Interim Report on the Administrative Law, Process and Procedure Project for the 21st Century

Executive Summary

The Administrative Law, Process, and Procedure Project for the 21st Century (Project) has been a bi-partisan undertaking of the House Judiciary Committee, overseen and conducted by its Subcommittee on Commercial and Administrative Law (CAL Subcommittee). The Project has had two principle goals: to reauthorize and to substantiate the need to reactivate the Administrative Conference of the United States (ACUS), and, simultaneously, to set in motion a study process that would identify the important issues of administrative law, process, and procedure that have emerged in the eleven year hiatus since its demise that would serve as a basis for immediate legislative consideration and action by the Committee or the initial agenda for further studies by a reactivated ACUS.

Initial success was achieved by the Committee regarding the first goal with the enactment of the Federal Regulatory Improvement Act of 2004, Pub. L. No. 108-401, on October 4, 2004, which reauthorized ACUS. As of the date of this Report, however, funding legislation has not been passed.

The second goal was initiated by the Committee's adoption of an oversight plan for the 109th Congress which made a study of emergent administrative law and process issues a priority oversight agenda item for the CAL Subcommittee. The oversight plan identified seven general areas for study: (1) public participation in the rulemaking process; (2) Congressional review of agency rulemaking; (3) Presidential review of agency rulemaking; (4) judicial review of agency rulemaking; (5) the agency adjudicatory process; (6) the utility of regulatory analyses and accountability requirements; and (7) the role of science in the regulatory process. The Subcommittee, in turn, tasked the Congressional Research Service (CRS) with coordinating the research effort. Through hearings, symposia, and the commissioning of empirical studies, recommendations for legislative action or for further study were developed.

Hearings

Since 2004, the Subcommittee has held a series of hearings in anticipation of and as part of the Project. Following its May 20, 2004 oversight hearing on the proposed reauthorization of ACUS, at which Justices Scalia and Breyer testified, the Subcommittee conducted a second hearing on ACUS that examined further reasons why there is a need to reactivate ACUS. In November, 2005, the Subcommittee held a hearing on the status of the Project. In 2006, the Subcommittee held three hearings. The first, in March, 2006, focused on the Congressional Review Act in light of the Act's tenth anniversary. The second dealt with how the Regulatory Flexibility Act (RFA) has been implemented since its enactment in 1980 and whether proposed legislation, such as H.R. 682, the Regulatory Flexibility Improvements Act, would adequately address certain perceived weaknesses in the RFA. On July 14, 2006, the Subcommittee held a hearing on the 60th anniversary of the passage of the Administrative Procedure Act (APA), addressing the question of whether the APA is still effective in the 21st century. A final hearing was held on November 14, 2006, at which the CRS coordinators of the Project briefed the Committee on the results of their efforts.

Symposia

In addition to conducting hearings, the Subcommittee to date has sponsored three symposia as part of the Project. The first symposium, held on December 5, 2005, “E-Rulemaking in the 21st Century,” dealt with federal e-government initiatives. This program, chaired by Professor Cary Coglianese of the University of Pennsylvania Law School, examined the Executive Branch’s efforts to implement e-rulemaking across the federal government. A particular focus of this program was the ongoing development of a government-wide Federal Docket Management System (FDMS). Presentations at the symposium were given by government managers involved in the development of the FDMS as well as by academic researchers studying e-rulemaking. Representatives from various agencies, including the Office of Management and Budget (OMB), the United States Environmental Protection Agency, and the Government Accountability Office (GAO), discussed the current progress of e-rulemaking. In addition, academics reported on current and prospective research endeavors dealing with certain aspects of e-rulemaking. The program offered a structured dialogue that addressed the challenges and opportunities for implementing e-rulemaking, the outcomes achieved by e-rulemaking to date, and strategies that could be used in the future to improve the rulemaking process through application of information technology.

On May 9, 2006, the Center for the Study of Rulemaking at American University hosted a day-long conference for the Subcommittee entitled, “The Role of Science in Rulemaking.” The four panels – The Office of Management and Budget’s Recent Initiatives on Regulatory Science, Science and Judicial Review of Rulemaking, Science Advisory Panels and Rulemaking, and Government Agencies’ Science Capabilities – reflected the current debate over whether “sound science” has been given sufficient weight in the development of regulatory standards. As part of that debate, questions have been raised about the quality of the data that are used in developing proposed and final rules, the use of peer review panels as part of the process to ensure quality, and the role that risk assessment can or should play in deciding what to regulate and at what levels.

On September 11, 2006, the CRS, on behalf of the CAL Subcommittee, sponsored a day-long seminar entitled, “Presidential, Congressional, and Judicial Control of Agency Rulemaking.” Consisting of four panels of academics, government officials and private sector public interest groups, the seminar addressed the following subjects: Conflicting Claims of Congressional and Executive Branch Legal Authority Over Rulemaking, Judicial Review of Rulemaking, Congressional Review of Rulemaking, and Presidential Review of Rulemaking: Reagan to Bush II.

Empirical Studies

Three empirical studies were initiated by CRS. The first, conducted by Professor William West of the Bush School of Government and Public Service at Texas A&M University, studied how agencies develop proposed rules, with a particular emphasis on how rulemaking initiatives are placed on regulatory agendas; how the rulemaking process is managed at inter- and intra-agency levels; and how public participation and transparency factor in the pre-notice and comment phase of rule formulation. Professor West presented his findings and conclusions at a hearing conducted by the CAL Subcommittee on March 30, 2006.

A second study commissioned by CRS sought to fill the void created by the absence of an authoritative, systematic empirical analysis of the effects of judicial review of agency rulemaking by federal appellate courts. Professor Jody Freeman of the Harvard Law School agreed to conduct the study, which will analyze the pertinent rulings of all federal circuit courts of appeal from 1995

to 2004 to determine the rate at which rules are invalidated in whole or in part, and the reasons for those invalidations. Professor Freeman's study is still on-going.

A third study arose out of the Role of Science in Rulemaking symposium, described earlier in this summary. It became apparent during a panel discussion on the role of science advisory bodies in agencies that there was no authoritative compilation of how many science advisory committees currently exist, how they were selected, how issues of neutrality and conflicts of interest were handled, how issues are selected for review, and the impact of advisory body recommendations on agency decisionmaking. To examine these questions, CRS commissioned a study to be conducted by Professor Stuart Bretschneider of The Maxwell School of Citizenship and Public Affairs at Syracuse University, which is expected to be completed by June 2007.

Preliminary Recommendations for Further Areas of Study and Possible Legislative Action

1. Public Participation in the Rulemaking Process.

- Should efforts to include the public in the rulemaking process before publication of a proposed rule (e.g., negotiated rulemaking, Small Business Regulatory Enforcement Fairness Act [SBREFA] panels) be expanded? How much do these processes currently add in terms of public participation?
- How effective is the *Unified Agenda of Federal Regulatory and Deregulatory Actions* in identifying future rulemaking (thereby giving the public advance warning of forthcoming regulatory actions)? What changes could make this *Agenda* a more effective means of notification?
- What has been the impact of agencies' use of "nonrulemaking" approaches (e.g., guidance documents, notices, etc.) and attenuated rulemaking approaches (e.g., use of the APA's "good cause exception to skip notices of proposed rulemaking) on the public's opportunities for participation? Should the public be able to comment on those approaches before they become final?
- Should all agencies be required to make comments received immediately available to the public (to allow comments on the comments)? Or, alternatively, should agencies provide "reply comment periods" (to discourage waiting to the end of the comment period)?
- What effect has "e-rulemaking" (including the use of e-mail comments and "comments on comments," on-line dialogues, the new Regulations.gov web site, agency-specific and the new governmentwide electronic dockets) had on the amount and nature of public participation in the rulemaking process, and how do agencies view those comments? Specifically:
 - How should agencies deal with the sometimes hundreds-of-thousands of e-mail comments generated by special interest groups?

- Should all agencies be required to offer “list serves” that allow members of the public to be notified of certain rules being available for comment?
- Has e-rulemaking allowed more people to participate in the rulemaking process, or simply facilitated access to traditional commenters?
- The APA does not specify how long public comment periods should be (although Executive Order 12866 suggests 60 days). Should there be a minimum comment period specified in the statute? If so, what should it be? Also, under what circumstances can/should agencies extend comment periods?
- Are agencies always required to respond to public comments, even if they take no further action on the proposed rule for years? How soon should they respond, and in what form? Is there a point when public comments become too “stale” to permit issuance of a rule based on those comments (without further public comments)?
- There are no governmentwide standards for what should be in the rulemaking record (e.g., a copy of the proposed rule, public comments, etc.) or a standard order of presentation of the documents? Should there be such standards? If so, who should establish them (OMB, National Archives and Records Administration, or some other entity)?
- Under what circumstances is it appropriate for agencies to allow commenters to file confidential comments? How should this procedure be regularized?
- The APA prohibits *ex parte* contacts in formal rulemaking, but is silent about such contacts in the much more common informal “notice and comment” rulemaking. Should Congress extend those prohibitions, and clearly establish when and what types of contacts are prohibited?
- The APA does not mention two relatively common forms of rulemaking that avoid traditional notice and comment requirements — interim final rulemaking and direct final rulemaking. Should Congress codify these forms of rulemaking and how they should (and should not) be used? More generally, should Congress revisit agencies’ use of all forms of the “good cause” exception?
- Some of the statutory analytical requirements in rulemaking (e.g., the Regulatory Flexibility Act and the Unfunded Mandates Reform Act) do not apply to rules for which there is no notice of proposed rulemaking (NPRM). Should these incentives for agencies to avoid NPRMs be eliminated? At a minimum, should the exemptions for interim final and direct final rules be eliminated?
- OMB’s new peer review bulletin allows agencies to decide whether to permit public comment on their peer review processes. Should agencies have that discretion, should agencies be required to permit public comments, or should public comments on what is supposed to be an “expert” process not be permitted (because, among other things, it could slow down rulemaking)?

- To what extent does public participation in its various forms (e.g., comment periods, public meetings, SBREFA panels, etc.) have an effect on agency decisionmaking during the rulemaking process? What empirical evidence is there of that effect?
- What is the proper role of consultants in the development stage of a rulemaking? Should there be a balance of views of competing stakeholders in the pre-NPRM period? Should agencies be required to invite competing views to ensure "balance"?
- Do consent decrees entered into by government agencies with private parties to settle challenges to rules and that effect substantive changes in the rules undermine the APA's notice and comment requirements and public participation opportunities? Do they raise separation of powers issues?

2. Presidential Review of Rules.

- To remove any question of its legitimacy, should Congress codify Presidential review of agency rulemaking? If so, how detailed should that codification be? For example, should it simply authorize the President to issue an executive order on this issue (thereby giving future Presidents the flexibility to change its provisions), with certain other requirements for transparency and limits on delay? Or should the codification spell out in detail the process by which Presidents should review rules before they are published?
- Should independent regulatory agencies' rules be subject to Presidential review (as they are now under the Paperwork Reduction Act)? Or would Presidential review adversely affect the independence intended for these agencies?
- What role should OMB play in the Presidential rule review process? Should OMB be a "counselor" to the agencies (as during the Clinton Administration), suggesting improvements to the agencies but generally deferring to agencies' statutory expertise? Or should it be more of a "gatekeeper" (as during the current Bush Administration) establishing strict standards and ensuring that regulations meet certain standards before publication?
- What rules should govern OMB's contacts with outside parties during the Presidential review process? For example, should OMB be allowed to meet with regulated entities outside of the period when agencies are not permitted to do so (because of restrictions on *ex parte* communications)? Should OMB be required to disclose to the public not only that such a meeting occurred, but also a summary of what was said (as some agencies are required to do) to provide an administrative record for any subsequent changes?
- How transparent should the Presidential review process be to the public? Are improvements in review transparency currently needed (either administratively or by statute)? Specifically:
 - Should OMB clearly define what types of "substantive" changes to rules need to be disclosed?

- Should agencies or OMB be required to disclose substantive changes made to rules during “informal” reviews (when OMB says it can have its greatest effect)?
- Should OMB clearly indicate in its database which rules were changed at its suggestion?
- A number of actions by OMB during the Bush Administration have had the effect of centralizing rulemaking authority in the Executive Office of the President. For example, within the past four years OMB has revitalized the regulatory review function under Executive Order 12866 (emphasizing cost-benefit analysis, returning rules to the agencies); and issued governmentwide guidelines on data quality and peer review (with OMB able to determine when agencies’ rules should be peer reviewed and at what level). Have these executive actions taken too much authority away from the agencies in whom Congress vested rulemaking authority, thereby upsetting the balance of power between Congress and the President in this area?
- How has the Office of Information and Regulatory Affairs (OIRA) “prompt letter” process worked? How many new regulations or improvements to existing rules can be traced to these letters?
- Should a new President be authorized to stay the effectiveness of “midnight rules” that are promulgated shortly before a new administration takes office? If so, should there be limits on the amount of time rules can be delayed?
- Does OIRA have legal authority to promulgate requirements or even guidelines regarding agencies’ use of peer reviews, risk assessments or guidance documents?
- Is Presidential review of rule cost beneficial? Is there an objective way to measure benefits that OIRA review provides?

3. Congressional Review of Rules.

- How effective has the Congressional Review Act (CRA) been in improving Congressional oversight of the rulemaking process? Does the Act need to be amended/replaced? For example:
 - Should agencies still be required to send all rules to the House, Senate, and GAO or should reporting be limited to just “major” or “significant” rules?
 - Should Congress amend the CRA to require electronic reporting of rules Congress and GAO?
 - How are GAO’s reports handled by Congress? Do they need refinement?
 - Should there be an expedited procedure for House consideration of rules reported for review?

- Should Congress clarify that an agency’s failure to report a covered rule renders the rule unenforceable and makes it subject to judicial Review?
 - Should Congress clarify how not to run afoul of the “substantially the same” prohibition in the CRA?
 - Should the “legislative day” measure be clarified since it is so unpredictable in terms of calendar days?
 - Should Congress adopt the changes in the CRA process that were contemplated by H.R. 3148 in the 109th Congress, including the proposal to establish a joint Congressional committee to screen and recommend proposed rules for disapproval? If so, should it provide the joint committee with authority envisioned in the Truth in Regulating Act to require the GAO to provide assessments of selected rules
- Other than the CRA, what other options does Congress have to prevent the implementation of an agency rule (e.g., appropriations riders)? How common are such approaches? Are they effective?
 - Should Congress establish a “Congressional Office of Regulatory Analysis” to help it oversee the agencies’ compliance with various rulemaking requirements? If so, should it follow the format envisioned in the Truth in Regulation Act (e.g., be established within the GAO, require assessment of all rulemaking requirements, etc.)? If so, should Congress simply reauthorize and fund TIRA?
 - Should Congress affirmatively approve all major rules (e.g., those with a \$100 million annual impact on the economy) before they take effect instead of the current scheme of making all final rules, major or minor, subject to review and possible disapproval?

4. Judicial Review of Rules.

- Should Congress clarify whether the Information Quality Act permits judicial review?
- In light of the Supreme Court’s 2001 ruling in *U.S. v. Meade*, is it time for Congress to establish rules of “deference” when a court finds a statutory delegation “ambiguous?”
- If studies showing that appellate courts are overturning more than 50% of challenged agency rules prove accurate, should Congress statutorily modify the “reasonable decisionmaking” standard, or limit judicial review in some other way?
- Should the APA be amended to make more clear when the courts can remand a rule without vacating it?

- The Chief Counsel for Advocacy of the Small Business Administration has been given unique power under SBREFA to file amicus briefs in cases challenging agency action. How effective/problematic has this been?
- Should Congress address the increasing use of consent decrees that modify or alter the substantive content of agency rules?

5. The Utility of Regulatory Analysis and Accountability Requirements.

- Should Congress reassess statutory requirements that prohibit agencies' considerations of cost in setting health and safety standards?
- Is cost-benefit analysis inherently biased in that the benefits of health and safety rules are often difficult or impossible to monetize?
- Executive Order 12866 requires agencies to assess the costs and benefits of all significant rules, and requires a full cost-benefit analysis of all "economically significant" rules. Does OMB apply these requirements and use cost-benefit information in a balanced way? For example, does OMB require all rules to have a cost-benefit analysis, or are certain rules exempt (e.g., Homeland Security rules)? Does OMB use cost-benefit analysis to prompt rulemaking or to increase regulatory requirements, or only to stop or limit rulemaking?
- How effective have been the regulatory requirements designed to protect small businesses and other small entities (e.g., the RFA and SBREFA)? Do they give federal agencies too much discretion in their application? Should the Small Business Administration (SBA) or some other entity be required to define key terms (e.g., "significant economic impact on a substantial number of small entities")? Or should there even be special protections for small businesses and other small entities?
- How effective have been the regulatory requirements designed to protect federalism (e.g., Executive Order 13132)? Do they give federal agencies too much discretion in their application? Should OMB or some other entity be required to define key terms (e.g., "significant federalism implications")? Or should there even be special protections for federalism?
- Should agencies be required to reexamine their rules periodically to ensure that they are still needed or impose the least burden? (Currently, agencies are only required to do so for rules that had/have a "significant economic impact on a substantial number of small entities.") Or, should Congress take on that reexamination responsibility (perhaps as contemplated in H.R. 3356 in the 108th Congress)? Relatedly, should agencies' final rules include a "sunset" provision that requires them to be reexamined and republished?
- Should the myriad of analytical and accountability requirements in various statutes and executive orders be rationalized and codified in one place?
- To what extent have the analytical and accountability requirements contributed to what is called by some the "ossification" of the rulemaking process?

- How accurate are agencies' pre-promulgation cost and benefit estimates?
- How much does it cost for agencies to conduct cost-benefit analyses, risk assessments, regulatory flexibility analyses, federalism assessments, etc.?

6. The Role of Science in the Regulatory Process.

- How should scientific advisory panels be constructed to ensure that they are unbiased?
- Under what circumstances should agencies' regulatory policies deviate from the recommendations of their scientific staff and advisory bodies?
- Do agencies have too much discretion to deny correction requests? Should agencies' correction denials be subject to judicial review? What effect has the act had on the length of time it takes agencies to issue rules? Do the Shelby Amendment and the Information Quality Act, in tandem, potentially restrict the release of research findings that would have significant social impact?
- What is the appropriate role of the courts in reviewing science-based agency regulatory decisions?
- Are government-wide standards for peer review needed? Does OMB have the authority to issue such standards? What effect will these requirements have on the length of time it takes agencies to issue rules?
- What has been the effect of the Supreme Court's ruling in *Daubert v. Merrell Dow Pharmaceuticals, Inc.* (regarding the acceptance and understanding of scientific evidence to be used in the legal system) on regulatory policymaking?
- What constitutes the "weight of evidence" in making risk-based regulatory decisions? Should Congress define the term, or should it be left up to the agencies within a specific regulatory context?
- Are agencies complying with OMB's peer review and risk assessment bulletins?

7. The Agency Adjudicatory Process.

- Is there a need to reassess the role of the administrative law judge (ALJ) and how these officials are selected and evaluated? Should regulatory ALJs be treated differently from benefits ALJs?
- Should the notion of a centralized ALJ corps be revisited?
- Is there a need to examine and review the role of non-ALJ hearing officers?
- Should the split-enforcement model of agency adjudication (e.g., Occupational Safety and Health Administration [OSHA]-Occupational Safety and Health Review Commission) be used more often?

- Should the APA contain a provision regarding informal adjudication?
- Should the APA's adjudication provisions be extended to all evidentiary hearings required by statute?

Acknowledgments

The Subcommittee on Commercial and Administrative Law of the Committee on the Judiciary of the United States of Representatives wishes to acknowledge these entities and individuals for their contribution to the Administrative Law, Process, and Procedure Project for the 21st Century:

Congressional Research Service –

I. Public Participation in the Rulemaking Process

Section 553 of the Administrative Procedure Act (APA) establishes the general procedures that an agency must follow when promulgating a rule.¹ Rulemaking under this section is referred to as “informal,” or “notice and comment” rulemaking, and requires an agency to publish notice of a proposed rulemaking in the Federal Register, provide opportunity for the submission of comments by the public, and to publish a final rule and a general statement of basis and purpose in the Federal Register “not less than 30 days before its effective date.”²

Regarding public participation in this context, the APA specifically provides that an agency “shall give interested persons an opportunity to participate in the rulemaking through submission of written data, views, or arguments with or without the opportunity for oral presentation.”³ Thus, the APA establishes that an informal rulemaking must, at a minimum, provide an opportunity for interested parties to submit written comments regarding the rule in question. The notice and comment process has been criticized as providing an inadequate forum for effective public participation, with some commentators asserting that the process does not further the public interest so much as provide a “forum for competition among interest groups,”⁴ and that it “fail[s] to encourage dialogue and deliberation among the parties most affected by [rulemaking].”⁵ Conversely, other commentators have suggested that there is ample evidence to support the proposition that agencies do in fact give serious consideration to comments received, oftentimes leading to significant changes in proposed rules.⁶ With these competing viewpoints in mind, the Project has focused on analyzing a broad spectrum of issues adhering to public participation in the rulemaking process, ranging from judicially derived participation requirements to recent innovations in electronic rulemaking.

Standards Governing Effective and Meaningful Public Participation in Informal Rulemaking Proceedings

The original model of informal rulemaking under the APA,⁷ which held sway from 1946 until the late 1960s, no longer exists. Fashioned to reflect the conception of administrative agencies as technically expert bodies capable of correctly finding and applying facts and law, only a subsidiary and minor role was accorded the interested public in agency policymaking proceedings. Since 1970, however, the Supreme Court and the federal courts of appeals have virtually singlehandedly reshaped the structure of informal rulemaking in a series of decisions

expanding both the obligations of agencies and the role of the reviewing courts. The result has been the transformation, without benefit of legislative amendment, of informal rulemaking into an on-the-record proceeding that has fostered widespread public participation in the process. These developments and the reasons for them are briefly recounted.

As originally conceived and practiced, an agency would develop a proposed rule under section 553 of the APA by drawing upon any sources of information or analysis, including business or consumer representatives, academicians, or the agency's own expertise. The agency then published a notice of proposed rulemaking (NPRM) in the Federal Register and opened the matter to written comment for an unspecified period, and any interested person could introduce into the record "data, views, or arguments"⁸ in support or opposition. The agency had discretion to hold oral hearings or take additional procedural steps to develop the rule further. After considering the proposal in light of the comments, the agency could withdraw the proposal, publish a revision, or promulgate a final rule accompanied by a concise statement of basis and purpose explaining its action. In this original APA model, the final statement could draw also upon sources of information or argument not previously raised or revealed.⁹ On review, a court would uphold the agency action if it found the rule within the scope of the agency's authority and not arbitrary and capricious. That is, the court would uphold the rule if the agency could construct a plausible supporting hypothesis. Agencies were put under no duty to consider all possible alternatives. They were expected to demonstrate that their policies were "rational" in only a minimal sense – more likely than not to promote a permissible goal.¹⁰ This standard of review gave an agency immense discretion and was mitigated only by the countervailing limitation that the supporting rationale had to be provided by the agency itself. A reviewing court would neither invent a hypothesis upon which the agency could have acted¹¹ nor accept inventions counsel might develop in the context of appeal.¹²

During this era, no one thought the comments required by section 553 were intended to constitute a complete record for decision either by the agency or the reviewing court.¹³ Under the original APA model, the agency acted primarily on the basis of its expertise, using whatever

⁸5 U.S.C. § 553(c) (2000). The APA does not specify the length of the comment period. Presidential executive orders since the Carter Administration have suggested a period of not less than 60 days "in order to afford the public a meaningful opportunity to comment on any proposed regulation." *See, e.g.*, Executive Order 12866, 58 Fed. Reg. 51735, Sec. 6(a)(1) (Oct. 4, 1993).

⁹*See, e.g.*, *Pacific Coast Eastern Conf. v. United States*, 350 F.2d 197, 205 (9th Cir. 1965), *cert. denied*, 382 U.S. 958 (1965).

¹⁰*See, e.g.*, *NLRB v. Seven-Up Bottling Co.*, 344 U.S. 344 (1953) (order will be upheld unless it can be shown that it is attempt to achieve ends other than those set forth in statute); *SEC v. Chenery Corp.*, 332 U.S. 194, 207 (1947) (order will be upset only if it lacks "any rational and statutory foundation").

¹¹*See, e.g.*, *SEC v. Chenery Corp.*, 318 U.S. 80, 94 (1943).

¹²*See, e.g.*, *Burlington Truck Lines v. United States*, 371 U.S. 156, 168-89 (1962).

internal processes and information it desired.¹⁴ Requiring comment simply gave the agency the opportunity to hear views of knowledgeable outsiders before exercising its own independent judgment.¹⁵ They were regarded solely as “instruments for the education of the administrator.”¹⁶ The agency was free, at the time of review, to support a rule with a “record” not based on the information available to various decisionmakers during the rule’s formation.¹⁷ While the courts at that time may have viewed *post hoc* rationalizations with suspicion,¹⁸ such rationalizations were acceptable. The agency could base its decision on expertise, unstated political considerations, or an inarticulable intuition.¹⁹ If the ultimate validity of the regulation turned on questions of fact, as opposed to agency policy judgments, then an enforcement proceeding was deemed an adequate forum for review.²⁰ In such proceedings, it was assumed the challenger could assail the rule as applied to his particular situation. Thus, under original APA model, settlement of issues of policy and fact were not based on the rulemaking record.

Professor Martin Shapiro has characterized the rule of the agencies and courts during this period and the reasons for this posture as follows:

In the early 1930's the New Deal created a government based on concentrating power in the hands of technically expert administrative agencies. By the early 1940's administrative law had been well shaped to express this theory. The new judges enunciated a theory of review that was a restatement of the progressive political theory. Power must be concentrated to be effective; and it must be wielded by experts in order to achieve rational results. Thus judges, who were not technically expert, must defer to agencies, who were. The central doctrines of the administrative law of the 1940's were the twin presumptions that agencies had correctly found the facts and had correctly found the law. Given such presumptions, there was nothing for the judges to do. They effectively transferred their power over regulation to the agencies at the same time they gave constitutional approval to the delegation of congressional regulatory power to the same agencies. Voila technocracy--rule by expert agencies.²¹

²¹Shapiro, *supra* note 14, at 19.

By the 1960s, however, criticism of the prevailing rulemaking model began to swell. Presidential commissions,²² jurists,²³ academics,²⁴ and so-called public interest protectors,²⁵ fueled in great measure by the immense growth in the role of the federal government, both in terms of the national resources allocated by the government and the degree of intrusiveness into individual decisions, expressed skepticism about both the substance and form of government decisionmaking. The product of many agencies' deliberations, these critics argued, was not a flexible policy, but no policy at all and which in some instances resulted in favoritism or uncertainty. The proliferation of the government's reach also raised questions as to the continued validity of the notion of the "expert" administrator.

The cumulative effect of these criticisms was a revolutionary overhaul of the whole structure of administrative regulation. Spearheaded by the courts, beginning in the mid-1960s and accelerating rapidly during the early years of the 1970s, a new consensus about agency policymaking began to emerge.²⁶ The key doctrinal shift was the enhanced emphasis on rulemaking as a method of formulating policy. Doubts about some agencies' legal authority to issue binding rules were erased by a series of judicial decisions.²⁷ Congress joined in this trend by granting broad rulemaking power in new regulatory statutes²⁸ and by increasingly resorting to "action-forcing" techniques to compel prospective adoption of policies.²⁹ Courts invoked a variety of legal grounds – due process,³⁰ organic statutes and internal agency procedures,³¹ or

abuse of discretion³² – for finding an obligation to proceed by rulemaking. Informal rulemaking became the presumptive and judicially preferred mode of policymaking procedure.³³

The courts not only demanded greater use of rulemaking for elaborating policy, but also radically transformed the ways in which agencies make rules and courts review them. Led by the Court of Appeals for the District of Columbia, creative judicial interpretation of the APA and of the agencies' organic statutes made rulemaking dramatically more accessible and procedurally formal. First, the courts lowered the barriers to public access to both agencies and courts by relaxing the standing, ripeness, and exhaustion rules.³⁴ Those rules originally had been designed to exclude from agencies and the courts every one except those few individuals who had suffered direct legal injury by government action. Now any interest group may assert small or indirect potential injury and thereby claim access to the decisionmaking processes of government.

The next step the courts took was to ensure that access was meaningful. This was accomplished by engrafting muscle and substance on the heretofore spare and cryptic notice and comment requirements of section 553. The courts now required a rulemaking record which had to contain the material on which the agency bases its decision.³⁵ Thus the use of nonrecord material in a final statement of basis and purpose was found to be cause for remand.³⁶ Even if the record as it stood would support the agency decision, the court could find an abuse of discretion if other, unrevealed sources affected the rulemaking process.³⁷ The courts also required agencies to place the relevant materials, particularly those of a complicated or technical nature, on the record at a time and in a form that would allow other parties an opportunity to examine and appraise them.³⁸ Last minute additions to the record were held not to suffice since

it deprived participants of the opportunity to comment or refute.³⁹ Interested parties had to have the opportunity to test the bases of the agency's position--factual, technical, analytical or theoretical.⁴⁰ Although the timely entry of material onto the record would suffice in most cases, some decisions stated that an agency should allow cross-examination or a specific opportunity for rebuttal if such procedures are the best method of illuminating issues.⁴¹

Finally, the courts imposed a series of requirements on the final statement of basis and purpose. The statement:

Must be sufficiently complete and detailed to enable the court to accomplish its reviewing function, assuring itself that the agency has engaged in reasoned decisionmaking, has given serious thought to alternative rulings, and has provided reasoned explanations for controversial normative and empirical determinations. In short, "the reviewing court must satisfy itself that the requisite dialogue occurred and that it was not a sham."⁴²

Thus, the statement must identify the major issues in the proceeding, explain the agency's reasoning on those issues, and establish that the agency has indeed identified and taken a hard look at all the relevant factors.⁴³ For important conclusions, the statement must point to specific materials in the record; vague allusions to material on file or to the agency's general expertise would not suffice.⁴⁴

⁴¹See, e.g., Bunker Hill Co. v. EPA, 572 F.2d 1286, 1305 n. 41 (8th Cir. 1978). In *Vermont Yankee Nuclear Power Corp v. NRDC*, 435 U.S. 519 (1978), the Supreme Court precluded the invalidation of rules solely because an agency failed to use specific procedures not required by section 553. The decision, however, did not overturn all the law of informal rulemaking that had been developed by the lower courts, and did not affect continuing strict scrutiny of agency adherence to the procedural requirements in the APA or in agency regulations and the obligation of agencies to engage in "reasoned decisionmaking," which was to include the consideration of alternatives. See *Motor Vehicle Mfrs. Assoc. v. State Farm Mutual Automobile Ins. Co.*, 463 U.S. 29 (1983).

⁴²NRDC, Inc. v. NRC, 547 F.2d 633, 658 n. 3 (D. C. Cir. 1976) (Tamm, J., concurring), *rev'd sub nom.*, *Vermont Yankee Nuclear Power Corp. v. NRDC, Inc.*, 435 U.S. 519 (1978). The Supreme Court specifically approved Judge Tamm's characterization of the role of the reviewing court.

⁴³Automotive Parts Accessories Ass'n v. Boyd, 407 F.2d 330, 338 (D.C. Cir. 1968); United States v. Nova Scotia Food Prod. Corp., 568 F.2d 240, 252-53 (2d Cir. 1977).

⁴⁴United States Line, Inc. v. FMC, 584 F.2d 519, 533-35 (D.C. Cir. 1978).

Agencies have also been held obligated to answer cogent comment and to do so in terms of the particular record in preparing the final statement.⁴⁵ A significant part of the statement's function is seen as responding to public comments and explaining how the agency resolved the problems raised. The obligation to respond to serious objections may even extend to criticisms that might have been made, but were not. The agency itself may have to refute serious arguments against its positions or contentions.⁴⁶

The judicial revolution effected between 1968 and 1983 remains in place today.⁴⁷ In essence, the courts now seek to ensure that agencies listen and respond to citizen comments by reading the "concise and general statement" language of the APA as a requirement that they conduct a dialogue with the public and that the agency's statement contains responses to the comments received. The point of the dialogue is that if the agency must respond to comments, it must listen to the comments. Thus, the courts have forced agencies to grant real access to the public by demanding that the agency prove it has listened by responding in detail to what the public has said to it.

Finally, these requirements for greater public access and procedural formality have been accompanied by more exacting review of substantive agency decisions. The very label used to describe modern review of judicial rulemaking – the "hard look doctrine" – captures the sense of transformation just described. Reviewing courts apparently are no longer content to affirm based upon the intuitive plausibility of the link between the policy announced and the statutory standard. An agency must be prepared to demonstrate the superiority of the choice made over others advanced by outside participants or conceived by the agency itself. To enforce that requirement, courts examine, often in painstaking detail, the agency's factual predicate, analytical methodology, and chain of reasoning. Rulemaking must be demonstrated to be an exercise in "reasoned decisionmaking."⁴⁸

Effective Public Participation During the Notice and Comment Phase. While the judicial maxims discussed above establish certain procedural and substantive safeguards designed to protect and foster effective public participation in rulemaking, significant issues continue to adhere to agency actions in the notice and comment phase that have the practical effect of minimizing or dispensing with public participation.

Sufficiency of the Notice. As touched upon above, the notice and comment procedures of the APA are designed "to allow the agency to benefit from the experience and input of the parties who file comments, and to see to it that the agency maintains a flexible and open-minded attitude towards its own rules."⁴⁹ Further, the notice and comment procedure

⁴⁹National Tour Brokers Ass'n v. United States, 591 F.2d 896, 902 (D.C. Cir. 1978).

“encourages public participation in the administrative process and educates the agency, thereby helping to ensure informed agency decisionmaking.”⁵⁰

To ensure that these goals are realized, courts have repeatedly held that a NPRM, in order to allow for meaningful public participation, must “fairly apprise interested persons” of the issues underlying the rulemaking proceeding.⁵¹ As such, if the differences between a proposed rule and a final rule are so substantial as to render ineffective the notice provided to the public, a reviewing court may vacate the final rule. It is important to note that this maxim does not establish that an agency may not alter a proposal in its final rule. Indeed, reviewing courts have declared that a final rule must differ from the proposed rule “when the record evidence warrants such a change,”⁵² and that a contrary position “would be antithetical to the whole concept of notice and comment.”⁵³ As was explained by the Court of Appeals for the District of Columbia, “a contrary rule would lead to the absurdity that in rule-making under the APA the agency can only learn from the comments on the proposals only at the peril of starting a new procedural round of commentary.”⁵⁴

In order to differentiate between permissible alterations to a final rule and those that would render a NPRM ineffective, reviewing courts have held that “a final rule which departs from a proposed rule must be a logical outgrowth of the proposed rule.”⁵⁵ Referred to as the “logical outgrowth doctrine,” this standard “focuses on whether th interested parties reasonably could have anticipated the final rulemaking from the draft permit.”⁵⁶ In *National Mining Ass’n v. MSHA*,⁵⁷ the Court of Appeals for the District of Columbia stated:

Our cases offer no precise definition of what counts as a “logical outgrowth.” We ask “whether ‘the purposes of notice and comment have been adequately served.’” *American Water Works Ass’n v. EPA*, 40 F.3d 1266, 1274 (D.C. Cir. 1994) (quoting *Fertilizer Institute v. EPA*, 935 F.2d 1303, 1311 (D.C. Cir. 1991)). Notice was inadequate when “the interested parties could not reasonably ‘have anticipated the final rulemaking from the draft [rule].’” *Id.* at 1275 (quoting *Anne Arundel County v. EPA*, 963 F.2d 412, 418 (D.C. Cir. 1992)). “[W]e inquire whether the notice given affords ‘exposure to diverse public comment,’ ‘fairness to affected parties,’ and ‘an opportunity to develop evidence in the record.’”

Regarding the practical application of the logical outgrowth doctrine, the court in *National Ass'n of Psychiatric Health Sys., et al. v. Shalala*, stated that “[t]he question . . . ‘always requires careful consideration on a case-by-case basis.’”⁵⁸ The court went on to explain that “it is fair to say that it is hard to discern a clear rationale differentiating the holdings” of cases that have considered whether a particular rulemaking falls within the scope of the doctrine.⁵⁹ Upon providing a series of examples illustrating this point,⁶⁰ the court again stressed that it was “clear that [a logical outgrowth doctrine] inquiry must be undertaken on a case-by-case basis,” stating that a reviewing court “must look to the specific facts of [a] case in determining whether [a] final rule was the logical outgrowth of the one proposed.”⁶¹

In addition to issues adhering to the logical outgrowth doctrine, reviewing courts have also accepted the notion that notice, to be adequate, must provide interested parties with the opportunity to “challenge the factual assumptions on which [the agency] is proceeding and to show in what respect such assumptions are erroneous.”⁶² In *Portland Cement Ass'n v. Ruckelshaus*, for instance, the Court of Appeals for the District of Columbia reviewed new source performance standards established by the Environmental Protection Agency (EPA)

⁶²*Magnuson-Moss Warranty -Federal Trade Commission Improvement Act*, H.R. Rep. No. 93-1606, at 33 (1974) (Conference Report).

pursuant to the Clean Air Act regarding the operation of Portland cement plants.⁶³ Addressing a published statement from the EPA indicating that it had relied on test results that were not made available for public comment in formulating the final rule, the court stated, “We find a critical defect in the decision-making process in arriving at the standard under review in the initial inability of petitioners to obtain – in timely fashion – the test results and procedures used”⁶⁴ The court went on to conclude that “[i]t is not consonant with the purpose of a rule-making proceeding to promulgate rules on the basis of inadequate data, or on data that, [in] critical degree, is known only to the agency.”⁶⁵

Based on these factors, it is apparent that reviewing courts have developed standards to ensure that the notice afforded to the public during an agency rulemaking proceeding is sufficient to satisfy the goals underlying the APA. As is indicated by the decisions noted above, however, any inquiry into the adequacy of notice is necessarily a fact-specific inquiry, lending a significant degree of uncertainty to an interested parties’ challenge to agency in this context. Furthermore, burdens associated with the prosecution of a challenge to an agency’s actions during the rulemaking process may be compounded by this uncertainty.

The Good Cause Exception. After the completion of the notice and comment process, an agency will occasionally decide that there is a need to suspend, amend, or revoke a final rule that may or may not have gone into effect. This determination may be motivated by a multitude of factors, such as the identification of new information or previously unconsidered consequences, suddenly altered economic or societal circumstances, or major shifts in governmental and/or regulatory policy.⁶⁶ Judicial decisions interpreting the APA’s requirements for informal rulemaking have established that a rule is final when published in final form, irrespective of whether the rule has actually gone into effect.⁶⁷ Likewise, related decisions have established that the effective date of a final rule is a substantive provision of a rule. As such, these decisions establish that any substantial modification to a final rule must be accomplished through additional notice and comment proceedings.⁶⁸

Cir. 1984); *Associated Builders and Contractors, Inc. v. Herman*, 976 F. Supp. 1 (D.D.C. 1997).

Given that a substantive modification itself constitutes a rulemaking under the APA, it is axiomatic that the modifying agency is required to comply with the Act's notice and comment procedures in implementing any changes. Agencies, however, may issue "interim final rules" that become effective without prior notice and opportunity for public comment based upon the good cause exception to the APA, which provides that an agency may forgo general notice and comment procedures if the agency "for good cause finds (and incorporates the finding and a brief statement of the reasons therefor in the rules issued) that notice and public procedure thereon are impracticable, unnecessary, or contrary to the public interest."⁶⁹ This "good cause exception" to the APA is "narrowly construed and only reluctantly countenanced" by the courts.⁷⁰

While the validity of an agency's use of the good cause exception is a fact-specific inquiry, a review of the relevant decisions reveals common factors that influence judicial disposition of rule modifications pursuant to the good cause exception.

Given that the good cause exception allows an agency to avoid the principles of public participation undergirding the APA, courts generally require a showing that exigent circumstances have rendered traditional notice and comment procedures unduly burdensome. In particular, courts have held that notice and comment procedures may be bypassed in instances where implementation deadlines imposed by statute or court order have rendered such procedures impractical, or where formal compliance with the APA would run contrary to the public interest due to a public health or safety emergency.⁷¹

In *Council of the Southern Mountains v. Donovan*, for instance, the court considered the Mine Safety and Health Administration's (MSHA) six-month suspension, without notice and comment, of regulations that required "coal operators to equip all underground miners with self-contained self-rescuers (SCSRs)."⁷² The court upheld the suspension, identifying several factors supporting the MSHA's action. First, the court found it significant that the suspension was necessitated by circumstances beyond the agency's control. Specifically, the court determined that field tests of the SCSRs were not completed due to external delays in obtaining the necessary equipment and cooperation, and that the agency had made a good faith effort to resolve these problems.⁷³ Furthermore, the court gave weight to the fact that the suspension was limited to six months.⁷⁴

Likewise, in *National Federation of Federal Employees v. Devine*, the court validated the suspension by the Office of Personnel Management (OPM), without notice and comment, of the 1981 "open season" for health plan selection by federal employees, citing "unforeseen

⁷³*Id.* at 581.

⁷⁴*Id.* at 582.

emergency circumstances, including last-minute benefit reductions and pending litigation in federal courts.⁷⁵ Analyzing the suspension, the court determined that OPM had properly suspended the rule in light of the fact that no accurate information regarding new contract terms was available.⁷⁶ Specifically, the court explained that the lack of this information could thwart the rule's goal of facilitating informed employee decisionmaking regarding health plans.⁷⁷ Furthermore, the court found the suspension was necessary to ensure the financial stability of the program, as Blue Cross-Blue Shield, which had suffered significant losses and was the predominant health care provider under the program, had threatened to withdraw completely unless the open season was postponed to allow it to solve actuarial problems.⁷⁸ Finally, the court also found it significant that the suspension was to be temporary.⁷⁹

These cases indicate that courts are willing to uphold modifications predicated upon the good cause exception in situations where external circumstances have compromised the safety or substantive goal of the regulation. As is shown below, however, the courts have been unwilling to accept unilateral suspensions when such concerns are absent.

In *Natural Resources Defense Council v. EPA*, the Court of Appeals for the Third Circuit considered the EPA's indefinite suspension, without notice and comment, of the effective date of a set of amendments to regulations establishing pretreatment standards for the introduction of pollutants into treatment works.⁸⁰ The EPA asserted that the suspension was necessitated by Executive Order 12291, which directed agencies to postpone the effective dates of not yet effective final rules to the extent necessary to allow for reconsideration of such rules' compliance with the newly imposed cost-benefit requirements of the order.⁸¹ The court held that the EPA did not have good cause to effectuate the suspension without complying with notice and comment requirements.⁸² Specifically, the court found that there was no reason why the agency could not have complied with the aforementioned order while also providing an abbreviated notice and comment period to meet the requirements of the APA.⁸³

In *Environmental Defense Fund v. Gorsuch*, the court invalidated the EPA's suspension, without notice and comment, of regulations pertaining to the treatment of hazardous waste under the Resource Conservation and Recovery Act (RCRA).⁸⁴ Although the EPA was directed to issue these standards by April of 1978, they were not promulgated until May of 1980 pursuant to a court order. The standards issued at this time constituted "Phase I" regulations establishing the basic regulatory structure of the RCRA's system of hazardous waste management. Phase II

⁸⁴713 F.2d 802 (D.C. Cir. 1983).

regulations establishing the technical standards for hazardous waste treatment were issued in January of 1981, to become effective in July of 1981. Shortly after the Phase II regulations took effect, however, the EPA, suspended the regulations.⁸⁵ This action was clearly influenced by Executive Order 12291, with the EPA further asserting good cause for the suspension on the grounds that the regulations had been criticized as too costly and were likely to be changed in the near future.⁸⁶ The court nullified the suspension, finding no basis for the justifications offered by the agency and noting that the EPA's reversal regarding its approach to the regulations constituted a "danger signal" requiring closer scrutiny of the agency's actions.⁸⁷

In another case rejecting an EPA rule suspension of an RCRA regulation, the court again found that the agency did not meet the requirements of the good cause exception. In *Environmental Defense Fund v. EPA*, the EPA permanently suspended annual reporting requirements for 1980 for hazardous waste generators and various treatment facilities, asserting that the agency's "tremendous workload" would prevent it from being able to adequately analyze reports.⁸⁸ Shortly thereafter, the agency temporarily suspended all reporting requirements, based on the fact that the agency was in the process of altering the reporting requirements and "wished 'to prevent the regulated community from expending resources toward complying with them in their present form.'"⁸⁹ The court held that there was not good cause for the immediate suspension of the regulations, since no external pressures had necessitated the stays.⁹⁰ Specifically, the court noted that the agency had previously indicated its intent to suspend or eliminate the reporting requirements, indicating that it could have complied with notice and comment requirements.⁹¹ Given these factors, the court held that there was "no legitimate reason whatsoever for EPA to ignore the commands of the APA."⁹²

While the aforementioned cases focus on agency rule suspensions specifically, their underlying rationales provide a general framework for analyzing the validity of an agency's substantive modification of a rule without first providing notice and an opportunity for comment. Accordingly, it would appear that the key factor in any such modification, irrespective of whether it is a suspension, amendment or revocation, is the existence of an external justification for the suspension. As was shown in *Southern Mountains* and *Devine*, it appears that reviewing courts are accepting of modifications that are necessitated by external circumstances.

Conversely, the three EPA cases discussed above indicate that a reviewing court will invalidate agency suspensions or modifications that are not necessitated by external circumstances, or that could have been implemented effectively while complying with notice and comment requirements. Relatedly, the courts seem extremely hesitant to validate actions that appear to be motivated by an internal policy shift on the part of an agency. It is important to note

⁸⁵*Id.* at 808-809.

⁹¹*Id.*

⁹²*Id.*

that the invalidated EPA suspensions discussed above were all predicated to some degree upon a shift in regulatory policy, as evidenced by Executive Order 12291.⁹³ The court addressed this situation indirectly in *Natural Resources Defense Council v. EPA*, stating that “as with substantive review . . . it makes sense to scrutinize the procedures employed by the agency all the more closely where the agency has acted, within a compressed time frame, to reverse itself by the procedure under challenge.”⁹⁴

A natural corollary of the emphasis placed upon the existence of exigent circumstances as a justification for the proper use of the good cause exception is that reviewing courts will be hesitant to validate a good cause rulemaking occasioned only by an agency’s desire to issue immediately effective regulations to “provide guidance or simplify enforcement.”⁹⁵ In *Zhang v. Slattery*, for instance, the Court of Appeals for the Second Circuit rejected the notion that the good cause exception could be used to justify the issuance of an interim-final rule aimed at broadening the scope of individuals qualified for asylum and to make asylum eligibility requirements easier to understand.⁹⁶ Specifically, the court stressed that such justifications were insufficient to establish good cause, as “the notice and comment requirement would be a dead letter if compliance could be excused whenever the beneficial effect” of a rule could be realized sooner without following the formal requirements of the APA.⁹⁷ Similarly, in *Action on Smoking and Health v. Civil Aeronautics Board*, the Court of Appeals for the District of Columbia stressed that the mere fact that an existing regulation is onerous or confusing cannot justify the adoption of a new rule without prior notice and opportunity for public comment.⁹⁸

Based upon these factors, it seems that modifications necessitated by exigencies beyond an agency’s control are much more likely to withstand scrutiny than those that appear to be the product of internal agency deliberations or shifts in policy.⁹⁹

Midnight Rules. While the invocation of the good cause exception itself has implications for the realization of meaningful and effective public participation, it can also have a significant impact when used to justify an administration’s response to “midnight rules.” Specifically, it is common for outgoing Presidential administrations to issue a large number of important rules at the end of their administrations. In turn, the incoming administration, particularly in instances where there is a shift of party control of the executive branch, will characteristically take steps to counter those that can be viewed as procedurally suspect under

⁹⁷*Id.* at 747.

⁹⁸713 F.2d 795, 801-802 (D.C. Cir. 1983) (In particular, the court stated that “the public interest exception to notice and comment requirements contemplates real harm to the public, not mere inconvenience to the agency.”).

⁹⁹This analysis addresses procedural issues pertaining to agency rule modifications. It should also be noted that such agency action may be challenged on a substantive as well as procedural basis. See Holmes, *supra* note 66, at 664. Furthermore, given that substantive modifications constitute rulemaking under the APA, they are also subject to the reporting and disapproval requirements of the Congressional Review Act, 5 U.S.C. §§ 801-808 (2000).

the APA. This dynamic manifested itself most recently during the transition from the Clinton to George W. Bush Administrations.

On January 20, 2001, President Bush's Chief of Staff, Andrew Card, issued a Memorandum for the Heads and Acting Heads of Executive Branch Departments and Agencies (Card Memo) that imposed a moratorium on regulatory activity until agency personnel appointed directly by the President were situated to make decisions and consult with the Office of Management and Budget (OMB). To accomplish this, the memo first directed that no proposed final regulations could be sent to the Federal Register for publication. Exceptions were provided for regulations addressing "emergency or other urgent situations relating to health and safety" or "regulations promulgated pursuant to statutory or judicial deadlines." Next, the Card Memo ordered that regulations that had been sent to the Office of the Federal Register (OFR), but not yet published, were to be withdrawn "for review and approval" by the new agency head. Finally, with respect to regulations that had been published in the Federal Register, but that had not yet become effective, agencies were directed to "temporarily postpone the effective date of the regulations for 60 days."

Agencies responded to the Card Memo by publishing a notice in the Federal Register adding 60 days to the effective dates of not yet effective rules, announcing that the change would be effective immediately under the "good cause" exception of the APA, the "good cause" being the necessity of a new administration to review and assess the efficacy and necessity of not yet effective rules. Although the matter is not without doubt, it is conceivable that the limited period of suspension and an inclination to afford deference to the transition difficulties of an incoming administration would militate a reviewing court to find good cause, while subsequent suspensions, without notice and comment, would presumably be deemed violative of the APA.

In *Natural Resources Defense Council v. Abraham*, the Court of Appeals for the Second Circuit addressed actions taken by the Department of Energy (DOE) in suspending a final rule imposing new efficiency standards for central air conditioners that was issued at the end of the Clinton Administration.¹⁰⁰ The DOE postponed the Clinton Administration rule on February 2, 2001 pursuant to the Card Memo, and then postponed the rule indefinitely on April 20, 2001. On July 25, 2001, the Department published a proposed rule to withdraw this regulation and replace it with a new rule imposing less stringent efficiency standards. DOE eventually published a new final rule that became effective on August 6, 2002, which provided for a less stringent efficiency standard than the rule that was twice delayed and ultimately revoked. The DOE's action on this rule was challenged by several State Attorneys General as well as the Natural Resources Defense Council. The Second Circuit struck down the Bush Administration rulemaking, both on substantive and procedural grounds. Regarding the initial delays of the rule, the court stated that its analysis would begin and end with the first delay which it found to be violative of the APA. In particular, the court rejected DOE's argument that it had good cause to suspend the effective date on the basis that it wished to "review and reconsider" the new standards, holding that there were no external circumstances cited by the DOE as justifying the delay. It is important to note, however, that the DOE did not cite the Card Memorandum as an external factor. Accordingly, while the decision in *NRDC v. Abraham* could be viewed as lessening the possibility that a court would accept such a rationale, it could nonetheless be argued that a discrete delay ordered by an incoming President might survive judicial scrutiny.

¹⁰⁰355 F.3d 179 (2nd Cir. 2004).

Irrespective of the issue of whether a reviewing court might be persuaded to validate a limited delay of midnight rules pursuant to the good cause exception, the potential for such executive action to vitiate effective and meaningful public participation is self-evident. Moreover, it is important to note that injury to principles of public participation in the midnight rules context is not limited to actions taken by an incoming administration. Outgoing administrations might also render effective public participation impossible by giving little attention to the thoughts of interested parties in the rush to finalize regulations before leaving office. Accordingly, the multitude of issues adhering in this context would appear to be ripe for consideration by a reconstituted ACUS.

Public Participation Prior to Notice and Comment. Another key issue in the public participation context has been whether efforts to include the public in the rulemaking process prior to the publication of a proposed rule should be expanded. Professor William West of the Bush School of Government and Public Services at Texas A&M University undertook an effort to study a specific aspect of this issue at the behest of the Committee, with the support of CRS.

Professor West formulated and conducted a project to analyze how agencies develop proposed rules, with a particular emphasis on how rulemaking initiatives are placed on agency regulatory agendas; how the rulemaking process is managed at inter- and intra-agency levels; and how public participation and transparency factor in the pre-notice and comment phase of rule formulation. Professor West has stated that the issue of public participation at this stage of agency rule formulation “may be especially relevant to the Congress as it considers possible amendments to the APA.” The study relied in large part on an electronic questionnaire sent to agency staff involved in the development of a large sample of individual rules and on interviews with high level agency personnel with extensive experience in the rulemaking process. One of the hopes for the study was that the questionnaire would generate data that would enable a systematic comparison of variations in agency practice regarding the scope, transparency, and inclusiveness of outside participation during this phase of rulemaking. A low response rate to the electronic questionnaire, however, prevented such a comparison. Nonetheless, the interview and survey data did enable Professor West and his team to make some very interesting and important observations relating to outside participation in proposal development: (1) that agency officials noted that the submission of information by public interest groups, industry representatives, other affected interests, and other agencies was “frequently indispensable to intelligent decision making;” (2) that the character of such participation is variable, based on a number of factors; and, (3) finally, that such participation does not generally occur as the result of an inclusive agency approach, instead occurring by virtue of agency invitation or participant initiative.

While the West study has contributed significantly to Congressional and academic understanding of the complex issues surrounding public participation in the pre-notice and comment rulemaking context, the low response rate to the survey could be viewed as supporting the position that a reconstituted ACUS could serve an important role in facilitating research of this type. Professor West has related his view that the survey was hobbled by a general reluctance of agencies to share information, as illustrated by the fact that two agencies went so far as to explicitly order their staff not to respond to the survey. It is arguable that a similar study, if conducted by a reconstituted ACUS, would have greater success in generating the information necessary to enable the systematic comparisons envisioned by the West study by virtue of its non-partisan nature and organizational independence.

Negotiated Rulemaking

One of ACUS' most significant achievements in the legislative context was its role in encouraging increased participation and consensus in rulemaking as manifested by the Negotiated Rulemaking Act of 1990.¹⁰¹ Negotiated rulemaking, sometimes referred to as "reg-neg," provides an alternative to the traditional notice and comment rulemaking dynamic under the APA, whereby involved parties attempt to reach consensus on a regulatory issue through compromise and the evaluation of priorities, with the ultimate goal of formulating a draft rule that is widely supported. The concept of negotiated rulemaking arose from dissatisfaction with what some perceived as the complex and adversarial nature of traditional rulemaking procedures. Professor Philip J. Harter, a leading proponent of negotiated rulemaking, opined in 1982 that the regulatory process had become stifled by the defensive nature of the interactions between agencies and affected parties.¹⁰² Professor Harter suggested a different approach in which differences were acknowledged and resolved through face-to-face negotiations, and laid out a series of principles that could make those negotiations successful.

Also in 1982, ACUS recommended that agencies consider using negotiated rulemaking as a way to develop proposed rules, published criteria for determining when negotiated rulemaking was likely to be successful, and suggested specific procedures to be followed when implementing the approach.¹⁰³ For example, ACUS said agencies should use "conveners" to determine whether negotiated rulemaking is appropriate and to identify affected interests. ACUS also recommended that Congress pass legislation explicitly authorizing agencies to use negotiated rulemaking, but giving them substantial flexibility to adapt negotiation methods.

In 1983, the Federal Aviation Administration became the first federal agency to try negotiated rulemaking (regarding flight and rest time requirements for domestic airline pilots), followed by the EPA and the Occupational Health and Safety Administration. In 1985, ACUS recommended refinements to the procedures based on these agencies' experience with the approach.¹⁰⁴ For example, ACUS said that agencies sponsoring the effort should take part in the negotiations, and pointed out that negotiated rulemaking could be used at several stages of the rulemaking process.

Congressional Action. The Negotiated Rulemaking Act of 1990 (5 U.S.C. §§ 561-570), as amended and permanently authorized in 1996 by the Administrative Dispute Resolution Act of 1996 (110 Stat. 2870, 3873), essentially enacted the ACUS recommendations, establishing basic statutory authority and requirements for the use of the approach while giving agencies wide latitude in its implementation. The Act supplements (but does not supplant) APA

¹⁰¹5 U.S.C. §§ 561-570; *see also* Administrative Conference of the United States, *Procedures for Negotiating Proposed Regulations*, Conference Recommendation 82-4 (1982); Conference Recommendation 85-5 (1985).

rulemaking procedures, and establishes a framework by which agencies are encouraged (but not required) to use negotiated rulemaking to develop proposed rules. The Act established public notice requirements and procedures by which affected parties can petition for inclusion in the process, and clarified that agencies must generally comply with the Federal Advisory Committee Act in establishing and administering the negotiating committee.¹⁰⁵ The negotiated rulemaking committee, composed of representatives of the agency and from the various non-federal interests that would be affected by the proposed regulation, addresses areas of concern in the hope that it can reach agreement on the contents of a proposed regulation. The agency can, if it agrees, then issue the agreement as a proposed rule, and eventually as a final rule, under existing APA procedures. The expectation is that any rule drafted through negotiated rulemaking would be easier to implement and less likely to be the subject of subsequent litigation.¹⁰⁶

Presidential Action. In September 1993, the Clinton Administration's National Performance Review (NPR) recommended (among other things) that federal agencies increase their use of negotiated rulemaking.¹⁰⁷ That same month, President Clinton issued Executive Order 12866, which, in part, directed federal agencies to "explore and, where appropriate, use consensual mechanisms for developing regulations, including negotiated rulemaking."¹⁰⁸ President Clinton also issued a separate memorandum in September 1993 directing each agency to identify at least one rulemaking for which the agency would use negotiated rulemaking during 1994, or to explain why the use of the approach was not feasible.¹⁰⁹

In May 1998, President Clinton issued another memorandum to the heads of executive branch departments and agencies intended to promote greater use of negotiated rulemaking.¹¹⁰ Specifically, he designated the Regulatory Working Group (which had been established by Executive Order 12866 and was composed of the heads of agencies with significant domestic regulatory responsibilities) as an interagency committee to "facilitate and encourage agency use of negotiated rulemaking."

¹⁰⁵The Federal Advisory Committee Act, 5 U.S.C. App. 2 (2000), regulates the formation and operation of advisory committees used by federal agencies that are not entirely composed of full-time federal employees.

¹⁰⁶Another process for early stakeholder involvement in rulemaking was established by the Small Business Regulatory Enforcement Fairness Act of 1996, Pub. L. 104-121, 5 U.S.C. § 609. The act required the Environmental Protection Agency and the Occupational Safety and Health Administration to convene a small business advocacy review panel before publishing any proposed rule that they determine may have a significant economic impact on a substantial number of small entities. Although the panels are required to be composed of federal employees, the panel must collect the advice and recommendations of representatives of affected small entities.

The Negotiated Rulemaking Process. The Negotiated Rulemaking Act permits agencies to establish a negotiated rulemaking committee if the head of the agency determines that doing so is “in the public interest.” In making that determination, the Act says the head of the agency must consider whether: (1) a rule is needed, (2) there are a limited number of identifiable interests that will be significantly affected by the rule, (3) there is a “reasonable likelihood” that a balanced committee can be convened that will adequately represent those identifiable interests and is willing to negotiate in good faith to reach consensus on a proposed rule, (4) there is a “reasonable likelihood” that the committee will reach a consensus on the proposed rule within a fixed period of time, (5) the negotiated rulemaking process will not delay the issuance of the proposed or final rule, (6) the agency has adequate resources that it is willing to commit to the committee, and (7) the agency will use the committee’s consensus as the basis of the proposed rule “to the maximum extent possible consistent with the legal obligations of the agency.” The Act also specifically permits the use of conveners to help the agency identify affected parties and to determine whether a committee should be established.

If the agency decides to establish a negotiated rulemaking committee, the Act requires the agency to publish a notice in the Federal Register (and, as appropriate, relevant trade or other specialized publications) containing (among other things) a description of the subject and scope of the rule, a list of affected interests, a list of those proposed to represent those interests and the agency, and a solicitation for comments.¹¹¹ The comment period must be for at least 30 calendar days. Membership on the committee is limited to 25 members (including at least one from the sponsoring agency), unless the agency head determines that more members are needed. The agency can select (subject to the approval of the committee by consensus) an impartial “facilitator” to chair meetings and oversee the administration of the committee. The facilitator does not have to be a federal employee, but agencies are required to determine whether a person under consideration to be a convener or a facilitator has any financial or other conflict of interest.

Any agreement on a negotiated rule must be unanimous, unless the negotiated rulemaking committee agrees to other conditions. If the committee reaches consensus, it must submit a report to the sponsoring agency containing the proposed rule and any other information it deems appropriate. Any proposal agreed to by the committee, however, is not binding on the agency or other parties; the agency may decide not to issue a proposed rule at all or not as designed by the committee, and interest groups represented on the committee may oppose the rule that they helped craft.¹¹²

The committee terminates not later than promulgation of the final rule. An agency may pay reasonable travel and *per diem* expenses, and reasonable compensation to negotiating committee members under certain conditions. Agency procedural actions related to establishing, assisting, or terminating the committee are not subject to judicial review, but any judicial review available regarding the rule resulting from negotiated rulemaking is unaffected.

Congressional Mandates to Negotiate. Although the Negotiated Rulemaking Act

¹¹¹ If the agency subsequently decides not to establish a negotiated rulemaking committee, the agency is required to publish another notice in the Federal Register explaining why it decided not to go forward. A copy of the notice must be sent to each person who applied for or nominated another person for membership on the committee.

¹¹² See *USA Group Loan Services, Inc. v. Riley*, 82 F.3d 708 (7th Cir. 1996).

gives agencies substantial discretion as to whether the approach should be employed in rulemaking, Congress has sometimes mandated its use by rulemaking agencies and established specific procedures and time frames to follow. For example:

- Section 7212 of the Intelligence Reform and Terrorism Prevention Act of 2004 (Pub. L. 108-458) required the Secretary of Transportation to use negotiated rulemaking in developing regulations establishing minimum standards for drivers licenses or personal identification cards.
- Section 222 of the “Consolidated Appropriations Act, 2004” (Pub. L. 108-199) required the Secretary of Housing and Urban Development to “conduct negotiated rulemaking with representatives from interested parties for purposes of any changes to the formula governing the Public Housing Operating Fund.”
- Section 1901(b)(3)(A) of the No Child Left Behind Act (Pub. L. 107-110) required the Secretary of Education to “establish a negotiated rulemaking process on, at a minimum, standards and assessments.” The section went on to stipulate that those involved in the process should be selected from among those that provided advice and recommendations on how the title should be carried out, and said that the process should follow the process outlined in the Negotiated Rulemaking Act (except that it should not be subject to the Federal Advisory Committee Act).
- Section 1125(a)(5) of the No Child Left Behind Act required the Secretary of Education to establish a negotiated rulemaking committee to prepare, for schools funded by the Bureau of Indian Affairs, a catalog of the condition of school facilities, a school replacement and new construction report, and a renovation repairs report. The Act specified the contents of each report and required that it be submitted to particular Congressional committees within 24 months.
- Section 106(b)(2) of the Native American Housing Assistance and Self-Determination Act of 1996 (Pub. L. 104-330) required that all regulations under the Act must be issued according to negotiated rulemaking procedures, and required that the negotiating committee be composed only of representatives of the federal government and “geographically diverse small, medium, and large Indian tribes.” Section 6 of the Native American Housing Assistance and Self-Determination Reauthorization Act of 2002 (Pub. L. 107-292) required negotiated rulemaking for any rules issued pursuant to amendments to the original Act.
- Section 490D(b)(3) of the Higher Education Amendments of 1998 (Pub. L. 105-244) required that negotiated rulemaking must be used for all subsequent regulations pertaining to the Act’s title on student assistance “unless the Secretary determines that applying such a requirement with respect to given regulations is impracticable, unnecessary, or contrary to the public interest.” The Secretary is required to publish such a determination in the Federal Register at the same time as the proposed rule.

Evaluations of Negotiated Rulemaking. According to ACUS and other advocates of the approach, negotiated rulemaking can have a number of beneficial effects, including the

following:

- reduced time, money and effort expended on developing and enforcing rules,
- earlier implementation of associated rules,
- better agency understanding of regulated parties' concerns,
- greater understanding by regulated parties of their responsibilities and higher compliance rates,
- more creative and effective regulatory solutions,
- less litigation associated with the rule, and
- more cooperative relationships between the agency and other parties.

ACUS and others have also identified a number of disadvantages of negotiated rulemaking.

- ACUS noted that the approach can be more resource-intensive than traditional rulemaking, at least in the short term, and does not work when the number of affected interests is too large (e.g., more than 25 negotiators).
- One author said that the approach has been used only rarely (reportedly for less than one-tenth of 1% of all rules), and he said only a few of those rules were considered “major” or “significant.”¹¹³ The author noted that the Negotiated Rulemaking Act instructs agencies to select rules based on their likelihood of consensus, not their importance.
- Another author said that negotiated rulemaking has been used sparingly “for the good reason that it represents a corporatist abdication of public authority to private interests,” and that even when used it only results in a proposed rule that is subject to the same procedural requirements as rules developed conventionally.¹¹⁴
- Another commandeer asserted that negotiated rulemaking does not work when developing regulations based on broad statutes, and may “inadvertently perpetuate the problem (of statutory vagueness) by facilitating efforts to shift blame for controversial public policies from legislators to bureaucrats.”¹¹⁵

¹¹³Cary Coglianese, *Is Consensus an Appropriate Basis for Regulatory Policy?*, in Eric Orts & Kurt Deketelaere, eds., *Environmental Contracts: Comparative Approaches to Regulatory Innovation in the United States and Europe* (Kluwer Law International, 2001), at 93-113.

¹¹⁵Juliet A. Williams, *The Delegation Dilemma: Negotiated Rulemaking in Perspective*, 17 *Policy Studies Rev.*, Spring 2000, at 125-146.

- Yet another study concluded that “the principles, theory, and practice of negotiated rulemaking subtly subvert the basic, underlying concepts of American administrative law — an agency’s pursuit of the public interest through law and reasoned decisionmaking. In its place, negotiated rulemaking would establish privately bargained interests as the source of putative public law.”¹¹⁶

Nevertheless, a number of observers continue to view negotiated rulemaking favorably, with one regulatory expert describing it as offering the public “the most direct and influential role in rulemaking of any reform of the process ever devised.”¹¹⁷

Empirical Analyses. Studies of how negotiated rulemaking works in practice have reached substantially different conclusions about its effects and prospects.

- In 1990, eight agencies that had convened negotiation committees reportedly told ACUS that even though full consensus was not always possible, the information developed through the process contributed substantially to the rule that was produced.¹¹⁸
- A 1992 study of four EPA negotiated rulemaking efforts indicated that the approach reduced the time needed to develop rules (particularly during the period between proposed and final rulemaking).¹¹⁹ Another study five years later examining more EPA negotiations, however, reached the opposite conclusion. It found that conventional rules and negotiated rules took about the same amount of time and that negotiated rules were more likely to be challenged in court.¹²⁰ Similarly, a 1999 study also concluded that negotiated rulemaking had “no discernible effect” on the amount of time between proposed and final rulemaking.¹²¹
- Another study indicated that negotiated rulemaking can improve participants’ perception of the final rule and of the overall rulemaking process.¹²² Participants

in negotiated rulemaking were reportedly more pleased with the quality of the information the process generated than those who filed comments on conventional rules, and more likely to view their participation as having an effect on the final rule. The study also indicated, however, that negotiated rulemaking imposes substantial costs on participants, who are required to attend multiple meetings and interact with other stakeholders for long periods of time.

Substantial disagreements exist regarding how the effectiveness of negotiated rulemaking should be measured (e.g., timeliness and the amount of litigation).¹²³ Most researchers agree, however, that the approach is not appropriate for all rules, and that more research is needed to determine its effects on rules, the rulemaking process, and participants in that process.

Electronic Rulemaking

Another significant development in the context of public participation has been the increased use of electronic technology by federal agencies in the rulemaking process. In particular, agencies have introduced a number of initiatives to use information technology (IT) in their rulemaking and other regulatory processes. The impetus for some of these efforts were Congressional or Presidential directives to better utilize IT in a range of administrative areas, but many were started at the initiative of career officials involved in the rulemaking process.

Presidential Initiatives. In its September 1993 report, the National Performance Review recommended increased use of information technology to increase opportunities for early, frequent, and interactive public participation in the rulemaking process. Shortly thereafter, an interagency Regulatory Working Group (established by Executive Order 12866) created a subgroup on information technology and rulemaking. By December 1994, several agencies (including the Nuclear Regulatory Commission and the Department of Agriculture's Animal and Plant Health Inspection Service) were accepting comments on proposed rules through electronic bulletin boards. For example, the Department of Labor (DOL) used electronic bulletin boards to support a negotiated regulatory process developing rules to protect workers building steel structures.

In the next several years, many federal agencies used IT in the rulemaking process to varying degrees. Many of these efforts centered on the facilitation of public participation in rulemaking. Most notably, the Department of Transportation developed its "Docket Management System," an electronic, image-based database covering every agency and every rulemaking within the Department. The system permitted electronic comments and access to regulatory supporting materials (e.g., economic analyses, comments of others) for all rules. Other agencies' IT initiatives focused on alternative aspects of regulatory management (e.g., compliance assistance, information collection and dissemination, and regulatory enforcement). For example, DOL developed a sophisticated set of interactive advisors on the Internet to help workers and

small businesses understand their rights and responsibilities under federal employment laws and regulations.

In July 2001, President Bush identified the expansion of e-government as one of the five priorities of his management agenda. To support this priority, OMB developed an implementation strategy that identified 24 e-government initiatives, one of which was e-rulemaking. This initiative is intended to provide a single portal for businesses and citizens to access the federal rulemaking process and comment on proposed rules. In May 2002, the Director of OMB sent a memorandum to the heads of executive departments and agencies advising them of “our intention to consolidate redundant IT systems relating to the President's on-line rulemaking initiative,” and indicated that consolidation of those systems could save millions of dollars. In late 2002, EPA was named lead agency for the e-rulemaking initiative. In January 2003, the Bush Administration launched the "Regulations.gov" website as the first module of its e-rulemaking initiative. The website permits the public to identify proposed rules that are open for comment government-wide, and permits the public to comment electronically on those rules. Although OMB indicated in March 2004 that Regulations.gov was being accessed by the public more than 15,000 times per month (e.g., to locate rules open for comment), other data indicated that fewer than 50 electronic comments per month were received from the public via the website in its first 10 months of operation. The second module of the e-rulemaking initiative is intended to create one or more electronic dockets for proposed and final rules, thereby allowing the public to access regulatory supporting materials and the comments of others from one website.

Congressional Initiatives. Congress has also taken numerous steps in recent years to encourage federal agencies to use IT in carrying out their missions. Some of these efforts have been specifically directed at the regulatory process, while others had an indirect effect on that process. For example, in 1998, Congress enacted the Government Paperwork Elimination Act (GPEA) (44 U.S.C. § 3504 note), which required that, by October 21, 2003, Federal agencies provide the public, when practicable, with the option of submitting, maintaining, and disclosing information electronically, instead of on paper. GPEA makes OMB responsible for ensuring that federal agencies meet the Act's implementation deadline. Although the act did not specifically mention rulemaking, both OMB and rulemaking agencies have indicated that its requirements provided an impetus for developing IT-based approaches to regulatory management.

The E-Government Act of 2002 (44 U.S.C.A. 3601 note) has been described as “the most far-reaching federal government effort to date for promoting online public involvement,” and contains requirements specific to rulemaking. Section 206 of the Act requires agencies, to the extent practicable, to accept public comments on proposed rules “by electronic means.” That section also requires agencies (again, to the extent practicable) to ensure that a publicly accessible federal website contains “electronic dockets” for their proposed rules containing all comments submitted on the rules as well as “other materials that by agency rule or practice are included in the rulemaking docket under (the APA), whether or not submitted electronically.” The E-Government Act also requires agencies to conduct a “privacy impact assessment” before initiating a new collection of information that uses information technology and contains individually identifying information. In addition, the Act established an Office of Electronic Government within OMB, headed by an Administrator appointed by the President. It requires the Administrator of that office to work with the Administrator of OIRA in establishing the strategic direction of the e-government program, and to oversee its implementation.

Assessment of E-Rulemaking. On December 5, 2005, the CAL Subcommittee sponsored a symposium, chaired by Professor Cary Coglianese of the University of Pennsylvania Law School, on “E-Rulemaking in the 21st Century” as part of the Project. This symposium brought together legislative and executive branch personnel, academic researchers, and non-governmental representatives for an in-depth discussion on e-rulemaking and the manner in which advances in information technology may impact the future of administrative rulemaking.

The symposium began by tracing the progress that has been made to date on the use of IT in the rulemaking process, as well as by noting the goals identified by Congress and the Executive Branch in their respective efforts to facilitate electronic rulemaking. While the participants at the symposium expressed broad support for expanding public participation and improving the substance of regulations through vehicles such as e-rulemaking initiatives, some participants voiced concerns that these two goals are not inherently compatible. In particular, it was suggested that while a certain level of public participation is essential in the rulemaking process, expansive participation does not ensure more effective regulation. As noted at the symposium, the potential for e-rulemaking to facilitate significant increases in the number of comments on a rule could lead to a dynamic where additional comments yield diminishing returns in relation to the increased burden on agencies to assess such comments. Furthermore, some participants suggested that increased participation could theoretically have a negative impact on agencies’ sound decisionmaking to the extent that an increased emphasis on public comments might deter an agency from giving appropriate weight to the value of expert judgment on complex regulatory matters.

Relatedly, other participants noted that an increase in public comments and the degree of consideration given thereto does not necessarily lead to the conclusion that the legitimacy of agency rulemaking efforts will be enhanced. A key aspect of this concern centers on the fact the possibility that even with advances in information technology, individuals and groups that file comments may not be representative of the general public. Some participants voiced the further concern that opposing interest groups could exploit the facilitative aspects of e-rulemaking to flood agencies with pre-formulate messages and thereby skew the utility and representativeness of any comments received.

In testimony presented before the Subcommittee on July 26, 2006, Professor Coglianese commented on the status of empirical research on e-rulemaking and noted that empirical data that has been obtained to date does not appear to support the initial expectation that advances in this context would facilitate a significant increase in public participation. Nonetheless, technological improvements may ultimately provide substantial benefits in this regard. Professor Coglianese also observed that ancillary benefits of e-rulemaking, such as increased transparency, enhanced ability for executive or Congressional oversight, administrative cost reduction, and greater ease of compliance provide additional justifications for continued efforts to improve agency utilization of electronic technology in rulemaking.

Areas for Additional Research

- Should efforts to include the public in the rulemaking process before publication of a proposed rule (e.g., negotiated rulemaking, SBREFA panels) be expanded? How much do these processes currently add in terms of public participation?
- How effective is the *Unified Agenda of Federal Regulatory and Deregulatory Actions* in identifying future rulemaking (thereby giving the public advance

warning of forthcoming regulatory actions)? What changes could make this *Agenda* a more effective means of notification?

- What has been the impact of agencies' use of "nonrulemaking" approaches (e.g., guidance documents, notices, etc.) and attenuated rulemaking approaches (e.g., use of the APA's "good cause exception to skip notices of proposed rulemaking) on the public's opportunities for participation? Should the public be able to comment on those approaches before they become final?
- Should all agencies be required to make comments received immediately available to the public (to allow comments on the comments)? Or, alternatively, should agencies provide "reply comment periods" (to discourage waiting to the end of the comment period)?
- What effect has "e-rulemaking" (including the use of e-mail comments and "comments on comments," on-line dialogues, the new Regulations.gov web site, agency-specific and the new governmentwide electronic dockets) had on the amount and nature of public participation in the rulemaking process, and how do agencies view those comments? Specifically:
 - How should agencies deal with the sometimes hundreds-of-thousands of e-mail comments generated by special interest groups?
 - Should all agencies be required to offer "list serves" that allow members of the public to be notified of certain rules being available for comment?
 - Has e-rulemaking allowed more people to participate in the rulemaking process, or simply facilitated access to traditional commenters?
- The APA does not specify how long public comment periods should be (although Executive Order 12866 suggests 60 days). Should there be a minimum comment period specified in the statute? If so, what should it be? Also, under what circumstances can/should agencies extend comment periods?
- Are agencies always required to respond to public comments, even if they take no further action on the proposed rule for years? How soon should they respond, and in what form? Is there a point when public comments become too "stale" to permit issuance of a rule based on those comments (without further public comments)?
- There are no governmentwide standards for what should be in the rulemaking record (e.g., a copy of the proposed rule, public comments, etc.) or a standard order of presentation of the documents? Should there be such standards? If so, who should establish them (OMB, National Archive and Records Administration, or some other entity)?

- Under what circumstances is it appropriate for agencies to allow commenters to file confidential comments? How should this procedure be regularized?
- The APA prohibits *ex parte* contacts in formal rulemaking, but is silent about such contacts in the much more common informal “notice and comment” rulemaking. Should Congress extend those prohibitions, and clearly establish when and what types of contacts are prohibited?
- The APA does not mention two relatively common forms of rulemaking that avoid traditional notice and comment requirements — interim final rulemaking and direct final rulemaking. Should Congress codify these forms of rulemaking and how they should (and should not) be used? More generally, should Congress revisit agencies’ use of all forms of the “good cause” exception?
- Some of the statutory analytical requirements in rulemaking (e.g., the Regulatory Flexibility Act and the Unfunded Mandates Reform Act) do not apply to rules for which there is no NPRM. Should these incentives for agencies to avoid NPRMs be eliminated? At a minimum, should the exemptions for interim final and direct final rules be eliminated?
- OMB’s new peer review bulletin allows agencies to decide whether to permit public comment on their peer review processes. Should agencies have that discretion, should agencies be required to permit public comments, or should public comments on what is supposed to be an “expert” process not be permitted (because, among other things, it could slow down rulemaking)?
- To what extent does public participation in its various forms (e.g., comment periods, public meetings, SBREFA panels, etc.) have an effect on agency decisionmaking during the rulemaking process? What empirical evidence is there of that effect?
- What is the proper role of consultants in the development stage of a rulemaking? Should there be a balance of views of competing stakeholders in the pre-NPRM period? Should agencies be required to invite competing views to ensure “balance”?
- Do consent decrees entered into by government agencies with private parties to settle challenges to rules and that effect substantive changes in the rules undermine the APA’s notice and comment requirements and public participation opportunities? Do they raise separation of powers issues?

II. Presidential Review of Rules

The Office of Management and Budget's (OMB) Office of Information and Regulatory Affairs (OIRA) reviews hundreds of significant proposed and final rules from all federal agencies (other than independent regulatory agencies) before they are published in the Federal Register. As a result of OIRA's review, many draft rules are changed before publication, withdrawn before a review is completed, or returned to the agencies because, in OIRA's analysis, certain aspects of the rule need to be reconsidered.

OIRA has been reviewing agencies' draft rules for more than 25 years, and those reviews have become an established and important part of the federal rulemaking process. While OIRA reviews clearly have an analytical component (e.g., ensuring compliance with legal and procedural requirements and conformance with principles of economic analysis), they are also a way to ensure that the agencies' regulatory programs are consistent with administration priorities. Although created by Congress, OIRA is located within the Executive Office of the President, and the President is OIRA's chief client. Because it represents the President and because it reviews hundreds of significant rules each year from dozens of federal agencies, OIRA can have a major influence on the direction of a wide range of public policies.

Presidential Review of Rules in the 1970s

Some form of centralized review of agencies' regulations within the Executive Office of the President has been part of the rulemaking process since the early 1970s. For example:

- In 1971, President Nixon established a "Quality of Life Review" program in which executive departments and independent agencies submitted all "significant" draft proposed and final rules pertaining to "environmental quality, consumer protection, and occupational and public health and safety" to OMB, which then circulated them to other agencies for comment.¹²⁴ In their submissions, agencies were to provide a summary of their proposals, including their principal objectives, the alternatives that they considered, and a comparison of the expected benefits and cost of those alternatives. Agencies were also required to submit a schedule showing estimated dates of proposed and final significant rules.
- In 1974, President Ford issued Executive Order 11821, which required agencies to prepare an "inflation impact statement" for each "major" proposed rule.¹²⁵ The statement was a certification that the inflationary impact of the rule had been evaluated in accordance with criteria and procedures developed by OMB. The executive order directed OMB to develop criteria for the identification of major rules that may have a significant impact on inflation, but specified that the office must consider costs, effects on productivity, effects on competition, and effects

¹²⁴This requirement was formally established through an October 1971 memorandum from then-OMB Director George Schultz. According to some observers, the requirements were routinely imposed only on the Environmental Protection Agency.

¹²⁵Exec. Order 11,821, *Inflation Impact Statements*, 39 Fed. Reg. 41,501 (Nov. 29, 1974). The order also required such statements for agency-proposed major legislation.

on supplies of important products and services. Before a major rule was published in the Federal Register, the issuing agency was required to submit the associated impact statement to the Council on Wage and Price Stability (CWPS). CWPS would then either provide comments directly to the agency or participate in the regular rulemaking comment process.

- In 1978, President Carter issued Executive Order 12044, which (among other things) required agencies to publish semiannual agendas of any significant rules under development or review, and to prepare a regulatory analysis for at least all rules with a \$100 million impact on the economy.¹²⁶ The analysis was to contain a succinct statement of the problem, a description of the alternative approaches considered, and the “economic consequences” of those alternatives. OMB was instructed to “assure the effective implementation of this Order,” but was not given specific review responsibilities. President Carter also established: (1) a “Regulatory Analysis Review Group” (RARG) to review the analyses prepared for certain major rules and to submit comments during the comment period, and (2) a “Regulatory Council” to coordinate agencies’ actions to avoid conflicting requirements and duplication of effort.

Creation of OIRA

Although OIRA is now often first thought of for its regulatory review responsibilities, its initial review responsibilities did not include the substance of agencies’ rules. OIRA was created within OMB by section 3503 of the Paperwork Reduction Act of 1980 (PRA) (44 U.S.C. Chapter 35).¹²⁷ The PRA provided that OIRA would be headed by an administrator, and designated the OIRA administrator as the “principal advisor to the Director on Federal information policy.” The Act also said that the Director of OMB “shall delegate to the [OIRA] Administrator the authority to administer all functions under this chapter.” Specific areas of responsibility in the PRA that were assigned to the Director (and later delegated to OIRA) included information policy, information collection request clearance and paperwork control, statistical policy and coordination, records management, privacy, and automatic data processing and telecommunications.¹²⁸ With regard to paperwork reduction, the Act generally prohibited agencies from conducting or sponsoring a collection of information until they had submitted their proposed information collection requests to OIRA and the office had approved those requests. The PRA’s requirements cover rules issued by virtually all agencies, including Cabinet departments, independent agencies, and independent regulatory agencies and commissions.¹²⁹

¹²⁶Exec. Order 12,044, *Improving Government Regulations*, 43 Fed. Reg. 12,661 (Mar. 24, 1978).

¹²⁷For a discussion of the PRA, see Harold Relyea, *Paperwork Reduction Act Reauthorization and Government Information Management Issues*, CRS Report RL30590.

¹²⁸The PRA was later amended in 1986 and again in 1995, and the list of OIRA’s duties changed somewhat. For example, the 1986 amendments sharpened the management focus of the Act and changed “information policy” to “information resources management.” As discussed later in this Report, the 1986 amendment also required the administrator of OIRA to be appointed by the President, subject to advice and consent of the Senate.

¹²⁹As used herein the term “independent regulatory agencies” refers to agencies established to
(continued...)

Although the PRA gave OIRA substantive responsibilities in many areas, the bulk of the office's day-to-day activities under the Act were initially focused on reviewing and approving agencies' proposed information collection requests. OIRA had 77 staff members when the PRA took effect in 1981, of which about half were involved in reviewing agencies' information collection requests. That year, OIRA took nearly 5,000 paperwork review actions — approving new and revised collections, extending existing collections, and reinstating expired collections. The office's paperwork clearance workload since then has generally been between 4,000 and 6,000 actions each year, although the number of OIRA staff overall and those reviewing proposed collections has declined substantially.¹³⁰ Although many federal regulations have an information collection component, the PRA did not authorize OIRA to review or comment on the non-paperwork elements of those regulations, or on regulations without an information collection component.¹³¹

Reagan Executive Orders on Regulatory Review

In 1980, President Reagan was elected on a platform critical of government's role in society in general and of federal regulations in particular. Shortly after taking office, he established a "Presidential Task Force on Regulatory Relief," headed by Vice President George H. W. Bush and composed of Cabinet officers (although the bulk of the task force's work was reportedly performed by OMB staff). The task force's responsibilities included: (1) monitoring the establishment of OMB's responsibility to coordinate and review new rules, (2) developing legislative changes to regulatory statutes, and (3) revising existing regulations. In relation to this last responsibility, the task force ultimately identified a total of 119 rules for alteration or cancellation by the issuing agencies, nearly half of which had been issued by the Department of Transportation or the Environmental Protection Agency. Although the task force said that implementation of the changes it recommended would save more than \$150 billion over the next 10 years, critics charged that this estimate ignored the benefits associated with the rules on what they referred to as the administration's regulatory "hit list." The task force's legislative efforts were less successful, failing to get Congress to enact revisions to clean air and water laws or to

¹²⁹(...continued)

be independent of the President, including the Federal Communications Commission, the Securities and Exchange Commission, and the Consumer Product Safety Commission. The term "independent agencies" refers to agencies that are independent of Cabinet departments but not independent regulatory agencies (e.g., the Environmental Protection Agency and the Office of Personnel Management).

¹³⁰For example, by 1989, OIRA's overall staffing had declined to fewer than 60 employees, of whom OIRA estimated 35 were reviewing information collection requests. By 1997, OIRA staffing declined 48 employees, of whom 22 were reviewing paperwork requests. See U.S. General Accounting Office, *Regulatory Management: Implementation of Selected OMB Responsibilities Under the Paperwork Reduction Act*, GAO/GGD-98-120, July 9, 1998.

¹³¹In some cases, though, the paperwork requirement may be the essence of the regulation. For example, EPA's Toxics Release Inventory (TRI) program is essentially a database created through collections of information imposed on businesses in order to inform the public about chemical hazards in their communities.

enact broad regulatory reform legislation that would have limited agencies' rulemaking powers.¹³²

In February 1981 — less than one month after taking office — President Reagan issued Executive Order 12291¹³³ on “Federal Regulation,” which greatly increased both the scope and importance of OIRA's responsibilities.¹³⁴ Specifically, the executive order generally required covered agencies (Cabinet departments and independent agencies, but not independent regulatory agencies) to:

- refrain from taking regulatory action “unless the potential benefits to society for the regulation outweigh the potential costs to society,” identify regulatory objectives to maximize net benefits to society, and select the regulatory alternative that involves the least net cost to society;
- prepare a “regulatory impact analysis” for each “major” rule, which was defined as any regulation likely to result in (among other things) an annual effect on the economy of \$100 million. Those analyses were required to contain a description of the potential benefits and costs of the rule, a description of alternative approaches that could achieve the regulatory goal at lower cost (and why they were not selected), and a determination of the net benefits of the rule. The issuing agency was to make the initial determination of whether a rule was “major,” but the executive order gave OMB the authority to require a rule to be considered major; and
- send a copy of each draft proposed and final rule to OMB before publication in the Federal Register. The order authorized OMB to review “any preliminary or final regulatory impact analysis, notice of proposed rulemaking, or final rule based on the requirements of this Order.” Non-major rules were required to be submitted to OMB at least 10 days before publication, but major rules had to be submitted as much as 60 days in advance.

Executive Order 12291 authorized the director of OMB to review any draft proposed or final rule or regulatory impact analysis “based on the requirements of this Order.” The executive order indicated that the review should be completed within 60 days, but allowed the director to extend that period whenever necessary. It also authorized the director to exempt classes of regulations from any or all of the order's requirements,¹³⁵ and generally required agencies to

¹³²The task force was disbanded in August 1983 after issuing a final report.

¹³³Exec. Order 12,291, *Federal Regulation*, 46 Fed. Reg. 13,193 (Feb. 19, 1981).

¹³⁴For a description of the effects of this order, see Erik D. Olson, *The Quiet Shift of Power: Office of Management & Budget Supervision of Environmental Protection Agency Rulemaking Under Executive Order 12291*, 4 Va. J. Nat. Resources L. 1 (1984).

¹³⁵The exemptions that OMB granted fell into four broad categories: (1) rules that were essentially nonregulatory in nature, (2) rules that delegated regulatory authority to the States, (3) rules that generally affected individual entities and that did not involve broader policy issues, and (4) rules for which a delay of even a few days could have imposed substantial costs and that were unlikely to involve significant policy issues. OMB granted about 30 exemptions, most of which
(continued...)

“refrain” from publishing any final rules until they had responded to OMB’s comments. The executive order made OMB’s authority to review agencies’ draft rules subject to the overall direction of the Presidential task force on regulatory relief.¹³⁶

Although the executive order did not specifically mention OIRA, shortly after its issuance the Reagan Administration decided to integrate OMB’s regulatory review responsibilities under the executive order with the responsibilities given to OMB (and ultimately to OIRA) by the PRA. As a result, OIRA’s responsibilities for substantive review of rules under the executive order were added to the office’s substantial responsibilities under the PRA. In 1981, OIRA reviewed the substance of nearly 2,800 rules under Executive Order 12291 in addition to the nearly 5,000 paperwork review actions it took that year.

In 1985, President Reagan extended OIRA’s influence over rulemaking even further by issuing Executive Order 12498, which required Cabinet department and independent agencies (but not independent regulatory agencies) to submit a “regulatory program” to OMB for review each year that covered all of their significant regulatory actions underway or planned.¹³⁷ Previously, Executive Order 12291 required each of those agencies to publish semiannual “regulatory agendas” of proposed regulations that the agency “has issued or expects to issue,” and any existing rule that was under review.¹³⁸ These agendas were required to contain a schedule for completing action on any major rule for which the agency had published a notice of proposed rulemaking. The new executive order went further, saying that, except in “unusual circumstances,” OMB could return any rule submitted for review under Executive Order 12291 to the issuing agency for “reconsideration” if it was not in the agency’s regulatory program for that year, or was “materially different” from what was described in the program.

In other words, OIRA could return a draft rule to an issuing agency if the office did not have advance notice of the rule’s submission, even if the rule was otherwise consistent with the requirements in Executive Order 12291.¹³⁹ The regulatory agenda and program requirements in these executive orders also permitted OIRA to become aware of forthcoming agency actions well in advance of the submission of a draft proposed rule, thereby permitting the office to stop or alter an objectionable rule before the rulemaking process developed momentum. Although Reagan Administration officials compared this planning process to the process used to develop the President’s budget, critics noted that the budget process has a final step that the regulatory process lacks, namely, review and approval by Congress.

Executive Order 12291 in Context. In several ways, the analytical and review requirements in Executive Order 12291 were significantly different from previous efforts. For

¹³⁵(...continued)
were established in 1981 or 1982.

¹³⁶Although the task force was chaired by Vice President Bush, the executive director was the administrator of OIRA. Other members included the Director of OMB, the Attorney General, and the Secretaries of Commerce, Labor, and the Treasury.

¹³⁷Exec. Order 12,498, *Regulatory Planning Process*, 50 Fed. Reg. 1036 (Jan. 8, 1985).

¹³⁸As is touched upon later, President Carter first required the use of these agendas in 1978.

¹³⁹An OIRA representative said that although the office had this authority it never used it, noting that would have been difficult to defend the return of an agency’s rule for purely procedural reasons.

example, the requirement in the new executive order that agencies choose the least costly approach to a particular regulatory objective went further than the requirement in President Carter's Executive Order 12044, which simply required agencies to analyze and consider alternative regulatory approaches. Also, whereas the regulatory oversight functions were divided among many offices (OMB, CWPS, RARG, and the regulatory council) during the Carter Administration, Executive Order 12291 consolidated these functions within OIRA.¹⁴⁰ Another major difference was the amount of influence that OIRA had compared to its predecessors. Under previous executive orders, CWPS and RARG had primarily an advisory role. In contrast, under Executive Order 12291, OIRA could overrule agency determinations regarding whether the rule was "major" (and therefore required a regulatory impact analysis), and could delay the regulation until the agency had adequately responded to its concerns (e.g., if it believed the agency had not considered all reasonable alternatives, that its analysis was not sound, or that it was contrary to administration policy). OIRA's significant influence on rulemaking was underscored by its organizational position within OMB, the agency that reviews and approves the rulemaking agencies' budget requests. Finally, and perhaps most importantly, the nature and transparency of the review process was significantly different under Executive Order 12291. Under the Carter Administration's approach, RARG and CWPS prepared and filed comments on agencies' regulatory proposals during the formal public comment period, *after* they were published in the Federal Register. In the case of RARG filings, a draft of the comments was circulated to all RARG members, and the comments and any dissents were placed on the public record at the close of the comment period. In contrast, OIRA's reviews occurred *before* the rules were published for comment, and Executive Order 12291 did not require that OIRA's comments on the draft rule be disclosed. This pre-publication review process made OIRA's regulatory reviews under Executive Order 12291 qualitatively different than its predecessors.

Early Views Regarding OIRA Reviews. The expansion of OIRA's authority in the rulemaking process via Executive Orders 12291 and 12498 was highly controversial. Although some believed that the authority did not go far enough (e.g., did not cover independent regulatory agencies), most of the concerns were that the expansion had gone too far. For example, a number of the concerns raised by Members of Congress, public interest groups, and others focused on whether OIRA's role violated the constitutional separation of powers and the effect that OIRA's review had on public participation and the timeliness of agencies' rules.¹⁴¹ Some believed that OIRA's new authority displaced the discretionary authority of agency decision makers in violation of Congressional delegations of rulemaking authority, and that the President exceeded his authority in issuing the executive orders. Others indicated that OIRA did not have the technical expertise needed to instruct agencies about the content of their rules. Still other concerns focused on OIRA's ability to carry out its many responsibilities. In 1983, GAO concluded that the expansion of OIRA's responsibilities under Executive Order 12291 had

¹⁴¹*Role of OMB in Regulation: Hearing Before the Subcomm. on Oversight and Investigations of the H. Comm. on Energy and Commerce*, 97th Cong. (1981); see also Morton Rosenberg, *Beyond the Limits of Executive Power: Presidential Control of Agency Rulemaking Under Executive Order 12,291*, 80 Mich. L. Rev. 193 (1981).

adversely affected the office's ability to carry out its PRA responsibilities, and recommended that Congress consider amending the Act to prohibit OIRA from carrying out other responsibilities like regulatory review.¹⁴²

Many of the early concerns about OIRA focused on the lack of transparency of the regulatory reviews, and specifically questioned whether OIRA had become a clandestine conduit for outside influence in the rulemaking process. Critics pointed out that in the first few months after the executive order was issued, OIRA met with representatives from dozens of businesses and associations seeking regulatory relief and returned dozens of rules to the agencies for reconsideration.¹⁴³ In response to these concerns, the OMB Director issued a memorandum in June 1981 stating that any factual material provided to OIRA regarding proposed rules should also be sent to the relevant rulemaking agency. The memorandum did not, however, apply to information provided to OIRA orally, and did not require that OIRA's meetings with outside parties be disclosed to the public.

OIRA's role in the rulemaking process remained controversial for the next several years. In 1983, Congress was so dissatisfied with OIRA's performance in the areas of regulatory and paperwork review that it permitted the office's appropriation authority to expire (although the office's statutory authority under the PRA was not affected and it continued to receive an appropriation via OMB).¹⁴⁴ In 1985, five House committee chairmen filed a friend-of-the-court brief in a lawsuit brought against the Department of Labor regarding the department's decision (reportedly at the behest of OMB) not to pursue a proposed standard concerning exposure to ethylene oxide, a sterilizing chemical widely used in hospitals and suspected of causing cancer. The chairmen claimed that OMB's actions represented a usurpation of Congressional authority.

Congress reauthorized OIRA in 1986, but only after making the administrator subject to Senate confirmation. By 1986, Congress began considering legislation to restrict OIRA's regulatory review role and to block OIRA's budget request. In an attempt to head off that legislation, in June 1986 the OIRA administrator issued a memorandum for the heads of departments and agencies subject to Executive Order 12291 describing new OIRA procedures to improve the transparency of the review process. For example, the memorandum said that only the administrator or the deputy administrator could communicate with outside parties regarding rules submitted for review, and that OIRA would make available to the public all written materials received from outside parties. OIRA also said that it would, upon written request after a rule had been published, make available all written correspondence between OIRA and the agency head regarding the draft submitted for review.¹⁴⁵

¹⁴³Letter from James C. Miller III, administrator of OIRA, to the Honorable John D. Dingell, Chairman, Subcommittee on Oversight and Investigations, House Committee on Energy and Commerce, April 28, 1981.

¹⁴⁴OIRA's authorization for appropriation also expired in 2001, and (as of the date of this report) has not been reestablished.

¹⁴⁵For further information on this policy, see Judith Havemann, *No 'Shade-Drawn' Dealings for OMB: Congress Gets Disclosure of Regulation-Review Procedures*, Wash. Post, June 17, 1986, at A21.

In 1987 the National Academy of Public Administration published a report on Presidential management of agency rulemaking that summarized the criticisms of the OIRA review process as well as the positions of its proponents.¹⁴⁶ The report also described a number of issues in regulatory review and offered recommendations for improvement. For example, the report recommended that “regulatory management be accepted as an essential element of presidential management.” It also recommended that regulatory agencies “log, summarize, and include in the rulemaking record all communications from outside parties, OMB, or other executive or legislative branch officials concerning the merits of proposed regulations.”

In 1988, ACUS also examined the issue of Presidential review of agency rulemaking and concluded that the reviews could improve coordination and resolve conflicts among agencies. ACUS also said, though, that Presidential review “does not displace responsibilities placed in the agency by law nor authorize the use of factors not otherwise permitted by law.”¹⁴⁷ The Conference recommended public disclosure of proposed and final agency rules submitted to OIRA under the executive order, communications from OMB relating to the substance of rules, and communications with outside parties, and also recommended that the reviews be completed in a “timely fashion.”¹⁴⁸

OIRA and the George H. W. Bush Administration

President George H. W. Bush continued the implementation of Executive Orders 12291 and 12498 during his administration, but external events significantly affected OIRA’s operation and, more generally, the federal rulemaking process. In 1989, President Bush’s nominee to head OIRA was not confirmed. Later, in response to published accounts that the burden of regulation was once again increasing, President Bush established the President’s “Council on Competitiveness” (also known as the Competitiveness Council) to review regulations issued by agencies. Chaired by Vice President Quayle, the council oversaw and was supported by OIRA, and reviewed particular rules that it believed would have a significant impact on the economy or particular industries. According to OIRA representatives, the council signified continued White House-level interest in the regulatory arena, and also represented a continuation of the type of role played by the Presidential Task Force on Regulatory Relief during the Reagan Administration.

Many of the Competitiveness Council’s actions were highly controversial, with critics assailing both the effects of those actions (e.g., rolling back environmental or other requirements) and the secrecy in which the council acted.¹⁴⁹ The council attempted to maintain strict secrecy regarding both its deliberations and those in the private sector with whom it

¹⁴⁷Administrative Conference of the United States, *Presidential Review of Agency Rulemaking*, Conference Recommendation 88-9 (1988).

¹⁴⁸The National Academy of Public Administration and the American Bar Association have also recognized the potential value of Presidential regulatory review. They also recommended reforms such as improved transparency and better communication between OIRA and agency staff.

¹⁴⁹Christine Triano & Nancy Watzman, *All the Vice President’s Men: How the Quayle Council on Competitiveness Secretly Undermines Health, Safety, and Environmental Programs* (Washington: OMB Watch/Public Citizen, 1991).

communicated or consulted.¹⁵⁰ Critics decried what they believed to be “backdoor rulemaking” by the Competitiveness Council, but the council continued its operations until the end of the Bush Administration in 1993. Meanwhile, OIRA continued its operations under Executive Order 12291, reviewing between 2,100 and 2,500 rules each year from 1989 through 1992.

Regulatory Review Under Executive Order 12866

In September 1993, President Clinton issued Executive Order 12866 on “Regulatory Planning and Review,” which revoked Executive Orders 12291 and 12498 and abolished the Council on Competitiveness.¹⁵¹ Although different from its predecessors in many respects, Executive Order 12866 (which is still in effect) continued the general framework of Presidential review of rulemaking. For example, it requires covered agencies (again, Cabinet departments and independent agencies but not independent regulatory agencies) to submit their proposed and final rules to OMB before publishing them in the Federal Register. The order also requires agencies to prepare cost-benefit analyses for their “economically significant” rules (essentially the same as “major” rules under Executive Order 12291). As discussed in detail below, however, Executive Order 12866 established a somewhat new regulatory philosophy and a new set of rulemaking principles, limited OIRA’s reviews to certain types of rules, and established transparency requirements that included but went beyond those that had been put in place by the administrator’s June 1986 memorandum. Section 2(b) of the order assigns responsibility for review of agency rulemaking to OMB, and specifically names OIRA as “the repository of expertise concerning regulatory issues.” The order also named the Vice President as principal advisor to the President on regulatory policy, planning, and review.¹⁵²

Specific Provisions in the Executive Order. In its statement of regulatory philosophy, Executive Order 12866 says, among other things, that agencies should assess all costs and benefits of available regulatory alternatives, including both quantitative and qualitative measures. It also provides that agencies should select regulatory approaches that maximize net benefits (unless a statute requires another approach). Where permissible and applicable, the order states that agencies should adhere to a set of principles when developing rules, including: (1) consideration of the degree and nature of risk posed when setting regulatory priorities, (2) adoption of regulations only upon a “reasoned determination that the benefits of the intended regulation justify its costs,” and (3) tailoring regulations to impose the least burden on society needed to achieve the regulatory objectives. Some of the stated objectives of the order are “to reaffirm the primacy of Federal agencies in the regulatory decision-making process; to restore the integrity and legitimacy of regulatory review and oversight; and to make the process more accessible and open to the public.” According to OIRA representatives, the “primacy” of the agencies provision signaled a significant change in regulatory philosophy, vesting greater control

¹⁵⁰See Bob Woodward & David Broder, *Quayle’s Quest: Curb Rules, Leave No Fingerprints*, Wash. Post, Jan. 9, 1992, at A1.

¹⁵¹Exec. Order 12,866, *Regulatory Planning and Review*, 58 Fed. Reg. 51,735 (Oct. 4, 1993).

¹⁵²Executive Order 13258, issued in February 2002, amended Executive Order 12866 and reassigned all roles originally assigned to the Vice President to the President’s chief of staff. See Exec. Order 13,258, *Amending Executive Order 12866 on Regulatory Planning and Review*, 67 Fed. Reg. 9385 (Feb. 26, 2002).

of the rulemaking process with regulatory agencies and taking away authority from OIRA. Also, the requirement that the benefits of a regulation “justify” its costs was a noticeably lower threshold than the requirement in Executive Order 12291 that the benefits “outweigh” the costs.

Section 6 of Executive Order 12866 established agency and OIRA responsibilities in the centralized review of regulations. In contrast to the broad scope of review under Executive Order 12291, the new order limited OIRA reviews to actions identified by the rulemaking agency or OIRA as “significant” regulatory actions, which are defined in section 2(f) of the order as the following:

Any regulatory action that is likely to result in a rule that may (1) have an annual effect on the economy of \$100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities; (2) create a serious inconsistency or otherwise interfere with an action taken or planned by another agency; (3) materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or (4) raise novel legal or policy issues arising out of legal mandates, the President’s priorities, or the principles set forth in the Executive Order.

By focusing OIRA’s reviews on significant rules, the number of draft proposed and final rules that OIRA examined fell from between 2,000 and 3,000 per year under the Executive Order 12291 to between 500 and about 700 rules per year under Executive Order 12866.

Executive Order 12866 also differs from its predecessors in other respects. For example, the order generally requires that OIRA complete its review of proposed and final rules within 90 calendar days, and requires both the agencies and OIRA to disclose certain information about how the regulatory reviews were conducted. Specifically, agencies are required to identify for the public: (1) the substantive changes made to rules between the draft submitted to OIRA for review and the action subsequently announced; and (2) changes made at the suggestion or recommendation of OIRA. OIRA is required to provide agencies with a copy of all written communications between OIRA personnel and parties outside of the executive branch, and a list of the dates and names of individuals involved in substantive oral communications. The order also instructs OIRA to maintain a public log of all regulatory actions under review and of all of the above-mentioned documents provided to the agencies.¹⁵³

OIRA’s Formal Review Process. OIRA reviews agencies’ draft rules at both the proposed and final stages of rulemaking.¹⁵⁴ In each phase, the review process starts when the rulemaking agency formally submits a regulatory review package to OIRA consisting of the rule, any supporting materials, and a transmittal form. The OIRA docket librarian then logs the

¹⁵³For a discussion of the differences between the transparency requirements under Executive Order 12291 and Executive Order 12866, see William D. Araiza, *Judicial and Legislative Checks on Ex Parte OMB Influence Over Rulemaking*, 54 Admin. L. Rev. 611 (2002); Peter M. Shane, *Political Accountability in a System of Checks and Balances: The Case of Presidential Review of Rulemaking*, 48 Ark. L. Rev. 161 (1995).

¹⁵⁴OIRA may also formally or informally review other rulemaking documents before proposed rules (e.g., advance notices of proposed rulemaking).

receipt of the review package and forwards it to the appropriate desk officer. In some cases, agencies withdraw their rules from OIRA during the review period and the rules may or may not be subsequently resubmitted. At the end of the review period, OIRA either returns the draft rule to the agency “for reconsideration” or OIRA concludes that the rule is consistent with the executive order. OIRA codes the rule in its database as “consistent with change” if there had been any changes to the rule, regardless of the source or extent of the change. OIRA codes rules in its database as “consistent with no change” only if they are exactly the same at the end of the review period as the original submission. If the draft rule is a proposed rule and is judged by OIRA to be consistent with the executive order, the agency may then publish a notice of proposed rulemaking in the Federal Register, obtain comments during the specified comment period, review the comments received, and make any changes to the rule that it believes are necessary to respond to those comments. (Executive Order 12866 says that this comment period should, in most cases, be at least 60 days for significant rules reviewed by OIRA.) If the draft is a final rule, the agency may publish the rule after OIRA concludes its review and the rule will generally take effect either at that point or at some later date specified by the agency.

In most of the years since Executive Order 12866 was issued, more than 90% of the rules that OIRA reviewed were coded in the database as either “consistent with change” or “consistent without change.” (See **Table 1**.) Only a small percentage of rules were withdrawn, and even fewer were returned to the agencies. The proportion of rules coded as “changed” has varied somewhat over time, but the last several years of the Clinton Administration (1997 through 2000) were fairly similar to the most recent non-transition years of the George W. Bush Administration (2002 and 2003). The data indicate that there were a relatively large number of rules that were withdrawn and returned in 2001 compared to other years. The withdrawn rules reflect actions taken at the start of the George W. Bush Administration pursuant to a memorandum issued by Assistant to the President and Chief of Staff Andrew H. Card, which generally directed Cabinet departments and independent agencies to: (1) not send proposed or final rules to the Office of the Federal Register, (2) withdraw from the Office rules that had not yet been published in the Federal Register, and (3) postpone for 60 days the effective date of rules that had been published but had not yet taken effect.¹⁵⁵ As discussed in greater detail later in this report, OIRA returned a number of rules to the agencies for reconsideration shortly after a new administrator was appointed in 2001.

Source: OIRA.

Note: "Other" includes rules that were sent improperly, emergency rules, and rules with a statutory or judicial deadline. Numbers do not total to 100.0 due to rounding.

The type of review that OIRA conducts under Executive Order 12866 sometimes depends on the type of draft rule submitted. For example, if the draft rule contains a collection of information covered by the PRA, the desk officer would also review it for compliance with that act. If the draft rule is "economically significant" (e.g., has an annual impact on the economy of at least \$100 million), the executive order requires agencies to prepare an economic analysis describing, among other things, the alternatives that the agency considered and the costs and benefits of those alternatives.¹⁵⁶ For those economically significant rules, OIRA desk officers are to review the economic analyses using the office's guidance on how to prepare regulatory analyses under the executive order.¹⁵⁷

An attachment to a September 20, 2001, memorandum to the President's Management Council described the general principles and procedures that OIRA reportedly uses in the

¹⁵⁶Section 3(f) of the executive order also defines an economically significant rule as adversely affecting "in a material way, the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities."

¹⁵⁷This guidance was issued as OMB Circular A-4 in September 2003. For a copy of this guidance, see [<http://www.whitehouse.gov/omb/circulars/a004/a-4.pdf>].

implementation of Executive Order 12866.¹⁵⁸ For example, the attachment indicated that the office would, where appropriate: (1) include an evaluation of whether the agency has conducted an adequate risk assessment, (2) give “a measure of deference” to regulatory impact analyses and other supporting technical documents that have been peer reviewed in accordance with specified procedures, (3) ensure that regulatory clearance packages satisfy the requirements in other executive orders (e.g., include the certifications required by Executive Order 13132 on “Federalism” and Executive Order 13175 on “Consultation and Coordination with Indian and Tribal Governments”), (4) consult with the Small Business Administration (SBA) and the SBA Chief Counsel for Advocacy, and (5) ensure that agencies evaluate the possible impact of the draft rule on the programs of other federal agencies.

There is usually some type of communication during the review process (often via e-mail or telephone) between the OIRA desk officer and the rulemaking agency regarding specific issues in the draft rule. Briefings and meetings are sometimes held between OIRA and the agency during the review process, with OIRA branch chiefs, the deputy administrator, or the administrator involved in some of these meetings. According to OIRA representatives, the desk officers always consult with the resource management officers on the budget side of OMB as part of their reviews, and reviews of draft rules are not completed until those resource management officers sign off. If the draft rule is economically significant, the desk officer would also consult with a government economist to help review the required economic analysis. For other rules, the desk officer might consult with other OIRA staff on issues involving statistics and surveys, information technology and systems, or privacy issues. In certain cases, OIRA may circulate a draft rule to other parts of the Executive Office of the President (e.g., the Office of Science and Technology Policy or the Council on Environmental Quality) or other agencies (e.g. the Departments of Energy, the Interior, or Transportation for certain Environmental Protection Agency rules).

Executive Order 12866 requires OIRA to complete its regulatory reviews within certain time frames: (1) within 10 working days of submission for any preliminary actions prior to a notice of proposed rulemaking (e.g., a notice of inquiry or an advance notice of proposed rulemaking), or (2) within 90 calendar days of submission for all other regulatory actions (or 45 days if OIRA had previously reviewed the material). In some instances, however, agency officials said OIRA will ask the rulemaking agency to withdraw the rule and resubmit it, restarting the review period. The executive order does not permit OIRA to “approve” or “disapprove” a draft rule; it is up to the agency to decide whether to proceed with publication of a rule after it had been returned, or to accept OIRA’s suggested changes. OIRA representatives said it is often an iterative process in which the agencies and OIRA negotiate issues and clarify terms. Nevertheless, agencies very rarely publish rules that OIRA returns or ignore substantive OIRA “suggestions.” In some instances, agency officials will formally or informally appeal OIRA determinations to the White House.

OIRA’s Informal Reviews. For some rules, there is an additional phase of “informal review” before the rule is officially submitted to OIRA. In its December 2001 report on the costs and benefits of federal regulations, OIRA stated that the office’s original review process “was designed as an end-of-the-pipeline check against poorly conceived regulations.”¹⁵⁹ OIRA

¹⁵⁸For a copy of this September 20, 2001 memorandum and the attachment, see [http://www.whitehouse.gov/omb/inforeg/oira_review-process.html].

¹⁵⁹Office of Management and Budget, *Making Sense of Regulation: 2001 Report to Congress on the Cost and* (continued...)

also said, however, that by the time an agency formally submits a rule to OIRA for review there may be “strong institutional momentum” behind the proposal and, as a result, the agency may be reluctant to address certain issues that OIRA analysts might raise. Therefore, OIRA indicated “there is value in promoting a role for OIRA’s analytic perspective earlier in the process, before the agency becomes too entrenched.” OIRA went on to state the following:

A common yet informal practice is for agencies to share preliminary drafts of rules and/or analyses with OIRA desk officers prior to formal decision making at the agency. This practice is useful for agencies since they have the opportunity to educate OIRA desk officers in a more patient way, before the formal 90-day review clock at OMB begins to tick. The practice is also useful for OIRA analysts because they have the opportunity to flag serious problems early enough to facilitate correction before the agency’s position is irreversible.

OIRA cannot informally review each of the hundreds of significant proposed and final rules that are submitted to the office each year. Informal reviews are most common when there is a statutory or legal deadline for a rule or when the rule is extremely large and requires discussion with not only OMB but also other federal agencies. The Environmental Protection Agency (EPA) and the Departments of Agriculture, Health and Human Services, and Transportation often issue those types of rules, and therefore are more likely to have their rules reviewed informally before formal submission.

OIRA has informally reviewed agencies’ draft rules since its review function was established in 1981, but informal reviews reportedly became more common when Executive Order 12866 was adopted in 1993 and OIRA’s reviews were focused on “significant” rules. There have been some indications, though, that OIRA has increased its use of informal reviews even further in recent years. For example, in its March 2002 draft report to Congress on the costs and benefits of federal regulation, OIRA said “agencies are beginning to invite OIRA staff into earlier phases of regulatory development in order to prevent returns late in the rulemaking process. It is at these early stages where OIRA’s analytic approach can most improve on the quality of regulatory analyses and the substance of rules.” Separately, in 2002, the OIRA administrator said “an increasing number of agencies are becoming more receptive to early discussions with OMB, at least on highly significant rulemakings.”¹⁶⁰

The administrator has also indicated that agencies’ “receptivity” to informal reviews may be enhanced by the possibility of a returned rule. For example, in early 2002 he said that OIRA was trying “to create an incentive for agencies to come to us when they know they have something that in the final analysis is going to be something we’re going to be looking at carefully. And I think that agencies that wait until the last minute and then come to us – well, in a sense, they’re rolling the dice.”¹⁶¹

¹⁶¹Rebecca Adams, *Regulating the Rulemakers: John Graham at OIRA*, CQ Weekly, Feb. 23, 2002, at 520-526.

Effects of OIRA's Reviews

Although a great deal has been written about OIRA's reviews of agencies' draft rules, few studies have systematically tried to determine the extent to which those reviews result in substantive changes to the rules. One such study (using data prior to the advent of Executive Order 12988) concluded that OIRA's reviews resulted in the rejection of some regulations that would have been economically inefficient, but did not appear to have improved the cost-effectiveness (e.g., costs-per-life saved) of many of the rules.¹⁶² Other studies have used OIRA's database showing the number of rules that were coded as "consistent with change" and "consistent without change" in an attempt to determine the significance of OIRA's effects on agencies' rules and whether those effects have changed over time.¹⁶³ As mentioned previously, however, the "consistent with change" code includes changes made at the initiation of the agencies as well as changes suggested by OIRA. Also, the code does not differentiate between minor editorial changes and changes that radically alter the effect of the rule. "Returns" and "withdrawals" in OIRA's database also need careful interpretation. A return may be for purely administrative reasons, not for substantive OIRA objections. Conversely, a withdrawal of a rule by an agency may have been initiated by OIRA. In order to use these data effectively, researchers should examine the associated documentation in the agencies' and OIRA's rulemaking dockets.

GAO's Analysis of OIRA's Effects. GAO published such an analysis in September 2003, supplementing information from OMB's database with information in the dockets and interviews with agency officials.¹⁶⁴ GAO reported that from July 1, 2001, through June 30, 2002, OIRA completed 642 reviews of agencies' draft proposed and final rules. Of these,

- About 33% (214) were coded in the database as "consistent with no change," indicating that OIRA considered the rules consistent with the executive order as submitted.
- About 50% (322) were coded as "consistent with change," indicating that the rules had changed after being submitted to OIRA, and that OIRA subsequently concluded that the rule was consistent with the executive order's requirements.
- About 8% (50) were coded as "withdrawn" by the agency.
- About 3% (21) were coded as "returned" to the agency by OIRA.
- About 5% (35) had some other disposition (e.g., "sent improperly," "emergency," or "statutory or judicial deadline").

In order to make its review manageable, GAO focused on 85 of those rules that were

¹⁶²Scott Farrow, *Improving Regulatory Performance: Does Executive Office Oversight Matter?* (Pittsburgh: Carnegie Mellon University, July 26, 2000).

¹⁶³See, e.g., Steven Croley, *White House Review of Agency Rulemaking: An Empirical Investigation*, 70 U. Chi. L. Rev. 821 (2003).

¹⁶⁴U.S. General Accounting Office, *Rulemaking: OMB's Role in Reviews of Agencies' Draft Rules and the Transparency of Those Reviews*, GAO-03-929, Sept. 2003.

coded as changed, withdrawn, or returned and that were submitted to OIRA by nine selected health, safety, or environmental agencies or offices: the Animal and Plant Health Inspection Service within the Department of Agriculture; the Food and Drug Administration within the Department of Health and Human Services; the Occupational Health and Safety Administration within the Department of Labor; the Federal Aviation Administration (FAA), the Federal Motor Carrier Safety Administration, and the National Highway Traffic Safety Administration (NHTSA) with the Department of Transportation (DOT); and the offices of air and radiation, water, and solid waste and emergency response within EPA. Seventy-one of the 85 rules had been coded “consistent with change,” nine were coded as “returned,” and five were coded as “withdrawn.”

GAO’s analysis of the underlying documents indicated that OIRA had a significant effect on at least 25 of the 85 draft rules. Specifically:

- Of the 71 “changed” rules, GAO concluded that OIRA had suggested significant changes to 17 of them — changes that affected the scope, impact, or estimated costs or benefits of the rules as originally submitted. In general, the focus of OIRA’s suggested changes appeared to be on reducing regulatory burden (and, in some cases, the expected benefits as well). Fourteen of the 17 significantly changed rules were from EPA’s office of air and radiation or its office of water. For example, at OIRA’s recommendation, EPA removed manganese from a list of hazardous wastes, deleted certain types of engines from coverage of a rule setting emissions standards, and delayed the compliance dates for two other types of emissions. Of the remaining 54 “changed” rules, the most significant changes made at OIRA’s suggestion involved adding explanatory language to the preambles of the rules and asking for comment on particular provisions. In 20 of the 54 rules, OIRA suggested only minor editorial changes (e.g., correcting spelling errors or citations) or made no suggestions at all.
- Of the nine rules that had been returned to the agencies by OIRA, two were returned because they had been improperly submitted, not because of substantive defect. OIRA returned the remaining seven rules because of concerns about the agencies’ regulatory analyses or a perceived lack of coordination between rulemaking agencies. For example, OIRA returned one EPA rule because the agency did not provide a quantitative analysis of costs and benefits, and returned a NHTSA rule because OIRA did not believe that the agency had demonstrated that it had selected the best available alternative. Five of the seven rules returned for substantive reasons had been submitted by the FAA.
- Of the five rules that were withdrawn, GAO determined that only one had been withdrawn at OIRA’s suggestion. The other four rules were withdrawn solely at the agencies’ initiative or as a result of a mutual decision by the agencies and OIRA.

If anything, GAO’s analysis understates the influence that OIRA has on agencies’ rules because its findings were often limited to the documentation that was available. If OIRA suggested a change to a rule before it was formally submitted to OIRA (e.g., during informal review), GAO’s analysis would not reflect those changes. In fact, the rule might not have even been in the universe of rules that GAO examined (i.e., those coded as changed, returned, or withdrawn during OIRA’s formal review). Other forms of OIRA influence may be even more

indirect and harder to document. For example, some agencies have indicated that they do not even propose certain regulatory provisions because they believe that OIRA would find them objectionable.

