as we have in the current fiscal year. This project is headquartered at Missoula, Mont., and it deals with the techniques of preventing lightning or reducing lightning, I should say, in the entire Rocky Mountain area, including Arizona and other parts of the Rocky Mountain system.

GRANT TO INSTITUTE OF ATMOSPHERIC SCIENCES

Senator MUNDT. At that point, Mr. Chairman, I think this is a very interesting development. Seeded clouds are less likely to have lightning strokes, and as you know, out in the Rapid City, S. Dak., near our forests out there, the Institute of Atmospheric Sciences has been doing a lot of work on cloud seeding at various levels.

It seems to me that this is one place where various branches of the Government can and should work together. That happens to be under the Bureau of Reclamation out there.

I wonder, Dr. Jemison, if you would look into this matter, and let me know whether if the money were to be made available, you would be in a position to contract with the institute, say, for about $50,000 per year to continue this type of work? Their job is primarily to make it rain and to cut down on hail. It would certainly be a great national dividend, if in fact, it can be demonstrated that it is likely to cut down lightning strikes which create forest fires.

Mr. JEMISON. Senator Mundt, we certainly would be glad to look into this and give you a report. I might say that many years ago, when this program started, I had the privilege of going to Rapid City and working with these people, and I know that since the beginning we have worked very closely together. I am not sure of this, but I believe that we have in the years past entered into contracts with the institute there, and certainly have pooled our efforts, in a very productive way.

Senator MUNDT. It seems to me that at just a very minimal cost, it might provide you with useful information, which you can build into your whole firefighting and forest protection program, and I would be happy to have this report.

Thank you.

Mr. JEMISON. Yes, sir.

BIOLOGICAL CONTROL OF FOREST INSECTS AND DISEASE

Chairman HAYDEN. Have you any significant research accomplishments to report in biological control of forest insects and disease?

Mr. JEMISON. Yes, there has been some really outstanding progress here, Senator Hayden. I might give just two examples: one in the insect field, and one in the disease field.

This past year, for the first time, our scientists in California have been able to synthesize a bark beetle attractant. This has proved to be a very potent attractant in the laboratory, and now this coming season, we are going out into the field. Of course, the significance of this is that with a sexual attractant, you can lure beetles to their death, so to speak, and perhaps then have a method of controlling destructive bark beetles, without the hazards of some chemical methods that we now have to employ.

In the disease field, we have made real progress by finding a soil antibiotic which is extremely antagonistic to root rot organisms. In dilutions of as little as 50 parts per billion it effectively stops the growth of root rot infections. We think this is a real breakthrough, and we hope to expand on this research.

BARK BEETLE CONTROL

Senator MUNDT. Mr. Chairman, let me say a word about the bark beetle. I think that is very encouraging. It appears to be sort of a breakthrough on this matter. I notice you have $2,630,000 in your request for bark beetle control this year. Is that going to be devoted largely to this new breakthrough, if that is the proper description of what has happened?

Mr. CLIFF. Mr. Chairman and Senator Mundt, the attractant that has been developed, as I understand it, is effective only on one bark beetle, the Ips beetle, and the Ips beetle is not the species that we have been fighting in the Black Hills, or the one which we are fighting in the Targhee and Teton areas in Wyoming and Idaho.

Senator MUNDT. It is an altogether different kind of bark beetle?

Mr. CLIFF. It is a different species. However, the fact that we are able to synthesize the attractant for this one bark beetle gives us encouragement to think that we may be able to synthesize an attractant for the other bark beetles. We will be working on that, but as of right now, we still have to go ahead with the control work on these other bark beetles.

Senator MUNDT. What is the situation out in western South Dakota on your bark beetle program?

Mr. CLIFF. I think it is pretty well under control there now.

Senator MUNDT. That is what I had been led to believe.

Mr. CLIFF. We had a bad flareup there a year or two ago, but it is my understanding that it is now on a maintenance basis. Is that right, Art?

Mr. SPILLERS. There are indications that it is coming back this spring, Senator Mundt.

Senator MUNDT. Beetles are coming back, you mean?

Mr. SPILLERS. Yes, sir; into the national forest in the Black Hills, and we have just recently assigned $59,000 to work on the Black Hills beetle. We are concerned that it is building up, and we are going to take action against it this year.

Senator MUNDT. But you haven't——

Mr. SPILLERS. We also are providing for it in the fund for 1968, Senator.

Senator MUNDT. You have not found any new attractant or any other device for fighting the Black Hills bark beetle?

Mr. SPILLERS. No, sir; unfortunately, we have not. It is very much like the mountain pine beetle that the Chief told you about that is causing so much damage down in the Targhee National Forest.

Mr. CLIFF. I did not intend to interrupt Dr. Jemison's comment on the sex attractant. If I have made any error in describing that, George, I would appreciate it if you would correct me.

Mr. JEMISON. I think you did very well, and rounded out my statement.

Senator MUNDT. Very good. Thank you.

FOREST ENGINEERING RESEARCH

Chairman HAYDEN. You are asking for some $215,000 additional in forest engineering research during the coming year. Would you please indicate the research projects to which you plan to distribute this increase, showing the amounts to go to each of the projects?

Mr. JEMISON. Mr. Chairman, I already have covered, I think, the fact that $90,000 of the increase will be used to strengthen the aerial logging research in the Pacific Northwest. We plan to put $50,000 at the Houghton, Mich., Engineering Laboratory where we are working on methods of using small-sized, low-grade material for pulp chips, and on the problem of separating bark from chips, a very necessary requirement in using this low-grade material. An amount of $40,000 would go to our engineering laboratory at Morgantown, W. Va., to speed the work on harvesting and log transportation problems in the rough topography of the Appalachians, and $35,000 would go to our Southern Engineering Laboratory in Alabama, where we are working on methods of seeding forests and of harvesting primarily small-sized pulpwood stands in the flat terrain of the South.

FOREST SURVEY

Chairman HAYDEN. What have you accomplished during the past year in the forest survey, and why is an increase needed?

Mr. JEMISON. During the past year, we completed reinventorying 49 million acres of forest land in 10 States. We completed analytical reports and published these for five States. We completed a special timber supply-demand analysis for the Columbia River area of the Northwest. The problem with the nationwide forest survey is that with increasing costs, we have gradually been falling behind in making reinventories that are necessary if we are to pick up the major changes or trends, and get the information necessary to plan ahead for many of our important forestry programs.

We are currently on about a 12-year average reinventory schedule, and we would like to get down to about an 8- to 10-year schedule, in order to have information accurate enough to make major program decisions. The $103,000 increase proposed for the survey would be used primarily to strengthen the work in the Southern States and in parts of the north central and northeastern area.

FOREST ECONOMICS RESEARCH PROGRAM

Chairman HAYDEN. Will you please explain your forest economics program and indicate why you need an increase of $297,000?

Mr. JEMISON. Mr. Chairman, in our forest economics research program, we find out what kind of forestry management practices pay, and how much. This work is directed at finding out the costs and benefits of alternative systems of management, such as thinning and reforestation, and other stand improvement practices; it is aimed at finding out how a land manager can fit together in the best way alternative measures that deal with not only timber, but with watershed management, wildlife habitat development, and so on. In this way the forester knows how he can use limited funds to maximize the payoff.

This is what we are doing in our forest economics research. The increases we have proposed here would be used primarily to make a study in depth of our timber production program, involving Douglas-fir, primarily, in the Northwest, to determine the comparative effects of alternative rotation ages, intensities of cutting, thinning programs, road developments and the like.

Also, we would accelerate work in finding out how to fit multiple use practices together to maximize benefits.

USE OF WOOD IN HOUSING

Chairman HAYDEN. Please explain just what contributions you are making and expect to make to the more effective use of forest products in housing and in other major uses.

Mr. JEMISON. Mr. Chairman, in the last year or two, we have brought together a great deal of information that we have developed in our forest products research program to the problem of making better use and fuller use of wood in housing. We have concentrated particularly on some of the lower quality woods, such as ponderosa pine that we find in the Southwest, where the general run-of-the-woods tree produces a rather low quality lumber.

I brought here this model house, which illustrates some of the new floor systems, roof systems, and wall systems, that have been developed in this research.

I would just like to mention specifically two of them. This cutaway I am holding illustrates a wall system where the 2 by 4 studs placed flatwise can be 4 feet apart, and where an insulating board and sound barrier is placed between them. It is surfaced on the inside with, you see, a gypsum board face on low-quality pine back stripping.

Now, the interesting thing about this is with this design, the house wall can be put up in large panels, say, 4 by 8, or 4 by 12 feet.

The roofing system is interesting, in that it uses low-grade backing made of plywood, faced with a fiber or plastic covering, which goes on the truss system on the roof with mastic and blind nailing. This roof will certainly outlast the life of the house, 50 years or more.

Now, the significant thing of all of this research is that we estimate a saving in cost of materials of $100 to $200 and $1,000 saving in the cost of labor per house. If only one-tenth of the homes to be built this year—1¼ million homes—used this system, the saving would be more than we have spent on all forest products research in the last 40 years. I think this illustrates the value of this type of research.

PULP AND PAPER RESEARCH

You asked about other fields. Let me just say that we have made similar progress in the field of pulp and paper research. I think I mentioned last year that we have perfected a system that is called the polysulfide system of pulping, in which we can increase the yield of usable pulp by 20 percent from the same unit of raw material. This year, we have gone farther with this process, and it has some very important antipollution features involved with the system.

STUDY OF POSSIBILITY OF PLYWOOD PLANT IN SOUTH DAKOTA

Senator MUNDT. What you have just said about plywood brings to mind that a number of my constituents out in South Dakota have talked to me many times about the possibility of the Forest Service conducting a study of the potential of a plywood plant in that general area. They have the feeling that the timber out in that area would be very suitable for that purpose, and I would appreciate it, if you would have your people look into this idea, and supply my office within the next few weeks, before markup time over here, a report as to whether or not you feel that such a study might be conducted. If you find such a study feasible please provide the estimated cost of the study. We have, as you know, a very fine forest products facility out in Rapid City, which could conduct this study. You may rather have it conducted by someone else. That is not important, but we would like to find out whether or not there is really enough timber there, and enough demand for plywood, to justify somebody putting money in it.

Mr. CLIFF. We will be glad to do that, Senator.

SAVINGS IN USE OF WOOD FOR HOUSING

Senator MUNDT. Thank you very much. That is an astonishing saving. Would you be able to break that down, Mr. Jemison, in the kind of homes that you keep coming to us for more reprograming money, because the cost keeps going up? And our limitations are pretty low. In a $27,000 house, as you are building it now, have you any idea what it would save in terms of one house?

Mr. JEMISON. Well, these figures I gave are average figures per house. I mentioned, I think, $100 to $200 per house in material saving costs, but the main saving of $1,000 per house is in labor, because of the engineering and the possibility of using a panelized construction rather than individual strip construction. So I would say that for a $27,000 home that is built mostly of wood, using this system, those savings would be representative.

Senator MUNDT. Maybe I should straighten up the record. Our clerk reminds us that you have only $21,500 allotted for the house, instead of $27,000. I guess $27,000 is a reprograming figure we look at all the time. All right.

ACCELERATION OF RANGE AND WILDLIFE HABITAT RESEARCH

Chairman HAYDEN. No increases are requested in several forestry research categories. Does this mean that the long-range study does not provide for acceleration of this work—range and wildlife habitat, for example?

Mr. JEMISON. Mr. Chairman, the long-range study does project ahead for the next 5 to 10 year periods increases in each of the categories or research fields that we have mentioned, and that appear in our budget. This particular year, there is no increase proposed for wildlife habitat and range management research as you suggest, and one or two other items. This is because, within the overall budget structure, we felt that the places where we put the increases were of higher priority than these items you mentioned.

Eventually, we would hope to program for these other areas, however.

RECRUITING SCIENTISTS

Chairman HAYDEN. How many additional scientists would you recruit if the budget increases for research are allowed? Are there problems of finding competent scientists in areas of expansion?

Mr. JEMISON. Mr. Chairman, if the budget increases are allowed, we would expect to add about 30 scientists. We have not had any particular problem, generally speaking, in recruiting scientists.

There are, of course, one or two problem areas. I might mention economics, for one, where we have had some difficulty in recruiting and holding economists. However, our needs are rather modest in this area, and we don't really anticipate any particular problem.

WOOD CHEMISTRY BUILDING, MADISON, WIS.

Chairman HAYDEN. The budget estimate for research construction is $2,278,000. Of this amount, $1,300,000 is for the wood chemistry building at the Forest Products Laboratory, Madison, Wis. In fiscal year 1965, $3,800,000 was appropriated for this purpose. What has been the difficulty that the construction has not gotten under way, and that in order to build this addition, another $1,300,000, making a total of $5,100,000, is necessary?

Mr. JEMISON. Mr. Chairman, I will have to go back to fiscal year 1963 to answer your question.

At that time, we discussed before this committee a wood fiber and wood chemistry laboratory project that would cost an estimated $4 million. Planning funds were provided, and during the architectural planning of this laboratory structure, it became evident that we were not going to get the entire structure for the $4 million that had been previously mentioned.

In spite of economies in the design, we found that when we went to invite bids for the construction contract in fiscal year 1965, the lowest bid exceeded the $3.8 million we had appropriated that year by, in round numbers, $1 million. We rejected all of the bids, and readvertised, and still the lowest bid was a million dollars over the amount we had.

Our only alternative was to eliminate the wood chemistry laboratory wing. Now, we made a study of comparative building costs on the campus of the University of Wisconsin, and we found that the costs were just running that much higher than the estimate made several years previously. Since that time, of course, building costs have gone up more and our current estimate is that to build this wood chemistry wing will now require $1.3 million.

I have a photograph here that might be useful to show at this time. The top picture there shows the new wood fiber laboratory, and outlined in white is where the wood chemistry laboratory would have gone, had we been able to build it. That is the spot where the wood chemistry wing will go, if the budget request is approved. This is a very fine laboratory. It makes good use of wood, of course, and the pulp and paper wing, which is almost completed, is a really outstanding building. We are very proud of it.

FOREST SCIENCES LABORATORY, MOSCOW, IDAHO

Chairman HAYDEN. When was the first stage of the Forest Sciences Laboratory at Moscow, Idaho, built?

Mr. JEMISON. The first stage of that laboratory was built with fiscal year 1962 funds.

Chairman HAYDEN. I judge from the description of this proposed addition that it will require $800,000 to build the second phase of the laboratory. Is that right?

Mr. JEMISON. Yes. The laboratory structure itself is estimated to cost $600,000, but an additional $200,000 is needed for greenhouses and auxiliary facilities.

FOREST SCIENCES LABORATORY, RESEARCH TRIANGLE

Chairman HAYDEN. When was the first stage of the Forest Sciences Laboratory at Research Triangle built?

Mr. JEMISON. Yes, that is near Durham, N.C. That was built in 1961.

RESEARCH LABORATORY, RHINELANDER, WISCONSIN

Chairman HAYDEN. Well, when did you build the existing laboratory at Rhinelander, Wis.?

Mr. JEMISON. That was built in fiscal year 1959.

STATUS OF CONSTRUCTION FUNDS PROVIDED IN 1967

Chairman HAYDEN. Last year funds were provided for the construction of or addition to four laboratories and funds were also provided for design and specifications for 10 others. Would you please place in the record a statement indicating the present status of the construction and the design work?

Mr. JEMISON. Yes, we will be glad to do that, sir.

(The information follows:)

Location	Amount (thousands)	Estimated completion
Construction funds:		
1. Athens, Ga	$1,000	Intermediate working drawings completed. Construction to start June 1967.
2. Carbondale, Ill	690	Intermediate working drawings completed. Construction to start May 1967.
3. Olympia, Wash	450	Construction started November 1966.
4. Oxford, Miss	450	Final working drawings being prepared. Construction to start May 1967.
Planning funds: [1]		
1. Berea, Ky	40	March 1968.
2. Burlington, Vt	40	February 1968.
3. Corvallis, Oreg	170	June 1967.
4. Delaware, Ohio	72	January 1968.
5. Durham, N.H	75	Do.
6. LaGrande, Oreg	28	June 1967.
7. Lincoln, Nebr	28	February 1968.
8, Madison, Wis	180	June 1968.
9. Nacogdoches, Tex	25	May 1967.
10. Provo, Utah	37	February 1968.

[1] All projects are now under architectural and engineering contracts. Plans will be completed on dates shown.

OFFICE-LABORATORY, FORT MYERS, FLA.

Chairman HAYDEN. Senator Holland has proposed construction of an office-laboratory facility at Fort Myers, Fla. Have plans and specifications for such a building been prepared?

Mr. JEMISON. Yes, these plans are complete and available. They were made as a result of a $16,000 planning appropriton that the Congress made in fiscal year 1965.

Chairman HAYDEN. How much is it estimated that construction of this facility would cost?

Mr. JEMISON. We estimate this laboratory would cost $220,000, sir.

STATE AND PRIVATE FORESTRY COOPERATION ACTIVITIES

Chairman HAYDEN. You are not proposing any changes in your State and private forestry cooperation activities. Do you have any particular comment you care to make regarding them?

Mr. CLIFF. Mr. Chairman, I would like to make a general comment on State and private forestry. We do propose a $100,000 increase for general forestry assistance, but other than that, this budget does not propose any increases. We consider that our State and private forestry responsibilities are very important.

The importance is illustrated by the fact that nearly three-quarters of all of the commercial forest land in this country is privately owned. About 73 percent is privately owned, and the extent to which this country is going to be self-sufficient in forest products in the future is going to depend largely on how well this three-fourths of the forest land is managed.

A little over one-fourth of our commercial forest land is publicly owned. The public forests, mainly national forests, are being reasonably well managed. We are moving ahead on the management of the public forests.

We are not making as good progress on the private forests. Of the three-fourths of the commercial forest land that is privately owned, only 13 percent of the total 100 percent, is owned by forest industry. The industrial forest landowners are making good progress in forestry, on this 13 percent.

Sixty percent of the total commercial forest land is owned by what we call small owners. On the 60 percent that is in the hands of these small owners, the forestry programs are lagging. We are not making as good progress as we need to make, in reforestation, forest protection, and forest management on this large amount of forest that is in small ownerships.

Half of this is in the hands of farmers. It is an integral part of farming activity, or should be.

The other half of this 60 percent is owned by a large spectrum of people who own it for various purposes. But it is land that should be better managed, and land on which we are going to depend in the future for more and more products and services; not only timber, but good watershed protection, wildlife, recreation, and so forth.

We are emphasizing multiple-use management of these properties, and we are trying to encourage better management in every way we can. We are making some progress, but I am sorry to say it is not enough. We cooperate on these programs with all 50 States. Every State in the Union, and Puerto Rico is now in our cooperative program. We are very proud of our cooperation with the States. Arizona was the last one to come in, just this last year, Senator. We are glad to have Arizona in this cooperative program, and that made the 50th State. There is not a great deal of privately owned forest land in Arizona, which is probably the reason that it was late joining the program.

In this budget, we were unable to recommend increases for State and private forestry programs. We hope in future budgets that we can move forward in proportion to the importance of this program.

NEW DEPUTY CHIEF

We have a new deputy chief in charge of State and private forestry activities in the Forest Service. He is Mr. E. M. Bacon, who replaced Boyd Rasmussen, who was promoted to the directorship of the Bureau of Land Management. Mr. Bacon is ill today, and is not here. His associate, Mr. Arthur Spillers, is here, and he will answer any further questions that you might have on State and private forestry activities.

HEADQUARTERS BUILDING, CUSTER, S. DAK.

Senator MUNDT. Mr. Chairman, we jumped into the State and private forestry from the construction. I had one question on construction. It deals with the status of the building at Custer. We appropriated money for the design of a headquarters building last year.

May I have something on that?

Mr. CLIFF. I am going to ask Mr. Hendee to comment on that. That is an administrative office.

Senator MUNDT. That is a different type?

Mr. CLIFF. That is a facility for administration, and not research. Mr. Hendee will comment.

Mr. HENDEE. Yes, Senator Mundt, you recall in the current year's budget, we had planning money for the headquarters building at Custer, S. Dak., and we have moved forward to where we have the architectural engineering contract about ready to let.

It will be let sometime this month. And they will go forward with the plans, the schedule that they have would indicate that the plans and final drawings would be completed by sometime in December of this calendar year.

Senator MUNDT. Thank you.

STATE AND PRIVATE FORESTRY ACTIVITIES

Mr. BAKER. Mr. Chairman, I would like to add to what Mr. Cliff just said about State and private forestry. The Secretary of Agriculture also puts a very strong emphasis and high priority on the importance of this undertaking, and is pressing us to expand and strengthen State and private forestry activities of the Forest Service and the Department of Agriculture generally.

Senator MUNDT. Suppose you have a piece of forest land that is privately owned. What can you do? What tools do you have? Does the State use tax devices, and so on, to encourage people to engage in the proper practices, or what do you do?

I know what you do in the public forest. What do you do with the private forests?

Mr. BAKER. Let me mention just a few, Senator Mundt, and I am going to ask Ed Cliff to go into considerable detail on this, because this is an important item.

We need better tax structures and a forest crop insurance program like we have crop insurance programs for wheat. We need a better credit system for privately owned forests. Improved development, and harvesting operations, and credit programs are needed. We need a greater recognition of the importance of forests, farm forests, small land ownership, as a multiple-use resource, to provide income to small landowners, both farmers and nonfarmers and for the public benefits.

Ed, I wish you would expand on some other aspects of this. It is not fully understood, Senator Mundt, as you know, and there is no idea here that the Federal Government ought to either exercise land use control or management control over privately owned forest land.

On the other hand, there is a national interest in the conservation, preservation, use, and development of the total forest resources. Multiple use on privately owned land should be encouraged by the Federal Government through technical assistance, credit, educational activities, and other efforts, that would be of assistance to private landowners. They could thus attain their own aspirations in the use of their forest resources.

Ed?

Mr. CLIFF. Thank you, John.

I am glad you mentioned the fact that these programs we have now and those that we contemplate are entirely voluntary. There is no regulation.

Senator MUNDT. I would assume they would have to be because the tracts are privately owned. With 73 percent of the land owned by the private individual it creates a problem.

Mr. CLIFF. We have about four major programs going now with the States. One is forest protection, where we contribute part of the cost of forest firefighting and fire prevention, on State and private lands.

We have a similar program, where we help with the insect disease control on a matching funds basis.

There also is a cooperative program where the Federal Government helps finance the employment of service foresters to work with these small landowners. Technical assistance is rendered to the private landowners who request it through the service foresters or sometimes called farm foresters. These men are employees of the State forester.

We work all of these programs through the State forester. We think this is the proper way to do it. This program is very similar to the county agent system, where the Federal Extension Service contributes to the employment of the State extension people and the county extension people. This effort should be strengthened, more service foresters are needed to do the job that needs to be done.

Senator MUNDT. What keeps that part of the program from proceeding with optimum speed? Is it a failure of the Federal Government to provide the matching funds or a failure of the States?

Mr. CLIFF. In the cooperation in forest management and processing program there are two or three reasons why we have not moved faster. First, the program is not well understood and lacks general public support. Secondly, we can't move any faster than the States are able to match the funds. In total the States are more than matching funds for cooperative forest management. In many States we are fully matching State expenditures. There is a limitation in the law as to the total amount that can be appropriated by the Federal Government.

This will have to be looked at. We are limited in progress by the extent to which the States can get financing and can proceed.

The States are way overmatching our fire control work now, and they are way overmatching our forest planting stock production program. The latter is a program where we help underwrite the cost of producing nursery stock for planting out on forest lands.

Senator MUNDT. How about the farm forestry? Are they overmatching that, or undermatching?

Mr. CLIFF. They are more than matching it. The exact figures, I don't have in mind.

STATE MATCHING OF FEDERAL FUNDS

Senator **Mundt**. Would you put a breakdown in the record?

Mr. **Cliff**. We can supply that for the record.

Senator **Mundt**. State by State?

Mr. **Cliff**. Yes; we would be glad to.

(The information follows:)

Cooperative forest management progress and expenditures, fiscal year 1966

State	Expenditures		
	Federal	State	Total
Alabama	$45, 168	$45, 168	$90, 336
Alaska	15, 535	15, 535	31, 070

Grand total	3, 171, 110	4, 258, 932	7, 430, 042

FUNDS PROVIDED BY STATES

Mr. **Spillers**. They are providing, if I may add, the States are putting up $4.9 million compared to our $3.5 million in farm forestry. They are all overmatching us in farm forestry.

Senator MUNDT. Yes, they are. Are we limited under the law?

Mr. SPILLERS. We are limited under the law to $5 million.

Senator MUNDT. But we are not putting that much up?

Mr. SPILLERS. No, sir; we are only putting up $3.5 million.

Senator MUNDT. If we put up the five, we would be just about matching.

Mr. SPILLERS. With respect to fire, Chief, if I may add, we are putting up $12.8 million; the States are putting up $72.3 million; thus, six times as much as we are in the fire program.

LETTER FROM SENATOR TALMADGE

Chairman HAYDEN. I will place in the record a copy of a letter addressed to me by Senator Talmadge proposing an increase of $3 million in the activity "Cooperation in forest fire control." What comment do you have with regard to this proposal?

Mr. CLIFF. May we supply a statement for the record?

Chairman HAYDEN. That will be satisfactory.

(The documents follow:)

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
February 3, 1967.

Hon. CARL HAYDEN,
Chairman, Interior and Related Agencies Subcommittee,
Appropriations Committee, U.S. Senate, Washington, D.C.

DEAR MR. CHAIRMAN: It has been brought to my attention that our states are in great need of an increase in cooperative forest fire prevention funds. This need has been caused by the increase in costs of salaries, equipment, operation and maintenance for fire protection.

Because of the recent Fair Labor Standards Act of 1966, wages paid for fire protection have been increased, making an unexpected demand on the available funds.

Since 1962 the states have received only $200,000 increase for fire protection, yet four states have been added to the program and, in addition, new areas are now being protected in the participating states. Because of this additional coverage the percentage of funds allocated to the various states have been forced to be reduced to make this fire protection possible. The states in 1965 spent $63,778,950 for fire protection, while the Federal Government only provided $12,811,000 in 1967. It should be noted that in 1965, federal participation was only 18.59% of the total.

An adequate fire protection program in each state is basic to sound forestry and related programs. Dependent upon this protection are soil and water programs, game and fish, tourism, and our timber for private industry.

Various state forestry departments consider the need of forest protection as today's greatest problem. Unless they are met, all other forest expenditures may be drastically cut in the future to provide for adequate fire protection. It is for these reasons that I strongly urge your consideration in increasing the appropriation for forest fire control under the State and Private Forestry Cooperation Program to $15,811,000.

With best wishes and kindest personal regards, I am.

Sincerely,

HERMAN E. TALMADGE.

DEPARTMENTAL STATEMENT

In 1966 a joint study of the forest fire protection situation on the State and privately-owned forest and watershed lands of the nation was completed by the Forest Service and the cooperating State Foresters in 49 States. It was determined that over 519 million acres should be protected under the cooperative program and that the estimated cost of protection to levels of tolerable loss would be $123 million.

Fiscal year 1966 expenditures were:

	Amount	Percent
State	$72,249,427	85
Federal	12,803,000	15
Total	85,052,427	100

Thus, in FY 1966 about 69 percent of the total forest protection need was being met.

During the period 1961–1965 the average annual rate of damage to or destruction of forests and watersheds amounted to about 4 million acres.

We share with the cooperating State Foresters, as expressed by their National Association, the conviction that the determination of need and cost is valid. We share their conviction that intensified fire protection to prevent destruction of privately-owned forests is basic to resource development and the support of dependent industries and communities.

An accelerated protection program could be undertaken if additional funds were made available. These funds could be effectively used, primarily by the States, to provide needed additional fire prevention and protection capability. If appropriated at the level proposed, the Federal share would be increased from 15 percent currently to 18 percent compared to an authorized Federal sharing level of 50 percent.

COOPERATIVE FOREST FIRE PREVENTION

Chairman HAYDEN. Senator Bible has requested that there be inserted in the record a copy of a letter that he has received from Mr. George Zappettini, State forester of Nevada, in which he supports an increase of $3 million in fiscal year 1968 for cooperative forest fire prevention.

(The letter follows:)

STATE OF NEVADA,
DEPARTMENT OF CONSERVATION AND NATURAL RESOURCES,
DIVISION OF FORESTRY,
Carson City, Nev., March 1, 1967.

Hon. ALAN BIBLE,
Senate Office Building,
Washington, D.C.

DEAR ALAN: I have been informed that the National Association of State Foresters is requesting an increase of $3 million in federal Clarke-McNary funds for cooperative forest fire prevention for the fiscal year beginning July 1, 1967. This will raise the fund from the present $12,811,000 to $15,811,000. Present law authorizes up to $20,000,000.

The request for increase in funds is based on the following factors:

1. Since 1962 costs to states for forest fire prevention have greatly increased for salaries, equipment, operation, maintenance and others.
2. New federal wage and hour laws effective 1967 and 1968 will greatly affect every phase of operation with expanded increases.
3. U.S.D.A. Timber Trends in the U.S. Resource Report #17 predicts an 80% increased demand for forest material by the year 2000.
4. Private commercial forest lands comprise 72% of total in U.S. and account for 75% of annual timber cut. Small forest landowners own about 60% of the commercial forest area of private ownership.
5. Since 1962 states have received only $200,000 increase in forest protection funds. Yet four states have been added to the program and additional forest area in some other states. Funds have been reduced to all states to make these additions possible.

6. Federal funds now total $12,811,000 in 1967. The states receive $11,826,500—$1 million administration purposes. The states spent $63,778,950 in 1965 for forest fire prevention—and it increased in 1966. In 1965 federal funds were only 18.59% of the total.

7. An adequate forest fire prevention program in each state is basic to a sound forest and related program. Dependent upon it are soil, and water, game and fish, recreation, tourism and the growing of timber for industry.

8. The various state forestry departments consider the needs of forest protection as today's greatest problem. Unless these needs are met, all other forest expenditures are on an uncertain future.

At present in Nevada, surveys show that approximately five million acres of forest and watershed in State and Private ownership are in need of protection. Of this we are extending adequate protection to less than a million acres. We have brought this to the attention of our legislators and county commissioners, but they are faced with ever increasing demands from other sources, especially education, and fire protection takes a back seat. However, in our present budget the State and counties are providing 80% of the total, the remainder coming from federal Clarke-McNary funds. Therefore, if an increase in federal funds was granted, Nevada would definitely be in for a fair share. This would, of course, be of great help in extending protection to our vital water producing areas.

Your consideration of the matter would be deeply appreciated.

Very truly yours,

GEORGE ZAPPETTINI,
State Forester.

1967 HARDWOOD IMPROVEMENT PROGRAM

Chairman HAYDEN. In the second supplemental appropriations act for 1967, $200,000 was budgeted and approved by the Congress for the purpose of initiating a hardwood improvement program on State and private lands. Would you please bring the committee up to date on the use made of this fund and the results obtained under this activity for which you are requesting an extra $100,000 in fiscal year 1968?

Mr. CLIFF. Mr. Spillers will respond to that, sir.

Mr. SPILLERS. Senator Hayden, you probably will recall that during the year, your committee provided us with $200,00 as a supplement for us to begin this type of work. This work was suggested by the President's Council of Economic Advisers because of the rapidly rising prices for hardwood timber and, also, the growing scarcity of quality timber. The Timber Trends study that we had made a few years ago clearly identifies the problems of supply of quality timber, both as to the short term and the long term. The sizes, the species and the grades of fine hardwoods that our industry and country needs are in short supply.

I would just like to show you this chart. Since October 1966, prices have fallen off largely because the select red oak flooring had dropped very rapidly and that was brought about by a decline in housing starts.

Toward the end of 1966, the housing starts were going at a rate of about a million a year. At the beginning of this year, we are estimating that they are running at about 1.1 million and experts tell us that for the last half of 1967, housing starts are expected to be up to 1.4 million, so we think that the decline has bottomed out, that we are on the up trend.

I did not show you some other species on here besides red oak. If I had plotted maple, No. 1 common gum, and black walnut, it would have shown that they have continued to go on up in price. I noticed the other day that the furniture manufacturers are again having some difficulty in filling their orders. We have a very difficult hardwood tree quality situation and if it continues, of course, it means greater scarcity, and the public just won't have the good, high quality hardwood that they want.

The industry, of course, will also be adversely affected by the inroads of substitutes, so we would like to work on this program with the industry and with the States.

The Hardwood Associations, at first, because of the decline in the prices during the second half of calendar year 1966, thought that this program was unnecessary. When I say the associations, I must except the Fine Hardwood Association, and the Walnut Association, who are very much interested in this program.

Now, since then, the Hardwood Associations are setting up a subcommittee of hardwood technicians, to help work with the small hardwood lumber producers. We think this is a verification of the need to do something about the hardwood situation. With the $200,000 that you granted us, we set up some pilot projects to see just what we could do to step up the growth of high quality hardwoods.

We have gotten well started in Michigan, Ohio, Pennsylvania, Georgia, and Virginia, and we are also doing some planning work in Tennessee, North Carolina, and South Carolina.

Of course, we have got quite a problem here, because the Timber Trends study showed us that a great number of our hardwood trees are small, of low quality, or are culls, and even though the growth and the inventory of hardwoods is constantly building up, that is just for the total amount of hardwoods, regardless of size or quality.

The hardwoods that are declining are the bigger size classes and the better species. In fact, our survey showed that only 29 percent of the hardwood sawtimber volume was in trees with grades 1 and 2.

So we have got a big problem here, to try and overcome this scarcity of high quality hardwoods. Does that answer your question, sir?

Chairman HAYDEN. It does.

GENERAL FORESTRY ASSISTANCE PROGRAM IN APPALACHIA

Under the general forestry activity you refer to an Appalachian regional program.

How much was devoted to this program under general forestry assistance? Please describe how the funds were expended and what advantages were gained?

Mr. SPILLERS. The Appalachian area is about 80 percent forested. We are doing everything there we can to accelerate the State and private forestry programs.

Under the general forestry assistance program, we were given $322,000, sir, and we distributed that to 11 States from Alabama to New York. The objective here is to help the small woodland owners, and the primary processors. As you know, in that area, most of the private woodland ownerships are very small. We are trying to carry to them the better management techniques that we have on the national forests, including multiple use. We are trying to help the small woodland owner in Appalachia practice the very best type of forestry he can. Of course, to do that, he needs protection from fire and insects; he needs help in tree planting; and he needs help particularly in management, marketing, and utilization and the sale of his products.

So that money is being spent to help the whole Appalachian community. We find that it is not only helpful to the individual landowner, but it is also helpful to the community, the small industries, and it makes Appalachia a better place to live in and to visit. This is also helpful to the entire Nation.

FOREST ROADS AND TRAILS

Chairman **Hayden**. For forest roads and trails in fiscal year 1968, you propose an appropriation of $110,500,000, an increase of $9,270,000 over the amount appropriated in fiscal year 1967. The justification for this estimate will be printed in the record.

(The document follows:)

Appropriation Act, 1967, and base for 1968	$101, 230, 000
Budget Estimate, 1968	110, 500, 000
Increase	+9, 270, 000

Project Statement

The following tabulation reflects the *total program* for the construction and maintenance of roads and trails on the National Forests by combining the funds available under the appropriation "Forest roads and trails" with the permanent appropriation of 10% of National Forest receipts. This permanent appropriation for "Roads and trails for States" (10% Fund) is estimated at $17,160,000 for 1968 compared with $16,778,480 for 1967, an increase of $381,520.

Project	1966	1967 estimate	1968 estimate	Increase or decrease
1. Construction of roads and trails	$77, 016, 582	$89, 051, 480	$118, 160, 000	+$29, 108, 520
2. Maintenance of roads and trails [1]	40, 514, 546	33, 535, 000	19, 000, 000	−14, 535, 000
Total obligations	117, 531, 128	122, 586, 480	137, 160, 000	+14, 573, 520
Transfer from "Roads and trails for States"	−14, 203, 671	−16, 778, 480	−17, 160, 000	−381, 520
Program under "Forest roads and trails" contract authorization	103, 327, 457	105, 808, 000	120, 000, 000	+14, 192, 000
Obligations incurred under unfunded contract authorization	−1, 191, 457	−4, 578, 000	−9, 500, 000	−4, 922, 000
Total available or estimate	102, 136, 000	101, 230, 000	110, 500, 000	+9, 270, 000

[1] Includes obligations incurred under Pacific Northwest Disaster Relief Act of 1965 (Public Law 89-41) approved June 17, 1965:

1966	$19, 745, 152
1967	15, 604, 848

Estimated obligations for Appalachian region (funds in connection with Appalachian Regional Development Act of 1965):

1966	$2, 250, 000
1967	2, 250, 000
1968	2, 191, 000

An increase of $9,270,000 is needed to meet cash requirements for liquidation of contract authorization. This appropriation provides for the liquidation of obligations incurred for the construction and maintenance of forest roads and trails pursuant to the authorization contained in the Federal-Aid Highway Act. An appropriation of $110,500,000 for 1968 is required to:

(1) Pay for obligations of the prior year which will be due for payment in fiscal year 1968.

(2) Pay the portion of 1968 obligations of $120 million contract authorization which will require cash payment in that year. This includes $170 million 1968 authority made available by the Federal-Aid Highway Act of 1966 less: (a) $3.3 million advanced to fiscal year 1967 for construction of timber access roads in Appalachian region and increased pay costs and, (b) $46.7 million deferred to later years.

The presence or lack of access by road or trail has a direct and controlling influence on all aspects of forest management, protection, utilization, and development. An adequate system of forest development roads and trails must be installed and maintained to facilitate the maximum practicable yield and use of all forest resources on a sound sustained-yield basis.

Use of $120 million of contract authorization in 1968 will permit a start on full accomplishment of the long-range program. The first objective is to increase the amount of advance road construction by the Government prior to the sale of timber, thereby reducing the amount of timber purchaser road construction. This will enable the Government to proceed toward the objective of placing the timber program on the planned basis. Plans are being developed for adequate transportation systems in the new National Recreation Areas, on lands purchased under the Land and Water Conservation Fund Act, and on Forest Service lands where reservoirs are constructed by other agencies.

Following is a summary of the major road construction and restoration to be undertaken in 1968 as compared with fiscal years 1966 and 1967:

[Dollar amounts in thousands]

	Fiscal year 1966		Fiscal year 1967		Fiscal year 1968	
	Miles	Amount	Miles	Amount	Miles	Amount
Recurrent road maintenance	113,417	$15,136	114,664	$14,738	116,459	$16,000
Recurrent trail maintenance	102,947	4,335	102,744	3,192	102,500	3,000
Bridge construction (units)	212	3,141	200	4,348	210	7,100
Road construction	1,496	50,957	1,795	56,588	2,139	76,560
Trail construction	668	3,457	1,287	4,240	600	4,500
Surveys, plans, and supervision for timber purchaser roads	5,000	16,713	5,089	18,385	5,000	20,000
Supplementing timber purchaser roads	1,995	2,263	1,083	4,495	1,500	8,000
Road purchase		486		995		2,000
Flood and earthquake damage repairs		21,043		15,605		

Authorizations for appropriations [1]

Fiscal year	Construction	Maintenance	Total	Funded	Unfunded
1966	$69,800,000	$53,200,000	$123,000,000	$123,000,000	
1967	69,000,000	16,000,000	85,000,000	48,374,000	$36,626,000
1968	151,000,000	19,000,000	170,000,000	110,500,000	59,500,000
Total	289,800,000	88,200,000	378,000,000	281,874,000	96,126,000

[1] The annual appropriation language and the department presentation combine the appropriation for "Forest roads and trails" made pursuant to 23 U.S.C. 205 and the appropriation of 10 percent of forest receipts for construction and maintenance of roads and trails pursuant to 16 U.S.C. 501. This merger of funds is made in order to simplify the programing, allotment, and accounting of funds at the field level. Since the accounts for these two funds are merged, it is not practicable to distribute obligations and expenditures between the 2 appropriations on a precise basis. The amounts shown for the "Forest roads and trails" appropriation are a proration based on the percentage that contract authorization used under the appropriated funds is of total available funds. Expenditure amounts for maintenance are based on all such obligations requiring cash payment during the fiscal year.

Status of unfunded authorizations

Unfunded contract authorizations beginning of 1967:	
Federal-Aid Highway Act of 1964	$137,856,000
Federal-Aid Highway Act of 1966 (1968 authorization available in 1967)	170,000,000
Appropriation, 1967	—101,230,000
Total unfunded beginning of 1968	206,626,000
1968 Budget estimate (cash requirements)	110,500,000
Balance to remain unfunded as of June 30, 1968	96,126,000

Analysis of cash requirements

1. Unliquidated obligations, June 30, 1966	$45,409,941
2. Estimated cash requirements to finance 1967 program	[1] 65,896,665
3. Total cash requirements by June 30, 1967	111,306,606
4. Less cash on hand 1967:	
Balance from 1966	10,076,606
Appropriation, 1967	101,230,000
Total	111,306,606
5. Obligations in 1967 for which cash was not provided in item 2	39,911,000
6. Estimated cash required to finance 1968 program	[2] 70,589,000
7. Total cash required for 1968	110,500,000

[1] An estimated 61% of the $90,203,000 new obligations and 70% of $15,605,000 obligations for Pacific Northwest flood damages will require cash payments during the fiscal year.

[2] An estimated 59% of the $120,000,000 new obligations will require cash payments during the fiscal year.

ROAD SYSTEM

Chairman HAYDEN. Do you have any particular comment regarding this program?

Mr. NELSON. Yes, Senator Hayden, I would like to comment on this program. Our transportation system affects every phase of our overall Forest Service work in the management of the national forests, and is very important. All of the visitors that visited the national forests last year, and spent 173 million visitor days, used this road system. All of the 12 billion board feet of timber were hauled over some part of this road system. It is used for disbursing hunters, the fishermen use it for access, it is used for our access for firefighting and for insect disease control work.

I think the Congress itself recognized the importance of a good road and trail system for the national forests needed for their complete management. In 1966, the Congress increased our authorization for roads and trails, up to $170 million a year. It is important. Even the wilderness visitors use trails, and we must have trails within the wilderness to make the wilderness usable. So even those that want national forest land left for wilderness use a part of these funds.

We have in existence at the present time 190,000 miles of roads within our road system, which is more miles than any other road agency has to administer. We are responsible for maintaining 161,000 miles of this road system, but 29,000 miles is maintained by some other public road agency. So our transportation system is a very important activity for all of our use of all our activities on the national forest, and we feel that we must move ahead with this program. This program, this budget for 1968, would allow us to move ahead at the rate of using $120 million of the $170 million authorization which is available for this year by authority of the 1966 Federal-Aid Highway Act.

Mr. Baker discussed this earlier in the testimony.

PROGRAM IN BLACK HILLS

Senator MUNDT. I receive a lot of correspondence about these roads and trails. Of course, the Black Hills area is a great tourist country. We have more people, 20 times over, come there to visit each year than we have people in the State.

Would you send me a letter setting out a little background on what you have now in the hills and what you plan in connection with this program?

Mr. NELSON. We will be very glad to do that, Senator Mundt.

Senator MUNDT. Thank you very much.

LAND ACQUISITION, SPECIAL ACTS

Chairman HAYDEN. There will be placed in the record the justification for your estimate of $80,000 needed for the acquisition of lands under various legislative enactments.

(The justification follows:)

ACQUISITION OF LANDS FOR NATIONAL FORESTS, SPECIAL ACTS

Appropriation Act, 1967, and base for 1968	**$80, 000**
Budget estimate, 1968	**80, 000**

Project statement

Project and authority	1966	1967	1968 estimate	Increase or decrease
1. Cache National Forest, Utah, act of May 11, 1938, as amended	$19, 973	$20, 000	$20, 000	
2. Uinta-Wasatch National Forest, Utah, act of Aug. 26, 1935, as amended	19, 935	20, 000	20, 000	
3. Toiyabe National Forest, Nev., act of June 25, 1938, as amended	7, 638	8, 000	8, 000	
4. Angeles National Forest, Calif., act of June 11, 1940			32, 000	+$32, 000
5. Sequoia National Forest, Calif., act of June 17, 1940	176	32, 000		−32, 000
Unobligated balance reverted to national forests fund	32, 278			
Total available or estimate	80, 000	80, 000	80, 000	

The Congress has enacted several special laws which authorize appropriation from the receipts of certain specified National Forests for the purchase of lands to minimize erosion and flood damage. Amounts appropriated and laws under which authorized are shown above.

There are critical watershed lands needing soil stabilization and vegetative cover restoration to prevent serious erosion and damaging floods within these National Forests. Land treatment measures must be applied and subsequently maintained on all lands in these areas to make corrective action fully effective. To assure full program effectiveness, the intermingled private lands must be acquired by the Federal Government.

During fiscal year 1966, 1,954 acres of land were purchased under the special purchase authorities applying to the Cache, Uinta and Wasatch National Forests in Utah. No lands were purchased in the National Forests of southern California in 1966.

Cache National Forest.—In fiscal year 1966, funds were available from two sources for purchase of lands within the Cache National Forest in Utah.

1. The Receipts Act of May 11, 1938, as amended—$20,000. This is an annual appropriation.
2. The Act of July 24, 1956—$200,000 was appropriated under this authority in fiscal years 1957 through 1960. These funds remain available until expended. Through fiscal year 1966, $181,908 has been obligated from this appropriation.

These funds are used to acquire key tracts of land in the steep, rough, and highly important watershed areas lying north of the Ogden River along the Wasatch front and on Wellesville Mountain of the Cache National Forest. These are rugged mountain lands above the river valley which have been damaged and their watershed functions impaired through forest fires or overgrazing. This contributes to excessive rainfall runoff causing severe erosion. The damaged watershed lands are potential sources of floods and mudrock flows. Many tracts of land are located in the north fork of Ogden River and on the drainage of Pineview Reservoir, a Federal reclamation project. Others are within the watersheds of the city of Ogden and the other small towns along the Wasatch front. Public ownership of these lands and the subsequent restoration and protection of their vegetative cover is a highly important part of a vigorous cooperative program with the local community and agencies.

The 1956 Act requires that expenditures of Federal funds be matched by contributions by local agencies or people. This requirement has been met through donations of lands valued at $185,000. Additional contributions are expected in fiscal year 1967.

The appropriation of $20,000 under the Act of May 11, 1938, is from receipts of the Cache National Forest. In the absence of this appropriation, the local counties would receive 25% of these receipts for roads and school purposes. Therefore, the local counties, in effect, are contributing one-fourth of the amount of this appropriation. These appropriations are extremely important to the continuation of a vital and worthwhile program extending over twenty years and shared in by both the local agencies and the Federal Government through the National Forests.

Through fiscal year 1966, 30,323 acres have been approved for purchase pursuant to the Receipts Act of 1938, and 15,307 acres under the Special Act of 1956. The 1967 objective is to acquire 1,500 additional acres of these critical watershed lands.

Uinta-Wasatch.—In fiscal years 1963 through 1967, an appropriation of $100,000 was made under the Uinta-Wasatch Receipts Act of August 26, 1935 for acquiring critical watershed lands in the American Fork Canyon watershed. A total of 2,126 acres has been approved for purchase through fiscal year 1966 and an estimated 700 acres will be acquired during 1967. It is estimated that it will take from two to three years to complete the necessary American Fork acquisitions.

Sequoia National Forest.—In each of fiscal years 1966 and 1967, $32,000 was appropriated under this Act to acquire critical watershed lands. No lands were approved for purchase in fiscal year 1966 as no desirable tracts were available at reasonable prices. For this reason the transfer of this program to Angeles National Forest is proposed for fiscal year 1968. It is estimated that approximately 300 acres will be purchased during 1967.

Toiyabe National Forest.—$8,000 was appropriated under this Act in each of fiscal years 1966 and 1967. During fiscal year 1966 one very key tract of land was acquired to consolidate National Forest holdings. The 1967 objective is to acquire 300 additional acres of important watershed lands in the Toiyabe National Forest.

MISCELLANEOUS LAND ACQUISITIONS

Chairman HAYDEN. Also I will include in the record the statements which you have supplied concerning funds appropriated in prior years for land acquisitions but for which no requests are being made this year.

(The statements follow:)

ACQUISITION OF LANDS FOR UINTA NATIONAL FOREST

Appropriation Act, 1967 and base for 1968	$300,000
Budget Estimate, 1968	--------
Decrease	—300,000

Project statement

Project	1966	1967	1968	Increase or decrease
Acquisition of lands for Uinta National Forest	------------	$300,000	------------	−$300,000

Public Law 89–226 authorized the purchase of approximately 10,000 acres of non-Federally owned land within a described part of the Uinta National Forest in Utah for the purpose of promoting the control of floods and the reduction of soil erosion through restoration of adequate vegetative cover. $300,000 were appropriated in fiscal year 1967. The lands to be acquired are located on the South Fork of the Provo River and constitute the watershed from which the City of Provo draws its municipal water supply. The lands are intermingled with, and surrounded by, National Forest land which is now the property of the United States and acquistion of the 10,000 acres authorized by Act would consolidate the National Forest area and not only serve to halt erosion and promote flood control, but facilitate administration of the National Forest.

As of December 31, 1966, 8,800 acres have been acquired at a cost of $203,500. It is anticipated that essentially all of the remaining lands will be acquired by the end of fiscal year 1968.

ACQUISITION OF LANDS FOR WASATCH NATIONAL FOREST

Project statement

Project	1966	1967	1968 estimate
Acquisition of lands for Wasatch National Forest	------------	$114,260	------------
Recovery of prior year obligations	−$2,951	------------	------------
Unobligated balance brought forward	−111,309	−114,260	------------
Unobligated balance carried forward	114,260	------------	------------
Total available or estimate	------------	------------	------------

The Act of September 14, 1962 (PL 87–661) provided authorization for the appropriation of $400,000 for purchase of privately owned lands within the Wasatch National Forest in Utah. The full amount of this authorization has been appropriated with the funds remaining available until expended.

As of June 30, 1966, approximately 10,000 acres had been acquired under this authority. It is expected that a large part of the remaining 9,000 acres will be acquired by the end of fiscal year 1968.

ACQUISITION OF LANDS FOR SUPERIOR NATIONAL FOREST

Project statement

Project	1966	1967	1968 estimate
Acquisition of lands for Superior National Forest	$273,804	$51,488	------------
Unobligated balance brought forward	−325,292	−51,488	------------
Unobligated balance carried forward	51,488	------------	------------
Total available or estimate	------------	------------	------------

The Act of June 22, 1948 (PL 80–733) as amended, provided authorization for the appropriation of $4.5 million for the purchase of lands and improvements thereon in the Boundary Waters Canoe Area, Superior National Forest, Minnesota. The full amount of this authorization has been appropriated with the funds remaining available until expended.

The legislation authorized and directed the Secretary of Agriculture to acquire any properties which in his opinion should be in Federal ownership in order to restore and preserve the wilderness character of the remaining canoe country along the Canadian boundary in Minnesota.

This purchase program is in its final stages. No further purchase negotiations will be carried on under this authorization and the appropriated funds are all obligated.

ACQUISITION OF LANDS FOR CACHE NATIONAL FOREST

Project statement

Project	1966	1967	1968 estimate
Acquisition of lands for Cache National Forest	$5, 119	$18, 092	
Unobligated balance brought forward	−23 210	−18, 092	
Unobligated balance carried forward	18, 092		
Total available or estimate			

The 1956 Appropriation Act provided $200,000 for the acquisition of lands in the Cache National Forest Pursuant to the Act of July 24, 1956 (70 Stat. 632). Obligations under this fund are in addition to the appropriation from National Forest receipts authorized by the Act of May 11, 1938 and provided in the appropriation, Acquisition of Lands for National Forests, Special Acts. Under the 1956 Act, funds appropriated must be matched by contribution of funds or land by local agencies or persons. Explanation of this program and the accomplishments thereunder are included on page 1746.

TIMBER DEVELOPMENT ORGANIZATIONS

Chairman HAYDEN. You estimate your needs under section 204 of the Appalachian Regional Development Act of 1965 at $746,000, all of which is an unobligated balance brought forward from fiscal year 1967. The statement which you submitted in connection with this proposal will be included in the record.

(The statement follows:)

TIMBER DEVELOPMENT ORGANIZATION LOANS AND TECHNICAL ASSISTANCE

Project statement

Project	1966	1967 estimate	1968 estimate	Increase or decrease
Loan and related expenses		$154, 000	$746, 000	+$592, 000
Technical assistance	$4, 180	45, 820		−45, 820
Unobligated balance brought forward	−950, 000	−945, 820	−746, 000	+199, 820
Unobligated balance carried forward	945, 820	746, 000		−746, 000
Total available or estimate				

In many areas of the Appalachian region, a chronic condition of underdevelopment and severe unemployment exists. As a result, many people are denied reasonable economic and cultural opportunities. In addition, the productive force in both physical and human resources is severely limited in its contribution to the Nation, while the costs of essential welfare services are steadily increasing. Technological advances have displaced the employment opportunity of many workers. This situation can be alleviated through purposeful and dynamic use of resources and technology available to us today. This region has great resources. Its people are productive and self-reliant.

At one time the Appalachian region was a center of lumber production. But when the lumber industry had harvested the virgin forests, production was drastically reduced. In its wake were left large areas of cut-over forest lands that have taken decades to regenerate to the extent that they can once again be regarded as usable resource. For these reasons, special supplementary forestry programs are being provided for the Appalachian region under authority provided in Section 204 of the Appalachian Regional Development Act of 1965.

TDO ACCOMPLISHMENTS TO DATE

Chairman HAYDEN. This program was started with a $1 million appropriation in the Second Supplemental Act of 1965. What have you accomplished with this fund thus far?

Mr. CLIFF. I think you are referring to what we call the timber development organization, and I will ask Mr. Spillers to comment on that.

Mr. SPILLERS. Thank you very much. Senator Hayden, first may I define a timber development organization. We call them TDO's and as you know they are provided for by the act.

A timber development organization is a nonprofit management marketing association. It is a means of managing fragmented forest ownerships. It applies particularly to the Appalachia area, where we have so many small forest tracts. Ofttimes, a farmer might have a dozen trees to sell, but he can't sell them himself, whereas if he could combine with a number of other landowners to have maybe 200 trees, they could find a ready market.

So the emphasis here is to provide a means for managing fragmented small ownership. The timber development organization will provide the management, sales and round wood marketing services, to landowners, and also provide them and the processors with professional forestry assistance for a nominal fee.

Now the Act does not permit the timber development organization to build or acquire an industry, nor does it enable them to buy land, except for demonstration purposes.

The timber development organization is a new idea, and we hope that it will work particularly in Appalachia, where it is so badly needed.

Last year, the Appalachia Commission provided money to the McDonald consultants to study what a timber development organization is, and what it could do. They made that study, and after they made the study, the Commission asked the U.S. Department of Agriculture to go ahead with three feasibility studies in Appalachia.

We have them well started in a very likely area in Tennessee, and one in New York. We will move into Kentucky in a very short time. These feasibility studies will show us whether or not a timber development organization has a good opportunity to succeed under the very difficult situations we find in Appalachia.

Chairman HAYDEN. How much of the amount carried forward into the fiscal year 1967 have you disposed of thus far?

Mr. SPILLERS. In fiscal year 1967, we will have disposed of $49,300 for the McDonald study, about $5,000 for overhead, and for assistance from the Farmer Cooperative Service, which is helping us study what can be done in that area and $35,000 for the feasibility studies.

Chairman HAYDEN. How much do you estimate that you will carry forward into fiscal year 1968?

Mr. SPILLERS. We estimate that we will carry forward only about $10,000 in 1968, sir.

Mr. CLIFF. Is that correct, Art?

Out of the million dollars, how much will we have left at the end of this fiscal year?

Mr. SPILLERS. Oh, I am sorry. I am overlooking the loaned funds. The big item in this, Senator, is the $900,000 for loan funds to help these timber development organizations once they get started.

To date, we have not spent any of this $900,000 but this is a carryover fund, as you know and as soon as the feasibility studies prove that TDO's can be started, they will need loan funds. We do not anticipate that they will be needing any of these loan funds, in fiscal year 1967.

Chairman HAYDEN. All right.

MISCELLANEOUS FUNDS AND ADMINISTRATIVE PROVISIONS

There will be printed in the record the statements which you have furnished concerning cooperative range improvements, assistance to States for tree planting, access roads, administrative provisions, permanent appropriations, working capital fund, and trust fund.

(The statements follow:)

COOPERATIVE RANGE IMPROVEMENTS

Appropriation, 1967 and base for 1968	$700,000
Budget estimate, 1968	700,000

Part of the grazing fees from the National Forests, when appropriated, are used for revegetation of depleted rangelands, construction and maintenance of range improvements, rodent control, and eradication of poisonous plants and noxious weeds. These funds are advanced to and merged with the appropriation, Forest protection and utilization, subappropriation, Forest land management.

FORMULA FOR APPROPRIATION

Section 12 of the Act of April 25, 1950 (Granger-Thye Act), provides that of the money received from grazing fees by the Treasury from each National Forest during each fiscal year there shall be available at the end thereof when appropriated by Congress an amount equivalent to 2 cents per animal month for sheep and goats and 10 cents per animal month for other kinds of livestock under permit on such National Forest during the calendar year in which the fiscal year begins.

Since figures for animal months permitted are not available until after more than one-half of the fiscal year for which funds are appropriated has elapsed, the 1968 appropriation request of $700,000 necessarily represents the best current approximation of the amount which will become available in the calendar year 1967 under the animal-months-permitted formula.

For calendar year 1965, the latest available figures, animal months permitted were 5,914,106 for cattle and horses, and 6,008,997 for sheep and goats. This calculates to $711,590 available under the formula.

ASSISTANCE TO STATES FOR TREE PLANTING

Appropriation, 1967 and base for 1968	$1,000,000
Budget estimate, 1968	1,000,000

Project statement

	1966	1967 estimate	1968 estimate	Increase or decrease
Assistance to States for tree planting	$972,677	$1,046,899	$1,000,000	−$46,899
Unobligated balance brought forward	−19,576	−46,899		+46,899
Unobligated balance carried forward	46,899			
Total available or estimate	1,000,000	1,000,000	1,000,000	

This program authorized under Section 401 of the Agricultural Act of 1956 (16 USC 568e) effectively assists the States in their reforestation programs. It has been responsible for directly speeding up the needed rehabilitation work on State and county forest lands. This program is making valuable contributions to the overall reforestation program for the Nation. To meet our timber goals, about 10 million acres will require some form of Federal tree planting aid during the 10-year period beginning with fiscal year 1968. Almost 2 million acres will require assistance through this program.

Through 1965, the program helped reforest about a half million acres. There are approved State plans for almost 1.3 million acres to be planted at an estimated Federal-State cost of $41 million. Thirty-five States are participating. Thirteen States have 53 seed orchards with 1,517 acres for the production of genetically improved forest tree seed. This program is largely responsible for these important developments.

Following are the major benefits that have been or will be obtained from Federal appropriations when matched with State appropriations:

	Unit	Fiscal year 1966	Fiscal year 1967	Fiscal year 1968
Area planted or seeded	Acre	90,000	100,000	100,000
Volume increase in Nation's production and supply of high-quality timber.	Cubic feet	10,000,000	10,500,000	10,500,000
Area of improved watershed conservation	Acre	8,000	9,000	9,000
Area of improved wildlife habitat	do	4,000	4,000	4,000
Area of forestry practices contributing to natural beauty.	do	6,000	7,000	6,000
Employment resulting in rural areas	Man-days	100,000	120,000	120,000

	Fiscal year 1966	Fiscal year 1967	Fiscal year 1968
Appropriation level:			
Federal	$1,000,000	$1,000,000	$1,000,000
State	2,400,000	2,500,000	2,500,000
Total	3,400,000	3,500,000	3,500,000

ACCESS ROADS

Project statement

Project	1966	1967	1968 estimate
Access roads	$53,951	$9,274	
Unobligated balance brought forward	−63,224	−9,274	
Unobligated balance carried forward	9,274		
Total available or estimate			

The unobligated balance from the fiscal year 1962 appropriation is $9,274. During fiscal year 1966 one road system involving 19 miles of existing roads was purchased at a cost of $53,950. The small remaining balance will be used to pay any excess awards which may result from settlement or trial of road condemnation cases initiated under this program.

Effective with fiscal year 1964, this appropriation was eliminated and future access road purchase, beyond that to be accomplished with the balance remaining in this appropriation, will be accomplished under the Forest Road and Trail appropriation.

ADMINISTRATIVE PROVISIONS, FOREST SERVICE

CHANGES IN LANGUAGE

Changes in language of this item are proposed as follows. New language is italicized. Deleted matter is enclosed in black brackets.

"Appropriations to the Forest Service for the current fiscal year shall be available for: (a) purchase of not to exceed [one] *two* hundred and [sixty-five] *fifty-nine* passenger motor vehicles of which one hundred and [fifteen] *sixty-five* shall be for replacement only, and hire of such vehicles; operation and maintenance of aircraft and the purchase of not to exceed four for replacement only; (b) employment pursuant to the second sentence of section 706(a) of the Organic Act of 1944 (5 USC 574), and not to exceed $25,000 for employment under section 15 of the Act of August 2, 1946 (5 USC 55a); (c) uniforms, or allowances therefor, as authorized by the Act of September 1, 1954, as amended (5 USC 2131); (d) purchase, erection, and alteration of buildings and other public improvements (5 USC 565a); (e) expenses of the National Forest Reservation Commission as authorized by section 14 of the Act of March 1, 1911 (16 USC 514); and (f) acquisition of land and interests therein for sites for administrative purposes, pursuant to the Act of August 3, 1956 (7 USC 428a).

"Except to provide materials required in or incident to research or experimental work where no suitable domestic product is available, no part of the funds appropriated to the Forest Service shall be expended in the purchase of twine manufactured from commodities or materials produced outside of the United States.

"Funds appropriated under this Act shall not be used for acquisition of forest lands under the provisions of the Act approved March 1, 1911, as amended (16 USC 513–519, 521), where such land is not within the boundaries of an established national forest or purchase unit."

The three changes would provide authority for the Forest Service to purchase 259 passenger motor vehicles of which 165 will be replacements. The justification of this need follows:

PASSENGER MOTOR VEHICLES

Purchase of passenger motor vehicles

During fiscal year 1968, it is proposed to replace 165 passenger vehicles. Of these, 150 will meet replacement standards and 15 will require replacement because of accidents or excessive maintenance costs. It is also proposed to purchase 94 additional passenger cars. Of these, 69 will be used as replacements or in lieu of additional one-half ton pickups and carryalls which are more expensive. The other 25 passenger motor vehicles will be additions to the Service-wide fleet to meet expanding program needs.

The Forest Service had a net fleet of 660 (includes 2 damaged vehicles disposed of in 1966 to be replaced in 1967) passenger carrying vehicles at the start of fiscal year 1967. It will add 45 units to its fleet during the fiscal year, making a total of 705 units available at the start of fiscal year 1968, excluding possible transfer to other agencies. It is proposed that the total number of passenger carrying vehicles be increased to 799 by the end of fiscal year 1968. Due to program needs, it may be necessary to replace sedans with station wagons or vice versa, but this would not change the total number of passenger motor vehicles scheduled for replacement or addition.

As of June 30, 1966, the age and mileage classes of the passenger vehicles on hand, exclusive of two buses, were:

Age data		Mileage data	
Year	Number of vehicles	Miles	Number of vehicles
1961 and older	68	60,000 and over	78
1962	128	50,000 to 59,999	99
1963	160	40,000 to 49,999	132
1964	130	30,000 to 39,999	121
1965	123	20,000 to 29,999	74
1966	90	10,000 to 19,999	90
		0 to 9,999	105
Total	[1] 699		[1] 699

[1] Includes 39 vehicles on hand awaiting disposal.

Justification for Substitution of Passenger Carrying Vehicles for Light Trucks

As of June 30, 1966, the Forest Service operated a net fleet of 660 passenger carrying vehicles. In addition, the Forest Service has 7,919 one-half to one ton trucks, 2-wheel drive. It is now possible to advantageously substitute some passenger carrying vehicles for pickups and carryalls. The pattern of utilization in some areas requires a sedan or station wagon-type vehicle in lieu of a truck.

The sedan or station wagon costs less to operate and maintain than a truck. During fiscal year 1967, we are replacing 40 light trucks, such as carryalls, pickups, panels, and sedan delivery trucks, with sedans and station wagons. The total estimated cost savings is $14,965 per year. If the Forest Service could substitute 69 passenger cars for light trucks in fiscal year 1968, this would result in an additional savings of about $25,000 each year.

Use of Vehicles

Passenger motor vehicles are used by:

(1) Forest officers in the protection, utilization, management, and development of the National Forests and land utilization projects and in the program for control of forest pests.

(2) Research technicians on experimental forests and ranges, on field research projects and forest surveys.

(3) Foresters engaged in carrying out the laws providing for State and private forestry cooperation.

(4) Regional office field-going administrative personnel in performing, directing, and inspecting field work.

The Forest Service is essentially a field organization and its passenger motor vehicles are located mainly at regional, National Forest, and ranger district headquarters, and experimental forests and ranges. There are over 225 million acres within the exterior boundaries of the National Forests.

About 435 million acres of State and private forest land are included within the areas which benefit from Federal participation in the cooperative forest program. Much of this area is without common carrier service, and most forest areas and research centers are remote from commercial travel routes, requiring extensive use of motor vehicles as a means of transportation. The major portion of transportation needs, particularly at forest regional and supervisor levels and at other larger headquarters involves multiple passenger use and can be more expeditiously and economically met by use of sedans and station wagons than by other types of vehicles.

Justification of Replacements

Dependability of passenger vehicles is an important factor in keeping work programs on schedule and in meeting emergencies. Vehicle breakdowns while on field travel cause disruptions and delays in field work as well as loss of effective work time of employees. The continued use of over-age equipment is undesirable from a safety standpoint since most of it is operated over rough, narrow, winding roads in mountainous country under adverse conditions. This use generally results in excessive operating and repair expenses when vehicles reach or exceed replacement standards.

In order to maintain passenger cars in a safe and satisfactory operating condition, it is the policy of the Forest Service to schedule periodic preventive maintenance inspections, services, and tune-ups to reduce the necessity for costly repairs and major overhauls, and to minimize lost time resulting from field breakdowns.

It is desirable to maintain a reasonable balance in the age class of the passenger vehicle inventory. The age class distribution is based upon conforming with replacement standards which recognizes that some units will be retired under the age standard and others under the use standard. Prescribed replacement standards, although applicable, are not always appropriate for all Forest Service vehicles because of the wide range of operating conditions and the comparatively short field season in many of the National Forests at higher elevations. Decision on replacement of passenger vehicles which reach replacement age is based on an appraisal of each unit. This involves a review of the history record combined with a mechanical inspection of the vehicle's condition and repair liability. When such appraisal indicates that the vehicle is satisfactory for further service without unreasonable repair expenditures, it is retained and assigned to lighter work, even though such action tends to upset the age standards for the fleet inventory.

The vehicles selected for replacement are those which cannot be operated another season without excessive repair expense. They are unsatisfactory for further use both as to safety and mechanical condition. The replacement authorization requested is within the normal annual replacement standards prescribed by the General Services Administration.

Essentially all passanger motor vehicles are pooled for use by all activities with replacement of pooled units financed from a Working Capital Fund. All appropriations reimburse this fund in ratio to use of vehicles on activities financed by the respective appropriations.

None of the replacements requested will be assigned to areas served or scheduled to be served by Inter-Agency Motor Pools.

Justification of Additions

The Forest Service analyzes current work plans and program in determining its overall passenger car requirements. This analysis includes a careful study of the number of vehicles needed at each field station, using as a guiding principle the ownership of only the minimum number of dependable units required to serve programs for which funds are budgeted. Also, it is Forest Service policy to utilize Inter-Agency Motor Pools or commercial car rental services to the fullest practicable extent. Passenger car use is restricted and is integrated with various activities so as to attain good utilization of all vehicles. Expanding activities in research, timber sales, public use of recreational facilities, fire protection, and other land management activities are increasing the need for more passenger cars. These increasing needs are being met in some areas through greater use of Inter-Agency Motor Pool vehicles. These pools, however, serve only very small parts of the total land area administered by the Forest Service; therefore, increasing requirements for passenger car transportation in several areas cannot be fully met except through purchase of additional units for the Forest Service fleet. None of the additions requested will be assigned to areas served or scheduled to be served by Inter-Agency Motor Pools.

Additions are financed from program funds in direct relationship to the anticipated use of the equipment. Distribution of costs to appropriations is based on analysis of use of the equipment fleet for the past three years and the estimated use for the budget year.

AIRCRAFT

Replacement of Aircraft

The 1968 estimates propose replacement of four aircraft by purchase and four by transfer from other agencies as available. The Forest Service currently has 57 aircraft:

Single-engine reconnaissance and transport airplanes	11
Light twin-engine reconnaissance and transport airplanes	13
Medium and heavy cargo transport airplanes (9 medium, 4 heavy)	13
T-34B lead airplanes (2-place scout)	19
Heilcopter	1

The reconnaissance and transport airplanes are multipurpose aircraft used primarily to transport firefighters, smokejumpers, administrative personnel, equipment and supplies to remote and inaccessible areas where commercial service is inadequate, or not available for detection and suppression of forest fires. They are also used to locate and survey timber stand and vegetation conditions, such as insect infestations, blowdown, diseased areas, undesirable species, and to appraise resources and damage, and evaluate effectiveness of control.

One light twin-engine airplane has been modified, equipped and is used primarily for fire mapping and infrared equipment in low visibility of smoke and at night.

The T–34B "lead" airplanes are primarily a single-purpose military model aircraft used by air tanker bosses to direct and control the dropping of fire retardants on forest fires by more than 120 tanker aircraft usually contracted from private owners.

The helicopter is used for training forest personnel in tactical use of helicopters and experimental development of techniques and equipment for direct tactical suppression of forest fires. It is currently assigned on the study project to develop safe and effective use of helicopters at night on fires.

The replacements requested will be primarily light twin-engine airplanes. They will be utility airplanes that may be used for several purposes, such as lead planes for air tankers, small paracargo dropping, reconnaissance, and transporting freight and passengers. These will be new standard manufactured airplanes to upgrade with greater utility some old surplus T–34B's and single-engine reconnaissance airplanes which have reached an age in total number of flying hours where it is uneconomical to overhaul or modernize them to meet civil airworthiness requirements. These replacements will provide a more effective operation, with the wider twin-engine operation safety margin. Forest Service aircraft are operated to a large extent over rough mountainous terrain where landing fields are poor and few. It is especially important that these aircraft be maintained for maximum performance and dependability to provide an adequate standard of safety.

Other aircraft currently in use may be replaced as newer and more suitable models and types become available from military services as excess property. They would be obtained on transfer without reimbursement and would not increase the fleet beyond 57 aircraft. Medium and heavy cargo and transport airplanes are needed to meet requirements as a result of rapidly diminishing number available from supplemental air carriers and other commercial sources. When aircraft are partially or completely destroyed in a crash accident, they may be replaced out of any available fund. The majority of current Forest Service aircraft were manufactured during World War II, and obtained from military surplus. Most of these planes have nearly reached their limit of useful age. The military services have a few types of aircraft which have more potential suitability for Forest Service work that may become surplus in the near future.

Roads and Trails for States, National Forests Fund

Appropriation, 1967	$16,778,480
Budget estimate, 1968	17,160,000
Increase (due to an estimated increase in National Forest receipts in fiscal year 1967)	+381,520

The permanent appropriation of 10% of National Forest receipts pursuant to the Act of March 4, 1913 (16 USC 501) is transferred to and merged with the annual appropriation for Forest Roads and Trails. The explanation of the use of these funds is included in the justification for that appropriation item.

Expenses, Brush Disposal

Appropriation, 1967 and base for 1968	$10,200,000
Budget estimate, 1968	10,300,000
Increase	+100,000

Project statement

	1966	1967 estimate	1968 estimate	Increase or decrease
Brush disposal	$9,004,649	$9,500,000	$9,600,000	+$100,000
Unobligated balance brought forward	−9,987,145	−11,178,168	−11,878,168	−700,000
Unobligated balance carried forward	11,178,168	11,878,168	12,578,168	+700,000
Total available or estimate	10,195,672	10,200,000	10,300,000	+100,000

Timber cutting normally increases the fire hazard because of dry fuel increase in the form of logging slash. This slash may also contribute to the buildup of insect populations, increase certain disease infestations, and cause damage to stream channels.

National Forest timber sale contracts require treatment of debris from cutting operations or deposit of funds to pay for the work. When economical and expedient the work is performed by the timber purchaser. If it is not feasible for the purchaser to do the work, it is done by the Government using deposits made by the timber purchaser to cover costs of the work as authorized under section 6 of the Act of April 24, 1950 (16 USC 490).

The effect of timber cutting and the manner of treating slash vary widely among regions. In the three eastern regions, volume cut per acre is relatively low, utilization is high, and generally, humid atmospheric conditions result in rapid decomposition of debris so little slash disposal work is necessary. An exception occurs in some sales where a heavier cut per acre is made, such as the jack pine stands of Minnesota. In such areas, slash is broken and mixed with mineral soil by discing with heavy equipment. This reduces the hazard and provides a good seedbed to aid regeneration. Treatment of slash to prevent insect epidemics is sometimes necessary in these areas.

In contrast, the cost of slash abatement on most sale areas of the West is high. High volumes per acre generally produce heavy slash. Long dry periods with much lightning and man-caused fire risk result in extremely hazardous fire potential. The warm, humid condition necessary for rapid slash deterioration seldom occurs so more intense slash disposal is required. Treatment varies greatly with different methods of cutting. Clear-cut areas are broadcast burned. In selectively cut areas, debris may be piled for burning over the whole area or in strips which serve as firebreaks.

While slash disposal follows general prescriptions within regions, individual needs of each sale offering are planned and appraised prior to advertisement and appropriate specific requirements are incorporated into each timber sale contract. In each instance the method used is the one which will attain adequate protection of the area at the least expense. In some instances adequate protection from fire is attained by providing additional protection until the slash hazard reverts to near normal. Logging debris which may move into water courses under these conditions must be removed. Greater intensity of fire protection for several years and occasional stream clearance may be less costly than complete slash disposal immediately after cutting. In such cases Brush Disposal funds are used to provide the needed manpower and facilities.

FOREST FIRE PREVENTION

Appropriation, 1967 and base for 1968	$45,000
Budget estimate, 1968	45,000

Project statement

Project	1966	1967 estimate	1968 estimate	Increase or decrease
Forest fire prevention	$23,892	$42,000	$47,000	+$5,000
Unobligated balance brought forward	−45,041	−64,195	−67,195	−3,000
Unobligated balance carried forward	64,195	67,195	65,195	−2,000
Total available or estimate	43,046	45,000	45,000	

The purpose of the project is public education on the need for the prevention of man-caused wildfires on all the Nation's forests and rangelands. Its goal is the further reduction of man-caused forest fires on all ownerships to the point where their impact on natural resource management programs is negligible.

This project is accomplishing its purpose in two ways:

1. By the dissemination to the public of Smokey Bear's forest fire prevention messages on commercial products licensed by the Chief of the Forest Service.

2. By support of the Smokey Bear Junior Forest Rangers and of the Smokey Bear Awards program through the contribution of fees and royalties by licensees.

The Smokey Bear licensing program is an important part of the Cooperative Forest Fire Prevention Campaign which has been in effect for 25 years. The campaign itself has been conducted each year since 1942 as a cooperative project of the State Foresters and the Forest Service, United States Department of Agriculture, and is a public service program of the Advertising Council. The campaign utilizes the free public service resources of the various national advertising channels such as car cards, poster display systems, radio and television networks, and magazine and newspaper allocation plans in developing public cooperation in the prevention of man-caused forest fires. Since 1945, this campaign has been built around Smokey Bear who has become recognized and accepted by the public as a nationwide symbol of forest fire prevention.

Under authorization of the Act of May 23, 1952 (18 USC 711), the Secretary of Agriculture has issued rules and regulations governing the licensing program. These licenses specify payment of royalties (usually 5%) and set up certain controls for administering the program and collecting the royalties including advance deposits to protect the Government's interest. Such collections, along with appropriated funds, are used to finance the Cooperative Forest Fire Prevention Campaign.

The licensing program provides about one-tenth of the total funds required for the Cooperative Forest Fire Prevention Program.

Examples of Recent Accomplishments

In fiscal year 1966, receipts from the commercial support educational programs were $43,046. These receipts came from 43 licensees.

Thanksgiving Day, Smokey Bear was featured twice on network television. A sixty-foot Smokey Bear balloon was in the Macy's Parade in New York City in the morning and in the evening an hour long color film titled "Ballad of Smokey Bear" was presented. The viewing audience for each of these programs is estimated at 50 million people. A forest fire prevention float was entered for the second successive year in the Pasadena Rose Parade on New Year's Day. The estimated television audience for the parade was 100 million people. The 1966 forest fire prevention film spot "Family Trees" won top honors for TV shorts and spots presented by the National Committee on Films for Safety.

New commercial Smokey Bear items included a book, "Letters to Smokey Bear," silver charm, electric clock, record, and sweat shirt.

State and Federal units purchased Smokey Bear material valued at $179,000 for the 1966 Campaign to supplement the material valued at $85,000 printed for them with appropriated funds.

RESTORATION OF FOREST LANDS AND IMPROVEMENTS

Appropriation, 1967 and base for 1968	$25,000
Budget estimate, 1968	25,000

Project statement

Project	1966	1967 estimate	1968 estimate	Increase or decrease
Restoration of forest land and improvements	$23,259	$39,979	$25,000	-$14,979
Unobligated balance brought forward	-18,443	-14,979		+14,979
Unobligated balance carried forward	14,979			
Total availble or estimate	19,795	25,000	25,000	

Recoveries from cash bonds or forfeitures under surety bonds by permittees or timber purchasers, who fail to complete performance, are used to complete improvement, protection, or rehabilitation work on lands under Forest Service administration. Funds received as settlement of a claim are used for improvement, protection, or rehabilitation made necessary by the action which led to the cash settlement (Act of June 20, 1958, 16 USC 579c).

PAYMENT TO MINNESOTA (COOK, LAKE, AND ST. LOUIS COUNTIES) FROM THE NATIONAL FORESTS FUND

Appropriation, 1967 and base for 1968	$144, 815
Budget estimate, 1968	145, 000
Increase	+185

Project statement

Project	1966	1967 estimate	1968 estimate	Increase or decrease
Payment to Minnesota from the national forests fund (total available or estimate)	$140, 619	$144, 815	$145, 000	+$185

The Act of June 22, 1948, as amended (16 USC 577c–577h) provides that the Secretary of the Treasury, upon certification of the Secretary of Agriculture, shall pay to the State of Minnesota at the close of each fiscal year an amount equivalent to three-fourths of one percent of the fair appraised value of certain National Forest lands in the counties of Cook, Lake, and St. Louis situated within the Superior National Forest. The Act further provides that payment to the State shall be distributed to each of these counties in conformity with the fair appraised value of such National Forest lands in each county.

PAYMENTS TO COUNTIES, NATIONAL GRASSLANDS

Appropriation, 1967 and base for 1968	$431, 250
Budget estimate, 1968	431, 250

Project statement

Project	1966	1967 estimate	1968 estimate
Payment to counties (total available or estimate)	$429, 041	$431, 250	$431, 250

At the end of each calendar year, 25% of the revenues from use of submarginal lands are paid to counties under the provisions of Title III of the Bankhead-Jones Farm Tenant Act, approved July 22, 1937 (7 USC 1012). Payments are made on the provision that they are used for school or road purposes, or both.

PAYMENTS TO SCHOOL FUNDS, ARIZONA AND NEW MEXICO

Appropriation, 1967 and base for 1968	$102, 931
Budget estimate, 1968	105, 000
Increase (due to an estimated increase in National Forest receipts in fiscal year 1967)	+2, 069

Project statement

Project	1966	1967 estimate	1968 estimate	Increase or decrease
Payments to school funds (total available or estimate)	$112, 130	$102, 931	$105, 000	+$2, 069

Under provisions of the Act of June 20, 1910 (36 Stat. 562, 573) certain areas within National Forests were granted to the States for school purposes. The percentage that these lands are of the total National Forest area within the State is used in determining payments to the States. The receipts from all National Forest land within the State are used as the basis for applying the percentage. For example, if total receipts for the State are $100,000 and if 10% of lands are in the "granted for school purposes" category, the payment to the State would be $10,000. The amounts so paid are deducted from the net receipts before computing the 25% payments to States.

As soon after the close of the fiscal year as the receipts from National Forests and the area of school lands in the States of Arizona and New Mexico are determined, the payments are made to the States. Estimated payments in fiscal year 1967 to Arizona will be $102,572 and to New Mexico $359.

PAYMENTS TO STATES, NATIONAL FORESTS FUND

Appropriation, 1967 and base for 1968	$41, 942, 319
Budget estimate, 1968	42, 900, 000
Increase (due to an estimated increase in National Forest receipts in fiscal year 1967)	+957, 681

Project statement

Project	1966	1967 estimate	1968 estimate	Increase or decrease
Payments to States (total available or estimate)	$35, 504, 367	$41, 942, 319	$42, 900, 000	+$957, 681

The Act of May 23, 1908, as amended (16 USC 500) requires, with a few exceptions that 25% of all money received from the National Forests during any fiscal year be paid to the States in which the forests are located, for the benefit of public schools and public roads of the county or counties in which such National Forests are situated. The amount of this appropriation varies each year in direct proportion to National Forest receipts during the previous fiscal year.

The amounts set aside from receipts collected for the sale of National Forest timber, grazing, special use permits, power, mineral leases, and admission and user fees, before the 25% is applied are listed below:

1. Payment to the State of Minnesota covering certain National Forest lands in the Counties of Cook, Lake, and St. Louis situated within the Superior National Forest is made under the terms of the Act of June 22, 1948, as amended (16 USC 577c–577h). Receipts collected from the areas covered by this Act are excluded when the 25% payment to the State of Minnesota is computed.
2. For lands in certain counties in Utah, Nevada, and California, the States receive 25% of receipts only after funds, if made available by Congress, have been set aside for the acquisition of National Forest lands within the specified National Forests under the terms of special acts authorizing appropriations from forest receipts for this purpose.
3. Payments to the States of Arizona and New Mexico under the provisions of the Act of June 20, 1910 (36 Stat. 562, 573), of shares of the gross receipts from the National Forests in those States which are proportionate to the areas of land granted to the States for school purposes within the National Forests.

WORKING CAPITAL FUND, FOREST SERVICE

The Working Capital Fund was established by the Act of August 3, 1956 (16 USC 579b), as amended by the Act of October 23, 1962 (76 Stat. 1157). It is a self-sustaining revolving fund which provides services to National Forests, experiment stations, and when necessary, to other Federal agencies, and as provided by law, to State and private agencies and persons who cooperate with the Forest Service in fire control and other authorized programs.