Regulated Entities' Contacts With OIRA. GAO also reported that regulated entities directly contacted OIRA either before or during its review process regarding 11 of the 25 rules that OIRA significantly affected.¹⁶⁵ Eight of those 11 cases involved EPA rules, and the nature of the contacts ranged from meetings with OIRA representatives to letters sent to OIRA. In 7 of the 11 cases, GAO concluded that what OIRA ultimately recommended to the rulemaking agencies was similar to what these regulated parties recommended to OIRA, in some cases, using similar language to that used by the regulated entities. For example, during OIRA's review of an EPA rule on identification and listing of hazardous waste, industry representatives met with and sent letters to OIRA opposing the listing of manganese as a hazardous waste constituent. (The industry representatives had made essentially the same argument to EPA during the public comment phase, but EPA did not agree.) The main focus of OIRA's comments to EPA at the conclusion of its review was that final action on listing manganese as a hazardous contaminant should be deferred. Notwithstanding the congruence between the comments of the regulated entities and OIRA's comments, GAO said it was impossible to determine the extent to which this or other suggestions made by the regulated entities might have influenced OIRA's actions, if at all.

Changes in OIRA's Policies and Practices During the George W. Bush Administration

The formal process by which OIRA reviews agencies' draft rules has changed little since Executive Order 12866 was issued in 1993.¹⁶⁶ There have, however, been several subtle yet notable changes in OIRA policies and practices in recent years, particularly since the OIRA Administrator John Graham took office in July 2001. In October 2002, the administrator said "the changes we are making at OMB in pursuit of smarter regulation are not headline grabbers: No far-reaching legislative initiatives, no rhetoric-laden executive orders, and no campaigns of regulatory relief. Yet we are making some changes that we believe will have a long-lasting impact on the regulatory state."¹⁶⁷

Return of the "Gatekeeper" Role. As noted previously, during the Reagan Administration, OIRA was often criticized for acting as a regulatory gatekeeper, actively overseeing and recommending changes to agencies' rules. During the Clinton Administration, however, the opposite concerns were expressed. A number of observers criticized OIRA for not overseeing the actions of the rulemaking agencies more aggressively. In September 1996, the then-administrator of OIRA testified that "we have consciously changed the way we relate to the agencies," and described OIRA's relationship with the rulemaking agencies as "collegial" and

¹⁶⁵Environmental and public interest groups also contacted OIRA regarding three of the rules.

¹⁶⁶There has been only one amendment to Executive Order 12866 since it was issued. As mentioned earlier in this Report, Executive Order 13258 reassigned all roles originally assigned to the Vice President in Executive Order 12866 (e.g., to be principal advisor to the President on regulatory policy, planning, and review) to the President's chief of staff.

¹⁶⁷John D. Graham, *Presidential Oversight of the Regulatory State: Can It Work?*, speech at the Heinz School, Carnegie Mellon University, Oct. 4, 2002.

“constructive.”¹⁶⁸ She also said she agreed with an article that said OIRA functioned during that period “more as a counselor during the review process than as an enforcer of the executive order.”¹⁶⁹

OIRA during the George W. Bush Administration has returned to the role it had during the Reagan Administration, even describing itself in an annual report as the “gatekeeper for new rulemakings.”¹⁷⁰ The administrator of OIRA has said one of the office’s functions is “to protect people from poorly designed rules,” and said OIRA review is a way to “combat the tunnel vision that plagues the thinking of single-mission regulators.” He has also compared OIRA’s review of agencies’ rules to OMB’s role in reviewing agencies’ budget requests. This return to the gatekeeper perspective of OIRA’s role has implications for an array of OIRA’s functions, and underlays many of the other changes described below.

Increased (and then Decreased) Use of Return Letters. As noted previously in **Table 1**, during the Clinton Administration, OIRA only rarely returned rules to the agencies for reconsideration. Specifically, according to OIRA’s database, of the more than 4,000 rules that OIRA reviewed from 1994 through 2000, OIRA returned only seven rules to the agencies — three in 1995 and four in 1997. OIRA administrators during that period said they viewed the use of return letters as evidence of the failure of the collaborative review process, since OIRA and the agencies were part of the same Presidential Administration.

In contrast, OIRA Administrator Graham referred to return letters as the office’s “ultimate weapon,” and views them as a way to make clear that the office is serious about the review process. In the first eight months after he took office in July 2001, OIRA returned 21 draft rules to the agencies for reconsideration. DOT had the most rules returned during 2001 and 2002 (eight), followed by the Social Security Administration (five) and the Department of Veterans Affairs (four).¹⁷¹ The letters commonly indicated that OIRA returned the rules because of concerns about the agencies’ analyses (e.g., whether the agencies had considered all reasonable alternatives or had selected the alternative that would yield the greatest net benefits).

Subsequently, however, the pace of OIRA’s return letters slowed. Although the average number of rules that OIRA reviewed each month stayed about the same, in the 26 months from March 2002 until March 2006, OIRA returned a total of six draft rules to the agencies — a dramatic decline from the 21 returns during the administrator’s first eight months in office.¹⁷² Only one rule was returned in 2004, and one more in 2005 — about the same pace as during the Clinton Administration. OIRA officials attributed the decline in return letters to the improved

¹⁷¹Copies of OIRA’s return letters are available on OMB’s website at [http://www.whitehouse.gov/omb/inforeg/return_letter.html].

¹⁷²Two of the five returns during this period involved the same DOT rule.

quality of agencies' regulatory submissions after the initial flurry of returns. For example, in November 2005 comments marking the 25th anniversary of OIRA, Administrator Graham said "we rarely need to issue a return letter" because agencies now "work with us to fix problems or they persuade us that there is no problem to fix."¹⁷³

Advent (and then Decline) of Prompt Letters. OIRA has traditionally been a reactive force in the rulemaking process, commenting on draft proposed and final rules that are generated by the agencies. Although OIRA occasionally suggested regulatory topics to the agencies during previous administrations, the practice was relatively uncommon and the discussions were not made public. In contrast, OIRA Administrator Graham was more publicly proactive, sending several agencies "prompt letters" (and posting them on the OIRA website) suggesting that they develop regulations in a particular area or encouraging the agencies' ongoing efforts.¹⁷⁴ For example, one such letter encouraged NHTSA to give greater priority to modifying its frontal occupant protection standard, and another letter suggested that OSHA make the promotion of automatic external heart defibrillators a higher priority. Other prompt letters recommended that the agencies better focus certain research or programs.

OIRA sent agencies four prompt letters in September 2001, six by the end of that year, and a total of at least 13 by the end of 2003. Since then, however, the number of prompt letter has diminished substantially. OIRA issued only two prompt letters in 2004, and none were issued in 2005. It is not clear why OIRA's use of prompt letters has declined so sharply. However, it is possible that OIRA may have reverted back to its previous approach of making more private rulemaking and regulatory suggestions to the agencies.

Increased Emphasis (Usually) on Economic Analysis. Although OIRA has always encouraged agencies to provide well-developed economic analyses for their draft rules, OIRA Administrator Graham expressed greater interest in this issue than his predecessors. Also, according to agency officials, there was a perceptible "stepping up the bar" in the amount of support required for their rules, with OIRA reportedly more often looking for regulatory benefits to be quantified and a cost-benefit analysis for every regulatory option that the agency considered, not just the option selected. In September 2003, OIRA published revised guidelines for economic analysis under the executive order and updated "best practices" guidance issued in January 1996.¹⁷⁵ The new guidelines were generally similar to the earlier guidance, but differed in several key areas — e.g., encouraging agencies to: (1) perform both cost-effectiveness and cost-benefit analyses in support of their major rules,¹⁷⁶ (2) use multiple discount rates when the

¹⁷³John Graham, *The 'Smart Regulation' Agenda: Progress and Challenges*, Nov. 7, 2005. Available at [<http://www.aei.brookings.org/admin/authorpdfs/page.php?id=1210>].

¹⁷⁴Copies of these prompt letters are available on OMB's website at [http://www.whitehouse.gov/omb/infoeg/prompt_letter.html].

¹⁷⁵As noted earlier in this report, this guidance (OMB Circular A-4) is available at [<http://www.whitehouse.gov/omb/circulars/a004/a-4.pdf>].

¹⁷⁶Cost-benefit analysis involves the systematic identification of all costs and benefits associated with a forthcoming regulation. Cost-effectiveness analysis seeks to determine how a given goal can be achieved at the least cost. In contrast to cost-benefit analysis, the concern in cost-effectiveness analysis is not with weighing the merits of the goal, but with identifying and analyzing the costs of alternatives to reach that goal (e.g., dollars per life saved).

benefits and costs of rules are expected to occur in different time periods,¹⁷⁷ and (3) use a formal probability analysis of benefits and costs when a rule is expected to have more than a \$1 billion impact on the economy (unless the effects of the rule are clear).

OIRA, however, has also signaled that these analyses are sometimes difficult if not impossible to do for certain types of rules. For example, OIRA Administrator Graham said in November 2005, “Homeland security regulations account for about half of our major-rule costs in 2004 but we do not yet have a feasible way to fully quantify benefits. A moment’s reflection will reveal some of the perplexing issues: How do we identify targets of potential terrorist attacks, the probability of attacks and associated damages, and the effectiveness of various countermeasures in reducing risk?”¹⁷⁸ Administrator Graham reportedly said that cost-benefit analysis may not be appropriate for these homeland security rules, and that a more practical “soft” test was being used for them.¹⁷⁹

Increased (but not Total) Transparency. As noted previously, many of the longstanding concerns about OIRA’s role in the rulemaking process have centered on the perceived lack of transparency of its reviews. Executive Order 12866 attempted to address some of those concerns, requiring (among other things) that agencies disclose after the publication of a rule the changes made to the rule during OIRA’s review and the changes made at the suggestion or recommendation of OIRA. The executive order requires OIRA to maintain a publicly available log disclosing the status of all regulatory actions under review and the names and dates of those involved in substantive oral communications (e.g., meetings, telephone calls) between OIRA staff and parties outside of the executive branch. These requirements notwithstanding, concerns about the lack of transparency continued. For example, even after issuance of the executive order, OIRA disclosed contacts with outside parties only if they occurred during the office’s formal review period, not if they occurred during its informal reviews.

In October 2001, OIRA Administrator Graham published a memorandum to OIRA staff on the office’s website that extended the executive order’s disclosure requirements in several areas. For example, the memorandum said that OIRA would disclose substantive meetings and other contacts with outside parties about a rule under review even if OIRA was only informally reviewing the rule. OIRA also said it would disclose substantive telephone calls with outside parties that were initiated by the administrator, not just calls initiated by outside parties. OIRA has also posted on its website lists of regulations currently under review,¹⁸⁰ reviews concluded in the previous 30 days,¹⁸¹ and its contacts with outside parties.¹⁸²

¹⁷⁷Discounting can have a significant effect on the present value of future health benefits. For example, in a February 2003 speech the OIRA administrator noted that the present value of 1,000 lives saved 50 years in the future is only 34 lives in present value when evaluated at a 7 % discount rate.

¹⁷⁸Graham, *supra* note 173.

¹⁸⁰See [<http://www.whitehouse.gov/omb/library/OMBREGSP.html>].

¹⁸¹See [<http://www.whitehouse.gov/omb/library/OMBREGSC.html>].

¹⁸²A list of OIRA’s meetings with outside parties can be found at
(continued...)

These changes notwithstanding, OIRA's regulatory reviews are still far from transparent. Agencies are still instructed not to disclose changes that OIRA suggests during informal reviews, and the meeting log on OIRA's web site does not clearly delineate the subjects of OIRA's outside meetings or the affiliations of those present at the meetings. Also, as noted previously, OIRA's database showing rules "changed" during its review is not an accurate indication of the rules that were *substantively* changed by OIRA.

Changes in OIRA Staffing. When OIRA was created in FY 1981, the office had a "full-time equivalent" (FTE) ceiling of 90 staff members. By 1997, OIRA's FTE allocation had declined to 47, a nearly 50% reduction. Although Executive Order 12866 (issued in late 1993) permitted OIRA to focus its resources on "significant" rules, this decline in OIRA staffing also occurred during a period in which regulatory agencies' staffing and budgetary levels were increasing and OIRA was given a number of new statutory responsibilities. Specifically, as discussed later in this Report, OIRA was expected to perform various duties under the Unfunded Mandates Reform Act of 1995, the Small Business Regulatory Enforcement Fairness Act of 1996, and the Regulatory Right-to-Know Act of 2001.

Starting in 2001, OIRA's staffing authorization began to increase; by 2002, it stood at 55 FTEs. Between 2001 and 2003, OIRA hired five new staff members in such fields as epidemiology, risk assessment, engineering, and health economics. OIRA indicated that these new hires reflected the increasing importance of science-based regulation in federal agencies, and would enable OIRA to ask penetrating technical questions about agency proposals.

OIRA's Other Responsibilities

In addition to its regulatory review responsibilities under Executive Order 12866 and its multiple responsibilities under the Paperwork Reduction Act (paperwork review, information resources management, statistical policy and coordination, records management, privacy and security, and information technology), Congress has assigned OIRA a number of other specific functions related to the rulemaking and regulatory process. For example:

- The Unfunded Mandates Reform Act of 1995 (2 U.S.C. §§ 1532-1538) generally requires agencies to prepare written statements describing the effects of their rules that are subject to the act's requirements. The Act requires the director of OMB to collect those written statements and provide them to the Congressional Budget Office, to establish pilot programs to test innovative regulatory approaches, and to prepare an annual report on the implementation of the act. The OMB director has delegated these responsibilities to OIRA.¹⁸³
- The Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA) (5 U.S.C. § 601 note) required EPA and OSHA to convene "advocacy review panels" before publishing proposed rules expected to have a significant

¹⁸²(...continued)

[<http://www.whitehouse.gov/omb/oirameetings.html>]. A list of its oral communications can be found at [<http://www.whitehouse.gov/omb/oirameetings.html>].

¹⁸³For a more complete discussion of UMRA, see Keith Bea & Richard S. Beth, *Unfunded Mandates Reform Act Summarized*, CRS Report RS20058.

economic impact on a substantial number of small entities.¹⁸⁴ The Act specifically requires the review panel to include full-time employees from OIRA as well as other agencies.

- SBREFA also contains provisions commonly referred to as the “Congressional Review Act,” which (among other things) requires agencies to delay the effective date of “major” rules, and requires GAO to submit a report on those rules within 15 days of their issuance. SBREFA defines a major rule as one that the OIRA administrator concludes has resulted or is likely to result in (among other things) a \$100 million annual effect on the economy.¹⁸⁵
- Section 515 of the Treasury and General Government Appropriations Act for Fiscal Year 2001 (44 U.S.C. §§ 3504 (d)(1) & 3516), generally known as the “Data Quality Act” or the “Information Quality Act,” directed OMB to take several actions (all of which were delegated to OIRA). Specifically, the Act required OMB to issue governmentwide guidelines that “provide policy and procedural guidance to Federal agencies for ensuring and maximizing the quality, objectivity, utility, and integrity of information (including statistical information) disseminated by Federal agencies.” OMB published those guidelines in final form on February 22, 2002.¹⁸⁶ The act also required agencies to develop their own guidelines (which were reviewed by OMB), and to report to OMB on the number and nature of complaints received and how such complaints were handled by the agency.
- Section 624 of the Treasury and General Government Appropriations Act, 2001, (31 U.S.C. § 1105 note), sometimes known as the “Regulatory Right-to-Know Act,” requires OMB to prepare and submit with the budget an annual “accounting statement and associated report” containing an estimate of the costs and benefits (including quantifiable and nonquantifiable effects) of federal rules and paperwork, to the extent feasible, (1) in the aggregate, (2) by agency and agency program, and (3) by major rule. The accounting statement is also required to contain an analysis of impacts of federal regulation on state, local, and tribal governments, small businesses, wages, and economic growth. Similar one-year requirements were in previous appropriations acts.
- The same legislation requires OMB to include “recommendations for reform” in its cost-benefit reports. Rather than rely on its own expertise, OIRA decided to solicit suggestions from the public. For example, in March 2002, OIRA asked the public for recommendations to eliminate or modify existing rules as well as to expand or extend existing programs. In response, OIRA received more than 300 suggestions, which OIRA turned over to the appropriate agencies for

¹⁸⁴This requirement is codified at 5 U.S.C. § 609 (2000).

¹⁸⁵For a more complete discussion of the Congressional Review Act, see Morton Rosenberg, *Congressional Review of Agency Rulemaking: An Assessment After Nullification of OSHA’s Ergonomics Standard*, CRS Report RL30116.

¹⁸⁶Office of Management and Budget, *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies; Notice; Republication*, 67 Fed. Reg. 8451 (Feb. 22, 2002).

prioritization. In February 2004, OIRA asked the public for suggested reforms of rules affecting the manufacturing sector. OIRA said it was focusing on manufacturing because of the relatively large impact that regulations have on that sector.¹⁸⁷

- The Small Business Paperwork Relief Act of 2002 (Public Law 107-198) requires OMB to annually publish, in the Federal Register and on the Internet, a list of compliance assistance resources available to small businesses. The Act also requires OMB to convene and chair a task force to study the feasibility of streamlining paperwork requirements on small businesses. The task force was required to file an initial report by the end of June 2003, and is required to file a second report by the end of June 2004.
- The E-Government Act of 2002 (Public Law 107-347) requires the OIRA administrator to work with the administrator of the Office of Electronic Government to establish the strategic direction of the governmentwide e-government program and to oversee its implementation. OIRA has been particularly active in the Administration's e-rulemaking initiative.
- In the Treasury and General Government Appropriations Act, 2002 (Public Law 107-67), Congress stated that about \$6.3 million of OMB's \$70.7 million appropriation was for OIRA, but stipulated that nearly \$1.6 million of that amount should not be obligated until OMB "submits a report to the Committees on Appropriations that provides an assessment of the total costs and benefits of implementing Executive Order No. 13166."¹⁸⁸
- The conference report for OMB's appropriation for fiscal year 2004 (to accompany H.R. 2673) directed OIRA to submit a report to the House and Senate Committees on Appropriations by June 1, 2004, on "whether agencies have been properly responsive to public requests for correction of information pursuant to the (Data Quality Act)."¹⁸⁹

Congress also sometimes limits OIRA's actions through riders on OMB's appropriation. For example, since 1983, language has been included in OMB's appropriation stating that none of the funds appropriated to OMB could be used for the purpose of reviewing any agricultural

¹⁸⁷A similar requirement for "recommendations for reform" was included in section 628(a)(3) of the FY2000 Treasury and General Government Appropriations Act. OIRA received 71 suggestions from the public in response to its call for "suggestions on specific regulations that could be rescinded or changed that would increase net benefits to the public," most of which came from the Mercatus Center at George Mason University. OIRA reviewed these suggestions and identified 23 as a "high priority" for review. Eight of the 23 high priority recommendations involved EPA rules, and five involved rules from the Department of Labor. Although business groups generally applauded this effort, environmentalists and public interest groups characterized it as the development of a "hit list" of rules that the Bush Administration wanted to eliminate.

¹⁸⁸Exec. Order 13,166, *Improving Access to Services for Persons With Limited English Proficiency*, 65 Fed. Reg. 50,12 (Aug. 16, 2000)

¹⁸⁹OIRA submitted this report in April 2004. For a copy of the report, see [http://www.whitehouse.gov/omb/inforeg/fy03_info_quality_rpt.pdf].

marketing orders issued by the Department of Agriculture. Marketing orders, which cover dozens of commodities from lemons to milk, basically keep prices up by regulating supplies, and had been targeted for elimination or amendment by President Reagan's task force on regulatory relief in the early 1980s. In response, Members of Congress have inserted this restriction in each subsequent appropriation bill, asserting that the Department of Agriculture, not OMB, has statutory authority in this area.

OIRA's Actions to Expand Its Role. Although OIRA's workload has clearly increased as a consequence of a series of Congressional requirements, OIRA has also voluntarily taken on additional responsibilities, often basing its actions on the office's interpretation of previous statutory or executive order authority or requirements.

Reform Recommendations. For example, in addition to requiring an annual "accounting statement" of the costs and benefits of regulations, the above-mentioned "Regulatory Right-to-Know Act" (section 624 of the Treasury and General Government Appropriations Act, 2001) also requires OMB to include "recommendations for reform" in its cost-benefit reports.¹⁹⁰ Citing this requirement, in May 2001, OIRA asked for suggestions on specific regulations that could be "rescinded or changed that would increase net benefits to the public." In response, OIRA received 71 suggestions, which it placed into high, medium, and low priority categories.¹⁹¹ In March 2002, OIRA asked the public for recommendations to eliminate or modify existing rules as well as to expand or extend existing programs. In response, OIRA received more than 300 suggestions, which OIRA turned over to the appropriate agencies for prioritization. In February 2004, OIRA asked the public for suggested reforms of rules affecting the manufacturing sector. OIRA said it was focusing on manufacturing because of the relatively large impact that regulations have on that sector. In March 2005, OIRA reported that it received 189 reform nominations, of which federal agencies and OMB determined that 76 had "potential merit and justify further action."¹⁹²

Peer Review Bulletin. In September 2003, OIRA published a proposed bulletin in the Federal Register on "Peer Review and Information Quality" that would have, if made final, provided a standardized process by which all significant regulatory information would be peer reviewed. Issued under the authority of the Information Quality Act, the PRA, and Executive Order 12866, the bulletin would have required agencies to: (1) have all "significant regulatory information" that the agencies intend to disseminate peer reviewed, (2) have "especially significant regulatory information" peer reviewed according to even higher standards, and (3) provide OIRA at least once each year with information about upcoming significant regulatory disseminations and the agencies' plans for conducting peer reviews. The proposed bulletin aroused significant controversy, with some observers expressing concern that it could create a centralized peer review system within OMB that would be vulnerable to political manipulation

¹⁹⁰A similar one-year requirement for "recommendations for reform" was included in section 628(a)(3) of the Fiscal Year 2000 Treasury and General Government Appropriations Act. Although business groups generally applauded this "look back" effort, environmentalists and public interest groups characterized it as the development of a "hit list" of rules that the Bush Administration wanted to eliminate.

¹⁹¹Eight of the 23 suggestions that OIRA designated a "high priority" involved EPA rules, and five involved rules from the Department of Labor.

¹⁹²For a copy of OIRA's report on "Regulatory Reform of the Manufacturing Sector," see [http://www.whitehouse.gov/omb/inforeg/reports/manufacturing_initiative.pdf].

or control by regulated entities. In April 2004, OIRA published a revised version of the proposed bulletin in response to nearly 200 comments received from the public.¹⁹³ The revised bulletin was broader in scope than the proposed bulletin in that it applied to “influential scientific information” (not just regulatory information) and “highly influential scientific assessments.” Agencies, however, were given substantial discretion to decide whether information was “influential” and therefore required a peer review, and the bulletin provided exemptions for certain classes of information (e.g., routine statistical information and products by government-funded scientists that are not represented as the views of the agency). In January 2005, OIRA published a final version of the bulletin in the Federal Register that was similar in many respects to the revised version.¹⁹⁴ OMB still retained significant authority in certain areas (e.g., when information is “highly influential”), so it is unclear how much discretion agencies will be given to decide when and what kind of peer review is required.

Guidance Practice Bulletin. In November 2005, OMB published a “Proposed Bulletin for Good Guidance Practices.”¹⁹⁵ Noting that agencies have increasingly relied on guidance documents to inform the public about regulatory requirements and to provide direction to their staffs, OMB said it was concerned that these documents “may not receive the benefit of careful consideration accorded under the procedures for regulatory development and review.” OMB did not cite any specific statutes or executive orders as authorizing the issuance of the bulletin, but it did indicate that it was “responsible both for promoting good management practices and for overseeing and coordinating the Administration’s regulatory policy.” In essence, the proposed bulletin would require agencies (not including independent regulatory agencies) to develop written procedures for the approval of “significant” guidance documents (defined in essentially the same way as “significant” rules in Executive Order 12866), to maintain a list of those documents on its web site, and to allow electronic comments on those documents. For “economically significant” guidance documents (e.g., those expected to have a \$100 million impact on the economy), agencies would be required to publish a notice in the Federal Register announcing that the draft guidance document is available, invite public comments, and respond to those comments.¹⁹⁶ Although the proposed bulletin does not specifically provide a role for OIRA in the approval process, some have expressed concerns that the bulletin could allow greater opportunities for the office and industry to influence agency decisionmaking.¹⁹⁷ As was the case with the peer review bulletin, OIRA is expected to retain significant discretion to decide which documents are subject to the bulletin’s requirements.

¹⁹³For a copy of this revised peer review bulletin, see [http://www.whitehouse.gov/omb/infoereg/peer_review041404.pdf].

¹⁹⁴Office of Management and Budget, *Final Information Quality Bulletin for Peer Review*, 70 Fed. Reg. 2664 (Jan. 14, 2005). OMB published the final bulletin on its web site on December 15, 2004. Certain provisions took effect in June 2005, but others did not take effect until December 2005.

¹⁹⁵OMB published the proposed bulletin on its web site on November 23, 2005, available at [http://www.whitehouse.gov/omb/infoereg/good_guid/good_guidance_preamble.pdf]. On November 30, 2005, OMB published a notice and request for comments on the proposed bulletin (but not the bulletin itself) in the Federal Register. 70 Fed. Reg. 71,866 (Nov. 30, 2005).

¹⁹⁶Because guidance is, by definition, nonbinding, it is not clear how it could have a \$100 million impact on the economy, and, therefore, qualify as “economically significant.”

¹⁹⁷See, e.g., Cindy Skrzycki, *Finding a Way to Better Guidance*, Wash. Post, Dec. 20, 2005, at D1.

Risk Assessment Bulletin. The most recent manifestation of OIRA's expanding (at least potential) influence was its publication of a proposed bulletin on agency risk assessment practices.¹⁹⁸ Released for public comment and peer review by the National Academy of Sciences on January 9, 2006, the stated purpose of the bulletin is "to enhance the technical quality and objectivity of risk assessments prepared by federal agencies by establishing uniform, minimum standards." The legal authority cited for the bulletin included the Information Quality Act, the Regulatory Right-to-Know Act, and "OMB's general authorities to oversee the quality of agency analyses, information and regulatory actions."¹⁹⁹ Public comments were requested on the proposed bulletin by June 2006, with the bulletin going into effect 12 months after its publication in final form. Risk assessments are used in a variety of ways in the federal government, and are particularly important in developing regulations involving health, safety, or the environment. The OIRA bulletin described a series of general risk assessment and reporting standards (e.g., "summarize the scope of the assessment" and "be scientifically objective"), with one set of standards specifically for risk assessments used in regulatory analyses. It also laid out a set of "special standards for influential risk assessments" (i.e., those expected to have a "clear and substantial impact on important public policies or private sector decisions"). The scope of the bulletin is quite broad, covering all agencies covered by the PRA (i.e., including independent regulatory agencies) and defining risk assessment in sweeping terms.²⁰⁰ The bulletin requires agencies to certify that each covered risk assessment has complied with its requirements, but allows agency heads to defer or waive some or all of its requirements. OIRA and the White House Office of Science and Technology Policy were made responsible for overseeing the bulletin's implementation.

¹⁹⁸This proposed risk assessment bulletin is available at [http://www.whitehouse.gov/omb/inforeg/proposed_risk_assessment_bulletin_010906.pdf].

¹⁹⁹Specifically, OIRA noted that section 515(a) of the IQA requires OMB to "provide policy and procedural guidance to Federal agencies for ensuring and maximizing the quality, objectivity, utility and integrity of information" disseminated by federal agencies. Also, OIRA said the Regulatory Right-to-Know Act directs OMB to "issue guidelines to agencies to standardize . . . measures of costs and benefits." One could argue that OIRA had already satisfied these requirements through the issuance of its February 2002 IQA guidelines and OMB Circular A-4.

²⁰⁰Risk assessment is defined as "a scientific and/or technical document that assembles and synthesizes scientific information to determine whether a potential hazard exists and/or the extent of possible risk to human health, safety, or the environment."

OIRA and the Future of Presidential Regulatory Review

For more than 25 years, OIRA has played a central role in the federal rulemaking process. Although some argued early in OIRA's history that the office's regulatory review role was unconstitutional, few observers continue to hold that view. No court has directly addressed the constitutionality of the OIRA regulatory review process, but in 1981 (the year that OIRA was created) the D.C. Circuit said the following:

The court recognizes the basic need of the President and his White House staff to monitor the consistency of agency regulations with Administration policy. He and his advisors surely must be briefed fully and frequently about rules in the making, and their contributions to policymaking considered. The executive power under our Constitution, after all, is not shared — it rests exclusively with the President.²⁰¹

OIRA is located within the Executive Office of the President and is the President's direct representative in the governmentwide rulemaking process. As Executive Order 12866 states, OIRA is the "repository of expertise on regulatory issues" within the Executive Branch, and is uniquely positioned both within OMB (with its budgetary influence) and within the federal rulemaking process (reviewing and commenting on rules just before they are published in the Federal Register) to enable it to exert maximum influence. As discussed above, OIRA has been given significant responsibilities by Congress, but perhaps its most significant role — regulatory review — has been assigned by the President. Further, OIRA has assigned itself a number of additional roles in recent years, including issuing standards for agencies to follow with regard to peer review, risk assessment, and guidance documents. Lisa Heinzerling has argued that OIRA's actions have also led to alterations in agencies' interpretations of regulatory statutes.²⁰² As a consequence, she says "OIRA's increasingly aggressive role in controlling agency action is so far the biggest administrative law story of the new century."²⁰³

Variations in how OIRA operates — as a gatekeeper or a counselor — are largely a function of the wishes of the President that the office serves. For example, in a June 2001 article in *Harvard Law Review*, Elena Kagan posited that, while it is generally acknowledged that President Reagan used OIRA's review function as a tool to control the policy and political agenda in an anti-regulatory manner, President Clinton did much the same thing to accomplish pro-regulatory objectives.²⁰⁴ She said he did so by exercising directive authority and asserting personal ownership over a range of agency actions, thereby making them "Presidential" in nature. She also characterized this emergence of enhanced methods of Presidential control over the regulatory state — what she termed the "presidentialization of administration" — as "the most important development in the last two decades in administrative process." Similarly, William F. West concluded that OIRA's regulatory review process "has promoted executive interests across administrations precisely because the process has internalized incumbents'

²⁰¹Sierra Club v. Costle, 657 F.2d 298 (D.C. Cir. 1981).

political preferences.”²⁰⁵ Therefore, instead of the “neutral competence” that some assert that bureaucracy can best provide Presidents, West characterizes OIRA’s performance as “responsive competence.”

As Sally Katzen, OIRA administrator during the Clinton Administration, told GAO, because OIRA is part of the Executive Office of the President, and the President is the office’s chief client, a change in the presidency has a profound effect on how OIRA operates.²⁰⁶ She also said each new administrator of OIRA — and ultimately each new administration — represents a reaction to the previous Administrator and administration. Just as the Clinton administration’s OIRA was a reaction to the administrations that preceded it, she said the current Bush administration’s OIRA is a reaction to the Clinton period. Similarly, in March 2002, then-OIRA Administrator Graham said “Presidents use the powers of OMB regarding agency action to advance Administration priorities and policy objectives We should remember that OMB is an office within the Executive Office of the President and its actions necessarily reflect Presidential priorities.”²⁰⁷

Other observers, however, view OIRA (like other executive branch agencies) as having more of a shared allegiance between the President and the Congress. They point out that OIRA was created by Congress, and has been given a number of statutory responsibilities through the PRA and other laws. Nevertheless, even supporters of a strong legislative perspective recognize that OIRA is part of the Executive Office of the President, and that Congress gave OIRA its responsibilities because of its strategic position within that office.²⁰⁸ With both statutory and executive order responsibilities, OIRA embodies a broader tension between Congress and the President for control of administrative agencies.

Stuart Shapiro has viewed OIRA in another way, however, describing the relationship and potential conflict between two of the office’s roles: reviewing the analytical bases for agencies’ rules and furthering the President’s agenda.²⁰⁹ Shapiro notes that the two goals are in harmony when both the results of agency cost-benefit analyses and the President’s position are the same (i.e., either both supporting the issuance of the subject regulation or opposing it). He also points out, however, that the two goals can be at odds, and notes that regulations (e.g., some related to homeland security) can prevail even if their costs are high and the benefits are ill-defined if supported by the White House. Similarly, Susan Dudley (nominated to be OIRA administrator on July 31, 2006) and Angela Antonelli noted that “OIRA is supposed to simultaneously provide independent and objective analysis, and report to the president on the progress of executive policies and programs. When those functions conflict, the Presidential

²⁰⁸For example, David H. Rosenbloom, in *Building a Legislative-Centered Public Administration* (Tuscaloosa, AL: The University of Alabama Press, 2001) states that “where coordinated government-wide clearance is required to achieve Congress’ policy objectives, there may be few or no alternatives (to paperwork and regulatory review within OMB).”

²⁰⁹Stuart Shapiro, *Politics and Regulatory Policy Analysis*, Regulation, Summer 2006, at 40-45.

agenda will most certainly prevail over independent and objective analysis.”²¹⁰

Although major differences of opinion exist among observers of the federal rulemaking process regarding the appropriateness of OIRA’s regulatory review role, the broad reach and influence of the office’s is undebatable. Rulemaking agencies formally challenge OIRA’s returns and “suggestions” for change only rarely, and sometimes refrain from even submitting draft rules for review if they believe they will be opposed by OIRA. Regulated entities also recognize OIRA’s influence, and seem to view the office as a “court of second resort” if they are unable to influence regulatory agencies to their position directly.

Possible Legislative Issues

Congress also recognizes the importance that OIRA plays in the rulemaking process, and usually holds several hearings each year examining OIRA’s implementation of its responsibilities pursuant to various statutes and executive orders. Proposals for changes to OIRA’s authority and responsibilities have focused on such issues as: (1) providing a statutory underpinning for regulatory reviews, (2) increasing or decreasing the office’s funding and staffing, (3) including independent agencies’ rules under the office’s regulatory review function, and (4) improving the transparency of OIRA’s regulatory review processes.

Statutory Authority for Regulatory Review. As noted previously, Congress has enacted legislation expanding OIRA’s statutory responsibilities, and has considered (but not enacted) legislation that would provide a statutory basis for OIRA’s regulatory review function. For example, in the 106th Congress, section 632 of S. 746 (the “Regulatory Improvement Act of 1999”) would have required the President (via OMB and OIRA) to “establish a process for the review and coordination of Federal agency regulatory actions.” The proposed legislation also would have placed in statute many of the transparency requirements in Executive Order 12866. The legislation, however, was not enacted.

At a CRS symposium on “Presidential, Congressional, and Judicial Review of Rulemaking,” held on September 11, 2006, Bill Kovacs from the United States Chamber of Commerce suggested that Executive Order 12866 be put into statute. Other panelists, however, voiced both practical and constitutional concerns about doing so. For example, Neil Eisner, Assistant General Counsel at the Department of Transportation, said the following:

I don’t think it would be a good idea to put it in statute. I think it’s an executive order that will need changes over the years, if for nothing else than to take the vice president out of the process and put the White House chief of staff into the process because of a particular administration. It’s too difficult to amend going through statute. As someone mentioned this morning, you don’t know what else might get added to it when you’re trying to make a simple little fix like that.

Sally Katzen, former OIRA administrator during the Clinton Administration agreed, noting that both the Clinton and Bush administrations have opposed codifying the order. Separately, a member of the audience expressed concerns about the constitutionality of Congress telling the president how the president had to supervise his Cabinet and sub-Cabinet appointees. There are many, many good reasons why codifying the executive order is a bad idea, but one issue that

²¹⁰Susan E. Dudley & Angela Antonelli, *Congress and the Clinton OMB: Unwilling Partners in Regulatory Oversight?*, Regulation, Fall 1997, at 17-23.

hasn't been mentioned, I think, is the serious separation of powers problem that will come from that.”

Mort Rosenberg of CRS asked, instead of simply taking the text of the order and putting into statute, whether it might not be a better idea “if you authorized the president to issue an executive order regarding the review of regulations, and put in there a bottom line, let's say, of transparency that's better than what's here now – put that in the law and give the president general authority that he has assumed for the last 26 years.” David Vladeck from Georgetown University said “that may be a better stratagem from Congress' standpoint and one way around some of the obvious separation of powers problems that would come from simply trying to enact the executive order into law.”

Increased Funding and Staffing. OIRA does not have a specific line item in the budget, so its funding is part of OMB's appropriation. Similarly, OIRA's staffing levels are allocated from OMB's totals. Although OIRA staffing has increased in recent years, as of May 2004, OIRA has fewer staff than it had when its regulatory review function was first established in 1981. Currently, about 30 OIRA desk officers and branch chiefs review about 3,000 agency information collection requests each year and about 700 significant rules each year. At various times in its history, certain Members of Congress have attempted to reduce funding for OIRA in order to signal Congressional displeasure with the office's actions.²¹¹ Other observers, however, believe that OIRA's funding should be increased, not reduced, arguing that a relatively small amount of additional resources for OIRA could yield substantial benefits.²¹²

At other times, proposed legislation has been introduced designating how OIRA staff should be used. For example, in the 108th Congress, a provision in H.R. 2432 as originally introduced would have required the OMB Director to “assign, at a minimum, the equivalent of at least 2 full time staffers to review the Federal information collection burden on the public imposed by the Internal Revenue Service.” The Internal Revenue Service accounts for more than 80% of the estimated paperwork burden, but OIRA indicated that it devoted less than one FTE to reviewing the agency's paperwork requests (because much of the burden is mandated by statute). The Bush Administration objected to this specific direction of OIRA staff, so the sponsors of the bill agreed to delete this requirement before it was approved by the House of Representatives in May 2004.

Coverage of Independent Agencies' Rules. Although several of the statutes that OIRA helps to administer include rules issued by independent regulatory agencies (e.g., the PRA, the Regulatory Flexibility Act, the Congressional Review Act, and the Data Quality Act), the executive orders that have established regulatory review within OIRA have explicitly

²¹¹For example, as noted previously, in OMB's appropriation for 2002, Congress stipulated that nearly \$1.6 million should not be obligated until OMB submitted a report assessing the total costs and benefits of implementing Executive Order 13166. Also, in the conference report for OMB's fiscal year 2004 appropriation (under the heading “Office of Information and Regulatory Affairs”), the conferees directed that \$1 million “be withheld from obligation until resolution of existing programmatic concerns by House conferees are addressed and the House and Senate Committee on Appropriations approve of such obligations.”

²¹²See, e.g., Robert W. Hahn & Robert E. Litan, *Why Congress Should Increase Funding for OMB Review of Regulations*, AEI-Brookings Joint Center for Regulatory Studies, Policy Matter 03-33 (Oct. 2003).

excluded rules issued by those agencies.²¹³ Some observers have suggested that this limitation be lifted, arguing that independent regulatory agencies issue regulations that have a significant impact on the economy (about \$230 billion per year according to OIRA), but their rules often contain little quantitative information on regulatory costs and benefits.²¹⁴ Those opposed to this expansion in OIRA's duties point out that independent regulatory agencies were established to be relatively independent of the President, and inclusion of their rules under OIRA's would be counter to this purpose. In response, proponents argue that independent regulatory agencies' rules are already reviewed for purposes such as paperwork clearance and ensuring that data quality requirements are met, so examining the substance of the rules is just an extension of those reviews.

At the CRS symposium on September 11, 2006, Sally Katzen, former OIRA administrator during the Clinton Administration, noted that both the Reagan and Clinton administrations contemplated expanding Presidential review to independent agencies:

When Boyden Gray was drafting 12291 for President Reagan, the same issue was raised. And as I said, the Department of Justice opined that the president had constitutional authority to extend to independent regulatory commissions. They chose not to do it. We reconsidered the question and chose not to do it. I think there is an aspect of an independent regulatory commission that says it should somehow be kept a little distant from the validly political actors. And this was not in that direction, and I think it's a sound one. It's not one based on the law. I think we had the authority; I think it's purely a question of desirability.

Transparency Improvements. One consistent area of concern to some observers has been the lack of transparency of the OIRA review process to the public. Notwithstanding recent improvements, they argue that it is difficult for the public to know with any degree of certainty what changes OIRA has suggested to agencies' draft rules, what contacts OIRA has made with regulated entities and other outside parties regarding those rules, or whether documents were exchanged between OIRA and the agencies. In its September 2003 report, GAO said that the documentation that agencies are required to provide showing the changes made at OIRA's suggestion or recommendation were not always available and, when done, were not always clear or consistent.²¹⁵ GAO also said that the transparency requirements incumbent on OIRA were not always clear, and recommended several improvements. For example:

- Although OIRA indicated that it can have its greatest impact on agencies' rules during *informal* reviews before review packages are formally submitted, OIRA indicated that agencies only had to disclose the changes made at OIRA's suggestion during *formal* review (some of which were as short as one day). GAO recommended that OIRA define this requirement in the executive order to include informal reviews, just as it did with regard to the requirements involving

²¹³For purposes of regulatory review, both Executive Order 12291 and Executive Order 12866 defined a covered "agency" as excluding those agencies specified in 44 U.S.C. § 3502(10) (2000).

²¹⁴*See, e.g.,* Center for Regulatory Effectiveness, *A Blueprint for OMB Review of Independent Agency Regulations* (Mar. 2002). The previously mentioned bill (S. 746) that proposed to establish in law Presidential review of rules would have included rules issued by independent regulatory agencies.

²¹⁵U.S. General Accounting Office, *Rulemaking*, GAO-03-929, at 110-16.

the office's communications with outside parties.

- As noted previously, the “consistent with change” code in OIRA’s database does not differentiate between OIRA- or agency-initiated changes, or changes that were major or minor in nature. GAO recommended that the database be changed to more clearly indicate which rules were substantively changed at OIRA’s suggestion.
- GAO also recommended refinements to the executive order’s requirements applicable to OIRA (e.g., more clearly indicating on its website the regulatory actions being discussed at meetings with outside parties and the affiliations of the participants) and the requirements applicable to the agencies (e.g., defining the types of “substantive” changes that agencies should disclose).

In commenting on GAO’s report, the administrator of OIRA said that the office planned to review its implementation of the executive order’s transparency requirements and would work to improve the clarity of its meeting log. The administrator did not, however, believe that changes made during informal OIRA reviews should be disclosed — even though he said that OIRA can have its greatest influence during informal reviews. Disclosure of these informal review changes could be required through an administrative directive issued by the OIRA administrator or, alternatively, through legislation.

Areas for Additional Research

In addition to, or possibly as a supplement to, these areas of possible legislative action, a number of issues regarding Presidential review of rulemaking bear further examination by ACUS or some other body. They include the following:

- Should Congress codify Presidential review of agency rulemaking? If so, how detailed should that codification be? For example, should it simply authorize the President to issue an executive order on this issue (thereby giving future Presidents the flexibility to change its provisions), with certain other requirements for transparency and limits on delay? Or should the codification spell out in detail the process by which Presidents should review rules before they are published? What are the policy implications of codification?
- Should independent regulatory agencies’ rules be subject to Presidential review (as they are now under the Paperwork Reduction Act)? Or would Presidential review adversely affect the independence intended for these agencies?
- What general type of role should OMB play in the Presidential rule review process? Should OMB be a “counselor” to the agencies (as during the Clinton Administration), suggesting improvements to the agencies but generally deferring to agencies’ statutory expertise? Or should it be more of a “gatekeeper” (as during the current Bush Administration) establishing strict standards and ensuring that regulations meet certain standards before publication?
- What rules should govern OMB’s contacts with outside parties during the Presidential review process? For example, should OMB be allowed to meet with

regulated entities outside of the period when agencies are not permitted to do so? Should OMB be required to disclose to the public not only that such a meeting occurred, but also a summary of what was said (as some agencies are required to do) to provide an administrative record for any subsequent changes?

- How transparent should the Presidential rule review process be to the public? Are improvements in review transparency currently needed (either administratively or by statute)? Specifically: (1) Should OMB clearly define what types of “substantive” changes to rules need to be disclosed?; (2) Should agencies or OMB be required to disclose substantive changes made to rules during “informal” reviews (when OMB says it can have its greatest effect)?; (3) Should OMB clearly indicate in its database which rules were changed at its suggestion?
- A number of actions by OMB during the Bush Administration have had the effect of centralizing rulemaking authority in the Executive Office of the President. For example, OMB has revitalized the regulatory review function under Executive Order 12866 (emphasizing cost-benefit analysis, returning rules to the agencies); and issued governmentwide guidelines on data quality and peer review (with OMB able to determine when agencies’ rules should be peer reviewed and at what level). Have these actions taken too much authority away from the agencies in whom Congress vested rulemaking authority, thereby upsetting the balance of power between Congress and the President in this area?
- Some critics have asserted that OIRA reviews, particularly for health, safety, and environmental rules, is a “one-way ratchet” in that the effects of the reviews are almost always designed to weaken, not strengthen the rules. To what extent is that true? Of the health, safety, and environmental rules that OIRA affects each year, how many are made more protective and how many are made less protective?
- How has the OIRA “prompt letter” process worked? How many new regulations or improvements to existing rules can be traced to these letters?
- Does OIRA have the legal authority to promulgate requirements or even guidelines regarding agencies’ use of peer reviews, risk assessments, or guidance documents?
- Is Presidential review of rules cost beneficial? Is there any way to objectively measure the benefits that OIRA review provides?
- Should OIRA’s funding and staffing be increased, decreased, or stay the same? If increased, is there evidence that doing so would yield substantial returns on investment?
- Should a new President be authorized to stay the effectiveness of “midnight rules” that are promulgated shortly before a new administration takes office? If so, should there be limits on the amount of time rules can be delayed?

III. Congressional Review of Rules

The constitutional dimension of the Administrative Law Project is most prominently evident in its review of the major Congressional effort to establish an effective mechanism to oversee the agency rulemaking, the passage in 1996 of the Congressional Review Act (CRA).²¹⁶ The House and Senate sponsors of the legislation make clear the important, fundamental institutional concerns that were addressed by the Act:

As the number and complexity of federal statutory programs has increased over the last fifty years, Congress has come to depend more and more upon Executive Branch agencies to fill out the details of the programs it enacts. As complex as some statutory schemes passed by Congress are, the implementing regulations are often more complex by several orders of magnitude. As more and more of Congress' legislative functions have been delegated to federal regulatory agencies, many have complained that Congress has effectively abdicated its constitutional role as the national legislature in allowing federal agencies so much latitude in implementing and interpreting congressional enactments.

In many cases, this criticism is well founded. Our constitutional scheme creates a delicate balance between the appropriate roles of the Congress in enacting laws, and the Executive Branch in implementing those laws. This legislation will help to redress the balance, reclaiming for Congress some of its policymaking authority, without at the same time requiring Congress to become a super regulatory agency.

The objective of the Act was to set in place a process that would keep Congress informed about the rulemaking activities of federal agencies and allow for expeditious Congressional review, and possible nullification, of particular rules. This was to be accomplished by requiring that all rules, and not only rules subject to the APA notice and comment requirements but guidance, policy statements, handbooks and the like, would have to be reported to Congress and be subject to legislative disapproval. An unreported rule could not be enforced. Expedited consideration procedures were provided for the Senate (but not the House). A disapproved rule, if not vetoed by the President, deprived the agency of authority to promulgate rules in the same area unless authorized to do so by Congress. Judicial review of certain actions taken under the Act were not to be subject to judicial review.

It was the apparent vision of the sponsors of the CRA that the effective utilization of the new reporting and review mechanism would draw the attention of the rulemaking agencies and that its presence would become an important factor in the rule development process. Congress was well aware at the time of enactment of the success achieved by President Reagan's executive orders centralizing review of agency rulemaking, from initial development to final promulgation, within OIRA, in the face of aggressive challenges of Congressional committees. The Clinton Administration, with a somewhat modified executive order, but with an aggressive posture of intervention into and direction of rulemaking proceedings, continued a program of central

²¹⁶ Pub. L. No. 104-121, 110 Stat. 857-874 (2000) (codified at 5 U.S.C. §§801-808).

control of administration.²¹⁷ The expectation was that Congress, through the CRA, would again become an effective player with the White House in influencing agency decisionmaking.

The ineffectiveness of the CRA review mechanism, however, soon became readily apparent to observers. Most prominently, the lack of a screening mechanism to identify rules that warranted review and an expedited consideration process in the House that complemented the Senate's procedures, and numerous interpretative uncertainties of key statutory provisions, served to deter use of this mechanism. By 2001, one commentator observed that if the perception of a rulemaking agency is that the possibility of Congressional review is remote, "it will discount the likelihood of Congressional intervention because of the uncertainty about where Congress might stand on that rule when it is promulgated years down the road," an attitude that is reinforced "so long as [the agency] believes that the president will support its rules."²¹⁸

The numbers accumulated since the Act's passage in 1996 are telling. Over 43,000 rules were reported to Congress over that period, including more than 630 major rules, and only one, the Labor Department's ergonomics standard, was disapproved in March 2001. Only 37 disapproval resolutions, directed at 28 rules, have been introduced during that period, and only three, including the ergonomics rule, passed the Senate. Many analysts believe the negation of the ergonomics rule was a singular event not likely to soon be repeated. Furthermore not nearly all the rules defined by the statute as covered are reported for review. The GAO has estimated that over 2,000 covered rules have not been submitted for review. Federal appellate courts in that period have negated all or parts of 60 rules, a number, while significant in some respects, is comparatively small in relation to the number of rules issued in that period.

Compounding such a perception that Congress would not likely intervene in rulemaking, particularly after 2001, has been the emergence of what has been called by one scholar as the "New Presidentialism,"²¹⁹ that has become a profound influence in administrative and structural constitutional law. It is a combination of constitutional and pragmatic argumentation that holds that most of the government's regulatory enterprise represents the exercise of "executive power" which, under Article II, can legitimately take place only under the control and direction of the President; and the claim that the President is uniquely situated to bring to the expansive sprawl of regulatory programs the necessary qualities of "coordination, technocratic efficiency, managerial rationality, and democratic legitimacy" (because he alone is elected by the entire nation). One of the consequences of this Presidentially-centered theory of governance, it is contended, is that it diminishes the other important actors in our collaborative constitutional enterprise. Were it maintained that the Congress is constitutionally and structurally unfit for running democratic responsiveness, public-regardness, managerial efficiency and technocratic

rationality, this scholar's suggested response is: why bother talking with Congress about what is the best way to improve the practice of regulatory government?

In a widely cited 2001 article,²²⁰ the current dean of the Harvard Law School, posits the foregoing notions and suggests that when Congress delegates administrative and lawmaking power specifically to department and agency heads, it is at the same time making a delegation of those authorities to the President, unless the legislative delegation specifically states otherwise. From this flows, she asserts, the President's constitutional prerogative to supervise, direct and control the discretionary actions of all agency officials. The author states that "a Republican Congress proved feckless in rebuffing Clinton's novel use of directive power - just as an earlier Democratic Congress, no less rhetorically inclined, had proved incapable of thwarting Reagan's use of a newly strengthened regulatory review process."²²¹ She explains that "the reasons for this failure are rooted in the nature of Congress and the lawmaking process. The partisan and constituency interests of individual members of Congress usually prevent them from acting collectively to preserve congressional power - or, what is the same thing, to deny authority to other branches of government."²²² She goes on to effectively deride the ability of Congress to restrain a President intent on controlling the administration of the laws:

Presidential control of administration in no way precludes Congress from conducting independent oversight activity. With or without significant presidential role, Congress can hold the same hearings, engage in the same harassment, and threaten the same sanctions in order to influence administrative action. Congress, of course, always faces disincentives and constraints in its oversight capacity as this Article earlier has noted. Because Congress rarely is held accountable for agency decisions, its interest is in overseeing much administrative action is uncertain; and because Congress's most potent tools of oversight require collective action (and presidential agreement), its capacity to control agency discretion is restricted. But viewed from the simplest perspective, presidential control and legislative control of administration do not present an either/or choice. Presidential involvement instead superimposes an added level of political control onto a congressional oversight system that, taken on its own and for the reasons just given, has notable holes.²²³

Dean Kagan's observations and theories appear to have been almost a blueprint for the Presidential actions and posture toward Congress of the current Administration.²²⁴

The CRA reflects a recognition of the need to enhance the political accountability of Congress and the perception of legitimacy and competence of the administrative rulemaking process. It also rests on the understanding that broad delegations of rulemaking authority to agencies are necessary and appropriate, and will continue for the indefinite future. The Supreme

Court's most recent rejection of an attempted revival of the nondelegation doctrine²²⁵ adds impetus for Congress to consider several facets and ambiguities of the current mechanism. Absent review, current trends of avoidance of notice and comment rulemaking, lack of full reporting of covered rules under the CRA, uncertain judicial review, and increasing Presidential control over the rulemaking process will likely continue.

A review of the more than a decade of experience under the CRA indicates that there is more than ample evidence to conclude that it has not worked well enough to achieve the objectives envisioned by its sponsors. Of all the subjects of the Administrative Law Project, it appears the most immediately amenable to legislative remediation though perhaps, the most difficult to politically achieve.

Review of Agency Rules Under the CRA

The CRA requires that all agencies promulgating a covered rule must submit a report to each House of Congress and to the Comptroller General (CG) that contains a copy of the rule, a concise general statement describing the rule (including whether it is deemed to be a major rule), and the proposed effective date of the rule. A covered rule cannot take effect if the report is not submitted. (section 801(a)(1)(A)) Each House must send a copy of the report to the chairman and ranking minority member of each jurisdictional committee. (section 801(a)(1)(C)) In addition, the promulgating agency must submit to the CG: (1) a complete copy of any cost-benefit analysis; (2) a description of the agency's actions pursuant to the requirements of the Regulatory Flexibility Act and the Unfunded Mandates Reform Act of 1995; and (3) any other relevant information required under any other act or executive order. Such information must also be made "available" to each House. (section 801(a)(1)(B))

Section 804(3) adopts the definition of "rule" found at 5 U.S.C. § 551(4), which provides that the term rule "means the whole or part of an agency statement of general . . . applicability and future effect designed to implement, interpret, or prescribe law or policy."²²⁶ The legislative history of section 551(4) indicates that the term is to be broadly construed: "The definition of rule is not limited to substantive rules, but embraces interpretive, organizational and procedural rules as well."²²⁷ The courts have recognized the breadth of the term, indicating that it encompasses "virtually every statement an agency may make,"²²⁸ including interpretive and substantive rules, guidelines, formal and informal statements, policy proclamations, employee manuals and memoranda of understanding, among other types of actions. Thus, a broad range of agency action is potentially subject to Congressional review.

The CG and OIRA Administrator have particular responsibilities with respect to a "major

²²⁵Whitman v. American Trucking Ass'ns, 531 U.S. 457 (2001).

²²⁶Section 804(3) excludes from the definition "(A) any rule of particular applicability, including a rule that approves or prescribes for the future rates, wages, prices, services, or allowance therefore, corporate or financial structures, reorganizations, mergers, or acquisitions thereof, or accounting practices or disclosures bearing on any of the foregoing; (B) any rule relating to agency management or personnel; or (C) any rule of agency organization, or practice that does not substantially affect the rights or obligations on non-agency parties."

²²⁷Attorney General's Manual on the Administrative Procedure Act at 13 (1948).

²²⁸Avoyelles Sportsmen's League, Inc., v. Marsh, 715 F.2d 897 (5th Cir. 1983).

rule,” defined as a rule that will likely have an annual effect on the economy of \$100 million or more, increase costs or prices for consumers, industries or state and local governments, or have significant adverse effects on the economy. The determination of whether a rule is major is assigned exclusively to the Administrator of OIRA. (section 804(2)) If a rule is deemed major by the OIRA Administrator, the CG must prepare a report for each jurisdictional committee within 15 calendar days of the submission of the agency report required by section 801(a)(1) or its publication in the Federal Register, whichever is later. The statute requires that the CG’s report “shall include an assessment of the agency’s compliance with the procedural steps required by section 801(a)(1)(B).”²²⁹ (section 801(a)(2)(A)) The CG has interpreted his duty under this provision narrowly as requiring that he simply determine whether the prescribed action has been taken, i.e., whether a required cost-benefit analysis has been provided, and whether the required actions under the Regulatory Flexibility Act, the Unfunded Mandates Reform Act of 1995, and any other relevant requirements under any other legislation or executive orders were taken, not to examine the substantive adequacy of the actions.

The designation of a rule as major also affects its effective date. A major rule may become effective on the latest of the following scenarios: (1) 60 calendar days after Congress receives the report submitted pursuant to section 801(a)(1)²³⁰ or after the rule is published in the Federal Register; (2) if Congress passes a joint resolution of disapproval and the President vetoes it, the earlier of when one House votes and fails to override the veto, or 30 calendar days after Congress receives the veto message; or (3) the date the rule would otherwise have taken effect (unless a joint resolution is enacted). (section 801(a)(3))

Thus, the earliest a major rule can become effective is 60 calendar days after the later of the submission of the report required by section 801(a)(1) or its publication in the Federal Register, unless some other provision of the law provides an exception for an earlier date. Three possibilities exist. Under section 808(2) an agency may determine that a rule should become effective notwithstanding section 801(a)(3) where it finds “good cause that notice and public

²²⁹See, e.g., *Chem Service, Inc. v. EPA*, 12 F.3d 1256 (3d Cir. 1993) (memorandum of understanding); *Caudill v. Blue Cross and Blue Shield of North Carolina*, 999 F.2d 74 (4th Cir. 1993) (interpretative rules); *National Treasury Employees Union v. Reagan*, 685 F.Supp 1346 (E.D. La 1988) (federal personnel manual letter issued by OPM); *New York City Employment Retirement Board v. SEC*, 45 F.3d 7 (2d Cir. 1995) (affirming lower court’s ruling that SEC “no action” letter was a rule within section 551(4)).

²³⁰The General Counsel of the GAO has ruled that the 60-day period does not begin to run until *both* Houses of Congress receive the required report. See B-289880, April 5, 2002, opinion letter to Hon. Edward M. Kennedy, Chairman, Senate Committee on Health, Education, Labor and Pensions from Anthony H. Gamboa, General Counsel. The situation involved a Department of Health and Human Service’s (HHS) major rule published in the Federal Register on January 18, 2002 with an announced effective date of March 29, 2002. The House of Representatives, however, did not receive the rule until February 14, 2002. HHS thereafter delayed the effective date of the rule until April 15, 2002, in an attempt to comply with the CRA. But the Senate did not receive the rule until March 15, 2002. The General Counsel determined that the rule could not become effective until May 14, 2002, 60 days following the Senate’s receipt, relying on the language of section 801(a)(1)(A) of the Act requiring that a copy of a covered rule must be submitted “to *each* House of Congress” in order to become effective.

procedure thereon are impracticable, unnecessary, or contrary to the public interest.”²³¹ Second, the President may determine that a rule should take effect earlier because of an imminent threat to health or safety or other emergency; to insure the enforcement of the criminal laws; for national security purposes; or to implement an international trade agreement. (section 801(c)) Finally, a third route is available under section 801(a)(5) which provides that “the effective date of a rule shall not be delayed by operation of this chapter beyond the date on which either House of Congress votes to reject a joint resolution of disapproval under section 802.”²³²

All other rules take effect “as otherwise allowed by law” after having been submitted to Congress under section 801(a)(1). (section 801(a)(4)) Under the APA, a final rule may go into effect 30 days after it is published in the Federal Register in final form. (5 U.S.C. § 553(d)) An agency, in its discretion, may delay the effectiveness of a rule for a longer period; or it may put it into effect immediately if good cause is shown.

All covered rules are subject to disapproval even if they have gone into effect. Congress has preserved for itself a review period of at least 60 days. Moreover, if a rule is reported within 60 session days of adjournment of the Senate or 60 legislative days of adjournment of the House, the period during which Congress may consider and pass a joint resolution of disapproval is extended to the next succeeding session of the Congress. (section 801(d)(1)) Such held over rules are treated as if they were published on the 15th session day of the Senate and the 15th legislative day of the House in the succeeding session and as though a report under section 801(a)(1) was submitted on that date. (section 801(d)(2)(A), (e)(2)) A held-over rule takes effect as otherwise provided. (section 801(d)(3)) The opportunity for Congress to consider and disapprove is simply extended so that it has a full 60 session or legislative days to act in any session.

If a joint resolution of disapproval is enacted into law, the rule is deemed not to have had any effect at any time. (section 801(f)) If a rule that is subject to any statutory, regulatory or judicial deadline for its promulgation is not allowed to take effect, or is terminated by the passage of a joint resolution, any deadline is extended for one year after the date of enactment of the joint resolution. (section 803) A rule that does not take effect, or is not continued because of passage of a disapproval resolution, may not be reissued in substantially the same form. Indeed,

²³¹Reviewing courts have generally applied the Administrative Procedure Act’s good cause exemption, from which this language is obviously taken, narrowly in order to prevent agencies from using it as an escape clause from notice and comment requirements. *See, e.g.,* *Action on Smoking and Health v. CAS*, 713 F.2d 795, 800 (D.C. Cir. 1987). As section 805 precludes judicial review for any “determination, finding, action or omission under this chapter,” there could be no court condemnation of a good cause determination, but the rule would still be subject to Congressional vacation and retroactive nullification.

²³²In *Leisegang v. Sect’y of Veterans Affairs*, 312 F.3d 1368, 1373-1376 (Fed. Cir. 2002), the appeals court held that Section 801(a)(3) “does not change the date on which [a major rule] becomes effective. It only affects the date when the rule becomes operative. In other words, the CRA merely provides a 60-day waiting period before the agency may enforce the major rule so that Congress has the opportunity to review the regulation.” At issue in the case was the date from which certain veterans benefits would be calculated. The benefit statute provided that it would be the date of the issuance of the rule. The government argued that the CRA was a superceding statute and that the effective date was when the CRA allowed it to be operative. The appeals court agreed with the veterans that the date of issuance, as prescribed by the law, was determinative.

before any reissued or new rule that is “substantially the same” as a disapproved rule can be issued it must be specifically authorized by a law enacted subsequent to the disapproval of the original rule. (section 801(b)(2))

Section 802(a) spells out the process for an up or down vote on a joint resolution of disapproval.²³³ A joint resolution of disapproval must be introduced within 60 calendar days (excluding days either House of Congress is adjourned for more than three days during a session of Congress) after the agency reports the rule to the Congress in compliance with section 801(a)(1). Timely introduction of a disapproval resolution allows each House 60 session or legislative days to pass it and thereby get the benefit of expedited consideration procedures, retroactive nullification of an effective rule, and the limitation on an agency from promulgating a “substantially similar” rule without subsequent Congressional authorization to do so by law.

The law provides an expedited consideration procedure for the Senate. If the committee to which a joint resolution is referred has not reported it out within 20 calendar days after referral, it may be discharged from further consideration by a written petition of 30 Members of the Senate, at which point the measure is placed on the calendar. After committee report or discharge it is in order at any time for a motion to proceed to consideration. All points of order against the joint resolution (and against consideration of the measure) are waived, and the motion is not subject to debate, amendment, postponement, or to a motion to proceed to other business. If the motion to consider is agreed to, it remains as unfinished business of the Senate until its final disposition. (section 802(d)(1)) Debate on the floor is limited to 10 hours. Amendments to the resolution and motions to postpone or to proceed to other business are not in order. (section 802(d)(2)) At the conclusion of debate an up or down vote on the joint resolution is to be taken. (section 802(d)(3))²³⁴

There is no special procedure for expedited consideration and processing of joint resolutions in the House. But if one House passes a joint resolution before the other House acts, the measure of the other House is not referred to a committee. The procedure of the House receiving a joint resolution “shall be the same as if no joint resolution had been received from the other House, but . . . the vote on final passage shall be on the joint resolution of the other House.” (section 802(f)(1)(2))

²³³For an in-depth discussion of procedural issues that may arise during House and Senate consideration of disapproval resolutions, see Richard S. Beth, *Disapproval of Regulations by Congress: Procedure Under the Congressional Review Act*, CRS Report RL31160.

²³⁴There is some question whether a motion to proceed is nondebatable because of the absence of language so stating. Arguably, the nondebatability of the motion is integral both to the scheme of the expedited procedure provisions as well as to the overall efficacy of the CRA’s statutory scheme and thus may be implied. Alternatively, debate on such a motion may be limited by Section 803(d)(2) which limits debate on joint resolutions, as well as “all debatable motions,” to ten hours. Ultimately, a resolution of this question by the Senate Parliamentarian, or the Senate itself, may be necessary. At the commencement of the debate on S.J.Res. 6, to disapprove the ergonomics rule, the presiding officer, however, declared, “The motion to proceed is not debatable. The question is on agreeing to the motion.” The motion was agreed to. 147 Cong. Rec. S1831 (daily ed. March 6, 2001). At least one other precedent exists in which it was ruled that a motion to proceed to a budget resolution under the Budget Act was nondebatable despite the silence of the act on the matter. See 127 Cong. Rec. S4871 (May 12, 1981).

Section 805 precludes judicial review of any “determination, finding, action or omission under this chapter.” This would insulate from court review, for example, a determination by the OIRA Administrator that a rule is major or not, a Presidential determination that a rule should become effective immediately, an agency determination that “good cause” requires a rule to go into effect at once, or a question as to the adequacy of a Comptroller General’s assessment of an agency’s report. The legislative history of this provision indicates that this preclusion of judicial review would not apply to a court challenge to a failure of an agency to report a rule. This appears not to be a judicially settled matter.

Finally, the law provides a rule of construction providing that a reviewing court shall not draw any inference from a Congressional failure to enact a joint resolution of disapproval with respect to such rule or a related statute. (section 801(g))

Utilization of the Review Mechanism Since 1996

Since March 1996, the CG had submitted reports pursuant to section 801(a)(2)(A) to Congress on over 630 major rules.²³⁵ In addition, GAO had cataloged the submission in excess of 43,000 non-major rules as required by section 801 (a) (1) (A). To date, 37 joint resolutions of disapproval have been introduced relating to 28 rules. One rule, OSHA’s ergonomics standard in March 2001, has been disapproved, an action that may prove to be unique to the circumstances of its passage. Two other rules have been disapproved by the Senate. One, the Federal Communication Commission’s 2003 rule relating to broadcast media ownership was disapproved by the Senate during the 108th Congress, but was not acted upon by the House. The second, a 2005 Department of Agriculture rule relating to the establishment of minimal risk zones for introduction of bovine spongiform encephalopathy (Mad Cow Disease) was disapproved on March 3, 2005, but its counterpart, H.J.Res. 23, was never acted upon by the House. A third joint resolution, S.J. Res. 20, seeking disapproval of a rule promulgated by the Environmental Protection Agency to delist coal and oil-direct utility units from the new source category list under the Clean Air Act, was defeated in the Senate by a vote of 47-51 on September 13, 2005.²³⁶

OSHA’s ergonomics standard had been controversial since the publication of its initial proposal for rulemaking in 1992 during the Bush Administration.²³⁷ OSHA circulated a draft proposal in 1994 which was met with strong opposition from business interests and the formation of an umbrella organization, the National Coalition on Ergonomics, to oppose its adoption. In 1995, OSHA circulated a modified draft proposal, particularly with respect to coverage and regulatory requirements. At the same time, Congressional opposition resulted in appropriations riders that prohibited OSHA from promulgating proposed or final ergonomics proposals during the fiscal years 1995, 1996, and 1998.²³⁸ The riders did not prohibit OSHA from continuing its development work, however, which included responding to concerns that

²³⁵General Accounting Office, *Reports on Federal Agency Major Rules*, available at [<http://www.gao.gov/decisions/majrule/majrule.htm>].

²³⁶The 37 disapproval resolutions are detailed in Morton Rosenberg, *Congressional Review of Agency Rulemaking: An Update and Assessment of the CRA After Ten Years*, CRS Report RL70116.

²³⁷The turbulent history of the development of the ergonomics standard is recounted in Edward Rappaport, *Ergonomics in the Workplace: Is It Time for an OSHA Standard?*, CRS Report 97-724.

²³⁸In a close floor vote, the rider proposed for FY1997 was deleted.

scientific knowledge of ergonomics was inadequate for rulemaking and that the cost of industry implementation of a broad standard would be extraordinarily costly. Congress mandated reports from the National Academy of Sciences which found a significant statistical link between workplace exposures and musculoskeletal disorders, but also noted that the exact causative factors and mechanisms are not understood. In 2000, Congressional attempts to pass another appropriation rider, as well as stand alone prohibitory legislation, failed, and on November 14, 2000, OSHA issued its final standard which became effective on January 16, 2001.²³⁹ Most employer responsibilities under the new standard, however, were not to begin until October, 2001.

As soon as the rule was issued two industry groups filed suit in the Court of Appeal for the District of Columbia Circuit challenging OSHA's authority to issue the rule, its failure to follow proper procedures, the rationality of its provisions, and the adequacy of its scientific and economics analyses. The intervening 2000 elections also altered the political situation with the election of a president and effective control of both Houses of Congress in the same political party. Opponents of the standard introduced a resolution of disapproval under the CRA, S.J.Res. 16, on March 1, 2001. A discharge petition was filed on March 5, and debate on and passage of the resolution occurred on March 6 by a vote of 56-44. That evening the House Rules Committee issued a rule for floor action the next day, and after an hour of debate H.J.Res. 35 was passed on March 7 by a vote of 223-206. The President signed the nullifying measure into law on March 20, 2002.²⁴⁰

In sum, the veto of the ergonomics standards may be seen as the product of an unusual, and possibly irreplicable, confluence of factors and events: control of both Houses of Congress and the presidency by the same party, the longstanding opposition by these political actors, as well as by broad components of the industry to be regulated, to the ergonomics standards, and the willingness and encouragement of a president seeking to undo a contentious, end-of-term rule from a previous administration.

In all other cases, if there is any discernible pattern to the introduced resolutions, it is to exert pressure on the subject agencies to modify or withdraw the rule, or to elicit support of members, which in some instances was successful.²⁴¹ The anecdotal evidence of successful exertion of such pressure is quite limited.

Structural and Interpretive Deterrents to the Effective Use of the CRA. The sparing use of the CRA mechanism since its enactment has fostered considerable debate. Several salient issues have emerged in that period. These have included the need for a screening mechanism for submitted rules; the absence of an expedited procedure in the House of Representatives for consideration of disapproval resolutions; the deterrent effect of the need for a supermajority to overcome a veto; scope of the law's coverage; the judicial enforceability of its key requirements; whether a disapproval resolution may be directed at part of a rule; and the effect of a rule nullification on future agency rulemaking in the same area, which have introduced uncertainties and impediments to confident use of the process.

²³⁹65 Fed. Reg. 68,261 (Nov. 14, 2000).

²⁴⁰Pub. L. No. 107-5 (2001).

²⁴¹See CRS Report 97-724, *supra* note 237, at 13-16, describing examples of successful influence.

Lack of a Screening Mechanism to Pinpoint Rules That Need Congressional Review; Proposals for Reform. The lack of a screening mechanism that will alert committees to rules that may raise important or sensitive substantive issues arguably prevents busy committees from prioritizing such issues. As indicated above, the Comptroller General's reports on major rules serve as check lists as to whether legally required agency tasks have been done and not as substantive assessments of whether they were done properly or whether the rules accord with Congressional intent. Indeed, lack of knowledge of the *existence* of such sensitive rules by jurisdictional committees or interested Members is rarely the case. What appears to be absent is in-depth scrutiny and analysis of individual rules by an authoritative and presumably neutral source that may provide the basis for triggering meaningful Congressional review.

The need for an independent substantive screening body was signaled by the introduction by Representative Sue Kelly of H.R. 1704 in the 105th Congress, a bill that would have established a Congressional Office of Regulatory Analysis (CORA).²⁴² The bill was referred to the House Judiciary and Governmental Reform and Oversight Committees both of which favorably reported differing versions of the legislation.²⁴³ Both versions would have established an independent CORA to be headed by a director appointed by the House Speaker and the Senate Majority Leader for a term of four years, with service in the office limited to no more than three terms. The current review functions of the CG under the CRA and the Congressional Budget Office under the Unfunded Mandates Act of 1995 would be transferred to the proposed CORA. The Judiciary Committee's version, in addition to having the Office make "an assessment of an agency's compliance with the procedural steps for 'major rules'" required by CRA, directs the proposed CORA to "conduct its own regulatory impact of these 'major rules.'"²⁴⁴ The bill as reported by the Government Reform Committee would have allowed the CORA director to use "any data and analyses generated by the Federal agency and any data of the Office" in analyzing the submitted rule. Both bills provided that a similar analysis of non-major rules was to be conducted when requested to do so by a House or Senate committee or by individual members of either House. First priority for the conduct of such analyses was given to all major rules. Secondary priority was assigned to committee requests. Tertiary priority was given individual member requests. Finally, under the Judiciary Committee version, the report was to be furnished within 45 days after Congress receives notification of the rule; the Governmental Reform bill would have allowed 30 days. H.R. 1704 received no floor action during the 105th Congress.

Some argue that an independent office of regulatory analysis would serve the Congressional need for objective information necessary to evaluate agency regulations. It might also provide credibility and impetus to utilize the review mechanism. Further, by providing intensive review of certain non-major rules, the possibility of OIRA "hiding" significant rules by not designating them as "major" is forestalled. Objections may be heard that creation of a new Congressional bureaucracy for review purposes would be unnecessarily duplicative of what the agencies have already done as well as extraordinarily expensive. The requirement of the Judiciary Committee's version that a CORA do its own cost-benefit analysis from scratch could be pointed to as an unknown cost factor, as well as a task that may not be possible to perform adequately within the allotted 45 days.

²⁴²A companion bill, S. 1675, was introduced in the Senate by Senators Shelby and Bond. 143 Cong. Rec. S1007 (daily ed. Feb. 25, 1998).

²⁴³See H.R. Rep. No. 105-441 (1998).

²⁴⁴Section 4 (a)(3)(A).

Congress agreed upon a limited test of the CORA concept, late in the 106th Congress, with the passage of the Truth in Regulating Act of 2000 (TIRA).²⁴⁵ That legislation established a three-year pilot project for GAO to report to Congress on economically significant rules. Under this pilot program, whenever an agency published an economically significant proposed or final rule a chairman or ranking minority member of a committee of jurisdiction of either House of Congress may request the CG to review the rule. The CG was to report on each rule within 180 calendar days. The report had to contain an “independent evaluation” by the CG of the agency’s cost-benefit analysis. We are aware of only one request ever made pursuant to the provision. That was submitted in January 2001 by the chairs of the jurisdictional committees of the House and Senate with respect to the Department of Agriculture’s forest planning and roadless area rule. GAO advised the requesters that although Act authorized \$5.2 million per year for the program, no monies had been appropriated and it could not proceed with the request. No further action was taken on the request and Congress never enacted an appropriation, thereby forestalling implementation of the project. It may be noted that the 180-day reporting period did not mesh exactly with the time period under the CRA for consideration of rules subject to resolution of disapproval, although completed requests for analyses of *proposed* rules might coincide with such reviews. In any event, the pilot program established by the Act expired in January 2004.

In the 109th Congress, Representative Sue Kelly introduced H.R. 1167, which would make permanent the authority of Congress to request GAO to perform regulatory analyses. The new TIRA, if it had been enacted as a permanent responsibility of GAO, would not appear to have required a specific appropriation to require agency performance of the vested task as was the case when it was established as a “pilot project.” It would, in effect, be an unfunded mandate on GAO. Although GAO currently does (and historically has always done) some reviews of agencies’ rules at Members’ requests under its current appropriations, both the volume and nature of the reviews are likely to be substantially different and may affect its ability to conduct other agency reviews. A similar bill, H.R. 725, would also have made TIRA permanent, but would have authorized up to \$5 million for the revenues. Although GAO may view this bill as preferable, if the authorized funds are not appropriated, GAO could be in the same “unfunded mandate” situation as it would under H.R. 1167.

In an apparent attempt to avoid the criticisms of the CORA model and to remedy some of the perceived impediments to the effectiveness of the CRA, Representative Ginny Brown-Waite introduced H.R. 3356, the Joint Administrative Procedures Committee Act of 2003, in the 108th Congress, which would amend the CRA by establishing a joint Congressional committee with broad authority to investigate, evaluate and recommend actions with respect to the development of proposed rules, the amendment or repeal of existing rules, and disapproval of final rules submitted for review under the CRA.²⁴⁶ The responsibilities are in addition to the current statutory framework providing for review of new rules that are required to be reported. A new provision permits the joint committee to recommend disapproval of new rules to jurisdictional committees. The proposed Joint Administrative Procedures Committee (JAPC) would be composed of 12 members from each House with no more than 7 from one political party, selected by the Senate Majority Leader and the Speaker of the House. The JAPC would receive all agency submissions of covered rules and provide copies to all jurisdictional committees. The JAPC has sixty days to consider the rule. The agency could be required to submit such reports

²⁴⁵Pub. L. No. 106-312, 114 Stat. 1248-50, 5 U.S.C. § 801 note (2000).

²⁴⁶See introductory remarks on the measure at 147 Cong. Rec. H2454 (daily ed. Oct. 21, 2003).

as is required by the joint committee such as a cost-benefit analysis or risk assessment. If no action is taken by JACP, the rule may go into effect. If a majority determines that rule is inconsistent with Congressional intent in the area, JACP may recommend a disapproval resolution to the House and Senate jurisdictional committees.

In its report to the jurisdictional committees, JACP is to pinpoint the objectionable provisions of the rule. The proposal would establish a new expedited consideration procedure for disapproval resolutions in the House of Representatives. On the third legislative day after a joint resolution is recommended by JACP, it is in order for any member of the House to move to proceed to consideration of the disapproval resolution. It is a privileged, non-debatable motion and once agreed to must be considered before any other business under expedited procedures. Only one hour of debate would be allowed. Finally, section 801(b)(2) of the CRA is amended to provide that an agency may promulgate a new rule without new statutory authorization if it carries out the recommendation set forth in the report submitted by the JACP to the jurisdictional committees. The bill was referred to the House Committees on Rules and Judiciary. The Judiciary Committee referred it to the CAL Subcommittee. No action was taken by either Committee. Representative Brown-Waite's proposal was reintroduced in the 109th Congress as H.R. 3148 but received no action.

Another bill, H.R. 576, introduced by Representative Ney in the 109th Congress, is similar in many respects to H.R. 3148, but quite different in certain fundamental ways. Both would create a 24-member House-Senate joint committee capable of holding hearings, requiring the attendance of witnesses, and making rules regarding its organization and procedures. Both also provide for an expedited consideration procedure in the House. Significant differences appear, however, with respect to the roles assigned to the joint committees. Under H.R. 3148, the current process established by the CRA for Congressional review of new agency rules is maintained. Required reports on new rulemakings are submitted to each House and such reports are sent to the jurisdictional committees of each House for action. Rules required to be reported are also sent to the joint committee. Special rules are provided for discharge from committees in the Senate and, under proposed H.R. 3148, from House committees. Expedited procedures are in effect for floor proceedings in each House. The only part to be played by the joint committee in the new rule review process under H.R. 3148 is to recommend to jurisdictional committees that certain submitted new rules be subject to disapproval resolutions. Deference to the current roles of jurisdictional committees is also maintained under H.R. 3148 with respect to the new duties given to the joint committee to selectively review existing federal agency rules in effect before the enactment of the CRA and existing major rules of federal agencies promulgated since April 1996. The joint committee may only recommend to jurisdictional committees that they take appropriate legislative action to amend or repeal such laws.

Under H.R. 576, the joint committee, rather than the jurisdictional committees of each House, receives the report of covered rules submitted for review by federal agencies as well as cost-benefit analyses and other materials. Jurisdictional committees receive copies of these materials from the joint committee. GAO is to submit its report on major rules to the joint committee, not the jurisdictional committees concerned. Major rules take effect no earlier than 60 days after the rule is published in the Federal Register or is received by the joint committee. Joint resolutions of disapproval are reported by the joint committee to the respective Houses for action. The joint committee may also report "by bill . . . recommendations with respect to matters within the jurisdiction of their respective Houses which are referred to the joint committee or otherwise within the jurisdiction of the joint committee." It would appear, then, that the joint committee would have the predominant role in the Congressional review process,

which would inject a highly controversial issue – diminution of the role of jurisdictional committees – in a reform debate already freighted with difficult and sensitive political and legal considerations.

A third bill introduced in the 109th Congress is H.R. 931, by Representative Hayworth, would prohibit any regulation proposed by a federal agency from going into effect until a bill enacted under expedited consideration procedures applicable to the rule is signed into law. The term “regulation” is given the broad meaning of the term “rule” as defined in 5 U.S.C. § 551(4). The bill does not specifically reference the current CRA process. In fact, it would supercede it and require rulemaking agencies to seek approval of all covered “regulations.” There is no provision for Congressional processing in a timely and expeditious manner raising the specter of a legislative back of a potentially huge number of proposed regulations.

Lack of an Expedited House Procedure. The current absence of an expedited consideration procedure in the House of Representatives may well be a factor discouraging use of the process in that body since, as a practical matter, it will mean engaging the House leadership each time a rule is deemed important enough by a committee or group of Members to seek speedy access to the floor. In view of the limits both on floor time and the ability to gain the attention of the leadership, perhaps only the most well situated in the body will be able to gain access within the limited period of review.²⁴⁷ Also, a perception that no action will be taken in the House might deter Senate action.

The Deterrent Effect of the Ultimate Need for a Supermajority to Veto a Rule. A consideration behind any serious effort to use the full CRA review mechanism likely has been the realization that any joint resolution disapproving a rule that does not have the support of the administration would be vetoed and require a two-thirds vote in each House to override. The deterrent potential of the need for a supermajority in each House to overcome a Presidential veto is significant, unless the object of the exercise is simply to provide the impetus for informal accommodations, such as occurred in the HCFA surety bond matter, or to influence Members to support remedial legislation. Nevertheless, the ready realization by agencies over time that passage of a disapproval resolution is highly unlikely could substantially reduce the efficacy of such a threat. Additionally, a possible consequence of such an assumption is that agencies will not factor in Congressional disapproval as part of the rule development process.²⁴⁸

²⁴⁷The experience with respect to the repeal of the ergonomics standard, discussed *supra* at notes 237 - 241 and accompanying text, would appear to bear this out.

²⁴⁸See Mark Seidenfeld, *The Psychology of Accountability and Political Review of Agency Rules*, 51 Duke L.J. 1059, 1089 (2001). Mr. Seidenfeld explains:

The paucity of motions for disapproval resolutions indicates that agencies are not apt to focus on fast-track review as a check on their rulemaking discretion at least until late in the rulemaking process. Agencies might be likely to focus on such review when they adopt rules that they know will be unpopular in Congress, but even then they need not fear the ramifications of fast-track review unless they also believe that the president opposes the rule or is willing to compromise it to win other political battles. Fast-track review may have greater significance for midnight rules that are subject to review when a different president is in office.

(continued...)

The validity of this assumption may be seen to have been borne out in the aftermath of the ergonomics standard veto. Since that action, 19 resolutions of disapproval with respect to 14 rules have been introduced, only one of which has been acted upon (by one House),²⁴⁹ an apparent return to the prior practice of using the mechanism to facilitate bargaining.

Thus, even with the successful disapproval of the ergonomics standard, the supermajority hurdle still remains. One possible solution is to establish a multi-tiered disapproval mechanism. That is, instead of all rules, major or non-major, being treated equally in that they can only be overturned by a joint resolution of disapproval, a process in which the entire burden of action is on the Congress, some rules might be designated for more selective, special review. For example, major or significant rules might be subject to a joint resolution of *approval*. Under such a scheme a major or significant rule would not become effective unless a joint resolution approving it passed both Houses within a specified period of time.²⁵⁰ To make such a scheme effective someone or some body, other than the OIRA administrator or a Congressional agency, such as the proposed CORA, might be vested with the authority to designate which rules are “major” or “significant” and thereby subject to the affirmative approval requirement. A benefit from the Congressional standpoint is that the burden for supporting and justifying such rules falls on the promulgating agencies. All other rules would be subject to disapproval resolutions. Another option would be to subject all covered rules to Congressional approval and establish an expedited procedure whereby non-controversial rules may be sped through leaving only a few for close consideration.²⁵¹

The Reluctance to Disapprove an Omnibus Rule Where Only One Part of the Rule Raises Objection. Section 808 of the review provision sets forth the mandatory text of any joint resolution of disapproval: “That Congress disapproves the rule submitted by the _____ relating _____, and such rule shall have no force or effect. (The blank spaces being appropriately filled in).” The quoted text refers to “the rule” and “such rule,” indicating a rule in its entirety. The experience of 33 joint resolutions of disapproval thus far introduced is that the first blank is filled with the name of the promulgating agency and the second with a generic title or description of the rule.²⁵² Similarly, the text of the review provision refers to “such rule,” “a rule,” or “the rule,” with no language expressly referring to a part of any rule

²⁴⁸(...continued)

Id.

²⁴⁹S.J.Res. 17, dealing with the FCC’s media ownership rule, which passed in the Senate but was not acted upon in the House.

²⁵⁰*See e.g.*, Reorganization Act Amendments of 1984, providing that both Houses of Congress had to pass a joint resolution approving a reorganization plan within 90 days of continuous session after the date of Presidential submission or else it is deemed disapproved. 5 U.S.C. § 906 (a) (1994).

²⁵¹Two bills introduced in the 106th Congress to revise the CRA utilized the joint resolution of approval approach. See S. 1348, 106th Cong. (1999) (Sen. Brownback) S. 2670, 106th Cong. (2000) (Sen. Thomas). A similar approach is reflected in H.R. 110 introduced by Rep. Hayworth (with 25 co-sponsors) in the 108th Congress. All agency rules must be reported to Congress and may become effective only on passage, by means of a fast-track procedure applicable to both Houses, of an approval law, which is not subject to judicial review.

²⁵²S.J.Res. 50 and H.J.Res. 123, “relating to surety bond requirements for home health agencies under the medicare and medicaid programs”

under review. The procedure leading to a vote on the proposed disapproval resolution allows for no amendments, and the final vote is up or down on the joint resolution as introduced.

The legislative history of the provision is similarly uniform in using language that would ordinarily indicate a reference to a submitted rule in its entirety, except in one instance. During a discussion of the section 802 procedure that would obtain when one House completes its action on a joint resolution and sends to it to the other House before the second House has yet to complete any action, the following comment is made:

Subsection 802(f) sets forth one unique provision that does not expire in either House. Subsection 802(f) provides procedures for passage of a joint resolution of disapproval when one House passes a joint resolution and transmits it to the other House that has not yet completed action. In both Houses, the joint resolution of the first House to act shall not be referred to a committee but shall be held at the desk. In the Senate, a House-passed resolution may be considered directly only under normal Senate procedures, regardless of when it is received by the Senate. A resolution of disapproval that originated in the Senate may be considered under the expedited procedures only during the period specified in subsection 802(e). Regardless of the procedures used to consider a joint resolution in either House, the final vote of the second House shall be on the joint resolution of the first House (no matter when that vote takes place). *If the second House passes the resolution, no conference is necessary and the joint resolution will be presented to the President for his signature. Subsection 802(f) is justified because subsection 802(a) sets forth the required language of a joint resolution in each House, and thus, permits little variance in the joint resolutions that could be introduced in each House.*²⁵³

²⁵³Joint Explanatory Statement of House and Senate Sponsors, 142 Cong. Rec. E571, at E577 (daily ed. April 19, 1996); 142 Cong. Rec. S3683, at S3686 (daily ed. Apr. 18, 1996) (emphasis added) (hereinafter Legislative History). These identical detailed explanations by the legislative sponsors of the intent and scope of the CRA's provisions appeared in the daily editions of the Congressional Record some three weeks after SBREFA was signed into law. In the absence of committee hearings and the sparse commentary during floor debate, these explanations represent the most authoritative contemporary understanding of the provisions of the law. It is, however, post-enactment legislative history and does not carry the weight that committee report explanations and floor debates provide. As one court dealing with the interpretation of a CRA provision stated, the post-enactment legislative history "buttresses the 'limited scope' of the CRA judicial review provision." The court warned, however, that "the lack of formal legislative history for the CRA makes reliance on this joint statement troublesome." See *United States v. Southern Indiana Gas & Electric Co.*, discussed *infra* at note 269 and accompanying text. It has recently come to our attention that the permanent edition of the Congressional Record for the 104th Congress places the Senate sponsors Joint Explanation at April 18, 1996, the same date it appeared in daily edition. See 142 Cong. Rec. 8196-8201. The House sponsors' Joint Explanation, which originally appeared in the daily edition of April 19, 1996, is now placed during the floor debate on SBREFA on March 28, 1996, the date of its passage. See 142 Cong. Rec. 6922-6930. There is no explanation for the earlier placement. As a consequence, we have determined to continue to treat the Joint Explanation as post-enactment legislative history that arguably merits close consideration by a reviewing court as a contemporaneous, detailed, in-depth statement of purpose and intent by the principal sponsors of the law.

The last two sentences seem to raise some uncertainty. The next to last sentence would appear to contemplate the possibility of a conference to resolve differences in resolutions. The last sentence minimizes what those differences could be. Some have suggested that the explanation contemplates that parts of rules may be the subject of disapproval resolutions, arguing that the framers of the provision would have known that many rules are complex and contain a variety of provisions, only one or a few of which may be objectionable, and would not have required a whole rulemaking to be brought down simply because of one offending portion out of many. It might also be argued that in light of the section 801(b)(2) prohibition against agency issuance of a rule “in substantially the same form” after passage of a disapproval resolution unless Congress by subsequent law authorizes it, not allowing rejection of part of a rule would have a draconian result.

In fact, an up or down vote on the entire rule would appear to have been the intent of the framers of the review provision. The language and structure of the provision, and the supporting explanation of the legislative history, contemplates a speedy, definitive and limited process. It is not unlike the legislative processes created for Congressional actions dealing with military base closings,²⁵⁴ international trade agreements,²⁵⁵ and Presidential reorganization plans,²⁵⁶ among others. Each dealt with complex, politically sensitive decisions which allowed only an up or down vote by the Congress on the entire package presented. It was understood that piecemeal consideration would delay and perhaps obstruct legislative resolution of the issues before it. For similar reasons, the statutory structure and legislative history of the review provision strongly indicate that Congress intended the process to focus on submitted rules as a whole and not to allow veto of individual parts. Perhaps a proper reading of the quoted portion of the legislative history is that it was contemplating the possibility that the blank to be filled in after “relating to” might have different generic descriptions of the rule subject to disapproval. A broader reading of these sentences would not otherwise appear warranted by either the legislative language itself or the rest of the explanatory legislative history.

If this reading is correct, it – as a practical matter – may be a factor in the limited use of the mechanism. As indicated, nullifying a rule means disabling an agency from regulating in the area covered by the rule unless Congress passes further authorization legislation, a significant consequence of any disapproval action. On the other hand, expressly authorizing nullification of portions of a rule might allow competing disapproval resolutions within each House and the certainty of a long, drawn out conference with the possibility of no agreement.

The Uncertainty of Which Rules Are Covered By the CRA. The framers of the Congressional review provision intentionally adopted the broadest possible definition of the term “rule” when they incorporated section 551(4) of the APA. As indicated previously,²⁵⁷ the legislative history of section 551(4) and the case law interpreting it make it clear that it was meant to encompass all substantive rulemaking documents – such as policy statements, guidance, manuals, circulars, memoranda, bulletins and the like – which as a legal or practical matter an agency wishes to make binding on the affected public.

²⁵⁴Defense Base Closure and Realignment Act of 1990, Pub. L. No. 101-510, § 2908 (b) 104 Stat. 1808, 10 U.S.C. § 2687, note (2000).

²⁵⁵See 19 U.S.C. §§ 2191-2193 (2000).

²⁵⁶See, e.g., Reorganization Act of 1984, 5 U.S.C. §§ 909-912 (2000).

²⁵⁷See *supra* notes 216-19 and accompanying text.

The legislative history of the CRA emphasizes that by adoption of the section 551(4) definition of rule, the review process would not be limited only to coverage of rules required to comply with the notice and comment provisions of the APA or any other statutorily required variation of notice and comment procedures, but would rather encompass a wider spectrum of agency activities characterized by their effect on the regulated public: “The committee’s intent in these subsections is . . . to include matters that substantially affect the rights or obligations of outside parties. The essential focus of this inquiry is not on the type of rule but on its effect on the rights and obligations of non-agency parties.”²⁵⁸ The framers of the legislation indicated their awareness of the now widespread practice of agencies avoiding the notification and public participation requirements of APA notice-and-comment rulemaking by utilizing the issuance of other, non-legislative documents as a means of binding the public, either legally or practically,²⁵⁹ and noted that it was the intent of the legislation to subject just such documents to Congressional scrutiny:

The committees are concerned that some agencies have attempted to circumvent notice-and-comment requirements by trying to give legal effect to general statements of policy, “guidelines,” and agency policy and procedure manuals. The committees admonish the agencies that the APA’s broad definition of “rule” was adopted by the authors of this legislation to discourage circumvention of the requirements of chapter 8.²⁶⁰

It is likely that virtually all the 43,000 non-major rules thus far reported to the Comptroller General have been either notice and comment rules or agency documents required to be published in the Federal Register. This would mean that perhaps thousands of covered rules have not been submitted for review.²⁶¹ Pinning down a concrete number is difficult since such covered documents are rarely if ever published in the Federal Register and thus will come to the attention of committees or Members only serendipitously.

Eight such agency actions have come to the attention of committee chairmen and Members and were referred to the Comptroller General for determinations whether they were covered rules. In five of the eight cases the CG determined the action documents to be covered rules:

²⁵⁸See Legislative History, *supra* note 253, at E 579, S 3687.

²⁵⁹This practice has been long recognized and criticized in administrative law commentaries. See, e.g., Robert A. Anthony, *Interpretive Rules, Policy Statements, Guidances, Manuals, and the Like—Should Federal Agencies Use Them To Bind The Public?*, 41 Duke L.J. 1311 (1992); cf., General Accounting Office, *Federal Rulemaking: Agencies Often Published Final Actions Without Proposed Rules*, GAO/GGD-98-126 (August, 1998).

²⁶⁰See Legislative History, *supra* note 253, at E 578, S 3687.

²⁶¹An indication of the vast number of unreported covered rules came as a result of an investigation by the House Subcommittee on National Economic Growth, Natural Resources, and Regulatory Affairs (Government Reform) which revealed that 7,523 guidance documents issued by the Department of Labor, the Environmental Protection Agency, and the Department of Transportation which were of general applicability and future effect had not been submitted for CRA review during the period March 1996 through November 1999. See *Non-Binding Legal Effect of Agency Guidance Documents*, H.R. Rep. 106-1009 (2000). GAO testimony at the Committee’s March 30, 2006 hearing on the CRA suggested that over 200 covered rules per year are unreported.

- Letter to Honorable Lane Evans, Ranking Minority Member, House Committee on Veterans' Affairs, B-292045 (May 19, 2003) (Department of Veterans Affairs memorandum terminating the Department's Vendee Loan Program is not a rule that must be submitted to Congress because it is exempt under section 804(3)(B) and (C) as a rule relating to "agency management" or "agency organization, procedure, or practice that does not substantially affect the rights or obligations of non-agency parties.").
- Letter to Honorable Ted Strickland, B-291906 (February 28, 2003) (Department of Veterans Affairs memorandum instructing all directors of health care networks to cease any marketing activities to enroll new veterans in such networks is excluded from CRA coverage by section 804(3)(C) which excludes "any agency rule of agency organization, procedure, or practice that does not substantially affect the rights or obligations of non-agency parties.").
- Letter to Honorable Doug Ose, Chairman, House Subcommittee on Energy Policy, Natural Resources, and Regulatory Affairs, Committee on Government Reform, B-287557 (May 14, 2001) (Department of Interior's Fish and Wildlife Service's Trinity River "Record of Decision" is a rule covered by the CRA because it is an agency statement of general applicability and future effect designed to implement, interpret, or prescribe law or policy and is an "agency action[] that substantially affect[s] the rights and obligations of outside parties.").
- Letter to the Hon. James A. Leach, Chairman, House Banking Committee, B-286338 (October 17, 2000) (Farm Credit Administration's national charter initiative held to be a rule under the CRA).
- Letter to Honorable David M. McIntosh, Chairman, Subcommittee on National Economic Growth, Natural Resources, and Regulatory Affairs, House Committee on Government Reform and Oversight, B-281575 (January 20, 1999) (EPA "Interim Guidance for Investigating Title VI Administrative Complaints Challenging Permits" held to be covered because it created new, mandatory steps in the procedure for handling disparate impact assessments which gave recipients new rights they did not previously possess for obtaining complaint dismissals, a substantive alteration of the previous regulation.).
- Letter to Senator Conrad Burns, B-278224 (November 10, 1997) (the American Heritage River Initiative announced by the Council on Environmental Quality was not a covered rule because it was established by Presidential executive order and direction and the President is not an "agency" under the APA and is not subject to the provisions of the APA);
- Letter to Honorable Ted Stevens, Chairman, Senate Appropriations Committee, et al, B-275178 (July 3, 1997) (Tongass National Forest Land and Resources Management Plan held an agency statement of general applicability and future effect that implements, interprets, and prescribes law and policy).
- Letter to Honorable Larry Craig, Chairman, Senate Committee on Energy and Resources, B-274505 (September 16, 1996) (memorandum of Secretary of Agriculture concerning the Emergency Salvage Timber Sale Program held to be a

covered rule because it is of general applicability and interprets and implements the statutory program.).

The GAO opinion on the American Heritage River Initiative rests its rationale that a Presidential directive to an agency that results in substantive action by that agency is not thereby covered by the CRA based on the Supreme Court's rulings in *Franklin v. Massachusetts*, 505 U.S. 788, 800 (1992) and *Dalton v. Spector*, 511 U.S. 462, 469 (1994). In light of *Chamber of Commerce v. Reich*, 74 F.3d 1322 (D.C. Cir. 1996) and *National Family Planning v. Sullivan*, 979 F.2d 227 (1992), which successfully challenged substantive changes in rules that were directed by a Presidential directive, the GAO General Counsel's conclusions may be problematic.

Also questionable is the General Counsel's analysis in its February 28, 2003 opinion concluding that a Department of Veterans Affairs (DVA) memorandum terminating a long-time veterans health outreach program was an exempt agency practice that had no substantial effect on the rights of non-agency parties. In contrast with its May 19, 2004 opinion dealing with a termination of a DVA vendee loan program, where it closely examined the statutory basis of the loan program and found that it was established on the basis of *discretionary* authority of the Secretary and provided no direct benefits to veterans, the General Counsel made no mention that the Congress had charged the Secretary of DVA "with the affirmative duty of seeking out eligible veterans and eligible dependants and providing them" with federal benefits and services.

Representative Strickland joined with the Vietnam Veterans of American in a suit seeking declaratory and injunctive relief to restore the program. In *Vietnam Veterans of America v. Principi*, 2005 WL 901133 (D.D.C. March 11, 2005), the district court found that "[u]nder 38 U.S.C. 7721, 7722, and 7227, Congress charges the Secretary of the Department of Veterans Affairs with the affirmative duty to 'provide outreach services.' This duty is not discretionary but must be done in accordance with Congress' wishes." The court concluded, however, that since Congress appropriated a lump-sum for both outreach services and health care services, and the record showed that some monies had been expended for outreach services, it indicated that Congress meant to allow the Secretary the discretion to decide "the manner in which [outreach services] are to be provided." The critique here is that the CG's failure to examine the Secretary's duty under the statute in question eliminated the possibility finding a substantial effect of the agency's action on the rights or obligations of non-agency parties, thereby forestalling the opportunity for legislative review under CRA procedures. It is interesting to note that subsequent to the CG's decision and the filing of the lawsuit, Congress enacted a limitation on the Fiscal Year 2004 VA appropriation stating It is interesting to note that subsequent to the CG's decision and the filing of the lawsuit, Congress enacted a limitation on the Fiscal Year 2004 VA appropriation stating, "[n]one of the funds made available may be used to implement any policy prohibiting the Directors of the Veterans Integrated Service Networks from conducting outreach or marketing to enroll new veterans within their respective networks," an apparent indication that Congress thought the controverted policy could be having an impact on potential beneficiaries. See Pub.L. No. 108-199, H.R. 2673, 108th Cong. § 418 (2004).

The Uncertainty of the Effect of An Agency's Failure to Report a Covered Rule to Congress. Section 801(a)(1)(A) of the CRA provides that "[b]efore a rule can take effect," the federal agency promulgating such rule shall submit to each House of Congress and the CG a report containing the text of the rule, a description of the rule, including whether it is a major rule, and its proposed effective date. Section 805 states that "no determination, finding, action or omission under this chapter shall be subject to judicial review." The Department of

Justice (DOJ) has broadly hinted that the language of section 805 “precluding judicial review is unusually sweeping” so that it would presumably prevent judicial scrutiny and sanction of an agency’s failure to report a covered rule.²⁶² DOJ has succeeded with its preclusion argument in two federal district court rulings. More recently the rationale of those opinions has been called into question and rejected by a third district court.

In *Texas Savings and Community Bankers Assoc. v. Federal Housing Finance Board*,²⁶³ three thrift associations and two of their trade associations sued the Federal Housing Finance Board challenging one of its policies regarding the home mortgage lending industry. The plaintiff’s argued, *inter alia*, that the policy was a rule required to be reported to Congress under the CRA and the failure to report it precluded its enforcement. The government asserted that section 805 was a blanket preclusion of judicial review. In response to plaintiff’s contention that section 805 only precluded review of any “determination, finding, or omission” by Congress, the court held that “the statute provides for no judicial review of any ‘any determination, finding, action or omission under this chapter,’ not ‘by Congress under this chapter.’ The court must follow the plain English. Apparently, Congress seeks to enforce the [CRA] without the able assistance of the courts.”²⁶⁴ The court made no reference to the scheme of the Act or its legislative history.

The Texas district court’s “plain meaning” rationale was cited with approval by an Ohio district in *United States v. American Electric Power Service Corp.*²⁶⁵ That case was one of many involving an extensive litigation campaign by the Environmental Protection Agency (EPA), begun in the mid-1990s to establish the extent to which a power plant or factory may alter its facilities or operations without bringing about a “modification” of that emission source so as to trigger the Clean Air Act’s New Source Performance Standards and pre-construction “new source review.”²⁶⁶ Among the issues common in these cases, and raised in this case, was whether EPA’s determination to begin a campaign of litigation enforcement after many years of no enforcement was a substantive change that had to be reported to Congress under the CRA. It was among 123 affirmative defenses raised by defendants, nine coal-fired power plants in Ohio, Virginia, and West Virginia, which the Government moved to dismiss. Citing the *Texas Savings* case approvingly, the district court agreed “that the language of Section 805 is plain” and that “[d]eparture from the plain language is appropriate in the ‘rare cases [in which] the literal application of a statute would produce a result demonstrably at odds with the intention of its drafters . . . or when the statutory language is ambiguous.’ . . . In all other cases, the plain

²⁶²See letter dated June 11, 1997 to the Honorable Lamar Smith, Chairman, Subcommittee on Immigration and Claims, Senate Judiciary Committee, from Andrew Fois, Assistant Attorney General, Office of Legislative Affairs, DOJ, and accompanying analysis dated June 10, 1997, at 9-11 (hereinafter DOJ Memorandum).

²⁶³1998 U.S. Dist. LEXIS 13470, 1998 WL842 181 (W. Texas), *aff’d*, 201 F.3d 551 (5th Cir. 2000).

meaning of the statute controls.”²⁶⁷ The court did not indicate whether it had attempted to discern whether there was any evidence of Congressional intent at odds with the court’s plain meaning reading. It did, however, provide an alternative rationale: “Furthermore, this Court is not convinced that the instant enforcement action amounts to rulemaking which would be covered by 5 U.S.C. 801 *et. seq.*, in the first instance,” without elaboration.²⁶⁸

In *United States v. Southern Indiana Gas and Electric Co.*,²⁶⁹ the court faced the same issue in a motion for summary judgment by the power company defendant. Rejecting the *Texas Savings* and *American Electric Power* precedents, it found that section 805 is ambiguous and susceptible to two possible meanings: that Congress did not intend for any court review of an agency’s compliance with the CRA or that Congress only intended to preclude judicial review of its own determination, findings, actions or omissions made under the CRA *after* a rule had been submitted to it for review. Adopting the first alternative, argued for by the Government and adopted by the *Texas Savings* and *American Electric Power* courts, would, according to the court, allow agencies “to evade the strictures of the CRA by simply not reporting new rules and courts would be barred from reviewing their lack of compliance. This result would be at odds with the purpose of the CRA, which is to provide a check on administrative agencies’ power to set policies and essentially legislate without Congressional oversight. The CRA has no enforcement mechanism, and to read it to preclude a court from reviewing whether an agency rule is in effect that should have been reported would render the statute ineffectual.”²⁷⁰ The court found that the post-enactment legislative history “buttresses the ‘limited scope’ of the CRA’s judicial review provision” but was careful to acknowledge that “the lack of formal legislative history for the CRA makes reliance on this joint statement troublesome.” Nevertheless, the court emphasized that it “reached its conclusion about the limited scope of the judicial review provision of the CRA based on the text of the statute and overall purpose of the act. The legislative history only serves to further reinforce the Court’s conclusion.”²⁷¹

It is certainly arguable that the *Southern Indiana* court’s view of the limited preclusiveness of section 805 is plausible and persuasive. Indeed, an even stronger case can be made from a closer analysis of the text and structure of the act taken as a whole. Moreover, although the court was correct as a general matter that post-enactment legislative history normally is given less weight, there are a number of Supreme Court rulings that recognize that under certain circumstances, arguably applicable here, contemporaneous explanations of key provisions’ intent have been found to be an “authoritative guide” to a statute’s construction. In one instance the Court relied on an explanation given eight years after the passage of the legislation.

The plain, overarching purpose of the review provision of the CRA was to assure that all covered final rulemaking actions of agencies would come before Congress for scrutiny and

possible nullification through joint resolutions of disapproval.²⁷² The scheme provides for the delayed effectiveness of some rules deemed innately important (“major rules”) (section 801(a)(3)), and temporarily waives the submission requirement of section 801 for rules establishing, modifying, opening, closing or conducting a regulatory program for a commercial, recreational, or subsistence activity related to hunting, fishing, or camping, or for a rule an agency “for good cause” finds that notice and public procedure are impractical, unnecessary, or contrary to the public interest. (section 808) Rules promulgated pursuant to the Telecommunications Act of 1996 are excluded from the definition of “major rule,” yet all such rules must ultimately be submitted for review. And while the scheme anticipates that some (or even most) rules will go into effect before a joint resolution of disapproval is passed, the law provides that enactment of a joint resolution terminates the effectiveness of the rule and that the rule will be treated as though it had never taken effect. (sections 801(b)(1), 801(f)) Further, a rule that has been nullified cannot be reissued by an agency in substantially the same form unless it is specifically authorized to do so by law after the date of the disapproval. (section 801(b)(2))

The review scheme also requires a variety of actions by persons or agencies in support of the review process, and time for such actions to be scrutinized by both Houses to implement the scheme. Thus, the CG must submit a report to Congress on each major rule submitted within 15 calendar days after its submission or publication of the rule (section 801(a)(2)(A)); the Administrator of OIRA determines whether a rule is a “major rule” (section 804(2)); and after a rule is reported the Senate has 60 session days, and the House 60 legislative days, to pass a disapproval resolution under expedited procedures. (section 802) Nevertheless, Congress has preserved for itself a period of review of at least 60 session or legislative days. Therefore, if a rule is reported within 60 session days of the Senate (or 60 legislative days of the House) prior to the date Congress adjourns a session of the Congress, the period during which Congress may consider and pass a joint resolution of disapproval is extended to the next succeeding session of the Congress. (section 801(d)(1))

Thus, the statutory scheme is geared toward Congressional review of all covered rules at some time; and a reading of the statute that allows for easy avoidance defeats that purpose. Interpreting the judicial review preclusion provision to prevent court scrutiny of the validity of administrative enforcement of covered but non-submitted rules appears to be neither a natural nor warranted reading of the provision. Section 805 speaks to “determination[s], finding[s], action[s], or omission[s] *under this chapter*,” a plain reference to the range of actions authorized or required as part of the review process. Congress arguably did not intend, as is more fully described below, to subject to judicial scrutiny, its own internal procedures, the validity of Presidential determinations that rules should become effective immediately for specified reasons, the propriety of OIRA determinations whether rules are major or not, or whether the CG properly performed his reporting function. These are matters that Congress can remedy by itself. Nevertheless, without the potential of court invalidation of enforcement actions based on the failure to submit covered rules, agencies are not likely to comply with submission requirements. If section 805 is read so broadly, it would arguably render ineffective as well the section 801(b)(2) prohibition against an agency promulgating a new rule that is “substantially the same” as a disapproved rule unless it “is specifically reauthorized by a law enacted after” the passage of a disapproval resolution. It is more than likely that a determination whether a new or reissued

²⁷² See Legislative History, *supra* note 253, at E 575 and S 3683 (“This legislation establishes a government-wide Congressional review mechanism for most new rules. This allows Congress the opportunity to review a rule before it takes effect and to disapprove any rule to which Congress objects.”).

rule is “substantially the same” as a disapproved rule is one that a court will be asked to make.²⁷³ Congress appears to have contemplated (and approved) judicial review in this and other situations when it provided in section 801(g) that “[i]f Congress does not enact a joint resolution of disapproval under section 802 respecting a rule, no court or agency may infer any interest of the Congress from any action or inaction of the Congress with regard to such rule, related statute, or joint resolution of disapproval.”

The legislative history of the review provision confirms this view of the limited reach of the judicial review preclusion language. A key sponsor of the legislation, Representative Henry Hyde, explained during the floor debate on H.R. 3136 that “Under Section 8(a)(1)(A), covered rules may not go into effect until the relevant agency submits a copy of the rule and an accompanying report to both Houses of Congress.”²⁷⁴

Shortly thereafter, the principal Senate and House sponsors of H.R. 3136 published a Joint Explanatory Statement in the Congressional Record providing a detailed explanation of the provisions of the Congressional review provision of the CRA and its legislative history. Senator Nickles explained:

Mr. President, I will submit for the Record a statement which serves to provide a detailed explanation and a legislative history for the congressional review title of H.R. 3136, the Small Business Regulatory Enforcement Fairness Act of 1996. H.R. 3136 was passed by the Senate on March 28, 1996, and was signed by the President the next day . . . Because title III of H.R. 3136 was the product of negotiation with the Senate and did not go through the committee process, no other expression of its legislative history exists other than the joint statement made by Senator Reid and myself immediately before passage of H.R. 3136 on March 28. I am submitting a joint statement to be printed in the Record on behalf of myself, as the sponsor of the S. 219, Senator Reid, the prime co-sponsor of S. 219, and Senator Stevens, the chairman of the Committee on Governmental Affairs. This joint statement is intended to provide guidance to the agencies, the courts, and other interested parties when interpreting the act's terms. The same statement has been submitted today in the House by the chairmen of the committees of jurisdiction over the congressional review legislation.²⁷⁵

The Joint Explanatory Statement is clear as to the scope and limitation of the judicial review provision:

Section 805 provides that a court may not review any congressional or administrative “determination, finding, action, or omission under this chapter”. Thus, the major rule determinations made by the Administrator of the Office of Information and Regulatory Affairs of the Office of Management and Budget are

²⁷³The disapproval of the ergonomics rule underlines a possible need for judicial review in certain instances where enforcement is necessary and appropriate to support the statutory scheme. That rule, which was broad and encompassing in its regulatory scope, raises the question as to how far can the agency go before it reaches the point of substantial similarity in its promulgation of a substitute. This issue is addressed in the next section.

²⁷⁴142 Cong. Rec. H3005 (daily ed. March 28, 1996).

²⁷⁵See Legislative History, *supra* note 253, at 142 Cong. Rec. S3683.

not subject to judicial review. Nor may a court review whether Congress complied with the congressional review procedures in this chapter. This latter limitation on the scope of judicial review was drafted in recognition of the constitutional right of each House of Congress to “determine the Rules of its Proceedings”. U.S. Const. art. I, §5, cl. 2, which includes each house being the final arbiter of compliance with such Rules.

The limitation on a court’s review of subsidiary determinations or compliance with congressional procedures, however, does not bar a court from giving effect to a resolution of disapproval that was enacted into law. A court with proper jurisdiction may treat the congressional enactment of a joint resolution of disapproval as it would treat the enactment of any other federal law. Thus, a court with proper jurisdiction may review the resolution of disapproval and the law that authorized the disapproved rule to determine whether the issuing agency has the legal authority to issue a substantially different rule. The language of subsection 801(g) is also instructive. Subsection 801(g) prohibits a court or agency from inferring any intent of the Congress only when “Congress does not enact a joint resolution of disapproval”, or by implication, when it has not yet done so. In deciding cases or controversies properly before it, a court or agency must give effect to the intent of the Congress when such a resolution is enacted and becomes the law of the land. The limitation on judicial review in no way prohibits a court from determining whether a rule is in effect. For example, the authors expect that a court might recognize that a rule has no legal effect due to the operation of subsections 801(a)(1)(A) or 801(a)(3).²⁷⁶

The Justice Department has suggested that such post-enactment legislative history should not carry any weight, particularly in view of the unambiguous nature of the preclusion language at issue.²⁷⁷ As discussed below, however, the courts appear to have taken a contrary view in analogous interpretive situations.

The Joint Explanatory Statement is a contemporaneous explanation of the Congressional review provision by the legislative sponsors of the legislation which is consonant with the text and structure of the legislation. Such statements by legislative sponsors have been described by the Supreme Court as an “authoritative guide to the statute’s construction.” *North Haven Bd. of Education v. Bell*, 456 U.S. 512, 526-27 (1982) (citing a bill summary placed in the Congressional Record by the bill’s sponsor after passage, and explanatory remarks made two years later by the same sponsor); *Pacific Gas & Electric Co. v. Energy Resources Conservation and Development Commission*, 461 U.S. 190, 211 n. 23 (1983) (relying on a 1965 explanation by “an important figure in the drafting of the 1957 [Atomic Energy Act]”); *Grove City College v. Bell*, 465 U.S. 555, 567 (1984) (remarks of sponsors deemed authoritative when they are consistent with the language of the legislation).

Finally, it may be noted that analogous preclusion of judicial review provisions in the original Paperwork Reduction Act of 1980, Pub. L. No. 96-511 and in the 1995 revision of the Act, Pub. L. No. 104-13, have been uniformly construed by the courts to allow enforcement of its public protection provision. Thus, 44 U.S.C. § 3504 (1994), which authorized the Director of

²⁷⁶See Legislative History, *supra* note 253, at E 577 and S 3686.

²⁷⁷See DOJ Memorandum, *supra* note 262, at 10, n.14.

OMB to review and approve or disapprove information collection requirements in agency rules, and to assign control numbers to such forms, provided that “there shall be no judicial review of any kind of the Director’s decision to approve or not to act upon a collection of information requirement contained in an agency rule.” (44 U.S.C. § 3504(h)(9)) A similar provision appears in the 1995 revision of the Paperwork Reduction Act.²⁷⁸ The 1980 legislation also contained a “public protection” provision, which absolved a person from any penalty for not complying with an information collection request if the form did not display an OMB control number or failed to state that the request was not subject to the act.²⁷⁹ The public protection provision, section 3512, has been the subject of numerous court actions, some finding it applicable and providing a complete defense to noncompliance, others finding it inapplicable. But no court has ever raised a question with respect to preclusion of judicial review.²⁸⁰

A reviewing court construing the language of the Congressional review provision, the structure of the legislation, and its legislative history, including post-enactment statements, is therefore likely to hold that a court is not precluded from preventing an agency from enforcing a covered rule that was not reported to Congress in compliance with section 801(a)(1)(A).

The Uncertainty of the Breadth of the Prohibition Against An Agency’s Promulgation of a “Substantially Similar” Rule After the Original Rule Has Been Vetoed. Enactment into law of a disapproval resolution has several important consequences. First, a disapproved rule is deemed not to have had any effect at any time. Thus, even a rule that has become effective for any period of time is retroactively negated.²⁸¹ Second, a rule that does not take effect, or is not continued because of the passage of a disapproval resolution, cannot be “reissued in the same form” nor can a “new rule” that is “substantially the same” as the disapproved rule be issued unless such action is specifically authorized by a law enacted subsequent to the disapproval of the original rule.²⁸² The full text of this provision states:

(2) A rule that does not take effect (or does not continue) under paragraph (1) may not be reissued in substantially the same form, and a new rule that is substantially the same as such a rule may not be issued, unless the reissued or new rule is specifically authorized by a law enacted after the date of the joint resolution disapproving the original rule.

Finally, if a rule that is subject to any statutory, regulatory or judicial deadline for its promulgation is not allowed to take effect, or is terminated by the passage of a joint resolution, any deadline is extended for one year after the date of enactment of the disapproval resolution.²⁸³

IRS, 593 F.Supp. 1540, *aff’d*, 773 F.2d 126 (6th Cir. 1984) (failure of IRS forms to have OMB control numbers did not violate section since it was a collection of information during the investigation of a specific individual or entity which is exempt under the provision).

²⁸¹5 U.S.C. § 801(f) (2000).

²⁸²5 U.S.C. § 801(b)(2) (2000).

²⁸³5 U.S.C. § 803 (2000).

It can be anticipated that opponents of a disapproval resolution will argue that successful passage of a resolution may disable an agency from ever promulgating rules in the “area” covered by the resolution without future legislative reauthorization as a successful disapproval resolution must necessarily bring down the entire rule. Or, at the very least, it may be contended that any future attempt by the agency to promulgate new rules with respect to the subject matter will be subject to judicial challenge by regulated persons who may claim that either the new rules are substantially the same as those disapproved or that the statute provides no meaningful standard to discern whether a new rule is substantially the same and that the agency must await Congressional guidance in the form of a statute before it can engage in further rulemaking in the area. The practical effect of these arguments, then, may be to dissuade an agency from taking any action until Congress provides clear authorization.

A review of the CRA’s statutory scheme and structure, the contemporaneous Congressional explanation of the legislative intent with respect to the provisions in question, the lessons learned from the experience of the March 2001 disapproval of the OSHA ergonomics rule, and the application of pertinent case law and statutory construction principles suggests several observations. First, it is doubtful that Congress intended that all disapproved rules would require statutory reauthorization before further agency action could take place. For example, it appears that Congress anticipated further rulemaking, without new authorization, where the statute in question established a deadline for promulgating implementing rules in a particular area. In such instances, the CRA extends the deadline for promulgation for one year from the date of disapproval. Second, a close reading of the statute, together with its contemporaneous Congressional explication, arguably provides workable standards for agencies to reform disapproved regulations that are likely to be taken into account by reviewing courts. Those standards would require a reviewing court to assess both the nature of the rulemaking authority vested in the agency that promulgated the disapproved rule and the specificity with which the Congress identified the objectionable portions of a rule during the floor debates on disapproval. An important factor in a judicial assessment may be the CRA’s recognition of the continued efficacy of statutory deadlines for promulgating specified rules by extending such deadlines for one year after disapproval. Third, the novelty of the issue, the uncertainty of the weight a court will accord the post enactment Congressional explanation, and the current judicial inclination to give deference to the “plain meaning” of legislative language, make it difficult to reliably anticipate what a court is likely to hold.

A blanket contention that enactment of a joint resolution disapproving an agency’s rules would disable that agency from promulgating future rules in the “area” of concern until Congress passes new legislation authorizing it to issue rules on that subject would not appear to have a substantial basis in the CRA. Such argumentation would apparently be based on the notion that the “plain meaning” of the CRA’s disapproval mechanism forecloses further rulemaking with respect to that subject matter unless Congress specifically reauthorizes such action in subsequent legislation. That is, as Congress can apparently only disapprove a rule as a whole, rather than pinpointing any particular portions, there is no sound basis for the agency to act without further legislative guidance where a rule deals exclusively with an integrated subject matter. The statute gives no indication as to how an agency is to discern what actions would be “substantially the same” and it would run the risk of a successful court challenge if it guessed wrong. It might be further argued that even if the agency promulgates new rules, which of course would be subject to CRA scrutiny, and Congress did not act to disapprove the new rules, that would not provide the necessary reauthorization since section 801(g) of the act provides as a rule of construction that in the event of the failure of Congress to disapprove a rule “no court . . . may infer any intent of Congress from any action or inaction of the Congress with regard to such, related statute, or joint resolution of disapproval.”

It is, of course, fundamental that statutory language is the starting point in any case of statutory construction. In recent years, the Supreme Court has shown a strong disposition to hold Congress to the letter of the language it uses in its enactments. In its ruling in *Barnhart v. Sigmon Coal Co.*²⁸⁴ the Court advised that the first step “is to determine whether the language at issue has a plain and unambiguous meaning with regard to the particular dispute in the case.”²⁸⁵ “The inquiry ceases ‘if the statutory language is unambiguous and the statutory scheme is coherent and consistent.’”²⁸⁶ In such cases, the Court has held, resort to “legislative history is irrelevant to the interpretation of an unambiguous statute.”²⁸⁷ In *Barnhart*, the Court warned, “parties should not seek to amend [a] statute by appeal to the Judicial Branch.”²⁸⁸

The plain meaning rule, however, is not an unalterable, rigid rule of construction and has been held inapplicable where it would “lead to an absurd result,”²⁸⁹ or “would bring about an end completely at variance with the purpose of the statute.”²⁹⁰ “It is ‘a fundamental canon of statutory construction that the words of a statute must be read in their context and with a view to their place in the overall statutory scheme’ Thus it is a more faithful construction of [a statute] to read it as a whole, rather than as containing two unrelated parts. It is the classic judicial task of construing related statutory provisions to make sense in combination.”²⁹¹ In the instant situation, it is arguably not likely that a court would hold that the “substantially the same” language of section 801(b)(2) is unambiguous, either on its face or in the context of the statutory scheme. The direction of the provision is not a self-enforcing mandate; it clearly requires a further determination whether rules have been reissued in “substantially the same form” or whether a new rule is “substantially the same” as the one disapproved. The ambiguity raised is who makes those determinations and on what basis.

The language of the provision, however, does not naturally or ineluctably lead to the conclusion that no further remedial rulemaking can take place unless Congress passes a new law. This reasoning is buttressed by section 803(a) which contemplates that agency rulemaking must take place after a disapproval action if the authorizing legislation of the agency mandates that rules disapproved had to have been promulgated by a date certain. That provision extends the deadline for promulgation for one year “after the date of enactment of the joint resolution,” not one year after Congress reauthorizes action in the area. The reasonable conclusion is that Congress understood that after disapproval, an agency, if it was under a mandate to produce a

particular rule, had to try again. The question then is, how was it to perform this task. The answer lies in the legislative history of the Act.

The Congressional Review Act was part of Title II of the Small Business Regulatory Enforcement Fairness Act of 1996. That Title was a product of negotiation between the Senate and House and did not go through the committee process. Thus, there is no detailed expression of its legislative history, apart from floor statements by key House and Senate sponsors, before its passage by the Congress on March 28, 1996 and its signing into law by the President on March 29. Thereafter, the principal sponsors of the legislation in the Senate (Senators Nickles, Reid and Stevens) and House (Representative Hyde) submitted identical joint explanatory statements for publication in the Congressional Record “intended to provide guidance to the agencies, the courts, and other interested parties when interpreting the act’s terms.”²⁹² Although it is a post-enactment explanation of the legislation, it is likely to be accorded some weight as a contemporaneous, detailed, in-depth statement of purpose and intent by the principal sponsors of the law.²⁹³

The Joint Explanatory Statement directly addresses a number of issues that may arise upon enactment of a disapproval resolution and attempts to provide guidance for both Congress and agencies faced with repromulgation questions. At the outset, the Statement notes that disapprovals may have differing impacts on promulgating agencies depending on the nature and scope the rulemaking authority that was utilized. For example, if an agency’s authorizing legislation did not mandate the promulgation of the disapproved rule, and the legislation gives the agency broad discretion, the authors deem it likely that it has the discretion whether or not to promulgate a new rule. On the other hand, the Statement explains that “if an agency is mandated to promulgate a particular rule and its discretion is narrowly circumscribed, the enactment of a resolution of disapproval for that rule may work to prohibit the reissuance of any rule.”²⁹⁴ By implication, a Congressional mandate to issue regulations that is not circumscribed would still be operative. A question arises as to how would the agency be guided in that circumstance? The Statement answers that very question by observing that it is the obligation of Congress during the debate on the disapproval resolution “to focus on the law that authorized the rule and make the congressional intent clear regarding the agency’s options or lack thereof after the enactment of a joint resolution of disapproval.”²⁹⁵ Thereafter, “the agency must give effect to the resolution of disapproval.”²⁹⁶ The full statement on the issue is as follows:

Effect of enactment of a joint resolution of disapproval

Subsection 801(b)(1) provides that “A rule shall not take effect (or continue), if the Congress enacts a joint resolution of disapproval, described under section 802, of the rule.” Subsection 801(b)(2) provides that such a disapproval rule “may not be reissued in substantially the same form, and a new rule that is substantially the

²⁹²See Legislative History, *supra* note 253.

²⁹⁵*Id.*

²⁹⁶*Id.*

same as such a rule may not be issued, unless the reissued or new rule is specifically authorized by a law enacted after the date of the joint resolution disapproving the original rule.” Subsection 801(b)(2) is necessary to prevent circumvention of a resolution disapproval. Nevertheless, it may have a different impact on the issuing agencies depending on the nature of the underlying law that authorized the rule.

If the law that authorized the disapproved rule provides broad discretion to the issuing agency regarding the substance of such rule, the agency may exercise its broad discretion to issue a substantially different rule. If the law that authorized the disapproved rule did not mandate the promulgation of any rule, the issuing agency may exercise its discretion not to issue any new rule. Depending on the law that authorized the rule, an issuing agency may have both options. But if an agency is mandated to promulgate a particular rule and its discretion in issuing the rule is narrowly circumscribed, the enactment of a resolution of disapproval for that rule may work to prohibit the reissuance of any rule. The authors intend the debate on any resolution of disapproval to focus on the law that authorized the rule and make the congressional intent clear regarding the agency’s options or lack thereof after enactment of a joint resolution of disapproval. It will be the agency’s responsibility in the first instance when promulgating the rule to determine the range of discretion afforded under the original law and whether the law authorizes the agency to issue a substantially different rule. Then, the agency must give effect to the resolution of disapproval.

The Congressional experience with the disapproval of the OSHA ergonomics standard provides a useful lesson. This rule became the first, and only, rule to be disapproved thus far under the CRA. The principal sponsor of the resolution, Senator Jeffords, at the outset of the debate addressed the issue whether disapproval would disable OSHA from promulgating a new rule. Senator Jeffords referred to the above-discussed Joint Statement and noted that OSHA “has enormously broad regulatory authority,” citing pertinent sections of the OSHA Act providing expansive rulemaking authority. The Senator concluded that “I am convinced that the CRA will not act as an impediment to OSHA *should* the agency decide to engage in ergonomics rulemaking.”²⁹⁷ What Senator Jeffords apparently understood was that while the agency had broad authority to promulgate rules, there was no Congressional mandate to issue an ergonomics rule in the underlying law. As a consequence, it was possible that no further rulemaking would occur, as implied by a letter to Senator Jeffords from Secretary Chao which indicated that a new rulemaking was only one of many options available to the Department should the rule be disapproved.²⁹⁸ In fact, OSHA made it clear on April 5, 2002, that no rulemaking was in the offing. On April 17, 2002, Senator Breaux and 26 co-sponsors, many of whom had voted in favor of the disapproval resolution, introduced S. 2184, which would direct the Secretary of Labor to promulgate a new ergonomics rule and specify in detail what should be included, what should not be included, and what evidence should be considered. Section 1 (b)(4) of the bill deems the direction to issue the rule “a specific authorization by Congress in accordance with Section 801 (b)(2)” of the CRA.²⁹⁹

²⁹⁷147 Cong. Rec. S1832-33 (daily ed. March 6, 2001) (emphasis added).

²⁹⁸*Id.* at S1832.

²⁹⁹*Id.*

An interesting contrast with the ergonomics situation was the consideration given by the key Senate sponsors of the Bipartisan Campaign Reform Act 2002 (BCRA),³⁰⁰ which requires that the Federal Election Commission (FEC) promulgate rules implementing the soft money limitations and prohibitions of Title I of the Act no later than 90 days after its date of enactment,³⁰¹ whether to introduce a CRA disapproval resolution with respect to the rules issued by the FEC on July 17, 2002.³⁰² The Senate sponsors believed that the new rules, which became effective on November 6, 2002, undermined the BCRA's ban on the raising and spending of soft money by federal candidates and officeholders and on national party use of soft money. As the FEC was mandated to promulgate rules to implement the BCRA by a date certain, it could have been argued that, in contrast with the general discretion OSHA has with respect to whether to issue any ergonomics standard, if Congress disapproved the FEC's soft money rule, the agency would be obligated to undertake a new rulemaking (to be completed within a year after the disapproval resolution was signed into law) that would reflect Congressional objections to the rule. At the same time, in accordance with the understanding of the Joint Statement, it would have been arguably incumbent on Congress in its debates on any such resolution to clearly identify those provisions of the rule that are objectionable as well as those that are not.

Whether this line of argument will be sufficient to withstand a challenge in the courts cannot be answered with any degree of certainty. Foreseeable obstacles may be the novelty of the issue, the amount of weight, if any, that a court will accord the post-enactment Congressional explanation of the CRA, and the current inclination of the courts to give deference to the plain meaning of statutory language and to eschew legislative history. A new rule may be challenged on grounds of lack of authority as a consequence of the disapproval resolution either because Congress failed to articulate its objections to the rule, thereby providing no standards for the agency to apply in its rulemaking, or that the new rules were "substantially the same" as the old, disapproved rules and therefore invalid under the CRA.

In the future, if Congress does not clarify its intent legislatively, when it considers a disapproval resolution it should be mindful of the guidance provided by the Joint Statement. The Joint Statement declares that it is the Congressional intent to make clear and specific identification of the options available to the agency, including identification of objectionable provisions in the proposed rule during the floor debates. In this way Congress provides an agency clear and direct guidance as to what it expects in the repromulgation process as well as a possible defense to a challenge based on the "substantially the same" language of the CRA.

Discussion: The Need for CRA Revision and the Options for Legislative Action

The identified flaws in the CRA justify at least modest legislative remediation, if for no other reason than to maintain a credible Congressional presence in the process of delegated administrative lawmaking. The role of Congress as the nation's dominant policy maker is

³⁰⁰Pub. L. No. 107-55 (2002).

seriously threatened by the substantial body of evidence demonstrating widespread agency evasion of notice and comment rulemaking requirements; the continued pressure for legislative enhancement of the already ominous trend toward intrusive substantive judicial review of agency rules; and the irrepressible calls for increased Presidential control of agency rulemaking. The potential pernicious consequences of these developments for Congress is illuminated by recent exhaustive scholarly examinations of rulemaking ossification,³⁰³ the latest unsuccessful attempt to resuscitate the nondelegation doctrine,³⁰⁴ and the continuing effort to legitimize the notion of the unitary executive.³⁰⁵ In particular, the ossification studies have detailed the manner in which rule promulgation has become too time consuming, burdensome, and unpredictable. The thrust of the academic critics, which assigns blame to each of the branches for the increasingly ineffective implementation of statutory mandates, has strongly suggested that courts are the chief

culprits because of their excessive intrusion in agency decisionmaking through interpretations and applications of APA's arbitrary and capricious test. Reviewing courts, it is maintained, will now find an agency to have violated its duty to engage in reasoned decisionmaking if its statement of basis and purpose is found to contain any gap in data or flaw in stated reasoning with respect to any issue. The commentators cite startling statistical evidence that reviewing courts have been holding major rules invalid almost fifty percent of the time.³⁰⁶ Preliminary indications of a study commissioned by the Committee appear to suggest a far more modest successful challenge rate, but the consequence of the perceived actions of the reviewing courts has been the encouragement of agencies to utilize alternative vehicles to make and announce far-reaching regulatory decisions. Agencies can use actions such as in adjudication of individual disputes or by so-called "non-rule" rules, where purportedly non-binding statements of policy are made in guidances, operating manuals, staff instructions, or like agency public communications.³⁰⁷ The proposed solutions of these scholars, however, are essentially adjurations to the judiciary to modify or abandon current doctrinal courses. For example, scholars suggest that courts abolish the duty to engage in reasoned decisionmaking and instead conduct a review of rules to determine whether they violate clear statutory or constitutional constraints, or apply Chevron defense more consistently and strictly.³⁰⁸

It may be recognized that only part of the problem facing Congress is simply fixing identifiable structural and interpretive flaws. Part may also be attributable to a lack of political will to confront and deal with complex and sensitive policy issues that major rulemakings often present. Avoidance is the easier path when a court is available to bail you out or an agency is handy to blame. During the CRS-sponsored symposium on "Presidential, Congressional, and Judicial Control of Rulemaking", one panelist, Professor Jack Beermann, expressed the view that making it easier for Congress to overturn an agency rule may come at a high political cost. He asked "Does Congress want to be in the position where [it is perceived] that everything an agency does is their responsibility since they've taken it on and Reviewed it under this mechanism? . . . Do they want to have that perception?" He concluded that "I think that this may just increase the blaming opportunities for Congress."

A good part of the problem also appears to lie in the failure of the Congress to understand and appreciate the nature of the stakes involved and the dangers inherent in failing to act decisively to resolve them. Professor Cynthia Farina appears correct in identifying the legitimacy of the administrative lawmaking process as being at the heart of the deossification, nondelegation and new Presidentialism debates. Her insight is to the necessity of viewing the

legitimacy and operational effectiveness of the regulatory process as a “collaborative enterprise” involving the appropriate official actors and institutional practices is an informing guidepost for action.³⁰⁹

Legislative Options

The following list of legislative options is based on propositions and assumptions extracted from the hearings held by the CAL Subcommittee on the CRA, the CRA symposium, CRS and GAO reports, and academic commentary: (1) Delegation of lawmaking authority to agencies is an unalterable and essential fact of life of the modern administrative state; (2) Agency lawmaking is a surrogate for the Congress, and should be understood as political in nature and openly recognized and treated as such; and (3) Presidential oversight of, and input into, agency lawmaking is appropriate and necessary as long as the review process is transparent, not subject to arbitrary delay, allows for meaningful public participation to be maintained, and displacement of agency authority is avoided.

1. *Amend the CRA to provide that all covered rules must be submitted to Congress cannot become effective until Congress passes a joint resolution of approval.* This would vest optimal control (as well as accountability) over agency rulemaking in Congress. It would presumably also force the agencies (and OIRA) to take into serious consideration evident Congressional concerns before submitting rulemaking proposals. It would require expedited consideration procedures be established in both Houses as well as a special process to assure speedy approval of non-controversial proposed rules. Testimony by the current House Parliamentarian before the Committee indicated that a “deeming” process could be established under the rulemaking authority of each House which would allow summary approval of all rules for which there has been no indication of a need for full consideration by the House, *i.e.*, the filing of a notice of intent by a specific number of Members with a prescribed time period after Congressional receipt of the proposed rule.³¹⁰ Although the internal decisional processes (expedited consideration and the deeming process) could be established by House rule, the requirement of Congressional approval of all rules would require the passage of a new law. Presidential approval of such legislation, however, is likely to be highly problematic.

2. *By rule of each House establish a joint committee to act as a clearinghouse and screening mechanism for all covered rules.* Such a committee would be advisory only, reporting to jurisdictional committees for both Houses its findings with respect to reported rules and recommendations, when appropriate, for action on joint resolutions of disapproval. The House of Representatives would establish by rule an expedited consideration procedure complimentary to the current Senate procedure. The joint committee would be authorized to request reports on submitted rules from GAO assessing such matters as the cost and benefits, cost effectiveness, and legal authority of the subject rule. None of the foregoing would require the passage of legislation requiring Presidential approval.³¹¹ There was recognition among witnesses at the

³⁰⁹Farina, *supra* note 305, at 232, 235, 238.

³¹⁰For a more detailed description of such process and a discussion of its constructional basis, see Morton Rosenberg, “*Whatever Happened to Congress Reviews of Agency Rulemaking? A Brief Overview, Assessment, and Proposal for Reform.*” 51 Admin. L. Rev. 1051, 1083-1090 (1999).

³¹¹An appropriation to cover the costs of GAO’s new assessment tasks would likely be (continued...)

Committee's hearings and panelists at the CRS symposium that the establishment of a joint Congressional committee that would screen rules and recommend action to jurisdictional committees in both Houses could provide the coordination and information necessary to inform both bodies sufficiently and in a timely manner to allow them to take appropriate actions under current law. The balanced nature of such a joint committee and its lack of substantive authority appears to provide a way to allay political concerns regarding "turf" intrusions. House Parliamentarian John V. Sullivan agreed that such a joint committee was a viable construct.

3. *Amend the CRA to direct that reports to Congress and GAO of covered rules are to be submitted electronically.* The House Parliamentarian and other witnesses and symposia panelists have indicated that the paperwork burden on the Parliamentarian's office as well as the uncertainties of proper receipt by Congress and timely redirection to the appropriate committees, and other problems with paper submissions, would be relieved by electronic submissions.

4. *Amend the CRA to require the reporting of only "major rules."* This option has been suggested by witnesses and panelists as a way to limit the screening burden on committees. It is based on the assumption that only "major rules" are likely to raise significant Congressional review issues. At present, however, the CRA allows only the Administrator of OIRA to designate which rules are to be deemed "major." There may be some reluctance in Congress to allow OIRA to alone determine which rules would be subject to review. Also, even a rule that may be conceded to be "minor," in the sense of it having minimal economic impact, may well have a significance to Congressional constituencies that are worth of addressing. The difficulty is designating a determiner that is politically acceptable and constitutionally appropriate. The Supreme Court's ruling in *INS v. Chadha*,³¹² the legislative veto case, precludes authorizing legislative committees or officers from selecting particular rules and ordering agencies to report them for review. In view of the practical and legal problems, it may well be that the current requirement of blanket rule reporting, perhaps supplemented by a screening body, such as the suggested joint committee, would be more acceptable.

5. *Amend the CRA to make it clear that failing to report a covered rule renders the rule unenforceable and is subject to judicial review.* The failure to have an unquestionably enforceable reporting requirement undermines the purpose fo the CRA. Legislative clarity with respect to that intent is essential.

6. *Amend the CRA to make it clear that an up-or-down vote is on the entire reported rule.* The credible threat of Congressional review will presumably force agencies to carefully tailor their rules with more attention to Congressional expectations. Expedition in the review process, however, is vital so as not to undermine agency enforcement and the certainty needed by the regulated community. The possibility of conflicting disapproval resolutions from each House, and long, perhaps unsuccessful conference committee deliberations, may undermine the intended purpose of the CRA. The CRA should make clear this purpose. The following option, however, may ameliorate the concern over the up-or-down vote on the entire rule.

7. *Amend the CRA to provide that if a rule is disapproved, an agency is prohibited from repromulgating only those provisions of the rule that the review process and floor debates on*

³¹¹(...continued)
necessary.

³¹²462 US. 919 (1983).

disapproval clearly identify as objectionable. Such a qualification to the CRA review process is supported by legislative intent of the sponsors of the CRA. If the option of creation of a joint committee is adopted, it would be consonant with the purpose of such a screening committee to charge it with identifying the discrete problems of the rule that were objectionable. The House resolutions establishing the joint committee could require making such an identification part of its recommendation for actions. That would obviate the necessity of legislative amendment to re-establish agency authority in an area after passage of a disapproval resolution.

Areas for Additional Research

In addition to, or possibly as a supplement to, these areas of possible legislative action, a number of issues regarding Congressional review of rules bear further examination by ACUS or some other body. They include the following:

- How effective has the Congressional Review Act been in improving Congressional oversight of the rulemaking process? Does the Act need to be amended/replaced? For example:
 - Should agencies still be required to send all rules to the House, Senate, and GAO or should reporting be limited to just “major” or “significant” rules?
 - Should Congress amend the CRA to require electronic reporting of rules Congress and GAO?
 - How are GAO’s reports handled by Congress? Do they need refinement?
 - Should there be an expedited procedure for House consideration of rules reported for review?
 - Should Congress clarify that an agency’s failure to report a covered rule renders the rule unenforceable and makes it subject to judicial Review?
 - Should Congress clarify how not to run afoul of the “substantially the same” prohibition in the CRA?
 - Should the “legislative day” measure be clarified since it is so unpredictable in terms of calendar days?
 - Should Congress adopt the changes in the CRA process that were contemplated by H.R. 3148 in the 109th Congress, including the proposal to establish a joint Congressional committee to screen and recommend proposed rules for disapproval? If so, should it provide the joint committee with authority envisioned in the Truth in Regulating Act to require the GAO to provide assessments of selected rules

- Other than the Congressional Review Act, what other options does Congress have to prevent the implementation of an agency rule (e.g., appropriations riders)? How common are such approaches? Are they effective?
- Should Congress establish a “Congressional Office of Regulatory Analysis” to help it oversee the agencies’ compliance with various rulemaking requirements? If so, should it follow the format envisioned in the Truth in Regulation Act (e.g., be established within the Government Accountability Office, require assessment of all rulemaking requirements, etc.)? If so, should Congress simply reauthorize and fund TIRA?
- Should Congress affirmatively approve all major rules (e.g., those with a \$100 million annual impact on the economy) before they take effect instead of the current scheme of making all final rules, major or minor, subject to review and possible disapproval?

IV. Judicial Review of Rules

Rulemaking and Judicial Review Under the APA

Section 4 of the APA, codified at 5 U.S.C. § 553, establishes the general procedures that an agency must follow when promulgating a rule.³¹³ Rulemaking under this section is referred to as “informal,” or “notice and comment” rulemaking, and requires an agency to publish notice of a proposed rulemaking in the Federal Register, provide opportunity for the submission of comments by the public, and to publish a final rule and a general statement of basis and purpose in the Federal Register “not less than 30 days before its effective date.”³¹⁴ The APA also establishes a general presumption in favor of judicial review of agency rulemaking activity by providing that the action “of each authority of the Government of the United States” is subject to review, except where “statutes preclude judicial review,” or “where agency action is committed to agency discretion by law.”³¹⁵ The APA likewise contains provisions proscribing generally the scope of judicial review of agency action, categorizing them at 5 U.S.C. § 706 as follows:

Scope of review

To the extent necessary to decision and when presented, the reviewing court shall decide all relevant questions of law, interpret constitutional and statutory provisions, and determine the meaning or applicability of the terms of an agency action. The reviewing court shall -

- (1) compel agency action unlawfully withheld or unreasonably delayed; and
- (2) hold unlawful and set aside agency action, findings, and conclusions found to be -
 - (A) arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law;
 - (B) contrary to constitutional right, power, privilege, or immunity;
 - (C) in excess of statutory jurisdiction, authority, or limitations, or short of statutory right;
 - (D) without observance of procedure required by law;
 - (E) unsupported by substantial evidence in a case subject to sections 556 and 557 of this title or otherwise reviewed on the record of an agency hearing provided by statute; or
 - (F) unwarranted by the facts to the extent that the facts are subject to trial de novo by the reviewing court.

³¹³5 U.S.C. § 553 (2000).

³¹⁴*Id.* at § 553(c), (d). Under the APA, a rule is defined as “the whole or part of an agency statement of general or particular applicability and future effect designed to implement, interpret, or prescribe law or policy or describing the organization, procedure, or practice requirements of an agency and includes the approval or prescription for the future of rates, wages, corporate or financial structures or reorganizations thereof, prices, facilities, appliances, services or allowances therefore or of valuations, costs, or accounting, or practices bearing on any of the foregoing.” *Id.* at § 551(4).

³¹⁵*Id.* at § 701.

In making the foregoing determinations, the court shall review the whole record or those parts of it cited by a party, and due account shall be taken of the rule of prejudicial error.³¹⁶

The standards delineated at section 706 are laid out in general terms, and the APA itself does not provide any further information clarifying the manner in which these standards are to be applied. Accordingly, the proper interpretation of these provisions has been the focus of substantial judicial consideration, resulting in several Supreme Court decisions that have significantly impacted agency rulemaking efforts under the APA.³¹⁷ As a general rule, courts defer to agency policy decisions, predicated upon the notion that federal regulatory agencies have greater expertise in assessing and responding to the technical complexities that underlie regulations. Apart from basic procedural deficiencies, there are two main reasons a court will strike down a rule. First, a reviewing court will generally only invalidate agency rules that are unlawful, in that they violate constitutional provisions or lack statutory authority. Second, a court can invalidate a statutorily authorized rule that is arbitrary or capricious in nature.

The Chevron Doctrine. Regarding this first category of basic lawfulness, the court will first look to ensure that the rule meets minimum constitutional requirements. Once this hurdle is passed, the court will then look to see whether the challenged regulation is within the agency's legal authority. Generally speaking, the court simply looks to see whether the rule in question is authorized by an act of Congress. In *Chevron v. Natural Resources Defense Council*, the Supreme Court established a two-part test for judicial review of agency statutory interpretations.³¹⁸ First, a reviewing court must determine "whether Congress has directly spoken to the precise question at issue."³¹⁹ If a court finds that there has been an express Congressional statement, the inquiry is concluded, as the court "must give effect to the unambiguously expressed intent of Congress."³²⁰ In the event that Congress has not unequivocally addressed the issue, a reviewing court must respect an agency's interpretation, so long as it is permissible.³²¹ The Court further stated that:

If Congress has explicitly left a gap for the agency to fill, there is an express delegation of authority to that agency to elucidate a specific provision of the statute by regulation Sometimes the legislative delegation to an agency on a particular question is implicit rather than explicit. In such a case, a court may not substitute its own construction of a statutory provision for a reasonable interpretation made by the administrator of an agency.³²²

The Court went on to note that "[j]udges are not experts in the [technical] field, and are

³¹⁹*Id.* at 842.

³²⁰*Id.* at 843.

³²¹*See INS v. Aguirre-Aguirre*, 526 U.S. 415, 424 (1999).

³²²*Chevron*, 467 U.S. at 843-44.

not part of either political branch of the Government,” while agencies, as part of the executive branch, appropriately make “policy choices – resolving the competing interests which Congress itself either inadvertently did not resolve, or intentionally left to be resolved by the agency charged with the administration of the statute in light of everyday realities.”³²³ Thus, the rationale for this deference is predicated upon the notion that it is not the role of the judiciary to “assess the wisdom” of policy choices and resolve the “struggle between competing views of the public interest,” as well as an agency’s greater expertise regarding the subject matter of the regulations.³²⁴

Essentially, if the statute is silent or ambiguous, the court’s inquiry must focus on whether the agency’s action is based on a permissible construction of the statute. This is an important point, because *Chevron* does not stand for the proposition that the agency has to construe the statute in the most logical manner, or that the court has to even agree with the agency. Instead, courts must respect a reasonable interpretation, given that Congress has delegated the responsibility for administering the particular program in question to the agency.

There are two basic justifications for this approach, as opposed to a standard that would require an agency to implement regulations that are seen as optimal by the judiciary. First is again the notion that administrative agencies are more familiar with the often complex subject matter at issue, and are therefore better suited to ascertain how general principles or legislative commands should be applied in a specific regulatory context. The second argument for deference to an agency’s construction of a statute is that statutory interpretation requires agencies to make policy judgments, and that these policy judgments should be made by agencies overseen by Congress, on the basis that it is not the proper role of the judiciary to evaluate the merits of competing policy proposals. Given this, the Supreme Court determined in *Chevron* that deference to regulatory agencies is reasonable, while stressing that deference is not abdication.

As applied through the *Chevron* review dynamic, the APA has been described as creating an agency-court partnership. The maxim of judicial deference delineated in *Chevron*, however,

³²³*Chevron*, 467 U.S. at 865. In *Cablevision Sys. Dev. v. Motion Picture Ass’n*, 836 F.2d 599, 608-609 (D.C. Cir. 1988), the court noted that, “*Chevron*’s rationale for deference is based on more than agency expertise.” Elaborating, the court stated, “Like the Court in *Chevron*, we are faced with several interpretations of ambiguous language which really involve competing policies among which Congress did not explicitly choose. We see no reason to deny the Copyright Office’s legitimacy in selecting, as the EPA did in *Chevron*, among those choices so long as the interpretation selected is reasonable.” *Id.* at 609.

³²⁴*Chevron*, 467 U.S. at 866; *Rust v. Sullivan*, 500 U.S. 173, 187 (1991). It should be mentioned that the Supreme Court revisited *Chevron* in *FDA v. Brown & Williamson Tobacco Corp.*, 529 U.S. 120 (2000), declaring that the Food & Drug Administration lacks jurisdictional authority to regulate tobacco products. In reaching this determination, the Court discussed the first prong of *Chevron*, declaring that the proper analysis is to focus not only on the statutory clause, but rather to consider the structure, function, and history of all relevant provisions, interpreting a statute “as a symmetrical and coherent regulatory scheme.” *Id.* at 1294. Upon concluding that Congress “squarely rejected proposals to give the FDA jurisdiction over tobacco,” the Court stated that it was “obliged to defer not to the agency’s expansive construction of the statute, but to Congress’ consistent judgment to deny the FDA this power.” *Id.* at 1315. This reasoning centers on an analysis of the unique regulatory scheme created for tobacco products under the first prong of the *Chevron* test, and, as such, does not appear to impact the traditional inquiry as it applies to the issue at hand.

has given rise to a significant degree of confusion as courts have attempted to balance judicial deference to agency action with traditional legal principles. This tension is perhaps most apparent when considering recent Supreme Court decisions addressing the issue of what the degree of such deference should be, and to what types of agency action should this deference adhere.

In *United States v. Mead*, for instance, the Supreme Court held that *Chevron* deference should only be accorded in instances where Congress intended to grant an agency the authority to issue rules with the force of law. The Court stated that such Congressional intent could be demonstrated by some other indication than a grant of authority to conduct notice and comment rulemaking, but did not specify what would constitute such an indication. The holding in *Mead* did specify, however, that interpretive rules do not qualify for *Chevron* deference. The practical effect of this determination was to require agencies to engage in notice and comment rulemaking in order to qualify for *Chevron* deference. Under this dynamic, agencies that do not engage in such rulemaking are still eligible for a lesser degree of deference pursuant to the holding in *Skidmore v. Swift & Co.*³²⁵ While the Court's decision in *Mead* limited the regulatory flexibility that had been enjoyed by agencies, it served concordantly to limit the practice on the part of agencies of promulgating rules with practical legal effect without following notice and comment procedures.

Justice Scalia dissented from the decision, declaring that the Court's holding would encourage agencies to engage in notice and comment rulemaking in instances where less resource-intensive procedures would suffice.³²⁶ Justice Scalia also asserted that the holding would lead to the "ossification of large portions" of statutory law, as agencies would be bound by judicial interpretations of statutes that were deemed to be outside the scope of the *Chevron* standard. According to Justice Scalia, this effect could be avoided only if agencies were able to effectively overrule judicial decisions, a development that would mark "a landmark abdication of judicial power."³²⁷

The Supreme Court revisited *Mead* in *National Cable & Telecommunications Ass'n v. Brand X Internet Services*, delivering a holding that could decrease agency incentives to engage in notice and comment rulemaking.³²⁸ Specifically, the Court held that a "court's prior judicial construction of a statute trumps an agency construction . . . only if the prior court decision holds that its construction follows from the unambiguous terms of the statute and thus leaves no room for agency discretion."³²⁹ According to the Court, a contrary position would vitiate Congressional intent by "allow[ing] a court's interpretation to override an agency's."³³⁰ The Court went on to note that a differing approach would also lead to the anomalous result that

³²⁵323 U.S. 134 (1944). In *Skidmore*, the Court held that "[t]he weight of such a[n] agency judgment in a particular case will depend upon the thoroughness evident in its consideration, the validity of its reasoning, its consistency with earlier and later pronouncements, and all those factors which give it power to persuade, if lacking power to control." *Id.* at 140.

³³⁰*Id.*

“whether an agency’s interpretation of an ambiguous statute is entitled to *Chevron* deference would turn on” whether an agency or a court had been the first to issue an interpretation.³³¹ Finally, echoing Justice Scalia’s dissent in *Mead*, the Court stated that a contrary holding would “lead to the ossification of large parts of our statutory law.”³³²

Justice Scalia dissented from the Court’s holding in *Brand X*, stating that the agency’s construction of the statute at issue was implausible, and further characterized the Court’s holding as an ineffectual approach to remedying the effects of the decision in *Mead*.³³³ Repeating his criticism that *Mead* had inappropriately limited the types of agency action that qualified for *Chevron* deference, Justice Scalia argued that the holding in *Brand X* would now make “judicial decisions subject to reversal by Executive officers.”³³⁴ Justice Scalia went on to argue that as “Article III courts do not sit to render decisions that can be reversed or ignored by Executive officers,” the Court was validating unconstitutional outcomes in a holding that would engender significant confusion and uncertainty.³³⁵

Arbitrary or Capricious Review. In analyzing agency regulations that are statutorily based, a court may nonetheless invalidate a rule that is deemed arbitrary or capricious. This standard of review, which is traditionally applied to informal rulemaking, is not clearly defined, and the judiciary’s interpretation of the meaning of this standard has changed substantially over the past thirty years. Until the 1970s, arbitrary or capricious review was extremely deferential, essentially requiring only that a regulation fall within the scope of legally delegated authority.³³⁶ This broadly deferential standard adhered until the Supreme Court handed down its decision in *Citizens to Preserve Overton Park, Inc. v. Volpe* in 1971, which established a dynamic that has led to more stringent review of rules.³³⁷

Overton Park dealt with an informal adjudication conducted by the Secretary of Transportation approving the release of federal funds for use in the construction of a highway through a park in Memphis, Tennessee.³³⁸ This approval was challenged as a violation of laws prohibiting the use of federal funds for highway construction through public parks so long as a “feasible and prudent” alternative route could be utilized. After determining that the arbitrary or capricious test controlled review of informal agency action, the Court construed the standard to require reviewing courts to analyze whether an agency decision was based on “a consideration of

³³⁸*See* Peter L. Strauss, *Revisiting Overton Park: Political and Judicial Controls Over Administrative Actions Affecting the Community*, 39 UCLA L. Rev. 1251 (1992).

the relevant factors and whether there had been a clear error in judgment³³⁹ The Court further instructed that while this inquiry into the facts must be “searching and careful, the ultimate standard of review is a narrow one,” stressing that a court “is not empowered to substitute its judgment for that of the agency.”³⁴⁰ The *Overton Park* Court remanded the case, so that, in its words, the lower court could conduct a “thorough, probing, in-depth review of the administrative record underlying the Secretary of Transportation’s decision.”³⁴¹ While the Court dictated this approach in the context of an informal adjudicative proceeding, it has been consistently applied to informal rulemaking as well.³⁴²

The language used by the Court in *Overton Park* is at once instructive yet ambiguous. The Court declares that judicial review under the arbitrary and capricious standard is to be “searching and careful,” while simultaneously espousing a deferential approach to review of informal agency action by stating that the judiciary “is not empowered” to impose its judgment on an agency. It has been asserted that courts applying the precepts of *Overton Park* “tend to ignore all but the mandate to conduct a ‘searching and careful’ inquiry,” slipping into a “a more active role than was intended for arbitrariness review.”³⁴³ In turn, this increased level of scrutiny has been cited as facilitating the development of what has come to be referred to as the “hard look” doctrine of arbitrary and capricious review. This approach has been characterized as obliging a reviewing court “to examine carefully the administrative record and the agency’s explanation, to determine whether the agency applied the correct analytical methodology, applied the right criteria, considered the relevant factors, chose from among the available range of regulatory options, relied upon appropriate policies, and pointed to adequate support in the record for material empirical conclusions.”³⁴⁴

The Supreme Court implicitly endorsed the hard look doctrine in *Motor Vehicle Manufacturers Association v. State Farm Mutual Automobile Insurance Co.*³⁴⁵ The *State Farm* holding centered on a decision by the Secretary of Transportation to rescind a rule issued by a prior administration requiring new cars to be equipped with automatic seatbelts or airbags. This decision was based on the agency’s determination that the rule would be ineffective due to the ability of customers to simply detach the automatic seatbelts. The Court began its analysis of the agency’s decision by determining that arbitrary and capricious review was appropriate, and reiterated the maxim from *Overton Park* that such review is “narrow and a court is not to substitute its judgment for that of the agency.”³⁴⁶ The Court then went on to state:

Normally, an agency rule would be arbitrary and capricious if the agency has

relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise.³⁴⁷

Applying this standard, the Court rejected the agency's action for two reasons. First, the Court found that the agency had failed to consider the possibility that inertia would have caused a substantial number of people to leave the seatbelts attached.³⁴⁸ Additionally, the Court found it significant that the Department of Transportation had failed to explain why it did not consider implementing a mandatory airbag or non-detachable restraint option.³⁴⁹ Given these omissions, the Court held that the agency had "failed to offer the rational connection between facts and judgment required to pass muster under the arbitrary and capricious standard."³⁵⁰ Finally, while noting that an "agency's view of what is in the public interest may change, either with or without a change in circumstances," the Court stressed that "an agency changing its course must supply a reasoned analysis" for such a change.³⁵¹ Holding that "the agency has failed to supply the requisite 'reasoned analysis' in this case," the Court remanded the matter to the agency for further consideration.³⁵²

As noted above, the Court in *State Farm* adopted the hard look doctrine while continuing to assert, as it had in *Overton Park*, that a reviewing court is not to substitute its judgment for that of the agency. This dichotomy between what, on the one hand, appears to be a very broad grant of discretion to a reviewing court and the much more restrictive notion that the courts are not to usurp agency judgment has been focused upon by both proponents and critics of the hard look standard. Some commentators have argued that the hard look doctrine is essential to allow for an appropriate level of judicial scrutiny of an agency's exercise of power, in that it ensures that agency decisions are not controlled by narrow private interests or an agency's own "idiosyncratic view of the public interest."³⁵³ Further, it is argued that the doctrine keeps the courts from engaging in a simplistic review to determine whether a regulation is merely within the bounds of a statutory directive by requiring the court to study the agency's decisionmaking process to make sure that the agency carefully deliberated the issues at play.³⁵⁴ There are certainly cases that have highlighted the deferential aspects of the *State Farm* decision, such as *Center for Auto Safety v. Peck*, where the D.C. Circuit Court stated that it would uphold a rule

³⁵⁴*Id.*

containing uncertainties, analytic imperfections, or even mistakes, as long as the agency's decisions were within the range of those that a reasonable person could derive from the evidence presented.³⁵⁵

On the other end of the spectrum, critics of hard look review maintain that it allows for so much judicial discretion "that a single unsympathetic or confused reviewing court can bring about a dramatic shift in focus or even the complete destruction of an entire regulatory program."³⁵⁶ An often cited example of this potential is the Fifth Circuit's decision in *Corrosion Proof Fittings v. EPA*.³⁵⁷ In that case, the court overturned a regulation regarding asbestos exposure that had involved a wide range of scientific studies and the receipt of over 200 comments. The court rejected the rule based on the fact that the EPA had not calculated the costs and benefits of each possible intermediate level of regulation.³⁵⁸ According to one commentator, the court's decision tasked the EPA with conducting a "potentially endless analytical crusade in search of the holy grail of the least burdensome alternative that still adequately protected against unreasonable risk," and did not defer "one whit to EPA's interpretation of its statute or to its exercise of rulemaking expertise."³⁵⁹ It has been argued that the establishment of a more stringent review dynamic in *Overton Park*, coupled with the adoption of the hard look doctrine in *State Farm*, has caused the rulemaking process to become more rigid and burdensome upon agencies. In turn, this has led to the assertion that rulemaking has become "ossified," with agencies either undertaking resource and time intensive steps to ensure that a rule will withstand increased scrutiny, or circumventing the traditional notice and comment rulemaking process by issuing policy statements and interpretive rules to effectuate compliance with a regulatory agenda.³⁶⁰

In light of the above analysis, it is apparent that the evolution of judicial review of agency rulemaking since the decision in *Overton Park* has had a significant impact in the regulatory context. Competing viewpoints on the propriety and effectiveness of the hard look doctrine, however, illustrate a lack of consensus on the nature of this impact. Proponents of judicial review characterize it as a tool that improves agency regulatory efforts by making agencies aware of Congressional mandates, improving analytical rigor, and increasing agency

Rev. 99 (1992) ("Contrary to the criticisms of those who would rewrite toxic substance control statutes, or restrict the scope of judicial review under these statutes, *Corrosion Proof Fittings* illustrates the importance of the substantive protections accorded private parties under the current toxic substances regulatory statutes. In particular, the Fifth Circuit's decision in *Corrosion Proof Fittings* is a case study in how judicial review can prevent inefficient and wasteful regulation of toxic substances. The court's decision recognizes that toxic substances are neither completely safe nor completely unsafe. Rather, according to the court, the opportunity costs of not using the substance must be balanced against the benefits which would accrue from a ban.").

³⁶⁰Lubbers, *supra* note 317, at 485.

responsiveness to those impacted by regulation.³⁶¹ Alternatively, as touched upon above, critics of judicial review maintain that it has had a debilitating effect on the regulatory environment by imposing onerous requirements on the development of new rules, either significantly delaying the promulgation of rules or encouraging agencies to avoid traditional rulemaking whenever possible.³⁶² These conflicting perspectives could be analyzed more objectively through the development of objective empirical data that could serve to “inform decision making about whether to expand or contract opportunities for judicial review.”³⁶³ Various studies have been conducted attempting to evaluate the number of challenges to agency rulemaking efforts and the effect of judicial review thereon. It has been stated, however, that “administrative law scholars have failed generally to produce systematic empirical analysis of the effects of judicial review.”³⁶⁴

Empirical Data and Anecdotal Information

The few empirical studies that have been conducted tend to evaluate the success rate for federal agency rules that are subjected to judicial review, by concluding generally that increased judicial scrutiny has had a substantial effect on agency rulemaking. In 1990, Peter H. Schuck and E. Donald Elliot published a thorough empirical study regarding judicial review of agency rulemaking.³⁶⁵ The goal of this study was to analyze the outcome of direct appellate court review of federal agency actions, and the scope of the study and its design might be viewed as instructive as to why such empirical analyses are rare in the field of administrative law. The study’s sample sets identified a total of 2,472 cases for review, with case analyses, interviews, and data recordation performed by law students at Georgetown and Yale from early 1987 to March 1989. The collected data were then coded, error corrected and subsequently entered into a computer for preliminary analysis.³⁶⁶ Among the numerous findings contained in the study, the authors reported: (1) that “[b]etween 1965 and 1985, administrative law became more complex and technical,” and that there was a dramatic growth in judicial caseloads, with the number of administrative law cases decided on the merits increasing “from 489 cases in 1965 to more than 1567 cases in 1987;”³⁶⁷ (2) that rates of affirmance by courts in administrative law cases ranged from 55.1% in 1965, to 60.6% in 1975, and to 76.6% in 1984-85;³⁶⁸ (3) that the rate of

affirmance was consistently lower in the D.C. Circuit from 1965 through 1988 as compared to other federal appellate courts;³⁶⁹ and (4) that in instances where courts remanded a matter to an agency for further consideration the agencies adopted “major changes” in 40% percent of the cases, and appeared “to do so primarily because of the remand.”³⁷⁰

According to the authors, the most important finding that emerged from their “twenty-year punctuated longitudinal analysis” was their determination that “the circuit courts are affirming agency decisions at a steadily increasing rate, a rate that approximated 76% in 1984-85, and reached over 81% in 1985— just after [the court’s decision in] *Chevron*.”³⁷¹ This finding has led to the general assertion that the deferential aspects of the *Chevron* decision, as discussed above, have “increased the rate of affirmance of agency actions by about 15 percent.”³⁷²

While there have been no updates or subsequent studies conducted according to the parameters of the Schuck and Elliot study, it is interesting to note that aggregated data from the Administrative Office of the United States Courts (AO) indicate that while the judicial caseload in the administrative context has not increased dramatically since the conclusion of the study, it nonetheless remains substantial. Specifically, the AO has released raw data indicating that there have been roughly 15,000 lawsuits pertaining to agency regulatory activity from 1995 through September 30, 2004.³⁷³

While the aforementioned study reported that roughly between 70 and 80 percent of regulations are upheld when challenged in federal court, a more recent study focusing on the EPA’s record in the D.C. Circuit in particular found a significantly lower success rate for that agency. Specifically, in 2000, the Reason Public Policy Institute (RPPI) published a study analyzing the success rate of substantive challenges to Environmental Protection Agency rules in the United States Court of Appeals for the District of Columbia Circuit during the Clinton Administration.³⁷⁴ The study identified 69 such cases, determining that the EPA won only 23 (33.33 percent) of these challenges, with the court striking down all or a substantial portion of the challenged rule in 53.62 percent of the cases. While noting that anecdotal evidence from other appellate courts indicated a higher success rate for the EPA, the RPPI study opined that this disparity might stem from the fact that few of the cases considered in other courts involved

³⁶⁸(...continued)

protocols in this context, the authors noted that information obtained from the Administrative Office of the United States Courts (AO) regarding this category differed from the findings of their study, with the AO reporting a 75% affirmance rate for 1965, a 70% affirmance rate for 1975 and a 75.9% affirmance rate for 1984-85. *Id.* at 1009-1010.

“challenges to broad regulatory decisions by the EPA,” and concluded its analysis by asserting that the low rate of affirmance in the D.C. Circuit was the result of deficiencies in the EPA’s development and execution of its regulatory agenda.³⁷⁵

These two studies appear to constitute the bulk of empirical information available analyzing the impact of judicial review on agency rulemaking efforts, and the data contained therein could be cited as either supporting or undermining the general assertion that the evolution of judicial review since *Overton Park* has contributed to the “ossification” of the rulemaking process. Indeed, in their concluding remarks regarding their extensive study, Schuck and Elliot declared:

Our own methodology is far from perfect. The conclusions to be drawn can be no better than the data on which they are based, and the data relating to some of the most interesting characteristics of decided cases are impressionistic and subject to competing interpretations. Even apart from these problems, our analysis failed at certain points to accomplish what we hoped.³⁷⁶

Whatever conclusions might be drawn from the data presented above, it should be noted that there is a large body of anecdotal information that has been cited by commentators as evidence that the arbitrary or capricious standard is being applied in such a fashion as to contribute significantly to the ossification of the rulemaking process.³⁷⁷ In particular, stringent judicial review is generally seen as at least partially responsible for changing the notice and comment process from a simple affair, to a complex and time consuming matter where, according to Justice Breyer, agencies “establish procedures to consider thoroughly all alternatives in every case,” which will only cause “considerable unproductive delay.”³⁷⁸ Finally, as touched upon above, it has been argued that this increased review has led agencies to fear judicial rejection to the degree that it has generally reduced agency willingness to engage in rulemaking altogether.³⁷⁹ At the same time, however, other commentators have asserted that the adverse effects of judicial review have been overestimated. Professor Cary Coglianese, for example, maintains that “[t]he empirical evidence for a retreat from rulemaking in the face of stringent judicial review is not nearly as clear as has been generally supposed.”³⁸⁰ In support of this position, Professor Coglianese cites findings showing that “the number of pages in the Code of Federal Regulations (CFR) has grown consistently over the years, even in the face of the

³⁸⁰Coglianese, *supra* note 361, at 1127.

courts' hard look review in the 1970's,"³⁸¹ and that "only a fraction of agency rules are ever subject to petitions for review."³⁸²

These competing scholarly viewpoints, coupled with the practical and analytical difficulties adhering to empirical analysis in this context, make it difficult to offer any determinative conclusion regarding the degree to which heightened judicial scrutiny has impacted agency rulemaking. It should be noted, however, that the CAL Subcommittee has sponsored an extensive empirical study of judicial review of agency rulemaking as part of the Administrative Law, Process and Procedure Project for the 21st Century. The CAL Subcommittee recruited Professor Jody Freeman of the Harvard Law School to conduct a study to ascertain what happens to agency rules upon appellate judicial review, with the aim of determining the rate at which rules are invalidated in whole or in part, and the reasons for that invalidation. The study is focusing on data derived from administrative agency appeals from 1995 to 2004. The data consists of 3,075 cases drawn from an initial database of over 10,000 cases involving administrative appeals from every circuit court over that time frame maintained by the AO. Professor Freeman's study is ongoing, but she discussed the methodology of the study and presented the preliminary findings of the study at a September 11, 2006 symposium on "Presidential, Congressional, and Judicial Control of Agency Rulemaking," that was hosted by CRS as part of the Committee's project. While the study is ultimately expected to yield significant and useful empirical data on the success of challenges to agency rules in the appellate courts, the limitations of this type of study might be seen as providing further evidence of the utility of a reconstituted ACUS. As Professor Freeman noted in her comments at the symposium, these types of studies do not give rise to a coherent and comprehensive empirical strategy that will foster optimal analysis of the administrative process for the long term. Rather, it could be argued that only an entity such as a reconstituted ACUS will have the ability to assemble a group of experts with the aim of formulating a cohesive methodology that will be supported by ongoing and systematic analysis.

Potential Congressional Options

In the event that Congress determines that judicial review of rules has adversely affected the agency rulemaking process to a degree meriting legislative intervention, the question turns to what steps might be taken to mitigate the impact of such review. There are several potential approaches available to Congress in this regard. Justice Breyer, for instance, has advocated the creation of a specialized administrative court to review rules.³⁸³ Conversely, whereas the Congressional Review Act establishes procedures for enacting joint resolutions of disapproval to strike down newly promulgated rules,³⁸⁴ Congress could act to establish a system whereby rules become effective only after the enactment of a joint resolution of approval, or, alternatively,

³⁸¹*Id.* at 1127-1128.

³⁸²*Id.* at 1129.

³⁸³See Breyer, *supra* note 378, at 68-72.

³⁸⁴5 U.S.C. §§ 801, *et seq.* (2000); *see also*, Morton Rosenberg, *Congressional Review of Agency Rulemaking: An Update and Assessment After Nullification of OSHA's Ergonomics Standard*, CRS Report RL30116.

could prescribe more deferential standards for judicial review.³⁸⁵ Another potential approach might be for Congress to preclude judicial review of agency rules altogether.

Generally speaking, there is a strong presumption in favor of judicial review of administrative action, and the courts will infer a right to judicial review in the face of legislative silence.³⁸⁶ It is well established, however, that this presumption may be overcome by “specific language or specific legislative history that is a reliable indicator of congressional intent”, or a specific congressional intent to preclude judicial review that is ‘fairly discernable’ in the detail of the legislative scheme.³⁸⁷ Accordingly, Congress could alter the current statutory dynamic to effect a blanket preclusion of judicial review of all agency rulemaking activity, or, conversely, could preclude review on a case-by-case basis as it sees fit.³⁸⁸ A recent example of a discrete statutory provision precluding judicial review of agency regulatory actions may be found in the law directing the expeditious construction of the World War II memorial on the National Mall.³⁸⁹ That law contained express language declaring that decisions regarding the location and design of the memorial, as well as the granting of a special use permit, “shall not be subject to judicial review.”³⁹⁰ Addressing claims raised in a lawsuit that agencies involved in the construction had violated various statutes governing their activities, the reviewing court held: “[w]e find that the Act withdrew our subject matter jurisdiction over the statutory claims, and therefore that we lack jurisdiction to entertain them,” subsequently dismissing the suit.³⁹¹

A related, less expansive approach might focus on crafting statutes to limit standing to seek judicial review to specific classes of plaintiffs. Regarding standing generally, the relevant portion of the APA provides:

A person suffering legal wrong because of an agency action, or adversely affected or aggrieved by agency action within the meaning of a relevant statute, is entitled to judicial review thereof Nothing herein (1) affects other limitations on judicial review or the power or duty of the court to dismiss any action or deny

³⁸⁵See, e.g., William S. Jordan, III, *Ossification Revisited: Does Arbitrary and Capricious Review Significantly Interfere With Agency Ability to Achieve Regulatory Goals Through Informal Rulemaking?*, 94 N.W. U. L. Rev. 393, 402 (2000).

³⁸⁶See *Bowen v. Michigan Academy of Family Physicians*, 476 U.S. 667, 670 (1986); *Abbot Laboratories v. Gardner*, 387 U.S. 136, 140 (1967).

³⁸⁷*Michigan Academy*, 476 U.S. at 673 (quoting *Block v. Community Nutrition Inst.*, 467 U.S. 340, 349, 351 (1984)).

³⁸⁸It should be noted that courts interpret such preclusion provisions as not applying to constitutional claims, so as to avoid the “serious constitutional question” that would arise “if a federal statute were construed to deny any judicial forum for a colorable constitutional claim.” *Webster v. Doe*, 486 U.S. 592, 603 (1988) (quoting *Michigan Academy*, 476 U.S. at 681 n.12).

³⁸⁹Pub. L. No. 107-11, 107th Cong., 1st Sess. (2001).

³⁹⁰*Id.*

³⁹¹*National Coalition to Save Our Mall v. Norton*, 269 F.3d 1092, 1094 (D.C. Cir. 2001).

relief on any other appropriate legal or equitable ground; or (2) confers authority to grant relief if any other statute that grants consent to suit expressly or impliedly forbids the relief which is sought.³⁹²

Separate from this general administrative provision are constitutional limitations on standing. Specifically, Article III of the Constitution defines and limits the jurisdiction of the federal courts to adjudication of “cases and controversies.”³⁹³ The Supreme Court has established that to satisfy the requirements of Article III, a party bringing suit must: (1) establish an “injury in fact” (2) caused by the actions of the defendant (3) that is redressable by a favorable judicial decision.³⁹⁴ In addition to constitutional requirements, the judiciary has developed prudential rules to constrain the instances in which review may be obtained. Like their constitutional counterparts, these judicially imposed limits on the exercise of federal jurisdiction are “founded in concern about the proper—and properly limited—role of the courts in a democratic society.”³⁹⁵ The prudential components of the standing doctrine require that: (1) a plaintiff assert his own legal rights and interests rather than those of third parties, (2) a plaintiff’s complaint be encompassed by the “zone of interests” protected or regulated by the constitutional or statutory guarantee at issue, and (3) courts decline to adjudicate “‘abstract questions of wide public significance’ which amount to ‘generalized grievances’ pervasively shared and most appropriately addressed in the representative branches.”³⁹⁶

While Congress may not alter constitutional standing requirements, it may modify or abrogate prudential components by “expanding standing to the full limit allowed by the Constitution.”³⁹⁷ Conversely, in instances where a potential plaintiff might otherwise meet the aforementioned constitutional and prudential requirements, Congress may, “subject to due process dictates,” provide for administrative action while limiting “to a specified class the right to seek judicial review.”³⁹⁸ In essence, Congress is enabled to bind the issues of standing and statutory jurisdiction together,³⁹⁹ giving rise to a dynamic closely related to preclusion of judicial review generally. As stated in *National Wildlife Federation v. Burford*, “[T]he statute at issue will preclude standing if it expresses a fairly discernible congressional intent to forestall a suit at the plaintiff’s behest. Although the plaintiff may fall within a statute’s zone of interest, judicial

review will not occur if the statute suggests the Congress intended to allow only a specific class of plaintiff to challenge an agency's action."⁴⁰⁰

This requirement was established in *Block v. Community Nutrition Institute*, where the Supreme Court determined that processors, but not consumers, of dairy had standing to obtain judicial review of milk market orders issued pursuant to the Agricultural Marketing Agreement Act of 1937 (AMAA).⁴⁰¹ Noting the aforementioned principles governing availability and preclusion of judicial review generally, the Court held that a relevant statute will be deemed to preclude standing for particular plaintiffs whenever Congressional intent to preclude is "fairly discernible in the statutory scheme."⁴⁰² Discussing the AMAA in particular, the Court found a fairly discernible intent to preclude consumers from challenging market orders in light of express provisions in the Act establishing a right of review for processors. The Court emphasized that preclusion would "not threaten realization of the fundamental objectives of the statute" and determined that "consumer suits might themselves frustrate achievement of the statutory purposes" by disrupting the "cooperative venture among the Secretary, producers, and [processors]" as contemplated by Congress, thereby "undermin[ing] the congressional preference for administrative remedies."⁴⁰³ Thus, in addition, or as an alternative to general preclusion of judicial review, the above analysis indicates that Congress could consider structuring statutes according to the precepts laid out in *Brock* to limit perceived negative effects of judicial review of agency rulemaking.

Areas for Additional Research

- Should Congress establish statutorily prescribed rules of "deference" that will apply upon a court's determination that a statutory delegation is ambiguous in light of the confusion engendered by the Supreme Court's decisions in *United States v. Mead* and *National Cable & Telecommunications Ass'n v. Brand X Internet Services*?
- Should Congress amend the judicial review provisions of the APA to clarify the definition of the "arbitrary and capricious" standard in order to address the effects of the Supreme Court's decisions in *Citizens to Protect Overton Park v. Volpe* and *Motor Vehicle Manufacturer's Ass'n v. State Farm Mutual Automobile Insurance Co.*?
- In the event that ongoing empirical studies affirm the anecdotal assumption that appellate courts reverse over 50% of challenged agency regulations either whole

⁴⁰⁰871 F.2d 849, 852 (9th Cir. 1989).

⁴⁰¹467 U.S. 340 (1984).

⁴⁰²*Id.* at 351.

⁴⁰³*Id.* at 352. In a subsequent case, the Court explained that the maxim delineated in *Block* supplements the traditional zone of interests test. It stated, "The inquiry into reviewability does not end with the 'zone of interest' test. In [*Block*], the interests of consumers were arguably in the zone of interests meant to be protected by the Act, but the Court found that point not dispositive because at bottom the reviewability question turns on congressional intent." *Clark v. Securities Industry Ass'n*, 479 U.S. 388, 400 (1987).

or in part, should Congress amend the APA to modify standards of review or seek to limit judicial review through other means?

- Should Congress clarify whether the Information Quality Act permits judicial review?
- Should the APA be amended to make more clear when the courts can remand a rule without vacating it?
- The Chief Counsel for Advocacy of the Small Business Administration has been given unique power under SBREFA to file amicus briefs in cases challenging agency action. How effective/problematic has this been?
- Should Congress address the increasing use of consent decrees that modify or alter the substantive content of agency rules?
- Should Congress amend the APA to address the prudential aspects of standing doctrine in response to judicial decisions regarding private rights of action, ripeness, finality, and exhaustion of administrative remedies?

V. Regulatory Analysis and Accountability Requirements

One of the first and most basic of regulatory accountability requirements was established by the APA, which generally requires that agencies publish their proposed rules in the Federal Register, receive and consider comments on the proposed rules, and then publish a final rule stating its basis and purpose.⁴⁰⁴ Between 1946 and 1980, Congress established dozens of federal agencies and programs designed to improve the environment, make workplaces safer, and protect consumers (e.g., the EPA, OSHA, and the Consumer Product Safety Commission). Subsequently, an array of federal economic, environmental, and social regulations were put in place that affected many of the decisions made by American businesses. Strong concerns then began to be raised about whether the benefits that these regulations and regulatory agencies were attempting to achieve were worth the costs associated with compliance. Concerns were also being raised about the cumulative effects of all federal regulations on individual businesses, and the effects that federal rules were having on particular segments of the economy (e.g., small businesses), and on other levels of government.

Since 1980, there have been numerous attempts in Congress and elsewhere to modify the federal rulemaking process. Underlying many of these “regulatory reform” efforts is a perceived need to reduce the burden associated with regulatory compliance. Proponents of reform contend that federal regulations are too costly, time consuming, complex, and intrusive for businesses and other regulated parties, and that better crafted rules can be developed through, among other things, the use of sophisticated analytical tools and greater oversight by the President and Congress. On the other hand, some contend that these reform efforts focus too much on the costs associated with regulations and do not adequately recognize the benefits that the rules provide. They also argue that additional requirements will have the effect of eroding existing regulatory protections or lengthening an already lengthy rulemaking process, thereby depriving the public of needed health, safety, and environmental improvements.

This chapter discusses a range of regulatory analysis and other accountability requirements that have been established by Congress and Presidents in recent decades. Those initiatives include cost-benefit and risk analysis requirements, small entity “flexibility” analysis and requirements focusing on unfunded mandates, attempts to establish regulatory accounting and budgets, moratoriums on new regulations, reviews of existing regulations, and efforts focusing on paperwork reduction and small businesses. After reviewing these efforts and examinations of them, the chapter concludes by discussing common themes, possible Congressional initiatives, and areas for future study.

Regulatory Analysis Requirements

A common (and some would say the primary) concern voiced by proponents of regulatory reform in recent decades has been that the costs associated with regulations often outweigh the benefits that those regulations are intended to provide. Another, and somewhat related, view is that more intelligent regulatory policies could achieve the same social goals

⁴⁰⁴William West, *Administrative Rulemaking: An Old and Emerging Literature*, 65 Public Admin. Rev., Nov./Dec. 2005, at 655-668 (“If rulemaking is subject to many controls, notice and comment remains the most basic and important.”)

(e.g., cleaner environment, safer workplaces) at much less cost (or achieve more ambitious goals at the same cost).⁴⁰⁵ To improve the quality and effectiveness of federal rules and minimize burden, regulatory reform proponents have frequently advocated greater use of a range of analytic tools during the rulemaking process, including cost-benefit analysis (sometimes referred to as benefit-cost analysis), cost-effectiveness analysis, and risk assessment.

“Cost-benefit analysis,” in this context, involves the systematic identification of all costs and benefits associated with a forthcoming regulation, including nonquantitative and indirect costs and benefits, and how those costs and benefits are distributed across different groups in society. A proposed regulatory requirement is judged to pass the “cost-benefit test” if the sum of its anticipated benefits outweighs the sum of its present and future costs in present value terms.

These prospective (also known as *ex ante*) estimates of benefits and costs that are done before rules are issued are necessarily uncertain and heavily dependent on numerous assumptions. Particularly difficult to quantify are long-term or uncertain effects of rules where subtle interactions between various factors are often not well understood or directly measurable. Cost-benefit analysis is particularly controversial when it seeks to rationalize inherent value trade-offs and to place a value on benefits not traded in the market (e.g., health or lives).⁴⁰⁶ Also, as the Supreme Court affirmed in 2001, some statutes prohibit the consideration of costs when setting certain health standards.⁴⁰⁷ These concerns notwithstanding, most economists believe that, when used carefully and with adequate data, cost-benefit analysis can be an effective tool in regulatory decisionmaking.⁴⁰⁸

“Cost-effectiveness analysis” seeks to determine how a given goal can be achieved at the least cost. In contrast to cost-benefit analysis, the concern in cost-effectiveness analysis is not with weighing the merits of the goal, but with identifying and analyzing the costs of alternatives to reach that goal (e.g., dollars per life saved). Cost-effectiveness analysis has been referred to as a “bang-for-the-buck” exercise in which the payoff is measured in health units rather than dollars. It is commonly seen as a better tool than cost-benefit analysis for uncovering cases in which large incremental costs result in minor gains. A disadvantage of this type of analysis is that misjudgments in determining the goal or the budget may go undetected.

“Risk assessment,” in this context, is the systematic evaluation of the probability of certain hazards occurring and their adverse effects, and can serve as the starting point for regulatory activity and for estimates of regulatory benefits. For example, risk assessment is often used to estimate the expected rate of illness or death in a population exposed to a hazardous chemical. The quality of the analysis depends on the adequacy of the underlying data and the validity of the methods and assumptions used. Advocates state that risk analysis may be

⁴⁰⁵See, e.g., Tammy O. Tengs & John D. Graham, The Opportunity Costs of Haphazard Social Investments in Life-Saving, in *Risks, Costs, and Lives Saved: Getting Better Results from Regulation* (Oxford University Press, Robert W. Hahn, ed., 1996). For a counter argument, see Richard W. Parker, *Grading the Government*, 70 U. Chi. L. Rev. 1345 (2003).

⁴⁰⁶See, e.g., Lisa Heinzerling & Frank Ackerman, *Pricing the Priceless: Cost-Benefit Analysis of Environmental Protection* (Georgetown University 2002).

⁴⁰⁷*Whitman v. American Trucking Ass'ns*, 531 U.S. 457 (2001).

⁴⁰⁸See Kenneth J. Arrow, et al., *Benefit-Cost Analysis in Environmental, Health, and Safety Regulation: A Statement of Principles* (The Annapolis Center 1996).

used as an objective, scientific basis for planning, identifying management strategies to promote risk reduction. Conversely, critics argue that risk analysis is often not entirely objective, in part because of inadequate data regarding the health and ecological effects of most chemicals.⁴⁰⁹ Major concerns are that risk analysis may oversimplify problems, that its conclusions can be easily manipulated, and that when used in cost-benefit analyses it may undervalue benefits, especially when projected over time. Another concern is that risk analyses often focus on relatively small risks to the population as a whole, rather than larger risks to smaller groups. These concerns notwithstanding, many observers believe that risk analysis, carefully used and supported by adequate data, can be a valuable management tool in developing and directing regulatory programs.⁴¹⁰

Presidential Initiatives. Each President within the past 35 years has required some form of regulatory analysis before rules are published in the Federal Register. For example:

- In 1971, President Nixon required agencies to develop a summary of their proposals, a description of the alternatives that they considered, and the costs of those alternatives.
- In 1974, President Ford required agencies to develop an “inflation impact statement” for each major proposed rule.
- In 1978, President Carter required agencies to prepare a regulatory analysis that examined the cost-effectiveness of the alternative regulatory approaches for major rules.

Current cost-benefit analysis requirements in the rulemaking process are primarily traceable to President Reagan’s Executive Order 12291, issued in February 1981.⁴¹¹ Under that executive order, covered agencies (those other than independent regulatory agencies) were generally required to: (1) refrain from taking regulatory action “unless the potential benefits to society for the regulation outweigh the potential costs to society,” (2) select regulatory objectives to maximize net benefits to society, and (3) select the regulatory alternative that involved the least net cost to society. The order also required covered agencies to prepare a “regulatory impact analysis” for each “major” rule, which was defined as any regulation likely to result in (among other things) an annual effect on the economy of \$100 million. Those analyses were required to contain a description of the potential benefits and costs of the rule, a description of alternative approaches that could achieve the regulatory goal at lower cost (and why they weren’t selected), and a determination of the net benefits of the rule.

These analytical requirements remained in place until September 1993, when President

⁴⁰⁹For example, EPA concluded that the full set of basic toxicity data was available for only about 7% of approximately 3,000 high-production-volume chemicals. See Environmental Protection Agency, *Chemical Hazard Data Availability Study: What Do We Really Know About the Safety of High Production Volume Chemicals?* (Apr. 1998).

⁴¹⁰For a more in-depth discussion, see Linda-Jo Schierow, *The Role of Risk Analysis and Risk Management in Environmental Protection*, CRS Issue Brief IB94036.

⁴¹¹Exec. Order 12,291, *Federal Regulation*, 46 Fed. Reg. 13,193 (Feb. 19, 1981).

Clinton issued Executive Order 12866.⁴¹² The new executive order, which is still in effect, revoked Executive Order 12291 but established analytical requirements that are similar (although not identical) to those it replaced. For example, regulatory principles under Executive Order 12866 include adoption of regulations only upon a “reasoned determination that the benefits of the intended regulation justify its costs”⁴¹³ and tailoring regulations to impose the least burden on society needed to achieve the regulatory objective. The order also requires a cost-benefit analysis for all “economically significant” rules (essentially the same as “major” rules under Executive Order 12291) containing an assessment of the anticipated costs and benefits of the regulatory action and an assessment of the costs and benefits of alternatives to the regulatory action (with an explanation of why the planned action is preferable). Like its predecessor, Executive Order 12866 applies to cabinet departments and independent agencies, but not to independent regulatory agencies such as the Federal Communications Commission and the Securities and Exchange Commission.

In January 1996, OIRA published a document that described “best practices” for preparing the economic analyses called for by the executive order.⁴¹⁴ In essence, the best practices document said that the analysis should: (1) clearly state the need for the proposed action (e.g., market failure) and make clear why federal regulation (as opposed to other methods such as state regulation or subsidies) is the appropriate solution, (2) clearly show that the agency considered the most important alternative approaches (e.g., performance-oriented standards or market incentives), and (3) assess the incremental costs and benefits of the proposed action (taking into account such factors as the appropriate baseline and the use of discount rates when benefits and costs occur at different times). The best-practices document also stated that cost-effectiveness analysis should be used where possible to evaluate alternatives, and says that estimating the benefits and costs of risk reducing regulations requires a risk assessment that, in part, characterizes the probabilities of occurrence of outcomes of interest.

President George W. Bush retained the general analytical requirements in Executive Order 12866. In September 2003, though, OMB and the Council of Economic Advisors finalized new guidance on regulatory analysis, refining and replacing the 1996 best practices document. Among other things, the new guidance (which has been formally issued as “OMB Circular A-4, Regulatory Analysis”): (1) places more emphasis on cost-effectiveness analysis as well as cost-benefit analysis, (2) requires formal probability analysis of future rulemakings with more than a \$1 billion impact on the economy, and (3) requires more systematic evaluation of qualitative as well as quantified costs and benefits.⁴¹⁵ The new guidance took effect on January 1, 2004, for regulatory analyses in support of proposed rules, and takes effect on January

⁴¹²Exec. Order 12,866, *Regulatory Planning and Review*, 58 Fed. Reg. 51,735 (Oct. 4, 1993). To view a copy of this order, see [<http://www.whitehouse.gov/omb/inforeg/EO12866.pdf>].

⁴¹³As previously mentioned, the standard in Executive Order 12291 was that regulatory benefits “outweigh” costs, not just that there be a “reasoned determination” that they “justify” those costs.

⁴¹⁴This “best practices” document was developed by an interagency group co-chaired by the Administrator of OIRA and a member of the Council of Economic Advisors. The document was revised and issued as guidance in 2000. To view a copy of the best practices document, see [<http://www.whitehouse.gov/omb/inforeg/riaguide.html>]. As noted later in this report, this document and the 2000 guidance was later replaced by OMB Circular A-4.

⁴¹⁵To view a copy of OMB Circular A-4, see [<http://www.whitehouse.gov/omb/circulars/a004/a-4.pdf>].

1, 2005, for analyses in support of final rules. Industry groups have been generally supportive of the new guidance, but public advocacy groups have expressed concerns that it may result in less regulation protecting public health and the environment.

In addition to the broadly applicable analytical requirements in Executive Order 12866 and related guidance, a number of other Presidential actions have required analyses of regulations for particular purposes. For example, Executive Order 13132 on “federalism” requires agencies to prepare a “federalism summary impact statement” whenever they issue a rule that has “significant federalism implications.”⁴¹⁶ The order goes on to say that the assessment is to contain “a description of the extent of the agency’s prior consultation with State and local officials, a summary of the nature of their concerns and the agency’s position supporting the need to issue the regulation, and a statement of the extent to which the concerns of State and local officials have been met.” Other executive orders specifically require agencies to assess the effect of their rules on children and on energy supply, distribution, or use. Most of these orders, however, give agencies substantial discretion to determine when the analytical requirements are triggered.

Congressional Initiatives. Congress has also required federal regulatory agencies to analyze the effect of their rules before they are issued. Some of the requirements are potentially applicable to a range of regulations while others are focused on particular types of rules. Perhaps the broadest of these requirements are in title II of the Unfunded Mandates Reform Act (UMRA) of 1995 (2 U.S.C. §§ 1532-1538).⁴¹⁷ Before promulgating a rule containing a mandate that may result in the expenditure of \$100 million or more by the private sector or state, local, and tribal governments in the aggregate, UMRA requires agencies (again, other than independent regulatory agencies) to prepare a written statement containing a “qualitative and quantitative assessment of the anticipated costs and benefits . . . as well as the effect of the Federal mandate on health, safety, and the natural environment.” These requirements are not triggered, though, if the agency issues a final rule without a previous notice of proposed rulemaking. (About half of all final rules do not have a prior proposed rule.) Also, as GAO pointed out in 1998 and 2004, UMRA’s analytical requirements do not apply to most economically significant rules, give agencies substantial discretion regarding their implementation, and do not require much more than is already required in Executive Order 12866.⁴¹⁸ As OMB reported in its most recent report on the implementation of UMRA, federal agencies classified only six rules as “public sector

⁴¹⁶Exec. Order 13,132, *Federalism*, 64 Fed. Reg. 43,255 (Aug. 10, 1999).

⁴¹⁷Title I of UMRA contains requirements applicable to Congressional consideration of bills containing mandates. For a more complete discussion of UMRA, see Keith Bea & Richard S. Beth, *Unfunded Mandates Reform Act Summarized*, CRS Report RS20058.

⁴¹⁸U.S. General Accounting Office, *Unfunded Mandates: Reform Act Has Had Little Effect on Agencies’ Rulemaking Actions*, GAO/GGD-98-30, Feb. 4, 1998; and *Unfunded Mandates: Analysis of Reform Act Coverage*, GAO-04-637, May 12, 2004.

mandates” under the act in its first 10 years.⁴¹⁹ In 2005, GAO reported that parties familiar with the act (e.g., public interest groups, businesses, state and local governments) had a range of ideas of how the Act’s requirements could be strengthened.⁴²⁰

Other statutory analytical requirements have been enacted with regard to particular issues or constituencies, such as the environment or small entities. For example, the National Environmental Policy Act (NEPA) of 1969 (42 U.S.C. §§ 4321-4347) requires all federal agencies to include in every recommendation or report related to “major Federal actions significantly affecting the quality of the human environment” a detailed statement on the environmental impact of the proposed action. The environmental impact statement must delineate the direct, indirect, and cumulative effects of the proposed action. Agencies are also required to include in the statement: (1) any adverse environmental effects that cannot be avoided should the proposal be implemented, (2) alternatives to the proposed action, (3) the relationship between local short-term uses of the environment and the maintenance and enhancement of long-term productivity, and (4) any irreversible and irretrievable commitments of resources that would be involved if the proposed action should be implemented. The adequacy of an agency’s environmental impact statement is subject to judicial review.

The Regulatory Flexibility Act (RFA) of 1980 (5 U.S.C. §§ 601-612) requires federal agencies to assess the impact of their forthcoming regulations on “small entities,” which the act defines as including small businesses, small governmental jurisdictions, and certain small not-for-profit organizations. The RFA requires the analysis to describe, among other things, (1) the reasons why the regulatory action is being considered; (2) the small entities to which the proposed rule will apply and, where feasible, an estimate of their number; (3) the projected reporting, recordkeeping, and other compliance requirements of the proposed rule; and (4) any significant alternatives to the rule that would accomplish the statutory objectives while minimizing the impact on small entities. The RFA’s analytical requirements are not triggered, though, if the head of the issuing agency certifies that the proposed rule would not have a “significant economic impact on a substantial number of small entities.” The RFA does not define “significant economic impact” or “substantial number of small entities,” thereby giving federal agencies substantial discretion regarding when the act’s analytical requirements are triggered. Also, as in UMRA, the RFA’s analytical requirements do not apply to final rules for which the agency does not publish a proposed rule, and agencies do not have to consider the cumulative impact of their rules on agencies in making analytical determinations under the act. Finally, the courts have interpreted the Act to require the analysis only with regard to direct effects on small entities, not any indirect effects.⁴²¹ GAO has examined the implementation of the RFA several times within the past ten to 15 years, and a recurring theme in GAO’s reports is the varying interpretation of the RFA’s requirements by federal agencies.⁴²² In 2001, GAO

⁴¹⁹U.S. Office of Management and Budget, “Tenth Annual Report to Congress on Agency Compliance with the Unfunded Mandates Reform Act,” part II of OMB’s 2005 Report to Congress on the Costs and Benefits of Federal Regulations, pp. 139-180, available at [http://www.whitehouse.gov/omb/inforeg/2005_cb/final_2005_cb_report.pdf].

⁴²¹See *Whitman v. American Trucking Ass’n*, 531 U.S. 457 (2001).

⁴²²See, e.g., U.S. General Accounting Office, *Regulatory Flexibility Act: Agencies’* (continued...)

testified that the promise of the RFA may never be realized until Congress or some other entity defines what a “significant economic impact” and a “substantial number of small entities” mean in a rulemaking setting.⁴²³ Other reviews have been more charitable, but often still conclude that improvements to the RFA and its implementation are needed.⁴²⁴

In the mid-to-late 1990s, Congress considered several comprehensive regulatory reform legislative proposals that were intended to increase or improve the use of cost-benefit analysis, cost-effectiveness analysis, or risk assessment by federal agencies.⁴²⁵ The bills’ particular requirements varied substantially, but all of them would have generally required federal agencies to analyze risks as well as costs and benefits when developing major rules. Some of the bills would have also required a cost-effectiveness analysis, and some required specific studies of how the rules would effect small businesses. Most of the bills would have required that benefits justify costs or that the agency select the most cost-effective alternative. On the other hand, most of the bills (particularly those in the 105th and 106th Congress) also indicated that these analytic requirements and decision criteria would not supercede the provisions in existing law (e.g., the Clean Air Act or the Safe Drinking Water Act) regarding whether, and if so, how agencies should weigh costs and risks in developing regulations.⁴²⁶ One of the most controversial aspects of some of these bills were provisions that would have made agencies’ cost-benefit analyses and risk assessments subject to judicial review. If these analyses were found to be deficient, the rules on which they were based could have been reversed.⁴²⁷ Some expressed concerns that the courts were ill-equipped to assess the quality or importance of such analyses to the underlying rules, and also indicated that the judicial review process could prohibit the speedy adoption of health, safety, and environmental rules. None of these comprehensive regulatory reform bills was enacted.

Bills requiring some type of regulatory analysis continue to be introduced. For example, in the 109th Congress, H.R. 2840 (the “Federal Agency Protection of Privacy Act”) would, if enacted, require agencies to prepare and make available to the public a “privacy impact analysis”

⁴²²(...continued)

Interpretations of Review Requirements Vary, GAO/GGD-99-55, April 2, 1999; U.S. General Accounting Office, *Regulatory Flexibility Act: Implementation in EPA Program Offices and Proposed Lead Rule*, GAO/GGD-00-193, Sept. 20, 2000.

⁴²³U.S. General Accounting Office, *Regulatory Flexibility Act: Key Terms Still Need to Be Clarified*, GAO-01-669T, April 24, 2001.

⁴²⁴See, e.g., Keith W. Holman, *The Regulatory Flexibility Act at 25: Is the Law Achieving Its Goal?*, 33 Ford. Urb. L.J. 1119 (2006).

⁴²⁵For a thorough discussion of many of these bills, see Linda-Jo Schierow, *Environmental Risk and Cost-Benefit Analysis: A Review of Proposed Legislative Mandates, 1993-1998*, CRS Report RL30031.

⁴²⁶As noted previously, some statutes forbid any consideration of costs in setting a health standard (e.g., national ambient air quality standards under the Clean Air Act). Other statutes establish other requirements (e.g., requiring agencies to regulate to the extent “feasible” or “achievable”) whose effect on the use of cost-benefit analysis in decisionmaking is less clear.

⁴²⁷In some cases (e.g., S. 746, the “Regulatory Improvement Act of 1999”), these bills permitted courts to remand or invalidate a rule if an agency had *failed to perform* a required analysis, but could not do so because of the *perceived inadequacy* of the analysis.

describing the effect of the rule on the privacy interests of individuals. The bill specifies that the analysis should describe the extent to which the rule provides notice of the collection of personally identifiable information, allows access to and permits correction of that information by those individuals, and provides security for the information. As in UMRA and the RFA, though, the analysis is not required if the agency issues a final rule without an associated proposed rule. Also, the requirement only applies to a rule that “pertains to the collection, maintenance, use, or disclosure of personally identifiable information from 10 or more individuals.”

Implementation of Analytical Requirements. In addition to the studies mentioned above regarding UMRA, the RFA, and other analytical requirements, a number of researchers have examined agencies’ economic analyses of rules under Executive Order 12866 and related guidance documents.⁴²⁸ Several of the studies indicated that the agencies’ analyses are not always consistent with the requirements in the order or the guidance. For example, in 1998 the General Accounting Office (GAO, now the Government Accountability Office) reported that some of the 20 economic analyses that it examined did not discuss alternatives to the proposed regulatory action and, in many cases, it was not clear why the agencies used certain assumptions.⁴²⁹ Also, five of the analyses did not discuss uncertainty associated with the agencies’ estimates of benefits or costs or document the agencies’ reasons for not doing so. GAO has also examined the cost-benefit analyses for particular rules, and often found them lacking in some of the same ways.⁴³⁰ Other studies have criticized agencies for not providing quantitative information on net benefits in their analyses.⁴³¹ Still other studies have examined the accuracy of agencies’ regulatory cost estimates, often concluding that costs are overestimated.⁴³² OMB reviewed the literature on *ex ante* cost and benefit estimates, and concluded that federal agencies tend to overestimate both benefits and costs.⁴³³

⁴²⁸See, e.g., Richard D. Morgenstern, ed., *Economic Analyses at EPA: Assessing Regulatory Impact* (Resources for the Future 1997); Robert W. Hahn, ed., *Risks, Costs, and Lives Saved: Getting Better Results from Regulation* (AEI Press 1996).

⁴³⁰U.S. Government Accountability Office, *Clean Air Act: Observations on EPA’s Cost-Benefit Analysis of Its Mercury Control Options*, GAO-05-252, Feb. 28, 2005. GAO concluded that EPA did not, among other things, consistently analyze available options or provide estimates of the costs and benefits of each option.

⁴³¹See, e.g., Robert W. Hahn & Patrick Dudley, *How Well Does the Government Do Cost-Benefit Analysis?*, Working Paper 04-01 (Washington: AEI-Brookings Joint Center for Regulatory Studies, Jan. 2004).

⁴³²For a summary of this literature, see Winston Harrington, Richard D. Morgenstern, & Peter Nelson, *On the Accuracy of Regulatory Cost Estimates*, 19 J. of Policy Analysis and Management, at 297-322 (2000); see also William K. Reilly, *The EPA’s Cost Underruns*, Wash. Post, Oct. 14, 2003, at A23 (“a review of some of the major regulatory initiatives overseen by the EPA since its creation in 1970 reveals a pattern of consistent, often substantial overestimates of their economic costs”).

⁴³³U.S. Office of Management and Budget, Office of Information and Regulatory Affairs, *Validating Regulatory Analysis: 2005 Report to Congress on the Costs and Benefits of Federal* (continued...)

GAO and others have also examined agencies' use of risk assessment in regulation. In 2001, GAO described selected agencies' chemical risk assessment procedures, noting (among other things) that the statutory and legal context in which the assessments are conducted and how the agency plans to use the information play an important role in determining why certain risk assessment approaches are used.⁴³⁴ For example, some statutes require regulatory decisions to be based solely on risk, while others require standards to be based on the "best available control technology." In general, GAO concluded that the agencies followed the four-step risk assessment process recommended by the National Academy of Sciences in 1983.⁴³⁵ The report also indicated that assumptions are an unavoidable part of risk assessment because science cannot always provide definitive answers to questions raised at various stages of an assessment.

In addition to studies examining the implementation of cost-benefit and risk assessment requirements, a large body of literature has developed debating the very notion of subjecting agencies' rules to these analytical requirements. Those supporting the use of these analytical methods view cost-benefit analysis as a helpful and neutral tool in regulatory decisionmaking.⁴³⁶ They point out that some type of cost-benefit balancing takes place during the rulemaking process anyway, and that the formal analysis simply makes that balancing (with the associated data and assumptions) more explicit, systematic, and rigorous. Furthermore, they argue that putting an accurate dollar value on costs and benefits as possible makes decisions regarding whether and how to regulate easier and more rational. As one author stated, "[m]onetizing risk and environmental benefit does not devalue these outcomes, but rather gives them real economic value when the effects might otherwise be ignored."⁴³⁷

Others, however, assert that cost-benefit analysis is inherently flawed and biased against regulation.⁴³⁸ For example, they assert that because regulatory benefits are generally more difficult to measure in dollar terms than regulatory costs, cost-benefit analysis is not carried out on a level playing field. Measurement of the benefits associated with health, safety, and environmental rules often requires an assessment of risk (e.g., how many people would get sick or die in the absence of the regulatory intervention) and a monetization of the associated benefits (i.e., placing a dollar value on the lives saved or illnesses prevented). These steps frequently involve significant methodological and ethical difficulties. As noted previously, data are frequently not available to measure regulatory risks precisely, and using "willingness to pay" models to determine the values to assign to health effects are highly controversial. Critics of

cost-benefit analysis also assert that regulatory cost data are often provided by regulated entities, who have an incentive to inflate those costs in order to influence agencies not to issue the rules. Other criticisms focus on the use of “discount rates” that reduce the value of future benefits to current dollars, and the “distributional” effects that are not often considered in such analyses. Finally, these critics suggest that although executive orders and statutes often indicate that non-monetized benefits must be considered as part of the rule development process, there is a natural tendency to discount or disregard non-monetized benefits. Therefore, a rule may be viewed as not passing a cost-benefit test even though its non-monetized benefits are significant. Still other critics assert that regardless of whether cost benefit analysis is neutral in concept, it is not neutral in effect, tending to result in the promulgation of fewer and weaker rules.⁴³⁹

Other Accountability Requirements

In addition to these analytic requirements, both Congress and Presidents in recent years have established a number of other requirements designed to improve the accountability of regulatory agencies. Perhaps most prominent among these has been the establishment of Presidential review of rules issued by covered agencies (all except independent regulatory agencies), most notably through Executive Order 12291 in 1981, and then continued but altered somewhat by Executive Order 12866 in 1993. As Presidential review is discussed at length elsewhere in this Report, however, this section will not discuss its various elements. Likewise, judicial review and Congressional review of rulemaking (e.g., the Congressional Review Act), also highly important accountability mechanisms, are discussed in detail in other chapters of this committee print. Finally, because legislative and executive branch initiatives in the areas of information quality, peer review, and risk assessment are discussed in other chapters, they will also not be discussed at length here.

Regulatory Accounting. Like taxing and spending, regulation is a basic function of government. Unlike taxing and spending, though, the costs that nonfederal entities pay to comply with federal regulations are not accounted for in the federal budget process. Some researchers have estimated those off-budget costs in the hundreds of billions of dollars, and the estimates of aggregate regulatory benefits are even higher.⁴⁴⁰ Congress decided that it needed more information on regulatory costs and benefits, so for several years it included language in appropriations bills that required OMB to submit annual reports to Congress. Most recently, section 624 of the Treasury and General Government Appropriations Act, 2001, (31 U.S.C. § 1105 note), sometimes known as the “Regulatory Right-to-Know Act,” put in place a permanent requirement for an OMB report on regulatory costs and benefits. Specifically, it requires OMB to prepare and submit with the budget an “accounting statement and associated report” containing an estimate of the costs and benefits (including quantifiable and nonquantifiable effects) of federal rules and paperwork, to the extent feasible, that assesses the costs and

⁴³⁹David M. Driesen, *Is Cost-Benefit Analysis Neutral?*, 77 U. Col. L. Rev. 335 (2006).

⁴⁴⁰*See, e.g.,* W. Mark Crain & Thomas D. Hopkins, *The Impact of Regulatory Costs on Small Firms* (Small Business Administration 2001). The study estimated the total costs of federal regulations at \$843 billion in 2000, of which \$497 billion fell on business and \$346 billion fell on consumers or governments.

benefits: (1) in the aggregate, (2) by agency and agency program, and (3) by major rule. The accounting statement is also required to contain an analysis of impacts of federal regulation on state, local, and tribal governments, small businesses, wages, and economic growth.⁴⁴¹

From 1997 through 2001, OMB provided estimates of the total costs and benefits of federal rules, but presented those estimates with strong caveats. For example, in its 1998 report OMB said there was not a professional consensus on how regulatory costs and benefits should be measured, and discussed a number of methodological problems (e.g., determining what costs and benefits would have occurred in the absence of the regulation). OMB's estimates (particularly of regulatory benefits) varied substantially from year to year,⁴⁴² and also varied from estimates provided by other researchers.

Since 2001, OMB has not presented cost or benefit estimates for all rules. Instead, the office has reported information for all regulations that it reviewed within a particular time-frame: (1) that had costs or benefits of at least \$100 million annually and (2) whose costs and benefits had been monetized by either the rulemaking agency or OMB. In its 2002 report, OMB said its decision to present data for only certain rules during a limited time-frame was driven by the inconsistent and increasingly aged nature of many of the studies used to develop aggregate estimates. OMB went on to say that "we do not believe that the estimates of the costs and benefits of regulations issued over ten years ago are reliable or very useful for informing current policy decisions." Therefore, OMB said that it decided not to provide aggregate estimates "in keeping with the spirit of OMB's new information-quality guidelines."⁴⁴³

In its September 2003 report, OMB provided estimates of the costs and benefits of 107 regulations that it reviewed during the 10-year period from October 1992 to September 2002.⁴⁴⁴ OMB's estimate of the cost of these rules ranged from \$36 billion to \$42 billion, and the estimated benefits ranged from \$146 billion to \$230 billion (all in 2001 dollars). OMB said that it recognized that this information was not a complete accounting of the costs and benefits of all federal regulations, or even for all rules issued during the 10-year period, and said that the total costs and benefits of all federal rules in place "could easily be a factor of ten or more larger than the sum of the costs and benefits reported (for the 10-year period)." Nevertheless, OMB said that estimates prepared for rules adopted prior to the 10-year period "are of questionable relevance now." OMB made a similar statement in its 2005 report on regulatory costs and

⁴⁴¹For a discussion of these requirements and other researchers' efforts to measure regulatory costs and benefits, see Curtis W. Copeland, *Federal Regulations: Efforts to Estimate Total Costs and Benefits of Rules*, CRS Report RL32339.

⁴⁴²For example, OMB's estimate of regulatory benefits was \$298 billion in 1997 and between \$260 billion and \$3.5 trillion in 1998. By 2000, OMB's upper-end benefit estimate declined to nearly \$1.8 trillion.

⁴⁴³As discussed later in this report, section 515 of the Treasury and General Government Appropriations Act, 2001, generally known as the "Data Quality Act" or the "Information Quality Act," amended the Paperwork Reduction Act and directed OMB to issue government-wide guidelines that "provide policy and procedural guidance to Federal agencies for ensuring and maximizing the quality, objectivity, utility, and integrity of information (including statistical information) disseminated by Federal agencies." OMB issued a final version of those guidelines in February 2002.

⁴⁴⁴See http://www.whitehouse.gov/omb/inforg/2003_cost-ben_final_rpt.pdf.

benefits.

Regulatory Budgets. In addition to better informing Congress and the public about the costs and benefits of regulations, some observers have suggested using regulatory accounting information to create a “regulatory budget” to improve regulatory accountability and control.⁴⁴⁵ A regulatory budget might limit the total volume of regulatory programs, expenditures, and compliance costs, by setting a cap on the compliance costs each agency could impose on the economy. Therefore, an agency proposing to add additional compliance costs would be obligated to remove a commensurate amount of existing cost. Implementing a regulatory budget, however, can present many conceptual and empirical problems, including the scope of regulations to be covered (almost all federal programs involve some degree of regulation, the amount depending to some extent upon one’s definition of “regulation”); the accuracy of cost estimates (direct and indirect, including the impact on firms, industries, and consumers beyond compliance costs); the accuracy of benefit estimates (generally regarded as more difficult to determine than estimating costs); and redundancy or overlap with state and local regulations.⁴⁴⁶

Legislation has been introduced that could lay the groundwork for regulatory budgeting in the future. For example, in the 108th Congress, H.R. 2432, the “Paperwork and Regulatory Improvements Act of 2003,” would have required OMB to designate at least five agencies (including at least EPA and the Departments of Labor and Transportation) as pilot projects in regulatory budgeting for fiscal years 2006 and 2007. The bill provided that the budgets “shall present, for one or more of the major regulatory programs of the agency, the varying levels of costs and benefits to the public that would result from different budgeted amounts.” The bill directed OMB to issue a report by February 2009 on the pilot project and “recommend whether legislation requiring regulatory budgets should be proposed.” During testimony in July 2003 on the bill, OMB suggested reducing the scope of the pilot projects, and clarifying that the budget levels set by OMB were not legally binding. Similar legislation has been introduced in the 109th Congress (H.R. 725, the “Paperwork and Regulatory Improvements Act of 2005”) that would, if enacted, require OMB to designate at least three agencies or offices to participate in a study on regulatory budgeting for fiscal years 2006 and 2007.

Moratoria on New Regulations. Imposing a moratorium on new rulemaking is a technique that has been used to assert control over the rulemaking process, particularly for an incoming Presidential administration.⁴⁴⁷ For example, on January 29, 1981, shortly after taking office, President Reagan issued a memorandum to the heads of the Cabinet departments and the EPA Administrator directing them to take certain actions that would give the new administration time to implement a “new regulatory oversight process,” particularly for “last-minute decisions” made by the previous administration. Specifically, the memorandum said that agencies should, to the extent permitted by law: (1) postpone for 60 days the effective date of all final rules that were scheduled to take effect during that 60-day period, and (2) refrain from promulgating any new final rules. Executive Order 12291, issued a few weeks later, contained another moratorium

⁴⁴⁵In fact, the creation of a regulatory budget was contemplated in section 6(a)(6) of Executive Order 12291 in 1981.

⁴⁴⁶Samuel Hughes, *Regulatory Budgeting*, Center for the Study of American Business, Washington University, Working Paper 160, June 1996.

⁴⁴⁷The volume of rulemaking typically increases at the end of a Presidential administration. See Jay Cochran, III, *The Cinderella Constraint: Why Regulations Increase Significantly During Post-Election Quarters* (Mercatus Center Oct. 5, 2000).

on rulemaking that supplemented, but did not supplant, the January 29, 1981, memorandum. Section 7 of the executive order directed agencies to “suspend or postpone the effective dates of all major rules that they have promulgated in final form as of the date of this Order, but that have not yet become effective.” Excluded were major rules that could not be legally postponed or suspended, and those that ought to become effective “for good cause.” Agencies were also directed to refrain from promulgating any new final rules until a final regulatory impact analysis had been conducted.

In January 1992, President George H.W. Bush imposed a 90-day moratorium on new regulations in response to criticisms that regulatory burden was increasing rapidly during his administration. The President instructed agencies to identify existing regulations and programs imposing unnecessary regulatory burdens and to develop programs to reduce or eliminate those burdens. Regulations that were issued in response to emergency situations, had statutory or judicial deadlines, dealt with military or foreign affairs, or were related to agency administrative matters were exempted from the moratorium. The moratorium was later extended, and remained in force until the end of the Bush Administration.

On January 22, 1993, the Director of OMB for the incoming Clinton Administration sent a memorandum to the heads and acting heads of Cabinet departments and independent agencies requesting them to: (1) not send proposed or final rules to the Office of the Federal Register for publication until they have been approved by an agency head appointed by President Clinton and confirmed by the Senate, and (2) withdraw from the Office of the Federal Register all regulations that had not been published in the Federal Register and that could be withdrawn under existing procedures. The requirements did not apply, however, to any rules that had to be issued immediately because of a statutory or judicial deadline. The OMB Director said these actions were needed because it was “important that President Clinton’s appointees have an opportunity to review and approve new regulations.”

Most recently, on January 20, 2001, Andrew H. Card, Jr., Assistant to President George W. Bush and Chief of Staff, sent a memorandum (often referred to as the “Card memo”) to the heads and acting heads of all executive departments and agencies generally directing them to: (1) not send proposed or final rules to the Office of the Federal Register, (2) withdraw from the Office rules that had not yet been published in the Federal Register, and (3) postpone for 60 days the effective date of rules that had been published but had not yet taken effect.⁴⁴⁸ The Card memo instructed agencies to exclude any rules promulgated pursuant to statutory or judicial deadlines, and to notify the OMB Director of any rules that should be excluded because they “impact critical health and safety functions of the agency.” The memo indicated that these actions were needed to “ensure that the President’s appointees have the opportunity to review any new or pending regulations.”

In February 2002, GAO reported on the delay of effective dates of final rules subject to the Card memo.⁴⁴⁹ GAO indicated that 371 final rules were subject to the Card memo, and federal agencies delayed the effective dates of at least 90 of them. As of the one-year anniversary of the Card memo, most of the 90 rules had taken effect, but one had been withdrawn and not replaced by a new rule, three had been withdrawn and replaced by new rules,

⁴⁴⁸ U.S. White House Office, *Regulatory Review Plan*, 66 Fed. Reg. 7702 (Jan. 24, 2001).

⁴⁴⁹ U.S. General Accounting Office, *Regulatory Review: Delay of Effective Dates of Final Rules Subject to the Administration’s Jan. 20, 2001, Memorandum*, GAO-02-370R, Feb. 15, 2002.

and nine others had been altered (e.g., different implementation date or reporting requirement). The agencies generally did not permit the public to comment on the delays or changes.

All of these Presidential moratoria on rulemaking have generally exempted regulations issued by independent regulatory boards and commissions, as well as regulations issued in response to emergency situations or statutory or judicial deadlines. Critics claim that moratoria disrupt the regulatory process and delay the implementation of important regulations. They have also raised concerns about changes in the effective dates of published rules without permitting public comment.⁴⁵⁰ In fact, some of the delays and changes initiated by these Presidential moratoria were later overturned by the courts.⁴⁵¹ Supporters, on the other hand, assert that moratoriums help to block undesirable regulations and enable the new administration and federal agencies to revise or eliminate less desirable regulations.

Reviews of Existing Regulations. Each year, federal agencies issue more than 4,000 final rules, which are then codified in the Code of Federal Regulations (CFR). Although most of the attention of regulatory reformers has been focused on new rules, reexamination of the large body of existing rules can reveal that they are no longer needed, or that improvements in the regulatory approach can make the program more effective or less burdensome. Reviews of existing regulations were recommended by ACUS,⁴⁵² and have been initiated by both recent Presidents and the Congress.

Presidential Initiatives. Most recent Presidents have directed agencies to reconsider their existing regulations. For example, in 1979, President Carter issued Executive Order 12044, which required agencies to review their existing rules “periodically.”⁴⁵³ One of the missions of President Reagan’s task force on regulatory relief was to identify existing regulations and recommend changes. During the previously-mentioned moratorium on new rules during the administration of President George H.W. Bush, agencies were instructed “to evaluate existing regulations and programs and to identify and accelerate action on initiatives that will eliminate any unnecessary regulatory burden or otherwise promote economic growth.”

Section 5 of Executive Order 12866, issued in September 1993, required agencies to submit to OIRA a plan for periodically reviewing their existing significant regulations to determine whether any should be modified or eliminated. According to the executive order, the purpose of the review was to make the agencies’ regulatory programs more effective, less burdensome, or better aligned with the President’s priorities and the principles specified in the order. In its report on the first year’s implementation of the executive order, OIRA said this review of existing rules was intended to be “a fundamental reengineering of entire regulatory systems,” not just “tinkering with regulatory provisions to consolidate or update provisions.”

⁴⁵⁰See, e.g., William M. Jack, *Taking Care That Presidential Oversight of the Regulatory Process is Faithfully Executed: A Review of Rule Withdrawals and Rule Suspensions Under the Bush Administration’s Card Memorandum*, 54 Admin. L. Rev. 1479 (2002).

⁴⁵¹See, e.g., *Natural Resources Defense Council v. Abraham*, 355 F.3d 179 (2d Cir. 2004).

⁴⁵²ACUS cautioned that such reviews should not be “one-size-fits-all,” but should be tailored to the agencies’ individual needs. For the specific recommendations, see Jeffrey S. Lubbers, *A Guide to Federal Agency Rulemaking* 399-400 (American Bar Ass’n 4th ed. 2006).

⁴⁵³Exec. Order 12,044, *Improving Government Regulations*, 43 Fed. Reg. 12,661 (Mar. 24, 1978).

Because of concerns that all agencies were not “taking the steps necessary to implement regulatory reform,” President Clinton sent a memorandum to the heads of Cabinet departments and independent agencies in March 1995 directing them to, among other things, conduct a page-by-page review of all their regulations in force and eliminate or revise those that were outdated or in need of reform. In June 1995, the President announced that this effort had resulted in commitments to eliminate 16,000 pages from the CFR. GAO later reported, however, that four agencies’ page elimination totals did not take into account the pages that they had added to the CFR while the eliminations were taking place.⁴⁵⁴ GAO also said that about half of the actions were likely to result in little or no reduction of regulatory burden.

The most recent OIRA-directed reviews of existing rules have involved the general public in the review process. In May 2001, OIRA asked the public to nominate rules that it believed should be modified or rescinded.⁴⁵⁵ In response, OIRA received 71 nominations from 33 commentators, and decided that 23 of the rules nominated merited “high priority review.” In March 2002, OIRA again solicited public comments on regulations in need of reform, and in response received more than 300 suggestions from about 1,700 commentators, some of which suggested making rules more stringent or developing new rules. This time, OIRA forwarded the suggestions to the relevant federal agencies for review and prioritization. In February 2004, OIRA requested public nomination of promising regulatory reforms relevant to the manufacturing sector. Specifically, OIRA requested that commenters suggest reforms to regulations, guidance documents, or paperwork requirements that would “improve manufacturing regulation by reducing unnecessary costs, increasing effectiveness, enhancing competitiveness, reducing uncertainty and increasing flexibility.”

Congressional Initiatives. Congress has also directed agencies to review the effects of their existing regulations. Some of these Congressionally-initiated review requirements focus on rules issued under specific statutes. For example, section 812 of the 1990 amendments to the Clean Air Act required EPA to provide information about the economic costs and benefits and the health, welfare, and environmental impacts of the Clean Air Act.⁴⁵⁶ The 1990 amendments also directed an interagency group to report every four years, beginning in 1996, on the costs, benefits, and effectiveness of the acid rain program.

Other Congressionally-directed regulatory reviews are more crosscutting, although still focused on particular types of rules. Section 610 of the Regulatory Flexibility Act (RFA) requires each federal agency to develop a plan for the review of its existing rules that have or will have a “significant economic impact on a substantial number of small entities.” The purpose of this “look-back” review is to determine whether the rules should be continued without change or should be amended or rescinded to minimize their impact on small entities. GAO reported in 1999, however, that few of these reviews were being conducted, and that

⁴⁵⁴U.S. General Accounting Office, *Regulatory Reform: Agencies’ Efforts to Eliminate and Revise Rules Yield Mixed Results*, GAO/GGD-98-3, Oct. 2, 1997.

⁴⁵⁵OIRA said it requested the nominations in response to a requirement in section 628(a)(3) of the fiscal year 2000 Treasury and General Government Appropriations Act that required OMB to submit “recommendations for reform” with its report on the costs and benefits of federal regulations.

⁴⁵⁶For a discussion of reviews of EPA rules, see U.S. General Accounting Office, *Environmental Protection: Assessing the Impacts of EPA’s Regulations Through Retrospective Studies*, GAO/RCED-99-250, Sept. 14, 1999.

regulatory agencies differed in how they interpreted this requirement.⁴⁵⁷ For example, it was not clear whether agencies are supposed to review rules that currently *have* an impact on small entities, or those that *had* that impact at the time the rules were issued. Another reason why so few section 610 reviews have been conducted is the discretion agencies have under the RFA in deciding whether their rules have a “significant” economic impact on a “substantial” number of small entities. If an agency certifies that a rule did not (or currently does not) have that impact, it does not have to conduct a section 610 review.⁴⁵⁸

Several of the comprehensive regulatory reform bills that Congress considered (but did not enact) during the mid-to-late 1990s would have required agencies to review virtually all of their existing rules, not just those issued under certain statutes or that affected small entities. For example, the “Regulatory Sunset and Review Act of 1995” (H.R. 994) would have required agencies to review each existing significant rule (and other rules upon request by affected parties or Congressional committees) within four to seven years after the bill’s enactment and then to either issue a report continuing the rule or take action to modify, consolidate, or terminate it. Later, the “Regulatory Improvement Act of 1997” (S. 981) would have required agencies to review existing rules identified by an advisory committee representing a balanced cross section of public and private interests. The agencies would have then had to decide whether to retain, amend, or repeal the rules it reviewed.

Paperwork Reduction Initiatives. Other regulatory reform initiatives have focused specifically on controlling the paperwork that often accompanies regulations. Many information collections, recordkeeping requirements, and third-party disclosures are contained in, or are authorized by, regulations as monitoring or enforcement tools. In fact, these paperwork requirements are the essence of many agencies’ regulatory provisions.⁴⁵⁹ A large amount of federal paperwork is necessary, and is how many agencies carry out their missions. For example, IRS needs to collect information from taxpayers and their employers to know the correct amount of taxes owed. EPA uses information requirements to ensure compliance with its regulations, to evaluate the effectiveness of its programs, and for other purposes. Nevertheless, federal agencies are expected to minimize the paperwork burden that they impose.

Paperwork Reduction Act. The most notable of the various reform initiatives to control federal paperwork is the Paperwork Reduction Act (PRA) (44 U.S.C. §§ 3501-3520), which was originally enacted in 1980 but was subsequently amended in 1986 and again in 1995. The original PRA replaced the ineffective Federal Reports Act of 1942, and established OIRA within OMB to provide central agency leadership and oversight of government-wide efforts to reduce unnecessary paperwork and improve the management of information resources.

⁴⁵⁷U.S. General Accounting Office, *Regulatory Flexibility Act: Agencies’ Interpretations of Review Requirements Vary*, GAO/GGD-99-55, April 2, 1999.

⁴⁵⁸For a discussion of this issue, see Michael R. See, *Willful Blindness: Federal Agencies’ Failure to Comply with the Regulatory Flexibility Act’s Periodic Review Requirement — and Current Proposals to Invigorate the Act*, 33 Ford. Urb. L.J. 1199 (2006).

⁴⁵⁹For example, EPA’s Toxics Release Inventory (TRI) program is essentially a database created through collections of information imposed on businesses in order to inform the public about chemical hazards in their communities. TRI reports require businesses in certain industries to report the quantity of any of more than 600 chemicals entering each environmental medium on site, transfers of the chemical in wastes to off-site locations, on-site treatment methods and efficiency, and source reduction and recycling activities.

Currently, the Act requires OIRA to maintain a government-wide strategic information resources management plan. Such a plan could help ensure that federal paperwork is the minimum necessary and is well integrated into agencies' missions and objectives.⁴⁶⁰ GAO reported in February 2002, though, that OMB had not fully developed and implemented an information resources management plan that articulated a comprehensive federal vision for all aspects of government information.⁴⁶¹

The PRA also requires agencies to receive OIRA approval (signified by an OMB control number) for each information collection request before it is implemented. Under the PRA's "public protection" provision, no one can be penalized for failing to comply with a collection of information subject to the Act if it has not been approved by OIRA within the previous three years. Each year, however, OIRA reports that agencies impose hundreds of paperwork requirements without OIRA approval (although the number of such PRA violations have declined in recent years).⁴⁶² OIRA can disapprove any collection of information (and generally stop any associated regulation) if it believes the collection is inconsistent with the requirements of the PRA.⁴⁶³

The 1995 amendments to the PRA required OIRA to set a goal of at least a 10% reduction in the government-wide burden-hour estimate for each of fiscal years 1996 and 1997, a 5% goal for each of the next four fiscal years, and annual agency goals that reduce burden to the "maximum practicable opportunity." Therefore, if these goals had been met, the amount of federal paperwork would have fallen by 35%—from about 7 billion burden hours at the end of fiscal year 1995 to about 4.6 billion hours at the end of fiscal year 2001. This anticipated reduction did not occur, though. In fact, by the end of fiscal year 2002, the government-wide paperwork estimate stood at more than 8.2 billion hours—a 17% increase since the PRA amendments took effect at the end of fiscal year 1995. The agencies often contend that they cannot reduce their paperwork requirements without changes in their authorizing statutes, many of which require the collection of certain types of information.

Other Paperwork Initiatives. In addition to the PRA, Congress has enacted other statutes in an attempt to reduce or at least control federal paperwork burden. For example, in June 2002, Congress enacted, and the President signed, the Small Business Paperwork Relief Act of 2002 (Pub. L. No. 107-198). The Act amended the PRA to, among other things, require each agency to establish a single point of contact to act as a liaison for small business concerns with regard to information collection and paperwork issues.⁴⁶⁴ It also directed agencies to make a

⁴⁶²For a summary of this trend, see U.S. General Accounting Office, *Paperwork Reduction Act: Record Increase in Agencies' Burden Estimates*, GAO-03-691T, April 11, 2003.

⁴⁶³Independent regulatory agencies can, by majority vote, void any OIRA disapproval of a proposed collection of information. Also, OIRA disapproval does not overrule a specific statutory requirement that certain information be collected.

⁴⁶⁴OMB posted compliance assistance resources and points of contact on its Web site at (continued...)

special effort to reduce information collection burdens for small businesses with fewer than 25 employees, and established a task force to study the feasibility of streamlining information collection requirements on small businesses. The task force delivered its first report in June 2003,⁴⁶⁵ and its final report is due in June 2004.

Statutory reforms have been introduced in each Congress in an attempt to address paperwork requirements in particular areas. For example, in the 108th Congress, H.R. 464, the “IDEA Paperwork Reduction Act of 2003,” was intended to “provide relief to teachers, administrators, and related service providers from excessive paperwork burden” required under the Individuals with Disabilities Act. Other bills have focused on such issues as the suspension of fines under certain circumstances for first-time paperwork violations for small businesses.

Initiatives Focusing on Small Entities. A number of regulatory reforms implemented in recent decades have attempted to get agencies to recognize the effect that their rules can have on small businesses and other small entities. Advocates of these initiatives note the important role that small entities play in the economy (e.g., about 50% of the gross domestic product) and point to research indicating that small entities are disproportionately affected by federal regulations.⁴⁶⁶ Others indicate, however, that special regulatory treatment of small entities is “both unjustified and socially destructive.”⁴⁶⁷

Although there have been some Presidential initiatives in this area,⁴⁶⁸ most of the significant rulemaking requirements affecting small entities have been imposed by Congress. As noted previously, the RFA requires agencies to examine the effects of their rules on small entities and, if the agency concluded the rule had a “significant economic effect on a substantial number of small entities,” to conduct a regulatory flexibility analysis. The Act gives regulatory agencies substantial discretion to decide when these analytical requirements are triggered. Other previously mentioned reforms focusing on small entities include the “look back” requirement in section 610 of the RFA and the requirements in the Small Business Paperwork Relief Act (e.g., a single point of contact for small businesses regarding paperwork).

A number of statutory reforms directed at small entities’ concerns were included in the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA). Perhaps most notably, SBREFA amended the RFA and permitted judicial review of agencies’ compliance with initial and final regulatory flexibility analysis requirements, their use of the “no significant impact” exclusion, and compliance with the “look back” requirement in section 610. (The

⁴⁶⁸For example, Exec. Order 13,272, *Proper Consideration of Small Entities in Agency Rulemaking*, 67 Fed. Reg. 53,461 (Aug. 16, 2002), among other things, required agencies to issue written procedures and policies to ensure that the potential impacts of draft rules on small entities are properly considered during rulemaking.

original RFA prohibited judicial review.) As discussed below, other SBREFA provisions included requirements that agencies develop compliance guides for small entities, provide small entities with penalty relief, permit more equal access to justice, and ensure that small entities' interests are represented on boards and panels involved in the rulemaking process.

Compliance Guides and Other Guidance. Section 212 of SBREFA requires agencies to publish one or more compliance guides for each rule or group of related rules for which the agency is required to prepare a final regulatory flexibility analysis under the RFA. Because this provision in SBREFA was built on the RFA, all of the discretion inherent in the RFA regarding whether to do an analysis also applies to whether compliance guides must be developed. For example, if the agency concludes that the final rule would not, in its opinion, have a "significant" impact on a "substantial" number of small entities, the agency is not required to prepare a compliance guide. When they are prepared, section 212 requires the guides to be published, to be designated as "small entity compliance guides," and to explain the actions a small entity is required to take to comply with the associated final rule. In other areas, though, section 212 gives agencies broad discretion. For example, the statute says agencies "may" prepare separate guides covering groups or classes of similarly affected small entities, and "may" cooperate with associations of small entities to develop and distribute the guides. Agencies are given "sole discretion" in the use of plain language in the guides, and the statute does not indicate when the guides must be developed or how they must be published. Therefore, under section 212, an agency could develop a compliance guide years after a final rule is published with no input from small entities. In 2001, GAO reviewed agencies' implementation of section 212 and concluded that the requirement did not appear to have had much of an impact on agencies' rulemaking actions.⁴⁶⁹

Section 213 of SBREFA requires federal agencies regulating the activities of small entities to establish a program for responding to inquiries concerning compliance with applicable statutes and regulations. The section also says that in any civil or administrative action against a small entity, such guidance "may be considered as evidence of the reasonableness or appropriateness of any proposed fines, penalties or damages sought against such small entity."

Penalty Relief. By the mid-1990s, concerns were being expressed about the impact that civil penalties can have on small businesses and other small entities, particularly for infractions that may be relatively minor in nature. In April 1995, President Clinton issued a memorandum directing the heads of 27 departments and agencies to modify the penalties for small businesses "to the extent permitted by law."⁴⁷⁰ For example, the memorandum said agencies "shall exercise their enforcement discretion to waive the imposition of all or a portion of a penalty when the violation is corrected within a time period appropriate to the violation in question." The memorandum also directed each agency to submit a plan to the Director of OMB describing the actions the agency would take, and said the plans should identify how notification of the agencies' policies would be given to frontline workers and small businesses.

Similar requirements were included in SBREFA, which was enacted less than a year later in March 1996. Section 223 of SBREFA, entitled "Rights of Small Entities in Enforcement

⁴⁶⁹U.S. General Accounting Office, *Regulatory Reform: Compliance Guide Requirement Has Had Little Effect on Agency Practices*, GAO-02-172, Dec. 28, 2001.

⁴⁷⁰U.S. President (Clinton), *Regulatory Reform-Waiver of Penalties and Reduction of Reports*, Memorandum of April 21, 1995, Code of Federal Regulations, vol. 3 (1996), pp. 474-475.

Actions,” requires agencies to provide small entities with some form of relief from civil monetary penalties. Specifically, the statute requires federal agencies regulating the activities of small entities to establish a policy or program by the end of March 1997 for the reduction and, under appropriate circumstances, the waiver of civil penalties on small entities. It also required agencies to submit a one-time report to four Congressional committees by the end of March 1998 on the scope of their programs or policies and the implementation of their penalty reduction efforts. Section 223 also gave federal agencies substantial discretion in how these requirements were to be carried out. In 2001 GAO examined the implementation of section 223 and determined that the agencies were using that discretion extensively.⁴⁷¹ For example, some of the agencies’ policies covered only certain civil penalty enforcement actions, and some of the policies gave small entities no more penalty relief than large entities. The agencies also varied in how key terms were defined and in their conditions and exclusions. GAO made several recommendations to strengthen penalty relief and improve Congressional oversight.

Ombudsman and Fairness Boards. Section 222 of SBREFA amended the Small Business Act (15 U.S.C. §§ 631 *et seq.*) to require the SBA Administrator to designate a “Small Business and Agriculture Regulatory Enforcement Ombudsman,” who was directed to work with each agency to ensure that small business concerns have an opportunity to comment on agencies’ enforcement actions. The ombudsman was directed to annually evaluate and report on each agency’s enforcement activities, including a rating of the “responsiveness to small business” of each agency’s regional and program offices. Section 222 also required the Administrator to establish a “Small Business Regulatory Fairness Board” in each SBA regional office to report to and advise the ombudsman on “excessive enforcement actions of agencies against small business concerns.

Equal Access to Justice Act Amendments. The Equal Access to Justice Act (28 U.S.C. § 2412 and 5 U.S.C. § 504) was originally enacted in 1980 to allow certain parties to recover attorney’s fees from the government in civil actions and administrative adjudication. Subtitle C (sections 231 and 232) of SBREFA amended this Act in three ways: (1) raising the hourly cap on attorneys fees to \$125 per hour, (2) generally permitting eligible parties to claim fees and other expenses related to defending against demands “substantially in excess of the judgment finally obtained” (not just if they prevailed in the case) and, (3) in these “excessive demand” cases, expanding the definition of an eligible party to include small entities as defined in the RFA.⁴⁷²

Advocacy Review Panels. Section 244 of SBREFA put in place special requirements for proposed rules issued by EPA and OSHA. EPA and OSHA are required to convene “advocacy review panels” before publishing a regulatory flexibility analysis for a proposed rule. Specifically, the agency issuing the regulation (OSHA or EPA) must notify the SBA Chief Counsel for Advocacy and provide information on the draft rule’s potential impacts on small entities and the type of small entities that might be affected. The Chief Counsel then must identify representatives of affected small entities within 15 days of the notification. The review panel must consist of full-time federal employees from the rulemaking agency, OMB, and SBA’s Chief Counsel for Advocacy. During the panel process, the panel must collect the

⁴⁷²See SBA Office of Advocacy, *The Equal Access to Justice Act and Small Business — Analysis and Critique*, Aug. 10, 2001.

advice and recommendations of representatives of affected small entities about the potential impact of the draft rule. The panel must report on the comments received and on the panel's recommendations no later than 60 days after the panel is convened, and the panel's report must be made public as part of the rulemaking record. An agency may or may not adopt the panel's recommendations. GAO examined the initial implementation of these requirements and reported that the participants generally agreed that the panels were worthwhile, but suggested several changes to make them work better.⁴⁷³

Concluding Observations

Most of the regulatory reform efforts enacted in the past 25 years have been introduced with great fanfare and even greater expectations. And in a few cases, the reforms appear to have achieved at least some of those expectations (e.g., the above-mentioned requirement that EPA and OSHA convene small entity advocacy review panels before developing proposed rules). It appears, however, that most of the regulatory reform initiatives implemented in the past 25 years or so have been less effective than their authors had initially hoped. Some have been less charitably described as failures.

Agency Discretion. One reason why some previous regulatory reform efforts have not been more effective appears related to the amount of discretion that agencies have been given in their implementation. In some cases, that discretion is directly provided to the agencies through statutory language (e.g., agencies "may" take certain actions, or are required to conduct an analysis "when feasible"). In other cases, the discretion is provided when the reform requirements are not clear, or when definitions of key terms are not provided. It is important to recognize that some measure of agency discretion in implementing the reforms is inevitable and necessary. But if that discretion results in ineffective analytical or accountability requirements, improvements in effectiveness may require some reductions in discretion.

One of the best known examples of a reform effort that gives agencies a great deal of discretion is the RFA, which allows agencies to define key terms such as "significant economic impact on a substantial number of small entities," thereby avoiding the act's requirements. For example, in 1999, the EPA issued a proposed rule that would have lowered the threshold for reporting the use of lead under the Toxic Release Inventory (TRI) program from 25,000 pounds to 10 pounds.⁴⁷⁴ As a result, any business with ten or more employees that used more than ten pounds of lead per year in its manufacturing process would have to fill out a TRI report. By EPA's own estimates, the TRI report took more than 100 hours to fill out the first time, and lowering the reporting threshold would have swept in more than 5,000 small businesses, costing each of them about \$7,500 the first year and more than \$5,000 each subsequent year. Nevertheless, EPA certified that this rule would not have a "significant economic impact on a substantial number of small entities," so it did not trigger the requirements of the RFA. GAO concluded in its 2000 report that EPA's policies — while setting a "high threshold" — were

⁴⁷⁴Environmental Protection Agency, *Lead and Lead Compounds*, 64 Fed. Reg. 42,222 (Aug. 3, 1999).

within the discretion that the RFA allows.⁴⁷⁵ GAO also determined that since 1996, EPA had certified 96% of its rules as not having a significant impact on small entities. During this same period, the office of pesticides and the office of solid waste within EPA had certified 100% of their rules.