The Working Capital Fund requires no cash appropriation. Initially, its assets were purchased by regular Forest Service appropriations and were donated to the fund. Where expansion of facilities, equipment, and inventories is required, the expansion is financed pro rata by benefiting Forest Service appropriations and the additional assets are donated to the fund. Some additional assets have been obtained from excess sources without cost to Forest Service appropriations or the Working Capital Fund. Some expansion was financed by profits realized in the first few years of operation of the fund. Since July 1, 1962, expansion has been financed by benefiting Forest Service appropriations.

Since July 1, 1962, some earnings have been applied to the excess of replacement cost over original cost of equipment replaced. Some earnings have been reserved for future excess replacement costs of equipment. The balance of accumulated earnings is limited to not more than 5% of gross income for one year to provide working capital. This is an administratively imposed limitation which restricts earnings but does not require additional profits to meet the standard whenever working capital is adequate.

The following is a tabulation of information pertaining to the capital and earnings of the Working Capital Fund:

Analysis of capital and earnings

[In thousands]

	Actual, through June 30, 1966	Estimated, through June 30, 1967	Estimated, through June 30, 1968
Value of assets donated to the fund	$29,993	$30,894	$31,894
Earnings applied prior to July 1, 1962, to additional equipment and excess replacement costs	3,751	3,751	3,751
Earnings applied since July 1, 1962, to excess replacement costs	1,915	3,307	4,207
Earnings reserved to cover future excess replacement costs	2,021	1,800	1,711
Earnings to provide working capital for operation	----------	202	202
Total	37,680	39,954	41,765

The following services are provided by the Working Capital Fund:

1. *Equipment Service.*—This service owns, operates, maintains, and replaces common use motor driven and similar equipment. This equipment is rented to National Forests, experiment stations, and in some cases, other agencies, at rates which recover the cost of operation, repair and maintenance, management, and depreciation. The rates also include an increment which provides additional cash which, when added to depreciation earnings and the residual value of equipment, provides sufficient funds to replace the equipment.

2. *Aircraft Service.*—This service operates and maintains Forest Service owned aircraft used in fire surveillance and suppression and in other Forest Service programs. The aircraft are rented to National Forests, experiment stations, and in some cases, to other agencies, at rates which recover the cost of operation, maintenance, repair, and improvements in the airworthiness of the aircraft. Replacement and the costs of additional aircraft are financed pro rata by benefiting Forest Service appropriations.

3. *Supply Service.*—This service operates the following common services:

(a) *Central Supply.* This is a centralized service for procurement, warehousing, and supply of common use items, such as work project tools, provisions, and supplies, which are issued and sold to National Forests, experiment stations, and others at prices which recover cost.

(b) *Photo reproduction.* These facilities store, reproduce, and supply aerial photographs, aerial maps, and other photographs of National Forest lands. The photographic reproductions are sold to National Forests, experiment stations, and others at cost.

(c) *Sign Shop.* These are small shops which manufacture and supply special signs for the National Forests for use in regulating traffic and as information to the public and other users of the National Forests. The signs are sold to National Forests and experiment stations at cost.

(d) *Subsistence.* These are facilities which prepare and serve meals at cost to Forest Service work crews in remote areas where adequate public restaurant facilities are not available.

(e) *Cribbing.* This facility manufactures special concrete structural material used in embankments along access roads in the National Forests. This material is sold to National Forests at prices which recover costs.

4. *Nursery Service.*—This service operates forest tree nurseries and cold storage facilities for storage of tree and seed stock. Tree seed is procured, cleaned, bagged, and stored in refrigerated facilities. Tree and seed stock are sold to National Forests, States, and other Federal agencies at cost.

COOPERATIVE WORK, FOREST SERVICE (TRUST FUND)

Contributions are received from cooperators, including counties, States, timber sale operators, individuals, and associations, and are expended by the Forest Service in accordance with the terms of the applicable cooperative agreements. The work consists of protection and improvement of the National Forests, work performed for National Forest users, and forest investigations and protection, reforestation, and administration of private forest lands.

The major programs conducted under this account are described below in terms of the projects reflected in the statement at the end of this section.

1. *Construction and Maintenance of Roads and Trails, and*
2. *Construction and Maintenance of Other Improvements.*

Under the Acts of June 30, 1914 (16 USC 498) and March 3, 1925, April 24, 1950 (16 USC 572) and October 13, 1964 (16 USC 537) deposits for cooperative work are accepted from State and local government agencies, associations, Federal timber purchasers, users of roads, and others for the construction and maintenance of roads, trails, and other improvements and for performing work which is the National Forest users' responsibility, this method of performance of the work being of mutual benefit or of benefit to the public at large. Cooperative deposits received for wildlife habitat improvement for States from their hunting and fishing fees are included in this activity.

3. *Protection of National Forest and Adjacent Private Lands.*—The Act of June 30, 1914 (16 USC 498) authorizes the acceptance of deposits for the protection of the National Forests and the Act of March 3, 1925, as amended by Section 5, Act of April 24, 1950 (16 USC 572), authorizes the acceptance of contributions for the protection of private lands in or near the National Forests. The major portion of the obligations is for the protection of private lands from fire. This arrangement helps both parties since there are millions of acres of private forest land intermingled with Federal ownership on the National Forests. The lands in private ownership are usually in small tracts. It would be uneconomical for the owner to set up a fire control organization for the protection of his land. The advantage to the Government is that in many cases it would be necessary to suppress the fires on the private land without reimbursement in order to protect the adjoining Federal land.

4. *Sale Area Betterment (including reforestation).*—Section 3 of the Act of June 9, 1930 (16 USC 576b) provides for deposits of funds by timber sale purchasers to cover the cost of reforestation and special cultural measures to improve the future stand of timber on the areas cutover by the purchaser. Deposits in fiscal year 1966 under this authorization totaled $22.6 million. Fiscal year 1966 accomplishments under this program are reported under the Forest land management subappropriation along with accomplishments for reforestation and stand improvement for that subappropriation.

5. *Scaling.*—Under provisions of the Act of April 24, 1950 (16 USC 572) and of Section 210 of the Act of September 21, 1944 (16 USC 572a) acceptance of deposits from timber purchasers for cooperative scaling service is authorized. Such arrangements are established only when requested by the operator and when the operator pays the extra cost of such services, either in advance or through reimbursement under appropriate payment guarantees.

6. *Research Investigations.*—The Acts of June 30, 1914 (16 USC 498) and May 22, 1928 (16 USC 581i-1) authorize the acceptance of deposits for forestry research. Deposits are received from State and other public agencies, and from industrial, association, and other private agencies to finance research projects of mutual interest and benefit to both parties. The deposits may be made either

in a single sum or on a continuing basis, and may either partially or wholly cover the cost of the research. The cooperative research projects may involve any aspect of forestry and vary widely as to scope and durations. A very common example of such cooperation is for a State to make a deposit to the Cooperative work fund in order to intensify or to speed up completion of a comprehensive survey of the forest resources of the State. Other examples are State contributions toward forest fire research. The results of such cooperative investigations are made available to the general public as well as to the depositor.

7. *Administration of Private Lands.*—The Act of March 3, 1925, as amended by Section 5, Act of April 24, 1950 (16 USC 572) authorizes the acceptance of contributions for the management of private lands. These contributions are made by private owners having land intermingled with or adjacent to National Forests who wish these lands managed in accordance with good forest management practices. Their holdings are usually too small to warrant the employment of professional foresters to administer such tracts. The advantages to the Government include the avoidance of possible high fire hazard areas resulting from improper cutting practices, the elimination of the necessity of precisely marking the boundaries of the private land, and additional private forest land handled under proper forest practices.

8. *Reforestation (private lands).*—The Act of March 3, 1925, as amended by Section 5, Act of April 24, 1950 (16 USC 572) authorizes the acceptance of contributions for reforestation of private lands situated within or near a National Forest. This work is limited to areas of private land within a planting project on the National Forests or to areas in which certain civic and other public-spirited organizations have taken an interest.

9. *Statement on Utilization of Funds.*—Following is a statement of funds received and obligated and balances available by major activities:

Cooperative work, Forest Service (trust fund)

Project	Balance available June 30, 1965	Actual, fiscal year 1966			Estimate, fiscal year 1967			Estimate, fiscal year 1968		
		Funds received	Obligations	Balance	Funds received	Obligations	Balance	Funds received	Obligations	Balance
1. Construction and maintenance of roads and trials	$1,181,030	$1,932,751	$1,513,829	$1,599,952	$1,930,000	$1,930,000	$1,599,952	$1,930,000	$1,930,000	$1,599,952
2. Construction and maintenance of other improvements	608,011	541,497	595,697	553,811	540,000	540,000	553,811	540,000	540,000	553,811
3. Protection on national forests and adjacent private land:										
(a) Fire	533,002	1,957,296	1,985,582	504,716	1,955,000	1,955,000	504,716	1,955,000	1,955,000	504,716
(b) Other	1,289,333	1,612,298	1,366,723	1,534,908	1,600,000	1,600,000	1,534,908	1,600,000	1,600,000	1,534,908
4. Sale area betterment on national forest lands (including reforestation)	32,100,873	22,576,232	17,957,006	36,720,099	22,095,000	22,095,000	36,720,099	23,095,000	23,095,000	36,720,099
5. Scaling of timber	238,843	902,185	869,628	271,400	900,000	900,000	271,400	900,000	900,000	271,400
6. Research investigations	278,991	922,422	845,045	356,368	920,000	920,000	356,368	920,000	920,000	356,368
7. Administration of private lands	9,470	15,306	13,538	11,238	15,000	15,000	11,238	15,000	15,000	11,238
8. Reforestation (private lands)	89,108	46,428	37,064	98,472	45,000	45,000	98,472	45,000	45,000	98,472
Subtotal	36,328,661	[1] 30,506,415	25,184,112	41,650,964	30,000,000	30,000,000	41,650,964	31,000,000	31,000,000	41,650,964
Advanced to forest protection and utilization for fighting forest fires [2]			3,800,000	−3,800,000		−3,800,000				
Total	36,328,661	30,506,415	28,984,112	37,850,964	30,000,000	26,200,000	41,650,964	31,000,000	31,000,000	41,650,964

[1] Includes $1,279 reimbursed to appropriation.

[2] Reflects obligations in 1966 for fighting forest fires which were recovered from the 1967 appropriation for fighting forest fires.

NOTE: Balances carried forward are due primarily to necessity of deferring work for which funds are deposited until the most practicable time. For instance, funds for sale area betterment are received in advance of cutting, but work cannot be started until cutting operations are completed. The time lag sometimes extends for several years, depending on the amount of preparatory work required in the sale area and weather conditions.

Above obligations for 1966 include:

(1) Transfers to National Forests Fund of earned sale area betterment deposits in excess of obligations for sale area betterment work	$145,616
(2) Refunds to cooperators	166,321
	311,937

Chairman HAYDEN. Would you care to comment on any of these statements?

Mr. CLIFF. I don't have any comments. I will ask the members of the staff if they care to comment on any of these particular items.

No, we have no comments, Senator.

Chairman HAYDEN. Do you have any questions?

Senator MUNDT. Just a few, Mr. Chairman.

RANGE RESEARCH WORK, RAPID CITY

On page 81 of the justification, you discuss range management work. Some of this type of work is being done at your facility out in Rapid City. Can you give us a report on the status of what Rapid City is doing in this area?

Mr. CLIFF. That is the range research work I believe you are referring to, and I again will ask Dr. Jemison to comment on that, if I may.

Mr. JEMISON. We are making good progress there at Rapid City with quite a modest program. We have found out the carrying capacity for some of the more productive bottom land range types in the Black Hills that are used for grazing, and we have found methods for improving these more productive ranges in the Black Hills.

Also, we are working out the place that grazing can find in a multiple-use type of forestry practice in the area, where some forage is available in timber stands that have been recently harvested, or that have been thinned and also that are being used for watershed purposes.

These are the principal things we have been working on.

Senator MUNDT. You mentioned Dr. Jemison, that this is a rather modest program. Do you have what is needed, and what is planned for carrying this program forward at the optimum speed?

Mr. JEMISON. Well, in our long-range study, there is a plan to accelerate this program, when it is possible to do so. We are making good progress with it. I think we have three scientists there now on this program, but we do anticipate speeding up the work, when we can do so.

Senator MUNDT. Is the facility there actually staffed in accordance with your original plan?

FACILITY EXPANSION

Mr. JEMISON. Well, again, the long-range study plans to increase the staff at that Rapid City facility, when we can do so. We are hoping when it is possible, to increase the work in timber management as well as——

Senator MUNDT. When you use the words "When we can do so," are you talking in terms of the financial situation, or is there a problem of a facility there?

Mr. JEMISON. Well, I guess I am referring to both. We do have, as you know, constraints on our budget, and we try to identify the higher priority things within the limits that we have to work under, but we are also crowded at Rapid City and we will need eventually to expand our facilities there.

Senator MUNDT. What do you anticipate in terms of expansion when finances permit?

Mr. JEMISON. I believe the plan is to put a small addition on to the present laboratory, and to add some auxiliary facilities that would require about $300,000 as I recall.

Senator MUNDT. You can put that in the record, if you want to.

Mr. JEMISON. Yes, it is $300,000, for construction, which would require $24,000 for the architectural planning which of course, would have to come first.

SAGEBRUSH CONTROL

Senator MUNDT. At the bottom of page 81 of the justification you discuss sagebrush control needed on some 95 million acres.

Are there any of these areas that you are talking about located in South Dakota? I don't recall much discussion about the sagebrush problem.

Mr. JEMISON. I think the work we are doing, I believe in southern Idaho, is work that would permit any control programs to be applied in South Dakota, if there were areas there that were in need of treatment.

Now, I am not sure exactly where these might be, but there might be some in South Dakota.

Senator MUNDT. I am not sure either, I just remembered that sagebrush used to be found out there.

Would there be anybody that could find that out?

Mr. CLIFF. I can comment on that, Senator. I know the Black Hills National Forest quite intimately, and also, I am acquainted with the national grassland areas. We don't have this problem in South Dakota, to the extent that it is present in other States, further west. There is a great deal of sagebrush in Wyoming, Utah, Nevada, Oregon, and Idaho, and other Western States.

Senator MUNDT. Does it destroy the grazing land? Is that what it does up there?

Mr. CLIFF. Well, on range that has been overgrazed in the past, the sagebrush tends to thicken up and it takes the soil moisture, and replaces the better species. Once it gets established, it is difficult for the better forage species to compete with it. So this research and the action program that we have is designed to reduce the sagebrush, and to give the better plant species an opportunity to grow. Sometimes we even have to reseed the better species after the sagebrush has been reduced.

Senator MUNDT. Is this a tough thing?

Mr. CLIFF. Sagebrush is an aggressive and persistent plant but we have several effective ways of controlling it. We don't plan on eradicating all sagebrush by any means, because sagebrush is a natural part of the environment. It is controlled only where it has increased abnormally, and where it has replaced good forage species. We are very careful that we leave enough to provide for the big game.

Big game animals browse on sagebrush, in the wintertime, and at some other times of the year, so we coordinate this program very closely with the State game departments. We are not trying to have a widespread elimination or eradication program, but one of control.

Senator MUNDT. This is not a weed that you approach like you approach halogeton, for example?

Mr. CLIFF. No, it is not in the same category. Halogeton is a very poisonous plant, and the action directed at that is one of eradication.

Senator MUNDT. When you say big game browse on sagebrush, are you talking about elk?

Mr. CLIFF. Primarily antelope and mule deer, but elk would make some use of it, too. In this program, we do reserve leave strips and we coordinate our efforts with the game people.

RANGE MANAGEMENT FINANCING NATIONAL FOREST, NEV., IMPROVEMENT

Chairman HAYDEN. Senator Bible has requested that there be inserted in the record a series of questions relative to adequate financing of range management and improvement in the national forest in Nevada. This will be done and these questions as well as one related to recreation may be answered also by insertion in the record.

(The questions and answers follows:)

Question. When did the Forest Service last request a program increase for range management?

Answer. In fiscal year 1963.

Question. Does this mean that range management has been adequately financed since that time?

Answer. As Mr. Cliff mentioned in reply to a question of relationship of this budget to the Development Program for the National Forests, there are a number of our program elements where it has not been possible to attain the levels of financing contemplated by the Development Program. However, we have established priorities within the Program and have met the most urgent needs. We must admit, however, that sustaining our current grazing load of 11 million animal unit months of livestock grazing, a level somewhat in excess of our current estimates of capacity, while we get our ranges in better condition, is becoming increasingly difficult at present levels of range development.

Question. One of your goals is to get all range allotments under intensive management. What is the value of intensive management?

Answer. Intensive management is the application of the best kind of practical knowhow and improvement to the individual range allotment. Its major values are better resource protection and higher assurance of sustained livestock use and permittee tenure. A majority of our 20,000 rancher-permittees are small operators who depend heavily upon forest ranges for grazing. For example, 70 percent of our cattle permittees own less than 200 cattle. These and other permittees need a larger animal base. In 1966, forest permittees told us they would like to graze 8 million more animal unit months of livestock than we now can permit. Intensive management with its facilitating revegetation and structural improvements will help us toward meeting this advance evidence of an expected higher future grazing demand upon all rangelands.

On an allotment basis, intensive management costs about $2200 annually, of which about $900 covers costs of range development and maintenance of improvements. Doing the minimal or extensive job that we do on most allotments costs about $600 per year per allotment. Outputs of livestock production, rural employment added and wildlife values, for extensive management are valued at approximately $9500. For intensive management the outputs are valued at $17,500.

Question. I assume you are practicing intensive management on National Forest ranges in Nevada?

Answer. Yes. We have 58 out of the total of 365 National Forest allotments in Nevada under intensive management.

Question. With 365 range allotments in Nevada and only 58 of them under intensive management, it seems to me you have a long way to go. Our Nevada forest ranges are very important forage sources. They need to be properly managed and improved so the stockmen can have more grazing. In addition, the forest ranges produce water that is the lifeblood to our State and they need to be properly handled for this important resource.

You have provided us your estimate of total needs in range on all the National Forests and National Grasslands. What are the needs in Nevada forest ranges? How long will it be before you can get these important Nevada ranges producing at their potential?

Answer. I agree, Senator, that Nevada's National Forest ranges are important. We want to do all we can to improve them to their potential.

In 1966, we made an inventory of needs on Nevada's forest ranges. This inventory showed range improvement needs of about $12 million. Improvements needed are primarily fencing, plant control and seeding, and water developments. There is need to complete analysis of Nevada's allotments, too, at a cost of approximately $330,000.

At existing funding levels, Nevada's ranges will not produce their potential before year 2000. With funding at an annual level of $900 thousand for range revegetation and improvement and $80 thousand for watershed improvement, together with $450,000 for range management, Nevada's National Forest ranges can be operating close to optimum productivity by about 1980.

Question. You have provided us with a statement of funding needs for range management in Nevada and goals. Can you expand upon the table in the Explanatory Notes (page 11) and tell us where range management stands for all National Forests and National Grasslands in relation to the proposed funding level for FY 1968 in the Development Program for the National Forests? And then I would appreciate it if you could provide us with an estimate of annual needs to accomplish your proposed program of intensive range management within reasonable time goals.

Answer. In FY 1968, the proposed schedule of financing for range management was to have been $16,357,000. Requests are for $11,823,000, or about $4.5 million under the Development Program level. Thus, in 1968, at requested levels, range would be financed at 72 percent of the planned level in the Development Program.

Annual needs through 1972 to accomplish the program of range resource management set forth in the Explanatory Notes within the time goals shown average about $17.1 million. Amount of need varies from year to year due to program phasing. Our best estimates show that range needs will increase to about $22 million in 1980, a reasonable time goal to accomplish intensive range management.

Question. From your testimony and the Explanatory Notes, it appears that this range development job will cost something over $150 million for improvements and if I have made the correct computation, about $100 million for revegetation. This totals one-quarter billion dollars. Then you have your management costs on top of that. What will the American public get for that quarter billion?

Answer. From a long-term expenditure of approximately one-quarter billion dollars for range resource developments, the American public should get ample return. This investment in good management will produce a range with higher capacity for livestock and wildlife. It will also provide a more attractive environment for the general forest visitor. The range will be producing at its potential for all resources and uses; it will be land properly managed under multiple use.

We are dealing with a 106-million acre segment of the public lands that is receiving more and more public attention and use. It must be developed and managed properly to meet the high demands expected to be made upon it. While the range has been used by the rancher since before the national forests were established, and the hunter and fisherman also has benefitted from it for many years, the general public now is beginning to find out about ranges. Hikers, trail riders, wilderness users and other forest visitors are insisting that the range resource be maintained in satisfactory condition both for their enjoyment and for soil and watershed protection.

This investment will provide specific benefits to the American community of farmer-rancher families. As you know, we have reported findings from some of our studies about these benefits in the Explanatory Notes (page 33 and Figure 4–a). The added value to the livestock ranching economy from the expected higher grazing allocation levels should prove the effectiveness of these programs of public range management and development. Other projections show that the American public will lose some 150 million animal unit months of grazing and its attendant values over the next 32 years at existing levels of range management and development.

Question. Has the Forest Service at any time spent any of their funds for the construction or operation of ski facilities?

Answer. It is our policy that both construction and operation of ski facilities on National Forests will be handled by private industry under special use permit. This has worked very well for the 200 developed ski areas we have on the National Forests. As near as I can recall, there has been only one case where appropriated funds have been used for construction of a ski lift. This was in the 1930's on Mt. Hood in Oregon and was one of the first chair lifts. Recently, it was reconstructed by funds made available by the Oregon and California Counties. It is still owned by the Forest Service but is operated under a special use permit. Also, in the 1930's, a few ski warming huts were constructed using emergency funds and labor such as Civilian Conservation Corps personnel. Since that time such facilities have been built with private capital or local public funds (not funds appropriated to the Forest Service).

It has been our experience that if a new ski development does not have an economic base sufficient to justify a private capital investment, it is likely that it will run into trouble in its operation costs and the promoters will be disappointed.

Chairman HAYDEN. Also, Senator Bible requested that there be inserted a letter to him under date of October 14, 1966, from the Associate Chief of the Forest Service on this same subject.

(The letter follows:)

DEPARTMENT OF AGRICULTURE,
FOREST SERVICE,
Washington, D.C., October 14, 1966.

Hon. ALAN BIBLE,
U.S. Senate.

DEAR SENATOR BIBLE: We certainly appreciated receiving your letter of September 20 and the copies of your correspondence with Mr. Riley Chambers and Regional Forester Iverson concerning the inadequate financing provided for range improvements and revegetation.

The Secretary of Agriculture has furnished the Forest Service with budgetary guidelines within which we must work. These guidelines reflect the Administration's effort to restrain Federal spending for domestic programs as a measure to combat inflation. They do not provide for full satisfaction of the financial needs of the Forest Service to ideally carry out its programs.

Our Fiscal Year 1968 budget estimates were recently submitted to the Secretary and we expect to have Bureau of the Budget hearings later this month. The estimates submitted are based on the relative needs of all Forest Service programs and the public demand for the various resources which we administer. In line with a policy of restraint, we have not provided in our estimates for full satisfaction of the budgetary needs of any of the Forest Service programs. The budget which will ultimately be submitted to the Congress will represent our best judgement of priorities among programs within the budgetary guidelines furnished us by the Secretary of Agriculture.

Regional Forester Iverson's letters to you of July 7 and 16, 1966, present a good analysis of the range management problems on the National Forests in Nevada. His observations are generally applicable to National Forest System ranges throughout the Western United States.

We are extremely conscious of the important part that National Forest ranges play in maintaining the stability of the livestock industry in the West. Livestock grazing has always been and continues to be a major use of the National Forests. It is a major objective of the Forest Service to improve and restore the National Forest rangelands to their full productivity potential.

Because of the heavy demands made on public grazing lands before and during the early period following their incorporation in the National Forests, the Forest Service has been faced with the long-term problem of rehabilitating deteriorated ranges and bringing stocking rates in line with sustained grazing capacity. We are still faced with this problem in many areas. The permitted grazing use on many National Forest System ranges continues to exceed the capacity of these ranges, in their present condition, to support this load on a sustained-yield basis. Without the necessary cultural treatment and management, the soil and vegetation continue to deteriorate in these areas and the productivity of the land for all resources is being further impaired.

Some very spectacular accomplishments have been made in recent years in arresting this deterioration and restoring the productivity of a number of National Forest System ranges. The generally fine cooperation of permittees is responsible for much of this accomplishment. Much more remains to be done.

Management of the range resource under the longstanding multiple-use principle of the Forest Service, which was given statutory sanction in the Multiple Use-Sustained Yield Act of 1960, is a complex task. Multiple objectives must be established. Coordinating measures must be taken to insure that all resources are protected and that the many uses can exist in harmony with each other. As the demand for the various resources grows, their management gets more complex. This takes more time and effort.

We are moving into a phase of range management which is much more intensive than practiced in the past. Intensive management systems are prescribed allotment by allotment based on thorough and systematic analysis. These intensive management systems have been initiated on about 4000 range allotments to date. The goal is to have all 11,600 range allotments in the National Forest System at this new level of management by 1973. This can only be done if the commensurate funding is provided.

The 10-year "Development Program for the National Forests", endorsed and sent to the Congress by President Kennedy in 1961, is the blueprint that is guiding many of our current activities on the National Forests. Range resource management is one of these major activities. Unfortunately, the development schedule recommended in that program has not been fully realized. From an overall budget standpoint we are about two years behind schedule already.

The intensive management necessary to assure improvement and continued productivity of forage resources fully coordinated with other values is requiring more range improvements than were formerly planned. In order to reevaluate improvement needs for range and for the other resources, our field units recently completed an enumeration of project needs for all phases of National Forest System management. Data are currently being evaluated in this office. Preliminary summaries of range improvements needed, and of areas needing revegetation, indicate that the estimates in the 10-year development program were very conservative.

We thank you for your interest in the programs of the Forest Service and hope we have given you the information you requested.

Sincerely yours,

A. W. GREELEY,
Associate Chief.

QUESTIONS SUBMITTED BY SENATOR HRUSKA

Senator MUNDT. Mr. Chairman, Senator Hruska submitted a list of questions for me to ask, but I think that it would be perfectly appropriate simply to put them in the record and let the representatives from the Forest Service prepare their answers for the record.

Chairman HAYDEN. All right.

(The questions and answers follow:)

SHELTERBELT LABORATORY, UNIVERSITY OF NEBRASKA

Question. Last year, Congress appropriated $28,000 for planning money for the construction of a Shelterbelt Laboratory in conjunction with the University of Nebraska at Lincoln. Can you tell us what progress has been made in completing the plans for this facility with that money?

Answer. An excellent prospectus for the laboratory has been prepared. General Services Administration has negotiated a contract with a local architect for the design of the laboratory. Plans and specifications are now being prepared.

Question. There is no budget request for the construction money for this facility. Do you expect to have the plans and specifications completed in time so that you could let contract for the construction during fiscal year 1968 if you had the money? In other words, could you use the money in fiscal year 1968 if you had it?

Answer. According to the schedule for the design contract, the plans and specifications will be completed in February, 1968. If funds were appropriated in fiscal year 1968, construction could start in the spring.

Question. Can you describe the building or buildings that would be constructed at Lincoln, together with any attached greenhouse facilities and the like? How much will the cost of the construction come to?

Answer. The major building will provide modern office space and specialized laboratories for our scientists and cooperators. They are learning how to culture shelterbelts, how to breed superior varieties of shelterbelt trees, and how to protect them from damaging diseases. The estimated cost of building the structure and developing this site is $350,000. An additional $150,000 is needed for the required headhouse-greenhouse and storage facilities. Together $500,000 is needed to construct the facilities planned for this phase of construction.

Question. What sort of cooperation have you been receiving from the University of Nebraska? Is the University making any contribution toward this project?

Answer. The University of Nebraska has been most cooperative. They have leased to the Forest Service a building site in a desirable location. Currently, they are putting in access roads. In all ways the University has helped us to continue our shelterbelt research program. They, like us, are anxious to see this Shelterbelt Laboratory built on the campus, so Forest Service and University scientists can forge ahead in their cooperative research.

Question. Is it not true that forestry research has tended to lag behind various other types of research? Is this partly because trees grow more slowly than other types of plants, and it, therefore, requires a longer span of years to obtain useful results?

Answer. Yes, I can truthfully say that forestry research lags behind other types of research. Expenditures by all forestry research agencies and industries nationwide only amounts to about one-half of one percent of the portion of gross national product generated by timber production activities alone. This compares with about two or three percent for research in some other areas. This lag, as you suggest, may in part result from the relatively long periods of time that forestry research takes. Probably of greater significance is the lack of realization by most people that forestry research produces substantial benefits in many cases very quickly. Many examples could be cited but one will illustrate the point.

In 1959, we found that eastern red cedar, an important shelterbelt tree, was being heavily damaged by a blight. In less than two years, research had developed a highly effective chemical control. Soon, thereafter, all tree nurseries were using the treatment prescribed with the result that the disease is no longer a problem.

Question. Can you describe some of the types of problems that will be studied at the Shelterbelt Laboratory at Lincoln when it is constructed?

Answer. As I mentioned earlier, two of our research projects will use the proposed facilities. One group of sicentists will be concerned with learning how to grow better shelterbelts; the other with protecting them from diseases. The first group is working on spacing of shelterbelt plantings to find the most effective design of tree plantings within a shelterbelt and the best distances between shelterbelts to control wind speed. Breeding trees for shelterbelts also promises exciting benefits. Certain species, varieties and individual trees have been found to have excellent properties for shelterbelt planting. Our plant pathologists are developing controls for the diseases that kill young trees and those that decimate the foliage of older trees. Shelterbelt plantings cost a great deal to establish and maintain. Our research is aimed at helping farmers to get the most long-term benefits from investments in shelterbelts.

QUESTIONS AND ANSWERS

Senator MUNDT. That is all I have.

Chairman HAYDEN. I also have questions presented by a number of Senators which can be handled in the same manner.

(The questions and answers follow:)

RESPONSES TO QUESTIONS BY SENATOR RUSSELL

BURNING OF COMMERCIAL FOREST LANDS

Question. How much acreage of privately-owned commercial forest land burned last year?

Answer. A total of about 850,000 acres.

Question. Of this total how much was in the South?

Answer. About 600,000 acres.

Question. Does the Forest Service consider present levels of fire protection under this program adequate?

Answer. Existing levels of protection have not precluded heavy fire losses, especially in dry years when suppression is difficult and costly and large fires occur. Current fire protection efforts by State Foresters have not brought about a reduction in the number of man-caused fires despite the work of Smokey Bear. Also, expansion of the use of aircraft for fire suppression and detection is a necessary modern technique.

Question. What are the legislative limitations on funding?

Answer. Section 3 of the Clarke-McNary Act authorizes to be appropriated not more than $20 million.

Question. What are the Federal and State contributions?

Answer. Fiscal year 1966 total expenditures were about $85 million. Of this, State expenditures were about $72 million, and the Federal share about $13 million. This represents a Federal participation of 15%.

Question. What level of appropriations for fiscal year 1968 did the Forest Service and the Department request?

Answer. The request to the Budget Bureau for Cooperative Forest Fire Control activities for fiscal year 1968 was for an increase of $3,472,000.

Question. Do you think that adequate provisions are being made for the future timber supplies for our new and expanding forest industries?

Answer. There are several reasons which point to a growing demand on forest resources in the future. Demands for industrial roundwood have been increasing more rapidly than the level of projection forecast in the Timber Trends report. There have been large increases in stumpage and log prices. In the South there has been very rapid expansion of timber based industries, especially in softwood plywood and wood pulp. At the present time, there are 34 mills which are operating or are under construction with a capacity of 2.6 billion board feet of softwood plywood. The expansion of all has increased the southern pine by 0.6 billion cubic feet, or roughly 25% since 1962. It has been recently estimated that mills in the South will have the capacity to use an additional 6 million cords of wood by 1968. Reduction of fire losses will be essential to meet this level of demand in the South.

Question. If Congress appropriates an additional $3 million for this program, what effect could be expected on the long range timber supply outlook?

Answer. The funds would permit the States to intensify their protection and economically reduce timber losses. This would be particularly true in the southern pine area where, as stated above, 600,000 acres of commercial forest land burned last year. Building up and maintaining adequate protection forces will be necessary if we are to assure the supply of raw material to the mills. As new forests are planted to supply future timber needs, protection forces will be in a better position to provide the necessary protection to these crops.

Question. How would an increase in this cooperative fire program permit States and private woodland owners to apply the latest findings of research?

Answer. Added funds would permit the States to employ additional technical specialists to work with private landowners. Specific application of research findings in use of prescribed fire, better use of all types of aircraft in detection and suppression, and expanded use of fire weather and fire danger measurements as a basis for determination of fire suppression strength would be possible. Full utilization of fire damage assessment techniques would be possible both for timber damages and other damages as measurement techniques are developed by research. Prevention and suppression strength is not now sufficient to fully utilize these newer more expensive techniques.

RESPONSES TO QUESTIONS BY SENATOR YOUNG

RESEARCH LABORATORY, BOTTINEAU, N. DAK.

Question. It is my understanding that initial staffing of the research laboratory at Bottineau, North Dakota, has been completed. Is this correct?

Answer. Yes.

CLARKE-MCNARY SECTION IV PROGRAM FUND DISTRIBUTION

Question. How is the distribution of funds to the various States handled under the Clarke-McNary Section IV Program?

Answer. With respect to this program which is listed as line item "Cooperation in Forest Tree Planting" on page 114, the current formula for distributing Federal funds allows a maximum of $12,000 to States with high operating costs per unit of production. These are primarily States with small production programs. Currently eligible for the maximum allotments are the States of Colorado, Idaho, Kansas, Montana, New Mexico, Nevada, North Daktoa, Oklahoma, South Dakota, and Utah. Some of these, however, may not qualify for the full amount. Eight other States are classed as "medium-well" financed and are eligible to receive up to $4,000. All other States may receive up to $3,000 if expenditures exceed receipts by a sufficient amount. Some States receive enough income from the sale of trees to fully finance nursery operations and do not claim Federal funds.

Question. Is there any way in which the funds for this program can be reapportioned so that funds could be shifted from one area to another as program needs change?

Answer. Yes sir. The current formula is the result of attempts to do just that. The formula can be changed whenever a better one can be devised. The Forest Service is always happy to consider suggestions for improvement of the formula. Upon several occasions each year this program is discussed thoroughly with either the National Association of State Foresters or its Executive Committee.

Question. Are the States required to provide any matching funds for this program?

Answer. Yes sir. At least 50% as required by the Clarke-McNary Act.

Question. How much money did you request for this program for Fiscal Year 1968?

Answer. $300,000.

Question. If additional funds were made available, how would they be utilized?

Answer. The States could match the full authorization and still stay within the 50% matching provision. Additional funds within the $2,500,000 statutory authorization would be used for two urgently needed steps:

To strengthen the States where more Federal-matching funds are needed, and to expand the activities of the State Foresters in the production of genetically-improved tree seed and planting stock. Recent research findings prove conclusively that trees can be genetically improved with results that will match improvements in wheat and cattle. New strains of trees can be genetically produced that have resistance to insects and disease that grow much faster and produce higher quality and financial returns. Only three States—Florida, Georgia, and Texas—has been making good strides in this activity. Seed orchards are expensive. In about one-half the States there is no effort to produce genetically-improved seed and planting stock, while in other States only a meager start has been made. Greater Federal financial assistance would speed up this effort.

FOREST LAND MANAGEMENT, NORTH DAKOTA

Question. I note that you have a budget increase of $9,600 for Forest Land Management in North Dakota. Would you give us the details?

Answer. This increase will be used to construct recreation facilities at Sather Lake, which is west of Watford City, North Dakota. It is estimated that these facilities will accommodate 35 people at one time.

WATER POLLUTION CONTROL

Question. Your justification book on Page 14 indicates a bid for an increase of about $3.4 million to improve waste treatment systems at 25 recreation sites for water pollution control, to develop recreational facilities, and to clean up existing recreation sites.

Do you propose to undertake any of these activities in North Dakota?

Answer. No, Senator, none of these improvements to existing waste treatment systems will be in North Dakota.

RESPONSES TO QUESTIONS BY SENATOR BYRD

WATERSHED DEVELOPMENT

Question. What is the status of the work at Trout Lake?

Answer. I'm happy to report that this is coming along well. We have already contracted to construct the dam. Work will be started soon if it is not already in progress. Through your efforts funds for this were included in the fiscal year 1967 budget. We have in this fiscal year 1968 budget now being considered enough funds to install the basic water and sanitation systems, a camping site on one of the loop roads, and preparation of a picnic ground site.

Question. Will this complete the necessary work here?

Answer. No, it will not. I believe last year we told you the total cost of what is needed in the way of recreational facilities to fully develop this area would cost about $800,000 with an additional $250,000 for roads. What we have in the budget for fiscal year 1968 will get the job well started, but it will not complete the necessary work.

Question. How are you coming along with the needed improvements at Sherwood Lake?

Answer. Again, Senator Byrd, I'm happy to say that we can report reasonably good progress here also. With fiscal year 1966 funds we were able to start a bathhouse, build a parking area and road to the bathhouse, and install a water and sewage system. In fiscal year 1967 the Anthony Job Corps Camp that is located not far from Sherwood Lake became fully operational. Much of the needed improvement work at Sherwood Lake is just the kind of work needed for training for the corpsmen, so they have been working there. With this help and the fiscal year 1967 funds we had budgeted, we are working on a beach development, a boat dock, the bathhouse and toilet, and doing some landscaping. This work will go forward in fiscal year 1968. In this fiscal year 1968 budget, now before you, we have included funds for some rather extensive maintenance and repair work on the dam and spillway. I think we will have Sherwood in good shape in the next year or two.

Question. What is the status of the work on the Spruce Knob-Seneca Rocks National Recreational Area?

Answer. This is coming along, but probably not as fast as it should. As you know, this area is getting lots of publicity here in the East; there is much interest in it and I am afraid the visitors will probably be coming faster than we will be ready for them.

You will recall that last year we told you we had funds to prepare the master plan for the area and to get started on a recreation development at Big Bend on the South Branch of the Potomac. Supervisor Olliver and Regional Forester James now have a draft of the development plan in our office for review. Because of the interest in the area and the somewhat conflicting ideas among those interested, this plan has to be very carefully considered. It must meet the objectives intended by Congress in establishment of the area, and must consider all resources with the needs of the recreation visitor paramount. Work on the campground at Big Bend is in progress. We have some funds to continue work here in the proposed fiscal year 1968 budget.

We are making some good progress, too, on needed road work in the area. You will recall that the access road to Spruce Knob from Highway No. 33 is pretty poor. With fiscal year 1967 funds, we are locating and designing a better road up the mountain. In the fiscal year 1968 budget, because of the increase proposed in our road funds, which incidentally makes us mighty happy, we have been able to program $1 million to start construction on this better access road. You will be interested, I'm sure, to know that the proposed increase in road funds will enable us to put an additional $1,800,000 of road funds in West Virginia. Last year we had available for West Virginia only about $1 million so this is almost a three-fold increase with a good part of it scheduled for the National Recreation Area.

Question. Will this development take care of the needs for this new area? Are there possibilities for water impoundments which are so lacking here and have such tremendous use when constructed as demonstrated by the small lake at Brandywine? I had the pleasure of dedicating the recreational facilities there several years ago.

Answer. No, Senator, this will not take care of the needs for this new area. I believe that at the time your bill to create the National Recreation Area was being considered by Congress, we estimated the cost of doing a good job of development in the first five years would be $8,450,000 with a further investment of $7,830,000 needed in subsequent years. So, while what I have told you we are now doing is a good start, it is a long way from meeting the needs of the area.

Now, to your question regarding the possibility of some water impoundments in the National Recreation Area. Yes, there are some good possibilities. Supervisor Olliver has told us that there are at least five sites which hold such possibilities. Altogether they could give a total surface area of perhaps 225 acres.

As was true at Trout Lake and the other lake sites we have talked about previously, the first step is to make detailed feasibility studies of dam sites. We won't be able to get to this in Fiscal Year 1968 with the budget you are looking at now.

Question. What is proposed in the way of developments on the South Branch of the Potomac River? This is an important part of the National Recreation area.

Answer. The Big Bend Campground I mentioned earlier is on the South Branch of the Potomac River. Construction has started on the campground and the proposed 1969 budget provides for the continuation of this work. The cost of the total project will exceed what will be available in 1968, so it will have to be finished in subsequent years.

With increase in road funds we hope to be able to start improvement work that is badly needed on the road down the South Fork in the not-too-far distant future.

Question. What has been accomplished in the matter of building an observation tower on Spruce Knob?

Answer. Well, Senator, because of your good help, I can report good progress here. Construction of this tower will begin in May and will require about four months to complete. Funds are available now for this contract. We will still need to enlarge the parking area to accommodate more cars and buses. We should also put some interpretive exhibits in the tower and install some interpretive nature trails around the top of this interesting peak. As it looks right now, this work will have to wait awhile but the tower should be usable late in 1967 or early in 1968.

Question. A question has been raised about Summit Lake in Greenbrier County. Can you tell me something about this?

Answer. Summit Lake, you may recall, Senator, is located about two miles off Highway No. 39 just a few miles east of Richwood. It is a small lake that was built cooperatively in 1955 with the State of West Virginia as a fishing lake. I believe the two-mile access road was financed with donations from citizens of Richwood to the State Road Commission. We have some rather modest recreation improvements around the lake. It is a very popular spot. The recreation facilities should be enlarged by building two campgrounds and the existing primitive-type campground should be converted to a picnic area. This would be in line with plans developed by well-qualified landscape architects and professional recreation planners. Aso, there are some minor repairs needed on the overflow tube in the dam. As it looks now, we will not be able to get to this work in fiscal year 1968.

Question. We discussed Eagle Lake on Hells Creek in Pocohontas County at last year's hearing. Will you give me a status report on this area?

Answer. Senator, I wish I could report good progress here, but I can't. Nothing has been done since we were here last year. Our preliminary studies show, as we reported them, that a dam is feasible in this locality.

Question. What is needed just to get this important project started?

Answer. Like in the case of Trout Lake, the first job would be to enter into a contract with an engineering firm to design the dam and prepare actual plans and cost estimates. The recreation developments should also be designed. Altogether probably $75,000 to $80,000 is needed to get this project in motion.

Question. Last year we also talked about a lake on Laurel Fork in Randolph County. Can you tell me where this project stands?

Answer. Here again, Senator, I will have to make the same report as I just made for Eagle Lake. Since our first studies affirmed that a dam is feasible, nothing further has been done.

Question. What will the Laurel Fork project cost and are funds provided in this budget?

Answer. Without sound engineering estimates on the cost of the dam, we cannot be too precise but our best estimate at this time is that the construction of the dam, construction of needed roads and parking, and installation of adequate recreation facilities would cost about $1,200,000 to $1,300,000. As I just said about Eagle Lake, the first step would be to get plans and specifications for the dam and a design of the facilities needed. I believe the engineering and design cost here would be about the same as at Eagle Lake; that is, $75,000 to $80,000. As is true for Eagle Lake, there are no funds in the budget for this project.

PRINCETON RESEARCH LABORATORY

Question. I am very much interested in the research program at the laboratory at Princeton, West Virginia. I believe you have two lines of work there—forest products marketing and utilization. Is that correct?

Answer. Yes.

Question. I have followed closely the forest products marketing project and have been impressed with the progress being made. What does this budget provide for that work?

Answer. $700,000, the same as for fiscal year 1967.

Question. Then no increase is being requested?

Answer. That is correct.

Question. Please outline for me the scope of your research in forest products marketing and give some examples of recent accomplishments.

Answer. The purpose of this research is to examine the factors that influence the flow of wood products into the market place. We determine and evaluate the things that make wood competitive with other products in construction, manufacturing and shipping. These studies show how production and marketing practices can be modified to make the use of woods more profitable and more extensive. We also do research to determine the feasibility of wood industry expansion.

We have made good progress at Princeton through marketing studies. Thirty publications tell the story of our accomplishments—13 of them this year. Major effort has gone into research on hardwood flooring, that has lost more than half of its market in the past 10 or 12 years. We now know why this has happened. The trend toward high rise apartments and slab onground dwellings has led to problems and high costs when strip wood flooring is used. But we are on the track of improvement that will reverse the trend toward use of substitute floor materials.

Another example of research progress relates to the use of low-quality hardwoods for pallets. Pallets, which are used in material handling, now account for about 20 percent of all hardwood lumber consumption but the potential for future growth in utilization is tremendous. We have recently shown that in one important industry—food handling—that palletization of dry grocery warehousing and shipping would save that industry millions of dollars a year. It should reduce the cost of food distribution 10 to 12 percent and hopefully lower the housewife's food bill. This research is expected to open a great new market for wood pallets.

The Princeton marketing research group have contributed in many other ways during the year; in new lumber drying procedures that increase values by $12 M bd. ft., in a mammoth apartment rehabilitation project in New York City, and in handling 250 requests for marketing information and assistance.

Question. How big a staff do you have at Princeton to do the marketing research job?

Answer. Presently we have a staff of 50; that is, 25 scientists and 25 support personnel.

Question. Now, may I ask you some questions about the forest products utilization research at Princeton? What is the present level of staffing and financing of this project?

Answer. This program is presently staffed with three scientists and three supporting personnel, a total of 6. It is financed in fiscal year 1967 with an appropriation of $100,000.

Question. What does the fiscal year 1968 budget request include for forest products utilization research at Princeton?

Answer. The same amount as for this year—$100,000.

Question. Then the research on utilization problems will presumably continue for the coming fiscal year at the same level as heretofore.

Answer. That is correct.

Question. What is being done in the utilization research program at Princeton?

Answer. We are working to improve wood products and techniques for utilizing hardwood logs and bolts. New products and new uses for hardwood materials are under study. Last year, I described research leading to the use of wooden highway guardrail posts. This year, the Princeton research has shown that a machine for driving these posts is practical and can drive posts at lower in-place costs than posts of competing materials. The research also includes pilot testing of new or modified wood products that have not been developed to the industry acceptance stage. For example, special railway ties are now under test in a mainline road with distinct possibility of proving more economical than standard ties, and reducing the probability of increased use of other materials.

Question. Is the present funding at a level you feel is adequate for attack on these utilization problems?

Answer. We plan ultimately to increase the allocation to this work when funds can be budgeted for it.

Question. What increase is needed to conduct this program at a reasonably full-scale pace?

Answer. The forest products utilization research program, to most effectively meet the needs as we see them, would require an annual expenditure of about $250,000.

This would mean an increase of $150,000 above the present level of financing. The research effort could make effective use of such increased financing whenever the budget situation permits.

Question. What would be done with this increased funding, if it were appropriated?

Answer. The gross supply of hardwoods in West Virginia is more than adequate, but the species mix and quality require the development of techniques for using economically the less preferred species and lower grade logs. Existing log conversion systems are unable to operate profitably on the large volumes of low quality material available. Appreciably increased use depends on development of new, more efficient, systems of log conversion or on a general increase in product value made possible through use of improved processing techniques or more effective use of alternate species. The strengthened program would enable us to move ahead vigorously in developing this technology.

Question. I believe you said you have 50 people at Princeton in marketing research and six in utilization studies. The laboratory facilities there were constructed several years ago. Are they adequate to house the present program?

Answer. The 56 people we have now at Princeton somewhat overtax our facilities. We have been able to crowd them in but they are working with some inefficiency due to space limitations. Of much more critical concern to us is the lack of adequate laboratory facilities for the development and pilot testing research in utilization and marketing. The minimum space we now have for this kind of work has to be used on a scheduled basis. One study group may have to delay or postpone an important step in their program until another study group vacates space or surrenders commonly-used equipment. The program will move ahead much more effectively when we can solve this problem.

Question. Have you determined what you need in the way of new facilities at Princeton?

Answer. Yes, as part of the long range study I mentioned earlier, we have carefully analyzed our laboratory needs and have made cost estimates.

Question. What do you estimate such laboratories would cost?

Answer. $500,000 to construct but first we would have to do the architectural and engineering planning. This is estimated to cost $39,000.

Question. Such planning funds are not included in your 1968 budget request. Is that correct?

Answer. No planning funds are in the budget.

Question. If $39,000 was made available in fiscal year 1968, could you feasibly go ahead with the project?

Answer. Yes. We have specific overall ideas of what we need and architectural planning could go ahead promptly.

MORGANTOWN RESEARCH LABORATORY

Question. What is the present level of staffing and financing the forest engineering research program at Morgantown, West Virginia?

Answer. The present engineering research program at Morgantown is now staffed with four scientists and four support personnel. It is financed in fiscal year 1967 with an appropriation of $150,000.

Question. Your budget request includes an increase for engineering research. How much of this do you plan to allocate Morgantown?

Answer. About $40,000.

Question. That would bring the funds available up to $190,000. How would you spend such an amount if appropriated?

Answer. We would expand our staff of systems engineers, probably to five. We would continue to work cooperatively with scientists at the University of West Virginia. Our program at Morgantown is aimed at developing improved systems for harvesting Appalachian hardwood timber in the rough mountain topography of the region.

Question. In the long range research study what level of financing have you determined to be necessary for a full-scale attack on these problems?

Answer. We believe a totally adequate effort would require about $360,000 per year.

Question. This would be, then, about $170,000 more than you say is included in the fiscal year 1968 budget request. Is that correct?

Answer. Yes.

Question. Could you feasibly expand the program to the $360,000 level in fiscal year 1968 if funds were available?

Answer. Yes, this amount could be used effectively when it can be appropriated. We have adequate facilities and high-level leadership at Morgantown to undertake such a program. We believe there is great promise in systems engineering studies that will lead to radically improved timber cutting, log loading, and other materials handling systems for Appalachian conditions.

Question. Please elaborate.

Answer. A basic requirement for the expansion and establishment of forest industries in Appalachia is the availability of low cost raw materials in the form of logs, poles, chips, and other wood products. Harvest of these materials must be done at the lowest possible cost if those industries are to remain competitive. It must provide a reliable flow of material at high rates for modern processing plants. It must be mechanized to obtain maximum labor productivity, radically improved safety conditions, and employment at maximum wage levels. The harvesting must also be done by methods compatible with preserving soil, water, and recreational values.

Logging equipment and systems are not now available to do this job in Appalachian forests. Only one-fourth of the timber being produced is actually used because much of it is of small size, low quality, or otherwise unprofitable to harvest under currently available methods of logging and handling. Typically, logging costs are more than half of the total cost of wood delievered to the mill.

Research is well along on new sources of power for woods work, new tools, better logging methods, and engineering systems to utilize large volumes of low grade wood and wood waste as fuel for power generation. Systems engineering studies have already resulted in information of value to loggers and equipment users. Strengthening the program would provide the means of moving this work ahead effectively during these next few years that are critical to the forest industry and the economy of the Appalachian region.

PARSONS RESEARCH LABORATORY

Question. Last year I believe I discussed with you the timber management research program at Parsons, West Virginia. How is this project progressing?

Answer. We continue to make good progress there in finding better ways to grow timber on lands being managed for watershed purposes as well. One of the more recent findings shows how cultural practices influence the proportion of high value species in a stand. Guides have been published for use by forest managers.

Question. What does this budget provide for the timber management research at Parsons and what is the staffing?

Answer. $105,000, the same as for fiscal year 1967. We have 4 scientists and 10 support personnel on this project.

Question. What further funding would be required to bring this work to full strength?

Answer. Our plans call for building this project to $140,000, an increase of $35,000.

Question. I notice that your budget request includes a substantial increase for forest tree improvement (genetics) research. Is this type of research underway in the Appalachian Region?

Answer. No, not at the present. The increase you mentioned will be used to strengthen projects of long standing where leads show very substantial benefits can be obtained by accelerating the research. Most of the increase would be used for research on the Pacific Coast, deep South, and Lake States.

Question. Is there a job to do through tree improvement research in the Appalachian Region? Are there likely to be "substantial benefits" as you say, from this sort of research?

Answer. Yes, very much so. Probably the biggest gap in this part of our program is in improvement of oaks, yellow poplar, black cherry, ash, and other Appalachian species. We know for sure that the opportunities for increased growth rates, high quality, and pest resistance can be developed through selection, propagation, and tree breeding.

Question. Since this is an important field of research and since you do not have an estimate in this budget for such research, I would like you to give this serious consideration in the development of your budget request for fiscal year 1969. It sounds to me this is a program we should get started on as soon as possible.

Answer. We will certainly do this for the 1969 budget.

STATE AND PRIVATE FORESTRY COOPERATION

Question. I note that the budget request for cooperative forestry includes $12,834,000 for Cooperation in Forest Fire Control. We have before us a request from the National Association of State Foresters that an increase of three million dollars be appropriated for this purpose. Could this amount be efficiently used if it were appropriated?

Answer. Yes it could. Loss of forests to disastrous fires could be reduced if additional funds were made available for this purpose.

Question. If this increase was appropriated, approximately what amount would be made available to West Virginia?

Answer. The present allocation is about $156,000. It would be increased to approximately $200,000.

Question. What is the present level of fire losses in the country and in West Virginia?

Answer. In 1965, approximately 0.25 percent of the protected State and private lands burned throughout the Nation, while approximately 1 percent burned in West Virginia. West Virginia's record is not good compared with most States in holding down the size of individual fires. For instance, in 1965 West Virginia had 60 large fires (over 300 acres each) which burned 54,745 acres or about 54 percent of the State's total burn. This was the largest number of fires over 300 acres recorded by any State that year. Using the total number of such fires for the past 4 years, West Virginia was second highest in the Nation.

It is important that we get on top of this big fire problem. Additional personnel, tankers, and other equipment are needed to provide the capability needed to hit potentially bad fires harder and quicker. This need is especially apparent during periods of unusually severe fire conditions when carelessness means more fire starts and when most of the disaster fires occur.

Question. With additional financing do you think you can show progress in preventing fire occurrence?

Answer. Yes. An intensified fire prevention program is needed, particularly in the East where suburban developments and greater uses by the public are causing more fires. Studies are now in progress that we hope will develop new and effective approaches to this problem.

As an example, in 1965, smoking, debris burning, and incendiary fires accounted for approximately ⅔ of the fires and 64 percent of the burned acreage in the State of West Virginia. A stepped-up prevention effort should reduce this record appreciably.

Question. What are some of the important values we are protecting that will justify increased expenditure in the fire control program?

Answer. First, the values protected have increased tremendously in recent years as the economy expanded.

The hard statistics of "so many dollars per cubic foot" of annual timber growth is only a portion of the value protected.

Water, soil, wildlife, and recreation, as well as timber, must be considered. The cost of protection must be weighed against all of these, plus the intrinsic value of scenery and other aesthetics. Protection of the woodland areas from fire becomes even more important as outdoor recreation facilities become more valuable to the millions of people living in the rapidly expanding eastern and central metropolitan areas.

A protective cover of vegetation on lands above water resource development projects is necessary to assure continued effectiveness of reservoirs and assure full realization of other planned benefits.

Fire protection is doubly important where corrective measures have been taken to heal the areas left bare by strip mining in several of our eastern States.

From the industrial outlook, it is known that protection of forests from fire is a prerequisite. A company looking for an area to expand their operation or to develop a permanent wood-using plant must be assured that the supply, both current and future, will be protected from the losses resulting from wild fire.

Question. I would like to follow up on the General Forestry Assistance item. A $100,000 increase for increasing hardwood lumber output. What States are they in and how do these projects operate?

Answer. These funds were sufficient to set up projects in five States for the last half of the year. The States are Michigan, Ohio, Pennsylvania, Virginia, and Georgia. The $100,000 increase is needed to fund these on-going projects for the full F.Y. 1968.

These projects are designed to offer services through the State Forester's organizations to landowners in the marking and harvesting of their timber, to loggers in improving the efficiency of their operations, and to sawmill owners in improving their manufacturing and seasoning processes.

Each of the five States has employed a sawmill specialist to provide services to sawmill owners. Services to landowners and loggers are being provided by specially assigned crews or through agreements with consultants.

Also under this program we have stationed a specialist at the Forest Products Laboratory to provide new research findings to processors and feedback on processing problems to the researchers.

A 4-week sawmill workshop was held in Poplar Bluff, Missouri, from January 23 to February 17. Ten sawmill specialists from nine eastern States and four Forest Service specialists were given intensive on-the-ground training in lumber manufacture. More workshops are planned.

Question. What is the situation with respect to hardwood supplies?

Answer. About 85 percent of the Nation's hardwood timber lands are privately owned—12 percent on forest industry holdings and about 73 percent in farm and miscellaneous private ownerships.

This hardwood timber inventory is widely distributed over large numbers of farm and other nonindustrial holdings on which forest management is generally lacking.

Survey statistics indicate that the total growth of hardwood sawtimber has been steadily rising in recent years and inventories have been increasing. However, these figures for total inventory seriously overstate the supply of hardwood logs suitable and available for economic utilization. Much of the inventory is in poorly formed and defective trees, small trees, and species having limited markets. Part of the inventory is in private woodlands held for recreation or other purposes where the owner is not interested in timber harvest. About one in every five trees over five inches in diameter is a cull tree. Such trees contain about 18 percent of the total volume of wood in hardwood stands. Hardwood stands with more than 1,500 board feet per acre comprise only one-third of the total hardwood acreage. The problem of small size and low quality is illustrated by Forest Survey classifiactions of eastern hardwood sawtimber trees by standard log grades. These show that only 11 percent of the hardwood sawtimber volume is in No. 1 lumber logs and only 29 percent in log grades No. 1 and 2 combined.

Further declines in the size and quality of hardwood trees are in prospect if the timber cut continues to increase and forest management programs continue near current levels. The outlook is for rising costs of lumber production, increased marketing problems and increasing use of substitutes for wood unless timber supplies are expanded and improvements in technology are achieved.

Question. Forests cover about three-fourths of West Virginia. What are you doing in hardwood improvement there?

Answer. West Virginia was to be one of the pilot States for a project. However, the State Forester, Mr. McClung, has had a serious problem in recruiting foresters. At the time we discussed a project for West Virginia, he had 14 vacancies in 29 authorized forester positions. He decided that his first obligation to the general Statewide forestry program was to attempt to fill these vacancies. West Virginia's program needs bolstering, and we will work with the State Forester in every way that we can.

Question. Could you effectively use an increase in this program?

Answer. Yes. While this is a pilot program, we could effectively increase services in the five States now participating. This pilot program could be extended to two or three additional States, especially West Virginia, where there is available hardwood timber and sufficient mill capacity to produce more lumber.

Question. What are your plans beyond this pilot phase?

Answer. We hope that the State Foresters in the major hardwood areas will pick up this hardwood program and keep it moving as an important part of their regular cooperative forest management programs.

RESPONSES TO QUESTIONS BY SENATOR M'GEE

Proposed Elk Management Research in Wyoming

Question. For the past several years I have strongly advocated the establishment of a program to conduct research on elk management in Wyoming. As members of this committee will recall, this item in prior years, has been approved by the committee and the Senate, but has been rejected by the House.

In hearings before this subcommittee in prior years, Forest Service officials have supported my request for funds to establish this project, and I would hope they will do so this year. It appears to me that the need for such a facility is becoming more apparent as each day passes.

I have just returned from hearings of this subcommittee in Casper, Wyoming, which pertained to the management of the Northern Yellowstone elk herd. which has been the subject of such controversy in recent weeks, and indeed in recent years. While this is somewhat a special problem, I am certain that the information and data that would be produced from a research project as I have suggested would be of significant help in the management of the Yellowstone Park elk as well as other elk herds in the Western states.

I repeat, as I stated last year, that new and increased demands are being made upon our lands, both public and private for many uses, including the grazing of both domestic and wild animals.

Last year you indicated that an appropriation of $100,000 would be necessary to maintain such a research program. Of this amount what would be required in the initial year to get this program underway?

Answer. To implement an elk habitat research program we would need the full $100,000 which you refer to if the problem is to be resolved in a reasonable period of time.

Question. If this amount were made available by this committee and the Senate, could the Forest Service undertake this program this fiscal year and could this money be expended wisely and beneficially for this purpose?

Answer. Yes, we could use the money effectively to implement the program during the 1968 fiscal year. Because of the importance of this research, we made some readjustments of our program at Laramie this year to free one scientist to do the planning and lay the groundwork for just such an effort. That planning is moving along well and we will be in a good position to implement the needed research as soon as funds are made available.

Question. Would you please comment generally on the merits of this proopsal?

Answer. Yes, I will be glad to. The elk herds of Wyoming are nationally known for aesthetic qualities and for hunting. However, abuse and overuse of the ranges on which the elk live and feed have had serious impacts on the elk herds, as well as on grazing of domestic animals and on watershed values and fish habitat. A strong research program is needed to determine how best to improve and manage elk ranges to allow optimum production of elk and yet not detract from other land use values. More specifically, research is needed to determine how both elk and livestock should be managed to permit restoration of deteriorated ranges and stabilization of vegetation and soil. Where native forage has been destroyed, we need to find out how to revegetate with suitable forage plants. Management methods must also be developed to allow use of cutover areas for range while new timber stands are being established.

RESPONSES TO QUESTIONS BY SENATOR PROXMIRE

Forest Products Laboratory, Madison, Wis.

Question. Dr. Jemison, I am delighted to hear of the progress that has been made on the building program at the Forest Products Laboratory in Madison. The two structures to be soon completed are excellent examples of functional design in laboratory construction and use wood to good advantage in their construction. The Wood Fiber Products Research buildings, providing both pilot plant and office space, have long been needed to alleviate the crowded conditions that hampered the progress of research on new and improved pulping and papermaking processes. It was our plan that you should complete the present phase of the building program as an efficient unit providing for the most efficient collaboration between wood chemists and wood fiber research scientists. It is unfortunate that you were unable to construct the planned third building with the money that was appropriated in 1964.

I am pleased to see that you followed the recommendation of this committee, made in connection with last year's budget hearings, to include funds for construction of a wood chemistry building at the Laboratory. Can you explain why it is important to your program that you complete construction of this third and final unit of the wood-fiber-chemistry complex, as originally planned?

Answer. It is important that we complete the wood fiber products-wood chemistry complex as originally planned because our programs in wood fiber products and wood chemistry are very closely related. Effective progress in wood fiber products research requires close daily collaboration and consultation on questions of cellulose and lignin chemistry. Effective progress in wood chemistry research requires close working relations with scientists working on studies of pulping methods and pulp processing chemicals. Neither group can work most effectively far removed from the other.

Many of the facilities used in wood chemistry research are similar to those used in wood fiber products research. Yet, it is not efficient to use the same facilities because of special requirements of the work in the two areas. It is therefore important that the facilities for these two areas of work be located close to each other and that space also be provided for the special, distinct, kinds of equipment needed by each group.

Economic reasons for going ahead with the wood chemistry portion of the complex are the steady rise in building costs that each year add about five percent to the cost of such construction and the fact that moving the wood chemistry group to the new facility will considerably facilitate the job of remodeling the present Laboratory space for efficient use by other scientists.

CHEQUAMEGON WATERS

Question. In 1966 Taylor County, Wisconsin, started construction of Chequamegon Waters, a 2,700-acre recreation lake about 20 miles west of Medford. The new lake is entirely within the Chequamegon National Forest. Much of the land along the shoreline suitable for recreation use is in Federal ownership, and the County contemplates full development of this land to maximize the potential of the lake. The estimated total cost of the Forest Service developments in the Chequamegon Waters plan is $1,700,000. Were funds requested by the Chequamegon Forest to start development of Chequamegon Waters?

Answer. The Chequamegon National Forest personnel have been working with Taylor County, who has developed a plan for Chequamegon Waters. Our people in the field are constantly working with local groups to see how National Forest lands might contribute to the rural economy. This, of course, is part of Secretary Freeman's program for the development of Rural America. In this case, Supervisor Yurich did identify the importance of the development but we found it impossible, due to overall budget limitations, to include this project in the fiscal year 1968 budget.

Question. How much would be needed to start this project in fiscal 1968 so that facilities are available to meet the projected additional use that will be attracted by the project by 1970?

Answer. If funds were to be made available so that the Forest Service could carry its share of the development of Chequamegon Waters in such a way as to fully meet the visitor load anticipated by 1970, about one-third of the job should be done in each of the next three years. If the project were to be completed in the three-year period, we would suggest $560,000 would be needed in fiscal year 1968. I believe it would be more realistic, however, to spread this over a five-year period, starting in the neighborhood of $300,000 the first year. This would be used to make a start in the development of the camping and picnicking facilities, the swimming beaches, the boating sites, the water and sanitation systems, and the interpretive services that this area warrants and which its visitors will need.

As you know, the State of Wisconsin is one of our important recreation areas and people spent 1,660,000 visitor-days on the National Forests in this State this past year. The Chequamegon area is heavily used by people from the urban areas of Minneapolis, St. Paul, Chicago, and Milwaukee.

LA CROSSE FOREST EXPERIMENT STATION

Question. I received a letter recently from the La Crosse County Water and Soil Conservation Supervisors urging additional funds to strengthen the work being done by Forest Service scientists at the La Crosse Forest Experiment Station. In your estimation would funds in addition to what is in the budget be helpful? If so, how much more would be needed to make a concerted attack on the floods and erosion that still plague the Coulee Region Forests area?

Answer. Our watershed management research at La Crosse is currently funded at $55,000 annually. The two scientists there are making good progress and have good laboratory facilities. Increased funds, when such can be provided, would certainly be helpful in strengthening and accelerating that research. A most effective concerted attack on flooding and erosion problems would require a program increase of $150,000.

Question. Have any funds been designated for Recreation Research in the Boundary Waters Canoe Area by the North Central Forest Experiment Station? I have received a number of letters urging that $100,000 be set aside for this purpose. What effect would the appropriation of this amount have on the area?

Answer. The budget for fiscal year 1968 includes a $50,000 increase for recreation research in the Boundary Waters Canoe Area.

The program there, which was begun in 1966, has made a start on some of the most urgent research needed to manage the area for heavy visitor use. An increase of $100,000, if appropriated, would make it possible to strengthen the work considerably by adding studies of patterns and densities of recreational use that can be accommodated on the area without excessive damage to forest cover and sites, pollution of water, or loss of the area's attractiveness. We would also be able to strengthen work aimed at determining how the recreational resource there can best be developed and maintained. This expanded research program would enable us to advance much faster in determining how best to guide recreational development and use to insure the area's continued value as a major recreational resource.

Question. I noticed the budget states additional funds and personnel will be needed for forest fire control. It goes on to say "costs above the amounts estimated for the current and budget years are authorized to be met from advances from other Forest Service appropriations. In addition, a supplemental appropriation for fighting forest fires is anticipated for 1967 under legislation proposed for later transmission. Could you give us some details on this item, such as the increase requested for fiscal 1968 over this year and the reasons for such an increase?

Answer. The item referred to is our regular Supplemental for Fighting Forest Fires which we have each year in varying amounts. This is an appropriation item which is difficult to predict since the amounts vary so widely each year dependent on the severity of the fire season. The Congress annually has been appropriating an initial $5,000,000 for that purpose with the understanding that the additional amounts will be submitted to the Congress later, as is being done this year.

SYLVANIA TRACT

Question. What amount is in the budget for development of the Sylvania Tract in the Ottawa National Forest, which became public property on July 28, 1966?

Answer. A total of $992,000 is budgeted for this project. This includes $300,000, mostly for recreation facilities but including necessary planning; $500,000 for roads; and $192,000 for a visitor services structure.

Question. What can be done under this amount?

Answer. In order to accommodate the first influx of visitors, we will (1) build a road with spurs to the sites planned for development; (2) construct facilities at Clark and Crooked Lakes, including items such as picnic grounds, swimming beaches, boat landings, and initial water and sanitation facilities; (3) initiate the Visitor Center structure at Watersmeet. We will also continue work on the special surveys and plans necessary to properly develop this outstanding area.

Question. In order of priority, what additional sums are required for Fiscal Year 1968, in your judgment, to (1) plan the development for protection and use of the area; (2) construct facilities; and (3) administer the use?

Answer. In addition to the $992,000 budgeted, if an additional amount up to $250,000 were provided, we would of course be able to make more rapid progress in providing recreation facilities that will be necessary before we can properly cope with and serve the area's influx of visitors. While some additional planning and design work would need to precede construction, the major part of this increase would be used for the additional facilities to protect the site and serve its visitors.

RESPONSES TO QUESTIONS BY SENATOR STENNIS

TREE SEED LABORATORY, STATE COLLEGE, MISS.

Question. Please tell us what this budget provides by way of a research program at the State College, Mississippi, tree seed laboratory.

Answer. Through adjustments in other programs at the Southern Station, we were able to allocate $16,000 to get the tree seed project underway at State College in F.Y. 1967. The new budget provides no increase to implement the seed research program. Therefore, in the coming year the program will continue at the same level. One scientist is assigned to this research.

Question. How much would it take to implement the program at a reasonable level?

Answer. An additional $75,000 would provide for two more scientists, including adequate technical assistance.

Question. What is the status of the Tree Seed Laboratory construction project at Mississippi State University?

Answer. $20,000 was appropriated in F.Y. 1966 for architectural planning. These plans are now complete.

Question. Could construction proceed immediately? What will the laboratory cost?

Answer. Construction can proceed as soon as funds are available. We estimate this construction will cost $290,000.

Question. Are funds included in the F.Y. 1968 budget for this facility?

Answer. No, they are not.

Question. Could you work effectively on an expanded tree seed research program before a seed laboratory is constructed?

Answer. Yes, Mississippi State University has provided us with temporary office and laboratory space. Our first job will be revision of the 20-year-old *Woody Plant Seed Manual*, a major reference on the characteristics of tree seeds throughout the country. This work will not require much laboratory space. Completion of this Manual will provide the starting point for new research in seed physiology, seed quality, and seed handling.

RESPONSES TO QUESTIONS BY SENATOR COTTON

PROPOSED RESEARCH LABORATORY, UNIVERSITY OF NEW HAMPSHIRE

Question. During one of my recent visits to New Hampshire I had an opportunity to check on the status of the proposed research laboratory at the University of New Hampshire. I was pleased to receive the report that the planning was underway with the $75,000 which Congress approved last year.

It was also pleasing to learn that considerable progress has been made and that the planning would be completed in January 1968. However, I am told that the budget for FY 1968 does not contain funding for the continuation of this project beyond the planning stage. As I understand it, the total cost of this laboratory would be about $955,000. If I am wrong on this figure, I would like to be corrected.

Experts in the field of forestry, as well as many other people who have been following this project, have expressed keen disappointment at the present situation. Your service has recognized the need for research in an effort to overcome several of the New England area's critical forestry problems. As you know, some of this research is being done in space provided by the University of New Hampshire which, like many other educational institutions across the country, is faced with critical space requirements caused by the rapid increase in enrollment. As a consequence, the University is in need of the space now devoted to the research and officials of the institution have offered campus space for the Forest Service to build a laboratory.

The research for which the facility is needed includes (1) studies of management of the beech-birch-maple forests of New England; (2) studies of management of eastern white pine; (3) forest genetics and tree improvement of white pine and selected high-value hardwoods in the Northeast; and (4) studies on flood-runoff reduction and water-yield improvement for the New England States. The beech-birch-maple forests are an important multiple-use resource on 10 million acres in New Hampshire and adjacent New England States. Eastern white pine, likewise, has been and must continue to be an important segment in the New England timber economy. Research on the management of this species including genetics studies on weevil resistance, will produce benefits of lasting importance.

There are a few questions I would like to have answered. As I have understood the practice of the Forest Service over the years, the planning is immediately followed by the request for construction funds. This would seem to be an orderly and economical procedure. I am wondering whether, in the preparation of your budget for 1968, you requested money for the laboratory?

Answer. Planning for our Forest Sciences Laboratory at Durham, New Hampshire, is moving right along. General Services Administration expects the contractor for the architectural work to complete the plans and specifications for construction early in 1968. We did request construction funds for fiscal year 1968 but the overall budgetary situation did not permit including this item in the budget which was sent to Congress.

Question. Assuming funds were provided, how much could you effectively use in 1968?

Answer. If funds were appropriated for fiscal year 1968, we would need the full amount of $955,000 to award a construction contract.

Question. If construction money is provided for fiscal year 1968, what would be the anticipated completion date of this facility?

Answer. Planning is well advanced so construction could start as soon as weather permits in the spring of 1968.

Question. Will failure to appropriate this amount result in delay of research on programs critically affecting New England forestry?

Answer. As you remarked, the University of New Hampshire is very crowded for space. As a result, we have moved our people out into a hardware store that we converted into temporary quarters. The inadequate facilities and cramped quarters prevent our scientists from doing their best work. In addition, it is impossible for us to move other projects to Durham that would benefit from closer association with the people we already have on the ground. Progress is being delayed. In short, the situation is far from ideal, and we are looking forward to having the new Forestry Sciences Laboratory now being planned.

RESPONSES TO QUESTIONS BY SENATOR MOSS

BROWSE IMPROVEMENT RESEARCH, PROVO, UTAH

Question. What progress has been made in browse improvement research by scientists at Provo, Utah? How far along is this work now?

Answer. The one scientist, with the assistance of two technicians from the Utah Fish and Game Department, has screened a number of species adapted to deteriorated deer winter ranges of the Great Basin; developed practical seeding and juniper control methods. To date, more than 70,000 acres of deer range in Utah have been successfully restored. Promising leads as to superior and more productive browse species and strains that are better adapted to more difficult environments have been uncovered, but research on genetic improvement has been nil.

Question. Are laboratory facilities now adequate for the program? If not, what is needed in the immediate future?

Answer. Forest Service Scientists at Provo have office space in rented quarters. No laboratories or other specialized facilities are available. Only makeshift facilities are available, at Ephraim, Utah, about 76 miles away. Funds are needed to construct a modern office laboratory on land leased to the Forest Service by Brigham Young University. Estimated cost of construction is $460,000 for the office laboratory and developing the site, plus $100,000 for a headhouse-greenhouse and storage facility. The total need at this time is for $560,000.

Question. What could be done at Provo with additional funds for the research program?

Answer. Additional funds would advance: (1) rapid screening, selection and controlled breeding of promising native and exotic shrub species for wildlife, erosion control, campground screening, roadside beautification and other uses; (2) techniques of seed storage and plantings for seed increase of selected strains; (3) extension of the present restoration work to a broader spectrum of sites; (4) seeding and planting economies; (5) basic studies into germination, growth, food and cover values, disease, insect, fire and drought resistance qualities. Findings would be generally applicable throughout the west.

FOREST SERVICE BUDGET

Chairman HAYDEN. I have received a number of communications relating to the Forest Service budget. These will appear at this point in the record.

(The communications follow:)

FEDERAL-STATE COOPERATIVE FIRE CONTROL

LETTER FROM SENATOR HOLLAND

U. S. SENATE,
COMMITTEE ON APPROPRIATIONS,
March 10, 1967.

Hon. CARL HAYDEN,
Chairman, Committee on Appropriations,
U. S. Senate, Washington, D.C.

MY DEAR SENATOR: I have been contacted by the State Forester of Florida with reference to the need for increased CM-2 matching funds for the next fiscal year.

It is my understanding that for the last nine years, Florida has received about the same Federal matching funds for cooperative forest fire control under CM-2. During this same time, Florida has increased its State and private expenditures due to rising costs and to greatly increased area under protection.

As an example, in 1956, State, County and local funds totaled $1.9 million spent for fire control. That year, $554,000 of federal funds were received under the CM-2 program. In 1965, nine years later, $4.8 million in State and private funds was spent while the Federal allotment was only $561,000. This is only a $7,000 increase in federal allotment while State and private expenditures were increased by $2.9 million.

The Florida Board of Forestry is faced with increasing labor, and wages, materials, supplies, fire fighting equipment and all items of necessity in connection with the program have increased over the years. For this reason and because the Board is including additional land in order to bring about statewide protection, additional Federal funds are sorely needed.

I will appreciate any action that can be taken by the Committee to increase CM-2 funds by $3 million nationwide.

With kind regards, I remain,

Yours faithfully,

SPESSARD L. HOLLAND.

STATEMENT BY PENNSYLVANIA DEPARTMENT OF FORESTS AND WATERS

The Pennsylvania Department of Forests and Waters respectfully requests favorable consideration by the Subcommittee on the request pending before the subcommittee to increase the Clarke-NcNary Law appropriation for fiscal year 1968 from $12,800,000 to $15,800,000.

Our reasons for requesting this increase are based on the following factors relating to the forest fire control and prevention program as conducted in the Commonwealth of Pennsylvania.

Fire control expenditures for Pennsylvania

Fiscal year	State expenditures	Federal expenditures	Total	Federal share (percent)
1963	$1,110,009	$247,300	$1,357,309	18
1964	1,228,567	255,700	1,484,267	17
1965	1,173,722	273,200	1,446,922	19
1966	1,312,249	305,700	1,617,949	19
1967	1,539,125	295,000	1,834,125	16

NOTE.—1963 through 1966 figures are actual expenditures, 1967 figures are actual for Forest Service, programed for State.

Forested areas of Pennsylvania, 1965 Forest Service survey

	Acres
Total land area (100 percent)	28,804,480
Total forested area (59 percent)	17,072,100
Nonforested area (41 percent)	11,732,380

As can be seen from this data, the level of federal contributions to this State's program has begun to decline. This at a time when the State's expenditures for the program are increasing steadily.

Unless the Federal appropriation is increased, the Federal contribution to Pennsylvania will experience a further decline, due to increased demands against the appropriation by all of the States.

FOREST SERVICE CONSTRUCTION

WILDLIFE HABITAT AND SILVICULTURE LABORATORY, NACOGDOCHES, TEXAS

LETTER FROM SENATOR YARBOROUGH

UNITED STATES SENATE,
COMMITTEE ON APPROPRIATIONS,

March 15, 1967.

HON. CARL HAYDEN,
Chairman, Interior Appropriations Subcommittee, Committee on Appropriations, United States Senate, Washington, D.C.

DEAR MR. CHAIRMAN: I request favorable consideration by your Subcommittee of an additional appropriation for construction of the U.S. Forest Service's Wildlife Habitat and Silviculture Laboratory at Nacogdoches, Texas. This research facility, for which $335,000 for construction costs is now needed, received a $25,000 appropriation last year for architectural design and planning.

The importance of this research laboratory lies in the fact that it is the regional headquarters for all wildlife habitat research of the U.S. Forest Service's Southern Forest Experiment Station, an area which includes 108 million acres of commercial forest. Research conducted at this center is not only necessary for preservation of wildlife, but is essential for providing the forest industry with sound management information.

For more than 20 years Stephen F. Austin State College has provided facilities for this research center on its campus at no expense to the government. Providing the Federal Government all facilities, utilities, and custodial services has been a type of private subsidy whose burden the College is no longer able to bear. The problem has become most acute in that the buildings now occupied by the Laboratory—antiquated World War II State-owned barracks—must be demolished in 1968 to make space for sorely needed college buildings.

The importance of the research conducted at Nacogdoches during the last 20 years has been well known throughout industry and the academic community. Much of this research has been continuous and cumulative. Failure to provide funds for replacement of this facility at this time would no doubt jeopardize years of fruitful progress and a most fruitful relationship between the Forest Service and the State College.

I hope your Subcommittee can provide the requested appropriation for this urgently needed construction in the Interior Appropriations bill.

With best wishes,

Sincerely yours,

RALPH W. YARBOROUGH.

FOREST SCIENCES LABORATORY, MOSCOW, IDAHO

STATEMENT OF SENATOR CHURCH

Mr. Chairman, many of the people in Idaho make their living from the forests or forest-based industries. In the northern and central parts of my state, forests are the principal resource. A threat to these forests is a threat to the local economy.

Most people immediately think of fire as the worst danger to a forest. Everyone has now heard the exhortions of Smokey Bear and knows the threat of fire in a living forest. Foresters have made spectacular technical advances in fire fighting, but acres of forest still go up in smoke.

Yet the biggest threat to the forests of my state today is not fire, Mr. Chairman. It is the threat from insects and disease. For while fire still kills some 75-million feet of sawtimber annually in the Northern Rocky Mountain Region, losses from insects and disease are averaging 1.9-billion feet. This loss is many times that caused by fire, and it is rising.

Foresters in my state tell me that nearly every tree species is now under attack by one or more destructive pests. The most destructive are the defoliators and the bark beetles. The tussock moth is causing great loss in the fir species, budworm is destroying spruce and the larch casebearer is attacking larch. Bark beetles are causing heavy loss in Ponderosa pine, lodgepole pine, Douglas fir, grand fir and spruce. These are only some of the present threats. No one knows those of the future.

Work has been proceeding for some years toward a better understanding of the way these pests and diseases multiply and behave. It has not been enough. The problems are multiplying faster than our knowledge of how to combat them. Our forests are being destroyed while we watch.

Mr. Chairman, I submit this statement to offer my support for funds for the second-stage of the Forestry Sciences Laboratory at Moscow, Idaho. Funds for planning the facility are in this Forest Service budget; construction funds will be in the next one. I want to underscore the necessity of expanded research on forest insect and disease infestations in my state, and urge the rapid construction and staffing of this laboratory.

Mr. Chairman, some 70 percent of the sawtimber volume in north and central Idaho is in federal ownership. Idahoans depend on it for a livelihood, and it is in danger. The concept of conservation calls for a sustained yield from these forests, and economics dictates it. The need for more research is unquestionable. The Moscow Forestry Sciences Laboratory is required.

SILVICULTURE AND SUGARBUSH LABORATORY, BURLINGTON, VT.

LETTER FROM SENATOR AIKEN

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
March 4, 1967.

Hon. CARL HAYDEN,
Chairman, Interior Appropriations Subcommittee,
Senate Office Building, Washington, D.C.

DEAR CARL: As you recall, I have appeared before your Subcommittee several times in recent years urging support for funds leading up to the construction of a maple production laboratory for the Forest Service at the University of Vermont in Burlington. You and the Members of your Subcommittee have been most generous in honoring these requests, and have also granted program funds absolutely vital to this research.

I understand the design phase has virtually been completed, and there is an urgent need for this facility in order to speed up vital research work that is of value to farmers producing maple syrup in Vermont, New York, Ohio, Pennsylvania, Wisconsin, Michigan, Massachusetts, New Hampshire, Maryland, Maine, Minnesota, Indiana and West Virginia.

As you will see from the enclosed report prepared for me by the Forest Service, $675,000 is needed for the construction of the laboratory and the related head-house-greenhouse and storage facility. Not only Vermont, but all of the States in the Maple Belt need this research to reverse the present decline in Maple production.

In view of the need for this work, and the sums already invested by the Federal Government, I request that the necessary construction funds be provided for Fiscal 1968 so that the Forest Service may move ahead in this work that is so important for improving the annual cash income of farmers who also harvest maple.

In questioning the Forest Service witnesses, I suggest that it would be helpful to have a detailed report for the record on the size of the present operation, the accomplishments to date, and the potential gains this research may produce. I am confident this record will show that it is important to proceed with construction in the next fiscal year.