The compliance guide requirement in section 212 of SBREFA also gives agencies substantial discretion. For example, the statute says agencies “may” prepare separate guides covering groups or classes of similarly affected small entities, and “may” cooperate with associations of small entities to develop and distribute the guides. Agencies are given “sole discretion” in the use of plain language in the guides, and the statute does not indicate when the guides must be developed or how they must be published. As a result, it would be possible for an agency to develop a *hard to understand* compliance guide *years after* a final rule is published with *no input* from small entities, and still be considered in compliance with the act. Likewise, under section 223 of SBREFA, an agency could have a small entity penalty relief policy that covered only some of its enforcement actions, and even where covered, give small entities no more penalty relief than large entities.

The Unfunded Mandates Reform Act (UMRA) also gives agencies a great deal of discretion in its implementation. For example, section 202 of UMRA requires agencies to prepare “written statements” containing, among other things, estimates of future compliance costs and any disproportionate budgetary effects “if and to the extent that the agency in its sole discretion determines that accurate estimates are reasonably feasible and that such effect is relevant and material.” The statute gives agencies the same discretion regarding estimates of the effects of their rules on the national economy. Therefore, an agency can omit these estimates if, in its sole discretion, it considers them inaccurate, unfeasible, irrelevant, or immaterial. Likewise, section 203 requires agencies to develop plans to involve small governments in the development of regulatory proposals that have a “significant or unique” effect on those entities. Therefore, an agency that concludes that a rule’s effect on small governments will not be “significant” or “unique” can avoid this requirement. None of the agencies that GAO reviewed in its 1998 report on UMRA had developed small government plans pursuant to section 203.⁴⁷⁶

Agency discretion is present in most federal rulemaking requirements — even the most longstanding and revered of those requirements. For example, the APA, which established the basic “notice and comment” rulemaking process, allows agencies to issue final rules without a NPRM if the agencies can demonstrate “good cause” — i.e., that allowing the public to comment is “impracticable, unnecessary, or not in the public interest.” And use of the good cause exception makes sense in certain circumstances, such as when new flight restrictions were needed quickly in the wake of the September 11, 2001, terrorist attacks. There is also some evidence, however, to suggest that agencies may be overusing this “good cause” exception. For example, in 1998, GAO reported that about half of the more than 4,600 final rules issued in 1997

⁴⁷⁵ U.S. General Accounting Office, *Regulatory Flexibility Act: Implementation in EPA Program Offices and Proposed Lead Rule*, GAO/GGD-00-193, Sept. 20, 2000.

⁴⁷⁶ U.S. General Accounting Office, *Unfunded Mandates: Reform Act Has Had Little Effect on Agencies’ Rulemaking Actions*, GAO/GGD-98-30, Feb. 4, 1998. Some agencies had such programs, but said they were not developed because of UMRA. No subsequent reviews of agency compliance with this provision have been conducted.

had no NPRMs.⁴⁷⁷ Although many of these rules involved administrative or technical issues that were not likely to generate comments, the agencies indicated that some of the rules without a notice would have a \$100 million impact on the economy. In some cases, it was unclear why the agency could not have issued a proposed rule. For example, one agency indicated that its rule would be in the public interest, and that constituted “good cause” not to allow the public to comment on it. In other cases the agencies said issuing proposed rules was impracticable because of statutory or other deadlines that had already passed by the time the rule was issued.

Presidents have also given agencies substantial discretion in the implementation of some of the requirements they have placed on rulemaking agencies. For example, in 1987, President Reagan issued Executive Order 12612 on “Federalism,” which established a set of fundamental principles and criteria for executive departments and agencies to use when formulating and implementing policies that have federalism implications.⁴⁷⁸ The executive order also required federal agencies to prepare a “federalism assessment” whenever the responsible agency official determines that a proposed policy had sufficient federalism implications to warrant the preparation of the assessment. The assessment was required to contain certain elements (e.g., identifying the extent to which the policy would impose additional costs or burdens on the states), and was to accompany any rule submitted to OMB for review under Executive Order 12866. The GAO, however, examined the implementation of Executive Order 12612 and, in 1999, concluded that it had little effect on agency rulemaking.⁴⁷⁹ Agencies prepared few federalism assessments because they concluded that their rules would not have sufficient “federalism implications” to merit an analysis, *even when they also said that the rules preempted state or local law*. In 1999, President Clinton issued Executive Order 13132 on “Federalism,” which revoked Executive Order 12612. Like its predecessor, though, the new executive order provides agencies with substantial flexibility to determine which of their actions have “federalism implications” and, therefore, when they should prepare a “federalism summary impact statement.”

Linking New Requirements to Old Requirements. Another reason why some regulatory reform measures have not worked as well as some expected is that the reforms have been related to or built on other reforms with some of the above-mentioned problems. As noted previously, the “look back” requirement in section 610 of the RFA and the compliance guide requirement in section 212 of SBREFA are triggered only when the rulemaking agency determines that a rule has a “significant economic impact on a substantial number of small entities.” Therefore, if the agency concludes that a rule would not, in its opinion, have a “significant” impact on a “substantial” number of small entities, the agency is not required to reexamine its rule or to prepare a compliance guide.

Even regulatory reforms that are regarded as effective can be adversely affected by their linkage to other rulemaking requirements. For example, the EPA and OSHA small business advocacy review panels that are required by SBREFA are only required when the agency determines that a rule might have a “significant economic impact on a substantial number of small entities.” Therefore, if EPA and OSHA conclude that their forthcoming proposal would

⁴⁷⁷U.S. General Accounting Office, *Federal Rulemaking: Agencies Often Issued Final Actions Without Proposed Rules*, GAO/GGD-98-126, Aug. 31, 1998.

not, if implemented, have such an impact on small entities, they can avoid the panel requirement.

Narrow Scope of Requirements. Other regulatory reforms would arguably be more effective if their scope were broader. For example, when Congress enacted the UMRA, it was considered one of the most important efforts to constrain the imposition of new requirements on state and local governments and businesses without new resources to implement those requirements. And, there is some evidence to indicate that the requirements that Congress placed on itself in title I of the Act have had that effect, at least with regard to state and local governments.⁴⁸⁰ Nevertheless, there is little direct evidence that the requirements placed on the agencies in title II of UMRA have had much, if any, effect on the rulemaking process. One reason involves the limited number of rules that the act covers.

- First, the statute says that UMRA does not cover any rules issued by independent regulatory agencies such as the Federal Communications Commission, the Securities and Exchange Commission, or the Consumer Product Safety Commission.
- Second, the statute says that UMRA also does not apply to any rules issued without a previous notice of proposed rulemaking. As discussed indicated earlier, about half of all final rules are issued without an NPRM, so UMRA does not apply to any of those rules.
- Third, UMRA says that agencies need not prepare a written statement containing (among other things) an estimate of benefits and costs if the rule in question imposes an enforceable duty only as part of a voluntary program or as a condition of federal financial assistance. A number of the programs that agencies consider “voluntary” (e.g., the No Child Left Behind Act) are not viewed that way by the states or other regulated entities.
- Finally, the Act says that agencies need not prepare an UMRA written statement if the rule will not require “expenditures” of at least \$100 million. As some rules do not technically require “expenditures” (e.g., the rule may prevent the money from ever getting into the pockets of affected parties), UMRA does not cover them.

Not surprisingly, when GAO examined the implementation of UMRA in 1998 and 2004, it concluded that the Act had little effect on agency rulemaking.

Although not discussed at length in this chapter, some observers have also criticized the limited scope of the Presidential review requirements in Executive Order 12866.⁴⁸¹ Like its

⁴⁸⁰Congressional Budget Office, *A Review of CBO’s Activities Under the Unfunded Mandates Reform Act*, testimony before the House Committee on Government Reform, March 8, 2005, available at [<http://www.cbo.gov/showdoc.cfm?index=6141&sequence=0>]. CBO said that although Congress has rarely used UMRA’s explicit enforcement mechanisms, “it has changed several pieces of legislation before enactment to either eliminate mandates or lower costs.”

⁴⁸¹The Center for Regulatory Effectiveness, *A Blueprint for OMB Review of Independent* (continued...)

predecessor (Executive Order 12291) and UMRA, the executive order covers only executive departments and independent agencies; it does not cover rules issued by independent regulatory agencies in such areas as telecommunications, energy, and trade with an estimated effect on the economy of more than \$200 billion – roughly the same as the health, safety, and environmental rules that OIRA *does* review. Advocates of extending the executive order to independent regulatory agencies' rules point out that OIRA already reviews their information collection requests under the PRA, and argue that reviewing the substance of their rules would be a logical extension of that effort. Opponents note, however, that these agencies were established to be independent of the President, and argue that including them under the scope of the executive order would violate that independence.

Countervailing Forces. Another reason why some accountability requirements appear to have been unsuccessful involves countervailing forces or conflicting goals that work against the achievement of the requirements' objectives. For example, the 1995 amendments to the PRA required OMB to set burden reduction goals for the next six years that would have, if they had been met, reduced the amount of federal paperwork from about seven billion burden hours at the end of fiscal year 1995 to about 4.6 billion hours by the end of fiscal year 2001. By the end of fiscal year 2002, however, the government-wide paperwork burden estimate stood at more than 8.2 billion hours. A number of factors contributed to agencies inability to achieve the goals set in the PRA, including increases in the population of respondents and failures in the paperwork clearance process.⁴⁸² One major factor, however, appears to be that, at the same time agencies were being told to reduce paperwork, Congressional and Presidential initiatives were either directly or indirectly requiring the agencies to collect *more* paperwork. Perhaps the best illustration of this is the Internal Revenue Service (IRS), which is responsible for about 80% of the federal paperwork requirements. In recent years, IRS officials have stated that the agency's paperwork requirements have increased largely because of new statutes providing new tax breaks for individuals and businesses (e.g., the American Jobs Creation Act of 2004 and the Working Families Tax Relief Act of 2004) and creating new levels of complexity.⁴⁸³ In order to determine whether taxpayers are deserving of such benefits, IRS requires additional information from them — thereby increasing the agency's estimated paperwork burden. Therefore, OIRA has concluded that IRS' burden reduction actions to represent the "maximum practicable opportunity" available to the agency, and are consistent with the burden reduction goals under the PRA.

Although the Congressional Review Act (CRA) was initially viewed as a way for Congress to reassert itself in the rulemaking process, checking agencies' work to ensure consistency with the intent of underlying statutes, its implementation has been well short of that goal. By March 2006, 10 years after the CRA was enacted, agencies had submitted more than 42,000 rules to Congress, including 610 "major" rules, most with a \$100 million impact on the economy. Although many of even the major rules were not controversial, dozens if not hundreds

Agency Regulations, (Mar. 2002). Available at [<http://www.thecre.com/pdf/blueprint.pdf>].

⁴⁸²U.S. Government Accountability Office, *Paperwork Reduction Act: New Approach May Be Needed to Reduce Government Burden on Public*, GAO-05-424. GAO determined that certain agencies were not carrying out all of their review responsibilities under the PRA.

⁴⁸³See, e.g., Mark W. Everson, Commissioner of Internal Revenue, testimony before the House Committee on Government Reform's Subcommittee on Regulatory Affairs, May 25, 2005, available at [http://reform.house.gov/UploadedFiles/IRS_testimony_PW2005.TaxPolicy--AMS.doc].

of the rules submitted to Congress were publicly opposed by a number of lawmakers, and 37 resolutions of disapproval had been introduced since 1996. Nevertheless, only one rule has been reversed under CRA procedures — the Department of Labor’s ergonomics rule in early 2001. Many reasons have been offered for the CRA’s lack of use (e.g., the lack of expedited legislative procedures in the House, or the lack of a neutral organization to provide Congress with information about rules).⁴⁸⁴ The primary reason, however, appears to be the balance of power between the Congress and the President. Under the CRA, if the President vetoes a joint resolution of disapproval regarding a rule *that has been approved by officials in his Administration*, it requires a two-thirds vote in both chambers for Congress to disapprove the rule over the President’s objection. As a result, it is very difficult for Congress to use the CRA to disapprove a rule that the President would like to see go into effect. In fact, the only time that the CRA has been used to disapprove a rule — the ergonomics rule — was when the presidency changed hands, and the incoming President wanted to see the previous Administration’s rule disapproved.

Areas for Possible Congressional Action

The above discussion suggests several possible types of Congressional action to improve the operation of these analytical and accountability requirements — e.g., reducing agency discretion in certain areas; removing the link between certain requirements and other, ineffective requirements; and broadening the scope of certain requirements.

Regulatory Flexibility Act. GAO and others have said that the key to improving the performance of the RFA is for Congress to define, or require some other entity to define, the term “significant economic impact on a substantial number of small entities.” Doing so could also improve the implementation of other analytical and accountability requirements built on the RFA (e.g., the small entity compliance guide requirements that are triggered only when an agency concludes that a rule has that level of impact).

Other suggested legislative improvements to the RFA include: (1) codification of Executive Order 13272, which requires agencies to establish written policies on how they measure their impacts on small entities and to notify SBA about draft rules expected to trigger the Act’s requirements; (2) requiring federal agencies to analyze foreseeable indirect impacts and cumulative impacts; and (3) strengthening the “look back” requirements in section 610 of the Act.⁴⁸⁵

Cost-Benefit Analysis Requirements. With regard to cost-benefit analysis, some have argued that Congress should reconsider current prohibitions regarding the consideration of cost in certain statutes (e.g., the Clean Air Act).⁴⁸⁶ Doing so, they argue, would allow agencies like EPA to use analytic tools that could improve decisionmaking.

Other Congressional Reforms. Some have suggested that the regulatory and analytical requirements that have been put in place during the past 60 years, but particularly in

⁴⁸⁴See, e.g., Mort Rosenberg, *Congressional Review of Agency Rulemaking: An Assessment after Nullification of OSHA’s Ergonomics Standard*, CRS Report RL30116.

⁴⁸⁵Holman, *supra* note 424, at 1135-1136.

⁴⁸⁶Sunstein, *supra* note 436, at 131-136.

the last 25 years, should be rationalized, and put into a single statute. Doing so, they argue, would make the rulemaking requirements more consistent, more integrated, and easier for rulemaking agencies to follow.

Issues for Further Research

In addition to issues for Congressional consideration, the above discussion suggests numerous areas for further research by ACUS or other researchers. Possible research questions include the following:

- Is cost-benefit analysis inherently biased in that the benefits of health and safety rules are often difficult or impossible to monetize?
- Executive Order 12866 requires agencies to assess the costs and benefits of all significant rules, and requires a full cost-benefit analysis of all “economically significant” rules. Does OMB apply these requirements and use cost-benefit information in a balanced way? For example, does OMB require all rules to have a cost-benefit analysis, or are certain types of rules or rules from certain agencies (e.g., Homeland Security rules) essentially exempt from these requirements?
- Does OMB use cost-benefit analysis to prompt rulemaking or to increase regulatory requirements, or only to stop or limit rulemaking?
- How effective have been the analytical requirements designed to protect small businesses and other small entities (e.g., the RFA and SBREFA)? Do they give federal agencies too much discretion in their application? Should SBA or some other entity be required to define key terms (e.g., “significant economic impact on a substantial number of small entities”)?
- How effective have been the regulatory requirements designed to protect federalism (e.g., in Executive Order 13132)? Do they give federal agencies too much discretion in their application? Should OMB or some other entity be required to define key terms (e.g., “significant federalism implications”)?
- Should agencies be required to reexamine their rules periodically to ensure that they are still needed or impose the least burden? (Currently, agencies are only required to do so for rules that had/have a “significant economic impact on a substantial number of small entities.”) Or, should Congress take on that reexamination responsibility (perhaps as contemplated in H.R. 3356 in the 108th Congress)? Relatedly, should agencies’ final rules include a “sunset” provision that requires them to be reexamined and republished?
- Should the myriad of analytical and accountability requirements in various statutes and executive orders be rationalized and codified in one place?
- To what extent have the analytical and accountability requirements contributed to what is called the “ossification” of the rulemaking process?

- How accurate are agencies' pre-promulgation cost and benefit estimates?
- How much does it cost for agencies to conduct cost-benefit analyses, risk assessments, regulatory flexibility analyses, federalism assessments, etc.?

VI. Science and the Regulatory Process

On May 9, 2006, the Center for the Study of Rulemaking at American University hosted an all-day conference for the CAL Subcommittee entitled “The Role of Science in Rulemaking.” As Neil Kerwin, interim president of American University and director of the Center for the Study of Rulemaking, said in his opening remarks, “[R]ulemaking is the transformation of information into legal obligations and rights. That information takes many forms, but the type of information that contributes most profoundly to a vast swath of rulemaking can be broadly categorized as scientific.” The role of science in rulemaking has become highly controversial in recent years, with observers from both the left and the right suggesting that “sound science” has been given insufficient weight in the development of regulatory standards. Those on the right assert that closer adherence to science would lessen the burden of unnecessary regulation, thereby lowering regulatory costs. Observers from left indicate that science is often trumped by political considerations, and as a result regulatory standards that science suggests are needed do not get developed. As part of that debate, questions have been raised about the quality of data that are used in developing proposed and final rules, the use of peer review panels as part of the process to ensure quality, and the role that risk assessment can/should play in deciding what to regulate and at what levels.

The conference’s first panel, “The Office of Management and Budget’s (OMB’s) Recent Initiatives on Regulatory Science,” focused on: the Information Quality Act and related OMB guidelines, OMB’s peer review bulletin, and the office’s 2006 draft bulletin on risk assessment. Moderated by Curtis Copeland of CRS, the panel members were: Don Arbuckle, Acting Administrator of OMB’s Office of Information and Regulatory Affairs (OIRA); Al Teich, Director of Science and Policy Programs of the American Association for the Advancement of Science; Bill Kovacs, Vice President for Environment, Technology and Regulatory Affairs of the United States Chamber of Commerce; and Rena Steinzor, Professor at the University of Maryland School of Law and Co-founder of the Center for Progressive Regulation.

The second conference panel, “Science and the Judicial Review of Rulemaking,” was moderated by Jeffrey Lubbers of the Washington College of Law at American University. It featured: Tom McGarity, Professor at the University of Texas School of Law; Sid Shapiro, Professor at the Wake Forest University School of Law; Peter Strauss, Professor at the Columbia University School of Law; and E. Donald Elliott, Partner at Willkie Farr & Gallagher, LLP.

The third panel, “Science Advisory Panels and Rulemaking,” was moderated by Morton Rosenberg of CRS. It was comprised of Wendy Wagner, Professor at the University of Texas School of Law; Jamie Conrad, Assistant General Counsel at the American Chemistry Council; Richard Parker, Professor at the University of Connecticut School of Law; and Fred Anderson, Partner at McKenna Long & Aldridge.

The fourth panel, “Government Agencies’ Science Capabilities,” was moderated by Laura Langbein of American University, the panel featured Richard Belzer of Regulatory Checkbook; John Morall, Branch Chief at OIRA; Robert O’Connor, Director of Decision, Risk and Management Sciences Program of the National Science Foundation; and Liza Hinzerling, Professor at Georgetown University Law School.

The discussions that occurred in these panels are summarized below, along with related information. As the OMB initiatives were a consistent theme in each of the panel discussions,

the first section below provides detailed information on the IQA and OMB's guidelines, OMB's peer review bulletin, and the proposed risk assessment bulletin.

OMB's Recent Initiatives on Regulatory Science

OMB's Office of Information and Regulatory Affairs (OIRA) was created by the Paperwork Reduction Act of 1980. Although OIRA is a relatively small office (currently, 55 full-time equivalents), it can have a significant— if not determinative— effect on a broad array of federal regulations that agencies issue to enact statutes and establish specific requirements. Under Executive Order 12866, OIRA reviews hundreds of significant proposed and final rules from all federal agencies (other than independent regulatory agencies) before they are published in the Federal Register. As a result of OIRA's review, many draft rules are changed before publication, withdrawn before a review is completed, or returned to the agencies because, in OIRA's opinion, certain aspects of the rule need to be reconsidered.

In recent years, OIRA has taken a number of actions — some unilaterally, some at the urging of Congress — that are expected to have a major effect on rulemaking and, in particular, regulatory science. The first such action (in 2001 and 2002) was the issuance of guidance to federal agencies on information quality, which was required by the Information Quality Act (also known as the Data Quality Act). The second action was related to the first, i.e., the development and issuance in 2003 and 2004 of a bulletin on “peer review” of the information that is used to develop regulations and other types of influential information that federal agencies disseminate to the public. Finally, in January 2006, OMB published a draft bulletin on risk assessment for public comment and for review by the National Academy of Sciences. Each of these actions is introduced below, followed by a summary of the panel discussion at the science and rulemaking conference.

Information Quality Act Guidelines

In December 2000, Congress passed and the President signed the Treasury and General Government Appropriations Act, 2001 (Pub. L. No. 106-554). Section 515 of that more than 700-page bill has subsequently been referred to as the “Data Quality Act” or the “Information Quality Act” (IQA) (codified at 44 U.S.C. §§ 3504(d)(1) and 3516). Although little noticed at the time, the IQA has subsequently been the subject of intense debate and controversy. The act required the Office of Management and Budget (OMB) to issue guidance to federal agencies designed to ensure the “quality, objectivity, utility, and integrity” of information disseminated to the public. It also required agencies to issue their own information quality guidelines, and to establish administrative mechanisms that allow affected persons to seek correction of information maintained and disseminated by the agencies that does not comply with the OMB guidance.

The IQA amended the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. Chapter 35), which already required OMB to develop and oversee the implementation of policies, principles, standards, and guidelines to apply to federal agency dissemination of public information. The PRA also required agencies to manage their information resources “to improve the integrity, quality, and utility of information to all users within and outside the agency.”⁴⁸⁷ Also already in place were a variety of nonstatutory requirements related to information dissemination (e.g.,

⁴⁸⁷44 U.S.C. § 3506(b)(1)(C) (2000).

OMB Circular A-130 on “Management of Federal Information Resources”). Therefore, the IQA can be seen as an extension of these previous statutory and nonstatutory requirements.

Representative Jo Ann Emerson is generally regarded as the primary sponsor of the IQA.⁴⁸⁸ The act, in its entirety, reads as follows:

(a) IN GENERAL. — The Director of the Office of Management and Budget shall, by not later than September 30, 2001, and with public and Federal agency involvement issue guidelines under sections 3504(d)(1) and 3516 of title 44, United States Code, that provide policy and procedural guidance to Federal agencies for ensuring and maximizing the quality, objectivity, utility, and integrity of information (including statistical information) disseminated by Federal agencies in fulfillment of the purposes and provisions of chapter 35 of title 44, United States Code, commonly referred to as the Paperwork Reduction Act.

(b) CONTENT OF GUIDELINES. — The guidelines under subsection (a) shall (1) apply to the sharing by Federal agencies of, and access to, information disseminated by Federal agencies; and (2) require that each Federal agency to which the guidelines apply (A) issue guidelines ensuring and maximizing the quality, objectivity, utility, and integrity of information (including statistical information) disseminated by the agency by not later than 1 year after the date of issuance of the guidelines under subsection (a); (B) establish administrative mechanisms allowing affected persons to seek and obtain correction of information maintained and disseminated by the agency that does not comply with the guidelines issued under subsection (a); and (C) report periodically to the Director (i) the number and nature of complaints received by the agency regarding the accuracy of information disseminated by the agency; and (ii) how such complaints were handled.

As noted previously, these provisions were inserted as section 515 of the more than 700-page Treasury and General Government Appropriations Act, 2001. There were no hearings or debates specifically on these provisions and no committee reports were filed. OMB had previously been urged by individual Members or committees to develop similar guidance on several previous occasions, but OMB had rejected those requests.⁴⁸⁹

Supporters of the IQA, many of whom represent businesses and other regulated parties, considered it an extremely important tool to oversee the work of rulemaking agencies. In fact,

⁴⁸⁸Some press reports attribute the IQA to Jim Tozzi, a former OMB official, who is currently head of the Center for Regulatory Effectiveness. The Center describes itself on its website as receiving “financial support, services in kind, and work product from trade associations and private firms,” and says its primary goals are to ensure that (1) the public has access to information used to develop federal regulations and (2) information that federal agencies disseminate to the public is of the highest quality. See <http://www.thecre.org>.

⁴⁸⁹See, e.g., the H.R. Rep. No. 105-592, at 49 (1998). For an example of OMB rejection of those requests, see the letter from John T. Spotilla, then-Administrator of OIRA, to the Honorable Jo Ann Emerson, Apr. 18, 2000, available at http://thecre.com/quality/20041012_letter.htm.

the United States Chamber of Commerce⁴⁹⁰ said the Act was “the most significant change to the federal rulemaking process since the Administrative Procedure Act was enacted more than 50 years ago,” and said it would have “a revolutionary impact on the regulatory process.” These supporters contended that the IQA and the resultant OMB and agency guidelines would improve the quality of agency science and regulation and force agencies to regulate based on the best science available. Some of these proponents also maintained that the act would help agencies defend their regulations against lawsuits and would reduce the number of lawsuits filed.

Critics of the IQA and the guidelines, including many environmental and public interest groups such as OMB Watch⁴⁹¹ and Public Citizen,⁴⁹² said the law was a tool by which regulated parties can slow and possibly stop new health, safety, and environmental standards, and that could lead to the revision or elimination of existing standards. They contended that the Act could have a chilling effect on agency distribution and use of scientific information. These critics foresaw a flood of data quality challenges, correction requests, and court suits on a wide range of scientific issues, which could tie up agency resources and significantly delay health, safety, and environmental regulations. Critics have also noted that since “quality” is a subjective term and some regulations are based on “best available data,” regulations could be arbitrarily rejected under the IQA, or may never be developed at all because of concerns about running afoul of the act.⁴⁹³

OMB Guidelines. In light of the Act’s scant legislative history and the Act’s lack of detail, OMB’s guidance interpreting key provisions in the Act has a major effect on its implementation. OMB published proposed governmentwide IQA guidelines in the Federal Register on June 28, 2001 (66 Federal Register 34489), and published final guidelines (with a request for further comments on certain points) on September 28, 2001 (66 Federal Register 49718). OMB later republished the guidelines (after making changes pursuant to public comments) on February 22, 2002 (67 Federal Register 8452).⁴⁹⁴ OMB noted that the guidelines apply to all federal agencies that are subject to the PPA, i.e., Cabinet departments, independent regulatory agencies (e.g., the FCC), and other independent agencies (e.g., the EPA). Agencies not subject to the PRA (and therefore not covered by the IQA or OMB’s guidelines) are the GAO, the Federal Election Commission, and government-owned contractor-operated facilities (e.g., laboratories engaged in national defense research and production activities).

The OMB guidelines describe OMB and agency responsibilities under the Act, including agency reporting requirements. For example, the guidelines note that the IQA essentially

⁴⁹⁰The Chamber of Commerce describes itself on its website as the world’s largest not-for-profit business federation. See <http://www.uschamber.org>.

⁴⁹¹OMB Watch describes itself on its website as a “nonprofit research and advocacy organization dedicated to promoting government accountability and citizen participation in public policy decisions.” See <http://www.ombwatch.org>.

⁴⁹²Public Citizen describes itself on its website as a “national, nonprofit consumer advocacy organization founded in 1971 to represent consumer interests in Congress, the executive branch, and the courts.” See <http://www.citizen.org>.

⁴⁹³For a discussion of this issue, see Rick Weiss, “Data Quality” Law is Nemesis of Regulation, Wash. Post, Aug. 16, 2004, at A1.

⁴⁹⁴For a copy of the OMB guidelines, see <http://www.whitehouse.gov/omb/fedreg/reproducible2.pdf>.

requires covered agencies to do three things: (1) issue their own guidelines by October 1, 2002, (2) establish administrative mechanisms allowing affected persons to seek correction of information that they believe does not comply with these guidelines, and (3) report periodically to OMB on the number and nature of the complaints that the agencies received. The guidelines also require the agencies to designate the Chief Information Officer or some other official to be responsible for agency compliance, and required them to develop agency-specific guidelines and administrative correction mechanisms. OMB said the agencies must permit the public to comment on their guidelines and correction mechanisms, and then must submit them to OMB for review before publishing them in final form. OMB also said the report on the number and nature of complaints received should be done on a fiscal year basis, with the first such report due to OMB on January 1, 2004.

The OMB guidelines also define a number of key terms that are undefined in the IQA, and those definitions have had a significant effect on how the act is implemented. OMB said “quality” encompasses elements of utility, objectivity, and integrity. The definitions of some of these and other terms are relatively straightforward and noncontroversial, but others have proven to be much more controversial because they establish the scope and applicability of the guidelines.

Information. OMB established the broad scope of the Act by defining “information” in the guidelines as “any communication or representation of knowledge such as facts or data, in any medium or form.” OMB went on to say that the definition includes information that the agency disseminates through its website, but does not include hyperlinks to information that other organizations disseminate.

Dissemination. The IQA only applies to information that is “disseminated” by federal agencies, so the definition of that word also has a major effect on the Act’s scope of coverage. The OMB guidelines define “dissemination” as “agency initiated or sponsored distribution of information to the public.” The guidelines make it clear that an agency can initiate the distribution of information either directly or indirectly (e.g., information prepared by an outside party and disseminated by an agency “in a manner that reasonably suggests that the agency agrees with the information”). OMB said an agency has “sponsored” an information dissemination if it directs a third party to distribute information or if an agency has the authority to review and approve it before it is distributed.

Objectivity. The OMB guidelines state that “objectivity” is a function of both presentation (i.e., whether the information is presented in an accurate, clear, complete, and unbiased manner) and substance (i.e., whether the information is accurate, reliable, and unbiased). OMB indicated that agencies can presume that data are sufficiently “objective” if they have been subject to an independent peer review process (e.g., as used by scientific journals), but a member of the public can rebut this presumption “based on a persuasive showing by the petitioner in a particular instance.”

Influential Information. Additional IQA obligations apply to scientific, financial, or statistical information that is “influential,” which the guidelines define as information that “the agency can reasonably determine” will have or does have a “clear and substantial impact on important public policies or important private sector decisions” when disseminated to the public. OMB authorized the covered agencies to define “influential” in ways appropriate for them, but indicated that the data and analytic results related to influential information should meet certain “reproducibility” and “transparency” standards. Specifically, OMB said that agency guidelines should “generally require sufficient transparency about data and methods that an independent

reanalysis could be undertaken by a qualified member of the public” and would generate similar results. Critics, however, have questioned how agencies are to know in advance of dissemination when information will be “influential,” or what constitutes an “important public policy.”

Risk Information. When agencies disseminate information related to the analysis of risks to human health, safety, and the environment, the OMB guidelines require agencies to “adopt or adapt” the “quality principles” that Congress established in the Safe Drinking Water Act Amendments of 1996 (42 U.S.C. § 300g-1(b)(3)(A) and (B)). When basing actions under this Act on science, the amendments require EPA to use “the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices” and to use “data collected by accepted methods or best available methods.” When presenting risk information to the public concerning safe drinking water, the amendments also require EPA (where “practicable”) to identify a “central estimate of risk” for specific populations, upper-bound and lower-bound estimates of risk, and “each significant uncertainty identified in the process of the assessment.” OMB said that through these amendments, “Congress adopted a basic quality standard for the dissemination of public information about risks of adverse health effects.” Critics, however, have questioned whether it is appropriate for OMB’s guidelines to export risk analysis principles established for the Safe Drinking Water Act to agency actions under other environmental, health, and safety statutes.

Correction Mechanisms. OMB’s data quality guidelines also generally describe the “administrative mechanisms” that agencies are required to establish to allow “affected persons to seek and obtain correction of information maintained and disseminated by the agency that does not comply with the guidelines.” Specifically, the guidelines state that the mechanisms should be “flexible, appropriate to the nature and timeliness of the disseminated information, and incorporated into agency information resources management and administrative practices.” They go on to say that the agencies must make decisions within “appropriate time periods,” and must “notify the affected persons of any corrections made.” Agencies also must establish an “administrative appeal process” to review the agencies’ initial decisions, and must specify “appropriate time limits” for the resolution of requests for reconsideration. The preamble to the guidelines indicates that, to ensure objectivity, the office that originally disseminates the information should not have responsibility for both the initial response and resolution of a disagreement.

OMB’s Reports on IQA Implementation. The IQA required agencies to report periodically to OMB on the information quality complaints they received, but the Act did not require that OMB report to Congress on its implementation. Subsequently, though, a reporting requirement was established. The conference report on H.R. 2673, the Consolidated Appropriations Act of 2004, indicated that the conferees were “concerned that agencies are not complying fully with the requirements of the [IQA],” and directed OMB to submit a report to the House and Senate Committees on Appropriations by June 1, 2004, on whether agencies had been “properly responsive” to public requests for correction of information pursuant to the IQA.⁴⁹⁵ The conference report also said that OMB should suggest changes to the act or to OMB’s guidelines to “improve the accuracy and transparency of agency science.”

On April 30, 2004, OMB provided a report to Congress on the implementation of the IQA

⁴⁹⁵“Implementation of the Federal Data Quality Act,” 149 Cong. Rec. H12699 (daily ed. Nov. 25, 2003).

during fiscal year 2003. In December 2005, as part of its annual report on the costs and benefits of federal regulations, OMB updated its 2004 report on IQA implementation.⁴⁹⁶ The report provided information on correction requests received in 2003 and 2004, repeated many of the observations included in the earlier report about IQA implementation, and offered several “helpful tips for stakeholders interested in writing an effective correction request.”

OMB noted that agencies’ interpretation of what qualifies as an IQA correction request “has not been consistent,” with some counting requests that were similar to those previously received and that did not appear to be generated by the Act, and others not counting those requests. Therefore, OMB cautioned readers “against drawing any conclusions about trends or year-to-year comparisons.”⁴⁹⁷ In its report, OMB decided to include some correction requests “despite the fact that some arguably are not generated by the Act.” OMB revised the number of correction requests received in fiscal year 2003 from 35 to 48, and said it considered only 37 requests to be generated by the IQA during fiscal year 2004. Therefore, OMB included a total of 85 correction requests for both years.

OMB reported that ten of these 85 requests led to the correction or partial correction of information (many of which, OMB said, were without significant policy implications), 13 were resolved through other processes (e.g., treated as comments on proposed rules), 17 were pending at the end of FY2004, and 45 had been denied. Of the 45 denied requests (which OMB characterized as “more substantive in nature”), 28 had been appealed, and 13 had been denied again by the end of the fiscal year.

As so few substantive correction requests had been received by the agencies (85 in two years, compared to more than three million Freedom of Information Act requests during fiscal year 2003), OMB said it was still not prepared to make suggestions for legislative changes to the IQA. OMB, however, pointed out that it had issued a memorandum to the President’s Management Council requesting that agencies post all IQA correspondence on their websites by December 1, 2004, and noted that many agencies had done so.

OMB noted that the number of substantive IQA requests received had been fewer than some had anticipated, that the correction request process had been used by virtually all sectors of society, and that, “to our knowledge, the [Act] has not affected the pace or length of rulemakings.”⁴⁹⁸ OMB also again noted that it had learned that “what constitutes a ‘dissemination’ is not straightforward,” and also said that most non-frivolous requests were denied because “a reasonable scientist could interpret the available information the way the agency had,” meaning “it is possible for neither the agency nor the requestor to be incorrect.”⁴⁹⁹

Finally, OMB included a section in its 2005 report on the IQA that listed “tips that will bolster the quality of correction requests and make them easier for agencies to address in a

⁴⁹⁶Office of Management and Budget, Office of Information and Regulatory Affairs, *Validating Regulatory Analysis: 2005 Report to Congress on the Costs and Benefits of Federal Regulations and Unfunded Mandates on State, Local, and Tribal Entities*, Dec. 2005, at 55-77.

⁴⁹⁷*Id.* at 58.

⁴⁹⁸*Id.* at 65.

⁴⁹⁹*Id.* at 63.

rigorous and timely fashion.”⁵⁰⁰ For example, OMB said the public should: (1) submit correction requests as part of the traditional comment process when the information is under public review (e.g., when rules are out for public comment); (2) provide agencies with peer-reviewed references to scientific sources that support their viewpoint; (3) be as specific as possible and suggest specific changes that need to be made; and (4) request withdrawal of a dissemination only as a last resort.

The IQA and Judicial Review. Some observers see judicial review as the crucial test of the Act’s future effectiveness. If judicial review is permitted, agencies may find themselves subject to potentially endless legal challenges to their regulations and other types of information disseminations, which could make them less likely to issue similar regulations in the future. On the other hand, the absence of judicial review may encourage agencies to pay less attention to the IQA and make them more subject to administrative directives provided by OMB. Law journal articles do not convey any consensus in the legal community as to whether an agency’s response to a data quality challenge is subject to judicial review, or whether a court in reviewing a regulation might be influenced by a data quality challenge to the underlying data. Recent decisions by two district courts and a circuit court, however, suggest that judicial review is not available under the Act.

In the first IQA-related case to be addressed by a court, on June 21, 2004, a district court ruled that the Act does not permit judicial review regarding an agency’s compliance with its provisions.⁵⁰¹ In that case involving the Missouri River, the court first noted that the IQA does not specifically provide for a private cause of action. The court then noted that judicial review was generally available under the APA, but not if the agency is acting within the discretion provided by Congress. That discretion is generally considered to have been provided if the statute at issue is written in such broad terms that “there is no law to apply.”⁵⁰² In this case, the court said that such terms as “quality,” “objectivity,” “utility,” and “integrity” are not defined in the IQA, and the history of the legislation does not provide any indication as to the scope of these terms. Therefore, absent any “‘meaningful standard’ against which to evaluate the agency’s discretion, the Court finds that Congress did not intend the IQA to provide a private cause of action.”

On June 25, 2004 — four days after the above court decision — the Department of Justice (DOJ) filed a brief recommending the dismissal of a lawsuit filed under the IQA by the Chamber of Commerce and the Salt Institute against the National Heart, Lung, and Blood Institute (NHLBI) within the National Institutes of Health. The lawsuit challenged the NHLBI’s statements concerning sodium consumption and health effects. The DOJ brief said that the plaintiffs lacked standing to challenge the agency’s underlying study on sodium consumption, and also said that there was no statutory basis for the court to review the agency’s action because the IQA does not permit judicial review. Specifically, DOJ said the following:

Plainly, nothing in the text of the statute indicates that Congress intended for the *federal courts* [emphasis in the original] to serve as ongoing monitors of the ‘quality’ of information maintained and disseminated by federal agencies.

⁵⁰⁰*Id.* at 70.

⁵⁰¹*In re* Operation of the Missouri River Sys. Litig., No. 03-MD-1555 at 49 (D. Minn. June 21, 2004) (order granting motions for summary judgment).

⁵⁰²*Heckler v. Chaney*, 470 U.S. 821 (1985).

Rather, the language and structure of the IQA reflects Congress's intent that any challenge to the quality of information disseminated by a federal agency should take place in administrative proceedings before federal agencies. Simply put, Congress nowhere provided a new judicial avenue for private parties to enforce the terms of the IQA.

DOJ also noted that the above-mentioned Missouri River court case was "the first and only court to address this issue recently determined that the IQA does not provide for private cause of action." The Chamber of Commerce and Salt Institute filed a brief on July 16, 2004, challenging DOJ's arguments.

On November 15, 2004, the United States District Court for the Eastern District of Virginia ruled in this case that the Salt Institute and the Chamber of Commerce lacked standing to sue (e.g., they had suffered no "injury in fact"), and that judicial review of the agency's decisionmaking was not available. Specifically, the court ruled that there is no private right of action under the IQA, saying that the "language in the IQA reflects Congress's intent that any challenges to the quality of information disseminated by federal agencies should take place in administrative proceedings before federal agencies and not the courts."⁵⁰³ The court also said that judicial review under the APA was not available because the agency's actions did not constitute a "final agency action" (i.e., one in which "rights or obligations have been determined, or from which legal consequences will flow"),⁵⁰⁴ and because the agency decisions were within the discretion provided to the agency by law.⁵⁰⁵ The court explained:

Neither the IQA nor the OMB guidelines provide judicially manageable standards that would allow meaningful judicial review to determine whether an agency properly exercised its discretion in deciding a request to correct a prior communication. In fact, the guidelines provide that "agencies, in making their determination of whether or not to correct information, may reject claims made in bad faith or without justification, and are required to undertake only the degree of correction that they conclude is appropriate for the nature and timeliness of the information involved." 67 Fed. Reg. at 8458. Courts have determined that regulations containing similar language granted sufficient discretion to agencies to preclude judicial review under the APA.⁵⁰⁶

On March 6, 2006, the Fourth Circuit dismissed the appeal by the Salt Institute and the Chamber of Commerce, agreeing with the district court that the appellants lacked standing because they did not suffer an injury from the published data.⁵⁰⁷ The Fourth Circuit concluded that the IQA "creates no legal rights in any third parties," including any right to "information or to correctness." Therefore, the court argued, "appellants cannot establish injury in fact and, therefore, lack Article III standing to pursue their case in the federal courts."

⁵⁰⁷Salt Institute v. Leavitt, 440 F.3d 156, 159 (4th Cir. 2006).

Panel Discussion. In his opening remarks during the panel discussion on OMB's science-related initiatives, Bill Kovacs from the United States Chamber of Commerce said that, because of these recent court decisions, the IQA is "little more than a nice academic exercise," and that his organization plans to go back to Congress "to get judicial review provisions put into the law." He also indicated that Executive Order 12866 could be amended to give OMB "more of a policing authority," but he quickly pointed out that any such amendment to the executive order could be "abolished by the next administration." In summary, he said the following:

And so I guess what we're really down to is we've got to decide as a nation whether . . . science should be part of the rulemaking process . . . Or we just have to say, look, the whole process was a farce, and we really don't need whatever OIRA is doing other than data collection. And we need to move on, but we need to make a decision. It's a huge public policy decision.

In contrast, Rena Steinzor of the University of Maryland School of Law said that the IQA represented the "corpularization of science; that is, looking at each piece of scientific evidence very critically, deconstructing every study, questioning each individual piece as opposed to viewing all the scientific evidence together and making a scientific judgment on what the weight of the evidence tells us." In answering a question from the audience regarding whether there was agreement regarding what "weight of the evidence" means, Al Teich from AAAS said it was hard to define, but then said "is what they say about pornography. You know it when you see it." He then went on to say, though, that it is "an accumulation of studies over a period of time that's accepted by a large majority of the relevant scientific community."

Don Arbuckle of OIRA, noting the criticisms levied at the IQA by the other panel members, said that OMB believes that the Act is "working quite well," and that it has been mischaracterized by a variety of actors. He noted that the Act "asked OMB to issue guidance and the agencies to issue guidance," and therefore characterized the guidance as "more of an internal government quality control exercise than a regulation or a law that is challengeable through the judicial branch. We think that's the way it was set up on purpose." He would not, however, indicate whether OIRA would oppose efforts to add judicial review to the statute. He also said that the guidance places a "hefty data burden of proof on the petitioner," and was not intended to "give people an easy avenue to criticize government work."

OMB's Peer Review Bulletin

On September 15, 2003, OMB, in coordination with the Office of Science and Technology Policy (OSTP), published a proposed bulletin in the Federal Register on "Peer Review and Information Quality." The bulletin, if made final, would have established a process by which all "significant regulatory information" and "especially significant regulatory information" would be peer reviewed.⁵⁰⁸ OMB described the term "peer review" in this context as "a scientifically rigorous review and critique of a study's methods, results, and findings by others in the field with requisite training and expertise." The proposed bulletin placed additional peer review

⁵⁰⁸Office of Management and Budget, Executive Office of the President, "Proposed Bulletin on Peer Review and Information Quality," 68 Fed. Reg. 54,023 (Sept. 15, 2003). This proposed bulletin had been released to the public via OMB's website on Aug. 29, 2003. See http://www.whitehouse.gov/omb/inforeg/peer_review_and_info_quality.pdf.

requirements on “especially significant regulatory information,” and said agencies were required to notify OMB in advance of any studies that might require peer review. The scope of the proposed bulletin was very broad, covering virtually all agencies and defining “regulatory information” as “any scientific or technical study that . . . might be used by local, state, regional, federal and/or international regulatory bodies.” OMB indicated it was issuing the bulletin because agencies’ peer review practices were inconsistent, and government-wide standards for peer review would make regulatory science more competent and credible.

The proposed bulletin aroused substantial controversy, with some observers expressing concern that it could create a centralized peer review system within OMB that would be vulnerable to political manipulation or control by regulated entities. OMB received nearly 200 comments on the proposal, including comments from Members of Congress, trade associations, public interest groups, and recognized experts in the field of peer review and scientific research. As a result of those comments, OMB (again in consultation with OSTP) published what it described as a “substantially revised” peer review bulletin in the Federal Register on April 28, 2004.⁵⁰⁹ In some ways, the revised bulletin was broader than its predecessor. For example, instead of focusing on “significant” and “especially significant regulatory information,” the revised bulletin centered on “influential scientific information” (which includes, but is not limited to, regulatory information) and “highly influential scientific assessments.” In other ways, though, the revised bulletin was less inclusive and directive. For example, it gave agencies more discretion to determine when information required a peer review, and when the more detailed review requirements for “highly influential” information were applicable. Also, unlike the proposed bulletin, the revised bulletin did not exclude individuals from being peer reviewers if they had received research grants from the agency disseminating the information being peer reviewed.

In structure, the revised peer review bulletin was similar to the proposed bulletin in that it still essentially required agencies to take three actions (to the extent permitted by law): (1) have a peer review conducted on all “influential scientific information” that the agency intends to disseminate, (2) have all “highly influential scientific assessments” peer reviewed according to more specific and demanding standards, and (3) indicate what “influential” and “highly influential” information the agency plans to peer review in the future. The revised bulletin defined the term “influential scientific information” as information the agency “reasonably can determine that the dissemination of which will have or does have a clear and substantial impact on important public policies or private sector decisions.” The bulletin said that agencies were also not required to conduct a peer review of influential information that had already had an “adequate” peer review, and gave agencies substantial discretion in determining whether a prior review was “adequate” (specifically stating that the earlier review “need not comply with all of the requirements of this bulletin”). The bulletin also gave agencies discretion in determining the appropriate peer review mechanism for any information not previously reviewed.

The revised bulletin contained a number of additional peer review requirements for

⁵⁰⁹Office of Management and Budget, Executive Office of the President, “Revised Information Quality Bulletin on Peer Review,” 69 Fed. Reg. 23,230 (Apr. 28, 2004). This revised bulletin had been released to the public via OMB’s website on April 15, 2004. To view a copy, see http://www.whitehouse.gov/omb/inforeg/peer_review041404.pdf. In this report, the first draft of the bulletin is referred to as the “proposed bulletin” and the second draft as the “revised bulletin.” Unless otherwise specified, each respective reference includes the introductory supplemental information as well as the body of the bulletin per se.

“scientific assessments” that are “highly influential.” These requirements were much more specific than those placed on “influential” scientific information, and appeared to give OMB and the agencies significant authority to determine when the requirements are applicable. The revised bulletin described in some detail how peer reviewers of highly influential scientific assessments should be selected, but still gave agencies substantial discretion in making the final decision. For example, the bulletin said that reviewers must be selected primarily on the basis of “necessary” expertise, experience, and skills, and must be diverse enough to “fairly” represent different perspectives. In a significant departure from the proposed bulletin, the revised bulletin also said that research grants awarded to a scientist through a competitive, peer-reviewed process did not disqualify that scientist from serving on a peer review panel. The revised bulletin said that agencies could decide on their own whether to make the information at issue available for public comment, but said agencies should “consider” having a public comment period and public meetings before the reviewers “when there is sufficient public interest.”

Finally, the proposed bulletin required agencies to notify OMB at least once each year of any existing or upcoming studies that might trigger the peer review requirements within the next year, and of the agencies’ plans for conducting those peer reviews. In contrast, the revised bulletin required each covered agency to post an “agenda” on its website every six months delineating any information disseminations subject to peer review. The revised bulletin was also much more specific about these notices than the proposed bulletin, requiring each entry on the agenda to contain a detailed description of the “peer review plan.”

OMB again requested comments on the revised peer review bulletin, and said that 57 individuals and organizations ultimately commented.⁵¹⁰ Most of the substantive comments were supportive of at least some of the changes that OMB made to the bulletin. For example, the presidents of the National Academy of Sciences and its two affiliated institutions, the National Academy of Engineering and the Institute of Medicine, generally praised the revision, arguing that it would “improve the quality of the government’s scientific assessments and . . . decision-making,” and “better accommodate the diverse circumstances of . . . federal agencies.”⁵¹¹ The American Association for the Advancement of Science (AAAS) said that the “revised version is much improved,” but still raised questions and made suggestions (e.g., that agencies be required

⁵¹⁰For OMB’s response to the comments provided on the revised peer review bulletin, see http://www.whitehouse.gov/omb/inforeg/peer2004/peer_response.pdf. For a link to each of the comments, see http://www.whitehouse.gov/omb/inforeg/peer2004/list_peer2004.html.

⁵¹¹National Academy of Sciences, *Academies’ Presidents Comment on OMB Peer Review Guidelines*, Press Release (Apr. 15, 2004), at <http://www4.nationalacademies.org/news.nsf/isbn/s04152004?OpenDocument>.

to make public the criteria for determining when outside entities would be commissioned to select peer reviewers or manage the peer review process, and how these entities would be selected and overseen by the agencies).⁵¹²

Some commenters, however, believed the changes had weakened the bulletin to such an extent that they withdrew their initial support. In particular, the United States Chamber of Commerce said that it could not support the issuance of a final bulletin until those problems are addressed.⁵¹³ The Chamber said it had “deep concerns” about (among other things) the “excessive” discretion given to agencies in the implementation of the bulletin, and the absence of “provisions allowing affected parties to contest any agency determination of applicability, peer review type, panel selection, charge, or other peer review program element as it applies to a specific case.” The Chamber said that the changes OMB made in issuing the revised bulletin “are so severe and debilitating as to eliminate the public benefit of having a common, government-wide minimum standard for peer review.”

Still others believed the changes had not gone far enough. For example, 12 Members of Congress said that the revisions did not address previously expressed concerns that the proposal was “unjustified, overly broad, burdensome, and did not appropriately guard against appointment of reviewers with conflicts of interest,” or that it provided OMB with “excessive authority over the production and dissemination of government information.”⁵¹⁴ The Members said that the need for the bulletin remained unjustified, that the exemptions in the revised bulletin resulted in an unbalanced approach, and that it creates “considerable new burdens on agencies.” They also said that “safeguards to ensure the integrity of the process for selection of reviewers have not been included in the Bulletin.”

On December 15, 2004, OMB published a final version of the peer review bulletin on its website.⁵¹⁵ The final bulletin was published in the Federal Register on January 14, 2005.⁵¹⁶ OMB said this version reflects “minor revisions” made in response to the public comments on the revised bulletin. For example, the final bulletin requires agencies to disclose the names of peer reviewers to the public and adds an annual reporting requirement to allow OMB to track how agencies are using the bulletin. Nevertheless, agencies are still afforded substantial discretion to determine when and what type of peer review is required. OMB also retains substantial discretion in certain areas.

Background of Peer Review. Some type of peer review has been used for centuries

within the scientific community to judge the quality of science. Peer review can take many different forms, and is used for a variety of purposes. For example, it is used commonly by federal agencies to evaluate research proposals, and plays a major role in funding decisions. In these cases it is often part of a broader category of evaluation known as merit review. Peer review is also the usual method by which the editors of scientific publications evaluate proposed research reports. It even plays an important role in many research institutions, including many government agencies, in decisions about retention and promotion for individual scientists and in reviewing research programs. A February 1999 report from the Committee on Science, Engineering, and Public Policy concluded that expert review (the most common form of which is peer review) is the most effective means of evaluating federally funded research programs.⁵¹⁷

Peer review is also used for scientific and technical products relating to policies, including regulations, to determine whether the underlying scientific findings are well supported. For example, such peer review was established as Environmental Protection Agency (EPA) policy in 1993.⁵¹⁸ In 1996, a panel of leading economists concluded that peer review should be used for economic analyses supporting regulations with a potentially large impact on the economy (e.g., those whose annual economic costs exceed \$1 billion).⁵¹⁹ The panel also indicated that reviewers should be selected based on their demonstrated expertise and reputations.

In its peer review bulletins, OMB recognized the variety of ways that peer review is used. OMB said that independent peer review is especially important in the regulatory arena because federal agencies often develop or fund the science that underlies their regulations, and then oversee the peer review of those scientific studies, thereby creating the appearance of a conflict of interest.

Legislative Peer Review Proposals. A number of statutes and legislative proposals have advocated the use of peer review in a regulatory context for particular issues. For example, the Safe Drinking Water Act (42 U.S.C. § 300g-1(b)(3)(A)) requires EPA, when taking action under the Act based on science, to use the “best available, peer reviewed science and supporting studies.” In the 108th Congress, the Water Resources Development Act of 2003 (H.R. 2557) would have generally required project studies to be subject to peer review by an independent panel of experts if the project has an estimated total cost of more than \$50 million. Similarly, the Sound Science for Endangered Species Act Planning Act of 2003 (H.R. 1662, 108th Congress) would have directed the Secretary of the Interior, in making decisions about species protection, to give greater weight to certain kinds of data that had been peer reviewed by qualified individuals as defined in the bill.

There have also been legislative efforts to require peer review more broadly. For example, in the 106th Congress, the Senate considered but did not enact bipartisan legislation (S. 746) that would have required virtually all agencies to provide for an independent peer review of any

required risk assessments and cost-benefit analyses of major rules that the agencies or the OMB Director reasonably anticipated were likely to have a \$500 million effect on the economy. The bill would have required that peer reviews be conducted through panels that were “broadly representative” and involved participants with relevant expertise who were “independent of the agency.” Nevertheless, if an agency certified that adequate peer review had already been conducted, and the OMB Director agreed, no further peer review would have been required. In its comments on this legislation, the GAO generally supported the use of peer review in this context, noting that “the rigorous, independent review of economic analyses should help enhance the quality, credibility, and acceptability of agencies’ decisionmaking.”⁵²⁰ The GAO, however, cautioned that (given the number of reviews contemplated) agencies would need to plan carefully for the reviews, and that the panels would need to reflect all points of view.

Presidential Support for Peer Review. Recent Presidential administrations have also supported peer review as a preferred means of assessing scientific research, both prospectively and retrospectively. For example, beginning with the fiscal year 1996 budget cycle, OMB and OSTP have jointly provided annual direction to agencies, encouraging them to emphasize the funding of peer-reviewed research over nonpeer-reviewed research for most scientific activities. In 1997, the then OIRA Administrator testified that the Clinton Administration supported peer review, but also said the Administration recognized that it is not cost-free in terms of agencies’ resources or time.⁵²¹

On September 20, 2001, the new OIRA Administrator for the George W. Bush Administration issued a memorandum for the President’s Management Council recommending (among other things) that agencies subject regulatory impact analyses and supporting technical documents for “economically significant” and “major” rules (e.g., those with a \$100 million annual effect on the economy) to independent, external peer review.⁵²² The OIRA Administrator also recommended certain criteria for peer review (e.g., disclosure by peer reviewers of prior technical or policy positions on the issues at hand and their sources of personal and institutional funding), and said OIRA would give agency analyses that had undergone such a review “a measure of deference” during its reviews of their regulatory proposals under Executive Order 12866.⁵²³

Cautionary Notes. Although the concept of peer review has generally received wide support, some observers have also raised cautionary notes or mentioned certain limitations to the approach in particular situations. For example, OMB indicated in 1997 that peer review costs can be significant for agencies in terms of both time and agency resources.⁵²⁴ To pay for peer review procedures, agencies may have to divert resources from other areas (e.g., regulatory

⁵²⁴Statement of Sally Katzen, *supra* note 521.

enforcement or standards development). Scientists from academic institutions who perform peer reviews on a voluntary basis may also incur opportunity costs with respect to other activities such as teaching and research.

Other concerns have focused on how peer reviews have been implemented. For example, GAO noted that peer review methods varied within and among federal agencies,⁵²⁵ and that agencies' economic analyses of major rules were often not peer reviewed.⁵²⁶ A number of observers have expressed concerns about the impact of peer review requirements on the pace of regulatory activity, with additional requirements exacerbating what is already often regarded as an "ossified" rulemaking process.⁵²⁷ In fact, some critics have suggested that regulatory relief and delay is the primary purpose of peer review proposals in this context.

Still other concerns about peer review have centered on issues of bias and balance. Experts agree that effective peer review panels must be (and must be perceived to be) free from any significant conflict of interest and properly balanced, allowing for a wide range of views and appropriate expertise. In June 2001, however, GAO reported that the policies and procedures developed by EPA's Science Advisory Board to ensure balance and independence of the Board's peer reviewers had limitations that reduced their effectiveness.⁵²⁸ For example, GAO said that the staff office did not routinely ensure that panel members' financial disclosures were complete or that they contained enough information to determine whether a conflict of interest existed. Also, panel members reportedly did not have to disclose information regarding previous positions on the matter being reviewed until the panel's first meeting, thereby making it difficult to determine the independence and balance of the panel members until after they had been selected. GAO also reported that the panel's policies and procedures did not adequately inform the public about the points of view represented on the panels. GAO made several recommendations in this report that were designed to better ensure that the Science Advisory Board's peer review panels are independent and balanced.

As noted previously, GAO reported that federal agencies' peer review practices are not consistent,⁵²⁹ and OMB cited that inconsistency as one of the reasons why the peer review bulletin was needed. Nevertheless, GAO did not recommend greater uniformity in agencies' peer review practices. Also, several studies of peer review in the federal government have

⁵²⁵GAO/RCED-99-99. For example, GAO reported that some agencies conducted peer reviews of research proposals primarily by mail, while others generally relied on panels or committees. All agencies used a combination of external and internal reviewers for these reviews, but one (Federal Aviation Administration) relied primarily on agency employees who were not employed in the project but had the required expertise.

⁵²⁶U.S. General Accounting Office, *Regulatory Reform: Agencies Could Improve Development, Documentation, and Clarity of Regulatory Economic Analyses*, GAO/RCED-98-142, May 1998. Only 1 of the 20 economic analyses that GAO reviewed had been independently peer reviewed.

⁵²⁷See, e.g., Thomas O. McGarity, *Some Thoughts on "Deossifying" the Rulemaking Process*, 41 Duke L.J. 1385 (1992); Richard J. Pierce, Jr., *Seven Ways to Deossify Agency Rulemaking*, 47 Admin. L. Rev. 59 (1995); Paul R. Verkuil, *Rulemaking Ossification – A Modest Proposal*, 47 Admin. L. Rev. 453 (1995).

⁵²⁹GAO/RCED-99-99.

suggested that rigidly uniform peer review procedures may not be desirable. For example, a 1996 National Science and Technology Council report indicated that peer review implementation should be flexible and “appropriate to the nature of scientific processes.”⁵³⁰ Similarly, in its 1999 report on peer review, GAO reported that OSTP believed agencies’ peer review practices should be “flexible and tailored to agency missions and type of research, and that specific uniform practices should not be dictated for every agency or all federally funded research.”⁵³¹ GAO also said that agencies viewed a variety of peer review methods as “both appropriate and essential, reflecting the varying nature of the research and its purposes, the differences in research timelier, the broad spectrum of [research and development] performers, and the varying funding mechanisms, such as grants, contracts, and cooperative agreements.”

Panel Discussion. Al Teich of AAAS said during the panel discussion on OMB’s science-related initiatives that many scientists looked at the OMB’s initial bulletin on peer review and said “well, this looks like a means of attacking regulation by attacking the science behind it,” and questioned whether the central premise behind the bulletin, i.e., that the most important science behind regulations was not being adequately reviewed. He also said that the science community’s negative reactions to OMB’s initial bulletin on peer review “focused on a number of things.”

First of all, they focused on the constraints on the selection of peer reviewers. They gave little discretion to the agencies. Peer reviewers were excluded if they had expressed an opinion on a subject. Academics were excluded if they were funded by an agency, but employees of regulated industries weren’t. There was a provision that called for, kind of, equal and opposite biases — if a peer reviewer had an unavoidable bias to find another one who had a counteracting bias without any discussion of the relative qualifications of the two reviewers. And finally, there was a question of attributions, which violated the general . . . procedure of giving anonymity to peer reviewers in science.

He went on to say, however, that OIRA “listened to the science community” and the second version was “much improved.” Don Arbuckle also indicated that the public commenting process for the peer review bulletin — particularly receiving a second round of comments — “proved to be extremely beneficial,” and said doing so helped ensure that the government accurately reflected consensus views regarding this highly controversial and politically sensitive issue.

OMB’s Proposed Risk Assessment Bulletin

On January 9, 2006, OIRA released a proposed bulletin on risk assessment for comment by

⁵³⁰ Subcommittee on Research, Committee on Fundamental Science, National Science and Technology Council, *Assessing Fundamental Science* (Nat’l Science Foundation July 1996). The National Science and Technology Council was established by executive order in November 1993 to coordinate federal research and development, and to establish clear national goals for science and technology investments. To view a copy of this report, see <http://www.nsf.gov/sbe/srs/ostp/assess/start.htm>.

⁵³¹ GAO/RCED-99-99, at 5.

the public and for peer review by the National Academy of Sciences (NAS).⁵³² The proposed bulletin would, if made final, establish general risk assessment and reporting standards, and establish special standards for “influential” risk assessments. The proposed bulletin would apply to all agencies covered by the Paperwork Reduction Act (i.e., cabinet departments, independent agencies, and independent regulatory agencies). The legal authorities cited for the bulletin include the Information Quality Act (IQA),⁵³³ the Regulatory Right-to-Know Act,⁵³⁴ which directs OMB to “issue guidelines to agencies to standardize . . . measures of costs and benefits” of federal rules; and Executive Order 12866,⁵³⁵ which says OIRA is the “repository of expertise concerning regulatory issues,” and requires agencies to base their decisions on the “best reasonably obtainable scientific, economic, or other information.” OMB said the risk assessment bulletin builds on its IQA guidelines⁵³⁶ and its peer review bulletin,⁵³⁷ and is intended to be a companion document to its guidance on regulatory impact analyses (OMB Circular A-4).⁵³⁸

Although characterized as “guidance” in the document’s summary, the narrative text mentions the “requirements” of the bulletin, and the language in the bulletin prior to the standards lists the standards with which “[each agency shall] comply. However, OMB also says that the bulletin applies to all agency risk assessments “to the extent appropriate.” Agency heads are authorized to waive or defer some or all of the requirements in the bulletin “where warranted by a compelling rationale.” Also, under the heading of “Judicial Review,” OMB said that the bulletin is “intended to improve the internal management of the Executive Branch,” and “does not create any right or benefit, substantive or procedural, enforceable at law or equity, against the United States, its agencies or other entities, its officers or employees, or any other person.” Public comments on the bulletin were requested by June 15, 2006.

Risk assessment is defined in the bulletin as a document that “assembles and synthesizes scientific information to determine whether a potential hazard exists and/or the extent of possible risk to human health, safety, or the environment.” In a regulatory context, risk assessment helps agencies identify issues of potential concern (e.g., whether exposure to a given risk agent causes effects such as cancer, reproductive and genetic abnormalities, or ecosystem damage); select

regulatory options; and estimate a forthcoming regulation's benefits. OMB said it "has a strong interest in the technical quality of agency risk assessments because these assessments play an important role in the development of public policies at the national, international, state and local levels." OMB also said that "there is general agreement that the risk assessment process can be improved, and said the purpose of the bulletin is "to enhance the technical quality and objectivity of risk assessments prepared by federal agencies by establishing uniform, minimum standards."

Background on Risk Assessment. Risk assessments, particularly quantitative assessments, date to the first half of the 20th Century, but their use was accelerated by the enactment of numerous health, safety, and environmental statutes in the early 1970s. In 1983, NAS identified four steps in the risk assessment process: (1) *hazard identification* (determining whether a substance or situation could cause adverse effects), (2) *dose-response assessment* (determining the relationship between the magnitude of the exposure to a hazard and the probability and severity of adverse effects), (3) *exposure assessment* (identifying the extent to which exposure actually occurs), and (4) *risk characterization* (combining the above information into a conclusion about the nature and magnitude of the risk).⁵³⁹ NAS pointed out that this four-step assessment process is separate and distinct from the decision on where to set a regulatory standard (which is termed "risk management").

In 1990, Congress mandated that a commission be formed to "make a full investigation of the policy implications and appropriate uses of risk assessment and risk management in regulatory programs under various Federal laws to prevent cancer and other chronic human health effects." In its 1997 final report, the commission said that the assessments should be guided by an understanding of the issues of importance to risk management decisions and to the public's understanding of what is needed to protect public health and the environment. The commission also noted, however, that risk-related controversy often "arises from what we don't know and from what risk assessments can't tell us."⁵⁴⁰

Data, Assumptions, and Context. Key elements in any risk assessment are the data used in determining the level of risk associated with any given substance or situation. In many cases, though, the data needed to assess risk are lacking. For example, in 1998, the EPA reported that of 3,000 high-production-volume chemicals, a full set of toxicity data was available for only about 200 (7%) of the chemicals, and there was no publicly available data for about 43% of the chemicals.⁵⁴¹ Similar data gaps exist regarding the extent to which people are exposed to chemicals. For example, in 2000, the GAO reviewed federal and state efforts to collect human exposure data on more than 1,400 naturally occurring and manmade chemicals considered by the Department of Health and Human Services (HHS), EPA, and other entities to pose a threat to human health. GAO reported that HHS and EPA surveys measured exposure of the general population for only 6% of those chemicals.⁵⁴²

⁵⁴²U.S. General Accounting Office, *Toxic Chemicals: Long-Term Coordinated Strategy Needed* (continued...)

Because of the lack of data, agencies often must make assumptions as part of the risk assessment process. Some critics believe those assumptions are unjustifiably “precautionary” (i.e., designed to ensure that risks are not underestimated) in the face of new scientific data and methods, thereby producing estimates that overstate actual risks, and that those effects are compounded when multiple precautionary assumptions are used. Others, though, believe that agencies are often not precautionary enough, particularly when estimating the synergism of exposures to multiple chemicals, or to account for risks to particularly vulnerable groups (e.g., children, the elderly, or the infirm).⁵⁴³ As part of the process of determining whether a hazard exists, agencies may conduct a “screening”-level risk assessment using conservative, “worst-case” scenarios. Only if this screening assessment reveals evidence of harm will the agency proceed to a more comprehensive estimate of risk.

The legal context in which risk assessments are conducted plays an important role in determining what type of assessment is performed and why certain approaches are used. For example, different agencies (and often different offices within a single agency) have different risk-related statutory mandates. Some statutes require regulatory decisions to be based solely or primarily on risk. For example, section 109 of the Clean Air Act requires the EPA to set national ambient air quality standards that allow for an “ample margin of safety” to protect public health. Other statutes require technology-based standards (e.g., “best available technology”), and still others require balancing the benefits of risk reduction against the costs incurred in setting risk management goals. Some statutes also place the primary responsibility for conducting risk assessments and compiling risk data for a particular chemical or source of exposure with industry, states, or localities, not federal agencies. For instance, industry petitioners have the primary responsibility to provide the data needed to support registration and tolerances from EPA for their pesticides. Still other statutes specifically define what will be a hazard, tell the agency to take certain methodological steps, or specify an exposure scenario. In many cases, however, the statutes simply provide a general framework within which agencies make specific assumptions and methodological choices.

What OMB’s Proposed Bulletin Would Require. OMB’s proposed risk assessment bulletin would establish general risk assessment and reporting standards, as well as special standards for “influential” risk assessments. The bulletin makes OIRA, in consultation with the Office of Science and Technology Policy, responsible for overseeing agency implementation of its requirements.

General Standards. With regard to the general standards, the bulletin establishes six risk assessments quality standards. The assessments must:

- clearly state the informational needs driving the assessment as well as the objectives of the assessment;
- clearly summarize the scope of the assessment (including identification of the agent, technology, or activity at issue; the hazard of concern; the affected

⁵⁴²(...continued)

to Measure Exposures in Humans, GAO/HE’S-00-80, May 2, 2000.

⁵⁴³For a discussion of some of these assumptions, see U.S. General Accounting Office, *Chemical Risk Assessment: Selected Federal Agencies’ Procedures, Assumptions, and Policies*, GAO-01-810, Aug. 6, 2001.

entities; and the event-consequence or dose-response relationships for the relevant exposure ranges);

- provide a qualitative and, where possible, a quantitative characterization of risk (including a range of plausible estimates for quantitative measures);
- ensure objectivity by “neither minimizing nor exaggerating the nature and magnitude of risk;⁵⁴⁴ using the best available data; being based on the weight of the available scientific evidence; and having a high degree of transparency regarding the data, assumptions, and methods;
- explain the basis of each critical assumption and those assumptions that affect the assessment’s key findings, including an evaluation (quantitative if possible) of the effects of plausible alternative assumptions; and
- contain an executive summary that discloses the assessment’s objectives and scope, key findings, and key scientific limitations and uncertainties.

When a risk assessment is produced in relation to regulatory analysis for a rule with annual economic effects of \$1 billion or more, the bulletin establishes a seventh requirement, i.e., that there be a “formal quantitative analysis of the relevant uncertainties about benefits and costs.” The bulletin highlights several “important aspects of risk assessments useful for regulatory analysis,” including: (1) identification of baseline risk; (2) comparison of baseline risk to alternative mitigation measures, noting any “countervailing risks” caused by those alternatives; (3) information on the timing of exposure and the onset of adverse effects, and the time between control measures and the cessation of those effects; and (4) when risk is measured quantitatively, the development of a range of plausible risk estimates, including a central estimate (e.g., a weighted average based on relative plausibility).

Special Standards for Influential Risk Assessments. The proposed bulletin defines an “influential risk assessment” as one that “the agency reasonably can determine will have or does have a clear and substantial impact on important public policies or private sector decisions.” OMB said that such assessments include those that determine the level of risk regarding health, safety, or the environment (e.g., risk assessments that support EPA’s National Ambient Air Quality Standards, Food and Drug Administration (FDA) tolerance levels, or economically significant rulemakings — e.g., those with a \$100 million impact on the economy). In addition to the general standards delineated above, the proposed bulletin requires all influential risk assessments to:

- be capable of being “substantially reproduced,” which is defined in the narrative portion of the bulletin (referencing the IQA guidelines) as meaning that “independent reanalysis of the original or supporting data using the same methods would generate similar analytical results”,⁵⁴⁵

⁵⁴⁴OMB said this standard would not apply to “screening-level” risk assessments designed to determine whether any hazard exists.

⁵⁴⁵The narrative text goes on to say that “public access to original data is necessary to satisfy this standard.”

- compare the results of the assessment to other results published on the same topic from “qualified scientific organizations” (which is undefined in the bulletin);
- highlight central estimates as well as high-end and low-end estimates of risk when such estimates are uncertain;
- characterize uncertainty with respect to the major findings of the assessment (e.g., by conducting a sensitivity analysis and providing a quantitative distribution of the uncertainty);
- portray results based on different effects observed and/or different studies to convey how the choice of effect and/or study influences the assessment;
- characterize (to the extent feasible) variability through a quantitative distribution, reflecting different affected population(s), time scales, geography, or other parameters relevant to the needs and objectives of the assessment;
- where human health effects are a concern, determinations of which effects are adverse shall be specifically identified and justified based on the best available scientific information generally accepted in the relevant clinical and toxicological communities;
- provide discussion (to the extent possible) of the “nature, difficulty, feasibility, cost and time associated with undertaking research to a report’s scientific limitations and uncertainties;” and
- consider all significant comments received on a draft risk assessment report, and issue a “response to comment” document summarizing the significant comments received and the agency’s responses.

NAS Review of the Bulletin. On March 22, 2006, a committee of the Board on Environmental Issues and Toxicology within the National Academies’ Division of Earth and Life Sciences began what is expected to be an 11-month peer review of OMB’s proposed bulletin. According to the committee’s website,⁵⁴⁶ it will:

determine whether the application of the proposed guidance will meet OMB’s stated objective to “enhance the technical quality and objectivity of risk assessments prepared by federal agencies.” In performing its task, the committee will comment, in general terms, on how the guidance will affect the practice of risk assessment in the federal government. The committee will identify critical elements that might be missing from the guidance. The committee will also determine whether OMB appropriately incorporated recommendations from previous reports of the NRC and other organizations into the proposed risk assessment guidance. In addition, the committee will assess whether there are scientific or technical circumstances that might limit applicability of the guidance.

On May 22, 2006, the committee held a public meeting on OMB’s proposed risk assessment

⁵⁴⁶The website is at <http://www8.nationalacademies.org/cp/projectview.aspx?key=34282>.

bulletin. According to press accounts, the nine federal agency officials who testified at the meeting voiced a variety of opinions about the bulletin.⁵⁴⁷ For example, the Director of FDA's Center for Drug Evaluation and Research reportedly said that if the bulletin was made final in its current form, doctors and the public might not receive timely warnings about potential health risks posed by drugs and medical devices (e.g., warnings related to the use of the anti-inflammatory drug Vioxx). To illustrate, the FDA director said that of 109 safety alerts that FDA issued in 2005, 92 of them would have been considered risk assessments under the bulletin, and therefore would have been delayed by the required analyses. He and two other agency officials (from the National Institute of Environmental Health Sciences and the National Institute for Occupational Safety and Health's Risk Evaluation Branch) reportedly said that the bulletin's definition of risk assessment is so broad that many types of federal analyses could be inappropriately covered by its requirements.

On the other hand, EPA's science advisor was quoted as saying that the agency was in "pretty good shape" in terms of meeting the requirements in the proposed bulletin, but nevertheless suggested that the guidance be revised to explain how much flexibility agencies have regarding its requirements (e.g., how agencies can get waivers from the bulletin's requirements). He and an official from the National Aeronautics and Space Administration also said that some aspects of the bulletin would conflict with their own, agency-specific guidance documents on risk assessment, and it was not clear how those conflicts should be resolved. A representative from the Department of Defense reportedly supported the proposed guidelines, noting that any increased cost would be justified by improvements in the resulting risk assessments.

Public Comments on the Proposed Bulletin. On June 22, 2006, OMB posted the comments it had received regarding the proposed bulletin on its website.⁵⁴⁸ Those comments varied significantly, with some suggesting ways to make the document stronger and more inclusive, while others suggested that OMB abandon the bulletin altogether.

For example, in its comments on the bulletin, the United States Chamber of Commerce said it "welcomes and applauds this undertaking by OMB to improve the risk assessments performed by federal government agencies and especially in requiring a reliable characterization of the uncertainties that impact the quality and useful information content of the assessments."⁵⁴⁹ Although it offered several suggestions for improvement, the Chamber generally concurred with the text of the bulletin and encouraged its implementation. Perhaps most notably, the Chamber viewed the lack of judicial review as a "significant weakness" that "begs the question of what happens if agencies simply choose to ignore the directions given in the Bulletin."

Other individuals and organizations, while also supporting the issuance of the bulletin, urged OMB to go further. For example, the National Association of Manufacturers said exceptions to the bulletin should be "very limited" (e.g., declared public emergencies), and said

⁵⁴⁷Pat Phibbs, *Definition of Risk Assessment Deemed Too Broad by Several Health Agency Officials*, BNA Daily Report for Executives, May 23, 2006, at A15.

⁵⁴⁸See http://www.whitehouse.gov/omb/inforeg/comments_rab/list_rab2006.html.

⁵⁴⁹See http://www.uschamber.com/issues/comments/060518_ombriskassessment.htm.

the “reproducibility” standard for influential assessments should be applied to all assessments.⁵⁵⁰ The National Federation of Small Businesses questioned the exemption for individual permitting decisions (e.g., EPA determinations regarding pesticide applications).⁵⁵¹ Two Members of Congress proposed deleting the phrase “to the extent appropriate” from the bulletin’s scope because it suggested that compliance with its requirements was at the discretion of the agencies.⁵⁵²

On the other hand, the Center for Progressive Reform (CPR) urged OMB to “withdraw the Proposed Bulletin and abandon efforts to revise it.”⁵⁵³ CPR said any effort to produce government wide, “one-size-fits-all” risk assessment requirements would only cause confusion and delay in the development of public and worker protections. The organization also questioned why OMB should be issuing risk assessment guidance at all, since it is composed primarily of economists and budget analysts, not scientists. In particular, CPR said certain terms in the bulletin are confusing (e.g., “central” or “expected” risk), requires information that may not exist or would be costly to obtain, and may lead to the further “ossification” of the rulemaking process. Similarly, the Natural Resources Defense Council (NRDC) expressed “grave misgivings” regarding the proposed bulletin, and urged OMB to withdraw it.⁵⁵⁴ In particular, NRDC said issuance of the document as a “bulletin” rather than as guidance and its use of directive terms (e.g., “shall”) suggest that the document is mandatory, and said the exclusion of risk assessments prepared by private industry for licensing and registration requirements “protects industry assessments from scrutiny.”

Other commenters raised additional issues. The American Bar Association (ABA) said the proposed bulletin is generally consistent with a 1999 ABA recommendation on risk assessment, but noted several areas for possible improvement (e.g., clarifying the amount of flexibility agencies have to deviate from the bulletin’s requirements).⁵⁵⁵ The ABA also suggested that OMB clearly describe the problems that warrant the creation of a new risk assessment bulletin, and also describe why OMB (and not the regulatory agencies) is best suited to resolve those problems. Dr. Gilbert Omenn, who chaired the Presidential/Congressional Commission on Risk Assessment and Risk Management in the 1990s, said the proposed bulletin has “worthy intentions,” but also said it was “too broad” and recommended a number of improvements (e.g., deletion of the “influential” risk assessment category and its additional requirements). He also recommended greater transparency in the OMB and agency review processes, and the correction of certain “omissions” (e.g., an exclusion for research agencies).

Panel Discussion. During The Role of Science in Rulemaking Symposium, Don Arbuckle of OIRA said the National Academy of Sciences (NAS) had been asked to look at the draft risk assessment bulletin “to try and make sure that we are following the practices that the NAS itself has recommended for many years.” He said one of the goals of the bulletin is to make it “specific enough to present best practices for the government but flexible enough for agencies that deal in very different types of endeavors to be able to use.”

⁵⁵⁵See http://www.whitehouse.gov/omb/inforeg/comments_rab/aba.pdf.

Rena Steinzor of the University of Maryland School of Law said that, from her perspective, there are two key problems with OMB's draft risk assessment bulletin: (1) a "one size fits all" approach that requires a central, weighted-average measure of risk (which she said "makes very little sense from a scientific perspective); and (2) the bulletin's "conflation of assessment and management" because it requires agencies to "develop an assessment of all the risk reduction measures that might be available and . . . what the implications are of those risk reduction measures." She also said that there is concern by some Members of Congress regarding how the NAS planned to carry out its peer review of the draft bulletin, and pointed out that the risk assessment requirements in the bulletin were not required regarding policy decisions where industry would want a prompt risk assessment (e.g. pesticides registration, FDA drug approvals, and nuclear power plant licensing).

In response to this last point, Don Arbuckle explained that the inapplicability of the risk assessment bulletin to those decisions was because "OMB generally tries to stay away from particular adjudications, from licensing, from cases where there is not, as the APA expresses it, 'cases of general applicability and future effect.'" He also said that the bulletin did not cover risk assessments in the insurance industry, financial institutions, and other types of fields because OMB felt that these endeavors were so different that it would be "not possible or not particularly useful to try to incorporate all of these together." Finally, he said it was not OMB's intent that the guidelines be a "one size fits all" approach, and "we would expect the NAS to tell us so if that was the case."

Science Advisory Boards

The Role of Science in Rulemaking Symposium panel discussion on scientific advisory boards reflected the current sharp divide of opinion how such independent expert panels are selected and operated and the weight their advice and recommendations should be accorded. There was little common agreement on such fundamental issues as to how and by whom members of such advisory bodies should be selected; how to deal with issues of neutrality and conflicts of interests; at what stage of the agency decision process should scientific and technical issues identified and selected for review be addressed; how much transparency should there be in the deliberation process of the expert panel members; how much public participation should there be in the panel member selection process and during the deliberations of the panel members; should the primary concern of the agency convenors of expert panels be populating with the best scientific and technological expertise available or should achievement of balance require including stakeholder and/or interest group representation; should such expert panels be cost-effective; what weight should be accorded the findings and recommendations of such panels; and should final reports be independently reviewed and refereed?

Discussions with the panelists and a review of the pertinent literature revealed that there has been no definitive census of currently existing scientific and advisory bodies that address the fundamental structural and operational questions just outlined. Federal advisory committees have been called the "fifth arm of the government" because of the significant role they play in advising federal agencies, the President, and the Congress on important national issues. Within the area of science and technology, it is estimated that thousands of such advisory boards and committees have been established over time to advise such entities as the Department of Health and Human Services and the EPA on topics ranging from safe levels of lead to the use of humans in research studies. Despite their prevalence and importance, little is known about the characteristics of these science committees, how they are established, how members are selected how they operate, or the impact or use of the results of their deliberations. Congress required an

annual report from the President describing all advisory committees, but that report was discontinued in 1998. The General Services Administration (GSA) does, however, still maintain a database listing all federal advisory committees (at <http://www.fido.gov/facdatabase>) with more than 200 of the committees identified as “science and technology” related. A better understanding of how science advisory committees operate and what role they play in the public policymaking process can help Congress and federal agencies as they establish and use them in the future.

To fill this crucial gap in knowledge and understanding, CRS recommended a year-long study to be done by the Maxwell School of Citizenship and Public Affairs of Syracuse University led by Professor Stuart Bretschneider, the Associate Dean and Chair of the Department of Public Administration. In a preliminary report to CRS on December 5, 2006, Professor Bretschneider reported that the first phase of the study had been completed. By plumbing the GSA database, the team created a spreadsheet that identifies all scientific and technological advisory committees existing in 2005, the agencies they serve, the authority under which they were created, their stated purpose, the classification of membership, how committee membership is balanced, the number of open and closed meetings held by each and the reasons given for closing meetings, and what each committee cost the government. The research team also determined what information the GSA database does not contain with respect to the particular issues of concern to Congress, and has developed suggestions for surveys to be conducted with federal agencies next year to elicit further information about these expert bodies to permit an informed Congressional evaluation of any legislative actions that may be necessary. The final report is expected to be completed by June 2007.

Analysis

Information Quality Act

Although the IQA is described by some as the most significant change to the federal rulemaking process in the past 60 years, both the relatively few substantive correction requests submitted in the Act’s first two years of implementation and its treatment by the district and circuit courts would suggest otherwise. That said, it is probably too early to conclude that its effect on rulemaking and regulatory science will always be as benign as it has been to date.

The Fourth Circuit’s determination regarding whether agencies’ actions are subject to judicial review under the IQA is likely to have a major effect on the Act’s implementation. If judicial review is unavailable under the Act, some observers believe that agencies will be more likely to deny information correction requests. Some have suggested that Congress amend the IQA and specifically provide for judicial review. Others have suggested focusing on new test cases, believing that the *Salt Institute* case did not represent the best case to test whether the IQA was subject to judicial review (e.g., because the appellants’ request was that information be made public, not that it be corrected). Another approach some have suggested is for OMB to take a more active role in reviewing agencies’ decisions under the act, perhaps as part of their regulatory review responsibilities under Executive Order 12866. It is likely that one or more of these steps will be taken to address perceived deficiencies in the act.

Even in the absence of judicial review, though, the IQA can still have a significant impact on federal agencies and their information dissemination activities. OMB’s reports on the implementation of the Act during fiscal years 2003 and 2004 provided numerous examples of

agencies changing their information dissemination practices in response to administrative requests for correction from affected parties. For example, in June 2004, the National Institute on Aging within the National Institutes of Health agreed to revise its website and printed publications, eliminating statements indicating that smokeless tobacco products are no less safe than cigarettes. The change was a direct result of an IQA correction request filed by the National Legal and Policy Center.⁵⁵⁶ IQA correction requests have also been filed by groups and in policy areas that few observers anticipated.⁵⁵⁷

The observations of other interested parties suggest additional possible areas of clarification or refinement in either the IQA or in any subsequent reporting requirements. For example, OMB Watch indicated that OMB's report to Congress should have examined the effect that the IQA was having on the pace of the regulatory process and on agency resources. OMB said it was not aware of any data indicating that the IQA was slowing down rulemaking, but also said agencies were finding that it took longer than expected to respond to correction requests and to implement the appeals process. To improve oversight regarding these issues, either Congress or OMB could initiate the collection of more systematic and reliable data regarding the I.A.'s effect on rulemaking or agencies' resources.

OMB's 2005 report notes that agencies are inconsistent in how they treat such submissions, with some characterizing them as IQA correction requests and others deciding not to do so. To clarify these and other issues, either Congress or OMB could better define the scope of the act or the issues to be included in any future report. Clarification could also be provided regarding whether correction requests that the agencies determine to involve issues outside the scope of the IQA (e.g., a challenge to the minutes of a federal advisory committee meeting) should be included in a report that is supposed to list correction requests under the Act.

Peer Review Bulletin

OMB's peer review bulletin is likely to have a significant effect on federal rulemaking and other forms of information dissemination and public policy. That effect is likely to be both direct (through agencies' and OMB's enforcement of the bulletin's requirements) and indirect (through references to the bulletin by others). For example, section 402 of the "Specialty Crops Competitiveness Act of 2004" (Pub. L. No. 108-465 (2004)) indicated that a required peer review of the procedures and standards governing the consideration of certain import and export requests "shall be consistent with the guidance by the Office of Management and Budget pertaining to peer review and information quality."

Some of the initial issues and concerns raised by commenters on the proposed peer review bulletin were clarified or otherwise addressed in the revised and final versions of the bulletin. Perhaps most notably, the bulletin now makes it clear that scientists are not prohibited from serving as peer reviewers if they receive research grants from the agency based on investigator-

⁵⁵⁶*Government Watchdog Group Successfully Challenges Federal Health Policy on Data Quality Act Grounds*, PR Newswire, July 14, 2004.

⁵⁵⁷For example, in October 2004, Americans for Safe Access (a Berkeley, California advocacy group) filed an IQA correction request with the Department of Health and Human Services asserting that the Department's statements that marijuana has no medical use in treatment in the United States "misstates the scientific evidence and ignores numerous reports and studies demonstrating the medical utility of marijuana and its constituent compounds."

initiated, competitive, peer reviewed proposals. The bulletin also provides exemptions from the peer review requirements for time-sensitive medical, public health, and safety information, and other compelling circumstances. A number of other issues remain unclear, however. These include: (1) the amount of discretion that agencies will actually have in carrying out the bulletin's requirements, (2) the degree to which the bulletin will accomplish the stated goal of making federal peer review practices more consistent, and (3) the effects of the bulletin on agencies and the federal rulemaking process.

Agency Discretion. The final peer review bulletin appears to give federal agencies substantial discretion in determining whether peer review is required for specific products and, if so, what type of peer review mechanism is appropriate and who should serve as peer reviewers. For example, the bulletin says agencies need not have peer review conducted on influential scientific information that had already been subject to "adequate" peer review. To determine whether a prior review was "adequate," agencies are directed to consider (among other things) whether the science is "novel" or "complex," and whether it is "important" to decisionmaking. Notably, though, the final bulletin no longer indicates that an "adequate" peer review "need not comply with" all of the requirements of the bulletin. Also, the final bulletin says that information should be considered "influential scientific information" if the agency "reasonably can determine" that it will have or does have a "clear and substantial" impact on "important" public policies or private sector decisions. The bulletin says that peer reviewers should be selected to provide the necessary expertise, experience, and skills, and the group of reviewers should be "sufficiently" broad and diverse to "fairly" represent the "relevant" scientific perspectives and knowledge.

On the other hand, the final bulletin also gives OMB substantial discretion in certain areas. For example, the bulletin indicates that OMB can require agencies to use the more exacting procedures for "highly influential scientific assessments" if OMB determines the information is a "scientific assessment" that "could" have a substantial impact on public policies or private sector decisions with a "potential impact" of more than \$500 million in any year, or is "novel, controversial, or precedent setting," or has "significant" interagency interest. Also, OMB can unilaterally approve agencies' use of alternative peer review procedures. The amount of discretion that agencies will actually have in carrying out their peer review programs (or, conversely, the amount of control that OMB will retain) will be apparent only through the bulletin's implementation. The amount of agency discretion (or OMB control) could vary substantially from one administration to another.

Consistency. OMB indicated that stronger peer review policies were needed because of the importance of the issue and, citing a 1999 GAO report, because of the "variability in both the definition and implementation of peer review across agencies." OMB went on to say that, prior to the development of the bulletin, "there were no government-wide standards concerning when peer review is required and, if required, what type of peer review processes are appropriate." Therefore, OMB said that the bulletin "establishes minimum standards for when peer review is required for scientific information, and the types of peer review that should be considered by agencies in different circumstances."

The final bulletin, however, may not provide the desired consistency in peer review definition or implementation. As indicated above, the bulletin leaves many key terms undefined or subject to interpretation, and gives the agencies substantial discretion regarding when certain actions should be taken (e.g., when previous peer reviews are "adequate") and which reviewers should be selected (i.e., those with the "necessary" expertise, experience, and skills). To the

extent that agencies are allowed to exercise discretion in these areas, consistency may be forfeited. On the other hand, strict enforcement of uniform procedures established by OMB carries with it a different set of concerns about aggregation of power within the Executive Office of the President, and may be resisted by federal agencies. Also, as noted previously, although GAO reported that agencies' peer review practices were inconsistent, it did not recommend greater consistency, and some view variation in those practices as appropriate and desirable.

Effects on Agencies and Rulemaking. A number of commenters expressed concerns regarding the effect that adding new peer review requirements would have on what is already viewed by some observers as a lengthy, "ossified" federal rulemaking process. Somewhat related concerns have been voiced regarding the cost of the requirements to federal agencies, with Senators Lieberman and Duhon suggesting that the requirements "do not pass OMB's own [cost-benefit] test of good rulemaking." In response, OMB provided estimates in the preamble to the revised bulletin indicating that it did not believe the costs would be prohibitive to the agencies. As noted previously, though, in 1997, OMB indicated that peer review costs could be significant in terms of both time and agency resources.⁵⁵⁸ Little empirical data are currently available regarding the cost of peer reviews, how they affect the federal rulemaking process, or their effect on the quality of the information being reviewed. It is even less clear how the peer review requirements suggested by OMB will affect those factors, and there appears to be no mechanism in place for collecting such data. There are some indications, however, that the requirements could delay regulatory action.⁵⁵⁹

The A.E.I.-Brookings Joint Center for Regulatory Studies recommended that OMB or some other entity build into the peer review program an evaluation to determine its effect on the quality of regulatory analyses. Any such evaluation could, at least conceptually, include an examination of the cost of the new peer review requirements to federal agencies and its effect on the pace of rulemaking. To determine the effect of the peer review bulletin on these or other factors, baseline information regarding the current state of the art would need to be gathered before the bulletin's implementation.

Even if the data indicate that peer review adds time to the early stages of the rulemaking process, that time may be worth the investment if doing so reduces the likelihood of subsequent judicial challenges to the rules. Peer review may also provide agencies with a preview of likely objections to a rule during the notice and comment phase, thereby allowing them to minimize any weaknesses and respond quickly to adverse comments. All of these factors would have to be considered in any evaluation of the effect of peer review on the regulatory process.

Risk Assessment Bulletin

Some believe that, because OMB's risk assessment bulletin is not subject to judicial review, it will not have a significant effect on rulemaking. Like the peer review bulletin, however, the manner in which OMB implements the bulletin will also determine its effectiveness. For example, it is unclear the extent to which agencies will be allowed to waive or defer the

⁵⁵⁸Statement of Sally Katzen, *supra* note 521.

⁵⁵⁹Ben Gellman, *White House Peer Review Requirements Could Delay Standards*, 10 Greenwire 9 (Dec. 17, 2004). The article quoted a program manager in the Department of Energy as saying that efficiency standards for residential furnaces and boilers, commercial air conditioners and other equipment were being delayed for two years because of OMB's peer review bulletin.

bulletin's requirements when they believe it is "warranted by a compelling rationale." Similarly, it is unclear whether OMB will allow agencies to decide when a risk assessment is "influential" (thereby triggering additional standards in the bulletin) and whether OMB will treat the bulletin's provisions as "guidance" or as "requirements." If OMB views the bulletin as requirements that are enforceable as part of its review of agency rules under Executive Order 12866, the bulletin could have a major effect on the development of health, safety, and environmental rules.

Issues for Congress or Further Study

As the above discussion suggests, a number of issues remain for possible Congressional consideration, or for further study by a re-funded ACUS or some other body. In some cases, Congress could weigh in and resolve the issue. For example, in light of recent court decisions, if Congress wants agencies' decisions under the IQA to be judicially reviewed, it could resolve any lingering questions by amending the statutes and permitting judicial review. Likewise, if Congress objects to using risk standards for one statute and applying them to other statutes, it could make its objections clear through statutory language, or through oversight of OMB's risk assessment bulletin.

Among the questions that merit further study are the following:

- How should scientific advisory panels be constructed to ensure that they are unbiased?
- Under what circumstances should agencies' regulatory policies deviate from the recommendations of their scientific staff and advisory bodies?
- Do agencies have too much discretion to deny correction requests under the IQA? What effect has the act had on the length of time it takes agencies to issue rules? Do the Shelby Amendment and the IQA, in tandem, potentially restrict the release of research findings that would have significant social impact?
- What is the appropriate role of the courts in reviewing science-based agency regulatory decisions?
- Are governmentwide standards for peer review and risk assessment needed? Does OMB have the authority to issue such standards? What effect have these requirements had on the length of time it takes agencies to issue rules?
- Are agencies complying with the peer review and risk assessment bulletins? For example, are agencies posting agendas listing their upcoming peer reviews? Are agencies peer reviewing all "influential" information? Are some agencies complying better than others? Should Congress refer to these bulletins in legislation as models for particular peer reviews or risk assessments?
- What has been the effect of the Supreme Court's ruling in *Daubert v. Merrell Dow Pharmaceuticals, Inc.* (regarding the acceptance and understanding of scientific evidence to be used in the legal system) on regulatory policymaking?

- What constitutes the “weight of the evidence” in making risk-based regulatory decisions? Should Congress define the term, or should it be left up to the agencies within a specific regulatory context?

VII. Agency Adjudication

The Choice Between Rulemaking or Adjudication

Another matter of significant importance and interest to the Project has been the issue of agency adjudication. In addition to rulemaking, it is a fundamental maxim of administrative law that agencies may control regulated activities and entities through adjudicatory processes. Regarding the basic issue of an agency's discretion to choose between rulemaking and adjudication, the Supreme Court established in *SEC v. Cheery Corporation (Cheery II)* that an agency has the authority to make law through adjudication.⁵⁶⁰ In *Cheery II* the Court addressed the SEC's refusal to approve the reorganization of a utility company on the basis that the reorganization would violate standards of fairness derived from the SEC's interpretation of the governing statute, as company insiders had received from their purchases. Neither the act at issue nor SEC regulations, however, proscribed such conduct. Nonetheless, the SEC issued a ruling that established a policy against insider trading. Through this action, the SEC formulated a rule and applied in the adjudication before it.

While observing that "[t]he function of filling in the interstices of the Act should be performed, as much as possible, through the quasi-legislative promulgation of rules to be applied in the future," the Court held that "the choice made between proceeding by general rule or by individual, ad hoc litigation is one that lies primarily in the informed discretion of the administrative agency."⁵⁶¹ In a prior decision in *Securities and Exchange Commission v. Cheery ("Cheery I")*, the Court had ruled that "before transactions otherwise legal can be outlawed or denied their usual business consequences, they must fall under the ban of some standards of conduct proscribed by an agency of government authorized to prescribe such standards." The holding in *Cheery II* established that this language did not require an agency, in instances where the standard is unclear, to develop a general rule prior to proceeding through individual adjudications. The Court emphasized in *Cheery II* that "[t]he absence of a general rule or regulation governing management trading during reorganization did not affect the Commission's duties in relation to the particular proposal before it."

Justice Jackson dissented from the holding in *Cheery II*, arguing that the SEC should have been required to give notice of the agency's position before its application, namely by requiring the agency to first promulgate a "rule" of general applicability. In particular, Justice Jackson voiced concern with the notion that an agency should be allowed to establish binding standards via adjudication under any circumstances, noting that "[e]ven if the Commission had, as the Court says, utilized this case to announce a new legal standard of conduct, there would be hurdles to be cleared. . . ." In essence, Justice Jackson's dissent forwards the position that agency adjudication is inherently unfair to the extent that the legal rights of an affected party can be impacted concordant with a decision explicitly prohibiting the conduct at issue for the first time.

Despite Justice Jackson's concerns, the Supreme Court has repeatedly upheld the general maxims of *Cheery II*, establishing that agencies have broad authority in choosing whether to develop agency law through rulemaking or adjudication. As the setting of policy through

⁵⁶⁰332 U.S. 194 (1947).

⁵⁶¹*Id.* at 202-03.

rulemaking became increasingly entrenched within agencies, however, the focus of argument shifted to the assertion that the formulation of general rules of policy through adjudication effectively and improperly circumvented the notice and comment provisions of the APA. The Supreme Court rejected this argument in *NLRB v. Bell Aerospace Co.*, stating that:

[T]he Board is not precluded from announcing new principles in an adjudicative proceeding...the choice between rulemaking and adjudication lies in the first instance within the Board's discretion. Although there may be situations where the Board's reliance on adjudication would amount to an abuse of discretion or violation of the Act, nothing in the present case would justify such a conclusion.⁵⁶²

This dichotomy effectively allows agency adjudicators to exert policy-making authority through a quasi-judicial proceeding, as opposed to the quasi-legislative nature of the procedures that govern notice and comment rulemaking. This dynamic has given rise to the question of whether it is appropriate for agencies to establish binding policy through adjudication when such action could be effected through notice and comment rulemaking. ACUS, as a reconstituted entity, would be in a unique position to analyze the impact of agency determinations to regulate through adjudication and rulemaking, with the aim of formulating a recommendation as to whether the APA should be amended to explicitly address issues adhering to agency adjudication.

In addition to issues regarding the equity of proceeding with adjudication or rulemaking in a given instance from a public policy perspective, there are also significant practical factors that may inform agency determinations in this context. A majority of commentators on the issue have posited that rulemaking carries significant benefits over adjudication. In particular, it has been asserted that rulemaking is superior to the degree that it allows agencies to manage the scope and logistical aspects of a proceeding, giving the agency greater control over its agenda and enabling it to formulate a regulatory strategy that is not subject to the procedural and substantive limitations of the adjudicatory process.⁵⁶³ Relatedly, rulemaking is seen as more efficient in that it enables agencies to promulgate rules with broad, prospectively binding legal effect, whereas orders and decisions reached via adjudication are merely of precedential value in subsequent proceedings.⁵⁶⁴

Conversely, adjudication may be viewed as superior in light of other practical considerations. Specifically, the increased complexity of the notice and comment rulemaking process may be avoided through the use of adjudication. This factor may be especially significant in contexts that are particularly suited to adjudication, as may be the case with discrete or highly specialized regulatory regimes, given that agencies may be able to give effect to the underlying aims of a statute more efficiently through adjudication than through compliance with the myriad clearance and review requirements imposed on notice and comment

⁵⁶²416 U.S. 267, 294 (1974).

⁵⁶³See Richard K. Berg, *Re-examining Policy Procedures: The Choice Between Rulemaking and Adjudication*, 38 Admin. L. Rev. 149, 163 (1986).

⁵⁶⁴*Id.* at 163-64.

rulemaking.⁵⁶⁵ Likewise, modifications may be made more easily through adjudication. While a specific rule may lose its utility over time, the typically generalized and broad nature of the authorities delegated to an agency by Congress will usually ensure the vitality of the overall statutory regime. Accordingly, given that modifications of repeals of rules through notice and comment rulemaking may be a cumbersome and contested issue, policy change through adjudication may be more efficient and flexible.⁵⁶⁶ Relatedly, standard setting through adjudication may allow agencies to address significant regulatory issues more precisely, thereby avoiding the risk that a generally applicable rule will be either over or under-inclusive.⁵⁶⁷

As the factors identified above indicate, there is a significant interplay between rulemaking and adjudication under the APA, and an agency's choice of which of these regulatory vehicles to employ centers on a myriad of equitable and practical considerations that can be of enormous significance to both the agency and those entities affected by agency regulatory efforts. Accordingly, there is a substantial likelihood that a sustained analysis of the multitude of factors that adhere in this context by a reconstituted ACUS would have a salutary effect on the fairness and efficiency of agency regulation.

Evidentiary Standards in Informal Adjudication

The Supreme Court has established a presumption of informality for rulemaking proceedings, but has not specifically addressed the issue in the context of agency adjudication.⁵⁶⁸ The APA establishes formal and explicit procedural requirements only for those adjudications that are "required by statute to be determined on the record after opportunity for an agency hearing."⁵⁶⁹ This provision effectively establishes that the APA's adjudication procedures are mandatory only in those instances when an agency is directed by the terms of a separate statute to conduct an evidentiary hearing in the adjudication of cases.

The federal courts have devised three separate approaches to assess whether an agency that is engaged in adjudication is required to use the formal procedures delineated in the APA. In *Seacoast Anti-Pollution League v. Castle*, the First Circuit held that the APA's formal adjudication provisions were applicable in any instance when a federal adjudicator is required by statute to hold a "hearing."⁵⁷⁰ The court in *Seacoast* explained that the statute at issue need not specifically require a hearing to be held "on the record" or "in compliance with" the formal adjudication provisions of the APA. Instead, under the *Seacoast* standard, the simple imposition of a statutory hearing requirement is sufficient to trigger these formal provisions.⁵⁷¹ Conversely, in *City of West Chicago v. Nuclear Regulatory Commission*, the Seventh Circuit held that unless clearly indicated by Congress, an agency is free to employ informal adjudication at its

discretion.⁵⁷² Under this approach, the simple inclusion of a requirement for a hearing in a statute will not mandate the use of the formal adjudication provisions of the APA; rather, the text of the statute or the legislative history accompanying the enactment must make it clear that Congress intended for the agency to use such formal procedures.⁵⁷³ Finally, the District of Columbia Circuit has held that the issue of whether a statute requires compliance with the APA's formal adjudication provisions must be resolved pursuant to the *Chevron* standard. Specifically, in *Chemical Waste Management, Inc. v. EPA*, the court, upon determining that it was unable to ascertain sufficiently whether a statute requiring the EPA to hold "public hearings" indicated a clear Congressional intent that formal procedures were to be followed, declared that it would defer to the EPA's position that the statute allowed "informal hearing procedures."⁵⁷⁴ Thus, under the *Chemical Waste* standard, an agency is free to devise its own procedures in adjudicating cases absent a clear statutory indication that the APA's formal provisions apply.⁵⁷⁵

This split in authority, coupled with the related result and effect that the vast majority of agency adjudications are not subject to the formal procedural protections of the APA, has been the source of significant academic consideration. The American Bar Association (ABA) has been particularly active in addressing this issue. In 2000, the ABA House of Delegates issued Resolution 113, recommending both that Congress should explicitly address whether formal or informal adjudication was required when enacting new law, and that, in instances where new legislation does not explicitly address the issue, a presumption should rest in favor of the application of the APA's formal adjudication requirements.⁵⁷⁶ While the first aspect of this resolution would provide legal clarity at a low cost to the legislative resources of Congress, the utility of the latter recommendation is less clear. Although it has been argued that such an approach would give effect to the original intent of the APA, it has also been asserted that the blanket imposition of formal procedural requirements would be excessively doctrinal and formalistic to the detriment of agency efficiency and flexibility.⁵⁷⁷

The ABA's Section on Administrative Law and Practice has engaged in further study of this issue, culminating in the submission of a revived proposal to the ABA House of Delegates that was approved on February 14, 2005.⁵⁷⁸ While retaining the aforementioned recommendations, the 2005 proposal specifically addressed informal adjudication, advocating that certain formal procedural protections should be extended to informal proceedings, such as the provision of an impartial decisionmaker, a requirement for the issuance of a written or oral decision of findings, and a prohibition on *ex parte* contacts.⁵⁷⁹

Areas for Additional Research

- Is there a need to reassess the role of ALJs and how they are selected and evaluated? Should regulatory ALJs be treated differently from benefits ALJs?
- Should the notion of a centralized ALJ corps be revisited?
- Is there a need to examine and review the role of non-ALJ hearing officers?
- Should the split-enforcement model of agency adjudication (e.g., OSHA-OSHRC) be used more often?
- Should the APA contain a provision regarding informal adjudication?
- Should the APA's adjudication provisions be extended to all evidentiary hearings required by statute?

ADMINISTRATIVE LAW, PROCESS AND PROCEDURE PROJECT FOR THE 21ST CENTURY

TUESDAY, NOVEMBER 14, 2006

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON COMMERCIAL
AND ADMINISTRATIVE LAW,
COMMITTEE ON THE JUDICIARY,
Washington, DC.

The Subcommittee met, pursuant to notice, at 3:27 p.m., in Room 2141, Rayburn House Office Building, the Honorable Chris Cannon (Chairman of the Subcommittee) presiding.

Mr. CANNON. I would like to apologize to the witnesses for the late start. The votes, and people chatting in the halls, make the gauntlet from the Capitol here virtually impassable. So I apologize to you, and I appreciate your patience and look forward to your testimony.

Today's hearing is a fitting way to bring to a close the 109th Congress. The Committee on the Judiciary, as one of its very first items of business for this Congress, authorized the Subcommittee on Commercial and Administrative Law to undertake a comprehensive study of administrative law, process and procedure on January 26, 2005, as part of the Committee's oversight plan for the 109th Congress.

This hearing represents the culmination of that 2-year study known as the Administrative Law, Process and Procedure Project for the 21st Century. Over the course of this project, the Subcommittee conducted six hearings, participated in three symposia, and sponsored several empirical studies.

Topics examined as part of this project included the adjudicatory process of agencies; the role of public participation in rulemaking; the process by which agency rulemaking is reviewed by the Congress, the President, and the Judiciary; and the role of science in the regulatory process.

From its very inception, this project has been a thoroughly bipartisan and nonpartisan undertaking. To that end, I want to thank the Subcommittee Ranking Member, Mr. Watt for his active and unwavering support throughout this undertaking, and point out that I look forward to working with him in whichever chairmanship he assumes in the next Congress.

It is also important to remember that this project was inspired and initiated by the House Judiciary Chairman, Jim Sensenbrenner. The project is a testament to the Chairman's deep and long-standing commitment to improving the law and procedure in general, and, in particular, to improving the administrative and

rulemaking process. Accordingly, we thank the Chairman for his insight and leadership in allowing the Subcommittee to spearhead this endeavor.

It is also appropriate at this time to extend our sincere thanks to the Congressional Research Service and its director, Dan Mulhollan, for devoting so many critical resources—physical, financial, and human—to this project.

The three witnesses who appear today on behalf of CRS, namely, Mort Rosenberg, Curtis Copeland and T.J. Halstead, deserve much of the credit for playing such a major role in guiding the project and ensuring its success.

It is my sincere hope that the findings and recommendations of the project's report, which will be issued later this month, will not just sit on the proverbial shelf to gather dust. Rather, it should become a valuable legacy for the next Congress.

Let me cite just one example. One of the most important legacies of the project is that it underscored the absolute and urgent need to have a permanent, neutral, nonpartisan think tank that can dispassionately examine administrative law and process and that can make credible recommendations for reform. Clearly, I am referring to the need to reactivate the Administrative Conference of the United States. Although reauthorized in the 108th Congress with overwhelming bipartisan support, the Conference remains to be funded.

The extremely nominal investment to fund ACUS would redound in billions of savings in taxpayer dollars. Accordingly, I encourage our Subcommittee Members on both sides of the aisle to continue to pursue this very worthy cause in the waning days of this Congress, and, if that fails, in the next Congress.

[The prepared statement of Mr. Cannon follows:]

PREPARED STATEMENT OF THE HONORABLE CHRIS CANNON, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF UTAH, AND CHAIRMAN, SUBCOMMITTEE ON COMMERCIAL AND ADMINISTRATIVE LAW

Today's hearing is a fitting way to bring to a close the 109th Congress. The Committee on the Judiciary—as one of its very first items of business for this Congress—authorized the Subcommittee on Commercial and Administrative Law to undertake a comprehensive study of administrative law, process and procedure on January 26, 2005 as part of the Committee's Oversight Plan for the 109th Congress.

This hearing represents the culmination of that two-year study, known as the Administrative Law, Process and Procedure Project for the 21st Century. Over the course of this Project, the Subcommittee conducted six hearings, participated in three symposia, and sponsored several empirical studies.

Topics examined as part of this Project included the adjudicatory process of agencies; the role of public participation in rulemaking; the process by which agency rulemaking is reviewed by the Congress, the President, and the judiciary; and the role of science in the regulatory process.

From its very inception, this Project has been a thoroughly bipartisan and nonpartisan undertaking. To that end, I thank the Subcommittee Ranking Member, Mr. Watt, for his active and unwavering support throughout this undertaking.

It is also important to remember that this Project was inspired and initiated by House Judiciary Chairman Jim Sensenbrenner. The Project is a testament to the Chairman's deep and longstanding commitment to improving the law and procedure in general, and, in particular, to improving the administrative and rulemaking process. Accordingly, we thank the Chairman for his insight and leadership in allowing the Subcommittee to spearhead this endeavor.

It is also appropriate at this time to extend our sincere thanks to the Congressional Research Service and its Director, Dan Mulhollan, for devoting so many critical resources—physical, financial, and human—to this Project. The three witnesses who appear today on behalf of CRS, namely, Mort Rosenberg, Curtis Copeland, and

T.J. Halstead deserve much of the credit for playing such a major role in guiding the Project and ensuring its success.

It is my sincere hope that the findings and recommendations of the Project's report, which will be issued later this month, will not just sit on the proverbial shelf to gather dust. Rather, it should become a valuable legacy for the next Congress.

Let me cite just one example. One of the most important legacies of the Project is that it underscored the absolute and urgent need to have a permanent, neutral, nonpartisan think-tank that can dispassionately examine administrative law and process and that can make credible recommendations for reform.

Clearly, I am referring to the need to reactivate the Administrative Conference of the United States. Although reauthorized in the 108th Congress with overwhelming bipartisan support, the Conference remains to be funded.

The extremely nominal investment to fund ACUS would redound in billions of savings in taxpayer dollars. Accordingly, I encourage our Subcommittee Members—on both sides of the aisle—to continue to pursue this very worthy cause in the waning days of this Congress and, if that fails, in the next Congress.

Mr. CANNON. I now turn to my colleague Mr. Watt, the distinguished Ranking Member—soon to be more distinguished—of the Subcommittee, and ask him if he has any opening remarks.

Mr. WATT. Thank you, Mr. Chairman. I assure you that being a Chair or a Ranking Member is not, by definition, more distinguishing or less distinguishing.

Mr. CANNON. I agree with the gentleman. I hope that I don't lose much stature in the process. It would be hard for you to gain more stature because you're a person of great accomplishments and distinction already.

Mr. WATT. It does feel good.

Mr. CANNON. Now let's not rub it in, okay?

Mr. WATT. I will just, if it is all right, Mr. Chairman, ask unanimous consent to revise and extend my remarks and submit a statement for the record, and will make a very brief comment about this hearing because I think it is important for us to do the follow-up. And hopefully whoever is in charge of this Subcommittee and Committee next term of Congress will not allow this to go unnoticed, and the package of recommendations will be implemented.

We are in thorough need of reform in Government agencies and the administrative procedures since we haven't had a major reform in over a decade, when we had the National Performance Review and the second Clinton/Gore term began to focus on some of these issues, so I think this is important. The Chair has put it at the top of his agenda, and I hope some Chair will put it at the top of their agenda in the next term of Congress if nothing is done this year.

That having been said, Mr. Chairman, I would ordinarily yield back, but if this is to be the last meeting of our Subcommittee in this term of Congress, I think I would be remiss not to express my gratitude to you and my high admiration for the manner in which you have conducted this Subcommittee and consulted with me as the Ranking Member. It's the kind of consultation that I think is important, and that the American people are saying they desire to have Republicans and Democrats have. And from my part, you can be assured wherever I am, as a Chair, it will be my intention to exercise the same kind of consultation as we go forward, either on this Subcommittee or on whatever Subcommittee I'm on, on Judiciary or Financial Services, which I may also be eligible for a Subcommittee on.

So you've set a good model for us and set a high standard for bipartisanship and consultation and respect and friendship, and I just publicly want to express my thanks to you for that.

And with that, I'll yield back the balance of my time.

Mr. CANNON. I want to thank the gentleman for those kind remarks. I can't imagine any kinder thing being said about me, except possibly that I'm a good father, but you don't know my family, so that's beyond your purview. But thank you very much for those kind comments.

And I would just point out that America has evolved, it's grown in the last 10 or 12 or 15 years, and I think the next Congress is going to be an opportunity to focus on what America needs and not in a partisan fashion. There are many, many issues that are truly nonpartisan that are important, and I look forward to working with the gentleman on many of those issues.

Without objection, the gentleman's entire statement will be placed in the record. Hearing no objection, so ordered.

[The information referred to was not available.]

Mr. CANNON. I ask unanimous consent to include a letter from the American Bar Association in the prehearing record. Hearing no objection, so ordered.

[The information referred to can be found in the Appendix.]

Mr. CANNON. Without objection, all Members may place their opening statements in the record at this point. Hearing no objection, so ordered.

Without objection, the Chair will be authorized to declare recesses of the hearing at any point. Hearing no objection, so ordered.

I ask unanimous consent that the Members have 5 legislative days to submit written statements from the conclusion of today's hearing record. Hearing no objection, so ordered.

I am now pleased to introduce today's witnesses for today's hearing.

Our first witness is Mort Rosenberg, a specialist in American public law in the American Law Division at the CRS. In all matters dealing with administrative law, Mort has been the Judiciary Committee's right hand. For more than 25 years he's been associated with CRS. Prior to his service at that office, he was chief counsel at the House Select Committee on Professional Sports, among other public service positions he's held. In addition to these endeavors, Mort has written extensively on the subject of administrative law. He obtained his undergraduate degree from New York University and his law degree from Harvard Law School, and he has been a remarkable help us to through this process, and I want to thank you for that, Mr. Rosenberg.

Our second witness is Dr. Curtis Copeland, a specialist in American Government at CRS. Dr. Copeland's expertise, appropriately relevant to today's hearing, is Federal rulemaking and regulatory policy. In addition to this area of expertise, Dr. Copeland also heads the Government and Finance Divisions, Executive and Judiciary Section at CRS, which covers issues ranging from Federal financial management to the appointment of Supreme Court Justices. Prior to joining CRS, he held a variety of positions at the Government Accountability Office over a 23-year period. Dr. Copeland received his Ph.D. From the University of North Texas.

Our final witness is T.J. Halstead, a legislative attorney in the American Law Division of CRS, and in this capacity is one of CRS's primary analysts on administrative law and separation of powers issues. Before joining CRS in 1998, Mr. Halstead received both his undergraduate and law degrees from the University of Kansas.

We understand and appreciate that as CRS staff, your testimony will be confined to technical, professional and nonadvocative aspects of the hearing subject matter pursuant to congressional guidelines on objectivity and nonpartisanship.

I extend to each of you my warm regards and appreciation for your willingness to participate in today's hearing.

In light of the fact that your written statements will be included in the hearing record, I request that you limit your oral remarks to 5 minutes. Accordingly, please feel free to summarize or highlight the salient points of your testimony.

You will note that we have a lighting system that starts with a green light. After 4 minutes it turns to a yellow light, and then at 5 minutes it turns to a red light. It is my habit to tap the gavel or a pencil at 5 minutes. We would appreciate it if you would finish up your thoughts within that time frame. We don't want to cut people off, and certainly not in the middle of your thinking, so it's not a hard red light or a hard termination.

After you've presented your remarks, the Subcommittee Members, in the order they arrive, will be permitted to ask questions of the witnesses subject to the 5-minute limit. I suspect that won't be a real long event.

Let me just say we welcome Mr. Chabot, who has joined us here on this end.

I would ask the witnesses to rise and raise your hand to take the oath.

[Witnesses sworn.]

Mr. CANNON. The record should reflect that all the witnesses answered in the affirmative.

Mr. Rosenberg, would you now proceed with your testimony.

TESTIMONY OF MORTON ROSENBERG, ESQ., SPECIALIST IN AMERICAN PUBLIC LAW, CONGRESSIONAL RESEARCH SERVICE, WASHINGTON, DC

Mr. ROSENBERG. Thank you, Mr. Chairman. Thank you, Mr. Watt. I just want to reiterate that I am honored not only to appear before you again, but also for giving me the opportunity to do the kind of work we've been doing for the last 2 years. It's been an education for me, and it's been a fruitful endeavor to put together, you know, symposia, be at these hearings, and to generally support the work of this Committee in identifying emerging issues.

Today, my CRS colleagues Curtis Copeland and T.J. Halstead and I will try to brief you on the status of the Process and Procedure Project and what might be done in the future. My testimony will focus on the potential significance of the reactivation of ACUS, and one of the seven elements of the project, the Congressional Review Act. Curtis and T.J. Will discuss the other six elements of the study.

With respect to ACUS, I've always thought that in this part of the project there was, you know—of course it's important for it to

be the reactivation that occurred in 2000—the reauthorization that occurred in 2004 was important, and that the funding and ultimate reactivation of ACUS was not important at that moment. But at some particular point—and our experience with our studies underlines the fact that there is a need for an organization like ACUS, which provided nonpartisan, nonbiased, comprehensive, practical and cost-effective assessments and guidance on a wide range of agency processes, procedures and practices, a history that has been well documented before this Committee.

What struck me as important was one of the study projects that we commissioned, the one which Professor West conducted with regard to participation in the—public participation in the prenotice and comment period. His excellent study was, you know, hindered a great deal by the fact that, as his testimony before this Committee revealed, that his entree to the Committee, to the agencies that he was attempting to get information and to do his assessments was met with recalcitrance and suspicion. Generally, the best information that he got was through informal interviews that were in, you know, deep, you know, background from knowledgeable officials of these agencies.

That was not true during the heyday of the Administrative Conference. Its reputation of credibility, of nonpartisanship, and expertise opened doors when an ACUS-sponsored researcher came to the door because there was a certain amount of self-interest involved. The reputation of ACUS as an entity that would provide expert guidance redounded, and the kinds of studies and suggestions for the agencies to—you know, to change their practices or to undertake new ways of decisionmaking redounded to their benefit so that there was a self-interest involved in having an ACUS study that could help that agency. So that reactivation, you know, that could be looked to as an extraordinarily important aspect to it.

I also enjoyed very much the empirical—the symposia that we conducted, as well as the—one of the more symposia—at least, and most interesting was the science and rulemaking symposium, from which, after questioning some of the members of the panel on advisory bodies, we discovered that nobody knew how many science advisory bodies were out there. Nobody knew what the selection process was—these were among experts in this field—and as a result of that revelation in itself—and the panels at that science symposia were quite excellent—we commissioned a study to develop a taxonomy of science advisory committees in the Federal Government, a study that will be completed sometime next June, and we'll present it to this Committee, which will tell us, you know, how many there are, how they're selected, how they're vetted, how they deal with conflicts of interest and various important information about these advisory committees that will allow Congress to decide whether any kinds of legislative actions needs more regulating.

The symposium we held on September 11 on Presidential, Congressional and Judicial Control of Rulemaking was also one that I would recommend to scholars, Congresspeople, everybody to read the transcript. One of the themes and one of the things that came across very well was the constitutional dimension of the study, or parts of the study, that you are engaged in. And I will talk about that, you know, in a few moments.

I chaired the panel on the Congressional Review Act, and of course I've spoken about the Congressional Review Act with you at one of your hearings. The panel was interesting, revealing, and I'd like to say a few words about the Congressional Review Act and where we could go from here.

Congress' stated objective of setting in place an effective mechanism to keep it informed about the rulemaking activities of Federal agencies which would allow for expeditious congressional review and possible nullification of particular rules may not have been met. That was the clear result of the testimony there and the discussion. Statistically, to date, over 43,000 rules have been reported to Congress, including over 630 major rules, and only one, the Department of Labor's ergonomics standard, was disapproved in 2001. Many analysts believe that the negation of the ergonomics rule was a singular event, not likely to be repeated.

Witnesses at your hearing pointed to structural defects in the mechanism, most commonly the lack of a screening mechanism to identify rules that warranted review by jurisdictional Committees, and then expedited consideration process in the House—the lack of an expedited consideration process in the House that complemented the Senate's procedures, as well as numerous interpretive difficulties of key statutory provisions that seemed to deter use of the mechanism.

One witness at the hearing, Todd Gaziano of the Heritage Foundation, while agreeing with the structural critique, suggested that the law's presence and the threat of a filing of a joint resolution of disapproval had had a degree of influence that could not be ignored. He agreed, however, that the framers of the legislation anticipated that the mechanism would provide an incentive for legislators to insist on institutional accountability as a response to criticisms of Congress that it had been delegating vast amounts of law-making authority to executive agencies without maintaining countervailing checks on the exercise of that authority.

There was also recognition among the witnesses that the establishment of a joint Committee that would screen rules, recommend action to jurisdictional Committees in both Houses could provide the coordination and information that were necessary to inform the bodies sufficiently and in a timely manner and nature of such to take appropriate legislative actions.

The balanced nature of such a joint Committee and its lack of substantive authority appeared to provide a way to allay political concerns over turf intrusions. The House Parliamentarian, John B. Sullivan, agreed that such a joint Committee was a viable construct.

A further question raised at the March hearing, and again at the panel discussion of the Congressional Review Act in the September 11th symposium, was whether it was necessary to have all the rules reported and reviewed. It was suggested that only major rules need be reported, which would save legislative time, and also money; and that the many rules, the thousands that have come before Congress, simply aren't of a stature that needs to be addressed by a jurisdictional Committee.

There was no consensus, however, among the panelists as to who or how a major rule would be defined. There was an agreement

among the panelists that the nonsubstantive advisory joint Committee would be a politically viable screening mechanism, but not the same unanimity with respect to an expedited House consideration procedure. Former House Parliamentarian, Charles Johnson, explained that it was likely that the lack of a parallel House expedited procedure in the CRA was purposeful. He explained that the House leadership believes that the House is a majoritarian institution, and that expedited procedures undermines majority rule.

One panelist, Professor Jack Beermann, expressed a view that making it easier for Congress to overturn an agency rule may come at a very high political cost. He asks the question, “does Congress really want to be in the position where it is perceived that everything an agency does is their responsibility, since they’ve taken it on and reviewed it under this mechanism? Do they want to have that perception?” He concluded, “I think that this may just increase the blaming opportunities for Congress.”

Professor Beermann also stated the belief that—similar to that expressed by Todd Gaziano, that the current CRA has the effect of forcing the executive to negotiate, which is a satisfactory result, in his view. I don’t think there is a lot of empirical evidence to support those comments, but it is a view that’s prevalent out there.

Proponents of the CRA concept, however, argue that it reflects a congressional recognition of the need to enhance its own political accountability, and thereby strengthening the perception of legitimacy and competence of the administrative rulemaking process.

It is also said to rest on an understanding that broad delegations of rulemaking authority to agencies are necessary and appropriate, and will continue for the indefinite future. The Supreme Court’s most recent rejection in 2001 in the *Whitman* case of an impending revival of the so-called nondelegation doctrine is impetus for Congress to consider several facets and ambiguities of the current mechanism.

Absent congressional review, it is argued, current instances of avoidance in notice and comment, rulemaking, lack of full reporting of covered rules to be submitted under the CRA, and increasing Presidential control over the rulemaking process will likely continue. Professor Paul Verkuil, who was on the CRA panel, was a particularly strong voice for this view at the symposium.

Let me conclude by observing that much of the Administrative Law Project has an important constitutional dimension, raising the crucial question of where ultimate control of agency decisionmaking authority lies in our constitutional scheme of separated, but balanced powers. The tension and conflicts of this scheme were well brought forth and voiced in CRS’s symposium on Presidential, Congressional and Judicial Control of Rulemaking.

There can be little doubt as to Congress’ authority to make the determinative decisions with respect to the wisdom of any particular agency rulemaking, and to prescribe the manner in which congressional review will be conducted. Whether or not to do so is a political decision, a hard one with many practical consequences. I thank you, and I’ll welcome questions.

Mr. CANNON. Thank you, Mr. Rosenberg.

[The prepared statement of Mr. Rosenberg follows:]

PREPARED STATEMENT OF MORTON ROSENBERG

STATEMENT

OF

MORTON ROSENBERG
SPECIALIST IN AMERICAN PUBLIC LAW
CONGRESSIONAL RESEARCH SERVICE

BEFORE THE

HOUSE SUBCOMMITTEE ON COMMERCIAL AND ADMINISTRATIVE LAW,
COMMITTEE ON THE JUDICIARY

CONCERNING

THE ADMINISTRATIVE LAW, PROCESS AND PROCEDURE PROJECT

PRESENTED ON

NOVEMBER 14, 2006

Mr. Chairman and Members of the Subcommittee

I am honored to appear before you again to present another progress report on CRS's efforts with respect to the unique and important study project initiated by the leadership of the House Judiciary Committee and your Subcommittee. You were concerned that in the last decade, a period coincident with the absence of the Administrative Conference of the United States, many new issues of administrative law, process, and procedure had emerged that had not been properly addressed or perhaps even identified. Today my CRS colleagues, Curtis Copeland and T.J. Halstead, and I will brief you on the status of the study project and what might be done in the future. My testimony will focus on the potential significance of the reactivation of ACUS and on one of the seven elements of the project, the Congressional Review Act. Curtis and T.J. will briefly discuss the other six elements of the study. Let me start with some background.

The Administrative Law, Process, and Procedure Project (Project) has been a bipartisan undertaking of the House Judiciary Committee, overseen and conducted by its Subcommittee on Commercial and Administrative Law. It has had two principal goals: to reauthorize and to substantiate the need to reactivate the Administrative Conference of the United States (ACUS), and, simultaneously, to set in motion a study process that would identify the important issues of administrative law, process, and procedure that have emerged in the eleven year hiatus since its demise that would serve as a basis for either immediate legislative consideration and action by the Committee or as the initial agenda for further studies by a reactivated ACUS.

Initial success was achieved by the Committee with respect to the first effort with the enactment of the Federal Regulatory Improvement Act of 2004, Pub. L. 108-401, on October 4, 2004, reauthorizing ACUS. But, as of this date, funding legislation has not been passed.

Action to accomplish the second goal was initiated by the Committee's adoption of an oversight plan for the 109th Congress which made a study of emergent administrative law an process issues a priority oversight agenda item for the Subcommittee on Commercial and Administrative Law. The oversight plan identified seven general areas for study: (1) public participation in the rulemaking process; (2) congressional review of agency rulemaking; (3) presidential review of agency rulemaking; (4) judicial review of agency rulemaking; (5) the agency adjudicatory process; (6) the utility of regulatory analyses and accountability requirements; and (7) the role of science in the regulatory process. The Subcommittee, in turn, tasked the Congressional Research Service (CRS) with coordinating the research effort.

ACUS

In previous testimony I have suggested that ACUS being in operation was not essential, at least initially, to the success of the Committee's Project. It is anticipated that many of the results of the studies and symposia will be directly useful in supplying the basis for necessary legislative action. Other results should be available to affected agencies and may inform or influence action to remedy administrative process shortcomings. In the view of many, however, the value in the long term of an operational ACUS for a fairer, more effective, and more efficient administrative process is inestimable, but sure, and is evidenced by the strongly supported congressional reauthorization in 2004. As you are aware, CRS does not take a position on any legislative options, and it is not my intent to espouse such a position on behalf of CRS. It may be useful, however, for this public record to re-state the

rationale that appears to have been successful in supporting the passage of the ACUS reauthorization measure.

ACUS' past accomplishments in providing non-partisan, non-biased, comprehensive, and practical assessments and guidance with respect to a wide range of agency processes, procedures, and practices is well documented.¹ During the hearings considering ACUS' reauthorization, C. Boyden Gray, a former White House Counsel in the George H.W. Bush Administration, testified before your Subcommittee in support of the reauthorization of ACUS, stating: "Through the years, the Conference was a valuable resource providing information on the efficiency, adequacy and fairness of the administrative procedures used by administrative agencies in carrying out their programs. This was a continuing responsibility and a continuing need, a need that has not ceased to exist."² Further evidence of the widespread respect of, and support for, ACUS' continued work at the hearings was presented by Supreme Court Justices Antonin Scalia and Stephen Breyer. Justice Scalia stated that ACUS "was a proved and effective means of opening up the process of government to needed improvement," and Justice Breyer characterized ACUS as "a unique organization, carrying out work that is important and beneficial to the average American, at a low cost."³ Examples of the accomplishments for which ACUS has been credited range from the simple and practical, such as the publication of time saving resource material, to analyses of complex issues of administrative process and the spurring of legislative reform in those areas.⁴

During the period of its existence Congress gave ACUS facilitative statutory responsibilities for implementing, among others, the Civil Penalty Assessment Demonstration Program; the Equal Access to Justice Act; the Congressional Accountability Act; the Magnuson-Moss Warranty-Federal Trade Commission Improvement Act; provision of administrative law assistance to foreign countries; the Government in the Sunshine Act of 1976; the Railroad Revitalization and Regulatory Reform Act of 1976; the Administrative Dispute Resolution Act; and the Negotiated Rulemaking Act.

In addition, ACUS produced numerous reports and recommendations that may be seen as directly or indirectly related to issues pertinent to current national security, civil liberties, information security, organizational, personnel, and contracting issues that often had government-wide scope and significance.

³ Hearing on the Reauthorization of the Administrative Conference of the United States, 108th Cong., 2d Sess. (May 20, 2004).

⁴ Fine, *supra*, note 1 at 46. See also Gary J. Edles, The Continuing Need for an Administrative Conference, 50 Adm. L. Rev. 101, 117 (1998); Jeffrey Lubbers, Reviving the Administrative Conference of the United States, 51 Dec. Fed. Law 26 (2004).

ACUS evolved a structure to develop objective, non-partisan analyses and advice, and a meticulous vetting process, which gave its recommendations credence. Membership included senior (often career) management agency officials, professional agency staff, representatives of diverse perspectives of the private sector who dealt frequently with agencies, leaders of public interest organizations, highly regarded scholars from a variety of disciplines, and respected jurists. Although in the past the Conference's predominant focus was on legal issues in the administrative process, which was reflected in the high number of administrative law practitioners and scholars, membership qualification has never been static and need not be. Hearing witnesses and commentators on the revival of ACUS have strongly suggested that the contemporary problems facing a new ACUS will include management as well as legal issues. The Committee can help assure that ACUS's roster of experts will include members with both legal backgrounds and those with management, public administration, political science, dispute resolution, and law and economics backgrounds. It could also encourage that state interests be included in the entity's membership.

All observers, both before and after the demise of ACUS in 1995, have acknowledged that the Conference was a cost-effective operation. In its last year, it received an appropriation of \$1.8 million. But all have agreed that it was an entity that throughout its existence paid for itself many times over through cost-saving recommended administrative innovations, legislation and publications. At the heart of this cost saving success was the ability of ACUS to attract outside experts in the private sector to provide hundreds of hours of volunteer work without cost and the most prestigious academics for the most modest stipends. The Conference was able to "leverage" its small appropriation to attract considerable in-kind contributions for its projects. In turn, the resulting recommendations from those studies and staff studies often resulted in huge monetary savings for agencies, private parties, and practitioners. Some examples include: In 1994, the FDIC estimated that its pilot mediation program, modeled after an ACUS recommendation, had already saved it \$9 million. In 1996, the Labor Department, using mediation techniques suggested by the Conference to resolve labor and workplace standard disputes, estimated a reduction in time spent resolving cases of 7 to 11 percent. The President of the American Arbitration Association testified that ACUS's encouragement of administrative dispute resolution had saved "millions of dollars" that would otherwise have been spent for litigation costs. ACUS's reputation for the effectiveness and the quality of its work product resulted in contributions in excess of \$320,000 from private foundations, corporations, law firms, and law schools over the four-year period prior to its defunding. Finally, in his testimony before the Subcommittee Justice Scalia commented, when asked about the cost-effectiveness of the Conference, that it was difficult to quantify in monetary terms the benefits of providing fair, effective, and efficient administrative justice processes and procedures.

I would note that ACUS' established credibility and non-partisan reputation opened doors at federal agencies and allowed access to ACUS-sponsored research to internal operational information that normally would not have been available otherwise. Professor William West testified before this Subcommittee of the reluctance of most agencies to provide him with information vital to his study on public participation at the development stage of a rulemaking proceeding. His requests for information were often met with reluctance and suspicion and his most valuable contacts with knowledgeable officials were on deep background. This was not the usual ACUS experience where agency cooperation was generally the rule. ACUS researchers were often welcomed because the results of their studies redounded to the benefit of the agency.

Reactivation of ACUS to make it operational would come at an opportune time. Let me provide some examples that respond to the Committee's interests. As I have indicated to you in past testimony and written memoranda, the Department of Homeland Security's (DHS) response to Hurricane Katrina and its continuing efforts to stabilize and adjust its organizational units to achieve optimum efficiency and responsiveness in planning for and successfully dealing with terrorist or natural disaster incidents have been and are continuing to receive considerable congressional attention and criticism. Both these issues, and the role ACUS might play in resolving them, appear closely related.

The Katrina catastrophe, for example, raised a number of questions as to the organization, authority and decisionmaking capability of DHS' Federal Emergency Management Agency (FEMA). Previously an independent, cabinet-level agency reporting directly to the President, FEMA was made a subordinate agency in the creation of DHS and saw some of its authority withdrawn and placed elsewhere and its funding reduced. Suggestions were made that these and other administrative operating deficiencies contributed to ineffective planning and responses that included communications break-downs among Federal, State and local officials, available resources not being used, and official actions taken too late or not taken at all, among others.⁵ It was also suggested that FEMA revert to its previous independent status outside of DHS. In October 2006 Congress acted by "reassembling" FEMA as a "distinct" entity within DHS. A reactivated and operational ACUS could be tasked with reviewing, assessing and making recommendations with respect to FEMA's new role, how it should play that role, and the authorities it needs to fulfill that role, as well as assessing the need for more comprehensive authority for such emergency situations.

The terrorist attacks of September 11, 2001, have had and will continue to have a profound effect on governmental processes. One of the initial responses to the 9/11 attacks was the creation in November 2002 of the Department of Homeland Security (DHS), a consolidation of all or parts of 22 existing agencies. Each of the agencies transferred to DHS had its own special organizational rules and rules of practice and procedure. Additionally, many of the agencies transferred have a number of different types of adjudicative responsibilities. These include such diverse entities as the Coast Guard and APHIS which conduct formal-on-the-record adjudications and have need for ALJs; and formal rules of practice, the Transportation Security Administration and the Customs Service, which have a large number of adjudications but do not use ALJs; and the transferred Immigration and Naturalization Service units which also perform discrete adjudicatory functions. The statute is silent as to whether, and to what extent, these adjudicatory programs should be combined and careful decisions about staffing and procedures are still required. Similarly, all the agencies transferred have their own statutory and administrative requirements for rulemaking that likely will have to be integrated. Also, the legislation gives broad authority to establish flexible personnel policies. Further, provisions of the DHS Act eliminated the public's right of access under the Freedom of Information Act and other information access laws to "critical infrastructure information" voluntarily submitted to DHS. The process of integration and implementation of the various parts of the legislation goes on and is likely to need administrative fine tuning for some time to come. Again, a reactivated ACUS could have a clear role to play here.

⁵ See, e.g., Susan B. Glassner and Michael Grunwald, Hurricane Katrina- What Went Wrong, Wash. Post., Sept. 11, 2005, A1, A6-A8.

The recommendations of the 9/11 Commission with respect to reforms and restructuring of the intelligence community were recognized by the Commission as having the potential of profoundly affecting government openness and accountability. It noted:

Many of our recommendations call for the government to increase its presence in our lives— for example, by creating standards for the issuance of forms of identification, by better securing our borders, by sharing information gathered by many different agencies. We also recommend the consolidation of authority over the now far-flung entities constituting the intelligence community. The Patriot Act vests substantial powers in our federal government. We have seen the government use the immigration laws as a tool in its counter-terrorism effort. Even without changes we recommend, the American public has vested enormous authority in the U.S. government.

At our first public hearing on March 31, 2003, we noted the need for balance as our government responds to the real and ongoing threat of terrorist attacks. The terrorists have used our open society against us. In wartime, government calls for greater powers, and then the need for those powers recedes after the war ends. This struggle will go on. Therefore, while protecting our homeland, Americans should be mindful of threats to vital personal and civil liberties. This balancing is no easy task, but we must constantly strive to keep it right. This shift of power and authority to the government calls for an enhanced system of checks and balances to protect the precious liberties that are vital to our way of life.

A reactivated ACUS could be utilized to facilitate the process of implementation of the restructuring and reorganization of the bureaucracy for national security purposes. ACUS could serve to identify measures that might slow down the administrative decisional process, thereby rendering the agency less efficient in securing national security goals, and also to assist in carefully evaluating and designing security mechanisms and procedures that can minimize the number and degree of necessary limitations on public access to information and public participation in decisionmaking activities that affect the public, and minimize infringement on civil liberties and the functioning of a free market.

Finally, in addition to the impact of 9/11, the decade long period since ACUS's demise has seen significant changes in governmental policy focus and emphasis in social and economic regulatory matters, as well as innovations in technology and science, that appear to require a fresh look at old process issues. For example, the exploding use of the Internet and other forms of electronic communications presents extraordinary opportunities for increasing government information available to citizens and, in turn, citizen participation in governmental decisionmaking through e-rulemaking. A number of recent studies have suggested that if the procedures used for e-rulemaking are not carefully developed, the public at large could be effectively disenfranchised rather than having the effect of enhancing public participation. The issue would appear ripe for ACUS-like guidance. Among other public participation issues that may need study include the peer review process; early challenges to special provisions for rules that are promulgated after a November presidential election in which an incumbent administration is turned out and a new one will take office on January 20 (the so-called "Midnight Rules" problem); and the continued problem of avoidance by the agencies of notice and comment rulemaking by means of "non-rule rules." Control of agency rulemaking by Congress and the President continues to present important process and legal issues. Questions that might be presented

for ACUS study could include: Should the Congress establish government-wide regulatory analyses and regulatory accountability requirements? Should the Congressional Review Act be revisited to make it more effective? Is there an effective way to review, assess and modify or rescind "old" rules? Is the time ripe for codification of the process of presidential review of rulemaking that is now guided by executive order. Finally, recent studies have raised questions as to the efficacy of judicial review of agency rulemaking. Anecdotal statistical evidence has shown that appellate courts are overturning challenged agency rules at rates in excess of 50%. As will be discussed below, CRS has commissioned a study to determine the accuracy of such claims. Whatever the result of the study, important questions may be raised: Is it appropriate for Congress to consider statutorily modifying the "reasonable decisionmaking standard" now prevailing, or to limit judicial preview of rulemaking by, for example, having all "major" rules come to Congress and be subject to joint resolutions of approval? These are among a myriad of process, procedure, and practices issues that could be addressed by a revived ACUS.

Hearings

Since 2004, the Subcommittee has held a series of hearings in anticipation of and as part of the Project. Following its May 20, 2004 oversight hearing on the proposed reauthorization of ACUS, at which Justices Scalia and Breyer testified, the Subcommittee conducted a second hearing on ACUS that examined further reasons why there is a need to reactivate ACUS. On November 1, 2005, the Subcommittee held a hearing on the status of the Project. In 2006, the Subcommittee held three hearings. The first, in March, 2006, focused on the Congressional Review Act in light of the Act's tenth anniversary. The second dealt with how the Regulatory Flexibility Act (RFA) has been implemented since its enactment in 1980 and whether proposed legislation, such as H.R. 682, the Regulatory Flexibility Improvement Act, would adequately address certain perceived weaknesses in the RFA. Finally, on July 14, 2006, the Subcommittee held a hearing on the 60th Anniversary of the passage of the Administrative Procedure Act (APA), addressing the question of whether the APA is still effective in the 21st century.

Symposia

In addition to conducting hearings, the Subcommittee to date has sponsored three symposia as part of the project. The first symposium, held on December 5, 2005, "E-Rulemaking in the 21st Century," dealt with Federal E-Government initiatives. This program, chaired by Professor Cary Coglianese, examined the Executive Branch's efforts to implement e-rulemaking across the federal government. A particular focus of this program was the ongoing development of a government-wide Federal Docket Management System (FDMS). Presentations at the symposium were given by government managers involved in the development of the FDMS as well as by academic researchers studying e-rulemaking. Representatives from various agencies, including the Office of Management and Budget (OMB), the U.S. Environmental Protection Agency, and the GAO, discussed the current progress of e-rulemaking. In addition, academics reported on current and prospective research endeavors dealing with certain aspects of e-rulemaking. The program offered a structured dialogue that addressed the challenges and opportunities for implementing e-rulemaking, the outcomes achieved by e-rulemaking to date, and strategies that could be used in the future to improve the rulemaking process through application of information technology.

On May 9, 2006, the Center for the Study of Rulemaking at American University hosted a day-long conference for the Subcommittee entitled "The Role of Science in the

Rulemaking.” The four panels – “The Office of Management and Budget’s Recent Initiatives on Regulatory Science,” “Science and Judicial Review of Rulemaking,” “Science Advisory Panels and Rulemaking,” and “Government Agencies’ Science Capabilities” – reflected the current debate over whether “sound science” has been given sufficient weight in the development of regulatory standards. As part of that debate, questions have been raised about the quality of the data that are used in developing proposed and final rules, the use of peer review panels as part of the process to ensure quality, and the role that risk assessment can or should play in deciding what to regulate and at what levels.

On September 11, 2006, the Congressional Research Service, on behalf of the Subcommittee, sponsored a day-long seminar entitled “Presidential, Congressional, and Judicial Control of Agency Rulemaking,” consisting of four panels of academics, government officials and private sector public interest groups that addressed “Conflicting Claims of Congressional and Executive Branch Legal Authority Over Rulemaking,” “Judicial Review of Rulemaking,” “Congressional Review of Rulemaking,” and “Presidential Review of Rulemaking: Reagan to Bush II.”

Empirical Studies

Three empirical studies were initiated by CRS. The first, conducted by Professor William West of the Bush School of Government and Public Service at Texas A&M University, studied how agencies develop proposed rules, with a particular emphasis on how rulemaking initiatives are placed on regulatory agendas; how the rulemaking process is managed at inter and intra-agency levels; and how public participation and transparency factor in the pre-notice and comment phase of rule formulation. Professor West presented his findings and conclusions at your March 30, 2006 hearing.

A second study commissioned by CRS sought to fill the void created by the absence of an authoritative, systematic empirical analysis of the effects of judicial review of agency rulemaking by federal appellate courts. Professor Jody Freeman of the Harvard Law School agreed to conduct the study which will analyze the pertinent rulings of all federal circuit courts of appeal from 1995 to 2004 to determine the rate at which rules are invalidated in whole or in part, and the reasons for those invalidations. Professor Freeman’s study is still on-going.

A third study arose out of a discussion during the panel on the role of science advisory bodies in agencies at the Science and Rulemaking symposium when it became apparent that there was no authoritative compilation of how many science advisory committees currently exist in the agencies, how they were selected, how issues of neutrality and conflicts of interest were handled, how issues are selected for review, and the impact of advisory body recommendations on agency decisionmaking. CRS commissioned such a study to be conducted by Professor Stuart Brettschneider of the Maxwell School of Public Administration of the Syracuse University. The study is expected to be completed by June, 2007.

The Congressional Review Act (CRA)

As I detailed in my testimony before this Subcommittee in its March 30, 2006, hearing on the tenth anniversary of the passage of the CRA, Congress’s objective of setting in place an effective mechanism to keep it informed about the rulemaking activities of federal agencies and to allow for expeditious congressional review, and possible nullification of particular rules, apparently has not been met. Statistically, to date, over 43,000 rules have

been reported to Congress, including over 630 major rules, and only one, the Department of Labor's ergonomics standard, was disapproved in March, 2001. Many analysts believe that the negation of the ergonomics rule was a singular event, not likely soon to be repeated. Witness at the hearing pointed to structural defects in the mechanism, most prominently the lack of a screening mechanism to identify rules that warranted review and an expedited consideration process in the House that complemented the Senate's procedures, as well as numerous interpretive uncertainties of key statutory provisions, that served to deter use of the mechanism.

One witness, Todd Gaziano of the Heritage Foundation, while agreeing with the structural critique, suggested that the law's presence, and the threat of the filing of a joint resolution of disapproval, has had a degree of influence that should not be ignored. He argued, however, that the framers of the legislation anticipated that the mechanism would provide an incentive for legislators to insist on institutional accountability as a response to criticisms that Congress had been delegating vast amounts of lawmaking authority to executive agencies without maintaining countervailing checks on the exercise of that authority. There was agreement among the witnesses that the establishment of a joint congressional committee that would screen rules and recommend action to jurisdictional committees in both Houses would provide the coordination and information necessary to inform the bodies sufficiently and in a timely manner to take appropriate legislative actions. The balanced nature of such a joint committee and its lack of substantial authority appeared to provide a way to allay political concerns regarding "turf" intrusions. The House Parliamentarian, John v. Sullivan agreed that such a joint committee was a viable construct.

A further question raised at the March hearing, and again at the panel discussion on the CRA at the September 11, 2006, symposium, was whether it was necessary to have all rules reported and reviewed. It was suggested that only "major" rules need be reported, which would save legislative time and money. There was no consensus among the panelists as to who and or how, "major rule" would be defined. There was agreement among the panelists that a non-substantive advisory joint committee would be a valuable screening mechanism, but not the same unanimity with respect to an expedited House consideration procedure. Former House Parliamentarian Charles Johnson explained that it was likely that the lack of a parallel House expedited procedure in the CRA was purposeful. He explained that the House leadership believes that the House is a majoritarian institution and that expedited procedures undermines majority.

One panelist, Professor Jack Beermann, expressed the view that making it easier for Congress to overturn an agency rule may come at a high political cost. He asked "Does Congress want to be in the position where [it is perceived that] everything an agency does is their responsibility since they've taken it on and reviewed it under this mechanism?... Do they want to have that perception? He concluded that "I think that this may just increase the blaming opportunities for Congress." Professor Beermann also stated the belief, similar to that expressed by Todd Gaziano, that the current CRA has the effect forcing the executive to negotiate, which is a satisfactory result.

Proponents of the CRA concept argue that it reflects a congressional recognition of the need to enhance its own political accountability and thereby strengthen the perception of legitimacy and competence of the administrative rulemaking process. It is also said to rest on understanding that broad delegations of rulemaking authority to agencies are necessary and appropriate and will continue for the indefinite future. The Supreme Court's most recent rejection in 2001 in the *Whitman* case of an impending revival of the non-delegation doctrine adds impetus for Congress to consider several facets and ambiguities of the current

mechanism. Absent effective congressional review, it is argued, current instances of avoidance of notice and comment rulemaking, lack of full reporting of covered rules under the CRA, and increasing presidential control over the rulemaking process will likely continue.

Let me conclude by observing that much of the Administrative Law Project has an important constitutional dimension, raising the crucial question of where ultimate control of agency decisionmaking authority lies in our constitutional scheme of separated but balanced powers. The tensions and conflicts in this scheme were well brought forth in CRS' symposium on presidential, congressional and judicial control of agency rulemaking. There can be little doubt as to Congress' authority to make the determinative decisions with respect to the wisdom of any particular agency rulemaking and to prescribe the manner in which the review shall be conducted. Whether or not to do so is a political decision, a hard one with many practical consequences.

Mr. CANNON. The Chair would like to recognize Mr. Coble, the gentleman from North Carolina, who has joined us, and also the gentleman from Massachusetts Mr. Delahunt.

In deference to your experience, we went beyond the 5-minute rule. When we made that decision, we had only a couple of us here, but if I could remind the other two questions—we will probably have time for questioning, but I would like to have the panel to have the opportunity to question, so I will probably tap at 5 minutes.

Thank you, Mr. Rosenberg.

And Dr. Copeland, you are now recognized.

TESTIMONY OF CURTIS COPELAND, PH.D., SPECIALIST IN AMERICAN NATIONAL GOVERNMENT, CONGRESSIONAL RESEARCH SERVICE, WASHINGTON, DC

Mr. COPELAND. Thank you very much.

Mr. Chairman, Members of the Subcommittee, thank you for inviting me here today to discuss the Administrative Law Project. My testimony will focus on three elements of that project, the Presidential review of rulemaking, the utility of regulatory analysis requirements and the role of science in the regulatory process.

During the past 25 years, the epicenter of Presidential review has been a small office within OMB, the Office of Information and Regulatory Affairs, or OIRA. OIRA's role in reviewing agency rules has changed with the changes in the Presidency. The current Bush administration has reasserted OIRA's gatekeeper role that was prominent during the Reagan administration.

Although OIRA's reviews have become somewhat more transparent in recent years, it is still far from a transparent process. For example, OIRA has said that it has its greatest impact before rules are formally submitted to it for review, but has instructed agencies not to disclose those changes to the public.

OIRA also remains highly controversial. Some public interests groups assert that OIRA review has been a one-way ratchet that only weakens and delays rules, while business groups contend that OIRA has not been assertive enough in reining in agencies.

A number of very interesting studies have recently examined the impact that OIRA has on rulemaking, but many issues remain that either Congress or ACUS may want to address. Those issues include whether Congress should codify Presidential review, whether independent regulatory agencies' rules should be subject to review, and what rules should govern OIRA's contacts with outside parties during the review process.

OIRA also has been a key player in implementing regulatory analysis requirements established by Congress and the President. Many of those requirements were developed in the 1980's and '90's in an effort to ensure that the benefits of regulation were worth the compliance cost. For example, before publishing any proposed or final rule, the Regulatory Flexibility Act of 1980 requires agencies to prepare an analysis describing the rule's effects on small businesses and what efforts the agency took to avoid those effects.

The Unfunded Mandates Reform Act of 1995 has similar requirements to protect the interests of State and local governments. Executive Order 12866 requires covered agencies to prepare a cost/

benefit analysis for any rule having a \$100 million impact on the economy. However, numerous studies indicate that these requirements have often been less effective than their advocates have hoped. For example, agencies can avoid a reg flex analysis if they certify that the rule in question does not have a “significant economic impact” on a “substantial number of small entities.” And agencies have certified rules, even when they cost businesses thousands of dollars each year in compliance costs.

In other cases, new requirements have been linked to old ones that have been viewed as ineffective. For example, the requirements that agencies develop compliance guides to help businesses and others comply with the regulations and that agencies reexamine their rules every 10 years are not triggered if the agency certifies those rules don’t have a significant impact on small entities.

After more than 25 years of experience with these analytic requirements, we know surprisingly little about their effectiveness or how they can be improved. Issues that Congress or ACUS could explore include the extent to which the requirements contribute to what is called the “ossification” of the rulemaking process; the accuracy of agency’s prerule estimates of cost and benefits; and whether the myriad of requirements should be made consistent and codified in one place.

The role of science in rulemaking has become highly controversial in recent years, with observers from both the left and the right suggesting that “sound science” has been given insufficient weight in the development of regulatory standards. The May 2006 symposium that Mort mentioned on this topic featured panelists discussing such issues as the role of science advisory panels, science and judicial review, and Government agencies’ capabilities. A panel that I moderated focused on OIRA’s recent science-related initiatives, including recent bulletins on peer review and risk assessment.

While OIRA’s peer review bulletin was initially very controversial, with some science groups and others asserting that it could make peer review vulnerable to political manipulation or controlled by regulated entities. As a result of those concerns, OIRA later published a substantially revised version of the bulletin that gave agencies more discretion, while reserving some for itself.

OIRA’s January 2006 proposed bulletin on risk assessment is currently undergoing peer review by the National Academy of Sciences. In May 2006, nine Federal agencies testified at a public meeting on that bulletin. Some agencies said that the scope of this risk assessment bulletin is so broad that doctors and the public may not receive timely warnings about potential health risks posed by medical devices and drugs like Vioxx. Other agencies were more supportive of the risk bulletin, but still proposed certain changes.

Possible areas for further research in this area include whether the Information Quality Act should be amended to provide for judicial review, how advisory panels can be constructed to ensure that they’re unbiased, and whether governmentwide standards for peer review and risk assessment are needed and working as intended. Objective and rigorous examinations of all of these administrative law issues by Congress or ACUS could prove to be a wise investment in the long term.

Mr. Chairman, that concludes my prepared statement. I'd be happy to answer any questions.

Mr. CANNON. Thank you, Dr. Copeland.

[The prepared statement of Mr. Copeland follows:]

PREPARED STATEMENT OF CURTIS W. COPELAND

Statement of Curtis W. Copeland
Specialist in American National Government
Congressional Research Service

Before

The Committee on the Judiciary
Subcommittee on Commercial and Administrative Law
House of Representatives

November 14, 2006

on

“The Administrative Law, Process, and Procedure Project”

Mr. Chairman and Members of the Subcommittee:

I am pleased to be here today to discuss this Subcommittee's bipartisan “Administrative Law, Process, and Procedure Project” and our work during the past two years related to that project. As my colleague Mort Rosenberg mentioned, an underlying theme in many of the comments and recommendations received related to those projects has been that the newly reauthorized Administrative Conference of the United States (ACUS) should be funded and tasked with addressing many of these kinds of topics. The projects also yielded numerous issues that Congress may want to address. My testimony today will focus on three elements of the administrative law project — presidential review of agency rulemaking, the utility of regulatory analysis and accountability requirements, and the role of science in the regulatory process — and will highlight some of the issues identified for ACUS or for Congress.

Presidential Review of Agency Rulemaking

At the September 11, 2006, symposium on “Presidential, Congressional, and Judicial Control of Rulemaking” that CRS sponsored for this Subcommittee, there was a great deal of discussion about whether Congress or the courts or the President actually controls agency rulemaking behavior.¹ At the conclusion of the day, the consensus seemed to be that, on a

¹ The transcripts of this symposium are available online at the website for the Center for the Study (continued...)

day-to-day basis, the President has far more control than either of the other branches. During the past 25 years, the epicenter of presidential control has been the Office of Information and Regulatory Affairs (OIRA) within the Office of Management and Budget. Although created by the Paperwork Reduction Act of 1980 and periodically tasked by Congress with other statutory responsibilities, OIRA is located within the Executive Office of the President and reviews hundreds of agency regulations each year before they are published to ensure that the President's policies are implemented. In a sense, therefore, OIRA embodies the tension between presidential and congressional control.

I moderated a panel at the September 11 symposium on "Presidential Review of Rulemaking: Reagan to Bush II." One of the participants on that panel was Sally Katzen, currently a professor of law at George Mason University who was administrator of OIRA from 1993 to 1998 during the Clinton Administration. As Professor Katzen pointed out, all presidents since President Nixon have called for some form of centralized review in order to, as she put it, "get their hands around agency rulemaking." The genesis of the current form of centralized presidential review is traceable to President Reagan's Executive Order 12291 in 1981, which tasked the newly-created OIRA with reviewing all agency rules except those from independent regulatory commissions — several thousand per year.² In 1985, President Reagan extended OIRA's influence over rulemaking even further by issuing Executive Order 12498, which required covered agencies to submit a "regulatory program" to OMB each year listing all of their significant regulatory actions underway or planned.³ As a result, any rule submitted to OIRA for review that had not been previously identified could be returned to the agency for "reconsideration."

The expansion of OIRA's authority in the rulemaking process via these executive orders was highly controversial. Some voiced concerns that OIRA's role violated the constitutional separation of powers and could affect public participation and the timeliness of agencies' rules.⁴ Some believed that OIRA's new authority displaced the discretionary authority of agency decision makers in violation of congressional delegations of rulemaking authority, and that the President exceeded his authority in issuing the executive orders. Others indicated that OIRA did not have the technical expertise needed to instruct agencies about the content of their rules. Still other concerns focused what was viewed as a lack of transparency of the review process. Professor Katzen said that during the Reagan era and, to a certain extent, during the Bush I era, OIRA was "a big black hole" where regulations went in and the public didn't know what happened. She also said OIRA was generally known as a group of "lean, mean junkyard dogs" who required agencies to make the changes that it wanted, and emphasized reducing regulatory costs over all other goals.

See also Morton Rosenberg, "Beyond the Limits of Executive Power: Presidential Control of Agency Rulemaking Under Executive Order 12291," *Michigan Law Review*, vol. 80 (Dec. 1981), pp. 193-247.

When President Clinton took office and Sally Katzen became head of OIRA in 1993, she said they wrote Executive Order 12866 to make several basic changes in the presidential review process.⁵ For example, under this executive order, OIRA only reviews “significant” rules from the covered agencies, reducing the number of rules reviewed from several thousand to about 600 per year. The new executive order also improved the transparency of OIRA’s reviews by, for example, requiring agencies to disclose the changes made as a result of OIRA’s review. Other changes included reaffirming the “primacy” of the agencies in the rulemaking process (since, she argued, they possess the subject matter expertise and experience) and recognizing that non-quantifiable costs and benefits are essential to consider. In essence, Professor Katzen said, OIRA adopted a more cooperative and friendly approach to the agencies than had been the case during the Reagan and first Bush Administrations.

When the current President Bush took office in 2001, and particularly after John Graham became OIRA administrator in July of that year, OIRA’s role in presidential review changed again — even though the pertinent executive order stayed the same. OIRA’s role as “gatekeeper” or watchdog returned, and with it came an increased emphasis on economic analysis and an increase in letters from OIRA returning rules to the agencies for their “reconsideration.” OIRA also ventured into several new areas, publishing bulletins in the last three years on peer review practices, agencies’ use of guidance documents, and risk assessment procedures. OIRA became somewhat more transparent during John Graham’s nearly five-year tenure, disclosing meetings with outside parties about rules whenever they occurred and publishing on the Office’s website the status of all rules under review. However, OIRA still contends that the changes that it recommends to agencies before the formal review process begins (when OIRA says it has its greatest impact) should not be disclosed to the public. Also, although OIRA reveals its meetings with outside parties, the lists provided sometimes make it difficult to know what rule is being discussed or who the outside parties actually represent.

In the last several years, several scholars have attempted to assess the actual impact that OIRA has on rules.⁶ While some of these studies are interesting and quite good, to really understand OIRA’s effects, researchers must go rule-by-rule and examine the evidence provided in rulemaking dockets. One such study that the General Accounting Office (GAO, now Government Accountability Office) completed three years ago revealed that OIRA frequently suggested only minor changes to rules, but had a much more significant impact on certain types of rules — most notably rules submitted to OIRA from the Environmental Protection Agency’s (EPA) air and water programs and the Federal Aviation Administration.⁷ For example, at OIRA’s recommendation, EPA removed manganese from a list of hazardous wastes, deleted certain types of engines from coverage of a rule setting emissions standards, and delayed the compliance dates for two other types of emissions.

⁵ Executive Order 12866, “Regulatory Planning and Review,” 58 *Federal Register* 51735, Oct. 4, 1993. To view a copy of this order, see [<http://www.whitehouse.gov/omb/inforeg/eo12866.pdf>].

⁷ U.S. General Accounting Office, *Rulemaking: OMB’s Role in Reviews of Agencies’ Draft Rules and the Transparency of Those Reviews*, GAO-03-929, Sept. 2003.

GAO also reported that, in several of these cases, OIRA recommended what business interest groups had suggested during their previous meetings with OIRA.

Although the nature of OIRA's review has clearly changed substantially during the past 25 years, there is little if any continued questioning of the legality of centralized presidential review. Many rulemaking agencies recognize that OIRA review can add value because it brings a different perspective to the rulemaking process and can, by its very presence, prevent bad ideas from becoming rules. However, many public interest groups do question whether centralized review is a good idea, arguing that OIRA review has usually been a "one-way ratchet" that weakens, not strengthens, rules; that it is still highly secretive and delays the issuance of rules; and that OIRA reviewers have caused agencies to issue rules that are inconsistent with their statutory mandates. Business groups, on the other hand, have argued that OIRA has not been assertive enough, and that agencies still control the rulemaking process to an unwarranted degree.

Unresolved Issues. Several issues regarding presidential review remain unresolved. For example:

- Should Congress codify presidential review of agency rulemaking? If so, how detailed should that codification be? For example, it might simply authorize the President to issue an executive order on this issue (thereby giving future Presidents the flexibility to change its provisions), with certain other requirements for transparency and limits on delay. Or should a codification spell out in detail the process by which Presidents should review rules before they are published? What are the policy implications of codification?
- Should independent regulatory agencies' rules be subject to presidential review? Or would presidential review adversely affect the independence intended for these agencies?
- What rules should govern OMB's contacts with outside parties during the presidential review process? For example, should OMB be allowed to meet with regulated entities outside of the period when agencies are not permitted to do so? Should OMB be required to disclose to the public not only that such a meeting occurred, but also a summary of what was said (as some agencies are required to do) in order to provide an administrative record for any subsequent changes?
- Are improvements in review transparency currently needed (either administratively or by statute)? For example, should agencies or OIRA be required to disclose substantive changes made to rules during "informal" reviews (when OMB says it can have its greatest effect)?
- Does OIRA have the legal authority to promulgate requirements or even guidelines regarding agencies' use of peer reviews, risk assessments, or guidance documents?
- Is presidential review of rules cost effective? Is there any way to objectively measure the benefits that OIRA review provides?

- Should OIRA's funding and staffing be increased, decreased, or stay the same? If increased, is there evidence that doing so would yield substantial returns on investment?

Regulatory Analysis and Accountability Requirements

Regulatory analysis and accountability requirements vary considerably with regard to their sources, their content, and their effectiveness. Some of these requirements are traceable to the presidential reviews that I just discussed, while others have their roots in statute. The "grandfather" of these requirements, and the foundation for most of them, is the Administrative Procedure Act (APA) of 1946 (5 U.S.C. 551 *et seq.*) which generally requires that agencies publish their proposed rules in the *Federal Register*, receive and consider comments on the proposed rules, and then publish a final rule stating its basis and purpose. Because my colleague T.J. Halstead is covering the APA and public participation issues in his testimony, I will only note that the word "generally" in my previous sentence is important here. A 1998 GAO study indicated that about half of all final rules were published without an opportunity for prior public comment, with agencies often invoking the "good cause" exception that allows them to avoid publishing a proposed rule for comment if the agency concludes it is "impracticable, unnecessary, or not in the public interest."⁸ While many of these final rules were on relatively minor issues, some were "significant" rules under Executive Order 12866, and some had at least a \$100 million impact on the economy.

Between 1946 and 1980, Congress established dozens of federal agencies and programs designed to improve the environment, make workplaces safer, and protect consumers. Subsequently, an array of federal economic, environmental, and social regulations were put in place that affected many of the decisions made by American businesses. Strong concerns then began to be raised about whether the benefits that these regulations and regulatory agencies were attempting to achieve were worth the costs associated with compliance. Concerns were also being raised about the cumulative effects of all federal regulations on individual businesses, and the effects that federal rules were having on particular segments of the economy (e.g., small businesses), and on other levels of government.

Congressional Initiatives. Since 1980, Congress has reacted to these concerns by establishing analytical and/or accountability requirements as part of the rulemaking process. These requirements have a variety of purposes, including the protection of certain interests from unnecessary regulatory burden, increased control over rulemaking agencies, and ensuring that the rules issued focus on issues of real public concern in as efficient and effective manner possible. Statutory initiatives imposing these requirements include the (1) the Regulatory Flexibility Act (RFA) of 1980 (5 U.S.C. 601-612), (2) the Paperwork Reduction Act (PRA) of 1980 (44 U.S.C. 3501-3520), (3) the Unfunded Mandates Reform Act (UMRA) of 1995 (2 U.S.C. 1532-1538), and the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA). Although these regulatory requirements clearly have had an effect on agency actions, many of them do not appear to have been as effective as their advocates had hoped.

⁸ U.S. General Accounting Office, *Federal Rulemaking: Agencies Often Issued Final Actions Without Proposed Rules*, GAO/GGD-98-126, Aug. 31, 1998.

For example, the Regulatory Flexibility Act requires federal agencies to assess the impact of their forthcoming regulations on “small entities” (e.g., small businesses and small governments), and requires that analysis to describe, among other things, (1) the reasons why the regulatory action is being considered; (2) the small entities to which the proposed rule will apply and, where feasible, an estimate of their number; (3) the projected reporting, recordkeeping, and other compliance requirements of the proposed rule; and (4) any significant alternatives to the rule that would accomplish the statutory objectives while minimizing the impact on small entities. However, the RFA’s analytical requirements are not triggered if the head of the issuing agency certifies that the proposed rule would not have a “significant economic impact on a substantial number of small entities.” The RFA does not define “significant economic impact” or “substantial number of small entities,” thereby giving federal agencies substantial discretion regarding when the act’s analytical requirements are triggered. A 2000 GAO study determined that EPA certified virtually all of its rules as not needing an RFA analysis, even rules that impose thousands of dollars of compliance cost on thousands of small entities.⁹ Also, the RFA’s analytical requirements do not apply to final rules for which the agency does not publish a proposed rule, and agencies do not have to consider the cumulative impact of their rules in making analytical determinations under the act. Finally, the courts have said that the act does not require the analysis with regard to indirect effects on small entities.¹⁰ GAO has examined the implementation of the RFA several times within the past 10 to 15 years, and a recurring theme in GAO’s reports is the varying interpretation of the RFA’s requirements by federal agencies.¹¹

Other statutory requirements also appear to have fallen short of proponents’ expectations. For example, section 202 of the Unfunded Mandates Reform Act requires agencies to prepare “written statements” containing, among other things, estimates of future compliance costs and any disproportionate budgetary effects “if and to the extent that the agency in its sole discretion determines that accurate estimates are reasonably feasible and that such effect is relevant and material.” The statute gives agencies the same discretion regarding estimates of the effects of their rules on the national economy. Therefore, an agency can avoid these estimates if, in its sole discretion, it considers them inaccurate, unfeasible, irrelevant, or immaterial. Likewise, section 203 of UMRA requires agencies to develop plans to involve small governments in the development of regulatory proposals that have a “significant or unique” effect on those entities. Therefore, an agency that concludes that a rule’s effect on small governments will not be “significant” or “unique” can avoid this requirement. When GAO examined the implementation of UMRA in 1998, it concluded that the act had little effect on agency rulemaking, due largely to statutory exemptions.¹² The act did not cover most of the rules that GAO examined with a \$100 million impact on the economy, and when a rule was covered, UMRA did not require the agency to do much more

¹¹ See, for example, U.S. General Accounting Office, *Regulatory Flexibility Act: Agencies’ Interpretations of Review Requirements Vary*, GAO/GGD-99-55, April 2, 1999; U.S. General Accounting Office, *Regulatory Flexibility Act: Implementation in EPA Program Offices and Proposed Lead Rule*, GAO/GGD-00-193, Sept. 20, 2000.

¹² U.S. General Accounting Office, *Unfunded Mandates: Reform Act Has Had Little Effect on Agencies’ Rulemaking Actions*, GAO/GGD-98-30, Feb. 4, 1998.

than it was already required to do under other statutes and executive orders. GAO reached a similar conclusion in its 2004 examination of UMRA's implementation.¹³ While critics deride this situation as regulatory reform ineffectiveness, others contend that Congress had good reason to entrust this amount of discretion to the agencies.

Some reforms have been related to or built on other reforms with some of the above-mentioned issues. For example, the "look back" requirements in section 610 of the RFA (mandating that agencies review certain rules within 10 years of their issuance) are triggered when the rulemaking agency determines that a rule has a "significant economic impact on a substantial number of small entities."¹⁴ As mentioned previously, some agencies certify almost all of their rules as not having that level of impact, so they can avoid section 610's requirements (as well as the analytic requirements in the RFA). For this and other reasons (e.g., a lack of clarity regarding key terms), studies of agencies' implementation of section 610 have consistently indicated that few of the required look-back reviews appear to be conducted.¹⁴

Section 212 of SBREFA requires agencies to publish one or more compliance guides for each rule or group of related rules for which the agency is required to prepare a final regulatory flexibility analysis under the RFA. Therefore, if the agency concludes that the final rule would not have a "significant" impact on a "substantial" number of small entities, the agency is not required to prepare a compliance guide. Agencies are given "sole discretion" in the use of plain language in the guides, and the statute does not indicate when the guides must be developed or how they must be published. Therefore, under section 212, an agency might develop a compliance guide years after a final rule is published with no input from small entities. In 2001, GAO reviewed agencies' implementation of section 212 and concluded that the requirement did not appear to have had much of an impact on agencies' rulemaking actions.¹⁵

Presidential Initiatives. In addition to these and other congressionally-established requirements, each President within the past 35 years has required some form of regulatory analysis before rules are published in the *Federal Register*. In addition to establishing OIRA review of rules, President Reagan's Executive Order 12291 generally required covered agencies to prepare a "regulatory impact analysis" for each "major" rule, which was defined as any regulation likely to result in (among other things) an annual effect on the economy of \$100 million. Those analyses were required to contain a description of the potential benefits and costs of the rule, a description of alternative approaches that could achieve the regulatory goal at lower cost (and why they weren't selected), and a determination of the net benefits of the rule.

These analytical requirements remained in place until September 1993, when President Clinton issued Executive Order 12866. This executive order, which is still in effect,

¹⁴ CRS Report RL32801, *Reexamining Rules: Section 610 of the Regulatory Flexibility Act*, by Curtis W. Copeland; General Accounting Office, *Regulatory Flexibility Act: Agencies Interpretations of Review Requirements Vary*, GAO/GGD-99-55, April 2, 1999.

¹⁵ U.S. General Accounting Office, *Regulatory Reform: Compliance Guide Requirement Has Had Little Effect on Agency Practices*, GAO-02-172, Dec. 28, 2001.

established analytical requirements that are similar (although not identical) to those it replaced. For example, the order requires a cost-benefit analysis for all “economically significant” rules (essentially the same as “major” rules under Executive Order 12291) containing an assessment of the anticipated costs and benefits of the regulatory action and an assessment of the costs and benefits of alternatives to the regulatory action (with an explanation of why the planned action is preferable).

Researchers have examined agencies’ economic analyses of rules under Executive Order 12866 and related guidance documents, and several of those studies indicated that the agencies’ analyses are not always consistent with the requirements in the order or the guidance.¹⁶ For example, in 1998 GAO reported that some of the 20 economic analyses that it examined did not discuss alternatives to the proposed regulatory action and, in many cases, it was not clear why the agencies used certain assumptions.¹⁷ Five of the analyses did not discuss uncertainty associated with the agencies’ estimates of benefits or costs or document the agencies’ reasons for not doing so. GAO has also examined the cost-benefit analyses for particular rules, and often found them lacking in some of the same ways.¹⁸ Other studies have criticized agencies for not providing quantitative information on net benefits in their analyses.¹⁹ Still other studies have examined the accuracy of agencies’ regulatory cost estimates, often concluding that costs are overestimated.²⁰ OMB reviewed the literature on *ex ante* cost and benefit estimates, and concluded that federal agencies tend to overestimate both benefits and costs.²¹

In addition to studies examining the implementation of cost-benefit and other rulemaking requirements, a large body of literature has developed debating the very notion of subjecting agencies’ rules to these analytical requirements. Those supporting the use of these analytical methods view cost-benefit analysis as a helpful and neutral tool in regulatory

¹⁶ See, for example, Richard D. Morgenstern, ed., *Economic Analyses at EPA: Assessing Regulatory Impact* (Washington: Resources for the Future, 1997); and Robert W. Hahn, ed., *Risks, Costs, and Lives Saved: Getting Better Results from Regulation* (Washington: AEI Press, 1996).

¹⁸ U.S. Government Accountability Office, *Clean Air Act: Observations on EPA’s Cost-Benefit Analysis of Its Mercury Control Options*, GAO-05-252, Feb. 28, 2005. GAO concluded that EPA did not, among other things, consistently analyze available options or provide estimates of the costs and benefits of each option.

¹⁹ See, for example, Robert W. Hahn and Patrick Dudley, *How Well Does the Government Do Cost-Benefit Analysis?*, Working Paper 04-01 (Washington: AEI-Brookings Joint Center for Regulatory Studies, Jan. 2004).

²⁰ For a summary of this literature, see Winston Harrington, Richard D. Morgenstern, and Peter Nelson, “On the Accuracy of Regulatory Cost Estimates,” *Journal of Policy Analysis and Management*, vol. 19 (2000), pp. 297-322. See also (former EPA Administrator) William K. Reilly, “The EPA’s Cost Underruns,” *Washington Post*, Oct. 14, 2003, p. A-23, which said “a review of some of the major regulatory initiatives overseen by the EPA since its creation in 1970 reveals a pattern of consistent, often substantial overestimates of their economic costs.”

²¹ U.S. Office of Management and Budget, Office of Information and Regulatory Affairs, *Validating Regulatory Analysis: 2005 Report to Congress on the Costs and Benefits of Federal Regulations and Unfunded Mandates on State, Local, and Tribal Entities*, pp. 41-52, available at [http://www.whitehouse.gov/omb/infoereg/2005_cb/final_2005_cb_report.pdf].

decisionmaking.²² They contend that some type of cost-benefit balancing takes place during the rulemaking process anyway, and that the formal analysis simply makes that balancing (with the associated data and assumptions) more explicit, systematic, and rigorous. Furthermore, they argue that putting as accurate a dollar value on costs and benefits as possible makes decisions regarding whether and how to regulate easier and more rational. As one author stated, “[m]onetizing risk and environmental benefit does not devalue these outcomes, but rather gives them real economic value when the effects might otherwise be ignored.”²³

Others, however, assert that cost-benefit analysis is inherently flawed and biased against regulation.²⁴ For example, they assert that because regulatory benefits are generally more difficult to measure in dollar terms than regulatory costs, cost-benefit analysis is not carried out on a level playing field. Measurement of the benefits associated with health, safety, and environmental rules often requires an assessment of risk (e.g., how many people would get sick or die in the absence of the regulatory intervention) and a monetization of the associated benefits (i.e., placing a dollar value on the lives saved or illnesses prevented). These steps frequently involve significant methodological and ethical difficulties. Data are frequently not available to measure regulatory risks precisely, and using “willingness to pay” models to determine the values to assign to health effects is highly controversial. Critics of cost-benefit analysis also contend that regulatory cost data are often provided by regulated entities, who have an incentive to inflate those costs in order to influence agencies not to issue the rules. Other criticisms focus on the use of “discount rates” that reduce the value of future benefits to current dollars, and the “distributional” effects that are not often considered in such analyses. Finally, these critics suggest that although executive orders and statutes often indicate that non-monetized benefits must be considered as part of the rule development process, there is a natural tendency to discount or disregard non-monetized benefits. Still other critics assert that regardless of whether cost benefit analysis is neutral in concept, it is not neutral in effect, tending to result in the promulgation of fewer and weaker rules.²⁵

Areas for Possible Further Research. In addition to the analytical requirements discussed above, a variety of other efforts have been made by Congress or Presidents to constrain agency rulemaking, including moratoriums on new rulemaking at the start of new presidential administrations, efforts to establish regulatory “accounting” mechanisms (which could pave the way to the establishment of a “regulatory budget”), the establishment of “advocacy review panels” at the start of certain EPA and OSHA rules, and attempts to limit the impact of rules on federalism and on individual privacy. After more than 25 years of experience with these various requirements, we know surprisingly little about their effectiveness or, where effectiveness is suspect, how they can be improved. Issues that Congress, ACUS, or both might explore in this area include the following:

²² See, for example, Cass R. Sunstein, *The Cost-Benefit State: The Future of Regulatory Protection* (Chicago: American Bar Association, 2002).

²³ W. Kip Viscusi, “Monetizing the Benefits of Risk and Environmental Regulation,” *Fordham Urban Law Journal*, vol. 33 (May 2006), p. 1003.

²⁴ See, for example, Lisa Heinzerling and Frank Ackerman, *Pricing the Priceless: Cost-Benefit Analysis of Environmental Protection* (Washington: Georgetown University, 2002).

²⁵ David M. Driesen, “Is Cost-Benefit Analysis Neutral?,” *University of Colorado Law Review*, vol. 77 (Spring 2006), pp. 335-404.

- Is cost-benefit analysis inherently biased in that the benefits of health and safety rules are often difficult or impossible to monetize? If not, can steps be taken to ensure that regulatory costs and benefits are fairly and accurately measured?
- Does OMB apply the cost-benefit analysis requirements in Executive Order 12866 and use cost-benefit information in a consistent way? For example, does OMB require all rules to have a cost-benefit analysis, or are certain types of rules or rules from certain agencies (e.g., Homeland Security rules) essentially exempt from these requirements?
- How accurate are agencies' pre-promulgation estimates of regulatory costs and benefits? How much do cost-benefit studies cost? Do cost-benefit requirements pass a cost-benefit test?
- Should Congress or the Administration define key terms in the Regulatory Flexibility Act (e.g., "significant economic impact on a substantial number of small entities")?
- Should agency rules be reexamined periodically to ensure that they are still needed or impose the least burden? If so, who should have that reexamination responsibility?
- Should the myriad of analytical and accountability requirements in various statutes and executive orders be rationalized and codified in one place?
- Have the analytical and accountability requirements contributed to what is called the "ossification" of the rulemaking process?

Role of Science in Rulemaking

On May 9, 2006, the Center for the Study of Rulemaking at American University hosted an all-day conference for this Subcommittee entitled "The Role of Science in Rulemaking." As Neil Kerwin, interim president of American University and director of the Center for the Study of Rulemaking, said in his opening remarks, "rulemaking is the transformation of information into legal obligations and rights. That information takes many forms, but the type of information that contributes most profoundly to a vast swath of rulemaking can be broadly categorized as scientific."

The role of science in rulemaking has become highly controversial in recent years, with observers from both the left and the right of the political spectrum suggesting that "sound science" has been given insufficient weight in the development of regulatory standards. Some assert that closer adherence to science would lessen the burden of unnecessary regulation, thereby lowering regulatory costs. Others argue that science is often trumped by political considerations, and as a result regulatory standards that science suggests are needed do not get developed. As part of that debate, questions have been raised about the quality of data that are used in developing proposed and final rules, the use of peer review panels as part of the process to ensure quality, and the role that risk assessment can/should play in deciding what to regulate and at what levels.

Information Quality Act. The May 2006 symposium featured panels discussing such topics as the role of science advisory panels in the rulemaking process, science and the judicial review of rulemaking, and government agencies' science capabilities. The issues discussed by those panels were too numerous and varied to detail here, but included how advisory panels can be structured to ensure neutral competence and how the courts should treat agencies' science determinations. Another panel focused on OIRA's recent science-related initiatives, and those initiatives were a consistent theme in each of the panel discussions.

The starting point of those OIRA initiatives was an act of Congress — a two-paragraph provision added to the 700-page Treasury and General Government Appropriations Act for Fiscal Year 2001 (P.L. 106-554) that is more commonly known as the "Data Quality Act" or the "Information Quality Act" (IQA) (codified at 44 U.S.C. 3504(d)(1) and 3516). Although little noticed at the time, the IQA has subsequently been the subject of intense debate and controversy. The act required OMB to issue guidance to federal agencies designed to ensure the "quality, objectivity, utility, and integrity" of information disseminated to the public. It also required agencies to issue their own information quality guidelines, and to establish administrative mechanisms that allow affected persons to seek correction of information maintained and disseminated by the agencies that does not comply with the OMB guidance.

Supporters of the IQA contended that it and the resultant OMB and agency guidelines would improve the quality of agency science and regulation and force agencies to regulate based on the best science available. Critics, on the other hand, said that the law was a tool by which regulated parties can slow and possibly stop new health, safety, and environmental standards, and that could lead to the revision or elimination of existing standards. They also contended that the act could have a chilling effect on agency distribution and use of scientific information.

In retrospect, it appears that both of these positions were overstated. OMB has reported that the expected flood of IQA correction requests did not occur (only 85 in the first two years of implementation), and that the correction request process had been used by virtually all sectors of society (albeit primarily by business groups). OMB said "to our knowledge, the (act) has not affected the pace or length of rulemakings," but neither it nor the agencies presented any data on this issue. Finally, OMB noted that most non-frivolous requests were denied because "a reasonable scientist could interpret the available information the way the agency had."²⁶

Recent court decisions indicate that agency denials of information correction requests are not judicially reviewable. For example, on June 21, 2004, a U.S. district court ruled that such terms as "quality," "objectivity," "utility," and "integrity" are not defined in the IQA, and the history of the legislation does not provide any indication as to the scope of these terms. Therefore, absent any "meaningful standard" against which to evaluate the agency's discretion, the Court finds that Congress did not intend the IQA to provide a private cause

²⁶ Office of Management and Budget, *Draft Report to Congress on the Costs and Benefits of Federal Regulations*, p. 50, available at [http://www.whitehouse.gov/omb/inforeg/2005_cb/draft_2005_cb_report.pdf].

of action.”²⁷ On November 15, 2004, the U.S. District Court for the Eastern District of Virginia (Alexandria Division) ruled that the Salt Institute and the Chamber of Commerce lacked standing to sue (e.g., they had suffered no “injury in fact”), and that judicial review of the agency’s decisionmaking was not available. On March 6, 2006, the U.S. Court of Appeals for the Fourth Circuit dismissed the appeal by the Salt Institute and the Chamber of Commerce, agreeing with the district court that the appellants lacked standing because they did not suffer an injury from the published data.²⁸ The Fourth Circuit concluded that the IQA “creates no legal rights in any third parties,” including any right to “information or to correctness.” Therefore, the court argued, “appellants cannot establish injury in fact and, therefore, lack Article III standing to pursue their case in the federal courts.”

At the May 2006 panel discussion on OMB’s science-related initiatives, Bill Kovacs from the U.S. Chamber of Commerce said that, because of these recent court decisions, the IQA is “little more than a nice academic exercise,” and that his organization planned to go back to Congress “to get judicial review provisions put into the law.” In contrast, Rena Steinzor of the University of Maryland School of Law said that the IQA represented the “corpuseularization of science; that is, looking at each piece of scientific evidence very critically, deconstructing every study, questioning each individual piece as opposed to viewing all the scientific evidence together and making a scientific judgment on what the weight of the evidence tells us.” Don Arbuckle, then acting administrator of OIRA, said that OMB believes that the act was “working quite well,” and characterized the IQA and related guidelines as “more of an internal government quality control exercise than a regulation or a law that is challengeable through the judicial branch.” He also said that the guidance places a “hefty data burden of proof on the petitioner,” and was not intended to “give people an easy avenue to criticize government work.”

Peer Review. Another science-related OIRA initiative has been the development of governmentwide standards for peer review of scientific information used in developing agency regulations. OIRA indicated that the bulletin was needed because agencies’ peer review practices were inconsistent, and government-wide standards would make regulatory science more competent and credible. The initial proposed bulletin, published in September 2003, aroused substantial controversy, with some observers expressing concern that it could create a centralized peer review system within OMB that would be vulnerable to political manipulation or control by regulated entities.²⁹ OMB received nearly 200 comments on the proposal, including comments from Members of Congress, trade associations, public interest groups, and recognized experts in the field of peer review and scientific research. At our May 2006 symposium, Al Teich of the American Association for the Advancement of Science said that many scientists concluded that the initial bulletin appeared to be “a means of attacking regulation by attacking the science behind it.”

As a result of these comments, OMB later published a “substantially revised” version of the bulletin that gave agencies more discretion to determine when information required a peer review, and when the more detailed review requirements for “highly influential”

information were applicable. Also, unlike the proposed bulletin, the revised bulletin did not exclude individuals from being peer reviewers if they had received research grants from the agency disseminating the information being peer reviewed. The bulletin essentially requires agencies to (1) have a peer review conducted on all “influential scientific information” that the agency intends to disseminate, (2) have all “highly influential scientific assessments” peer reviewed according to more specific and demanding standards, and (3) indicate what “influential” and “highly influential” information the agency plans to peer review in the future. Although these revisions were generally embraced by the scientific community and others, business groups believed the changes had weakened the bulletin to such an extent that they withdrew their initial support. Still others believed the changes had not gone far enough, asserting that the bulletin was unnecessary and did not appropriately guard against appointment of reviewers with conflicts of interest.

On December 15, 2004, OMB published a final version of the peer review bulletin on its web site.³⁰ OMB said this version reflected “minor revisions” made in response to the public comments on the revised bulletin. For example, the final bulletin requires agencies to disclose the names of peer reviewers to the public and adds an annual reporting requirement to allow OMB to track how agencies are using the bulletin. Agencies are still afforded substantial discretion to determine when and what type of peer review is required. The amount of discretion that agencies actually have in carrying out their peer review programs (or, conversely, the amount of control that OMB retains) will be apparent only through the bulletin’s implementation, and therefore could vary substantially from one administration to another. Certain provisions of the peer review bulletin took effect in June 2005, with other provisions taking effect six months later.

To date, I am unaware of any empirical studies of how this peer review bulletin has been implemented. Nevertheless, the bulletin is likely to have a significant effect on federal rulemaking and other forms of information dissemination and public policy, both directly and indirectly through references to the bulletin by others. For example, section 402 of the “Specialty Crops Competitiveness Act of 2004” (Pub. Law 108-465, signed by the President on Dec. 21, 2004) indicated that a required peer review of the procedures and standards governing the consideration of certain import and export requests “shall be consistent with the guidance by the Office of Management and Budget pertaining to peer review and information quality.”

Risk Assessment. On January 9, 2006, OIRA released a proposed bulletin on risk assessment for comment by the public and for peer review by the National Academy of Sciences (NAS).³¹ The proposed bulletin would, if made final, establish general risk assessment and reporting standards, and establish special standards for “influential” risk assessments by all agencies. Risk assessment is defined in the bulletin as a document that “assembles and synthesizes scientific information to determine whether a potential hazard exists and/or the extent of possible risk to human health, safety, or the environment.” In a regulatory context, risk assessment helps agencies identify issues of potential concern (e.g.,

³⁰ Office of Management and Budget, *Final Information Quality Bulletin for Peer Review*, Dec. 15, 2004, available at [http://www.whitehouse.gov/omb/inforeg/pccr2004/peer_bulletin.pdf].

³¹ Office of Management and Budget, “Proposed Risk Assessment Bulletin,” Jan. 9, 2006, available at [http://www.whitehouse.gov/omb/inforeg/proposed_risk_assessment_bulletin_010906.pdf].

whether exposure to a given risk agent causes effects such as cancer, reproductive and genetic abnormalities, or ecosystem damage); select regulatory options; and estimate a forthcoming regulation's benefits. OMB said that "there is general agreement that the risk assessment process can be improved, and said the purpose of the bulletin is "to enhance the technical quality and objectivity of risk assessments prepared by federal agencies by establishing uniform, minimum standards."

Although characterized as "guidance" in the document's summary, the narrative text mentions the "requirements" of the bulletin, and the language in the bulletin prior to the standards lists the standards with which "[e]ach agency shall" comply. However, OMB also says that the bulletin applies to all agency risk assessments "to the extent appropriate." Agency heads are authorized to waive or defer some or all of the requirements in the bulletin "where warranted by a compelling rationale." Public comments on the bulletin were requested by June 15, 2006, and on June 22, 2006, OMB posted the comments it had received on its web site.³² Those comments varied significantly, with some suggesting ways to make the document stronger and more inclusive, while others suggested that OMB abandon the bulletin altogether.

On March 22, 2006, a committee of the Board on Environmental Issues and Toxicology within the National Academies' Division of Earth and Life Sciences began what is expected to be an 11-month peer review of OMB's proposed bulletin. On May 22, 2006, the committee held a public meeting on OMB's proposed risk assessment bulletin. According to press accounts, the nine federal agency officials who testified at the meeting voiced a variety of opinions about the bulletin.³³ For example, the Director of FDA's Center for Drug Evaluation and Research reportedly said that if the bulletin was made final in its current form, doctors and the public might not receive timely warnings about potential health risks posed by drugs and medical devices (e.g., warnings related to the use of the anti-inflammatory drug Vioxx). He and two other agency officials (from the National Institute of Environmental Health Sciences and the National Institute for Occupational Safety and Health's Risk Evaluation Branch) reportedly said that the bulletin's definition of risk assessment is so broad that many types of federal analyses could be inappropriately covered by its requirements. On the other hand, EPA's science advisor was quoted as saying that the agency was in "pretty good shape" in terms of meeting the requirements in the proposed bulletin, but nevertheless suggested that the guidance be revised to explain how much flexibility agencies have regarding its requirements (e.g., how agencies can get waivers from the bulletin's requirements).

Like the peer review bulletin, the manner in which OMB implements the risk assessment bulletin will determine its effectiveness. For example, it is unclear the extent to which agencies will be allowed to waive or defer the bulletin's requirements when they believe it is "warranted by a compelling rationale." Similarly, it is unclear whether OMB will allow agencies to decide when a risk assessment is "influential" (thereby triggering additional standards in the bulletin) and whether OMB will treat the bulletin's provisions as "guidance" or as "requirements."

Possible Issues for Congressional or ACUS Consideration. As the above discussion suggests, a number of issues remain for possible congressional consideration, or for further study by a re-funded ACUS or some other body. In some cases, Congress could weigh in and resolve the issue. For example, in light of recent court decisions, if Congress wanted agencies' decisions under the Information Quality Act to be judicially reviewed, it could resolve any lingering questions by amending the statutes and permitting judicial review. Likewise, if Congress objected to using risk standards for one statute and applying them to other statutes, it could act through legislation or through oversight of OMB's risk assessment bulletin.

Among the questions that may merit further study are the following:

- How can scientific advisory panels be constructed to ensure that they are unbiased?
- Under what circumstances should agencies' regulatory policies deviate from the recommendations of their scientific staff and advisory bodies?
- What were Congress's intentions in passing the IQA? Has it served those purposes?
- Do agencies have too much discretion to deny correction requests under the IQA? What effect has the act had on the length of time it takes agencies to issue rules? What if anything should be done to ensure that the act is consistently implemented?
- Should OMB take a more active role in reviewing agencies' decisions under the IQA? Should Congress or OMB initiate the collection of data regarding the IQA's effect on rulemaking or agencies' resources?
- What is the appropriate role of the courts in reviewing science-based agency regulatory decisions?
- Are governmentwide standards for peer review and risk assessment needed? Does OMB have the authority to issue such standards? What effect have these requirements had on the length of time it takes agencies to issue rules?
- Are agencies complying with the peer review and risk assessment bulletins? For example, are agencies posting agendas listing their upcoming peer reviews? Are agencies peer reviewing all "influential" information? Are some agencies complying better than others? Should Congress refer to these bulletins in legislation as models for particular peer reviews or risk assessments?
- What constitutes the "weight of the evidence" in making risk-based regulatory decisions? Should Congress define the term, or should it be left up to the agencies within a specific regulatory context?

Mr. Chairman, that concludes my prepared statement. I would be happy to answer any questions that you or other Members of the Subcommittee might have.

Mr. CANNON. Mr. Halstead.

TESTIMONY OF T.J. HALSTEAD, ESQ., LEGISLATIVE ATTORNEY, AMERICAN LAW DIVISION, CONGRESSIONAL RESEARCH SERVICE, WASHINGTON, DC

Mr. HALSTEAD. Mr. Chairman, Members of the Subcommittee, I am pleased to be here today to discuss the Subcommittee's Administrative Law Process and Procedure Project.

I've been particularly involved in the consideration of four issues that have arisen in the various symposia, hearings and studies conducted under the project's banner, namely, public participation in the rulemaking process, agency adjudication, judicial review of agency rulemaking, and the utility of a reconstituted ACUS in light of the regulatory clearance and review functions of the Office of Management and Budget. I have addressed those issues in detail in my prepared statement, and I would like to focus today on efforts that have been made to study court participation and judicial review over the course of the project. I think they illustrate both the time and effort that has gone into the project, as well as factors that could be viewed as supporting the continuing need for an entity such as ACUS.

The staff of your Subcommittee has spent a great deal of time focusing on public participation issues ranging from the impact of non-rule rules on public participation, to whether e-rulemaking initiatives have, in fact, facilitated an increase in public participation.

Professor Cary Coglianese convened a congressional symposium for the Committee on the e-rulemaking issue last December, and I think that type of collaborative effort has been essential to furthering our understanding of these issues. One interesting aspect of that symposium was the general consensus that e-rulemaking initiatives have not, in fact, generated the significant increase in participation that was largely expected in light of the strides that have been made in electronic technology and accessibility. The participants of that symposium recommended further studies on the issue, and, in particular, recommended expanding and institutionalizing opportunities for collaboration, which is a role that ACUS has served in the past and could arguably fulfill again.

Another significant study that Mort mentioned in his testimony has been conducted by Professor William West at Texas A&M, focusing on how agencies develop proposed rules, with a particular emphasis on public participation and transparency in the prenotice and comment phase of rule formulation. The study relied in large part on an electronic questionnaire sent to agency staff involved in the development of a large sample of individual rules and on interviews with high-level agency personnel with extensive experience in the rulemaking process. One of the hopes of that study was that the questionnaire would generate data that would enable a systematic comparison of variations in agency practice during this phase of rulemaking, but, as Mort mentioned, a low response rate to the survey prevented that from happening.

The interview and survey data did enable Professor West and his team to make some very interesting and important observations relating to the outside participation of individuals in the development of rules, but I think the low response rate to that survey, again,

could be taken to support the position that there is an important role for ACUS. Professor West himself has related his view that the survey was hobbled by a general reluctance on the part of agencies to share information, with apparently two agencies explicitly ordering their staff not to respond to the survey.

Given the factors that Mort mentioned earlier regarding ACUS's nonpartisan nature and organizational independence, it's quite possible that a reconstituted ACUS would be able to secure a greater response for these types of studies, which in turn would further Congress' knowledge of such issues.

Another key study in the project is being conducted by Professor Jody Freeman at Harvard Law School, focusing on empirical analysis of judicial review of agency rulemaking. The goal of the study is to find out what happens to agency rules during review in the circuit courts, essentially to determine how often rules are invalidated in whole or in part, and the reasons why they are invalidated. Professor Freeman's study is ongoing, but she discussed the methodology of the study and presented her preliminary findings at our September 11, 2006, symposium on Presidential, Congressional and Judicial Control of Agency Rulemaking.

The study is ultimately expected to yield significant and useful empirical data on the success of challenges to agency rules in the appellate courts, but the limitations on this type of study might be seen as providing further evidence of the futility of a reconstituted ACUS. Professor Freeman herself noted in her comments at that symposium that stand-alone studies of this type do not give rise to a coherent and comprehensive empirical strategy that fosters optimal analysis of administrative process for the long term. Rather, it could be argued that only an entity such as a reconstituted ACUS will have the ability to assemble a group of experts with the aim of formulating a cohesive methodology that will be supported by ongoing and systematic analysis.

I hope my testimony has given you an idea of the scope of work that's been done in these areas, as well as the potential for a reconstituted ACUS to further improve our knowledge and understanding of administrative law and process, and I look forward to answering any questions that you might have. Thank you.

Mr. CANNON. Thank you, Mr. Halstead.

[The prepared statement of Mr. Halstead follows:]

PREPARED STATEMENT OF T.J. HALSTEAD

Statement of T.J. Halstead
Legislative Attorney, American Law Division
Congressional Research Service

Before

The Committee on the Judiciary
Subcommittee on Commercial and Administrative Law
House of Representatives

November 14, 2006

on

“The Administrative Law, Process, and Procedure Project”

Mr. Chairman and Members of the Subcommittee:

My name is T.J. Halstead. I am a Legislative Attorney with the American Law Division of the Congressional Research Service at the Library of Congress, and I thank you for inviting me to testify today regarding the Committee’s ongoing and bipartisan “Administrative Law, Process and Procedure Project.”

My testimony today will address three issues that have been studied over the course of the project: public participation in the rulemaking process, agency adjudication, and judicial review of agency rulemaking, with a focus on how the various symposia and academic studies sponsored by the Committee have contributed to our understanding of the significant and complex issues that adhere in these contexts, as well as to illustrate the potential ability of a reconstituted Administrative Conference of the United States to further aid our appreciation of such issues. My testimony will additionally discuss the issue of whether a reconstituted ACUS would be duplicative of activities that are currently performed by the Office of Management and Budget.

Public Participation

Effective public participation in agency rulemaking is a fundamental principle of the Administrative Procedure Act, and the staff of your Committee has been particularly active in considering factors impacting such participation. Working with your staff, we have identified a wide range of issues that have arisen in this context, ranging from the effect of “non-rulemaking approaches,” such as the issuance of interpretive rules and policy

statements on public participation, to the effect of e-rulemaking initiatives.

On December 5, 2005, Professor Cary Coglianese of the University of Pennsylvania Law School convened a symposium on "E-Rulemaking in the 21st Century" that was sponsored by the Committee. This symposium brought together legislative and executive branch personnel, academic researchers, and non-governmental representatives for an in-depth discussion on e-rulemaking and the manner in which advances in information technology may impact the future of administrative rulemaking. In testimony presented before the Committee on July 26, 2006, Professor Coglianese commented on the status of empirical research on e-rulemaking, noting that empirical data that has been obtained to date does not appear to support the initial expectation that advances in this context would facilitate a significant increase in public participation. Nonetheless, technological improvements may ultimately provide substantial benefits in this regard. Professor Coglianese also noted that ancillary benefits of e-rulemaking, such as increased transparency, enhanced ability for executive or congressional oversight, administrative cost reduction, and greater ease of compliance provide additional justifications for continued efforts to improve agency utilization of electronic technology in rulemaking.

Another key issue in the public participation context has been whether efforts to include the public in the rulemaking process prior to the publication of a proposed rule should be expanded. Professor William West of the Bush School of Government and Public Services at Texas A&M University undertook an effort to study a specific aspect of this issue at the behest of the Committee, with the support of the Congressional Research Service.

Professor West formulated and conducted a project to analyze how agencies develop proposed rules, with a particular emphasis on how rulemaking initiatives are placed on agency regulatory agendas; how the rulemaking process is managed at inter and intra agency levels; and how public participation and transparency factor in the pre-notice and comment phase of rule formulation. Professor West has stated that the issue of public participation at this stage of agency rule formulation "may be especially relevant to the Congress as it considers possible amendments to the APA." The study relied in large part on an electronic questionnaire sent to agency staff involved in the development of a large sample of individual rules and on interviews with high level agency personnel with extensive experience in the rulemaking process. One of the hopes for the study was that the questionnaire would generate data that would enable a systematic comparison of variations in agency practice regarding the scope, transparency, and inclusiveness of outside participation during this phase of rulemaking. However, a low response rate to the electronic questionnaire prevented such a comparison. Nonetheless, the interview and survey data did enable Professor West and his team to make some very interesting and important observations relating to outside participation in proposal development: that agency officials noted that the submission of information by public interest groups, industry representatives, other affected interests, and other agencies was "frequently indispensable to intelligent decision making"; that the character of such participation is variable, based on a number of factors; and, finally, that such participation does not generally occur as the result of an inclusive agency approach, instead occurring by virtue of agency invitation or participant initiative.

While the West study has contributed significantly to congressional and academic understanding of the complex issues surrounding public participation in the pre-notice and comment rulemaking context, the low response rate to the survey could be viewed as

supporting the position that a reconstituted ACUS could serve an important role in facilitating research of this type. Professor West has related his view that the survey was hobbled by a general reluctance of agencies to share information, as illustrated by the fact that two agencies went so far as to explicitly order their staff not to respond to the survey. It is arguable that a similar study, if conducted by a reconstituted ACUS, would have greater success in generating the information necessary to enable the systematic comparisons envisioned by the West study by virtue of its non-partisan nature and organizational independence.

Agency Adjudication

Another matter of significant importance and interest to the project has been the issue of agency adjudication. In addition to rulemaking, it is a fundamental maxim of administrative law that agencies may control regulated activities and entities through adjudicatory processes. Regarding the basic issue of an agency's discretion to choose between rulemaking and adjudication, the Supreme Court established in *SEC v. Chenery Corporation* that "the choice made between proceeding by general rule or by individual, ad hoc litigation is one that lies primarily in the informed discretion of the administrative agency." This dichotomy effectively allows agency adjudicators to exert policy-making authority through a quasi-judicial proceeding, as opposed to the quasi-legislative nature of the procedures that govern notice and comment rulemaking. This dynamic has given rise to the question of whether it is appropriate for agencies to establish binding policy through adjudication when such action could be effected through notice and comment rulemaking. ACUS, as a reconstituted entity, would be in a unique position to analyze the impact of agency determinations to regulate through adjudication and rulemaking, with the aim of formulating a recommendation as to whether the Administrative Procedure Act should be amended to explicitly address issues adhering to agency adjudication.

The mechanics of agency adjudication are also an issue that might be ripe for review by a reconstituted ACUS. To this end, CRS has identified a series of issues in this context that have been of interest to administrative law scholars and practitioners, ranging from the question of whether there is a need to reevaluate the Administrative Law Judge program, with a focus on the selection of ALJ's and the issue of whether ALJ's dealing with regulatory matters should be treated differently than those handling benefits cases. Additionally, a comprehensive study of the issue of whether the APA's adjudicatory provisions should be extended to all evidentiary hearings required by statute, as has been suggested by the American Bar Association, would appear to be particularly suitable for examination by ACUS.

Judicial Review

Judicial review of agency rulemaking has emerged as an issue of great significance and interest in the years since the demise of ACUS, and the study of this issue has factored prominently in efforts undertaken in aid of the Administrative Law, Process, and Procedure Project.

Under the Administrative Procedure Act, courts are authorized to invalidate rules that are deemed to be arbitrary or capricious. This standard of review, is not clearly defined, and the judiciary's interpretation of the meaning of this phrase has changed substantially over the past thirty years. Until the 1970's, arbitrary or capricious review

was extremely deferential, essentially requiring only that a regulation fall within the scope of legally delegated authority. However, the Supreme Court's 1971 decision in *Citizens to Protect Overton Park, Inc. v. Volpe* established a dynamic that has led to more stringent review of rules.

Overton Park addressed a challenge to the Secretary of Transportation's decision to approve the release of federal funds for the construction of a highway through a park, on the basis that the decision violated a prohibition on the use of federal highway funds for highway construction through public parks so long as another feasible and prudent route could be used. Applying the arbitrary or capricious standard to the Secretary's decision, the Court held that it was required to analyze whether the decision was based on "a consideration of the relevant factors and whether there had been a clear error in judgment..." The Court stated that while this inquiry must be "searching and careful," the standard of review was ultimately narrow. The Court then proceeded to remand the case so that the lower court could conduct a "thorough, probing, in-depth review of the administrative record underlying the Secretary's decision."

The language used by the Court in *Overton Park* is at once instructive yet ambiguous. The Court declares that judicial review under the arbitrary and capricious standard is to be "searching and careful," while simultaneously espousing a deferential approach to review of informal agency action by stating that the judiciary "is not empowered" to impose its judgment on an agency. It has been asserted that courts applying the precepts of *Overton Park* "tend to ignore all but the mandate to conduct a 'searching and careful' inquiry," slipping into a "a more active role than was intended for arbitrariness review." In turn, this increased level of scrutiny has been cited as facilitating the development of what has come to be referred to as the "hard look" doctrine of arbitrary and capricious review. This approach has been characterized as obliging a reviewing court "to examine carefully the administrative record and the agency's explanation, to determine whether the agency applied the correct analytical methodology, applied the right criteria, considered the relevant factors, chose from among the available range of regulatory options, relied upon appropriate policies, and pointed to adequate support in the record for material empirical conclusions."

The Supreme Court implicitly endorsed the hard look doctrine in *Motor Vehicle Manufacturers Association v. State Farm Mutual Automobile Insurance Co.*, while continuing to assert, as it had in *Overton Park*, that a reviewing court is not to substitute its judgment for that of the agency. This dichotomy between what, on the one hand, appears to be a very broad grant of discretion to a reviewing court and the much more restrictive notion that the courts are not to usurp agency judgment has been focused upon by both proponents and critics of the hard look standard. Some commentators have argued that the hard look doctrine is essential to allow for an appropriate level of judicial scrutiny of an agency's exercise of power, in that it ensures that agency decisions are not controlled by narrow private interests or an agency's own "idiosyncratic view of the public interest." Conversely, critics of hard look review maintain that it allows for so much judicial discretion "that a single unsympathetic or confused reviewing court can bring about a dramatic shift in focus or even the complete destruction of an entire regulatory program." It has been argued that the establishment of a more stringent review dynamic in *Overton Park*, coupled with the adoption of the hard look doctrine in *State Farm*, has caused the rulemaking process to become more rigid and burdensome upon agencies. In turn, this has led to the assertion that rulemaking has become "ossified," with agencies either undertaking resource and time intensive steps to ensure that a rule will withstand increased scrutiny, or circumventing the

CRS-5

traditional notice and comment rulemaking process by issuing policy statements and interpretive rules to effectuate compliance with a regulatory agenda.

Various studies have been conducted attempting to evaluate the number of challenges to agency rulemaking efforts and the effect of judicial review thereon. However, it has been stated that “administrative law scholars have failed generally to produce systematic empirical analysis of the effects of judicial review.”

In hopes of ameliorating this situation, the Committee recruited Professor Jody Freeman of the Harvard Law School to conduct a study aimed at providing just such an empirical analysis. With the aid of Curtis Copeland, one of my fellow CRS coordinators of this Project, Professor Freeman was able to obtain access to data on administrative agency appeals from the Administrative Office of the Courts (AOC) from 1995 to 2004. The data consists of 3,075 cases drawn from an initial database of over 10,000 cases involving administrative appeals from every circuit court over that time frame. The goal of the study is to ascertain what happens to agency rules upon appellate judicial review, with the aim of determining the rate at which rules are invalidated in whole or in part, and the reasons for that invalidation. Professor Freeman’s study is ongoing, but she discussed the methodology of the study and presented the preliminary findings of the study at a September 11, 2006 symposium on “Presidential, Congressional, and Judicial Control of Agency Rulemaking,” that was hosted by CRS as part of the Committee’s project. While the study is ultimately expected to yield significant and useful empirical data on the success of challenges to agency rules in the appellate courts, the limitations of this type of study might be seen as providing further evidence of the utility of a reconstituted ACUS. As Professor Freeman noted in her comments at the September 11, 2006 symposium, these types of studies do not give rise to a coherent and comprehensive empirical strategy that will foster optimal analysis of the administrative process for the long term. Rather, it could be argued that only an entity such as a reconstituted ACUS will have the ability to assemble a group of experts with the aim of formulating a cohesive methodology that will be supported by ongoing and systematic analysis.

The Differing Roles of ACUS and OIRA

Regarding the reauthorization and refunding of ACUS, I have worked closely with the staff of your Committee over the past two years in analyzing assertions that a reconstituted ACUS would be duplicative of functions that are already performed by Office of Information and Regulatory Affairs (OIRA) within the Office of Management and Budget (OMB). Before addressing the merits of this argument, I think it is useful to provide an overview of the statutory structures and missions of these two entities.

Legislation creating a permanent Administrative Conference of the United States was enacted in 1964,¹ with funds first appropriated in 1968.² In 1995, the activities of ACUS ceased when funding for its activities was terminated. ACUS was reauthorized in the 108th Congress,³ but has yet to receive an appropriation. The statutory provisions governing ACUS were never repealed by Congress, and the reauthorization in the 108th Congress only slightly

¹ See 5 U.S.C. §§ 591-96.

² P.L. 90-392 (1968).

³ P.L. 108-401, 108th Cong. 2d Sess. (2004).

revised its original provisions, by authorizing appropriations and by making four additions to the "purposes" section of the Act.⁴

Pursuant to its statutory authorization, ACUS is tasked with (1) providing "suitable arrangements through which Federal agencies, assisted by outside experts, may cooperatively study mutual problems, exchange information, and develop recommendations for action by proper authorities to the end that private rights may be fully protected and regulatory activities and other federal responsibilities may be carried out expeditiously in the public interest"; (2) promoting "more effective public participation and efficiency in the rulemaking process"; (3) reducing "unnecessary litigation in the regulatory process"; (4) improving "the use of science in the regulatory process," and (5) improving "the effectiveness of laws applicable to the regulatory process."⁵

The reauthorization leaves intact ACUS' original membership dynamic, which is structured, in effect, as a public/private partnership, in order to maximize "the joint participation of agency and outside experts in administrative procedure."⁶ In the event of appropriation its membership will thus consist of a minimum of 75 and a maximum of 101 members, composed of a Chairman, council, and assembly. The Chairman would be appointed by the President, the council would be composed of the chair and ten other members, and the assembly, if comprised in accordance with prior practice, would consist of approximately 100 members, "consisting of representatives of federal agencies, boards, and commissions and private citizens, including lawyers, law professors, and others knowledgeable about administrative law and practice."⁷

During the course of its original existence, ACUS was widely viewed as an effective, independent and nonpartisan entity. For instance, Sally Katzen, a former Administrator of OIRA during the Clinton administration, stated in 1994 that ACUS "has a long-standing tradition of private-sector membership that crosses party and philosophical lines."⁸ Likewise, C. Boyden Gray, a former White House Counsel in the George H.W. Bush administration, testified before the House Judiciary Committee's Subcommittee on Commercial and Administrative Law in support of the reauthorization of ACUS, stating: "Through the years, the Conference was a valuable resource providing information on the efficiency, adequacy and fairness of the administrative procedures used by administrative agencies in carrying out their programs. This was a continuing responsibility and a continuing need, a need that has not ceased to exist."⁹

As further evidence of the respect of, and support for, ACUS, it is interesting to note that Supreme Court Justices Scalia and Breyer testified before the Subcommittee in support of the reauthorization of ACUS. Justice Scalia stated that ACUS was “a proved and effective means of opening up the process of government to needed improvement,” and Justice Breyer characterized ACUS as “a unique organization, carrying out work that is important and beneficial to the average American, at a low cost.”¹⁰ Examples of the accomplishments for which ACUS has been credited range from the simple and practical, such as the publication of time saving resource material, to analyses of complex issues of administrative process and the spurring of legislative reform in those areas.¹¹

The Office of Management and Budget traces its origin to the establishment of the original Bureau of the Budget within the Department of the Treasury by the Budget and Accounting Act of 1921.¹² The Bureau was transferred to the newly created Executive Office of the President by Reorganization Plan No. 1 of 1939,¹³ and was subsequently designated as the Office of Management and Budget by Reorganization Plan No. 2 of 1970.¹⁴ While OMB’s primary function centers on budget formulation and execution, it has many other major functions, including regulatory analysis and review. The Paperwork Reduction Act of 1980, later recodified as the Paperwork Reduction Act of 1995, established the Office of Information and Regulatory Affairs within OMB. In addition to its statutory responsibilities, OIRA exerts significant influence on the scope and substance of agency regulations through a presidentially mandated review and planning process. Shortly after the creation of OIRA in 1980, President Reagan issued Executive Order 12291, which imposed cost-benefit analysis requirements on rule formulation and established a centralized review procedure for all agency regulations. Responsibility for this program was delegated to OIRA.

In practical effect, E.O. 12291 gave OIRA a substantial degree of control over agency rulemaking, enabling OMB to exert considerable influence over agency efforts in this context from the earliest stages of the process. The impact of E.O. 12291 on agency regulatory activity was immediate and substantial, with OIRA reviewing over 2000 regulations per year and returning multiple rules to agencies for reconsideration. As a result of this rigorous review process, agencies became sensitized to the regulatory agenda of the Reagan Administration, largely resulting in the enactment of regulations that reflected the goals of the Administration.¹⁵ The issuance and implementation of the order generated controversy and criticism, with opponents asserting that the review process was distinctly anti-regulatory and constituted an unconstitutional transfer of authority to OIRA from the executive agencies. This review scheme was retained to similar effect and controversy in the George H.W. Bush Administration.

¹⁴ 84 Stat. 2085 (1970).

¹⁵ See T.J. Halstead, *Presidential Review of Agency Rulemaking*, Congressional Research Service, Rep. No. RL32855 at 3 (2005).

President Clinton supplanted the Reagan era review scheme with Executive Order 12866, entitled "Regulatory Planning and Review."¹⁶ The Clinton order implemented a more selective and transparent review process, while generally retaining the centralized review dynamic established by E.O. 12291. Coupled with the comparatively pro-regulatory stance of OMB during the Clinton era, this review scheme resulted in a decrease in the rates of OIRA review of rules, from an average of 2080 regulations per year in fiscal years 1982-93 to an average of 498 in fiscal year 1996.¹⁷ It is important to note that this decrease in the numbers of rules reviewed does not indicate a concession on the part of the Clinton Administration that there were limits on presidential control of the scope of OIRA review or on the agency rulemaking process specifically.¹⁸ Rather, it would appear that the Clinton Administration employed the OIRA review process and general assertions of administrative control over agencies in order to implement its regulatory agenda.¹⁹

The George W. Bush Administration has retained E.O. 12866, utilizing it to implement a review regime that subjects rules to more stringent review than was the case during the Clinton Administration. It has been asserted that the current Administration has returned to the review dynamic that prevailed under E.O. 12291, with OIRA describing itself as the "gatekeeper for new rulemakings."²⁰ Under the current Administration, OIRA has increased the use of "return" letters to require agencies to reconsider rules, which, in turn, has led agencies to seek OIRA input "into earlier phases of regulatory development in order to prevent returns later in the rulemaking process."²¹ This dynamic arguably buttresses executive control over agency rulemaking efforts by exerting influence over rulemaking activity at the earliest stages of rule formulation.²² Additionally, OIRA has instituted the practice of issuing "prompt letters" to appropriate agencies to encourage rulemaking on issues it feels are ripe for regulation.²³ OIRA has acknowledged that prompt letters "do not have the mandatory implication of a Presidential directive," characterizing them instead as a device that "simply constitutes an OIRA request that an agency elevate a matter in priority."²⁴ As with the use of return letters, the use of prompt letters has arguably enabled OIRA to exert a substantial degree of influence on an agency's regulatory agenda.²⁵

While ACUS and OIRA could be viewed as operating within the same sphere to the extent that they are both concerned with regulatory matters, it would appear that there are substantial, concrete differences between their respective structures and missions that in turn give rise to a fundamental difference between the nature and manner of their respective assessments of agency performance in the administrative process.

²⁴ *Id.* at 11.

²⁵ *Id.* at 11.

Most importantly, ACUS is an independent entity, whereas OIRA is responsible for effectuating a given administration's regulatory agenda. As touched upon above, ACUS was widely regarded as an independent, objective entity that was tasked with the unique role of assessing all facets of administrative law and practice with the single goal of improving the regulatory process. As stated by one commentator, "[t]his level of bipartisanship contributed greatly to the ability of the Administrative Conference to reach consensus on issues for their merits rather than because of any particular ideology or party agenda; this in turn contributed to the credibility of the Conference's work and the willingness of academics and private attorneys to volunteer their time to the Administrative Conference."²⁶ Conversely, OIRA does not possess the indicia of independence or objectivity that characterized ACUS, nor does it claim such a character. As an arm of OMB, situated within the Executive Office of the President, OIRA is quintessentially executive in nature, with a predominant mission to advance the policy goals of the President. As such, while OIRA might be characterized as serving a coordinating function in the administrative context, it naturally follows that this function is exercised under the influence of the President.²⁷ Indeed, the activities of OIRA during the Reagan, Clinton, and George W. Bush Administrations, as touched upon above, would appear to establish that this coordinating function has been employed to further the regulatory agenda of those administrations.

The distinction between ACUS as an independent entity and OIRA as an executive agency may also be seen as having practical effects that give further credence to the ability of ACUS to serve in the consideration of agency specific issues. For instance, Loren A. Smith, currently serving as a Senior Judge on the United States Court of Federal Claims and a former Chairman of ACUS, has stated:

[T]he very fact of ACUS' smallness and its lack of investigative powers and budget sanctions, made agencies willing to come to ACUS and listen to ACUS. OMB or the General Accounting Office were threatening. The General Services Administration and the Office of Personnel Management were often perceived as the enemy. ACUS on the other hand, was seen as the kind counselor, one who gave useful, and generally palatable remedies. It thus had the confidence of most of the Executive branch and the Congress. And a place like this is not to be valued lightly.²⁸

Apart from concerns regarding independence and objectivity, it has been suggested that while the staff of OIRA possess a significant degree of expertise with regard to administrative issues, there are nonetheless fundamental structural issues that would inhibit OIRA's efficacy in this context, such as the "multitude of issues flowing through agencies daily, the severely limited resources of executive oversight, and the variety of control relationships that exist in the administrative system."²⁹ Justice Breyer echoed this sentiment

²⁶ Fine, n. 8, *supra*, at 55.

²⁷ See, e.g., Lubbers n. 6, *supra*, at 152.

²⁸ Loren A. Smith, *The Aging of Administrative Law: The Administrative Conference Reaches Early Retirement*, 30 Ariz. St. L.J. 175, 181 (1998).

²⁹ See Edles, n. 11, *supra*, at 135 (quoting Thomas O. Sargentich, *The Supreme Court's Administrative Law Jurisprudence*, 7 Admin. L.J. Am. U. 273, 280 (1993)). Professor Edles has further suggested that "[p]rocedure and process changes would rarely, if ever, rise to the level

(continued...)

in his testimony discussing the mission of ACUS, stating "I have not found other institutions readily available to perform this task. Individual agencies, while trying to reform themselves, sometimes lack the ability to make cross-agency comparisons....The Office of Management and Budget does not normally concern itself with general procedural proposals."²⁹

Also, the broad scope of ACUS' mission, coupled with its independence and expertise is seen by many as making it the appropriate entity to analyze the efficacy of the functions of OMB itself. In his testimony before the Subcommittee, C. Boyden Gray identified OMB activities as being ripe for study by ACUS, suggesting "empirical research on the innovation of the OMB 'prompt' letter, matters relating to data quality and peer review issues," as particularly suitable topics for inquiry.³¹

These issues of independence and objectivity, the widely recognized expertise and bipartisan nature of ACUS, and the broad scope of the work it conducted in all facets of the administrative process could thus be taken to belie the notion that the activities of a reconstituted ACUS would be duplicative of the functions of OMB or its Office of Information and Regulatory Affairs.

- - - - -

Mr. Chairman, that concludes my prepared statement. I would be happy to answer any questions that you or other Members of the Subcommittee might have.

Mr. CANNON. And again, thank you all for being here today.

Mr. ROSENBERG, if I could just follow up on some of your comments. You talked at some length about the Congressional Review Act and about how it would work here in Congress. And you fell a little short of talking about what we actually talked about, I think, in this hearing, and that was if Congress were to review every rule. In other words, if you set aside the major rules as impractical to actually determine, then what the effect of that would be that noncontroversial rules would be viewed as minor, and if anybody had a problem with a rule, they could raise that problem in the course of a congressional oversight process.

That would mean that Congress would have to staff up somewhat. The Majority or the Minority would shift a little bit in how they would happen, but you would have an internal process whereby notice and comment could be had, and that way what was major would be determined not by the agency's action or by some other standard which would be difficult to implement, but rather by the reaction of the population. So that in the case of a small business and the effect of a regulation on a small business, small businesses could come forward and say, hey, this regulation would be more difficult, and you could do it in a more easier fashion.

I don't know if you recall that part of the conversation, but it seems to me actually that the panel is agreeing that if you give up the idea of making a distinction between major and minor regulations, that you pretty soon end up in a point where you just say maybe Congress should review all, and then those that are substantial would become the point of focus. Do you recall that? And what is your thinking on that today?

Mr. ROSENBERG. What I was talking about today was a relation of testimony at the March hearing. It has been my view that there is a way to deal with all rules; that if, let's say, a joint Committee was set up as a screening mechanism, or a quorum-type vehicle was set up as a screening mechanism, which then presented recommendations, an internal procedure could be set up to screen out those rules that might be deemed minor rather than major, and that a deeming process that we talked about at the last hearing, which was approved by current Parliamentarian Sullivan and former Parliamentarian Charlie Johnson, that these could be the mechanism for—

Mr. CANNON. Would you mind suspending for a moment here while we have people leave? Thank you.

Please proceed.

Mr. ROSENBERG. The difficulty with limiting congressional review to major rules is just what you're saying: You're going to be losing rules that have an impact. Right now a major rule is defined by the Office of Management and Budget, and I don't know that you want to continue to have the Office of Management and Budget deciding what is a major rule, and therefore, these are the only rules that will come before Congress. You could do it verbally, with a sense of a \$100 million impact, or a catch-all kind of a thing where it has a major significance, impact on—I did a nice thing here.

One of the constitutional problems is Congress itself can't decide what to bring up, what would be a charter problem, demanding that an agency bring up a particular rule. So you may have a prob-

lem of all or nothing, and to have the kind of effective congressional oversight, it would seem to me that all rules, as they are now, should come before Congress. And you would set up a procedure whereby there would be a screening process that, let's say, after 30 days, if a particular rule is not acted upon or a joint resolution of approval is not followed against that particular rule, it then goes to a calendar Wednesday when all the rules are being passed at that particular point or approved.

Mr. CANNON. But the charter problem doesn't exist if all rules come through, but directing a rule—Congress is not good at directing, so you don't ultimately have a charter problem, do you?

Mr. ROSENBERG. Not when it's there, not with all the rules covered. Then there can be a selection process and a deeming of approval at that particular point. You could get rid of 99.98 percent of the rules every year, and you would be able to catch the 60 or so major rules that come forward, if they're necessary. Most of the major rules are not that controversial either. So that you would have a process whereby the meaningful threat is out there that Congress is looking, and that these rules will have to come up, you know, in a way that, you know, conforms with what they were supposed to be.

Mr. CANNON. Mr. Watt, would you allow me to do one more question?

Mr. WATT. Sure.

Mr. CANNON. Dr. Copeland, when you talked about the blaming process—I think you mentioned that, that was mentioned by one of the witnesses here—that is, does Congress want to be blamed for rules that it approves based upon agency action? It seems to me that that's actually our job.

But secondly, having a process whereby you have a political review means that if you don't have significant objection to a rule, that the blame really goes to the people who have the interest who didn't assert the interest at the time. So do you think that the blaming—concern about blaming is something that Members of Congress would want to avoid, or is it something that we can deal with if we did some kind of a review of all regulations and perhaps a vote on all regulations?

Mr. COPELAND. I don't recall getting into the blaming issue, but I can respond to your question a bit.

The issue of whether congressional accountability for agency rules—it really gets back to the question of that the agency rules are based on congressional action. But the problem is more alluded to if Congress got in the business of approving all rules. There is about 4,000 final rules issued every year, and that would take up a significant amount of Congress' time. So some process of weeding these things out is necessary in order to avoid that overwhelming task.

The question then becomes how do you pick. And if you let OMB and the agencies pick which ones are subject to congressional review and would come up here. But technically any rule, under the Congressional Review Act—and Mort, correct me if I'm wrong—any rule can be challenged right now; there can be a resolution of disapproval on any rule, and it doesn't have to be one that an agency does a major rule report on or that GAO does a major rule report

on. So Congress can pick which ones, and certainly the interest groups in Washington are adept at pointing things out to Congress which ones they have a problem with.

Mr. ROSENBERG. The difficulty is it goes through a normal process of legislation, and you know how difficult that is. That's why expedited procedures assist in focusing and taking action in a timely and effective way. I'm the one that brought up the blaming—

Mr. CANNON. Oh, I'm sorry. You were quoting someone else, but—

Mr. ROSENBERG. I was quoting one of the participants on my panel who was making a political point, you know, that you're never going to get this because it puts too much responsibility. It may be that Congress gets blamed for doing things, and most often for not doing things; and here you're adding a whole category of rules that they could have taken care of, and somebody will hammer then. So therefore, let's have a procedure that's less threatening to us, or to you guys.

Mr. CANNON. I would hope that you could do some sort of expedited procedure and pass all bills, and the American people actually want that, and they're beginning to see that. And the blame thing is an initiating thing that we look at as individuals. Institutionally I think that Congress ought to have a greater role in the vast amount of law that gets created under the direction of the law we pass, but at the behest of the Administration.

Mr. ROSENBERG. One of the ostensible reasons for the passage of the Congressional Review Act was to place responsibility and accountability on Congress in order to wipe out the criticism that they nearly delegated vast amounts of power out and never, you know—

Mr. CANNON. That lever hasn't worked as well—it might have worked a little bit, but we don't have the data, and it hasn't worked clearly as well as we had hoped. But you know that I'm a fan of the idea of passing all.

Thank you, all. And I would like to recognize Mr. Watt.

Mr. WATT. Thank you, Mr. Chairman.

And let me also join you in thanking the witnesses who have devoted so much time to this project, and I think advanced it to a point where hopefully it can be picked up and moved forward.

Mr. Rosenberg, I just had one clarifying question because I wasn't sure I understood what you were saying about ACUS being reauthorized in the 108th Congress, but wasn't so critical that it be funded. What was that point?

Mr. ROSENBERG. Well, my meaning was simply that the process that we're going through, the study process, the projects, the symposia, were setting the groundwork. And we could set the groundwork over a 2-year period, which we have done, but at some point there would have to be an ACUS or something like ACUS. There has to be something like ACUS to provide the kind of objective, nonpartisan consideration and study of sophisticated—

Mr. WATT. Right. I just wanted to make sure that the record was clear that all three of the witnesses, I assume, would strongly advocate funding of ACUS, not just reauthorizing it; or is there any disagreement about that?

Mr. ROSENBERG. We don't advocate, but we would be pleased—

Mr. WATT. I mean, supportive and pleased, yes.

Mr. ROSENBERG. Let's just do it one by one so we'll have it in the record, and there won't be any equivocation about it.

Mr. ROSENBERG. I am supportive of a reactivated ACUS.

Mr. COPELAND. Certainly it makes sense for these issues to be explored further. I think the potential is there for significant savings as a result of this because the people will quibble about what the total dollar value is of all regulations, but it's clearly in the hundreds of millions of dollars. Just last year OMB approved 82, I believe it was, economically significant rules, each of which is \$100 million; 1 percent of that total is \$82 million.

Mr. HALSTEAD. It's very difficult to quantify how much money ACUS saved over its existence. There are anecdotal examples—

Mr. WATT. Let me be clear. I'm trying to get a straight answer into the record that you support or don't support appropriating money to fund ACUS.

Mr. HALSTEAD. I think over the course of the project we've identified several factors that could be looked at as very much supporting the notion that a reconstituted, refunded ACUS would have a beneficial effect for modern administrative government.

Mr. WATT. Having established that from all three of the witnesses, let me also be clear. If you have some concept of what the appropriate appropriation level would be to adequately fund ACUS. And I guess I would say that against—obviously not having ACUS or something similar to it has had substantial economic impacts on various parts of our economy, businesses, so forth and so on. I'm trying to kind of put in context for the next Congress or future Congresses or Members of this Committee or the Judiciary Committee what it would cost as opposed to what it would save, I guess. And so what kind of appropriation level would we be talking about to adequately fund ACUS? Got a clue?

Mr. HALSTEAD. Well, we—

Mr. WATT. Mr. Halstead.

Mr. HALSTEAD. Using the prior reauthorization, it authorized, if my memory serves correctly, a funding level for fiscal years 2005 through 2007 of roughly \$3 million a year. I think it's 3.2 million for the 2007 authorization. And based on the work that the Subcommittee did for that initial reauthorization, the expectation is that that would be somewhere in the neighborhood of what you would need for ACUS to get up and running in an effective fashion.

When you look at the academic literature study in ACUS, it has always been regarded as a very cost-effective organization in relation to the return it provides. So somewhere around that \$3 million figure is maybe—

Mr. WATT. Three million?

Mr. HALSTEAD. Three million, yes.

Mr. WATT. Okay. And that's the figure that you're projecting that would be to get it up and running. What is the annual figure, ballpark, that you would think it would be appropriate to sustain it once it is up and running on an annual basis?

Mr. HALSTEAD. I would think it would be somewhere in that neighborhood. Throughout the course of its existence, it was at somewhat roughly that proportional level.

Mr. WATT. Okay. I just wanted all that to be in the record because, I mean, you know, we're constantly doing cost/benefit analyses. It seems to me that this is one of those occasions that, while we're not being scientific about it, that it's important for us to make it very clear to future Committees and Congresses that we view ACUS as being a very cost-effective agency. And \$3 million, if you're saving substantial cost in paperwork and administrative burden and getting substantial benefits out of what ACUS does, is a minuscule amount of money when juxtaposed against the benefit that we get out of it.

That's the point I'm trying to drive home, and I don't want this hearing to end without having that unequivocally in the record. If anybody wants to argue with it, I want that from the witnesses, but—nobody seems to be arguing with it, so I'm going to do like the Chairman does when he administers the oath: Let the record show that everybody is nodding in affirmative agreement with the statements that I just made.

And with that, I'm happy, and I'll yield back, Mr. Chairman.

Mr. CANNON. Thank you.

Let me just add my view that ACUS is a remarkably cost-effective tool for governing ourselves, and that while I suspect that neither of us will be back on this Committee or directing this Committee next cycle, we will both be advocates for ACUS and for change. I am certainly concerned about who does Chair this Committee, and I'm hoping that we get someone—we've talked to several people who might end up doing that—who would recognize the importance of what we would be doing with this study and how we can translate that into law.

I'd like to ask unanimous consent to introduce into the record this memorandum from the Congressional Research Service from Mr. Rosenberg and Mr. Halstead, which its subject is the comparison of the duties and objectives of the Office of Management and Budget and the Administrative Conference of the United States with respect to the assessments of executive agency performance in the administrative process. I think that that is a valuable addition, especially in conjunction with the questions Mr. Watt asked.

[The information referred can be found in the Appendix.]

Mr. CANNON. I want to, again, thank the witnesses for being here, and the hearing will now be adjourned.

[Whereupon, at 4:23 p.m., the Subcommittee was adjourned.]

APPENDIX

MATERIAL SUBMITTED FOR THE HEARING RECORD

LETTER FROM THE AMERICAN BAR ASSOCIATION SUBMITTED BY THE HONORABLE CHRIS CANNON, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF UTAH, AND CHAIRMAN, SUBCOMMITTEE ON COMMERCIAL AND ADMINISTRATIVE LAW

GOVERNMENTAL AFFAIRS OFFICE
DIRECTOR
Robert D. Crane

Re: Hearing on "The Administrative Law, Process and Procedure Project for the 21st Century"

Kenneth J. Calabrese
(202) 642-1798
kcalabrese@abafed.org

Dear Chairman Cannon and Ranking Member Watt:

Kerry M. Lawrence
(202) 642-1746
klawrence@abafed.org

On behalf of the American Bar Association ("ABA") and its more than 410,000 members, I write to advise your Subcommittee of the great interest that the ABA, particularly its Section of Administrative Law and Regulatory Practice (the "Section") and its Judicial Division's National Conference of the Administrative Law Judiciary ("NCALJ"), has in the subject of today's scheduled hearing on "The Administrative Law, Process and Procedure Project for the 21st Century". The Project is a very important and worthwhile endeavor and it is our hope that we can work with you and your Subcommittee on the various key administrative law and rulemaking reforms contemplated by the Project. In addition, if the Subcommittee holds additional hearings on the Project or any other administrative law reform issues in the future, the ABA and the Section would welcome the opportunity to testify. As the Chair of the Section, I have been authorized to express the ABA's views on this important subject and request that this letter be included in the official record of today's hearing.

The ABA, including the Section of Administrative Law and Regulatory Practice and NCALJ, has a longstanding interest in reforming and improving the overall administrative law and rulemaking process, including the seminal statute in this area, the Administrative Procedure Act (APA). Towards that end, the ABA has adopted policy on a host of issues regarding the APA over the years, including reforms in rulemaking, public information, and judicial review. In 2001, the Section completed a comprehensive review of the APA culminating in a restatement of administrative law.¹ The most recent ABA policy pertaining to the APA is a resolution proposing

amendments to some sections of the APA relating to adjudication. We request that your Subcommittee give due consideration to this proposed amendment as you continue work on your Project. Below we have highlighted some issues of pressing concern to the ABA with regard to administrative law and rulemaking. These include: amendment of the adjudication provisions of the APA, reauthorization and appropriation of funds for the Administrative Conference of the United States, and creation of the "Administrative Law Judge Conference of the United States."

1. Proposed Changes in APA Adjudication

The rulemaking, public information, and judicial review provisions of the APA apply to all federal agencies (with specific exceptions). However, this is *not* the case with the adjudication sections of the APA (primarily sections 554, 556 and 557). These sections presently apply only to a small subset of the subject matter of federal agency adjudications: Social Security Act disability, old-age and survivors benefits claims, Medicare claims, labor law cases, and certain hearings conducted by about 20 other independent regulatory agencies and other Executive Branch agencies. We call these Type A hearings.

These APA provisions guarantee basic, fundamental fairness. They provide for the right to: present evidence and confront the opponent's evidence; require an impartial decision-maker; prohibit ex parte contacts; require separation of adjudicatory from advocacy functions within the agency; and require a statement of findings and reasons. Unfortunately, however, the APA adjudication provisions do not apply under present law to a vast number of adjudications in which an evidentiary hearing is required by federal statutes. Some of the excluded hearings are cases involving immigration and asylum, veterans' benefits, government contract disputes, civil money penalties, security clearances, IRS collection disputes, and about 80 other hearing schemes. We call these Type B hearings. There is no logical reason for the distinction between Type A and Type B hearings. Yet the number of statutes calling for Type B hearings is steadily increasing while the number of statutes calling for Type A hearings remains relatively constant. The APA should apply to all adjudicatory hearings required by statute that are conducted by federal agencies.

In 2005, the ABA adopted a resolution urging Congress to apply the adjudication provisions of the APA to Type B adjudication for the first time. This ABA policy, attached as Appendix A, includes draft legislative language as well as a detailed explanatory report. The ABA strongly urges the Subcommittee to support the APA reforms outlined in this resolution.

Although the ABA's proposal would subject Type B hearings to the adjudication provisions of the APA, one important part of the existing APA would *not* be applied to Type B hearings under our proposal. Specifically, these hearings would not be conducted by administrative law judges ("ALJs"). In an ideal world, ALJs would preside in all hearings required by federal statutes, but this does not appear to be feasible at this time. Nonetheless, these proposed reforms would offer vastly more protection to persons litigating against federal agencies than is provided by existing law.

In addition to expanding the APA adjudication provisions to Type B hearings, the ABA's policy proposal calls for a number of other significant changes in these provisions. In particular, it (1) mandates the adoption of a code of ethics for all administrative presiding officers, whether they serve in Type A or Type B hearings; (2) provides protection for full-time Type B presiding officers

November 14, 2006
Page 3

against dismissal without good cause; (3) expands the opportunity to seek a declaratory order; and (4) clarifies various definitions in the existing Act that have caused confusion – in particular, the definition of a “rule.”

The drafters of the APA wanted to achieve uniformity of procedure in federal administrative law. They achieved that goal with respect to rulemaking, judicial review, and freedom of information, but they did not achieve it with respect to adjudication. Since 1946, a vast number of Type B hearing schemes have emerged that fall outside the APA’s protective umbrella. The ABA’s recommended reforms would bring Type B hearings under the APA umbrella, which in turn would assure fair administrative procedures to generations of future litigants who find themselves in disputes with federal agencies.

2. Administrative Conference of the United States

In the Federal Regulatory Improvement Act of 2004, P. L. 108–401, Congress reauthorized the ~~Administrative Conference of the United States (“ACUS”) for fiscal years 2005, 2006, and 2007.~~ This reauthorization comports with long-standing ABA policy supporting ACUS and its reauthorization. Specifically, the ABA adopted policy in February 1989 that calls for reauthorization of ACUS with funding sufficient to permit the agency to continue its role as the government’s coordinator of administrative procedural reform. A copy of this ABA policy statement is attached as Appendix B. In our view, a revitalized ACUS could play a crucial role in the future development of the federal APA as well as the other areas of reform contemplated by your Project. Indeed, ACUS would be an ideal forum for exploring just the sort of comprehensive reevaluation of the APA and other reforms that the Subcommittee has been addressing in its Project. It could provide a vital, inclusive and prestigious adjunct to the Subcommittee’s work.

ACUS was originally established in 1964 as a permanent body to serve as the federal government’s in-house advisor on, and coordinator of, administrative procedural reform. It enjoyed bipartisan support for over 25 years and advised all three branches of government before being terminated in 1995. Through the years, ACUS was a valuable resource providing information on the efficiency, adequacy, and fairness of the administrative procedures used by administrative agencies in carrying out their programs. This was a continuing responsibility and a continuing need, a need that has not ceased to exist.

The ABA and its Section of Administrative Law and Regulatory Practice strongly supported the reauthorization of ACUS in 2004 and we applaud your strong leadership in both sponsoring and facilitating the passage of the legislation that made this possible. Since ACUS was reauthorized in 2004, the ABA has been honored to work with you and your staff in an effort to secure adequate funding for the reconstituted agency from Congress. As part of that effort, the ABA sent a letter to the Senate Appropriations Committee on July 18, 2006, urging them to provide funding for ACUS for fiscal year 2007 at the fully authorized level of \$3.2 million. A copy of that letter is attached as Appendix C.

As the ABA explained in its correspondence to the Senate Appropriations Committee, now that Congress has enacted bipartisan legislation reauthorizing ACUS, the agency should be provided with the very modest resources that it needs to restart its operations without unnecessary delay. Unfortunately, neither the Senate nor the House Appropriations Committees have approved the

November 14, 2006
Page 4

funding that ACUS needs to reconstitute its staff, secure office space and supplies, and resume its critical work. Therefore, the ABA urges you and the Subcommittee to continue your efforts to secure funding for ACUS for fiscal year 2007. In addition, whether or not ACUS receives this critical funding this year, we urge you to support legislation in the new 110th Congress that would reauthorize ACUS for fiscal year 2008 and beyond so that it can continue its vital mission.

3. **Administrative Law Judge Conference of the United States**

The ABA also encourages Congress to establish the proposed Administrative Law Judge Conference of the United States as an independent agency to assume the responsibility of the United States Office of Personnel Management ("OPM") with respect to Administrative Law Judges ("ALJs"), including their testing, selection, and appointment. The ABA's proposal—adopted by the ABA House of Delegates in August 2005 and attached as Appendix D—would maximize administrative efficiency by consolidating services, promoting professionalism, promoting public confidence in administrative decision-making, ensuring high ethical standards for administrative law judges, and providing necessary Congressional oversight. Therefore, the ABA strongly urges the Subcommittee to support this proposal by approving legislation that would formally establish the ALJ Conference of the United States.

Thank you for considering the views of the ABA, the Section of Administrative Law and Regulatory Practice, and NCALJ on these critical issues. We stand ready to assist you and the Subcommittee in a reexamination of the APA and with regard to the many other important reforms contemplated by the Project. We will be contacting your staff shortly to consider next steps. In the meantime, if you would like to discuss the ABA's views in greater detail, please feel free to contact me at 301/736-8000 or the ABA's senior legislative counsel for administrative law issues, Larson Frisby, at 202/662-1098.

Sincerely,

Daniel E. Troy, Chair
ABA Section of Administrative Law and Regulatory Practice

cc: Members of the Subcommittee on Commercial and Administrative Law
The Honorable Teta L. Castwood, NCALJ
The Honorable Jodi B. Levine, ABA Judicial Division

**RECOMMENDATION 114
ADOPTED BY THE
HOUSE OF DELEGATES
OF THE
AMERICAN BAR ASSOCIATION**

February 14, 2005*

RESOLVED, That the American Bar Association urges Congress to amend and modernize the adjudication provisions of the Administrative Procedure Act and to expand certain fundamental fair hearings provisions of that Act by enacting legislation consistent with the attached draft bill entitled "Federal Administrative Adjudication in the 21st Century," dated February 2005, recognizing the administrative law judge adjudication as the preferred type of adjudication for evidentiary proceedings conducted under the Administrative Procedure Act.