Sincerely yours,

GEORGE D. AIKEN.

DEPARTMENTAL STATEMENT

This increase ($675,000) will provide for construction of an urgently needed laboratory-office building and a headhouse-greenhouse on a site leased to the Forest Service by the University of Vermont. The estimated cost for the laboratory-office is $575,000 and for the headhouse-greenhouse and storage facility, $100,000. These facilities will provide modern research laboratories for scientists studying the genetics and physiology of maple sap production. Present quarters in the Federal Building at Burlington are not suitable for laboratory research. At these quarters it is not possible to do the basic biological research needed to improve the production techniques and to develop superior strains of sugarbush trees.

The maple sugar industry adds to the economy and provides added income for many rural people in the northern states. In 1965 more than 8 million dollars worth of maple syrup were produced; mostly by people working during a part of the year when other farm work was low.

The new laboratory and headhouse-greenhouse would provide facilities for accelerating research. Scientists could speed studies of sap extraction and sap flow, hybridization and breeding of sugarbush trees, irrigation and fertilization of sugarbushes, and propagation of superior strains.

WOOD PRODUCTS MARKETING AND APPLIED UTILIZATION LABORATORY, DULUTH, MINN.

LETTER FROM SENATORS M'CARTHY AND MONDALE

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
March 8, 1967.

Hon. CARL HAYDEN,
Chairman, Senate Appropriations Committee,
1235 New Senate Office Building.

DEAR SENATOR HAYDEN: In letters to you and members of the Committee in 1965, and again last year, we discussed the need for establishing a facility for a Federal Wood Products Marketing and Applied Utilization Laboratory on the Duluth campus of the University of Minnesota.

We appreciate the response given by the Committee to those letters. As you know, $39,000 was included in the Senate Appropriations bill for the Interior Department and related agencies for preparation of design and specifications for this important facility. We regret that it was not possible to retain this item in the conference report.

There is, in our judgment, little need to recount here the value of such a facility. It is sufficient to say that its creation would assist in the development of new markets, the expansion of existing ones, and provide for the more efficient utilization of the vast timber resources of this region.

The proposed facility does not involve duplication of existing laboratories and it is not in conflict with their objectives. The appropriation of $39,000 needed to develop design and specifications for the proposed facility is not a large amount of money, and would cause no substantial budgetary increase. We are most hopeful that the Committee will again find it possible to include this important item in its report.

With all good wishes.

Sincerely,

EUGENE J. MCCARTHY.
WALTER F. MONDALE

FOREST PRODUCTS LABORATORY, MADISON, WISCONSIN

STATEMENT BY SENATOR NELSON

Few people are aware of the economic significance of wood in the national economy of this country. For example, few people know that:

1. The wood-based industries rank among the top five in gross national product.
2. One person in every 20 earns his living in a wood-based industry.
3. Wood, unlike metal or petroleum, is a renewable resource.
4. Wood-based industries can offer large scale non-urban employment throughout the country.
5. Wood-based industries offer the potential for the most promising employment opportunities in depressed areas.
6. The U.S. Forest Service alone is custodian of 186,000,000 acres of forest land in the U.S. which carries a definite obligation for it to find wise and economic uses for this tremendous resource.

Few people recognize that according to the National Science Foundation data:

1. The average American industry employs 27 scientists per 1,000 employees—with some industries approaching 100 scientists per 1,000 employees.
2. The pulp and paper industry averages 7 scientists per 1,000 employees.
3. The lumber and wood industry has but 3 to 4 scientists per 1,000 employees.

So, while billions are spent annually for research on aerospace, electrical, chemical, petroleum, machinery transport equipment, and similar fields only a few million are spent on wood, including pulp and paper.

Few people know what a remarkable yet complex material wood really is. Nor do they know the real potential of this renewable raw material, available at such a relatively low cost. Even the pulp and paper industry which is technically far ahead of other wood-based industries, depends primarily on a process established in its basic form by empirical means in 1889.

The wood-based industries are largely composed of many thousands of relatively small companies scattered throughout the Nation. It is not an organized industry that can wield strong pressures for attention. Yet it is a potential for economic development in every state of the Union and its major resources lie in predominantly depressed and relatively underdeveloped rural areas.

With these facts in mind I want to speak in behalf of the Forest Products Laboratory. I do this not because it happens to be located in Madison, Wisconsin, but because I personally know how its work continues, year after year, to draw thousands of technical people from every state in the Union and from all over the world for consultation and advice on potential developments from our vast timber resources.

I know that the semichemical pulp process developed years ago at the Forest Products Laboratory is today used in 40 pulpmills throughout the country with a market value of $300 million annually.

I know that this Laboratory has found uses for little-used species, especially hardwoods, with highly productive yields in paper products, in the rapidly growing pallet industry, in chemicals and many other byproducts.

I also know that investigations in the Laboratory's research program are aimed at reducing waste and pollution of our waters and our air. Such efforts deserve the highest priority if we are to give the attention we should to the preservation and improved utilization of our most valuable natural resources.

This work takes time and skill and modern facilities and money for those scientists who are willing to work for the good of us all—now and for the generations to come. Last year the Senate went on record urging priority attention to the further development of the chemical research facilities at the national Laboratory in Madison, Wisconsin. I am gratified that the Bureau of the Budget has understood the need for this item and has this year included funds for the wood chemistry unit with which to complete the chemical and fiber research complex there. By further implementing this research we can expect vast improvements in the more complete utilization of our timber resources, much of which is now wasted. The stream and air pollution that results from the disposal of these wastes is of great concern to all of us.

It is with deep conviction that I urge you to approve the $1,300,000 item which is included in the budget along with a very modest increase in research program funding.

FOREST INSECT AND DISEASE LABORATORY, DELAWARE, OHIO

STATEMENT OF BOARD OF TRUSTEES, OHIO FORESTRY ASSOCIATION, INC.

The Board of Trustees of the Ohio Forestry Association, Inc. by official action, makes the following statement for the committee records: in behalf of the program to expand the much needed addition to the Forest Insect and Disease Laboratory at Delaware, Ohio.

This regional Forest Service Laboratory is ideally located to serve the midwestern and northeastern states, including Ohio. Last year, our Executive Director Emeritus Robert R. Paton, appeared before your committee to recommend passage of an item of $72,000 to prepare the design and engineering specifications for an additional building for this facility. Congress wisely made this appropriation and the planning phase for this project is proceeding on schedule.

It is our purpose at this time, to recommend that an item of $950,000 be added to the current appropriation for constructing this planned addition. Because of the pressing need for expanding insect and disease research in this region, Congress authorized necessary program increases which have resulted in serious overcrowding at the Delaware laboratory. Originally designed for 35 scientists and supporting personnel, some 58 people are now located there. This increase of nearly 60 percent in personnel has caused inefficiency in the use of scientific manpower and a shortage in laboratory space for modern scientic equipment and apparatus.

The new laboratory addition would, therefore, not only relieve cramped conditions, but provide the kind of modern and highly specialized facility essential to rapid progress toward the discovery of improved pest control methods. Laboratories are needed that can be isolated for fundamental investigations with dangerous and toxic chemicals, including radioisotopes, chemosterilants, and other materials.

The forests in Ohio and other northeastern states are noted for their variety and diversity. Some 50 commercially important and almost as many non-commercial tree species grow east of the Mississippi River. The oak-hickory and maple-beech-birch forests are certainly the most important and widespread, but other forest types, such as the elm-ash-cottonwood type and aspen-birch type, are also economically important.

All of these hardwood forests are attacked by insect and disease pests. Losses from insects and diseases equal nearly 42 percent of the total volume removed. Some of our most catastrophic disease epidemics, including chestnut blight, Dutch elm disease, and defoliators such as gypsy moth and fall cankerworm have occurred among the hardwoods.

Many other tree disease and insect pests are less spectacular but, collectively, cause serious losses in the forest resource. Thus, the annual loss to heartrots and borers alone, exceeds the annual increase in volume in many of our most important hardwoods. Oak mortality, ash and birch diebacks, maple decline, sweetgum blight, and black cherry decline are serious problems that appear to be triggered by subtle changes in the environment and are complicated by the invasion of secondary insects and fungi.

Scientists at the Delaware laboratory are giving particular attention to oak wilt, hardwood decays and cankers, and plantation diseases, including root decline and air pollution damage of white pine plantings.

Also, several serious insect problems are being studied to find new or better methods for their control. Among these are the black locust borer, vectors of oak wilt, tulip poplar scale, and the elm bark beetle, which carries the Dutch elm disease fungus.

In fact, this is the only federal installation where research on controlling the insect transmission of the Dutch elm disease is being investigated. There is an immediate need to evaluate less hazardous insecticides for controlling this disease. The use of DDT sprays, while effective when applied under proper conditions, can no longer be tolerated because of the long residual properties of this insecticide. However, new research on this and other serious pest problems cannot be undertaken with the limited facilities now available.

Thus, we believe an addition to the Delaware laboratory is a most urgent and pressing need. This proposed addition to the laboratory is designed to meet the needs of forest industries in Ohio and other northeastern states.

The Ohio Forestry Association, now in its 64th year, has worked closely with the U.S. Forest Service in Ohio over the years. We are sincerely proud of this fine organization, its program, and the caliber of its staff.

We wish to thank your committee for the privilege of presenting this statement to you in behalf of this proposal.

STATEMENT OF TOLEDO METROPOLITAN PARK DISTRICT

Mr. Chairman and members of the Senate Subcommittee on Appropriations for Interior and Related Agencies, I am Robert R. Metz, Assistant Director-Secretary of the Toledo Metropolitan Park District.

I am writing on behalf of the urgently needed expansion of the Forest Service laboratory facilities at Delaware, Ohio. I also wish to commend the committee for its awareness of this need when it approved funds for planning an addition to the Delaware laboratory in 1966. As you know, the 89th Congress appropriated $72,000 for this purpose last year. My appearance before the Senate Appropriations Subcommittee on behalf of this item is evidence of my conviction that enlargement of the present facilities is essential to the development of adequate control programs for shade and forest tree pests.

My primary purpose in writing is to recommend that the committee approve $950,000 for construction of an addition to the present laboratory facilities at Delaware, Ohio.

This planned expansion of laboratory facilities at Delaware was included in the National Forestry Research Program presented to the Congress by the Secretary of Agriculture in 1964.

Insects and diseases ruin untold numbers of trees used to improve our environment—trees planted in our parks and along our streets for shade, landscaping, and general beautification. On a national scale, the value of shade trees alone is estimated to $30 billion, and $37 million is spent each year to protect them from insect pests. Because of the enormous values at stake, the need to protect these values and the responsibility of research to discover practical methods of control, the Forest Service established a laboratory at Delaware, Ohio in 1959 with funds appropriated by the 85th Congress to develop and recommend control measures for shade and forest tree pests. Located on 137 acres of federal land, it is ideally located to serve Ohio and the northeastern states.

Following its occupancy, research was started promptly and is continuing on control methods for such serious pests as: (1) Dutch elm disease, which has already devastated the beauty of many of our eastern cities and parks; (2) Oak wilt, potentially the most serious disease of oaks in the East; (3) Air pollution damage of white pine, a critical problem limiting the value of this widely planted tree for ornamental and timber purposes; (4) Maple scale, an insect pest of major importance on maple trees planted for their beauty throughout our towns and cities; and (5) Heartrots and borers that destroy and degrade many of our most valuable hardwood timber species.

The most urgent need now at the Delaware Laboratory is enlargement of the physical plant. Since 1960, the research programs authorized by the Congress have caused serious congestion and overcrowding. I have observed some scientists currently doing research in trailers, greenhouses, and temporary storage buildings. As you can imagine, such facilities do not permit the best use of our scientific manpower, nor are they conducive to recruiting the additional scientists needed to launch a more vigorous attack on the many shade tree problems yet unsolved.

The proposed new addition to the Delaware laboratory would be designed and equipped to take advantage of the latest advances in technology, thus providing scientists with up-to-date techniques for solving the more difficult problems in pest control. Such research cannot now be conducted with the limited facilities currently available. These specialized research techniques require special laboratory construction with provisions for the safe handling of dangerous and toxic chemicals and radioisotopes.

If we hope to make rapid progress toward the solution of our serious tree pests, immediate consideration should be given to the construction of new facilities which can take advantage of these recent advances.

In my position I am responsible for the planting, maintenance and care of thousands of acres of metropolitan parks in northwest Ohio. For example, right now we have more than 5,000 acres in our park system which have been set aside for recreational and outdoor educational purposes. No one can estimate the aesthetic value of the natural beauty of this area to the general public, but we do know that as urban populations explode and tensions multiply, the need for open space environment becomes immediate and real. It has been only in the last few years, however, that we have become fully aware of the importance of these values.

The need to protect and restore the natural beauty of our land was fully recognized by the President in his Congressional Message on Natural Beauty last year and reemphasized in his State of the Union message in January of this year.

One of the major aspects of this message is to beautify outdoor America, to enhance its aesthetic value, to improve its utility for camp sites, parks, and recreation, and at the same time increase its overall worth to every American citizen.

Hardwood forests cover about one-tenth of the land area and over one-half of the total forest area of our nation. They are the dominant feature of our eastern forests which encompass the most heavily populated sections of the country. To millions of people, hardwood forests and outdoors are synonymous.

Hardwoods comprise a complex and diverse group of several hundred species of trees, each having its own characteristics in size, coloration, shape, durability, and utility. Unfortunately, the forest stands that now remain in our parks, recreational areas, vistas, overlooks, and camp sites are the result of mismanagement of forest stands harvested for timber many years ago. Only the poorer specimens remain. They have suffered from abuse and misuse. Losses due to such catastrophic diseases as chestnut blight, Dutch elm disease, and several widespread but less spectacular diebacks and declines have made their impact for all to see and regret. The net result of the action and interaction of these forces is that our forested woodlands and recreational areas are highly susceptible to disease and insect attack.

Dead, dying and yellowed trees are an eyesore on many rural and forest landscapes today. Scarred and broken trees are a blot on our highways. Overmature trees and trees weakened by decay are a serious hazard to recreational developments. There are numerous instances on record of serious injury and death from such causes, as well as extensive property loss.

The challenge and the opportunity is to restore these forested recreational areas to their full potential for outdoor beauty, recreation, and sports activity. We, the park administrators cannot do this alone. We need the help of scientists who have the advantages of adequately equipped laboratories and equipment to provide the fundamental information for the development of reliable and safe methods of insect and disease control.

The protection of shade and ornamental trees from insect and disease attack constitutes the largest single threat to tree maintenance. More than fifty percent, representing more than $37 million, of public and private shade tree maintenance costs is for protection of damaging pests. Reliable figures show that more than $37 million is spent annually for this purpose. With the 120 million shade trees now present in urban areas, specialists estimate their value conservatively at $30 billion. About 70 percent of this valuable resource is located in the northeastern United States.

The natural resources of America are a great American heritage. The need for protecting trees from insect and disease damage in urban communities, forested parks, and public recreational areas is the challenge our generation now faces.

With the investment that we already have in one of our greatest natural resources, there can be little question as to the need for enlarging the relatively modest research facility at Delaware, Ohio. This is especially true when we realize that the Delaware facility is the only federal laboratory in the nation which has primary responsibility for the protection of trees in metropolitan centers, parks, along highways, and in recreational areas.

Therefore, I want to recommend that your committee approve $950,000 for construction of an addition to the present facility at Delaware, Ohio.

Thank you for your consideration of my statement on behalf of the urgently needed enlargement of the Forest Service facilities.

Forest Range Management Laboratory, Fort Myers, Florida

LETTER FROM REPRESENTATIVE ROGERS (FLORIDA)

Congress of the United States,
House of Representatives,
Washington, D.C., February 28, 1967.

Hon. Spessard L. Holland,
Senate Office Building.

Dear Senator: I am very anxious to get money appropriated for the Forest Service Laboratory. It is my understanding that $220,000 is needed for planning and construction and as you may recall, the approval of Congress was needed to appropriate funds for these costs. This has been done and the property upon which the laboratory is to be located will be donated, but there is a time element involved, which is August of this year. Therefore, it would be very helpful if we could get the funds or assurance of funds by August.

As the enclosed letter will show, the Forest Service puts high priority on this project and any help you could give will be very much appreciated.

Sincerely yours,

Paul G. Rogers.

LETTER FROM FOREST SERVICE

February 14, 1967.

Hon. Paul G. Rogers,
House of Representatives.

Dear Mr. Rogers: I am sorry that my letter of January 31, 1967, did not clear up the situation of funding for construction of the Fort Myers Laboratory. Construction of this laboratory did and still does have high priority on our list of construction needs. However, the budget for fiscal year 1968 only provided for two of several high priority needs in the Forest Service research budget.

Because an Administrative Agency is not permitted to disclose any details of preliminary budget review, we could not be fully communicative during the budget formulation process. Neither are we allowed to reveal the contents of the next year's budget prior to its submission to the Congress.

Funds for each laboratory project are designated by name in the President's budget already submitted and are passed on by the Congress individually. Thus, we know of no way to provide funds for the Fort Myers project during fiscal year 1968, without the approval of the Congress through Appropriation Committee action.

We, too, are desirous that construction of this laboratory at Fort Myers proceed as soon as feasible. We hope that a more favorable overall fiscal situation will enable us to provide for construction of this laboratory soon.

Sincerely yours,

George M. Jemison, *Deputy Chief.*

DEPARTMENTAL STATEMENT

A modern office-laboratory facility is needed for research scientists working on wild land problems in southern Florida. Forest Service scientists are striving to achieve maximum benefits from cattle grazing, timber production, wildlife habitat management and recreation use of the slash pine-wiregrass areas of the Southeast. Planning funds for a laboratory were included in the fiscal year 1965 budget. Architectural design and specifications are complete, and construction can proceed as soon as funds are appropriated. A building site has been donated with the provision that funds for construction be appropriated prior to August 1, 1967.

Cattle grazing and timber growing are major uses for millions of acres of slash pine-wiregrass lands, also capable of sustaining large wildlife populations. Research at Fort Myers has indicated possibilities of harmonizing uses effectively and managing these lands profitably for multiple use purposes. The research program is focused on problems of reducing grazing impacts on young slash pine, using prescribed fire, regenerating and managing tree stands, controlling palmetto and other undesirable plants, and increasing the output of quality forage and game food. Cooperative support from private and public sources is excellent. But the research has now reached a stage where a modern office-laboratory is critically needed.

Construction of an office-laboratory estimated to cost $220,000 would provide space and equipment for controlled studies and analyses of plant and soil materials from field tests and other phases of the program. The Fort Myers staff at present has no laboratories of any kind, and the entire unit is headquartered in rented rooms in two converted school buildings. No other laboratory is available or planned that can serve this problem area.

Mammoth Visitor Center, Inyo National Forest, Calif.

LETTER TO SENATOR KUCHEL

March 17, 1967.

Hon. Thomas H. Kuchel,
United States Senate

Dear Senator Kuchel: This is in reply to your March 14, 1967, letter requesting answers to specific questions relative to the status of the Mammoth Visitor Information Center in the Inyo National Forest.

1. What portion of the $25,000 appropriated for planning in FY 1967 has been spent?

Answer: Of the $25,000, the present obligation is $17,215, leaving a remainder of $7,785, which will be expended before June 1, 1967.

2. Have plans been developed for the construction of the Mammoth Visitor Center?

Answer: Planning has been completed on the amphitheatre and related structures; the Visitor Center building, utilities, roads, and parking areas are in working drawings. Final plans for these will be complete by June 1, 1967.

3. If so, can you supply me with a breakdown of the estimated costs of the Mammoth Visitors' Center as planned?

Answer: A breakdown of the estimates is as follows:

MAMMOTH VISITOR INFORMATION CENTER

VIS Building:	
Audio-visual room, reception, and display	$184, 100
District Ranger office	66, 400
Total	250, 500
Amphitheatre and related structures	66, 000
Walks, landscaping, and sprinkler system	40, 000
Electrical distribution, sewage and water	35, 000
Inspection and contract administration	20, 000
Contingency	8, 500
Forest Land Management Appropriation, subtotal	420, 000
Roads and Trails Appropriation,[1] subtotal	60, 000
Grand total	480, 000

[1] Proposed for construction from Road and Trail Appropriation over 2 fiscal years.

4. How much money is requested by the Department in the FY 1968 budget for the Mammoth Visitors' Center?

Answer: There are no funds provided in the FY 1968 budget for the construction of this facility.

5. If funds were provided for the Mammoth Visitors' Center in FY 1968 would the Department be in a position to proceed with the construction of the Center?

Answer: The Forest Service would have the capability to construct this facility if funds were provided.

Sincerely yours,

A. W. GREELEY,
Associate Chief.

ADMINISTRATIVE HEADQUARTERS, ELY, MINN.

LETTER FROM SENATORS M'CARTHY AND MONDALE

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
March 14, 1967.

Hon. CARL HAYDEN,
Chairman, Committee on Appropriations,
United States Senate.

DEAR MR. CHAIRMAN: A wide variety of vital Forest Service programs are headquartered in the Superior National Forest in Ely, Minnesota. The Forest Service recognizes the key location of these facilities. It also recognizes the inadequacy of present facilities if the public is to be served appropriately.

Accordingly, we are writing to bring to the attention of the Committee the urgent need which exists for the inclusion of an item in the Forest Service appropriations for FY 1968 with which to initiate work on engineering specification and architectural design for the new facilities required at Ely.

Enclosed with this letter are communications from the Forest Service documenting the importance and urgency of this project, as well as a brochure prepared by interested local parties in order to provide the Committee with a single source of relevant information.

An item in the amount of $50,000 is needed in order that work on this important new administrative facility at Ely may begin. The amount of this request is small, and would represent no substantial budgetary increase. We are, therefore, most hopeful that the Committee will be able to include this item in the Forest Service appropriations for FY 1968.

Your generous attention to this matter is appreciated.

Sincerely,

EUGENE J. MCCARTHY.
WALTER F. MONDALE.

LETTER TO SENATOR MONDALE

UNITED STATES DEPARTMENT OF AGRICULTURE,
FOREST SERVICE,
Washington, D.C., March 6, 1967.

Hon. WALTER F. MONDALE,
U.S. Senate, Washington, D.C.

DEAR SENATOR MONDALE: This is in reply to your inquiry of February 27 and Dr. Grahek's February 21 letter concerning the need for a new Forest Service administrative headquarters at Ely, Minnesota.

We appreciate the interest that the citizens of Ely have in getting modern and expanded facilities for all of the Forest Service programs with headquarters at this location. We know this is a key location and that to serve the public adequately new buildings are needed.

In analyzing the total Service-wide building construction needs for fiscal year 1968, it was necessary to eliminate most of the costly major projects in order to concentrate the available dollars in badly needed employee housing, particularly in those areas under 3,000 population, where suitable rental property for housing and office space is not available.

We are aware of the urgent needs at Ely and these needs will again be considered, along with all other administrative improvement needs, when we prepare our fiscal year 1969 building program. If possible, we may be able to begin the planning for this facility at that time.

We wish to thank you for your interest in our Forest Service program.

Sincerely yours,

CLAIRE HENDEE,
Deputy Chief.

RECREATION FACILITIES, LAKE MONROE, IND.

LETTER FROM LAKE MONROE ASSOCIATION

BLOOMINGTON, IND.

SENATOR CARL HAYDEN,
Chairman, Senate Appropriations Committee:

Congress has been most helpful in encouraging the devolpment of Lake Monroe in Southern Indiana as a multi-purpose reservoir. We are truly grateful for the interest and assistance which you have given to this and other similar projects. Lake Monroe has improved area flood control and opened a new economic potential in this region. The new 10,500 acre lake will soon be providing additional water supply for the City of Bloomington, Indiana University and hundreds of miles of new rural water lines as well as our own City of Bedford. Hundreds of acres for recreation and wildlife have been set aside by the federal and state governments and the tourism is having a dramatic impact on the area's six counties. Recently, for example, a St. Louis developer announced plans to invest $20,000,000 in a resort and housing complex near the lake. In addition, two power plants have been constructed downstream at Petersburg (Indianapolis Power and Light Co., and REMC) and we anticipate at least one major pulp mill in this area as a result of the increased guaranteed flow in White River. All this in what was a "poverty" area.

The above results confirm the fact that reservoir funds are really an investment in the future. They pay for themselves very quickly. But it still takes facilities to make the recreational benefits available to large numbers of people. So, in addition to thanking you for your past interest and support, I want to enlist your continued help.

Specifically, the U.S. Forest Service is developing a great public recreation area—easily accessible to over 2,000,000 people—at Hardin Ridge on Lake Monroe. Their current agency request for approximately $300,000 would provide funds for completion of a sanitation system and public sanitary facilities. We would hope that this can be approved—and augmented—to include a visitor information center, and amphitheatre, more camping units, a trail system, and a beach retaining wall. An Indiana University study, financed by ARA, indicated that well over 1,000,000 persons per year would be using these facilities. Actually, over 790,000 visited the lake area last year (Corps of Engineers count) even before beaches and other facilities were open. Obviously, the recreation potential is even greater than anticipated. We believe the accelerated development of facilities for these people will be a sound investment and urge your favorable consideration of funding requests for the Hoosier National Forest, particularly in the Lake Monroe area.

Cordially,

HAROLD GOSSMAN, *President.*

RECREATION FACILITIES, COUNCIL BLUFF LAKE, MISSOURI

STATEMENT OF MERAMEC BASIN ASSOCIATION

TO: THE CHAIRMAN, INTERIOR AND RELATED AGENCIES SUB-COMMITTEE OF THE SENATE APPROPRIATIONS COMMITTEE OF THE CONGRESS OF THE UNITED STATES:

The Meramec Basin Association is a not-for-profit Missouri corporation organized to represent the people of the Meramec Basin of Missouri and to work with them in securing sound use and preservation of the resources of the Basin and the closely adjacent localities having geographic, political, economic and social ties with the Basin area. The Association has 900 members and a board of 58 directors representing a cross section of interests and localities in the region.

In addition to the justification of the H–25 project provided by reports of both the U.S. Engineers and U. S. Dept. of Agriculture, and the social and economic changes which call for projects of this nature in the area, there is a strong, additional reason for moving H–25 reservoir to completion as part of this most unusual and wide scope of water resources development that is underway in our Basin.

The Basin development program embraces a 3,980 square miles drainage system of Ozark terrain. The combination of 5 U.S. Engineer mainstream reservoirs and 60 Department of Agriculture upland reservoirs called for in the planning will provide a water control and use system that has been much needed for flood control, recreation, water supply and related land treatment programs.

A very serious problem in connection with the H–25 project is the fact that the upland reservoir program of the U.S.D.A. is overshadowed in the minds of many people in the area by the large mainstream reservoir projects. Yet the upland program is designed to work with the mainstream program—both programs to operate as a system. And to achieve a great portion of the upland program—as well as some phases of the mainstream program, the participation of non-federal interests is required in financing, sponsorship, and operation.

Completion of H–25 (Council Bluff Lake is the name which has been selected for it) will not only meet pressing needs in its general locality but will give us the prime example needed in terms of encouragement and enlightenment, and a leadership project that will expedite the arrangements which are being shaped up at this time at state, regional and local levels for assuming responsibility for their share of financing and management.

The development called for in the entire cooperative effort based on the federal Basin plan will have—with no exaggeration—really gigantic economic, resource, and social values. The mainstream program is getting underway, thanks to the interest and financing provided by the Congress. There is an absolute minimum of opposition to any of the entire plan. Our people see the need for it. But seeing the need, and getting in gear for action, are two different matters.

Our Basin is largely Ozark hills and valleys—with, up to now, a rather static and lightly constituted population base. The development of new mines, the actualities of the water resource program—are all new to our people. With respect to the water program, construction of H–25 reservoir will aid us both materially and in building our peoples' confidence to move ahead.

Plans on paper are nice and create hope in many people. But—as we hope you will agree—we feel that incentive for action in such new programs comes strongest and most soundly from a good example of what can be done with a paper plan. Nothing could serve the cause more of advancing the needed program of the Department of Agriculture than completion of this Forest Service reservoir.

We respectfully request that the Appropriation Committee provide the necessary funds needed to build and develop H–25 reservoir by the U. S. Forest Service.

Respectfully submitted,

JAMES F. GAMBLE,
Executive Director.

LAND MANAGEMENT AND RESEARCH

LETTER FROM SENATOR MAGNUSON

UNITED STATES SENATE,
COMMITTEE ON APPROPRIATIONS,
March 13, 1967.

Hon. CARL HAYDEN,
Chairman, Senate Appropriations Committee,
Washington, D.C.

DEAR MR. CHAIRMAN: The Forest Service 1968 budget request for thinnings and salvage funds is, I understand, $1.4 million. This will provide enough money for 280 million feet of sales involving thinnings and salvage.

The Forest Service has informed me that the maximum volume of salvage and thinning material considered marketable without additional road construction is 423 million board feet. I have recently received word that the marketing of this maximum volume could be realized if an additional $700,000 were expended. This would bring the total appropriation to $2.1 million, but the increase in marketable material would be substantial.

The benefits of the salvage and thinning program are numerous. It allows for salvage of insect-disease killed or infested trees, advance salvage of small trees that otherwise would be broken during a normal logging operation, salvage of broken chunks and pieces after a normal logging operation, salvage of low value species requiring special markets, and commercial thinnings in immature stands. The benefits of this program, I understand, are in direct proportion to the volume of the thinnings and salvage operation.

I respectfully urge you to give every possible consideration to the above request for increased funding.

Sincerely yours,

WARREN G. MAGNUSON.

LETTER FROM SENATOR FULBRIGHT

UNITED STATES SENATE,
Washington, D.C., March 14, 1967.

Hon. CARL HAYDEN,
Chairman, Committee on Appropriations,
1235 New Senate Office Building, Washington, D.C.

DEAR MR. CHAIRMAN: Enclosed for your consideration is a letter dated March 9 addressed to me by Mr. S. V. Sihvonen, Manager of the Georgia-Pacific Corporation Division Office in Crossett, Arkansas. This letter points out the need for appropriations to support the Southern Hardwoods Laboratory in Stoneville, Mississippi, and to construct a Seed Research Laboratory at Mississippi State University. Both these activities are important to the timber industry in Arkansas, and I hope that the necessary funds may be provided.

With best wishes, I am,

Sincerely yours,

J. W. FULBRIGHT.

LETTER FROM GEORGIA-PACIFIC CORPORATION

MARCH 9, 1967.

Hon. J. W. FULBRIGHT,
Senate Office Building,
Washington 25, D.C.

DEAR SENATOR FULBRIGHT: The wood-using industries in the lower South rely a great deal on the knowledge of growing and using hardwood resources that the Southern Hardwoods Laboratory at Stoneville, Mississippi, has developed in recent years. This important research facility has performed a vital service to industry by furthering this knowledge and if it is to continue this much needed research, additional support is required to adequately staff and operate the Laboratory. Last year, the Senate approved $250,000 in support of this program, but the amount was reduced to $125,000 by the Joint-conference Committee.

Significant progress of great value has been made at Stoneville but increased demands for quality sawlogs and pulpwood warrants an acceleration in this basic research. An increase of $125,000, the amount of the reduction for last year, is urgently needed if the research program is to reach an adequate, more useful level.

In addition to this need, there is a requirement for construction of a Seed Research Laboratory at Mississippi State University to facilitate research into technology and physiology of seed production of Eastern tree species. The U.S. Forest Service established this program in 1966 on the campus of Mississippi State University under the administration of the Southern Forest Experiment Station. It is fitting that immediate research will concentrate on the valuable Southern hardwoods where present knowledge is limited. This project was located at State College to utilize valuable assistance from Mississippi State University scientists. At present the work is being conducted in borrowed and rented facilities of the University and the research effort is limited by this arrangement. To facilitate the program, preliminary plans for construction have been completed and $290,000 will be required for construction of this much needed facility in fiscal year 1968.

The Georgia-Pacific Corporation is highly interested in its hardwood resources in Arkansas, Louisiana, Mississippi and the Appalachians. One-seventh of our extensive land holdings are in permanent hardwood sites and approximately one-fifth of our raw material is hardwood.

Loss of hardwood forest land to agriculture and other uses has amounted to more than a million acres in the last four years. This dictates that we must learn how to grow more hardwood on less and less area in the future. Also, development of methods and means for preventing and controlling value damaging insects and disease, as well as learning new uses for all species of varying grades, are imperative if we are to progress in the hardwood business.

Finding answers to the problems facing us today through the type of research carried on by these facilities will, no doubt, lead to expansion of the hardwood-using industries of the South. This will have a highly desirable economic effect on our State as well as the South as a whole.

For these reasons we wish to urge that you strongly consider the $125,000 additional support for the Southern Hardwoods Laboratory and the $290,000 for construction of a Seed Research Laboratory when this matter is presented before the House Subcommittee on Appropriations on March 16.

Sincerely,

S. V. Sihvonen, *Manager.*

STATEMENT OF C. H. LEWIS TIMBER COMPANY

I am Charles H. Lewis, Jr., owner and operator of the C. H. Lewis Timber Company, Zachary, La. In previous appearances before this body, I was serving in the capacity of Executive Director of The Louisiana Forestry Association and only academically familiar with the subject on which I will speak today. In my present position, I am daily faced with the problems of hardwood management and am directly concerned with the ever-growing need for greater production of higher quality species while sites for hardwood culture are rapidly being lost to impoundments and agricultural clearing.

Forty-five percent of the national production of hardwood sawtimber is produced on the 45 million acres of hardwood forests in the Mississippi River Delta and similar sites in the South. Answers are urgently needed for a number of serious problems facing southern hardwood timber growers.

Studies of soil and site requirements and the strengthening of tree-improvement research are necessary. Research on basic water relationships in southern bottomland forests needs to be strengthened. Flooding, drainage, and other water-regulation measures to favor timber growth should be perfected so that they can be prescribed for different bottomland conditions.

In the lower Mississippi Delta region and in the lower reaches of the other main rivers crossing the Coastal Plain, stands of tupelo and cypress occupy extensive swampland areas. Tupelo, the most widely occurring and fastest growing species in the swamp forest, is valuable for pulp and container veneer. It grows in previously unmanaged stands, however, and little is known about methods for regenerating a new crop to insure future supplies. Research will concentrate on determination of the soil and site requirements favoring continuous management for tupelo, and on effective techniques for planting the species.

Animal damage, which is on the increase in southern bottomland hardwoods, is most severe in planted stands but is also serious in extensive natural forests of cottonwood, sweetgum, and other important species. Deer are the primary cause, but nutria and beaver cause serious losses, as well. Animal damage control may be possible through providing alternate food supplies, the use of repellents, the use of less palatable species or strains of trees, or other measures. These areas are in urgent need of exploration by research.

Insect losses in these forests are heavy. In the past decade, defoliators have killed trees and reduced the growth rate on over 3 million acres. Borers attack living trees and degrade the wood.

The development of preventive and control measures for hardwood borers, defoliators, and insects damaging hardwood regeneration and young stands, will be permitted by increased hardwood insect research. The factors influencing insect attack in the tension zones adjacent to the Great Plains, particularly in Texas, where even slight reductions in rainfall are followed by excessive dying of species such as the live oaks, are in immediate and urgent need of increased study.

Facilities for this increased research are available at Stoneville. A $250,000 annual increase was requested for fiscal year 1967. The $125,000 granted permitted a good start on research in several of the listed problem areas. A further increase of $125,000 for fiscal year 1968 would permit an increase research effort as a badly needed next step in intensifying work on southern hardwood production and protection.

Your Subcommittee, we are sure, recognizes the enormity of the problems facing the southern hardwood industry. The Louisiana Forestry Association strongly urges the members of this Subcommittee and the Congress to seriously consider an orderly progression of increased research in bottomland hardwood production and protection at Stoneville, and including research on hardwood seed technology and physiology at State College, Mississippi. To meet the hardwood needs of the South and the Nation within the initial years ahead, a total expansion of research of $500,000 merits your most serious consideration. This increase should be made in a series of orderly increments over the next four to five years and as justified to your Subcommittee for the program areas we have described.

STATEMENT OF LOUISIANA FORESTRY ASSOCIATION

Ladies and gentlemen, I am William Matthews, Executive Director of The Louisiana Forestry Association, which consists of 2,000 Tree Farmers, forest landowners, and other citizens interested in the welfare of forestry. The organization I represent has testified for research several times in the past, and with your help we have an excellent, modern Forest Research Center at Alexandria, Louisiana. I thought you'd like to know this Center is highly productive and we are pleased with the work of all Projects located there. So I'd like to thank you for your support in the past.

I am here today on behalf of Forest Insect Research, which is one of the units at our Alexandria Research Center. This unit has a team of scientists concentrating research on the southern pine beetle, which has reached the epidemic stage in many parts of the South today.

This tiny insect is a major killer of southern pines. Tunnels made by parent beetles beneath the bark quickly kill the trees and destroy vast stands of timber. In the past decade, explosive epidemics from Virginia to Texas have claimed enough timber to build 100,000 houses.

Severe outbreaks are still going on throughout most southern states today, and losses resulting from them are greater than those caused by wildfire, diseases, and all other pests combined.

Pathetically, there is no known practical method of control available to landowners. Millions of dollars being spent in attempts to suppress the beetle have completely failed. New epidemics continue to reappear, often in the same stands.

We now realize that we must tackle the problem in a different way. And this new approach is to improvise effective and economical chemical control methods, and to develop *indirect* measures that will prevent future outbreaks. This latter objective is determining methods of managing stands so that they will be inhospitable to the beetle, and how to destroy the beetle by using natural enemies, such as parasites, predators, and disease, as a form of biological warfare. The possibilities of creating more vigorous stands by management practices, and of mass rearing, timely release, and encouragement of natural enemies, hold considerable promise as more economical, longer lasting, and safer controls than are possible by chemical means.

(There are many natural enemies of the southern pine beetle and here is an example of one predator known as the checkered beetle. The parent beetle is much larger than its prey, and pounces upon and devours hundreds of bark beetles as they attempt to bore into the tree.)

Here is a photograph of an immature checkered beetle feeding upon a bark beetle grub. Unlike the adult, it lives within the bark beetle tunnels and destroys young broods in all stages of development.)

Although practical and money-saving results are anticipated from the fundamental and complex research underway, the work is seriously hampered by a lack of funds for supporting personnel and travel. New outbreaks, which are constantly springing up all over the South, are compounding Project efforts by throwing a heavier load upon the scientists and the facilities with which they have to work.

So, what I am asking today is just enough money to strengthen the Project sufficiently to carry out its important mission: that of solving the southern pine beetle problem. We feel that an increase of $100,000 in Project funds will be sufficient for the scientists to carry out their assigned responsibility throughout some 80 million acres of pineywoods in 10 southern states. This increase will enable the unit to employ one biochemist and additional technicians to support the research staff. These additions will relieve the scientists from routine field and laboratory duties, and thus enable them to meet new and challenging leads that have already developed from their findings. We urge your serious consideration of the complexity of the beetle problem and the rewards that most certainly will result from the proposed staff strengthening.

LETTER FROM SENATOR LONG (MO.)

UNITED STATES SENATE,
COMMITTEE ON BANKING AND CURRENCY,
March 20, 1967.

Hon. CARL HAYDEN,
Chairman, Subcommittee on Interior Department and Related Agencies,
Senate Committee on Appropriations, Washington, D.C.

DEAR MR. CHAIRMAN: The purpose of this letter is to request that your Subcommittee consider an appropriation increase of $160,000 to the Forest Service, Department of Agriculture, for forest wildlife habitat research in Missouri. This amount would be consistent with the "National Forestry Research Program" presented to the Congress in 1964 and the U.S. Department of Agriculture's "A National Program of Research for Agriculture," presented to the Congress in October of 1966.

The need for wildlife habitat management research in Missouri has been presented to your Subcommittee previously. Personal testimony and correspondence from officials of the Missouri Department of Conservation, the University of Missouri, and others were delivered in the years 1963, 1964, and 1965.

Tremendous changes are being made in the living conditions of wild animals due to the conversion of timber to range. The average acreage of woodland converted through spraying to range in Missouri, Arkansas, Oklahoma, and Kansas is now 250,000 acres per year. It is estimated that over 1.5 million acres have been treated in the past 10 years.

Research is needed to find out how to make this new land use practice improve the habitat for fish and game, or to prevent its deterioration. In addition to the practice of spraying timber to convert it to range, forest management practices are changing from "selective cutting" to clearcutting. Research is needed to find out how this system can be handled for the maximum production and maintenance of wildlife habitat.

The opportunity for productive, cooperative research in Missouri is excellent. The State Conservation Department, the University of Missouri, and the Bureau of Sport Fisheries and Wildlife in the U. S. Department of the Interior all are prepared to cooperate with the Forest Service in such a study.

An appropriation of $160,000 would provide for the salaries of five scientists, student trainees, technical assistance, clerical staff, scientific equipment, costs of conducting laboratory and field research and other essential services. It is estimated that approximately one-fourth of the funds would be used in habitat evaluation research, one-half on habitat improvement research, and one-fourth on research dealing with management of the habitat.

I would certainly appreciate your Subcommittee giving every possible consideration to this matter.

Sincerely,

EDWARD V. LONG.

STATEMENT OF FOREST COMMISSIONER OF MAINE

It is a privilege and a pleasure to submit by letter to your Committee a statement about the need for an increase in the Forest Service appropriation for Forest Survey and particularly about the need for an increase to the Northeastern Forest Experiment Station for Surveys in our area. I understand that the current authorization for Forest Survey is 2½ million dollars and that the 1967 appropriation was $2,055,000. I strongly recommend that the $445,000 authorized additional funds be appropriated this year. Immediate consideration should also be given to legislative action necessary to increase the authorization limit to allow for the expanding demands for current and comprehensive Forest Surveys. It is my understanding that Senator Ellender has submitted Senate Bill #1136 with the provision to increase the present authorization of $2.5 million. I support this proposed amendment to Section 9 of the Forest Survey Act of 1928.

I am requesting the 1968 increase because the survey in our area, and I'm sure in other areas too, provides invaluable state-by-state forest resource information on a recurrent basis. Our industries depend on up-to-date knowledge of the immediate availability and changing trends in timber supplies to guide their decisions regarding land acquisition and procurement programs, and the feasibility of and locations for new or expanded wood using plants. Our State Forestry program depends on the Survey to provide basic data for program direction. The Survey provides much of the essential information needed for special programs to build up the local economy in under developed areas. Further, Forest Survey information guides management decisions on industrial forests and other private woodlands. However, because of insufficient funds resurveys are being made too infrequently and with inadequate detail.

The Forest Service has a goal in our area of making resurveys on a 10-year interval. However, they have not been able to reach this goal. The Northeast Forest Experiment Station which does the Survey in the Northeast, now has crews in New York and Ohio. In these states the previous surveys were made 13 to 17 years ago. The forests of Maine are one of the few remaining scheduled for survey when these States are completed. However, the last survey in Maine was conducted in the period 1954 to 1958. The State of Maine and the Maine Forest Industries are anxious to get the resurvey underway as soon as possible. We urgently need this information because of the millions of dollars of expansion now underway and planned by the wood-using industries in our State. As cooperators we plan to assist the Forest Service in this Survey.

During recent years the costs of conducting Survey work has increased considerably. Along with this, increased demands on Forest Survey, particularly for information and data needed in line with modern resource decisions and action programs have greatly added to the cost of the program. Thus, even with substantial cooperation from states, industries, and other agencies, increased costs and demands have made it impossible to provide adequate timber inventories at the scheduled intervals within the appropriations provided by Congressional action.

In the "Pine Tree State" of Maine, forests are truly important. They cover 17 million acres or 86 percent of our land area. Our pulp and paper industry, fourth largest in the country, is the most important single industry in the State. It accounts for 27 percent of the value of all products manufactured in Maine. To keep this going, pulpwood flows in a steady stream from the forests to the mill. The lumber industry accounts for another 8 percent of the value of all products harvested. What happens to the timber industries in Maine will have major effect on our State's economy.

It is for these reasons that I urge you to give thoughtful consideration to $445,000 increase in Forest Survey funds. Of this increase at least one-third is needed in the Northeast to achieve a 10-year cycle for resurveys and to provide the answer we urgently need to guide the development of our forest based economy.

STATEMENT OF WESTERN FORESTRY AND CONSERVATION ASSOCIATION

The Forest Survey

Up-to-date and complete information on the acreage, volume, growth, use and loss of the nation's forests is necessary for planning the best utilization and management of these vital resources. Timber supply problems have increasingly plagued Western forest land owners and forest users during the past few years. The success of joint private and public efforts to solve these problems is dependent upon an understanding of forest resources and forest industry conditions.

Timber mortality is currently of great concern to this Association. It is estimated at almost 7 billion board feet annually in Oregon and Washington alone, which is equal to about two-fifths of the volume of timber harvested each year in these two leading forestry states.

To help cope with the problem of timber mortality and growth loss, our membership resolved at our last annual meeting that surveys should be accelerated and kept up-to-date as a basis for prompt utilization and marketing of mortality salvage and thinnings, and as a basis for joint public-private action programs aimed at controlling the natural agents so destructive of valuable timber.

"Western Forestry and Conservation Association is greatly concerned about the continuing mortality of timber and loss of growth from natural destructive agents. If the losses to mortality and growth from insects, disease, and animals can be recovered, they will add greatly to the volume that can be harvested for useful purposes.

"The Association recommends that the Forest Survey and other related surveys be directed toward prompt marketing and utilization of salvage, including mortality, thinnings, and other forest products which can increase forest yields on a profitable basis.

"The Association recognizes the progress accomplished through the cooperative efforts of public agencies and the forest products industries in the past several decades and urges continued effort be directed towards improvement of forest yields."

The nationwide Forest Survey is responsible for collecting and analyzing this kind of information. The Forest Survey should work jointly with forest economics research in timber supply analyses concerned with how much of the physical volume of the timber inventories are currently and prospectively available for economic use. For example, the lodgepole pine resources of the West are barely being utilized, yet there is over 53 billion board feet of sawtimber size. Logging residues are another problem in economic utilization of wood material needed to meet future demands. Special studies should be made to determine how much of this unused wood material is economically available and what problems prevent its current use. Several harvesting equipment manufacturers have expressed a need of this information from Forest Survey as a basis for their equipment development programs.

A major problem which the Forest Survey faces, and which is getting little or no attention at the present, is the problem of the relationships between the units of measure used in reporting inventory, timber harvest, mortality, growth and product output. This, and similar problems of Survey techniques, need to be solved by Forest Survey techniques research in order to make future reports and analyses more meaningful to the public. The Forest Survey techniques research project in Portland which serves all the West on these problems needs to be at least doubled in strength. Techniques developed in this project are also the basis for improvements in timber management planning inventories on the important federal lands in the West.

The remaining difference of $400,000 between the Forest Survey appropriation ceiling and the present appropriation is much needed. It could all be used effectively in the Western Forest Survey projects at Portland, Odgen, and Juneau. Since similar strengthening is needed through the nation, the ceiling should also be increased to permit increased appropriations.

The $103,000 proposed in the fiscal year 1968 budget is a small step in the right direction. The Association urges its support and early further increase.

Forest Engineering Research

The Forest Service has demonstrated and documented the large gains to be made from the development of aerial logging methods by forest engineering research. This project, located in Seattle, has a well-planned program of research to develop the needed aerial systems with the cooperation and assistance of the timber and logging equipment industries. All forest land users are vitally concerned with the need for logging systems that can efficiently harvest timber from areas that have special watershed, recreation and landscape values. The many benefits to be gained are related in detail in the record of the hearings last year. The Association supports the increase of $215,000 proposed in the national budget for fiscal year 1968 and urges further strengthening of this work as rapidly as orderly development permits.

Forest Genetics Research

The proposed increase for forest genetics research in the Administration's budget for the Forest Service is heartening to members of our Association. Scientific forest tree breeding offers a most promising and practical avenue for boosting timber yields and for minimizing timber losses caused by insects, disease, and animals.

The Douglas fir region of the Pacific Northwest affords especially bright prospects for rapid progress in tree improvement research and development. This region's large and diverse timber industry is dependent upon a continuing and increasing supply of raw material. The Northwest contains large areas of forest land suitable primarily for timber production. Its tree species exhibit a wide degree of genetic variation. And finally, it is a region where reforestation is accomplished to a large extent through field planting of nursery stock, which thus affords readymade avenues for rapidly introducing superior tree germ plasm into forest production. Timber production gains as high as 50 percent appear realizable for some Douglas fir forests within 20 years if a strong program of genetics research can be provided and carried forward aggressively. We strongly support this budget item of $560,000 for the Nation, and urge that the Douglas fir genetics research project at Corvallis be strengthened as rapidly as possible to its planned level.

Cooperative Forest Fire Research

Our Association is vitally concerned about the protection of forests from fire, and we are pleased to support the item in the Forest Service budget for fiscal year 1968 which calls for an increase of $200,000 for forest fire research. We understand that part of this increase will be used to establish a new cooperative forest fire research project at the University of Washington in Seattle. This unit will help to fill an urgent national need by stimulating cooperative fire research by graduate students, and by providing a much needed graduate training program for specialists in forest fire control science. We strongly favor the establishment of this cooperative project.

Modern Laboratories Essential for Efficient Research

The Western Forestry and Conservation Association commends the Congress for progress made last year toward providing more adequate laboratory facilities for forestry research programs in the Pacific Northwest. Planning funds were made available for the Range and Wildlife Habitat Laboratory at LaGrande, Oregon, and for the Forestry Sciences Laboratory at Corvallis, Oregon. These two planning jobs are moving along efficiently on schedule and will be completed before July 1, 1967. We recommend that construction funds for these two critically needed research facilities now be provided promptly. Construction funds were appropriated last year for the Silviculture and Animal Problems Laboratory at Olympia, Washington. This building is now well under way and it will materially help research progress on the Olympia, Washington projects for animal damage control and Douglas fir silviculture when it is occupied next fall. The Association recognized the gravity of the animal damage situation by passage of the following resolution in Portland, Oregon, at its annual meeting in December, 1966:

"Western Forestry and Conservation Association is concerned that long used rodenticides and repellents are being suppressed by regulatory agencies. In many areas, successful forest regeneration is dependent on rodent control.

"The Association recommends that research be expanded to find alternative materials and techniques for protecting seeds from rodents. Until such new materials and methods are available, reevaluation of the existing materials is needed in regard to proper dosages and application methods."

Bend Silviculture Research

Our Association members are disappointed to learn that the Forest Service budget for fiscal year 1968 does not include an increase for the research program of the Silviculture Laboratory at Bend, Oregon, even though this need was recognized by positive action in the Senate last year. We strongly reaffirm our recommendation of a year ago that the program of the Bend Laboratory be strengthened by providing sufficient funds to bring staffing up to the planned level. This Forest Service project carries the Federal responsibility for timber-growing research for all forest types in eastern Oregon and eastern Washington—a commercial forest empire aggregating 20 million acres. The difference between the value of current timber production in this area and the potential production that could be captured with the help of accelerated research is estimated at $50 million a year in stumpage value alone. We urge your continued efforts to get this research project operating at capacity.

Forest Recreation Research

Western forestry is increasingly concerned with the mounting pressures of outdoor recreation on the private and public forests of this nation. We note that the President shares this concern and proposes a $332,000 increase in forest recreation research for the Forest Service.

Recreation and tourism are growing rapidly. Both private and public lands are under increased pressure from people who want to use forests for purposes other than timber production.

We must understand the impact of recreation demands on our basic industry resource—the forests. Research should be directed toward learning how to integrate recreation use into sound, overall management of the forest resource. Recreation should be regarded as a forest product for which the user must pay his appropriate share, and it must be carefully coordinated with other types of forest use.

For these reasons, the Association urges strengthened Forest Service programs of forest recreation research, both biological and sociological. Full staffing of this important research would require an additional $200,000. This vital research program should be strengthened promptly and progressively to provide knowledge upon which to base full use of our forest potential without critical conflict.

STATEMENT OF NATIONAL FOREST PRODUCTS ASSOCIATION

I am Ralph D. Hodges, Jr., Vice President, Government Relations for the National Forest Products Association. NFPA, with headquarters in Washington, D.C., is a federation of seventeen regional, product and species associations representing the forest products industry from coast to coast.

Approximately one-third of our nation's timber supply comes from lands administered by federal agencies. While the Forest Service in the Department of Agriculture is the principal agency, several agencies in the Department of the Interior, principally the Bureau of Land Management and the Bureau of Indian Affairs, contribute substantially to our nation's wood supply. Consequently there are several items we would like to discuss with you.

National Forest Development Roads and Trails.—These funds are vitally needed to open up and make productive vast areas of national forest. This is extremely important in maintaining and improving the economies of hundreds of rural and timber areas. The productivity of these locked up federal lands can contribute much to the stability and the attractiveness of rural life. The timber that will be made accessible is also needed in our economy. It must be made accessible if the national forests are to contribute a share to our national economy.

Industry representatives worked successfully with the Forest Service and the Congress on legislation to facilitate cooperative road construction and road use agreements that help on management of intermingled federal and private lands.

Road construction and maintenance costs are shared on the basis of planned use. This undertaking has been highly successful. The Road and Trail funds need to be appropriated, however, in order for the national forests to bear a proper share.

Our industry also worked with the Public Works Committees in securing a substantial increase in the authorization level for forest development roads and trails—$170 million annually for 1968 and 1969. This is the amount necessary in order for the federal forest lands to be put under management on an orderly basis.

The budget request for 1968 is considerably below the authorization level, but is an increase of more than $9 million over 1967. This seems to be an intelligent step up toward the goal of about $170 million annually and will help the Forest Service to gear up to the authorized level.

Since funds are necessarily limited it is important that the maximum benefit be obtained from each dollar spent. The return to the local and regional economy is usually greatest when initial road construction is to a standard that will: (1) permit forest management including fire and insect protection; (2) provide economical log hauling; and (3) meet other anticipated uses in the immediate future. The emphasis should be on opening up new areas for forest management rather than upgrading existing roads. This will make a maximum contribution to our national wealth and sustenance of rural economies. We hope these funds won't be dissipated building or rebuilding roads to unnecessarily high standards.

Thinning and Salvage.—An increasing volume of our nation's wood supply will be coming from thinnings and salvage in our immature and young growth timber stands. We are developing techniques, machinery, and markets for the complete use of these thinnings. This gives us an over-all increase of about 40 percent in timber production over the rotation period.

Both the Forest Service and the Bureau of Land Management did a magnificent job in salvaging much of the 1962 Columbus Day blowdown in Oregon. This held insect infestations to a minimum and removed much material that was a serious fire danger. Our industry has also become more sophisticated in the utilization of this salvage material and in many instances is making an economic return from material that was wasted a few years ago. All this means added returns to the federal treasury from federal timber sales.

The Forest Service budget request for 1968 includes $1.4 million for thinning and salvage of about 280 million board feet. It is estimated that about 140 million board feet more could be harvested annually if an additional $700,000 were available. These sales are apparently more costly to administer, but as experience is gained efficiency should improve.

Hardwood Improvement Project.—This year's proposed Forest Service budget includes $300,000 for the so-called "Hardwood Improvement Project," an increase of $100,000 over the supplemental funds approved in October, 1966. This project was developed by the Forest Service and presented for your approval and funding in the supplemental appropriation bill in the closing days of the last Congress. There was no time, apparently, for consultation with the forest products industry which was the intended beneficiary of the project. The State Foresters in the intended areas also had no knowledge of the program.

We received several versions of what the project was supposed to do and why. The consensus among Forest Service people is that it is an intensified application of existing programs of Cooperative Forest Management and Utilization and Marketing. It was presented to this Subcommittee as the vehicle necessary to reduce hardwood lumber prices, which took a sharp upswing for a few weeks last spring, but then moderated sharply ever since.

The Forest Service has changed directions and locations several times with this program since the hearing last October. This points up the desirability of developing programs cooperatively with all those concerned. We suggest that on such programs this Subcommittee request that the Administrative branch consult with the landowners, industry and the State and local governments that will be affected.

We do want to publicly express the fact that the people in our industry are deeply conscious of the high degree of professional competence represented on this Subcommittee. It is heartening to know that these grave matters concerning the forest industries and our relationship to federal agencies are considered and dealt with by Members of the Senate whose expertise, exhaustive research, and dedication to these responsibilities are universally respected.

When we differ, as indeed we occasionally must, we do so with the confidence that this Subcommittee will finally act on the basis of sound information, clear understanding, and highly qualified judgment.

It is always a genuine pleasure to work with this Subcommittee, Mr. Chairman. Please accept the sincere appreciation of our industry.

STATEMENT OF THE AMERICAN FORESTRY ASSOCIATION

I am Kenneth B. Pomeroy, Chief Forester of The American Forestry Association.

In a sense the members of this organization served as mid-wives at the birth of the Forest Service. Ever since that memorable date six decades ago these people have kept in close touch with its development.

They noted with pleasure the tremendous strides in protecting the forests from fires. They applauded the achievements in timber management. And they eagerly awaited each new finding of research scientists.

In recent years Association members have been staunch supporters of the 1961 Development Program for the National Forests and the 1964 National Forest Research Program. Unfortunately, these well-conceived plans are only being funded at two-thirds of the projected rate for National Forest development of one-third the planned rate for forestry research.

We recognize the exigencies now facing the Nation and we urge Congress to do whatever is necessary to bring hostilities in Vietnam to a successful conclusion. When this emergency is past, we shall urge Congress to fully fund both the National Forest and the Forest Research programs.

Meanwhile, we commend the Bureau of the Budget for presenting a well-conceived financial plan for the Forest Service for Fiscal Year 1968. We urge its implementation by the Congress.

FORESTRY RESEARCH IN WASHINGTON

LETTER FROM SENATOR MAGNUSON

MARCH 10, 1967.

Hon. CARL HAYDEN,
Chairman, Senate Appropriations Committee,
1235 Senate Office Building, Washington, D.C.

DEAR MR. CHAIRMAN: The Forest Service, in cooperation with industry, other government agencies, the states, and universities, has undertaken various research projects designed to increase man's general knowledge of the forest and to assure his efficient utilization and allocation of all its resources. Several projects are of particular interest to me.

An increase of funds for forest recreation research of $332,000 is needed if this program is to fulfill its purpose. Included in this program would be the establishment of a Forest Recreation unit in cooperation with the University of Washington at Seattle.

The Forest Hydrology Laboratory at Wenatchee, Washington, will need an increase of $75,000 in fiscal year 1968.

At Olympia, Washington, a Silviculture and Animal Problems Laboratory is in the process of being constructed and will soon be ready for use. One of the projects located there, the Douglas fir silviculture project, will require an increase of $160,000 to bring the staff complement up to the planned level.

The Forest Service fiscal year 1968 budget includes the establishment of a cooperative forest fire research unit at the University of Washington. I understand that $30,000 of the budget increase will go toward this project.

One of the most intriguing of the Forest Service Research programs is the Forest Engineering Research project in Seattle where, among other things, studies are being made to determine the utility of employing helicopters and balloons in logging. The President's budget proposal of $215,000 nationally is necessary to continue these kinds of efforts in forest engineering.

Nationally insects and diseases cause 2,400,000,000 cubic feet mortality loss every year. Additionally revenues are needed to obtain results from pest control research.

On March 6, 1967, I sent you a copy of a statement by the Washington State Commissioner of Public Lands, Bert L. Cole, which provides justification for the above budget increases. James S. Bethel, Dean of the College of Forestry at the University of Washington, has provided me with another very succinct statement of justification. Dean Bethel's statement is enclosed, and I request that his statement be inserted in the Hearing Record. Also enclosed is a statement of justification for the Wenatchee, Washington Forest Hydrology Laboratory prepared by the Laboratory and provided me by Mr. Sam Boddy of the Chelan County Industrial Development Council, Inc. I request that this statement also be made a part of the record.

I respectfully urge you to give every possible consideration to the above requests for increased funding of these very vital Forest Service Research programs.

Sincerely yours,

WARREN G. MAGNUSON.

STATEMENT OF DEAN JAMES S. BETHEL

In these days of rapidly changing technologies and accelerating demands of our natural resources, it is increasingly clear that we must strive to use those resources more efficiently. It is highly urgent that we provide now for improving the efficiency in utilizing our forest resources. Forestry research has great potential for contributing to that efficiency. I want to commend the Administration's budget proposal for providing greatly needed added strength to the Forest Service research program.

Forest Recreation Research

We need to be concerned not only with the commodity products from the forest but also with the social values involved. This will require more research related to those social values and recreational uses of the forest.

Recreation and tourism are growing quite rapidly in the Pacific Northwest and will become much more significant in the regional economy. A recent study predicts that demand for outdoor recreation will be four times greater in the year 2000 than it was in 1960 in the Pacific Northwest.

Recreation depends in large part upon the scenic quality of the region. The Pacific Northwest is noted for the high quality of the natural environment and its relatively undeveloped status. Where recreation was once an incidental use of the forest, it is in some instances the major use today. The whole forest, both public and private, is involved.

Recreation demands are not only increasing in quantity. They are also becoming much more varied, more complex, and often more sophisticated. A multitude of new problems are created in integrating forest recreation with other uses of the forest.

Many factors influencing the administration of wildland recreation are not clearly understood at this time. This was evident in the North Cascades Study Report and subsequent hearings. There is only a limited base of scientific knowledge derived from recreation research upon which to make recreation decisions. As a result, many decisions involving recreation are still made upon the basis of a good deal of emotion. We need to know what people want when they seek forest recreation. We also need to develop reliable procedures for predicting trends and future needs for recreation and the impact upon the forest resource.

These issues will require the involvement of social scientists as well as biological specialists. There is presently a deficiency of competent recreational research personnel to carry out the necessary research. We need to increase the graduate training in the applied aspects of a wide variety of disciplines involved in wildland recreation.

We have been making some progress in meeting this demand at the University of Washington. We have increased our staff in forest recreation and are in the process of strengthening the curricula for recreation students at both the graduate and undergraduate level. The University faculty has demonstrated outstanding talent and leadership in recreation policy in the areas of forestry, sociology, economics and fishery resources. In 1965, for example, the College of Forestry sponsored a Wildland Recreation Management Seminar which featured the interdisciplinary approach necessary for recreational management.

I also urge accelerated research effort on the management of wilderness and related recreation areas currently underway by the Forest Service.

The University of Washington has been working closely with the Forest Service on studies to determine the attitudes and preferences of recreationists who use wilderness and campground areas in national forests and national parks. Other studies have included the physical impact on the wilderness environment and the interpretation of the forest environment and natural resource management for the recreationist.

Forest Service plans call for the establishment of a Forest Recreation Research unit in cooperation with the University of Washington. The establishment of such a cooperative recreation unit at the University of Washington is urgently needed now. The current research effort of the Forest Service in recreation in the Northwest is severely limited by an annual budget of only $35,000. An additional $200,000 is needed to launch a full-scale recreation research program by the Forest Service in the Pacific Northwest. I strongly urge the strengthening of this work as rapidly as possible. The proposal to increase the funds for recreation research in the Forest Service by $332,000 is long overdue and urgently needed.

Forest Hydrology Laboratory, Wenatchee, Washington

Five scientists and their assistants are presently employed at the Forest Hydrology Laboratory. They are measuring streamflow under natural conditions to determine the relationships between vegetation and water runoff. They are determining the amounts of soil erosion that result from logging, road building and other management practices, as well as the amount of water that is used by trees. All of these studies are important to us in the Pacific Northwest where distribution and timing of watershed runoff is particularly important to the farm and fruit crops of eastern Washington as well as for the production of hydroelectric power.

The University of Washington staff members work closely with the Forest Service scientists at the Hydrology Laboratory. Undergraduate and graduate students participate in the studies at the Laboratory during the summer season. The Forest Service staff, in turn, stimulates the application of research results by participating in teaching and seminars at the University. An additional $75,000 is needed to operate the Wenatchee Laboratory at its optimum level.

Olympia, Washington Laboratory

Last year the Congress provided funds for building the much needed Silviculture and Animal Problems Laboratory at Olympia. Construction has moved ahead rapidly and at the present rate of progress, the building will be finished and ready for occupancy by scientists from both the Forest Service and the Bureau of Sports Fisheries and Wildlife by September, 1967. These facilities will help to stimulate research progress in the control of animal damage to forest trees and the intensive culture of young Douglas-fir forests.

I am concerned, however, about building up our knowledge of how to grow Douglas-fir more intensively as a crop. The Douglas-fir silviculture project, with three scientists, is only half-staffed. This project is supposed to fulfill the Federal responsibility for the development and refinement of cultural practices to increase timber yields on some 20 million acres of Douglas-fir timberland. A program increase of $150,000, needed to correst this deficiency, can be justified many times over by the critical West Coast timber supply situation.

Cooperation in Forest Fire Research

After more than 60 years of organized forest fire protection in the United States, we still burn some 2 to 4 million acres every year on lands protected by all agencies. We spend some $100 million annually in our efforts to prevent fires and to extinguish those that do occur. In making further progress, two major requirements must be met. First, there is a need to train more specialists in the advanced techniques of forest fire control. Second, we must involve the university scientific community more fully in forest fire research.

We are developing a strong program in forest fire science at the University of Washington, and will offer special graduate courses in this field starting next fall. Although this program will be centered in the College of Forestry, it will involve strong participation by other departments at the University, including meteorology, engineering, and the physical sciences.

We are pleased to learn that the Forest Service budget for fiscal year 1968 will include the establishment of a cooperative forest fire research unit on our campus in Seattle. This move will help to improve the quality of our graduate training program and will, at the same time, greatly accelerate progress in cooperative forest fire research. It will further help to orient our fire training and research efforts more closely to forest fire protection problems that are of regional and national significance. We strongly endorse the establishment of this cooperative unit.

Forest Engineering

The Forest Engineering Research project in Seattle has been operating at less than one-quarter of the level indicated as necessary in the "National Forestry Research Program."

Even so, valuable progress has been made in cooperation with the University of Washington with the timber, logging equipment, and other industries. A handbook of wire rope tensions and deflections has been developed to provide engineers with the basic knowledge needed to lay out logging skylines more effectively. The potential efficiencies of improved skylines yet to be developed by further research have been shown to be impressive. The improved capabilities of wide single tires as replacements for dual tires on logging trucks have been clarified. Preliminary tests of helicopters in logging have been completed and summarized. Initial studies of balloon logging indicate that economic applications could be developed through intensified research.

The problems being investigated are much too complex and too important in relation to the current low level of research effort. Much greater emphasis is needed on these projects if we are to take full advantage of the potential benefits from the development of advanced aerial logging systems. The appropriation hearings last year indicated that the Seattle project alone could effectively utilize considerably more than the entire increase of $215,000 proposed for this work nationally in the budget for fiscal year 1968.

Summary

In summary, the proposed increase in the Forest Service budget for forestry research is vital to meeting the research needs of the nation. In addition to the above specific areas, we in the Northwest are vitally interested in the projected increases for research in the areas of genetics, pathology, and economics. This additional support is critically needed to expand current research programs and to undertake new aspects of forestry research.

The Forestry Research Task Force has indicated that approximately $41 million will be needed for forestry research by 1972. This amounts to an annual increase of about $5 million over current research levels. Obviously, this increase must come from combined Federal, state and local efforts. However, the requested increases in Forest Service research is vitally needed if we are to reach the minimum total level indicated.

STATEMENT OF SAM BODDY

The Forest Hydrology Laboratory in Wenatchee, Washington, is a recent addition to research installations operated by the Forest Service, U.S. Department of Agriculture, in the Pacific Northwest. The main purpose of this unit is to provide facilities for basic forest soil and water research. It also functions as a base for applied watershed management research in the forests and associated ranges of the Mid-Columbia Basin in Washington and Oregon.

The forests and ranges of Washington and Oregon supply primary raw products for the region and occupy the source areas for dependable supplies of water so vital to economic development. For example, in Central Washington, seven major tributaries of the Columbia River flowing from the east side of the Cascade Range produce approximately 8 million acre-feet per year. Seven million acre-feet of water are produced from mountain watersheds in eastern Oregon. These water supplies are the basis for a billion-dollar economy in agriculture, wood utilization, metal processing, and recreation. The value of farm and fruit crops made possible through irrigation average $160 million annually and provide employment for 100,000 people in five eastern Washington counties. Clean streams and lakes are the basis of a recreation industry which brings $50–80 million to the area each year, and ample hydro-electric power supplies have created an incentive for an industrial growth that is just beginning to develop.

Land managing agencies and owners have the responsibility for seeing that timber in water-source areas is harvested properly, that the ranges are not overgrazed, and that recreation potentialities are fully developed. All these uses affect water supply, and they must be geared to the requirements for clean rivers and regulated flows.

In 1956, the Pacific Northwest Forest and Range Experiment Station, the research arm of the Forest Service in Washington and Oregon, began a program of watershed management research in Wenatchee. It started with one scientist and has gradually increased to five. At the outset it was recognized that there were many problems on the forest-range watersheds that needed solution. With the manpower and facilities available, it has been possible to attack a few of the important ones with the plan that the project will be strengthened at the earliest opportunity to permit attention to the others. At present, work is centered on two high-priority problems, water yield improvement and erosion reduction.

Improvement of water yield

Much of the irrigated land in eastern Washington and Oregon suffers a loss in production because of dwindling water supply during the last half of the growing season. This poses many questions about possibilities of managing forest lands to increase waterflow.

Facilities provided by the Forest Hydrology Laboratory permit study of the water cycle, a key to understanding water yield. It has been possible, for example, to measure how much water is consumed by different species of forest trees. These studies are providing clues to possible measures for salvaging water for downstream use. The climatic environment in forests is also being studied to determine how changes in cover will affect local temperature, humidity, and wind movement. Water losses by evaporation and transpiration are influenced by these environmental factors, and reduction of such losses, where feasible, can increase the supply of usable water for human needs.

Erosion reduction

Certain uses of forest and rangelands—construction of roads, timber harvesting, grazing, and recreational use—disturb the soil. A frequent result is accelerated loss of soil by erosion. Eroded soil fills streambeds, irrigation ditches, and reservoirs with silt, adds to the cost of maintaining water control structures, and makes water unfit for many uses. Times of greatest damage are during spring flood periods when rain combines with snowmelt and during summer months when highly localized rainstorms hit the eastern Cascade Range, the Okanogan Highlands, and the Blue and Ochoco Mountains. Maintenance, cleanup, and repair of roads, irrigation ditches, impoundments and stream channels cost millions of dollars annually in Oregon and Washington. Coupled with this is a reduction in productive capacity on land from which topsoil has been removed by erosion.

To solve the complicated problems of erosion, it is necessary to learn more about forest soils. Basic information is being uncovered by intensive examination in the Forest Hydrology Laboratory. Results, translated into usable guides for the land manager, will enable him to predict and avoid areas where serious erosion is likely to occur. Concurrently, methods designed to minimize erosion from road construction, logging, and grazing are being tested and improved. The ultimate objective is not to restrict legitimate uses of forest and rangelands but to devise efficient guidelines, adapted to special requirements of forest soils, that will achieve all potential multiple benefits of wildland culture.

Coupled with the problem of reducing erosion is the equally important task of rebuilding land which has deteriorated from past abuse. There are more than 2 million acres of seriously eroding land in eastern Washington and Oregon that need to be restored to a pleasing and productive landscape. In their present condition, they are a constant threat to downstream values. On these flood-source areas, topsoil is generally absent and moisture storage is seriously reduced. Water runs rapidly off the surface of these lands causing erratic streamflow and still more erosion and loss in production.

Known species and methods of planting usually fail on these problem lands. Experiments with fertilizer have shown some promise where native vegetation still remains to respond. Other methods to slow down surface runoff and stabilize soil are being explored. Among them are contour trenches, diversions, water spreaders, and gulley plugs.

The objective of this research is to develop techniques and plant materials which will be most efficient in reclaiming depleted sites. The need is urgent in view of the increasing recreation use, particularly in the fragile, high altitude areas where much of the land needing rehabilitation is found.

The Forest Hydrology Laboratory

A focal point for watershed research in eastern Washington and Oregon is provided by the Forest Hydrology Laboratory in Wenatchee. Construction of the first stage was authorized by Congress in fiscal year 1962, with an appropriation of $300,000. A subsequent allotment of $36,000 in Accelerated Public Works funds provided for construction of a small greenhouse and for site improvement.

The Laboratory serves as a base of operations for watershed research in the outdoor laboratory of eastern Washington and Oregon. It also provides a place for research under carefully controlled environmental conditions not possible in field experiments.

This intensive research effort is using the combined skills of specialists who are highly trained in several disciplines. Modern equpment gives them capability in the latest research techniques. Only through this fundamental team approach can progress be made on some of the difficult watershed management problems facing us today. Trial-and-error or "applied" research on which we have relied in the past has not been adequate to provide a valid basis for intelligent watershed management decisions.

The Laboratory is presently staffed with five scientists and six supporting personnel. Five additional scientists with their supporting personnel will be needed to carry out the long-range research program. By FY 1977, this level of operation will require a budget of approximately $350,000 to cover salaries, equipment, and other operating costs.

The outlook

A key factor in developing the long-range program is the need for orderly growth in staffing and planned expansion of workable units throughout subsequent stages of laboratory construction. Since its organization in 1956, watershed research at Wenatchee has developed a broadly based comprehensive attack upon the problem of water yield improvement. There is now need for increasing research activity in watershed rehabilitation. Thousands of acres of lands once destructively grazed remain in poor hydrologic condition. Action programs of the national forests within the region are annually applying interim methods having minimum research bases to 40–50,000 acres of critical erosion seeding and revegetation projects.

Strengthening the research program in watershed rehabilitation will require addition of a Soil Physicist and a Range Ecologist to the present research team of five scientists. Seven full-time scientists and their support personnel will fully utilize the Hydrology Laboratory facility at its present stage of development.

Foregoing soils research has established relationships between soil characteristics inherent from parent materials, and soil erosion hazard or potential. It is now necessary to relate these soil characteristics to hydrologic behavior, i.e., soil-water reception, storage, and drainage. These relationships involve consideration of porosity, pore size, texture or particle size distribution, and structure as they relate to water-film forces. There is also need to investigate the ways in which the pronounced effects of vegetation upon water storage and drainage are exerted in restoring permeability and porosity.

Production of the greatest quantity of high quality water requires maintenance and/or improvement of the soil-protective properties of vegetation. A great deal of research effort has been expended in certain areas to discover and propagate exotic plants which may have outstanding features for erosion control, particularly in lower elevations. Few of these species have proved to be adaptable to the severe, droughty conditions commonly encountered in the high altitude problem areas of eastern Oregon and Washington. Yet, within this area there are numerous examples of clearcut evidence of the beneficial effects of adapted, fibrous-rooted indigenous species. Native browse, grass, grasslike, legume, and other herbaceous plants that provide dense, permanent soil cover should be screened for their erosion-controlling potential and ease of establishment. There are indications that while a complete herbaceous cover controls erosion, it does not strongly control runoff. Therefore, criteria are needed to establish minimum amounts of herbaceous cover needed to protect against soil movement, yet enhance establishment of ultimate vegetation cover.

LETTER FROM WASHINGTON COMMISSIONER OF PUBLIC LANDS

March 2, 1967.

Hon. Warren G. Magnuson,
U.S. Senator,
Room 127, Senate Office Building,
Washington, D.C.

Dear Warren: In reviewing the Administration's budget for fiscal year 1968, I am encouraged to note that some modest strengthening is recommended for the forestry research program of the U.S. Forest Service.

Our expanding population and our increasing commitments—both domestic and overseas—are accelerating the pressures on our forests for more timber products, more opportunity for constructive outdoor recreation, and for more pure water for our communities, our irrigation agriculture and hydroelectric power. Intensifying the management of forests to meet the needs will require better technologies than present knowledge can provide.

I know you understand well the importance of organized research in dealing with this situation. For this reason I am reporting to you on several Forest Service research activities with which I am personally familiar, and which need to be strengthened at the earliest opportunity.

Please include this letter and my enclosed statement in the record of the hearings. I know you are acquainted with much of this work, and I deeply appreciate your careful consideration of projects so important to the continued progress of our State and Nation.

Very sincerely yours,

Bert L. Cole,
Commissioner of Public Lands.

STATEMENT OF WASHINGTON COMMISSIONER OF PUBLIC LANDS

The timber products industries are of vital importance to the Pacific Northwest and to the Nation. Currently in Washington and Oregon, these industries are annually adding some $3.8 billion to our gross two-state product value, and a total of more than $7.5 billion to our gross national production of goods and services.

The rising demand for wood products, both for domestic use and for export, sharpens the need to increase timber yields. At the same time, the demands for the non-timber products and services of the forest—outdoor recreation, wildlife, range forage and water—have increased even more sharply and promise to continue upward.

The pressures for managing, protecting and using our forests more efficiently were never greater.

Olympia Research Laboratory

In efforts to help meet this need, the Washington State Department of Natural Resources and the U. S. Forest Service are active partners in two cooperative forestry research projects at Olympia, Washington.

One project, seeks to increase the yield of Douglas-fir forests through the development of more efficient cultural practices such as thinning, fertilizing, and the prompt start of a new tree crop after mature trees have been harvested. As the most important timber tree in Oregon, Washington, and Northern California, Douglas-fir is the primary source of raw material for the wood product industries in these areas.

The second project at Olympia is developing effective, economical and safe controls for the troublesome losses that animals—rodents, rabbits, porcupine, bear, deer and elk—are causing in our Nation's forests. In Oregon and Washington alone, the total damage caused by animals to forest trees, seeds and seedlings is estimated at $15 million annually. The U.S. Bureau of Sports Fisheries and Wildlife is also participating actively in this animal damage control research.

Last year Congress provided funds for the Silviculture and Animal Problems Laboratory at Olympia. The contract for this $45,000 facility was awarded last November; construction was 40 percent complete on February 1, and the laboratory will be ready for occupancy by early fall. This building will speed research progress and will, in addition, be an example of the efficient use of wood construction in modern laboratory design.

With completion of the Olympia Laboratory in prospect, it is timely to take a close look at the staffing needed to get full value from the projects located there. I am especially concerned about the Douglas-fir Silviculture Project which is now staffed at only 50 percent of the planned six scientist level. We look to this project for leadership in the development and refinement of cultural practices for young stands of Douglas-fir and associated conifer species. Indications are that current yields might be increased up to two or more times their present levels through measures such as thinning, weeding and fertilizing. But a multitude of questions must be answered through research before these practices can be widely applied with confidence. The continuing demand for ever-increasing timber supplies, which is causing so much concern in the Douglas-fir region, underlines the urgency of this need. The Douglas-fir Silviculture Project should now be brought to its planned strength as soon as financing can be provided. This would require an additional $160,000 of program funds.

Engineering Research at Seattle

Last year I called attention to the urgent need for accelerated forest engineering research on balloon and skyline logging systems.

It has been estimated that an additional 500 million board feet of timber could be harvested every year from areas of difficult access in western Washington and western Oregon alone if the efficiency of aerial logging systems were improved through research.

Another year has passed and, although the small research group in Seattle has worked diligently and productively, the major potential for increasing the efficiency of timber harvest on difficult terrain still lies ahead. It cannot be achieved without greater effort. Last year's hearings brought out that $400,000 could be effectively applied on this project. Now the President's budget for fiscal year 1968 proposes an increase of $215,000 nationally in forest engineering research. I strongly urge you to support this, and to increase it when opportune, so that the necessary progress can be made with as little further delay as possible.

Cooperative Forest Fire Research at Seattle

I understand that some $30,000 of the budget increase for Forest Service research will be used to staff a cooperative forest fire research project at the University of Washington in Seattle. The critical need for a greater number of professionally trained forest fire control specialists has been recognized nationally by private, state and Federal forest protection agencies.

Establishment of this unit will help to develop a strong graduate program in the field of forest-fire control science. It will stimulate progress in cooperative fire research through more effective use of graduate students, the University's skills in meteorology and engineering, and in its strengthened forest-fire science staff in the College of Forestry.

Watershed Research at Wenatchee, Washington

Studies at the Wenatchee Forest Hydrology Laboratory are showing how much water is used by forest trees. On the slopes of Mission Ridge, hydrologists are finding out how much snow tree crowns intercept, and how much evaporates. If trees decrease the accumulation of snow for water runoff, then the water supply as well as the amounts of wood and forage might be increased by careful thinnings. All of these studies are providing clues for obtaining more high-quality water for downstream use.

Information is urgently needed on how to minimize erosion from road construction and logging and on how to recognize and avoid areas where serious erosion is likely to occur. Over 500,000 acres of critical forest and range watershed lands in eastern Washington are seriously eroding and need to be restored to a productive, attractive landscape. Rehabilitation of flood source areas requires additional research on soils and plant materials to do the job efficiently.

The Administration's proposal to increase watershed research in the Forest Service nationally by $211,000 recognizes an important water resource need.

An increase in Forest Service research at Wenatchee of $75,000 annually would permit using the Laboratory more efficiently and speed the developing of improved forest soil and water management practices.

Recreational Research

Additional research in forest recreation is extremely urgent in our State. The President's proposed budget increase of $332,000 for the entire nation will help to strengthen an area of serious deficiency. Outdoor recreation facilities must be greatly increased on State, county, Federal and private forest lands. But sound recreation investments should be based on sound research.

The Forest Service has a promising start on this work in the State of Washington with one full-time and one part-time scientist assigned. Coordinated plans call for a seven-scientist recreation research task force in Seattle, which would require an additional $200,000 for efficient operation. I urge that increased funds for recreation research by the Forest Service, in cooperation with the University of Washington, be provided at the earliest opportunity to accelerate the strengthening of this project until it is fully activated.

Insect and Disease Research

Currently insects and diseases are destroying eight times the wood volume consumed by forest fires. Most of the research undertaken to reduce these losses is being done by the U.S. Forest Service Experiment Stations, but expenditures are not in proportion to the damage sustained.

Since 1959, when the European pine shoot moth was discovered in Seattle, the Department of Natural Resources has cooperated with the Forest Service in successful efforts to prevent spread of the insect to ponderosa and lodgepole pine forests of eastern Washington. Currently the Forest Service is contracting with Washington State University to develop techniques for mass rearing of the insect and sterilization of the males. Both projects are essential to the primary objective of determining the feasibility of eradicating the insect in the Puget Sound area by using the sterile male technique.

To maintain this and other pest control projects will require increasing Federal appropriations. Additional revenues that you can obtain for pest control will shorten the time needed to reduce the national annual 2,400,000,000 cubic feet mortality loss caused by insects and diseases to an acceptable level.

DEPARTMENTAL STATEMENT

1. Olympia, Washington

a. *Douglas-fir Silviculture.*—The timber produced in the Northwest formerly came almost entirely from old-growth stands. The supply of such timber is diminishing and industry is increasingly dependent on second-growth. The silviculture program at Olympia is intended to develop intensive cultural practices for growing Douglas-fir.

The management of natural stands needs to be studied further to develop cultural systems that produce maximum timber yields, that can be harmonized with other forest uses including provision for aesthetics, and that will be compatible with systems requiring a minimum of slash burning. To make the most of the increasing acreage of young stands, initial spacing, pre-commercial thinning, and growth in stands of regulated density need study. The importance and value of the species may justify soil management practices, such as fertilization and manipulation of understory vegetation. Such information will also be needed with genetically improved strains, which can now be definitely foreseen.

b. *Prevention and Control of Animal Damage to Forests.*—Some $15 million of forest production is estimated to be lost annually in the Pacific Northwest because of animal damage. The problem is worse in areas where a high investment has been made in seeding or planting a new forest, only to have it destroyed by rodents, deer, bears, and porcupines.

A cooperative research program was initiated in animal damage prevention and control in 1964. The research staff consists of four scientists. Work has been devoted to use and effectiveness of synthetic chemicals to repel animals from planted seedlings, initiating and coordinating a regional animal damage survey, effects of damage on individual seedlings, and natural environmental effects on animal feeding habits. An effective treatment to repel rabbits from planted seedlings was developed. A search has been started for naturally occurring chemicals with repellent properties, and the systematic effects of the rabbit repellent are being investigated.

c. *Facilities.*—Congress provided $450,000 in fiscal year 1967 to build the Silviculture and Animal Problems Laboratory at Olympia. Construction began late in 1966 and the new Laboratory is expected to be ready for occupancy this year.

d. *Funding.*—The Douglas-fir silviculture and animal damage research at Olympia is currently funded at $202,000. The budget for fiscal year 1968 provides for no increase in this effort. With the completion of the new Laboratory, increased staffing could be effectively used to move ahead toward the solutions of the important problems being studied. An increase of $160,000 could be used efficiently to strengthen the Douglas-fir silviculture research.

2. Seattle, Washington

a. *Forest engineering* research at Seattle is aimed at developing aerial logging systems to harvest timber economically from difficult access areas while protecting other values of the forest. The limited research already underway has shown that aerial logging can possibly reduce by 50 percent the mileage of roads now required for timber harvest. This means considerably less investment in forest roads and substantial reduction in soil disturbance, erosion, and damage to growing stock and scenic values. Such advanced aerial logging systems could increase timber harvest in the Douglas-fir region by over 500 million board feet annually from areas now considered inaccessible.

Forest engineering research at Seattle is financed at a level of $68,000 in fiscal year 1967. The fiscal year 1968 budget provides for an increase of $90,000 in that appropriation. To fully implement engineering research on aerial logging methods and bring aerial logging into full operational use within a reasonable time will require an increase of about $400,000 in the level of funding.

b. *Forest Recreation.*—One of the most critical problems in the field of forest-outdoor recreation is to better understand the motivations, the preferences, and the requirements of the steadily increasing numbers of people who visit the forests for recreational purposes. The Forest Service is now making a small start toward meeting this need through its cooperative research program with the University of Washington. Present funding provides for one scientist part time in this effort. Plans call for substantially strengthening this work. In 1968 approximately $50,000 additional is budgeted for this research. To achieve the necessary staffing and level of operation for this project will require an appropriation increase of $200,000.

c. *Forest Fire Research.*—The Forest Service established a forest fire science project at Seattle, Washington, in cooperation with the University of Washington.

Graduate students work under the joint leadership of faculty members and Forest Service forest fire scientists on research to develop new knowledge and technology for the prevention and control of forest fires. This program provides essential research information and develops the highly qualified professional personnel urgently needed in both forest fire control and research activities. The high stakes that we have in protecting American forests from fire and the complexities of the job require that we give it the best possible scientific input. The cooperative forest fire science project at Seattle is designed to do this.

Forest fire research at Seattle is currently funded at $86,000. The budget for fiscal year 1968 includes an additional $30,000 to strengthen this work. This increase can be used effectively to move the work ahead toward meeting the urgent needs for improved control of forest fires.

3. Wenatchee, Washington

Watershed Management Research.—The Forest Hydrology Laboratory at Wenatchee provides facilities for basic soil and water research and serves as a focal point for field studies aimed at improving yields of water and reducing loss of soil from forests and associated ranges in the Columbia Basin.

The urgency and significance of the watershed management research at Wenatchee is based on the strong dependence of the economy on adequate water supplies. Dependable supplies of good water are vital for irrigation of farm and fruit crops, for recreation, and for hydroelectric power.

The research program is operating on an annual budget of $165,000 in fiscal year 1967. Space and facilities available at the Laboratory could accommodate a research program funded at the level of $240,000 annually. Thus, an increase of $75,000 over the present level of funding could be used to strengthen and accelerate the research. An increase of $30,000 proposed for Wenatchee in the fiscal year 1968 budget will partially meet this need.

4. Corvallis, Oregon

Insect and Disease Research.—Nearly 6 billion board feet of timber are destroyed annually by insects and diseases in Oregon and Washington. These are serious losses which cannot be replaced quickly.

Forest insect and disease research that applies to pest problems of the State of Washington is headquartered in Corvallis, Oregon. Insect research is aimed at acquiring sufficient knowledge of biology, behavior, and ecological requirements of forest insects to make possible the development of effective, safe, and practical control measures. For example, one project aims at learning how to use insect pathogens against major forest pests. Some of the research is done cooperatively by Washington State University.

Disease research is aimed at reducing forest disease damage by determining (1) optimum harvest ages for major tree species on various sites, (2) measures to favor biological control of root rots, and (3) where to apply dwarfmistletoe sanitation operations most effectively.

Forest insect research at Corvallis is currently funded at $352,000 annually and forest disease research at $190,000 annually. The fiscal year 1968 budget provides for a small increase in this program. The insect and disease research could use effectively a total increase of $150,000. Such funding would make it possible to resolve some of the difficult problems confronting forest managers.

Last year $170,000 was appropriated for planning an addition to the Corvallis Forest Science Laboratory. This planning is progressing so that construction could be initiated in 1968. The estimated cost of the structure now being planned at $2,500,000.

LETTER FROM SENATOR JACKSON

UNITED STATES SENATE,
COMMITTEE ON INTERIOR AND INSULAR AFFAIRS,
February 24, 1967.

Hon. CARL HAYDEN,
Chairman, Appropriations Committee,
United States Senate, Washington, D.C.

DEAR MR. CHAIRMAN: I have learned that the 1968 Budget Request for the Forest Service includes an increase of $30,000 over the 1967 Budget for staffing at the Forest Hydrology Laboratory in Wenatchee, Washington. While this increase is gratifying, the immediate needs are for an increase of $75,000 instead of $30,000.

The increase would allow the addition of two scientists and their supporting technical assistants at Wenatchee. These scientists would be engaged in projects relating to the rehabilitation of critically eroded watersheds and improving the water yields, both in quantity and quality, along the eastern slopes of the Cascades.

The Hydrology Laboratory is already built, so this increase would be entirely devoted to initiating research projects which would be of benefit to my state and the Nation.

I respectively ask that an additional $45,000 be allowed for staffing this laboratory.

Sincerely yours,

HENRY M. JACKSON, *Chairman.*

SHAWNEE NATIONAL FOREST, ILL.

STATEMENT OF SALINE VALLEY CONSERVANCY DISTRICT

Chairman Hayden, members of the Senate Subcommittee on Appropriations for the Department of Interior and Related Agencies: I am George M. Scherrer, Manager of the Saline Valley Conservancy District, businessman, member of the Executive Committee of the Shawnee Resource Conservation and Development Project, and citizen of Shawneetown, Illinois.

It is my purpose in this statement to support the continued development of several key projects of the U.S. Forest Service in the Shawnee National Forest. I have great interest in the projects since some are within the Saline Valley Conservancy District and all are within the Shawnee Resource Conservation and Development Project Area.

The continued orderly development of these key projects will contribute much to the economic growth of Southern Illinois. Statistics from the Saline Valley Conservancy District's report, "Poverty in a Section of Egypt, U.S.A." show that the average family income in the area is well below the state average. The improvement of the economy of the area would increase the economic well being of each family. I will point out the economic contribution of each project later in this presentation.

The Shawnee National Forest is within 150 miles of approximately 5,600,000 people and within a day's drive of nearly 50,000,000 people. The development of the outdoor recreational facilities will give those people an opportunity to spend leisure time in the outdoors with a modest expenditure of money.

A study, "The Future of Tourism and Recreation in Southern Illinois," was made by Checchi and Company under contract to the Department of Business and Economic Development of the State of Illinois and the Economic Development Administration of the U.S. Department of Commerce. This study gives high priority to the development of the U.S. Forest Service projects in Southern Illinois as a contribution to the economy of the area.

Specific projects for continued development and needed for the economic growth of the area are:

1. *George Rogers Clark Recreation Way, $260,000.*—Checchi and Company in the study "The Economic Potentials of Tourism and Recreation in Southern Illinois" stated that "Potentially we feel that this 'corridor' (combined with associated projects) would be the area's greatest tourism-recreation attraction."

The funds are for engineering and design of the Recreation Way and recreation development planning for the corridor.

It is expected that the project will produce annual expenditures of $8,500,000 from recreational visits.

Checchi and Company estimate that 6,000 jobs will result from the project.

2. *Lusk Creek Lake, $100,000.*—These funds are requested for final engineering design of the structure for this lake.

Geological feasibility studies were contracted during Fiscal Year 1967. Structure design is needed as the next step toward completion of the project. A cost-benefit study of the project shows that for each dollar expended on the project $2.45 will be returned by recreational visits. It is estimated that recreational visits will produce annual expenditures of $2,250,000 when development is completed.

3. *Lake of Egypt Recreation Area, $250,000.*—1,700 acres were purchased on the south side of this lake by the Forest Service with Land and Water Conservation Funds in Fiscal Year 1966. Development was started in Fiscal Year 1967. 4.2 miles of access road, 42 camping units, and 31 picnic sites have been established. The $250,000 is needed to construct a beach, a bathhouse, a water and sewage system, and additional campsites. These added facilities are needed to complement and improve those already established. These developments are on the only large body of water available at the present time.

It is estimated that recreational visits to this area will produce annual expenditures of nearly $1,000,000 when development is completed.

4. *Week's Law Funds for Land Purchase, $500,000.*—Land and Water Conservation Funds may be used only for land purchases within the proclaimed boundaries of the Shawnee National Forest as they existed on January 1, 1965. Certain key tracts vital to the completion of special projects lie outside these boundaries as they existed on January 1, 1965. Therefore, land needed for them cannot be purchased with Land and Water Conservation Funds.

These projects and amounts needed are:

a. Kinkaid Lake	$100,000
b. Little Cache Lake	50,000
c. Tower Rock Recreation Area	50,000
d. George Rogers Clark Recreation Way	100,000

Other key tracts are needed for public access to present National Forest lands or to block in present National Forest ownership within the proclaimed boundaries. These tracts are not eligible for purchase with Land and Water Conservation Funds. The projects and amounts needed are:

a. Kinkaid Lake	$50,000
b. Shawnee "Gap"	50,000
c. General Forest Area	100,000

It is estimated that the Kinkaid Lake project will produce an annual expenditure of $2,700,000 from recreational visits.

The Little Cache project will produce an annual expenditure of $200,000.

The economic gains from completion of these projects will greatly aid the economy of Southern Illinois and improve the average annual income of each family in the area.

Thank you for this opportunity to present a statement in behalf of the U.S. Forest Service. The Saline Valley Conservancy District, the Shawnee Resource Conservation and Development Project, and Southern Illinois, Incorporated will continue to cooperate with the Forest Service in matters of mutual interest and benefit to Southern Illinois.

LETTER FROM SALINE COUNTY BOARD OF SUPERVISORS

Senator CARL HAYDEN,
Chairman, Senate Subcommittee on Appropriations for the Department of Interior and Related Agencies, U.S. Senate, Washington, D.C.

DEAR SIR: Saline County is located in Southern Illinois—a spacious and picturesque region of the Midwest. The recreation resource of our county is great and with proper development, it could become of tremendous economic value to the people here. A portion of the proposed George Rogers Clark Recreation Way would pass through Saline County. We believe that this scenic highway across the Shawnee Hills, by connecting all of the many recreation attractions of our area, will create an area of outstanding recreational opportunity and thus contribute bountifully to the economy of our County.

As a first step in assuring that the George Rogers Clark Recreation Way becomes a reality, we request that $260,000 be added to the Forest Service budget for fiscal year 1968. We give wholehearted support to Senate Bill 353 as introduced by Senators Dirksen and Percy, authorizing the Secretary of Agriculture to make a preliminary survey of the proposed George Rogers Clark Receation Way. It is our understanding that this money would be used to obtain the necessary engineering and recreational services required to locate and design this scenic highway and its recreation corridor on the Shawnee National Forest.

We also request that $500,000 in land acquisition funds be added to the Forest Service budget for fiscal year 1968. Such funds made available through the Weeks Law would enable the Forest Service to purchase much needed tracts of land in areas of high public use and not eligible for purchase from Land and Water Fund.

The careful and favorable consideration of these requests by your subcommittee will be appreciated. We are grateful for the opportunity to present this statement.

Yours very truly,

C. L. BLACKMAN,
Chairman, Saline County Board of Supervisors.
MAYNARD CANNON,
Saline County Clerk.

LETTER FROM KINKAID-REEDS CREEK CONSERVANCY DISTRICT

MARCH, 10, 1967.

Senator CARL HAYDEN,
Chairman, Senate Subcommittee on Appropriations for Interior and Related Agencies, U.S. Senate, Washington, D.C.

DEAR SENATOR HAYDEN: We wish to take this means of informing you and your subcommittee of our views concerning two very important projects in Jackson County. We would be grateful if our comments were made part of the hearing records when you consider the Forest Service budget requests for fiscal year 1968.

Kinkaid Lake is to be constructed on the upper portion of Kinkaid Creek in northwest Jackson County. This lake will be a multipurpose structure and when all of the planned developments are completed, it will be an outstanding recreation attraction. The lake will be within the Shawnee National Forest. We propose that $500,000 in Weeks Law funds be added to the Forest Service budget for the purpose of acquiring lands needed for the National Forest development for this and other similar projects.

We also wish to express our support for the recently introduced Senate Bill 353, authorizing the Secretary of Agriculture to make a preliminary survey of the proposed George Rogers Clark Recreation Way within the Shawnee National Forest in Southern Illinois. The George Rogers Clark Recreation Way will be a scenic recreation road across Southern Illinois. This road will bring an estimated 3.5 million additional visitors to Southern Illinois. Local jobs and income will greatly multiply as a result. We sincerely hope that your committee will find it possible to add $260,000 to the Forest Service budget for this project. These funds would be used for engineering and recreation surveys necessary to design and locate the George Rogers Clark Recreation Way.

It is respectfully requested that you and your subcommittee give favorable attention to our requests.

Sincerely yours,

CLAUDE THOMPSON, *President.*

LETTER FROM SHAWNEE RESOURCE CONSERVATION AND DEVELOPMENT PROJECT

MARCH 3, 1967.

Senator CARL HAYDEN,
Chairman, Senate Subcommittee on Appropriations for the Department of Interior and Related Agencies, Washington, D.C.

DEAR SENATOR HAYDEN: The Executive Committee guides the activities of the Shawnee Resource Conservation and Development Project toward obtaining the project's objective: Improvement, development and conservation of Southern Illinois' Natural resources to provide employment and other economic opportunities to the local people. As such, we are naturally very interested in the multiple use management being practiced on the Shawnee National Forest which is within our project area.

We know that your subcommittee will be holding hearings very soon concerning the fiscal year 1968 budget for the Forest Service. We sincerely and urgently recommend that the following projects be funded:

Senate Bill 353 as introduced by Senators Dirksen and Percy—$260,000 to obtain preliminary surveys for the scenic George Rogers Clark Recreation Way which lies within the area adjacent to the Shawnee National Forest.

Lake of Egypt—$250,000 to continue development of camping, picnicking, hiking and swimming areas on 1,700 acres of the Shawnee National Forest on the south side of the lake in Johnson County.

Lusk Creek—$100,000 to obtain the final design plans for this structure which will create a 2,300 acre lake in Pope County for recreation as well as for soil and water conservation purposes.

Purchase of high value public use tracts—$500,000 to be made available through the Weeks Law for the purchase of lands necessary for the development of Southern Illinois' natural resources.

All of these projects, when completed, will greatly aid in obtaining our project's objectives. We urge your sympathetic study of our requests.

Sincerely yours,

L. E. GARD,
Chairman, Executive Committee, Shawnee RC&D Project.

LETTER FROM BAY CREEK WATERSHED CONSERVANCY DISTRICT

MARCH 6, 1967.

Senator CARL HAYDEN,
Chairman, Senate Subcommittee on Appropriations for Interior and Related Agencies, Washington, D.C.

Dear SENATOR HAYDEN: The Bay Creek Conservancy District is acutely aware of the social and economic need of conservation and recreation activities in our area of Southern Illinois. Thus, we are interested in the activities of the Forest Service in managing the Shawnee National Forest. We wish to make two recommendations to your sub-committee in regard to the budget of this agency for fiscal year 1968.

First, we recommend that $500,000 be added to the Forest Service budget through the Weeks Law for the purpose of land purchases in areas of major public use. These lands are needed for important National Forest development, including recreational development. These developments will increase tourism and strengthen our economy.

Second, we fully endorse the proposed George Rogers Clark Recreation Way across Southern Illinois via the Beautiful Shawnee Hills. The initial step in the development of this scenic road has been initiated by Senators Dirksen and Percy in the form of Senate Bill 353. We fully support this bill which authorizes the Secretary of Agriculture to make a preliminary survey of the George Rogers Clark Recreation Way. We request that $260,000 be granted to the Forest Service for the purpose of obtaining recreation and engineering surveys and plans for the design and location of the road.

All of these requests are made sincerely and with the hope that you and your sub-committee will give them favorable attention.

Yours very truly,

B. F. ANDERSON, *President.*

LETTER FROM VIENNA (ILLINOIS) KIWANIS CLUB

Senator CARL HAYDEN,
Chairman, Senate Subcommittee on Appropriations for Interior and Related Agencies, Washington, D.C.

DEAR SENATOR HAYDEN: We believe that the development of the recreation potential in Johnson County and Southern Illinois is vital to the economy of this area. We understand that your committee will hold hearings soon on budget requests for the Forest Service.

The Shawnee National Forest traverses the scenic Shawnee Hills from the Mississippi to the Ohio River. Within these scenic hills are many developed recreation sites and a great many more potential recreation areas. In order to tie these areas into one recreation complex that will create a recreation attraction, we urge the construction of the George Rogers Clark Recreation Way. The scenic and historical highway would be of great economic benefit to our area. We wish to fully support Senate Bill 353 introduced by Senators Dirksen and Percy. This bill authorizes the Secretary of Agriculture to prepare a preliminary recreation and engineering survey of the proposed route.

In addition to this project, the Lake of Egypt Recreation Area is very important. This 1,700 acre Forest Service area is in the process of being developed for recreation. This effort must be continued during the coming year. We request that $250,000 be added to the Forest Service budget to add a swimming area, additional camping and picnic facilities, and a Visitor Information Center.

The continuing recreation development in Southern Illinois requires additional land purchase. The purchase of land in areas of major public use will greatly benefit Southern Illinois. We urge that $500,000 be allocated through the Weeks Law for Forest Service purchase of the areas which are not eligible for Land and Water Conservation Funds.

We would be grateful if your sub-committee will consider these matters carefully.

Sincerely yours,

WILBURN WOOD,
President, Vienna Kiwanis Club.

SUBCOMMITTEE RECESS

Chairman HAYDEN. Do you have anything further? If not, we have enjoyed what you had to say.

Today's hearing is concluded. Tomorrow at 10 a.m., we will hear the Commission of Fine Arts and the National Foundation on the Arts and the Humanities.

Thank you.

Mr. BAKER. Mr. Chairman, it has been a pleasure to have you here.

(Whereupon, at 12:40 p.m., Monday, March 13, 1967, the subcommittee was recessed, to reconvene at 10 a.m., Tuesday, March 14, 1967.)

DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1968

TUESDAY, MARCH 14, 1967

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met at 10 a.m., in room 1223, New Senate Office Building, Hon. Carl Hayden (chairman) presiding.

Present: Chairman Hayden and Senator Bartlett.

COMMISSION OF FINE ARTS

STATEMENT OF CHARLES H. ATHERTON, SECRETARY; ACCOMPANIED BY DONALD B. MYER, ASSISTANT SECRETARY; JOSEPH M. BREEN, BUDGET OFFICER; AND SIDNEY D. LARSON, DIRECTOR OF BUDGET, OFFICE OF THE SECRETARY OF INTERIOR

BUDGET REQUEST

Chairman HAYDEN. Good morning, gentlemen.

There will be placed in the record the statement in justification of the appropriation request for the Commission of Fine Arts for fiscal year 1968. This request is $115,000, the same amount as was appropriated for the past year.

(The justification follows:)

SALARIES AND EXPENSES

Analysis by activities

Activity	Fiscal year 1966 amount available	Fiscal year 1967 amount available	Fiscal year 1968 estimate
Administration	$111,051	$115,000	$115,000
Unobligated balance lapsing	11,949		
Total	123,000	115,000	115,000

JUSTIFICATION

The estimate of funds needed to operate the Commission of Fine Arts during Fiscal Year 1968 is $115,000, which is the same amount available for Fiscal Year 1967. Despite rising travel costs this estimate of operating expenses is based on savings realized through cost reduction and management improvement

programs instituted during Fiscal Year 1967. The estimate provides for the staff of the Commission (which is comprised of an Executive Secretary (GS–15), an Assistant Secretary for Fine Arts matters (GS–13), a Writer-Editor, Fine Arts (GS–12), a Writer-Editor, Legislative Affairs (GS–11), a Historical Research Assistant (GS–9) and two secretaries (Stenography) (GS–8), together with the necessary operating expenses including travel costs of the members of the Commission. The estimate also provides for proposed consulting services in Fiscal Year 1968.

1. The Commission of Fine Arts was established in 1910 to fill the need for a permanent advisory agency whose members would be qualified to make available to the Government the authority of expert opinion upon questions of art arising in the course of administration. As an independent agency, it was intended to serve a two-fold purpose; first, to give free advice concerning aesthetic standards and matters of civic design involved in the orderly development of the City of Washington; and, second, to furnish expert opinion on questions of art to the President, to the Congress and its committees, and to the heads of various departments and agencies of the Federal and District Governments.

The seven members of the Commission are appointed by the President and serve without pay. They give freely of their time, meeting for one or two days each month as required, with compensation only for actual expenses of travel and subsistence incurred in attending meetings. The technical and professional problems that come to the Commission fall primarily into the fields of architecture, general site planning, landscape architecture, sculpture and painting, but, in recent years, an increasing amount of time has been devoted to critical review and report of proposed legislation, whose aim is to foster production and appreciation of the Fine Arts.

The authorized scope of the Commission's activity covers not only Federal and District Government projects in the City of Washington and its environs, but also certain designated private and semi-public construction projects under authority as noted hereafter; and its scope often includes Federal projects outside the District of Columbia and abroad, such as the World War I and World War II memorials and cemeteries, the designs for which come before the Commission by authority of Public Law 534–67th Congress (42 Stat. 1509) as amended. During the 56 years of the Commission's existence, the seventy-one members who have served on it, have steadfastly insisted on the maintenance of the highest aesthetic standards in the design of the Federal and semi-public projects that are referred to it by law.

2. Specific functions of the Commission comprise the following:

(a) Under the provisions of its Enabling Act, Public Law 181–61st Congress, approved May 17, 1910, the Commission of Fine Arts advises generally upon questions of art when required to do so by the President, or by any committee or member of either House of Congress.

It advises specifically on all plans for parks and public buildings, constructed by the executive departments or the District of Columbia, which in any essential way affect the appearance of the City of Washington and its environs. Authorization has been given or is pending for the design of many new Federal and District buildings, most of which are planned for erection in the central area of the City of Washington, as part of the expansion of the Federal or District Governments.

It also advises upon location and design of statues, fountains, and monuments in public squares, streets and parks in the District of Columbia and upon the selection of models for the statues, fountains, and monuments erected under the authority of the United States and upon the selection of artists for the execution of the same.

Rendering an opinion on the merit of designs for medals, insignia, coins, or other art projects created and produced by the executive department is also a phase of the Commission's duties.

(b) The Commission carries out the provisions of the Shipstead-Luce Act, Public Law 231–71st Congress (46 Stat. 366) approved May 16, 1930, an Act to regulate the height, exterior design, and construction of private and semi-public buildings in certain areas of the National Capital. In this function the Commission reports its findings on the above features to the Commissioners of the District of Columbia before building permits are issued at the Permit Branch of the Department of Licenses and Inspections.

(c) The Commission also carries out the provisions of the Old Georgetown Act, Public Law 808–81st Congress (64 Stat. 903, Chap. 984), approved September 22, 1950, an act to regulate the height, exterior design and construction of private and semi-public buildings in the Georgetown area of the National Capital. This action also requires review and recommendations to the Commissioners of the District of Columbia on the merits of designs submitted for building permits.

Chairman HAYDEN. Will you please summarize your statement for the committee?

Mr. ATHERTON. Mr. Chairman, I am Charles Atherton. Mr. Walton, the chairman, regrets that he is unable to be here this morning, but he has asked me to stand in for him, and perhaps answer any questions you have. We have a short statement here that I think you already have. We would request that it be inserted in the record.

Chairman HAYDEN. That will be done.

(The statement follows:)

The Commission of Fine Arts is requesting an appropriation of $115,000, which is the same as the amount appropriated for Fiscal Year 1967. No major changes are planned in our programs for the coming fiscal year.

During Fiscal Year 1966, the Commission acted upon 573 formal submissions, carrying an estimated cost of many millions of dollars. A tabular listing is attached hereto showing the number of applications for the past three fiscal years. In addition to the increased complexity of formal submissions, there has also been a corresponding increase in the number of informal reviews and daily requests for information about Washington. With the administration's current programs proposed for the development of the Capital, I expect this trend will continue to accelerate in the coming year.

The appropriations for the Commission have remained relatively small throughout its 57 year history. I therefore hope the Committee will favorably consider our request for the amount needed for the next fiscal year.

The members of the Commission are appointed by the President and serve without compensation, receiving only actual travel expenses incurred in attending meetings. Since the Commission was established in 1910 more than 60 distinguished architects, landscape architects, painters, sculptors, and laymen in the field of fine arts have given freely to their Government the benefit of their experience and professional skills in advising the President, the Congress and government agencies on matters involving the fine arts.

Number of submissions presented to the Commission of Fine Arts during the past 3 fiscal years

	1964	1965	1966
Shipstead-Luce Act (approved May 16, 1930)	150	145	115

Commission of Fine Arts Act	147	----------	----------

LEVEL OF ACTIVITIES

Chairman HAYDEN. I judge from the justification statement and from your statement that your activities in the coming year will be essentially the same as those of fiscal year 1967. Is that correct?

Mr. ATHERTON. That is correct, Senator.

Chairman HAYDEN. Summarize your statement.

Mr. ATHERTON. All right. Our summary can be very brief. As you point out, our program remains at pretty much the same level from year to year. We don't plan any new programs. We don't plan any expansion. The work level, I think, will probably be about the same in the coming year as it has been in the past year, so we hope we present no problem to you.

Chairman HAYDEN. Thank you very much.

Mr. ATHERTON. Thank you, sir.

TUESDAY, MARCH 14, 1967.

DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE

OFFICE OF EDUCATION

ARTS AND HUMANITIES EDUCATIONAL ACTIVITIES

STATEMENT OF MISS KATHRYN BLOOM, DIRECTOR, ARTS AND HUMANITIES PROGRAM; ACCOMPANIED BY JAMES M. SPILLANE, CHIEF, ARTS AND HUMANITIES INSTITUTES BRANCH; MELVIN E. ENGELHARDT, ACTING CHIEF, INSTRUCTIONAL PROGRAM SECTION; HARLAN HOFFA, ART EDUCATION SPECIALIST; MRS. SALLY H. BOND, BUDGET ANALYST; THOMAS McNAMARA, BUDGET ANALYST; AND FREDERICK PFLUGER, BUDGET EXAMINER, OFFICE OF EDUCATION, DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE

PROPOSED BUDGET

Chairman HAYDEN. For the arts and humanities educational activities of the Office of Education, there is a proposed budget of $1 million. The justification statement for this budget will be entered into the record.

(The justification follows:)

AUTHORIZING LEGISLATION

ARTS AND HUMANITIES

P.L. 89-209

FINANCIAL ASSISTANCE FOR STRENGTHENING INSTRUCTION IN THE HUMANITIES AND THE ARTS

SEC. 12. (a) There is authorized to be appropriated to the Commissioner of Education for the fiscal year ending June 30, 1966, and each of the two succeeding years the sum of $500,000; but for the fiscal year ending on June 30, 1969, and each subsequent fiscal year, only such sums may be appropriated as the Congress may hereafter authorize by law. Such sums shall be used for (1) making payments to State educational agencies under this section for the acquisition of equipment (suitable for use in providing education in the humanities and the arts) and for minor remodeling described in subsection (c)(1) of this section, and (2) making loans authorized in subsection (f) of this section.

(b) Sums appropriated pursuant to subsection (a) shall be allotted in the same manner as provided in subsections (a) and (c) of section 302 of the National Defense Education Act of 1958, as amended (72 Stat. 1588; 20 U.S.C 442).

TEACHER TRAINING INSTITUTES

SEC. 13. (a) There is authorized to be appropriated to the Commissioner of Education for the fiscal year ending June 30, 1966, and each of the two succeeding years the sum of $500,000; but for the fiscal year ending on June 30, 1969, and each subsequent fiscal year, only such sums may be appropriated as the Congress may hereafter authorize by law. Such sums shall be used to enable the Commissioner of Education to arrange, through grants or contracts, with institutions of higher education for the operation by them within the United States of short term or regular session institutes for advanced study, including study in the use of new materials, to improve the qualification of individuals who are engaged in or preparing to engage in the teaching or supervising or training of teachers, of such subjects as will, in the judgment of the Commissioner, after consultation with the Chairman of the National Endowment for the Humanities, strengthen the teaching of the humanities and the arts in elementary and secondary schools.

(b) Each individual who attends an institute operated under the provisions of this part shall be eligible (after application therefor) to receive a stipend at the rate of $75 per week for the period of his attendance at such institute, and each such individual with one or more dependents shall receive an additional stipend at the rate of $15 per week for each such dependent.

Arts and humanities educational activities

	Estimate to Bureau of Budget	Budget estimate to Congress	House allowance	Senate allowance	Appropriation
1966	$1,000,000	$1,000,000	$1,000,000	$1,000,000	$1,000,000
1967	1,000,000	1,000,000	1,000,000	1,000,000	1,000,000
1968	1,000,000				

Arts and humanities educational activities, Office of Education

	1967 estimate	1968 estimate	Increase or decrease
1. Instructional assistance to schools:			
(a) Grants to States	$440,000	$440,000	
(b) Loans to nonprofit private schools	60,000	60,000	
Total	500,000	500,000	

JUSTIFICATION OF ESTIMATE

Section 12 of the National Foundation on the Arts and Humanities Act of 1965 authorizes $500,000 annually for fiscal years 1966 through 1968 for matching grants to States and loans to nonprofit private schools for equipment and minor remodeling suitable for education in the arts and humanities. Twelve percent is reserved for loans and is allotted by States on the basis of nonpublic school enrollments. The balance for public schools is allotted by State on the basis of school-age population and income per school-age child.

There exists a need not only to encourage students to major in the arts and humanities, but also to provide this instructional component for pupils in the sciences so that they may have a well-rounded education. Teaching today in the fields of the arts, as in science, requires modern equipment and materials. Some examples of items that can be acquired by schools under the program are brushes, easels, mechanical drawing instruments, tools for modeling and carving, kilns, looms, cameras, darkroom equipment, musical instruments and accessories, stage equipment, books (other than textbooks), films, music documents, and art objects. The subject fields involved are the visual arts (painting, drawing, graphics, sculpture, crafts, photography, and film production), music, theater, the dance, and the humanities (literature, languages, history, anthropology, philosophy, etc.).

The fiscal year 1968 request of $500,000, the same level as the 1967 appropriation, will continue to assist States in improving instructional programs in this important but neglected area.

	1967 estimate	1968 estimate	Increase or decrease
2. Teacher training	$500,000	$500,000	

JUSTIFICATION OF ESTIMATE

Section 13 of the Act authorizes an amount of $500,000 for grants or contracts with institutions of higher education for the operation of short-term or regular session institutes for advanced study to strengthen the teaching of and knowledge about the arts and humanities in public and private nonprofit elementary and secondary schools. Participants in such institutes may be teachers, supervisors or trainers of teachers and are eligible upon acceptance to receive stipends of $75 per week for the duration of the institute, plus an allowance of $15 per week for each dependent.

More than one-fifth of our secondary schools desiring to offer art courses cannot do so for lack of qualified teachers. Classroom teachers in 70 to 80 percent of our elementary schools are expected to teach music and art in their classrooms without any help from a specialist; yet few have had any music training or background in art appreciation and discrimination. More and more schools are introducing interdisciplinary courses in the arts and humanities, but very few teachers have the requisite broad background to teach such programs. Elementary and secondary education is woefully unprepared to remedy this situation and, therefore, this program is intended to help find ways, and to establish models, which will up-grade arts and humanities *generally* as well as specifically. Meanwhile, qualified teachers are lacking in all basic art, music and humanity courses (the classics, etc.), and it is appropriate to provide whatever direct assistance, in whatever appropriate programs can be solicited.

In the summer of 1966 a total of eleven institutes were held which 431 participants, out of 2,400 applicants, attended. Instructional costs amounted to $230,000 and stipends to participants totaled $225,476. These institutes included one in Latin, three in music, three in the humanities, two in art, and one each in theater and film appreciation.

Plans for 1967 call for approximately the same number of institutes and participants with a wide spread among the various fields. In order to achieve the greatest possible impact with available funds, it is planned to include one or two institutes for trainers of teachers and for supervisors of in-service training programs for teachers of the arts and humanities. Where feasible, priority will be given to proposals which could not be funded by other Federal programs.

The 1968 estimate of $500,000 will again support a similar set of 10–11 institutes and will continue to reinforce the Federal commitment in this badly neglected area.

PREPARED STATEMENT

Chairman HAYDEN. Will you please enter your written statement in the record, in full, and then highlight it for the committee?

Miss BLOOM. Thank you, Mr. Chairman.

(The statement follows:)

Mr. Chairman and members of the committee, the request of $1,000,000 for this program is the same amount that was appropriated in 1967. One half of the appropriation is for Section 12 of the National Foundation on the Arts and Humanities Act and provides grants to States and loans to nonprofit, private schools for equipment, materials, and minor remodeling to improve education in the arts and humanities. Twelve percent of the authorization is reserved for loans to private schools. Few schools today are properly prepared to teach subjects in the arts and humanities because of the great variety of expensive equipment and materials needed for up-to-date instruction, particularly in the arts. This request will continue limited support in this long neglected area of education.

Section 13 of the Act provides for institutes for advanced study. An appropriation of $500,000 for this section allows for about 12 institutes a year. These institutes serve best by providing information about the different types of programs which might best help to improve the qualifications of school teachers for whom the legislation is intended.

I will be happy to answer any questions you may have.

APPROPRIATION REQUEST

Miss BLOOM. The Commissioner of Education, Mr. Howe, asked me to say that he was sorry he could not be present this morning, and he asked me to come in his place.

We are here to request $1 million for the third year of a program which has two parts. One part is teacher-training institutes in the arts and humanities for elementary grade teachers, high school teachers, and supervisors in these fields.

The second part of the program deals with the purchase of equipment to be used in the elementary and secondary schools, to improve instruction in all of the fields of the arts, and in the humanities. We have a brief statement which summarizes the fact that during the past year, a half million dollars have been spent in each of these two areas for equipment and for the teacher-training institutes. Last summer, there were 11 institutes, with 431 teachers present. Those were teachers that teach at all levels of education, and in all of the arts and in all of the humanities.

We feel that both of these programs asked for a minimum amount of money. It is the first time that this kind of assistance could be given to the schools in the arts and in the humanities, and we feel that this minimum investment has been very, very important during the brief time it has been in existence.

EXTENSION OF AUTHORIZATION

Chairman HAYDEN. The statute under which this appropriation is made expires with this fiscal year. Do you have any plans for seeking an extension of the authorization act?

Miss BLOOM. Tentative plans call for seeking extension under the National Defense Education Act, which already has authorization in the Office of Education to provide both kinds of assistance, teacher-training institutes in many other fields, and the provision of equipment and materials in many other fields.

And this would simply round out the kind of support of this type which would be available to the schools of the Nation.

TEACHER INSTITUTES

Chairman HAYDEN. With regard to the attendance of individuals at your teacher institutes, is there a time limit on their attendance?

Miss BLOOM. The authorization provides that teacher training institutes can either be short-term; that is, for instance, just during the summer, or that they could be all through the year. However, with a half million dollars, we haven't been able to have any institutes that go a whole year in length, and so last year, there were 11 institutes for the summer only, and for this coming summer, there are 12 institutes, just for the summer only.

In other words, there is no statutory limitation, but the limitations of funds make it necessary to have just the short-term ones.

Chairman HAYDEN. Can a teacher who has participated in one of these institutes this year come back again next year?

Mr. SPILLANE. No, not this year.

Miss BLOOM. Not the second year.

ACCOMPLISHMENTS

Chairman HAYDEN. Would you please review your accomplishments for the past year?

Miss BLOOM. I would say one of the most important accomplishments is that the schools recognize the fact that the Federal Government really cares about the arts and humanities. I think the element of recognition has been very important, that teachers for the first time can have these institutes, and I think for the first time, that the States can buy equipment has been extremely important.

Then, second, the fact that many, many teachers in the schools have very little training, very little specialized training in the arts and in the humanities, but, nevertheless, they are expected to do a good job of teaching them. I think the fact that they can come back and have refresher courses, learn new kinds of techniques and learn new approaches, has been very, very important to all of our students in the schools.

Chairman HAYDEN. With regard to the grants made to the various States, what reports do you receive on the accomplishments?

Miss BLOOM. The chief accomplishment there has been the fact that using funds which would range from around $600 or $700 for some of the States with smaller school populations to up around $25,000 or $30,000, the schools have not been able to do very extensive things about equipping classrooms, but they have been able to purchase equipment and materials like visual aids, and films, slides, reproductions, various kinds of resources that can be circulated around the States so that as many children as possible can have the benefit of the teaching that can be done with them.

LOANS TO SCHOOLS

Chairman **Hayden**. For loans to nonprofit private schools, $60,000 has been made available. How long do these schools have to repay these loans, and what is done with the moneys received in repayment?

Miss **Bloom**. I would like to ask Dr. Engelhardt, from the Office of Education, to speak to the point on the loans.

Mr. **Engelhardt**. The loan period is 10 years. They have this long to repay the loan, after it has been granted. There is sometimes a difference in time there. A loan may be applied for, but the actual transaction of the loan may not take place until several months later, until the nonprofit school is ready for it, so from the time the loan is given, the school has 10 years to repay.

Moneys received in repayment are deposited in the United States Treasury.

Chairman **Hayden**. Well, we thank you for your appearance.

Miss **Bloom**. Thank you very much, Mr. Chairman.

TUESDAY, MARCH 14, 1967.

NATIONAL FOUNDATION ON THE ARTS AND THE HUMANITIES

STATEMENT OF ROGER L. STEVENS, CHAIRMAN, NATIONAL ENDOWMENT FOR THE ARTS; ACCOMPANIED BY LIVINGSTON BIDDLE, DEPUTY CHAIRMAN; CHARLES MARK, DIRECTOR OF STATE AND COMMUNITY OPERATIONS; DAVID STEWART, DIRECTOR OF EDUCATIONAL AND PUBLIC MEDIA PROGRAMS; PAUL SPREIREGEN, DIRECTOR OF ARCHITECTURAL AND DESIGN PROGRAMS; BARNABY C. KEENEY, CHAIRMAN, NATIONAL ENDOWMENT FOR THE HUMANITIES, ACCOMPANIED BY WALLACE B. EDGERTON, DEPUTY CHAIRMAN; GLADYS K. HARDY, DIRECTOR, OFFICE OF PLANNING AND ANALYSIS; ROBERT H. WALKER, DIRECTOR, DIVISION OF EDUCATIONAL AND SPECIAL PROJECTS; J. SAUNDERS REDDING, DIRECTOR, DIVISION OF RESEARCH AND PUBLICATION; AND JAMES H. BLESSING, DIRECTOR, DIVISION OF FELLOWSHIPS AND STIPENDS; AND CHARLES B. RUTTENBERG, GENERAL COUNSEL, AND ROBERT W. COX, DIRECTOR OF ADMINISTRATION, NATIONAL FOUNDATION ON THE ARTS AND THE HUMANITIES

INTRODUCTION OF ASSOCIATES

Chairman HAYDEN. The next item is the National Foundation on the Arts and Humanities.

Mr. STEVENS. I would like to introduce Mr. Mark, head of our State operations, and Mr. Biddle, our deputy; Mr. Ruttenberg, the general counsel; and David Stewart, who is head of the educational and public media projects, and Paul Spreiregen, who is director of architectural and design programs, and Mr. Keeney, who is head of the National Endowment for the Humanities.

BUDGET REQUEST

Chairman HAYDEN. There will be placed in the record the justification statements for an appropriation of $14,370,000 for the National Foundation on the Arts and the Humanities. Of this amount, $7,750,000 is for the National Endowment of the Arts; $5 million is for the National Endowment for the Humanities; and $1,620,000 is for administration of the program through a shared staff. In addition, $2 million will be available, $1 million to each endowment, if matched by unrestricted donations.

(The justification follows:)

NATIONAL FOUNDATION ON THE ARTS AND THE HUMANITIES

GENERAL INTRODUCTION

The National Foundation on the Arts and Humanities was established by Congress as the first Federal agency specifically concerned with all aspects of the cultural and human quality of the lives of Americans. The Law accurately recognized the arts and humanism as a public necessity. It gave hope to an important segment of our people who, while clearly recognizing the need for technological progress, had been growing increasingly concerned by the predominant emphasis placed on technology in government and education. They saw in the new Foundation the same vision President Johnson captured when he said: "The quality of our life must become as much a national issue as the quality of our goods and services."

The Chairmen of the two Endowments of the Foundation, and the members of both the National Council on the Arts and the National Council on the Humanities, are well aware that the hopes of artists and scholars rest on the decisions they render. Everyone concerned shares the knowledge that these are pioneering days in fields which are traditionally individualistic and devoted to particular methods for improving the quality of life.

How best to face these challenges and responsibilities has been the constant question confronting the two Councils appointed by the President to advise the Chairmen. Many alternatives were obvious, and many given serious considerations, as study began to bring the national needs into focus.

The Humanities Endowment could have spent all, and indeed three times more than its total authorization on fellowships alone. It could have spent all of its funds this year for the support of research alone, or for support of educational experimentation and development of better teaching at the college level only. It would not have been difficult to spend much more than the total of $4.5 million appropriated in 1966 and 1967 on the public programs, particularly on educational television and radio. Alternatively, it could have selected a number of universities and colleges known for their excellence and for their innovative capacity and made them institutional grants for the support of the humanities. However, if it had attempted to divide its resources equally among the some 2,000 colleges in the country, the grants would have been of the virtually useless sum of $2,500 per institution.

Like the Humanities, the Arts Endowment studied the national needs and rejected the obvious courses of action, such as, dividing the $4 million appropriated to carry out the purposes of Section 5(c) of the Act, among symphony orchestras, museums, and arts councils.

Instead, the Endowments have elected to be as imaginative as possible. Innovative programs were undertaken which were designed to stimulate additional support from other sources, projects to have a dramatic impact on the nation were developed, and above all, grants were carefully distributed so that the major problems in almost every sort of scholarship and art form were highlighted. The result of this diversified program along a broad spectrum has resulted in a favorable acceptance from both the public and professional world.

The Endowments are now in a position to proceed with programs and objectives based on the national needs and the experience gained during the first full year of operation. These are discussed in detail on the following pages.

However, the impression should not be given that a year's experience was necessary before the national needs were known. The problems in the arts and humanities have been quite definitely known for several years. The Commission on the Humanities and the Rockefeller Brothers Panel Report had called the nation's attention to the inadequacy of support from corporations, government, and individuals and the necessity for bold new approaches. Sixty to eighty million dollars per year was cited as the amount of new funds necessary on an emergency basis if the performing arts alone merely were to maintain the present level of excellence. The recent volume published by the Twentieth Century Fund, entitled "The Performing Arts: The Economic Dilemma," focuses sharply on the needs in this area of the arts. The Humanities Commission, in its comprehensive report published in 1964, and highly pertinent to the enabling legislation, cited the need for massive aid to advanced students if highly intelligent people were to be attracted to humanistic subjects in order to offset the imbalance created by aid to the sciences.

When the Ford Foundation granted $82 million to the larger of the professional symphony orchestras in 1965, a major crisis in the music world was avoided temporarily. This action was fortunate for the new Federal Foundation because it alleviated one of the many chronic problems, but the size of the grant again pointed out the scope of aid required if we are even to maintain our cultural life. These problems are also discussed later in this budget.

One other extremely important aspect of the Foundation should be pointed out. Although the enabling Act provides for the support of the arts and humanities in the United States, the ramifications of these activities throughout the world should not be overlooked. Our nation has a deep commitment in the world-wide battle for man's intellect. There can be no stronger weapon for our defense and offense than concerted programs encouraging truth and enlightenment.

Governments which give support to free thought and free expression receive the confidence of other nations and the appreciation of their own talented citizens. In 1964, the Congress declared "that the growth and flourishing of the arts depend upon freedom, imagination, and individual initiative." The same words describe humanistic scholarship, the foundations of our democratic society, and the goals the Endowments and their Councils of private citizens seek to achieve.

UNRESTRICTED GIFTS

(Matching Federal Funds)

Arts Endowment and Humanities Endowment (for 1968) $2,000,000

Both the Arts Endowment and the Humanities Endowment are making concerted efforts to encourage private donors to make unrestricted gifts to the Endowments, so that these can be matched for program purposes by Federal funds.

The present ceiling on Federal sums to match such gifts is $2 million for the Arts Endowment and $3 million for the Humanities Endowment.

At this time, the Arts Endowment has received approximately $365,500 in unrestricted gifts. These funds, with the equivalent Federal sum available, or a total of $731,000 are being used to support projects in the field of educational television as has been reported to the Subcommittee Chairmen. Specifically, a grant of $625,000 has been made to the Educational Broadcasting Corporation, to support programs of high quality covering a wide spectrum of the arts, and to enable these programs to be distributed free of charge to educational television stations throughout the country; a grant of $75,000 has been made to the National Educational Television (NET) to support an expanded program in drama; and the remaining funds are being used to initiate a program sponsored by Educational Television Stations (ETS, based in Indiana) to encourage local education television stations throughout the country to develop their own programs involving local arts groups.

By far the largest unrestricted gift received to date by the Arts Endowment was donated by the Bristol-Meyers Corporation (December, 1966). The Arts Endowment believes that this gift sets a highly significant precedent with respect to the enabling legislation, and represents a substantial step forward in the Endowment's efforts to establish a developing partnership with American industry and private philanthropic sources. It may well lead to a further increase of unrestricted gifts, although it is, of course, too early to forecast additional funding of this kind with any preciseness.

In this regard, the Arts Endowment believes it is essential that the full amount requested in the President's Budget be made available for 1968. Any lower ceiling, the Arts Endowment believes, would seriously discourage potential private donors and fundamentally impede the Endowment's efforts in this regard.

As stated in the Senate report on the enabling legislation, a very important objective of the Arts and Humanities Act is to encourage private philanthropy to support the arts and the humanities. It was specifically for this reason that Section 11(b) was written into Public Law.

The Arts Endowment requests an opportunity to explore fully the potentials of this provision in the law, which in effect means that one Federal dollar helps stimulate three private dollars for programs in the arts. One dollar in an unrestricted gift releases one Federal dollar, and these two dollars must be matched again by the particular arts organization receiving assistance.

The National Council on the Arts has approved a number of priority projects, each requiring a level of funding above current abilities, should unrestricted gifts enable expansion of the Endowment's activities.

Examples: immediate aid to educational television in 1967, which the gifts to date make possible; funds for the development of an American Film Institute, and the preservation of important American film collections from total deterioration and loss forever to the public; and preparation of a special major slide collection of outstanding examples of the visual arts, painting, sculpture and architecture, contemporary and historic.

As in the case of the Arts Endowment, major foundations are being contacted with respect to their willingness to make unrestricted gifts to the Humanities Endowment. It is too early to forecast the amount of these gifts precisely; but it is necessary that adequate federal funding be available for these purposes.

The current ceiling on federal funding to match unrestricted gifts to the Humanities Endowment is $3 million. It is requested that the full amount recommended in the President's budget be appropriated.

The National Council on the Humanities has recommended a number of priority projects which would strengthen and expand our educational programs if unrestricted gifts were donated to the Endowment. Examples of these are a study of the status of the humanities in the schools, an experimental program in the uses of cartridge tapes as an instructional and educational device, the creation of a visiting scholars program for secondary school teachers, and programs to provide colleges with new sources of manpower for teaching.

Because both Endowments are convinced that funds well beyond present budgetary limitations could be utilized for most beneficial and priority purposes, it would seem of great importance that the full amount requested in the President's Budget, with respect to Federal funds to match unrestricted gifts, be approved.

It should be pointed out that the authorized sums in this regard are as follows:

For the Arts Endowment a total of $6.75 million for 1966, 1967 and 1968.

For the Humanities Endowment a total of $15 million for these three fiscal years.

The amounts requested are far below the total authorized allowances and are considered by both Endowments as being of essential value to their operations.

NATIONAL ENDOWMENT FOR THE ARTS

The National Endowment for the Arts has statutory responsibility for developing a broad national policy and program for support of the arts * in the United States. The Endowment proposes for Fiscal Year 1968 a budget totaling $8.750 million in Federal funding for its program activities.

The budget is in accord with the funding recommended in the President's budget for fiscal 1968 as follows: $5 million for programs and projects, exclusive of state aid; $2.750 million for assistance to state arts agencies; and $1 million as an equal share of the $2 million to match unrestricted gifts.

NEEDS IN THE ARTS

The budget is based upon the study and experience of the Endowment's activities since enactment of the enabling legislation in September, 1965. This first period of time, including five meetings of the National Council on the Arts, the development of a competent staff and increasing numbers of requests for assistance, has pointed up conditions and needs which, in the opinion of the Chairman and the 26 private citizen members of the Council, are basic to the reasons why the Congress supported passage of the National Foundation on the Arts and the Humanities Act of 1965 (P.L. 89-209).

Over the past 20 years, this country has witnessed a steadily increasing desire among our citizens to share in the accomplishments of the mind and spirit.

Though this phenomenon hardly needs repetitious documentation, it is true that during this period the number of symphony orchestras has more than

---

*The arts are defined in the enabling legislation to include music (instrumental and vocal), dance, drama, folk art, creative writing, architecture and allied fields, painting, sculpture, photography, graphic and craft arts, industrial design, costume and fashion design, motion pictures, television, radio, tape and sound recording, and the arts related to the presentation, performance, execution and exhibition of such major art forms.

doubled, museums of various types are being established at the rate of one every three and one-half days, and we have seen the development of some 30 professional resident theatre companies outside the New York area. In 1950, there were eight local arts councils seeking to serve community needs and almost no State activity. Today there are more than 300 local councils, and 54 of the 55 States, as defined in the Public Law, have established arts agencies which are now receiving Endowment support. (The 55th, American Samoa, has indicated it will apply for assistance next year.)

The phrase "cultural explosion" has sometimes been used to describe this rapid development of the arts, but by and large it has not been a boon to the individual artist or arts organization; for it has created acute economic problems. These have become more and more critical during the past five years.

Essentially this is the problem:

While the demand for the arts has been growing in every part of the country, the traditional institutions responsible for satisfying much of the demand have been unable to keep pace with it.

> The Ford Foundation, after an extensive study on the state-of-the-arts in the mid-1950's, concluded that the major problem facing the Arts in the future would involve generating sufficient revenues to meet the accelerating demand for artistic services of all types.
>
> The Rockefeller Brothers Panel Report, published in 1965, stated that $60 million in additional support was needed *annually* for the performing arts alone.

This rapid expansion has taken place largely at the expense of the artists themselves. Because traditional resources of financial support have not been able to keep pace with the growth, it is the artist who has worked longer hours without increased income. Post-war wage-price spirals passed by the performing artist with such alacrity that he stands today with labor contracts which would be completely unacceptable to other working groups. The last 10 years have seen a series of strikes and management-labor negotiations among orchestra, ballet, and opera companies which can only be called desperate attempts to solve an impossible situation. Directors of arts institutions are frank to admit that resources to meet contractual commitments two or three years from today are not in sight. The 1960's are a crisis time in the development of the American arts, and it is the artist who has become the victim of increasing demands upon his talent while traditional sources of support are actually decreasing, or too slowly increasing to meet current responsibilities. Despite enormous dedication on the part of trustees and patrons, the economic situation within the art world remains desperate.

Examples:

> Despite recent improvements, fully 80 per cent of our professional symphony orchestra musicians still average less than $5,000 for their year's work, according to the American Symphony Orchestra League.
>
> Actors' Equity states that 75 per cent of the professionally qualified actors and actresses earn less than $2,500 per year from theatrical employment.
>
> Less than eight serious composers have income from royalties on their works which allow them the luxury of full-time composition; and they are envy of the large number of other composers who find it necessary to teach or orchestrate, to earn enough for part-time work in their chosen field.
>
> According to the American Guild of Musical Artists, professional ballet dancers average less than $3,600 per year.
>
> We have no full-time poets.
>
> Despite over 1,300 organized concert audiences, which are generally fully subscribed, the artists fees produced through these thousands of performance opportunities are so low that only 60 recitalists are fully employed as concert artists, according to leading concert management sources.
>
> Quality in the arts suffers considerably because of these factors.

The obvious question is why artists continue to earn subsistence incomes while there is a constantly growing interest in the arts in all parts of the nation.

Even economists find the economics of the arts difficult to understand. They find it difficult because comparisons are too frequently made between the arts and business, or at least entertainment. If the comparison is made to schools—which is proper because the arts are essential to education and the educated person—then the economics come into sharper focus.

Like schools, health and welfare programs, and other services, the arts cannot be priced out of reach of the average citizen, or they will shrink and fail to serve their function—to bring enlightenment and spiritual growth to all.

In simplified terms, the arts have suffered in our expanding economy in the same way that our schools and hospitals have suffered: the cost of service has exceeded the ability of the society to pay the full budget by traditional means.

When this happens in any field of endeavor, it sets off a number of reactions.

1. The practitioners (nurses, teachers, artists) tend to move toward the places where conditions are most prosperous and offer the greatest opportunities.
2. A number of practitioners are forced out of their fields because of low income or an inability to move.
3. Institutions expand their services until they are in financial crisis, or find the quality of service deteriorating.
4. Research programs and innovative ideas which could bring progress toward solving problems and expanding services are curtailed because available funds are needed for basic services.

All these reactions began in the arts when the demand for services increased simultaneously with the expansion of the national economy. Artists in all fields began to move to the larger cities during the thirties, but in larger numbers shortly after World War II as traditional sources of support proved inadequate in other parts of the country.

Opera singers, for example, discovered they could find employment opportunities only in the opera houses of Europe. Over 600 trained American singers are employed as featured performers in Europe at the present time.

A large number of trained and talented artists, particularly musicians and dancers, have abandoned their careers and now work at other employment where wages are keeping pace with increased living costs.

Organizations, straining to meet the increased demand, have found funds to be inadequate and the supply of high-quality artists diminishing. These organizations either lowered their quality of service, or ceased to exist.

As examples, the American Ballet Theatre, representing a $10 million investment over a 25-year period, was rescued from being disbanded only by the timely formation of the National Endowment for the Arts and an emergency grant. . . . The Actors Workshop of San Francisco recently was dissolved for lack of funds despite its substantial reputation . . . Virtually every symphony orchestra exists in the chronic state of financial crisis today. The St. Louis, Chicago, and Indianapolis symphonies are among the well publicized examples of the tremendous efforts required by public and private resources to find even temporary, short-lived solutions . . . Even the Metropolitan Opera, playing to 98 per cent capacity every season, suffers from increasing financial deficits; the new contract with the Metropolitan Opera orchestra will raise the total annual deficit close to $2. million annually.

The underlying erosions in any depressed situation are most destructive when left uncorrected.

Young people with talent are not becoming performers and creators because they witness the disadvantages of such a career as opposed to others.

The private foundations over the years have invested only three-to-four per cent of their philanthropic funds for the arts, and they tend to support established patterns of giving, rather than to innovate new ones.

Corporate and private individual giving offer little encouragement at present. The National Industrial Council Board found in 1964 that less than five per cent of corporate contribution funds went to the arts.

Cities with highly organized federated annual campaigns for the arts receive contributions from only 1.5 per cent of the population, according to a management consulting firm study finished in 1964.

The recent massive Ford grants totaling $82 million to aid symphony orchestras were of great importance; but they apply only to 61 professional orchestras, extend over a 10-year period, and $60 million of this support must be matched by other financial resources.

Bold new programs which can accelerate box office and contributory income and build new audiences for the arts have not been possible because of the lack of investment capital. This latter condition is particularly disturbing, coming as it does when demands for services are so overwhelming.

With enactment of legislation establishing the National Endowment for the Arts, this attitude of pessimism has begun to change. Even before passage, urgent appeals for assistance were received daily at the offices of the National Council on the Arts, established late in 1964.

After enactment and the attendant press coverage, requests began to multiply substantially and an increasing number of artists and arts leaders visited the Endowment's offices. It was finally necessary for the Chairman to publicly discourage applications for projects involving large sums of money due to the limited funds appropriated. Despite these public statements of policies and priorities, the applications and inquiries continue to flow. Every State has contributed to a correspondence load which averages 380 inquiries and requests per month. This figure includes only *new* inquiries each month. And even with a fair degree of public understanding concerning the Endowment's programs in force, requests falling into ineligible categories average nearly $4. million per month. These requests cover a very wide variety of cultural programs, but the constantly stated reason for requesting assistance is that the individuals or organizations have exhausted all other resources of support and are turning to their Federal Government as a last hope.

> In this respect, it is interesting to note that in 1953 the boards of directors of symphony orchestras belonging to the American Symphony Orchestra League were surveyed and found almost unanimously opposed to Federal support for the arts. By 1965, a similar survey of 900 member organizations showed just the reverse to be true. In the 12-year span, deficits have mounted which cannot be met by the traditional private sources which once served these orchestras well.

The economic situation in the arts and its ramifications are reason enough for Federal concern, but one other complex factor must be considered for a full description of our national needs in the arts.

Studied projections by private and Federal Researchers estimate that the year 2000 will bring a gross national product of $2.1 trillion and a population of more than 300 million people. This represents three times today's productivity for only 50 per cent more people.

These increases will cause tremendous problems to our Nation in terms of productivity and population. But even greater problems will result from the combination of abundant goods produced through less and less dependency on laboring hours, while we have even more people available for work that doesn't exist.

How the working man will spend his non-work hours and what the quality of life will be in 34 years depends almost entirely upon the plans and programs undertaken at this time.—These relate not only to the inner satisfaction man derives from the arts, but to the outer aspects of his whole environment, those especially reflected in the arts of architecture planning, landscape architecture and design.

It remains to be said that the arts have been of fundamental value to all leading civilizations. Throughout history they have translated and described in lasting form man's highest aspirations. They express our individuality as nothing else can. Indeed, the chief contribution of the arts lies in what they can do for the individual—for his eyes and ears, his senses, his mind, and, perhaps most vital of all, his curiosity, his desire to explore, his all-important faculty of awareness. As this faculty is increased, as excellence is sought, so does the individual improve himself as a human being. In a rich and prospering country, in one called upon to assume a special role of leadership, and in one dedicated to the full development of the individual in a democratic society, it would seem of the utmost importance that the arts should be supported in every way possible.

OBJECTIVES

In light of the paramount needs in the arts, and from the experience gained by the Council and the Endowment, six clear objectives are manifest:

1. *The first objective is to increase opportunities for citizen appreciation and enjoyment of the arts through a wider distribution of our artistic resources throughout all areas of the nation.* Programs designed to achieve this objective will be primarily of a mobile nature. Certain performing and visual arts organizations can only be described as national artistic resources and these will be more widely available through matching grants for national tours. Other in-

stitutions of high artistic quality which have not been able to tour extensively performances or exhibitions in the past will be supported in their efforts to serve an entire region of several States. Still other institutions of professional quality, which are primarily local, will be assisted in serving a larger audience.

2. *The second objective is to sustain and encourage individual performing and creative artists*, in order that these especially talented and dedicated persons may more effectively offer the people of the nation artistic opportunities of the highest professional excellence. Programs aimed at this objective will be focused on individual grants to performing and creative artists so that they may have a measure of financial stability as they increase their special talents, and on developing opportunities for them to become better known to the public.

3. *The third objective is to help sustain and develop existing independent institutions of the arts*, in order that a high level of achievement can be attained and greater private support generated. Programs will be aimed primarily at overcoming the lack of capital needed for the consistent production of programs of the highest quality.

4. *The fourth objective is to increase the awareness and importance of the arts to our citizens through educational and experimental projects.* Programs under this objective will be small in terms of funds required for any single project, but the results could have an enormous impact on the future of the country. Such current educational pilot projects as the Laboratory Theatre for Education, and a study of the arts curriculum entrance requirements of our colleges will undoubtedly affect the attitude of many school boards toward the arts. Another pilot project—poetry readings in the schools in three cities—has stimulated interest by at least a dozen school systems and is now a program favorably viewed by the Office of Education as part of their Title III concepts under PL. 89-10. Also of an experimental nature is a matching grant project with the University of Wisconsin concerning the problems and opportunities for the arts in rural communities throughout the country.

5. *The fifth objective is to increase citizen participation in local artistic programs through a partnership with the States.* This objective is in part specifically stated in the Act. Programs aimed at achieving this goal will fall within the State program where a broad range of imaginative and worthwhile projects have been approved and are under way at the present time.

6. *The sixth objective is to provide the people of this nation with new opportunities in all aspects of the arts* which are consistent with the achievements of other mature societies. The emphasis here is on the words "new" and "in all aspects of the arts." The United States does not have a film institute nor an institute of design as do almost all of the other developed countries of the world. Currently, the Endowment is funding studies to determine how such institutions can be of greatest benefit to the United States. The Endowment intends to focus on new ideas and needs in the arts and to conduct objective studies concerning the feasibility of establishing new institutions or services. If a long term gain for our people can result from such a new institution or service, then encouragement will be given to its establishment.

The programs described in this budget estimate are based on the above objectives. Some strike decisively toward one goal, while others move broadly toward a number of objectives. It is possible that new objectives may emerge in light of developing experience; but at the present time, these are the objectives and programs which are considered of the greatest immediate consequence.

MUSIC

(1968—$1,225,000)

The Endowment's music projects, already in progress and projected for 1968, have been developed to further five of our stated objectives, as follows:

1. Wider distribution of our artistic resources through a project to send gifted young soloists on tour throughout the country; through the development of regional opera programs in the Southeast, on the West Coast, and support of opera for national audiences new to this art form; and through the establishment of a master chamber orchestra which will tour regularly.

2. The individual artist will be sustained and encouraged through all of these projects.

3. Independent existing institutions are being assisted, especially to create new works and broaden their audiences. The Boston Opera Company was given a grant to produce the difficult but artistically significant work, "Moses and Aaron" by Schoenberg. The Metropolitan Opera National Touring Company is being helped to develop new high school audiences and new labor group audiences. The San Francisco Opera will be able to develop a special four-state program.

4. Educational and experimental projects include both the young soloists program and the master chamber orchestra, plus a study project to develop in the United States the unique methods of teaching music, originated by Zoltan Kodaly.

5. New opportunities for the public and for the musicians are also reflected in the master chamber orchestra project and the young musical artist project. An event of special interest, nationally and internationally, was the meeting at the Interlochen Music Camp of the International Society for Music Education in Michigan this summer. This distinguished gathering was the first such meeting to be held in the Western Hemisphere, an encouragement of international communication in the arts, peculiarly appropriate to the purposes of our enabling legislation.

In keeping with the above, the following funding is requested for 1968:

Gifted young soloists' project -------------------------------------- $278,000

In 1967, a grant of $44,500 has already been made to develop plans for a project to select (through a distinguished panel of musicians) a group of gifted young soloists who will be given the opportunity to tour the United States, appearing with orchestras or other musical associations. These young men and women will be given broad opportunities to develop their skills as recitalists, including major metropolitan appearances. Assistance to these young artists is of critical importance in developing their careers within our own country.

Included in this program is a plan whereby the young concert artists will remain for several days when performing on college campuses, offer lecture-demonstrations, and generally assist in stimulating interest in music among the students. A minimum of $278,000 will be required for the full development of this program during fiscal year 1968. (See attached budget.)

Master chamber orchestra -------------------------------------- $400,000

This is a major program which will establish an orchestra of virtuoso calibre to function both as a performing group and as an institute to help solve the shortage of outstanding instrumentalists in our country, particularly in the string sections of orchestras. The rapidly expanding demand for orchestral music, and the necessity to provide greater financial stability for our musicians through longer concert seasons, has placed an increasingly heavy burden on the leading players of our major orchestras. The physical strain on certain types of instrumentalists will make it necessary within the next five years for many orchestras to employ extra musicians to carry part of the load. Presently, no organization exists to train these musical leaders.

Alexander Schneider, violinist and eminent chamber musician and conductor, will direct the project. A grant of $32,500 has been made to him to select the initial ensemble of 50 musicians, and to prepare the project for its first full year, which will require the above budgeted figure.

The chamber orchestra plans to tour, and will include visits of longer than the usual one-night performance—again, as with the Gifted Young Soloists' Project, offering the opportunity for expanded study of music as it is rehearsed and performed. Lecture-demonstrations and master classes will be included in some of these several-day engagements, and programs for the special needs in some disadvantaged areas are planned. (See attached budget.)

Regional opera projects -------------------------------------- $475,000

In last year's budget request, the following statement was submitted: ". . . The National Council on the Arts does not envision an elaborate system of regional (opera) companies in the near future. The plan here is rather to encourage the existing groups to gradually expand their touring efforts, or mount special productions for touring as a first experimental step."

During Fiscal Year 1967 the following projects were undertaken:

1. Boston Opera Company: A matching grant of $50,000 was approved. This

was an emergency grant, which came at a critical time in the artistic life of this excellent company, directed by Sarah Caldwell. It exemplifies the failure of traditional resources to meet fully the needs of an outstanding arts organization.

2. Regional Opera in the Southeast: A special study to gather all available information on the existing facilities and support for opera production in the southeastern part of the country is planned in 1967, with a view to developing a regional opera program which will ultimately include studio activities, full-scale productions, and well-presented local opera of a quality previously not available in the United States. At present $35,000 has been approved for research and development purposes. In addition, while the project is being researched, it is planned that the Metropolitan National Touring Company will extend its appearances in this part of the country to help develop the audience for opera already existing there, and a matching grant of $63,000 has been committed for this development.

3. Metropolitan Opera National Company: A grant of $150,000 to provide special performances in a number of midwest states for high school students and labor groups has been approved. The grant will enable these groups to have the opportunity to enjoy opera of the highest calibre, often for the first time. The Company, which in its last year's tour received nearly unanimous acclaim from the critics, was formed to bring opera to all parts of the country and to give young singers the opportunity for operatic performances hitherto available in most cases only in Europe. (It should be noted that the excellence of opera training in this country is without parallel, but our singers have found employment after graduation largely in Germany and Italy.) The Endowment's grant is only a small addition to the over-all budget required for this tour.

4. San Francisco Opera Company: A grant of $105,000 was approved for the San Francisco Opera Company for a one-year program. The project will create a small flexible opera ensemble to perform condensed and full-length versions of opera for schools and neighborhood and community organizations, including nationality and labor groups. Performances will also be held in smaller "grass root" areas where large scale opera is not feasible. Plans for regional performances by this ensemble will include California, Southern Oregon, Nevada, and Arizona.

For 1968 a minimum of $475,000 is estimated as essential for the continuance of projects to bring excellence in the opera to larger regional audiences, and to begin development of a national touring company.

Kodaly music education project------------------------------------ $40,000

From many expert sources we have learned that the method of music education developed in Hungary by the composer and teacher Zoltan Kodaly has amazing results with youngsters. Teachers throughout the United States have written to applaud the announcement of a project which will start with the study of the Kodaly teaching method by a selected group of able teachers and young musicians.

Eventually, it is planned that these professional musicians, through non-agency funds, will be sent to Hungary to learn the skills first-hand and bring them back for adaptation to the needs of this country.

Dr. Alexander Ringer, professor of musicology at the University of Illinois, is administering a study grant of $12,150 to set up the project. $40,000 is requested to continue this project in fiscal year 1968. The funds would enable up to six especially selected music teachers or musicians to prepare in 1968 for the fuller implementation of this project with Dr. Ringer.

International Music Council Congress ------------------------------ $32, 000

In keeping with the stated interest of the National Council on the Arts in supporting international meetings held in the United States and of important benefit to the development of the arts in this country, the Council has recommended support in 1968 of the International Music Council Congress, scheduled to hold its next conference in New York and Washington during April of 1968. None of the conferences of the International Music Council have taken place in the United States before, although credit for its organization has largely been ascribed to American representatives. The Endowment has already supported precedent-setting activities of this kind by enabling the United States to host significant international events in the arts, and believes that this particular conference will greatly benefit the field of music in the United States and serve to project American accomplishments to other countries, including those from Europe and Asia. The amount involved, $32,000, would be matched and is much needed to insure an effective program.

GIFTED YOUNG SOLOISTS' PROJECT

This project is designed to assist the musical careers of up to twelve especially gifted young artists, to be selected for American tours, which can include 35 concert annual engagements for each artist. These appearances (whether in concert halls or at educational institutions) will help to stabilize the careers of these young artists at a time when stability is most needed, that period between the conclusion of formal music education and the fully professional career. This is the period most difficult for the young artist to bridge.

The project will be handled through the Carnegie Hall-Jeunesses Musicales agency, which has considerable experience in assisting young American musicians. The funds will greatly increase the opportunity for young American artists to tour this country, and will allow for lengthened engagements at some colleges or other sponsorships, where the artist can be available for all kinds of additional demonstration, open rehearsals, or less formal educational gatherings with other interested young people. Under present conditions in the field of music, opportunities for an intensive schedule of regular performances are rarely available to talented young musicians.

Estimated budget for 1968

The National Endowment for the Arts will provide funds to cover fees, per diem, travel, concert promotion and tour direction services, to be administered through Carnegie Hall-Jeunesses Musicales as provided hereafter:

1. Fees: $250 per artist, $100 per accompanist (per engagement)
2. Per diem: $16
3. Concert promotion and Tour Direction Services: $155 per concert
4. Travel, Health and Accident Insurance

Estimated budget: 12 artists×35 concerts=420 concerts in 10–12 weeks (minimum: 3 concerts per week, 7 per diem, plus travel).

Per week:

Fee for artist ($250×3)	$750
Fee for accompanist ($100×3)	300
Per diem allowance (7×2×$16)	224
Services ($155×3)	465
3 concerts×$95 (travel, etc.)×2	570
	[1] 2,309

---

[1] $2,309×12 artists×10 weeks average, plus $1,000 for contingencies equals $278,000.

MASTER CHAMBER ORCHESTRA

This is a major program to establish an orchestra of virtuoso calibre which can function both as a performing group and as an institute to help solve the shortage of outstanding instrumentalists in our country. A budget of $400,000 to organize and launch the project is required.

Alexander Schneider, violinist and eminent chamber musician and conductor, will direct the project. A grant of $32,500 has been made to him to select the initial ensemble of 50 musicians.

The chamber orchestra ultimately plans to tour, and will include visits of longer than the usual one-night performance, offering the opportunity for expanded study of music as it is rehearsed and performed. Lecture-demonstrations and master classes will be included in some of these several-day engagements, and programs for the special needs in some disadvantaged areas will be considered for planning.

Estimated budget: 1st season, Sept. 1, 1967 to May 30, 1968

A. Operating costs:	
1. Continuing office costs	$12,400
2. Continuing auditions	4,000
3. Rental of chapter hall (Carnegie) per year	15,000
4. House costs (Carnegie Hall concerts) per concert with one rehearsal, 20 concerts×$2,000	40,000
5. Promotion of concerts	7,000
B. Orchestra salaries and employment benefits (for 9 months):	
1. 37 players×$9,000	333,000
2. 11 players with negotiated salaries (estimated $12,000)	132,000
3. Conductor, orchestra manager, and other assistance	40,000
C. Travel and per diem for 32 weeks (estimated 50 men×100 concerts):	
1. Travel (50×100×$20)	100,000
2. Weekly per diem (32×50×$42)	67,200
3. Weekly pension fund (32×50×$8.65)	13,840
4. Contractor ($346×32)	11,072
D. Miscellaneous expenses and contigencies, at 3 percent of total budget	24,488
Total	[1] 800,000

[1] ½ of total funding from Arts Endowment, or an estimated $400,000.

DRAMA

(1968—$750,000)

The programs and projects in drama, already funded and herewith submitted, are aimed at attaining five of the six major objectives of the National Endowment for the Arts, as follows:

1. A wider distribution of artistic resources is achieved through the programs, some national in scope, some local, of the resident professional theatre companies, and through special audience development programs.

2. Grants to organizations which produce new works will sustain and encourage the individual playwright who is the most important creative element in the theatre. The Endowment has also initiated projects to assist playwrights and the production of new plays outside of New York.

3. The programs of aid to permanent professional theatre companies aim to both sustain and develop these institutions, permitting them to achieve and maintain high artistic standards.

4. The Laboratory Theatre pilot project, which is educational and experimental, may well point the way toward future developments in both the teaching and presentation of theatre for young audiences. (It should also be mentioned that the American Lyric Theatre Workshop, mentioned below, is a unique experiment, and is also closely related to drama, as it is to dance, music, creative writing, and the visual arts as well.)

5. Projects like the American Lyric Theatre Workshop and the Laboratory Theatre are aimed toward the development of new forms which can expand the art of the theatre and lead to the formulation of new institutions.

In keeping with the above, the following funding is requested for 1968:

Grants to permanent professional theater companies $250,000

After a careful survey of the existing permanent professional theater organizations, the Endowment initiated a program in fiscal years 1966 and 1967 of grants to sixteen selected theater groups including both resident theaters and those which tour. These grants, totaling $483,500, were for the general artistic development of the company, in most cases specifically through the employment of high calibre actors and directors.

This was conceived as a continuing program. The theaters which received grants are eligible to reapply. Many other theaters have already requested assistance. All these theaters will be reviewed and their work evaluated by members of the National Council on the Arts, the Theatre Panel, and through special research by the Endowment. Theaters will be judged on the basis of the quality of their current work and community service, their creative utilization of the grant (if they have received one), and their need. The above amount is extremely minimal in terms of needs, but budgetary limitations do not permit expansion at this time.

Laboratory Theater project	$500,000

A joint effort of the Endowment and the Office of Education, the Laboratory Theatre is a pilot project now underway in two cities: Providence and New Orleans. High quality professional resident companies, of a type not available in these cities heretofore, are presenting free daytime performances of classic plays to elementary and secondary school children. The plays produced are coordinated with the school curriculum, and special readings and lectures are given as supplemental aids to classroom work. The companies also give evening and weekend performances for adults. This project is in its first year. To fully prove its effectiveness and educational value, it is essential that the projects in each city continue for at least two years. The goal is to build new audiences for theater of high quality and thus to encourage community support and sufficient private resources for the theaters themselves. (Funds are requested to continue support for the New Orleans and Providence theaters and to fund one new such theater in one other metropolitan area, and possibly a second, should sufficient funds remain from this allocation. To date $165,000 has been required for Endowment funding of the initial projects in each of the two cities, Providence and New Orleans. Second-year costs may be lower, thus allowing for the possibility of two new projects.)

DANCE

1968—$300,000

The programs in dance are aimed at fulfilling five of the six major objectives of the Endowment as follows:

1. Wider distribution of our artistic resources is the major purpose of both the dance programs described below.
2. The individual artist is sustained and encouraged through the matching grants to the companies which, in turn, assist the individual dancers and choreographers.
3. Institutions are assisted directly by these programs.
4. Audience education is a primary objective of these programs and accomplished by the Endowment's plan that companies include master classes and lecture demonstrations in their schedules while on tour.
5. By assisting the developing dance companies of high standard, new opportunities and institutions are essentially created. The economics of dance require this type of support if companies are to achieve the stability necessary to bonafide institutions.

Dance has always been considered the stepchild of the performing arts in the United States from the standpoint of finance, administration and organization. At the moment not more than five or six dance companies can claim both a national reputation and relatively stable support capable of surviving a crisis. The average income of a professional dancer is $3,000 to $3,500 a year, and only a handful of companies can offer close to year-round employment.

And yet this country has produced two ballet companies which rank among the finest in the world, the New York City Ballet and the American Ballet Theatre—and Martha Graham, a towering figure in the world of modern dance, internationally acclaimed. Other modern dance choreographers, among them Jose Limon, Anna Sokolow, Merce Cunningham, Paul Taylor, are of the first rank, and have finely-trained but financially hard-pressed companies. During the past few years there has been remarkable growth in ballet, with hundreds of companies across the country, some of them professional, and many others doing high quality work and aiming toward professionalism.

All of these companies and individuals in dance, with the possible exception of the New York City Ballet which has since 1963 been supported by the Ford Foundation, are, with so many arts organizations, in an almost continual state of financial crisis. The other major companies and artists have been supported almost exclusively by a few smaller private foundations and wealthy patrons. This support is running out and a way must be found to maintain and nourish the best of what we have, as well as to encourage the most promising. Here, as in the theatre, but to an even greater extent, audience education is crucial. Choreographic talent must be stimulated and encouraged, for the vitality of this art form, as of every other, depends as much upon the creation of new forms and contemporary expressions as upon the conservation of the heritage of the past.

Grants to major dance companies	$250,000

Support here is essential if these companies are to maintain and develop their excellence. The necessity for touring and audience education has already been pointed out. It is planned to assist several among the most qualified and needed companies to tour, with an educational program which would involve not only formal performances, but lecture demonstrations as well. Selections would be made by the Endowment's dance panel.

Program of support for developing dance companies	$50,000

The Dance Panel and Endowment staff are currently surveying the major developing dance companies to select those with the highest artistic standards and the most potential for the future. As a beginning program, small grants would be made to these companies to assist them in engaging guest choreographers and dancers, to increase dancers' salaries, and to mount new works which enlarge their repertories.

CREATIVE WRITING

(1968—$500,000)

Programs and projects in creative writing are aimed at five of the six major objectives of the Endowment as follows:

1. Wider distribution of our artistic resources through the poetry projects for school children *, through the increased distribution of writers' works made possible by work of the Coordinating Council of Literary Magazines *, and through the literary anthology *, which will be widely offered for sale at a reasonable price.
2. The individual creative writer is the heart of the literary programs and therefore almost all the programs are helpful in some way. Individual grants for work-in-progress *, the literary anthology *, the Poetry project *, and the Equal Creative Opportunity project will all be of considerable aid to the particular writers involved.
3. Institutions of the arts are sustained and developed by the Coordinating Council of Literary Magazines project.
4. The Poetry *, and Equal Creative Opportunity projects substantially serve the objective of increasing citizen awareness through experimental and/or educational activities.
5. New opportunities in the arts for our citizens is the object of the Coordinating Council, the Literary Anthology *, and the Equal Opportunity projects.

In keeping with the above, the following funding is requested for 1968:

Grants to individual creative writers	$240,000

In the field of literature the *individual* creative artist is paramount. While other creative art forms value the individual, they also involve established and complex institutions such as museums, theatres, opera and dance companies. The writer works alone for months and years before the finished product can be offered to the public. *It is estimated by the Authors' League that a first novel earns less than $1,000 for its creator and that there are fewer than 300 writers who are able to spend full time on their writing because of financial needs.*

The existing individual grants programs of private foundations such as Rockefeller and Guggenheim have been unable to keep up with increased living cost trends. A typical private grant award is approximately half what is needed to maintain a reasonable standard of living in the United States in the sixties.

It is anticipated that a number of our grants may go to supplement inadequate awards from other sources.

In addition, we hope to emphasize a grants program aimed at reaching:

(a) non-teaching writers

---

*Projects continuing from 1967.

(b) women with domestic responsibilities and dependent children

(c) talented writers from underprivileged backgrounds, who may need further educational or cultural supportive assistance before they can succeed in their work

(d) young writers who do not yet have the kind of established reputations which appeal to private foundations

(e) older writers who have made distinguished contributions to the cultural fabric of this country, and whose productive years may be extended and enriched by aid and recognition from the federal arts program.

All these classes of writers tend to be neglected by existing private programs.

Over a third of the total literary programs is devoted to these grants for works-in-progress. Funds received are to cover necessary travel, materials, and living expenses. Grants are estimated to range between $4,000 and $10,000, depending on individual need, type of project, and possible support of writer from other sources.

Project to equalize creative opportunity	$30,000

A *Pilot Project.*—To develop creative skills in literature, and the appreciation of the American literary heritage in culturally disadvantaged urban areas and isolated rural areas.

It is planned that three areas, different in quality but adjacent geographically, be selected in the following categories:

(a) an urban high school in an underprivileged area

(b) a Negro college which lacks creative arts programing

(c) an isolated rural college

Programs in the three areas would be coordinated, utilizing writers and teachers of creative writing for in-residence programs at the institutions, from periods of one week upwards. In collaboration with the existing faculty, they would design programs which would relate to the particular needs of the students involved.

The goals are tri-fold: First, the student would be put in closer touch with works of outstanding literary value on a person-to-person basis; second, doors to literature and the arts would be opened to him in ways that would strengthen his own motivation in continuing education, and acquiring tools of self-expression; and, third, the benefits of creative expression would assist the student in raising his own estimation of himself and his ability to contribute to the life of his area and his country.

From projects such as these, and their careful evaluation, more widespread programs of a similar kind—or of an improved kind—could be developed on a much broader scale in future years.

Program in poetry: In Schools and Communities	$80,000

The success of the joint project between the Academy of American Poets and the National Endowment for the Arts in bringing poets and poetry to the public schools of New York, Detroit, and Pittsburgh prompts the allocation of matching funds for similar programs, throughout the United States particularly for schools in the underprivileged areas, and in rural school areas where every type of cultural advantage, is lacking. In 1966 the Endowment granted to the Academy $47,000 to initiate this project in New York. 112 schools were involved at first; 200 more applied, forming the basis for an additional grant of $33,000. We consider this project as already having proved its merit, and as an example of a relatively small grant which has produced exceptional results.