*Note: The "Recommendation," but not the attached "Report," constitutes official ABA policy.

FEDERAL ADMINISTRATIVE ADJUDICATION
IN THE 21ST CENTURY ACT

A BILL

To amend title 5, United States Code, to modernize the adjudication provisions of the Administrative Procedure Act and to extend certain fundamental fair hearing provisions to additional hearings required by statute.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress Assembled,

SECTION 1. SHORT TITLE.

This Act may be cited as the "Federal Administrative Adjudication in the 21st Century Act".

SEC. 2. DEFINITIONS.

- (a) Section 551 of title 5, United States Code, is amended—
- (1) by striking "and" at the end of paragraph (13);
 - (2) by striking the period at the end of paragraph (14) and inserting "and"; and
 - (3) by adding the following at the end:

"(15) 'Type A adjudication' means adjudication required by statute to be—

 - "(A) determined on the record after opportunity for an agency hearing; or
 - "(B) conducted in accordance with sections 556 and 557 of this title;

"(16) 'Type B adjudication' means an agency evidentiary proceeding required by statute, other than a Type A adjudication;

"(17) 'agency evidentiary proceeding' means an agency proceeding that affords an opportunity for a decision based on evidence submitted by the parties orally or in writing; and

"(18) 'presiding officer' means the initial decisionmaker in a Type B adjudication."
- (b) Section 551(4) of title 5, United States Code, is amended to read as follows:
- "(4) 'rule' means the whole or a part of an agency statement of general applicability designed to implement, interpret, or prescribe law or policy or to describe the organization, procedure, or practice requirements of an agency;"

SEC. 3. TYPE A AND B ADJUDICATIONS.

Section 554 of title 5, United States Code, is amended—

(1) in subsection (a),

(A) by striking "adjudication required by statute to be determined on the record after opportunity for an agency hearing" in the matter preceding paragraph (1) and inserting "Type A adjudication and Type B adjudication";

(B) by inserting "or in a Type A or Type B adjudication" at the end of paragraph (1); and

(C) by striking paragraph (2) and redesignating paragraphs (3), (4), (5), and (6) as paragraphs (2), (3), (4), and (5), respectively;

(2) in subsection (b), by inserting "in a Type A or Type B adjudication" after "an agency hearing" in the matter preceding paragraph (1);

(3) in subsection (c),

(A) by inserting "in a Type A or Type B adjudication," at the beginning of the subsection; and

(B) by striking "on notice and in accordance with sections 556 and 557 of this title" and inserting "in accordance with the procedures for Type A adjudication specified in subsection (d) or Type B adjudication specified in subsection (e)";

(4) in subsection (d),

(A) by designating the first sentence as paragraph (2) and by striking "he" in that sentence and inserting "he or she";

(B) by designating the second sentence as paragraph (3) and redesignating the existing paragraphs (1) and (2) in that sentence as subparagraphs (A) and (B), respectively;

(C) by designating the third and fourth sentences as paragraph (4) and, in the first sentence as so redesignated, by striking all after "agency in a" and inserting "Type A adjudication may not, in that or a factually related adjudication, participate or advise in the initial or recommended decision or any review of such decision except as witness or counsel in public proceedings"; and

(D) by inserting the following at the beginning of the subsection:

"(1) A Type A adjudication shall be conducted in accordance with sections 556 and 557 of this title," and

(5) by striking subsection (e) and inserting the following:

"(e)(1) A Type B adjudication shall be conducted in accordance with the procedures specified in this subsection.

"(2) A party may present its case or defense by oral or documentary evidence and conduct such cross-examination as may be required for a full and true disclosure of the facts. An agency may, when a party will not be prejudiced thereby, adopt procedures for the submission of all or part of the evidence in written form.

"(3) The functions of a presiding officer or an officer who reviews the decision of a presiding officer shall be conducted in an impartial manner.

"(4)(A) A presiding officer shall make the recommended or initial decision in the adjudication unless he or she becomes unavailable to the agency.

"(B) Except to the extent required for the disposition of ex parte matters as authorized by law, the presiding officer shall not consult with any person or party on a fact in issue, unless on notice and with an opportunity for all parties to participate.

"(C) A full-time presiding officer shall not be responsible to or subject to the supervision or direction of an agency employee engaged in the performance of investigative or prosecuting functions. A part-time presiding officer in an adjudication shall not be subject to the supervision or direction of an agency employee engaged in the performance of investigative or prosecuting functions in the same adjudication.

"(D) An employee or agent engaged in the performance of investigative or prosecuting functions for an agency in an adjudication may not, in that or a factually related adjudication, participate or advise in an initial or recommended decision or any review of such decision, except as witness or counsel in public proceedings.

"(E) The requirements of this paragraph do not apply—

- "(i) in determining applications for initial licenses;
- "(ii) to proceedings involving the validity or application of rates, facilities, or practices of public utilities or carriers; or
- "(iii) to the agency or a member or members of the body comprising the agency.

"(5) The requirements of sections 556(e) and 557(d) shall apply to the proceeding and, in particular, the requirements that apply to an administrative law judge under section 557(d) shall apply to the presiding officer in the proceeding.

"(6) The decision of a presiding officer shall include a statement of findings, conclusions, and reasons, on material issues of fact, law, and discretion presented on the record. The decision may be delivered orally or in writing in the discretion of the presiding officer. In the event the decision is reviewed at a higher agency level, the parties shall have an opportunity to submit comments on the decision before the review process is completed.

"(7) An agency engaged in Type B adjudications may adopt rules that provide greater procedural protections than are provided in this section.

"(8) Unless otherwise specified, after the date of enactment of this subsection, the establishment of an opportunity for hearing in an adjudication subject to the requirements of this section shall be deemed to provide for a Type A adjudication."

"(9) Nothing in this section shall affect the requirements relating to agency or judicial review that are presently provided by statute.

SEC. 4. SUNSHINE ACT EXCEPTION.

Section 552b(c)(10) of title 5, United States Code, is amended by striking "formal agency adjudication pursuant to the procedures in section 554 of this title" and inserting "an agency evidentiary proceeding under section 554 of this title."

SEC. 5. DECLARATORY ORDERS.

Section 555 of title 5, United States Code, is amended by adding the following at the end:

"(f) The agency, with like effect as in the case of other orders, and in its sound discretion, may issue a declaratory order to terminate a controversy or remove uncertainty."

SEC. 6. ISSUES RELATING TO EVIDENCE.

Section 556(d) of title 5, United States Code, is amended—
 (1) by inserting "and may be entirely based on evidence that would be inadmissible in a civil trial" at the end of the third sentence; and
 (2) by adding the following after the second sentence: "Evidence may be excluded, although relevant, if its probative value is substantially outweighed by the danger of confusion of the issues, or by considerations of undue delay, waste of time, or needless presentation of cumulative evidence."

SEC. 7. ALJ AND PO ETHICAL STANDARDS; REMOVAL AND DISCIPLINE OF PRESIDING OFFICERS.

(a) Title 5, United States Code, is amended by inserting after section 559 the following:
 "§ 559a. Ethics and independence of Presiding Officers and Administrative Law Judges

"(a) The Office of Government Ethics shall prescribe regulations providing for appropriate ethical standards for administrative law judges and presiding officers who conduct adjudications under section 554 of this title.

"(b) The regulations shall be prescribed in accordance with section 553(b) and (c) of this title.

"§ 559b. Removal and discipline of presiding officers

"(a) A presiding officer, as defined in section 551 of this title and who is full-time, may be disciplined or removed from his or her position as presiding officer only for good cause and only after a hearing before the Merit Systems Protection Board, subject to judicial review. The hearing shall be a Type A adjudication.

"(b) The exceptions applicable to administrative law judges, relating to national security or reductions in force, shall be applicable to the discipline or removal of a presiding officer."

(b) The analysis for chapter 5 of title 5, United States Code, is amended by inserting the following after the item relating to section 559:
 "560a. Ethics and independence of Presiding Officers and Administrative Law Judges.
 "560b. Removal and discipline of presiding officers."

SEC. 9. SUPERSEDING CONTRARY STATUTORY PROVISIONS.

The provisions of this act supersede existing contrary statutory provisions.

REPORT**Introduction**

The Administrative Procedure Act of 1946 (APA)¹ controls the procedures of almost all federal government administrative agencies and it has achieved nearly constitutional status. The APA is of immense importance to the governmental process and to uncounted millions of people who are impacted by federal agencies. The APA regulates *all* federal agency rulemaking and *all* judicial review of agency action (with narrowly drawn exceptions in each case). Under the Freedom of Information Act,² an amendment to the APA passed in 1966, *all* federal government information is covered (again with specific exceptions). The Negotiated Rulemaking Act and the Administrative Dispute Resolution Act³ comprehensively regulate agency alternate dispute resolution.

As discussed in greater detail below, only a portion of agency adjudication is subject to the adjudication provisions of the APA. We call these "Type A adjudications." Type A adjudications are the cases in which administrative law judges (ALJs) ordinarily preside—primarily benefits cases involving Social Security, Medicare,⁴ and Black Lung. In addition, Type A adjudication covers a wide array of regulatory adjudication, such as that conducted by the FTC, NLRB, SEC, and FERC. Type A adjudication also covers a variety of other programs involving civil penalties, labor, transportation, and communication. The APA provides significant protections to litigants in Type A adjudication. These include detailed provisions relating to the merit selection, independence, compensation, freedom from performance evaluation, and tenure of ALJs.

Numerous statutes that call for evidentiary hearings as part of regulatory or benefit programs are not governed by the APA's adjudication provisions. We refer to these as "Type B adjudications." Presiding officers (POs) rather than ALJs conduct these hearings. We believe it would be in the public interest to extend certain APA provisions that prescribe fundamental norms of fair adjudicatory procedure to Type B adjudication. Although all presiding officers should, of course, be selected based on merit, competence and experience, we do not propose that the APA's specific provisions relating to the selection, compensation and tenure of ALJs be extended to POs in Type B adjudication since it is not practical to do so.

This resolution attempts to modernize the adjudication provisions of the APA by accomplishing the following goals:

1. Extend certain APA procedural protections to Type B adjudication (Part I of this Report).

¹ 5 U.S.C. §551 et. seq. The APA is cited herein without the prefix "5 U.S.C."

² APA §552.

³ 5 U.S.C. §§561 et. seq. 571 et. seq.

⁴ The new prescription drug provision will undoubtedly increase the number of Medicare cases heard by ALJs. See Eleanor D. Kinney, *Changes in the Adjudication of Medicare Beneficiary Appeals in the New Medicare Prescription Drug Legislation: Reform or Retreat?* 29 Admin. & Reg. Law News 6 (Spring 2004) (transfer of ALJs deciding Medicare cases from Social Security to HHS).

2. Require adoption of ethical standards for ALJs and POs and protect full-time POs against removal or discipline without cause. (Part II).
3. Clarify the definitions of rule and adjudication under the APA (Part III).
4. Clarify the circumstances in which newly adopted adjudication schemes will be Type A as opposed to Type B adjudication (Part IV).
5. Clarify the APA provisions relating to evidence (Part V).
6. Clarify the ability of all adjudicating agencies to issue declaratory orders.
7. Clarify the right to obtain transcripts at agency's cost of duplication (Part VI).
8. Clarify that legislation adopted pursuant to these recommendations will supersede existing contrary statutory provisions (Part VII).

I. Extending APA procedural protections to Type B adjudication

II.

The existing APA adjudication provisions cover only Type A adjudication. *The proposal discussed in this section of the report would not change Type A adjudication or alter the various provisions in the APA that safeguard ALJ independence.*³ We propose to extend certain procedural protections that are presently applicable to Type A adjudication to Type B adjudication.⁴

A. Type A adjudication under the APA

The term "Type A adjudication" covers all those hearing schemes to which the existing APA adjudicatory provisions apply.⁵ These proceedings, often referred to as "formal adjudication," are ordinarily conducted by ALJs.⁶ They include hearings relating to Social Security, Medicare, and Black Lung benefits as well as to hearings provided by an array of regulatory agencies. There are approximately 1,350 federal ALJs.

In general, Type A adjudications are presently identified by statutes (outside the APA) that either i) explicitly require that sections 556-557 of APA apply or ii) call for adjudication "required by statute to be determined on the record after opportunity for an agency hearing."⁷ As discussed in Part IV, the phrase "on the record" has acquired talismanic properties and most cases hold that those very words (or other clear evidence of Congressional intent) must be used

³ The proposals discussed in Parts II to VII apply to Type A adjudication but do not involve fundamental changes.

⁴ These recommendations relate only to "adjudication" which, as discussed in part III below, means action of a particular rather than general applicability. Thus, proceedings for rulemaking for an entire industry, like those in *United States v. Florida East Coast Ry.*, 410 U.S. 224 (1973), would be treated as rulemaking, not adjudication, and would not be treated as Type B adjudication.

⁵ APA §554, 556-58. See proposed §551(15) defining "Type A adjudication."
⁶ Type A adjudication includes some relatively rare situations in which ALJs do not preside. First, a statute may provide that APA §§556-57 apply except that ALJs do not preside. APA §554(b). See Michael Atimov, editor, *A Guide to Federal Agency Adjudication* §1003 (ABA Section of Administrative Law and Regulatory Practice, 2003) (hereinafter referred to as *Guidebook*). Second, the APA allows the agency head or head to preside instead of ALJs, although this rarely if ever occurs. Third, in initial licensing or reinstatement cases, the APA allows the agency to designate staff members other than ALJs as presiding officers. §556(b). Type A adjudication covers hearings and procedures described in this footnote even though in fact ALJs do not preside.

⁷ APA §554(a) (emphasis added). See *Guidebook* §1.01. Under the proposed default provision discussed in part IV below, adjudicatory hearings called for in future statutes will be Type A adjudication (even if the statute does not use the magic words "on the record") unless Congress provides the contrary.

before Type A adjudication provisions come into play. Other than the changes described in Parts II to VII of this Report, which are not fundamental in nature, we propose no changes in Type A adjudication since we view the system of Type A adjudication as working well.

B. Type B adjudication and informal adjudication

The recommendation proposes extension of certain fundamental procedural protections set forth in the existing APA to "Type B adjudications," meaning evidentiary proceedings required by statute other than Type A adjudication.¹⁰ Type B adjudication covers a wide range of evidentiary proceedings that are conducted by presiding officers (POs) who are not ALJs.¹¹

Although people sometimes refer to Type B adjudication as "informal adjudication," this usage is not proper. Many Type B hearings are as "formal" or even more "formal" than Type A hearings.¹² The term "informal adjudication" is properly used to describe the vast array of adjudications conducted by federal agencies with respect to which no statute requires a hearing.¹³ There are literally millions of informal adjudications, ranging from economically important orders (such as refusal to grant a bank charter) to low-stakes decisions (such as allocation of campsites by federal forest rangers). Our proposals do not affect informal adjudication as defined in this paragraph.

C. Rationale

The provisions in Title V of the U. S. Code relating to rulemaking, judicial review, alternative dispute resolution, and government information apply across the board, but the APA's provisions for adjudication apply only to a portion of federal agency evidentiary proceedings.¹⁴ This unfortunate balkanization of hearing procedures defeats the purpose of the drafters of the APA who wished to achieve greater uniformity and to provide basic fair-hearing norms in most agency adjudication.¹⁵

A 1992 study by ALJ John H. Frye III (based on 1989 data) identified about 83 case-types (involving about 343,000 cases annually) of Type B adjudication.¹⁶ Frye identified 2,692

¹⁰ See proposed APA §§551(16) and (17).

¹¹ In practice, numerous titles are used to describe POs, but we used the generic term PO to include all such positions. See proposed APA §551(18).

¹² Most Type A hearings are Social Security cases which are conducted in a non-adversarial, relatively informal fashion.

¹³ The term "informal adjudication" is sometimes used to describe Type B proceedings that are conducted informally but we believe that the term "informal adjudication" should be reserved for the vast array of adjudicatory proceedings as to which no statute requires an evidentiary hearing.

¹⁴ APA §§555 and 559 apply to all adjudications but provide protections that fall far short of those provided in Type A adjudication or the protections we propose should be applicable to Type B adjudication. See Guidebook §§.04, 9.06.

¹⁵ Jeffrey S. Lubbers, *APA Adjudication: Is the Quest for Uniformity Failing?* 10 Admin. L. J. 65 (1996); Cooley R. Howarth, *Restoring the Applicability of the APA's Adjudicatory Procedures*, 56 Admin. L. Rev. (2004); Attorney General's Manual on the APA § (1947).

¹⁶ John H. Frye III, *Survey of Non-ALJ Hearing Programs in the Federal Government*, 44 Admin. L. Rev. 261, 264 (1992). Frye eliminated 46 case types that showed a caseload of less than one case per year. See also Paul Vachal et al., *The Federal Administrative Judiciary*, Vol. 2 (1992) ACUS Rec. & Rep. 775, 788-90, 843-73. In

POs. Of the 83 case-types, 15 accounted for 98% of the total. The largest Type B category is deportation cases. There are a substantial number of law enforcement cases, including civil penalties administered by numerous agencies,¹⁸ as well as passport denials or security clearance disputes. Type B adjudication includes many benefit cases such as veterans' benefits and Medicare Part B cases decided by employees of insurance carriers. A substantial number of cases deal with economic matters (farm credit, public contract disputes, bid protests, or debarment of contractors) and federal employment relationships (such as those administered by the Merit Systems Protection Board).

In 2002, Raymond Limon updated Frye's study.¹⁹ Limon found 3,370 Type B POs, about a 25% increase from 1989 figures. In contrast, there are 1,351 ALJs in 29 different agencies (a 15% increase).²⁰ Frye reported 393,800 Type B proceedings each year; Limon reported 556,000 (a 41% increase).²¹

POs may be full-time decisionmakers or may be agency staff members who engage in part-time judging along with other tasks.²² Frye found that full-time POs decide about 90% of the Type B cases (but part-time POs decided cases in 34 of the 83 case-types, mostly the less active ones).²³ Most of the full-time POs are lawyers but most of the part-time POs are not lawyers.²⁴

Based on the criteria set forth in Part IV, it would be desirable to convert many of the existing systems of Type B adjudication to Type A adjudication. However, it is unlikely that Congress will be persuaded to do so in the foreseeable future. Thus, our proposal recognizes that

cooperation to the 343,000 Type B adjudications, the ACUS study estimated that there were about 300,000 Type A adjudications per year in the late 1980's.

¹⁸ Under the Clean Water Act, EPA can impose a "class 1 civil penalty" (\$10,000 per violation up to \$25,000 maximum) or a "class 2 civil penalty" (\$10,000 per violation with a maximum of \$125,000). A class 2 penalty must follow "notice and opportunity for a hearing on the record in accordance with section 554 of Title 5." A class 1 penalty also requires notice and a hearing but "such hearing shall not be subject to section 554 and 556 of Title 5 but shall provide a reasonable opportunity to be heard and present evidence." 33 U.S.C.A. §1319(d)(7). These Class 2 penalties call for Type A adjudication but Class 1 penalties call for Type B adjudication. For a thorough treatment of civil penalties and Type B adjudication, see William F. Funk, *Close Enough for Government Work—Using Informal Procedures for Imposing Civil Penalties*, 24 Seton Hall L. R. 1 (1993).

¹⁹ Office of Administrative Law Judges, *The Federal Administrative Judiciary Then and Now—A Decade of Change 1992-2002* (Dec. 23, 2002).

²⁰ Limon stated that in 1992 there were 1167 ALJs; in 2002, there were 1351 ALJs. Limon 3, n.4. During much of the period between the Frye and Limon reports, the hiring of ALJs was frozen. But for the freeze, the number of ALJs would undoubtedly have expanded more rapidly.

²¹ Numerous recent statutes call for Type B adjudication. For example, a recently enacted statute provides for "collection due process" (CDP) hearings by the IRS. IRC §§6320, 6330. The IRS now conducts about 30,000 CDP hearings annually and the number is rising steadily. CDP hearings appear to be Type B adjudication although numerous issues about the nature of CDP hearings and judicial review thereof are at present unresolved. See Bryan T. Camp, *Tax Administration as Inquisitorial Process and the Partial Paradigm Shift in the IRS Restructuring and Reform Act of 1998*, 56 Florida L. Rev. 1, 117-28 (2004); Leslie Book, *The Collection Due Process Rights: A Hurray or Sigh in the Right Direction*, 41 Houston L. Rev. (2004).

²² Some part-time POs are not agency staff members; they may be retired judges or academics who are called upon by the agency from time to time as their particular expertise is needed.

²³ Frye found that there were 601 full-time POs and 2130 part-time POs. However, full-time POs decided about 90% of the Type B cases. Frye 349-50.

²⁴ Frye 349. Limon found that of 3370 POs, only 1370 were lawyers. However, of the 601 full-time POs, 438 were lawyers.

second-best is better than nothing at all. It is intended to insure fundamental, baseline procedural protection in the large universe of Type B adjudication.²⁴ In practice, so far as we can determine, such protections are normally provided in existing Type B adjudication schemes. Nevertheless the public deserves to be guaranteed that such protections will always be provided through generally applicable and accessible APA provisions, instead of the existing maze of due process requirements and situation-specific statutes and procedural regulations.

D. Meaning of "evidentiary proceeding"

Our proposal recognizes and distinguishes three types of federal adjudication. Type A adjudication refers to the set of evidentiary hearings usually conducted by ALJs and is unaffected by our proposal.²⁵ Type B adjudication refers to evidentiary hearings required by statute that are conducted by POs. Our proposal would impose a set of procedural requirements on Type B adjudication. Informal adjudication entails decisions by federal agencies with respect to which no statute calls for a hearing. Our proposal does not affect informal adjudication (except to make clear that it is possible to issue a declaratory order through informal adjudication—see Part VI).

As discussed in Part IV, there is considerable case law that distinguishes Type A from Type B adjudication. Unfortunately, this case law is in conflict. Our proposal does not attempt to resolve this conflict but assumes that the line between Type A and Type B would continue to be drawn under existing law. (Part IV of our proposal would clarify the Type A/Type B distinction for statutes adopted in the future). We discuss here the problem of distinguishing Type B adjudication from informal adjudication.

Type B adjudication, as defined in proposed §551(16), means "an agency evidentiary proceeding required by statute, other than Type A adjudication."²⁶ Under proposed §551(17), the term "agency evidentiary proceeding" means "a proceeding that affords an opportunity for a decision based on evidence submitted by the parties orally or in writing." As provided in new §551(18), a "presiding officer" conducts Type B adjudication. Thus a Type B proceeding will

²⁴ New provisions in California's APA that were enacted in 1995 call for a scheme similar to this proposal. The California statute preserved a system of Type A adjudication that relies on central panel ALJs. It then provides for an "administrative adjudication bill of rights" for Type B adjudication. See generally Michael Janow, *The Influence of the Federal Administrative Procedure Act on California's New Administrative Procedure Act*, 32 *Tulsa L.J.* 287 (1996).

²⁵ See note 16 which observes that a few classes of Type A adjudication are not heard by ALJs. The definition excludes from Type B adjudication the types of cases already excepted from Type A adjudication by §554(a) with some modifications: (1) a matter subject to a subsequent trial of the law and the facts de novo in a court or in a Type A or Type B adjudication; (2) proceedings in which decisions rest solely on inspections, tests, or elections; (3) the conduct of military or foreign affairs functions; (4) cases in which an agency is acting as an agent for a court; or (5) the certification of worker representatives.

We strike out an existing exemption: "(2) the selection or tenure of an employee other than an ALJ." Hearings required by statute that concern the tenure of government employees would normally be classified as Type B adjudication. If any statute provides for evidentiary hearings relating to selection of employees, these would generally be Type B hearings also. Hearings relating to the tenure of ALJs would continue to be Type A adjudication. We propose that disputes concerning the tenure of Type B POs should also be Type A adjudication. We propose to strike out the existing exemption because hearings relating to selection and tenure of federal employees should be included in the APA's provisions for Type A or B adjudication. See Part II.

always be identified by the presence of a federal statute (other than the APA) that calls for an evidentiary proceeding.

Federal statutes frequently call for evidentiary "hearings" that are not Type A adjudication. The definition of Type B adjudication captures these proceedings.²⁷ Some statutes use terms other than "hearing" to describe such proceedings but the intention of the statute is to call for an "evidentiary proceeding."²⁸ The term "evidentiary proceeding" covers hearings required by statute even if all of the evidence is submitted in writing rather than orally, so long as the decisionmaker is limited to considering only record evidence. The term includes non-adversarial, inquisitorial hearings in which the Government is not represented, such as the hearings conducted by the Board of Veterans' Appeals (just as Type A adjudication includes non-adversarial Social Security hearings).²⁹

The term "evidentiary proceeding" does not include statutory provisions calling for notice and comment-type procedures (even if applicable to adjudication) where such procedures do not limit the decisionmaker to consideration only of the evidence in the record.³⁰ Nor does it include so-called "hearings" in which the public is invited to appear and make statements (such as often occurs with respect to various forms of land use decisions),³¹ informal inquiries, or investigatory or settlement-oriented hearings (meaning hearings that can be followed by another de novo administrative review or de novo judicial review to finally resolve the matter).³²

²⁷ For example, in railroad unemployment insurance cases, an employee "shall be granted an opportunity for a hearing before a referee." 35 USC §355. A federal government employee claiming workers compensation "is entitled to a hearing on his claim before a representative of the Secretary." 5 USC §8124(b)(1). In Agriculture Department disputes, there is a "right to appeal an adverse decision for an evidentiary hearing of a hearing officer." 7 USC §6996(a). Persons who are subject to IRS collection activities have "a right to a hearing." IRC §6330(a)(1).
²⁸ In immigration cases, the statute states that an Immigration Judge (IJ) "shall conduct proceedings for deciding the inadmissibility or deportability of an alien." In context, it is clear that the IJ is to conduct an evidentiary proceeding. For example, an alien "shall have reasonable opportunity to present evidence and cross examine witnesses presented by the government." The IJ is authorized to administer oaths, receive evidence, and issue subpoenas; the IJ must rule on evidentiary objections and provide findings and reasons for decisions. 8 USC §1229a(j)(3)(1), (b)(1), (4)(B); 8 CFR §240.1(c). The Contract Disputes Act provides that a board of contract appeals shall "provide to the fullest extent practicable informal, expeditious, and inexpensive resolution of disputes and shall issue decisions in writing." A member may administer oaths, authorize depositions, and subpoena witnesses for taking of testimony. Again, the context makes clear that an evidentiary hearing is intended. 41 USC §607(c), (10). We understand that the existing system of public contract dispute resolution already meets all requirements of Type B adjudication.

²⁹ 38 USC §8710(a), 7107(b). BVA hearings are informal and non-adversarial. See 38 CFR §20.700(c).
³⁰ See 16 USC §1450(d)(A) concerning licensing decisions for activities within the coastal zone. The Secretary of Commerce can override a state's objection to the issuance of a federal license or permit after finding the activity consistent with goals and objectives of the Coastal Zone Management Act or necessary in the interests of national security. The Secretary must first provide an opportunity for the state and permit applicant to submit detailed comments. Though the regulations implementing this provision establish detailed appellate-like procedures for the conduct of the Secretary's inquiry, the statute indicates no requirement for an evidentiary proceeding as the Secretary is not limited to considering only the data contained in the written comments submitted by the parties.

³¹ See, e.g., *Bostroy v. United States*, 690 F.2d 1170, 1174-83 (5th Cir. 1982) ("opportunity for public hearing" does not trigger APA formal adjudication).
³² Present section 554(a)(1) contains an exception for "a matter subject to a subsequent trial of the law and the facts de novo in a court." We propose to add the words "or in a type A or Type B adjudication." We intend thereby to make clear that the requirements for Type B adjudication will not apply where a "hearing" required by statute can be followed by another de novo trial of the law and facts, whether it takes place in an Article III court or before some administrative tribunal or Article I court. In short, a litigant gets only one Type B or Type A administrative proceeding, not two. (For this purpose, we do not consider the remote likelihood that the agency heads or other

It would be possible to extend Type B adjudication to evidentiary proceedings called for by the Due Process clause of the 5th Amendment. We do not propose this because it would be difficult to decide which due process cases call for evidentiary proceedings and which ones call for some sort of interaction that is less formal than an evidentiary proceeding.³³ Due process cases use an ad hoc balancing test to decide what procedures are applicable³⁴ and thus resist the sort of rigidity that the proposed statutory test would entail.

It would also be possible to extend the Type B adjudication concept to evidentiary proceedings called for by agency procedural regulations rather than by statute.³⁵ We do not propose this, however, because it would create perverse incentives. It might discourage agencies from voluntarily adopting hearing procedures through their regulations when they are not required to do so. Also, it might encourage agencies to dispense with hearing procedures now called for by regulations. Agencies should not be discouraged from providing procedural protections that they are not required to provide.³⁶

E. APA provisions applicable to Type B adjudication

Under proposed APA §554(e), certain provisions of the existing APA will apply to Type B adjudication:

- Timely notice and right to submit settlement offers;³⁷
- The right to present a case by oral or documentary evidence and to conduct cross examination when required for a full and true disclosure of the facts;³⁸

reviewing authority can call for a de novo hearing after the decision of an ALJ or a PO as constituting a subsequent de novo trial).

³³ See, e.g., *Cleveland Bd. of Education v. Loudermill*, 470 U.S. 532 (1985) (procedures required before public employee is discharged); *Goss v. Lopez*, 419 U.S. 565 (1975) (procedures required before suspending child from school for ten days or less).

³⁴ *Mishrow v. Elkridge*, 404 U.S. 319 (1976).

³⁵ The VA regulations (but not a statute) provide for a hearing in connection with benefits disputes (so-called "regional office hearings"), 38 CFR §3.103(c). Such hearings are not Type B adjudication for two reasons: 1) they are provided for in regulations rather than by statute, and 2) they are followed by a subsequent de novo administrative hearing provided by the Board of Veterans' Appeals. Similarly, the Equal Employment Opportunities Commission provides hearings for federal employees who allege prohibited discrimination but such hearings are authorized by regulation rather than by statute. See 42 U.S.C. §2000e-16(b); 29 CFR §1614.109(c) (2003).

³⁶ Of course, agencies might choose to incorporate the principles applicable to Type B adjudication in their procedural regulations calling for evidentiary proceedings. It seems likely that many would choose to do so (or have already done so).

³⁷ Proposed APA §554 (b) and (c) apply the existing APA provisions for notice and submission of settlement proposals to Type B proceedings. See Guidebook ¶4.02.

³⁸ Proposed APA §554(e)(2) adapts language from APA §556(d): "A party may present its case or defense by oral or documentary evidence and conduct such cross-examination as may be required for a full and true disclosure of the facts." See Guidebook ¶5.07, 5.08. As in Type A adjudication, a PO would have discretion as to whether evidence should be presented orally or in writing. Similarly, a PO would have discretion whether to allow cross-examination. A PO may decide that cross-examination is not needed for a "full and true disclosure of the facts" where the issue to be resolved is not a disputed factual question that turns on credibility. As in Type A adjudication, a PO may decide that evidence that has been received in written form need not be subject to cross-examination.

Under VA regulations, no cross-examination is allowed in BVA hearings. However, the parties (presumably including the PO) may ask "follow-up questions" of the witnesses. 38 CFR §20.700(c) ("Parties to the

- Decisionmaker impartiality;³⁹
- Decisionmaker independence and separation of functions;⁴⁰
- Prohibition on ex parte contacts with decisionmakers;⁴¹
- The exclusive record and official notice provisions;⁴² and
- the requirement of a written or oral decision containing findings and reasons. In the event that the PO's decision is reviewed at a higher agency level, the PO's decision must be disclosed to the parties who have an opportunity to comment on it prior to the highest-level decision.⁴³

It is intended that the provisions for notice and hearing, decisionmaker independence, and written or oral decisions, would apply only to the initial proceeding.⁴⁴ The requirements of impartiality, separation of functions, ex parte contact, and exclusive record would apply both to the initial decision stage and to the agency review stage. We also believe that the exception from the Government in the Sunshine Act that applies to the "initiation, conduct, or disposition" of Type A adjudication should be extended to include Type B adjudication.⁴⁵

hearing will be permitted to ask questions, including follow-up questions, of all witnesses but cross-examination will not be permitted"). Because of the non-adversarial format of DVA hearings (meaning that the VA is not represented), there may be little occasion for cross-examination. The provision for follow-up questions should be sufficient to meet the requirements of proposed §554(d)(1). Similarly, IRS collection due process (CDP) hearings do not include cross-examination. Reg. §301.6330-1(d)(1) A-D6 ("the taxpayer or the taxpayer's representative do not have the right to subpoena and examine witnesses at a CDP hearing"). The issues in a CDP hearing would not ordinarily involve credibility conflicts so cross-examination should not be necessary.

³⁹ Proposed APA §554(c)(3) adopts language drawn from §556(f): "The functions of a presiding officer or an officer who reviews the decisions of a presiding officer shall be conducted in an impartial manner." See *Guidebook* ¶7.02.

⁴⁰ Proposed §554(c)(4)(A) provides that a PO shall make the recommended or initial decision unless he or she becomes unavailable. This parallels existing §554(d). Proposed §554(c)(4)(B) provides that a PO shall not consult any person or party ex parte on a fact in issue. This parallels existing §554(b)(1). Proposed §554(c)(4)(C) prohibits command influence. It parallels existing §554(d)(2). The proposed command influence provision applies only to full-time POs. It would be impracticable to prohibit command influence in the case of part-time POs who engage in investigations or prosecution functions in other cases and are supervised by staff members who engage in such functions. Instead, we propose that a part-time PO not be supervised by a person serving as prosecutor or investigator in the same adjudication that the PO is deciding. We seek to avoid extra costs or disruption of existing structures, and we do not wish to compel agencies to reorganize themselves. Finally, §554(c)(4)(D) parallels the existing provision for separation of functions; it prohibits agency prosecutors or investigators in a case from participating or advising in the decision of that case. See *Guidebook* ¶7.06.

⁴¹ Proposed APA §554(c)(5) incorporates the provisions of existing APA §557(i). See *Guidebook* ¶7.04.

⁴² Proposed APA §554(c)(6) also incorporates APA §556(c): "The transcript of testimony and exhibits, together with all papers and requests filed in the proceeding, constitutes the exclusive record for decision. . . . When an agency decision rests on official notice of a material fact not appearing in the evidence in the record, a party is notified, on timely request, of an opportunity to show the contrary." See *Guidebook* ¶7.08.

⁴³ Proposed APA §554(c)(6) requires a PO's decision to include "a statement of findings, conclusions, and reasons, on material issues of fact, law, or discretion presented on the record. The decision may be delivered orally or in writing to the discretion of the PO. This provision modifies language in existing APA §557(i). See *Guidebook* ¶6.02. We understood that some POs deliver oral decisions. We did not wish to compel a change in this practice by requiring written decisions. We also understood that in some Type B proceedings, POs write recommended decisions that are not disclosed to the parties until after the agency review phase is completed. Our proposal would change this practice.

⁴⁴ Normally the initial proceeding would be conducted by a PO but these requirements should also apply if the initial proceeding is conducted by the agency heads or other officials.

⁴⁵ 5 USC §552a(c)(10).

Numerous provisions of the existing APA will not apply to Type B adjudication unless required by statute (or by agency rule). These include:

- The various provisions relating to the hiring, compensation, rotation, evaluation and discharge applicable to ALJs.⁴⁶
- Provisions relating to evidence and burden of proof.⁴⁷
- Various provisions relating to review of initial decisions.⁴⁸
- The right to an award of attorney's fees under the Equal Access to Justice Act.⁴⁹

Judge Frye's report confirms that Type B adjudication is already conducted in accordance with the requirements of proposed section 554(c) in almost all cases. Therefore, the adoption of these baseline procedural protections should not significantly change the way that federal agencies conduct Type B adjudication. These provisions will not increase the costs of conducting Type B adjudication or cause delays or confusion or require costly agency reorganizations. Our intention is to assure that litigants will receive fundamental procedural protections in Type B adjudication without requiring restructuring of existing hearing schemes.

II. Ethical standards and protection against reprisal

Proposed §559a requires the Office of Government Ethics to adopt ethical standards for all federal ALJs and POs. This proposal implements Resolution 101B, adopted August 6, 2001, in which the ABA recommended that members of the administrative judiciary be held accountable under appropriate ethical standards adapted from the ABA's Model Code of Judicial Conduct in light of the unique characteristics of particular positions in the administrative judiciary.

The objective of Resolution 101B, and of proposed §559a, is to assure that both ALJs and POs be held accountable to appropriate ethical standards. These rules should be based on the ABA Model Code of Judicial Conduct as a starting point, taking account of the unique characteristics of particular positions of ALJs and POs. The rules should also consider the codes of ethics adopted by groups such as NCALJ and the 1989 Code of Conduct for Administrative Law Judges, and might include particular standards adapted to the unique characteristics of various positions held by ALJs and POs, for part-time and full-time POs, or for lawyers and non-lawyers.⁵⁰

⁴⁶ 5 U.S.C. §§3105, 7521, 5372, 3344, 1305. See *Guidebook* Chapter 10.

⁴⁷ §556(d). See *Guidebook* §§.03 to 5.05. In our view, it is not necessary to incorporate the APA's provisions relating to evidence and burden of proof in order to insure fair procedure in Type B adjudications. In particular, we did not wish to impose the *Greenwich Collieries* decision on agencies conducting Type B adjudication unless they choose to adopt it. *Director, Office of Workers' Compensation Programs v. Greenwich Collieries*, 512 U.S. 267 (1994); *Guidebook* §5.033.

⁴⁸ APA §557(b), (c). See *Guidebook* §6.03. Again, we did not believe it necessary to incorporate these detailed provisions to achieve fair procedures in Type B adjudication.

⁴⁹ See *Guidebook*, chapter 11. We would not be opposed to extending EAJA to Type B adjudication but do not recommend it at this time in the interests of minimizing the budgetary impact of our proposal.

⁵⁰ The ABA's Model Code of Judicial Conduct stresses that "anyone, whether or not a lawyer, who is an officer of a judicial system and performs judicial functions...is a judge within the meaning of this Code."

Also in keeping with Resolution 101B, proposed section 559b provides that full-time POs shall be removed or disciplined only for good cause and only after a hearing to be provided by MSPB under the standards of Type A adjudication, subject to judicial review.²³ Section 559b is also based on ABA Resolution 101B.²⁴ POs should be protected from negative consequences for engaging in ethical and independent decisionmaking. Good cause should include violation of the ethical rules referred to in the preceding paragraph. POs should also be entitled to judicial review of such decisions.

III. Clarifying the definition of rule

At present, the APA's definition of "rule" is defective.²⁵ Rulemaking is the process for formulating a "rule." A "rule" is a "statement of general or particular applicability and future effect designed to implement, interpret or prescribe law or policy...and includes the approval or prescription for the future of rates, wages, corporate or financial structures or reorganizations thereof, prices, facilities, appliances, services or allowances therefore or of valuations, costs, or accounting, or practices bearing on any of the foregoing." Adjudication is the process for formulating an "order" and an "order" means a "final disposition . . . in a matter other than rule making but including licensing."²⁶

The statute should be amended so that agency action of *general applicability* is a rule and agency application of *particular applicability* is adjudication.²⁷ Under the existing definitions, for example, an FTC cease and desist order would be a rule (since it is agency action of particular applicability and future effect), but everyone treats cease and desist orders as "orders" rather than as "rules" and agrees that they should be subject to adjudicatory procedure.²⁸ This

²³ As provided in Recommendation IV, newly enacted hearing schemes should be Type A rather than Type B adjudication unless Congress specifically provides to the contrary. Consistent with the spirit of Recommendation IV, we recommend here that adjudications arising out of the discipline or discharge of POs should be Type A adjudication, meaning that such cases would be heard by the MSPB's ALJs rather than its POs. Of course, the same exceptions presently applicable to hearings to remove ALJs (relating to national security or to reductions in force) would also apply to removal of POs. 3 USC §7521(b)(A) and (B), referring to §7532 and §3502. A full-time PO would be treated as such even if the official had limited incidental duties in addition to judicial responsibilities in evidentiary hearings.

²⁴ The 2001 resolution made clear that, for this purpose, the administrative judiciary includes all individuals whose exclusive role in the administrative process is to preside and make decisions in a judicial capacity in evidentiary proceedings, but does not include agency heads, members of agency appellate boards, or other officials who perform the adjudicative functions of an agency head.

²⁵ See *Guidebook* §1.04; Ronald M. Levin, *The Case for (Finally) Fixing the APA's Definition of "Rule,"* 56 Admin. J. Rev. (2004).

²⁶ APA §§551(4) to (7).

²⁷ The recommendation also deletes the words "and includes the approval or prescription for the future of rates, wages, corporate or financial structures or reorganizations thereof, prices, facilities, appliances, services or allowances therefore or of valuations, costs, or accounting, or practices bearing on any of the foregoing." The effect of the latter change is that rulemaking of general applicability would be rulemaking but rulemaking of particular applicability would be adjudication. See *United States v. Florida East Coast Ry.*, 410 U.S. 224 (1973) (holding that setting of industry-wide railway rate should be treated as informal rulemaking under the APA).

²⁸ As under existing law, a rule that in practice would apply to only a single person is still a rule (rather than an adjudication) as long as it is stated in general terms and it is theoretically possible that it could apply to additional persons. An agency's grant of exemption from a rule to a particular person would be an adjudication.

proposal is already ABA policy. It was part of a set of recommendations approved in 1970 by the HOD.

A further clarifying amendment removes the words "and future effect" from the definition of "rule." This revision would make clear that the APA applies to retroactive rules. Under Supreme Court case law,²⁷ an agency may not adopt a retroactive rule that has the force of law unless Congress explicitly authorizes the agency to do so. When agencies do adopt retroactive rules with the force of law, they should be adopted with appropriate notice and comment procedures.²⁸ In addition, interpretive rules often have retroactive effect; the APA's definition of "rule" should also cover retroactive interpretive rules.

IV. Type A Adjudication: Guidelines for Congress and a Default Provision When Statute is Unclear

In June, 2000, the ABA House of Delegates adopted Resolution 113, a recommendation sponsored by the Judicial Division, that set forth criteria Congress should consider in deciding whether a new adjudicatory scheme should employ Type A adjudication. A second part of the resolution created a default provision that would sweep newly adopted adjudicatory schemes into Type A unless Congress provided otherwise. This 2000 resolution is germane to the present set of recommendations. If Congress takes up the issues of Type A and B adjudication, it would naturally consider this recommendation at the same time.²⁹

A. Criteria for deciding whether new program should employ Type A adjudication

When Congress sets up a new program involving adjudications with opportunity for hearing, it should consider and explicitly determine whether the new program will be Type A adjudication.

Congress should consider the following factors (each of which points toward Type A rather than Type B adjudication):

- a. Whether the adjudication is likely to involve a substantial impact on personal liberties or freedom, whether the orders carry with them a finding of criminal-like culpability or would have substantial economic effect, or whether the orders involve determinations of discrimination under civil rights or analogous laws.
- b. Whether the adjudication would be similar to, or the functional equivalent of, a current type of Type A adjudication.

²⁷ *Brewer v. Georgetown University Hospital*, 488 U.S. 204 (1988). We do not propose to change the rule of the *Georgetown* case but only to provide that the APA's definition of rule applies when an agency is authorized to adopt a retroactive rule or when it adopts a retroactive interpretive rule.

²⁸ See ABA House of Delegates Resolution (Feb. 1997) stating that "retroactive rules are and should be subject to the notice and comment requirements of Section 553 of the Administrative Procedure Act."

²⁹ Because of the various changes in statutory nomenclature embodied in this recommendation and report (such as adoption of the terms Type A and B adjudication), we propose non-substantive changes in the 2000 recommendation.

c. Whether the adjudication would be one in which adjudicators ought to be lawyers.⁴⁰

B. Default provision

Congress should amend the APA to provide prospectively that absent a statutory requirement to the contrary, in any future legislation that creates opportunity for an adjudicatory evidentiary hearing, such hearing shall be Type A adjudication.⁴¹

C. Rationale

Under the existing APA, Type A adjudication exists only when "adjudication [is] required by statute to be determined on the record after opportunity for an agency hearing..."⁴² Where a statute calls for an evidentiary hearing but does not use the magic words "on the record," it has been difficult to decide whether the resulting adjudication is Type A or Type B. The case law is conflicting.⁴³ ABA Resolution 113, already adopted by the HOD, calls for Congress to carefully consider this issue when it adopts future legislation that creates opportunity for an adjudicatory evidentiary hearing. The Resolution provides a useful list of factors that Congress should consider when it makes that decision. The resolution also calls for a prospective-only default rule. Under that rule, future legislation that creates opportunity for an adjudicatory evidentiary hearing will require Type A adjudication unless Congress provides the contrary.

This default rule will nudge federal administrative law in the direction of greater use of ALJs and Type A adjudication. This will result in enhancement in the impartiality and skill of adjudicatory decisionmakers and an accompanying improvement in the fairness and quality of decisions. Generally, agencies are well aware of legislation that affects them and the burden should be on the agencies to inform Congress at the time it considers a new adjudicatory scheme if the agency believes that Type A is inappropriate.⁴⁴

⁴⁰ These factors are substantially the same as those in ACUS Recommendation 92-7, 57 Fed. Reg. 61760 (Dec. 29, 1992).

⁴¹ Resolution 113 states that such hearings "shall be subject to 5 USC §§554, 556, and 557." The present Recommendation used the term Type A adjudication which embodies the sections of the APA referred to in Resolution 113. No change in meaning is intended.

⁴² APA §554(a).

⁴³ See *Guidesbook* §3.01; Gary Edles, "An APA-Default Presumption for Administrative Hearings: Some Thoughts on 'Onsifying' the Adjudication Process," 55 Admin. L. Rev. 787, 796-804 (2003); Cooley R. Howarth, *Federal Licensing and the APA: When Must Formal Adjudicative Procedures Be Used?* 37 Admin. L. Rev. 317 (1985); Cooley R. Howarth, *Restoring the Applicability of the APA's Adjudicatory Procedures*, 56 Admin. L. Rev. (2004). Three distinct lines of cases have emerged. Some cases conclude that Type A adjudication is intended despite absence of the words "on the record." *Shadman v. SBC*, 450 U.S. 91, 96 n.13 (1981); *Seacoast Anti-Pollution League v. Coale*, 572 F.2d 672, 675-78 (1st Cir. 1978); *Lane v. USDA*, 120 F.3d 106 (9th Cir. 1997). Other cases require the use of the words "on the record" or some other clear statement of Congressional intention. *City of West Chicago v. NRC*, 701 F.2d 632, 644-45 (7th Cir. 1983); *RR Comm'n of Texas v. United States*, 765 F.2d 221, 227-29 (D.C. Cir. 1985). And still others accord *Chevron* deference to the agency's determination that the statute does not call for Type A adjudication. *Chemical Waste Mgmt. Inc. v. EPA*, 875 F.2d 1477, 1480-83 (D.C. Cir. 1989).

⁴⁴ According to the Report accompanying Resolution 113, the default rule would apply to "any new adjudication that Congress creates with an opportunity for a hearing." See Edles, 812-14.

V. Issues relating to evidence

A. Residuum rule

The "residuum rule" (followed in some states) requires that a decision must be supported by at least some non-hearsay evidence. This rule creates many problems, such as requiring the judge to make constant hair-splitting rulings about hearsay and its many exceptions, and requiring the parties to object at some appropriate time that the residuum rule applies in order to preserve the issue on appeal. It is generally believed that *Richardson v. Perales*⁴⁵ rejected the residuum rule at the federal level but this should be made clear in the statute.

The proposed amendment to APA section 556(d) accomplishes this result by adding the italicized language: "A sanction may not be imposed or rule or order issued except on consideration of the whole record or those parts thereof cited by a party, and may be entirely based on evidence that would be inadmissible in a civil trial."

B. Evidence—FRE 403

In general, the Federal Rules of Evidence are not applicable to administrative agencies. The existing APA provides that an agency "as a matter of policy shall provide for the exclusion of irrelevant, immaterial, or unduly repetitious evidence."⁴⁶ An ACUS study indicated that this provision was inadequate because it did not give ALJs adequate case management tools. The consultant's survey of ALJs indicated that they believed they lacked power to exclude evidence that was patently unreliable or whose probative value was so low that it would not justify the amount of hearing time it would require.

The ACUS study declared: "This is a serious disadvantage. The delay and high cost of the administrative process poses a severe threat to the quality of justice available in our modern administrative state. Admission and cross-examination of a large volume of low quality evidence contributes significantly to the extraordinary length and attendant high cost of many agency adjudications."⁴⁷

As a result, ACUS recommended that agencies adopt evidentiary rules allowing decisionmakers to exclude evidence under Federal Rule of Evidence 403.⁴⁸ That rule provides: "Although relevant, evidence may be excluded if its probative value is substantially outweighed by the danger of . . . confusion of the issues . . . or by considerations of undue delay, waste of time, or needless presentation of cumulative evidence."⁴⁹ We agree and recommend that section 556(d) of the APA be amended to specifically permit ALJs to exclude evidence based on the FRE 403 standard (as modified slightly to take account of the differences between administrative and judicial proceedings).

⁴⁵ 402 U.S. 389 (1971).

⁴⁶ APA §556(d).

⁴⁷ Richard J. Pierce, Jr., *Use of the Federal Rules of Evidence in Federal Agency Adjudications*, 39 Admin. L. Rev. 1, 23 (1987).

⁴⁸ ACUS Recommendation 86-2, 51 Fed. Reg. 25642 (July 16, 1986).

⁴⁹ The citation in this quotation is for the words "or misleading the jury" and "danger of unfair prejudice," which seem inapplicable to the administrative process.

VI. Declaratory orders

Existing §554(e) empowers an agency to issue a declaratory order to terminate a controversy or remove uncertainty. The placement of this subsection in the existing statute implies that only an agency authorized to conduct Type A adjudication can issue a declaratory order. We believe that any agency, whether conducting Type A, Type B, or informal adjudication, should be authorized to issue a declaratory order. Therefore, we propose moving this provision to §555, which applies to agency proceedings generally.⁷⁹

VII. Transcripts

The APA should provide that transcripts of agency proceedings (if they exist) should be available to private parties at cost of duplication. This is probably already required by §11 of the Federal Advisory Committee Act which provides: "Except where prohibited by contractual agreements entered into prior to the effective date of this act, agencies shall make available to any person, at actual cost of duplication, copies of transcripts of agency proceedings (as defined in §551(12))." It would be useful to incorporate this provision in the APA itself where it would not be overlooked. As a result, we recommend that section 556(e) be amended by adding the italicized language and deleting the stricken out language:

"The transcript of testimony and exhibits, together with all papers and requests filed in the proceeding, constitutes the exclusive record for decision in accordance with section 557 of this title and on payment of lawfully prescribed fees, shall be made available to the parties. Agencies shall make such transcripts available to the parties at the actual cost of duplication. When an agency decision rests on official notice of a material fact not appearing in the evidence in the record, a party is entitled, on timely request, to an opportunity to show the contrary.

VIII. Superseding contrary statutory provisions

Legislation adopted pursuant to these recommendations will supersede existing contrary statutory provisions.

Respectfully submitted,
 Randolph J. May
 Chair, Section of Administrative Law and
 Regulatory Practice

February 2005

APPENDIX
(Ramseyer Rule)

I. Extending APA procedural protections to Type B adjudication

A. Definitions

Add to APA § 551 (definitions), 5 U.S.C. §551:⁷¹

- (15) "Type A" adjudication means adjudication required by statute to be—
 (A) determined on the record after opportunity for an agency hearing; or
 (B) conducted in accordance with sections 556 and 557 of this title;
 (16) "Type B adjudication" means an agency evidentiary proceeding required by statute, other than a Type A adjudication;⁷²
 (17) "agency evidentiary proceeding" means an agency proceeding that affords an opportunity for a decision based on evidence submitted by the parties orally or in writing; and
 (18) "presiding officer" means the initial decisionmaker in a Type B adjudication.

B. Type B adjudication

Amend existing APA §554 so that it reads as follows:

Sec. 554. - Adjudications

(a) *General principles.* This section applies, according to the provisions thereof, in every case of Type A adjudication and Type B adjudication adjudication required by statute to be determined on the record after opportunity for an agency hearing, except to the extent that there is involved—

- (1) a matter subject to a subsequent trial of the law and the facts de novo in a court or in a Type A or Type B adjudication;⁷³
 (2) the selection or tenure of an employee, except an administrative law judge appointed under section 3105 of this title;⁷⁴
 (3) proceedings in which decisions rest solely on inspections, tests, or elections;

⁷¹ Subsequent references to the APA will exclude the prefatory 5 U.S.C.

⁷² The problem of distinguishing Type A, Type B, and informal adjudication is discussed in Parts I.A. and I.B. of the Report that follows these recommendations.

⁷³ In some agencies, the agency heads or a superior reviewing authority can, in theory, require a new de novo hearing of a case already heard by an ALJ or a FO to be conducted before the agency heads. We understand that this virtually never occurs in practice. The unlikely possibility of a de novo rehearing at the agency head level should not be taken into account in applying this subsection. Thus the rules relating to Type A and Type B adjudication apply to the hearing provided by an ALJ or a FO despite the remote possibility that the case could be heard anew at a higher level. For further discussion, see note 22 of the Report.

⁷⁴ This exception in the existing act becomes inappropriate in light of the adoption of the provisions relating to Type B adjudication. For further discussion, see note 26 of the Report.

- (3) the conduct of military or foreign affairs functions;
- (4) cases in which an agency is acting as an agent for a court; or
- (5) the certification of worker representatives.

(b) *Notice.* Persons entitled to notice of an agency hearing in a Type A or Type B adjudication shall be timely informed of —

- (1) the time, place, and nature of the hearing;
- (2) the legal authority and jurisdiction under which the hearing is to be held; and
- (3) the matters of fact and law asserted. ... [balance of subsection remains the same]

(c) *Settlement proposals.* In a Type A or Type B adjudication, the agency shall give all interested parties opportunity for —

- (1) the submission and consideration of facts, arguments, offers of settlement, or proposals of adjustment when time, the nature of the proceeding, and the public interest permit; and
- (2) to the extent that the parties are unable so to determine a controversy by consent, hearing and decision on notice and in accordance with sections 556 and 557 of this title, in accordance with the procedures for Type A adjudication specified in subsection (d) or Type B adjudication specified in subsection (e).

(d) *Procedures for Type A adjudication.*

- (1) A Type A adjudication shall be conducted pursuant to sections 556 and 557 of this title.
- (2) The employee who presides at the reception of evidence pursuant to section 556 of this title shall make the recommended decision or initial decision required by section 557 of this title, unless he or she becomes unavailable to the agency.
- (3) Except to the extent required for the disposition of ex parte matters as authorized by law, such an employee may not —
 - (A) consult a person or party on a fact in issue, unless on notice and opportunity for all parties to participate; or
 - (B) be responsible to or subject to the supervision or direction of an employee or agent engaged in the performance of investigative or prosecuting functions for an agency.
- (4) An employee or agent engaged in the performance of investigative or prosecuting functions for an agency in a case may not, in that or a factually related case, participate or advise in the decision, recommended decision, or agency review pursuant to section 557 of this title, except as witness or counsel in public proceedings. Type A adjudication may not, in that or a factually related adjudication, participate or advise in the initial or recommended decision or any review of such decision, decision, recommended decision, or agency review pursuant to section 557 of this title, except as witness or counsel in public proceedings. This subsection does not apply —
 - (A) in determining applications for initial licenses;
 - (B) to proceedings involving the validity or application of rates, facilities, or practices of public utilities or carriers; or
 - (C) to the agency or a member or members of the body comprising the agency.

(e) The agency, with like effect as in the case of other orders, and in its sound discretion, may issue a declaratory order to terminate a controversy or remove uncertainty.⁷⁵

(e) *Procedures for Type B adjudication.*

- (1) *General rule.* A Type B adjudication shall be conducted in accordance with the procedures specified in this subsection.
- (2) *Presentation of evidence.* A party may present its case or defense by oral or documentary evidence and conduct such cross-examination as may be required for a full and true disclosure of the facts. An agency may, when a party will not be prejudiced thereby, adopt procedures for the submission of all or part of the evidence in written form.
- (3) *Impartiality of presiding officers and reviewing officers.* The functions of a presiding officer or an officer who reviews the decisions of a presiding officer shall be conducted in an impartial manner.
- (4) *Agency decisional process*
 - (A) A presiding officer shall make the recommended or initial decision unless he or she becomes unavailable to the agency.
 - (B) Except to the extent required for the disposition of ex parte matters as authorized by law, the presiding officer shall not consult any person or party on a fact in issue, unless on notice and with an opportunity for all parties to participate.
 - (C) A full-time presiding officer shall not be responsible to or subject to the supervision or direction of an agency employee engaged in the performance of investigative or prosecuting functions. A part-time presiding officer in an adjudication shall not be subject to the supervision or direction of an agency employee engaged in the performance of investigative or prosecuting functions in the same adjudication.
 - (D) An employee or agent engaged in the performance of investigative or prosecuting functions for an agency in an adjudication may not, in that or a factually related adjudication, participate or advise in an initial or recommended decision or any review of such decision, except as witness or counsel in public proceedings.
 - (E) The requirements of this paragraph do not apply—
 - (i) in determining applications for initial licenses;
 - (ii) to proceedings involving the validity or application of rates, facilities, or practices of public utilities or carriers; or
 - (iii) to the agency or a member or members of the body comprising the agency.
 - (5) *Ex parte communications.* The requirements of sections 556(e) and 557(d) shall apply to the proceeding and, in particular, the requirements that apply to an administrative law judge under section 557(d) shall apply to the presiding officer in the proceeding.
 - (6) *Decision.* The decision of a presiding officer shall include a statement of findings, conclusions, and reasons, on material issues of fact, law, and discretion presented on the

⁷⁵ The provision for declaratory orders is moved from §554 to §555. See VI. below.

record. The decision may be delivered orally or in writing in the discretion of the presiding officer. In the event the decision is reviewed at a higher agency level, the parties shall have an opportunity to submit comments on the decision before the review process is completed.

(7) Additional protections. An agency engaged in Type B adjudications may adopt rules that provide greater procedural protections than are provided in this section.

C. Sunshine Act exception.

Section 552b(c)(1)(D) in the Government in the Sunshine Act provides an exception to the Sunshine Act requirements for the "initiation, conduct, or disposition by the agency of a particular case of formal agency adjudication pursuant to the procedures in section 554 of this title or otherwise involving a determination on the record after opportunity for a hearing." This section should be amended to make clear that the exception applies also to Type B adjudication.

II. Ethical standards and protection against reprisal

A. Ethical standards

Add new section 559a:

559a. Ethics and independence of presiding officers and administrative law judges

(a) The Office of Government Ethics shall prescribe regulations providing for appropriate ethical standards for administrative law judges and presiding officers who conduct adjudications under section 554 of this title.

(b) The regulations shall be prescribed in accordance with sections 533(b) and (c) of this title.

B. Removal and discipline of presiding officers

Add a new section 559b:

559b. Removal and discipline of presiding officers

(a) A presiding officer, as defined in section 551 of this title and who is full-time, may be disciplined or removed from his or her position as presiding officer only for good cause and only after a hearing before the Merit Systems Protection Board, subject to judicial review. The hearing shall be a Type A adjudication.

(b) The exceptions applicable to administrative law judges, relating to national security or reductions in force, shall be applicable to discipline or removal of a presiding officer.

III. Clarification of the definition of rule

APA section 551(4) should be amended to read as follows:

(4) "rule" means the whole or a part of an agency statement of general applicability designed to implement, interpret, or prescribe law or policy or to describe the organization, procedure, or practice requirements of an agency;

~~Rule means the whole or a part of an agency statement of general or particular applicability and future effect designed to implement, interpret, or prescribe law or policy or describing the organization, procedure, or practice requirements of an agency and includes the approval or prescription for the future of rates, wages, corporate or financial structures or reorganizations thereof, prices, facilities, appliances, services or allowances therefor or of valuations, costs, or accounting, or practices bearing on any of the foregoing.~~

IV. Type A adjudication: guidelines for Congress and a default provision when statute is unclear

A. Criteria for deciding whether new programs should be Type A adjudication.

When Congress creates a new program involving adjudication with opportunity for an evidentiary hearing, it should consider and explicitly determine whether the new program will be Type A or Type B adjudication.

Congress should consider the following factors (the presence of which would weigh in favor of the use of Type A rather than Type B adjudication):

- a. Whether the adjudication is likely to involve a substantial impact on personal liberties or freedom, whether the orders carry with them a finding of criminal-like culpability or would have substantial economic effect, or whether the orders involve determinations of discrimination under civil rights or analogous laws.
- b. Whether the adjudication would be similar to, or the functional equivalent of, a current type of Type A adjudication.
- c. Whether the adjudication would be one in which adjudicators ought to be lawyers.

Please note that this provision relating to criteria for choosing between Type A and Type B adjudication is not included in the Bill language above since it is not intended to be a statutory provision.

B. Default provision.

Congress should amend the APA to provide prospectively that, absent a statutory requirement to the contrary, in any future legislation that creates an opportunity for hearing in an adjudication, such hearing shall be Type A adjudication.

V. Issues relating to evidence

Section 556(d) should be amended by adding the italicized language:

Except as otherwise provided by statute, the proponent of a rule or order has the burden of proof. Any oral or documentary evidence may be received, but the agency as a matter of policy shall provide for the exclusion of irrelevant, immaterial, or unduly repetitious evidence. Evidence may be excluded, although relevant, if its probative value is substantially outweighed by the danger of confusion of the issues, or by considerations of undue delay, waste of time, or needless presentation of cumulative evidence. A sanction may not be imposed or rule or order issued except on consideration of the whole record or those parts thereof cited by a party and may be entirely based on evidence that would be inadmissible in a civil trial. [The remainder of §556(d) remains the same]

VI. Declaratory orders

Section 555 should be amended by adding thereto the following subsection:

(f) Declaratory orders. The agency, with like effect as in the case of other orders, and in its sound discretion, may issue a declaratory order to terminate a controversy or remove uncertainty.

VII. Transcripts

Section 556(e) should be amended by adding the italicized language and striking the crossed-out language:

The transcript of testimony and exhibits, together with all papers and requests filed in the proceeding, constitutes the exclusive record for decision in accordance with section 557 of this title, *and, on payment of lawfully prescribed costs, shall be made available to the parties. Agencies shall make such transcripts available to the parties at the actual cost of duplication.* When an agency decision rests on official notice of a material fact not appearing in the evidence in the record, a party is entitled, on timely request, to an opportunity to show the contrary.

VIII. Superseding contrary statutory provisions

The provisions of this act supersede existing contrary statutory provisions.

Appendix B

RECOMMENDATION 126A
ADOPTED BY THE
HOUSE OF DELEGATES
OF THE
AMERICAN BAR ASSOCIATION

February 1989

BE IT RESOLVED, that the American Bar Association supports the
reauthorization of the Administrative Conference of the United States (ACUS) and the
provision of funds sufficient to permit ACUS to continue its role as the government's in-
house advisor and coordinator of administrative procedural reform.

SENIOR WASHINGTON LETTER
WRITER
Shirley A. McMillen
202 662-1777

July 18, 2006

The Honorable Thad Cochran
Chairman
Committee on Appropriations
United States Senate
Washington, D.C. 20510

The Honorable Robert C. Byrd
Ranking Member
Committee on Appropriations
United States Senate
Washington, D.C. 20510

Re: Funding the Newly Reauthorized Administrative Conference of the
United States for Fiscal Year 2007

Dear Chairman Cochran and Ranking Member Byrd:

On behalf of the American Bar Association ("ABA") and its more than 400,000 members nationwide, I write to express our strong support for funding the Administrative Conference of the United States ("ACUS") for fiscal year 2007 at the fully authorized level of \$3.2 million. As your Committee prepares to mark up the Transportation, Treasury Appropriations Bill later this week, we urge you to provide full funding for ACUS, which was just reconstituted in the last Congress by the enactment of the "Federal Regulatory Improvement Act of 2004" (P.L. 108-401, formerly, H.R. 4917). Once it is provided with this modest funding, the agency will be able to restart its operations and then begin addressing the many important tasks that may be assigned to it by Congress, including, for example, assisting the Department of Homeland Security to consolidate the administrative processes from the more than 20 federal agencies that were included in the new Department.

ACUS was originally established in 1964 as a permanent body to serve as the federal government's in-house advisor on, and coordinator of, administrative procedural reform. It enjoyed bipartisan support for over 25 years and advised all three branches of government before being terminated in 1995. In 2004, Congress held several hearings on ACUS reauthorization, and during those hearings, all six witnesses, including Supreme Court Justices Antonin Scalia and Stephen Breyer, praised the work of the agency. The written testimony of Justices Scalia and Breyer is available on the ABA's website at <http://www.abanet.org/policy/ACUSreauthorization.html>.

July 18, 2006
Page 2

Following these hearings, H.R. 4917 was introduced by Rep. Chris Cannon (R-UT), Chairman of the House Judiciary Subcommittee on Commercial and Administrative Law, for the purpose of reauthorizing and restructuring the agency. That bipartisan legislation ultimately garnered 34 cosponsors—including 18 Republicans and 16 Democrats—before being approved unanimously by the House and Senate at the end of the 108th Congress. President Bush then signed the measure into law on October 30, 2004.

At the request of Chairman Cannon, the Congressional Research Service ("CRS") prepared a short study describing the many benefits of ACUS, and a copy of the CRS Memorandum of October 7, 2004 is also available at <http://www.abanet.org/polsadv/ACUSreauthorization.html>. As outlined by CRS, ACUS has many virtues, including the following:

• A newly-reconstituted ACUS would provide urgently needed resources and expertise to assist with difficult administrative process issues arising from the 9/11 terrorist attacks against the United States as well as other new administrative issues. The CRS Memorandum concludes that "ACUS's reactivation would fill the exact urgent need for an expert independent entity to render relevant, cost-beneficial assistance with respect to complex and sensitive administrative process issues raised by 9/11 restructuring and reorganization efforts," including the creation of the Department of Homeland Security by consolidating parts of 22 existing agencies and the 9/11 Commission's recommendations to establish a new intelligence structure. In addition, CRS noted that ACUS could provide valuable analysis and guidance on a host of other administrative issues, including public participation in electronic rulemaking, early challenges to the quality of scientific data used by agencies in the rulemaking process, and possible refinements to the Congressional Review Act. A fully-funded ACUS could effectively address these and myriad other issues involving administrative process, procedure, and practice at a cost that is minimal when compared to the benefits that are likely to result.

• ACUS enjoys strong bipartisan support and all observers agree that it has been extremely cost-effective. As CRS also noted in its Memorandum, all six of the witnesses who testified before the House Judiciary Subcommittee on Commercial and Administrative Law agreed that during the more than 25 years of its existence, "... the Conference was a valuable resource providing information and guidance on the efficiency, adequacy and fairness of the administrative procedures used by agencies in carrying out their missions." ACUS was unique in that it brought together senior representatives of the federal government with leading practitioners and scholars of the private sector to work together to improve how our government functions. That collaboration has been sorely missed in many ways, as was so clearly brought out in the hearings. As CRS explained, ACUS produced over 180 recommendations for agency, judicial, and congressional action over the years, and approximately three-quarters of these reforms were adopted in whole or in part. Because ACUS achieved these impressive reforms with a budget of just a few million dollars per year, CRS noted that "all observers, both before and after the demise of ACUS in 1995, have acknowledged that the Conference was a cost-effective operation."

• Before it was terminated in 1995, ACUS brought about many significant achievements. In addition to providing a valuable source of expert and nonpartisan advice to the federal government, ACUS also played an important facilitative role for agencies in implementing changes or carrying out recommendations. In particular, Congress gave ACUS facilitative statutory responsibilities for implementing a number of statutes, including, for example, the Equal Access to Justice Act, the

July 18, 2006
Page 3

Congressional Accountability Act, the Government in the Sunshine Act, the Administrative Dispute Resolution Act, and the Negotiated Rulemaking Act. In addition, ACUS' recommendations often resulted in huge monetary savings for agencies, private parties, and practitioners. For example, CRS cited testimony from the President of the American Arbitration Association which stated that "ACUS' encouragement of administrative dispute resolution had saved millions of dollars that would otherwise have been spent for litigation costs." CRS also noted that in 1994, the FDIC estimated that "its pilot mediation program, modeled after an ACUS recommendation, had already saved it \$9 million." The CRS Memorandum provides numerous additional examples of ACUS' prior successes as well.

• ACUS' role in the regulatory process is totally separate and distinct from that of OIRA. In the past, some have suggested that ACUS' activities perhaps may duplicate some of the activities of OMB's Office of Information and Regulatory Affairs ("OIRA"). This reflects a misunderstanding of ACUS' fundamental role in the regulatory process. By virtue of its history and institutional design, ACUS is uniquely in a position to achieve bi-partisan consensus on administrative and regulatory improvements; to provide a forum for executive and independent agencies to exchange "best practices" ideas; and to bring private sector lawyers and academics together with political and career government officials to address ways to improve government operations.

OIRA is a very different type of entity that is neither inclined nor equipped to address many of the issues that ACUS has focused on. For example, there is no way that OIRA could have devoted so much time and attention to developing the ADR techniques that so many government agencies adopted. Nor does OIRA play any role in agency adjudication or judicial review issues. OIRA's principal role is to represent the President in making sure that the Administration's regulatory policy is followed. ACUS's role, on the other hand, is to be an independent catalyst for seeking to reform and improve administrative and procedural issues that necessarily tend to receive less attention in Congress or the White House in the face of what are deemed more pressing day-to-day matters.

In sum, now that Congress has enacted bipartisan legislation reauthorizing ACUS, the agency should be provided with the very modest resources that it needs to restart its operations without unnecessary delay. To accomplish this goal, we urge you to provide \$3.2 million in funding for ACUS for fiscal year 2007 during your Committee's mark up of the Transportation Treasury Appropriations Bill later this week.

Thank you for considering the views of the ABA on this important issue. If you would like to discuss the ABA's views in greater detail, please feel free to contact the ABA's senior legislative counsel for administrative law issues, Larson Frisby, at 202/662-1098, or the Chair of the ACUS Task Force of the ABA Administrative Law Section, Warren Belmar, at 202/586-6758.

Sincerely,

Robert D. Evans

Appendix D

RECOMMENDATION 106A
ADOPTED BY THE
HOUSE OF DELEGATES
OF THE
AMERICAN BAR ASSOCIATION

August 9, 2005*

RESOLVED, that the American Bar Association encourages Congress to establish the Administrative Law Judge Conference of the United States as an independent agency to assume the responsibility of the United States Office of Personnel Management with respect to Administrative Law Judges including their testing, selection, and appointment.

*Note: The "Recommendation," but not the attached "Report," constitutes official ABA policy.

REPORT

Federal administrative law judges ("ALJ") have been members of the American Bar Association, Judicial Division, National Conference of the Administrative Law Judiciary, since 1971; this resolution renews and extends existing American Bar Association policy.¹

The Office of Personnel Management ("OPM") is mandated to administer the ALJ program and to maintain a register of qualified applicants and test and evaluate prospective applicants.² However, OPM recently closed its Office of Administrative Law Judges and has otherwise failed to adequately service the agencies and the judges under its mandate. In 2003, the functions were dispersed to other OPM divisions, without notice to the agencies or to ALJs regarding the terms of transfer. Thus, there is no central administrative office to administer the administrative law judge program at OPM, and there is no agency that provides suggestions to Congress to improve the administrative adjudication process.

The Administrative Law Judge Conference of the United States will perform those functions and enhance the independence of decision-making and the quality of adjudications of administrative law judge hearings under the Administrative Procedure Act ("APA"). The Administrative Law Judge Conference of the United States would be similar to the Judicial Conference of the United States, which provides administrative functions for Federal Article III judges, but its creation would effect no change in the current relationship between ALJs and the agencies where they serve. Rather the new Conference would assume the current responsibilities of OPM with respect to administrative law judges, including their testing, selection, and appointment.

Federal administrative law judges are appointed under 5 U.S.C. § 3105.³ Their powers emanate

¹The American Bar Association has adopted policy supporting the independence and integrity of the administrative judiciary in 1983, 1989, 1998, 2000 and 2001. Indeed, the Association's commitment to the independence of the administrative judiciary is reflected in the jurisdictional authority of the Standing Committee on Judicial Independence, which is authorized to promote this value.

²The classification of "administrative law judge" is reserved by OPM for the specific class of appointments made under 5 U.S.C. § 3105 and applies to all agencies.
 "The title 'administrative law judge' is the official class title for an administrative law judge position. Each agency will use only this official class title for personnel, budget, and fiscal purposes." 5 C.F.R. § 930.203b.
 5 C.F.R. § 930.201 requires OPM to conduct competitive examinations for administrative law judge positions and defines an ALJ position as one in which any portion of the duties includes those which require the appointment of an administrative law judge under 5 U.S.C. 3105. ALJs can only be appointed after certification by OPM.
 An agency may make an appointment to an administrative law judge position only with the prior approval of OPM, except when it makes its appointment from a certificate of eligibles furnished by OPM. 5 C.F.R. § 930.203c. Id. § 930.203a; see also 5 U.S.C. § 5372 (2009) (providing for pay for administrative law judges, also subject to OPM approval).

³See also, 5 U.S.C. sec. 5372 (a) ("For the purposes of this section, the term 'administrative law judge' means an administrative law judge appointed under section 3105.")

from the Administrative Procedure Act.⁴ Extensive legal experience is necessary for the position, because experience provides maturity, expertise in compiling a reliable record, first-hand knowledge with problems likely to be encountered as an administrative law judge, and intimacy with rules of evidence and procedure similar to those used in administrative hearings.⁵ After reviewing the duties of the office, the Supreme Court has declared that federal administrative law judges are like other federal trial judges for tenure and compensation⁶ and that ALJs are functionally equivalent to other Federal trial judges:

Cases heard and decided by ALJs involve billions of dollars and have considerable impact on the national economy. In fact, a single ALJ may handle a single case that may affect millions of people and involve billions of dollars. ALJs adjudicate cases involving a wide range of regulatory matters...

The Office of Personnel Management

The need for a separate agency to manage the ALJ program is prompted by longstanding problems with OPM's administration of the program. The APA contemplated that the Civil Service Commission (now OPM)⁷ would oversee merit selection and appointment of ALJs and would also act as an ombudsman for the ALJ program but OPM has essentially abandoned that role. Section 1305 provides that for the purpose of sections 3105 (appointments), 3344 (loans), and 45373 (pay) OPM "may: investigate, require reports by agencies, prescribe regulations, appoint advisory committees as necessary, recommend legislation, subpoena witnesses and records, and pay witness fees." Although the OPM Program Handbook, p. 4, affirms those responsibilities, OPM has seldom exercised them, except for regulations, including sometimes less-than-benign changes in selection and RIF regulations.⁸

On May 21, 1991, the National Conference of Administrative Law Judges (NCALJ)⁹, in the Judicial Division of the American Bar Association, wrote to OPM, pointing out that:

⁴ See, A Guide to Federal Agency Adjudication, Michael Asimov, ed., 164 (*American Bar Association Administrative Law Studies*, 2002). For example, subject to published rules of the agency, administrative law judges are empowered to administer oaths, issue subpoenas, receive relevant evidence, take depositions, and regulate the course of the hearing. These fundamental powers arise from the Administrative Procedures Act "without the necessity of express agency delegation" and "an agency is without the power to withhold such powers" from its administrative law judge, *id.* The Administrative Procedure Act seeks to affirm and protect the role of the administrative law judge, whose "impartiality," in the words of the Supreme Court in *Marshall v. Service*, 446 U.S. 238, 250 (1980), "serves as the ultimate guarantee of fair and meaningful proceedings in our constitutional regime."

⁵ Aniel T. Sharon and Craig B. Pettibone, "Merit Selection of Federal Administrative Law Judges," 70 *Judicature* 216, 218 (1987).

⁶ *Batz v. Economos*, 438 U.S. 478 (1978).

⁷ *Federal Maritime Com'n v. South Carolina State Ports Authority*, 535 U.S. 743 (2002); see also, *Rhode Island Dept. of Environmental Management v. United States*, 304 F.3d 311 (1st Cir. 2002) (finding that Department of Labor administrative law judges are functionally equivalent to Federal District Judges).

⁸ Administration of the ALJ program was originally placed in the Civil Service Commission and was subsequently bifurcated to OPM and the Merit Systems Protection Board ("MSPB").

⁹ See Appointment, Pay, and Removals of Administrative Law Judges, 63 Fed. Reg. 8,874 (proposed Feb. 23, 1998).

¹⁰ Now the National Conference of the Administrative Judiciary.

OPM has not taken a leadership role in the education of either ALJs or the agencies as to the nature of their relationship or the judge's function, or in the supervision or investigation of problems related to that relationship and function. OPM has not conducted or sponsored orientation programs for ALJs or their administrators, has not monitored the appointment of sufficient numbers of ALJs by agencies (although traditionally it has carefully monitored appointments to prevent the appointment of too many), has not adopted or proposed uniform rules for conduct, procedure, robes, support staff, office or hearing space, and has not investigated or made recommendations on any of these questions, or the long-standing strife between the SSA and its ALJs, or, most recently, the apparent due process breakdown at MSPB in connection with projected furlough of ALJs in fiscal 1991.

That letter suggested 10 items that OPM should undertake to improve relationships between ALJs and their agencies and the lot of ALJs generally, including education for ALJs and their reviewing authorities, administrative leave for education, guidelines for offices, staff support, robes and perks, model procedural rules, standards of conduct, appointment of sufficient judges by agencies, a mini-corps, and an investigation of the SSA and furlough situations and pay issues. In June 1991 OPM forwarded that letter to the Administrative Conference of the United States (ACUS) for consideration in connection with its study of the Federal administrative judiciary. That study was completed in 1992 and recognized the importance of continuing and improving the position of ALJs and the ALJ program.¹¹ However, OPM neither referenced nor dealt with any of the NCALJ concerns, and OPM undertook no action on the report even though it sponsored it.

In August 1994 NCALJ again sought a response to its letter and was told by OPM in a September 8, 1994, letter that "several of your concerns appear to be more appropriately identified as agency matters" and that "other concerns appear to involve matters which conflict with this agency's evolving policy of returning greater responsibility for personnel management to the agencies." The letter did not address the fact that such a policy might conflict with OPM's responsibilities under the APA. In short, while OPM has responsibility to study and report to Congress concerning the ALJ program, it has not done so and has proclaimed an interest in returning its function to the agencies.

From 1998 to 2004, agencies were generally unable to hire new judges from the OPM register. While *Adler*¹² was pending, OPM suspended the examination process for administrative law judges (ALJ). Therefore, the ALJ register became dated. With one exception,¹³ agencies could not hire judges from the ALJ Register during this period. In *Bash v. Office of Personnel Management*, 315 F.3d 1358 (Fed. Cir. 2003), after an applicant was rejected in his request to be given part of the ALJ examination, the Federal Circuit determined that the suspension of testing was a reviewable employment practice.¹⁴ On

¹¹ 1 C.F.R. § 305.92-7. [57 FR 61760, Dec. 29, 1992].

¹² *Meeker v. Merit Systems Protection Board*, 319 F.3d 1368 (Fed. Cir. 2003).

¹³ In August, SSA was granted a waiver by OPM to hire 126 judges who would have qualified under any scoring formula. See *Hearing Before the Subcommittee on Social Security of the Committee on Ways and Means House of Representatives*, One Hundred Seventh Congress, Second Session (MAY 2, 2002).

¹⁴ Smecting America Bar Association policy establishes that with respect to the recruitment and selection of administrative law judges (ALJs) employed by Federal agencies, OPM, and Congress, where necessary, are to develop strategies to increase the percentages of women and minority candidates, eliminate venereal preferences from this process, allow selection by agencies from a broader range of candidates for ALJ positions, and enhance

February 27, 2004, the United States Supreme Court finally dismissed the requests for certiorari.

OPM has also failed to follow its own regulations concerning priority placement from the ALJ priority referral list (PRL),¹⁷ resulting in irreparable harm to an ALJ on the PRL and a preliminary injunction against its continued improper administration of the PRL.¹⁸

Various other questions have arisen concerning the appropriate administration of the ALJ program, including the adoption of a Code of Judicial Conduct for ALJs, which OPM has refused to consider as part of its responsibility under present law. While OPM has met periodically with ALJ representatives, it has refused requests to establish an advisory committee or to meet with ALJ representatives on a regular basis to discuss these and other problems concerning the ALJ program.¹⁹

Administration of the ALJ program by OPM has been inadequate, and OPM has repeatedly indicated by words and deeds that it does not want to continue responsibility for the administration of operational programs such as the ALJ program. Indeed, until 1998 the OPM long-range plan did not recognize the ALJ program as one of its responsibilities. From 1994-95 the Office of Administrative Law Judges was upgraded by placing an administrative law judge in charge of the office, but since that time the office director has been a personnel specialist rather than a judge and the office has been subordinated under other testing functions. For many years OPM refused to maintain a continuously open examination for ALJ applicants, and when it finally opened the register continuously, it applied illegal criteria, as noted above, in examining and scoring applicants. As a result of OPM inaction, agencies have not been able to address hiring needs.

Maximize Administrative Efficiency

The Administrative Law Judge Conference of the United States will assume all duties with respect to administrative law judges currently mandated to OPM. The budget currently dedicated to administration of an administrative law judges' program by OPM will be transferred to the Administrative Law Judge Conference. Agencies will continue to select ALJs but the selection process and ALJ register will be managed by the Administrative Law Judge Conference of the United States.

It is also anticipated that the office of the Chief Judge will have the capacity to review rules of procedure, rules of evidence, peer review, and where appropriate, make suggestions *vis a vis* to promote administrative uniformity.

Ensure High Standards

The Administrative Law Judge Conference of the United States will assure high standards for

OPM's Office of Administrative Law Judges. Although OPM facially adhered to these requests, it failed to administer the system during the period when it was involved in the *Agall* litigation.

¹⁷ Under 5 CFR §930.215, an ALJ who is separated from service because of a reduction in force (RIF) is entitled to priority referral for any ALJ vacancy ahead of others on the ALJ register of eligibles maintained by OPM.

¹⁸ *Rothberg v. United States*, No. 98-10752-JUT, Order dated December 10, 1998, 1998 U.S. Dist. LEXIS 19432 (D. Mass., 1998).

¹⁹ In 1998 and 1999, OPM advised ALJs that they are required to maintain active bar status to retain their status as ALJs, although there is no provision in the OPM regulations granting authority to do so. Unlike attorneys, ALJs are barred from the practice of law by the Code of Judicial Conduct (Canon SP/ABA, 1990), which has been applied to ALJs by the Merit Systems Protection Board (*In re Chacoff*, 1 MSPBR 612, 651 (1978)) and by some agency regulations. In some states, Federal ALJs like other judges, cannot be members of the state bar. E.g. Alabama.

Federal Administrative Law Judges. It will permit the chief judge to adopt and issue rules of judicial conduct for administrative law judges. This is consistent with ABA policy, which states in part, that members of the administrative judiciary should be held accountable under appropriate ethical standards adapted from the ABA Model Code of Judicial Conduct in light of the unique characteristics of particular positions in the administrative judiciary.¹⁸

Promote Professionalism

The Conference can be used as a resource for continuing judicial education, consistent with ABA policy.¹⁹ ABA policy also encourages governmental entities at all levels to permit government lawyers, including those in judicial administrative positions, to serve in leadership capacities within professional associations and societies.²⁰

Promote Public Confidence

Establishment of the Administrative Law Judge Conference of the United States will significantly increase public trust and confidence in the integrity and independence of decision making by administrative law judges throughout the Federal Government.

Congressional Oversight

Congress needs a new organization to assure independent review of agency compliance with the APA and reporting to Congress on these important public safeguards for fundamental due process and the fair hearing process before administrative agencies. The Administrative Law Judge Conference of the United States will provide regular reports to the Congress on agency compliance with the APA and the provisions relating to ALJ utilization, management and compensation. This process will assist the Congress in its oversight of agency compliance with the APA. This reform permits Congress to maintain oversight on constitutional safeguards such as the right to an impartial and independent decision maker, notice and opportunity to appear at a hearing, a written explanation for the decision and the issuance of a timely hearing decision. This is consistent with ABA policy that Congress provide a practical process for agency matters.²¹

Respectfully Submitted,

Lorraine Arkfeld, Chair, Judicial Division

MEMORANDUM FROM MORTON ROSENBERG, SPECIALIST IN AMERICAN PUBLIC LAW AND T.J. HALSTEAD, LEGISLATIVE ATTORNEY, AMERICAN LAW DIVISION, CONGRESSIONAL RESEARCH SERVICE, TO THE SUBCOMMITTEE ON COMMERCIAL AND ADMINISTRATIVE LAW

Memorandum

August 3, 2005

TO: House Subcommittee on Commercial and Administrative Law, Committee on the Judiciary
Attention: Susan Jensen

FROM: Morton Rosenberg
Specialist in American Public Law
American Law Division

T.J. Halstead
Legislative Attorney
American Law Division

SUBJECT: Comparison of the Duties and Objectives of the Office of Management and Budget and the Administrative Conference of the United States With Respect to the Assessments of Executive Agency Performance in the Administrative Process

Pursuant to your request, this memorandum provides a brief overview of the duties and objectives of the Administrative Conference of the United States and the Office of Management and Budget, with a focus on whether the activities of a reconstituted Administrative Conference would be duplicative of functions already performed by OMB.

Structure and Functions of ACUS

Legislation creating a permanent Administrative Conference of the United States (ACUS), was enacted in 1964,¹ with funds first appropriated in 1968.² In 1995, the activities of ACUS ceased when funding for its activities was terminated. ACUS was reauthorized in the 108th Congress,³ but has yet to receive an appropriation. The statutory provisions governing ACUS were never repealed by Congress, and the reauthorization in the 108th

¹ See 5 U.S.C. §§ 591-96.

² P.L. 90-392 (1968).

³ P.L. 108-401, 108th Cong. 2d Sess. (2004).

Congress only slightly revised its original provisions, by authorizing appropriations and by making four additions to the “purposes” section of the Act.⁴

Pursuant to its statutory authorization, ACUS is tasked with (1) providing “suitable arrangements through which Federal agencies, assisted by outside experts, may cooperatively study mutual problems, exchange information, and develop recommendations for action by proper authorities to the end that private rights may be fully protected and regulatory activities and other federal responsibilities may be carried out expeditiously in the public interest”; (2) promoting “more effective public participation and efficiency in the rulemaking process”; (3) reducing “unnecessary litigation in the regulatory process”; (4) improving “the use of science in the regulatory process;” and (5) improving “the effectiveness of laws applicable to the regulatory process.”⁵

The reauthorization leaves intact ACUS’ original membership dynamic, which is structured, in effect, as a public/private partnership, in order to maximize “the joint participation of agency and outside experts in administrative procedure.”⁶ In the event of appropriation its membership will thus consist of a minimum of 75 and a maximum of 101 members, composed of a Chairman, council, and assembly. The Chairman would be appointed by the President, the council would be composed of the chair and ten other members, and the assembly, if comprised in accordance with prior practice, would consist of approximately 100 members, “consisting of representatives of federal agencies, boards, and commissions and private citizens, including lawyers, law professors, and others knowledgeable about administrative law and practice.”⁷

During the course of its original existence, ACUS was widely viewed as an effective, independent and nonpartisan entity. For instance, Sally Katzen, a former Administrator of OMB’s Office of Information and Regulatory Affairs (OIRA) during the Clinton administration, stated in 1994 that ACUS “has a long-standing tradition of private-sector membership that crosses party and philosophical lines.”⁸ Likewise, C. Boyden Gray, a former White House Counsel in the George H.W. Bush administration, testified before the House Judiciary Committee’s Subcommittee on Commercial and Administrative Law in support of the reauthorization of ACUS, stating: “Through the years, the Conference was a valuable resource providing information on the efficiency, adequacy and fairness of the administrative procedures used by administrative agencies in carrying out their programs. This was a continuing responsibility and a continuing need, a need that has not ceased to exist.”⁹

As further evidence of the widespread respect of, and support for, ACUS, it is interesting to note that Supreme Court Justices Scalia and Breyer testified before the Subcommittee in support of the reauthorization of ACUS. Justice Scalia stated that ACUS was "a proved and effective means of opening up the process of government to needed improvement," and Justice Breyer characterized ACUS as "a unique organization, carrying out work that is important and beneficial to the average American, at a low cost."¹⁰ Examples of the accomplishments for which ACUS has been credited range from the simple and practical, such as the publication of time saving resource material, to analyses of complex issues of administrative process and the spurring of legislative reform in those areas.¹¹

Structure and Functions of OMB

The Office of Management and Budget traces its origin to the establishment of the original Bureau of the Budget within the Department of the Treasury by the Budget and Accounting Act of 1921.¹² The Bureau was transferred to the newly created Executive Office of the President by Reorganization Plan No. 1 of 1939,¹³ and was subsequently designated as the Office of Management and Budget by Reorganization Plan No. 2, of 1970.¹⁴ While OMB's primary function centers on budget formulation and execution, it has many other major functions, including regulatory analysis and review. The Paperwork Reduction Act of 1980, later recodified as the Paperwork Reduction Act of 1995, established the Office of Information and Regulatory Affairs (OIRA) within OMB. In addition to its statutory responsibilities, OIRA exerts significant influence on the scope and substance of agency regulations through a presidentially mandated review and planning process. Shortly after the creation of OIRA in 1980, President Reagan issued Executive Order 12291, which imposed cost-benefit analysis requirements on rule formulation and established a centralized review procedure for all agency regulations. Responsibility for this program was delegated to OIRA.

In practical effect, E.O. 12291 gave OIRA a substantial degree of control over agency rulemaking, enabling OMB to exert considerable influence over agency efforts in this context from the earliest stages of the process. The impact of E.O. 12291 on agency regulatory activity was immediate and substantial, with OIRA reviewing over 2000 regulations per year and returning multiple rules to agencies for reconsideration. As a result of this rigorous review process, agencies became sensitized to the regulatory agenda of the Reagan Administration, largely resulting in the enactment of regulations that reflected the goals of the Administration.¹⁵ The issuance and implementation of the order generated controversy and criticism, with opponents asserting that the review process was distinctly anti-regulatory and constituted an unconstitutional transfer of authority to OIRA from the executive

agencies. This review scheme was retained to similar effect and controversy in the George H.W. Bush Administration.

President Clinton supplanted the Reagan era review scheme with Executive Order 12866, entitled "Regulatory Planning and Review."¹⁶ The Clinton order implemented a more selective and transparent review process, while generally retaining the centralized review dynamic established by E.O. 12291. Coupled with the comparatively pro-regulatory stance of OMB during the Clinton era, this review scheme resulted in a decrease in the rates of OIRA review of rules, from an average of 2080 regulations per year in fiscal years 1982-93 to an average of 498 in fiscal year 1996.¹⁷ It is important to note that this decrease in the numbers of rules reviewed does not indicate a concession on the part of the Clinton Administration that there were limits on presidential control of the scope of OIRA review or on the agency rulemaking process specifically.¹⁸ Rather, it would appear that the Clinton Administration employed the OIRA review process and general assertions of administrative control over agencies in order to implement its regulatory agenda.¹⁹

The George W. Bush Administration has retained E.O. 12866, utilizing it to implement a review regime that subjects rules to more stringent review than was the case during the Clinton Administration. It has been asserted that the current Administration has returned to the review dynamic that prevailed under E.O. 12291, with OIRA describing itself as the "gatekeeper for new rulemakings."²⁰ Under the current Administration, OIRA has increased the use of "return" letters to require agencies to reconsider rules, which, in turn, has led agencies to seek OIRA input "into earlier phases of regulatory development in order to prevent returns later in the rulemaking process."²¹ This dynamic arguably buttresses executive control over agency rulemaking efforts by exerting influence over rulemaking activity at the earliest stages of rule formulation.²² Additionally, OIRA has instituted the practice of issuing "prompt letters" to appropriate agencies to encourage rulemaking on issues it feels are ripe for regulation.²³ OIRA has acknowledged that prompt letters "do not have the mandatory implication of a Presidential directive," characterizing them instead as a device that "simply constitutes an OIRA request that an agency elevate a matter in priority."²⁴ As with the use of return letters, the use of prompt letters has arguably enabled OIRA to exert a substantial degree of influence on an agency's regulatory agenda.²⁵

Analysis

While ACUS and OIRA could be viewed as operating within the same sphere to the extent that they are both concerned with regulatory matters, it would appear that there are substantial, concrete differences between their respective structures and missions that in turn give rise to a fundamental difference between the nature and manner of their respective assessments of agency performance in the administrative process.

Most importantly, ACUS is an independent entity, whereas OIRA is responsible for effectuating a given administration's regulatory agenda. As touched upon above, ACUS was widely regarded as an independent, objective entity that was tasked with the unique role of assessing all facets of administrative law and practice with the single goal of improving the regulatory process. As stated by one commentator, "[t]his level of bipartisanship contributed greatly to the ability of the Administrative Conference to reach consensus on issues for their merits rather than because of any particular ideology or party agenda; this in turn contributed to the credibility of the Conference's work and the willingness of academics and private attorneys to volunteer their time to the Administrative Conference."²⁶ Conversely, OIRA has none of the indicia of independence or objectivity that characterized ACUS, nor does it claim such a character. As an arm of OMB, situated within the Executive Office of the President, OIRA is quintessentially executive in nature, with a predominant mission to advance the policy goals of the President. As such, while OIRA might be characterized as serving a coordinating function in the administrative context, it naturally follows that this function is exercised under the influence of the President.²⁷ Indeed, the activities of OIRA during the Reagan, Clinton, and George W. Bush Administrations, as touched upon above, would appear to establish that this coordinating function has been employed to further the regulatory agenda of those administrations.

The distinction between ACUS as an independent entity and OIRA as an executive agency may also be seen as having practical effects that give further credence to the ability of ACUS to serve uniquely in the consideration of agency specific issues. For instance, Loren A. Smith, currently serving as a Senior Judge on the United States Court of Federal Claims and a former Chairman of ACUS, has stated:

[T]he very fact of ACUS' smallness and its lack of investigative powers and budget sanctions, made agencies willing to come to ACUS and listen to ACUS. OMB or the General Accounting Office were threatening. The General Services Administration and the Office of Personnel Management were often perceived as the enemy. ACUS on the other hand, was seen as the kind counselor, one who gave useful, and generally palatable remedies. It thus had the confidence of most of the Executive branch and the Congress. And a place like this is not to be valued lightly.²⁸

Apart from concerns regarding independence and objectivity, it has been suggested that while the staff of OIRA possess a significant degree of expertise with regard to

²⁶ Fine, n. 8, *supra*, at 55.

²⁷ See, e.g., Lubbers n. 6, *supra*, at 152.

²⁸ Loren A. Smith, *The Aging of Administrative Law: The Administrative Conference Reaches Early Retirement*, 30 *Ariz. St. L.J.* 175, 181 (1998).

administrative issues, there are nonetheless fundamental structural issues that would inhibit OIRA's efficacy in this context, such as the "multitude of issues flowing through agencies daily, the severely limited resources of executive oversight, and the variety of control relationships that exist in the administrative system."²⁹ Justice Breyer echoed this sentiment in his testimony discussing the mission of ACUS, stating "I have not found other institutions readily available to perform this task. Individual agencies, while trying to reform themselves, sometimes lack the ability to make cross-agency comparisons...The Office of Management and Budget does not normally concern itself with general procedural proposals."³⁰

Also, the broad scope of ACUS' mission, coupled with its independence and expertise could be seen as making it the appropriate entity to analyze the efficacy of the functions of OMB itself. In his testimony before the Subcommittee, C. Boyden Gray identified OMB activities as being ripe for study by ACUS, suggesting "empirical research on the innovation of the OMB 'prompt' letter, matters relating to data quality and peer review issues," as particularly suitable topics for inquiry.³¹

These issues of independence and objectivity, the widely recognized expertise and bipartisan nature of ACUS, and the broad scope of the work it conducted in all facets of the administrative process could thus be taken to belie the notion that the activities of a reconstituted ACUS would be duplicative of the functions of OMB or its Office of Information and Regulatory Affairs.

²⁹ See Edles, n. 11, *supra*, at 135 (quoting Thomas O. Sargentich, *The Supreme Court's Administrative Law Jurisprudence*, 7 Admin. L.J. Am. U. 273, 280 (1993)). Professor Edles has further suggested that "[p]rocedure and process changes would rarely, if ever, rise to the level sufficient to attract OIRA's attention." See Edles, n. 11, *supra*, at 135-36 n. 212.

THE 60TH ANNIVERSARY OF THE ADMINISTRATIVE PROCEDURE ACT: WHERE DO WE GO FROM HERE?

TUESDAY, JULY 25, 2006

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON COMMERCIAL
AND ADMINISTRATIVE LAW,
COMMITTEE ON THE JUDICIARY,
Washington, DC.

The Subcommittee met, pursuant to notice, at 11:30 a.m., in Room 2141, Rayburn House Office Building, the Honorable Chris Cannon (Chairman of the Subcommittee) presiding.

Mr. CANNON. The Committee on the Judiciary's Subcommittee on Commercial and Administrative Law will come to order.

The current Federal regulatory process faces many significant challenges. Just last week, the Subcommittee on Commercial and Administrative Law conducted a hearing on legislation aimed at addressing various loopholes and recurrent inefficiencies involving the Regulatory Flexibility Act of 1980. As this hearing revealed, these shortcomings in the regulatory process translate into real costs that are borne by every American.

Other problematic issues that have arisen over the years in the area of administrative law and procedure include the absence of transparency at certain stages of the rulemaking process, the increasing incidence of agencies publishing final rules without having them first promulgated on a proposed basis, the stultification of certain aspects of the rulemaking process, and the need for more consistent enforcement by agencies.

Given the fact that the Administrative Procedure Act was enacted more than 60 years ago, a fundamental question that arises is whether the act is still effective in the 21st century.

To help us answer that question, House Judiciary Committee Chairman Sensenbrenner, with the active support of Ranking Member Conyers, last year asked our Subcommittee to spearhead the Administrative Law Process and Procedure Project.

With the objective of conducting a nonpartisan, academically credible analysis, the project will culminate with the preparation of a detailed report with recommendations for legislative proposals and suggested areas for further research to be considered by the hopefully soon-to-be reactivated Administrative Conference of the United States.

As many of you know, ACUS was an independent agency that served as a think-tank and made numerous recommendations that

improved efficiency, adequacy, and fairness of the procedure used by agencies to carry out administrative programs. We are particularly pleased that Professor Breger, who previously served 6 years as the chairman of ACUS, is here to share his views on the state of the APA, especially in light of his experience with ACUS.

Today's hearing is one of a series of programs and hearings that our Subcommittee has conducted as part of this project. In addition to the Regulatory Flexibility Act, the Subcommittee conducted a hearing on the Congressional Review Act, as well as a hearing on the project itself.

The Subcommittee has also cosponsored two symposia as part of the project. The first symposium, held last December, focused on Federal e-Government initiatives. This program, chaired by Professor Coglianesi, examined the executive branch's efforts to implement e-rulemaking across the Federal Government. Professor Coglianesi will provide a summary of that symposium for us today, as well as an update on subsequent developments, especially with respect to the Government-wide Federal docket management system.

The Subcommittee's second symposium examined the role of science in the rulemaking process. Issues considered at that program included OMB's recent initiative dealing with regulatory science and the role of science advisory panels.

A further symposium is planned for September 11, 2006, which will examine such issues as the respective roles that the executive and legislative branches play in the rulemaking process. As part of the project, several studies are also being conducted. One of these studies, which another of our witnesses, Professor Bill West, will discuss today, examines how agencies develop proposed rules.

While the APA generally requires agencies to involve the public in the rulemaking process by publishing notices of proposed rulemaking to which the public can submit comments, critical decisions regarding proposed rules are often made in the months and perhaps even years before rules are published. Surprisingly, little is known about how agencies actually develop these rules. Professor West's study will shed some light on this heretofore unexamined area of the rulemaking process.

At this time, I would like to extend, on behalf of the Subcommittee, our thanks to the Congressional Research Service for funding this very much needed research and for its role, as particularly exemplified by Mort Rosenberg and Curtis Copeland, in coordinating this and other research endeavors for the project. As Professor Magill will later explain, the need for empirical research is not being met. This gap only emphasizes the need to reactivate ACUS.

I now turn to my colleague, Mr. Watt, the distinguished Ranking Member of the Subcommittee, and ask him if he has any opening remarks.

[The prepared statement of Mr. Cannon follows:]

PREPARED STATEMENT OF THE HONORABLE CHRIS CANNON, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF UTAH, AND CHAIRMAN, SUBCOMMITTEE ON COMMERCIAL AND ADMINISTRATIVE LAW

The current federal regulatory process faces many significant challenges. Just last week, the Subcommittee on Commercial and Administrative Law conducted a hear-

ing on legislation aimed at addressing various loopholes and recurrent inefficiencies involving the Regulatory Flexibility Act of 1980. As this hearing revealed, these shortcomings in the regulatory process translate into real costs that are borne by every American.

Other problematic issues that have arisen over the years in the area of administrative law and procedure include the absence of transparency at certain stages of the rulemaking process, the increasing incidence of agencies publishing final rules without having them first promulgated on a proposed basis, the stultification of certain aspects of the rulemaking process, and the need for more consistent enforcement by agencies.

Given the fact that the Administrative Procedure Act was enacted more than 60 years ago, a fundamental question that arises is whether the Act is still effective in the 21st Century.

To help us answer that question, House Judiciary Committee Chairman Sensenbrenner—with the active support of Ranking Member Conyers—last year asked our Subcommittee to spearhead the Administrative Law, Process and Procedure Project. With the objective of conducting a nonpartisan, academically credible analysis, the Project will culminate with the preparation of a detailed report with recommendations for legislative proposals and suggested areas for further research to be considered by the hopefully soon-to-be reactivated Administrative Conference of the United States.

As many of you know, ACUS was an independent agency that served as a think tank and made numerous recommendations that improved the efficiency, adequacy, and fairness of the procedure used by agencies to carry out administrative programs. We're particularly pleased that Professor Breger, who previously served six years as the Chairman of ACUS, is here to share his views on the state of the APA especially in light of his experience with ACUS.

Today's hearing is one of a series of programs and hearings that our Subcommittee has conducted as part of this Project. In addition to the Regulatory Flexibility Act, the Subcommittee conducted a hearing on the Congressional Review Act as well as a hearing on the Project itself.

The Subcommittee has also cosponsored two symposia as part of the Project. The first symposium, held last December, focused on federal e-government initiatives. This program, chaired by Professor Coglianese (pronounced "Co-lone-niece"), examined the Executive Branch's efforts to implement e-rulemaking across the federal government. Professor Coglianese will provide a summary of that symposium for us today as well as an update on subsequent developments especially with respect to the government-wide Federal Docket Management System.

The Subcommittee's second symposium examined the role of science in the rulemaking process. Issues considered at that program included OMB's recent initiatives dealing with regulatory science and the role of science advisory panels.

A further symposium is planned for September 11, 2006, which will examine such issues as the respective roles that the executive and legislative branches play in the rulemaking process.

As part of the Project, several studies are also being conducted. One of these studies, which another of our witnesses—Professor Bill West—will discuss today, examines how agencies develop proposed rules.

While the APA generally requires agencies to involve the public in the rulemaking process by publishing notices of proposed rulemaking to which the public can submit comments, critical decisions regarding proposed rules are often made in the months and perhaps even years before rules are published. Surprisingly, little is known about how agencies actually develop these rules. Professor West's study will shed some light on this heretofore unexamined area of the rulemaking process.

At this time I would like to extend—on behalf of the Subcommittee—our thanks to the Congressional Research Service for funding this very much needed research and for its role, as particularly exemplified by Mort Rosenberg and Curtis Copeland, in coordinating this and other research endeavors for the Project. As Professor Magill will later explain, the need for empirical research is not being met. This gap only emphasizes the need to reactivate ACUS.

Mr. WATT. Thank you, Mr. Chairman.

I thank the Chairman for convening this hearing and for the very important and strong and committed leadership role that he has played in taking the charge of our Chairman, Mr. Sensenbrenner, and the Ranking Member, seriously and studying this area.

Today, as he has indicated, we will hear from noted scholars on various aspects of the Administrative Procedure Act. APA is as important now as it was when it was first enacted in 1946. From Administration to Administration, whether Democratic or Republican, the role of the administrative agencies in our political system cannot be underestimated.

Although recently new entities have emerged to compete for the title of fourth branch of Government, such as the media, lobbyists and corporate interests, of course, there is no doubt that our administrative agencies continue to exercise power officially reserved for the first three branches, or power not defined by the Constitution at all.

The Administrative Procedure Act is a necessary tool to ensure that the power conferred upon the agencies is not abused and that it is exercised efficiently and fairly. Our rapidly changing technological landscape requires that we look to see whether the APA requires modernization to ensure that fairness and efficiency remain viable.

So I look forward to hearing from the witnesses about the various developments in the area of administrative rulemaking and the regulatory process, with an eye toward improving and strengthening the process.

My staff person has just reminded me that if the APA is 60 years old, it is a baby-boomer. So we need to be researching our own roles. Maybe we have two baby-boomers here, trying to figure out what to do about another baby-boomer. So everybody is studying age and growing old. It is time that we do it on the APA.

Thank you. I yield back.

Mr. CANNON. I thank the gentleman.

Without objection, the gentleman's statement will be placed in the record. Hearing no objection, so ordered.

Without objection, all Members may place their statements on the record at this point. Hearing no objection, so ordered.

Without objection, the Chair will be authorized to declare recesses of the hearing at any point. Hearing no objection, so ordered.

I ask unanimous consent that Members have 5 legislative days to submit written statements for inclusion in today's hearing record. Hearing no objection, so ordered.

Some of the witnesses have asked for additional time to submit more formal statements. We appreciate your willingness to be here, and in a couple of cases on relatively short notice, and so I ask unanimous consent that the witnesses be allowed 5 days within which to submit more formal statements. Hearing no objection, so ordered.

At this point, I would like to submit on unanimous consent a statement from the Federal Administrative Law Judges Conference for inclusion in the record. Hearing no objection, so ordered.

[The material referred to follows:]

July 25, 2006
Page 2

Below we have highlighted some issues of pressing concern to the ABA. These include: amendment of the adjudication provisions of the APA, reauthorization and appropriation of funds for the Administrative Conference of the United States, and creation of the "Administrative Law Judge Conference of the United States."

I. Proposed Changes in APA Adjudication

The rulemaking, public information, and judicial review provisions of the APA apply to all federal agencies (with specific exceptions). However, this is *not* the case with the adjudication sections of the APA (primarily sections 554, 556 and 557). These sections presently apply only to a small subset of the subject matter of federal agency adjudications: Social Security Act disability, old-age and survivors benefits claims, Medicare claims, labor law cases, and certain hearings conducted by about 20 other independent regulatory agencies and other Executive Branch agencies. We call these Type A hearings.

These APA provisions guarantee basic, fundamental fairness. They provide for the right to present evidence and confront the opponent's evidence; require an impartial decision-maker; prohibit ex parte contacts; require separation of adjudicatory from advocacy functions within the agency; and require a statement of findings and reasons. Unfortunately, however, the APA adjudication provisions do not apply under present law to a vast number of adjudications in which an evidentiary hearing is required by federal statutes. Some of the excluded hearings are cases involving immigration and asylum, veterans' benefits, government contract disputes, civil money penalties, security clearances, IRS collection disputes, and about 80 other hearing schemes. We call these Type B hearings. There is no logical reason for the distinction between Type A and Type B hearings. Yet the number of statutes calling for Type B hearings is steadily increasing while the number of statutes calling for Type A hearings remains relatively constant. The APA should apply to all adjudicatory hearings required by statute that are conducted by federal agencies.

In 2005, the ABA adopted a resolution urging Congress to apply the adjudication provisions of the APA to Type B adjudication for the first time. This ABA policy, attached as Appendix A, includes draft legislative language as well as a detailed explanatory report. The ABA strongly urges the Subcommittee to support the APA reforms outlined in this resolution.

Although the ABA's proposal would subject Type B hearings to the adjudication provisions of the APA, one important part of the existing APA would *not* be applied to Type B hearings under our proposal. Specifically, these hearings would not be conducted by administrative law judges ("ALJs"). In an ideal world, ALJs would preside in all hearings required by federal statutes, but this does not appear to be feasible at this time. Nonetheless, these proposed reforms would offer vastly more protection to persons litigating against federal agencies than is provided by existing law.

In addition to expanding the APA adjudication provisions to Type B hearings, the ABA's policy proposal calls for a number of other significant changes in these provisions. In particular, it: (1) mandates the adoption of a code of ethics for all administrative presiding officers, whether they serve in Type A or Type B hearings; (2) provides protection for full-time Type B presiding officers against dismissal without good cause; (3) expands the opportunity to seek a declaratory order; and

July 25, 2006
Page 3

(4) clarifies various definitions in the existing Act that have caused confusion – in particular, the definition of a “rule.”

The drafters of the APA wanted to achieve uniformity of procedure in federal administrative law. They achieved that goal with respect to rulemaking, judicial review, and freedom of information, but they did not achieve it with respect to adjudication. Since 1946, a vast number of Type B hearing schemes have emerged that fall outside the APA’s protective umbrella. The ABA’s recommended reforms would bring Type B hearings under the APA umbrella, which in turn would assure fair administrative procedures to generations of future litigants who find themselves in disputes with federal agencies.

2. Administrative Conference of the United States

In the Federal Regulatory Improvement Act of 2004, P. L. 108–401, Congress reauthorized the Administrative Conference of the United States (“ACUS”) for fiscal years 2005, 2006, and 2007. This reauthorization comports with long-standing ABA policy supporting ACUS and its reauthorization. Specifically, the ABA adopted policy in February 1989 that calls for reauthorization of ACUS with funding sufficient to permit the agency to continue its role as the government’s coordinator of administrative procedural reform. A copy of this ABA policy statement is attached as Appendix B. In our view, a revitalized ACUS could play a crucial role in the future development of the federal APA. Indeed, ACUS would be an ideal forum for exploring just the sort of comprehensive reevaluation of the APA that the Subcommittee has initiated. It could provide a vital, inclusive and prestigious adjunct to the Subcommittee’s work.

ACUS was originally established in 1964 as a permanent body to serve as the federal government’s in-house advisor on, and coordinator of, administrative procedural reform. It enjoyed bipartisan support for over 25 years and advised all three branches of government before being terminated in 1995. Through the years, ACUS was a valuable resource providing information on the efficiency, adequacy and fairness of the administrative procedures used by administrative agencies in carrying out their programs. This was a continuing responsibility and a continuing need, a need that has not ceased to exist.

The ABA and its Section on Administrative Law and Regulatory Practice strongly supported the reauthorization of ACUS in 2004 and we applaud your strong leadership in both sponsoring and facilitating the passage of the legislation that made this possible. Since ACUS was reauthorized in 2004, the ABA has been honored to work with you and your staff in an effort to secure adequate funding for the reconstituted agency from Congress. As part of that effort, the ABA sent a letter to the Senate Appropriations Committee on July 18, 2006, urging them to provide funding for ACUS for fiscal year 2007 at the fully authorized level of \$3.2 million. A copy of that letter is attached as Appendix C.

As the ABA explained in its correspondence to the Senate Appropriations Committee, now that Congress has enacted bipartisan legislation reauthorizing ACUS, the agency should be provided with the very modest resources that it needs to restart its operations without unnecessary delay. Unfortunately, neither the Senate nor the House Appropriations Committees have approved the funding that ACUS needs to reconstitute its staff, secure office space and supplies, and resume its critical work. Therefore, the ABA urges you and the Subcommittee to continue your efforts to

July 25, 2006
Page 4

secure funding for ACUS for fiscal year 2007. In addition, whether or not ACUS receives this critical funding this year, we urge you to support legislation in the new 110th Congress that would reauthorize ACUS for fiscal year 2008 and beyond so that it can continue its vital mission.

3. Administrative Law Judge Conference of the United States

The ABA also encourages Congress to establish the proposed Administrative Law Judge Conference of the United States as an independent agency to assume the responsibility of the United States Office of Personnel Management ("OPM") with respect to Administrative Law Judges ("ALJs"), including their testing, selection, and appointment. The ABA's proposal, adopted by the ABA House of Delegates in August 2005 and attached as Appendix D, would maximize administrative efficiency by consolidating services, promoting professionalism, promoting public confidence in administrative decision-making, ensuring high ethical standards for administrative law judges, and providing necessary Congressional oversight. Therefore, the ABA strongly urges the Subcommittee to support this proposal by approving legislation that would formally establish the ALJ Conference of the United States.

Thank you for considering the views of the ABA, the Section of Administrative Law and Regulatory Practice, and NCALI on these critical issues. We stand ready to assist you and the Subcommittee in a reexamination of the APA at its 60th anniversary. We will be contacting your staff shortly to consider next steps. In the meantime, if you would like to discuss the ABA's views in greater detail, please feel free to contact me at 317/274-4091 or the ABA's senior legislative counsel for administrative law issues, Larson Frisby, at 202/662-1098.

Sincerely,

Eleanor D. Kinney, Chair
ABA Section of Administrative Law and Regulatory Practice

cc: Members of the Subcommittee on Commercial and Administrative Law
The Honorable Jodi B. Levine, ABA Judicial Division

Appendix A

RECOMMENDATION 114
ADOPTED BY THE
HOUSE OF DELEGATES
OF THE
AMERICAN BAR ASSOCIATION

February 14, 2005*

RESOLVED, That the American Bar Association urges Congress to amend and modernize the adjudication provisions of the Administrative Procedure Act and to expand certain fundamental fair hearings provisions of that Act by enacting legislation consistent with the attached draft bill entitled "Federal Administrative Adjudication in the 21st Century," dated February 2005, recognizing the administrative law judge adjudication as the preferred type of adjudication for evidentiary proceedings conducted under the Administrative Procedure Act.

*Note: The "Recommendation," but not the attached "Report," constitutes official ABA policy.

**FEDERAL ADMINISTRATIVE ADJUDICATION
IN THE 21ST CENTURY ACT**

A BILL

To amend title 5, United States Code, to modernize the adjudication provisions of the Administrative Procedure Act and to extend certain fundamental fair hearing provisions to additional hearings required by statute.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress Assembled,

SECTION 1. SHORT TITLE.

This Act may be cited as the "Federal Administrative Adjudication in the 21st Century Act".

SEC. 2. DEFINITIONS.

(a) Section 551 of title 5, United States Code, is amended--

- (1) by striking "and" at the end of paragraph (13);
- (2) by striking the period at the end of paragraph (14) and inserting "; and"; and
- (3) by adding the following at the end:
 - "(15) 'Type A adjudication' means adjudication required by statute to be—
 - "(A) determined on the record after opportunity for an agency hearing; or
 - "(B) conducted in accordance with sections 556 and 557 of this title;
 - "(16) 'Type B adjudication' means an agency evidentiary proceeding required by statute, other than a Type A adjudication;
 - "(17) 'agency evidentiary proceeding' means an agency proceeding that affords an opportunity for a decision based on evidence submitted by the parties orally or in writing; and
 - "(18) 'presiding officer' means the initial decisionmaker in a Type B adjudication."

(b) Section 551(4) of title 5, United States Code, is amended to read as follows:

"(4) 'rule' means the whole or a part of an agency statement of general applicability designed to implement, interpret, or prescribe law or policy or to describe the organization, procedure, or practice requirements of an agency;"

SEC. 3. TYPE A AND B ADJUDICATIONS.

Section 554 of title 5, United States Code, is amended—

- (1) in subsection (a),
- (A) by striking "adjudication required by statute to be determined on the record after opportunity for an agency hearing" in the matter preceding paragraph (1) and inserting "Type A adjudication and Type B adjudication";
- (B) by inserting "or in a Type A or Type B adjudication" at the end of paragraph (1); and
- (C) by striking paragraph (2) and redesignating paragraphs (3), (4), (5), and (6) as paragraphs (2), (3), (4), and (5), respectively;
- (2) in subsection (b), by inserting "in a Type A or Type B adjudication" after "an agency hearing" in the matter preceding paragraph (1);
- (3) in subsection (c),
- (A) by inserting "In a Type A or Type B adjudication," at the beginning of the subsection; and
- (B) by striking "on notice and in accordance with sections 556 and 557 of this title" and inserting "in accordance with the procedures for Type A adjudication specified in subsection (d) or Type B adjudication specified in subsection (e)";
- (4) in subsection (d),
- (A) by designating the first sentence as paragraph (2) and by striking "he" in that sentence and inserting "he or she";
- (B) by designating the second sentence as paragraph (3) and redesignating the existing paragraphs (1) and (2) in that sentence as subparagraphs (A) and (B), respectively;
- (C) by designating the third and fourth sentences as paragraph (4) and, in the first sentence as so redesignated, by striking all after "agency in a" and inserting "Type A adjudication may not, in that or a factually related adjudication, participate or advise in the initial or recommended decision or any review of such decision except as witness or counsel in public proceedings"; and
- (D) by inserting the following at the beginning of the subsection:
- "(1) A Type A adjudication shall be conducted in accordance with sections 556 and 557 of this title"; and
- (5) by striking subsection (e) and inserting the following:
- "(e)(1) A Type B adjudication shall be conducted in accordance with the procedures specified in this subsection.
- "(2) A party may present its case or defense by oral or documentary evidence and conduct such cross-examination as may be required for a full and true disclosure of the facts. An agency may, when a party will not be prejudiced thereby, adopt procedures for the submission of all or part of the evidence in written form.
- "(3) The functions of a presiding officer or an officer who reviews the decision of a presiding officer shall be conducted in an impartial manner.
- "(4)(A) A presiding officer shall make the recommended or initial decision in the adjudication unless he or she becomes unavailable to the agency.
- "(B) Except to the extent required for the disposition of ex parte matters as authorized by law, the presiding officer shall not consult with any person or party on a fact in issue, unless on notice and with an opportunity for all parties to participate.

"(C) A full-time presiding officer shall not be responsible to or subject to the supervision or direction of an agency employee engaged in the performance of investigative or prosecuting functions. A part-time presiding officer in an adjudication shall not be subject to the supervision or direction of an agency employee engaged in the performance of investigative or prosecuting functions in the same adjudication.

"(D) An employee or agent engaged in the performance of investigative or prosecuting functions for an agency in an adjudication may not, in that or a factually related adjudication, participate or advise in an initial or recommended decision or any review of such decision, except as witness or counsel in public proceedings.

"(E) The requirements of this paragraph do not apply—

"(i) in determining applications for initial licenses;
 "(ii) to proceedings involving the validity or application of rates, facilities, or practices of public utilities or carriers; or
 "(iii) to the agency or a member or members of the body comprising the agency.

"(5) The requirements of sections 556(e) and 557(d) shall apply to the proceeding and, in particular, the requirements that apply to an administrative law judge under section 557(d) shall apply to the presiding officer in the proceeding.

"(6) The decision of a presiding officer shall include a statement of findings, conclusions, and reasons, on material issues of fact, law, and discretion presented on the record. The decision may be delivered orally or in writing in the discretion of the presiding officer. In the event the decision is reviewed at a higher agency level, the parties shall have an opportunity to submit comments on the decision before the review process is completed.

"(7) An agency engaged in Type B adjudications may adopt rules that provide greater procedural protections than are provided in this section.