Projects in arts criticism	$50,000

One of the major blocks to the greater appreciation and knowledge of the arts by our citizens is the inconsistency of criticism about the arts. It has been said that, "High standards of criticism are the best advertising the arts can have." Though excellent critics are now practicing, the general standard is low and too often tends toward academic bravado and to badly written and confused prose. As a result, the average newspaper or magazine reader often has a confused impression of the basic values of the arts in our society.

Therefore, a program designed to elevate the standards of literary criticism is urgently needed. One phase of the project would involve workshops and seminars which would be planned for critics and prospective critics from a variety of geographic areas. Also, individual grants would offer opportunities for critics to see and experience the arts in parts of the United States away from their home base.

It is planned that this allocation would be carefully coordinated with the programs of the National Endowment for the Humanities in this field. The Arts Endowment funding would allow for only a limited number of pilot activities in 1968, but it is believed that these could play a very significant role in the development of the arts in the United States.

Coordinating Council of Literary Magazines	$50, 000

A matching grant project to continue funding for a much-needed coordinating council serving the leading literary magazines of the country. These magazines, which are nonprofit corporations, lack sufficient capital to begin such a council. Once established, the financial benefits derived from coordinating such services as promotion, publication, and distribution, would enable the magazines to meet the costs of maintaining the council. The funding is based on minimum estimates of magazine representatives with whom the project has been discussed and by whom it has been enthusiastically recommended.

Literary anthology	$50, 000

This grant would continue the awards of $1,000 to writers and $500 to editors of magazines participating in the annual anthology of the best American writing. This project involves seven leading New York publishers, who have agreed to publish the anthology in rotation, observing uniform production standards from year to year. The funds supplied by the Endowment are to cover the sums needed to pay the winning writers and the magazine editors who originally selected their work. Like the Council for Literary Magazines described above, the anthology has been initiated on a pilot basis, and warrants continued support.

VISUAL ARTS

(1968—$535,000)

The programs and projects in the visual arts are aimed at attaining all six of the objectives of the National Endowment for the Arts as follows:

1. Wider distribution of our artistic resources is planned through programs with museums, traveling exhibitions, and distribution of prints and drawings to schools and libraries.
2. Assistance to the individual artist is planned through grants-in-aid for his professional development, through encouraging the development of certain types of distribution programs, through commissioning drawings, and through developing methods for a better understanding of contemporary art.
3. Support for existing institutions is included through museum programs and aid to specific art programs in schools.
4. Educational and experimental objectives are aided by pilot projects involving reproduction of graphic art and research in photographic services.
5. A partnership with the states is strengthened by distributing the benefits of certain projects through state arts agencies.
6. New opoprtunities for the general public are inherent in all of the planned programs and projects, but particularly in the photographic curatorships and the drawing and print portfolio projects.

In keeping with the above, the following funds are requested for 1968:

Museum projects	$220, 000

To make the resources of museums available to wider audiences, and to encourage the public to come to exhibition centers and to stimulate awareness in the arts, several projects are planned on a matching basis with outstanding museums. One such project will send exhibitions, films, lecturers, and the like throughout an entire state, utilizing the facilities of a major metropolitan museum. Smaller scale projects will be directed toward regional exhibitions of the visual arts. These programs will establish guidelines for creative cultural programming, utilizing new techniques for arts exhibits and for audience development. The exhibitions will be toured to community centers, college campuses, secondary and primary schools. This is a continuing program initiated in

1967 with a $90,000 matching grant to the Detroit Institute of Art, and matching grants of $30,000 each to the Institute of Contemporary Arts in Boston and the Amon Carter Museum in Forth Worth, Texas.

Project for photography	$20, 000

American photography has, in the past, made significant contributions to the record of our society. The daily use of photographs as a fundamental means of bringing national self-knowledge and understanding to our people is an art form in the highest sense and deserves support.

At present, museums lack sufficient funds to establish photography programs, though interest in such programs is intense. Also, there is a lack of knowledge as to the most effective means of training curators, designing programs, and developing broad recognition for excellence in photography. Therefore, $20,000 is requested for a small number of individual grants for curatorial fellowships at nonprofit institutions such as museums and historical societies, as a first step toward increasing public awareness of the importance of photography as an art form.

Grants-in-aid to painters and sculptors	$225, 000

We believe any well-balanced program to assist the visual artist from Endowment funds should include individual grants-in-aid. Like the creative writer, the visual artist works alone. The distribution of his work and the increase of public appreciation for his talents can be advanced by other means; but a key factor in assistance to the visual artist is a direct grants-in-aid project. Private and public funds have at times supported the individual visual artist, but at the present, there is limited support for his activities due to the withdrawal of the Ford Foundation's program, which in the past supported individual artists with grants of $10,000.

Direct financial aid to an artist at a crucial phase in the development of his career is considered by the Visual Arts Panel to be the most efficient way to enable him to continue his work and attain eventual financial stability. Panels of leading visual artists have been organized by the Endowment to serve the visual arts in all parts of the country. We now have an East Coast panel, a West Coast panel, and one concerned with the areas in between.

Awards to visual artists during 1967 totaled $300,000. Many more applications for this project were received than could be approved. We therefore request the above funds to continue a program of individual assistance to visual artists in 1968. We believe that at least $500,000 could be expended beneficially for this project in 1968. The request reflects budgetary limitations, and the need for a balanced and diversified program within these limitations.

Craft and folk art projects	$70, 000

During 1967 the National Council on the Arts approved grants to the Festival of the Performing Arts of American Indian ($29,000), American Folk Festival Association ($39,500) and the Archie Bray Foundation Crafts Workshop ($5,000). These small grants were selected on the basis of merit to assist in the stimulation of interest in the American folk and craft heritage.

Continued assistance to the above organizations is now under consideration and several other possible projects are under study.

$70,000 is requested to continue such projects and for further support of our folk art and craft national needs. The graphic and craft arts are included in the definition of arts categories in the enabling legislation. An allocation in this area is considered important to a well-balanced overall program. Relatively small grants can prove highly effective.

ARCHITECTURE, PLANNING AND DESIGN

(1968—$400,000)

The projects in this field of the arts are aimed at fulfilling all major Endowment objectives. Special emphasis, however, is placed on the first objective, dealing with a wider distribution of beneficial arts resources; on the fourth objective, dealing with increased awareness of the importance of the arts in our society; and on the sixth objective, concerned with developing new arts institutions.

In keeping with the above, the following funding is requested for 1968:

National institute	$150,000

The Endowment has committed $100,000 in 1967 for a study on how best to establish a National Institute on architecture, planning and design, and approved $222,500 for demonstration projects to be undertaken in conjunction with the study. The firm of Robert Nathan Associates has been approved to begin the first information-gathering phase of the study, now well under way. It is planned that the whole study will be completed by the spring of 1967.

It is envisioned that the Institute would serve as a center where expert advisory services would be coordinated and developed to serve our people, cities and states in their search for higher quality environment. Leading architects, planners and designers would be involved. As pointed out earlier, other leading nations have such institues—as, for example, Sweden, where excellence in design has brought about important economic benefits in international trade.

At the present time, it is believed that the Institute would function best as an independent facility, which would undertake special studies and research projects, hold conferences and seminars, publish reports and issue information bulletins. These activities would actively involve and serve leading professionals in the United States, as well as mayors, planning commissioners, governors, industrialists, educators, and other public officials and private citizens.

The Endowment believes that the study will fully justify the need for establishing the Institute on a permanent basis, at first with a relatively small, competent professional staff. It is believed that the securing of matching funds from outside sources would present no problem.

The Endowment estimates that $150,000 of its own funds would be needed for the first year of the Institute's life, and that, as in the case of the American Film Institute described below, these funds should be allocated now for 1968.

Demonstration and research projects

To enable the institute in its first year to conduct much-needed demonstration and research projects, we believe that a minimum of $250,000 should be allocated in 1968.

Examples of such pilot projects are as follows:

1. Support of industry through research on the improved design of urban street furnishings such as electric lighting fixtures, signs, benches, planting.
2. Support of improved design of community facilities in new suburban town centers.
3. Support of improved design in a newly developing recreation area, leading to a prototype park which would both retain and enhance natural beauty.
4. Support of improved design in portable arts facilities for residential neighborhoods, outlying towns and rural areas.
5. Support for prototype restoration and embellishment of the main squares of rural towns.
6. Support for prototype development of an old town's historic area stressing contemporary use and an improved economy.

PUBLIC MEDIA

(1968—*American Film Institute and Special Education Projects*, $480,000)

(1968—*Educational Television, Radio, Recording*, $200,000)

Programs and projects in the public media—television, recording, radio, and motion pictures—are aimed at meeting five of the major objectives of the National Endowment for the Arts.

1. To create wider distribution of the nation's artistic resources throughout all areas of the country by means of America's unique system of non-commercial television and radio broadcasting stations. All arts programs produced for television and radio will be distributed on a national basis, the programs embracing virtually all forms of the arts.
2. To sustain and encourage individual performing and creative artists by providing, through American Film Institute auspices, opportunities for talented individuals to make their special contributions to the film medium.
3. To sustain and develop existing institutions in the arts through the provision of support for the production of television and radio programs designed for a national audience.

4. To increase public awareness and importance of the arts through dissemination of experimental television and radio programs to a national audience and, through an American Film Institute, to offer the highest quality education and training to talented film makers.

5. To establish an entirely new national artistic institution, an American Film Institute (similar organizations have been serving most of the countries of Europe for many years) capable of greatly enhancing the art of film making throughout the United States.

In view of the above, the following amounts are requested:

AMERICAN FILM INSTITUTE, AND SPECIAL EDUCATION PROJECTS

(1968—$480,000)

The National Council on the Arts, from the 1966 appropriation, approved a $91,000 contract with one of the country's leading research organizations, Stanford Research Institute, to conduct a study leading to recommendations for establishing an American Film Institute. This inquiry was based upon the conviction that the production of motion pictures, pioneered in America, represents one of the leading forms of artistic expression in the world today. As President Johnson remarked when he signed into law the bill creating a National Foundation on the Arts and the Humanities, "We will create an American Film Institute, bringing together leading artists of the film industry, outstanding educators, and young men and women who wish to pursue this 20th Century art form as their life's work."

The Stanford Research Institute study, guided by members of the National Council on the Arts, has taken advantage of the expert judgment and opinion of highly qualified individuals in the film industry, film education and scholarship. Technical expertise in matters of motion picture storage and retrieval have also been carefully studied.

Recognizing that film is a "universal language," the research has not been limited to domestic experience. Most European countries have established film institutes in which experimental film-making opportunities and training for talented young artists are available, as well as formal and informal educational activities enhancing audience appreciation of this contemporary art. The Stanford study has embraced this European experience by on-the-spot inspections of film institutes in England, France, Italy, Czechoslovakia, Poland, Bulgaria, and the Scandinavian countries.

The study of film art and administrative procedures best suited to serve all motion picture interests in the United States has included the educational responsibilities (to audience and film-maker) of a national film institute, location criteria, manpower and training requirements, exhibition, storage and retrieval technology, archival potentialities, and long-range financing.

The major part of this allocation, at least $350,000, is requested for matching fund purposes in 1968 to assist in the establishment of an American Film Institute, an entirely new national artistic enterprise, providing a service to film artist and audience alike, building upon the Stanford study now nearing completion, and the recommendations of the National Council on the Arts.

Any remaining funds from this allocation would be used to support special pilot projects related to education—i.e., the Endowment is supporting with $72,000 in 1967 a unique project on a matching basis with Fordham University to develop special teaching methods using films of high quality in the instruction of secondary school children, particularly those from culturally and economically deprived backgrounds. It is planned to continue this project, should it prove as effective as anticipated. In 1968 the Endowment also plans to initiate with $30,000 a Master Teachers program, utilizing the talents of experienced artists in giving special advanced instruction at educational institutions.

EDUCATIONAL TELEVISION

(1968—$125,000)

Since its inception in 1952, when the Federal Communications Commission reserved 242 channels for non-commercial, educational television broadcasting, ETV has come of age. More than 115 stations are on the air, serving a regular audience of more than 10,000,000 with informal cultural and public affairs programs for adults, informal programming for children, and instructional televised lessons reaching into more than 50% of the nation's school systems. Regional ETV networks are now beginning to link metropolitan stations and statewide educational television networks. The creation of a national, non-commercial network is not far in the future.

Educational television has emerged from its early promise of an "electronic blackboard" to become one of America's most valuable cultural resources.

Through the pioneering efforts of American philanthropy, notably the financial assistance programs of the Ford Foundation, and Federal support for construction of new stations offered by the Educational Television Facilities Act, this new medium of communication now promises to play a major role in an age of increasing leisure time and opportunity for appreciation of the arts.

The National Council on the Arts in the current year has not only taken advantage of the opportunities for using this valuable resource to bring outstanding programs in all the arts into the homes and schools of the nation, but has also encouraged programming experimentation in the art of television itself. From current resources, the National Council on the Arts has approved grants totaling $768,000, which when matched meant $1.536 million for new programs and support of a wide spectrum of the arts. One grant was made possible by a $300,000 unrestricted gift from the Bristol-Meyers Corporation (see above). This project will bring 19 new major television programs to the 115 educational stations across the country. The total Federal share for this $1.25 million budget was $325,000. Two other grants approved in 1967 totaled $143,600 and were primarily aimed at wide distribution of arts programs via educational television. Unrestricted gifts donated to the Arts Endowment made possible virtually all of this educational television program, with the exception of $37,000 which is reserved from the Endowment's other available funds to meet all 1967 commitments in this area.

EDUCATIONAL RADIO, DISC AND TAPE RECORDING

(1968—$75,000)

The first educational radio station was established more than forty years ago; today there are well over 300 such stations. Twenty percent of these have gone on the air since 1962. This growth presents a challenge and an opportunity to those concerned with the vitality of education, and the arts in the United States.

Educational radio is a valuable national resource. The time is propitious for a new and vigorous experimental approach to art programs on radio and for exploring the art of radio, itself. Prior to the emergence of television, radio broadcasting, in addition to its communication of orchestral music and opera, had begun to discover its potential for dramatic art through the work of persons such as Norman Corwin, Dylan Thomas, Louis MacNeice, Archibald MacLeish, Henry Reed, and Orson Welles. It is highly desirable to re-establish "theatre for the ear" and other forms of the radio art, if for no other reason than to present alternatives to the unrelieved format of music and news which presently dominates this public medium. It is important to note that radio remains the best medium with which to reach people in areas such as Appalachia where television is barred in many instances by cost and terrain.

The opportunities and potentialities for fostering new talent and enriching this national radio resource are enormous. This has been demonstrated by venturesome non-commercial radio programming in the arts on educational stations such as WRVR in New York, WGBH in Boston, and in other locations.

The potentialities of non-commercial recording of music, drama, literary, and other arts programs for eventual use in public and private libraries as well as in cartridges designed for automobiles have been less well explored but bear an important relationship to radio broadcasting. The National Council on the Arts proposes to assist non-commercial radio stations in experimental projects designed to explore new ways to record arts programs on discs and tapes for distribution to large audiences.

The Endowment requests $75,000 for a matching grant project to support, through the auspices of National Educational Radio (a division of the National Association of Educational Broadcasters), non-commercial radio programs in poetry, drama, music, and discussion of the arts, produced by local educational radio stations, and distributed by National Educational Radio to its affiliated stations throughout the country.

PROGRAMS FOR SEVERAL ART FORMS

($360,000)

Projects and programs which are planned to serve more than one art form strike broadly at all of the six major objectives.

1. Wider distribution of our artistic resources is the very purpose of the Rural Arts Study project.
2. The individual artist is supported and sustained from small projects within the American Lyric Theatre Workshop and the Rural Arts Study.
3. Existing institutions of the arts are in large measure responsible for the carrying out of the rural project.
4. Both projects are experimental and educational by concept.
5. The rural project is primarily designed to serve the States by developing "blueprints" for rural programs which will be helpful to State programs.
6. The Lyric Theatre is a new institution established to develop new standards of excellence through a unique combination of the arts. It could lead to a new American art form of special value to our people. (See attached statement by Jerome Robbins.)

American Lyric Theatre workshop	$300,000

The American musical is a form of theatre which is recognized internationally as this country's foremost contribution to world theatrical art. Neither opera nor operetta, not pure ballet or straight drama, it is a uniquely American product developed and brought to fruition by our most outstanding creative and performing talents—playwrights, composers, choreographers, actors, dancers, singers, scenic artists, and musicians.

But here, as elsewhere, the economic pressures of our existing theatre have brought this flourishing form to a standstill in terms of creative development, so that even our finest contemporary musicals must be narrowly confined to their commercial aspects.

It is toward the creation of a new lyric theatre that the Endowment has made available to one of the most remarkably talented artists of our time, Jerome Robbins, funds to set up a workshop which will use all the forms and potentials of our lyric theatre to produce new and original works—works capable of expressing ideas with poetic vision and imagination. It will be a kind of laboratory in which projects involving music, speech, song and dance will be worked upon and developed, utilizing the talents of our leading writers, directors, painters, composers, and performing artists, and developing a company to perform these works.

The aim of the workshop is to provide a place for performing and creative artists to join together, work on ideas, create new works, extend and develop the musical theatre into an art capable of poetically expressing the events of our lives. It is planned so that ultimately a repertory of works will be assembled and developed, and a company and school established. $300,000 has been allocated for this project in 1967. We request the same funding for 1968. It should be pointed out that Mr. Robbins has agreed to devote two years to this project without personal compensation.

Rural arts study project	$60,000

The 1960 census revealed that 76,706,476 people still lived in communities under 10,000 population. This is nearly half the population of the United States. With this fact in mind, plus the results of a 1966 National Council on the Arts study which indicated that communities with an average population of 25,000 had virtually no cultural facilities and only limited services, a rural arts project was launched in FY 1967, with an allocation of $58,000.

This study is concerned with the problems of providing the highest possible standard for arts activities in the smallest of our towns. The University of Wisconsin offered to provide the matching funds necessary and five rural communities ranging in size from 1,100 to 9,000 population were selected. Two other communities were chosen for control purposes. Twelve private and State agencies are cooperating in the experiment, in addition to many of the departments and services provided by the University itself.

Over a three-year period, the five communities will be involved in the following five phases of the program:

1. An initial research survey to evaluate the arts programs presently available.
2. A demonstration phase involving prepared performances of plays, music, films and art exhibitions.
3. A phase during which the talents of the residents will be identified and aided.
4. An organizational phase in which local arts activities will be brought together for planning.
5. An evaluation and study phase.

The results of this project can have an important impact on the future of the arts in rural communities and the plans of the various State arts councils as they begin to plan State programs to serve all the people and communities within their borders through Section 5(h) of the National Foundation on the Arts and the Humanities Act. Therefore, $60,000 is requested to carry this project into its second year of study.

Statement by Jerome Robbins Regarding the American Lyric Theatre Workshop Project

The American Lyric Theatre Workshop would be a theatre, laboratory in which projects involving music, speech, song and dance would be worked upon and developed. It would also develop a company capable of performing works which do not fit into the present theatre forms, be it our commercial theatre or the separate realms of pure opera, ballet or concert.

Having worked in all of these fields, I find myself (along with others) with a body of ideas and projects which cannot be realized within the forms or pressures of our existing theatre. Even our contemporary musicals, which are internationally recognized as a unique American accomplishment, are narrowly confined to their commercial aspects.

I want to create a *new* kind of lyric theatre. It would use all the forms and potentials of our lyric theatres to produce new and original kinds of works capable of expressing ideas in large forms with poetic vision and free imagination. With my many years of experience in all fields of theatre, I believe that with proper assistance I will be able to bring such a theatre into existence.

Like a scientist or a painter, I need a laboratory in which to study, do research, develop material, experiment, and try projects. To do this I need time, space which would be a unique development in our American culture, and an indigenous and equipment (people). From this exploration, I hope to achieve a theatre which would be a unique development in our American culture, and an indigenous outgrowth of the American scene.

The Workshop would consist of a professional group of actors, dancers and singers who have talents in all three arts. There is such strong, rich talent available. A carefully selected group of apprentices would be added in the training and work. Composers, authors, poets, painters and others would be asked to instigate and collaborate on ideas. Projects would be started; some would be gathered from already existing material, some must be written. A great deal of the material must be developed within the workshop itself through continuing experimentation. When enough progress is made, audiences will be invited to observe "work-in-progress" rehearsals.

The ultimate aim of the workshop is to provide a place for performing and creative artists to join together, work on ideas, create new works, extend and develop the musical theatre into an art capable of poetically expressing the events, deep hopes and needs of our lives.

Finally, I hope a repertory of works could be assembled and developed, and that a company and school would arise, established on the grounds that our native indigenous materials and talents which we already know are rich, availble and productive.

Toward these ends, I am willing to free myself completely of commitments and devote myself solely to making this project come to fruition.

PROGRAMS FOR STUDY AND RESEARCH IN THE ARTS—$250,000

Section 6 of P.L. 89–209 transfers the functions of the National Council on the Arts under P.L. 88–578 to the National Endowment for the Arts. One of the functions transferred and of considerable assistance to the Endowment is the provision of authorization for special studies and research to determine the national needs in the arts. Using this authorization as a means of investigating the feasibility of certain major projects and proposals before public funds are invested has proved extremely helpful during the first two years of operation.

In the fields of the arts, codified information is in extremely short supply, and it is usually necessary to enlist the aid of particular institutions or individual experts in order to thoroughly check the advisability of undertaking a specific project. Certain projects are now under consideration which can be much more effectively evaluated if grants can be made to study the project in detail. Currently, these projects include the $91,000 contract with Stanford Research Institute regarding establishment of an American Film Institute, and the developing study, begun by Robert Nathan Associates, for establishing a national institute on architecture, planning and design.

Further, certain studies in limited areas of inquiry can have of themselves great impact upon the nation. For example, a current study on the arts curriculum entrance requirements of our colleges will point up evidence that greater emphasis is necessary at the high school level if we are to produce artistically literate citizens. Several other studies in this general area of arts curricula research can be of considerable help to education agencies at all levels.

Therefore, $250,000 is requested for individual grants and special research grants to institutions to carry out specific study, information, and research projects of national value.

PROGRAMS FOR ASSISTANCE TO THE STATES—$2,750,000

The declaration of purpose in the National Foundation on the Arts and the Humanities Act recognizes that support of national progress in scholarship in the arts and humanities, while a matter for appropriate concern to the Federal Government, is primarily a matter for private and local initiative. The provisions of the Act give substance to the declaration by specifically providing for the partnership between the States and the Federal Government for the development of the arts. Section 5(h) of the Act implements this partnership by providing for grants to be made to the States to assist them in supporting projects meeting the objectives of the Act.

In order to receive such assistance, each State first submits a State plan. The plan designates or provides for a State agency as the sole agency for administration of the plan and also provides that Federal funds paid to the State as grants-in-aid shall be expended solely on projects and programs approved by the State agency. Such projects may be supported from Federal funds to the extent of 50 percent of their cost. A total of $2,750,000, as authorized in Section 11(c) of the Act, is requested for this purpose to be allotted equally among the States as required by the Act. This will result in not more than $50,000 being paid to each State annually.

In FY 1967, 50 States and four special jurisdictions out of the total eligible 55 political entities applied for and received grants totaling $2,000,000, the full Congressional appropriation. All of these grants were approved with the assurance on the part of the States that State agencies and State plans would be developed for annual support. All the States have shown intention of applying for support for 1968.

In this first year of funding, 295 separate new projects in the arts were included in State applications. Due to appropriations curtailment, only 80 percent of these planned projects will be carried out. Nevertheless, including Federal grants, nearly $3,000,000 of new funds will be spent within the States on art projects and programs designed to bring about greater citizen participation and appreciation. With full appropriations, and with the initial year special non-matched study grants completed, the States would have $5,500,000 for additional new projects in 1968.

Perhaps the most significant feature of this program is the increase of support for the arts in excess of the minimum required to match Federal funding. Nineteen States have created permanent arts agencies this year by legislative action and made them part of the State's administrative machinery. This will mean administrative appropriations under State Civil Service for the maintenance of the agencies. Appropriations for these arts agencies have increased from $1,909,840 in 1965–66 for 23 States to $3,563,094 in the current year for 30 States. Best estimates indicate that requests to State legislatures for the next fiscal year will exceed $5,750,000 and include all States and special jurisdictions.

Combined with Federal funds, the States should be initiating approximately 700 new projects in the arts during the next fiscal year.

Therefore, in order to continue the momentum developed by this program, and to match the enthusiasm generated within the various States, the full authorized amount of $2,750,000 is requested for 1968.

NATIONAL ENDOWMENT FOR THE HUMANITIES

Comparative summary of amounts available for 1967 with 1968 estimates

Appropriation and activity	Estimated available, 1967	Estimate, 1968	Increase or decrease (−)
Support of fellowship program	$1,900,000	$1,950,000	$50,000
Support of programs for research and publication	1,508,000	1,750,000	242,000
Support of programs in formal education and public understanding	832,000	1,150,000	318,000
Development and planning	260,000	150,000	−110,000
Total	4,500,000	5,000,000	500,000

SUMMARY STATEMENT

The Congress has charged the National Endowment for the Humanities with the development of a broad national policy of support for the humanities, because their support and use is in the national interest. The estimates submitted in this document serve two purposes; they describe the Endowment's initial efforts to carry out its mission in fiscal 1967, and they explain its plans and requested levels of funding for fiscal 1968.

To accomplish the Congressional mandate, it is necessary to enable humanists to provide knowledge and understanding of what is past and what is abstract, aesthetic, or not material, so that thoughtful men may realize their true potential through achieving greater perspective, being inspired to a vision of achievement, having the material with which to develop their wisdom, and ultimately to master themselves in their environment, including that part of the environment that we have made through technology. These things taken together are the ingredients of the nation's spirit, its ethics, and its morality. They are the basis of the judgments of value involved in all important decisions, whether they be public or private. They are bound together by the relevance of a man's knowledge and thought to his actions.

The need, therefore, is to provide better education and teaching in the humanities, better scholarly and creative work, and wider dissemination of the results through formal and informal educational channels.

The Endowment in fiscal 1967 and 1968 is attempting to attain three closely-related objectives based upon its mandate and the needs. These objectives are:

1. The development of individuals as scholars, teachers, and practitioners of the humanities throughout the country, in order that they may more effectively bring scholarship and thought to students in schools and colleges and to adults who are not formally registered in educational institutions. The appropriation request of $1,950,000 for fellowships is keyed to this objective.

2. The development and application of knowledge of the humanities through research, publication, and other scholarly activities in order to increase the national resources of knowledge and wisdom in those areas which pervade all life. This objective is of particular national importance, as funds for basic research in the humanities are sparse. The appropriation request of $1,750,000 for research and publication is keyed to this objective.

3. The development of the teaching of the humanities in schools, colleges, and universities, and also among the public at large through various communications media, in order that increasing numbers of the nation's citizens will have the ability and the desire to bring the humanities to bear upon their lives as citizens and individuals. It is urgently in the national interest to make available to the broad public as well as to the scholarly community the attitudes of mind, the methods of assessing value, the self-knowledge and civic knowledge which are the ultimate contributions of the humanities to public and private life. The appropriation request of $1,150,000 for formal education and public understanding is keyed to this objective.

The Endowment was not completely staffed until after the 1967 fiscal year had begun; therefore the bulk of the fiscal 1966 appropriation of $2.5 million was added to the fiscal 1967 appropriation of $2 million, giving the Endowment an effective program budget of approximately $4.5 million in the present fiscal year. Over 90% of these funds have been obligated as of the date of this submission. The 26 private citizens who are appointed by the President to serve as members of The National Council on the Humanities have reviewed and recommended the program activities planned for fiscal 1968, and the estimates of cost which are attached to these activities. The Endowment proposes for the fiscal year 1968 a budget totalling $6 million dollars in Federal funding for its program activities. The budget is in accord with the funding recommended by the President's budget for fiscal 1968 as follows: $5 million for program activities as indicated below, and $1 million as an equal share of the $2 million sought by the National Foundation on the Arts and Humanities to serve as matching funds for unrestricted gifts. The figures represent an increase of approximately $500,000 over the amount available in 1967 for program activities (from approximately $4.5 million to $5 million), and a decrease of $2 million in the amount available to serve as matching funds for unrestricted gifts (from $3 million to $1 million).

I. Fellowships

	Estimated, available, 1967	Estimate, 1968	Increase or decrease (–)
Appropriation: Support of fellowship programs	$1,900,000	$1,950,000	$50,000
Activities:			
Fellowships for young scholar-teachers	860,000	850,000	–10,000
Summer stipends	250,000	300,000	50,000
Senior fellowships	790,000	800,000	10,000

The programs financed under this appropriation are aimed at increasing the pool of effective and dedicated scholars and teachers in the humanities; they achieve this by providing three categories of fellowship support, two of which aim at the young scholar during the first five years of his professional career, and the other of which aims at the mature scholar who is in a position either to complete a work of high significance to the humanities, or to develop a new and promising line of investigation. The three programs are: 1) fellowships for young scholar-teachers; 2) summer stipends for young scholar-teachers; and 3) senior fellowships.

These activities are comprised within the authorization by Congress to the Endowment to "initiate . . . programs to strengthen the research potential of the United States in the humanities," and to "award fellowships and grants to institutions and individuals for training . . . in the humanities." [P.L. 89–209, sec. 7 (c) 2, 3)]. But as Congress in the same legislation authorized the Endowment to apply its programs to "those aspects of the social sciences which have humanistic content and employ humanistic methods" [sec. 3 (a)], it should be borne in mind that all of the Endowment's activities under this appropriation item are open to social scientists as well as humanists, so far as they meet the above definition.

The long-range objective of the fellowship programs is to maximize the national pool of effective and dedicated humanists and social scientists, through the provision of time for sustained study and reflection and the provision of the opportunity to gain access to research materials. In fiscal 1967 and 1968 these programs are in their initial stage of growth, and a certain amount of exploration and experimentation in their operation is essential. The results of the programs in 1967 have suggested certain revisions in the estimates for 1968, which are detailed below. However, the nature of the programs is such that the subactivity categories described below should permit modest flexibility of funds within the total estimate.

1. Fellowships for young scholar-teachers

The critical period in the development of a young scholar occurs during the first five years after his full entry into professional life. If he is able to sustain his intellectual vitality and win recognition and esteem, he may be expected to exert as a teacher and a scholar the leadership which flows from substantial achievement. Unfortunately, during these early years teaching assignments are at their heaviest and opportunities for sustained study and writing are rarely available. To meet the need for such opportunities, the Endowment is awarding approximately 100 fellowships in fiscal 1967 to young scholars to provide support for up to eight months of study at a cost of $860,000; therefore the average stipend is $8,600.

In administering this program, the Endowment has taken particular care to seek out scholars in smaller institutions and in geographical locations where the means of professional development are least accessible. Colleges and universities are permitted to nominate only one candidate each, thus insuring the widest possible distribution among institutions, and review committees have been established in each geographical region, composed of members drawn from the regions' own colleges and universities, to review the regional nominees.

The results of this arrangement were good in fiscal 1967. Even though the period between announcement of the fellowships and the deadline for application was unavoidably compressed (with the result that some eligible institutions did not submit a nominee), the fellowships in 1967 went to 39 states and the District of Columbia, and to institutions ranging from small colleges to major research universities. There is every expectation that in 1968, the geographical spread will be greater still.

In planning this program for 1968, the Endowment sought to remedy an obvious inequity while attempting to keep the cost proportionate to the total appropriation the Endowment can seek. The first year's experience showed that a fixed monthly stipend would be more equitable than a variable one keyed to salary, since in the latter case one penalizes the individual for the poverty of his institution. The cost of the program will decline slightly by the new method of calculating awards. It is anticipated that the program will be operated in fiscal 1968 at the 1967 level; under the new method, the cost will decrease from $860,000 in fiscal 1967 to approximately $850,000 in fiscal 1968 for approximately 100 fellowships. Expansion of the program in fiscal 1968 seems unwise in view of other responsibilities, but as there are some 13,000 young faculty members in the humanities alone who are eligible for this program, a reduction in the program would represent a step backward from the minimal effort, rather than a wise husbanding of resources.

2. *Summer stipends*

Another method for enabling the young scholar to develop his effectiveness in his career of scholarship and teaching is to permit him to spend his summer in study and thought, rather than impelling him of necessity to devote it to an income-producing pursuit. Some universities and colleges, but still far too few, award summer stipends to faculty members; however, the competition for these limited funds is intense, and the young scholar usually does not prevail.

The problem is heightened by an imbalance between institutional funds available for science, and those available for the humanities. For example, at one university, the average yearly figure for summer support of scholars in the sciences is over $41,000; in the humanities it is just over $12,000. A study of 38 liberal arts colleges showed that institutional funds available for support of scholars in the humanities ranged from none to $15,000, with the median between $5–6,000.

To meet this need, and in the hope of stimulating institutions to increase their efforts in this respect, the Endowment awarded 130 summer stipends at a cost of $250,000 in fiscal 1967 among the roughly 13,000 eligible young scholars. Thus, the average stipend was just under $1,900. In administering the program, the same procedures of institutional nomination and regional review were followed as in the fellowship program. The distribution of these stipends was as geographically and institutionally diverse as in the fellowship program.

The Endowment's summer stipends program is probably the easiest and least costly for institutions to emulate; therefore planning for 1968 has been geared to increasing the program's visibility and encouraging institutional participation. The number of such stipends is increased; the stipend, as in the case of the other two fellowship categories, has been set at a fixed amount; and the recipient is permitted to accept institutional or other sources of funding to supplement his stipend. It is anticipated that this arrangement will draw more institutional funds into such programs, both by the financial incentive and by the increase in numbers. Under such an arrangement, the Endowment can offer 200 such awards in 1968 for a cost of $300,000. This represents a rather small increase over the 1967 cost (see our letter to the House and Senate appropriations committees dated January 20, 1967), but a significant increase in the number of awards granted.

3. Senior fellowships

The third program under this appropriation item, the senior fellowships, aims at providing up to a year of time for uninterrupted research, thought, and writing for mature scholars in the humanities and social sciences. The purpose is to enable such scholars, academic and nonacademic, to make a significant contribution to their field, to scholarship generally, and to the general public. Such opportunities have been numerous in the sciences, and the enormous effect they have had in the production of scientific insight and advance indicates what they can achieve in the humanities and allied fields.

As the thrust of this program is to provide support for those who are likely to achieve significant break-throughs, the administration differs from the two young scholar-teacher programs. No institutional nomination is required, and applicants are evaluated in terms of their past performance and the promise of significant achievement. A national panel of distinguished practitioners of the humanities and the social sciences has been established to review the applications without regard to institution or geographical location. It is perhaps not much of an exaggeration to say that this program of senior fellowships may become the most distinguished award made in the humanities. In fiscal 1967, 57 such fellowships were awarded at a cost of $790,000. The average figure was thus $13,860. The bulk of the recipients were scholars of national reputation, and some of international reputation, in the fields of the humanities.

In planning the program for 1968, the 1967 experience again recommended operation upon the basis of a fixed monthly stipend rather than one keyed to salary for the same reasons which apply in the other programs. However, in the senior fellowship program this method may increase the average cost of each fellowship, because applicants are permitted to seek support for a longer range of time than in the other two programs, and the period of time, rather than amount of salary, will determine level of support. The program cost remains at approximately the 1967 level (the increase is from $790,000 to $800,000), and the program should be able to grant within the range of 50-60 fellowships for that amount.

It was with some difficulty that the decision was made to seek to maintain the activities under this appropriation item at their fiscal 1967 level. The reaction to the 1967 activities has been highly favorable, and under ideal circumstances an increase in the level of support would be sought. However, this is the largest single appropriation item as it stands, and to increase it significantly would eviscerate the ability to carry out other legislative mandates.

Examples of activities supported under this appropriation in fiscal 1967.—With funds provided by this appropriation in fiscal 1967 for senior fellowships, several studies will be made which will increase knowledge and understanding of the American experience: as one scholar studies the role and development of the American West in the 20th century, another will seek to interpret the major shifts of emphasis which occurred in American society and culture during the Second World War; a third will study deeper roots of American politics by examining the emergence of "Virginia's governing class" in the 18th century. Other scholars will be exploring matters farther afield—one, for example, a political scientist, will be studying the development of political sociology as a branch of political science and sociology.

The accomplishments of the fellowships and summer stipends for young scholars are likely to be reflected in their increased competence as teachers and scholars in their field over the whole of their professional career. But some indication of probable accomplishment can be found in examples of their proposed use of the awards. As one scholar uses the funds to make a study of the role of Woodrow Wilson in Mideastern nationalism during World War I, another will be quite independently examining the relations between Britain and the Mideast during the same period; the two efforts taken together will reinforce understanding of the complex roots of modern political problems in the Mideast. Another scholar will undertake a re-examination of the poetry of Wordsworth, while others will be seeking greater understanding of the development of concepts of political representation in the middle ages, the concept of moral virtue in the works of Aristotle, the changing role of women in 19th-century America, and the public careers of Senators Vandenberg and Bricker.

II. Research and publications

	Estimated available, 1967	Estimate, 1968	Increase or decrease
Appropriation: Support of research and publication programs	$1,508,000	$1,750,000	$242,000
Activities:			
Support of research	1,158,000	1,400,000	242,000
Support of editing and publication	350,000	350,000	--------------

The programs financed under this appropriation item are aimed at development and application of new knowledge in the humanities, and at providing new methods of making accessible to scholars the work which has previously been done in their areas of interest. Additionally, they seek to support the publication of works of particular importance to the scholarly and general communities which are not easily available. The activities are 1) support of research; and 2) support of editing and publication.

These activities are comprised within the authorization by Congress to the Endowment to "initiate and support research and programs to strengthen the research potential of the United States in the humanities by making arrangements (including grants, loans, and other forms of assistance) with individuals or groups to support such activities," and to "support the publication of scholarly works in the humanities." [P.L. 89–209, sec. 7(c) (2), (6)]. As in the case of the programs described under the fellowships appropriations item, these programs provide support not only to scholars in the humanities, but also to those in the social sciences whose work falls under the definition of P.L. 89–209: "those aspects of the social sciences which have humanistic content and employ humanistic methods." [sec. 3(a)]

The long-range objective of these programs is to provide support at a level which will permit the nation's scholars in the humanities to maximize, both in extent and in sophistication, the research potential of this country; and eventually to bring this research to bear on the improvement of public and private life. The further objective is to provide this support in ways which are flexible enough and various enough to fund major projects involving the collaboration of many scholars in differing fields and small-scale projects of individual scholars or small groups of scholars. In fiscal 1967 and 1968 the programs are being operated at a level which in general permits only the latter kind of support; but such operation is probably necessary groundwork for later expansion.

As activities under this appropriation item increase in variety and level of funding over the long term, each will develop a higher degree of specificity—for example, it may be desirable in the future to offer a separate program of support for the humanistic aspects of the social sciences; it may be desirable to offer special programs aimed at fields in the humanities which appear relatively underpopulated or unproductive when compared with other fields; it may be desirable to strengthen the ability of American scholars to participate in the international aspects of some kinds of scholarly research; and it may be desirable to offer a program which enables humanistic scholars to use computers as more than a labor-saving device in their research. However, in light of other responsibilities of the Endowment, no new programs are sought in fiscal 1968, and the increase sought for on-going programs is only slightly above the fiscal 1967 level.

1. Support of research

As little Federal support is available for research in the humanities (less than 0.5% of Federal funds for support of research in fiscal 1965, according to the 18th report of the House Committee on Government Operations), the Endowment is attempting to draw the boundaries of eligibility for this program as wide as possible. Individuals and groups of scholars in all fields of the humanities and social sciences are eligible for support; affiliation with an academic institution is usual but is not mandatory. The research supported under this program ranges from precisely-defined studies of particularly important points in the various fields to syntheses based upon the combination of established knowledge and new research. The program places at the forefront the national interest in the development and strengthening of research potential in the humanities, but it cannot be expected that all such research will be of immediate applicability any more than all scientific research is of immediate use.

The program is administered in such a way as to draw evaluations of applications for support from a wide spectrum of competent scholars in a variety of fields. Panels comprised of scholars from all over the country have been established to make recommendations upon applications; in addition individual scholars of marked distinction are used to give preliminary evaluations of applications received. In view of the thrust of this program, which is to develop the strongest possible programs of research in the humanities, it is not desirable to establish any criteria, other than exceedingly high quality and fundamental importance, for funding projects.

In fiscal 1967, approximately 100 applications for research support were strongly recommended for funding by the panels and referees, and 66 more were recommended for support contingent upon available funds. If the Endowment had granted the requested amount of support for the 100 strongly-recommended applications, the cost of the program would have been approximately $2,830,000, and the average cost per grant would have been approximately $28,300. Three measures were taken to bring costs within the available funds for 1967 of $1,158,000: 1) no grants were made for a period of longer than one year; 2) if it was apparent that a substantial and discrete achievement could not be completed in a one-year period, no grant was made; and 3) in almost all cases where it was possible, a partial grant, rather than the amount requested, was provided, in the expectation that other sources of funds would be sought or that, if such efforts were not successful, a substantial achievement would nevertheless ensue from the grant. By these methods the program was able to make grants to 78 out of the 100 strongly-recommended applications, at an approximate average grant cost of $14,850. This average cost figure is just over half the average amount requested by the applicants.

In planning the program for fiscal 1968, it was clear that, even assuming a stable volume of strongly-recommended applications, additional funds would be desirable; it was further apparent that, with growing awareness of the program in the scholarly community, the volume would not be stable, but would increase (in the first four years of the operation of the National Science Foundation, volume of application increased in a comparable program 220%, and averaged a 30% annual increase). Finally, it seemed wise, in view of the Endowment's other activities, that the increase sought should be a modest one. It is planned to operate the program in fiscal 1968 at a cost of $1,400,000; this is an increase of $242,000 over the 1967 cost. If the three measures mentioned above are applied (one-year grants, no grants to projects which cannot make substantial achievement in one year, and partial grants wherever possible), it should be possible to maintain approximately the same ratio between the number of applications strongly recommended and the number of grants made. It is desirable at this time to maintain flexibility as to the number and magnitude of grants to be made within the total program estimate for fiscal 1968, since the figure depends on the nature of the projects, the concrete possibility of other sources of support in each instance, and the feasibility of partial funding in each instance.

2. *Support of editing and publication*

At present, this activity is limited to support for the editing of definitive editions of major American authors, and a study of the most practical and desirable way for the Endowment to implement its legislation mandate to "support the publication of scholarly works in the humanities." [P.L. 89–209, sec. 7(c)(6)].

As in the case of support of research, two quite different kinds of support of two quite different magnitudes of cost can be provided under this mandate. One kind is support for large-scale multi-volume projects involving the work of many scholars working on various segments of the overall task; this is in fact the kind of project which is conceived by several groups which have applied to the Endowment for support. The other kind of support is for single volumes or individual periodicals involving the work of a single scholar or a small group, and in which the major cost of support is not usually reflected in salaries and wages, but in costs incidental to the production and dissemination of the scholarly work.

In fiscal 1967 the Endowment is supporting a large-scale project to produce definitive texts of several major American authors; the advantage of such a project is that it is likely to benefit from the collective expertise and judgement of dozens of competent scholars, and that the consequent result will be production of texts with consistent standards of scholarship and format. No direct support is being given for the second kind of project, but a study grant is being made to representatives of university presses to ascertain, in consultation with other publishers and with scholars in the humanities, the present and future needs of support for the publication of scholarly works. Until the study is completed, it would be premature for the Endowment to expand its efforts in this respect, though it is anticipated that a very small sum of money (approximately $50,000) can be expended on this kind of project in fiscal 1968.

The cost of the publication support program in fiscal 1967 was $350,000, and it is desired to maintain it at that level of funding in fiscal 1968.

* * * * * * *

The activities described above for fiscal 1967 represent in effect a report to Congress on the Federal activity in support of basic research in the humanities and their allied disciplines, because these programs are virtually the only Federal ones with this focus. Although it seemed unwise to seek major increments in the program costs in fiscal 1968, the examples cited below indicate the value of the programs, and point to the national benefits which will accrue when a higher level of funding is possible.

Examples of activities supported under this appropriation in fiscal 1967.—With funds provided for scholarly research by this appropriation in fiscal 1967, a group of literary scholars will continue an imaginative investigation into the role which popular literature has played in shaping American attitudes; another group from a broad spectrum of fields will examine China in the 14th through the 17th century, a period crucial in the development of Chinese civilization; a political scientist and his colleagues will be investigating the personal, political and social attitudes of early members of the Nazi party in the hope of arriving at new understanding of the conditions under which such political parties arise; approximately 36 American scholars of international reputation will be enabled to exercise leadership in international scholarly societies; a group of scholars assembled from differing fields will continue their efforts to provide a method whereby all scholars of American history and allied fields can gain easy access to scholarly information in their fields; and another group will be seeking to assemble comparative historical data on American and other major nations.

With the help of funds provided under this appropriation in fiscal 1967 for support of editing and publication, 15 volumes of the works of Emerson, Thoreau, Hawthorne, Whitman, and other major American authors, will be completed in definitive scholarly editions.

III. Educational and public programs

	Estimated available, 1967	Estimate 1968	Increase or decrease (−)
Appropriation: for support of educational and public programs.	$832,000	$1,150,000	$318,000
Activities:			
1. Education programs	274,000	660,000	386,000
a. Elementary and secondary	148,660	300,000	151,340
b. Institutional programs	61,340	215,000	153,660
c. Teaching internships	64,000	100,000	36,000
d. Experimental programs	----------	45,000	45,000
2. Public programs	508,000	490,000	−68,000
a. Communications	208,000	140,000	−68,000
b. Museums and historical societies	300,000	240,000	−60,000
c. Experimental programs	50,000	110,000	60,000

The United States in the second half of the twentieth century finds itself the world's materially and technologically richest society; yet there is growing concern at the imbalances in our society's intellectual life. Emphasis on science and technology, materialism and affluence do not alone enrich the quality of human life nor do they satisfy the deeper aspirations of our citizens.

The tone of a civilization stems from the attitudes woven into the minds of its people in their formative and most receptive years: the books and poetry (and today television) that one comes to appreciate in childhood; the intellectual stimulation in the classroom; the music and plays and films that sparkle the imagination; the knowledge of great books, history, philosophy and art that are the essence of the stimulus for richer understanding of life.

The Humanities Endowment has a unique role in seeking ways to foster these intangible qualities through the programs financed under this appropriation using the existing structure of American education, and using the channels of communication open to the inquiring minds of the general public. The programs are divided into two activities (1) aimed at furthering knowledge of humanities through formal education and 2) aimed at stimulating interest in the humanities in areas, other than formal education, which affect the general public. When these are accomplished, or well begun, the Endowment can increase efforts to encourage the use of humane knowledge in decision making.

These activities are comprised within the authorization by Congress to the Endowment to "develop and encourage the pursuit of a national policy for the promotion of progress . . . in the humanities," to "foster the interchange of information in the humanities," and to "foster, through grants or other arrangements with groups, public understanding and appreciation of the humanities." [P.L. 89-209, sec. 7(c)(1), (4), (5)]. As in the case of the programs described under the preceding appropriation items, the activities funded here provide support not only to those in the humanities, but also to those in the social sciences whose interests fall under the definition of P.L. 89-209: "those aspects of the social sciences which have humanistic content and employ humanistic methods." [Sec. 3(a)]

The long range objective of these programs is to provide support for innovation in formal instruction and in means of presenting humanistic knowledge to the general public, and to provide support in such ways and at such levels of funding that the status of the humanities in the schools and among the general public will be dramatically raised. In the initial stages of these programs it is desirable to permit some flexibility of funds between the programs, which are in an exceedingly complex area where Federal and other public agencies, as well as private organizations, have large and various programs.

In both of the activities included in this appropriation item, the Endowment has sought to administer its programs in such a way as to draw forth the maximum amount of outside consultation and evaluation. Panels of competent experts, consultants drawn from various areas of operation, and individual scholars in various fields have advised the staff on the structure of the programs, solicitation of applications, and evaluation of applications. In many instances all of these processes have been brought to bear on each application received; and in all instances at least one of these methods has been used to achieve appropriate outside opinion, both as to the programs themselves, and as to the applications within the programs.

In every case, an important consideration has been the availability of other sources of funds—whether Federal, local, or private. A consistent effort has been made to refer applicants whose proposals seemed eligible for other Federal programs of support to those sources; and in general, the programs have been administrated in close consultation with other Federal educational agencies, such as the Office of Education, the National Science Foundation, and the National Endowment for the Arts.

(1) Education programs

In carrying out the programs in formal education, the Endowment has been mindful of the fact that potentially supportable educational projects often come from the same constituencies receiving attention and funding from other agencies of the Federal Government (for example, the Office of Education) and from private foundations. Therefore, the Endowment seeks to play an innovative, supportive and an evaluative role, while at the same time establishing consultative and cooperative arrangements with the various Federal and private agencies. Three programs are presently funded under this activity: (a) strengthening the humanities in elementary and secondary education; (b) institutional programs for strengthening the humanities in higher education; and (c) improving the quality of teaching in the universities through an internship program.

In fiscal 1967, the amount available for these three programs is $274,000. In fiscal 1968, the Endowment is seeking to increase the funding for this activity to $660,000.

(a) *Elementary and Secondary Education.*—Improvement of the teaching of the humanities in the nation's elementary and secondary schools is the broad aim of this program in the appropriation activity. Significant public and private support already exists for the development of curricula affecting the humanities in the schools, particularly at the secondary levels of education, but these developments have only partially been disseminated into the nation's school system. Good basic curricula exist in many fields, but the gap between development and application remains large. This reflects lack of strong rapport between the universities, which have developed the curricula, and the schools, which must decide whether to accept and apply them.

In fiscal 1967, the Endowment is supporting, as one aspect of this program, efforts which will bring school personnel into a continuing relationship with college and university teachers so that they will together contribute to the application of new and effective methods of teaching humanistic subjects. The typical vehicle for curriculum dissemination is the summer institute or workshop, but mechanisms for continual give and take between the innovator and practitioner have been emphasized in the projects being supported. In fiscal 1968, a modest expansion of this aspect of the program is anticipated; the volume of applications will grow as a result of increasing awareness in the schools of the Endowment's concern with the problem of more effective curriculum dissemination.

Through the encouragement of proposals for new and important techniques in the teaching of humanistic subjects, the Endowment hopes to support projects which will not only ultimately benefit the academically oriented student, but the student whose educational career is primarily vocational in emphasis. Additional study and experience needs to be gained in the definition of what can fruitfully be supported in strengthening or introducing humanistic content into vocational schools. Concurrently, the Endowment is concerned with the effort to enrich the lives of culturally deprived students, bearing in mind that cultural deprivation is not limited to low income levels. This is another aspect of the overall program effort to use the humanities as a vehicle to help youngsters understand and appreciate the world, their cultural and ethnic heritage, and themselves. In fiscal 1967, modest support is provided for a project which imaginatively attacks the problem of providing culturally disadvantaged children with an exposure to the humanities they have no present means of achieving. This is an area of concern which is planned for gradual expansion in fiscal 1968.

In fiscal 1967, $148,660 was available for support of projects to improve humanities teaching in elementary and secondary schools. In fiscal 1968, the Endowment wishes to increase the level of funding for this program to $300,000 so that it may increase its support for imaginative projects in curriculum dissemination, in qualitatively increasing the humanistic knowledge of teachers, in strengthening the humanistic content of vocational education and in enhancing opportunities for culturally disadvantaged children.

(b) *Institutional programs.*—The long range aim of this program is to improve higher education, and specifically to revitalize, reorganize and strengthen the teaching and content of humanities in the colleges and universities of the country. The task is to accelerate the infusion of humanistic and artistic thought, awareness and activity throughout the fabric of American higher education. In the long run the aim is to broaden the range and number of institutions providing a more hospitable climate for the humanities and social sciences; to enlarge the ranks of humanists and to recruit more first rate individuals into the humanities and social sciences; and to enable humanists to claim a more incisive voice in higher education.

Initially in fiscal 1967 with limited funds, the Endowment is supporting projects for institutional cooperation planned to encourage colleges and universities in the same vicinity to take mutual advantage of their respective facilities and resources. In this manner, research interests of college faculties can be kept alive and stimulated; and a cross-fertilization of teaching ideas can take place. Exchanges of faculties and students, reciprocal use of libraries, joint colloquia and departmental seminars, and joint planning, research and teaching are the kinds of efforts being encouraged as a means to more effective teaching in the humanities.

In fiscal 1968, this type of project should be modestly expanded to support development of new methods of teaching. These might take the form of experimenting with use of personnel, imaginative use of new technology and media, the development of interdisciplinary curricula and other innovations. The result of innovations within disciplines and between disciplines in the humanities and the social sciences should be to create teaching and teaching materials which make humanistic scholarship more relevant to each other and to daily life. Humanistic studies are less subject to a speedy reevaluation and revision of curricula than are the scientific subjects. But coherent steps, such as those described above, can be taken to strengthen the teaching of humanities in undergraduate and graduate education.

Concurrently, professional education, well regarded in this country and abroad, is nevertheless criticized for its highly specialized content and the absence of a broad humane context in which technical matter is studied and taught. Technical and professional schools are themselves concerned about this problem and efforts by some institutions to find ways in which the human understanding of professional persons can be increased is encouraging. The Endowment seeks in fiscal 1968 to provide support for projects which demonstrate imaginative approaches to this problem.

The Endowment is also mindful of the significant role that junior or community colleges are playing within the spectrum of higher education. These colleges now enroll one-third of all entering freshmen in college, and before many years will enroll over one-half. There are now some 800 junior colleges, and the number is growing annually by 40 to 50 such institutions; state-wide systems are developing and many metropolitan areas are establishing multicampus junior college systems. In fiscal 1968, the Endowment includes this dynamic sector of higher education in its efforts to find ways of improving instruction in the humanities. In support for junior colleges particular attention will be directed at the role of the humanities in the education of those students who may not continue further formal education.

In fiscal 1967, $61,340 was available for institutional programs. In fiscal 1968, gradual and careful broadening of this program is sought at an estimated cost of $215,000. Discussions with the academic community indicate that this program could usefully absorb much larger funding; however, because of other Endowment responsibilities this program requests an increase which is modest relative to the needs.

(c) *Teaching internships.*—Although no sharp distinctions can be made, it is generally true that colleges excel in teaching, and universities in research. In fiscal 1967, the Endowment has established a teaching internship program which uses the college environment as a training ground for potential university instructors. A small number of colleges are designing experimental courses in which a committed younger university teacher can participate for a year under the guidance of a master teacher. It is expected that the resident teacher will return to a university department with an increased capacity for imparting his knowledge of humanistic subjects to undergraduate students. The response of colleges and university departments to this innovation for improving the calibre of teaching has been encouraging. The Endowment hopes to enlarge this program from the present level of $64,000 to $100,000 in fiscal 1968.

(d) *Experimental programs.*—In the educational programs activitiy, the Endowment is in the initial stages of developing and defining the specific efforts to achieve an environment in our schools, colleges and universities where the humanities can flourish and develop immediacy and relevance in the lives of students and teachers. A small amount of funding is requested for fiscal 1968 which would enable the Endowment further to test methods of implementing objectives and to support pilot demonstrations which will point the way to new programs for the future.

Adult continuing education is an example of an important and increasingly essential aspect of the educational scene which is becoming accepted as a part of the responsibilities of our educational institutions. Continuing education, not so much in the sense of continuation of formal education or in the sense of remedial courses, but rather as a way of transferring systematic learning processes themselves to the interests and demands of adult life, is becoming a major interest of large numbers of the public. The Endowment believes it can help broaden the commitment to adult education for a variety of groups and individuals.

Fruitful experimentation can be attempted in many other areas: such as channeling the increasing involvement and commitment by students themselves to help in the education of others who have had more limited opportunities; developing methods of early identification of outstanding students for careers in the humanities; and developing pilot projects of a humanistic nature for the benefit of occupational and professional groups.

The $45,000 requested for seeking new methods in fiscal 1968 is small, but it is projected within the limitation of a total request of $660,000 for formal education programs.

2. *Public programs*

The second activity included in this appropriation item aims at creating public appreciation of the humanities, and at developing and fostering the ability to apply humanistic method and humanistic content to the problems of public and private life. Three programs are presently funded under this activity: (a) strengthening the humanistic capacities of various communications media; (b) strengthening the training of museum and historical society personnel; and (c) experimental programs, which will permit the Endowment to gain small-scale experience in new areas prior to development of full-fledged programs or activities.

In fiscal 1967, the amount available for these three programs is $558,000. This is about 12% of the Endowment's total available 1967 funds; as such, it reflects the desire of the Endowment to spend a small amount well in an area where Federal and other public agencies, as well as private agencies, have various programs. Although a decline of $68,000 from the 1967 level is shown by the 1968 estimate of $490,000, in fact the funding of on-going programs would rise by $42,000, since the decline is caused by the termination of the Endowment's talking books program, which new legislation relating to the Library of Congress has permitted the Endowment to discontinue. The modest rise of $42,000 sought for on-going programs reflects the other pressures on Endowment funds, in view of which it seems unwise to plan for a dramatic increase in the funding level of this activity during the next fiscal year.

(a) *Communications media.*—The aim of this program is to improve qualitatively those media which customarily bring the general public into direct contact with the subject matter of the humanities. The media upon which this program concentrated in fiscal 1967 were television, "talking books," and the press. For fiscal 1967 the Endowment was appropriated $100,000 to fund a study of educational television and radio. A grant is being made for that amount to underwrite a study, by competent persons in the field, of the present quality of presentations in the humanities on instructional television, to suggest ways in which the presentations can be improved qualitatively, and to produce and submit model presentations of humanistic content of exceptional quality. The Carnegie Commission on Educational Television in its report expressed the hope that Federal and other agencies would study the role of television in formal instruction. In view of the Commission's recommendations, the Endowment decided to focus initial attention on a study of instructional television. It is anticipated that the result of the study will affect the thrust of efforts in fiscal 1968, but it seems clear that if the Endowment is to support significant humanistic improvement in the visual media over the long run, it will need to expand its efforts into public educational television as well as instructional television, into instructional films and video-tape libraries for the schools, and perhaps indirectly, into commerical television. In fiscal 1968, the funding sought remains at approximately the 1967 amount.

For 1967 the Endowment received an appropriation of $100,000 for the development of talking books to be made available to persons other than the blind. New legislation enabling the Library of Congress to continue such efforts makes it unnecessary for the Endowment to seek further funds for this effort in 1968. An experimental effort for 1967, which has received an enthusiastic response, was to grant funds to a non-profit organization with long experience in the production of "talking" books for the blind, to produce new titles in the humanities to be experimentally disseminated to a small group of cooperating hospitals, for the use of temporarily handicapped patients who are unable to read by conventional means. It is expected that experience with the Endowment-funded effort will lead local groups to continue the effort with their own funds. A further benefit is that the "talking" books, which may run to over 1600 new titles in the humanities, will be made available to the Library of Congress for distribution by its 34 regional libraries, as well as under the new legislation which permits distribution to handicapped persons other than the blind. In addition, such recordings could be broadcast by radio stations to a general audience.

The final effort in the communications program in fiscal 1967 was to support initial planning of a program for the qualitative improvement of journalistic critics; as the effort is expanded in subsequent years, it will permit critics to deepen their understanding of the humanistic environment, thereby providing the public with a more stimulating and informed basis for reacting to literature, the performing arts, scholarship, and education.

The Endowment seeks funding in fiscal 1968 for the communications media program at approximately the fiscal 1967 level. The "talking" books program will be terminated, but an increase of $42,000 is sought for on-going efforts. In the case of television, the plan is to broaden the definition of proposals eligible for support to include new methods of producing films for instructional or educational purposes in the humanities, and the particular interest of the Endowment will be in establishing closer relationships between scholars and teachers in the humanities on the one hand, and the actual producers of the films and video-tapes on the other. In the case of critics, further planning grants, and perhaps a small grant for an experimental critics program, will be made in fiscal 1968; but it is not expected that such efforts will involve a major portion of the program funds for communications media.

(b) *Museum and historical society personnel.*—In the view that the museums and historical societies of the nation are a major untapped source of humanistic understanding, the Endowment is operating a program in fiscal 1967 which aims at the most critical need of these institutions: upgrading the competence of their professional staff by in-service training and by the training of new personnel for the field. In the current fiscal year, grants are being made for cooperative ararngements between museums and universities to expand the educational and training opportunities for students who intend to make their professional career in museums and historical societies; other grants are being made to bring personnel who are presently full-time staff at small museums into the environment of a large teaching museum where they can, for a designated interval, deepen their subject matter knowledge and improve the skills necessary to impart this knowledge effectively through collections and exhibits; still other grants were made to enable museum and historical society personnel to participate in short-term training seminars and training institutes. The cost of this program in fiscal 1967 was $300,000. In 1968, as in fiscal 1967, these efforts will be coordinated with those of other agencies by a committee of the Federal Council on the Arts and Humanities.

It is planned to operate the program at a slightly lower level of cost in fiscal 1968; $240,000 is the estimated cost. The funds freed by the reduction will be applied to the third program under this activity, the experimental programs.

(c) *Experimental programs in new areas.*—In fiscal 1967, a small sum was allocated to make grants which would enable the Endowment to test methods of implementing objectives before seeking substantial levels of funding. In fiscal 1967 only one such grant is being made, for a study of the feasibility and desirability of establishing a center or centers in which outstanding or promising people from the whole range of the humanities and the social sciences are included. In such a setting, the interchange of information in the humanities and among humanists and social scientists could be facilitated, and the interplay of disciplines heightened. The center or centers would serve an educational purpose; but hopefully they would also demonstate the relevance to public and private life of the humanities and allied disciplines, both in the interests of the members and in the dissemination of their teaching and scholarship.

If the feasibility study of the center progresses adequately in fiscal 1967, it will be funded to completion in fiscal 1968. In addition, in fiscal 1968 other experiments will be funded—for example, it may be desirable to make a small grant to explore the possibility of cooperative educational programs in the humanities between schools and museums, or to make a grant to test the validity of the planning of the critics program, or to make a grant for a pilot-program in an aspect of communications media. In order to have the capacity to carry out such experiments, the Endowment seeks a budget for experimental programs in this activity category of $110,000 in fiscal 1968, as opposed to $50,000 in fiscal 1967.

The total funding sought for the activities under this appropriation item in fiscal 1968 is $1,150,000, an increase of $318,000 over the 1967 cost. Even with this increase, the amount is markedly smaller than that requested under the two previous appropriation items. As soon as possible, the Endowment will seek to bring this appropriation up to parity with its other appropriations; but in view of the overall authorization ceiling, the fiscal 1968 requested increase is as far in that direction as it seems possible to move at present. It is anticipated that most gifts from private sources will be used in this area.

Examples of activities supported under this appropriation in fiscal 1967.—With funds provided by this appropriation in fiscal 1967, secondary schools in five school districts will establish cooperative summer programs with neighboring universities to improve the competence of teachers in a variety of humanistic disciplines; children who have never read—or even seen—a book, will be encouraged to appreciate reading and book-ownership; teachers in Alaska and elsewhere will gain a greater knowledge and appreciation of Alaskan history, classroom teachers and instructional television producers will develop closer relationships and new methods to improve materials used in instructional television; an association of thirteen neighboring colleges will exchange faculty and other resources among themselves and with nearby universities in order to strengthen their teaching and curricula in the humanities; and museum curators will learn how to understand and display their collections to better effect.

IV. Planning and development

	Estimated available, 1967	Estimate, 1968	Increase or decrease (−)
Appropriation and activity: Planning and development	$260,000	$150,000	−$110,000

The appropriation language submitted to the Congress for the National Foundation on the Arts and Humanities in fiscal 1968 contains the provision that not to exceed 3% of the funds appropriated for the programs of each Endowment shall be available for program development and evaluation. This section of the justification explains why such a provision is desirable; but it also explains why, irrespective of the legislative provision, the Endowment is requesting funds to be appropriated specifically for program planning and development.

By statute the National Endowment for the Humanities is directed to "develop and encourage the pursuit of a national policy for the promotion of progress and scholarship in the humanities." It is given the additional responsibility by law of fostering the interchange of information in the humanities, and encouraging public understanding and appreciation. [P.L. 89–209, sec. 7(c) (1), (4), (5)]. To fulfill its missions, the Endowment must assemble reliable information and conduct studies significant for the development of its programs and policies, but also significant for the development of a national policy for the humanities.

The Endowment therefore has a dual responsibility with respect to development and planning. For the agency to function effectively it should acquire the quality and quantity of information which allows it to maximize its impact on the humanities while expending the minimum possible of Federal funds. The information assembled for this purpose should then be susceptible to combination with other information in order to "foster interchange" and "encourage public understanding and appreciation."

In fiscal 1967 the Endowment is providing support for efforts useful to the Endowment itself but also useful to the academic and educational community. A study will be made of the strengths and weaknesses of teaching in the humanities at the level of higher education. Such a study will suggest activities which the Endowment ought to support; but equally important, it will provide food for thought for educators concerned with strengthening the humanities in the colleges and universities, and for the general public interested in higher education.

In fiscal 1967 another study is planned to determine whether a visiting scholars program in which personnel from the colleges and universities are consistently involved with secondary school personnel all over the country is feasible and desirable. The various organizations which have made partial efforts to provide this kind of service will be involved in the study, and the hope is that out of the study will come greater national visibility for the need to think of all education—not just humanistic education—as a joint responsibility of instructors at every level of the educational enterprise.

In fiscal 1967 and continuing in 1968, the Endowment, with the cooperation of the National Endowment for the Arts and the Office of Education, plans to establish a commission on the humanities in the schools, for the purpose of assessing and defining the proper status of the humanities in the schools, of determining the probable effect of on-going curriculum development project and of devising practical steps to maximize their impact.

The nature of planning and development grants is such that they are not administered in open competition; however, all grants are reviewed by outside evaluators and by committees of the National Council on the Humanities prior to award.

In fiscal 1968 the amount sought for planning and development grants is decreased $110,000 from the fiscal 1967 level of $260,000 to $150,000; this reflects the desire to allow the maximum amount of funds to be available for action grants under the other three appropriation items, while leaving a minimum amount available for program development and evaluation.

APPENDIX A

Fellowships offered by the National Endowment for the Humanities, fiscal year 1967 [1]

[Fellowships are listed by State, institution, and number and kind of fellowship support on an awards offered basis]

---

[1] In subsequent budget submissions, the endowment will append a listing of fellowships awarded in the fiscal year most recently completed. However, since the present fiscal year is the 1st full year of operation, it seemed more likely to be useful to the committees and to Congress to append a list of fellowships being offered in the present fiscal year.

APPENDIX B

RESEARCH, EDUCATIONAL AND PUBLIC PROGRAM GRANTS AWARDED BY THE NATIONAL ENDOWMENT FOR THE HUMANITIES, FISCAL YEAR 1967 [1]

(Grants are listed by state, institution and approximate amount on a grants offered basis. Multiple grants are indicated by number following the name of the institution.)

State and institution	*Approximate amount*
Alaska: Alaska Methodist University	$9,580
Arizona: Museum of Northern Arizona, Flagstaff	10,000
California:	
Claremont Graduate School and University Center (2)	35,211
Fresno State College	5,300
Lowie Museum, Berkeley	10,000
Occidental College	5,300
Pomona College	5,300
University of California, Berkeley	1,273
University of California, Los Angeles (2)	27,650
University of California, Santa Barbara (2)	16,321
Colorado: Colorado College	5,300
Connecticut:	
American Oriental Society, New Haven	25,000
American Society of Papyrologists, New Haven	19,250
University of Connecticut	16,599
Yale University (3)	79,900
Wesleyan University	5,300

---

[1] In subsequent budget submissions, the Endowment will append listing of grants made in the fiscal year most recently completed. However, since the present fiscal year is the first full year of operation, it seemed more likely to be useful to the Committees and to Congress to append a list of grants being made in the present fiscal year. Such a listing is of necessity tentative, and accounts for the fact that some grant totals are approximate.

APPENDIX B—Continued

State and institution	*Approximate amount*
Delaware:	
Dover School District, Dover	$6,500
University of Delaware	32,400
Winterthur Museum, Winterthur	10,000

ADMINISTRATIVE EXPENSES

11.0 Personnel Compensation

The following table shows the number of positions, annual salary rate, average employment or man-years, and net cost for permanent positions, and funds for intermittent employment (Council Members, temporaries, panelists, consultants, and experts) estimated for 1967 from available funds and budgeted for 1968:

	Estimated for 1967				Requested for 1968			
	Positions	Annual rate	Man-years	Net cost	Positions	Annual rate	Man-years	Net cost
Permanent:								
A. Arts	32	$376, 176	28. 5	$342, 600	40	$462, 176	38. 0	$437, 450
B. Humanities	26	311, 373	22. 1	265, 195	30	353, 994	28. 5	335, 055
C. Shared staff	17	161, 257	14. 6	141, 405	31	285, 982	29. 5	270, 627
Total, permanent	75	848, 806	65. 2	749, 200	101	1, 102, 152	96. 0	1, 043, 132
Intermittent:								
A. Arts				24, 000				60, 303
B. Humanities				24, 000				63, 565
Total intermittent				48, 000				123, 868
Total, personnel compensation				797, 200				1, 167, 000

A. PERSONNEL COMPENSATION—NATIONAL ENDOWMENT FOR THE ARTS

1. *Permanent positions.*—An increase of eight permanent positions is requested for the National Endowment for the Arts. The necessity for this request is caused primarily by the increasing volume of grants and proposals to be proc-

essed in all program areas and serious staffing insufficiencies demonstrated by experience. Approximately 33% more proposals are being received in 1967 than were received in 1966. As more new programs are established and funded, this rate will increase, workloads will increase, and staffing needs will increase. The eight new permanent positions are needed in the following units:

a. *Office of the Chairman:*

2 Clerk-Typists	GS-5

The two clerk-typists are requested primarily to assist in answering the heavy and increasing volume of correspondence of the Endowment, Chairman, Deputy Chairman, and National Council on the Arts. The workload on existing staff has already reached proportions which require additional assistance in this area, and will increase still further in 1968.

b. *Office of State and Community Operations:*

1 Clerk-Typist	GS-5

This office is responsible for the administration of the Endowment's program for a partnership with the States beginning in the current year representing one third of the Endowment's total program budget. In all, 102 separate applications were processed and approved under current appropriations. As required by the Act, each State must report to the Chairman on the results of grants made within the year. The States submitted a total of 295 projects for approval, all of which must be evaluated by this office.

In 1968, over 700 projects are expected in applications from all of the States and territories. These must then be evaluated and an equal number for 1969 processed before July 1, 1968, as required by the Act.

In addition to the large volume of evaluation and processing of projects and evaluations done by this office, and the large amount of correspondence and travel necessary to maintain relations with 55 separate and autonomous State arts agencies, this office also provides the other Program Directors with valuable information concerning the conditions of the arts throughout the country. Without professional and clerical assistance much valuable information will not be available for analysis and planning.

c. *Program Directors for Special Arts Programs:*

2 Program Assistants	GS-13
1 Program Assistant	GS-12

The bulk of the workload connected with the increased volume of grants and proposals falls to the Program Directors for the several art form categories. These staff members are responsible for the evaluation of proposals (300-400 in each art form in the Endowment's first year of operation); the evaluation of operating grant programs (of varying sizes and dimensions, from major programs to individual grants); travel and correspondence to maintain liaison with professional associations, private institutions, public organizations, and individuals related to the particular art form; advisory services to applicants and grantees; and the setting up and operation of advisory panels. This workload and the intimate knowledge of the particular art form required in these positions require the employment of one professional assistant for each of these Program Directors in the fields of music, drama, and the visual arts. Further, we have this problem: without these back-up positions not only will important portions of the various programs suffer, but the loss, through sickness or attrition, of any one of the Program Directors would result in a serious set-back to the program. Our Program Directors in the fields of creative writing and architecture and design are also in need of assistants. In the interest of economy, however, it is believed that the above request will meet minimal needs in 1968.

d. *Office of Planning and Analysis:*

1 Director	GS-15
1 Secretary	GS-5

We need an Office of Planning and Analysis—the President has emphasized the urgent need for better planning; the Bureau of the Budget has asked for greater effort in this respect; experience has already proved our need. The primary function of the Office will be to assist in establishing the long-range objectives of the Endowment; planning toward these objectives; integration of this planning with current programs; and the coordination of the total work of the Endowment toward the established objectives.

2. *Intermittent employment.*—In the early stages of our new programs consultants and experts are essential; evaluative panels have proved to be an absolute necessity—as a mater of fact, their use is authorized by our basic law; the Council, in order to be fully effective, should meet four times a year. Experience has emphasized this need.

It should also be pointed out that panelists in 1967, in a number of cases, have been asked to serve without compensation, particularly in the latter half of 1967, because of an acute shortage of funds. We believe that this creates unfair hardships and should not be continued. The compensation costs of such services are estimated as follows:

	Estimated for 1967	Requested for 1968
(*a*) Council members	$10,800	$14,400
(*b*) Council committees	1,200	5,475
(*c*) Panelists	3,875	21,000
(*d*) Consultants and experts	8,125	19,428
Total	24,000	60,303

a. *Council:*	
4 2-day meetings averaging 24 members in attendance at $75 per day each: (4 x 2 x 24 x 75)	$14,400
b. *Committees of the Council:*	
Executive Committee	1,800
Film Committee	1,200
Education Committee	1,125
Planning Committee	1,350
Total	5,475
c. *Panelists:*	
7 panels, 70 members, 3 2-day meetings, at $50 per day each	21,000
d. *Consultants and Experts:*	
Consultants and Experts	19,428
Total, Intermittent Employment	60,303

B. PERSONNEL COMPENSATION—NATIONAL ENDOWMENT FOR THE HUMANITIES

1. *Permanent positions.*—Funds for the following additional positions are requested:

a. *Office of the Chairman:*	
1 Public Information Officer	GS–13
1 Secretary	GS– 6
b. *Division of Fellowships & Stipends:*	
1 Program Analyst	GS– 9
c. *Division of Research & Publications:*	
1 Program Analyst	GS–11

a. *Office of the Chairman:* The two additional positions needed are:

Public Information Officer at GS–13 is needed now and the Endowment's grant activities are increasing and are expected to increase greatly in 1968 and thereafter. This officer, under the immediate supervision of the Deputy Chairman, would deal with the press and the general public wishing information (as distinct from queries from potential applicants). Included in the duties would be: Planning press relations, writing press releases, answering inquiries by telephone or mail, planning and dissemination of reports to the public on Endowment activities or interests, channel for requests for NEH speakers or participants in conferences, writing speeches for other staff members and speaking as a representative of NEH, providing information to Members of the Congress and officials of the Executive Branch, and maintaining liaison with the Director of Public Affairs of the Arts Endowment.

Secretary to the Public Information Officer at GS–6.—Typing and secretarial duties for the Officer described above will be extensive and staff for this workload is not now available.

b. *Division of Fellowships and Stipends:* A *Program Analyst* at GS–9 is needed in addition to the present Program Officer in view of the anticipated volume of applications. Duties would include administrative work to organize and systematize the procedures of the Fellowship programs; liaison with the Grants Office on pre-screening and post-grant details; assisting in the administrative duties of arranging for review panels; organizing panel meetings (including the necessary paperwork for travel vouchers, expenses, etc. of panelists, arranging for the meeting place in different regions of the country, etc.); collection and organization of materials for panel meetings; and quantitative research and evaluation of the developing trends of the fellowship program, e.g., the number of fellows by discipline, geographic spread, from liberal arts colleges or multi-university, etc.

c. *Division of Research and Publications:* A *Program Analyst* at GS–11 is needed as a third professional member of the staff to assist in handling the anticipated increase in volume of applications. The administrative duties would be similar to those described for the similar position proposed for the Division of Fellowships. However, the analyst in this Division would be more involved in the evaluation of proposals in terms of research relating to the merits of a specific proposal, i.e. determining the extent of other scholarly efforts in the field, validity of proposals, budget, relationship of project to other proposals under consideration, etc. The analyst would be an assistant to the Director in arranging for pre-panel expert evaluation; research about scholarly research in the humanities and publications in order to develop program guidelines and substantive emphasis; maintaining relations with grantees, getting and evaluating narrative reports from grantees; and generally functioning as a program assistant to the Director and the Program Officer on administrative and substantive matters of the Division.

2. *Intermittent Employment.*—Experience to date has shown the desirability of such resources and that 1967 funds available for the purpose are seriously inadequate. For 1968 the Endowment requests the following:

	Estimated for 1967	Requested for 1968
(*a*) Council members	$17,400	$22,050
(*b*) Selection panels and experts	28,500	41,515
Total	45,900	63,565

a. *Council Members.*—The estimate of $22,050 is calculated as follows:

(a) Four Council meetings—2 days each at $75 per day	$15,000
(b) Council committee meetings at $75 per day:	
Committee on Planning—8 days (6 members)	3,600
Committee on Fellowships—2 days (7 members)	1,050
Committee on Research—3 days (6 members)	1,350
Committee on Educational & Special Projects—2 days (7 members)	1,050
Total, Council	22,050

The estimate of $22,050 for the compensation of the National Council for the Humanities members will provide for 4 two-day meetings of the Council; the compensation of individual Council members attending meetings of the Committee for Planning, the Committee on Fellowships, the Committee on Research and Publications, and the Committee on Education and the Public.

b. *Selection Panels and Experts.*—The Endowment employs various panels and individual consultants at $50 a day who assist in the evaluation of applications for fellowships, the evaluation of proposals and serve in a general advisory capacity. The $41,515 requested for the services of these panels and individual consultants is calculated as follows:

(1) Division of Fellowships: For panels on Senior Fellowships, Regional Panels, and Final Selection Panels, and Experts on Post-doctoral and Summer Fellowships	$12,400
(2) Division of Research and Publications: For experts for pre-panel evaluation and Regional Panels	15,000
(3) Division of Educational and Special Projects: For panel on Museum Fellowship Interns, etc., and other needed consultants	6,250
(4) Office of Planning and Analysis: Needed consultants	7,865
Total	41,515

C. PERSONNEL COMPENSATION—SHARED STAFF

The Foundation's "shared staff" units (General Counsel, Administration, Grants, Research) were established to serve both Endowments more economically and effectively than would be possible with small separate staffs. The following table shows the number of positions, total annual salary rate, average employment or man-years, and net cost estimated for 1967 and requested for 1968:

Unit	Estimated for 1967				Requested for 1968			
	Positions	Annual rate	Man-years	Net cost	Positions	Annual rate	Man-years	Net cost
1. Office of General Counsel	2	$33,808	2.0	$33,808	4	$54,245	3.8	$51,337
2. Office of Administration	6	52,397	4.6	41,974	10	89,653	9.5	84,829
3. Office of Grants	5	41,199	4.3	34,678	10	81,197	9.5	76,838
4. Office of Research	4	33,862	3.7	30,945	7	60,887	6.7	57,623
Total	17	161,257	14.6	141,405	31	285,982	29.5	270,627

Establishing a new Federal agency with all new programs is a complex and difficult administrative undertaking at best:

> The unique organizational and authority structure of this agency poses additional problems for which precedent and example are lacking. Imagination—invention—innovation are required, and the administrative and legal staff, experience, and time for the task are essential.
>
> Designing, testing, installing, and perfecting administrative policies and systems needed to make this an effective and efficient instrument of government must receive more attention.
>
> Administrative servicing by another agency was necessary at the start and has been of real value in certain routine activities such as payroll work. At the same time, the arrangement has created other time-consuming problems and has not lent itself to the internal development of urgently needed administrative policy, structure, procedure, and practice.

This budget recognizes the importance of these matters and proposes a course of action and provision of resources to make necessary progress possible.

1. Office of the General Counsel

The General Counsel of the Foundation serves as legal adviser to the National Endowment for the Arts, the National Endowment for the Humanities, and the Federal Council on the Arts and the Humanities. He is also responsible for handling legislative matters of concern to the Foundation.

In a new agency, it is highly important that solidly based legal precedents be established at an early date in order to have a sound basis on which to build.

Policy problems and day-to-day urgent legal questions have placed a very heavy burden on the Foundation's Office of General Counsel. Moreover, the dual nature of the organization imposes special responsibilities on the Office of General Counsel which do not exist in a unilateral structure. Furthermore, legislative matters are becoming of increasing concern to the Foundation.

It is, therefore, clear that the Office will require additional assistance in 1968 in order to carry out its duties in an adequate manner. As a minimum, this involves employment of an additional attorney and a secretary. This additional attorney would be able to conduct the fundamental legal research so urgently required, as well as to assist the General Counsel in dealing with legislative matters and with daily problems of an emergency nature.

Accordingly, an attorney at GS–14 and a secretary at GS–5 are requested.

2. *Office of Administration*

From its establishment until September 1, 1966, most of NFAH's administrative services (personnel, payroll, accounting, auditing, financial reporting, purchasing, reproduction, etc.) were provided by the General Services Administration on a reimburseable basis.

Beginning on September 1, 1966, administrative services were transferred on a phased plan from GSA to the National Science Foundation.

The agreement between the National Science Foundation and NFAH stipulates that this arrangement is to exist only until June 30, 1967, and that all plans and activities during the current year will be based on the assumption that NFAH will be on its own administratively after that date. GSA and NSF consider this highly desirable if not imperative.

The administrative workloads handled by this office are increasing and will increase substantially in 1968. The Endowment programs and staffs served are budgeted at higher levels in 1968. The budget for this unit reflects these factors.

In-house performance of basic and essential administrative functions will require four additional positions. Each of these positions will have a primary area of responsibility but will also involve assisting and substituting in one or more other areas. The four new positions are:

> One at GS–12 primarily assigned to budget, accounting, financial reporting, and related work. This position will be the principal fiscal officer; it demands broad and detailed professional competence in these fields.
>
> One at GS–12 primarily responsible for personnel and payroll work. This position will involve the full range of responsible functioning in two complex administrative fields.
>
> One at GS–7 for voucher examination, financial document preparation, and related work. This position will provide clerical and back-up assistance to the two higher level positions listed above.
>
> One clerk-typist at GS–4 to serve these and existing positions.

3. *Office of Grants*

The Office of Grants is responsible for administrative policies to effect the specialized objectives of several distinct grant programs in the arts and humanities areas, and to assure consistency with Federal requirements. The Office has additional responsibility for records and processing systems.

The current staff allowance consists of a Director, two assistants, and two secretarial-clerical personnel. This staff can maintain current grant financial status records, process obligation and payment documents, and provide some support for administrative processing of applications. However, it (1) cannot provide adequate assistance in implementation of grants policies, and (2) cannot undertake substantial processing and controls functions required for 1968.

As its primary duty, the Grants Office should give major assistance to program personnel in applying sound grants administration practices. The need is acute because of the variety and complexity of the Foundation's activities. Distinct approaches have to be refined for grants arrangements with individuals and with groups, with universities and organizations, for research, fellowships, and productions. Resulting policies have to be applied on a case-by-case basis.

For these requirements, two additional Grants Specialists at GS–12 are requested.

The second role of the Grants Office is maintenance of records, processing, and controls systems for applications. The volume of activity is expanding rapidly, particularly in those program areas characterized by mass periodic handling of documents, through the review and award stages. The growth of applications is estimated in the substantive budgets of the Endowments. In addition to the quantity factor, the variety in processing systems is significant. Each type of award program, within each of the Endowments, requires a separately designed relationship in program office and Grant Office roles.

Three additional positions are requested: One Grants Assistant at GS-9 to supervise systems operations, and review applications for administrative sufficiency; and two clerk-typists at GS-4 to provide clerical and secretarial support.

4. Office of Research

The Office of Research locates, evaluates, and compiles information and materials for public distribution and for Program Directors, Deputy Chairmen, Chairmen and Council Members of the National Endowment for the Arts, the National Endowment for the Humanities, and the Federal Council on the Arts and the Humanities. Under the supervision of the Chairmen of the National Endowment for the Arts and the National Endowment for the Humanities, it is responsible for the development and operation of a library of books, periodicals and basic materials; gathering and organizing background material and information; designing, compiling and preparing special publications, reports and publications; initiating and executing studies and research programs for staff use and for publication.

The office provides administrative, secretarial, research and editorial services to the Federal Council on the Arts and the Humanities. It is responsible for locating, evaluating and distributing information on existing and developing Federal programs in all areas of the arts and humanities and for obtaining and reviewing information on all other programs in those areas developed by public and private organizations.

Existing and emerging interest in the arts and the humanities are creating new program areas, new audiences, new opportunities for teachers and artists and new sources of financial support. Governments, foundations and associations, and the artistic academic, and business communities are developing new institutions and expanding existing organizations. Each must be investigated in order to permit the Chairmen, Program Directors, and staff of the National Foundation on the Arts and the Humanities to evaluate current and projected programs. Each must be explored to enable the Foundation to keep the Congress, press, and public informed. To meet the needs of an expanding library and an increased demand for background materials and publications, it is planned to expand the Office of Research to include:

One additional Research Assistant at GS-9 to assist in soliciting, compiling, evaluating, and preparing for publication informational materials.

Secretary for the Federal Council on the Arts and the Humanities at GS-13, to arrange and record meetings, prepare and distribute information and materials, compile reports and studies, coordinate activities, programs and publications where necessary and provide general assistance to the Director of Research; and a secretary at GS-5 to handle the resulting clerical responsibilities.

Other Objects

12.0 Personnel Benefits

Estimated for 1967	$56,000
Requested for 1968	77,000

The amount needed for the agency share of employee benefits programs is determined by computing 7 percent of the estimated net salary total. This figure is lower than the 7½ percent normally used because the Foundation's experts and consultants are not eligible for Civil Service retirement benefits.

21.0 Travel and Transportation of Persons

Estimated for 1967	$70,000
Requested for 1968	126,000

To carry out the purposes of the Act, both Endowments are authorized to utilize panels of experts and special consultants. These are essential to the projects and programs of the Endowments. They make recommendations concerning grants to be made; they help initiate new ideas; and they serve to broaden the base of private participation in the Endowments' activities. The panels listed below will be fully operative in 1968; all will be established during 1967. The panelist numbers have been kept to the lowest minimum believed possible to cover the responsibilities prescribed in the Act.

A. ARTS

The following table shows the travel funds estimated for 1967 under the appropriation and limitation and requested for 1968:

	Estimated for 1967	Requested for 1968
1. Council	$12,500	$15,000
2. Council committees	2,000	3,650
3. Panels	4,500	19,320
4. Staff	16,000	25,030
Total, arts	35,000	63,000

1. *Council Members.*—Four Arts Council meetings are planned for each year. On the basis of actual experience, this will require a minimum of $15,000.

2. *Council Committees.*—

Executive Committee—6 members for 4 one-day meetings	$1,200
Film Committee—4 members for 4 one-day meetings	800
Education Committee—5 members for 3 one-day meetings	750
Planning Committee—6 members for 3 one-day meetings	900
Total, Council committees	3,650

3. *Panels.*—

Art form	Panelists	Transportation estimated cost
Architecture and design	10	$1,800
Creative writing	10	1,800
Drama	10	1,800
Dance	10	1,800
Music	10	1,800
Visual arts and museums	10	1,800
Public media	10	1,800
Total	70	12,600

Transportation.—These costs are based on an average of $60 for each panelist for three two-day meetings in 1968.

Per Diem.—Three meetings at two days each for 70 panelists, $6,720; total panel travel, $19,320.

4. *Staff Travel.*—In order to evaluate projects already funded by the Endowments, to make careful assessments of projects for future funding, to contact leading representatives of the arts in various parts of the country, and thus to help develop new programs and ideas, it is essential that adequate travel funds be available for Endowment staff. Present travel limitations impose serious restrictions on the staff's abilities to carry out properly the purposes of the Act in 1967. These problems, if unresolved, will impose far greater difficulties in 1968 in terms of developing programs and those submitted in this budget. It is em-

phasized that the following amounts represent the Endowment's minimum estimates for staff travel in keeping with the various programs and their objectives.

	Salary	
	Yearly	Monthly
Program directors:		
Architecture and design	$2,760	$230
Creative writing	2,760	230
Drama and dance	4,680	390
Music	2,760	230
Visual arts	2,760	230
Public relations officer	2,280	190
State program director	5,280	440
Office of Chairman and Deputy	1,750	146
Total, staff travel	25,030	

B. HUMANITIES

	Estimated for 1967	Requested for 1968
1. Staff	$2,786	$12,300
2. Council	14,512	20,700
3. Fellowship program	6,066	8,700
4. Research and publication	8,856	8,300
5. Educational and special projects	1,980	6,000
6. Office of planning	800	6,000
Total, humanities	35,000	62,000

The travel estimates and justifications for the Arts Endowment were presented above in considerable detail. The requirements of the Humanities Endowment were computed in substantially the same fashion; consequently, this section of the budget is presented in less detail.

The travel estimated is the minimum amount needed for the travel necessary for the Endowment staff to maintain contact with the academic community, to attend conferences, and to supervise and observe the actual operation of various programs funded by the Endowment in 1968. This would enable the Endowment staff to keep abreast of developments in the Humanities throughout the country and to consult with applicants, grantees, contractors, and others involved in the Endowment's program.

The travel estimated for the Council members, members of selection committees, and consultants enables them to travel to and from Washington and to regional meetings to assist the staff of the Endowment in the development, review, and evaluation of programs and polices.

The amount available for staff travel in 1967 is inadequate for the implementation of the program.

C. SHARED STAFF

The only travel budgeted directly for the Foundation's Shared Staff is for local trips by taxicab and bus. An allowance of $500 is needed for this purpose.

For travel by members of the Federal Council on the Arts and the Humanities $500 is requested.

23.0 Rentals, communications, and utilities

Estimated for 1967	$53,000
Requested for 1968	85,000
Equipment rental:	
Estimated for 1967	5,500
Requested for 1968	6,500

Rental and maintenance of Xerox equipment is the only item in this account. The difference in the 1967 and 1968 amounts is a result of acquisition late in 1967 of a Model 2400 copier to replace a Model 914. Increased production and improved quality, as well as savings in time, will more than compensate for the difference in cost.

Communications:

Estimated for 1967	$34,400
Requested for 1968	50,000

The increase in 1968 reflects cost of installation and equipment rentals for additional staff and greatly increased activity necessitated by expanding programs.

$20,000 is requested for 1968 to pay the Post Office Department for postage costs for both 1967 and 1968. To date the Foundation has not been billed but we have been informed by the General Services Administration to plan to meet the cost no later than 1968.

Building rental and space alterations:

Estimated for 1967	$13,100
Requested for 1968	28,500

In addition to the appropriation transfer of $74,700 to the General Services Administration for office rent, an additional $5,200 was paid from this object class for a small additional block of space made available early in the fiscal year.

Housing the additional staff for which funds are requested in 1968 will require $22,500 for office space rental. Partitions and other alteration work will require $6,000; a total of $7,900 has been spent for this purpose in 1967.

24.0 Printing and reproduction

Estimated for 1967	$12,500
Requested for 1968	26,000

The Arts and Humanities paragraphs below refer to special needs attributable to the separate programs. General needs, such as letterhead stationery envelopes, internal administrative materials, and the like, are covered under "Shared Staff."

A. ARTS

Estimated for 1967	$5,750
Requested for 1968	9,500

The Arts Endowment receives a huge volume of requests for information. Adequate supplies of materials of various kinds giving current program information must be maintained ready for mailing.

The needs for more and better program announcements, application forms, and other program management tools are increasing and as programs develop frequent revisions and reprinting will be necessary.

Manuscripts are often received by the Endowment as attachments to proposals or grant applications; these documents must be reproduced for Council and panel consideration and many are lengthy.

B. HUMANITIES

Estimated for 1967	$6,250
Requested for 1968	9,500

By 1968 we anticipate increased activity in the production of materials to inform the public about Humanities' Endowment programs, factbooks in various areas of Endowment interest, and other similar materials. Some materials will receive wide distribution, such as certain materials aimed at college humanities teachers (80,000 copies at least), with an even larger number for secondary school teachers. Many of these programs have never before received Federal government financing and enthusiasm for them in the academic community is expected to generate a large volume of correspondence. Informational needs about expanded programs in 1968 will require greater expenditures for printing and reproduction.

C. SHARED STAFF

Estimated for 1967	$500
Requested for 1968	7,000

General printing and reproduction needs are increasing and will continue to do so in 1968. These demands are caused by (1) expanding Foundation programs and activities, with resultant larger and more intensive public response and interest, in turn involving increased correspondence and need for informational materials; and (2) new and greater volume of forms and other program management materials.

Also included for 1968 is $1,000 for the Federal Council on the Arts and the Humanities.

25.1. Other services

	Estimated for 1967	Requested for 1968
A. Arts	$12,500	$25,500
B. Humanities	4,000	47,500
C. Shared staff	2,000	1,000
Total	18,500	74,000

Another need arising from the newness of the Foundation's programs and responsibilities as a Federal endeavor is that for expert assistance in fact gathering, analysis, and evaluation. Sources of information in these fields within government are inadequate. Thus the two Endowments must look to qualified individuals and institutions to help.

A. ARTS

Current information on the status of the arts is most accurately kept by the professional associations of arts organizations, of which there are more than one hundred. While certain kinds of information are available to the Endowment merely by requesting cooperation, other types of statistics and data are not routinely recorded. It is to the financial advantage of the Endowment to contract for these services with membership organizations which maintain regular contacts with their members than to attempt to gather this information independently.

In addition, it is necessary from time to time to contract with organizations specializing in specific background information in order to gather preliminary material for activities under consideration. Under these contracts would fall the updating, revising, and expanding of already completed studies as well as separate small contracts for statistical analysis of past and present projects.

B. HUMANITIES

The contract services funds will be used to purchase the technical information and expertise (largely existing within the staffs of non-profit or commercial organizations) which it would be prohibitively expensive to obtain in any other way. For example it is clear that the Endowment will need technical expertise on both computers and libraries to fulfill our role as a contributor to the President's study on Libraries. Additionally some data processing will be required for record keeping and analysis of programs as volume increases; an example is the need to have data-processing services on our fellowship applications in order to maintain statistical control.

C. SHARED STAFF

As the administrative staff becomes able to serve the Foundation completely "in-house," this account can be reduced to a minimum of $1,000 to meet emergencies or very special problems.

25.2 Services of other agencies

Estimated for 1967	$25,000
Requested for 1968	0

The 1967 figure is the amount obligated for payment to other agencies for administrative services agreements. These services are being furnished by the General Services Administration for a portion of the year and by the National Science Foundation for the remainder of 1967, while no agreements of this type are anticipated for 1968.

26.0 Supplies and materials

Estimated for 1967	$6,750
Requested for 1968	9,000

The Shared Staff is responsible for maintaining operating and inventory supplies and materials at a level sufficient to enable the Foundation to accomplish its day-to-day functions effectively and efficiently. Additional and expanded programs, anticipated increases in staff, and administrative independence will necessitate greater expenditure for supplies in 1968.

31.0 Equipment

Estimated for 1967—$1,000
Requested for 1968—$56,000

As noted earlier, reliance on other agencies to furnish large amounts of printing and other operational functions has proven complex, cumbersome, and generally unsatisfactory, certainly for the long pull. The Foundation believes that it must at the earliest practical date, develop capability to perform these functions on its own. For these purposes, new equipment will be needed as follows:

Bookkeeping equipment.—A machine at approximately $10,000 will be required for performance "in-house" of responsible fiscal functions.

Automatic typewriter.—Experience has already clearly demonstrated the need for modern equipment in handling necessary paper work in grants administration. Manual work is expensive in time and money. One urgently needed tool is a Flexowriter or similar machine. The needed machine will cost approximately $3,000. This modern implement would pay for itself in two or three years and output would be improved in quality and timeliness.

Collator.—We have one small offset press and a Model 2400 Xerox Copier. Hand collating the output of these machines is slow and costly. Purchase of a small mechanical collator would be a good investment—it would improve speed of service and save expensive staff time. A $600 collator would pay for itself in the first year.

"Punch and bind".—To furnish multi-page documents such as this budget presentation, other reports to the Congress, materials for Council members, informational materials for State Arts Councils and humanistic institutions, a small table model punch-and-bind set would be most helpful. Sending such work out to be done is time-consuming and wasteful. Investment of $375 to purchase the equipment would be good business.

Other equipment.—For efficient operation the following new items will be needed:

1. One adding machine	$250
2. Dictating equipment	4,175
3. Portable typewriters	1,675
Total	6,100

Equipment replacement.—Our furniture, typewriters, and other furnishings and equipment will still be relatively new in 1968. Thus, replacement should be limited to items damaged to the point of uneconomic repair. We have little experience to guide us here; $1,500 is estimated.

Office furnishings.—Furniture will have to be acquired for the 26 new positions for which funds are requested. Experience this year indicates an average cost per new position of $1,500. Estimating only $1,250 per new position in 1968, an allowance of $32,500 for this purpose is requested.

Miscellaneous.—Unforeseen needs always occur. Generally, these are for small items. $1,925 is estimated for this purpose.

NATIONAL FOUNDATION ON THE ARTS AND THE HUMANITIES

Itemization of estimate

[In thousands of dollars]

	Actual, 1966	Estimate, 1967	Estimate, 1968	Increase (+) or decrease
Program and financing:

NATIONAL ENDOWMENT FOR THE ARTS

PREPARED STATEMENT

Chairman HAYDEN. Mr. Stevens, will you please submit your written statement for the record, and then highlight it for the committee?

Mr. STEVENS. Yes, sir. I have here a statement that I will submit to the committee, and just highlight it in general.

(The statement follows:)

During its first year and a half of operations, covering two fiscal years, the National Endowment for the Arts has initiated some 93 separate projects to support and encourage the development of the arts in the United States.

Small projects, requiring less than $10,000 in Federal funds, have been implemented, and major projects have been supported, requiring funding in the range of $250,000 to $300,000. Through the Endowment's program, arts organizations and individual artists are being assisted in all 50 states, and in the District of Columbia, Guam, Puerto Rico and the Virgin Islands. At this time 295 additional projects to benefit the arts are being conducted by state arts agencies supported by the Endowment with the $2 million appropriated for this purpose.

NEEDS IN THE ARTS

The needs in the arts are set forth in detail in our justification. However, I would like to stress at this point the primary cause of concern. Plainly stated, the traditional sources of private support which sustained the development of the arts in the United States in the past are no longer able to keep pace with new and ever-increasing demands. A number of factors are involved and these are discussed in the justification. In brief, however, let me say that the arts in this country are facing a time of financial crisis; and if they are to be enjoyed and appreciated by the many and not the few, they will need a substantial transfusion of new funding. By substantial, I mean funds in excess of $150 million per annum.

Now, it is not the intent here to suggest that such a sum should come from the Federal government at this time. Our authorizing level is in no such category. However, with the funds recommended in the President's budget, we can provide that essentially needed "seed money" which can stimulate private incentive and initiative. What we are requesting for the Arts Endowment on a per capita basis, is less than 5 cents per person per year in Federal funds. In those terms, it would appear a small amount, but I can assure you that it can mean a most valuable investment in terms of our country's present and future goals.

For what is involved here is, really, the quality of our life. Man's aspirations have always been expressed in tangible and lasting form through the arts; understanding and appreciation of the arts put us in close touch with these aspirations. The knowledge to be gained through the arts, the new dimensions the arts add to human awareness and inspiration are of great value to all our people, especially now when as an affluent nation we have increasing amounts of leisure time to enjoy. Particularly is this applicable to our older citizens. The arts can provide them with broad new opportunities for a more rewarding life.

INDIVIDUAL IN A DEMOCRACY

Thus, in this statement I want to make very clear that what I am describing is not a frill or a luxury. It is of fundamental worth to the individual, and to the full development of an individual in a democratic society. This is of special relevance at this moment in our history. We are not only a nation which is rich in material resources, but we have a deep cultural heritage, and we need to be deeply concerned with its growth and fulfillment. If we are to win the battle which involves men's minds, we must project at this very time the best possible image of the United States abroad. The arts—great music, drama, literature, painting and sculpture—speak in an international language. They voice universal aspirations. They cross boundaries which otherwise may be closed. They personify freedom of expression, and the worth of the individual within the framework of democratic beliefs. The arts are central to the quality of our life, and it is of exceeding importance at this critical time in history that they be assured of a climate in which they may flourish. The encouragement of such a climate is in accord with our mandate from the Congress.

But if the arts are to be fully beneficial to our people, they must be readily available to the many and not to the privileged few. Our efforts are directed toward this purpose as much as they are toward assisting individual creative and performing artists and the organizations they themselves sustain and foster.

PUBLIC INTEREST

Too often today the arts, especially the performing arts, are priced out of range of the general public. The costs of producing excellence in drama, in music, in opera, have risen sharply in recent years. Community theatres are plagued with increasing deficits. Our nation's major orchestras have been assisted by massive support, totaling $82 million, from the Ford Foundation; but there are great numbers of orchestras, whose annual budgets are less than $100,000 which the Ford program does not reach; and these are increasingly hard-pressed.

The recent inability of the Metropolitan Opera Company to support a national touring company emphasizes the current failure of private sources to support a major artistic endeavor at a level commensurate with public demand.

If the financial crisis facing the arts in the United States today is allowed to continue, it can only worsen and produce conditions which may well be impossible to rectify. With adequate funding, the Arts Endowment can alleviate this crisis, by meeting emergencies where they exist, by taking priority actions needed to build a careful program for the future, and, above all, by helping to stimulate a broad-based partnership between our citizens and our government.

THE NATIONAL COUNCIL

The 26 private citizen members of the National Council on the Arts, who have met five times since the enabling legislation was enacted and twice during the current fiscal year, continue to work diligently and frequently at their own expense between regular Council meetings. Their advice and experience have been of immeasurable value to the operation of the Endowment. They have originated many new ideas for our nation's cultural advancement, and through their leadership they help us achieve the goals of partnership between the Government and the private community.

Partnership and cooperation with the private community is further advanced through panels of private experts who are assisting us, as authorized in the legislation. We believe that these panels are essential to our work, not only in the recommendations they make, but because they provide us with the opportunity of encouraging private initiative, in accord with the spirit of the Public Law. If there is favorable action on our appropriation request, we can strengthen this cooperative partnership, and we can better meet the needs in all areas of the arts.

Let me review briefly some of the projects which we have initiated to date.

Since September 29th, 1965, when the Act was signed into law by President Johnson, the National Endowment for the Arts has designed programs which are creating new opportunities for artists, initiating innovative projects in the arts, expanding and developing audiences, and enabling existing organizations to broaden arts programs.

With the advice of the National Council on the Arts, Endowment programs have:

Assisted artists by enabling

50 novelists, poets, painters, sculptors and composers teaching in institutions of higher learning to take one-year leaves to pursue creative work in the arts.

77 promising young students in the arts who graduated from college in June 1966 to visit art centers, museums, institutions, cities or areas of the United States in order to broaden their cultural experience.

60 painters and sculptors to receive awards in recognition of past contributions and to encourage their future careers.

8 choreographers to create and produce important works.

22 writers, including novelists, poets, and biographers to conduct research or complete works in progress; and the Radcliffe Institute for Independent Study to provide aditional fellowship funds to women creative writers.

Playwrights to secure public performances of high professional quality in resident professional and university theatres.

Provided the stimulus for 50 States, the District of Columbia, Puerto Rico, the Virgin Islands and Guam to survey their cultural resources and develop programs, facilities and services at the community level. Thirty-three States and three jurisdictions have created official State arts agencies since 1965 when the National Foundation on the Arts and the Humanities was established. The state program, with close to 300 projects now under way, is proving of great value.

Opened new opportunities for arts programming on educational television by using unrestricted gifts to the National Endowment for the Arts for projects which have enabled educational stations throughout the country to provide additional programming in arts fields.

Initiated new programs aimed at creating an American Lyric Theatre Workshop, a National Chamber Orchestra, a Literary Anthology to assist small magazines and writers whose works appear in them, low-rent studio-living quarters for artists; and also aimed at expanding metropolitan museum resources to smaller communities.

AUDIENCE DEVELOPMENT

Encouraged the expansion and development of audience by enabling

The Martha Graham Dance Company to make its first national tour in 15 years in the fall of 1966. The tour gave people in 32 cities with a total population of 16.7 million the opportunity to see an internationally acclaimed dance organization.

The American Ballet Theatre to embark upon nationwide tours in the fall of 1966 and the spring of 1967. The tours give people in 73 cities with a total population of 21.4 million the opportunity to view one of the nation's best existing full-scale dance companies.

The New York Shakespeare Festival to conduct educational programs throughout the city.

Resident professional theatre companies to enhance the artistic quality of their productions. People in 16 cities with a total population of 19 million will have the opportunity to attend performances by 15 resident professional and repertory theatres which have engaged performers and guest directors to further develop the excellence of their companies.

Hull House in Chicago to implement plans for special theatrical productions in public housing projects, and in areas for the economically disadvantaged.

Stimulated young audiences by enabling

Laboratory Theatre Companies in Providence and New Orleans to give free performances to student audiences, play to the general public at reasonable rates, and develop techniques to improve the instruction of dramatic literature in secondary schools. More than 90,000 children in the two cities will have the opportunity to attend performances during the first year of this project.

The Academy of American Poets to send young poets into hundreds of New York, Detroit and Pittsburgh public school classrooms to read and discuss their own poetry and to permit high school English teachers to attend lectures and readings by outstanding senior poets.

The Metropolitan Opera National Company to give special performances for student and labor groups throughout the country.

The National Repertory Theatre to expand its audience subscription program and broaden its student educational programs. People in 12 cities with a total population of 20.4 million will have the opportunity to attend this leading repertory company's performances.

EDUCATION PROGRAMS

Strengthened arts in education programs by enabling Fordham University to develop a demonstration program using films to stimulate effective communication among culturally disadvantaged secondary school children; Budd Schulberg's Writers' Workshop at Douglass House in the Watts area of Los Angeles to expand its activities; Dorothy Maynor's St. James Community House School of the Arts to continue music and theatre training programs for underprivileged youth in New York City.

Supported the first international conferences held in the United States by American P.E.N. (Poets, Playwrights, Essayists and Novelists) and the National Music Camp at Interlochen, Michigan, which were attended by more than 450 writers and 800 musicians from foreign countries.

Strengthened existing arts organizations by enabling the Wisconsin Idea Theatre to explore methods of bringing arts activities to small rural communities; supporting the Boston Opera Company's special production of Schoenberg's "Moses and Aaron"; assisting the Metropolitan Museum of Art to provide a special two-month exhibition of historical and contemporary costumes; and developing technical assistance programs for the American National Theatre and Academy, the American Symphony Orchestra League, and the American Educational Theatre Association.

Launched studies to explore the feasibility and techniques of establishing an American Film Institute, an institute concerned with environmental design and including architecture, planning and landscape architecture, an Association of American Dance Companies, and a new system of music education for elementary and secondary schools.

Assisted regional arts programs with support for such pilot projects as a design conference on Tock's Island which includes six counties in New Jersey and Pennsylvania, and a feasibility study on converting the Denver Symphony Orchestra from a local to a regional group.

Initiated a series of other pilot projects in architecture and allied fields which can produce prototypes for improved highway signs and graphics to enhance the appearance of the highway and improve highway safety, for industrial river areas, and for an American guide series on significant architecture, landscape architecture and planning.

OTHER ACTIVITIES

Other projects which the Endowment is undertaking will permit

Composers to defray the costs of copying scores and parts for orchestral presentation of their work.

Painters to create new prints for distribution in portfolios of the highest quality to high schools, libraries and educational institutions, and special editions of contemporary and historic drawings to be similarly circulated.

Young musicians to participate as soloists in national tours.

Fifty undergraduate students selected by schools of architecture, planning and landscape architecture to travel and conduct research during the summer before their final year of study.

Students of architecture, planning or landscape architecture to obtain practical experience through work in selected public agencies on significant public projects throughout the country.

Regional opera development in the Southeast United States.

Three cities to display outstanding pieces of sculpture in specially designed outdoor areas.

The American Playwrights Theatre to make new plays available to member university, community and resident professional theaters and the Inter-American Foundation for the Arts to increase artistic exchange between Latin America and the United States.

PILOT PROJECTS

Finally, let me stress, as I did a year ago, that the program we are developing is based on pilot projects—on those which our Council of private citizens and our panels of private experts believe are most essential.

They do not, of course, fully answer the many needs in the arts, for that is beyond the scope of our funding; but we believe that they constitute a solid base for future actions, and that this base is of indispensable value to the future quality of our country's life.

COUNCIL FORMATION AND MEMBERSHIP

Mr. STEVENS. We are now in our second fiscal year of the arts endowment program. The council was established a year earlier. We have had a number of meetings of the 26 individuals who constitute the National Council on the Arts. These are leaders in the various fields of the arts throughout the country. They have given very generously of their time, and we feel the programs that they have suggested through the National Council have been very successful, in terms of public acceptance and press acceptance.

We have had a number of favorable articles written about them. We feel, therefore, that we must be handling the money appropriated to us efficiently and well.

ENCOURAGING PRIVATE FUNDING THROUGH PILOT PROJECTS

The demand for the arts, for money in the arts, you might say, is so large that we feel that we should devote ourselves to pilot projects, hopefully to prove that an idea is a good one, and should be supported by private funds, if possible, and that has been our policy.

NONFUNDING OF ARTS FACILITIES

We have had to arbitrarily refuse to give any money for physical improvements and rehabilitation of arts facilities, because the few million dollars appropriated to us could be expended on just one project. Also, generally speaking, we have not made funds available for just plain deficit operations. We feel that the communities have to handle that.

So what we have tried to do is to stimulate and to lead and to help new projects and support worthwhile projects that are already in operation.

ART APPRECIATION DEVELOPMENT

We feel that we should support great talent where necessary, where the money is needed. Also at the same time, we believe we should try to develop an appreciation and an interest in the arts, by the people throughout the country, and try to balance out a situation where, generally speaking, creative artists and performing artists are concentrated on the east and west coasts. We feel it is necessary to bring the talent to the people throughout the country, which because of the great distances and costs involved, is rather hard to do today.

We also feel it is most important that we keep in mind that there are shorter hours of work now, and there is more leisure time, and people are living longer, and they can look forward to a longer retirement. To help people enjoy a better way of life and to be happier, we feel that the arts can constitute a very important factor in this respect, sir.

ESTIMATED UNOBLIGATED BALANCE

Chairman HAYDEN. What is your estimated unobligated balance of prior appropriations, that is, for fiscal years 1965, 1966, and 1967, as of June 30 of this year?

Mr. STEVENS. Approximately $76,000 is the amount that we have not authorized for expenditures at this time. Is that not correct, Mr. Biddle?

Mr. BIDDLE. Yes, Mr. Chairman, we have a summary table, which I submit to the committee, showing the allocations that we have to date approved for various projects in the arts.

Now, this covers two fiscal years, when the grants were possible to be made.

Chairman HAYDEN. I will put that in the record.

(The table follows:)

Summary of Arts Endowment projects by allocations to arts categories (following listing in Public Law 89-209) [1]

	Projects, 1966 (½ year)	Projects, 1967	Projects, 1968 estimate	3-year totals
Music	$212,575	$195,500	$750,000	$1,158,075
Opera [2]	----------	403,000	475,000	878,000
Drama	265,000	713,000	750,000	1,728,000
Dance	605,250	38,550	300,000	943,800
Creative writing	261,747	573,000	500,000	1,334,747
Visual arts [3]	163,000	957,000	535,000	1,655,000
Architecture and design	(4)	222,500	400,000	622,500
Public media [5] and special educational projects	437,000	226,433	680,000	1,343,433
Projects for a variety of art forms	449,500	435,564	360,000	1,245,064
Special studies and research	91,000	173,950	250,000	514,950
Total	[6] 2,485,072	[6] 3,938,497	5,000,000	11,423,569
Support of State arts agencies	(7)	2,000,000	2,750,000	4,750,000

---

[1] It is difficult, in all cases, to identify projects of the Endowment by specific art categories. In many instances projects are designed to encourage a better appreciation of excellence in the arts by our people, and this relates to an educational factor, while in no way duplicating the efforts of other agencies. The Laboratory Theater project, described in the justification, is an example. It relates to drama, but its primary purpose is educational: to increase among young people a greater appreciation of excellence in the theater. In this case the allocation is divided between the category of drama and special educational projects over the 3-year span. The table, therefore, represents a guide to the Endowment's programing and funding approved by the National Council on the Arts, within a somewhat flexible category framework.

(With respect to the Laboratory Theater, it should be pointed out that the Endowment is cooperating with the Office of Education on this project, but that the preproduction costs essential to the project could only be funded by the Endowment under its enabling legislation. This is also an example of how the provisions of Public Law 89-209 are uniquely suited to initiating projects which may be supported, once they are established, by other agencies.)

[2] Opera, the costliest of all the arts to produce, is treated as a separate category under music.

[3] The visual arts include in this summary painting and sculpture, the graphic arts, and folk art, though this latter category could also be covered by projects dealing with a variety of the arts.

[4] Study planned in these fields.

[5] Public media projects have also been supported by unrestricted gifts made to the Endowment, as explained on p. A-4.

[6] As shown in the table, funds totaling $6,423,569 have been committed at this time out of a total appropriation of $6,500,000 for 1966 and 1967. The Endowment is reserving $76,431 to cover contingencies for the remainder of the fiscal year, when it is expected all funds will be obligated.

[7] Not authorized.

Absence of Carryover Funds

Chairman Hayden. How much of this unobligated balance results from funds to be carried over from the fiscal year 1967 appropriations?

Mr. Biddle. If I could answer that, Mr. Chairman, I believe that by the end of this current fiscal year, we will have obligated overy bit of our appropriation. We don't have any carryover funds for next year's projects.

SIX OBJECTIVES

Chairman Hayden. You list six objectives of the National Endowment for the Arts. Would you review these briefly for the committee?

Art Appreciation

Mr. Stevens. Well, the first objective is to increase the opportunities for citizen appreciation and enjoyment of the arts through a wider distribution of our artistic resources throughout all areas of the Nation, I touched upon that in my opening statement. It is a primary concern of ours to make quality art available, in the performing arts and in the visual arts, to people throughout the country.

Sustain and Encourage Individual Artists

The next objective is to sustain and encourage individual performing and creative artists. Of course, fundamentally, it is the individual that creates art, and it is necessary to make grants to such individuals, in order that new art can be created.

And, also, it is most important that the artist feel that the Government is interested in his welfare. One of the problems, I think, in the past in this country, is that artists have been often neglected, and felt that they were alone in the world, and yet they have created so much happiness and created so much that has helped the rest of the world, I think it is important that they feel that they are appreciated.

Sustain and Develop Art Institutions

The third objective is to sustain and develop eixsting independent institutions of the arts. A good example of that would be Martha Graham's company. She is one of the great geniuses of the century. For years, she has been unable to tour the country. We gave a grant to her group to make a tour throughout the country, and to give people a chance to see this great genius on a farewell tour.

Also, we did the same for the famous American Ballet Theatre Company. We made it possible for them to tour at the same time, enabled them to stay in business.

Citizen Education

Another objective is to increase the awarness and importance of the arts to our citizens through educational and experimental projects.

We have such projects as poetry readings, which have been much more successful than we anticipated. We have a project involving schools, where for the first time, many schoolchildren can go and see classics performed, in what is called live theater. In both New Orleans and in Providence, we are trying out an experiment involving the impact a first-rate professional theatrical company can have on secondary school pupils. The hope is that the pupils, seeing for the first time the plays they are studying in school, will take a great deal of interest in the classics. Usually, they are taught in an uninteresting way. Now, I have attended both the Providence and the New Orleans projects, and considering that today, the average child is supposed to have spent 20 hours a week watching television, it is amazing, the reaction that these children have to first-rate live performances of classical plays.

That is an example of what we are talking about.

Citizen Participation

Then we would like to increase the citizen participation in local artistic programs through a partnership with the States. One of the more successful parts of our program concerns that portion of the act which calls for a grant of $50,000 to each State, if they have an arts agency, and the money is matched for each project they undertake.

The first year allowed for a study costing up to $25,000, which did not have to be matched, and it is interesting to note in some form or other, there is a State arts agency in literally every State and territory of the country right now. How many of them will continue, after their study, to provide $50,000, which is necessary for the matching grant, we don't know, but I would think a very large proportion of them, and this is a way of seeing that every State has a chance to participate in the program.

I think there are something like 295 projects, wasn't it, Mr. Mark, that came out of the first year of this program?

Mr. Mark. Yes.

New Opportunities in the Arts

Mr. Stevens. And then the sixth objective is to provide the people of this Nation with new opportunities in all aspects of the arts. That is sometimes a matter of studies, to see what is necessary, and what the public feels that they need in the way of the arts. We also like to create opportunities as far as the small communities are concerned.

RURAL ARTS PROJECT

We have a very interesting project in Wisconsin right now, assisted by the University of Wisconsin, where studies are being made in five small communities under 10,000 people, to see what their needs and hopes are for the arts. I would not want to take your time now to go into it in detail, but I think it would be very interesting as far as the committee would be concerned to see that the communities under 10,000 feel they are just as interested in the arts as the larger cities.

AMERICAN FILM INSTITUTE

Another kind of project is the American Film Institute. One could very properly say, why should the Arts Council be helping the film industry, which has large profits, by trying to establish a film institute?

Well, the point is that the film industry never has done this. Many other nations, certainly the leading European nations, and countries behind the Iron Curtain, have film institutes. These film institutes are developing young talent that is very seriously competing with our films.

Now as we all know, leaving the arts aside for the moment, there is a very large amount of money that comes in from foreign exchange, which we need these days, and if the foreign countries develop this new talent as they have been doing, they can become very competitive. In fact, they are already becoming very competitive.

The problem is—and it really is a problem that goes all through every field of the arts—that there is a gap between the time that a person graduates from college or school, and becomes able to earn his living professionally. The top professional people in the film business feel it is very important to sustain and develop young talent. As I say, it goes through in the theater, literature, visual arts, and that is the real problem today.

MUSIC PROGRAMS AND ORGANIZATIONAL MATCHING FUNDS

Chairman HAYDEN. Thank you. I observe from your justification statement that the $32,000 programed for the International Music Council Congress will be matched by that organization. Are the other grants under your music program also matched by the recipients?

Mr. STEVENS. Well, sir, the law says that all of our grants to organizations must be matched, or we can make nonmatching grants to individuals. Now, in one case, we have a music project for young soloists. We would make the grants directly to them. In the case of a master chamber orchestra, as listed in our justification, it will be necessary for them to match that grant, but they can do it, out of both funds they get elsewhere, or from receipts. As I say, the law calls for all grants to institutions to be matching.

MASTER CHAMBER ORCHESTRA

Chairman HAYDEN. I see. On page 25 of your justification statement you set forth a budget of $800,000 for the master chamber orchestra, and indicate that the arts endowment's share of this budget is $400,000. Who supplies the remainder?

Mr. STEVENS. That, as I say, is the case of an organization. They have to either get the money from private individuals, foundations, or they can use receipts, as a matching basis.

LABORATORY THEATER

Chairman HAYDEN. For the laboratory theater project, a budget of $500,000 is indicated. Would you please describe this project for the committee?

Mr. STEVENS. Yes, sir. I mentioned it several minutes ago. That is the project that we started last year in New Orleans and Providence, which is to bring live theater as a teaching instrument to the secondary schools. And I mentioned before the success we are having with that program.

Chairman HAYDEN. Where do you propose to finance a new theater which you indicate will be funded, and the possible new theater which may also be funded?

Mr. STEVENS. We approved two laboratory theater projects for this year. The Office of Education, which cooperates with us on these projects, chooses the locations. They chose Providence and New Orleans, and as I understand it, they have a tentative approval for another project in Los Angeles. Actually, the local school boards concerned applied for the funds to pay for the performances. We in the arts endowment put up the preproduction money, but they buy the performances for the children, and so when they have approved a location, then it is our duty to try to supply the schoolchildren with the finest possible productions.

The total request involved here is $500,000. The two projects in Providence and New Orleans were funded by us at $165,000 each. It may well be possible to curtail these amounts during the second year of the projects in these two cities because of increasing community interest and the possibilty of gaining community funding. We would like to see these theaters, begun in areas where they were needed and where they would not compete with local groups, continue until they are self-supporting. We believe this would be a great advantage to the cities involved. If it is possible to enlist sufficient community support in Providence and New Orleans, we would be in a position to fund a fourth laboratory theater project in 1968. We mention this in our justification. There has been, as I say, great interest in this program in other parts of the country, and we would like to see it expand. We consider its beginnings highly successful, particularly for young people, but it also provides the adult community in the cities involved with the opportunity of seeing evening and weekend performances of top theatrical quality at reasonable prices.

In sum, we would like to continue the two projects that we are already doing for another year, along with the project in Los Angeles, and possibly in a fourth city.

DANCE PROJECTS

Chairman HAYDEN. Do I understand that the $250,000 which you have programed for grants to major dance companies is to be available but the grantees have not yet been determined?

Mr. STEVENS. No, sir; there is a dance panel meeting on March 22 and 23 to make these determinations. Our dance programs have received most favorable publicity in the press. It is a field that is very short of money. It is developing fast, and, as I say, we have aided two known companies. We have given support to choreographers. As is the case with all of our grants, we try to work with the leaders in the field, and take their advice, as to what we should do, and how we should make the grants. As I say, this dance panel meeting will take place shortly, and I will be glad to forward to the committee the choices.

ARTS IN DISADVANTAGED AREAS

Chairman HAYDEN. What is equal creative opportunity project?

Mr. STEVENS. That is a project in accord with the belief that there is a great deal of creativity among the poorer people and the disadvantaged. For example, we have supported a project in Watts, under the auspices of Budd Schulberg, after the riots last year, in which he has found that there is a great deal of writing talent in that area. He is, of course, a well-known novelist.

There is a great deal of writing talent available in these poor areas, and it does not get a chance to be discovered. Last year we made a grant to help him in his work of giving disadvantaged people a chance to prove themselves.

In fact, studies show now that creativity has less a correlation with IQ interestingly enough, than had been thought. From what I am told, if you have a very high IQ, you are not necessarily creative. A lot of people think that there is a great deal of creativity that does not come to the surface for many reasons. We know this applies to people in the poor areas, and we are doing small experiments in that line.

MUSEUM PROJECTS

Chairman HAYDEN. Can you tell us now which museums will be assisted in your "Museum projects" item, for which you ask $220,000?

Mr. STEVEN. Yes. Part of it will be to continue projects that we have been working on already, where we have made grants to three museums: one, in Detroit; one in Fort Worth; and one in Boston.

The purpose of these grants is to develop ways and means of taking the arts out to locations away from the museums, and also to try to develop a means of making the resources of the museums available to more people by bringing people into museums, so we can set up a program that will help the museums grow, and help educate the many people that do not now use the great resource we have in museums.

GRANTS TO PAINTERS AND SCULPTORS

Chairman HAYDEN. How will you divide the $225,000 proposed for grants-in-aid to painters and to sculptors?

Mr. STEVENS. Well, last year we made 60 awards, many to younger and lesser known sculptors and painters. For next year the number would be more limited. We are planning approximately 45 for next fiscal year.

NATIONAL DESIGN INSTITUTE

Chairman HAYDEN. Please describe the National Institute under the section of your justification entitled "Architecture, planning, and design," and indicate whether the $150,000 requested is the total amount which will be necessary.

Mr. STEVENS. I would like to have Mr. Spreiregen, our Director on Architecture and Design, answer that question.

Mr. SPREIREGEN. Well, Mr. Chairman, at this time, we are in the midst of a very detailed study to determine what should be the role and objectives of a National Institute for Design, and in doing this, we are talking with the leading architects, city planners, landscape architects, industrial designers, and interior designers of the country, to find out the need for such an institute, and what this role might be.

So far, we have found that there are four quite deserving areas of activity for this institute, one being the support of professional education; one being the support of research and development; one being the improvement of public information; and one involving experiment prototypes in various kinds of design projects.

The $150,000 that we have asked for is to begin the institute next year. We want to begin it modestly, because we want to learn our way as we go.

AMERICAN FILM INSTITUTE

Chairman HAYDEN. Who will provide the matching funds for the American Film Institute?

Mr. STEVENS. Hopefully, the foundations and the film companies themselves. There has been indications that there will be funds forthcoming, because other people, even the film industry itself, now, is beginning to see the necessity of a film institute. Our film advisory group is in contact with several of the large foundations to get the matching money, because in this case it is necessary to have matching money before we can start.

AMERICAN LYRIC THEATER WORKSHOP

Chairman HAYDEN. The American Lyric Theater Workshop which you propose to fund at $300,000 is now in existence. Would you please describe this project and indicate how long it will be continued?

Mr. STEVENS. The project has been in operation this year, and would operate for another year, as far as the Council is concerned. Mr. Jerome Robbins, who is regarded as the outstanding choreographer and director of dance and theater in the world, literally, came to us a year ago, and said that he felt a necessity for new art forms in the theater—new development. He agreed to work without any compensation for 2 years, and being one of the most highly paid men in the industry, he was sacrificing a great deal of money to do this.

What he felt was that to develop this new form of theater he needed to be like a scientist who could experiment with actors, dancers, musicians, and composers, and the like. There are severe limitations in commercial theater today, where they need the complete script when they go into rehearsal.

Otherwise, they would literally bankrupt themselves. Mr. Robbins wanted the chance to experiment and to develop a new theater art form. What it really amounts to, fundamentally, is that he expects to be able to use music and dance to advance the story line, as it is technically called.

If any of you saw "West Side Story" this was what was called a breakthrough in that field, because dance was used to advance the story line.

As I said before, he hopes to combine dance and music, and come up with a new form of entertainment. Now, because he is such a genius, the Council unanimously felt that this was the kind of project we should do, because there would be no private groups that would undertake such a project.

FUNDS FOR STUDY AND EVALUATION

Chairman HAYDEN. Included within your $5 million estimate for activities under section 5(c) of your act is $250,000 for individual grants and special research grants to institutions for specific study, information, and research projects. I understand that this will meet the costs of the National Council on the Arts which was transferred to the Endowment for the Arts. My question is this: Is the $250,000 to be in addition to the 3 percent of section 5(c) funds requested for "Program development and evaluation"?

Mr. STEVENS. They cover two different aspects. One is a study to see what kinds of projects the Council should enter into.

Take the case of the Film Institute, that I just mentioned. Because there was such a large industry, and there were conflicting groups, we felt that by hiring an independent group, namely, Stanford Research, which wasn't involved in films themselves, they could study the project without any prejudices. We felt that after their study was ready, and it is nearly completed, we would then be able to make intelligent decisions in going forward with the Film Institute. We felt that is the case in a number of fields, in which we want to enter.

EVALUATION

But in terms of the 3 percent, that is an evaluation situation. To give you an example of that, we have made grants to a number of community theaters. There were some that we weren't able to make grants to, through lack of funds. We feel that before we go forward and make any more grants, that the program should be evaluated. An independent critic is now visiting all the theaters we made grants to, and some that we did not make grants to, so that we could have a report, as to whether our program was working the way we hoped it would, and from an outside source.

As I said before, we are mainly supporting pilot projects, and trying to see whether they are worthwhile. Hopefully, the foundations and private individuals, if we can demonstrate to them the needs in this field, will carry on with the projects, rather than us. And that is what that 3 percent is for. It is to evaluate.

AID TO STATE ART AGENCIES

Chairman HAYDEN. Have you disbursed the total amount thus far appropriated for assistance to States?

Mr. STEVENS. Mr. Mark, how do we stand on our assistance to States?

Mr. MARK. We have to date disbursed all but $235,000 of the $2 million appropriated. I have requests right now that I am processing for another $37,000; so within a week, we will have left $197,986, to be called for.

STUDIES

I anticipate that this money will be called for within the next month, because, as you know, we funded studies first for a number of these States, and these studies are just beginning to come in now. They are just beginning to complete them, and then they can call on a limited amount of matching money for this year, which is about $12,000.

PROGRAMS

Most of the moneys left are for States which have done the study first, and have not asked for their program funds to date. Altogether 14 States are involved. Six States have asked for part of their matching program money. They are just getting started, and eight are just completing their studies.

Mr. STEVENS. I might add, Mr. Chairman, if I might, that last year, because of the cut in the amount that has been authorized, from $2,750,000 to $2 million, there were a number of States that wanted and felt they could match more money, but could not do it because we just didn't have the money to give them.

APPROPRIATIONS EQUALLY DIVIDED AMONG ALL STATES

Mr. MARK. As the act reads, "All sums appropriated must be equally divided among all States," so that any amount less than $2.75 means a cut in appropriations for all the States. There are 55 entities defined as States. That number divided into the requested amount means $50,000 for each.

Chairman HAYDEN. Senator Bartlett.

Senator BARTLETT. I have just a question or two, Mr. Stevens.

Mr. STEVENS. Yes, sir.

STATE AGENCY INCREASE

Senator BARTLETT. You mentioned that each of the States now has a unit, and wherever the American flag flies beyond their shores, there is likewise a unit. Did these all come into being, or most of them, following the Federal action?

Mr. STEVENS. I think it is fair to say that most of them did. How many art agencies were organized, Mr. Mark?

Mr. MARK. Actually, in terms of having an active program organization, there were approximately four before the act. There were some that were on paper, you might say, some groups meeting, which weren't really organizing anything that was substantial or functioning as they now are. So we have gone from about five to 54, in a year.

Senator BARTLETT. The four aside from the States being Puerto Rico, Guam——

Mr. MARK. Puerto Rico, Guam, Virgin Islands, and the District of Columbia. American Samoa is the last unit, and they haven't come in yet.

Senator BARTLETT. We have got the Trust Territory to deal with, too.

Mr. MARK. That is not in the act.

Senator BARTLETT. Not in the act. It should be.

Mr. MARK. Yes.

AMERICAN FILM INSTITUTE

Senator BARTLETT. I would be interested if you would explain a little bit more, Mr. Stevens, about the Film Institute.

Mr. STEVENS. Well, as I mentioned before, from the very start of the activities of the Arts Council, the members of who were professionals in the field felt that it was most important that a film institute be started in this country, so that there could be a training program to cover the period when young people were leaving universities, and before they could earn their living as professionals. There is a gap there of training that is badly needed, and many of the professional photographers, directors, and writers have, through their organizations, volunteered to give a certain period of their time to help younger people get trained, if a film institute could be formed.

European Film Competition

Where it will be located, one does not know, but it could either be in Washington, New York, or Los Angeles. The need is there, as is evidenced by the fact that many foreign films are penetrating our market, and they are doing a great deal of business, from a practical dollars-and-cents point of view. It is felt that because it has been hard for people to break into the business, and because younger talent is neglected, that something must be done to keep even with the competition of European films.

Training Program

Senator Bartlett. The basic purpose of this, then, will be to produce original films?

Mr. Stevens. No, sir. The basic purpose will be training.

Senator Bartlett. Training?

Mr. Steven. Training for individuals in every facet of the films. In the educational field, actors, directors, and also documentary film people. Our film advisory group has worked very hard. The Stanford research group have interviewed leaders in film institutes abroad, and they have also interviewed approximately 125 well-known individuals here, in every facet of the film business, so that it has been a very thorough and exhaustive study. At the same time, many leaders of our film industry have given a great deal of time to it.

Anticipated Film Industry Funding

Now, there has been some discussion that if this film institute is formed, and it gets into operation, that some of the major film companies might make available funds for the best students in the film institute to try to make some new films, but that is in a hypothetical stage. But like everything else, there gets to be a time when somebody has to take action, just as a doctor becomes an intern, and then he becomes a resident physician, but eventually, he has to perform that first operation.

To make it really succesful, however, I hope that there would be funds available for the more talented people to develop films of their own, or produce films of their own.

Senator Bartlett. That is to say, during the course of this training, if it happened that a brilliant film were produced, it would not be thrown in the ashcan.

Mr. Stevens. No, sir.

Study Cost

Senator Bartlett. What was the fee paid or what will be paid to Stanford research for this?

Mr. Stevens. As I recall, it was $91,000. We allocated $100,000, but it came in at $91,000.

ALASKA ARTS AGENCY

Senator BARTLETT. Going back to the State art councils, and I want to say that there is a very active council in Alaska, principally due to the inspired leadership of Mrs. William Emmal. The activity is going to peak very soon because this is Alaska's centennial year, and the arts council work is going to play a very great part in the centennial celebration.

NONCORRELATION OF IQ AND ARTS CREATIVITY

You interested me very much, Mr. Stevens, when you said that there is no necessary relationship between the IQ and creative ability. How extensive have these studies been? This opens up a delightful prospect.

Mr. STEVENS. Well, it is a fascinating concept, Senator. My knowledge of this, of course, is very limited, because it would involve a project more perhaps in the humanities than in our field. Mr. Calvin Taylor, from the University of Utah, is one of the people that has done a great deal of work in that field, and don't misunderstand me. Just because a person has a high IQ doesn't necessarily eliminate creativity. But they have found that the correlation, especially in the higher IQ's, it is not necessarily running along parallel on the graph, as you would expect, to creative ability.

COOPERATIVE STUDIES

I would hope, and I think I can speak for Dr. Keeney, that he and his council and our council might cooperate someday in doing further studies, because I think there is a feeling that there is a great deal of creativity which now is lost. There is a foundation, I think it is the Richardson Foundation, that has been financing Mr. Taylor on these projects, but their fundamental application is for industry, rather than for the arts and humanities. We are watching these studies, however, and maybe we can join in with them some time in the future, don't you think?

OVERRATED CORRELATION BETWEEN IQ AND ACADEMIC PERFORMANCE

Mr. KEENEY. I would like to join in on some study of creativity. I am not convinced yet that that is the best means to do it.

I might add, sir, that the correlation between IQ and academic performance isn't as high as it is generally thought to be, either.

Senator BARTLETT. Well, I will conclude by saying that what has been related by both of you on this subject today ought to command all the headlines in all the papers tonight and tomorrow morning throughout the United States, but it will not.

Thank you very much.

Mr. STEVENS. Thank you, sir.

NATIONAL ENDOWMENT FOR THE HUMANITIES

Chairman HAYDEN. Now, Dr. Keeney, would you please file such written statement as you have for the record, and highlight it for the committee?

Mr. KEENEY. Mr. Chairman, I appreciate the opportunity to appear before this distinguished subcommittee. This is Mrs. Hardy, who is director of the planning and analysis staff, and Mr. Edgerton, the deputy chairman, on her right. Dr. Redding is director of the research division. Mr. Walker is director of the education division, and Mr. Blessing is director of the fellowship division.

PREPARED STATEMENT

I will file my statement for the record.

(The statement follows:)

First I shall speak very briefly of the mission of the Endowment for the Humanities. Historically, societies, including our own, have attempted to solve their practical and political problems before spending much of their national energy or resources on their intellectual and esthetic problems. Our own society is a partial exception, since the leaders who established our independence and our government were well versed in the humanities, especially the ancient classics, history and political philosophy, and drew many of their examples and much of their wisdom from that study. The enduring nature of our Constitution is a monument to their experience, which taught them what was expedient, and their studies of history and philosophy, which taught them what was right. That the Constitution is both expedient and right is the reason it has endured.

In the second half of the 19th, and the first half of the 20th Century, Americans and their educators became preoccupied with the need for technological knowledge and skill for use in the material development of the country, and in so doing, they and we often lost touch with the humane subjects as a forming element in real life. Decisions came oftener to be made on the basis of expediency rather than of value and ultimate considerations. What appears to be expedient often turns out to be the opposite, often because it is not right.

There have been many efforts to encourage the return to study of values through the arts and humanities, but it was not until the last Congress that the Federal Government began to take an active part. Historically, the difficulty is that often it is too late when humane knowledge is applied to practical problems. Justice, for example, which our society has sought ever since its inception, is a very practical problem. It is also an abstract problem and has been the preoccupation of every philosopher from Plato on, and of every political theorist. It is also an historical problem, for the various efforts of societies to secure justice are illuminating and often useful in a contemporary framework. It is important, therefore, that as our society seeks justice it draw not only upon the practical experience of case and statute law but upon the history of previous efforts and on abstract thought about the nature of justice itself. This I think is an illustration of what the Humanities Endowment is about and of what its purpose is. It is intended to improve the study and the teaching of literature, of philosophy, of history, of art, and of the social sciences in order that our lives may be enriched thereby, but I think, more importantly, so that we may lead our lives better as individuals and as a society, and that we may make our decisions thoughtfully. Ultimately, the purpose of the Endowment is to facilitate the use of human knowledge in decision making, both public and private.

In its effort to carry out its mission, the Humanities Endowment has established three principal programs. One of these is to improve the quality of practicing humanists through fellowships, which are intended to give them opportunity to develop; the second to improve the amount and quality and understanding of humane knowledge through grants for research: and third, to improve the presentation of the humanities both in school and out, in order that we may have better understanding and better use of these essential subjects which contain much of that which makes our lives worthwhile. It is our aim to find ways in which innovative programs may be launched and evaluated. However, innovation without subsequent development of successful programs is dangerously frustrating. It is important that we build upon our successful program sufficiently to make a real impact.

FISCAL YEARS 1966 AND 1967

In fiscal year 1966 the Endowment planned its program, but made very few actual grants. (Indeed, only $39,000 was formally obligated, although an additional $500,000 was specifically designated in FY 1966 for grants to be made within various program areas shortly after the beginning of the 1967 fiscal year.) In effect, therefore, the Endowment entered the present fiscal year with virtually the total fiscal 1966 appropriation of $2.5 million unobligated; this amount, combined with the fiscal 1967 appropriation of $2 million, gave the Endowment a program budget of approximately $4.5 million with which to operate in the present fiscal year. The Endowment had obligated most of this program budget by February 15 of the present fiscal year. Staffing proceeded rather slowly, but is now virtually complete.

We have awarded 287 fellowships, with a total expenditure of $1,900,000. Of these, the 57 senior fellowships were awarded to a group of scholars who are likely to make important contributions to knowledge. The 100 postdoctoral fellowships for younger scholars as well as the 130 summer stipends are intended to be spread as broadly as possible geographically and among institutions. These latter two have about tripled existing opportunities for young scholars. Through these three programs we have made grants to individuals in 187 institutions in 44 states and the District of Columbia.

In the research program we attempted to select from the many proposals made to us those that were most promising in terms of the caliber of the investigators and the quality of the material to be investigated. We have deliberately emphasized American studies, feeling that these subjects would have the most immediate relevance to the problems that face the Nation. Many of the grants, and more of the applications, were to support work that is essential for further progress in the various fields such as bibliographies, dictionaries, and other aids to scholarship. A major grant was made to the Modern Language Association to fund its Center for Editions of American Authors, which prepares definitive editions of great American authors whose works are now in inaccurate text. The editorial work is by established scholars, who use and thereby train younger humanists. About twenty such volumes have appeared. These are important for scholars investigating the thought of the writers. They are important for students in colleges and schools, and they will be important for a wide segment of the general public when they find their way into inexpensive but accurate reprints at no further expense to the government. Thus, this grant summarizes the three purposes of the Endowment—to develop humanists, to increase humane knowledge, to disseminate it through teaching to students and to make it available to the American public. In general, the quality of the research proposals supported is good and some, like the Editions of American Authors, will very quickly have an effect upon national thought and life.

The programs of fellowships and research grants bear initially on scholars and ultimately on all of us. The program to present the humanities to students and to the public, to improve their understanding and their knowledge will ultimately depend upon them, but cannot await their results. Therefore we have attempted in this program to select areas that were not adequately covered by various other Federal and private programs of support of education, to find new areas for improvement, and to set up pilot and experimental programs in the hope that they will produce worthwhile opportunities for other agencies as well as for this one.

Roughly speaking, this program can be divided into two parts: that which is conducted in schools and that which is conducted outside of schools. We aim to encourage colleges and universities to cooperate together to improve mutually their resources and instruction in the humanities and social sciences. In the schools we have attempted to tie together universities and school systems, and to encourage the dissemination into actual teaching of some of the excellent research that has been done. Related to but not within schools, we have set up a program in two depressed communities to encourage exposure to good books for school children who are not accustomed to good books at home, using parents and college students as tutors.

For the public, most of whom are outside of the schools, we have attempted to improve the resources of museums by setting up programs to improve their management and to train their personnel. Over 300,000,000 Americans visited museums last year, and learned something about their past in that way. At the last count there were 5,000 museums in the United States, and they are growing at the rate of over 100 per year. They are a great resource for public education and understanding, as are the local historical societies for which we have similar programs. Most museums and historical societies need better trained personnel, and more financial support. We have concentrated on the first need, for personnel, anticipating that better staffs will make the museums even more interesting, and attract more private support.

A great deal of attention has been paid to educational and instructional television during the past year. In our appropriation for this year was $100,000 for a study of educational television. We proceeded with caution until we had a general idea of the substance of the Carnegie Report. We have made one grant of $100,000 to underwrite a study, by competent persons in the field, of the present quality of presentations in the humanities on instructional television, to suggest ways in which the presentations can be improved qualitatively, and to produce and broadcast model presentations of humanistic content of exceptional quality.

In order to call the attention of the school systems to the great resources that are available to them in the colleges and universities, and to call the attention of the colleges and universities to the great opportunities that are open to them in the school systems, we are proceeding now to set up a humanities "faculty" available to those school systems of the nation desiring it. It will consist of distinguished teachers of the humanities from universities who will each spend a couple of months visiting school systems and working with the teachers, and perhaps with the students. We hope that we will be able to find private support for this program from the unrestricted gifts we are seeking, so that the Endowment may draw upon the undesignated funds to be made available if they are matched. We expect that if this program is successful the schools will pick up most of the cost, and that close associations will be formed among clusters of colleges and universities on the one hand, and of school systems on the other.

In order to draw attention to the condition of the teaching of the humanities in the schools and the need for their improvement, we plan likewise with private support to set up a commission to study the humanities in the schools to make recommendations for teaching them more effectively, in order that they may focus the attention of the nation on what is done and what needs to be done. In this effort the U.S. Office of Education and the Arts Endowment will cooperate.

A final example of our educational program is in the area of talking books for persons who are not blind, for which we received an appropriation of $100,000 in fiscal 1967. Many patients in hospitals are fully in possession of their mental faculties but are unable to read because of physical disability. Many hospitals have internal radio circuits over which music of various quality is transmitted to the patients and which could be used for recorded books. We have made a grant to Recordings for the Blind, by which they will produce perhaps as many as a thousand titles on recordings. They have made arrangements with four large hospitals of various types to make this material available to their patients, sometimes by internal radio, sometimes by tape recorder, and in one hospital by cartridge tapes, which RCA will record and lend to the hospital together with players for the tapes. We have planned for an evaluation of this program in order to determine whether or not it is worthwhile to enlarge but we do not expect to continue major activities in this area because of the recently enlarged mandate to the Library of Congress by legislation which now permits them to prepare talking books for persons who are not blind. Moreover, we anticipate that this program will be continued by private donors to hospitals if it is successful. Since many of the titles recorded will come from works edited as a result of our grant for editions of American authors, this grant will further amplify the public effect of humane scholarship.

We have faced a major problem of selection this year in all of our programs. The number of applications suitable for grants has substantially exceeded the number of grants our funds permit us to make. In order to make our selections we went through these steps: First, there was a staff examination and discussion within the staff as a whole of various proposals. Those for which no programs were funded were eliminated at this stage. Then we assembled panels of experts and submitted the proposals to them for their recommendation. Since most of the panels recommended more grants than there were funds, further staff work was necessary. Finally, the recommendations of the panels and of the staff were submitted to the National Council on the Humanities, which advised the Chairman in each case, and the grants are being made on that basis. It is clear from the applications that there are significant opportunities for further support in these and other areas.

REQUEST FOR 1968

For fiscal 1968 we have requested the full authorization of $5,000,000 under section 11(a) for carrying out the purposes of section 7(c) of P.L. 89-809, and, together with the Endowment for the Arts have requested $2,000,000 under section 11(b) of the same act. In addition, we have requested somewhat larger administrative funds. We have had great difficulty administering this year's program with the staff now authorized, and it has been impossible to investigate applicants on the spot with the travel funds available. Both for evaluation of applications and for evaluation of the success of grants awarded, staff travel is essential.

For the program to develop individual humanists through fellowships, we ask $1,950,000, which is $50,000 more than is available this year. This program has great promise as a means of developing larger and better resources of highly trained humanists for this country and providing humanists with greater incentive and opportunity to excel. Eventually we should like to expand it considerably, but the opportunities in research and education are so great that this amount seems a reasonable share of the total funds. We anticipate no major changes in the program during fiscal 1968 except those suggested by the experience of 1967, but we shall be examining other possibilities during the remainder of this year and beginning of next year. For example, considerable numbers of very competent humanists take positions in academic administration, or outside of education entirely. After a decade or so, sometimes less, sometimes more, many of them wish to return to teaching. If they have been out of teaching for more than five years, they are in fact obsolete. We believe that it would be a useful and economical device to provide a few of these people each year with funds for six months to a year of intensive work to start them off again as teachers and scholars.

The research program has available this year $1,508,000. For next, we wish $1,750,000, an increase of $242,000. We anticipate a much greater volume of applications resulting from an earlier announcement and better knowledge of the Endowment. We already have some very interesting applications. Since many of our grants will result in publication, we wish to make a modest beginning of support of publication for the already heavily burdened nonprofit university presses, but no major program of that sort can be expected with authorized funds. We have made this year a number of grants for the use of the computer in humane research. These are mostly probes to determine fruitful areas. We hope that we will be able to find more sophisticated ways in which the computer can be used in the arrangement and retrieval of humane knowledge so that it may be more quickly available and more readily useful to those who require accurate and rapid digest of what is known, and equally important, what is not known.

For the improvement of understanding of the humanities in and out of the schools, we have asked for the largest increase, bringing the total to $1,150,000, as against $832,000 this year. This increase of $318,000 results from an effort to achieve better balance among our programs, and is based upon the experience of this year, which indicates that there are many formal and extramural educational activities that are not now adequately supported, and which may be started with great profit. It is our desire, in the educational area, to get things started and to demonstrate their worth in the hope that other funding agencies, both governmental and private, as well as colleges and universities and school systems, will take over a good deal of their support. We shall continue to attempt to get the best innovative work in elementary and secondary education into wider use, and to tie more closely together universities, which are the sources of teachers and of knowledge, with school systems, which use both. Again, if we can establish useful devices, which are accepted by the public and private agencies, we are ready to turn tested programs over to them. We hope, further, to encourage the cooperation of groups of colleges and universities more economically to use their scanty human and financial resources in the humanities, and we are particularly anxious to find ways to assist the community colleges to develop a program of instruction in the humanities which will be a worthwhile educational experience in itself, and at the same time relevant to the many vocational programs conducted in community colleges. We hope, in a small way, to encourage at all levels of education innovation and experimentation.

We believe that the program that we have launched in museums and historical societies is the one which will have the quickest impact on large numbers of Americans, and we wish to continue that. In communications, i.e., journalism, radio, television, and film, we shall seek to find ways in which to bring the best humane knowledge and resources to bear on the education not only of school children but of the adult public. Here again, we can only hope to serve an innovative function. Finally, we are anxious to continue our study of the desirability and feasibility of a center for the humanities and social sciences, where scholarship and action would be brought more closely together, hopefully to the mutual benefit of both.

In the course of the remainder of this fiscal year and the beginning of the next, we shall plan and test procedures to determine the effectiveness of grants made in the various programs. We shall seek to evaluate the concrete accomplishment in the individual grants, and of the grants collectively, to assess the importance of the work done through grants made, both in terms of other possible grants and in terms of different levels of funding of the grants.

Of particular importance in the accomplishment of the evaluative task is the appropriation requested for planning and development in the final section of our budget submission. We have asked for $150,000, in order that we may test programs which we have not yet formed and so that we may adequately evaluate the worth of existing programs. This relatively small expenditure should result in the elimination of waste by pre-testing and thorough investigating of ideas for programs.

The programs of which I have spoken are described more fully in the appropriations request.

May I state again the meaning of the humanities and the arts. It has often been said that civilizations and societies are remembered, not for their acts and their power, but for the ideas they leave behind them in their literature, their philosophy, their art and their laws. These are the things that give life its quality. We owe it to ourselves to create a high civilization for our own enrichment and to leave its monuments behind for our posterity.

RESPONSIBILITIES

Mr. KEENEY. The Humanities Endowment is charged with the development and the promotion of literature, history, philosophy, history of arts, and those other subjects that relate to the acts, the beliefs, the speculations, the judgments, and the aspirations of man in the past. Though they are in the past, they shaped and illuminate the present. It is our constant effort to bring the wisdom of the past and the experience of the past into the present, to help make the great decisions that lie before us.

For example, the achievement of justice for all has been one of the major preoccupations of the people of this country since our settlement. It has also been a preoccupation of all the great civilizations of the past. And one can illuminate his thinking about justice through the study of philosophy, through the study of history, through the study of law, political science, and, hopefully, may more frequently make a just decision.

NATURE OF PROGRAMS

We have three broad programs aimed at this objective: One is to improve humanists through the award of fellowships at the postdoctoral level; the second is to increase knowledge through the award of research grants; and the third is to use this knowledge and to use these people through the better development of teaching of the humanities.

APPROPRIATIONS

Our appropriation for fiscal year 1966 was $2½ million. Since the Endowment was not fully organized at that time, only $39,000 of that was obligated at the end of the year, so that there was almost a 2½ million carryover.

You appropriated for this year $2 million, and we had, therefore, in all, about $4½ million to spend this year. We have committed all of this, excepting for $396,000.

DISCUSSION OF PROGRAMS

We have achieved a broad spread in our fellowship program, which we have prejudiced in favor of the smaller institutions, rather than permitting the fellowships to cluster in a few universities as most fellowship programs do. Nevertheless, we think we have achieved a very high quality of choice.

The range of research grants is very wide, and again, they have been awarded to various kinds of institutions.

The probing and innovative activities of our educational program are intended to find better ways to do better teaching, whether it is to people in schools or to the general public. For example, we have within our public programs a museum program. Each year, 300 million people in this country are estimated to visit museums, and we are spending this year about $300,000 to improve the personnel of those museums.

DOLLAR VOLUME OF APPLICATIONS AND GRANTS, FISCAL YEAR 1967

We had requests for grants totalling $53 million by 1,500 applicants.

We have awarded $4.1 million to 414 applicants in 46 States and the District of Columbia.

APPROPRIATION REQUEST FOR FISCAL YEAR 1968

Our request for 1968 is for our full program authorization of $5 million, which is $500,000 more than we actually had this year. We also request a small increase in the staff.

In the fellowship program, we would like to increase that to the extent of $50,000. We would like to increase the research program by $240,000, the education program by $318,000, since we are finding new ways to approach that, and to decrease the planning and development activity by $110,000, in order to carry out these programs.

I should have said, sir, that the $396,000 of fiscal 1967 funds that we have not yet committed for obligation will be committed, and probably completely obligated, by the end of fiscal year 1967.

Mr. Chairman, I believe, and Congress declared when it passed this law, that the humanities are vital to our society, not simply to make it more elegant and pleasant, but to make us wiser, so that we may carry out our responsibilities well, and make decisions that are right and just, as well as expedient.

Thank you, Mr. Chairman.

TOTAL OBLIGATIONS AND EXPENDITURES

Chairman HAYDEN. Will you please provide for the record the total amount which the National Endowment for the Humanities has obligated during its existence?

Mr. KEENEY. Yes, sir. We have obligated $809,474, and an additional $3,292,762 is currently in the process of obligation; that is why I spoke of $4,102,236 as in effect obligated.

Chairman HAYDEN. Also, please submit the total amount which the National Endowment for the Humanities has actually expended thus far.

Mr. KEENEY. As of March 8, $496,410.

SPECIFIC FISCAL YEAR 1967 APPROPRIATIONS

Chairman HAYDEN. Last year, the Congress indicated specific amounts which you could distribute among five different activities. Would you review briefly for the committee your programs under these activities, including, of course, the reprogramings which have been approved by the Appropriations Committees?

FELLOWSHIPS

Mr. KEENEY. Yes, sir. The first activity was $750,000 for 100 fellowships to younger teacher scholars. Second was $300,000 for 200 summer fellowships for scholar-teachers in the same age bracket. The third was $750,000 for 50 grants to senior scholars.

I wrote the distinguished chairman of the committee on January 20, requesting reprograming to change the first figure, the hundred fellowships for younger scholars, to $860,000, reduce the number of summer fellowships to 130, and the amount to $250,000, to increase the number of grants to mature scholars to 55 or 60, and the amount changed to $790,000.

This was on the basis of experience with the applications. The cost of some of the programs was higher than we had thought. That of the other, lower.

Chairman HAYDEN. To my recollection, the committee approved that.

Mr. KEENEY. Yes, sir; and I thank you.

These fellowships have all now been awarded.

EDUCATIONAL TELEVISION AND RADIO

Then we had $100,000 for educational television and radio, which we granted to the WGBH Educational Foundation of Boston, to assess the present quality of humanities programs on instructional television, to indicate ways in which these might be improved, to make model presentations of the highest possible quality available through a national competition. We had no desire to duplicate the study that was in process by the Carnegie Commission. Their study dealt primarily with educational rather than instructional television.

We are not concerned with the technical aspects of television. We regard it and the other media simply as we regard print. It is a way of presenting the humanities to students and to the people.

"TALKING BOOKS"

The fifth and final program for which the committee appropriated funds is the talking books program, through which we have made a grant of $100,000 to Recordings for the Blind, to set up a pilot study at several hospitals in the use and value of taped and otherwise recorded talking books for patients who cannot read the printed book for reasons other than blindness; paralysis, for example. Participating in this study will be the Rhode Island Hospital, the Institute of Rehabilitation Medicine at the New York University Medical Center, Goldwater Memorial Hospital, Bellevue Hospital, and, hopefully, the Walter Reed Hospital.

We estimate that 1,600 books will be taped and made available in this way, in literature, history, philosophy, and the social sciences. These taped books will be made available to each of the hospitals, to play either by the bedside or over their internal radio systems to patients.

I have myself been in the position of these patients, and I think that if I had enough money and were in it again, and were subjected to the ordinary radio treat that you get, and had the alternative of listening to a good book read, that I might pay for part of the cost myself as a gift to the hospital. And I rather suspect that this program will become self-financing.

When the tapes are done, they will be given to the Library of Congress for duplication and circulation through its regional libraries. And since their recently enacted legislation enables them to broaden the distribution of talking books to a wider range of people, we will not continue this program after 1968. We do wish to participate in the continuing programs of the library, which is enthusiastic about our program, and which has been consulted from the beginning, feeling it would be very useful both to us and to them.

I would also say that one of the recording companies, RCA, learned about this through a conversation with me, and at their own expense, they are taping some of these volumes on the new cartridge tapes, and will distribute them to the hospitals.

RESEARCH AND PUBLICATION PROGRAMS

Chairman HAYDEN. With respect to your item for research and publication, I note a proposed $242,000 increase in the subitem "Support of Research." Would you please explain this activity fully?

Mr. KEENEY. Yes, sir. Much of what all Americans read and see on the screen or on the television set is based in the final analysis on basic research and in the humanities; for example, the historical presentations on television are based upon what scholars have found out about the ways of the past.

The presentations of dramas are likewise in part based upon the knowledge of how people behaved in the past. The same thing is true for historical novels, and, indeed, most books on nontechnical subjects.

EDUCATION AND BASIC RESEARCH

The education of all American students is affected profoundly by basic research in the humanities. A ninth-grade textbook in

American history has facts and interpretations in it. They came from the work of scholars doing basic research in the humanities, and in any given textbook, there is embodied the work of literally thousands of research scholars. Usually, the textbook writer gets at this work through a synthesis, made by a man who takes the research of several scholars, and puts it together. If we did not have basic research in the humanities, we would not have any accurate textbooks. We would instead be teaching from Hans Christian Andersen's fairy tales, which, by the way, were used in school when I was a boy.

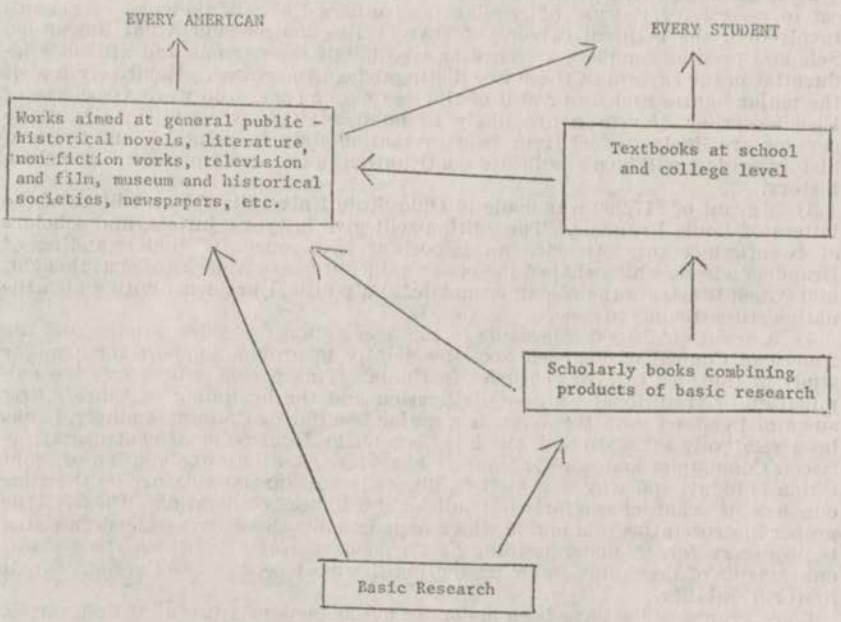
Chairman HAYDEN. Yes.

Mr. KEENEY. I have here a little chart, sir, which I would like to submit for the record, which shows how basic research affects scholarly works of synthesis, which affect textbooks, which affect every student. Basic research, through the various channels shown on the chart, affects television and radio and various forms of literature—reaching and affecting every American. And this, I think, shows rather neatly the place of basic research in the humanities.

Chairman HAYDEN. That will be included in the record.

(The chart follows:)

THE USES OF BASIC RESEARCH IN THE HUMANITIES



EVERY AMERICAN
EVERY STUDENT
Works aimed at general public - historical novels, literature, non-fiction works, television and film, museum and historical societies, newspapers, etc.
Textbooks at school and college level
Scholarly books combining products of basic research
Basic Research

FEDERAL SUPPORT OF BASIC RESEARCH

Mr. KEENEY. Now, we have figures which indicate that less than half a percent of all the money that the Federal Government spends on research is spent on research in the humanities. At present, the Federal support of basic research in the sciences totals $2.1 billion. In the humanities, it is less than $2 million. The private foundations, likewise, use a relatively small part of their resources for this purpose. Out of $281 million that the Ford Foundation spent in 1965, $824,000 was for humanistic research, and the same pattern shows up in other foundations.

I would like to submit for the record, sir, a description and explanation of a few of the research grants that we have made.

Chairman HAYDEN. That may be done.

Mr. KEENEY. If research grants are looked at separately, without looking at the whole picture, one may get the notion that they are trivial, and even frivolous. If you look at them as an effort to understand all of man's activities as they bear upon the present, I think you get a more clear picture.

(The explanation of research grants follows:)

RESEARCH GRANTS OF THE NATIONAL ENDOWMENT FOR THE HUMANITIES

1) A grant of $23,900 was made to the University of Wisconsin to support a study which proposes to examine systematically various historical examples of urban planning and urban design theories in order to arrive at a better understanding of what concepts of urban planning ought to be. In view of the growing Federal expenditure on urban problems, a grant to a distinguished scholar at a distinguished institution to attempt to find out what a city ought to be seems particularly appropriate.

2) A grant of $40,000 was made to the Columbia University oral history project to record for the use of scholars and others the reminiscences of persons involved in the political careers of Dwight Eisenhower and Adlai Stevenson. Scholars need as complete a record as possible of the persons and attitudes influential in the careers of these two distinguished Americans. Relatively few of the major figures and fewer still of the less major ones, who were associates of Eisenhower or Stevenson are likely to publish memoirs. Additionally, these persons are likely to feel freer in conversation than in print. Thus, the oral history project will be a significant contribution to the study of recent American history.

3) A grant of $17,200 was made to Ohio State University for an edition of the letters of Louis Brandeis. The edition will give lawyers, jurists, and scholars of twentieth-century America an important new source of understanding of Brandeis' views, which shaped in some significant areas American legal thought, and which illustrate the social, economic, and political problems with which the nation still attempts to cope.

4) A grant of $10,000 was made to the Association for Asian Studies and the American Council of Learned Societies jointly to provide support for a major study of the 14th to 17th centuries in China. This period, which was the culmination of traditional Chinese civilization and the beginning of China's first sustained contact with the West, is a major frontier of Chinese studies. It has been relatively little studied, but has become the focal point of controversy between Communist and non-Communist historians, since an explanation of what China is today, and why it is as it is, hinges in substantial measure on the view one has of what characterized traditional Chinese civilization. Clearly, the proper interpretation of a period which is undeniably the matrix of modern China is necessary for an understanding of the modern world in which the Chinese one-quarter of mankind is now presenting the most complex and serious threat to world stability.

Some grants which have been made are not as obviously useful at first glance, but they are in fact as likely to be useful in the long run:

1) A grant of $9,262 was made to the University of California, Santa Barbara, for support of a history of cartoons and comic strips. In illiterate or semiliterate societies, pictures with no words or few words are an important means of communication. Even in fully literate societies they are major sources of political and social comment. Thus, there have been front-page stories in most American newspapers about the comic strip published in Africa which deals with a super-woman who protects the "third world" (the African, neutralist

world) from the "evil machinations" of the great powers. Closer to home, there have been front-page stories about Al Capp's alleged satire of Joan Baez. When it is recalled that European and American society were semi-literate until the present century, and that some Americans still read the comics first, and then turn to the front-page news, an investigation of the history of this form of communication seems likely to provide new understanding of how they have affected and reflected public viewpoints.

2) A grant of $10,000 was made to the Institute of Medieval Canon Law for scholarly editions of the texts of the law of the medieval Christian church. These texts were influential in shaping attitudes of Western Europe toward many aspects of life that now have little to do with religion. (For example, the church laws relating to the taking of interest on loans were both argued for and argued against for centuries, and help explain the ambivalent attitude which many European nations had toward capital accumulation.) The church laws were useful to national governments as well, for they provided examples which the governments could borrow and put to their own use—this at a time when governments were groping toward some consistent way of organizing themselves. Not only did these texts help shape the civilization from which America primarily springs; they are also important in the immediate present, since the clearest possible understanding of them is important to an institution which is based upon them, yet which is in the process of dramatic change.

3) A grant of $25,000 was made to the American Oriental Society to help support the expense of holding the International Congress of Orientalists in the United States. One of the things for which this country is most criticized abroad is its lack of hospitality to international congresses of scholars, except in the sciences where funds are available for such meetings. We are, as everyone knows, engaged in a serious struggle with Red China. It is therefore important to us to develop the study of the Orient not only through support of American scholars, but through improving their relations with scholars of Oriental affairs in other countries.

4) Several grants were made to support archeological excavations. These grants were made in small amounts in areas where neither the National Science Foundation nor the Smithsonian Institution was able to provide support for various reasons. These archeological grants serve several purposes. They will increase our understanding of the remote past, but a remote past which shapes our lives. (The Greek and Roman view are still with us; and to a student Caesar is only slightly more remote than Hitler; and if we have no respect for the remote past, we shall have no respect for the immediate past—nor shall we learn from it.) They will train students in the classics to study and teach with greater knowledge and effectiveness. Perhaps above all, these grants pay the ultimate compliment to several of the nation's friends abroad. They say, in effect, to a foreign country, "This country and its scholars find your past interesting and important; they want to learn about you, not because of some sordid desire to use what they learn against you, but simply because what your country has contributed to the world is recognized as important by the United States." And since the scholars who carry out these archeological excavations have close ties with the scholarly communities in their host countries, they are paying the compliment to a highly influential group of foreign citizens.

SOURCE OF RESEARCH AND PUBLICATION FUNDS

Chairman HAYDEN. Were the funds expended for research and publication in fiscal year 1967 those included in the fiscal year 1967 appropriation or in funds made available prior to that year?

Mr. KEENEY. They were carryover funds from 1966, sir.

EDUCATIONAL PROGRAMS

Chairman HAYDEN. Please discuss the educational programs activity for the committee, indicating particularly the need for an increase of $318,000 over the amount which was available for fiscal year 1967.

Mr. KEENEY. Yes, sir. The reason for this increase is that we now have a sufficient staff and sufficient outside interest and applications to explore a range of suggested approaches to our mission, particularly through the schools. Up to now, we have stressed grants to individuals, since that kind of need was easiest to identify. We know that there is a great deal that we should and must contribute to restoring a sense of proportion to education, from the early grades through post-doctoral instruction, and we are probing to find out the best way to do it.

We would like to continue a few projects we have started in a small way. One of these is to send young university instructors who are very much research oriented into college teaching environments, where the emphasis is on teaching, to spend a year or so, in the hope that they will improve their teaching. Another is to improve cooperation between universities and colleges, and groups of colleges, which is very hard to do.

Then we would like to explore some new approaches, such as grants to departments and groups which have shown leadership in research and teaching, conferences to point out the most effective way to improve teaching in the humanities in the public schools and in the junior colleges, and trial programs in vocational, professional, and adult education.

EXPERIMENTAL EDUCATIONAL PROGRAM

By experimental programs, we mean some of the activities to which I have just referred—conferences, demonstration grants, pilot experiments, and other exploratory activities that will help us define our role and our function. We want to have some meetings and conferences to keep us honest; that is, to bring in outside opinions, so that we won't become hypnotized by our own ideas, which is a characteristic of foundation people.