"(I) Unless otherwise specified, after the date of enactment of this subsection, the establishment of an opportunity for hearing in an adjudication subject to the requirements of this section shall be deemed to provide for a Type A adjudication."

(E) Nothing in this section shall affect the requirements relating to agency or judicial review that are presently provided by statute.

SEC. 4. SUNSHINE ACT EXCEPTION.

Section 552b(c)(10) of title 5, United States Code, is amended by striking "formal agency adjudication pursuant to the procedures in section 554 of this title" and inserting "an agency evidentiary proceeding under section 554 of this title."

SEC. 5. DECLARATORY ORDERS.

Section 555 of title 5, United States Code, is amended by adding the following at the end:

"(f) The agency, with like effect as in the case of other orders, and in its sound discretion, may issue a declaratory order to terminate a controversy or remove uncertainty."

SEC. 6. ISSUES RELATING TO EVIDENCE.

Section 556(d) of title 5, United States Code, is amended--
 (1) by inserting "and may be entirely based on evidence that would be inadmissible in a civil trial" at the end of the third sentence; and
 (2) by adding the following after the second sentence: "Evidence may be excluded, although relevant, if its probative value is substantially outweighed by the danger of confusion of the issues, or by considerations of undue delay, waste of time, or needless presentation of cumulative evidence."

SEC. 7. ALJ AND PO ETHICAL STANDARDS; REMOVAL AND DISCIPLINE OF PRESIDING OFFICERS.

(a) Title 5, United States Code, is amended by inserting after section 559 the following:

"§ 559a. Ethics and independence of Presiding Officers and Administrative Law Judges

(a) The Office of Government Ethics shall prescribe regulations providing for appropriate ethical standards for administrative law judges and presiding officers who conduct adjudications under section 554 of this title.

(b) The regulations shall be prescribed in accordance with section 553(b) and (c) of this title.

"§ 559b. Removal and discipline of presiding officers

(a) A presiding officer, as defined in section 551 of this title and who is full-time, may be disciplined or removed from his or her position as presiding officer only for good cause and only after a hearing before the Merit Systems Protection Board, subject to judicial review. The hearing shall be a Type A adjudication.

(b) The exceptions applicable to administrative law judges, relating to national security or reductions in force, shall be applicable to the discipline or removal of a presiding officer."

(b) The analysis for chapter 5 of title 5, United States Code, is amended by inserting the following after the item relating to section 559:
 "560a. Ethics and independence of Presiding Officers and Administrative Law Judges.
 "560b. Removal and discipline of presiding officers."

SEC. 9. SUPERSEDING CONTRARY STATUTORY PROVISIONS.

The provisions of this act supersede existing contrary statutory provisions.

REPORT**Introduction**

The Administrative Procedure Act of 1946 (APA)¹ controls the procedures of almost all federal government administrative agencies and it has achieved nearly constitutional status. The APA is of immense importance to the governmental process and to uncounted millions of people who are impacted by federal agencies. The APA regulates *all* federal agency rulemaking and *all* judicial review of agency action (with narrowly drawn exceptions in each case). Under the Freedom of Information Act,² an amendment to the APA passed in 1966, *all* federal government information is covered (again with specific exceptions). The Negotiated Rulemaking Act and the Administrative Dispute Resolution Act³ comprehensively regulate agency alternate dispute resolution.

As discussed in greater detail below, only a portion of agency adjudication is subject to the adjudication provisions of the APA. We call these "Type A adjudications." Type A adjudications are the cases in which administrative law judges (ALJs) ordinarily preside—primarily benefits cases involving Social Security, Medicare,⁴ and Black Lung. In addition, Type A adjudication covers a wide array of regulatory adjudication, such as that conducted by the FTC, NLRB, SEC, and FERC. Type A adjudication also covers a variety of other programs involving civil penalties, labor, transportation, and communication. The APA provides significant protections to litigants in Type A adjudication. These include detailed provisions relating to the merit selection, independence, compensation, freedom from performance evaluation, and tenure of ALJs.

Numerous statutes that call for evidentiary hearings as part of regulatory or benefit programs are not governed by the APA's adjudication provisions. We refer to these as "Type B adjudications." Presiding officers (POs) rather than ALJs conduct these hearings. We believe it would be in the public interest to extend certain APA provisions that prescribe fundamental norms of fair adjudicatory procedure to Type B adjudication. Although all presiding officers should, of course, be selected based on merit, competence and experience, we do not propose that the APA's specific provisions relating to the selection, compensation and tenure of ALJs be extended to POs in Type B adjudication since it is not practical to do so.

This resolution attempts to modernize the adjudication provisions of the APA by accomplishing the following goals.

1. Extend certain APA procedural protections to Type B adjudication (Part I of this Report).

¹ 5 U.S.C. §§51 et. seq. The APA is cited herein without the prefatory 5 U.S.C.

² APA §552.

³ 5 U.S.C. §§561 et. seq.; 571 et. seq.

⁴ The new prescription drug provision will undoubtedly increase the number of Medicare cases heard by ALJs. See Eleanor D. Kinney, *Changes in the Adjudication of Medicare Beneficiary Appeals in the New Medicare Prescription Drug Legislation: Reform or Retreat?* 29 Admin. & Regal. Law News 6 (Spring 2004) (transfer of ALJs deciding Medicare cases from Social Security to HHS).

2. Require adoption of ethical standards for ALJs and POs and protect full-time POs against removal or discipline without cause. (Part II).
3. Clarify the definitions of rule and adjudication under the APA (Part III).
4. Clarify the circumstances in which newly adopted adjudication schemes will be Type A as opposed to Type B adjudication (Part IV).
5. Clarify the APA provisions relating to evidence (Part V).
6. Clarify the ability of all adjudicating agencies to issue declaratory orders.
7. Clarify the right to obtain transcripts at agency's cost of duplication (Part VI).
8. Clarify that legislation adopted pursuant to these recommendations will supersede existing contrary statutory provisions (Part VII).

I. Extending APA procedural protections to Type B adjudication

II.

The existing APA adjudication provisions cover only Type A adjudication. *The proposal discussed in this section of the report would not change Type A adjudication or alter the various provisions in the APA that safeguard ALJ independence.*⁵ We propose to *extend* certain procedural protections that are presently applicable to Type A adjudication to Type B adjudication.⁶

A. Type A adjudication under the APA

The term "Type A adjudication" covers all those hearing schemes to which the existing APA adjudicatory provisions apply.⁷ These proceedings, often referred to as "formal adjudication," are ordinarily conducted by ALJs.⁸ They include hearings relating to Social Security, Medicare, and Black Lung benefits as well as to hearings provided by an array of regulatory agencies. There are approximately 1,350 federal ALJs.

In general, Type A adjudications are presently identified by statutes (outside the APA) that either i) explicitly require that sections 556-557 of APA apply or ii) call for adjudication "required by statute to be determined *on the record* after opportunity for an agency hearing."⁹ As discussed in Part IV, the phrase "on the record" has acquired talismanic properties and most cases hold that those very words (or other clear evidence of Congressional intent) must be used

⁵ The proposals discussed in Parts II to VII apply to Type A adjudication but do not involve fundamental changes.
⁶ These recommendations relate only to "adjudication" which, as discussed in part III below, means action of *particular* rather than *general* applicability. Thus, proceedings for ratemaking for an entire industry, like those in *United States v. Florida East Coast Ry.*, 410 U.S. 224 (1973), would be treated as rulemaking, not adjudication, and would not be treated as Type B adjudication.

⁷ APA §§554, 556-58. See proposed §551(15) defining "Type A adjudication."
⁸ Type A adjudication includes some relatively rare situations in which ALJs do not preside. First, a statute may provide that APA §§556-57 apply except that ALJs do not preside. APA §556(b). See Michael Asimow, editor, *A Guide to Federal Agency Adjudication* §10.03 (AJIA Section of Administrative Law and Regulatory Practice, 2003) (hereinafter referred to as *Guidebook*). Second, the APA allows the agency head or bonds to preside instead of ALJs, although this rarely if ever occurs. Third, in initial licensing or ratemaking cases, the APA allows the agency to designate staff members other than ALJs as presiding officers. §556(b). Type A adjudication covers hearings and proceedings described in this footnote even though in fact ALJs do not preside.
⁹ APA §554(a) (emphasis added). See *Guidebook* §3.01. Under the proposed default provision discussed in part IV below, adjudicatory hearings called for in future statutes will be Type A adjudication (even if the statute does not use the magic words "on the record") unless Congress provides the contrary.

before Type A adjudication provisions come into play. Other than the changes described in Parts II to VII of this Report, which are not fundamental in nature, we propose *no changes* in Type A adjudication since we view the system of Type A adjudication as working well.

B. Type B adjudication and informal adjudication

The recommendation proposes extension of certain fundamental procedural protections set forth in the existing APA to "Type B adjudication," meaning evidentiary proceedings required by statute other than Type A adjudication.¹⁰ Type B adjudication covers a wide range of evidentiary proceedings that are conducted by presiding officers (POs) who are not ALJs.¹¹

Although people sometimes refer to Type B adjudication as "informal adjudication," this usage is not proper. Many Type B hearings are as "formal" or even more "formal" than Type A hearings.¹² The term "informal adjudication" is properly used to describe the vast array of adjudications conducted by federal agencies with respect to which no statute requires a hearing.¹³ There are literally millions of informal adjudications, ranging from economically important orders (such as refusal to grant a bank charter) to low-stakes decisions (such as allocation of campsites by federal forest rangers). Our proposals do not affect informal adjudication as defined in this paragraph.

C. Rationale

The provisions in Title V of the U. S. Code relating to rulemaking, judicial review, alternative dispute resolution, and government information apply across the board, but the APA's provisions for adjudication apply only to a portion of federal agency evidentiary proceedings.¹⁴ This unfortunate balkanization of hearing procedures defeats the purpose of the drafters of the APA who wished to achieve greater uniformity and to provide basic fair-hearing norms in most agency adjudication.¹⁵

A 1992 study by ALJ John H. Frye III (based on 1989 data) identified about 83 case-types (involving about 343,000 cases annually) of Type B adjudication.¹⁶ Frye identified 2,692

¹⁰ See proposed APA §§551(16) and (17).

¹¹ In practice, numerous titles are used to describe POs, but we used the generic term PO to include all such presiders. See proposed APA §551(18).

¹² Most Type A hearings are Social Security cases which are conducted in a non-adversarial, relatively informal fashion.

¹³ The term "informal adjudication" is sometimes used to describe Type B proceedings that are conducted informally but we believe that the term "informal adjudication" should be reserved for the vast array of adjudicatory proceedings as to which no statute requires an evidentiary hearing.

¹⁴ APA §§555 and 558 apply to all adjudications but provide protections that fall far short of those provided in Type A adjudication or the protections we propose should be applicable to Type B adjudication. See *Guidebook* ¶¶9.04, 9.06.

¹⁵ Jeffrey S. Lubbers, *APA Adjudication: Is the Quest for Uniformity Faltering?* 10 *Admin. L. J.* 65 (1996); Cooley R. Howarth, *Restoring the Applicability of the APA's Adjudicatory Procedures*, 56 *Admin. L. Rev.* (2004); *Agency General's Manual on the APA* 9 (1947).

¹⁶ John H. Frye III, *Survey of Non-ALJ Hearing Programs in the Federal Government*, 44 *Admin. L. Rev.* 261, 264 (1992). Frye eliminated 46 case types that showed a caseload of less than one case per year. See also Paul Verkuil et al., *The Federal Administrative Judiciary*, Vol. 2 [1992] ACUS Rec. & Rep. 779, 788-90, 843-73. In

POs. Of the 83 case-types, 15 accounted for 98% of the total. The largest Type B category is deportation cases. There are a substantial number of law enforcement cases, including civil penalties administered by numerous agencies,¹⁷ as well as passport denials or security clearance disputes. Type B adjudication includes many benefit cases such as veterans' benefits and Medicare Part B cases decided by employees of insurance carriers. A substantial number of cases deal with economic matters (farm credit, public contract disputes, bid protests, or debarment of contractors) and federal employment relationships (such as those administered by the Merit Systems Protection Board).

In 2002, Raymond Limon updated Frye's study.¹⁸ Limon found 3,370 Type B POs, about a 25% increase from 1989 figures. In contrast, there are 1,351 ALJs in 29 different agencies (a 15% increase).¹⁹ Frye reported 393,800 Type B proceedings each year; Limon reported 556,000 (a 41% increase).²⁰

POs may be full-time decisionmakers or may be agency staff members who engage in part-time judging along with other tasks.²¹ Frye found that full-time POs decide about 90% of the Type B cases (but part-time POs decided cases in 34 of the 83 case-types, mostly the less active ones).²² Most of the full-time POs are lawyers but most of the part-time POs are not lawyers.²³

Based on the criteria set forth in Part IV, it would be desirable to convert many of the existing systems of Type B adjudication to Type A adjudication. However, it is unlikely that Congress will be persuaded to do so in the foreseeable future. Thus, our proposal recognizes that

comparison to the 343,000 Type B adjudications, the ACUS study estimated that there were about 300,000 Type A adjudications per year in the late 1980's.

¹⁷ Under the Clean Water Act, EPA can impose a "class 1 civil penalty" (\$10,000 per violation up to \$25,000 maximum) or a "class 2 civil penalty" (\$10,000 per violation with a maximum of \$125,000). A class 2 penalty must follow "notice and opportunity for a hearing on the record in accordance with section 554 of Title 5." A class 1 penalty also requires notice and a hearing but "such hearing shall not be subject to sections 554 and 556 of Title 5 but shall provide a reasonable opportunity to be heard and present evidence." 33 U.S.C.A. §1319(g)(2). Thus Class 2 penalties call for Type A adjudication but Class 1 penalties call for Type B adjudication. For a thorough treatment of civil penalties and Type B adjudication, see William F. Funk, *Close Enough for Government Work?—Using Informal Procedures for Imposing Civil Penalties*, 24 Seton Hall L. R. 1 (1993).

¹⁸ Office of Administrative Law Judges, *The Federal Administrative Judiciary Then and Now—A Decade of Change 1993-2002* (Dec. 23, 2002).

¹⁹ Limon stated that in 1992 there were 1167 ALJs; in 2002, there were 1351 ALJs. Limon 3, n.4. During much of the period between the Frye and Limon reports, the hiring of ALJs was frozen. But for the freeze, the number of ALJs would undoubtedly have expanded more rapidly.

²⁰ Numerous recent statutes call for Type B adjudication. For example, a recently enacted statute provides for "collection due process" (CDP) hearings by the IRS. IRC §§6320, 6330. The IRS now conducts about 30,000 CDP hearings annually and the number is rising steadily. CDP hearings appear to be Type B adjudications although numerous issues about the nature of CDP hearings and judicial review thereof are at present unresolved. See Bryan T. Camp, *Tax Administration as Inquisitorial Process and the Partial Paradigm Shift in the IRS Restructuring and Reform Act of 1998*, 94 Florida L. Rev. 1, 117-29 (2004); Leslie Book, *The Collection Due Process Rights: A Mistay or Step in the Right Direction*, 41 Houston L. Rev. (2004).

²¹ Some part-time POs are not agency staff members; they may be retired judges or academics who are called upon by the agency from time to time as their particular expertise is needed.

²² Frye found that there were 601 full-time POs and 2170 part-time POs. However, full-time POs decided about 90% of the Type B cases. Frye 349-50.

²³ Frye 349. Limon found that of 3370 POs, only 1370 were lawyers. However, of the 601 full-time POs, 438 were lawyers.

second-best is better than nothing at all. It is intended to insure fundamental, baseline procedural protection in the large universe of Type B adjudication.²⁴ In practice, so far as we can determine, such protections are normally provided in existing Type B adjudication schemes. Nevertheless the public deserves to be guaranteed that such protections will always be provided through generally applicable and accessible APA provisions, instead of the existing maze of due process requirements and situation-specific statutes and procedural regulations.

D. Meaning of “evidentiary proceeding”

Our proposal recognizes and distinguishes three types of federal adjudication. Type A adjudication refers to the set of evidentiary hearings usually conducted by ALJs and is unaffected by our proposal.²⁵ Type B adjudication refers to evidentiary hearings required by statute that are conducted by POs. Our proposal would impose a set of procedural requirements on Type B adjudication. Informal adjudication entails decisions by federal agencies with respect to which no statute calls for a hearing. Our proposal does not affect informal adjudication (except to make clear that it is possible to issue a declaratory order through informal adjudication—see Part VI).

As discussed in Part IV, there is considerable case law that distinguishes Type A from Type B adjudication. Unfortunately, this case law is in conflict. Our proposal does not attempt to resolve this conflict but assumes that the line between Type A and Type B would continue to be drawn under existing law. (Part IV of our proposal would clarify the Type A/Type B distinction for statutes adopted in the future). We discuss here the problem of distinguishing Type B adjudication from informal adjudication.

Type B adjudication, as defined in proposed §551(16), means “an agency evidentiary proceeding required by statute, other than Type A adjudication.”²⁶ Under proposed §551(17), the term “agency evidentiary proceeding” means “a proceeding that affords an opportunity for a decision based on evidence submitted by the parties orally or in writing.” As provided in new §551(18), a “presiding officer” conducts Type B adjudication. Thus a Type B proceeding will

²⁴ New provisions in California’s APA that were enacted in 1995 call for a scheme similar to this proposal. The California statute preserved a system of Type A adjudication that relies on central panel ALJs. It then provides for an “administrative adjudication bill of rights” for Type B adjudication. See generally Michael Assinow, *The Influence of the Federal Administrative Procedure Act on California’s New Administrative Procedure Act*, 32 *Tulsa L.J.* 297 (1996).

²⁵ See note 16 which observes that a few classes of Type A adjudication are not heard by ALJs.

²⁶ The definition excludes from Type B adjudication the types of cases already excepted from Type A adjudication by §554(4) with some modifications: (1) a matter subject to a subsequent trial of the law and the facts, its review in a court or in a Type A or Type B adjudication; (2) proceedings in which decisions rest solely on inspections, tests, or elections; (3) cases in which an agency is acting as an agent for a court; or (4) the certification of worker representatives.

We strike out an existing exemption: “(2) the selection or tenure of an employee other than an ALJ.” Hearings required by statute that concern the tenure of government employees would normally be classified as Type B adjudication. If any statute provides for evidentiary hearings relating to selection of employees, these would generally be Type B hearings also. Hearings relating to the tenure of ALJs would continue to be Type A adjudication. We propose that disputes concerning the tenure of Type B POs should also be Type A adjudication. We propose to strike out the existing exemption because hearings relating to selection and tenure of federal employees should be included in the APA’s provisions for Type A or B adjudication. See Part II.

always be identified by the presence of a federal statute (other than the APA) that calls for an evidentiary proceeding.

Federal statutes frequently call for evidentiary “hearings” that are not Type A adjudication. The definition of Type B adjudication captures these proceedings.²⁷ Some statutes use terms other than “hearing” to describe such proceedings but the intention of the statute is to call for an “evidentiary proceeding.”²⁸ The term “evidentiary proceeding” covers hearings required by statute even if all of the evidence is submitted in writing rather than orally, so long as the decisionmaker is limited to considering only record evidence. The term includes non-adversarial, inquisitorial hearings in which the Government is not represented, such as the hearings conducted by the Board of Veterans’ Appeals (just as Type A adjudication includes non-adversarial Social Security hearings).²⁹

The term “evidentiary proceeding” does *not* include statutory provisions calling for notice and comment-type procedures (even if applicable to adjudication) where such procedures do not limit the decisionmaker to consideration only of the evidence in the record.³⁰ Nor does it include so-called “hearings” in which the public is invited to appear and make statements (such as often occurs with respect to various forms of land use decisions),³¹ informal inquiries, or investigatory or settlement-oriented hearings (meaning hearings that can be followed by another *de novo* administrative review or *de novo* judicial review to finally resolve the matter).³²

²⁷ For example, in railroad unemployment insurance cases, an employee “shall be granted an opportunity for a hearing before a referee.” 35 USC §355. A federal government employee claiming workers compensation “is entitled to a hearing on his claim before a representative of the Secretary.” 5 USC §8124(b)(1). In Agriculture Department disputes, there is a “right to appeal an adverse decision for an evidentiary hearing of a hearing officer.” 7 USC §6996(a). Persons who are subject to IRS collection activities have “a right to a hearing.” IRC §6330(a)(1).
²⁸ In immigration cases, the statute states that an Immigration Judge (IJ) “shall conduct proceedings for deciding the inadmissibility or deportability of an alien.” In context, it is clear that the IJ is to conduct an evidentiary proceeding. For example, an alien “shall have reasonable opportunity to present evidence and cross examine witnesses presented by the government.” The IJ is authorized to administer oaths, receive evidence, and issue subpoenas; the IJ must rule on evidentiary objections and provide findings and reasons for decisions. 8 USC §1229a(1)(a)(1), (b)(1), (4)(B); 8 CFR §240.1(c). The Contract Disputes Act provides that a board of contract appeals shall “provide to the fullest extent practicable informal, expeditious, and inexpensive resolution of disputes and shall issue decisions in writing.” A member may administer oaths, authorize depositions, and subpoena witnesses for taking of testimony. Again, the context makes clear that an evidentiary hearing is intended. 41 USC §607(e), 610. We understand that the existing system of public contract dispute resolution already meets all requirements of Type B adjudication.

²⁹ 38 USC §3710(a), 7107(b). BVA hearings are informal and non-adversarial. See 38 CFR §20.700(c).
³⁰ See 16 USC §1456(c)(2)(A) concerning licensing decisions for activities within the coastal zone. The Secretary of Commerce can override a state’s objection to the issuance of a federal license or permit after finding the activity consistent with goals and objectives of the Coastal Zone Management Act or necessary in the interests of national security. The Secretary must first provide an opportunity for the state and permit applicant to submit detailed comments. Though the regulations implementing this provision establish detailed appellate-like procedures for the conduct of the Secretary’s inquiry, the statute indicates no requirement for an evidentiary proceeding as the Secretary is not limited to considering only the data contained in the written comments submitted by the parties.

³¹ See, e.g., *Butney v. United States*, 699 F.2d 1170, 1174-83 (5th Cir. 1982) (“opportunity for public hearing” does not trigger APA formal adjudication).
³² Present section 554(a)(1) contains an exception for “a matter subject to a subsequent trial of the law and the facts *de novo* in a court.” We propose to add the words “or in a type A or Type B adjudication.” We intend thereby to make clear that the requirements for Type B adjudication will not apply where a “hearing” required by statute can be followed by another *de novo* trial of the law and facts, whether it takes place in an Article III court or before some administrative tribunal or Article I court. In short, a litigant gets only one Type B or Type A administrative proceeding, not two. (For this purpose, we do not consider the remote likelihood that the agency heads or other

It would be possible to extend Type B adjudication to evidentiary proceedings called for by the Due Process clause of the 5th Amendment. We do not propose this because it would be difficult to decide which due process cases call for evidentiary proceedings and which ones call for some sort of interaction that is less formal than an evidentiary proceeding.³³ Due process cases use an ad hoc balancing test to decide what procedures are applicable³⁴ and thus resist the sort of rigidity that the proposed statutory test would entail.

It would also be possible to extend the Type B adjudication concept to evidentiary proceedings called for by *agency procedural regulations* rather than by statutes.³⁵ We do not propose this, however, because it would create perverse incentives. It might discourage agencies from voluntarily adopting hearing procedures through their regulations when they are not required to do so. Also, it might encourage agencies to dispense with hearing procedures now called for by regulations. Agencies should not be discouraged from providing procedural protections that they are not required to provide.³⁶

E. APA provisions applicable to Type B adjudication

Under proposed APA §554(c), certain provisions of the existing APA will apply to Type B adjudication:

- Timely notice and right to submit settlement offers;³⁷
- The right to present a case by oral or documentary evidence and to conduct cross examination when required for a full and true disclosure of the facts;³⁸

reviewing authority can call for a de novo hearing after the decision of an ALJ or a PO as constituting a subsequent de novo trial).

³³ See, e.g., *Cleveland Bd. of Education v. Loudermill*, 470 U.S. 532 (1985) (procedures required before public employee is discharged); *Goss v. Lopez*, 419 U.S. 565 (1975) (procedures required before suspending child from school for ten days or less).

³⁴ *Mathews v. Elridge*, 424 U.S. 319 (1976).

³⁵ The VA regulations (but not a statute) provide for a hearing in connection with benefits disputes (so-called "regional office hearings"), 38 CFR §3.103(c). Such hearings are not Type B adjudication for two reasons: i) they are provided for in regulations rather than by statute, and ii) they are followed by a subsequent de novo administrative hearing provided by the Board of Veterans' Appeals. Similarly, the Equal Employment Opportunities Commission provides hearings for federal employees who allege prohibited discrimination but such hearings are authorized by regulation rather than by statute. See 42 U.S.C. §2000e-16(b); 29 CFR §1614.109(a) (2013).

³⁶ Of course, agencies might choose to incorporate the principles applicable to Type B adjudication in their procedural regulations calling for evidentiary proceedings. It seems likely that many would choose to do so (or have already done so).

³⁷ Proposed APA §554 (b) and (c) apply the existing APA provisions for notice and submission of settlement proposals to Type B proceedings. See *Guidebook* §4.02.

³⁸ Proposed APA §554(e)(2) adapts language from APA §556(d): "A party may present its case or defense by oral or documentary evidence and conduct such cross-examination as may be required for a full and true disclosure of the facts." See *Guidebook* §5.07, 5.08. As in Type A adjudication, a PO would have discretion as to whether evidence should be presented orally or in writing. Similarly, a PO would have discretion whether to allow cross-examination. A PO may decide that cross-examination is not needed for a "full and true disclosure of the facts" where the issue to be resolved is not a disputed factual question that turns on credibility. As in Type A adjudication, a PO may decide that evidence that has been received in written form need not be subject to cross-examination.

Under VA regulations, no cross-examination is allowed in BVA hearings. However, the parties (presumably including the PO) may ask "follow-up questions" of the witnesses. 38 CFR §20.700(c) ("Parties to the

- Decisionmaker impartiality;³⁹
- Decisionmaker independence and separation of functions;⁴⁰
- Prohibition on ex parte contacts with decisionmakers;⁴¹
- The exclusive record and official notice provisions;⁴² and
- the requirement of a written or oral decision containing findings and reasons. In the event that the PO's decision is reviewed at a higher agency level, the PO's decision must be disclosed to the parties who have an opportunity to comment on it prior to the higher-level decision.⁴³

It is intended that the provisions for notice and hearing, decisionmaker independence, and written or oral decisions, would apply only to the initial proceeding.⁴⁴ The requirements of impartiality, separation of functions, ex parte contact, and exclusive record would apply both to the initial decision stage and to the agency review stage. We also believe that the exception from the Government in the Sunshine Act that applies to the "initiation, conduct, or disposition" of Type A adjudication should be extended to include Type B adjudication.⁴⁵

hearing will be permitted to ask questions, including follow-up questions, of all witnesses but cross-examination will not be permitted"). Because of the non-adversarial format of EYA hearings (meaning that the VA is not represented), there may be little occasion for cross-examination. The provision for follow-up questions should be sufficient to meet the requirements of proposed §554(e)(1). Similarly, IRS collection due process (CDP) hearings do not include cross-examination. Reg. §301.6330-1(d)(3) A-D6 ("the taxpayer or the taxpayer's representative do not have the right to subpoena and examine witnesses at a CDP hearing"). The issues in a CDP hearing would not ordinarily involve credibility conflicts so cross-examination should not be necessary.

³⁹ Proposed APA §554(e)(3) adapts language drawn from §556(b): "The functions of a presiding officer or an officer who reverses the decisions of a presiding officer shall be conducted in an impartial manner." See *Guidebook* ¶7.02.

⁴⁰ Proposed §554(c)(4)(A) provides that a PO shall make the recommended or initial decision unless he or she becomes unavailable. This parallels existing §554(d). Proposed §554(e)(4)(B) provides that a PO shall not consult any person or party ex parte on a fact in issue. This parallels existing §554(e)(1). Proposed §554(e)(4)(C) prohibits command influence. It parallels existing §554(e)(2). The proposed command influence provision applies only to full-time POs. It would be impracticable to prohibit command influence in the case of part-time POs who engage in investigation or prosecution functions in other cases and are supervised by staff members who engage in such functions. Instead, we propose that a part-time PO not be supervised by a person serving as prosecutor or investigator in the same adjudication that the PO is deciding. We seek to avoid extra costs or disruption of existing structures, and we do not wish to compel agencies to reorganize themselves. Finally, §554(e)(4)(D) parallels the existing provision for separation of functions; it prohibits agency prosecutors or investigators in a case from participating or advising in the decision of that case. See *Guidebook* ¶7.06.

⁴¹ Proposed APA §554(e)(5) incorporates the provisions of existing APA §557(d). See *Guidebook* ¶7.04.

⁴² Proposed APA §554(e)(5) also incorporates APA §556(e): "The transcript of testimony and exhibits, together with all papers and requests filed in the proceeding, constitutes the exclusive record for decision. . . . When an agency decision rests on official notice of a material fact not appearing in the evidence in the record, a party is entitled, on timely request, to an opportunity to show the contrary." See *Guidebook* ¶7.08.

⁴³ Proposed APA §554(e)(6) requires a PO's decision to include

"a statement of findings, conclusions, and reasons, on material issues of fact, law, or discretion presented on the record. The decision may be delivered orally or in writing in the discretion of the PO." This provision modifies language in existing APA §557(c). See *Guidebook* ¶6.02. We understand that some POs deliver oral decisions. We did not wish to compel a change in this practice by requiring written decisions. We also understand that in some Type B proceedings, POs write recommended decisions that are not disclosed to the parties until after the agency review phase is completed. Our proposal would change this practice.

⁴⁴ Normally the initial proceeding would be conducted by a PO but these requirements should also apply if the initial proceeding is conducted by the agency heads or other officials.

⁴⁵ 5 USC §552(e)(10).

Numerous provisions of the existing APA will *not* apply to Type B adjudication unless required by statute (or by agency rule). These include:

- The various provisions relating to the hiring, compensation, rotation, evaluation and discharge applicable to ALJs.⁴⁶
- Provisions relating to evidence and burden of proof.⁴⁷
- Various provisions relating to review of initial decisions.⁴⁸
- The right to an award of attorney's fees under the Equal Access to Justice Act.⁴⁹

Judge Frye's report confirms that Type B adjudication is already conducted in accordance with the requirements of proposed section 554(e) in almost all cases. Therefore, the adoption of these baseline procedural protections should not significantly change the way that federal agencies conduct Type B adjudication. These provisions will not increase the costs of conducting Type B adjudication or cause delays or confusion or require costly agency reorganizations. Our intention is to assure that litigants will receive fundamental procedural protections in Type B adjudication without requiring restructuring of existing hearing schemes.

II. Ethical standards and protection against reprisal

Proposed §559a requires the Office of Government Ethics to adopt ethical standards for all federal ALJs and POs. This proposal implements Resolution 101B, adopted August 6, 2001, in which the ABA recommended that members of the administrative judiciary be held accountable under appropriate ethical standards adapted from the ABA's Model Code of Judicial Conduct in light of the unique characteristics of particular positions in the administrative judiciary.

The objective of Resolution 101B, and of proposed §559a, is to assure that both ALJs and POs be held accountable to appropriate ethical standards. These rules should be based on the ABA Model Code of Judicial Conduct as a starting point, taking account of the unique characteristics of particular positions of ALJs and POs. The rules should also consider the codes of ethics adopted by groups such as NCALJ and the 1989 Code of Conduct for Administrative Law Judges, and might include particular standards adapted to the unique characteristics of various positions held by ALJs and POs, for part-time and full-time POs, or for lawyers and non-lawyers.⁵⁰

⁴⁶ 4 U.S.C. §§3105, 7521, 5372, 3344, 1305. See *Guidebook* Chapter 10.

⁴⁷ §556(d). See *Guidebook* §5.03 to 5.05. In our view, it is not necessary to incorporate the APA's provisions relating to evidence and burden of proof in order to insure fair procedure in Type B adjudication. In particular, we did not wish to impose the *Greenwich Collieries* decision on agencies conducting Type B adjudication unless they choose to adopt it. *Director, Office of Workers' Compensation Programs v. Greenwich Collieries*, 512 U.S. 267 (1994); *Guidebook* §5.033.

⁴⁸ APA §557(b), (c). See *Guidebook* §6.03. Again, we did not believe it necessary to incorporate these detailed provisions to achieve fair procedures in Type B adjudication.

⁴⁹ See *Guidebook*, chapter 11. We would not be opposed to extending EAJA to Type B adjudication but do not recommend it at this time in the interests of minimizing the budgetary impact of our proposal.

⁵⁰ The ABA's Model Code of Judicial Conduct stresses that "anyone, whether or not a lawyer, who is an officer of a judicial system and performs judicial functions...is a judge within the meaning of this Code."

Also in keeping with Resolution 101B, proposed section 559b provides that full-time POs shall be removed or disciplined only for good cause and only after a hearing to be provided by MSPB under the standards of Type A adjudication, subject to judicial review.⁵³ Section 559b is also based on ABA Resolution 101B.⁵⁴ POs should be protected from negative consequences for engaging in ethical and independent decisionmaking. Good cause should include violation of the ethical rules referred to in the preceding paragraph. POs should also be entitled to judicial review of such decisions.

III. Clarifying the definition of rule

At present, the APA's definition of "rule" is defective.⁵⁵ Rulemaking is the process for formulating a "rule." A "rule" is a "statement of *general or particular applicability and future effect* designed to implement, interpret or prescribe law or policy, . . . and includes the approval or prescription for the future of rates, wages, corporate or financial structures or reorganizations thereof, prices, facilities, appliances, services or allowances therefore or of valuations, costs, or accounting, or practices bearing on any of the foregoing." Adjudication is the process for formulating an "order" and an "order" means a "final disposition . . . in a matter *other than rule making* but including licensing."⁵⁶

The statute should be amended so that agency action of *general applicability* is a rule and agency application of *particular applicability* is adjudication.⁵⁷ Under the existing definitions, for example, an FTC cease and desist order would be a rule (since it is agency action of particular applicability and future effect), but everyone treats cease and desist orders as "orders" rather than as "rules" and agrees that they should be subject to adjudicatory procedure.⁵⁸ This

⁵³ As provided in Recommendation IV, newly enacted hearing schemes should be Type A rather than Type B adjudication unless Congress specifically provides to the contrary. Consistent with the spirit of Recommendation IV, we recommend here that adjudication arising out of the discipline or discharge of POs should be Type A adjudication, meaning that such cases would be heard by the MSPB's ALJs rather than the POs. Of course, the same exceptions presently applicable to hearings to remove ALJs (relating to national security or to reductions in force) would also apply to removal of POs. 5 USC §7521(b)(4) and (5), referring to §7522 and §7502. A full-time PO would be treated as such even if the official had limited incidental duties in addition to judicial responsibilities in evidentiary hearings.

⁵⁴ The 2001 resolution made clear that, for this purpose, the administrative judiciary includes all individuals whose exclusive role in the administrative process is to preside and make decisions in a judicial capacity in evidentiary proceedings, but does not include agency heads, members of agency appellate boards, or other officials who perform the adjudicative functions of an agency head.

⁵⁵ See *Guidebook* §1.04; Ronald M. Levin, *The Case for (Finally) Fixing the APA's Definition of "Rule,"* 56 Admin. L. Rev. 4 (2004).

⁵⁶ APA §§551(4) to (7).

⁵⁷ The recommendation also deletes the words "and includes the approval or prescription for the future of rates, wages, corporate or financial structure or reorganizations thereof, prices, facilities, appliances, services or allowances therefore or of valuations, costs, or accounting, or practices bearing on any of the foregoing." The effect of the latter change is that ratemaking of general applicability would be rulemaking but ratemaking of particular applicability would be adjudication. See *United States v. Florida East Coast Ry.*, 410 U.S. 224 (1973) (holding that setting of industry-wide railway rate should be treated as informal rulemaking under the APA).

⁵⁸ As under existing law, a rule that in practice would apply to only a single person is still a rule (rather than an adjudication) as long as it is stated in general terms and it is theoretically possible that it could apply to additional persons. An agency's grant of exemption from a rule to a particular person would be an adjudication.

proposal is already ABA policy. It was part of a set of recommendations approved in 1970 by the HOD.

A further clarifying amendment removes the words "and future effect" from the definition of "rule." This revision would make clear that the APA applies to retroactive rules. Under Supreme Court case law,⁵⁷ an agency may not adopt a retroactive rule that has the force of law unless Congress explicitly authorizes the agency to do so. When agencies do adopt retroactive rules with the force of law, they should be adopted with appropriate notice and comment procedures.⁵⁸ In addition, interpretive rules often have retroactive effect; the APA's definition of "rule" should also cover retroactive interpretive rules.

IV. Type A Adjudication: Guidelines for Congress and a Default Provision When Statute is Unclear

In June, 2000, the ABA House of Delegates adopted Resolution 113, a recommendation sponsored by the Judicial Division, that set forth criteria Congress should consider in deciding whether a new adjudicatory scheme should employ Type A adjudication. A second part of the resolution created a default provision that would sweep newly adopted adjudicatory schemes into Type A unless Congress provided otherwise. This 2000 resolution is germane to the present set of recommendations. If Congress takes up the issues of Type A and B adjudication, it would naturally consider this recommendation at the same time.⁵⁹

A. Criteria for deciding whether new program should employ Type A adjudication

When Congress sets up a new program involving adjudications with opportunity for hearing, it should consider and explicitly determine whether the new program will be Type A adjudication.

Congress should consider the following factors (each of which points toward Type A rather than Type B adjudication):

a. Whether the adjudication is likely to involve a substantial impact on personal liberties or freedom, whether the orders carry with them a finding of criminal-like culpability or would have substantial economic effect, or whether the orders involve determinations of discrimination under civil rights or analogous laws.

b. Whether the adjudication would be similar to, or the functional equivalent of, a current type of Type A adjudication.

⁵⁷ *Bowen v. Georgetown University Hospital*, 488 U.S. 204 (1988). We do not propose to change the rule of the *Georgetown* case but only to provide that the APA's definition of rule applies when an agency is authorized to adopt a retroactive rule or when it adopts a retroactive interpretive rule.

⁵⁸ See ABA House of Delegates Resolution (Feb. 1992) stating that "retroactive rules are and should be subject to the notice and comment requirements of Section 553 of the Administrative Procedure Act."

⁵⁹ Because of the various changes in statutory nomenclature embodied in this recommendation and report (such as substitution of the terms Type A and B adjudication), we propose non-substantive changes in the 2000 recommendation.

c. Whether the adjudication would be one in which adjudicators ought to be lawyers.⁶⁰

B. Default provision

Congress should amend the APA to provide prospectively that absent a statutory requirement to the contrary, in any future legislation that creates opportunity for an adjudicatory evidentiary hearing, such hearing shall be Type A adjudication.⁶¹

C. Rationale

Under the existing APA, Type A adjudication exists only when "adjudication [is] required by statute to be determined on the record after opportunity for an agency hearing..."⁶² Where a statute calls for an evidentiary hearing but does not use the magic words "on the record," it has been difficult to decide whether the resulting adjudication is Type A or Type B. The case law is conflicting.⁶³ ABA Resolution 113, already adopted by the HOD, calls for Congress to carefully consider this issue when it adopts future legislation that creates opportunity for an adjudicatory evidentiary hearing. The Resolution provides a useful list of factors that Congress should consider when it makes that decision. The resolution also calls for a prospective-only default rule. Under that rule, future legislation that creates opportunity for an adjudicatory evidentiary hearing will require Type A adjudication unless Congress provides the contrary.

This default rule will nudge federal administrative law in the direction of greater use of ALJs and Type A adjudication. This will result in enhancement in the impartiality and skill of adjudicatory decisionmakers and an accompanying improvement in the fairness and quality of decisions. Generally, agencies are well aware of legislation that affects them and the burden should be on the agencies to inform Congress at the time it considers a new adjudicatory scheme if the agency believes that Type A is inappropriate.⁶⁴

⁶⁰ These factors are substantially the same as those in ACUS Recommendation 92-7, 57 Fed. Reg. 61760 (Dec. 29, 1992).

⁶¹ Resolution 113 states that such hearings "shall be subject to 5 USC §§554, 556, and 557." The present Recommendation used the term "Type A adjudication" which embodies the sections of the APA referred to in Resolution 113. No change in meaning is intended.

⁶² APA §554(a).

⁶³ See *Guidebook* §3.01, Gary Edles, "An APA Default Presumption for Administrative Hearings: Some Thoughts on 'Onstaying' the Adjudication Process," 55 Admin. L. Rev. 787, 796-804 (2003); Cooley R. Howarth, *Federal Licensing and the APA: When Must Formal Adjudicative Procedures Be Used?* 37 Admin. L. Rev. 317 (1985); Cooley R. Howarth, *Restoring the Applicability of the APA's Adjudicatory Procedures*, 56 Admin. L. Rev. (2004). These distinct lines of cases have emerged. Some cases conclude that Type A adjudication is intended despite absence of the words "on the record." *Steadman v. SEC*, 450 U.S. 91, 96 n.13 (1981); *Seawast Anti-Pollution League v. Costle*, 572 F.2d 872, 875-78 (1st Cir. 1978); *Lane v. USDA*, 120 F.3d 106 (8th Cir. 1997). Other cases require the use of the words "on the record" or some other clear statement of Congressional intention. *City of West Chicago v. NRC*, 701 F.2d 632, 644-45 (7th Cir. 1983); *RR Comm'n of Texas v. United States*, 765 F.2d 221, 227-29 (D.C. Cir. 1985). And still others accord *Chevron* deference to the agency's determination that the statute does not call for Type A adjudication. *Chemical Waste Mgmt., Inc. v. EPA*, 873 F.2d 1477, 1480-83 (D.C. Cir. 1989).

⁶⁴ According to the Report accompanying Resolution 113, the default rule would apply to "any new adjudication that Congress creates with an opportunity for a hearing." See Edles, 812-14.

V. Issues relating to evidence

A. Residuum rule

The "residuum rule" (followed in some states) requires that a decision must be supported by at least some non-hearsay evidence. This rule creates many problems, such as requiring the judge to make constant hair-splitting rulings about hearsay and its many exceptions, and requiring the parties to object at some appropriate time that the residuum rule applies in order to preserve the issue on appeal. It is generally believed that *Richardson v. Perales*⁶⁵ rejected the residuum rule at the federal level but this should be made clear in the statute.

The proposed amendment to APA section 556(d) accomplishes this result by adding the italicized language: "A sanction may not be imposed or rule or order issued except on consideration of the whole record or those parts thereof cited by a party, *and may be entirely based on evidence that would be inadmissible in a civil trial.*"

B. Evidence—FRE 403

In general, the Federal Rules of Evidence are not applicable to administrative agencies. The existing APA provides that an agency "as a matter of policy shall provide for the exclusion of irrelevant, immaterial, or unduly repetitious evidence."⁶⁶ An ACUS study indicated that this provision was inadequate because it did not give ALJs adequate case management tools. The consultant's survey of ALJs indicated that they believed they lacked power to exclude evidence that was patently unreliable or whose probative value was so low that it would not justify the amount of hearing time it would require.

The ACUS study declared: "This is a serious disadvantage. The delay and high cost of the administrative process poses a severe threat to the quality of justice available in our modern administrative state. Admission and cross-examination of a large volume of low quality evidence contributes significantly to the extraordinary length and attendant high cost of many agency adjudications."⁶⁷

As a result, ACUS recommended that agencies adopt evidentiary rules allowing decisionmakers to exclude evidence under Federal Rule of Evidence 403.⁶⁸ That rule provides: "Although relevant, evidence may be excluded if its probative value is substantially outweighed by the danger of . . . confusion of the issues . . . or by considerations of undue delay, waste of time, or needless presentation of cumulative evidence."⁶⁹ We agree and recommend that section 556(d) of the APA be amended to specifically permit ALJs to exclude evidence based on the FRE 403 standard (as modified slightly to take account of the differences between administrative and judicial proceedings).

⁶⁵ 402 U.S. 389 (1971).

⁶⁶ APA § 556(d).

⁶⁷ Richard J. Pierce, Jr., *Use of the Federal Rules of Evidence in Federal Agency Adjudications*, 39 Admin. L. Rev. 1, 23 (1987).

⁶⁸ ACUS Recommendation 86-2, 51 Fed. Reg. 25642 (July 16, 1986).

⁶⁹ The citation in this quotation is for the words "or misleading the jury" and "danger of unfair prejudice," which seem inapplicable to the administrative process.

VI. Declaratory orders

Existing §554(e) empowers an agency to issue a declaratory order to terminate a controversy or remove uncertainty. The placement of this subsection in the existing statute implies that only an agency authorized to conduct Type A adjudication can issue a declaratory order. We believe that any agency, whether conducting Type A, Type B, or informal adjudication, should be authorized to issue a declaratory order. Therefore, we propose moving this provision to §555, which applies to agency proceedings generally.⁷³

VII. Transcripts

The APA should provide that transcripts of agency proceedings (if they exist) should be available to private parties at cost of duplication. This is probably already required by §11 of the Federal Advisory Committee Act which provides: "Except where prohibited by contractual agreements entered into prior to the effective date of this act, agencies shall make available to any person, at actual cost of duplication, copies of transcripts of agency proceedings (as defined in §551(12))." It would be useful to incorporate this provision in the APA itself where it would not be overlooked. As a result, we recommend that section 556(e) be amended by adding the italicized language and deleting the stricken out language:

"The transcript of testimony and exhibits, together with all papers and requests filed in the proceeding, constitutes the exclusive record for decision in accordance with section 557 of this title ~~and on payment of lawfully prescribed costs, shall be made available to the parties.~~ *Agencies shall make such transcripts available to the parties at the actual cost of duplication.* When an agency decision rests on official notice of a material fact not appearing in the evidence in the record, a party is entitled, on timely request, to an opportunity to show the contrary.

VIII. Superseding contrary statutory provisions

Legislation adopted pursuant to these recommendations will supersede existing contrary statutory provisions.

Respectfully submitted,
Randolph J. May
Clair, Section of Administrative Law and
Regulatory Practice

February 2005

APPENDIX
(Ramseyer Rule)

1. Extending APA procedural protections to Type B adjudication

A. Definitions

Add to APA § 551 (definitions), 5 U.S.C. §551:⁷¹

- (15) "Type A" adjudication means adjudication required by statute to be—
(A) determined on the record after opportunity for an agency hearing; or
(B) conducted in accordance with sections 556 and 557 of this title;
- (16) "Type B adjudication" means an agency evidentiary proceeding required by statute, other than a Type A adjudication;
- (17) "agency evidentiary proceeding" means an agency proceeding that affords an opportunity for a decision based on evidence submitted by the parties orally or in writing; and
- (18) "presiding officer" means the initial decisionmaker in a Type B adjudication.

B. Type B adjudication

Amend existing APA §554 so that it reads as follows:

Sec. 554. - Adjudications

(a) *General principles.* This section applies, according to the provisions thereof, in every case of Type A adjudication and Type B adjudication adjudication required by statute to be determined on the record after opportunity for an agency hearing, except to the extent that there is involved—

- (1) a matter subject to a subsequent trial of the law and the facts de novo in a court or in a Type A or Type B adjudication;⁷²
- (2) the selection or tenure of an employee, except an administrative law judge appointed under section 3105 of this title;⁷³
- (2) proceedings in which decisions rest solely on inspections, tests, or elections;

⁷¹ Subsequent references to the APA will exclude the prefatory 5 U.S.C.

⁷² The problem of distinguishing Type A, Type B, and informal adjudication is discussed in Parts I.A. and I.B. of the Report that follows these recommendations.

⁷³ In some agencies, the agency heads or a superior reviewing authority can, in theory, require a new de novo hearing of a case already heard by an ALJ or a PO to be conducted before the agency heads. We understand that this virtually never occurs in practice. The unlikely possibility of a de novo rehearing at the agency head level should not be taken into account in applying this subsection. Thus the rules relating to Type A and Type B adjudication apply to the hearing provided by an ALJ or a PO despite the remote possibility that the case could be heard anew at a higher level. For further discussion, see note 32 of the Report.

⁷⁴ This exception in the existing act becomes inappropriate in light of the adoption of the provisions relating to Type B adjudication. For further discussion, see note 26 of the Report.

- (3) the conduct of military or foreign affairs functions;
 - (4) cases in which an agency is acting as an agent for a court; or
 - (5) the certification of worker representatives.
- (b) *Notice.* Persons entitled to notice of an agency hearing in a *Type A* or *Type B* adjudication shall be timely informed of —
- (1) the time, place, and nature of the hearing;
 - (2) the legal authority and jurisdiction under which the hearing is to be held; and
 - (3) the matters of fact and law asserted. ... [balance of subsection remains the same]
- (c) *Settlement proposals.* In a *Type A* or *Type B* adjudication, the agency shall give all interested parties opportunity for —
- (1) the submission and consideration of facts, arguments, offers of settlement, or proposals of adjustment when time, the nature of the proceeding, and the public interest permit; and
 - (2) to the extent that the parties are unable so to determine a controversy by consent, hearing and decision ~~on notice and in accordance with sections 556 and 557 of this title, in accordance with the procedures for Type A adjudication specified in subsection (d) or Type B adjudication specified in subsection (e).~~
- (d) *Procedures for Type A adjudication.*
- (1) *A Type A adjudication shall be conducted pursuant to sections 556 and 557 of this title.*
 - (2) The employee who presides at the reception of evidence pursuant to section 556 of this title shall make the recommended decision or initial decision required by section 557 of this title, unless he or she becomes unavailable to the agency.
 - (3) Except to the extent required for the disposition of ex parte matters as authorized by law, such an employee may not —
 - (A) consult a person or party on a fact in issue, unless on notice and opportunity for all parties to participate; or
 - (B) be responsible to or subject to the supervision or direction of an employee or agent engaged in the performance of investigative or prosecuting functions for an agency.
 - (4) An employee or agent engaged in the performance of investigative or prosecuting functions for an agency in a case may not, in that or a factually related case, participate or advise in the decision, recommended decision, or agency review pursuant to section 557 of this title, except as witness or counsel in public proceedings. *Type A adjudication may not, in that or a factually related adjudication, participate or advise in the initial or recommended decision or any review of such decision, decision, recommended decision, or agency review pursuant to section 557 of this title, except as witness or counsel in public proceedings.* This subsection does not apply —
 - (A) in determining applications for initial licenses;
 - (B) to proceedings involving the validity or application of rates, facilities, or practices of public utilities or carriers; or
 - (C) to the agency or a member or members of the body comprising the agency.

(e) The agency, with like effect as in the case of other orders, and in its sound discretion, may issue a declaratory order to terminate a controversy or remove uncertainty.⁷⁵

(e) *Procedures for Type B adjudication.*

(1) *General rule.* A Type B adjudication shall be conducted in accordance with the procedures specified in this subsection.

(2) *Presentation of evidence.* A party may present its case or defense by oral or documentary evidence and conduct such cross-examination as may be required for a full and true disclosure of the facts. An agency may, when a party will not be prejudiced thereby, adopt procedures for the submission of all or part of the evidence in written form.

(3) *Impartiality of presiding officers and reviewing officers.* The functions of a presiding officer or an officer who reviews the decisions of a presiding officer shall be conducted in an impartial manner.

(4) *Agency decisional process*

(A) A presiding officer shall make the recommended or initial decision unless he or she becomes unavailable to the agency.

(B) Except to the extent required for the disposition of ex parte matters as authorized by law, the presiding officer shall not consult any person or party on a fact in issue, unless on notice and with an opportunity for all parties to participate.

(C) A full-time presiding officer shall not be responsible to or subject to the supervision or direction of an agency employee engaged in the performance of investigative or prosecuting functions. A part-time presiding officer in an adjudication shall not be subject to the supervision or direction of an agency employee engaged in the performance of investigative or prosecuting functions in the same adjudication.

(D) An employee or agent engaged in the performance of investigative or prosecuting functions for an agency in an adjudication may not, in that or a factually related adjudication, participate or advise in an initial or recommended decision or any review of such decision, except as witness or counsel in public proceedings.

(E) The requirements of this paragraph do not apply—

- (i) in determining applications for initial licenses;
- (ii) to proceedings involving the validity or application of rates, facilities, or practices of public utilities or carriers; or
- (iii) to the agency or a member or members of the body comprising the agency.

(5) *Ex parte communications.* The requirements of sections 556(e) and 557(d) shall apply to the proceeding and, in particular, the requirements that apply to an administrative law judge under section 557(d) shall apply to the presiding officer in the proceeding.

(6) *Decision.* The decision of a presiding officer shall include a statement of findings, conclusions, and reasons, on material issues of fact, law, and discretion presented on the

⁷⁵ The provision for declaratory orders is moved from §554 to §555. See VI. below.

record. The decision may be delivered orally or in writing in the discretion of the presiding officer. In the event the decision is reviewed at a higher agency level, the parties shall have an opportunity to submit comments on the decision before the review process is completed.

(2) Additional protections. An agency engaged in Type B adjudications may adopt rules that provide greater procedural protections than are provided in this section.

C. Sunshine Act exception.

Section 552b(c)(10) in the Government in the Sunshine Act provides an exception to the Sunshine Act requirements for the "initiation, conduct, or disposition by the agency of a particular case of formal agency adjudication pursuant to the procedures in section 554 of this title or otherwise involving a determination on the record after opportunity for a hearing." This section should be amended to make clear that the exception applies also to Type B adjudication.

II. Ethical standards and protection against reprisal

A. Ethical standards

Add new section 559a:

559a. Ethics and independence of presiding officers and administrative law judges

(a) The Office of Government Ethics shall prescribe regulations providing for appropriate ethical standards for administrative law judges and presiding officers who conduct adjudications under section 554 of this title.

(b) The regulations shall be prescribed in accordance with sections 553(b) and (c) of this title.

B. Removal and discipline of presiding officers

Add a new section 559b:

559b. Removal and discipline of presiding officers

(a) A presiding officer, as defined in section 531 of this title and who is full-time, may be disciplined or removed from his or her position as presiding officer only for good cause and only after a hearing before the Merit Systems Protection Board, subject to judicial review. The hearing shall be a Type A adjudication.

(b) The exceptions applicable to administrative law judges, relating to national security or reductions in force, shall be applicable to discipline or removal of a presiding officer.

III. Clarification of the definition of rule

APA section 551(4) should be amended to read as follows:

(4) "rule" means the whole or a part of an agency statement of general applicability designed to implement, interpret, or prescribe law or policy or to describe the organization, procedure, or practice requirements of an agency.

~~_____ "rule means the whole or a part of an agency statement of general or particular applicability and future effect designed to implement, interpret, or prescribe law or policy or describing the organization, procedure, or practice requirements of an agency and includes the approval or prescription for the future of rates, wages, corporate or financial structures or reorganizations thereof, prices, facilities, appliances, services or allowances therefore or of valuations, costs, or accounting, or practices bearing on any of the foregoing.~~

IV. Type A adjudication: guidelines for Congress and a default provision when statute is unclear

A. Criteria for deciding whether new programs should be Type A adjudication.

When Congress creates a new program involving adjudication with opportunity for an evidentiary hearing, it should consider and explicitly determine whether the new program will be Type A or Type B adjudication.

Congress should consider the following factors (the presence of which would weigh in favor of the use of Type A rather than Type B adjudication):

- a. Whether the adjudication is likely to involve a substantial impact on personal liberties or freedom, whether the orders carry with them a finding of criminal-like culpability or would have substantial economic effect, or whether the orders involve determinations of discrimination under civil rights or analogous laws.
- b. Whether the adjudication would be similar to, or the functional equivalent of, a current type of Type A adjudication.
- c. Whether the adjudication would be one in which adjudicators ought to be lawyers.

Please note that this provision relating to criteria for choosing between Type A and Type B adjudication is not included in the Bill language above since it is not intended to be a statutory provision.

B. Default provision.

Congress should amend the APA to provide prospectively that, absent a statutory requirement to the contrary, in any future legislation that creates an opportunity for hearing in an adjudication, such hearing shall be Type A adjudication.

V. Issues relating to evidence

Section 556(d) should be amended by adding the italicized language:

Except as otherwise provided by statute, the proponent of a rule or order has the burden of proof. Any oral or documentary evidence may be received, but the agency as a matter of policy shall provide for the exclusion of irrelevant, immaterial, or unduly repetitious evidence. *Evidence may be excluded, although relevant, if its probative value is substantially outweighed by the danger of confusion of the issues, or by considerations of undue delay, waste of time, or needless presentation of cumulative evidence.* A sanction may not be imposed or rule or order issued except on consideration of the whole record or those parts thereof cited by a party *and may be entirely based on evidence that would be inadmissible in a civil trial.* [The remainder of §556(d) remains the same]

VI. Declaratory orders

Section 555 should be amended by adding thereto the following subsection:

(f) Declaratory orders. The agency, with like effect as in the case of other orders, and in its sound discretion, may issue a declaratory order to terminate a controversy or remove uncertainty.

VII. Transcripts

Section 556(e) should be amended by adding the italicized language and striking the crossed-out language:

The transcript of testimony and exhibits, together with all papers and requests filed in the proceeding, constitutes the exclusive record for decision in accordance with section 557 of this title. ~~and, on payment of lawfully prescribed costs, shall be made available to the parties.~~ *Agencies shall make such transcripts available to the parties at the actual cost of duplication.* When an agency decision rests on official notice of a material fact not appearing in the evidence in the record, a party is entitled, on timely request, to an opportunity to show the contrary.

VIII. Superseding contrary statutory provisions

The provisions of this act supersede existing contrary statutory provisions.

Appendix B

RECOMMENDATION 126A
ADOPTED BY THE
HOUSE OF DELEGATES
OF THE
AMERICAN BAR ASSOCIATION

February 1989

BE IT RESOLVED, that the American Bar Association supports the reauthorization of the Administrative Conference of the United States (ACUS) and the provision of funds sufficient to permit ACUS to continue its role as the government's in-house advisor and coordinator of administrative procedural reform.

The Honorable Thad Cochran
Chairman
Committee on Appropriations
United States Senate
Washington, D.C. 20510

The Honorable Robert C. Byrd
Ranking Member
Committee on Appropriations
United States Senate
Washington, D.C. 20510

Re: Funding the Newly Reauthorized Administrative Conference of the
United States for Fiscal Year 2007

Dear Chairman Cochran and Ranking Member Byrd:

On behalf of the American Bar Association ("ABA") and its more than 400,000 members nationwide, I write to express our strong support for funding the Administrative Conference of the United States ("ACUS") for fiscal year 2007 at the fully authorized level of \$3.2 million. As your Committee prepares to mark up the Transportation, Treasury Appropriations Bill later this week, we urge you to provide full funding for ACUS, which was just reconstituted in the last Congress by the enactment of the "Federal Regulatory Improvement Act of 2004" (P.L. 108-401, formerly, H.R. 4917). Once it is provided with this modest funding, the agency will be able to restart its operations and then begin addressing the many important tasks that may be assigned to it by Congress, including, for example, assisting the Department of Homeland Security to consolidate the administrative processes from the more than 20 federal agencies that were included in the new Department.

ACUS was originally established in 1964 as a permanent body to serve as the federal government's in-house advisory on, and coordinator of, administrative procedural reform. It enjoyed bipartisan support for over 25 years and advised all three branches of government before being terminated in 1995. In 2004, Congress held several hearings on ACUS reauthorization, and during those hearings, all six witnesses, including Supreme Court Justices Antonin Scalia and Stephen Breyer, praised the work of the agency. The written testimony of Justices Scalia and Breyer is available on the ABA's website at <http://www.abanet.org/poladv/ACUSreauthorization.html>.

GOVERNMENTAL AFFAIRS

Randy D. Linn
(202) 682-1765
rlinn@abanet.org

July 18, 2006
Page 2

Following these hearings, H.R. 4917 was introduced by Rep. Chris Cannon (R-UT), Chairman of the House Judiciary Subcommittee on Commercial and Administrative Law, for the purpose of reauthorizing and resurrecting the agency. That bipartisan legislation ultimately garnered 34 cosponsors—including 18 Republicans and 16 Democrats—before being approved unanimously by the House and Senate at the end of the 108th Congress. President Bush then signed the measure into law on October 30, 2004.

At the request of Chairman Cannon, the Congressional Research Service ("CRS") prepared a short study describing the many benefits of ACUS, and a copy of the CRS Memorandum of October 7, 2004 is also available at <http://www.abanet.org/oladiv/ACUS/Reauthorization.html>. As outlined by CRS, ACUS has many virtues, including the following:

- A newly-reconstituted ACUS would provide urgently needed resources and expertise to assist with difficult administrative process issues arising from the 9/11 terrorist attacks against the United States as well as other new administrative issues. The CRS Memorandum concludes that "[ACUS's] reactivation would fill the current urgent need for an expert independent entity to render relevant, cost-beneficial assistance with respect to complex and sensitive administrative process issues raised by 9/11 restructuring and reorganization efforts," including the creation of the Department of Homeland Security by consolidating parts of 22 existing agencies and the 9/11 Commission's recommendations to establish a new intelligence structure. In addition, CRS noted that ACUS could provide valuable analysis and guidance on a host of other administrative issues, including public participation in electronic rulemaking, early challenges to the quality of scientific data used by agencies in the rulemaking process, and possible refinements to the Congressional Review Act. A fully-funded ACUS could effectively address these and myriad other issues involving administrative process, procedure, and practice at a cost that is minimal when compared to the benefits that are likely to result.
- ACUS enjoys strong bipartisan support and all observers agree that it has been extremely cost-effective. As CRS also noted in its Memorandum, all six of the witnesses who testified before the House Judiciary Subcommittee on Commercial and Administrative Law agreed that during the more than 25 years of its existence, "...the Conference was a valuable resource providing information and guidance on the efficiency, adequacy and fairness of the administrative procedures used by agencies in carrying out their missions." ACUS was unique in that it brought together senior representatives of the federal government with leading practitioners and scholars of the private sector to work together to improve how our government functions. That collaboration has been sorely missed in many ways, as was so clearly brought out in the hearings. As CRS explained, ACUS produced over 180 recommendations for agency, judicial, and congressional actions over the years, and approximately three-quarters of these reforms were adopted in whole or in part. Because ACUS achieved these impressive reforms with a budget of just a few million dollars per year, CRS noted that "all observers, both before and after the demise of ACUS in 1995, have acknowledged that the Conference was a cost-effective operation."
- Before it was terminated in 1995, ACUS brought about many significant achievements. In addition to providing a valuable source of expert and nonpartisan advice to the federal government, ACUS also played an important facilitative role for agencies in implementing changes or carrying out recommendations. In particular, Congress gave ACUS facilitative statutory responsibilities for implementing a number of statutes, including, for example, the Equal Access to Justice Act, the

July 18, 2006
Page 3

Congressional Accountability Act, the Government in the Sunshine Act, the Administrative Dispute Resolution Act, and the Negotiated Rulemaking Act. In addition, ACUS' recommendations often resulted in huge monetary savings for agencies, private parties, and practitioners. For example, CRS cited testimony from the President of the American Arbitration Association which stated that "ACUS's encouragement of administrative dispute resolution had saved 'millions of dollars' that would otherwise have been spent for litigation costs." CRS also noted that in 1994, the FDIC estimated that "its pilot mediation program, modeled after an ACUS recommendation, had already saved it \$9 million." The CRS Memorandum provides numerous additional examples of ACUS' prior successes as well.

• ACUS' role in the regulatory process is totally separate and distinct from that of OIRA. In the past, some have suggested that ACUS' activities perhaps may duplicate some of the activities of OMB's Office of Information and Regulatory Affairs ("OIRA"). This reflects a misunderstanding of ACUS' fundamental role in the regulatory process. By virtue of its history and institutional design, ACUS is uniquely in a position to achieve bi-partisan consensus on administrative and regulatory improvements; to provide a forum for executive and independent agencies to exchange "best practices" ideas; and to bring private sector lawyers and academics together with political and career government officials to address ways to improve government operations.

OIRA is a very different type of entity that is neither inclined nor equipped to address many of the issues that ACUS has focused on. For example, there is no way that OIRA could have devoted so much time and attention to developing the ADR techniques that so many government agencies adopted. Nor does OIRA play any role in agency adjudication or judicial review issues. OIRA's principal role is to represent the President in making sure that the Administration's regulatory policy is followed. ACUS's role, on the other hand, is to be an independent catalyst for seeking to reform and improve administrative and procedural issues that necessarily tend to receive less attention in Congress or the White House in the face of what are deemed more pressing day-to-day matters.

In sum, now that Congress has enacted bipartisan legislation reauthorizing ACUS, the agency should be provided with the very modest resources that it needs to restart its operations without unnecessary delay. To accomplish this goal, we urge you to provide \$3.2 million in funding for ACUS for fiscal year 2007 during your Committee's mark up of the Transportation Treasury Appropriations Bill later this week.

Thank you for considering the views of the ABA on this important issue. If you would like to discuss the ABA's views in greater detail, please feel free to contact the ABA's senior legislative counsel for administrative law issues, Larson Frisby, at 202/662-1098, or the Chair of the ACUS Task Force of the ABA Administrative Law Section, Warren Belmar, at 202/586-6758.

Sincerely,

Robert D. Evans

RECOMMENDATION 106A
ADOPTED BY THE
HOUSE OF DELEGATES
OF THE
AMERICAN BAR ASSOCIATION

August 9, 2005*

RESOLVED, that the American Bar Association encourages Congress to establish the Administrative Law Judge Conference of the United States as an independent agency to assume the responsibility of the United States Office of Personnel Management with respect to Administrative Law Judges including their testing, selection, and appointment.

*Note: The "Recommendation," but not the attached "Report," constitutes official ABA policy.

REPORT

Federal administrative law judges ("ALJ") have been members of the American Bar Association, Judicial Division, National Conference of the Administrative Law Judiciary, since 1971; this resolution renews and extends existing American Bar Association policy.¹

The Office of Personnel Management ("OPM") is mandated to administer the ALJ program and to maintain a register of qualified applicants and test and evaluate prospective applicants.² However, OPM recently closed its Office of Administrative Law Judges and has otherwise failed to adequately service the agencies and the judges under its mandate. In 2003, the functions were dispersed to other OPM divisions, without notice to the agencies or to ALJs regarding the terms of transfer. Thus, there is no central administrative office to administer the administrative law judge program at OPM, and there is no agency that provides suggestions to Congress to improve the administrative adjudication process.

The Administrative Law Judge Conference of the United States will perform those functions and enhance the independence of decision-making and the quality of adjudications of administrative law judge hearings under the Administrative Procedure Act ("APA"). The Administrative Law Judge Conference of the United States would be similar to the Judicial Conference of the United States, which provides administrative functions for Federal Article III judges, but its creation would effect no change in the current relationship between ALJs and the agencies where they serve. Rather the new Conference would assume the current responsibilities of OPM with respect to administrative law judges, including their testing, selection, and appointment.

Federal administrative law judges are appointed under 5 U.S.C. § 3105.³ Their powers emanate

¹The American Bar Association has adopted policy supporting the independence and integrity of the administrative judiciary in 1983, 1989, 1998, 2000 and 2001. Indeed, the Association's commitment to the independence of the administrative judiciary is reflected in the jurisdictional authority of the Standing Committee on Judicial Independence, which is authorized to promote this value.

²The classification of "administrative law judge" is reserved by OPM for the specific class of appointments made under 5 U.S.C. § 3105 and applies to all agencies:

"The title 'administrative law judge' is the official class title for an administrative law judge position. Each agency will use only this official class title for personnel, budget, and fiscal purposes." 5 C.F.R. § 930.203b.

5 C.F.R. § 930.201 requires OPM to conduct competitive examinations for administrative law judge positions and defines an ALJ position as one in which any portion of the duties includes those which require the appointment of an administrative law judge under 5 U.S.C. 3105. ALJs can only be appointed after certification by OPM:

An agency may make an appointment to an administrative law judge position only with the prior approval of OPM, except when it makes its appointment from a certificate of eligibles furnished by OPM. 5 C.F.R. § 930.203a. *Id.* § 930.203a; see also 5 U.S.C. § 5372 (2000) (providing for pay for administrative law judges, also subject to OPM approval).

³See also, 5 U.S.C. sec. 5372 (a) ("For the purposes of this section, the term 'administrative law judge' means an administrative law judge appointed under section 3105.")

from the Administrative Procedure Act.⁴ Extensive legal experience is necessary for the position, because experience provides maturity, expertise in compiling a reliable record, first-hand knowledge with problems likely to be encountered as an administrative law judge, and intimacy with rules of evidence and procedure similar to those used in administrative hearings.⁵ After reviewing the duties of the office, the Supreme Court has declared that federal administrative law judges are like other federal trial judges for tenure and compensation⁶ and that ALJs are functionally equivalent to other Federal trial judges:⁷

Cases heard and decided by ALJs involve billions of dollars and have considerable impact on the national economy. In fact, a single ALJ may handle a single case that may affect millions of people and involve billions of dollars. ALJs adjudicate cases involving a wide range of regulatory matters...

The Office of Personnel Management

The need for a separate agency to manage the ALJ program is prompted by longstanding problems with OPM's administration of the program. The APA contemplated that the Civil Service Commission (now OPM)⁸ would oversee merit selection and appointment of ALJs and would also act as an ombudsman for the ALJ program but OPM has essentially abandoned that role. Section 1305 provides that for the purpose of sections 3105 (appointment), §3344 (loans), and §5372 (pay) OPM "may... investigate, require reports by agencies, prescribe regulations, appoint advisory committees as necessary, recommend legislation, subpoena witnesses and records, and pay witness fees." Although the OPM Program Handbook, p. 4, affirms these responsibilities, OPM has seldom exercised them, except for regulations, including sometimes less-than-benign changes in selection and RIF regulations.⁹

On May 21, 1991, the National Conference of Administrative Law Judges (NCALJ)¹⁰, in the Judicial Division of the American Bar Association, wrote to OPM, pointing out that:

⁴ See, A Guide to Federal Agency Adjudication, Michael Asimow, ed., 164 (*American Bar Association Administrative Law Section*, 2003). For example, subject to published rules of the agency, administrative law judges are empowered to administer oaths, issue subpoenas, receive relevant evidence, take depositions, and regulate the course of the hearing. These fundamental powers arise from the Administrative Procedures Act "without the necessity of express agency delegation" and "an agency is without the power to withhold such powers" from its administrative law judges. Id. The Administrative Procedure Act seeks to affirm and protect the role of the administrative law judge, whose "impartiality," in the words of the Supreme Court in *Marshall v. Jerrico*, 446 U.S. 238, 250 (1980), "serves as the ultimate guarantee of fair and meaningful proceedings in our constitutional regime."

⁵ Amiel T. Sharon and Craig B. Pettibone, "Merit Selection of Federal Administrative Law Judges," 70 *Judicature* 216, 218 (1987).

⁶ *Rutz v. Egan*, 438 U.S. 478 (1978).

⁷ *Federal Maritime Com'n v. South Carolina State Ports Authority*, 535 U.S. 743 (2002); see also, *Rhode Island Dept. of Environmental Management v. United States*, 304 F.3d 511 (1st Cir. 2002) (finding that Department of Labor administrative law judges are functionally equivalent to Federal District Judges).

⁸ Administration of the ALJ program was originally placed in the Civil Service Commission and was subsequently bifurcated to OPM and the Merit Systems Protection Board ("MSPB").

⁹ See Appointment, Pay, and Removals of Administrative Law Judges, 63 Fed. Reg. 8,874 (proposed Feb. 23, 1998).

¹⁰ Now the National Conference of the Administrative Judiciary.

OPM has not taken a leadership role in the education of either ALJs or the agencies as to the nature of their relationship or the judge's function, or in the supervision or investigation of problems related to that relationship and function. OPM has not conducted or sponsored orientation programs for ALJs or their administrators, has not monitored the appointment of sufficient numbers of ALJs by agencies (although traditionally it has carefully monitored appointments to prevent the appointment of too many), has not adopted or proposed uniform rules for conduct, procedure, robes, support staff, office or hearing space, and has not investigated or made recommendations on any of these questions, or the long-standing strife between the SSA and its ALJs, or, most recently, the apparent due process breakdown at MSPB in connection with projected furlough of ALJs in fiscal 1991.

That letter suggested 10 items that OPM should undertake to improve relationships between ALJs and their agencies and the lot of ALJs generally, including education for ALJs and their reviewing authorities, administrative leave for education, guidelines for offices, staff support, robes and perks, model procedural rules, standards of conduct, appointment of sufficient judges by agencies, a mini-corps, and an investigation of the SSA and furlough situations and pay issues. In June 1991 OPM forwarded that letter to the Administrative Conference of the United States (ACUS) for consideration in connection with its study of the federal administrative judiciary. That study was completed in 1992 and recognized the importance of continuing and improving the position of ALJs and the ALJ program.¹¹ However, OPM neither referenced nor dealt with any of the NCALJ concerns, and OPM undertook no action on the report even though it sponsored it.

In August 1994 NCALJ again sought a response to its letter and was told by OPM in a September 8, 1994, letter that "several of your concerns appear to be more appropriately identified as agency matters" and that "other concerns appear to involve matters which conflict with this agency's evolving policy of returning greater responsibility for personnel management to the agencies." The letter did not address the fact that such a policy might conflict with OPM's responsibilities under the APA. In short, while OPM has responsibility to study and report to Congress concerning the ALJ program, it has not done so and has proclaimed an interest in returning its function to the agencies.

From 1998 to 2004, agencies were generally unable to hire new judges from the OPM register. While *Adell*¹² was pending, OPM suspended the examination process for administrative law judges (ALJs). Therefore, the ALJ register became dated. With one exception,¹³ agencies could not hire judges from the ALJ Register during this period. In *Bush v. Office of Personnel Management*, 313 F.3d 1358 (Fed. Cir. 2003), after an applicant was rejected in his request to be given part of the ALJ examination, the Federal Circuit determined that the suspension of testing was a reviewable employment practice.¹⁴ On

¹¹ 1 C.F.R. § 305.92-7. [57 FR 61760, Dec. 29, 1992].

¹² *Mecker v. Merit Systems Protection Board*, 319 F.3d 1368 (Fed. Cir. 2003).

¹³ In August, SSA was granted a waiver by OPM to hire 126 judges who would have qualified under any scoring formula. See *Hearing Before the Subcommittees on Social Security Of the Committee on Ways and Means House of Representatives*, One Hundred Seventh Congress, Second Session (MAY 2, 2002).

¹⁴ Sunsetting American Bar Association policy establishes that with respect to the recruitment and selection of administrative law judges (ALJs) employed by federal agencies, OPM, and Congress, where necessary, are to develop strategies to increase the percentages of women and minority candidates, eliminate veterans' preferences from this process, allow selection by agencies from a broader range of candidates for ALJ positions, and enhance

February 27, 2004, the United States Supreme Court finally dismissed the requests for certiorari.

OPM has also failed to follow its own regulations concerning priority placement from the ALJ priority referral list (PRL),¹⁷ resulting in irreparable harm to an ALJ on the PRL and a preliminary injunction against its continued improper administration of the PRL.¹⁸

Various other questions have arisen concerning the appropriate administration of the ALJ program, including the adoption of a Code of Judicial Conduct for ALJs, which OPM has refused to consider as part of its responsibility under present law. While OPM has met periodically with ALJ representatives, it has refused requests to establish an advisory committee or to meet with ALJ representatives on a regular basis to discuss these and other problems concerning the ALJ program.¹⁷

Administration of the ALJ program by OPM has been inadequate, and OPM has repeatedly indicated by words and deeds that it does not want to continue responsibility for the administration of operational programs such as the ALJ program. Indeed, until 1998 the OPM long-range plan did not recognize the ALJ program as one of its responsibilities. From 1994-95 the Office of Administrative Law Judges was upgraded by placing an administrative law judge in charge of the office, but since that time the office director has been a personnel specialist rather than a judge and the office has been subordinated under other testing functions. For many years OPM refused to maintain a continuously open examination for ALJ applicants, and when it finally opened the register continuously, it applied illegal criteria, as noted above, in examining and scoring applicants. As a result of OPM inaction, agencies have not been able to address hiring needs.

Maximize Administrative Efficiency

The Administrative Law Judge Conference of the United States will assume all duties with respect to administrative law judges currently mandated to OPM. The budget currently dedicated to administration of an administrative law judges' program by OPM will be transferred to the Administrative Law Judge Conference. Agencies will continue to select ALJs but the selection process and ALJ register will be managed by the Administrative Law Judge Conference of the United States.

It is also anticipated that the office of the Chief Judge will have the capacity to review rules of procedure, rules of evidence, peer review, and where appropriate, make suggestions ~~for~~ to promote administrative uniformity.

Ensure High Standards

The Administrative Law Judge Conference of the United States will assure high standards for

OPM's Office of Administrative Law Judges. Although OPM feebly adhered to these requests, it failed to administer the system during the period when it was involved in the *Asadi* litigation.

¹⁷ Under 5 CFR §930.215, an ALJ who is separated from service because of a reduction in force (RIF) is entitled to priority referral for any ALJ vacancy ahead of others on the ALJ register of eligibles maintained by OPM.

¹⁸ *Rutberg v. United States*, No. 98-10752-JUT, Order dated December 10, 1998, 1998 U.S. Dist. LEXIS 19832 (D. Mass., 1998).

¹⁷ In 1998 and 1999, OPM advised ALJs that they are required to maintain active bar status to retain their status as ALJs, although there is no provision in the OPM regulations granting authority to do so. Unlike attorneys, ALJs are barred from the practice of law by the Code of Judicial Conduct (Canon 5F)(ABA, 1990), which has been applied to ALJs by the Merit Systems Protection Board (*In re Choccolito*, 1 MSPBR 612, 651 (1978)) and by some agency regulations. In some states, Federal ALJs like other judges, cannot be members of the state bar. E.g. Alabama.

Federal Administrative Law Judges. It will permit the chief judge to adopt and issue rules of judicial conduct for administrative law judges. This is consistent with ABA policy, which states in part, that members of the administrative judiciary should be held accountable under appropriate ethical standards adapted from the ABA Model Code of Judicial Conduct in light of the unique characteristics of particular positions in the administrative judiciary.¹⁸

Promote Professionalism

The Conference can be used as a resource for continuing judicial education, consistent with ABA policy.¹⁹ ABA policy also encourages governmental entities at all levels to permit government lawyers, including those in judicial administrative positions, to serve in leadership capacities within professional associations and societies.²⁰

Promote Public Confidence

Establishment of the Administrative Law Judge Conference of the United States will significantly increase public trust and confidence in the integrity and independence of decision making by administrative law judges throughout the Federal Government.

Congressional Oversight

Congress needs a new organization to assure independent review of agency compliance with the APA and reporting to Congress on these important public safeguards for fundamental due process and the fair hearing process before administrative agencies. The Administrative Law Judge Conference of the United States will provide regular reports to the Congress on agency compliance with the APA and the provisions relating to ALJ utilization, management and compensation. This process will assist the Congress in its oversight of agency compliance with the APA. This reform permits Congress to maintain oversight on constitutional safeguards such as the right to an impartial and independent decision maker, notice and opportunity to appear at a hearing, a written explanation for the decision and the issuance of a timely hearing decision. This is consistent with ABA policy that Congress provide a practical process for agency matters.²¹

Respectfully Submitted,

Louraine Arkfeld, Chair, Judicial Division
August, 2005

¹⁹ Standards for the Education of the Administrative Judiciary, Policy 99 A101, *ABA Policy/Procedures Handbook*, 268 (2004).

²⁰ Policy 99-A-112. It also encourages governmental entities to adopt standards that would authorize government lawyers, including those in judicial administrative positions, to (1) make reasonable use of government law office and library resources and facilities for certain activities sponsored or conducted by bar associations and similar legal organizations, and (2) utilize reasonable amounts of official time for participation in such activities.

²¹ See ABA Policy, August, 1997, *ABA Policy/Procedures Handbook: Policy on Legislative and National Issues*, 233 (2004).

Mr. CANNON. I am now pleased to introduce the witnesses for today's hearing.

Our first witness is Dr. Bill West of the Bush School of Government and Public Service at Texas A&M University. A 1971 graduate of the United States Military Academy, Dr. West earned his Ph.D in political science at Rice University. Currently, he teaches public policy administration at the Bush School. He also serves as the school's director of the Master in Public Service and Administration program. Dr. West has authored two books and published numerous articles.

Our next witness is Marshall Breger, who is a professor of law at the Columbus School of Law at the Catholic University of America and was my chief of staff Matt Iandoli's professor while he studied at Catholic.

Professor Breger has had a diverse career. From 1993 to 1995, he was a senior fellow at The Heritage Foundation. During the prior Bush administration, he served as solicitor of labor, the chief lawyer for the Labor Department. In 1992, he served concurrently by presidential designation as the acting assistant secretary for labor management standards.

As I alluded to earlier, Professor Breger was the chairman of ACUS from 1985 to 1991. For 2 years during that period, he served as an alternate delegate of the United States to the United Nations Human Rights Commission in Geneva.

A prolific writer and editor, Professor Breger is vice president of the Jurispolicy Center, a Jewish conservative think-tank. Professor Breger obtained his undergraduate and master's degrees from the University of Pennsylvania. He received his law degree magna cum laude from the University of Pennsylvania, where he was an editor of the law review and a member of the Order of the Coif.

Our third witness is Professor Elizabeth Magill of the University of Virginia Law School, where she teaches, not surprisingly, courses on administrative law, as well as on food and drug law and constitutional structure.

Upon obtaining her undergraduate degree from Yale College, Professor Magill served as a senior legislative assistant for North Dakota Senator Kent Conrad. Thereafter, she obtained a law degree from the University of Virginia School of Law. After graduating from law school, Professor Magill clerked for the Honorable J. Harvey Wilkinson of the Fourth Circuit Court of Appeals, and then for Justice Ruth Bader Ginsburg. Like her fellow panelists, Professor Magill has also published extensively.

Our final witness is Professor Cary Coglianese. As I noted in my opening remarks, Professor Coglianese was the moderator of the Subcommittee's symposium on e-rulemaking, which was held in this very room last December.

Welcome back.

Professor Coglianese is the Edward B. Shils professor of law and professor of political science at the University of Pennsylvania Law School. Prior to joining the University of Pennsylvania, Professor Coglianese spent 12 years on the faculty of the John F. Kennedy School of Government at Harvard. While there, he served as the faculty chair in the school's Regulatory Policy Program and director of its Politics Research Group.

Professor Coglianese received his undergraduate degree from Albertson College. He then went on to the University of Michigan, where he received his law degree and master's degree in public policy, as well as a doctorate in political science.

I extend to each of you my warm regards and appreciation for your willingness to participate in today's hearing.

In light of the fact that your written statements will be included in the record, you may not want to limit your comments to 5 minutes. We will have time for questions, and you can certainly volunteer things during the Q&A. I don't think we are going to have a great deal of competition from other Members of the Committee here.

You do have a lighting system in front of you. After 4 minutes, it turns from green to yellow. It is my habit to tap just with a pencil or something to draw your attention to the fact that we are getting to that point. It is not a big deal today, given the fact that we are not overwhelmed with folks that want to ask questions.

After you have presented your remarks, we will go in order, if others arrive, of arrival, to ask questions. Pursuant to the direction of the Chairman of the Judiciary Committee, I ask the witnesses to please stand and raise your right hand to take the oath.

[Witnesses sworn.]

The record should reflect that the witnesses all answered in the affirmative.

You may be seated.

Professor West, would you please proceed with your testimony?

TESTIMONY OF PROFESSOR WILLIAM WEST, THE BUSH SCHOOL OF GOVERNMENT AND PUBLIC SERVICE, TEXAS A&M UNIVERSITY, COLLEGE STATION, TX

Mr. WEST. I am Bill West from The Bush School of Government and Public Service at Texas A&M University. Thank you for inviting me to testify in commemoration of the 60th anniversary of the APA.

My testimony today will focus primarily on parts of a recent exploratory study of how agencies develop proposed rules. The study was conducted by a team of seven Bush School students that I supervised and that was supported by the Congressional Research Service. Curtis Copeland and Mort Rosenberg of CRS provided invaluable support and guidance for the project.

I might also note that Caitlyn Miller, who is the student leader of the project, is here today.

Mr. CANNON. Could I interrupt and ask who Ms. Miller is? Could we have her raise her hand?

Welcome. Nice to have you here today.

Pardon me for the interruption.

Mr. WEST. That is fine.

The 60th anniversary of the APA is a good occasion to consider its effects and its limitations. An especially important, if neglected topic, is that part of the rulemaking process that takes place before the APA's requirements come to bear. Notice and comment is intended to ensure that rulemaking is transparent and accessible to all relevant stakeholders. Yet although these procedures are un-

doubtedly salutary, it is also true that they come to bear at a relatively late stage in the decision-making process.

The part of the rulemaking process that precedes the publication of notice frequently lasts for several years and almost always results in a specific and thoroughly justified policy proposal. It is where the most critical decisions often occur. If public notice and comment is intended to promote inclusive and transparent participation in decision-making therefore, how inclusive and transparent is participation in proposal development?

As a starting point, one thing that our study finds is that pre-notice participation is common and that it takes place through a variety of mechanisms. Although participants vary a great deal from one agency to the next, and indeed from one rule to the next, they can include representatives of industry and other affected interests, public interest groups and other agencies. OMB and other entities within the executive office of the president are also sometimes involved.

Unlike notice and comment under the APA, however, participation in the development of proposed rules usually does not occur by general invitation. Rather, it is informal and occurs at the specific invitation of the agency or at the initiative of the participant. The primary exception to this is when agencies solicit comments from all interested parties through an advance notice of proposed rulemaking. Although agencies' use of advanced notice varies, it is never routine or even frequent. It is probably employed significantly less than 5 percent of the time across the Federal bureaucracy.

Participation during the pre-notice phase of rulemaking thus is not subject to the same institutional guarantees of inclusiveness that the APA provides during the comment phase. Whether this is a problem, much less a problem that Congress should address, suggests a number of more specific questions.

For example, how effective are agencies in gathering input from all relevant stakeholders during proposal development? If they are not effective, do the APA's notice and comment requirement serve as a check on earlier imbalances in participation? Would the benefits of institutional reforms that might increase inclusiveness in proposal development outweigh their costs in terms of administrative efficiency?

Our examination of pre-notice rulemaking also addresses the question of transparency. Although the APA is silent on the subject, there has been an expectation since the 1970's that agencies base their rules on a record. Although they generally docket communications outside the executive branch that occur after the publication of notice, however, there is wide variation across agencies in pre-notice docketing practices. Some indicate that they record all communications with non-executive actors throughout this phase. Others indicate that they do not require any pre-notice docketing.

In between these two extremes there is variation in the types of communications placed on the public record and in the stage of the proposal development process at which docketing begins. As with inclusiveness, the policy issues surrounding transparency are complex.

If on-the-record communications promote openness in decision-making, for example, they may also impede the collection of needed information. As in the legislative process, moreover, on-the-record communications may be inimical to the bargaining and compromise required for the accommodation of affected interests.

Some officials we interviewed for our study also indicated that off-the-record communications with other agencies and OMB were important for coordination among administrative programs. Indeed, any effort by Congress to require docketing within the executive branch would necessarily have to consider the court's sympathy for a unified executive in recent decades.

I should hasten to emphasize that our study was designed to identify key issues, rather than to resolve them. In these and many other respects, gaining a better understanding of the administrative process is an essential foundation for sound institutional policy.

Again, I am grateful for the opportunity that you and CRS have given to us to explore one broad dimension of rulemaking, and I applaud other recent initiatives to shed more light on topics such as e-rulemaking and the role of advisory committees in administrative decision-making.

As an extension of these last observations, let me close by stressing the need to devote more resources to policy and legal analysis in the administrative process. For years, the Administrative Conference of the United States produced objective studies by first-rate scholars that were of considerable practical, as well as academic value.

I am happy that ACUS has been reauthorized, and I would like to join those who have argued that it should be re-funded as well. This would produce substantial benefit for relatively little cost.

Thank you.

[The prepared statement of Mr. West follows:]

PREPARED STATEMENT OF PROFESSOR WILLIAM WEST

I am Bill West from the Bush School of Government and Public Service at Texas A&M University. Thank you for inviting me to testify in commemoration of the 60th anniversary of the Administrative Procedure Act. I am honored to be here.

My testimony today will focus primarily on the results of a recent study of how agencies develop proposed rules. The study was conducted by a team of seven Bush School students that I supervised and that was supported by the Congressional Research Service. Curtis Copeland and Mort Rosenberg of CRS provided invaluable support and guidance for the project. I am also grateful to Daniel Mulhollan, Angela Evans, and Kent Ronhovde for their initiatives in establishing a relationship between CRS and the Bush School. Our study of rulemaking is one of several worthwhile projects that CRS has sponsored at the Bush School and other schools of public affairs.

The Administrative Procedure Act is a venerable statute that has served the nation well. As many have remarked, however, American administrative law was a comparatively new field at the time the APA was enacted and the so-called bureaucratic state was still in its relative infancy. New procedural constraints on agency discretion have been added as the bureaucracy has grown and as new issues of legitimacy and accountability have arisen. Mechanisms for direct oversight of administrative policy making have been added as well. The most important development in this latter regard has been the institutionalization of regulatory review in the Executive Office of the President that has occurred over the past three decades.¹ The

¹ James Blumstein, "Presidential Administration and Administrative Law: Regulatory Review by the Executive Office of the President: An Overview and Policy Analysis of Current Issues," *Duke Law Journal* 51 (2001).

various controls that shape the administrative process have been added largely in a piecemeal fashion and perhaps without sufficient consideration of how they all fit together.

In any case, the 60th anniversary of the APA is an appropriate occasion to consider its effects and its possible limitations. With regard to rulemaking, one might examine the effects of public comment on agency decisions or the impact of judicial review (or the threat thereof) as the meaning of the "arbitrary-or-capricious" standard has evolved. Or one might examine the relationship between the APA's objectives, on the one hand, and centralized executive oversight of rulemaking on the other. Scholars have, in fact, given a good deal of attention to these and other important topics relating to formal, institutional constraints on agencies' exercise of legislative discretion.

At the same time, scholars have practically ignored the informal processes that precede the APA's notice-and-comment requirements and most other controls on rulemaking. This, despite the fact that the most important policy decisions in rulemaking are arguably made as proposals are being developed. I have noted elsewhere that the notices of proposed rulemaking that appear in the Federal Register are usually very specific. Further, they often take years to develop and reflect a substantial investment of agency resources. Important proposals are sometimes accompanied by book-length documents that lay out their legal and empirical premises. Suffice to say that agency officials usually feel that they are on firm ground before they invite public comment, and that the most critical issues in terms of defining problems and eliminating alternative solutions to those problems have at least tentatively been resolved.²

This is not to deny the importance of notice and comment. Several recent studies have found that agencies do sometimes alter proposed rules in ways that are consistent with the comments they receive.³ As a matter of perspective, however, it is difficult for agencies to change proposed rules in fundamental ways. An obvious disincentive is sunk organizational costs. Intertwined with this is the fact that the demands of due process may compel agencies to invite additional comments in response to substantial changes, thus lengthening an already protracted process.⁴ An irony of rulemaking procedures is that the effort to ensure the viability of public comment by requiring agencies to base their decisions on a record (as the courts have generally done since the 1970s and has Congress done in some enabling legislation) creates an incentive for agencies to develop proposals that will not need to be changed.

With these observations as a point of departure, the project that we conducted for CRS examines how agencies develop proposed rules. It relies primarily on agency documents, on an electronic questionnaire sent to agency staff involved in the development of a large sample of individual rules, and on telephone interviews with high-level agency careerists with extensive experience in the rulemaking process. As an exploratory study, it addressed three general sets of issues as a way of identifying questions for further research: how are rulemaking initiatives placed on agencies' agendas; how is the rulemaking process managed within and across agencies; and what is the character of outside participation in the development of proposed rules. The last of these questions may be especially relevant to the Congress as it considers possible amendments to the APA.

The goals of the APA offer a frame of reference for evaluating participation in proposal development. The Act sought to provide some uniformity across agencies (at least regulatory agencies) as they carried out their quasi-judicial and quasi-legislative responsibilities. By the same token, it sought to ensure a degree of due process that was appropriate for each of these functions. In the case of rulemaking, the "informal" or "notice-and-comment" procedures set forth in section 553 were designed to promote a certain level of rationality as well as transparency and inclusiveness in administrative policy making. The requirements that agencies publish a notice

⁴West, *supra* note 1. These observations were also confirmed in some of the interviews conducted for the study described in this testimony.

in the Federal Register and solicit comments from any and all interested parties were designed to promote these latter, democratic values.⁵

As many have noted, developments in administrative law over the past three-and-a-half decades have been intended to reinforce these goals. The most important has been the requirement that agencies based their rules primarily on a record. This has resulted in part from provisions in some enabling statutes that supersede the APA and in part from judicial (re)interpretation of the APA's "arbitrary or capricious" standard of review. Although the courts have backed off from the precedents of the 1970s in some respects, the "hard-look" doctrine of review is hardly dead—especially if one compares current practices with those that existed during the first two-and-a-half decades after the APA's passage. Whether instituted by Congress or the courts, the extension of more rigorous due process to rulemaking has been motivated in part by the desire to ensure that bureaucracy consider all legitimate comments in arriving at policy decisions.⁶ This goal became popular as the result of the allegation that agencies were "captured" by special interests.⁷

If many of the most important decisions are made before notice appears in the Federal Register, however, what of the participation that occurs as agencies are developing proposals? How inclusive and transparent is that process? As with most of the other issues we examined in our study, there are no simple answers here. This is largely because agency practices are so diverse with regard to most of the key dimensions of proposal development. Although we had hoped that the data from our electronic survey would allow us to make systematic comparisons of such variation across agencies and policy areas, a low response rate prevented this. Still, our interviews and survey data allow for some important observations that suggest further study and that may ultimately be relevant for institutional reform. Indeed, the observation that such variation exists may be significant in and of itself given the relative standardization of practices within the comment phase of rulemaking.

One thing that we found is that outside participation in proposal development is common. Although it does not always occur, it does occur frequently. Not surprisingly, in fact, a number of the officials we interviewed noted that gathering information from people outside of the agency was frequently indispensable to intelligent decision making. Although participants vary a great deal from agency to agency and from one rule to the next, they can include representatives of industry and other affected interests, public interest groups, and other agencies. The latter might become involved in order to resolve jurisdictional issues or coordinate across programs or to represent the interests of their constituents.

OMB's Office of Information and Regulatory Affairs can also be an important participant in proposal development. Although its level of involvement varies a good deal from one agency to the next, some officials characterized OIRA as the "800-pound gorilla." Its informal role in policy formulation is undergirded by the formal powers it enjoys at a later stage to return for reconsideration proposed rules that are not properly justified or that are inconsistent with the president's agenda. In contrast, there was a near consensus among those we interviewed that, although specific statutory requirements were a very important source of rulemaking initiatives in some agencies, the extent and impact of congressional involvement in the development of proposed rules tended to be quite limited.

Beyond the observation that it occurs and that it can involve various actors, we found that the character of participation varies considerably. The timing of input is one important dimension of variation. Some officials indicated that their agencies communicate with extra-governmental actors throughout proposal development while others indicated that their policy is to terminate communications at an intermediate stage of the process. Among the latter, the most common termination point is after the agency has collected general views about the nature of the problem being addressed and possible solutions to that problem and before it begins to articulate and support a specific policy proposal. The mechanisms of participation also vary a great deal. They range from informal conversations at trade conferences or over the telephone to e-mails and letters to hearings to advisory committees, among various other possibilities. Some agencies even use focus groups on occasion.

A generalization that one can offer about participation in proposal development, however, is that—unlike notice-and-comment under the APA—it *does not usually occur by general invitation*. Rather, it occurs either at the specific invitation of the

⁵*The Administrative Procedure Act: A Legislative History* (Washington, D.C.: U.S. Government Printing Office, 1946) Senate Doc. 248, 79th Cong., 2d. Sess.

⁷Richard B. Stewart, "The Reformation of American Administrative Law," *Harvard Law Review* 88: 1667–1814 (1975).

agency or at the initiative of the participant. The primary exception to this generalization is when agencies solicit comment from all interested parties through an advanced notice of proposed rulemaking. Yet although the use of ANPRMs varies from one agency to the next, they are never used on a routine or even a frequent basis. Although we did not gather precise data, it appears as if they are employed significantly less than five percent of the time across all rulemaking.

Our interviewees offered several explanations for their reluctance to use advance notices more often. One was that ANPRMs were an additional source of delay in a process that was already slowed by numerous procedural hurdles. This disincentive was sometimes reinforced by pressures from Congress and elsewhere to issue rules in a timely fashion. Another explanation was that advanced notices did not produce any useful information beyond what the agency could obtain by contacting stakeholders individually. Not surprisingly, virtually all of the officials we interviewed indicated that they made assiduous efforts to gather all relevant perspectives, and many expressed confidence that they usually knew who were affected by their rules. In addition, several officials noted that, because it did not occur in response to a specific proposal, comment pursuant to advance notices was too unfocused to be of much value. Two of the senior people we interviewed noted that their agencies' use of ANPRMs had declined in recent years as the result of these factors.

In brief, then, although critical policy decisions are at least tentatively made during proposal development, participation during that phase of rulemaking is not subject to the same institutional guarantees of inclusiveness that the APA provides during the comment phase of rulemaking. Whether or not this is a problem, much less a problem that Congress should seek to address is a complex issue that involves a variety of considerations. One obvious question is whether agencies are effective in gathering input from all relevant stakeholders during proposal development (or whether participation and influence tends to be confined to the "usual suspects"). To the extent participation during proposal development is not inclusive, another important set of questions have to do with whether the APA's notice and comment requirements redress participatory imbalances during proposal development. Are agencies willing to make substantial changes in proposed rules? Given the resources required for effective comment, moreover, the formal opportunity to offer feedback on proposed rules may have little practical effect in enfranchising those who have not had access to agency decision makers during proposal development. Finally, even if Congress could promote inclusiveness through institutional constraints on proposal development, the potential benefits of such a reform must also be weighed against its costs in terms of administrative efficiency and effectiveness. The officials we interviewed were unanimous in their opinion that requiring advanced notices for all or certain classes of rulemaking would impose undue delay on decision making.

Our study also addressed the related issue of transparency in proposal development. Again, although the APA is silent on the subject, there has been an expectation since the 1970s that agencies base their rules on a record. Given this, almost all of the officials we interviewed indicated that they made available to the public all communications with actors outside of the Executive Branch (including legislators and legislative staff) that occurred after a notice appeared in the Federal Register. In contrast, there was wide variation in pre-notice docketing practices. A high-level official in the general counsel's office of one department indicated that his agency's policy was that practically all communications with non-executive actors must be recorded. In contrast, another official indicated that his agency did not feel a need to docket any pre-notice communications. In between these two extremes, some interviewees said that their agencies did not docket early communications designed to collect general information about problems but became more conscious of the need to docket communications at the later stages of proposal development. Others indicated that they tended only to docket communications that were material to their proposed rules.

Such wide variation in docketing practices may be attributable in part to the current ambiguity of judicial precedent in this area over the past thirty years. It is also undoubtedly attributable to agency culture and tradition, as well to the preferences key officials. One senior careerist with a good deal of influence over administrative procedures within his department indicated that he favored strict docketing requirements on policy as opposed to legal grounds. Given that most pre-notice participation occurred at the specific invitation of agency officials, he felt that recording such communications was desirable as a way of avoiding perceptions of bias in the process.

As with inclusiveness, the prescriptive issues surrounding transparency are complex and invite further research. If off-the-record communications obviously detract from the openness (and thus perhaps the legitimacy) of proposal development, they

may also be desirable in terms of administrative efficiency and effectiveness. Although the officials we interviewed were not as consistent in their opposition to docketing requirements as they were to advanced notices, a number of them indicated that *ex parte* conversations facilitated the kind of information gathering required for rulemaking. As in the legislative process, moreover, on-the-record communications may be inimical to the bargaining and compromise required for the accommodation of competing interests. Although agency officials involved in rulemaking typically describe it as a “technical” process of ascertaining legislative intent and making sound factual determinations, there is little doubt that it is also frequently a political process that requires “partisan mutual adjustment” among competing interests. (It usually requires only a little prodding in interviews to bring this out.)

Some officials also indicated that off-the-record communications with other agencies and OMB were important for coordination and management among administrative programs. Indeed, any effort by Congress to require the docketing of communications within the Executive Branch would necessarily have to consider the legal implications of such a policy. This observation is underscored by the Supreme Court’s sympathy in recent decades for a “unified executive” as a means of rationalizing policy implementation across the federal bureaucracy.⁸ Yet while managerial prerogatives within the executive are certainly an important consideration, it is also true that other agencies, OMB, and the White House sometimes act as conduits for private interests in their efforts to influence rulemaking. This is well-documented in the case of OIRA, for example.⁹ To some extent, therefore, docketing requirements for non-governmental actors but not for members of the Executive Branch might have the potential to produce a misleading appearance of transparency.

All of this is to say that the development of proposed rules deserves much more attention than it has received. It is the proverbial black box; the part of the iceberg that lies under the water. Again, our study was an exploratory effort designed to identify some of the key parameters of variation in the process and to identify important questions rather than to answer them. That was true of our consideration of agenda setting and the management of proposal development as well.

In the case of agenda setting, for example, we found that whereas some agencies’ rulemaking consisted primarily or exclusively of discretionary initiatives that derived from various sources (agency staff research, feedback from enforcement officials, suggestions from affected groups, etc.) other agencies’ agendas were dominated by non-discretionary (legislatively required) rules. Still other agencies combined the two in various proportions. A systematic, cross-agency study of where ideas for rules come from and of why some ideas become rules and others do not can add a good deal to our understanding of how government works. An examination of agenda setting might also have prescriptive value. In the case of one agency, for example, although non-discretionary rules comprised a minority of its total workload, the fact that they took precedence nonetheless made it difficult to plan and execute a coherent agenda for all rulemaking. The official with whom we spoke felt that more effective communication with Congress could help alleviate this problem.

The management of proposal development is also a fertile area for further investigation. For example, we found that some agencies have highly detailed, formalized procedures whereas others have no written policies to guide the process. The degree to which key decisions in the formulation of proposed rules is centralized at the departmental level also varies a good deal. To observe that such variation exists naturally suggests the questions of why it exists and what difference it makes in terms of agency performance.

There are many other important dimensions of proposal development that have received little if any attention. For example, what are the forms and roles of advisory committees and to what extent do these bodies provide effective representation for stakeholders? Another important set of questions concerns whether and how rulemaking is coordinated across agencies. The list could go on.

This is not to say that studying proposal development is easy. Evaluative and prescriptive analysis is complicated at the conceptual level by the fact that we expect different qualities in the rulemaking process. Given its legislative nature, we naturally want it to reflect the democratic values of openness and balanced responsiveness. Given its administrative nature, we also want it to be carried out in as timely and efficient a manner as possible. A third criterion, which might be labeled “substantive rationality,” is the expectation that rulemaking decisions be objective and

⁸ Elena Kagan, “Presidential Administration,” *Harvard Law Review* 114 (2001).

⁹ For a recent discussion see William F. West, “The Institutionalization of Regulatory Review: Organizational Stability and Responsive Competence at OIRA,” *Presidential Studies Quarterly* 35 (March 2005).

based on rigorous empirical evidence. All of these criteria are legitimate bases for assessing proposal development (and rulemaking more generally). As might be evident from the preceding discussion, however, they all potentially conflict with one another in critical ways.

Data collection presents another, more practical challenge to the study of proposal development. Because of its extreme diversity, studies that focus on one or a few cases are of limited value in developing generalizations. Conversely, gathering process-related data for a large sample of rules can be a daunting task. As we found, for example, efforts to accomplish this goal through surveys of agency personnel face several obstacles, not the least of which is the inherent reluctance of bureaucracy to share information. Indeed, two agencies ordered their staff not to comply with our survey despite (or perhaps because of) a cover letter indicating that it was being conducted under the auspices of CRS and the Judiciary Committee. Even the senior officials we interviewed, all of whom were extremely helpful, were sometimes unable to share internal documents describing the rulemaking process.

Still, the research needs to be done. Gaining a better understanding of the administrative process is an essential foundation for sound institutional policy. Again, I am grateful for the opportunity that you and CRS have given us to explore one broad dimension of rulemaking and I also applaud other recent initiatives to shed more light on topics such as e-rulemaking and the use of advisory committees.

As an editorial observation, let me close by stressing the need to devote more resources to policy and legal analysis in these and other areas of the administrative process. For years, the Administrative Conference of the United States produced studies by first-rate scholars that were of considerable practical as well as academic value. Because it was clearly non-partisan and free of organizational ties that might otherwise bias its analysis, ACUS enjoyed the kind of access to agencies that is necessary for studying many of the most important issues in the administrative process. I am happy that ACUS has been re-authorized, and I would like to join the more distinguished individuals who have argued that it should be funded as well. This would produce substantial benefit for relatively little cost.

Thank you.

Mr. CANNON. Thank you. We will use that last statement when it comes to get it re-funded.

Professor Breger, you are recognized for 5 minutes.

TESTIMONY OF PROFESSOR MARSHALL BREGER, THE CATHOLIC UNIVERSITY OF AMERICA-COLUMBUS SCHOOL OF LAW, WASHINGTON, DC

Mr. BREGER. Thank you. My name is Marshall Breger. I teach at the Columbus School of Law at The Catholic University of America. I am pleased to join you today in this discussion of the future of the Administrative Procedure Act.

If I may just follow along with Congressman Watt's comments, the Administrative Procedure Act may be 60, but I think like many baby-boomers, it is not ready for retirement, rather for reviving, re-tuning, and hopefully a new lease on life.

Having said that, the APA has served us well for the last 60 years, but we have to remember we are today in a different time and a different place. In 1946, over 90 percent, and I could get you the exact numbers, but over 90 percent of the activities of administrative agencies were adjudications. Now, it has flipped. It is mostly rulemaking.

In 1946, we came out of the New Deal with great enthusiasm, belief in the power of the regulatory process to address political, economic, and social problems. Today, we are more realistic, if not more skeptical. Indeed, we have a kind of default position for market solutions and the regulatory process has to prove itself in every instance. But being skeptical about regulation does not mean that you should be uninterested in the regulatory process. In fact, it means you need to think more hardly, more seriously, and have

more empirical research about regulation, what works, what doesn't work, and what works better. So I am very pleased that this Committee is beginning to address that issue.

I am going to speak about a number of issues in rulemaking, which I believe is the gravamen of this hearing, that I think are important to consider in thinking about revisions of the APA. First, informal rulemaking. You know that the notice and comment rule-making process has been called by Kenneth Davis the greatest invention of Government in the 20th century. No doubt, it swept the board and changed the nature of the administrative process.

However, we have seen in the last 60 years growing accretion of requirements for what is supposed to be informal, from the judiciary, growing accretions of requirements from Congress in mandates, and from the White House OIRA process, making informal more formal.

We have had the growth of non-statutory informal rulemaking techniques, interim rulemaking, direct final rulemaking, advance notice of proposed rulemaking. And we have had the increasing tendency for agencies to bypass the "informal" notice-and-comment process using interpretive rules and other forms of guidance to avoid what they call the "ossification" of the rulemaking process.

Now, we certainly don't want ossification. What we have to think of now, is the time to begin to institutionalize and codify some of these non-statutory techniques and to consider how to pattern interpretive and guidance documents to make sure that they provide the proper transparency and public participation that the Administrative Procedure Act stands for.

Secondly, we have seen and we will see a growth in cooperative regulation, EPA, OSHA, VPP program, EPA Brownfields program, where there is an individuated interaction between the regulated entity and the regulator. It is trying to find flexible individual solutions. This is good. This is terrific, but it leaves us a challenge. How to have flexibility and at the same time neutrality, fairness and the rule of law? The rulemaking process has to think about that.

Similarly, we have to think about public-private partnerships. We have had and we will have an increased growth in public-private partnerships, Government-sponsored enterprises, Government corporations, contracting out of what we generally think of as public functions, charter schools, private prisons. Does administrative law end when we start to move out of the traditional or classic public bureaucracy? That is a challenge for administrative law and for the APA.

Judicial review. When the APA was passed, it instituted the notion of substantial evidence on the record as a criteria for judicial review. Justice Frankfurter said, Congress has set a mood for the judges to follow in reviewing administrative agency actions. Sixty years is a great deal of judicial experience. It may be appropriate for Congress to revisit that mood and recalibrate its notions of the proper relationship between judicial review of the courts and the agencies.

And similarly, the whole problem of deference to agency interpretations of statutes and regulations, the Chevron case, and now the

Mead and cases following, call out for some guidance from Congress on what the proper canons of construction should be.

Finally, I think we need to be looking at State and local innovations. There is a tendency when the APA was passed, to Federal administrative law. That is what we study. That is what we focus on. There has been a really cauldron of creativity in the States, California, Arizona, Florida to name a few. We need studies to look at what they have been doing and to see how they are relevant to the Federal administrative process.

Now, to complete this agenda, what we need is an institution like the Administrative Conference to undertake the kinds of studies that marry not just academic expertise, but practical experience. That was a peculiar genius of the conference.

So I applaud this Committee for reauthorizing the conference, and I hope that it will be appropriated in this year and future years to continue this work and begin to solve these problems.

I thank the Committee, and I would be happy to answer any questions.

[The prepared statement of Mr. Breger follows:]

PREPARED STATEMENT OF MARSHALL J. BREGER

STATEMENT OF

MARSHALL J. BREGER
PROFESSOR, CATHOLIC UNIVERSITY OF AMERICA, COLUMBUS SCHOOL OF
LAW

BEFORE THE
SUBCOMMITTEE ON COMMERCIAL AND ADMINISTRATIVE LAW
COMMITTEE ON THE JUDICIARY

UNITED STATES HOUSE OF REPRESENTATIVES

**“60TH ANNIVERSARY OF THE ADMINISTRATIVE PROCEDURE ACT:
WHERE DO WE GO FROM HERE?”**

WASHINGTON, D.C.

JULY 25, 2006

My name is Marshall Breger. I am a Professor of Law at the Columbus School of Law, Catholic University of America. From 1985-91 I was Chairman of the Administrative Conference of the United States (ACUS) and from 1991-93 I was Solicitor of Labor for the Department of Labor. I have taught administrative law and government regulation at various law schools including, the Catholic University, the University of Buffalo, the University of Texas, as well as the Jagellonian University, Krakow, Poland and the Hebrew University of Jerusalem.

I am pleased to participate in this hearing on the “60th Anniversary of the Administrative Procedure Act: Where Do We Go From Here?”

I

The Administrative Procedure Act passed in 1946 is often called the “bible” of administrative law. It is certainly the “default” position in administrative adjudication and rulemaking for agencies which lack other statutory instruments and is often “read into”

enabling statutes by the courts.

The Act, when passed, was an heroic effort to marry New Deal perspectives on regulation with traditional common law concepts of accountability and due process. As Justice Jackson pointed out, “[t]he Act... represents a long period of study and strife; it settles long-continued and hard-fought contentions, and enacts a formula upon which opposing social and political forces have come to rest. It contains many compromises and generalities and, no doubt, some ambiguities.”¹ Nonetheless, it was a compromise, one that worked exceedingly well in setting out the parameters for the developing “administrative state” in the last half of the 20th century. It was able to do so, in part, because of judicial interpretations which breathed life into relatively “sparse” statutory language concerning such subjects as “notice and comment” or informal rulemaking; informal adjudication; and concepts like a “formal hearing on a record.”

The APA provided us with innumerable important innovations in administrative law including “informal” or “notice and comment” rulemaking; statutory codification of the various common law levels of the scope of judicial review of agency adjudication (including the requirement of “substantial evidence on the record”) and rulemaking, as well as the ALJ system. Later amendments triggered the transparency revolution exemplified by the Freedom of Information Act and promoted innovative adjudication and rulemaking techniques for federal agencies such as alternative dispute resolution (“ADR”) and “reg-neg” or negotiated rulemaking.

Beginning in the 1990’s, our perspective on the role of government and government regulation changed from the traditional New Deal paradigm. Indeed, Americans have shown a “deep uneasiness,” as James Freedman has put it, “about the

¹ *Wong Yang Sung v. McGrath*, 339 U.S. 33, 40 (1950).

coercive and dehumanizing influence of bureaucratic organizations.² One reason is a belief that bureaucracies “too often appear concerned primarily with formalistic adherence to their own wishes, rather than with seeking such a personalized response to the peculiarities of his specific circumstance.”³ This concern that the letter of the law often undercuts its “spirit” is well described in Philip Howard’s best seller, The Death of Common Sense.⁴

Others have urged that laissez-faire or market-based solutions are presumptively superior to regulatory regimes that have often placed substantial burdens on the American “administrative state.” Even more, we now recognize that the cumbersome “command and control” regulations of the New Deal era, ought to be replaced, wherever possible, by “performance based” standards. Indeed, some have argued that we are now at a kind of “constitutional moment,” to borrow from Bruce Ackerman,⁵ where the default position in American politics is market-based solutions and where the proponents of regulation have, as it were, the burden both of production and of proof.

But this innate skepticism towards government regulation only increases the need for thoughtful analysis about administrative law and administrative procedure. I can understand skepticism toward regulation or views that the default position should be a market solution. Nonetheless, however nostalgic we may be for the government “lite” of the early Republic, we cannot, following King Canute, simply wave away the regulatory impetus that is intrinsic to a technological and globalized age. While we may dislike and

distrust regulation we cannot dislike it so much that we do not care that what regulation there must be is both fair and efficient. If we are going to regulate, we want to do so in the most advantageous manner. That is why I applaud this Committee for thinking seriously and systematically about the last 60 years of experience of rulemaking under the APA and how it can be improved.

As we look back over the 60 years of the APA, it is hardly surprising that the administrative law “roadmap” has become somewhat dated, since the terrain and climate have changed as well.⁶ As I understand this hearing to be focused on issues related to rulemaking, I note below a number of areas where further research and rethinking regarding administrative rulemaking may be useful.

- **Cooperative regulation and its effect on rulemaking**

We live in an age of reconceptualization of administrative law in which scholars are proposing new paradigms such as “reflexive” regulation, “cooperative implementation,” and “interactive compliance.”⁷ Commentators have begun to ascertain a new approach to government intervention based on informal approaches to regulatory management. These initiatives, variously termed “democratic experimentation,” cooperative regulation, “the Renew Deal”⁸ are all premised on the view that “Americans still want government to tackle...[large problems]; they just don’t want government to tackle these problems via the characteristic institutional form of the New Deal- Great

⁶ For earlier perspectives, see Marshall J. Breger, *Administrative Law After Forty Years*, 33 FED. B. NEWS & J. 297 (Sept. 1986); Marshall J. Breger, *The APA: An Administrative Conference Perspective*, 72 VA. L. REV. 337 (1986).

⁷ JAY A. SIGLER & JOSEPH E. MURPHY, *INTERACTIVE CORPORATE COMPLIANCE: AN ALTERNATIVE TO REGULATOR COMPULSION* (Quorum Books 1988). “Interactive compliance rests upon the encouragement (and development) of reliable self-regulatory systems for corporate activity.” *Id.* at x.

⁸ Orly Lobel, *The Renew Deal: The Fall of Regulation and the Rise of Governance in Contemporary Legal Thought*, 89 MINN. L. REV. 342, 352-56 (2004).

Society constitutional order, namely, bureaucracy.⁹

The desire for flexibility has resulted in federal programs such as OSHA's Voluntary Protection Program (VPP), and its Cooperative Compliance Program (CCP), the EPA's Project XL, and its Environmental Leadership Program (ELP). It has also meant the promotion of performance standards and market based regulations such as deposit/refund systems, tradable pollution permits and pollution taxes, as well as the proposed elimination of numerous traditional command and control regulations. On occasion this has led to efforts to provide institutional carrots to give incentives for supererogatory performance as with the Wage and Hour "trendsetter" program.

These approaches are all premised on the use of individuated flexibility within the application of general norms. Some of these approaches (such as proposals for self-audits in OSHA and EPA) are a form of "self-regulation" within general regulatory guidelines. Others require the use of economic incentives and the use of information based requirements.¹⁰ All these "cooperative" appraisals raise issues of principles of neutrality and fairness. There is a need to develop systematic administrative procedures to merge traditional rulemaking concepts with these new structures across the board.

- **Public-private partnerships**

The 21st century will see an increased use of non-traditional government activity. This includes public-private partnerships, the out-sourcing of public functions through, as example, privately-run services and charter schools, and government corporations or Government Sponsored Enterprises (GSE's) like the present day Fannie Mae. When government "contracts out" public functions, are all elements of administrative procedure

⁹ Michael Dorf, *After Bureaucracy*, 71 U.C.L.A. L. REV. 1245, 1271 (2004).

¹⁰ As in EPA's toxic release inventory (TRI) program.

no longer relevant? How should the provisions of the Administrative Procedure Act relate to privatization and public-private partnership? This is a key problem that administrative law must face in the coming decades.

- **Developments in Informal Rulemaking**

The APA informal rulemaking process have been called “one of the greatest inventions of modern government.”¹¹ In recent years, however, we have seen increased efforts by federal agencies to bypass the statutory notice and comment requirements of informal rulemaking due perhaps to efforts by federal agencies to avoid the so-called “ossification” of the administrative process. This has occurred through a variety of “bypass” mechanisms. Agencies have used (or misused) statutory exceptions to “notice and comment” rulemaking including the “good cause” exception, interpretive rulemaking and use of so-called guidance documents in the expectation that they will have the functional effect of substantive rules. OMB has recently offered up a proposed “good guidance practices” memo to advise agencies regulating the promulgation of informal documents that *de facto* have the force of law.¹² And courts have variously attempted to sort this all out. As we know much of the prevailing “notice and comment” rulemaking processes are the result of judicial gloss on the APA’s statutory requirements. It is appropriate for Congress to consider the extant (and in some cases conflicting) judicial interpretations in this area in light of this rich judicial experience. It is appropriate as well for Congress to consider some basic legislative fixes of existing rulemaking procedures including: better definitions of the term “rule” and “order,” institutionalizing the practices of interim-final

¹¹ 1 DAVIS ADMINISTRATIVE LAW TREATISE § 6.15, at 283 (Supp. 1970).

¹² Office of Management and Budget, Proposed Bulletin for Good Guidance Practices, *available at* http://www.whitehouse.gov/omb/inforep/good_guid/good_guidance_preamble.pdf (last visited July 22, 2006).

and direct-final rulemaking; the institutionalization of “hybrid rulemaking;” and providing a statutory basis for “Advanced Notice of Proposed Rulemaking” (APRN).

- **Effective Use of Science in Rulemaking**

One of the most contested issues in rulemaking is the question of how to ensure the appropriate factual predicate for rulemaking where complex scientific and technological issues are involved. This is, of course, a cognate problem to that which courts face in dealing with “junk science.” The OMB Bulletin on this subject “establishes that important scientific information shall be peer reviewed by qualified specialists before it is disseminated by the federal government” so as to “enhance the quality and credibility of the government’s scientific information.”¹³ The matter is highly charged, however, with claims that regulated interests have captured the process of scientific evaluation.

The Information Quality Act (also referred to as the Data Quality Act) was designed to promote transparency regarding the scientific basis of data used by agencies in formulating regulatory policy. Under the IQA affected parties can challenge data disseminated by a federal agency by filing a request for correction (RFC).

Now anything that promotes peer review and scientific debate should be applauded. And it is early days in our judgments regarding these OMB bulletins. I do believe, however, that systematic review of the effectiveness of those OMB guidelines is appropriate to ensure that both peer review and the IQA will succeed in their purpose and, at the same time, not paralyze the administrative process.

- **E-rulemaking**

¹³ Office of Management and Budget, Final Information Quality Bulletin for Peer Review, available at <http://www.whitehouse.gov/omb/information/2005/m05-03.pdf> (last visited July 24, 2006).