We need to bring in imaginative people to advise us, without wanting anything themselves, and to stimulate us, and we don't want to abandon the role we have begun to exert on the humanistic quality of educational and instructional television, on the caliber of museum personnel, and on the content of recorded material.

Would you like me to give you a notion of one of the sorts of conferences that we would like to have, sir?

Chairman HAYDEN. Yes.

Mr. KEENEY. We would like to bring together various kinds of people who have ideas and experience that may be useful to us, and simply listen to them. We would like to bring together some imaginative teachers; some imaginative people who started to be teachers, and stopped; and some imaginative students who changed their fields, to see if we can get suggestions about how better the humanities might be presented.

Chairman HAYDEN. I believe that the experimental programs activity is a new one to be initiated in fiscal year 1968. What is planned under this activity?

Mr. KEENEY. This is the group of conferences of which I just spoke, and pilot grants and meetings with small groups of people from which to get ideas.

PLANNING AND DEVELOPMENT

Chairman HAYDEN. For planning and development in fiscal year 1968, you propose an appropriation of $150,000. I understand that this is in addition to the 3 percent of funds provided for activities under section 7(c) of your act for which you request legislative authority in order to devote the money to evaluation and program development. Please describe your expected activities.

Mr. KEENEY. This is the same money that is described in the two sections; 3 percent of $5 million is $150,000. We have just expressed it as an amount, as well as a percentage.

Now, here we intend to make thoughtful assessments of teaching of the humanities at various levels, studies that will suggest the dimensions of broad problems which face the educational community, and which will help us to plan our program in the broad context of national needs in the humanities.

MATCHING UNRESTRICTED GIFTS

Chairman HAYDEN. One item of the budget is $2 million to be available only for matching unrestricted gifts which are received during the coming fiscal year. For each of these endowments, how much in unrestricted gifts has been received?

Mr. KEENEY. Well, the Humanities Endowment has thus far received only token gifts, which are in lieu of honoraria for members of the staff who have spoken to groups that are unlikely to be applicants. We expect a substantial gift very shortly, which we intend to use to establish a commission on the humanities in the schools. This will seek to assess and define the proper role of the humanities in the schools, to identify general standards, and to find new ideas, which can really only be done by a nationally prestigious group. We have discussed it with the Commissioner of Education, who supports the proposal, and if I may, I will insert into the record a letter from him in which he endorses it.

(The letter follows:)

DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE,
OFFICE OF EDUCATION,
Washington, D.C., March 9, 1967.

DR. BARNABY C. KEENEY,
Chairman, National Endowment for the Humanities,
Washington, D.C.

DEAR BARNABY: Recently you asked for my opinion on the advisability of establishing a Commission on the Humanities. I feel that such a Commission could be of value generally, and particularly helpful to the Office of Education.

As you know I believe that the humanities should play a significant role in raising the level of educational effectiveness. The contributions which a Commission on the Humanities could make to this goal would be of great assistance.

If we can be of help in developing your plans, please let me know.

Sincerely yours,

HAROLD HOWE II,
U.S. Commissioner of Education.

GIFTS EXPECTED

Mr. KEENEY. We expect other substantial unrestricted gifts which will permit us to support programs which we cannot from our basic appropriations, and which are compatible with the purposes of the endowment.

One of these programs, we hope, will be the establishment of a national humanities faculty for the schools, to bring university teachers and scholars into fruitful contact with secondary-school teachers, thereby creating sustained enthusiasm and interest in contemporary scholarship in these fields, and tying together in a continuous way the schools and the colleges.

We have others likewise. We expect to provide indirectly advice to corporations, interested in educational and experimental media, such as those recording companies that put material of humanistic content onto tapes or records, by putting them into contact with distinguished humanists in the various fields.

I think you would like to have Mr. Stevens talk about theirs.

Chairman HAYDEN. I would. You may tell us, Mr. Stevens, about these unrestricted gifts.

ARTS ENDOWMENT UNRESTRICTED GIFTS

Mr. STEVENS. Mr. Chairman, we have received so far approximately $366,000 of unrestricted gifts, as well as an additional commitment of $60,000, covering the next 3 years. This is part of a $100,000 gift which was given to us by a foundation at $20,000 a year, beginning last year. The first two $20,000 installments are included in the $366,000, and we have got a commitment for the remaining $60,000, but of course, until the cash actually is received, we can't use it.

Mr. KEENEY. I think that next year, sir, when I will not be so occupied as I was this year setting up the program, that I can go out and raise a fair amount of money.

Mr. STEVENS. Mr. Chairman, I think we expect to, too.

USE OF DONATIONS

Chairman HAYDEN. For what have the donations been used?

Mr. KEENEY. Well, since we haven't any, I think Mr. Stevens had better answer that question.

Mr. STEVENS. We used this money for educational television programs, making grants to the Educational Broadcasting Corp., Channel 13, and to National Educational Television, known as NET, and also to—Mr. Stewart, what is the exact name of the other group?

Mr. STEWART. Educational Television Stations.

Mr. STEVENS. Educational Television Stations. They all have similar names, but they are slightly different, and we used all of the unrestricted gift money for that purpose.

GIFTS FOR SPECIFIC PURPOSES

Chairman HAYDEN. Well, have any attempts been made by donors to provide gifts for specific purposes?

Mr. STEVENS. There have been actually checks sent in to us for specific purposes, with stipulations that they be matched, and we have had to return them in those cases. The law calls for matching funds only if the gifts are unrestricted.

However, the Council passed a resolution stating that if unrestricted gifts came in, that we would use the money for certain purposes.

Last summer, the Council passed a resolution that the first unrestricted gifts that we received, we would match and make grants to the field of educational television. We have on record right now a resolution saying that if anyone gives us unrestricted gifts, that we will use the funds now for assisting the film institute.

Chairman HAYDEN. I see.

Mr. KEENEY. We had one would-be donor who wanted to give us money to do something that was outside of our purposes, and I told him to go away, and he did.

Senator BARTLETT. CIA?

Mr. KEENEY. No, sir; it was an old friend of mine.

We can accept restricted gifts under the legislation, if they come within the purposes of the act, but they don't get matched by the Treasury.

ADMINISTRATIVE EXPENSES

Chairman HAYDEN. For administrative expenses in the fiscal year 1968, you are requesting $1,620,000, as compared to $1 million which was provided in fiscal year 1967.

Would you please discuss this request indicating the number and distribution of additional positions requested, as well as advising the committee of increases in other activities which you believe are required?

Mr. KEENEY. Yes, sir; we had $1 million appropriated for fiscal year 1967 for administration, and we carried over $113,000. So the increase is smaller than it looks. It is $507,000; $370,000 of this increase is for an additional 26 positions: eight for arts, four for humanities, 14 to the shared staff.

ARTS ENDOWMENT STAFF

These will permit the arts endowment to keep pace with the expanding volume of proposals received and grants processed, and provide for the establishment of the planning and analysis capability.

HUMANITIES ENDOWMENT STAFF

The additional positions in humanities will provide staff to handle the increased workload due to the increased volume of applications and grants, and will provide for the establishment of a public information officer who is vitally needed to help the endowment carry out one of its purposes, which is defined in the act, to foster public understanding and appreciation of the humanities.

SHARED STAFF

The 14 increased positions in the shared staff reflect several considerations. The most important of these is that we have an agreement now with the National Science Foundation to do the bulk of our administrative work for us. This agreement expires on the 30th of June, and we have to develop our own accounting and personnel capacity. The four new positions requested in the administrative office will provide that capacity.

The grants office is understaffed to meet present needs sufficienty, and it will be particularly understaffed for the increased volume, and there are five positions requested there.

The five other new positions in the shared staff will increase the responsiveness of the office of general counsel and increase the inhouse library and research capacity of the foundation.

The total increase in personnel benefits for the 26 new positions is $21,000.

TRAVEL

We request a $56,000 increase for travel, to allow the two Councils to meet quarterly, and to permit their subcommittees to meet as necessary, to carry out their responsibilities under the act, to permit us to use consultants and experts on a scale commensurate with the increase in applications, and to permit the staff to conduct on-the-scene evaluations of proposals and funded projects, which was very severely handicapped this year.

I believe that this capacity will result in a saving of money, because you can often find that a grantee or an applicant who looks good on paper does not look very good at home, if you visit him and snoop around.

RENT, COMMUNICATIONS, UTILITIES

We request a $32,000 increase for rent, communications, and utilities, of which $20,000 is to pay the post office for postage in fiscal year 1967 and fiscal year 1968, which we haven't been paying. The remainder is for increased telephone service, for the rental of a more capable Xerox, which saves secretarial time, and for rent and alterations to house a larger staff.

PRINTING AND REPRODUCTION

There is a $14,000 increase requested for printing and reproduction, and one of $2,000 for supplies and materials, which reflect the cost of efficiently conducting a rapidly growing program, and presenting it to the public.

Then we need outside services, which we can purchase cheaper than we can develop staff capacity. We need information depth in certain fields, and we need technical information and expertise, which is central to studies, analyses, and evaluations. We request an increase of $56,000 for that.

We request an increase of $56,000 to provide bookkeeping equipment, typewriters, and collators, and punch and binding equipment, and there is a decrease of $25,000 in services of other agencies.

Roger, would you like to add to that?

Mr. STEVENS. Well, nothing, Mr. Chairman, except for the fact that we are dealing with all the States, in our State grants, and it is necessary to keep in contact with these State agencies. We are a national group. Our program involves every State in the Union in addition to the State arts council grants, and we have to keep in constant contact, and actually see what is going on, to do our job properly.

In addition to that, as I said previously, each one of the major categories of the arts requires panels, and while the members of the panels have been very generous with their time, they must come from all over the country to give us the proper perspective and the proper choices, and it seems unfair to expect them to serve without being paid for it. Because of the fact that our programs are spread throughout the country, what may seem a little high in the areas we are discussing is really very conservative.

We try to do the best we can, and we limit travel whenever possible. We aren't careless with it at all.

GENERAL COUNSEL'S OFFICE

Chairman HAYDEN. Among the increases requested for the shared staff is an attorney and a secretary for the office of general counsel. What are some of the examples of the legal problems which have to be met by the Foundation?

Mr. KEENEY. The counsel, the general counsel, advises both endowments. He advises both councils, each of which has unusual legal requirements. Also, he advises the Federal Council on the Arts and Humanities.

Since this is new legislation, and since this is the Federal Government's first venture into support of the arts and humanities on any significant scale, the majority of the legal opinions rendered by the general counsel are precedent-making, and in fact, develop administrative law.

It should be remembered, though, that in addition to rendering legal advice, the general counsel, at the request of the two chairmen, participates in a very significant way in the development of the Foundation's policies, and is very effective at that. The general counsel provides legal interpretations of the act, and of other statutes and regulations.

He negotiates and drafts all contracts. He reviews all grants for legal and policy aspects, and he works with the other administrative officers in the carrying out of their responsibilities.

He studies all legislation that has to do with the arts and humanities, which is quite a burdensome activity.

Some of the unusual activities he gets involved in are the incorporation of the film institute, and the obtaining of its tax-exempt status, negotiating with the Modern Language Association of America, a Humanities Endowment grantee, with respect to copyright and royalty matters, and establishing a legal relationship among the association, publishers, and the endowment.

He drafts regulations for the Foundation. For example, those relating to civil rights and conflicts of interest. The additional attorney is necessary to enable the general counsel to participate fully in all aspects of the endowment activities by relieving him of the day-to-day legal work.

NEED FOR MORE STAFF

Mr. STEVENS. Mr. Chairman, could I make one further comment on this increased staff?

Chairman HAYDEN. Yes.

Mr. STEVENS. We requested the increase because we really had not gotten fully under way in the previous year; so what may appear to be increases, sir, are really filling out the program and the staff that we originally were expected to have, but didn't because of the time problems. I think that the strength of our case can best be shown by the fact that the Bureau of the Budget allowed us to increase our job positions, even though they are very stringent on any such increases, as you probably know.

OFFICE OF ADMINISTRATION

Chairman HAYDEN. For the office of administration, four additional positions are requested. This will make a total of 10. What are the assignments of the present six personnel in the office of administration?

Mr. KEENEY. Shall I supply this for the record, sir, or would you like me to go through it now?

Chairman HAYDEN. Put it in the record.

(The information follows:)

Although we have six positions at present in the Office of Administration, only four are now filled because of our severe shortage of administrative money. The four currently filled positions are:

A Director of Administration responsible for planning, designing, installing and operating, or otherwise providing the full range of administrative activities.

An Administrative Assistant primarily responsible for handling day-to-day administrative work processing between the Foundation and the National Science Foundation.

A Secretary to the Director who, in addition to the usual secretarial duties, focuses on personnel matters.

A Mail Clerk-Messenger who also handles procurement, property, supply, duplicating, and related matters.

The vacant positions are:

A Mail Clerk-Messenger to assist our one employee now assigned to this work.

An Accounting Clerk to assist in the task of financial record-keeping.

PRESIDENT'S STUDY ON LIBRARIES

Chairman HAYDEN. What is the President's study on the libraries and how does the Endowment on the Humanities contribute to this study?

Mr. KEENEY. The President established the President's Committee on Libraries, and the National Advisory Commission on Libraries by Executive order last September, to appraise the role and adequacy of libraries now and in the future, as sources of scholarly research, as centers for distribution of knowledge, and as links in our communications network.

The Commission will make a final report to the President's Committee on Libraries, devoted to an evaluation of the policy and the programs and practices of public agencies and private organizations.

The Endowment has a responsibility under the Executive order which empowers the Commission to request assistance from any Federal agency.

The Chairman of the Commission, Dr. Douglas Knight, has been in to talk with us, and has requested our assistance, but has not specified his request as yet. We are in constant communication.

HUMANITIES AND LIBRARIES

Now, ultimately, the study of the humanities depends upon libraries, to an extent that is greater than that in any other field.

You cannot do humane teaching and research without great libraries. This country, by the way, is richer in libraries than any country in the world, and this is one of the glories of the country. The endowment is particularly interested in special libraries which have been built up over the years, such as the Houghton Library at Harvard, the John Carter Library at Brown, the Huntington Library, the Folger Library here, and the other great American repositories of research materials.

The findings and recommendations of the President's Commission will influence and affect the Endowment's program in the future, and whatever help we give it will be relevant to our purposes.

EQUIPMENT

Chairman HAYDEN. A portion of your $56,000 increase for purchase of equipment would go to providing furniture and office equipment for the new personnel requested. How much do you use in General Service Administration surplus stock to meet these requirements?

Mr. KEENEY. We have been able to obtain some furniture from them, and we continue to inspect their warehouse, to use any satisfactory items we can find.

Chairman HAYDEN. Dr. Keeney, I have a number of questions concerning the Endowment for the Humanities. I shall hand them to you and ask that you prepare responses. Both questions and answers will be printed at the end of this record. (See p. 1925.)

Mr. KEENEY. Very well, sir.

Chairman HAYDEN. Senator Bartlett.

Senator BARTLETT (presiding). Thank you, Mr. Chairman.

What is your travel appropriation for this year?

Mr. KEENEY. It is $35,000 for each endowment—a total of $70,000.

Senator BARTLETT. $70,000.

Mr. KEENEY. Yes, sir.

Senator BARTLETT. And this may have been explained while I was necessarily absent, but how many people are on your staff now?

Mr. KEENEY. We have a total of 24 on the Humanities staff as of March 12, out of 26 available positions. The two unfilled positions are secretarial. We have a total of how many on the Arts staff?

Mr STEVENS. We began with 32 positions available on the arts staff, but have curtailed to 28 to meet budget limitations.

Mr. KEENEY. Twenty-eight arts, 24 humanities, and 17 shared, sir.

Senator BARTLETT. And as you explained, the Bureau of the Budget has approved each of these increased appropriation requests?

Mr. KEENEY. Yes, sir.

"TALKING BOOKS"

Senator BARTLETT. In connection, sir, with the "talking book" program, you mentioned Goldwater Memorial Hospital. Where is it?

Mr. KEENEY. It is in New York.

Senator BARTLETT. In New York.

HUMANITIES GRANT

Mr. KEENEY. By the way, sir, these are some of the books that come out of the Center for American Editions which received a grant. Works of Emerson, Twain, Hawthorne, and Whitman. Many of these will be read onto those records.

Senator BARTLETT. Which books specifically are those with you?

Mr. KEENEY. Well, "Leaves of Grass," there is "The Scarlet Letter," there is one by Twain, "Which Was the Dream," and there is the "Journals of Ralph Waldo Emerson." Twenty volumes of these have appeared. There will be about 160 all told.

Senator BARTLETT. Have some of the books of this type been put on tape yet and used?

Mr. KEENEY. Not yet, no, sir, but they will be.

Senator BARTLETT. None. What is your assumption as to the reception of a book such as any one of those four as compared with a wild west story?

Mr. KEENEY. I think the reception of the "Journals of Ralph Waldo Emerson" would be very poor. I think that "Which Was the Dream" would not be very popular. It is a work that Twain discarded.

"The Scarlet Letter" would be, I think, very popular. That is a gripping book. The Walt Whitman poetry would appeal to a great many people, particularly when it is read.

Did you see that television program on Mark Twain the other night?

Senator BARTLETT. No, I miss all the good ones.

Mr. KEENEY. That was the best of the whole year. This was a great program. It was a recitation from Mark Twain's works.

Senator BARTLETT. I guess we will have a repeat on that.

Mr. KEENEY. I am sure it will be, sir.

Senator BARTLETT. Well, let us take "Leaves of Grass" by Walt Whitman, which is a big book. This won't all be read at one time?

Mr. KEENEY. No, sir. You know, you can stop these machines any time you want to, and that would fill several records or reels of tape.

Senator BARTLETT. You have to have people with especially good voices to record, I imagine.

Mr. KEENEY. And who understand what they are reading.

Senator BARTLETT. Two requisites there.

Mr. KEENEY. Yes. Now we also expect these books to go into popular editions, so that students can use accurate texts, inexpensively, and so that the general public can buy them in bookstores, or in airports, or railroad stations.

DECREASE IN BUDGET

Senator BARTLETT. I notice that while you have a good many increases proposed in your budget, Mrs. Hardy suffered a loss of over $100,000.

Mr. KEENEY. Yes, sir. Mrs. Hardy is so intelligent that she really does not need a great deal of money.

Senator BARTLETT. She didn't protest, then, because you explained that to her.

Mr. KEENEY. That is not exactly the way I put it, but, no, we had more in it this year, sir, because this was the year when we were really starting to make plans. Next year we can carry them on, with a little less money.

Senator BARTLETT. Do you regard your staff as being creative?

Mr. KEENEY. Most members of it; some are not.

Senator BARTLETT. Have you conducted any IQ tests?

Mr. KEENEY. I haven't. But I think I could make a fairly shrewd guess at them. I would say they range from about 125 to 160.

Senator BARTLETT. Well, we are going to disprove that other theory that high IQ and creativity don't go together then.

Mr. KEENEY. Well, I am a low one.

Senator BARTLETT. I have no further questions. I guess I have a lot more, but I won't go into them now.

Thank you very much, gentlemen, and Mrs. Hardy, for your appearance.

Mr. KEENEY. Thank you, sir.

RESPONSES TO QUESTIONS BY SENATOR HAYDEN

Actual and Anticipated Accomplishments

Question. Over the long run, what do you think the Humanities Endowment can accomplish for the nation? After approximately one year's activity, how much has the Humanities Endowment accomplished?

Answer. In carrying out its objectives, the Humanities Endowment will assist in the development of highly trained scholars and teachers for the colleges and the schools. Support of research will result in a much better understanding of our past and will help bring the past into the present as a resource through the improvement of teaching and of teaching materials for the schools and the colleges. Likewise, it should result in the development of a great deal of public information and public understanding. Ultimately if the Humanities Endowment is successful, our public and private citizens will have a better basis for making the great and small decisions which lie before us as individuals and as a society; for much of the material on which judgments of value must be based lies in the collection of works which we call the humanities—the experience of history, the moral and aesthetic judgments of literature, the formulative effect of art, and the practical wisdom of political science.

After approximately one year, the Endowment has gotten off to a good start in pursuing these objectives. It is fully staffed and very competently staffed for the most part. The program is soundly developed, and it is generally appreciated by the various constituencies of the Endowment, such as the members of colleges and universities and of school systems and the media of communication. It is a little too early to judge the actual effect of most of the grants, but in the case of the largest one, the Center for the Edition of American Authors is already producing books. Prior to our grant, this organization was in being, and some twenty volumes of the works of the greatest 19th century authors have already appeared—some of which contain material that has never before been published, whereas others contain for the first time since the author left it, the correct text. This important work will now move more rapidly and securely. We have made grants or awarded fellowships in 46 of the 50 states to persons in all sorts of educational institutions and to other persons and organizations that are outside educational institutions. We had about 1,500 applications this year, and the total amount requested was over $53 million. We have thus far committed $4,100,000 of the $4.5 million available to us at the beginning of the year, and we expect to obligate the rest before the 30th of June. As the Endowment becomes better known and its program more versatile, the volume of applications will increase greatly, as will the amount requested. It is indeed fortunate that in this first year the requested amount was more than ten times greater than the amount available, for this forced establishment of a very high standard of judgment and great selectivity among applications. It is my intention that these high standards will continue to be applied and that is certainly the intention of the Council.

Another way of putting it is that we have helped scholars and teachers learn and teach more about our society and how it came to be how it is.

FEDERAL SUPPORT JUSTIFICATION

Question. In the final analysis, why should the Federal government be involved in supporting the humanities?

Answer. It is of vital concern to the Federal government and to the people of this country upon whom it depends and who depend upon it that every citizen be as wise and understanding of himself, of his society, and of his government as possible. Many of our great advances of this generation have come as a result of Federal support of scientific and technological research. This harvest is just beginning to be collected. In 1967, the Federal expenditure for all kinds of scientific activities was $15.9 billion. In the fiscal years 1963–5, the physical sciences received 68 to 69% of all Federal support of basic research; the life sciences 26 to 28%; the social sciences about 2%; and all other fields less than 0.5%. The arts and the humanities, of course, fall in the other fields that received less than 0.5%. We have many situations, such as air pollution, in which we have a technological solution to an important problem, but we do not a social or political solution. Some of the solutions can be found through the study and application of the humanities and social sciences. Our society today is preoccupied with achieving justice for all. This, of course, has been a major concern of societies in the past—American, European, and Oriental. Much of the content of works of philosophy and political theory are devoted to the question of justice, and much can be learned from their study. Mistakes can be avoided by examining similar situations in the history of the past. Indeed, I think it is reasonable to say that our only chance of controlling the technology that we have created is through the applications of principles which can be found in the humanities and social studies. In 1965, the House Committee on Government Operations recommended as follows:

"The committee recommends that massively increased support for scholarship and for instruction in the humanities and the social sciences—by some combination of private means, or by Federal, State, and local government support—be accepted as an important national goal."

Five years earlier, the President's advisory committee on science had recommended a similar goal.

STUDIES

Question. Has the Endowment supported studies of the development of the American Republic and the development of democratic ideals?

Answer. Yes, indeed, 47 of the fellowships are directly concerned with American history; seventeen others are concerned with American literature and other aspects of American development. These range from the study of New England in the 17th and early 18th century to John W. Bricker. Of the research grants, 29 are concerned with American subjects ranging from a selection of records of American colonial courts, which will be useful to students of history and of the law, to an oral history of President Eisenhower and Stevenson. Others deal with literature, with art and music, and with government. In the Division of Education and Special Projects, 8 grants are directly concerned with American affairs; and many of the fellows and interns in the museum program and some of the young teachers in the teaching internship program will be concerned with acquiring and/or teaching a better understanding of American and democratic ideals. One of these grants is for an institute on the role of Alaska in the development of the United States. Another has to do with the American ideal as it is expressed in history, art, and literature; and a third will place on records or tapes for the disabled some of the greatest classics of American literature and thought, including some of the works being published through our grant to the Center for Editions of American Authors.

Question. You are coming before this Committee to request $5.0 million to conduct programs in support of the Humanities. What is the amount of federal support for science?

Answer. Federal support of science in the present fiscal year is estimated by the National Science Foundation to amount to $15.9 billion dollars, of which $5.6 billion will support basic and applied research.

Post-Doctoral Fellowships

Question. How does the number of post-doctoral fellowships available in the sciences compare with those in the humanities?

Answer. The following table shows that in 1967–68 post-doctoral fellowships total 2,911 in the sciences as compared with 486 in the humanities.

	Postdoctoral fellowships in sciences for 1967–68	Postdoctoral fellowships in humanities for 1967–68
Air Force Office of Scientific Research postdoctoral fellowships	15	
American Association of University Women		7
American Cancer Society research fellowships and grants	20–30	
American Council of Learned Societies		36
American Heart Association research fellowships	25	
Atomic Energy Commission fellowships	25	
Center for behavioral sciences	50	
Center for Hellenic Studies		8
Cerebral Palsy Foundation fellowships in brain research	5–10	
Folger Library		35
Ford Foundation faculty research fellowships in economics	20	
Fulbright-Hays research scholarships		75
Guggenheim Foundation (for 1966–67)	113	150
Huntington Library		2
National Academy of Sciences research associateships in Federal laboratories	146	
National Council to Combat Blindness research fellowships	16	
Labor Foundation awards	25	
NASA resident research associateships	124	
NSF postdoctoral, senior postdoctoral, science faculty, and NATO fellowships	350	
Office of Education		66
Population Council biomedical fellowships	30	
Public Health Service (NIH) postdoctoral and special postdoctoral fellowships	1,900	
Smithsonian visiting research associateships	12	5
Society for Religion in Higher Education		22
Social Science Research Council		20
SSRC and ACLS area studies grants		60
Helen Hay Whitney Foundation research fellowships	18–20	
Total	2,911	486

Fellowship Program Resources

Question. How does your fellowship program compare with resources presently available for fellowships in the humanities?

Answer. There are approximately *486* fellowships in the humanities available from other sources for 1967-68. The *287* Endowment fellowships and stipend awards thus make a considerable increase over the amount of support previously available.

Humanities endowment:	
Senior fellowships	57
Fellowships for younger scholars	100
Summer stipends	130
Total	287
Postdoctoral awards available in the humanities from other soures for 1967–68:	
Guggenheim	150
American Council of Learned Societies	36
Fulbright-Hays	75
Folger Library	35
Huntington Library	2
Social Science Research Council	20
American Association of University Women	7
Center for Hellenic Studies	8
Society for Religion in Higher Education	22
Smithsonian	5
Office of Education	66
SSRC & ACLS area studies grants (including many small grants)	60
Total	486

Even more significant than this general increase in the number of fellowships available in the humanities is the great increase in the number of awards available to younger scholars within five years of their full entry upon their professional careers. Approximately 55 fellowships will be awarded to such younger scholars for 1967-68 from the other major programs, to which the Endowment will add 100 fellowships and 130 summer stipend awards:

Guggenheim	30
American Council of Learned Societies	5
Fulbright-Hays	20
Total	55
Humanities endowment:	
Fellowships for younger scholars	100
Summer stipends	130
Grand total	285

Question. In view of the severity of the situation in Viet Nam, how can you justify expenditures not essential to the national security?

Answer. The situation in Viet Nam is the present manifestation of a struggle between democratic and authoritarian government that has been continuous throughout almost all of this century. It is in effect a struggle for the control of men's minds. It is therefore of essential importance that our people and our government have the intellectual capacity to conduct this struggle. Battles are won not by guns but by soldiers who use guns and bombs and all the other instruments of warfare. It has been our experience in this country that those soldiers who best understand their way of life fight best and longest. I remember vividly from the last war the great hunger for books among the troops. One day during the Battle of the Bulge, one of the men in my unit found a book; and in the evenings after that, we all read it. I read a page, tore it from the book, and passed it to another, who would in turn read it and pass it on, and so on. When the fighting was over, books became abundantly available; but it would have helped these men a great deal if they had had them when they needed them most. We are in the business of supplying the content for books but not simply for pleasure but in order that our people may develop their wisdom.

Another way of putting it is that the society which understands its liberties best, preserves them best.

This is a time of great decisions and of crisis. In time of crisis, we tend to forget our consciences. In a sense, the humanities contain our conscience, and can remind us that it is more important to be right than to be expedient.

Question. What are the fellowship activities of OE, NSF, and other Federal and private fellowship sources and is there overlap between their programs and yours? Why your program if there is?

Answer. The Office of Education has post-doctoral fellowship programs in "critical" modern foreign languages and in educational research. The former are so limited in scope that overlap with NEH is minimal; awards under the latter program do not overlap at all. NSF has three post-doctoral programs: Senior Fellowships, Science Faculty Fellowship, and Post-Doctoral Fellowships for younger scientists. Of the 65 Senior and 250 Science Faculty awards (only about one-third of the latter are at the post-doctoral level) announced in December, all except 16 were in natural sciences and engineering (viz.: economics: 8, history of science: 4, sociology: 3, linguistics: 1).

The major fellowship programs that overlap with ours are the Guggenheim (approximately 150 awards to humanists for 1967–68), the ACLS (36 awards), the Fulbright-Hays (about 75 research scholarships in the humanities), the Folger Library (35), SSRC (20), and OE (66 in critical foreign languages). There are also about 60 SSRC and ACLS Area Studies Grants, many of which are small grants. Altogether, roughly 480 such awards are available for 1967–68.

In spite of this overlap, NEH fellowships, fall far short of filling the needs of scholars capable of using fellowship support productively. If fellowships were to be awarded over a 5-year period to one-quarter of the approximately 13,000 young humanities faculty members who have completed doctorates within the past five years, 650 fellowships per year would be needed just for this purpose, yet other programs provide only 50 or 60 awards annually to such young people. If, in addition, ten percent of the 38,000 associate and full professors in the humanities (in four-year colleges and universities alone) were to receive fellowships within the same 5-year period, an additional 760 fellowships per year would be needed—a total of approximately 1,400 per year. That additional fellowships could be well used can be seen in the large number of distinguished scholars on the Senior Fellowship alternate list.

Question. What is the relation of your educational programs to those of the Office of Education, OEO, and NSF?

Answer. The National Endowment for the Humanities does operate and plans to continue to operate in areas generally under the federal responsibility of other agencies. We do so in order to restore a needed emphasis, in order to encourage the spread of ideas we think useful, and in order to influence the future planning of other agencies. We attempt to do this always for very special purposes and in full knowledge of and with the cooperation of, the agency involved.

For example, our program in curriculum dissemination was developed to complement the Elementary and Secondary Education Act. By disseninating new curriculum developments supported by the Office of Education. We are helping local schools and school boards to spread ideas which they have found effective.

We do not compete with OEO but simply encourage model programs which we hope will show how the subject matter of the humanities can become an important part of the experience of cultural enrichment.

In our junior college program, which has not even reached the planning stage, we have been in close consultation not only with the OE personnel involved, but also with the professional associations.

As for vocational education, as our 1967 budget justification pointed out, we seek merely to experiment through grants to interest schools and school boards with the concept of encouraging a richer background for students whose aim in going to school is primarily to make them employable at a semi-skilled level. We feel that it is just as important to make this group aware of the humanistic dimensions of life as it is with college and university students. While OE is devoting massive funding to one aspect of the problem, we can be experimenting with other aspects on a more selective basis.

As time goes on, we may wish to become more like the NSF in its relatively comprehensive concern with the teaching of scientific subjects in all contexts. At present, our means and experience dictate a policy of selective, experimental grants made only after a close study of existing needs and the activities and plans of other agencies, federal and state, public and private.

Question. What are other sources of research money in the humanities, either public or private? What are criteria in final choice? What is the process of final selection?

Answer. *Public sources of research support in humanities.—*

Federal research in the humanities, fiscal year 1967:	
NEH	$1,500,000
National Historical Publications Commission	350,000
Total	1,850,000

Federal support of research in areas allied to humanistic research, fiscal year 1967:	
Smithsonian (support of archeological excavation in excess-currency countries) (five post-doctoral fellows in history)	1,300,000
Office of Education (cooperative educational research)	[1] 300,000
Total	1,600,000

[1] Approximate.

The only other public sources of research money would be through the appropriations which state legislatures make for the general purposes of state-supported universities; and most of this does not support humanistic research.

Private sources of research support in humanities.—(1) Probably the largest aggregate amount would be from the colleges and universities themselves. However, a recent study showed that the average amount which these institutions make available yearly to their faculty for support of humanistic research is between $5-$6,000. At most colleges and universities, the absence of sponsored (i.e., Federally or industrially financed) research in the humanities aggravates the situation, as few institutions have large amounts available in any area; particularly in the humanities. (2) Private foundations do not spend substantial amounts on research in the humanities. For example, the Ford Foundation in 1965, made grants totalling $824,000 for humanistic research, including $750,000 for the national translation center. An appropriation of $500,000 was voted in 1965 for humanistic research and scholarship. The total FF grant budget for 1965 was $281.5 million. The Carnegie Corporation—out of a total amount spent in the U.S. in fiscal 1966, $11.2 million, approximately $720,000 was spent to support research projects identifiable as being in the humanities. (3) The ACLS, which is a recipient of private and public funds (including FF and Carnegie), spent in fiscal 1966 $202,500 on grants-in-aid support for research, computer-oriented research, travel to conferences and publications.

Criteria.—The criteria for the judgment of research projects are as follows: (1) Are the research proposals innovative; that is do they promise to break new ground in humanistic research or to provide new insights and suggest new directions of humanistic endeavor? (2) Will they result in a substantial addition to or recovery of humanistic knowledge? (3) Do they have value, either as scholarly projects in themselves, or as scholarly tools? (4) Are the designs of the projects adequate to the hoped for results? (5) Are the applicants competent to accomplish what is proposed? (6) Are the sums requested necessary, and is the amount requested proportionate to the value of the project?

Process of selection.—Naturally, it is impossible to apply these criteria in a mechanical or mathematical way. Individual persons or groups of people must measure each proposal and come to an assessment of its strength in meeting each of these criteria. Therefore, the process of review of applications is framed to provide the Endowment with as much informed judgment about each application as our funds permit. The following steps make up our review process: (1) All proposals are reviewed by staff, which gives them a preliminary screening. Staff may reject proposals for technical reasons: they are not within the programs of the Endowment; they duplicate earlier proposals; or the applicant is ineligible. (2) Proposals about which there are doubts or which the staff lacks the competence for preliminary screening are sent to individual scholars or experts—usually two and sometimes three—who send in their judgments on forms devised for the purpose. (3) When these judgments are in, the proposals are sent to the panelists, who are acknowledged experts in their fields, and who later meet as a body and bring their thinking to bear on the proposals. (4) As a body, the panelists come to a specific judgment on each proposal, for consideration by the National Council on the Humanities. (5) By law, the Council, which is appointed by the President of private citizens in all fields of life, must make a recommendation to the Chairman of the Endowment on each proposal before a grant can be made. (6) The Chairman may then make the grant. Although he is not required by law to follow the Council's recommendation to approve or reject an application, in fact all grants made thus far have been approved by the Council in their recommendation to the Chairman.

DISTRICT OF COLUMBIA PROJECTS

Question. Has the Endowment supported any activity here in Washington which could exemplify some of its aims and interests?

Answer. One example is very close at hand: 314 A Street, N.E. This is the Museum of African Art and the Frederick Douglass Institute, which received one of our earliest grants. This Institute is still small and rather unpretentious. It is run by one or two capable people who give meaning to the word "dedicated." On a very small budget they have begun to assemble objects and books which will eventually connect the history of the Negro in Africa with his history in Colonial America and the United States. The collection is both a library and a museum. It is a focal point for larger collections nearby at the Library of Congress and the Archives.

We are happy with the way our grant has been used for a number of reasons: (*a*) the Institute has prepared traveling exhibitions which make its resources mobile and which allow its message to be presented all over the country; (*b*) the facilities of the Institute have been concentrated on education to the extent that regular visits to its premises are now undertaken by classes ranging from elementary school children through the highly educated trainees at the Foreign Service Institute; (*c*) the grant we made became seed money in the best sense: i.e., it allowed this struggling enterprise to raise itself to the level where it could compete for and receive funding from more affluent sources. It now has a good-sized grant via the District of Columbia Board of Education which will expand its educational function; it is in the process of submitting an application for a large grant from a private foundation whence it has been led to expect support; (*d*) finally, in a loose way, this grant symbolizes a concern of ours that the Endowment play its part in involving all Americans in the stream of our mutual humanistic past and particularly involving those groups which have often been overlooked.

SUBCOMMITTEE RECESS

Senator BARTLETT. The subcommittee will recess until 10 a.m. Wednesday, March 15, when the National Capital Transportation Agency and the Division of Indian Health will come before the committee.

(Whereupon, at 11:40 a.m., Tuesday, March 14, 1967, the subcommittee was recessed, to reconvene at 10 a.m., Wednesday, March 15, 1967.)

DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1968

WEDNESDAY, MARCH 15, 1967

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, D.C.

The subcommittee met at 10 a.m., in room 1223, New Senate Office Building, Hon. Carl Hayden (chairman) presiding.

Present: Chairman Hayden and Senator Bartlett.

NATIONAL CAPITAL TRANSPORTATION AGENCY

STATEMENT OF WALTER J. McCARTER, ADMINISTRATOR; WARREN D. QUENSTEDT, DEPUTY ADMINISTRATOR; HOWARD W. LYON, DIRECTOR, OFFICE OF ENGINEERING; WILLIAM I. HERMAN, DIRECTOR, OFFICE OF PLANNING AND FINANCE; OWEN J. MALONE, GENERAL COUNSEL; CODY PFANSTIEHL, DIRECTOR, OFFICE OF PUBLIC INFORMATION AND COMMUNITY SERVICE; AND J. NEAL TOMEY, DIRECTOR, OFFICE OF ADMINISTRATION

BUDGET REQUEST FROM UNOBLIGATED BALANCE

Chairman HAYDEN. The subcommittee will be in order.

For "Salaries and expenses" in fiscal year 1968 the National Capital Transportation Agency requests that $400,000 of an unobligated balance of last year's appropriation be reappropriated to remain available during fiscal year 1968. I will place in the record the justification statement in support of the congressional action requested.

(The justification follows:)

GENERAL OBJECTIVES AND BUDGET YEAR PROGRAMS

The National Capital Transportation Act of 1965 authorizes the Agency "to design, engineer, construct, equip, and take other action * * * to provide for the establishment of the system of rail rapid transit lines and related facilities" in the Nation's Capital.

The system, as presently authorized, will be 24.9 miles long, with double-track throughout, and will include 29 stations. About half (13.1 miles) will be underground, 7.5 miles will utilize existing rights-of-way, and the balance of 4.3 miles will occupy other exclusive rights-of-way.

The total cost of constructing and equipping the proposed system is estimated to be $431 million to be provided by direct appropriations of $150 million ($100 million by the Federal Government and $50 million by the District of Columbia) and $281 million to be derived from the public sale of bonds to be repaid out of the revenues of the system.

Within the amounts authorized, funds, totalling approximately $19.6 million were appropriated in Fiscal Years 1966 and 1967 under the appropriation "Construction, Rail Rapid Transit System" and the unobligated balances of these funds are currently financing the major engineering and architectural programs of the Agency.

For Fiscal Year 1967, funds in the amount of $1.4 million were appropriated under the appropriation "Salaries and expenses, NCTA" to finance the administrative expenses of the Agency such as the salaries of personnel, personnel benefits, travel, planning and financial studies, and related support costs. These funds would provide for 66 full-time positions as well as part-time personnel to be compensated on a "when-actually-employed" basis.

The Washington Metropolitan Area Transit Authority was created, effective February 20, 1967, by Interstate Compact by and between Maryland, Virginia, and the District of Columbia, pursuant to Public Law 89–774, approved November 6, 1967. The Authority's primary function is a plan, develop, finance, and provide for the operation of a rapid rail transit system serving the Washington Metropolitan Area Transit Zone. The legislation provides for the transfer of functions and duties of the National Capital Transportation Agency to the Washington Metropolitan Area Transit Authority on September 30, 1967.

In view of the provision for the transfer of functions and duties on September 30, 1967, the Agency is requesting funds only for the period from July 1, 1967 to the date of transfer on September 30, 1967. This budget request of $400,000 would provide for the continuation of the currently authorized staff of 66 positions, related expenses necessary to the functioning of the Agency for this 3-month period and certain expenditures in connection with the transition to the interstate Authority.

Schedules and narrative justification material to explain the estimates follow.

Summary of estimates by budget activities

[In thousands of dollars]

	Actual, fiscal year 1966	Estimate, fiscal year 1967	Estimate, fiscal year 1968
1. Engineering direction	104	182	80
2. Traffic and system financial planning	231	405	170
3. Architectural design	24	71	20
4. Real estate acquisition and relocation assistance		27	10
5. Executive direction and administration	277	315	120
Total	636	1,000	400

[In thousands of dollars]

	Actual, fiscal year 1966	Estimate, fiscal year 1967	Estimate, fiscal year 1968
1. Engineering direction	104	182	80

The Office of Engineering is responsible for the preparation of engineering plans, estimates of cost, specifications and supervision of construction of the rail rapid transit system. The various elements comprising the total system include basic subway, aerial and other open construction; trackwork, train control, power distribution and related wayside facilities; stations, parking lots and bus transfer facilities; the rolling stock and associated equipment; and right-of-way requirements for the various items of construction. The estimated cost for these facilities totals $431,000,000 phased over a seven-year period. The design and construction phases of the Transit Development Program must be coordinated with the programs of other agencies and jurisdictions.

The authorized strength for the current year is as follows:

Civil engineer, GS-16 (Director)	1
Civil engineer, GS-15	1
Civil engineer, GS-14	1
Electrical engineer, GS-14	1
Right-of-way engineer, GS-13	1
Electrical engineers, GS-13	2
Equipment engineer, GS-13	1
Civil engineers, GS-13	2
Civil engineer, GS-12	1
Electrical engineer, GS-11	1
Utilities engineer, GS-11	1
Civil engineer, GS-11	1
Specifications engineer, GS-11	1
Technician, GS-9	1
Civil engineer, GS-7	1
Electrical engineer, GS-7	1
Draftsman, GS-7	1
Secretary, GS-7	1
Secretary, GS-6	1
Draftsman, GS-5	1
Secretary, GS-5	1
Total	23

During the current year the Office of Engineering is concentrating on establishing standards and criteria to the level of refinement required to award final engineering design contracts for portions of the system scheduled for early construction. Final design activities are being initiated. In addition, equipment development efforts are being emphasized as well as further soils exploration projects.

The Agency will expand its final design activities during Fiscal Year 1968 and by the end of FY 1968, it is expected that final design contracts representing approximately 30 individual construction segments or activities could be underway by the Agency or Authority. Detailed monitoring of these design contracts and increasing public works coordination efforts will be the responsibility of the Civil Engineering Division.

The Office of Engineering, through its Division of Equipment, will undertake the development of criteria and specifications and the monitoring of engineering and construction activities in the areas of electrical facilities (including traction power), electrical work for rolling stock, and facilities for the maintenance of rapid transit vehicles.

These estimates include $80,000 to provide for 23 full-time positions and related support costs during the first three months of Fiscal Year 1968.

	Actual, fiscal year 1966	Estimate, fiscal year 1967	Estimate, fiscal year 1968
2. Traffic and system financial planning	$231,000	$445,000	$170,000

The Office of Planning and Finance is responsible for all functions which affect operating costs, traffic, fares and revenues, and financial plans for the proposed system. It is also responsible for the coordination of rapid transit planning with other area-wide transportation planning and land use planning.

Its responsibilities include: preparing operational patterns and specific service schedules; forecasting traffic; negotiating for the provision of feeder bus services and determining an equitable allocation of fares between bus and rapid transit operators; developing a fare schedule and a fare collection system; providing for non-fare box revenues; preparing programs to provide financial support for the construction and operation of the system including the type or types of bonds to be issued, the scheduling of the bond issues, and the underwriting provisions; developing depreciation policies and schedules; determining, in coordination with the Office of Engineering, specific rapid transit routes and station locations; coordinating with all local planning highway, and public works agencies; planning for the development of areas close to rapid transit stations; and developing a plan for the external flow of traffic in station areas.

The authorized staff of the Office of Planning and Finance for the current year is as follows:

Financial economist, GS-16 (Director)	1
Urban planner, GS-15	1
Urban planner, GS-14	1
Traffic engineer, GS-14	1
Transit operations analyst, GS-14	1
Economist (public finance), GS-14	1
Industry economist, GS-13	1
Traffic engineer, GS-11	1
Transportation financial specialist, GS-10	1
Urban planner, GS-9	1
Economic statistician, GS-7	1
Statistical clerks, GS-4	2
Highway engineering aid, GS-4	1
Secretary, GS-7	1
Clerk-stenographer, GS-5	1
Total	16

Prior to the transfer of functions to the Washington Metropolitan Area Transit Authority it will be necessary for the Office of Planning and Finance to initiate certain projects in order to complement the phasing of the Agency's final design schedule. Two such studies, totalling $30,000, were included in the original estimates to the Bureau of the Budget and consist of:

UPTOWN CENTERS STUDIES

The construction of the rapid rail transit system will provide increased accessibility to many parts of the city, thus providing a potential for centers of increased activity. Such activity could include shopping centers, office buildings, light industrial area, apartments or educational facilities.

The Uptown Center Studies will be developed cooperatively with the District of Columbia Government and other agencies. They will develop data on:

1. Impact on transit ridership, revenues and operations.
2. Additional bus transfer and parking facilities required.
3. Additional transit station facilities needed.

It is anticipated that there will be at least four critical station areas to be analyzed so that the results can be used as inputs to the Agency's final design program during the first quarter of F.Y. 1968. The estimated cost of these studies is $20,000.

NONFARE BOX REVENUE FACILITIES

The Agency contemplates limited use of convenience type concessions within some of its station areas as well as controlled advertising within the transit facilities. Final design of stations must accommodate the space requirements of these facilities. Thus, decisions on those stations included in the early final design phase must be made promptly.

The project will develop needed information in the following areas:

1. The types of concessions which would be appropriate and profitable at selected station sites.
2. The development of specific advertising concepts and programs.
3. Space and special requirements at specific stations for the provision of such facilities.

It is estimated that this project will cost $10,000.

Other projects included in the original estimates which do not now have the same high priority or will be financed by the Washington Metropolitan Area Transit Authority instead of the Agency, are:

Fare collection system and fare structure	$25,000
Financial and operational study	40,000
Transportation Planning Board specialized studies	10,000
	75,000

(NOTE.—Although funds for these three projects may not be required by the Agency, the amounts are included in the totals for this budget activity to conform with the schedules contained in the President's budget document and should be retained to cover contingencies incident to the termination of the Agency's activities.)

These estimates include $170,000 to provide for 16 full-time positions, consultants and experts to be compensated on a "when actually employed" basis and related support costs for the three months' activity in Fiscal Year 1968. As indicated, $75,000 of this amount may not be needed for the purpose originally proposed.

	Actual, fiscal year 1966	Estimate, fiscal year 1967	Estimate, fiscal year 1968
3. Architectural design	$24,000	$71,000	$20,000

The Office of Architecture is responsible for the quality of design of all visible features of the rapid transit system, e.g., stations and transfer terminals, with their furnishings and equipment, and all exterior structures. In large measure, the future patronage of the system will depend on its attractiveness and the excellence of its design. The impact of the system on its surroundings will require the most sensitive design treatment in order that the amenities of affected neighborhoods may be enhanced.

The architectural-design program is governed by the requirements of the construction schedule, prepared by the Office of Engineering, and is intended to implement that schedule. It has two phases:

1. System-wide "concept" design, including criteria and standards and preliminary drawings for the various stations and structures and for continuing control of work to be performed in the second phase.
2. Production of plans and specifications for actual construction and supervision of construction, to be guided by design policies established during the first phase.

In the first phase, consultants are employed to extend the Agency's staff, enabling the necessary range of design talents to be applied quickly and economically, as required. In this phase, the scope of work for final design of stations and structures is determined so that the latter can be performed under fixed-fee contracts, to the advantage of the government. At the same time, criteria are established for controlling the subsequent design program. During this phase, close coordination is maintained with the Office of Engineering, with the Office of Planning and Finance, and with various agencies of the Federal, and District of Columbia governments. Exhibits and models for submission to these agencies and for public presentations will be prepared by the consultants, whose product will be monitored continually by the Office of Architecture.

In the second phase, Architect-Engineer firms will be employed to produce final plans and specifications (bid documents) for actual construction of portions of the system. This work will be monitored jointly by the Office of Architecture and the Office of Engineering. Design controls for this work, established during the first phase, consist of general plans and directive drawings and standard details and specifications.

The authorized strength of the Office of Architecture for the current year is as follows:

Senior architect, GS-15 (Director)	1
Architect, GS-14	1
Architect, GS-12	1
Architect, GS-11	1
Secretary, GS-5	1
Total	5

During the first half of Fiscal Year 1967, the Office of Architecture has been concerned with system-wide conceptual design and the preparation of preliminary drawings for stations scheduled for early construction. Coordination of these drawings with other government agencies, including approvals when required, is a necessary but time-consuming process which must be completed before final-design contracts can be negotiated. Final design contracts are to be initiated at a steadily increasing pace during the second half of Fiscal Year 1967.

These estimates include $20,000 for this activity to provide for 5 full-time positions, and related support costs during the first three months of FY 1968.

	Actual, fiscal year 1966	Estimate, fiscal year 1967	Estimate, fiscal year 1968
4. Real estate acquisition and relocation assistance		$27,000	$10,000

The construction program of the Agency will require the acquisition of certain easements to permit the subway tubes or boxes beneath the surface of private property and the purchase of other property for the operation of the system. Authority is contained in the basic legislation of the Agency for condemnation of property but it is also provided that no action in condemnation of any property shall be commenced in behalf of the Agency until a reasonable effort has been made to negotiate with the owner of the property. All negotiations and negotiated purchases will be handled by the Agency. Condemnation litigation will be conducted by the Department of Justice on behalf of the Agency

The acquisition program for Fiscal Year 1966 included purchase of one parcel at a cost of $1,150,830. The program for Fiscal Year 1967 involves over $5 million and the program for Fiscal Year 1968 will be in excess of $11 million involving the leasing of 10 parcels, acquiring easements on 54 parcels, and purchasing segments of parcels along the B&O Route in the District of Columbia and Maryland. In addition, the Agency will be involved in the readjustment and/or relocation of public utilities interfering with construction activities.

The Office of Real Estate Acquisition and Relocation Assistance has the responsibility for the implementation of these programs in collaboration with the Office of Engineering and the Office of General Counsel.

For the current year the authorized strength of this Office is:

Realty specialist, GS-14	1
Real estate negotiator, GS-11	1
Secretary, GS-4	1
Total	3

These estimates include $10,000 for three full-time positions and related support costs for the 3-month period of activity in FY 1968.

	Actual, fiscal year 1966	Estimate, fiscal year 1967	Estimate, fiscal year 1968
5. Executive direction and administration	$277,000	$315,000	$120,000

This activity provides for (1) the Offices of the Administrator and Deputy Administrator, (2) the Office of the General Counsel, (3) the Office of Public Information and Community Services, and (4) the Office of Administration.

(1) Office of Administrator and Deputy Administrator

The Office of the Administrator and Deputy Administrator is concerned with the overall policy and executive direction of the Agency. The Deputy Administrator also serves as the principal Contracting Officer for the Agency in addition to other supervisory responsibilities.

The authorized strength of the Office for the current year is as follows:

Administrator (statutory position)	1
Special assistant for congressional liaison, GS–16	1
Confidential assistant, GS–11	1
Deputy Administrator (statutory position)	1
Contract specialist, GS–13	1
Secretary, GS–9	1
Total	6

These estimates include $40,500 for six full-time positions and related support costs for the three months in Fiscal Year 1968.

(2) *Office of General Counsel*

The General Counsel is the principal legal advisor of the Administrator and the chief law officer of the Agency. Under his direction, the Office of the General Counsel is responsible for all of the legal work of the Agency including consideration of legal problems relating to the broad policy aspects of the Agency's programs, the issuance of opinions on legal questions arising in the administration of agency program, the preparation and review of administrative rules and regulations, analysis and drafting of proposed legislation, the preparation and interpretation of contracts, leases, deeds and similar documents, representation of the Agency in administrative proceedings or quasi-judicial hearings held in connection with the administration of the Agency's program and arising out of its contracts or otherwise, assistance to the Department of Justice in the preparation of civil litigation cases arising out of the Agency's work, including eminent domain and other proceedings.

The authorized strength of the Office of General Counsel for the current year is as follows:

Attorney-advisor, GS–16 (General Counsel)	1
Attorney-advisor (procurement), GS–15	1
Attorney-advisor (real estate), GS–14	1
Secretary, GS–7	1
Secretary, GS–5	1
Total	5

These positions are needed to handle the workload of the Office in providing legal services respecting the preparation of necessary contracts, and their administration including legal services relative to change orders, claims, disputes, etc. This Office is also engaged in numerous projects involving proposed legislative recommendations and in a variety of matters concerned with the transition of the Agency from Federal status to the interstate compact organization.

These estimates include $33,100 for five full-time positions and related support costs for the three months in Fiscal Year 1968.

(3) *Office of Public Information and Community Services*

The Office of Public Information and Community Services is responsible for the public information and public relations programs of the Agency as well as the internal information facilities. The office also maintains the necessary liaison with the various media—press, radio, and television as well as the general public. In this latter function, the Office of Public Information and Community Services deals with federations and groups representing more than 500 organizations in the National Capital region.

The authorized strength of the Office for the current year is as follows:

Information officer, GS–15 (Director)	1
Information specialist, GS–9	1
Secretary, GS–6	1
Total	3

Because the Agency's program is local in application it will affect physically, financially, and personally every citizen of the region. There is a high degree of interest in the project. In consequence, the Agency's public information and community service work is *in response* to demands from media, organizations, and the general public for personal briefings and information concerning station design, routes, proposed service, location of facilities, effects and timetables of construction, and similar matters. In the spirit of the President's increased efforts to better the Government's service to the public, it is incumbent on the Agency to provide detailed and personal information services.

In the process of participating in this relationship of the Agency with the community, this office is able to relieve the technical and executive staff of the tasks which develop, resulting in more efficient operation of the total staff. There is, of course, the further advantage that close relations with the community through this office assure that Agency staff is aware of public reactions to the Agency's Programs with regard to transportation problems.

Because architectural and engineering plans, including initial construction activity, will become specific in FY 1968, the workload and requests for services can be expected to increase greatly. In addition, the Office is now furnishing services to the Washington Metropolitan Area Transit Authority in response to the directive by the Congress that NCTA cooperate with the Authority.

These estimates include $15,600 for three full-time positions and related support costs for the three months in Fiscal Year 1968.

(*4*) *Office of Administration*

The Office of Administration is responsible for all management services including personnel, budget planning and execution, accounting and fiscal activities, mail and records, space, equipment, and similar matters.

The authorized strength of the Office of Administration for the current year is as follows:

Administrative officer, GS-15 (Director)	1
Personnel assistant, GS-13	1
Staff assistant, GS-12	1
Administrative clerk, GS-5	1
Clerk-stenographer, GS-5	1
Total	5

The Agency has an agreement with the General Services Administration to provide certain services such as payroll, purchasing, printing and reproduction, machine accounting and related "housekeeping" functions. The Agency reimburses GSA for these services.

These estimates include $30,800 for five full-time positions, and other expenses of this office for the three-month period in Fiscal Year 1968 including $3,750 for reimbursement to the General Services Administration for agency-wide "housekeeping" services and $1,000 for maintenance agreements for the existing laborsaving devices in the Agency.

SUMMARY OF ESTIMATES BY OBJECT OF EXPENSE

11 *Personnel compensation.*—The estimate of $244,000 includes $239,000 to finance 66 full-time positions and $5,000 for the employment of consultants and experts to be compensated on a "when actually employed" basis.

12.0 *Personnel benefits.*—The estimate of $17,000 includes funds to cover benefits authorized by law including retirement contributions, health benefits, life insurance, and Federal Insurance Contribution Act taxes. The estimate is based on a percentage of the net personnel costs. The estimate also includes $350 for reimbursement to Bureau of Employees' Compensation, Department of Labor pursuant to the 1960 amendments to the Federal Employees' Compensation Act (5 U.S.C. 785).

21.0 *Travel and transportation of persons.*—Includes $3,000 to cover official travel expenses and per diem costs for the regular full-time staff and consultants and experts employed on an intermittent basis.

23.0 *Rent, communications, and utilities.*—Includes $5,000 for rent, communications and utilities. The principal item of expense in this account is telephone services.

24.0 *Printing and reproduction.*—The estimate includes $4,000 to cover miscellaneous printing and reproduction services including the cost of printing an annual report as required by the authorizing legislation.

25.1 *Other services.*—Includes $121,000 for special contractual services for the following type studies and projects:

1. Uptown Centers Studies.
2. Non-Fare Box Revenue.
3. Graphics and special presentation materials.
4. Maintenance contracts on mechanical equipment.

(NOTE.—Other projects, totalling $75,000, in the original submissions to the President are not now included in the work programs of the Agency. The amount is included in the total in order that the schedules will conform to the President's budget.)

25.2 *Services of other agencies.*—The estimate of $4,000 includes $3,000 for payment to the General Services Administration for miscellaneous administrative services provided on a reimbursable basis and $1,000 for reimbursement to the Public Health Service to cover medical services and to the General Services Administration to cover miscellaneous charges for building management services.

26.0 *Supplies and materials.*—Includes $2,000 for consumable drafting, engineering and clerical supplies.

PREPARED STATEMENT

Chairman HAYDEN. Mr. McCarter, you will please file your written statement in the record, and summarize it for the committee.

Mr. MCCARTER. Thank you, Mr. Chairman.

(The statement follows:)

Mr. Chairman and members of the subcommittee, I appreciate this opportunity to appear before you today to support NCTA's appropriation request for Fiscal Year 1968.

This year, the Agency is in a posture quite different from that of previous years.

During its last Session, the 89th Congress enacted Public Law 89–774 giving the Congress' consent to the Washington Metropolitan Area Transit Authority Compact among Maryland, Virginia and the District of Columbia. The compact creates a new tri-state organization, the Washington Metropolitan Area Transit Authority, empowered to take over and continue the work begun by NCTA, and to develop and carry out plans and financial arrangements for a regional rail rapid transit system.

Under Section 3(a) of the Compact Consent Legislation, the Agency's functions and duties—namely, NCTA's responsibility for the basic subway system approved in the National Capital Transportation Act of 1965 (P.L. 89–173)—will be transferred to the new Authority effective September 30, 1967—about seven (7) months from now.

This means that NCTA's funds requirement for Fiscal Year 1968 is limited to the first three months of the new period—next July, August and September.

The request before the Subcommittee now is for $400,000 of administrative funds to carry the Agency over this three month period. Unlike previous years, there is no request pending for funds under the appropriation "Construction, Rail Rapid Transit System". During the three months involved, the Agency will be winding-up its affairs and will have no need for additional engineering and design funds, or for construction appropriations.

In effect, we are not asking for new money. Because of the advent of the compact it will not be necessary to obligate all the administrative funds the Subcommittee provided the Agency for the current year, so we are requesting a reappropriation of $400,000 out of the remaining 1967 funds.

Section 3(b) of the Compact Consent Legislation provides that effective September 30, the Department of Housing and Urban Development and the Government of the District of Columbia will be authorized to seek the necessary construction funds through the appropriate Subcommittees of the Appropriations Committees, for payment to the new Authority.

Until the transfer date, NCTA will remain responsible for moving the subway program forward. There will be no slackening of activity. To assure that the basic program is not delayed, the new Authority has indicated its desire to take over the present NCTA staff. While employment decisions are going to have to be made on an individual basis, it is hoped that the bulk of our trained people will stay with the project.

The funds being requested today will permit the Agency to continue at its presently authorized strength of 66 full-time positions and will provide the related support costs for the three month period. They will also enable the Agency to initiate two planning projects that will be needed as part of the Agency's final design program during the first quarter of Fiscal Year 1968.

The first is an "Uptown Centers Study". The new rapid rail system will greatly improve accessibility to many parts of Washington. It will encourage development of new centers of increased activity such as shopping centers, office buildings, light industry, and apartments within the service area of the transit stations.

This Uptown Centers Study will be undertaken cooperatively with the District of Columbia Government, the National Capital Planning Commission, and other interested agencies. It will provide important data concerning:

1. The impact of such development on transit ridership, revenues and operations.
2. Requirements for additional bus transfer and parking facilities, and
3. Requirements for additional transit station facilities.

The other special project is a study of "Non-Fare Box Revenue Facilities". The transit system will include a number of convenience type concessions and controlled advertising within its stations. The project will develop necessary information concerning (1) appropriate types of concessions at particular station locations, (2) specific advertising concepts, and (3) the space and any other special requirements needed to accommodate such activities.

All these matters bear importantly on station design, and the results of these two studies will be needed as part of the final design activity that will be underway before next September.

This present request for a re-appropriation of $400,000 under the Salaries and Expenses appropriation will fund these activities, and is needed to meet the Agency's other requirements during the three month period involved.

Turning now to the program itself, I would like to bring the Subcommittee up-to-date on the status of our work.

During the past year, the Agency has concentrated on the task of preparing the construction standards, design criteria, specifications, and general plans needed in order to let final design contracts on the portion of the system to be constructed first. The engineering work has included a definitive subsurface soils investigation and testing program along the routes of the system to develop detailed recommendations as to design criteria, and foundation underpinning and construction techniques and procedures.

On the architectural side, as the President requested, we've conducted a worldwide search for design concepts and ideas that can be used to make the Washington system attractive as well as useful. The Agency's consulting architects have surveyed all the major systems in other countries. They have developed conceptual designs for handsome, brightly lighted, spacious, unobstructed stations. Their concept envisages a consistent basic style throughout the system, but also provides for variety among individual stations, so as to reflect the special needs of each neighborhood as well as the engineering necessities.

I am pleased to say that all of the engineering and architectural work has been moving forward satisfactorily.

As I think the Subcommittee is aware, under the National Capital Planning Act of 1952 the Agency's plans must be reviewed in successive stages by the National Capital Planning Commission. At this point, the Commission has reviewed and approved the platform locations and access points for the transit station at Judiciary Square and three of the stations on upper Connecticut Avenue. The platform locations of the three downtown stations beneath G Street, N.W. have also been approved, and our architectural concepts have been approved in principle by the Commission of Fine Arts.

The next phase in the work is final design. The Agency will soon be in a position to begin letting final design contracts covering approved elements of the system. The first actual construction project is expected to begin during the Summer of 1968.

Another matter of special interest is the Agency's up-to-date traffic study. During its hearings in September, 1965 and last year the House Subcommittee expressed great interest in having an independent analysis made of the patronage and revenue potential of the authorized rail rapid transit system. Such a study has been done, and included a complete origin and destination survey of all bus riders in the National Capital Area. The new estimate of 1980 traffic is within 2½ percent of the Agency's original forecast.

In other respects, however, the new study has produced some unanticipated results.

For example, it demonstrates that the Columbia Heights Route of the authorized system is a very weak traffic generator and will produce less than one-half the passenger volume originally forecast. It raises such serious questions concerning the economic justification of the Route, that the Agency is prepared to recommend its deletion from the system.

The new data also show that the number of rail transit riders who will use bus transportation at both ends of their rail trip is going to be considerably greater than was originally estimated.

These are the passengers who will arrive at outlying rail transit stations by bus, ride the system to Downtown G Street, and then transfer again to buses for the final leg of their trip to work.

Contrary to earlier expectations, the new study shows that with the present downtown alignment—all downtown stations are in G Street—there will be an unusually heavy volume of bus traffic between the G Street subway stations and the federal employment area in Southwest Washington. Assuming 70 passengers per bus, it is estimated that during the peak hour 50 buses will be needed at the 8th and G Street Station and 75 at the 12th and G Street Station to accommodate transferring passengers, the bulk of whom will be destined for or coming from the Southwest Area.

This Southwest situation is the most striking change that has come about since the plans for the present system were prepared. Prior to the 1965 Act, the National Capital Planning Commission estimated that there would be some 46,000 people employed south of the Mall in 1980.

There has been a radical change. It is now estimated that by *1971* or about the time of the first subway operations—an estimated 85,000 jobs will be located in this part of downtown Washington alone, a downtown daytime population larger than the entire downtown populations of such cities as Seattle, Pittsburgh and Baltimore.

These changed conditions and the new traffic data emphasize the desirability of early subway transit service to the Southwest area. In the Agency's view, the need is such that a line south of the Mall should be built as part of the basic system.

Consequently, NCTA has developed a plan that would modify the presently authorized system in two major respects. First, in view of the new traffic data the proposal would eliminate the present Columbia Heights Route. Second, it proposes that service be provided the Southwest employment area by extending the present Benning Route west from Second Street, S.E. to Canal Street at the foot of Capitol Hill. From there, the line would bend south of Independence Avenue to the vicinity of 7th and D Streets, S.W., then northwest to 12th Street and Independence Avenue, and north along 12th Street through the Federal Triangle to Eye Street, N.W. where the line would join and become a part of the present Pentagon Route. The new alignment would include three stations in Southwest and one in the Federal Triangle.

With the deletion of the Columbia Heights Route, the proposed change would add an estimated $41.5 million to the overall cost of the basic system. The traffic data show, however, that in 1980 with the Southwest alignment, the modified system will attract some 22,300,000 additional passengers a year, and added annual revenue of approximately $3.5 million. Assuming a 5½ percent interest rate, this would be sufficient to fund the added cost of the change over a 40 year period.

My opinion is that the modified basic system would produce a better overall system in terms of operating efficiency and flexibility. It would eliminate a number of complex and difficult engineering problems presented by the present alignment. And it would provide a much better framework on which to build the regional system.

Mr. Chairman, since 1960 this Subcommittee has provided all of the planning money and the bulk of the program funds that have sustained and advanced the Transit Development Program. It is because of your continued interest and assistance that the subway system is to become a reality for the Nation's Capital. Since NCTA will be going out of existence next September, this is probably our last appearance before the Subcommittee. I want you to know that the Agency appreciates all of the assistance the Subcommittee and its very able Staff has given it over the years. And I want to add my personal thanks for the many courtesies extended to me and my staff. The Subcommittee has always been eminently fair in its consideration of the Agency's requests.

This Transit Development Program is essential for the orderly development and preservation of the Nation's Capital. By moving it ever closer to fulfillment, you have done a great service to the *Nation*—not just the residents of the Washington area.

My staff and I are grateful for all you've done.

We are available to provide any additional information the Subcommittee may desire in connection with our present request.

Thank you, Mr. Chairman.

SUCCESSION OF WASHINGTON METROPOLITAN TRANSPORTATION AUTHORITY

Mr. McCARTER. I appreciate the opportunity to appear before you. This agency is in a different situation than previously. As you know, the 89th Congress, late in the last session, adopted Public Law 89–774, granting its consent to an interstate compact, creating the Washington Metropolitan Area Transportation Authority. The Authority became legally effective on February 20 of this year, and under the legislation the National Capitol Transportation Agency will go out of business on September 30 of this year, to be succeeded by the Authority. So we are asking for administrative funds to carry us to the September 30 date, for the 3 months July, August, and September.

SALARIES AND STUDIES

The amount requested is $400,000 and in addition to funds for salaries, it also includes money for two studies, which relate to essential planning activities. One is an uptown center study, which would be done in cooperation with the National Capital Planning Commission. As you know, as a subway station is constructed, it affects the surrounding area, and the National Capital Planning Commission wants to coordinate the development of the community around each subway station in relation to the way the subway station is designed.

The other study is for non-fare-box revenue facilities which also relate to station design. In other words, what kind of commercial activities and advertising are you going to put in, and things of that nature. As we design the subway stations, we want to make a study of what appropriately can be put in the station for non-fare-box revenue, and still follow the President's directive that we build the finest stations in Washington of any place in the world. As a matter of fact, he suggested that we examine all of the subways of the world, to be sure that we were building the very best.

ARCHITECTURAL SURVEY

The architects that we engaged made a survey of all the subway operations in the world. I personally went on a trip last summer with a national transit group, in a workshop session, where we went to Moscow, Stockholm, Berlin, Milan, Paris, and London, to see if they have anything better than systems in this country.

INDEPENDENT TRAFFIC STUDY

The Interior and Related Agencies Subcommittee of the House Appropriations Committee requested that we have a new independent traffic study of the basic system to determine whether or not the previous studies and projections that had been made were proper, and whether or not we had made the right estimates of the amount of traffic, the amount of income, and so forth. That study has just been completed, and it indicates that there ought to be certain changes in the basic system.

One of the things that we found was that with only a G Street subway line downtown, the feeder buses from the central downtown line to Southwest Washington, would create excessive bus congestion. There would be so many feeder buses that it would almost be more buses downtown than there are now. In contrast with the original plans, which estimated that by 1980, there would be 46,000 employees in Southwest Washington, they now predict that there will be 85,000 by 1971. So I have suggested two things with respect to the basic system. I have suggested that the Columbia Heights line, which did not show up as a good traffic producer, be eliminated, and that we have a line in the vicinity of Independence Avenue, to serve this growing Government complex in Southwest.

Such a modification would cost a net of $41 million more than we had anticipated for the basic system, but the extra passengers and revenue as a resut would more than amortize the extra cost and the additional bonds that would be necessary to finance it.

COOPERATION WITH AUTHORITY AND BASIC SYSTEM CONTINUANCE

Now I say again that the compact authority is to take over on September 30. In the meantime, pursuant to the compact consent legislation, the Agency is required to cooperate with the new Authority, and give them services, so that there will be a proper transition. Those services are being provided on a reimbursable basis. In other words, as our present staff does a job for the Authority, it is done on a reimbursable basis, so that we are gladly working with them, but in the meantime, we are continuing full speed ahead on the basic system.

Thank you.

TRANSFER OF FUNCTIONS TO WASHINGTON METROPOLITAN AREA TRANSIT AUTHORITY

Chairman HAYDEN. Thank you.

The Washington Metropolitan Area Transit Authority has now been created, and its existence was announced on February 20. Is the Authority going to assume all of the functions, duties, and responsibilities of the National Capital Transportation Agency when the Agency goes out of existence on September 30?

Mr. MCCARTER. Yes; the legislation provides that the President, as of that date, will transfer all of the functions to the Authority, except the personnel, which he couldn't transfer, but they have indicated that they want to take the personnel over.

Chairman HAYDEN. Will the functions absorbed by the Authority include the actual construction of rapid rail transit systems?

Mr. McCARTER. Yes.

PREPARATION AND SUBMISSION TO CONGRESS OF REGIONAL TRANSPORTATION PLAN

Chairman HAYDEN. Is it expected that insofar as the activities of the National Capital Transportation Agency are concerned the Washington Metropolitan Area Transit Authority will operate in essentially the same manner?

Mr. McCARTER. Well, it is a tristate agency, and they are to prepare a regional transportation plan. You see, the plan that we had was just what I call a basic transportation system. The Authority is to prepare a regional transportation plan, determine the cost, determine the net project cost, determine how it would be financed, and then come back to Congress with that plan.

ANTICIPATED 1967 FUNDS OBLIGATIONS

Chairman HAYDEN. I see.

Obviously, you do not expect to obligate the $400,000 which you indicate should be reappropriated, but how much of the other $1 million appropriated for fiscal year 1967 do you actually expect to obligate before June 30 of this year?

Mr. McCARTER. I will ask Mr. Tomey to answer that.

Mr. TOMEY. We anticipate that substantially most of the $1 million will be obligated by June 30, Mr. Chairman. As of February 28, we had obligated approximately $500,000, or about half, so on a pro rata or monthly basis, we are about 2 months behind, but we do have some activities that we think may utilize most of those funds. Some of the costs will be offset, of course, by reimbursements from the Authority for the work that we perform for them, so the net obligation may be somewhat less than a million dollars, but not too much less, sir.

TRANSITION EXPENDITURES

Chairman HAYDEN. In an early part of your justification, you indicate that the $400,000 which you request will cover "certain expenditures in connection with the transition to the interstate authority." What are these particular expenditures?

Mr. TOMEY. The precise amounts have not been identified, sir, but in connection with the transition, there are a variety of legal problems affecting the transfer of the assets of the agency, the active contracts, and leading up to the transition of personnel. In addition, the working programs of the Agency, engineering architectural and planning activities, will also be transferred, but they are not identifiable in a specific dollar amount.

AUTHORIZED, FILLED, AND UNFILLED POSITIONS

Chairman HAYDEN. All right.

All of the authorized personnel strength which you list in your justifications statement are those which you requested in your fiscal year 1967 budget. Have all of the positions which you requested last year been filled at any time since last July 1?

Mr. TOMEY. No, sir. The budget contemplated a staff of 66 full-time positions, and at the present time, we have 42 position filled, so there is a lag of 24 positions, and many of these very likely would continue into fiscal year 1968.

UNBUDGETED SEVERANCE PAY AND TERMINAL LEAVE

However, I would point out that while there may be a savings as a result of not reaching full strength; there are two rather sizable unbudgeted items, of severance pay and terminal leave, which we think could offset any savings. As a matter of fact, they would more than offset any savings resulting from not reaching our full strength, sir.

ACTIVITY PERSONNEL

Chairman HAYDEN. Will you please submit tabluations to show the actual positions filled as of today for each of the activities listed in your budget justifications?

Mr. TOMEY. Yes, sir. We will be glad to do that, sir.

(The information follows:)

Employment by activity (as of Mar. 15, 1967)

	Permanent	Temporary	Total
Office of Engineering	11		11
Office of Planning and Finance	8	2	10
Office of Architecture	2	1	3
Office of Real Estate Acquisition and Relocation Assistance	1		1
EXECUTIVE DIRECTION			
Office of Administrator and Deputy Administrator	5		5
Office of General Counsel	4		4
Office of Public Information and Community Services	3		3
Office of Administration	4	1	5
Total	38	4	42

HIRING PERSONNEL FOR AUTHORITY ON REIMBURSABLE BASIS

Chairman HAYDEN. If the various offices are not up to personnel strength, do you believe that you can hire adequate personnel for a period of 3 months or less?

Mr. MCCARTER. Mr. Chairman, I might say that what hiring we are doing now is being hired for the compact on a reimbursable basis. I think you are right, that we couldn't hire the people for such a short period, if they thought they were only going to work for the Agency, but if they are hired on the basis that they will work for the compact, then they can be hired.

AUTHORITY ABSORPTION AND PAY OF NCTA STAFF

Chairman HAYDEN. In the press release of February 20, 1967, announcing the establishment of the Board of Directors of the Washington Metropolitan Area Transit Authority, it is stated that, "To insure uninterrupted progress in the development of the complete system the Authority expects to absorb the NCTA staff of 40 on or before September 30." Do you know yet which of your personnel will be absorbed in this manner, and, if they are so absorbed, who will then pay their salaries? You or the Authority?

Mr. McCarter. If they are absorbed by the Authority, of course, they will be paid by the Authority. Now the number that they will absorb will depend on several factors. You see, our employees are all Federal employees. They have certain Federal benefits. If they go with the Authority, it is a non-Federal agency and each employee will have to determine as an individual basis whether or not to go with the Authority or whether to seek other Federal employment. These decisions will depend somewhat on the personnel plan which the new Authority is developing, particularly the various benefits. They are working diligently on a personnel plan to try to attract our employees. But no employee yet has committed himself as to whether he is going to go with that agency, or whether he is going to try to get another job with the Federal Government.

1967 TASKS

Chairman Hayden. Last year in presenting your justifications for a salaries and expenses appropriation you indicated the number of tasks to be accomplished during this year. How have you progressed on those?

Mr. McCarter. We have progressed on all the major tasks except final design. We have not gone into final design yet, although we are ready to go into final design on certain sections. We are still discussing with ourselves and others whether or not we want to go into final design on sections, with certain other sections left open. However we are ready, now, on several sections, to go into final design.

Chairman Hayden. In the statement dated January 27, 1967, Messrs. Quenstedt and Lyon indicated that it was expected that the National Capital Transportation Agency would start the first of many final-design projects by March of this year.

Mr. McCarter. Yes.

Chairman Hayden. What final-design projects have you underway at this time?

Mr. McCarter. We have none underway. We are ready now, but we have none actually underway.

SALE OF REVENUE BONDS

Chairman Hayden. What, if any, progress have you made with respect to sale of revenue bonds?

Mr. McCarter. Well, the revenue bonds would come in after you have used all of the grant money. Now it was expected before the compact was formed that this agency would be coming back to Congress for authority to issue revenue bonds, and it was anticipated that NCTA would have been converted to a Federal corporation, before any bonds were issued. Now, instead of that, the compact authority was formed and it would be the organization to issue the bonds. But such revenue bonds would not be issued until after the $150 million in grant money was expended. The authority is just about to employ financial consultants to advise on the floating of the bonds.

STUDIES ON UPTOWN CENTERS AND NONFARE BOX REVENUE FACILITIES

Chairman HAYDEN. I note under your outline of needs for traffic and system financial planning a request for $30,000 to conduct studies relating to uptown centers and to nonfare box revenue facilities. Have you done nothing on these two subjects since your existence?

Mr. MCCARTER. No, that is provided for in next year's budget, the uptown centers, will depend on how fast the National Capital Planning Commission works, because we will work with them, and the nonfare box revenue will depend on how far along the architects are on their stations, and so forth.

Chairman HAYDEN. Do you feel it would be possible in the space of 3 months for you to initiate and complete these studies?

Mr. MCCARTER. Well, we expect them to be completed but if they are not, they would be taken over by the compact authority, as they take over all of our functions.

SEVERANCE PAY AND TERMINAL LEAVE

Chairman HAYDEN. With respect to the same planning, you indicate that $75,000 may not be required during the 3 months of the appropriation period for other studies but should be retained to cover contingencies incident to the termination of the Agency's activties. Indicate the nature of these contingencies.

Mr. TOMEY. These are the items I adverted to previously, Mr. Chairman, severance pay and terminal leave. Our calculations at this time indicate that these requirements could be as much as $165,000. Now to partially offset that, we recognize we will have a savings in personnel by not having reached our full strength. This, I calculate to be about $80,000, plus $2,000 for benefits. Then the $75,000 we will not need for studies would provide $157,000 to apply against these unbudgeted items. We think this is close enough, the estimate of $165,000 could be off, so we would ask for this flexibility in appropriating the full $400,000 to cover this contingency, sir.

Mr. MCCARTER. I was surprised to learn that when an agency is discontinued, and the employee is not eligible for retirement, as a result of that, there is quite an amount of severance pay. It is quite a large amount of money.

STATUS OF CONCEPTUAL DESIGN

Chairman HAYDEN. What is the status of the systemwide conceptual design and the preparation of preliminary drawings for subway stations?

Mr. MCCARTER. We have, I think, the conceptual design completed from Rhode Island Avenue through Judiciary Square, G Street, and up Connecticut Avenue, and in some respects, for the entire system, because we have taken soil samples, and we have mapped the entire system, but leading up to final design, we are almost ready from Rhode Island Avenue to Van Ness on the Connecticut Avenue route.

PLANNING COMMISSION STATION APPROVALS

Now the stations are quite well along, and the Planning Commission has approved four stations on Connecticut Avenue, has approved Judiciary Square, has approved the location of the other two stations on G Street, but not the entrances, because we are working with the District of Columbia Redevelopment Land Agency to determine the nature of the area around those stations, and hoping that the redevelopment and the station entrances can go along side by side. An early proposal was to make G Street a pedestrian street, which we did not adopt. Then the next plan was to put in sidewalk entrances, which aren't as desirable as we would like them to be, so now we are working with RLA to try to find better entrances to those stations.

TRAVEL FUNDS REQUISITE

Chairman HAYDEN. In view of the short period of time for which this appropriation is requested and the probability that there will be fewer employees than the authorized strength, is $3,000 actually necessary for travel and transportation of personnel?

Mr. MCCARTER. Well, the staff that will go with the compact must keep up to date on what is going on in the field. For instance, and that is not in next year's appropriation, but the finest new system on this continent is in Montreal, Canada. Some members of my staff and most of the board of the authority are going to a rail transit meeting in Montreal, the first week in April, to make a real workshop study of that operation, where they do have beautiful stations, where the riding was double what they had anticipated, and so forth, it is essential to go to such places to look at new developments, periodically and even this staff, and they are going to be a continuous staff, would have to do some of that.

1967 LAND ACQUISITION AND CONSTRUCTION FUNDS

Chairman HAYDEN. Last year, in this bill, $9,055,000 was provided for land acquisition and construction. In addition 50 percent of that amount was made available in the District of Columbia appropriations bill. What, actually, have you been able to accomplish during the past year with those funds?

Mr. TOMEY. Those appropriations, coupled with fiscal year 1966 funds, Mr. Chairman, provide a total availability of $19.5 million. As of February 28, we had obligated $4,476,000, of which $1,150,000 was for procurement of one parcel of land. The balance had been used for contracts, essentially in the development of our systems standards, criteria, specifications, architectural conceptual activities and soil testing programs.

ACCOMPLISHMENTS UNDER CONSTRUCTION APPROPRIATIONS

Chairman HAYDEN. Would you put in the record a list of accomplishments under you construction appropriations since the beginning of the National Capital Transportation Agency?

Mr. Tomey. Yes, sir.

(The list follows:)

Summary of accomplishments with construction funds

Appropriation title	Fiscal year	Amount of appropriation	Obligations	Action
Land acquisition and construction.	1962	$1,000,000	$89,000	Projects included an engineering study of land acquisition costs and a reimbursement to the Virginia Department of Highways for costs of wider bridges on Route 66 at beltway interchange.
Do	1963	400,000		
Construction, rail rapid transit system.	1966	6,000,000	2,660,630	Development on a systemwide basis of the surveying, mapping, design standards and criteria, standard specifications for construction and definitive subsurface exploration program. Initiated work on general engineering plans on segments scheduled for early construction. Acquisition of 1 large parcel of real estate. Scheduling for design and construction phases.
Do	1967	13,582,500	1,815,650	Continuation of conceptual engineering and architectural programs to a point permitting an imminent start of final design activities. Subsurface explorations have continued on schedule.

Note.—Unobligated balance of appropriation transferred as follows:

Fiscal year	Amount	Transferred to—
1965	$500,000	Salaries and expenses, NCTA.
1966	490,000	Do.
1966	321,000	Construction, rail rapid transit system.

ANTICIPATED OBLIGATION OF CONSTRUCTION FUND

Chairman Hayden. How much of your construction fund do you expect to have obligated by the time you go out of existence on September 30?

Mr. McCarter. Frankly, that is a question I can't answer. It will depend on how much final design is entered into, and the President said in his message on the compact that the new compact board was to be my advisers. I will consult with them. Any final design contract that we would let now would have to be a final design contract that carried over, and there will be legal questions, as to how such contracts may be transferred from NCTA to the new authority. We expect to start some final design, but I can't say how much yet. I don't know.