E-Government is an umbrella term which includes: e-publication, “by far the most important and widespread government use” involving “dissemination or ‘publication’ of information;”¹⁴ e-filing or “online filing of official documents;”¹⁵ and e-procurement.¹⁶ The E-Government Act, which codifies these innovations, “fill(s) a gap in the APA, which does not by express terms require the agency to make the comments its (sic) receives during the comment process available to the public.”¹⁷ Nevertheless it offers significant opportunities to incentivize public participation in the administrative process.

I know that this Congress has had some problems with the management of the E-Government initiative and that Congressional appropriators have recently applied spending restrictions, to the e-government “project.”¹⁸ Nonetheless, I believe that e-government and e-rulemaking in particular, offers extraordinary opportunities to increase both participation and transparency in the administrative process, thus increasing the democratic quotient of administrative law. E- rulemaking has the potential to enhance legislative transparency by spawning “deliberative forums... (and) panels of citizens, like traditional juries, that would advise about rulemaking.”¹⁹ As but one example, which I reuse for heuristic purposes only, David Fontana has urged a two-tier rulemaking system. Besides traditional “notice and comment” rulemaking, the system would offer “enhanced participation involving administrative jury deliberations (juries featuring stakeholders and members of the general public).” He proposed that “the more public participation in the promulgation of an agency rule, the more deference that rule should receive when it is

challenged in court.”²⁰ This proposal may well be too complex for ‘practical implementation, yet it does focus us on the lodestar which should guide thinking about e-rulemaking- how to use it to maximize public participation, or what John Reitz terms “e-democracy.” In its deliberations, Congress must be chary that these efforts do not simply “increase the incentive for agencies and the public to ‘work around’ technological mechanisms and shift away from transparent toward less democratic, but more manageable models of back-room consultation.”²¹

- **Judicial Review of Agency Regulations**

As this committee knows, there is evidence that appellate courts are reversing more than 50% (some say 80%) of challenged agency rules. Whatever the exact number, this high incidence of reversal suggests either that agencies are not doing their job or that courts are substituting their own policy preferences for agencies or both. I know that this committee has commissioned the Congressional Research Service (CRS) to undertake empirical work on the first of these possibilities. And that empirical information, must, of course, inform this Committee’s deliberations.

Nonetheless, I believe it is useful for the Committee to consider whether it is worth rethinking the scope of judicial review of rulemaking as put forth in Section 706 of the Administrative Procedure Act as well as the rules of “deference” for “ambiguous” statutory delegations in light of *United States v. Meade*²² and cases following. It is more than reasonable to expect Congress to set general guidelines for the scope and standards of judicial review and to “privilege” the most appropriate canons of statutory

construction. At the end of the day the proper allocation of deference between the judiciary and federal agencies both as to agency findings of fact and agency interpretations of statutory instruments is an appropriate matter for Congress. In earlier proposed regulatory reform bills, Congress has on occasion suggested new approaches here and it remains worthy of exploration.

- **Revisiting Existing Regulations**

As Solicitor of Labor during the administration of President George H. W. Bush, I am sensitive to the need to revisit existing regulations. In an in-house review in the early 1990's of our regulations on the books I remember being astonished by the existence of rules related to gas lights more appropriate to the horse and buggy era.

I believe strongly in revisiting existing regulations for their present utility. I believe this requirement should exist beyond the present requirement of reexamination of rules that have or have had "a significant economic impact on a substantial number of small entities." I do not know if the proposed Sunset Commission will encompass such a revisiting of discrete rules or rather the review of programs and agencies. In any event, Congress should consider requiring agencies to review their existing rules every ten years according to a set of agreed on criteria.

I know that in HR 3356 the 108th Congress had contemplated a mechanism for revisiting existing regulations, so to speak, through establishment of a Joint Administrative Procedures Committee at the "back end" of rulemaking so as to provide a "fast track" method of revisiting regulations in force. I would suggest exploration of a different approach.

Placing the responsibility on the administrative agency itself is a preferable

procedure. It will allow for full use of the agencies experience and technical experience. Congress always retains the right to change an agency enabling Act so as to render a regulation nugatory or to prevent appropriation of funds for its enforcement.

- **Study of state administrative law initiatives**

We have seen in recent years a rebirth of interest in state and federal administrative law. Florida, Arizona, and California, to name a few, have rulemaking procedures from which the federal government can learn. A model state Administrative Procedure Act has been promulgated. States have long served as the "laboratories of democracy." Systematic efforts should be made to study these local innovations and their relevance to the federal government. And of course, however problematic its implementation, the Congressional Review Act (CRA) continues to provide Congress an opportunity to visit major rules, at the "front end" before they actually came into force.

II

These are but a few of the emergent issues in administrative law related to rulemaking that require intensive study and analysis. But academic analysis alone will not suffice. The improvement of the administrative process can best occur in a context where academic analysis is tested in the crucible of experience – the experience of government agencies, of the regulated community and of public interest groups. The peculiar genius of the Administrative Conference of the United States (ACUS) was to provide such a crucible – one which married both analysis and expertise, "a partnership of the public and private sectors, but with a distinctively governmental flavor."²³

The heart of the unique enterprise that was ACUS was the plenary Assembly.

²³ See Gary J. Edles, *The Continuing Need for an Administrative Conference*, 50 ADMIN. L. REV. 101, 111 (1998). See generally Marshall J. Breger, *The Administrative Conference of the United States: A Quarter Century Perspective*, 53 U. PITT. L. REV. 813 (1992).

Meeting at least twice a year and consisting of up to 101 members, the Assembly included representatives of the each government department of agency-often the chief legal officer-private sector members from the practicing bar, scholars in the field of administrative law or government or others specially informed by knowledge and expertise with respect to federal administrative procedure” The membership was remarkable diverse for an advisory committee although the agency bylaws stated that “[e]ach member is expected to participate in all respects according to his own views and not necessarily as a representative of any agency or other group or organization, public or private.”²⁴

It is because of the wealth of independent expertise represented in ACUS that the Senate Government Affairs Committee assigned specific responsibilities to ACUS to assist in implementing the Congressional Accountability Act of 1995. As the Senate Committee stated:

Because ACUS is comprised of experts and practitioners representing a wide range of perspectives and interests, and has a record of developing unbiased solutions to regulatory problems, the Committee believes that this agency is well suited to producing the studies and recommendations needed to fulfill the intent...[of the bill].²⁵

The Administrative Conference is uniquely suited to promote fairness and efficiency in our “administrative state.” ACUS studies and the forge of the “Assembly” process can provide invaluable assistance to Congress and the agencies in providing seasoned and practical approaches that draw on 60 years of administrative experience to propose

²⁴ Bylaw 302.2(a)(1), *reprinted in* 1994-95 Annual Report of the Administrative Conference of the United States 119 (Sept. 1995). In order to further encourage diversity, the Conference in 1984 restricted membership to four consecutive terms. And in order not to lose the wealth of expertise of veteran members an emeritus category was created that of Senior Fellows. While Senior Fellows did not vote in the Assembly plenary session they participated fully in the Activities of the Conference.

²⁵ Regulatory Reform Act of 1995, Pub. L. No. 104-1, 109 Stat. 3 (1995).

amendments to the Administrative Procedure Act. The ACUS study and review process can serve to defuse highly charged issues with partisan overtones, allowing, at least in part, the parameters of debate to be set by objective expert research, both analytical and empirical. As you consider how to move forward in this 60th anniversary of the APA I urge Congress to fully fund ACUS and allow it to serve all of branches of government in study and in understanding the “administrative state.” Rest assured, it will assist this Committee in its work.

I am pleased to answer any questions you may have.

Mr. CANNON. Thank you, Professor.

I couldn't help thinking while you were speaking that between the Ranking Member and me, we at least, maybe more than average between us, spent more than half of the life of APA as lawyers. That is a startling concept when you think about the evolution, especially recent evolution. In your litany of these issues, I was getting more and more nervous. How do we deal with this?

The answer, of course, is ACUS. We need to reauthorize it. We need to fund it. We need to get people who are smart together because even with all the scope of this Committee and its resources, we can't deal with the problems that are transforming before us as quickly as the litany that you presented. So thank you for that. We will have some questions.

Professor Magill, you are recognized for 5 minutes.

TESTIMONY OF PROFESSOR M. ELIZABETH MAGILL, UNIVERSITY OF VIRGINIA SCHOOL OF LAW, CHARLOTTESVILLE, VA

Ms. MAGILL. Thank you, Mr. Chairman. My name is Elizabeth Magill. I am a law professor at the University of Virginia. I teach and write in the fields of administrative law and constitutional law.

I am so pleased to be asked to testify before the Subcommittee because, like a lot in the administrative law community, we have all admired the work of the Subcommittee, the leadership in seeking the reauthorization of ACUS and its passage in 2004.

We have admired the efforts of the Subcommittee with the assistance of CRS's American Law Division to start to identify a research agenda to address important questions of administrative process and funding projects like Professor West's and the project Professor Freeman testified about last fall and the fall of 2004. We are so excited about what is happening, and it is such a pleasure as a result of that to be asked to testify.

This hearing recalls the adoption of the APA and asks the question, where do we go from here? I am going to do my best in the last minute of my remarks to answer that question, but I have to say at the outset that I don't know exactly where we go from here because in my opinion we don't fully comprehend where we are right now.

That is, despite the scope and the significance of the administrative state, there is not enough, as all the witnesses to date have said, and I bet the subsequent witness will say and this Subcommittee knows so well, there is not enough systematic and careful work that asks about the way the administrative state works, actually what it does, and whether it does it well.

Nor is there enough systematic work about the various mechanisms we have and rely on to curb the exercise of agency discretion, congressional oversight, executive oversight, judicial review. There are lots of examples that highlight the lack of empirically grounded research and writing on the administrative state.

One of my favorites that I uncovered is that there is an often repeated statistic, repeated many times, that 90 percent of agency action is informal, that is it falls below the APA requirements. It is not formal enough to invoke the APA requirements. I traced the origin of the statistic and the author of the statistic said, this is a guess. So I think the first step to studying the course for the future

is the investment of resources in careful study of the most pressing issues that arise across a range of agencies.

And if I might add a little bit to the pitch for why ACUS, it is wonderful that it is here, why it needs to be appropriated, I think administrative process is a little different than a lot of other questions we might want to address. And that is because administrative agencies do a wide variety of things in a wide variety of ways. So there is an enormous complexity.

At the same time, I think most people who study them think there are enough similar tasks that they do, for instance, relying on science to make decisions, a similarity in their processes, that you can generalize across agencies. But that is a pretty tough task to produce useful answers to questions that both take account of the complexity that is across the administrative state, but also try to find generalizable lessons.

So I think that is an added sort of argument for why we need funding of a think tank like ACUS.

I think I was asked to testify because for the past several years I have been trying to find out exactly where we are now, which is what I said was I think the first step to figuring out where we go in the future. With a colleague at the University of Michigan, Steve Croley, we have been working together to try to provide a comprehensive empirical picture of Federal agency decision-making.

Our data, our project will present pretty detailed data on the frequency and type of decisions that Federal agencies make, both across agencies and across time. Our goal is to explain with attention to the legal parameters of agency decision-making tools, as in-depth a data as is available on the frequency, including the changing frequency over time, of agency reliance on these tools. By "these tools," I mean rulemaking, adjudication, litigation on behalf of agencies, and guidance.

Our data is presented in the aggregate, how many rules do we have across the Federal Government and how that has changed over time, if it has changed over time, and it is also agency by agency. So our project is, as I have described, quite descriptive, but we also try to address various questions that are raised by the descriptive patterns we uncovered.

We undertook this project because as students of the administrative state and teachers of administrative law, we were incredibly frustrated by the lack of comprehensive information about what agencies do, and whether it has changed over time, and if so, how. So our primary goal has been to supply what we think is missing, some certain basic comprehensive facts about agency behavior.

We have relied on a lot of sources in the work we have been doing. In identifying the sources, we I think have had an ACUS-like attitude, which is our preference was for data collected across a large number of agencies, collected by neutral entities at regular intervals. So we wanted to avoid collecting data agency by agency because that risks inconsistency in the way a single entity characterizes what it does.

Our sources are largely Government sources. They are OPM, the GAO, the Regulatory Information Service Center, OIRA at OMB, the GSA, the Executive Office of U.S. Attorneys, and the Administrative Office of the Courts. So the work of the project really has

been collecting and presenting in meaningful and useful form data that is already out there.

We are still very much in the process of writing and analyzing what we found. In January of 2006, we presented some preliminary findings, and let me give you a flavor of them. The core of the work is a chapter devoted to each of the major policymaking tools available to agencies, as I said, rulemaking, adjudication, Government litigation, and guidance. I will talk about rulemaking, adjudication and Government litigation very quickly, because I have 50 seconds left.

So knowing how many rules are promulgated each year is actually a pretty complicated enterprise. A rule is a legal term of art. There are different definitions of rules, and even within definitions, there are different types of rules. There are two sources that provide pretty good aggregate data and those are the ones we rely on.

Agencies together issue over about 4,000 final rules per year, an amount that reflects a gradual decline from the early 1980's when they issued over 6,000 rules a year, and 66 percent of all final rules come from agencies whose heads report to cabinet secretaries, and 10 percent come from the independent agencies. That is a decline from about 20 percent 2 decades ago, and the last 25 percent come from agencies like EPA that don't report to cabinet secretaries, but to the president.

Not all rules, though, have substantive effect. Some are ministerial. There are somewhere between, 1,000 and 1,200 rules each year that had a substantive effect. Among the substantive rules, about 500 to 700 are far-reaching enough that they trigger White House review. That number was closer to 500 in the 1990's and it is now, since 2000, closer to 700 each year. Of those 500 to 700, 45 to 75, depending on the year, are huge rules, for lack of a better term. They have an estimated annual impact on the economy of more than \$100 million.

I am going to skip to Government litigation because I think what we see there is—

Mr. CANNON. Ms. Magill, from my perspective, I am quite interested and you don't need to worry about the time.

Ms. MAGILL. Okay. All right. Sorry. These are red stop signs.

Let me talk a moment, half of a minute, about adjudication. Tracking adjudication, as many people at this table know, in the Federal Government is actually quite difficult. There are two different kinds of adjudicators, there are actually more than that, but administrative law judges, obviously, and what have been denominated presiding officers.

They are not administrative law judges, but they preside over evidentiary hearings. There is no current Government-wide collection of data on the number of adjudications performed each year. The vast majority of administrative law judges in the Federal Government adjudicate cases in the Social Security Administration. The Social Security Administration ALJs have since 1991 always constituted more than 72 percent of all Federal ALJs. After the Social Security Administration, the next highest employers of ALJs are Labor, the NLRB, and the Energy Department.

In the aggregate from 1991 to 2004, the number of ALJs in the Federal Government increased by 13 percent, and that increase, of

course, occurred during a period when total Government employment declined by about 15 percent. But the 13 percent increase was not consistent across agencies.

Basically, Social Security Administration ALJs increased, while other ALJs decreased. So Social Security ALJs increased 31 percent, while non-Social Security Administration ALJs declined 37 percent. Roughly speaking, you could say that the number of adjudicators in the Federal Government who are implementing regulatory programs, say, at the NLRB or in the Energy Department, declined, while the number of adjudicators adjudicating benefits in the Social Security Administration increased.

There are many adjudicators in the Federal Government, however, who are not ALJs. We know this from two surveys, the first one conducted under the auspices of ACUS, and the first one was in 1989. It showed that there were several thousand presiding officers in 1989. The author found 2,600 presiding officers. That number increased to 3,300 in a follow-up survey in 2002.

The largest users of presiding officers were in the Justice Department's Executive Office for Immigration Review, the Veterans Administration and the IRS. That was from 2002.

Last, Government litigation. I think it is less written about, although there are actually quite great data sources that tell you what is happening with Government litigation. That is one window onto the administrative state, observe the litigation that is brought on behalf of agencies, and also the defense of litigation when the United States defends an agency from a suit brought against it. Affirmative litigation is called U.S. plaintiff litigation in the reports, and U.S. defendant litigation is the defense of litigation.

A look at these data are actually revealing on a lot of different fronts. The most dramatic descriptive trend, my coauthor and I found, was a quite significant decline in U.S. plaintiff litigation starting from 1990 to the present. The Administrative Office of the U.S. Courts reports that U.S. plaintiff litigation declined by two-thirds in a 14-year period between 1990 and 2004, going from 30,000 U.S. plaintiff cases to 10,000 in 2004.

Another source we used was from the Justice Department which tracks the cases brought by United States Attorneys in U.S. Attorneys' offices throughout the country, which is the lion's share of litigation handled by the Justice Department. From 1991 to 2003, overall civil cases handled by the U.S. Attorneys declined by 11 percent, but the U.S. plaintiff cases declined by 60 percent, while U.S. defendant cases increased 11 percent. Affirmative litigation on behalf of every agency that the Justice Department represents declined, except for the Interior Department.

Kind of a whirlwind tour of statistics that we are going to present with more detail in our book. The goal, as I said, is to provide an accurate and systematic picture of the activities of the administrative state. Like the other witnesses, I hope this sort of grounded work will be a basis for moving forward, identifying the right questions to ask and potentially identifying solutions.

The data obviously raise a lot of different questions. Why in the last 5 years are there more significant rules being forwarded to the White House's OIRA for review? What accounts for the rise in presiding officers? Why is the number of regulatory ALJs declining?

And what is happening to the work that they did? Why has U.S. plaintiff litigation declined so dramatically?

So I think the real question that this Subcommittee is interested in is where do we go from here. My plea is we don't quite know where we are, and we need to invest more resources in figuring out where we are and identifying the important questions, and answering them in a systematic way, not by anecdote, not by haphazardly gathered data, but by very careful collection of information that establishes the facts on the ground and allows us to move forward.

Thank you very much.

[The prepared statement of Ms. Magill follows:]

PREPARED STATEMENT OF ELIZABETH MAGILL¹

My name is Elizabeth Magill and I am a law professor at the University of Virginia School of Law. Thank you for asking me here today.

My teaching and research are in the fields of constitutional law and administrative law. I have taught administrative law and related courses—food and drug law, advanced administrative law—since 1998. My academic writing in administrative law is about judicial review of administrative action and about the varied procedural choices agencies make when they implement their statutory mandates—whether, for instance, they adopt a legislative rule or adjudicate a case or bring an enforcement action in the courts. I have served as a reporter for the APA Restatement Project of the Administrative Law and Regulatory Practice Section of the American Bar Association.

I am especially pleased to be asked to testify before this Subcommittee. Like many administrative law professors, I have admired this Subcommittee's work on administrative process. The academics I know all cheered this Subcommittee's leadership in seeking the reauthorization of the Administrative Conference of the United States and we hailed its passage in 2004. We have also admired the efforts of this Subcommittee to, with the assistance of the Congressional Research Service's American Law Division, identify a research agenda to address important questions of administrative process and to fund several research projects.

I. WHERE DO WE GO FROM HERE?

This hearing, which recalls the adoption of the Administrative Procedure Act sixty years ago, has been convened to ask what the future holds. I will do my best to answer that question in a moment, but I must note at the outset that it is not exactly clear where we go from here. That is because we do not fully comprehend where we are this moment. Despite the scope and significance of the administrative state, there is not enough systematic work that identifies what agencies are doing and asks whether they are doing it well; nor is there enough systematic work that asks about the effects of the mechanisms used to curb agency discretion—Congressional oversight, Executive and judicial review. There are many examples that highlight this lack of empirically-grounded research and writing on the administrative state. As Professor Jody Freeman pointed out in her testimony before this Subcommittee in 2005, an often-repeated statistic was that 80% of EPA rules were challenged in court; the only problem was that this had no basis in fact as one study demonstrated. Another often repeated statistic is that 90% of agency action is "informal"—that is, it does not follow procedures specified in the APA—but, after tracing the origin of this statistic, I found that the author of the statistic represented it as a "guess."

In my view, the first most important step to setting a course for the future is the investment of resources in careful study of the most pressing issues that arise across a range of agencies. This Subcommittee's leadership has started us down that road, and I will speak in a moment about work that advances that objective. But I do not have any doubt that more remains to be done.

Careful and systematic study is not an easy task and that is one reason why there is not enough of it. The administrative state is incredibly complex. Agencies have distinctive statutory mandates—some distribute benefits, some regulate the market, some protect the nation. They also follow different processes and have distinctive designs—Commission, Administrator, Cabinet level or not Cabinet level. They ad-

¹A revised version of this statement is published in the Appendix of this hearing.

dress a dizzying variety of tasks in varied ways. That complexity makes systematic and generalizable research very difficult to conduct.

At the same time, it is clear that administrative agencies are not so distinctive that one cannot generalize about their behavior and draw conclusions about what may trouble us about the soundness or wisdom of their activities. Of course, most agencies are subject the basic template provided for in the Administrative Procedure Act. More than that, though, many agencies share similar substantive tasks—they must rely on scientific judgments to do their business or they manage large benefit programs or they are in the business of licensing firms before they enter the market. Looking across agencies to determine and assess how they perform these tasks is obviously a worthwhile endeavor. Agencies are also subject to similar controls. They are the object of close oversight by Congress, the Executive, and/or the federal courts. Thus, despite the enormous complexity of the administrative state, there are common issues and problems that affect a large set of agencies such that cross-agency study will repay enormous dividends and will guide administrative reforms.

To figure out where we go from here, then, we must invest the resources to study the general issues that affect a substantial number of agencies and, if warranted, identify problems and formulate solutions. I would emphasize that those resources must be put in the hands of people who will approach their study in a systematic way. In my view, such studies must rely on the time-tested methods of social scientific inquiry, rather than the haphazard gathering of data or, worse, anecdote. It is only careful study that can establish the facts of the matter and thus provide a sound basis for identifying problems that need to be rectified.

There are several promising signs that such study is starting to occur. In part, these developments are due to the efforts and vision of the Members and staff of this Subcommittee and the CRS. Re-authorization of ACUS has generated enormous enthusiasm in the administrative law community. The studies that this Subcommittee's efforts have spawned—Professor West's work on public participation in rule-making that we are hearing about today and Professor Freeman's study of judicial review of administrative action—are important efforts that will advance our understanding and clarify what, if anything, is needed in the way of law reform. More than that, in my corner of the world, an increasing number of my peers are convinced of the need for empirical study of the administrative state and an increasing number of people in law teaching have the necessary training to engage in rigorous empirical work.

II. ESTABLISHING AN ACCURATE PICTURE OF THE ADMINISTRATIVE STATE'S ACTIVITY

For the past several years, I have been working with a colleague to complete what I just testified was the most important step to take before we could identify what comes next—that is, we have been working on a project to find out exactly where we are now. My colleague is Professor Steven Croley at the University of Michigan Law School and we have been working together to provide a comprehensive empirical picture of federal agency decision-making. We have received several grants to support our work, including from the Milton and Miriam Handler Foundation and the Olin Foundation. Our goal, in the most general terms, is to describe what agencies do and how that has changed over time.

Our project will present detailed data on the frequency and type of decisions that federal agencies make, both across agencies and across time. Our book explains the legal parameters of agencies' primary decision making tools—including legislative rulemaking, adjudication, litigation, and agency guidance—and provides as in depth data as is available about the frequency, including change in frequency over time, of agency reliance on those tools. Our data is presented in the aggregate (how many rules across the federal government and how has that changed over time) as well as agency by agency. We also identify patterns in that data. Our project is heavily descriptive, but we also provide narrative explanation of why, when, and how federal agencies make decisions, and we address various normative questions implicated by our empirical findings as well.

Professor Croley and I undertook this project because, as students of the administrative state, we were frustrated by the lack of comprehensive information about agency decision-making. Most administrative law scholarship focuses primarily on judicial review of agency decision making. While obviously important, judicial reaction to agency work product is only one window onto the activities of the administrative state. Meanwhile, political scientists and economists who write about agency behavior are not generally attentive to the legal differences among the agencies' policymaking tools. As teachers of administrative law, we found no work that examined empirically the range and frequency of procedures agencies employ. More than that, no work provides a ready general source of data about the form and frequency of

administrative agencies' legal work-product. Our motivation for undertaking this project has been primarily to supply what is missing—certain basic, comprehensive facts—about agency behavior and agency decision-making.

Our effort has several goals. Most basically, we aim to shed descriptive light on fundamental but understudied questions about federal agency decision-making. For example: Exactly how often do agencies engage in rulemaking and adjudication processes under APA? Which agencies do so the most, and which the least? Have agencies engaged in more or less rulemaking, and adjudication, over time (and adjusting for variables like population, GNP, and legislative activity)? In addition, how many of which different types of rules—“regulatory rules,” “redistributive rules,” “governmental housekeeping rules,” etc.—have agencies issued over recent years? How many staff have agencies committed to the adjudication processes over time? How many times do agencies sue to enforce their statutory mandates and how, if at all, has that changed over time? How often are agencies sued and required to defend their exercises of authority and how, and if so, has that changed over time?

A related goal of our project is to provide others with an empirical base from which others can draw their own conclusions about administrative government. We hope to inspire others to enlist the data we supply to advance their own research on agency behavior. Abstract discussions of administrative government should be grounded as much as possible in concrete facts about what agencies really do, and the facts we present will inform others' work.

Last but not least, we engage in analyses ourselves, practicing what we preach. That is, in addition to presenting the facts about the type and volume of agency activities, we consider how those facts might connect to perennial normative debates about, for example, executive versus legislative control of agencies, agency accountability and independence, and the appropriate size and role of the federal government, among others. We also explore our descriptive findings by running several statistical tests to evaluate hypotheses related to normative discussions of agency activity. For example, we investigate whether certain agency decision-making procedures increase or decrease with Republican or Democratic administrations, or in times of divided or undivided government, among other things.

We have collected data from a very wide variety of sources. In identifying sources, we had a strong preference for data collected across a large number of agencies, and collected by neutral entities at regular intervals. We wished to avoid collecting data agency by agency because of the risks of inconsistency this raises. Our sources are largely available from various government sources. The data come from, for example, Office of Personnel Management, GAO, the Regulatory Information Service Center, Office of Information and Regulatory Affairs at OMB, the General Services Administration, Executive Office of the United States Attorneys, and the Administrative Office of the U.S. Courts. Much of it is available in a raw form that must be analyzed and aggregated to be meaningful and appropriate for generalization. Most of the labor of our project consists of the legwork of finding, compiling, and aggregating data across many different sources, and then organizing and presenting that data in meaningful ways.

We are still in the process of producing our book. But in January of 2006, at the annual meeting of the American Association of Law Schools, we presented some of our preliminary findings. I will recount for you some of what we reported there.

The core of the book are chapters devoted to each of the major policy making tools available to agencies—rulemaking, adjudication, government litigation, and guidance. Let me provide a few highlights of our findings about rulemaking, adjudication, and government litigation:

***Rules:** Knowing how many rules are promulgated each year depends on the type of rule as well as the classification system of the entity that collects the information. “Rule” is a legal term of art and there are different definitions of rule and different types of rules. But, two sources, RISC and GAO, provide the most useful aggregate data on the number of rules issued each year. Relying on these data sources, we have come to the following preliminary conclusions.

First, agencies together issue just over 4,000 final rules per year, an amount reflecting a gradual decline since the early 1980s, when they issued just over 6,000 rules a year. Second, about 66% of all final rules come from agencies whose heads report to cabinet secretaries, while only about 10% percent come from the independent agencies, down from about 20% percent two decades ago. The remaining 25% come from executive-branch agencies, like the EPA, whose heads do not report to cabinet secretaries but to the President.

Considering proposed rather than final rules, the same general pattern emerges. Agencies now publish about 2,700 proposed rules a year, down from over 3,500 in the early and mid-1980s. Here, however, independent agencies publish a bigger share, 15–20% of proposed rules, with non-cabinet executive agencies publishing

just barely more than that, and the remaining 60% then coming from cabinet agencies.

Not all rules, however, have a substantive effect. Somewhere between 1,000 and 1,200 rules issued each year have a substantive effect. Among substantive rules, between about 500 and 700 rules each year are far-reaching enough to trigger White House review. The number was closer to 500 in the late 1990s, and approximates 700 each year since 2000. Of those, about 45 to 75 per year constitute huge rules with an estimated annual impact on the economy of more than \$100 million.

***Adjudication:** Tracking adjudication in the federal government is difficult because there are different types of adjudicators—Administrative Law Judges (ALJs) and Presiding Officers (POs)—who preside over evidentiary hearings and there is no current governmentwide collection of data on the number of adjudications conducted each year. For one putting together an accurate empirical picture of administrative adjudication, the primary sources are OPM personnel data, two publications by the ACUS in the late 1970s, and two surveys of non-ALJ adjudications conducted in 1989 and 2002.

The vast majority of ALJs in the federal government adjudicate cases in the Social Security Administration. SSA ALJs have, since 1991, always constituted more than 72% of the total ALJs in the federal government. After SSA, the next highest employers of ALJs are Labor, NLRB, and the Energy Department.

In general, from 1991 through 2004, the total number of ALJs increased by 13%, from 1191 to 1341. This increase occurred during a period when total government employment declined by 15%.

The 13% increase in the number of ALJs was not consistent across agencies. Social Security Administration ALJs increased by 31% while the number of non-SSA ALJs declined 37% between 1991 and 2004. In other words, the number of adjudicators who are implementing regulatory programs declined while those adjudicating benefits have increased.

Many who adjudicate cases in the federal government are not ALJs. We know from two surveys that there are several thousand POs conducting evidentiary hearings. In a 1989 survey, the author found 2,692 POs and this number increased to 3,370 according to a follow-up survey conducted in 2002. As of the 2002 survey, the largest number POs were in the Justice Department's Executive Office for Immigration Review, the Veterans Administration, and the IRS and the largest number of cases decided by POs were in EOIR, the IRS, and the Appeals Council of the SSA.

***Government Litigation:** One window onto the administrative state is to observe litigation on behalf of agencies in the courts. This includes affirmative litigation—called "US as plaintiff" litigation—brought by the federal government as litigation whether the government is defending against a challenge to its activities—called "US as defendant." The Administrative Office of the Courts and the Executive Office of U.S. Attorneys each track this litigation.

A look at those data are revealing on a variety of fronts, but the most dramatic descriptive trend is the dramatic decline in "US as plaintiff" litigation. The Administrative Office of the Courts reports that US plaintiff litigation declined by two thirds in a 14 year period. In 1990, there were 30,000 US plaintiff cases and this declined to 10,000 in 2004. During the same period, US as defendant litigation increased dramatically, from just under 25,000 cases to nearly 40,000 cases.

The Executive Office of the US Attorneys reports similar data, although their data track agency litigation more closely because US Attorneys represent client agencies throughout the government. From 1991 through 2003, overall civil cases handled by US Attorneys declined by 11%. But US plaintiff cases declined by 60% while US defendant cases increased by 11%. Affirmative litigation on behalf of every agency that DOJ represents declined, except the Interior Department.

This whirlwind tour of statistics provides just a slice of the data we will present in our book. As you can see, our goal is to provide an accurate and systematic picture of the activities of the administrative state. It is our hope that this sort of grounding will be a basis for moving forward by identifying the right questions to ask. And the data raise many questions: Why, in the last five years, are there more "significant" rules being forwarded to OIRA for review? What accounts for the rise in POs? Why is the number of regulatory ALJs declining? Why has US Plaintiff litigation declined so dramatically?

III. WHERE DO WE GO FROM HERE?

So I return to the question I started with, namely, where do we go from here? As I said at the outset, I do not know where we go next because of the dearth of

sound and careful work about where we are now. I am absolutely confident that further study is necessary to identify problems and formulate solutions. And the reauthorized ACUS gives us a real opportunity to move forward. Once funding is secured, many will clamor to fund various research projects. They may disagree on the priority, but few will disagree about the central need for more and more rigorous work about what is occurring at agencies. And there are many worthy research projects. In the fall of 2005, you heard testimony from Professor Jeffrey Lubbers, Mr. Mort Rosenberg, and Professor Jody Freeman, all suggesting possible avenues for research of a reconstituted ACUS. I have read their testimony and believe they made extremely valuable suggestions. I will add a few of my own to the list. My suggestions are not detailed proposals for study, but what I view to be the most important general areas for research.

External Agency controls: To my mind, a central question about agency activity is whether and how the various oversight mechanisms that are in place for agencies work. Agencies are subject to control and oversight by Congress, by the Executive, and they are subject to judicial review by courts. To my mind, asking about the function and efficacy of these control mechanisms is probably the most important question we can be asking. Thankfully, there is work that has been and is being done on these areas. Professor Croley has carefully studied the White House Review of agency rules and Professor Freeman is now engaged in her own comprehensive study of judicial review of agencies. These two studies are notable for their systematic—as opposed to ad hoc—approach and they have and will teach us a lot. But we need to do more because these external controls on agencies are so important and it is a complex enterprise to assess their efficacy. In my view, we are just at the beginning of building an accepted base of knowledge and moving toward conclusions about the wisdom and efficacy of these control mechanisms.

Internal Agency Controls: Another promising area for research is to get inside the agency and study how agencies make their important decisions. My own research has made me very interested in why it is agencies choose to implement their mandates in such different ways, some relying heavily on adjudication, others relying heavily on rules. But there are many other questions, for instance: When and why do agencies adopt enforcement guidelines? How do they organize internal appeals from front-line decision makers? How do they set their regulatory priorities? These questions about the internal decision making process of agencies are central to understanding why they behave the way they do and, as a result, are worthy of sustained attention.

Effectiveness of Rules. Many have noted that we have no way to determine the effectiveness of rules after they are in place. Among other things, we presently have no mechanism to determine whether the projections contained in the cost-benefit analysis when the rule is adopted turn out to be accurate in the long-run. Answering this question may not answer questions about the overall efficacy of regulations, but it would be a useful question to ask and, more importantly, it is just the sort of analytic task that a think tank arm of government could design and conduct. A research program aimed at identifying the promising ways to go about assessing the costs and benefits after implementation and comparing them to earlier projections would be a worthy enterprise.

Thank you for inviting me here today. I am gratified by the interest this Subcommittee has shown in the efficacy and fairness of administrative process.

Mr. CANNON. Thank you. I look forward to your report.

Professor Coglianese, you are recognized for 5 minutes or whatever time you would like to take.

TESTIMONY OF PROFESSOR CARY COGLIANESE, UNIVERSITY OF PENNSYLVANIA LAW SCHOOL, PHILADELPHIA, PA

Mr. COGLIANESE. Thank you very much.

Chairman Cannon, and fellow Members of the Subcommittee, I appreciate the invitation to testify here today. I recently joined the University of Pennsylvania Law School faculty, after spending 12 years at the John F. Kennedy School of Government, where I remain a senior research fellow and continue to do work on administrative law, with a particular emphasis on empirical inquiry of the regulatory process.

I would like to take my time today to talk about the role of information technology in the rulemaking process, and what kind of implications that has for thinking about the Administrative Procedure Act in the next 60 years. I would like to make three main points.

First, information technology is here to stay. It is an important fixture in the administrative process. Second, empirical research on the effects of information technology is important for decision-makers to have available in deciding how to deploy information technology in a smart way. And third, information technology projects present key management challenges, some of which will demand congressional involvement in oversight.

Let me take each of these in turn. First, information technology has become a major issue in how we think about the rulemaking process today, and it will only continue to be a major issue in the future.

Now, that is, I think, something that is quite different than at least the first 50 years of the Administrative Procedure Act. During that time, information technology moved roughly from carbon copy to photocopy, but the way in which information was managed by regulatory agencies remained largely paper-based. People who wanted to find out about the rulemaking process had to come to Washington, physically enter a docket room to gather information. If they wanted to participate in the regulatory process, there might be an occasional public hearing held somewhere in the country that they might attend, but generally speaking they would participate by picking up the phone or, more commonly, sending in a letter.

That has changed. It is now possible with information technology for people in Washington State, as well as Washington, D.C., to access information about any rule that Government agencies are developing. It is now possible for people all around the country to engage in an interactive iterative way with themselves or with Government officials over regulations, through the Internet.

This is a process that has been encouraged, that is the process of employing information technology in the rulemaking process, encouraged by both the Clinton administration and the Bush administration. The Bush administration most recently has created an e-rulemaking initiative which has produced an online portal called *Regulations.gov* at which place any member of the public can go and find out about any proposed rule that is open for comment and comment on it.

The e-rulemaking initiative is now also developing a Federal docket management system which will be a single location on the Internet where eventually a member of the public could go and find all the supporting documents for any rule across the Federal Government. These issues are, as I say, here to stay.

The second point is that we need to understand what difference this information technology is actually making, what kind of effects it is having on the rulemaking process. Now, one of the predictions that is most widespread both among Government officials, as well as among academics, is that the Internet will create what some people have even called a revolution in public participation, allowing citizens to play a role in rulemaking that they have never been able to play before and involving them on a frequent basis in the regulatory process.

This actually is an issue that researchers have examined quite extensively already. A growing body of research is developing on these questions. What is most surprising, perhaps given these predictions, is that the available research is showing that public participation has not increased in almost all rules due to the advent of the Internet.

I say that should be surprising given the predictions, but I think with hindsight it probably shouldn't be too surprising. Rulemaking, whether it is e-rulemaking or not, is still a fairly technical, and if not even arcane, area of public policymaking. So we probably shouldn't be surprised that many members of the public are not participating on a frequent basis.

Indeed, just as the Internet has lowered the cost to participate in the rulemaking process, it has also lowered the cost for members of the public to chat online with their friends or follow sports results or celebrity gossip or do other things that they would probably much rather do with their time.

Now, the fact that public participation has not expanded with the advent of e-mail and *Regulations.gov* does not mean that e-rulemaking shouldn't be pursued. There are other important purposes for using information technology in the regulatory process, from transparency, from public expectations about access to Government, from enhanced oversight by the legislature or the executive branch, various administrative efficiencies, and I also think a great deal of benefit for academic researchers.

But for all of those purposes, empirical research will be important to figure out which kind of technologies are actually serving those goals, how well are they serving those goals, and how can information technology be better deployed to serve those goals.

My third and final point is that in any information technology project, technology is only half the battle. Organizational and institutional factors matter a lot for the success of any information technology project. When we had our symposium here in December of 2005, a number of people expressed concerns and complaints about the current Federal Docket Management System, its searching capability, and the kinds of information that it holds.

Those are concerns that the people managing the project are aware of. But they might be among the first to acknowledge that the institutional structures right now for pursuing information technology projects relate to rulemaking, the FDMS project in particular, are really somewhat makeshift. It is the Environmental Protection Agency that is actually managing a Government-wide IT initiative related to rulemaking.

However much you may admire the work that the folks at EPA are doing, it is not clear that an individual regulatory agency should have the authority to be managing this project. We might look in the future at the model of the Office of Federal Register or the National Archives and Records Administration as a possible institutional way of organizing information technology projects in the future.

Of course, as with efforts for empirical research and other important efforts of Government, IT projects also need adequate funding vehicles as well. So there is a continued role for Congress in pur-

suing and overseeing information technology projects as they related to rulemaking.

I thank the Committee for the opportunity to talk with you about these issues and for your interest in these issues.

[The prepared statement of Mr. Coglianesi follows:]

On

**“The 60th Anniversary of the Administrative Procedure Act:
Where Do We Go From Here?”**

Mr. Chairman and Members of the Subcommittee, my name is Cary Coglianese and I appreciate the invitation to testify here today about the how the future of administrative rulemaking may be affected by advances in information technology.

I am the Edward B. Shils Professor of Law and Professor of Political Science at the University of Pennsylvania and a Senior Research Fellow at the John F. Kennedy School of Government at Harvard University. My research and teaching focus on regulation, administrative law, and environmental law, with a particular emphasis on the empirical evaluation of alternative regulatory strategies and procedures. I am a Vice Chair of the E-Rulemaking Committee of the American Bar Association's section on

Administrative Law and Regulatory Practice, and have published a number of research papers on e-rulemaking, or the application of advanced information technology to the rulemaking process.¹

Beginning in 2002, with support from the National Science Foundation's Digital Government Program, I convened a series of workshops designed to develop a research agenda on e-rulemaking.² This effort has played a role over the last several years in launching a new, interdisciplinary community of academic researchers working on e-rulemaking, connecting researchers with government officials responsible for information technology and rulemaking, and helping generate a growing body of academic research.³

In 2005, I worked with the staff of this Subcommittee as well as with the Congressional Research Service to convene a symposium on e-rulemaking held here on December 5, 2005. This symposium, sponsored by the Subcommittee, brought together legislative and executive branch staff and appointees with academic researchers, representatives from non-governmental organizations, and other interested members of the public for an extended dialogue on e-rulemaking and its implications for the future of administrative law.

Balla, Unifying Rulemaking Information: Recommendations on the New Federal Docket Management System, *Administrative Law Review* 57: 621-645 (2005); Cary Coglianese, The Internet and Citizen Participation in Rulemaking, *IS: Journal of Law and Policy for the Information Society* 1: 33-57 (2005); Cary Coglianese, E-Rulemaking: Information Technology and the Regulatory Process, *Administrative Law Review* 56: 353-402 (2004); Cary Coglianese, Information Technology and Regulatory Policy, *Social Science Computer Review* 22: 85-91 (2004).

² The workshops were supported under NSF award number 0226053 (8/15-2002 - 7/31/2004). The final report from the workshops can be found on-line at http://www.ksg.harvard.edu/cbg/ppp/enrulemaking/papers_reports/E_Rulemaking_Report2004.pdf.

³ Much research produced on e-rulemaking in the last four years, as well as various related government reports and documents, can be found on-line at www.enrulemaking.org.

My testimony today draws on some of the presentations and deliberations that took place at the December 2005 symposium, but also on my other research related to e-rulemaking. My comments fall into three categories. First, I briefly review the progress made to date by the federal government in implementing e-rulemaking. Second, I report some of the principal findings from available empirical research on the impact of e-rulemaking on public participation in the rulemaking process. Finally, I highlight some issues that remain for consideration both by researchers as well as by legislative and executive decision makers.

1. Progress on E-Rulemaking

In the early to mid-1990s, as the Internet began to find its way into business transactions as well as everyday life, the movement to apply information technology to the rulemaking process began to take shape. During this time, the Clinton Administration's National Performance Review recommended that agencies begin to explore uses of new technologies in the regulatory process.⁴ The Administrative Conference of the United States (ACUS) issued a comprehensive report on the use of on-

⁴ Office of the Vice President, Accompanying Report of the National Performance Review, *Creating a Government That Works Better & Costs Less: Improving Regulatory Systems* 39 (1995), available at <http://govinfo.library.unt.edu/npr/library/reports/reg04.html> (recommending that agencies "[i]ncrease [their] use of information technology," as this would, among other things, "give the public easier and more meaningful access to rulemaking and policy guidance documents"); Office of the Vice President, Accompanying Report of the National Performance Review, *Creating a Government That Works Better & Costs Less: Reengineering Through Information Technology* 25, 28 (1995), available at <http://govinfo.library.unt.edu/npr/library/reports/it03.html> (recommending the use of information technology "to reduce the complexities that citizens face" and improve "[c]itizen access to government information and services").

line dockets by administrative agencies.⁵ Congress adopted amendments to the Freedom of Information Act and the Paperwork Reduction Act designed, respectively, to increase the on-line availability of information held by administrative agencies and to expand agency use of information technology.⁶ And the Office of the Federal Register began to make the *Federal Register* and the *Code of Federal Regulations (CFR)* available on-line.⁷

Administrative agencies themselves began to make rulemaking documents available on their web sites. In addition, a few agencies began to scan comments and process them electronically, while other agencies began to allow the public to submit comments via email. In 1998, the Department of Transportation (DOT) became the first regulatory agency to establish a department-wide, on-line regulatory docket.⁸ This docket – which can be found at dms.dot.gov – provides full access to all supporting documents and public comments related to the Department's rulemakings and gives member of the public an easy, electronic vehicle for submitting comments on proposed rules. Within a few years, the Environmental Protection Agency (EPA) and several other agencies also began implementing their own on-line docket systems.⁹

Carlitz, *On-line Rulemaking and Other Tools for Strengthening Our Civic Infrastructure*, *Administrative Law Review* 54: 1421 (2003).

In 2002, Congress passed the E-Government Act,¹⁰ which directs agencies to accept comments that are submitted electronically and to establish full electronic dockets for their rulemakings. The Act also authorized a new Office of Electronic Government within OMB, required that this office produce guidelines for all agency web sites, and generally encouraged agencies to explore new applications of information technology.

Beginning around this same time, the George W. Bush Administration launched an eRulemaking Initiative as part of a larger e-government program.¹¹ The eRulemaking Initiative is managed by EPA in cooperation with other agencies and with oversight by OMB. It consists of three parts.

The first part, completed in January 2003, involved the creation of a search-and-comment portal located at www.regulations.gov. The *Regulations.Gov* portal houses an on-line, searchable index of the Office of Federal Register's listings of notices of proposed rules. Users can search all proposed rules that are open for public comment and use the portal to submit comments on any proposed rule issued by any federal agency. The system automatically disseminates comments submitted through *Regulations.Gov* to the appropriate administrative agencies.

The second stage of the Bush Administration's e-rulemaking project, first launched in September 2005, involves the implementation of a multi-agency docket management system. The aim is to use the new Federal Docket Management System (FDMS) to store, and allow public access to, all documents related to every new regulation across the entire federal government. Currently, about ten federal departments

¹⁰ E-Government Act of 2002, Pub. L. No. 107-347, 166 Stat. 2899 (2002).

¹¹ OMB, The President's Management Agenda, Fiscal Year 2002, available at <http://www.whitehouse.gov/omb/budget/fy2002/mgmt.pdf>

or agencies, or portions thereof, have migrated their dockets to FDMS, and plans are to have additional agencies join the system in the coming years.¹²

A third stage of the eRulemaking Initiative, still in planning, is intended to develop a standard suite of desktop tools relevant to the work of rulemaking. These tools would assist agency staff in data collection, analysis, decision making, and rule-writing.

In addition to these efforts by the Bush Administration, administrative agencies continue to explore new applications of information technology to the rulemaking process. For example, several agencies have experimented with on-line dialogues, which allow members of the public to interact with each other and with government officials in Internet discussion forums.

II. Empirical Research on E-Rulemaking

These various e-rulemaking efforts have been justified on many grounds, including improved governmental transparency as well as administrative efficiency.¹³ Another common justification for using information technology in rulemaking has been to increase public participation in what has otherwise been a relatively obscure governmental process. Both governmental officials and administrative law scholars have predicted that information technology will expand the role of citizens in rulemaking.¹⁴ One of the earliest administrative law articles on e-rulemaking claimed that the Internet

¹³ For a list of various goals that e-rulemaking could serve, see Cary Coglianese, E-Rulemaking: Information Technology and the Regulatory Process, *Administrative Law Review* 56: 353-402 (2004).

¹⁴ See, e.g., *supra* note 4; Press Release, Executive Office of the President, Office of Mgmt. & Budget, OMB Accelerates Effort to Open Fed. Regulatory Process to Citizens and Small Businesses (May 6, 2002), available at <http://www.whitehouse.gov/omb/pubpress/2002-27.pdf> (explaining the Bush administration's effort to make the "regulatory process more open to the public" through on-line rulemaking).

will “change[] everything,” helping to ensure that “[c]itizens can . . . play a more central role in the development of new agency policies and rules.”¹⁵ Another legal scholar has argued that e-rulemaking holds the potential to “enlarge significantly a genuine public sphere in which individual citizens participate directly to help . . . make government decisions.”¹⁶

Such predictions might appear bolstered by recent rulemakings that have generated large numbers of citizen comments. Over the past few years, for example, a Federal Communications Commission (FCC) rulemaking on media ownership,¹⁷ an EPA rulemaking on mercury pollution,¹⁸ and a U.S. Forest Service rulemaking on road construction in wilderness areas¹⁹ have each elicited hundreds of thousands of comments, many of which were submitted electronically.

The existence of such rules with large numbers of comments raises the question of whether e-mail and other applications of technology like *Regulations.gov* have facilitated an increase in citizen commentary on administrative rules. So far, the early

¹⁹ Stuart W. Shulman et al., Electronic Rulemaking: A Public Participation Research Agenda for the Social Sciences, *Social Science Computer Review* 21: 1, 2–3 (2003).

empirical research on e-rulemaking has examined this precise question more extensively than any other.

To date, the available information on *Regulations.gov* suggests that it has not resulted in any substantial impact on public participation in rulemaking. The Government Accountability Office (GAO) reported in September 2003 that only about a few hundred comments came in via *Regulations.gov* during its first five months in operation.²⁰ According to the GAO's study, *Regulations.gov* brought in only about eight of the 300,000 overall comments submitted to the EPA and twenty-one of the 18,000 comments submitted to DOT during the same time period.²¹ By October 2004, *Regulations.gov* had reportedly brought in 9,800 comments to various federal regulatory agencies,²² which is clearly a more substantial response but still only amounts to an average of two comments per the 4,900 rules the federal government proposed during this same period. Furthermore, we simply cannot know how many of the comments submitted via *Regulations.gov* would have been submitted to agencies anyway through other channels. More study of the impact of *Regulations.gov* is certainly not unwarranted.

Even if *Regulations.gov* has not increased the level of citizen comments on agency rules, there remains the question of whether *e-mail* has contributed to any such increase. One media report has mentioned that comments on DOT rulemakings "soared

when electronic submission became routine.²³ Comparing comments filed in 1998, the first full year of the DOT's on-line docket, with comments filed two years later in 2000, it has been claimed that there has been nearly a twenty-fold increase in the average number of comments per rule.²⁴

However, any comparison of the average comments filed in two individual years can be misleading. Since rulemakings have not been randomly selected for email comment submissions, it is possible that DOT's rules in 2000 were simply more controversial or otherwise more likely to generate comments than were its rules in 1998. It is also possible that the differences in the average number of comments stemmed from an exceptionally large number of comments in just one or two rules in 2000, even while most rules in both years still had about the same number of comments.

Recent studies have tested the impact of the availability of email and have found that, even after the introduction of email, most proposed rules still continue to generate relatively few comments, even though occasionally a rule will generate a high volume of comments. In a recent study of comments filed in seventeen randomly selected DOT rulemakings, 83 percent of the total comments came from just a single proceeding, a rule concerning the mandatory retirement age for commercial airline pilots.²⁵ According to the study, "most DOT rulemaking dockets established after [the introduction of DOT's on-line system in] 1998 continued to receive only a few submissions during the notice-and-comment period."²⁶ Similarly, according to a recent study of Federal

Communications Commission (FCC) proceedings, “in 99% of dockets, the e-filing [option] does not seem to cause an increase in individual or interest group participation.”²⁷

A particularly careful study by political scientists Steven Balla and Benjamin Daniels was presented at the December 2005 Symposium on E-Rulemaking in the 21st Century.²⁸ Balla and Daniels examined over four hundred and fifty DOT rules, roughly half issued between 1995 and 1997 (before the introduction of the DOT’s on-line system) and the other half issued afterwards (between 2001 and 2003).²⁹ By systematically comparing comments before and after the agency’s on-line docket system, Balla and Daniels’ study was designed to avoid the problems of small samples or comparisons of just two individual years. They found, surprisingly, that commenting followed basically the same patterns across both time periods. The median rulemaking in 2001–03 generated nearly the same number of comments as the median rulemaking did in 1995–97 (thirteen versus twelve).³⁰ The *average* number of comments was different (628 in 2001–03 versus 162 in 1995–97), but only because of two (rare) outlier rules in the 2001–03 period that were especially controversial.³¹ By and large, most rules continued to generate relatively modest levels of comments even after email and on-line docketing.

Similar results can be found in other studies. According to study of nine of the most comment-prone DOT rulemakings in late 1999 and early 2000, for example, very

few individuals filed comments in the vast majority of the rulemakings.³² At least at present, neither email nor *Regulations.gov* appear to have resulted in any dramatic increase in public participation in the rulemaking process. Most rules continue to generate modest numbers of comments -- and still fewer comments from ordinary citizens. As in the past, the occasional rulemaking does attract a large number of citizen comments, but these rules remain rare. Moreover, most of the comments submitted in these rare rules are quite unsophisticated and unhelpful to the agencies, if not even duplicative. For example, in another study presented at the December 2005 Symposium, researchers examined about 500,000 comments submitted in connection with an especially controversial EPA rule, finding that less than 1 percent of these comments had anything original to say.³³

Of course, with the hindsight made possible by this growing body of empirical research, it probably should not be surprising that information technology has not caused any substantial upswing in citizen participation in agency rulemaking, at least in most rulemakings. The subject matter of most agency rules continues to be rather technical, if not arcane. Information technology may lower the cost of finding documents about proposed rules or of communicating with government officials, but it has not reduced the non-technological barriers -- such as lack of knowledge or motivation -- that stand in the way of more widespread citizen participation in rulemaking. Filing a comment in a rulemaking requires knowing about agency rulemaking in general, as well as knowing

³² Thomas C. Beierle, *Discussing the Rules: Electronic Rulemaking and Democratic Deliberation* (Resources for the Future, Discussion Paper No. 03-22, 2003), available at <http://www.rff.org/Documents/RFF-DP-03-22.pdf>

about the specific issues involved in a given agency rulemaking. Even with the Internet, it remains relatively costly for citizens to learn about a rulemaking proceeding and submit a substantive comment.³⁴ Moreover, these costs are what economists call opportunity costs. Even if the Internet decreases the absolute cost of submitting a comment to a government agency, it also decreases the absolute costs of other opportunities more attractive to most citizens, such as chatting with friends, keeping track of sports results, following the stock market, staying on top of celebrity gossip, or playing computer games.

The empirical findings to date suggest that non-technological barriers to public participation in rulemaking remain substantial. Perhaps the most that can be expected from e-rulemaking in terms of public participation, therefore, will be more modest, incremental changes. One incremental change could be an increase in participation by groups or individuals who are already highly motivated or reasonably sophisticated, such as by members of professional groups affected by proposed rules (e.g., pilots or flight attendants with respect to Federal Aviation Administration proceedings). A second incremental change could be an increase in the number of comments submitted on especially controversial rulemakings. Instead of seeing the exceptionally controversial rule receive hundreds or thousands of comments, as in the past, such rare rules may now start to receive tens of thousands or hundreds of thousands of comments. These effects may be notable in specific cases, but in general the level of public participation in rulemaking appears so far to have remained largely unchanged by the introduction of information technology.

III. Remaining Issues and Challenges

The empirical results obtained to date are significant as they draw into serious question a popular belief that e-rulemaking will usher in a revolution in citizen participation. By relying on the best available information, policy makers and designers of administrative procedures can make more realistic judgments about how to use information technology in the regulatory process -- or whether to change rulemaking procedures given the new technologies that are now available. Of course, even though the effects of e-rulemaking on levels of public participation do not fit the conventional wisdom, this does not mean that information technology has no value or should not be applied in new ways to the rulemaking process. As noted earlier, e-rulemaking may be justified for other reasons, such as improved transparency, enhanced ability for congressional or executive branch oversight, reductions in administrative costs, greater ease of compliance, or improvements in researchers' ability to study (and thereby generate ideas about improvements in) regulatory policy. All of these other possible rationales for e-rulemaking certainly merit their own consideration, as well as their own empirical study.

There is still a good possibility that for some of the challenges associated with government rulemaking, technological improvements may provide demonstrable benefits. Some technological improvements may simply enhance existing e-rulemaking systems. For example, a number of concerns about deficiencies of the FDMS were raised by participants in the December, 2005 symposium sponsored by the Subcommittee, such

as concerns about the ease and accuracy of FDMS' search capability or the completeness and consistency of the data fields the system uses. Other improvements may be needed in order to achieve new or broader objectives. For instance, as several observers have noted, it is now possible to create information systems that would enable users to move seamlessly between related legislation and legislative history, implementing regulations, supporting regulatory documents and public comments, guidance documents, and even court filings and decisions.³⁵ Right now, separate information systems have been developed for information produced in separate institutional settings, whether in Congress, agencies, or the courts. Yet for those who must comply with regulations, if no others, it would be markedly easier to understand and navigate through their regulatory thicket with clear computer linkages built into different types of regulatory information.

Making technological improvements – whether to existing systems or in order to advance still broader objectives – undoubtedly will require some institutional change. Some of these institutional changes will be budgetary, for resources will be needed not only to make the technological developments and modifications but also for empirical research needed to determine which technologies to deploy or to evaluate their efficacy in practice. Other institutional changes will be legal and jurisdictional ones. At present, the government-wide FDMS has been developed and managed by the EPA, working in consultation with other regulatory agencies. However much one may admire the work EPA has done, it is still far from clear that any individual regulatory agency is the proper

venue for the management of such a cross-agency initiative. After all, the current eRulemaking Initiative has faced certain financial and legal constraints owing in part to its somewhat makeshift institutional structure.³⁶ If the government does seriously intend to centralize all its regulatory dockets, consideration should be given to whether to vest management of such a central system in an independent records agency, much like the *Federal Register* is produced within the National Archives and Records Administration.

Successful e-rulemaking will ultimately require integrating both technological and institutional considerations, seeking the optimal fit of both organizational structures and technological capabilities to achieve relevant goals. Since information technology is intended to achieve improvements to both the substance and process of rulemaking, future empirical research will also be needed to determine the extent to which information technology advances the goals of those who implement it. Continued collaborative efforts between government and the research community should enable decision makers to make better judgments about any further modifications to and improvements in the rulemaking process.

³⁶ Cindy Skrzycki, *Document Portal Sticks on Funding*, *Washington Post*, January 10, 2006; Page D01.

Mr. CANNON. Thank you, Professor.

I intend to do more than one round of questioning, if that is agreeable to Mr. Watt. So I am going to limit myself to 5 minutes, and we will go back and forth, if that is interesting to you.

I was intrigued, Professor Coglianese, by your comments about empirical studies. Can I ask a couple of questions of you all, four or five?

How many of you have been online to look at Wikipedia or any other wiki? Do any of you do that? It is a fascinating experience.

How many of you have used Google as your search engine? Okay. How many of you have e-mailed, or how many of you have looked at gmail? Okay, you are obviously the guru here.

Are any of you members of an online community?

Let me tell you my experience. I don't spend a lot of time on the Net because my time is jerked around. But yesterday, I am too fat and I want to lose weight, and to do that I decided to Google "calorie counter."

So I ended up with a whole bunch of choices, and I went to a site called "sparklepeople" or something like that. It looked like it had a calorie counter, so I went to the site and couldn't find the counter without joining. And I thought, what the heck, I joined the community, so I signed up.

They asked for my e-mail. I was reluctant to give my real e-mail, and so I decided to see what Gmail is like. I don't mean to bore you here, but if you are talking about being empirical, you can't do empirical analysis retrospectively. You have to look at the tools that are available, and that is where I am sort of headed here. So Gmail is not e-mail.

Let me just say, you also look at Gmail. I am not recommending that because that would not be a congressional thing to do, but it was fascinating, and I decided to sign up for the Gmail account. And I used that as the e-mail address, and I hope I am protected because you use your cell phone number, by the way, when you do Gmail. It is not e-mail. It is a different thing and very interesting.

And then I became part of the community. It turns out the calorie counter was more awkward to use there than otherwise, but I did flip through the site to see how it worked, and it is a real community about people trying to use weight.

In that environment, in the environment we are in, which is an environment of dramatic change, just with the difference between e-mail, where you communicate back and forth, and Gmail, where I think what they say on the Web site is archive and don't delete.

So, for instance, I had a very interesting conversation on texting from my telephone to my son's telephone in quite a poignant point of our lives, and what I have on my telephone is my statement in the outbox and his statement in the inbox, and you can't put them together, at least not with the technology that I have.

So I have saved that, because it is sort of interesting. In fact, it is very interesting. I think 10 years from now he is going to be fascinated when we go back over that conversation. You can't do that given the technology that is the latest technology you can get that I have had, but you can do it with Gmail.

And so, when you talk about people being engaged, I am sort of lecturing here, but the reason I am, I really appreciated the input.

This has been a remarkable hearing. When you look at the decisions we have to make, and you all are focused on those and dealing with those, it has got to be done in the context not of what Government is or what has been happening or what agencies have been doing or what agencies haven't been doing, or what people are involved.

Given the nature of the community, you are not going to get people, individuals normally involved with a system that has questions about what records are available, when you have Google that makes everything available.

And so it seems to me part of what we need to do here is look at where we can go with people and their involvement. And you don't expect a guy who is not a geophysicist to be commenting on a rule that relates to something technical like geophysics. But you can get him involved if you have a community and a discussion and a conclusion and a choice.

And many times, we don't vote on the rules. We do the things that make rational sense, but you can get feedback from people in the context of maybe we should think about this. If you have gone through and read and evaluated and considered the implications of what you are doing, how do you think Government ought to react?

In that context, I think that we have to look back at our most famous and first democrat, Thomas Jefferson, who believed that that governs best which is closest to the people that are affected by it. How much Government are we going to be able to shift away from the Federal level and toward the local level? And by the way, you can multiply complexity because there are a lot more people at the local level than there are in Washington, D.C.

So I am going to ask some questions in my next round. My time is almost up. I hope you will help as we go forward with this project, and you guys have been involved and we appreciate it. We absolutely need, the thing that has come through with great clarity is we need ACUS.

ACUS is not what it was in the 1960's. ACUS is the place where we can draw with resources everybody together and think about these issues. They are not Republican issues. They are not Democrat issues. They are issues of our time. They are issues that are largely created by technology and if we don't answer them thoughtfully and with a thoughtful process, we are going to get the wrong kinds of answers.

So with that, I will yield back and recognize the gentleman, the Ranking Member, for 5 minutes.

Mr. WATT. Mr. Chairman, I am impressed.

Mr. CANNON. That I didn't ask a question? [Laughter.]

Mr. WATT. No, with your knowledge of the technology. While you were exploring the technology, I was out running. [Laughter.] It will help you lose weight a lot faster.

Mr. CANNON. He doesn't need the calorie counter. I am almost ready to take that up. [Laughter.]

Mr. WATT. Just a suggestion to you, in case you are looking for a suggestion about how to lose weight. Don't count the calories, just burn them. [Laughter.]

Anyway, having said that, Professor Breger, your last round of statements, or your last subject that you dealt with, was some of

the creativity at the State level. I was hurriedly trying to read through your testimony. You gave it a sentence or two in your oral statement and you gave it a sentence or two in your written statement, too.

So can you tell us a little bit more about what some of the States are doing in terms of creativity that we ought to be at least thinking about?

Mr. BREGER. Thank you, Congressman.

Arizona has, institutionalized by the State legislature, a kind of State OIRA process, which has some innovative features for centralized review of rulemaking, including the centralized review also suggesting to the agencies when they should be re-looking at existing rules or not.

Florida has its own State APA which has dealt with interpretive regulations in innovative ways, also problems of waiver of regulation by agencies. California's Administrative Procedure Act has a different approach toward judicial review with different levels of deference.

And of course, the model State Administrative Procedure Act, which is a kind of model for the States, has a number of different approaches and solutions from the APA that are worth considering, including interpretive regulations among others. Those are just a few of the kind of creative activity that is going on in the States.

I would be happy to enlarge on that in written testimony.

Mr. WATT. I think that would be helpful to us, lest we have to go and Google what the States are doing. While my Chairman will be capable of doing that, I assure you I will not. [Laughter.]

I won't either e-mail it or Gmail it.

Let me try to tie together what Professor Magill and Professor Coglianesse said. Is it possible that the decline in hearings and U.S. litigation may be being precipitated by those limited number of people who are engaging in e-technology? It seems to me that one possibility is that e-technology is certainly enabling people who are interested in an issue to be a lot more involved in discussing that issue quickly and interactively.

It used to be that you could only comment through the written, paper, slow-mail process. You got no response to that until the rule was actually made. Is this notion that I have that this increased interactive capability may be helping to sort through some of the disagreements that are taking place or were taking place that were not resolved, and maybe leading to a reduction in administrative procedures and/or litigation?

Ms. MAGILL. Sure. It is an interesting idea. I guess the theory would be that increased participation and potential collaboration resolves conflicts, and therefore agencies have less need to bring enforcement actions or pursue violators of rules or statutory violations. That is an interesting idea.

It is not something we had yet thought of, but we haven't yet zeroed in on this descriptive finding. At the moment, we are very big-picture, what has happened with rulemaking, what has happened with adjudication, what has happened with litigation. This descriptive trend surprised us. We presented it in January of 2006. There were several people from the Justice Department who were also surprised.

So we don't know the answer, and the best I can say is I think there are lots of possibilities. This is one possibility we can think about. We are some months away from thinking about it in a sort of rigorous way. What could possibly explain the reductions, and then try to test whether those factors do show up as causally related to the reduction, or at least correlated with the reduction.

So it is an interesting idea, and I am sad to say I can't yet tell you with confidence whether I think the data supports it.

Mr. COGLIANESE. We don't have any definitive research on that specific question, but it is highly plausible. In fact, one would expect that if members of the public can access Government information about rulemaking more easily, then their comments should be better informed and more helpful to the agency, right, which should enable the agency to make a better rule.

And if it is easier for interested members of the public, as you say, those who have a connection with the rule and an understanding of the general area, if it is easier for them to participate, then Government may hear more from them. And that may enable them to anticipate problems, anticipate conflicts, and create a better rule.

Right now, we don't have any research that examines the extent to which information technology creates better rules, but we would hope it does. And we would hope that with increased investments and innovation in information technology, we could come up with tools that would make rules even better; that would not only avoid litigation, but deliver more benefits to society.

Mr. WATT. Mr. Chairman, I know I am over my time, but since I am on a roll and I haven't gotten Professor West yet, can I ask one more question? Well, actually one more question after that, too, but it is not as important.

Mr. CANNON. Would the gentleman mind? I would like to follow up on the last question. Are you going to change the subject?

Mr. WATT. No. I think I am going to extend it to the pre-comment period with Mr. West. That is what he devoted most of his time talking about, and his student may want to join in the conversation with us.

I was just fascinated by how you can do this pre-comment period, get more interactive, especially through technology you could do it. But I don't know how you would do it without having a bunch of Government officials just sitting there e-mailing back and forth in every agency.

How would you structure this increased pre-comment notion that you think is desirable, that it seemed to me that you all thought it might be desirable, and maybe actually helpful in maybe decreasing even more the litigation, if you could get more people talking earlier in the process. But how do you structure something like that without just being so burdensome that it just takes up so much time that you can't manage it?

Mr. WEST. That is a great question. I don't have a ready answer for it.

You know, we wanted to see how much communication there was in the pre-notice phase of rulemaking, and with whom it took place and raise some issues. Should the pre-notice process be structured? That begs a number of other questions. In part, it depends on how

effective the comment phase of rulemaking is in redressing imbalances that occur during it.

Mr. WATT. It has to be structured to some extent, don't you think, because otherwise you don't know who to communicate with. Maybe that is a good dissertation undertaking for your student. She is smiling, hey, maybe I can structure something pre-comment period.

Mr. WEST. Well, that is a great question.

An obvious alternative would be to require agencies to use advance notices for all rules or for certain kinds of rules, maybe rules that reach a certain threshold of significance. Actually, our study was based in large part on interviews with seasoned public servants, many of whom had been working in the area of rulemaking for decades. They were uniformly against that, a requirement for advance notice is across the board. They thought that that would just impede efficiency too much.

Mr. WATT. And be burdensome.

Mr. WEST. It would be burdensome. It would delay the process.

Mr. WATT. It would take a lot of time.

Mr. WEST. Sure it would, yes. It is already a protracted process and they felt that it would lengthen rulemaking by years, in some cases.

Mr. WATT. I didn't change the subject, I don't think.

Mr. BREGER. Mr. Chairman, if I can just add, when I was Solicitor of Labor, when we did Advance Notices of Proposed Rulemaking, these were for major rules. We thought through in advance questions to ask with great particularity to see what the different interest groups in the regulated community thought about going in different directions. We found that was very helpful.

We also developed some roundtables trying to bring together different interest groups. I won't call them focus groups.

Mr. WATT. That is the same thing as a chat room?

Mr. BREGER. But in person. That was pre-high-tech. Again, that was very useful in bringing to our attention problems in our thinking and therefore make the rule better.

And finally, and of course with Professor Coglianesi here, I have to mention negotiated rulemaking, which is another mechanism, where he is an expert, but another mechanism which we used at the Labor Department to bring out in kind of less than formal ways problems with a proposed rule to try to refine it and improve it in the rule development process.

Thank you.

Mr. CANNON. Neg reg, of course, was one of the great successes of ACUS.

Mr. BREGER. Yes.

Mr. CANNON. May I ask, how many students do we have who are associated with your project here? Do you want to raise your hand, those who are associated with Dr. West's project?

Mr. WEST. Just one.

Mr. CANNON. One. Do you have any other students associated with Dr. Magill's project?

Okay, we are not going to put anybody on the spot here. Thanks.

Let me follow up on this line of reasoning, whether we call it a chat room or in-person kind of thing. Let me give you another experience that I had, also related to my weight.

I have decided, since this discussion, I am going to find a keyboard that has more resistance so I am using more calories when I do that, but I noticed my weight was different in Utah than in Washington. I had the same brand of scale. I got it from Costco. It was very consistently different.

So I Googled the difference in altitude and weight. I got a very simple answer, but that was as part of a discussion board, and somebody responded to that simple answer with a more complex answer, and then somebody who had a Ph.D in something came on and said no and then gave a very big answer, a very complicated answer. The net effect is I think it is just a consistent difference in my scales.

But the reason I tell that story is because if you look at the world like having to do a pre-rulemaking and a notice of rulemaking or a negotiated rulemaking, you are dealing with what a few people in an agency are seeing, as opposed to what the world is seeing. And so maybe if you have a context for discussions, this rule is not working because I have a farm in Minnesota and it is a different situation from the people that you have regulated in other parts of the country.

If you have that kind of an environment, all of a sudden you get the right kind of input from the right kind of people, and then maybe some agronomist somewhere can point out, you think your farm is different, but in these regards it is the same. And the guy says, oh, yes, you are right. And so you have compliance by a guy who might otherwise not comply on the low end, and therefore less litigation, but on the other end you have people, associations of people that then focus on their interest and their differences and the way they communicate.

So if you look at the Internet as a way to do what we used to do better, it is not the same thing as saying, what do we have, what tools do we have available that allows us to do better what we ought to be doing, rather than what we have done. And so, let me just hope that that will ferment in your perfervid imaginations.

Ms. Magill, may I ask you a question? You said that the 90 percent agency actions informal statistic, when did he come up with that guess? Do you know?

Ms. MAGILL. It was a speech given in the middle of the 1970's, published in the Administrative Law Journal.

Mr. CANNON. We have been using that figure, that guess, for 30 years.

Ms. MAGILL. Professor Freeman had an example in the fall of 2005 in her testimony that I think people relied upon. This was the 80 percent figure, 80 percent of EPA rules are challenged in court. A study demonstrated that that was not true. I am not sure my 90 percent figure has been the basis for policymaking, but it is repeated a lot.

Mr. CANNON. It is repeated a lot, yes.

Ms. MAGILL. It is repeated a lot. It is a difficult enterprise to carefully answer the question, how much agency action is informal, even in one agency. So maybe a guess is the best we can do. I don't

think so. But to answer that question definitely would be hard, but again, we can do better than a guess, I think.

Mr. CANNON. And probably the difference is going to be relevant and significant as we go forward.

Ms. MAGILL. Yes.

Mr. CANNON. Dr. West, in your prepared statement, you said two agencies ordered their staff not to comply with your survey, despite a cover letter indicating that it was being conducted under the auspices of CRS and the Judiciary Committee.

What were the two agencies that refused to cooperate with you?

Mr. WEST. Caitlyn, correct me if I am wrong, but I think it was the Internal Revenue Service and the Department of Transportation.

Mr. CANNON. Ms. Miller, would you like to join us at the table? We won't even put you under oath. We would love to have you here.

Do either of you have a guess as to why those two agencies were uncooperative?

This goes on your resume. You have yet to testify. You have to say something at some point. [Laughter.]

Mr. WEST. The person from the IRS told us that. We assured everyone that the survey would be confidential and that it would not even identify specific regulations, but they were nonetheless afraid that that would establish a precedent that would lead to lawsuits or other efforts to open up, to get access to communications that occurred during the pre-notice phase of rulemaking. That was my recollection for IRS.

I can't remember the rationale that was given to us by the Department of Transportation.

Ms. MILLER. We did do the survey electronically, and we got some e-mails. We sent out the cover letter to all of our respondents, and then we sent out a preliminary e-mail with the link to the survey. We got some responses back that there were policies from the counsel's office in the departments that they were not to participate in any academic surveys. Their impression was that they were too busy.

Mr. CANNON. I suspect that means we have to haul them in here before this Committee, right?

Mr. WEST. I will add, though, that especially with the Department of Transportation, the other part of our study consisted of interviews with experienced Government officials, people from general counsel's offices and so forth. There were several people from Transportation that were extremely helpful in that part of the project.

Mr. CANNON. You know, there is an interesting overlay between what Congress can do and what our staff can do, and what an academic institution can do. I suspect that ACUS sort of helps bridge that gap by working together with staff.

Do you think, Professor West, that if ACUS had been involved that that would have affected these agencies' reaction?

Mr. WEST. Well, it might have, and this is something that Curtis Copeland and I discussed. ACUS is obviously a nonpartisan agency without any apparent institutional bias. So people in the agencies might be more forthcoming to cooperate in research by ACUS than

in research occurring under the auspices of, say, a congressional Committee.

Mr. CANNON. But would you indulge me for one more question? Dr. Breger, you headed ACUS for a period of time. In your experience, did ACUS ever work with Committee staff to get information that was otherwise difficult to get?

Mr. BREGER. We worked with Committee staff in the sense that Committee staff often suggested projects to us. We generally had a good working relationship with the agencies. The reason is that every agency by statute was a member of ACUS. Usually, their chief legal officer, or their general counsel, was the member or the deputy general counsel in charge of regulations. So they, in a sense, bought into the process.

As a result, we had a much easier time. I won't say "easy." We had a relatively easy time in gaining their cooperation, certainly on the front end of the study. One of my jobs after the plenary assembly approved a recommendation was to knock on everyone's door and say, why don't you accept it? That was not always so easy.

Mr. CANNON. You know, you gave a litany of the problems we have. Everybody has suggested that there is a vast amount that we don't know that is knowable, and ACUS can help us know that on the one hand. On the other hand, we have great opportunities to transform what we do, and having agencies buy in through ACUS makes the case very, very strongly, I think, for ACUS.

I yield back. Do you have more questions, Mel?

Mr. WATT. I just wanted to follow up with Professor Coglianese. Can you provide a little information about how EPA got to managing e-rulemaking, the whole process? And would ACUS be an alternative to that? Or what would be the logical alternatives to one particular agency taking the lead on something like that?

Mr. COGLIANESE. Certainly. The president established an e-Government agenda which had 24 different projects. E-rulemaking was one of those projects. For each project, the Administration designated a lead agency to administer these initiatives.

My understanding is that OMB hired a consulting firm to examine the hardware that was used by agencies that had online docket systems in place already, and that the consultant report identified the EPA as having the best hardware, which was not surprising since EPA was one of the most recent agencies, at that time, to adopt such a system. So it had the latest technology.

EPA has since worked with a great deal of cooperation by all the other agencies, 100 agencies or so, that are connected in this e-rulemaking initiative. Many of the agencies that issue a lot of rules are more active in working collaboratively with EPA, but the project is administered by EPA. That has led to some challenges when it comes to funding.

Initially, OMB was channeling funds on a pro-rata basis according to how many rules an agency issues, all coming from different agencies to fund this initiative. The congressional Appropriations Committee didn't quite agree with that as an approach to funding e-Government efforts and has since called into question that practice, and now it is much more difficult to fund this project adequately because of this makeshift institutional structure.

The other thing that has happened is that EPA really has no final say, in a sense, because it is not administering a statutory mandate that has vested management authority in it. So an alternative model for undertaking an e-rulemaking project like this that covers the entire Federal Government would probably not be ACUS, but something like the Office of Federal Register, which similarly is charged with an information management function that cuts across the entire Federal Government. There are standards for what goes into the Federal Register, what format it is in, and the like, and those standards apply to all agencies.

So something like that might be the more appropriate model to look at creating an institution that could manage information technology projects that cut across the Government, and hopefully extend indefinitely into the future and allow for innovation as technology improves over time.

Can I add one other comment, by the way, to your earlier point about chat rooms and involving the public in notice-and-comment rulemaking?

Mr. WATT. I have actually never been in a chat room.

Mr. COGLIANESE. I just wanted to note, it wasn't in my testimony, but it is in a forthcoming article I have written that will appear in the Duke Law Journal. There have been several agencies that have tried chat-room, online discussions, interactive forums, as ways of generating information.

There was one study by Woody Stanley, a DOT employee, where he looked at a project that the Federal Motor Carriers Administration had undertaken. He went to the Web site, and you could either join the chat room or you could file a comment.

Interestingly enough, the people who filed the comments and chose that avenue tended to be the usual suspects. But people who entered the chat room and discussed issues tended to be truck drivers who wouldn't ordinarily have filed comments. And through that interactive dialogue, Stanley reports, there were different kinds of issues that were presented to the agency than emerged in the comments.

The comments focused on a lot of technical issues, costs and the like. The truck drivers were raising issues of practicality, of safety and the like, that were not emphasized as much through the formal comments. So there is some work being done by agencies to explore these interactive opportunities, and some research being done on what it all means.

Mr. WATT. Your second dissertation is on structuring this e-rulemaking technology. We are giving her a lot of information today.

Thank you, sir. I appreciate it. I yield back.

Mr. CANNON. I have one very quick question, and then a couple of things for the record.

Professor Coglianese, have you worked at all with the IEEE to help develop standards in this regard? They are a massive resource, and you ought to connect with them.

In fact, let me suggest a name, Lee Hollaar, L-E-E, last name H-O-L-L-A-A-R, has worked on the Hill on the Senate side. He has a degree in computer science and also law, and he works closely with the IEEE. He is on several of their Committees, and we can get you his phone number. He would be a great guy to talk to

about this because he is smart and he has the background and he can connect with the folks who ought to be doing this at IEEE, and they ought to be part of our overall project.

And just for the record, it is Ms. Miller, right? And what is your first name?

Ms. MILLER. Caitlyn.

Mr. CANNON. C-A-I-T-L-I-N?

Ms. MILLER. Y-N.

Mr. CANNON. Y-N. Okay. Great. M-I-L-L-E-R.

Ms. MILLER. Correct.

Mr. CANNON. Just so you know, this is the permanent record forever, and you are here with us. We thank you for being here.

I ask unanimous consent that we keep the record open for 10 business days, working days, for follow-up written questions. Without objection, so ordered.

Let me just thank you all. We appreciate your expertise. It is a very difficult issue which is timely and very important, and we appreciate your involvement here today, but also in the broader project. We look forward to seeing you again soon.

Thank you.

We are adjourned.

[Whereupon, at 12:59 p.m., the Subcommittee was adjourned.]

A P P E N D I X

MATERIAL SUBMITTED FOR THE HEARING RECORD

REVISED PREPARED STATEMENT OF PROFESSOR M. ELIZABETH MAGILL, UNIVERSITY OF VIRGINIA SCHOOL OF LAW, CHARLOTTESVILLE, VA

My name is Elizabeth Magill and I am a law professor at the University of Virginia School of Law. Thank you for asking me here today.

My teaching and research are in the fields of constitutional law and administrative law. I have taught administrative law and related courses—food and drug law, advanced administrative law—since 1998. My academic writing in administrative law is about judicial review of administrative action and about the varied procedural choices agencies make when they implement their statutory mandates—whether, for instance, they adopt a legislative rule or adjudicate a case or bring an enforcement action in the courts. I have served as a reporter for the APA Restatement Project of the Administrative Law and Regulatory Practice Section of the American Bar Association.

I am especially pleased to be asked to testify before this Subcommittee. Like many administrative law professors, I have admired this Subcommittee's work on administrative process. The academics I know all cheered this Subcommittee's leadership in seeking the reauthorization of the Administrative Conference of the United States and we hailed its passage in 2004. We have also admired the efforts of this Subcommittee to, with the assistance of the Congressional Research Service's American Law Division, identify a research agenda to address important questions of administrative process and to fund several research projects.

I. WHERE DO WE GO FROM HERE?

This hearing, which recalls the adoption of the Administrative Procedure Act sixty years ago, has been convened to ask what the future holds. I will do my best to answer that question in a moment, but I must note at the outset that it is not exactly clear where we go from here. That is because we do not fully comprehend where we are this moment. Despite the scope and significance of the administrative state, there is not enough systematic work that identifies what agencies are doing and asks whether they are doing it well; nor is there enough systematic work that asks about the effects of the mechanisms used to curb agency discretion—Congressional oversight, Executive and judicial review. There are many examples that highlight this lack of empirically-grounded research and writing on the administrative state. As Professor Jody Freeman pointed out in her testimony before this Subcommittee in 2005, an often-repeated statistic was that 80% of EPA rules were challenged in court; the only problem was that this had no basis in fact as one study demonstrated. Another often repeated statistic is that 90% of agency action is “informal”—that is, it does not follow procedures specified in the APA—but, after tracing the origin of this statistic, I found that the author of the statistic represented it as a “guess.”

The first most important step to setting a course for the future is the investment of resources in careful study of the most pressing issues that arise across a range of agencies. This Subcommittee's leadership has started us down that road, and I will speak in a moment about work that advances that objective. But I do not have any doubt that more remains to be done.

Careful and systematic study is not an easy task and that is one reason why there is not enough of it. The administrative state is incredibly complex. Agencies have distinctive statutory mandates—some distribute benefits, some regulate the market, some protect the nation. They also follow different processes and have distinctive designs—Commission, Administrator, Cabinet level or not Cabinet level. They ad-

dress a dizzying variety of tasks in varied ways. That complexity makes systematic and generalizable research very difficult to conduct.

At the same time, it is clear that administrative agencies are not so distinctive that one cannot generalize about their behavior and draw conclusions about what may trouble us about the soundness or wisdom of their activities. Of course, most agencies are subject the basic template provided for in the Administrative Procedure Act. More than that, though, many agencies share similar substantive tasks—they must rely on scientific judgments to do their business or they manage large benefit programs or they are in the business of licensing firms before they enter the market. Looking across agencies to determine and assess how they perform these tasks is obviously a worthwhile endeavor. Agencies are also subject to similar controls. They are the object of close oversight by Congress, the Executive, and/or the federal courts. Thus, despite the enormous complexity of the administrative state, there are common issues and problems that affect a large set of agencies such that cross-agency study will repay enormous dividends and will guide administrative reforms.

To figure out where we go from here, then, we must invest the resources to study the general issues that affect a substantial number of agencies and, if warranted, identify problems and formulate solutions. I would emphasize that those resources must be put in the hands of people who will approach their study in a systematic way. In my view, such studies must rely on the time-tested methods of social scientific inquiry, rather than the haphazard gathering of data or, worse, anecdote. It is only careful study that can establish the facts of the matter and thus provide a sound basis for identifying problems that need to be rectified.

There are several promising signs that such study is starting to occur. In part, these developments are due to the efforts and vision of the Members and staff of this Subcommittee and the CRS. Re-authorization of ACUS has generated enormous enthusiasm in the administrative law community. The studies that this Subcommittee's efforts have spawned—Professor West's work on public participation in rule-making that we are hearing about today and Professor Freeman's study of judicial review of administrative action—are important efforts that will advance our understanding and clarify what, if anything, is needed in the way of law reform. More than that, in my corner of the world, an increasing number of my peers are convinced of the need for empirical study of the administrative state and an increasing number of people in law teaching have the necessary training to engage in rigorous empirical work.

II. ESTABLISHING AN ACCURATE PICTURE OF THE ADMINISTRATIVE STATE'S ACTIVITY

For the past several years, I have been working with a colleague to complete what I just testified was the most important step to take before we could identify what comes next—that is, we have been working on a project to find out exactly where we are now. My colleague is Professor Steven Croley at the University of Michigan Law School and we have been working together to provide a comprehensive empirical picture of federal agency decision-making. We have received several grants to support our work, including from the Milton and Miriam Handler Foundation and the Olin Foundation. Our goal, in the most general terms, is to describe what agencies do and how that has changed over time.

Our project will present detailed data on the frequency and type of decisions that federal agencies make, both across agencies and across time. Our book explains the legal parameters of agencies' primary decision making tools—including legislative rulemaking, adjudication, litigation, and agency guidance—and provides as in depth data as is available about the frequency, including change in frequency over time, of agency reliance on those tools. Our data is presented in the aggregate (how many rules across the federal government and how has that changed over time) as well as agency by agency. We also identify patterns in that data. Our project is heavily descriptive, but we also provide narrative explanation of why, when, and how federal agencies make decisions, and we plan to address various normative questions implicated by our empirical findings as well.

Professor Croley and I undertook this project because, as students of the administrative state, we were frustrated by the lack of comprehensive information about agency decision-making. Most administrative law scholarship focuses primarily on judicial review of agency decision making. While obviously important, judicial reaction to agency work product is only one window onto the activities of the administrative state. Meanwhile, political scientists and economists who write about agency behavior are not generally attentive to the legal differences among the agencies' policymaking tools. As teachers of administrative law, we found no work that examined empirically the range and frequency of procedures agencies employ. More than that, no work provides a ready general source of data about the form and frequency of

administrative agencies' legal work-product. Our motivation for undertaking this project has been primarily to supply what is missing—certain basic, comprehensive facts—about agency behavior and agency decision-making.

Our effort has several goals. Most basically, we aim to shed descriptive light on fundamental but understudied questions about federal agency decision-making. For example: Exactly how often do agencies engage in rulemaking and adjudication processes under APA? Which agencies do so the most, and which the least? Have agencies engaged in more or less rulemaking, and adjudication, over time (and adjusting for variables like population, GNP, and legislative activity)? In addition, how many of which different types of rules—“regulatory rules,” “redistributive rules,” “governmental housekeeping rules,” etc.—have agencies issued over recent years? How many staff have agencies committed to the adjudication processes over time? How many times do agencies sue to enforce their statutory mandates and how, if at all, has that changed over time? How often are agencies sued and required to defend their exercises of authority and how, and if so, has that changed over time?

A related goal of our project is to provide others with an empirical base from which others can draw their own conclusions about administrative government. We hope to inspire others to enlist the data we supply to advance their own research on agency behavior. Abstract discussions of administrative government should be grounded as much as possible in concrete facts about what agencies really do, and the facts we present will inform others' work.

Last but not least, we engage in analyses ourselves, practicing what we preach. That is, in addition to presenting the facts about the type and volume of agency activities, we consider how those facts might connect to perennial normative debates about, for example, executive versus legislative control of agencies, agency accountability and independence, and the appropriate size and role of the federal government, among others. We also explore our descriptive findings by running several statistical tests to evaluate hypotheses related to normative discussions of agency activity. For example, we investigate whether certain agency decision-making procedures increase or decrease with Republican or Democratic administrations, or in times of divided or undivided government, among other things.

We have collected data from a very wide variety of sources. In identifying sources, we had a strong preference for data collected across a large number of agencies, and collected by neutral entities at regular intervals. We wished to avoid collecting data agency by agency because of the risks of inconsistency this raises. Our sources are largely available from various government sources. The data come from, for example, Office of Personnel Management, GAO, the Regulatory Information Service Center, Office of Information and Regulatory Affairs at OMB, the General Services Administration, Executive Office of the United States Attorneys, and the Administrative Office of the U.S. Courts. Much of it is available in a raw form that must be analyzed and aggregated to be meaningful and appropriate for generalization. Most of the labor of our project consists of the legwork of finding, compiling, and aggregating data across many different sources, and then organizing and presenting that data in meaningful ways.

We are still in the process of producing our book. But in January of 2006, at the annual meeting of the American Association of Law Schools, we presented some of our preliminary findings. I will recount for you some of what we reported there.

The core of the book are chapters devoted to each of the major policy making tools available to agencies—rulemaking, adjudication, government litigation, and guidance. Let me provide a few highlights of our findings about rulemaking, adjudication, and government litigation:

***Rules:** Knowing how many rules are promulgated each year depends on the type of rule as well as the classification system of the entity that collects the information. “Rule” is a legal term of art and there are different definitions of rule and different types of rules. But, two sources, RISC and GAO, provide the most useful aggregate data on the number of rules issued each year. Relying on these data sources, we have come to the following preliminary conclusions.

First, agencies together issue just over 4,000 final rules per year, an amount reflecting a gradual decline since the early 1980s, when they issued just over 6,000 rules a year. Second, about 66% of all final rules come from agencies whose heads report to cabinet secretaries, while only about 10% percent come from the independent agencies, down from about 20% percent two decades ago. The remaining 25% come from executive-branch agencies, like the EPA, whose heads do not report to cabinet secretaries but to the President.

Considering proposed rather than final rules, the same general pattern emerges. Agencies now publish about 2,700 proposed rules a year, down from over 3,500 in the early and mid-1980s. Here, however, independent agencies publish a bigger share, 15–20% of proposed rules, with non-cabinet executive agencies publishing

just barely more than that, and the remaining 60% then coming from cabinet agencies.

Not all rules, however, have a substantive effect. Somewhere between 1,000 and 1,200 rules issued each year have a substantive effect. Among substantive rules, between about 500 and 700 rules each year are far-reaching enough to trigger White House review. The number was closer to 500 in the late 1990s, and approximates 700 each year since 2000. Of those, about 45 to 75 per year constitute huge rules with an estimated annual impact on the economy of more the \$100 million.

***Adjudication:** Tracking adjudication in the federal government is difficult because there are different types of adjudicators—Administrative Law Judges (ALJs) and Presiding Officers (POs)—who preside over evidentiary hearings and there is no current governmentwide collection of data on the number of adjudications conducted each year. For one putting together an accurate empirical picture of administrative adjudication, the primary sources are OPM personnel data, two publications by the ACUS in the late 1970s, and two surveys of non-ALJ adjudications conducted in 1989 and 2002.

The vast majority of ALJs in the federal government adjudicate cases in the Social Security Administration. SSA ALJs have, since 1991, always constituted more than 72% of the total ALJs in the federal government. After SSA, the next highest employers of ALJs are Labor, NLRB, and the Energy Department.

In the aggregate, from 1991 through 2004, the total number of ALJs increased by 13%, from 1191 to 1341. This increase occurred during a period when total government employment declined by 15%.

But the 13% increase in the number of ALJs was not consistent across agencies. Social Security Administration ALJs increased by 31% while the number of non-SSA ALJs declined 37% between 1991 and 2004. In other words, the number of adjudicators who are implementing regulatory programs declined while those adjudicating benefits have increased.

Many who adjudicate cases in the federal government are not ALJs. We know from two surveys that there are several thousand POs conducting evidentiary hearings. In a 1989 survey, the author found 2,692 POs and this number increased to 3,370 according to a follow-up survey conducted in 2002. As of the 2002 survey, the largest number POs were in the Justice Department's Executive Office for Immigration Review, the Veterans Administration, and the IRS and the largest number of cases decided by POs were in EOIR, the IRS, and the Appeals Council of the SSA.

***Government Litigation:** One window onto the administrative state is to observe litigation on behalf of agencies in the courts. This includes affirmative litigation—called "US as plaintiff" litigation—brought by the federal government as well as litigation where the government is defending against a challenge to its activities—called "US as defendant." The Administrative Office of the Courts and the Executive Office of U.S. Attorneys each track this litigation.

A look at those data are revealing on a variety of fronts, but the most dramatic descriptive trend is the dramatic decline in "US as plaintiff" litigation. The Administrative Office of the Courts reports that US plaintiff litigation declined by two thirds in a 14 year period. In 1990, there were 30,000 US plaintiff cases and this declined to 10,000 in 2004. During the same period, US as defendant litigation increased dramatically, from just under 25,000 cases to nearly 40,000 cases.

The Executive Office of the US Attorneys reports similar data, although their data track agency litigation more precisely because the reports categorize litigation based on the client agency that US Attorneys are representing. From 1991 through 2003, overall civil cases handled by US Attorneys declined by 11%. But US plaintiff cases declined by 60% while US defendant cases increased by 11%. Affirmative litigation on behalf of every agency that DOJ represents declined, except the Interior Department.

This whirlwind tour of statistics provides just a slice of the data we will present in our book. As you can see, our goal is to provide an accurate and systematic picture of the activities of the administrative state. It is our hope that this sort of grounding will be a basis for moving forward by identifying the right questions to ask. And the data raise many questions: Why, in the last five years, are there more "significant" rules being forwarded to OIRA for review? What accounts for the rise in POs? Why is the number of regulatory ALJs declining? Why has US Plaintiff litigation declined so dramatically?

III. WHERE DO WE GO FROM HERE?

So I return to the question I started with, namely, where do we go from here? As I said at the outset, I do not know where we go next because of the dearth of sound and careful work about where we are now. I am absolutely confident that further study is necessary to identify problems and formulate solutions. And the reauthorized ACUS provides an opportunity to move forward. Once funding is secured, many will clamor to fund various research projects. They may disagree on the priority, but few will disagree about the central need for more and more rigorous work about what is occurring at agencies. And there are many worthy research projects. In the fall of 2005, you heard testimony from Professor Jeffrey Lubbers, Mr. Mort Rosenberg, and Professor Jody Freeman, all suggesting possible avenues for research of a reconstituted ACUS. I have read their testimony and believe they made extremely valuable suggestions. I will add a few of my own to the list. My suggestions are not detailed proposals for study, but what I view to be the most important general areas for research.

External Agency controls: To my mind, a central question about agency activity is whether and how the various oversight mechanisms that are in place for agencies work. Agencies are subject to control and oversight by Congress, by the Executive, and they are subject to judicial review by courts. Asking about the function and efficacy of these control mechanisms is probably the most important question we can be asking. Thankfully, there is work that has been and is being done on these areas. Professor Croley has carefully studied the White House Review of agency rules and Professor Freeman is now engaged in her own comprehensive study of judicial review of agencies. These two studies are notable for their systematic—as opposed to ad hoc—approach and they have and will teach us a lot. But we need to do more because these external controls on agencies are so important and it is a complex enterprise to assess their efficacy. In my view, we are just at the beginning of building an accepted base of knowledge and moving toward conclusions about the wisdom and efficacy of these control mechanisms.

Internal Agency Controls: Another promising area for research is to get inside the agency and study how agencies make their important decisions. My own research has made me very interested in why it is agencies choose to implement their mandates in such different ways, some relying heavily on adjudication, others relying heavily on rules. But there are many other questions, for instance: When and why do agencies adopt enforcement guidelines? How do they organize internal appeals from front-line decision makers? How do they set their regulatory priorities? These questions about the internal decision making process of agencies are central to understanding why they behave the way they do and, as a result, are worthy of sustained attention.

Effectiveness of Rules. Many have noted that we have no way to determine the effectiveness of rules after they are in place. Among other things, we presently have no mechanism to determine whether the projections contained in the cost-benefit analysis when the rule is adopted turn out to be accurate in the long-run. Answering this question may not answer questions about the overall efficacy of regulations, but it would be a useful question to ask and, more importantly, it is just the sort of analytic task that a think tank arm of government could design and conduct. A research program aimed at identifying the promising ways to go about assessing the costs and benefits after implementation and comparing them to earlier projections would be a worthy enterprise.

Thank you for inviting me here today. I am gratified by the interest this Subcommittee has shown in the efficacy and fairness of administrative process.

RESPONSE TO POST-HEARING QUESTIONS FROM PROFESSOR WILLIAM WEST, THE
BUSH SCHOOL OF GOVERNMENT AND PUBLIC SERVICE, TEXAS A&M UNIVERSITY,
COLLEGE STATION, TX

Again, thank you for the opportunity to testify before your subcommittee. The questions you have posed about my statement are good ones. I have provided some brief answers below but would be happy to follow up at greater length on any of them.

1. *Why is it important to study how agencies develop proposed rules?*

The notice-and-comment requirements of the Administrative Procedure Act seek to ensure that participation in rulemaking is inclusive and transparent. Arguably, however, the most important policy decisions are usually made before these procedures go into effect. Proposed rules tend to be very detailed and represent a good deal of time and effort in their preparation. Although changes are sometimes made during the comment phase, they are difficult to make because of sunk organizational costs and because of the demands of due process. Changes in proposed rules tend to be made at the margins when they occur. Given this, it is important to examine the character of participation during proposal development. How prevalent is it? Is it broadly representative of all stakeholders? Is it open or transparent?

2. *In your written statement, you state that "scholars practically ignored the informal processes that precede the APA's notice-and-comment requirements and most other controls on rulemaking." Why is that?*

I suspect that part of the explanation is simply that this part of the process involves communications and organizational dynamics that are difficult to study. The data are not readily accessible (as we found out in our study), and the processes tend to be so idiosyncratic that they defy efforts at generalization. (That is, one or a few in-depth case studies of particular rules might not tell you that much about the process across the board.) Until recently, moreover, the study of rulemaking has been confined primarily to law scholars, who have naturally been more interested in formal procedures than informal processes.

3. *In conducting the study, you obviously had to solicit information from the agencies themselves. How were you able to ensure that the responses you received were forthright and verifiable? For example, what is the likelihood that the agency would admit, if you will, that it routinely consults with only one source in developing proposed rules?*

Great question! We bent over backwards to assure people that the interviews were confidential but there is still an incentive to look good. Frankly, I would not expect many bureaucrats to admit (even to themselves) that they are biased and fail to consult with all relevant stakeholders. Without addressing this question in a more definitive way, however, a highly relevant finding is that most communications with outside interests occur either at the invitation of the agency or at the initiative of the participant (who somehow finds out about the proposal). At least in a procedural sense, therefore, participation falls short of the inclusiveness that notice-and-comment seeks to ensure.

4. *To what do you attribute the low response rate of agencies to your study's survey?*

There may be several explanation:

- Paranoia. Notwithstanding our assurances that we would not identify specific individuals or rules, some people were no doubt put off by the possibility that they might get into trouble. A number of those contacted indicated that they had to ask their superiors if they could participate, and at least two agencies ordered their people not to complete the surveys.
- Time. People are busy and the survey required 20-30 minutes to complete.
- The wrong people. We sent the questionnaires to agency staff listed as in the Federal Register as "contact officers" for specific rules. As it turned out, these were not always people who were familiar with the rule in question. As it also turned out, they did not always pass the questionnaire along to individuals who were knowledgeable (as they were asked to do).
- A blunt instrument. As an effort to collect information on many different types of rules, our survey naturally had to pose questions in very general terms. Not all of the questions were relevant to all off the rules, and I think this put some people off (even though we did our best to deflect this). I'm sure some thought that we were hopelessly naive regarding the nature of rulemaking.

5. What are the benefits and detriments to soliciting input from interested parties prior to the formal promulgation of a proposed rule?

Benefits: Evenhandedness. Everyone—or at least everyone with access to the notice— would have an opportunity to be heard. This, in turn, might lead to agency decisions that are informed by a broader, more complete range of input. Even it did not improve the substantive quality of decision making, moreover, giving everyone a shot might add to the legitimacy of the process.

Detriments: It would make an already-protracted process even more drawn-out. According to most agency officials, moreover, advance notices would not provide much additional useful information. The argument they make here is that the agency knows who the relevant stakeholders are and it seeks to ensure balanced communications with them as a matter of course. Also, several interviewees indicated that public comment pursuant to open-ended notices (such as those that would be provided in an ANPRM) tends to be too unfocused to be of much value for decision makers.

6. If the participation in proposal development is not usually by general invitation, how can an agency know that it has the benefit of a representative cross-section of those who may be affected by the proposal?

It can't for sure— at least at the time. Agency officials almost uniformly think they have a good feel for who all the stakeholders are but relying solely on this obviously runs the risk of confining participation to the "usual suspects." Of course, a cynic might add (with some empirical support) that participation pursuant to notice-and-comment tends to be confined to organized interests. So you don't know that you are tapping all relevant stakeholders here either.

7. *With the availability off the internet, why can't an agency engage in proposal solicitations by general invitation?*

I assume that this refers to identifying initiatives for proposed rules rather than to the development of proposals. There is no reason why an agency can't do this. As you know, the APA allows anyone to petition an agency to initiate a rulemaking proceeding. To me, at least, the more interesting question is how an agency decides which initiatives it will pursue out of many ideas for proposed rules that are brought to its attention.

8. *Given the wide variation of practices and policies that you observed among the agencies regarding the subject matter of your study, do you think OMB's Office of Information and Regulatory Affairs should play a greater role in providing guidance?*

This is a tough question that really has two parts. The first has to do with whether more uniformity in proposal development is desirable. Of course, the counter argument is that every agency operates in a unique environment and that indeed every rule is unique. Obviously, however, the intent of the APA was to standardize certain aspects of the administrative process across agencies and individual proceedings. Given that intent, coupled with the observation that many of the important determinations in rulemaking occur before the APA's constraints go into effect, you could certainly make the case for some general guidelines concerning the character of pre-notice participation. These might affect such things as what kinds of participation are permissible at what stages of the process and what kinds of participation must be docketed.

To the extent that some types of standardization might be appropriate, however, the second part of the question has to do with who should set the policies. Why OIRA? If Congress deems this to be an important issue, then why shouldn't it develop the institutional policy? After all, rulemaking is the exercise of delegated legislative authority. And procedures that set forth *how* agencies make decisions ultimately have an important bearing on *what* they do. We are essentially talking about a possible extension of the APA here, and I don't think this responsibility should be abdicated to the executive branch. (But I am somewhat of a legislative partisan.)

9. *You state in your statement that two agencies ordered their staff not to comply with your survey despite a cover letter indicating that it was being conducted under the auspices of the Congressional Research Service and the Judiciary Committee. What were the two agencies that refused to cooperate with you? Why do you think that these agencies were uncooperative? Do you think these agencies would have been more cooperative if the study was being conducted by a reactivated Administrative Conference of the United States?*

The two agencies were the IRS and the Department of Transportation. The IRS indicated to me that it was afraid of the precedent this might set. Notwithstanding the fact that we were not naming particular rules, it felt that this might open-up FOIA requests to obtain information about the development of specific regulations. I think DOT simply felt that complying with the survey

would be too time-consuming for their staff. (I should add that several high-level officials in DOT were extremely forthcoming in interviews about the rulemaking process in general.) I don't know, but I suspect that ACUS might have better access given its status as an entity without insitutional or partisan biases.

RESPONSE TO POST-HEARING QUESTIONS FROM PROFESSOR MARSHALL BREGER, THE CATHOLIC UNIVERSITY OF AMERICA—COLUMBUS SCHOOL OF LAW, WASHINGTON, DC

**Questions for Professor Marshall Breger
The Catholic University of America – Columbus School of Law**

- 1. It has been more than ten years since the Administrative Conference of the United States (ACUS or the Conference) was terminated. What, if any, problems have arisen in administrative law and practice that could have been addressed by the Conference if it was in existence over this period?**

As the “Administrative State” has evolved, major problems have arisen in administrative law and practice in the years since ACUS was terminated. I list below a number that could (indeed, I am certain would) have been addressed by ACUS if it had still been in existence.

- The problem of “interpretative rules” and issues of “fair warning” to the regulated community of the expectations of regulators.
- The challenge of e-regulation and e-democracy.
- Administrative law and regulatory policy issues of privatization and the “contracting out” of public functions.
- The intersection of administrative law and management issues in federal agencies.
- Administrative law issues of the “National Security State” including issues related to the homeland security.
- Empirical studies on the actual effect of OMB requirements including “prompt letters,” data quality and peer review issues.
- ADR and negotiated rulemaking.
- Fair and efficient implementation of FOIA.

- 2. If ACUS were reconstituted, what, if anything, would you recommend be changed about the Conference?**

One change worth working on is a legislative fix to resolve the so-called Emoluments Clause problem laid out in Gary Edles, *Service on Federal Advisory Committees: A Case Study of OLC’s Little-Known Emoluments Clause Jurisprudence*, 58 *Admin L. Rev.* 1 (2006). Put simply, at one point the Office of Legal Counsel took the position that “[f]ederal advisory committee members hold offices of profit or trust within the meaning of the Emoluments Clause” a position which made private sector participation by law firm partners problematic. Although OLC has reversed its position as to most advisory committee members. *See*, Application of the Emoluments Clause to a Member of the President’s Council on Bioethics, 2005 OLC LEXIS 2 (Op. Off. Legal Counsel, Mar. 9, 2005), it has expressly declined to do so for ACUS members even though ACUS members serve entirely as non-government advisors in much the same way as individuals on other agency advisory committees.

I further believe that Congress should encourage, if not mandate, ACUS to undertake top to bottom single agency reviews of agency practices and procedures

as it did with the Internal Revenue Service during the 1970s. While a revived ACUS may wish to commence such a review only on an agency's request, Congress could certainly mandate such reviews to assist the agency to improve its administrative practices and procedures.

3. How important is it to preserve the bipartisan, nonpolitical nature of ACUS?

It would be vital to preserve the bipartisan, unpolitical nature of ACUS. Failing that, to be blunt, the "game would not be worth the candle."

4. Should ACUS be reconstituted as part of another agency, such as the Justice Department or the General Services Administration? Should it be privatized?

Constituting ACUS as part of a federal agency will in an essential way undercut the unique "added value" it brought to reflection and innovation in the administrative process – the marriage of public and private, of regulation and regulated. Operating under the auspices of any executive or congressional branch agency – be it Justice or otherwise, any future ACUS would lack the independence from whichever "party line" is regnant at the time. Similar issues would exist with a privatized ACUS.

I might add that federal judges, who were active participants in ACUS' activities, would likely not participate if ACUS were part of an executive branch agency or department.

5. What should be the priorities for a reauthorized ACUS?

The practices for a reconstituted ACUS should include at least the following:

1. A thorough 60 year review of the APA and the options for further improvement in light of the historical experience.
2. Increased empirical work on administrative law.
3. Promotion and implementation of agency ADR and negotiated rulemaking (the latter of which has remained underdeveloped in recent years).
4. Opportunities in cooperative federalism.
5. The administrative law issues related to privatization and contracting out of public functions.
6. Issues related to the better managing of private sector management tools and government agencies, where appropriate.
7. Research into government compensation programs for victims of mass tort situations and development of reform suggestions and options.

6. What, if anything, should be done to ensure that the Conference's membership is representative?

From my experience as a former Chair, the structure of ACUS as applied had little problem with “diversity.” In the middle of the Reagan administration we had members from unions, the public interest sector as well as academics highly critical of the administration in power. All these persons had an overriding commitment to making the administrative process work and as long as issues were framed in that manner significant substantive advances were possible.

7. Do you have any recommendations as to how ACUS could be given more authority/leverage to achieve implementation of its recommendations?

The problem of how to incentivize agencies to adopt ACUS regulations is a complex one. Below are a number of statutory proposals.

- ACUS could be required to send its recommendations to the relevant House and Senate appropriations and authorizations committees who could follow up as appropriate.
- Congress could explicitly mandate a yearly report from ACUS on agency implementation.

8. Should ACUS be given any administrative responsibilities (e.g., providing guidance on the implementation of ADR, Government in the Sunshine Act, Unified Agenda of Federal Regulations, Equal Access to Justice Act)?

ACUS is at its best in dealing with cross-agency issues in that it is not controlled by any particular parochial bias. Thus it would be appropriate, indeed sensible, to give ACUS statutory responsibility to provide guidance and develop “best practices” as well as administrative responsibility in the implementation of such government wide administrative law programs as the Government in the Sunshine Act, the ADR Act, Negotiated Rulemaking Act, etc. Congress has done this in the past. It should consider doing so in the future.

I would also urge that ACUS be charged with collecting and collating basic statistics regarding the administrative process.

Congress should also give ACUS administrative responsibilities for ADR and “regulated rulemaking” functions throughout the federal agencies.

9. Given the fact that the recommendations of the Administrative Conference of the United States (ACUS or Conference) were only advisory in nature, how were the agencies encouraged to adopt them?

Agencies were encouraged to adopt ACUS recommendations in three ways. First, an agency representative (often the general counsel) invariably participated in Assembly discussion on a recommendation (and often in the earlier committee discussions). Thus, they had a chance to “buy in” to the recommendation early on. Second, as Chairman one of my most important tasks was to meet with agency heads, and general counsel and “jawbone” them to favorably respond to

the recommendation. Third, good-government groups and specialized lawyers associations often followed up with an agency on behalf of an ACUS recommendation.

10. What were some of the Conference's most significant accomplishments?

One could not focus on the accomplishments of ACUS without starting with its work on alternative dispute resolution and negotiated rulemaking. The Administrative Dispute Resolution Act, Public Law 101-552, and the Negotiated Rulemaking Act, Public Law 101-648, would not have been passed without the studies and recommendations of ACUS. ACUS spearheaded agency implementation of these statutes.

Other significant accomplishments include Recommendations 68-7 and 70-1 to remove implements to judicial review of agency action. The first Recommendation proposed a modification to the judicial review requirements to eliminate the \$10,000 jurisdictional threshold where the injury resulted from adverse action by a federal department or agency. The second urged abolition of the doctrine of sovereign immunity that deprived the federal courts of jurisdiction to entertain citizen suits in the absence of an express abrogation of the doctrine by Congress. The third Recommendation proposed that plaintiffs' claims not be dismissed merely because a particular agency official had been improperly identified or could not be joined as a defendant. These recommendations were implemented by Congress in Public Law 94-574.

Another statutory accomplishment was Public Law 102-345, the Federal Aviation Administrative civil penalty legislation that adopted ACUS recommendations in this area. And one should not ignore Recommendation 80-5 on "Eliminating or Simplifying of the 'Race to the Courthouse'" in Judicial Review of Agency Action which lead directly to Public Law 100-236.

Of course, most of ACUS recommendations are implemented by the agencies themselves as, for example, the numerous recommendations implemented by the IRS after the ACUS "top-down" review of IRS procedures during the 1970s.

11. How was the Conference able to attract such high caliber members, staff, and fellows?

The Conference had a unique ability to attract the brightest faculty members, staff and fellows. There were a number of reasons for this. First, the entire academic community interested in administrative law viewed it as the premier vehicle for progress in administrative law. The same was true of the legal community where senior partners who were practitioners fully participated. At the same time most government entities assigned their general counsel or deputy general counsel concerned with administrative law issues to represent it at the Conference.

Because of the importance of administrative procedure to the judicial process, we had the privilege of extraordinary liaisons from the Judicial Conference of the United States.

I can personally attest to the extraordinary quality of the staff which I believe was due to the unique opportunity presented civil servants to both deeply think about practical problems in government regulation and to propose solutions.

12. What were the principal reasons why ACUS was defunded?

My general impression is that the defunding of ACUS reflected a (I am sorry to say) "short-sighted" decision to close down at least one federal agency to fulfill the generally salubrious promise of the "Contract with America" to reduce federal bureaucracy. Possessing only a "good government" constituency, ACUS had few robust interest groups to sustain it. In addition, it appears that various administrative law judges (ALJs) unhappy with Conference recommendations applicable to their concerns, urged the defunding of the Conference. This is a complex historical question, however, and the best and most unbiased study of the history can be found in Toni Fine, *A Legislative Analysis of the Demise of the Administrative Conference of the United States*, 30 *Ariz. St. L.J.* 19 (1998).

13. Is there any way to estimate the savings in taxpayer dollars that resulted from the Conference's recommendations?

Just to put the matter in perspective, in its last year of operation, ACUS received an appropriation of \$1.8 million. The value of the pro bono contributions of the private sector members would far exceed this sum. While cost-saving assessments are necessarily speculative we may note that in 1994 the FDIC estimated that its pilot mediation program, modeled after an ACUS recommendation, had already saved it \$9 million. In 1996, the Labor Department, using mediation techniques suggested by the Conference to resolve labor and workplace standard disputes, estimated a reduction in time spent resolving cases of 7 to 11 percent. The President of the American Arbitration Association testified that ACUS' encouragement of administrative dispute resolution had saved "millions of dollars" that would otherwise have been spent for litigation costs. Since ACUS began the push for agency ADR in the early 1980's both the Department of Justice and the ABA have "gotten on board."

Similar financial savings have come from the use of settlement judges (ACUS Rec. 88-5). ACUS provided this innovative concept throughout the government. In just one agency, the National Labor Relations Board (NLRB) former Chairman William Gould noted that, in the first two years employing the new technique, the Board increased its settlement rate by about 25%. Chairman Gould estimated that each litigated case costs the government about \$35,000 and private parties spent at least as much. You can check the number of settled cases and do the math.

Other ACUS innovations including its early-on exploration of “user fees” and “self-audits” laid the groundwork for extremely significant government savings if these ideas are developed further.

While I have not researched this I have no doubt that each of the large executive branch agencies have administrative procedure reform divisions each of which most likely cost more yearly than did all of ACUS. To the extent to which ACUS is given responsibilities for “across the board” administrative law issues individual agency expenditures for this purpose may be to some small extent redundant as there would be less need to “reinvent the wheel.”

Finally, we must not neglect the value of fairness and efficiency in the administrative process, “dignitary values” not easily susceptible to monetization but central to the “rule of law.”

RESPONSE TO POST-HEARING QUESTIONS FROM PROFESSOR M. ELIZABETH MAGILL,
UNIVERSITY OF VIRGINIA SCHOOL OF LAW, CHARLOTTESVILLE, VA

Professor Elizabeth Magill
Answers to Questions

1. A major theme of your testimony is the lack of empirically-grounded research and writing on the subject of administrative procedure and process. Why is there such a paucity of academic interest in this subject?

I am not certain why there is such a paucity of empirically grounded work. Empirical work takes a long lead time and usually requires funding in order to purchase or analyze large data sources. Academics who are housed in law schools have not traditionally been able to conduct such research, either because the lead time is too long or the funding is not available. I would suspect that one reason for the lack of such work is due to the demise of the Administrative Conference of the United States, which, when in operation, sponsored in-depth studies of administrative agency activity.

2. Would a reactivated Administrative Conference of the United States (ACUS) serve as a clearinghouse for such research and writing?

Yes, it would. I would hope that it would rely on time-tested social science methods in both identifying research problems and conducting the research, in which case it would be an invaluable resource.

3. Some have suggested that a private sector version of ACUS would be just as efficient as an independent, federally subsidized ACUS. What are your thoughts about this proposition?

I do not have views about a private ACUS.

4. In your prepared statement, you describe a research project that you and Professor Croley are preparing. How are you able to encourage and/or ensure agencies' cooperation with your research?

We have encountered no difficulty with agencies. We have found, however, that some agencies do not compile the data we would like and some data is not systematically collected across the government. For instance, no entity systematically collects data on the number and type of adjudications conducted by all agencies in the government.

5. What accounts for the general decline in the number of rules promulgated each year?

It would require a sophisticated study to determine the answer to that question and we have not done that. It could be any number of factors, including a reduction in the number of statutory provisions that need to be implemented by rules to changes in the overall priorities of agencies. We do not know.

6. What criteria did you use to determine whether a rule has a substantive effect?

The criteria we followed were the same criteria followed by the various entities from which we collected the data. We did not have an independent definition.

7. With respect to adjudication within the federal agencies, you state that there are two types of adjudicators - administrative law judges (ALJs) and presiding officers. Please explain the differences between the two.

Administrative Law Judges (ALJs) often preside over adjudications conducted by agencies, if the adjudication is "required by statute to be determined on the record after opportunity for an agency hearing." 5 U.S.C. 554. The statutory provisions governing ALJs can be found in 5 U.S.C. §§ 1305, 3105 et. seq. Presiding officers preside over hearings in federal programs but do not have the same statutory protections available to ALJs. These hearing officers are identified and described in John H. Frye III, Survey of Non-ALJ Hearing Programs in the Federal Government, 44 Admin.L.Rev. 261 (1992).

8. What explanation, if any, do you have as to why the number of ALJs has increased by 13% from 1991 to 2004, a period when total federal government employment decreased by 15%?

I do not have an explanation, but it is important to note that the increase in ALJs has not been evenly distributed across government programs that rely on ALJs. Social Security Administration ALJs increased during the period (by about 30%), while non-SSA ALJs declined (by 37%) during this period. Thus, ALJs who preside over benefit programs—who make up the lion's share of the federal government's ALJs—have increased while other types of ALJs have declined in the same period.

9. What explanation, if any, do you have as to why the number of cases in which the United States is a plaintiff has declined so dramatically in a 14-year period?

We do not have an explanation. Again, it will take a sophisticated study to determine the answer to that question. We intend to undertake it, but we have not yet done so. There are many possible reasons, including changes in the statutory framework that the government is enforcing to changes in priorities of government litigators over the years.

RESPONSE TO POST-HEARING QUESTIONS FROM PROFESSOR CARY COGLIANESE,
UNIVERSITY OF PENNSYLVANIA LAW SCHOOL, PHILADELPHIA, PA

Responses to Questions Submitted by the House Judiciary Committee's
Subcommittee on Commercial and Administrative Law

Cary Coglianese
University of Pennsylvania Law School

August 2006

Question 1: At the December e-rulemaking symposium, you noted that with the advent of the information age, regulatory agencies are pressed to become more transparent and thereby engage the public. Has this really happened yet?

Response to Question 1: Yes, although the extent to which agencies have taken such actions varies. The E-Government Act of 2002 requires federal regulatory agencies to post on-line announcements for new rulemakings and to accept on-line submissions of comments, to the extent feasible. In keeping with this legislation, regulatory agencies have in recent years taken a number of steps to make information electronically available to the public and to make it easier for members of the public to communicate on-line with agency staff. Among these steps have included the establishment of rulemaking websites, on-line dockets with supporting information, electronic discussion groups, and web-based links for submitting comments.

The Bush Administration has launched a government-wide e-rulemaking effort, through its Regulations.Gov portal, making it possible for citizens to comment electronically on proposed rules issued by any regulatory agency. The Administration is also currently implementing an electronic Federal Docket Management System (FDMS), which allows users to retrieve background information on proposed rules. At present, only a fraction of all federal agencies have their docket information available through this system, but the Administration plans eventually to migrate regulatory dockets for all federal agencies into FDMS.

The extent to which agencies provide on-line visibility of regulatory information and use the Internet to engage with the public does vary. Only a few agencies have so far used electronic discussion boards or chat rooms, and even those agencies have done so only with respect to a handful of issues. Consequently, although some considerable efforts to apply information technology are currently underway, there remains a still greater potential for uniformity and ubiquity in these efforts across the entire federal government.

Question 2: What are the principal benefits and detriments of the Federal Docket Management System?

Response to Question 2: If fully and effectively implemented, the Federal Docket Management System (FDMS) will make available on-line all supporting materials for federal rulemakings – at any of a hundred or more federal agencies and subagencies. For

many federal entities, this will be the first time that their docket information is available to the public on-line. For anyone interested in or affected by proposed rules, this will mark an advance in the accessibility of regulatory information and the functional transparency of governmental decisionmaking. This advance will be most notable for those agencies that do not already have an on-line docket system, but even for those that do already have systems the benefits that will accrue from having a uniform, government-wide system will be similar to those that accrue from having a uniform, government-wide system of public notice about rulemakings through the *Federal Register*.

The benefits of FDMS will be most meaningful if the system is designed and implemented properly. At this time, outside observers have expressed concerns about how FDMS has been developing. These concerns, some of which were aired at the December e-rulemaking symposium, include: the incompleteness of certain fields of information in the system; the lack of full text searching within dockets; the need for a listserv function that allows users to receive email alerts when new items are posted to a docket; insufficient consistency in meta-tagging documents; and the issue of how electronic records will be archived. Certain older agency websites, such as the one created at the U.S. Department of Transportation (DOT), are much more user-friendly than the current FDMS. Consequently, there is a concern that even though the FDMS will bring many agencies a full two steps forward into the information age, it could result in some agencies like DOT taking a step backward.

There are larger questions about the institutional structure surrounding the development of the FDMS. As I noted in my testimony, FDMS is currently being managed by the U.S. Environmental Protection