CONSTRUCTION FUND EXPENDITURES

Chairman Hayden. Of your construction funds, what is the total amount you have expended thus far?

Mr. Tomey. If you mean expenditures, I do not have that figure available. May we supply it for the record?

Chairman Hayden. You can put it in the record.

(The information follows:)

As of February 28, 1967, expenditures under the appropriation "Construction, Rail Rapid Transit System" totalled $2,794,596.

CONSTRUCTION FUND OBLIGATION

Chairman HAYDEN. Of your construction funds, what is the total amount which you have obligated thus far?

Mr. TOMEY. $4,476,000.

ANTICIPATED CONSTRUCTION CONTRACTS

Chairman HAYDEN. What construction contracts do you expect to let between now and September 30, to whom, and in what amounts?

Mr. MCCARTER. Those will be final design contracts. To whom, we don't know. When a final design contract is proposed, a contractor evaluation board will be established to examine the qualifications of many engineering firms, and the procedure is that they make a recommendation of three, in order of preference. That is referred to me. I either select the first or second or third, refer it to Mr. Quenstedt, who is our contracting officer, for negotiation, and then we award the contract.

Chairman HAYDEN. Any questions?

SEVERANCE PAY AND TERMINAL LEAVE

Senator BARTLETT. Just a few. Not very many, Mr. Chairman, because you have covered the ground so thoroughly, and have gone so far, both on the surface and beneath the surface, that I don't have many questions.

But I do want to ask this: If the severance pay and terminal leave exceed your available funds, what procedures do you intend to follow to come into possession of the needed money?

Mr. MCCARTER. We anticipate that the $400,000 would cover those, as Mr. Tomey has said. If there isn't enough money, I don't know what happens.

Mr. TOMEY. That would raise a serious fiscal problem. I assume that we would have to ask Congress for relief. This relief might be to make available certain unliquidated obligations of prior year appropriations.

Senator BARTLETT. But this may be a little bit chancy.

Mr. TOMEY. That is correct, sir. Of course, our estimate has been made on the liberal side. I have anticipated the maximum amounts of severance pay and terminal leave, and if any of our employees do not accept positions with the Authority but continue in Federal employment, then they would not be entitled to severance or terminal leave payments, so this would reduce the estimate that I have given, sir.

INVOLUNTARY SEPARATION FROM FEDERAL SERVICE

Senator BARTLETT. Now if an employee has been with the Federal Government long enough to have had retirement privileges, and leaves the job involuntarily, he or she gains important advantages in respect to the person who retires under normal circumstances, is that right?

Mr. TOMEY. Well, there are two situations, Senator Bartlett. One is where the person is eligible for an immediate annuity, and the other is where the employee is entitled to a deferred annuity. In the first situation, if they have been forced to retire, I don't know what special advantages they have except that they are eligible for 20- or 25-year discontinued service retirement. There may be a reduction by virtue of being underage, and the lesser number of years affects the amount of the annuity.

Senator BARTLETT. I think it goes further than that. I think involuntary retirement gives certain special monetary benefits to those retiring.

Mr. MCCARTER. I don't know what they are, but we did have a civil service specialist look over the record of each employee, and advise them exactly what their rights are. For instance, my secretary, who is eligible for retirement, she knows now exactly what her retirement would be under these circumstances. Now I don't know what it would be under other circumstances.

Senator BARTLETT. I can inform you that involuntary retirement gives advantages. And I will add that for a few frightful hours on a November day last year, I thought I was going to be involuntarily retired without any of those advantages.

Mr. MCCARTER. I see.

[Laughter.]

ABSENCE OF TRANSPORTATION ROUTES IN LOWER INCOME AREAS

Senator BARTLETT. Now this morning the Washington Post carried a full-length column on the lack of planning routes into the low-income areas, such as Shaw and Adams-Morgan, and made the argument that all or most everything that is being done is being done for the middle-class and upper-income groups.

MIDDLE-OF-WASHINGTON ROUTE

Mr. MCCARTER. We do not have a route up through what I call the middle of Washington, through the area where I live, for instance. In long-range planning, the Planning Commission and our staff have indicated that there should be a route up through that area but that doesn't mean that it is just for middle-income people. As a matter of fact, the heaviest route, according to our traffic engineers, will be the Benning route, which serves Anacostia and the Northeast area. Now in all of these areas, there must be bus feeders to the rapid transit system. I think there ought to be one up through the area in question, but we couldn't provide for it in the original program. The compact may be able to do that, but a rapid transit system must serve large concentrations of people. It is not like a busline. A rapid transit line must have adequate bus feeders, so that the rapid transit line will become even more useful to the people who use bus feeders.

COLUMBIA HEIGHTS LINE

We were told by the traffic engineers when we were considering the Columbia Heights line, that people headed for downtown would not get on the Columbia Heights line and to come in by rapid transit via a circuitous route, because the bus would take them in just as fast by a more direct route.

Rapid Transit Line Bus Feeder Service Requisite

Now there must be bus feeder service for rapid transit lines, we have one route on the B. & O. route and one on the Connecticut Avenue. There must be crosstown buses, for people who are going to destinations on the rapid transit, and as a matter of fact, I think the traffic survey indicated that substantially over 60 percent of the riders on rapid transit will have used buses to get to the rapid transit.

Now in Chicago, I found out that there were very few what I called walk-on rapid transit stations. In other words, every rapid transit station has to have a bus feeder, or a parking lot, or a place for what I call "kiss and ride," where the wife brings the husband or the husband brings the wife to the rapid transit, and I was surprised to find in Chicago that as many husbands bring their wives to rapid transit, because the wives work downtown and the husband works out in a factory some place, but you must have those combinations for a viable rapid transit station. You just can't afford a rapid transit station for what you call walk-ons, except in the heavy employment areas.

Anticipate Combination Bus and Rapid Transit Fare

Senator **Bartlett**. Even so, is there the possibility that in the situation here, you may force the lowest income groups into paying for the rapid transit ride plus the bus ride?

Mr. **McCarter**. Well, our plan was that the combination ride would be the same as a single ride. In other words, in making our studies, although we have had no negotiations with the bus company, we have assumed that a person using both bus and rapid transit would pay 25 cents. The person using rapid transit would pay 25 cents, and then in our studies, the allocation of income was 12½ cents to the bus, and 12½ cents to the rapid transit in that combination ride.

Now, in effect, that is what we have in Chicago. We have universal fare, and we keep the accounting records there the same way. We allocate to rapid transit that which is collected on rapid transit, allocate to buses that which is collected on buses, which comes to the same thing as half and half, you see.

Now some people argue that this allocation isn't fair, because they take a longer ride on rapid transit than they do on a bus, but that's the way we did it, and that's the way we had planned to do it here.

INTERRELATION OF FINAL DESIGN AND FINAL ROUTING

Senator **Bartlett**. Now one final question, or at least, I think the final one. Can you efficiently and fairly go into final design of the system, or even a part of it, until the final routing is known and approved?

Mr. **McCarter**. Well, that is a question that we have discussed with the Budget Bureau and the Advisor to the President on National Capital Affairs. We do know that certain parts of the basic system are fixed. Now, the parts that we don't know about are the junctions, which I am trying to eliminate and where the station will be on the Capitol Grounds. We are still negotiating with the Architect of the Capitol, and having some difficulties, but the Connecticut Avenue route, down to Farragut Square, is fixed. And the B. & O. route is also fixed. However, if we went into final design now, on the G Street portion, it would be spotty final design. It would be this section, then skip another section, then go to a third section, but these could be connected later, and it is easier if we don't have the junctions. If we have the route that I propose to serve Southwest Washington, and in effect, have two separate lines, one beginning at Connecticut Avenue and Van Ness coming down across G Street and out the B. & O. route to form a U-shaped line. The other one comes from Benning across the southeast area below the Capitol and up across 12th Street, and over to the Pentagon, with a major passenger transfer at 12th and G Streets and a passenger transfer at Farragut Square. It improves the financial viability of the system and improves the operation. I think it improves it in every respect, and it serves 85,000 employees that we hadn't been serving.

Now I have to come back to Congress with that modification, and they are still debating whether I do it, or whether we can let the compact do it.

Senator BARTLETT. Thank you very much. That's all, Mr. Chairman.

Chairman HAYDEN. Thank you for your appearance, sir.

Mr. MCCARTER. Thank you.

WEDNESDAY, MARCH 15, 1967.

DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE

PUBLIC HEALTH SERVICE

DIVISION OF INDIAN HEALTH

INDIAN HEALTH ACTIVITIES

STATEMENT OF DR. ERWIN S. RABEAU, DIRECTOR; ACCOMPANIED BY KAZUMI KASUGA, DEPUTY DIRECTOR, HENRY V. CHADWICK, EXECUTIVE OFFICER, CHARLES C. JOHNSON, CHIEF, OFFICE OF ENVIRONMENTAL HEALTH, AND SOL ORDEN, CHIEF, FINANCIAL MANAGEMENT BRANCH, DIVISION OF INDIAN HEALTH; JAMES D. NEIFERT, STAFF ARCHITECT, DIVISION OF BUILDINGS AND FACILITIES; CARRUTH J. WAGNER, DIRECTOR, SAUL R. ROSOFF, EXECUTIVE OFFICER, AND RALPH BAHN, FINANCIAL MANAGER, BUREAU OF HEALTH SERVICES; LEO J. GEHRIG, DEPUTY SURGEON GENERAL; G. R. CLAGUE, ACTING CHIEF FINANCE OFFICER; AND HENRY A. NEIL, DIRECTOR, DIVISION OF BUDGET, OFFICE OF THE SECRETARY

BUDGET REQUEST

Chairman HAYDEN. The subcommittee will now consider the budget justifications for the Public Heauth Service estimate of $82,133,000 for Indian health activities during fiscal year 1968. The justification statements will be printed in the record.

(The justifications follow:)

HIGHLIGHT STATEMENT

INTRODUCTION

The Division of Indian Health has the responsibility of providing total medical care services to approximately 385,000 Indians and Alaska Natives. These health services are of a comprehensive type including prevention, treatment and rehabilitation on an individual, as well as community, basis.

Services in 1968 will be provided through a system of 51 hospitals, their outpatient clinics, 46 health centers (which include centers at larger Bureau of Indian Affairs boarding schools) and at about 300 other locations which include health stations and satellite field clinics. Services will also be provided through contractual arrangements with non-Federal hospitals, private physicians, dentists, and state and local agencies.

Despite the steady improvement in the health status of the Indian and Alaska Native beneficiaries, they still bear excessive burdens of disease, illness, accumulated disability and premature death. The health status of American Indians and Alaska Natives is comparable to that found in the general population of a generation ago.

Most illnesses and 13 percent of the deaths are due to infectious diseases and their residuals. These diseases include gastroenteritis, dysentery, influenza, pneumonia, tuberculosis, otitis media, trachoma, and common communicable diseases of childhood.

Health problems among these people reflect the extreme hardship of their physicial environment, social isolation, varying levels of education and limited economic opportunity in the places they live.

Gross insanitary conditions, poor and crowded housing, lack of available safe water supplies, inadequate nutrition based on improverished socio-economic status and the emotional problems inherent in a cultural transition support the high rates of infectious diseases, emotional problems and mental illnesses.

The latest available data (1964) indicates significantly higher mortality rate among Indians and Alaska Natives than among the general population. Indian mortality rates for selected causes as compared to those for all races, are as follows:

Infant deaths per 1,000 live births:
  Indian excluding Alaska Native: about 1.4 times higher.
  Alaska Native: about 2 times higher.
Infectious diseases (mortality rates per 100,000 population):
  Tuberculosis:
    Indian excluding Alaska native: about 5 times greater.
    Alaska Native: about 5 times greater.
  Gastroenteric diseases, Indian: over 4 times greater.
  Influenza and pneumonia:
    Indian excluding Alaska Native: about 2 times greater.
    Alaska Native: nearly 3 times greater.

Incidence rates for many of the infectious diseases show even greater disparities:

Tuberculosis (new active):
  Indian: nearly 7 times higher.
  Alaska: about 20 times higher.
Dysentery (amebic and bacillary), Indian: about 45 times greater.
Measles-Indian: about 3 times greater.

These health deficiencies and the need for resources and methods for nurturing acceptable health practices to overcome the existing problems are recognized by both the Public Health Service and its Indian and Alaska Native beneficiaries. Their growing recognition of the benefits of modern medicine and health practices is amply demonstrated by their increasing use and acceptance of available health services and the more active participation of Tribal councils and individual members in health affairs.

HOSPITALIZATION AND CLINIC SERVICES

Hospital admissions continue at a high rate and reached about 92,000 in 1966. Leading reasons for hospitalization, outside of the Alaska Native hospitals are: (1) deliveries, (2) respiratory conditions, (3) accidents, (4) diseases of the digestive system, and (5) nervous system and sense organ diseases. In Alaska, respiratory illnesses rank first, deliveries second, and accidents third.

Pediatric workload is high, comprising between 35 and 40 percent of the general hospital discharges. Readmissions, especially among the very young children up to 5 years of age, are high (attributed to a great extent to the home environment, lack of sanitary facilities, exposure to reinfections, malnutrition, neglect, accidental injuries). Of the pediatric discharges from Indian General Hospitals, 70% involve hospital episodes of children under 5 years of age.

Outpatient visits and workloads at all hospital clinics, field health clinics and stations are increasing, especially the immunization workloads.

In March of 1966 the Division of Indian Health completed its program plan for F.Y. 1968. This was initiated at the service unit level and consolidated into a comprehensive plan with Indian cooperation and consultation.

The Indian Health program is comprehensive for all age groups and both sexes including preventive treatments and rehabilitative and curative services.

In developing the 1968 plan an attempt was made to group together those diseases that were amenable to similar preventive and treatment methods.

It was found that these disease groupings were very similar to those of the groupings of the International Classification of Diseases. The Division therefore adopted the seventeen I.C.D. disease classifications for the development of the program plan.

The Division's objectives and plans for 1968 to combat the seventeen health problems among Indians and Alaska Natives are contained in the 1968 budget as follows:

HEALTH PROBLEM

I. Infective and parasitic diseases

Objective

Reduction of mortality rate from an estimated 38 to 36 per 100,000 population in 1968.

Plan of action

1. Bring under medical supervision 75% of the children under one year of age by attendance at three well-baby clinics.

2. Complete immunization on 80% of the children under one year of age and 75% of children before entering school.

3. Give annual physical examinations to all children enrolled in BIA schools, and beneficiaries in Office of Economic Opportunity Headstart Program.

4. Provide instruction in good health practices for prevention and spread of infective and parasitic diseases to adult outpatients and inpatients.

5. Improve recording and reporting in clinics and outpatient departments to obtain reliable statistical data for program planning and evaluation.

6. Place more emphasis on education in health matters in all facilities, and in the home and community contacts by motivating hygienic practices, providing clinics on feeding of children, interpreting relationships of healthful living and child care to incidence of frequently occurring infective and parasitic diseases.

7. Make available basic sanitation facilities so that an additional 9% of the homes serving beneficiaries will be provided with safe water and proper facilities for refuse and excreta disposal.

8. Train recipients of basic sanitation facilities under PL 86–121 in the beneficial use, maintenance, and repair of such facilities.

(*a*) Construct sanitation facilities for 800 housing units constructed under Federal programs.

9. Conduct follow-up surveys of completed sanitation facilities.

10. Render technical assistance to beneficiaries to reduce insanitary conditions in their environment.

11. Render environmental health services to Federal Institutions, and facilities serving Indian and Alaska Natives.

12. Perform trachoma screenings of total population where incidence is higher than 1,000/100,000, and examine each family contact.

13. Screen all children within 3 months after entering school for first time in areas where the trachoma incidence rate is less than 1,000/100,000.

14. Provide a TB screening activity which will test each student annually; reactors will receive a chest X-ray. All hospital admissions will be X-rayed.

15. Maintain an area-wide TB control register.

16. Provide treatment and related health services for all patients with infective and parasitic diseases.

17. Provide medical care in 50% of the Division of Indian Health hospitals in accordance with standards recommended by the American Academy of Pediatrics and published in Care of Children in Hospitals and in the Manual of American Standards in Obstetric—Gynecologic Practice published by the American College of Obstetricians and Gynecologists, 1965.

II. Neoplasms

Objective

Reduction of mortality rate from an estimated 73 to 72 per 100,000 population.

Plan of action

1. Provide organized health education to the target population re the prevention and/or early detection of cancer.

2. Provide prompt diagnostic work-up of 100% of persons with symptoms of malignancy.

3. Provide for early detection of cervical cancer in women over 30 years of age by doing cervical smears in 75% of the adult female population, and lung cancer in persons over 15 years of age.

4. Provide medical treatment to all diagnosed cases of malignancy.

5. Provide related services including counseling and supportive services for emotional and social problems to all cancer patients and their families.

III. Allergic, endocrine system, metabolic and nutritional diseases

Objective

Reduction of mortality rate from an estimated 24.0 to 23.5 per 100,000 population.

Plan of action

1. Provide nutrition training for medical and paramedical staff of 75% of the Service Units.
2. Provide nutrition education to all hospitalized patients.
3. Conduct screening:
   (*a*) PKU blood screenings for all infants in the first week of life.
   (*b*) Diabetes—Routine tests will be run on 75% of the outpatients, and 100% of all inpatients hospitalized.
4. Provide treatment and related services to all patients with diagnosis of allergic, endocrine, metabolic and nutritional diseases.

IV. Diseases of the blood and blood-forming organs

Objective

Hold mortality rate at the same level of one per 100,000 population.

Plan of action

1. Provide for inclusion of testing for hemoglobin or hematocrit level on all children age 1–4 years.
2. Provide blood testing on all inpatients.
3. Routine blood testing on 50% of the outpatients.
4. Provide nutrition counseling for all patients with iron deficiency anemia.

V. Mental, psychoneurotic and personality disorders

Objective

Hold mortality rate at the same level of 10.6 per 100,000 population.

Plan of action

1. Collect community baseline mental health data at three Service Units.
2. Place emphasis of the three Service Units on early detection, diagnosis of mental disorders, treatment, and rehabilitation.
3. Incorporate in physical examination of children and youth of each Service Unit, observations and evaluation of emotional and mental growth and development.
4. Training—(*a*) Train a limited number of medical and paramedical personnel in early detection of psychoneurotic, and personality disorders; (*b*) Instruct all mothers through child health conferences on mental health concepts related to child care.
5. Provide for evaluation studies in each Service Unit of all emotionally ill persons.
6. Arrange for individualized inpatient care for acutely ill mental patients.
7. Develop an outpatient psychiatric service where different levels of treatment are available for patients who are not acutely ill, and are problem drinkers.

VI. Diseases of the nervous system and sense organs

Objective

Reduction of mortality rate from 72 to 71 per 100,000 population.

Plan of action

1. Incorporate in all examinations of children early detection of brain damage, eye defects, and hearing impairment.
2. Include screening for glaucoma in all physical examinations performed on persons 40 years of age and over.
3. Give annual vision and hearing examinations to all children enrolled in BIA schools and provide treatment for each child with defects.
4. Continue to utilize all available resources such as crippled children's services, state medical care programs, rehabilitation centers and Vocational Rehabilitation Administration Program.

VII. Diseases of the circulatory system

Objective

Hold mortality rate at 150 per 100,000 population. Even though the age of the beneficiary is gradually increasing, this will not have an impact in 1968.

Plan of action

1. Incorporate in all health examinations early detection of diseases of the circulatory system by:
   (*a*) Doing electrocardiograms on 40 percent of male inpatients and outpatients over 40 years of age.
   (*b*) Providing electrocardiograms to 25 percent of the female population over 40 years of age.
2. Provide continuous prophylaxis for all persons with rheumatic fever.
3. Provide organized health education that will reach 70 percent of persons 10–45 years of age about smoking and heart disease.
4. Provide family-centered nutrition counseling for all obese persons.
5. Provide treatment and related services for all diagnosed cases of circulatory diseases.

VIII. Diseases of the respiratory system

Objective

Reduction of mortality rate from an estimated 84 to 82 per 100,000 population.

Plan of action

1. Provide completed flu immunizations and boosters for all boarding school children, dormitory personnel, pregnant women, chronically ill, and persons over 65.
2. Provide health education to mothers attending well-baby clinics about personal hygiene, nutrition and early treatment.
3. Provide treatment and related services for all diagnosed cases of disease of the respiratory system.

IX. Diseases of the digestive system

Objective

Reduction of the mortality rate from approximately 72 to 70 per 100,000 population.

Plan of action

1. Provide instruction in good health practices to 90 percent of adult inpatients and outpatient seen at DIH facilities.
2. Provide treatment and related services for all patients with diseases of the digestive system.
3. Provide family-centered nutrition counseling to all patients having diseases of the digestive system seen at DIH facilities.
4. Reduce the abnormal loss of teeth from an average of .32 to .29 per person by preventing and treating dental decay and periodontal diseases by:
   (*a*) Examining and treating the beneficiary population in ages 3–17 years.
   (*b*) Providing corrective treatment to 90% of the carious teeth found.
   (*c*) Providing a prophylaxis to 85% of beneficiaries over 18.
   (*d*) Treating 85% of the persons found to have overt periodontal disease.
5. Reduce the incidence of dental decay by preventing new decay in persons less than 18 years of age by:
   (*a*) Providing topical fluoride treatment to 87% of persons examined annually in the direct and contract services program.
   (*b*) Adding fluoride to 50% of the community water supplies provided under PL 86–121.
   (*c*) Adding fluoride supplements to the diets of 16% of the beneficiary population under the age of nine which are deficient in fluoride.
6. Provide 100% of required extraction services.

X. Disease of the genito-urinary system

Objective

Hold current mortality rate at 20 per 100,000 population for 1968

Plan of action

1. Provide instruction in good health practices to 90% of adult inpatients and outpatients seen at DIH facilities.

2. Provide for early detection of genito-urinary infection in children and adults. Urinary analysis will be made of those attending well-child clinics, and each inpatient; also 50% of the outpatients.

XI. Deliveries and complications of pregnancy, childbirth and puerperium

Objective

Reduction of mortality rate from 2.7 to 2.6 per 100,000 population and the overall complications of pregnancy from 27% to 24%.

Plan of action

1. Intensify and expand educational efforts to bring 55% of expectant mothers under medical supervision before the third trimester.
2. Increase number of hospital deliveries to 98%.
3. Increase number of postnatal medical examinations to 60%.
4. Provide public health nursing service to 50% of postnatal patients.
5. Provide nutrition counseling on diet and breast feeding to all women during the maternity cycle.

XII. Diseases of the skin and cellular tissue

Objective

Reduction of the annual incidence of skin disease by 7.5%.

Plan of action

1. Provide sanitation facilities to an additional 9% of the beneficiary population.
2. Educate each mother attending well-child clinics concerning the need for personal hygiene to prevent skin disorders in children.
3. Instruct all school children in personal hygiene.
4. Provide treatment and related services for all patients with skin diseases.

XIII. Diseases of the bones and organs of movement

Objective

Maintain as a minimum an incremental increase of 52 hospital discharges over the 1,598 hospital discharges anticipated in 1967. Increased acceptance of health services by older Indians resulting from the educational activities of the program will bring about a continually increasing demand for health services for this disease category as the life expectancy of the beneficiary population increases.

Plan of action

1. Provide all known cases with treatment and instruction in methods to prevent deterioration.
2. Teach all known cases the proper use of medications for home treatment of the disease.

XIV. Congenital malformations

Objective

Reduction of mortality rate from approximately 17 to 16 per 100,000 population.

Plan of action

1. Ensure early recognition of congenital malformations by thorough examination of each child before leaving the hospital, and during each year of life prior to entering school.
2. Treat and, whenever possible, correct each congenital malformation.
3. Provide early counseling to parents of all malformed children on growth, development and rehabilitation.
4. Provision of preventive services:
   (*a*) All pregnant women to be seen early by a physician.
   (*b*) All Service Units to have organized programs to reach 60% of women 15 years of age and over with education on value of early prenatal care.
   (*c*) Fifty per cent of pregnant women to be enrolled in mother and baby care classes.
   (*d*) Genetic counseling to be provided to all persons 15–19 years of age.

XV. Certain diseases of early infancy

Objective

Reduction of mortality rate for such diseases from approximately 61 to 59 per 100,000 population.

Plan of action

1. Provide health instructions to all mothers before discharges from hospital on proper care and feeding.
2. Provide public health nursing follow-up within one week of discharge.
3. Provide treatment and related services for all newborns (0–28 days of life) with diarrhea and pneumonia.
4. Provide treatment and related services for all infants found to have nutritional maladjustments.
5. Provide medical care and related services to all premature infants.
6. Provide an improved environment to an additional 9% of the beneficiaries through sanitation facilities construction.

XVI. Symptoms, senility and ill-defined conditions

Objective

Reduction of mortality rate from 48.0 to 47.5 per 100,000 population.

Plan of action

1. Train medical and paramedical personnel in more accurate diagnosis.
2. Provide nutrition services on request to nursing homes with Indian patients.
3. Provide planned nutrition services for adults over 55 years of age living alone.
4. Screen patients with labile, ill-defined conditions for stressful or anxiety provoking conditions in the home, work or school.
5. Provide treatment and related services to all patients in this category.

XVII. Injuries, accidents, and adverse effects of chemical and other causes

Objective

Reduction of mortality rate from approximately 195 to 191 per 100,000 poulation.

Plan of action

1. Establish an accident prevention program in all Area Offices to facilitate the establishment of the use of a standardized system for reporting the circumstances and causes of accidents.
2. Reduce the mortality and the extent and severity of morbidity and residuals of accidental injuries by:
    (*a*) Identifying most frequent sources of first aid and strengthening first aid education.
    (*b*) Continuing to develop in-service training programs for DIH personnel on effective care and treatment of injuries at the scene of the accident and at hospitals and clinics.
    (*c*) Initiating programs in cooperation with BIA tribal groups and law enforcement officials with emphasis on driver education programs.
    (*d*) Assisting in the development of accident prevention program in schools.
    (*e*) Establishing adequate rehabilitation services through use of DIH facilities, other Federal hospitals, and available state and local resources.
3. Reduce accidents in hospitals and other health facilities by strengthening safety programs in DIH installations,

Appropriation, 1966 (adjusted)	$67,527,000
Total amount available	67,527,000
Appropriation, 1967	73,671,000
Transferred to "Operating expenses, Public Buildings Service" (80 Stat. 674)	−12,000
Transferred from "Economic opportunity program." Office of Economic Opportunity (180 Stat. 1063)	800,000
Proposed supplemental for civilian pay raise	1,190,000
Proposed supplemental for military pay raise	177,000
Proposed supplemental for wage board increases	498,000
Total amount available, 1967	76,324,000

SUMMARY OF INCREASES AND DECREASES, 1968

Hospital health services: To provided for mandatory increases ($713,000), and program increases ($2,157,000) for additional staff; establishment of operations research program, direct operation of medical facilities on Pribilof Islands, supervisory food service training program, pediatric and pharmacy residency programs, and continuation of COSTEP training program; additional maintenance of facilities and new and replacement equipment	+$2, 870, 000
Net change, hospital health services	+2, 870, 000
Contract medical care: To provide for mandatory increases ($780,000), and a program decrease (−$980,000) due to anticipated effect title XIX medicare	−200, 000
Net change, contract medical care	−200, 000
Field health services: To provided for mandatory increases ($222,000), and program increases ($3,098,000) in the preventive health activities of sanitation, dental, public health nursing, health education and field medical services	+3, 320, 000
Net change, field health services	+3, 320, 000
Special assistance to the Menominee Indian people: To provide for decrease in special assistance to the Menominee Indian people due to nonrecurring construction of sanitation facilities	−450, 000
Net change, special assistance to the Menominee Indian people	−450, 000
Administration: To provide for mandatory increases ($39,000), and program increases ($230,000)	+269, 000
Net change, administration	+269, 000
Net change, 1968	+5, 809, 000
Budget estimate, 1968	82, 133, 000

Analysis by activities

Activity	Amount available, 1966	Amount available, 1967	Estimate, 1968	Increase (+) or decrease (−)
Hospital health services	$39, 668, 768	$43, 900, 000	$46, 770, 000	+$2, 870, 000
Contract medical care	12, 647, 678	14, 106, 000	13, 906, 000	−200, 000
Field health services	13, 033, 051	15, 631, 000	18, 951, 000	+3, 320, 000
Special assistance to the Menominee Indian people		800, 000	350, 000	−450, 000
Administration	1, 880, 879	1, 887, 000	2, 156, 000	+269, 000
Unobligated balance lapsing	296, 624			
Total	[1] 67, 527, 000	[1] 76, 324, 000	[1] 82, 133, 000	+5, 809, 000

[1] Excludes reimbursements as follows: 1966, $836,300; 1967, $501,000; 1968, $496,000.

1. Hospital health services

Hospital health services:

Amount available, 1966	$39, 668, 768
Amount available, 1967	43, 900, 000
Estimate, 1968	46, 770, 000
Increase	2, 870, 000

The estimate of $46,770,000, an increase of $2,870,000, consists of the following:

Statutory salary promotions	$583, 000
FICA rate increases	9, 000
Annualization of 1967 wage board increases	121, 000
Total mandatory increase	713, 000
Program increase (182 positions)	2, 157, 000
Net increase	2, 870, 000

Need for increase

The increase of $2,870,000 is requested for the following:

1. Funds for additional staff to improve the quality of medical care. Improvement of inpatient and outpatient employee/patient ratios.
2. Funds for operation research program.
3. Funds for direct operation of medical facilities on Pribilof Islands.
4. Funds for additional training.
5. Funds to meet maintenance and repair requirements.
6. Funds to meet equipment requirements in terms of backlog, normal replacement and new equipment.
7. Funds to cover mandatory increases.

Additional staff to improve inpatient and outpatient employee/patient ratio (132 positions and $967,000)

Considerable attention has been given for many years to the strengthening of the on-going medical care program. The continued improvement in facilities through new and modernized buildings will permit the achievement of an improved quality of medical care. A measure of this is found in the increasing number of facilities meeting the minimum health and safety structural standards of the Joint Commission on Accreditation of Hospitals.

However, there remains significant obstacles to overcome in achieving an improved quality of medical care. These have been documented in the Division's annual review of problems and deficiencies. Concern has been expressed in previous hearings regarding the quality of medical care in DIH hospitals and the need to meet the standards of service now being met in community and other Federal hospitals. Deficiencies noted in Joint Commission surveys are largely attributable to staffing limitations. These limitations are portrayed in the following table which compares the Division of Indian Hospital employee patient ratios with those of other short-term general hospitals:

	Employee per 100 patients	Average length of stay
All short-term hospitals:[1]		
Federal	176	19.1
Non-Federal	245	7.8
DIH Indian-General hospitals[2]	153	9.3

[1] Source: Aug. 1, 1966, Guide Issue, Journal of American Hospital Association.

[2] Fiscal year 1966 data (provisional).

Evaluation of these ratios should include consideration of the following factors:

1. DIH hospitals have more acutely ill patients, and a higher percentage of female and pediatric patients than the community hospital. A higher ratio of employees to patients is required for these types of patients.
2. Because of isolation and severe climate conditions, our hospitals require more than the normal number of supporting staff to provide community-type utility services to the hospital and quarters.
3. The need to provide services regardless of the size of the workload requires a minimum staff excessive to the average employee patient ratio.

Twenty-six of the 51 DIH hospitals in FY 1966 had an ADPL less than 30. Limitations of overall ratio of employee to patients resulted in limited hours of nursing coverage and care, dietary services, housekeeping and maintenance services, laboratory and X-ray technician services, and medical record services. In addition to the overload placed on the available employees, highly skilled professionals are required to spend time on less skilled activities. Attempt to attain accreditation for hospitals and to attract and retain professional health care personnel have been severely handicapped.

The application of the staffing methodology studies (developed for various hospital departments by the University of Michigan) in the six GM&S DIH hospitals over 100 beds is expected to be of significant assistance in meeting specific departmental staffing needs. The implementation of completed studies will be initiated in 1968.

An increase of $967,000 is required to finance the 132 positions that are requested. The utilization of personnel requested in terms of improved employee/patient ratio is reflected in a following table which groups hospitals in our system by size and/or mission and relates to each group the employee/patient ratios for 1966, 1967 and 1968.

Operations Research (*increase of 19 positions and $240,000*)

It has long been recognized that the Division of Indian Health is in the unique position of operating one of the few truly comprehensive health programs in the Nation for a discrete population group. The Division has responsibility for planning and implementing comprehensive health services for the American Indian and Alaska Native, both of whom are geographically and culturally isolated from the dominant white society. More than 380,000 beneficiaries of the program are eligible for the widest range of curative, rehabilitative and preventive health services, including hospital medical care, maternal and child care, dental care, public health nursing, disease surveillance and control, nutrition, health education, and sanitation facilities construction.

The efficient and effective management of available resources including men, money, materials and facilities, must be achieved through decision-making and resource allocations based upon firm scientific data, and planning data which permits predictability of results. Since the needs of the beneficiaries far exceed the resources available to meet those needs, the maximization of available resources takes on a particular significance.

Comprehensive community health must successfully compete with all other demands for the tax dollar. Less-than-objective justifications for fiscal support are poor substitutes for quantified measures of specific health problems; for quantified measures of priority; for comparative cost estimates of alternate courses of actions designed to alleviate or eliminate priority health problems; and for quantifiable measures of program effectiveness and efficiency.

The Division of Indian Health is confident that the planning and implementation of restorative, rehabilitative and preventive health services can be systemized—that the many factors and facets which contribute to the total yield of such services can be identified and measured—that there are, and there can be developed more practical and more accurate methods and procedures for measuring a community's health status and problems—that evaluation systems can be developed which will truly reflect the results of any specific program or combination of programs—and finally, that the Division can develop mathematical allocation models which will enable it to predict the changes which may occur in the health status of a given community when a specified program package is systematically administered and/or altered.

While the complexities of administering Public Health programs are great, some knowledge is already available regarding the many variables involved in planning and implementing a comprehensive health program. Unfortunately, the majority of our knowledge is fragmentary, having been gained through studies conducted by and for monodiscipline groups. These studies have been usually designed to eliminate or hold constant the interaction of other professional disciplines. Consequently, the interrelation of public health program effects is not definable in quantitative terms. The fact of the matter is, that the Division really cannot begin to describe the total effects of a given program action within a community structure. It does not have quantitative models for determining the most prudent distribution of limited resources, either in terms of various community health problems, or in terms of program effectivenss. The operation Systems Analysis Module proposes to place and to analyze public health systems within their total context.

The benefits in increased program efficiency through systematic planning and implementation would not accrue to the Division of Indian Health and its beneficiaries alone. Direct translation and application to any organization, agency or county would be possible. Since all major variables will have been quantified and incorporated in mathematical models, the interested agency may well only need to insert the proper quantities and observe the predicted results.

Because of the broad implications of Operation SAM, and recognizes the unique opportunity enjoyed by the Division of Indian Health to provide a "laboratory" for the development, testing, and refinement of administrative concepts which could be utilized both nationally and worldwide, the Division is particularly pleased with the enthusiastic endorsement of the proposal by the American Public Health Association, the American Academy of General Practice, the American Academy of Pediatrics and the Association of State and Territorial Health Officers.

Mission and objectives

Stated succinctly, the mission of Operation SAM is to improve efficiency and effectiveness of DIH comprehensive health programs through applied research in program planning and implementation.

From the long-range point of view, the Systems Analysis Module will be involved in the following operations, among many others, in order to achieve the projects mission:

1. Determination of the best methods and procedures for development and implementation of community health plans.
2. Evaluation of community and program data to determine types and specificity of data required for meaningful planning and evaluation of program.
3. Development of methods and procedures for management data collection, storage, retrieval and analysis, feasible for service unit implementation.
4. Development of statistical models for use in program planning and evaluation.
5. Development of methods and techniques for assessment of priorities for action on community health problems.
6. Development of a comprehensive cost-benefit analysis system for application to community health problems.
7. Development of a prototype service unit operations manual.
8. Development of "DIH Operations Criteria Series" planning and evaluation documents utilizing the program package approach.
9. Development of improved methods and procedures for orientation and skills training of service unit staff.
10. Serving as an orientation and training unit for DIH staff and visiting Officials.
11. Improvement of methods and procedures for the operation of the hospital as the center of community health services and the Service Unit Director as the manager of comprehensive health services.
12. Determination of optimum levels of expanded functions for supporting staff, and techniques for appropriate training.

Initial staffing pattern

The interdisciplinary team approach is not accidental. One of the major reasons for a systems analysis team is to bring the most advanced scientific procedures to bear on the problem at hand, or to develop new and more fruitful procedures. The idea is that no mind can hold all the potentially useful scientific information, but a "team mind" may. Since most man-machine systems have physical, biological, psychological, sociological, economic and engineering aspects, these phases of the total system studied can best be understood and analyzed by those trained in the appropriate fields. A mixed team increases the number of aspects of the operation which can be examined in detail and the pool of possible approaches to a program's growth. To bring to bear this multidiscipline approach the following positions are being requested—1 Director, 1 Hospital Administrator, 1 Biometrician, 1 Econometrician, 1 Operations Research Analyst, 1 Visual Aide Technician, 1 Social Worker, 1 Sanitarian, 1 Public Health Nurse, 1 Health Educator, 1 Maintenance Man, 1 Laborer, 3 Secretaries, 1 Epidemiologist and 3 Clerks. This group will provide the foundation or core of highly trained personnel and it will be expanded only as a demonstrated need indicates the addition of professionally related discipline.

As the experience and the needs of the DIH systems analysis team dictate, and as fiscal resources permit, additional competencies related to the social sciences, health education, public health nursing and environmental health, as examples, will be added to the research team.

Initial program plans

The initial primary objective of Operation SAM is: "The design and preliminary implementation of an integrated and comprehensive management information system based on service unit planning and evaluation needs."

This objective is of prime importance in order to develop baseline management data, utilizing the Papago Reservation as the operational community. Basic management information is the elementary requirement for accomplishing all the stated objective related to planning and evaluation, and particular attention will be placed on developing methods of data measurement as well as methods for data collection.

The information system will take into consideration the health services input, the individual in his environment, and the results of the services.

Specific areas to be developed are:

(*a*) Physical environment of the individual.
(*b*) Social environment of the individual.
(*c*) Community environment of the individual.
(*d*) Health level of the individual.
(*e*) Services and treatments received (including self-treatment).
(*f*) Services and treatments available but not utilized.
(*g*) Cost of services and treatments.

A secondary initial objective of Operation SAM is to develop the capability for orienting and training DIH staff in the system analysis approach.

Direct Operation of medical facilities on the Pribilof Islands (8 positions and $117,000)

Public Law 89–702, Section 205, effective November 2, 1966, charges the Secretary of Health, Education, and Welfare with providing medical and dental care to the natives of the Pribilof Islands and on a reimbursable basis to Federal Employees and their dependents and tourists and other persons in the Pribilof Islands. The Public Health Service has been delegated this responsibility by the Secretary.

These health services had been furnished by personnel of the United States Public Health Service, Division of Indian Health, on a reimbursable agreement with the United States Fish and Wildlife Service, Department of the Interior.

An increase of 8 positions and $117,000 are requested in order to provide for the direct health services necessary for the proper and effective implementation of Section 205 of Public Law 89–702.

Training (increase of 23 positions and $323,000)

In order to elevate the health of Indian and Alaska Natives to the highest possible level, it is necessary to make a comprehensive assault on the adverse factors affecting Indian Health and to provide appropriate preventive, curative and rehabilitative services.

To achieve these results, it is necessary that a highly trained and competent staff be developed at all levels and in a wide variety of medical fields including all the medical and surgical specialities, dentistry, nursing, pharmacy, dietetics and nutrition, medical social workers, health record personnel, medical educators, sanitarians and others.

The largest single obstacle to providing high quality care in the past has been the scarcity of trained personnel in all these specialties. As part of the Division's long range plans, it has been determined that it will be necessary to develop programs to train personnel since those sufficiently interested and motivated to obtain their training in the Division are far more likely to remain in the program. Even those who leave the program after a few years will contribute to the overall pool of medical resources available to the nation.

Specific improvements can be effected through residency and other training programs in order to accelerate the elimination of the following pressing health needs and deficiencies of the beneficiary population.

Infant deaths.—The death rate for children under one year in 1955, the year of transfer of health responsibilities to the Public Health Service, was 61.2 per 1,000 live births for Indians and 74.8 per 1,000 live births for Alaska Natives.

At the present time, this has been reduced to 35.9 and 54.8 per 1,000 live births among Indians and Alaska Natives, respectively. In some areas in Alaska it still remains over 100 per 1,000 live births. This rate, which is still more than three times the current U.S. all races rate, can only be reduced to approximate that of the general population through an expanded pediatric and family centered health program. This program can be accelerated through the enlistment of physicians specifically trained to handle the Indians' and Alaska Natives' individual and community health problems.

Childhood diseases.—When the Indian child reaches school age, immunization programs directed through the school provide protection against the effects of polio, dyphtheria, measles, whooping cough, and other such infections. In the pre-school ages, however, where these diseases are most prevalent, effective immunization programs have been limited. Further progress is dependent upon increased emphasis on home-centered, physician-directed, community health programs. In the absence of this type of expanded program, the incidence for measles among Indian children is six times that of the non-Indian; whooping cough more than eight times; and streptococcal infections approximately seven times. The incidence of measles among Alaska Natives is four times that of the non-Indian. Whooping cough occurs ten times more commonly than the U.S. all races rate. In addition, the death rate and complications due to these diseases, as well as pneumonia and diabetes, are much higher in the Indian and Alaska Native child. A fully effective and efficient program requires the direction of properly oriented physicians to conduct therapeutic and preventive service through the hospital and the home.

Child hospitalization.—The infant Indian and Alaska Native child will require two to four hospitalizations during the first year of his life. During the next four or five years, he will require hospitalization three to four times as often as the non-Indian child. This accounts for the fact that over 35 percent of the hospitalizations in Indian hospitals are pediatric as compared to a little over 17 percent for the population in general.

It is known that health educational programs conducted by the physician and his health team can have a marked effect upon those conditions which cause hospitalization through an appreciation and practice of good hygiene and health.

Facility utilization.—The Division of Indian Health facilities are constructed and equipped to provide a wide range of medical and surgical services. However, the experience and training of the young physician staff does not permit their fullest utilization.

A significant proportion of the physician staff are serving in the program directly after internship (79%) and have not had adequate educational exposure nor the special training necessary to permit such expanded activities as are required. Residency training in pediatrics and general practice would materially offset this deficiency and provide a more useful, better-trained, well-rounded and oriented physician to serve in the capacity of family physician to the Indian and Alaska Native and his community.

Longevity of staff tenure.—At the present time, the rate of retention of entering physicians for careers in the Public Health Service is 16 percent. The establishment of residency programs will not only increase the number of men remaining in career service but will also have a substantial effect on recruitment of additional numbers of promising physicians with a desire for performing these specialities in pediatrics and general practice.

The initiation or continuation in 1968 of the following training programs is requested:

Phoenix Pediatric Residency Training Program, 13 positions and $112,000.

Alaska Pediatric Residency Training Program, 4 positions and $65,000.

The present shortage in the United States of physicians who are certified as specialists in pediatrics and the expanding need for these qualified professionals in the Division of Indian Health program has prompted the Division of Indian Health to provide residency programs in pediatrics at the Anchorage, Alaska and Phoenix, Arizona Medical Centers. These programs, accredited by the American Medical Association and the American Academy of Pediatrics, are a planned two-year continued program which consists of training and supervised experience in general pediatric care with emphasis on child growth and development with provision for an optional third year of graduate study at a school of Public Health or preventive medicine in the field of maternal and child health. Training and supervision would be primarily at the Phoenix and Alaska Medical Centers and their incident field areas.

Four residents and nine supportive positions and $112,000 are requested for the Phoenix Pediatric Residency Training Program.

Two residents and two supportive positions and $65,000 are requested for the Alaska Pediatric Residency Program.

Supervisory Food Service Training, 2 positions and $92,000: Funds in the amount of $92,000 are requested in 1968 to support a training program designed to train food service supervisors for Division of Indian Health hospitals. Food service supervisor training courses suitable for the Division's needs are virtually nonexistent. From 1961 to 1966 six Division food service workers completed a training course offered once a year by Michigan State University. While some aspects of this course are reasonably suitable for Division of Indian Health requirements, overall the course is not compatible with the academic and experience backgrounds of Division of Indian Health candidates and the responsibilities of food service supervisors in the Division's hospitals. Moreover, the limited enrollment of 40 students for the course selected primarily from Michigan and adjoining states restricts severely the number of Division students who can be accepted. The majority of potential candidates for food supervisors cannot meet the academic requirements for enrollment in the two-year training program at Phoenix College. Here again, the College program is not designed to fill the specific needs for hospital food service supervisors in the Division of Indian Health. Costs of college level training programs are considerably greater than those in the proposed Division training program.

This budget provides for a four months training course for food service supervisors with a maximum of 8 students per class. Two classes will be graduated each year. The curriculum will be designed to include the study and application of all principles of management and control in the supervision of hospital food service departments. Laboratory facilities will include the major elements of a small hospital food service department for practical experience in the application of the principles presented. Field observation and experience in a 200 bed hospital and in small hospitals with dietitians will be scheduled. The training program director will provide follow-up evaluation and consultation for the trainees when they have completed the course and returned to duty.

Criteria for admission to the course shall be prior institutional cooking experience, potential for leadership and supervision, present employment in a DIH hospital (exception will be made for Indians or Alaska Natives who otherwise meet the requirements) and a minimum of a tenth grade education with preference given to high school graduates. Long-range training plans include a course in food preparation and related subjects for food service workers below the food service supervisor level. The same personnel and facilities will be utilized in conducting this program.

The Director of the Food Service Supervisors Training Program will be a professional dietitian with teaching experience as well as administrative and clinical experience in dietetics.

An increase of 2 training staff positions and $92,000 is requested for the funding of the personnel compensation and related supporting costs for the teaching staff (Director and Secretary), food service relief positions, living costs, travel, equipment and rental of space.

Gallup Pharmacy Residency Program, 4 positions and $29,000: Two hospital pharmacy residency positions and two supporting staff are requested at Gallup, New Mexico. These residencies must meet established standards and will be accredited by the American Society of Hospital Pharmacists. The residencies are for one year each.

The establishment of hospital pharmacy residencies in the Division was recommended by the Pharmacy Advisory Committee to the Division Chief in a report submitted March 6, 1964. It was also recommended by the American Pharmaceutical Association's Committee on Governmental Pharmaceutical Services on its recent trip to the Gallup Hospital.

Most states require a year of internship or residency training for licensure.

The Indian Health pharmacy services are unique in that they are comprehensive and cover both preventive services and treatment services. The needs of the Indians are so different from the rest of the population because of their beliefs, customs and cultural background that special techniques and procedures must be used in providing pharmacy services.

The residency program would provide the young pharmacist with training in a comprehensive public health, preventive and treatment pharmacy service program and meet the standards required for accreditation and licensure.

An addition of two persons to the pharmacy staff is required to provide the necessary training and instruction to the two residents and to provide the pharmacy services. Additional equipment for a control laboratory is also needed.

Four positions and $29,000 are requested to initiate the Pharmacy residency program in 1968.

COSTEP—Advanced Professional Training, $25,000: This increase will permit an expansion of the Commissioned Officer student training extern program which provides a sucessful mechanism for training, recruitment and career development of new officers in the Service.

The COSTEP program provides training opportunities in a professional environment for students in health related studies and stimulation of interest by promising students in Public Health Service careers and continues to serve as an effective recruiting technique for helping to meet the manpower requirements of the Public Health Service. The requested increase will permit an increase of 17 students at a cost of $1,470 per student.

Maintenance and repair ($200,000)

To maintain and to make minor repairs to the Division of Indian Health real property and related equipment in Fiscal Year 1968 will cost $1,535,000 which is an increase of $200,000 over the 1967 level. The basis for this requirement of funds is the projected total area of 4,947,543 square feet of building to be maintained; the maintenance of the boiler plants, electrical generators, sewage disposal systems and the utility services for electricity, water, steam, and communications systems; the inspection and correction of deficiencies of elevators, boilers, sterilizers; the procurement of tools and special instruments to accomplish the above work; and the minor repairs which can be accomplished within this funding.

Included in the maintenance responsibility of the Division of Indian Health are 891,428 square feet of building space constructed prior to 1936 requiring extensive repairs, steam boilers in service far beyond their normal operating age that should be replaced, deficiencies in our older hospitals that should be corrected to provide reasonable standards of health services, and a large backlog of minor structural repairs and painting that should be accomplished without further delay.

The increase in maintenance and repair funds is necessary due to (1) cost escalation of contract labor, equipment, materials and supplies, (2) increased square foot of floor areas which will be acquired and (3) increasing unmet needs.

Maintenance costs in Alaska are approximately 78 percent higher than in other areas. There are now 51 hospitals of which 34 hospitals were constructed prior to 1946 and 3 of these prior to 1916.

Area of buildings to be maintained:

60 or more years old; 91,048 sq. ft. or 1.84%.
40 to 59 years old: 279,340 sq. ft. or 5.65%.
20 to 39 years old: 2,042,496 sq. ft. or 41.28%.
Temporary buildings: 157,152 sq. ft. or 3.18%.
Trailers: 7,914 sq. ft. or 0.16%.
Permanent Buildings less than 20 years old: 2,369,592 sq. ft. or 47.89%.
Total: 4,947,542 sq. ft. or 100.00%.

The backlog of unmet needs for major repairs and for repairs and for replacement of obsolete and deteriorated building services equipment is estimated at $5,000,000.

The 1968 maintenance and repair funding was determined through a modified University of Oklahoma formula for building maintenance utilizing modifying factors similar to those used by the Veterans Administration.

The Oklahoma University formula fixes annual building maintenance costs as a percentage of current building replacement costs, i.e., 1.75% for wood frame construction, 1.30% for combination masonry-wood construction, and 1.10% for combinations reinforced concrete, steel, and masonry construction. An "Adjusted Use Factor" is added which considers the intensity of use of a structure. Other plant management costs such as janitorial services, maintenance of roads, walks, outside utilities, collection and disposal of wastes, plant operation, etc., are computed separately by category.

The Veterans Administration has modified the Oklahoma University formula by computing all buildings maintenance on the basis of 1.10% of the current replacement cost and an adjusted use factor of 50% (increase) for hospitals. The derived figure equals 70% of their maintenance and repair budget. The other 30% is a blanket amount for maintenance of grounds, utilities, etc.

Equipment (Increase of $310,000)

An increase in equipment funds in the amount of $310,000 is requested for 1968 exclusive of $14,000 for the Supervisory Food Service Training Program; $1,000 for the Pharmacy Residency Program, and $13,000 for the Operations Research Program. Of the 1968 total of $1,680,000, $1,059,000 will be applied against the current large equipment backlog and replacement requirements. $152,000 will provide for Groups II and III (portable) equipment requirements related to new construction, $8,000 will provide for vehicle replacement purchases, $433,000 will provide for additional and non-capitalized equipment requirements, and $28,000 will provide for the above mentioned new programs.

The following table sets forth the Hospital Health Services current equipment backlog and the replacement and other requirements and estimated acquisitions for 1967 and 1968:

Backlog as of 7/1/66 (Beginning F.Y. 1967)		$1,465,000
1967 Replacement Requirements	$824,000	
1967 New and Non-Capitalized Requirements	348,000	
1967 Other Requirements including construction	161,000	+1,333,000
1967 Estimated Replacement Acquisitions	833,000	
1967 Estimated New and Non-Capitalized Acquisitions	348,000	
1967 Estimated Other Acquisitions	161,000	−1,342,000
Backlog as of 7/1/67 (Beginning F.Y. 1968)		1,456,000
1968 Replacement Requirements	559,000	
1968 New and Non-Capitalized Requirements	433,000	
1968 Other Requirements including construction	188,000	+1,180,000
1968 Estimated Replacement Acquisitions	1,059,000	
1968 Estimated New and Non-Capitalized Acquisitions	433,000	
1968 Estimated Other Acquisitions	188,000	−1,680,000
Backlog as of 7/1/68 (Beginning F. Y. 1969)		956,000

Program summary

For 1968 an appropriation in the amount of $46,770,000 is requested for the hospital health services activity, to cover (1) the operation of 51 Public Health Service Indian hospitals and attached outpatient clinics (2) a nurse training program associated with Public Health Service Indian hospitals and (3) the maintenance of all Public Health Service Indian Health facilities consisting of hospitals, health centers, stations, school clinics and staff quarters.

The hospitals operated by the Division of Indian Health vary in size from 6 to 381 beds and in complexity from primary medical care facilities to comprehensive referral centers. The 42 facilities eligible for survey by the Joint Commission on Accreditation of Hospitals are being improved to meet and maintain these minimal standards as resources become available. At the present time 17 have accreditation and another 9 are preparing for a survey. Seven hospitals were accredited in 1966.

The replacement hospitals at Lawton, Oklahoma and Belcourt, North Dakota will be in full operation in 1968. The modernized outpatient department at Wagner, South Dakota will be in full operation in 1967. The Mescalero, New Mexico replacement hospital will be completed in 1967.

A new program is being initiated to provide direct services on the Pribilof Islands.

An operations research program located at Tucson, Arizona, utilizing the Papago Reservation as the operational community will be directed toward the design and preliminary implementation of an integrated and comprehensive management information system based on Service Unit planning and evaluation of needs.

Expected workloads for the total program are shown on the following table:

HOSPITAL HEALTH SERVICES

Workload data

Average daily patient census by type of patient (excluding newborn)	1966 actual	1967 estimate	1968 estimate	Change (+) or (−)

[1] Excludes reimbursements as follows: 1966, $836,300; 1967, $407, 000; 1968, $402,000.

2. Contract Medical Care

Contract medical care:

Amount available, 1966	$12, 647, 678
Amount available, 1967	14, 106, 000
Estimate, 1968	13, 906, 000
Decrease	200, 000

The estimate of $13,906,000 provides a net decrease of $200,000 consisting of:

1. An increase of $775,000 for rising costs of program operation.
2. An increase of $5,000 to provide for statutory pay increases.
3. A decrease of $980,000 and 54 patients a day resulting from the anticipated effect of Medicare legislation (Title XIX) on the Indian Activities Contract Medical Care program.

Need of increase

An analysis of the rates negotiated in agreements with the various hospitals, clinics, physicians, and dentists with which the Division of Indian Health has current formal contracts, indicates a steady upward trend of at least 5% annually. Published continuing surveys of health care costs corroborate this trend and reveal an even higher nation-wide rate of increase. In order to maintain the amount of services required under this program it is necessary to plan for this added cost, and request funds sufficient to cover the increase. An increase of $775,000 is requested in 1968 for the rising costs in contract rates necessary for program operation.

An increase of $5,000 is requested to provide funds for statutory within grade increases.

A decrease of $980,000 and 54 average daily patient load are reflected in the 1968 estimate resulting from the anticipated effect of Medicare legislation on the Indian Health Activities contract medical care program.

Plan of work

The request of $13,906,000 is for the purchase of medical care through contractual arrangements and is an essential element of the Public Health Service Indian Health program. Formal agreements are entered into with community hospitals, private physicians and clinic groups, dentists and providers of ancillary health services to assure that quality care is obtained. Through this mechanism health services are practically and effectively provided for the widely scattered and small groups of Indian beneficiaries who urgently need such service. In addition, the use of contract services makes possible special diagnostic and therapeutic services which many small and intermediate sized Public Health Indian hospitals cannot provide at economical costs. Emergency hospitals and medical care services are frequently required at locations not readily accessible to health facilities directly operated by the PHS Indian Health program. This Division does not operate any in-patient facilities equipped to provide psychiatric care to Indian beneficiaries and therefore this type of service must be procured through contracts.

The following table indicates the distribution of funds under the various items requested for the 1968 program. It also shows how 1966 funds were obligated and the plan of funding for 1967 operations. The actual experience of average daily patient loads are reported for 1966 together with expected levels for 1967 and 1968.

Contract medical care

	1966 actual			1967 estimate			1968 estimate		
	Average daily census	Rate	Amount	Average daily census	Rate	Amount	Average daily census	Rate	Amount
Hospitalization:									
General	473	34.34	$5,928,629	507	36.16	$6,691,600	463	37.93	$6,427,200
Tuberculosis	227	18.78	1,555,620	221	19.70	1,589,100	211	20.67	1,596,300

Physicians' services (inpatient fees, office visits, consultation services)			2,846,006			3,277,000			3,277,000
Dental services (emergency services, dental laboratory, prothesis)			463,524			510,000			546,000
Other costs (laboratory and X-ray services, pharmaceuticals, proprietary drugs for inpatients and outpatients, prosthesis and burials)			844,576			952,100			950,000
Total			12,647,678			14,106,000			13,906,000

3. Field health services

Subactivity	Amount available, 1966	Amount available, 1967	Estimate, 1968	Increase (+) or decrease (−)
(*a*) Sanitation	$2,106,138	$2,448,000	$3,198,000	+$750,000
(*b*) Dental	2,137,182	2,406,000	2,855,000	+449,000
(*c*) Public Health nursing	1,877,672	2,227,000	2,480,000	+253,000
(*d*) Health education	673,802	811,000	959,000	+148,000
(*e*) Field medical services	6,238,257	7,739,000	9,459,000	+1,720,000
Total	13,033,051	15,631,000	18,951,000	+3,320,000

Summary of change

Statutory salary promotions	$214,000
FICA rate increase	8,000
Program increase (273 positions)	3,098,000
Net increase	3,320,000

(*a*) *Sanitation*—The estimate of $3,198,000 provides an increase of $750,000 and 65 positions consisting of:

Statutory salary promotions	$33,000
FICA rate increase	1,000
Program increase:	
Regular program (27 positions)	336,000
Construction program (38 positions)	380,000
	716,000
Net increase	750,000

Need for increase

Lack of basic sanitary facilities, gross insanitary practices, and inadequate understanding of modern health and sanitation in the Indian and Alaska Native home and community continue to exist despite increasing attention being given to these problems by Indian Tribes and their members. Surveys made during the period 1957 to 1964, on Indian reservations representing more than 10 percent of the total beneficiary population, showed that: (1) one-half of the Indian families (average 5.5 persons per family) lived in one and two-room houses, (2) more than 70 percent obtained their domestic water from potentially contaminated sources and haul or carry it, (3) more than 75 percent had grossly inadequate facilities for sanitary waste disposal. These environmental conditions, together with lack of understanding of modern health practices, in large measure are responsible for the high incidence of preventable diseases and needless premature deaths, particularly among Indian infants. Diarrhea, dysentery, and respiratory ailments continue to cause a significant patient load on Public Health Service hospitals, clinics, and contract facilities. Other environmental conditions, including insect and wild rodent vectors, continue to result in sporadic epidemics on Indian reservations.

A continuing program of consultation and services is made available to Indian Tribes, groups and families for the purpose of helping them to improve and maintain a healthful home and community environment. These basic services are concerned with improving sanitation conditions at the home, at Indian celebrations, and at trading posts and other commercial establishments serving Indians. Consultation is also provided on sanitation problems associated with Tribal economic development projects, including the rapidly growing tourist industry. Particular emphasis is placed on the adoption of sanitation codes by Tribal governing bodies. Considerable effort is expended in follow-up surveys of completed sanitation facilities projects to assure that maintenance and care are being furnished and that the facilities are being properly used.

Minimum criteria for basic sanitation services and consultation coverage provide that: (1) home premises surveys and individual family consultation be given each Indian household every other year; (2) plans for all new Tribal enterprises are checked from a sanitation standpoint; (3) all trading posts are surveyed at least semi-annually; (4) all celebrations are under surveillance to minimize the opportunity for epidemic outbreaks; and (5) all completed sanitation facilities are surveyed at least twice during the first year of operation and at least annually thereafter.

In the provision of these basic services the Indian and Alaska Native sanitarian aides are key members of the staff who help bridge the gap of cultural differences to bring modern environmental sanitation practices to Indian communities and groups. These aides are trained by the Service in the basic elements of sanitation and they in turn impart this knowledge to their own people. Ninety sanitarian aides are currently employed on Indian reservations and in Alaska native villages. The present Indian and Alaska Native sanitation aid staff represents about one-half of the known need for such personnel.

In addition to the foregoing the basic environment health activities incorporate a consultative service to assure that a high level of environmental sanitation is maintained in Federal facilities serving Indians. It is considered desirable that all government facilities serving Indians and Alaska Natives have a comprehensive environmental health survey once every two years and a survey of their food service operations semi-annually.

A review of the basic environmental health activities for fiscal year 1966, using the minimum criteria herein cited, suggests that 53 percent of these essential services were provided. It is anticipated that this level of operations will be increased to approximately 58 percent during fiscal year 1967.

The sanitation facilities construction activity complements the basic environmental health activity by providing tangible support in those situations where the need for facilities exceed the available resources of the beneficiaries. The Service is authorized to provide this assistance under Public Law 86–121, the Indian Sanitation Facilities Act. The activity employs a coordinated Tribal-Federal attack to correct gross deficiencies in individual and community water supplies, waste disposal, and other sanitation facilities. Staffing to implement this work is supported under this subactivity.

In the construction activity, Indians participate in project planning and construction and assume responsibility for the operation and maintenance of the completed facilities. The staff effort is devoted to project engineering, technical support and motivation and training of Indian families and groups. Indian participation in the construction activity in the form of men, money, and materials approximates one-third the total value of construction.

Since the beginning of this activity seven years ago, through fiscal year 1966, a total of 511 sanitation projects have been undertaken. These include: 393 construction projects (61 of which serve Federal housing projects) and 118 engineering investigations, emergency works and other special projects. Of these 367 are completed or in operation, and 127 are underway as of June 30, 1966. The remainder are projects to complement new Federal Housing construction and are in the final stages of planning and negotiation with the Indian tribes.

Educational and motivational efforts that comprise the basic environmental health activities and the tangible support provided by the sanitation facilities construction activity complement each other so as to present a most salutary result. This is suggested by the indicated trend in the reduction in mortality and incidence rates from diarrhea and dysentery and in infant death rates. Before 1964, gastroenteritis was the leading notifiable disease entity among Indians. In 1964, this disease had dropped to second place. During the 10 year period 1954 to 1964, the death rates of gastroenteritis had declined from 56/100,000 population to 19.3/100,000 population. Another barometer of improved conditions may be viewed in the infant death rate which declined from 65.5/1,000 live births in 1954 to 35.9/1,000 live births in 1964. It is also noted that infant death rate in the postneonatal group has decreased from approximately six times to approximately three times that of the general population. These changes in some measure reflect the increased emphasis given to improving the environmental conditions surrounding Indian homes and communities.

During fiscal year 1967 the Service continued to cooperate with the Public Housing Administration and the Bureau of Indian Affairs by providing sanitation facilities for new Indian housing construction. In addition similar assistance is being rendered to other Federal Agencies and Tribal housing organizations.

The Fiscal Year 1968 request for the construction of Indian Health Facilities includes $8,000,000 for 65 sanitation facilities construction projects and $2,464,000 for assistance to Federal and Tribal housing programs. This will enable new or improved sanitation facilities to be made available to approximately 8,000 Indian and Alaska Native families in more than 80 different geographical locations.

Plan of work

Twenty-seven of the additional positions requested are for basic environmental health activities. These include eleven Indian sanitarian aides, seven professional sanitarians, six sanitary engineers and three clerks. They will be employed to meet the additional "follow-up" workload of training beneficiaries in operation, maintenance, and utilization of complete sanitation facilities serving an additional 6,000 Indian and Alaska Native homes. They will extend basic environmental health services on nine Indian reservations and in various communities in Alaska and Oklahoma to an additional beneficiary population of 45,000.

These services will include in addition to providing follow-up services to recipients of completed sanitation facilities comprehensive environmental health surveys at Indian homes, inspections of trading posts and other commercial facilities on Indian reservations, and institutional sanitation and food service coverage at Federal installations serving Indians. An increase of 8 percent above present level of such services is programmed.

Thirty-eight of the additional staff positions requested will implement the increase in level of sanitation facilities construction under P.L. 86-121. These positions provide engineering and support capability in the development of projects, negotiation of agreements, securing tribal participation in the work, logistical support and supervision of the installation of facilities and provide essential training to the Indian people in operation, maintenance and care of completed facilities. The construction activity requested will permit an additional 9 more percent of the known need to be met.

(*b*) *Dental.*—The estimate of $2,855,000 provides an increase of $449,000 and 42 positions consisting of:

Statutory salary promotions	$41,000
FICA rate increase	1,000
Program increase (42 positions)	407,000
Net increase	449,000

Status of program

Dental caries, periodontal disease, missing teeth, orthodontic conditions and complications of these conditions continue to be major health problems afflicting the Indian and Alaska Native populations. These problems are greatly magnified by the continuing backlog of need and by the inability to increase the dental resources necessary to keep up with the tremendous growth in the child population. During Fiscal Year 1966, 125,819 examined patients received 570,779 dental services. The group of beneficiaries examined represents 33.1 percent of the total beneficiary population. Only 22.9 percent of the estimated services required by the total population were provided and the children were the recipients of most of this limited care.

Although the dentist to general population ratio is about 1 to 2,000, in the Indian Health program there is one clinician to about 3,700 people.

Recent years have shown a marked increase in corrective and preventive services provided. For example, during 1966, topical fluoride treatments were provided to 82,729 patients as compared to 18,930 in 1962 and 3,139 in 1958. The number of filled teeth per person examined has increased from 0.9 in 1958 to 2.9 in 1966. Much of this improvement is due to increased efficiency through expanded and improved use of auxiliary personnel, improvement of the clinical facilities and training in efficient management of the dental clinic.

The Dental Branch requires 14 dentists including 1 long-term trainee for a dental public health residency, 27 dental assistants and one clerk to increase its program of bringing beneficiary children to a maintenance level of dental care. Some of these new positions are required to staff new facilities constructed during 1967. Health education and other preventive services will continue to be emphasized. In line with the requested increase, the following table sets forth major planned accomplishments in the direct services program during 1968 as compared to 1966 and 1967.

	1966	Estimate, 1967	Estimate, 1968
Oral health levels:			
Decay experience, persons ages 6 to 17	5.70	5.59	5.48
Periodontal disease, per 1,000 [1]	284	282	278
Dentures required, per 1,000 [1]	217	210	207
Workload estimated to produce above improvements:			
Beneficiaries examined	110,117	114,000	126,000
Total services provided	502,710	517,000	577,000
Topical fluorides	74,368	76,000	86,000
Dentures provided	2,053	2,200	2,600
Additional resources requested to accomplish above workload:			
Dentists, assistants, etc	----------	----------	42
Funds	----------	----------	$449,000

[1] Crude health level data derives primarily from examination of children and does not adequately reflect more severe disease among adults.

(*c*) *Public health nursing.*—The estimate of $2,480,000 provides an increase of $253,000 and 25 positions consisting of:

Statutory salary promotions	$30,000
FICA rate increase	1,000
Program increase (25 positions)	222,000
Net increase	253,000

Need for increase

The public health nurse is the focal point and a major resource in the extension of health services from the hospital into the Indian home and community. The activities of the public health nurse in the home, school, and community, coupled with her knowledge and understanding of the Indian family and way of life enable the DIH program to provide greater depth and quality of service. The need for adequate home follow-up of patients discharged from the hospital, early case finding, teaching of good health practices, and prevention and control of acute infectious and chronic diseases, requires additional staff, both professional and supportive.

The gradual increase in the past few years in the number of non-professional staff and the increasing numbers of community health aides being employed through OEO programs necessitates an increase in the number of supervisory level staff. There is need to train, supervise, and closely coordinate the efforts of the various levels of personnel contributing toward the provision of public health nursing services.

Plan of work

The program increase of $222,000 for 1968 provides $13,000 in additional funds to cover contract services with States and $209,000 to permit the addition of 25 public health nursing personnel to the staff. This includes 4 public health nurse supervisors, 7 public health nurses, 9 nursing assistants, 1 driver-interpreter and 4 clerks.

The additional staff will allow for the extension of services to approximately 1,500 additional families. Efforts will be intensified in providing care to pregnant women during the maternity cycle; to infants and preschool age children including those health services associated with Head Start Programs; to provide instruction in good health practices to individuals and families; to assist school personnel with the integration of health teaching in the curriculum; to increase participation in community health education programs aimed at high risk groups to reduce morbidity and mortality resulting from accidents, heart disease, cancer, and diabetes.

(*d*) *Health education.*—The estimate of $959,000 provides an increase of $148,000 and 10 positions consisting of:

Statutory salary promotions	$10,000
Program increase (10 positions)	138,000
Net increase	148,000

Need for increase

Deficiencies in health education are evident in individual, family and community health behavior among the beneficiary groups.

Lags in health behavior are implicit in three of the leading causes for hospital admissions among children—respiratory infections, gastroenteric infections, and accidents. Problems made up of these causes have their beginning in unfavorable health behavior (attitudes, practices, ignorance, and misunderstanding), which mitigates against health improvement and conservation. The incidence of gastroenteric infections which in the main are brought about by poor personal hygiene and home sanitation practices, in the final analysis can be reduced only through changes in behavior that will lead to the proper care and full utilization of whatever facilities may be available. Accidents to children in the home—burns, falls, poisonings—can generally be attributed to improper human behavior. Malnutrition, alcoholism and poor oral health are other areas of concern which reflect improper attitudes toward recommended health practices and scientifically correct health knowledge.

In addition to the above deficiencies in individual and family health practices, there is unwillingness on the part of the beneficiary group to accept collective responsibility for carrying out measures to improve and to protect their health. This manifests itself in: (1) An inability to utilize resources other than those provided by the Indian Health Program; (2) Failure to follow prescribed treatment or preventive measures; (3) Limited participation in health education and promotional activities.

The health education staff must, therefore, concern itself with an organized approach to this latter deficiency as well as with those educational deficiencies related to specific diseases and health and safety hazards. In addition to the above activities, specialized staff are also needed to provide direct health education services to other DIH staff and to Indian groups in order to overcome program deficiencies. The major deficiencies in program are: (1) Inadequate capitalization on the educational potentials present in the program; (2) Limited assistance to Indian leaders and groups in planning and carrying out health educational and promotionl activities; and (3) Lack of complete involvement of other agencies and organizations that have potentials for contributing to improving the health of the beneficiaries.

Plan of work

An increase of 10 positions composed of five education specialists, one community health education assistant and four secretaries will permit the extension of professionally guided health education activities to five additional service units.

(e) *Field medical services.*—The estimate of $9,459,000 provides an increase of $1,720,000 and 131 positions consisting of:

Statutory salary promotions	$100, 000
FICA increase	5, 000
Program increase (131 positions)	1, 615, 000
Net increase	1, 720, 000

Need for increase

The increase of $1,720,000 is requested for the following:

1. Funds for additional staff to expand preventive health services.
2. Funds to provide for additional fee-basis physicians (consultants).
3. Funds for additional training.
4. Funds to expand mental health program.
5. Funds to cover mandatory increases.

Increased workload and expansion of preventive health services.—Current facilities have continued to experience an increased demand for services as a result of better acceptance of care by the Indian beneficiaries. The 1968 estimate of 680,000 outpatient visits for therapeutic and preventive services at Indian Health Centers, Health Stations, Schools and Satellite Field Clinics, exceeds by 50,000 visits the 1967 estimate. Plans have been made to expand the preventive activities of the ongoing programs particularly in the intensification and expansion of services directed toward the prevention of infective and parasitic diseases, nutritional diseases, mental disorders, complications of pregnancy and certain diseases of early infancy.

These expanded services will also be directed toward the early identification and treatment of tuberculosis, cancer, diabetes, mental disorders, eyesight and hearing problems, heart and related diseases, and congenital malformations.

To meet both the increased workload and the expansion of programs an increase of $1,066,000 is requested to cover the cost of drugs, medical supplies and laboratory services ($54,000) groups II and III construction equipment for newly constructed health centers and stations ($152,000) new replacement and non-capitalized equipment ($53,000) as well as salaries and related costs of additional professional and supporting staff which include 13 medical officers, 8 pharmacists, 7 nurses, 4 social workers, 5 nutritionists, 3 practical nurses, 11 nursing assistants, 2 health records clerks, 32 clerks-clerk typists, 7 maintenance men, 5 medical technicians and 1 administrative assistant (98 positions and $807,000).

Fee basis physicians consultants (increase of $50,000)

There is a need for more consultants to visit health centers and satellite clinics to provide specialty care and advice. This will improve the quality of medical care offered to beneficiaries, improve the morale and confidence of the young medical officer operating clinics, provide broad medical coverage for beneficiaries and generally improve the quality and quantity of care provided. At the present time only minimum emergency and limited consultant services are available. There is a need for the services of more radiologists, pathologists, neurologists, orthopedists, internists, opthalmologists, urologists, and other specialists. Fifty thousand dollars is requested in 1968 for this purpose.

Training (increase of 23 positions and $349,000)

A coordinated and comprehensive training program in specialty professions of preventive health is essential to providing thoroughly trained staff with the tools necessary for combating health problems unique to the Indians and Alaska Natives. The proposed increases in training for preventive health activities are as follows:

Alaska Community Health Aide Training Program, 4 positions and $95,000.

The high incidence of disease and the inability of professional health personnel to travel between Alaska villages because of time, distance, and—even more important—weather conditions, make it imperative that some other source of service be provided. Due to the problems unique to Alaska this service can best be provided by sub-professionals functioning as an assistant to, and under the direction of, health professionals. At least 150 villages in Alaska vitally need this service.

A brief summation of factors contributing to the vital need for community health aides includes:

I. Available professional and supporting staff are grossly inadequate in number to met the demands. Consequently village visits are infrequent.

II. The vast geographic expanse and uncertain weather conditions often create conditions of complete isolation. Communications with the "outside" is frequently only by radio for such periods.

III. Language and cultural problems create a barrier between the health staff and the beneficiary, making adequate communications difficult.

IV. The unique fishing and hunting economy of the small villages results in a socio-economic level which precludes supporting locally available health facilities and personnel.

V. Beneficiaries very often are not "aware" of the health deficiencies extent.

VI. The beneficiaries' understanding of health matters is minimal due to such factors as:

(*a*) low level of academic education;
(*b*) dearth of health education; and;
(*c*) a lack of motivating factors.

The objectives of the planned 15 week initial program of training are to impart the knowledge and skills necessary to satisfactorily perform the duties assigned the aides. Additional training and refresher courses will be conducted periodically within the funds requested.

Approximately 201 aides for regular duty are needed in the 150 villages under consideration. An additional 24 aides are needed as replacements. These figures are based on one aide per 200 population. It is planned that alternate aides be trained for those communities with only one aide. This would require an additional 104, resulting in a total of 329 aides to be trained.

Four additional staff and $95,000 will be required tc carry out the training program for 45 aides the first year.

Preventive Medicine Residency Program, 3 positions and $30,000.

The present shortage of physicians in the United States who are certified as specialists in preventive medicine and the expanding need for these qualified professionals in the Division of Indian Health program prompted the Division of Indian Health to establish a residency program in Preventive Medicine and Public Health with the University of Oklahoma. This program, accredited by the American Medical Association and the Board of Preventive Medicine is a planned three-year continued program which provides for three preceptors, one coordinator and three residents in each one of the three years. The above increase will provide for the additional three residents required in the third year of the program at an increased cost of $30,000.

Medical and Allied Speciality Long-term Training, 4 positions and $60,000.

Public health and medical services in this country are undergoing a rapid evolution which will eventually make available to the Indian and Alaska Native population modern, high-quality health services of every description. While it is neither possible nor necessary to predict the exact forms and methods of medical care in the future, there are certain well-defined indications of the direction in which health services are moving. These various trends point clearly to considerable modifications of the methods and plans of administering the facilities, personnel, and programs.

Broad problems must be evaluated and studies made if adequate beneficiary health services and programs are to be carried out effectively—the improvement and expansion of out-patient services; the more effective use of home medical care; the development of adequate laboratory, diagnostic, and therapeutic units properly located to serve the increasing beneficiary population; recognition of necessary specialization and of the grouping of skills and talents of specialists into various forms of group practice; and the pronounced influence of preventive medicine on the Indian Health program.

The diversified nature of public health and the corresponding scarcity of trained personnel makes it necessary to develop competent personnel with the advanced administrative and technical knowledge peculiar to the field of public health in several areas of specialization, including the following: public health administration, hospital administration, medical care administration, behavioral sciences, health education, maternal and child health administration (including school health), environmental health administration, public health laboratory, public health engineering, sanitary science, epidemiology, biostatistics, occupational health, public health nursing administration, public health nutrition and public health social work.

Four positions and $60,000 are requested for out-of-service training for personnel with medical and allied professional specialties in order to develop advanced competency in the administrative and technical disciplines in public health.

Social Work Associates Training, 7 positions and $50,000.

A goal of the social work program is to provide the Division with trained and experienced personnel who can—

(1) assist Indians individually and in groups to solve personal and environmental problems that interfere with the attainment of a high level of health.

(2) provide technical consultation within DIH and to outside groups to improve quality of services to Indians.

(3) maintain effective liaison with related social agencies to achieve program coordination and maximum efficiency.

There is a manpower crisis in social work which makes it unlikely that this Division will be able at any time within the foreseeable future to employ enough trained social workers to provide an adequate level of profesisonal social services for all Indian patients who need them. The HEW social workers manpower study currently conducted under Under Secretary Wilbur J. Cohen's direction revealed that there were in this country 10,000 unfilled, budgeted vacancies for qualified social workers in 1964.

In 1964 the social work program reached less than 20 percent of the 48,000 general medical patients in DIH and contract facilities, 60 percent of the 1,150 tuberculosis patients and 6 percent of the 187,000 persons who sought attention as outpatients. Social work studies among less deprived groups of patients have shown that each general medical and surgical patient requires four hours of total social work time and each tuberculosis patient 18 hours. Assuming that the outpatient number encompasses all inpatients, DIH would need to increase its staff ten fold to provide even brief casework services to Indian patients who are under severe personal or socioeconomic pressure.

It is proposed to set up an apprenticeship type system for the training of social work associates. Specific objectives will be to provide inservice training and preceptorship to:

(*a*) Extend the potential of the present staff by extending the effect of their knowledge and skill to more patients.

(*b*) Free professional personnel from routine but necessary tasks thus enabling them to handle more of the complex situations, and more time on program consultation, and program planning activities.

(*c*) Strengthen the program by training and utilizing as social work associates carefully related and qualified Indian—Eskimo college students.

Although it is planned to give preference to Navajo and Eskimo speaking recruits, the total Indian Health Program can benefit from the training and the utilization of other Indians and non-Indians to reach the unmet social service needs of beneficiaries.

Many Indians and Alaska natives are interested in working with the problems of their own people. Traineeships for Social Work Associates will provide an opportunity for these Public Health Service beneficiaries to contribute to the reduction of Indian Health problems.

Seven positions and $50,000 are requested to initiate this program in Fiscal Year 1968. These funds will provide for a supervisory social workers training instructor, four social worker associate trainees, and two clerks essential to the implementation of this program.

COSTEP, Advanced Professional Training, $14,000.

This increase will permit an expansion of the Commissioned Officer student training extern program which provides a successful mechanism for training, recruitment and career development of new officers in the Service.

The COSTEP program provides training opportunities in a professional environment for students in health related studies and stimulation of interest by promising students in Public Health Service careers and continues to serve as an effective recruiting technique for helping to meet the manpower requirements of the Public Health Service. The requested increase will permit an increase of approximately 10 students at a cost of $1,420 per student.

Division of Indian Health Training Center, 5 positions and $100,000.

Discussed below is a plan for relocation and expansion of the Division of Indian Health Training Center from Phoenix to Tucson, Arizona.

The nature of the Division's mission—that of providing direct medical and health services to almost 400,000 beneficiaries—and the makeup of the personnel required to carry out the mission, militates for the conduct of continuing intensive, manifold training programs and activities.

A significant part of the training needed to keep the health professional and technical complement of the staff, which constitutes over one-half of the total, abreast of rapid changes in technology can be provided by training resources either outside the Government or with other Government agencies. However, because of the dispersed nature of operations—5,380 personnel functioning in at least 300 different locations—the cost of providing all needed training following traditional methods wherein staff members are sent individually to various training locations is prohibitive.

Additionally, this type of training, even if financially feasible, would not meet all Division training needs for several reasons:

1. Loss of services while in training.
2. Unique factors inherent in providing services for a culturally-different, language-impeded, disadvantaged beneficiary.
3. Various aspects of the Division's operations itself, which is singular among all non-Government and Government organizations in its structure and comprehensiveness of program.

The extent to which the Division is now involved in various types of training is illustrated by the following.

Each year the Division sends approximately 400 persons outside the government for training. From 4,000 to 5,000 are annually trained within the Government. Of the latter, 90 percent are provided training within the Service or Division itself.

The present training program fragments the available resources of men, money and materials for training activities, resulting in a multiplicity of space, facilities, personnel, equipment and services. Even more important, it has resulted in a disparity between the needs of the individual training programs and the services which their allotted funds will provide.

The staffing of the present training center at Phoenix has been limited to a Director, an acting assistant director and an education specialist (audio visual) who have had the responsibility for epidemiology training, health records training and audio visual services for training, information and health education. This staff is presently developing programs of training in the areas of management, laboratory and housekeeping.

As can be seen from the foregoing discussion more effective means must be found to provide the training necessary to maintain and improve the capabilities of staff in order that the health of the beneficiaries may be elevated.

In order to develop such an effective training program and assure that the funds being expended for inservice training are expended in the most judicious, effective and profitable manner possible, it is proposed that the Division Training Center be expanded.

A nucleus of 12 professional training personnel supported by the professional personnel of the operations research project and health center will be capable of providing training or training materials of practically any type and scope needed to meet existing and future specific needs of the Division.

New and improved training methods will be researched and developed in conjunction with the operations research project so as to provide even more efficient and effective training.

It is anticipated that established and additional new types of courses will be conducted at the Tucson facility such as were conducted regularly at Phoenix and Albuquerque and sporadically at other locations, both by Center personnel and by Area and Service Unit personnel.

Certain well-defined training programs or activities now being conducted or proposed, which lend themselves to location at, or conduct out of, a common facility have been or will be drawn together for more effective utilization of resources.

These programs include:

1. Epedimiology Training, formerly at the Training Center, Phoenix Area Office Facility.
2. Environmental Health Training Phoenix Environmental Health Special Projects Group Facility.
3. Health Records Training, formerly at the Training Center, Phoenix Area Office.
4. Medical Social Services Training, including Associate Training (Proposed).
5. Food Service Supervisor Training (Proposed).

In addition to these established or proposed formalized training programs, there are a number of Division-wide conferences, workshops and seminars held annually or more often which could be far more effectively conducted at a well equipped and staffed facility. Examples are workshops held by the Environmental Health and Nursing Programs on a variety of subjects, and mixed discipline workshops on such subjects as plague, hospital cross-infection control, accidents, enteric diseases, and dental health.
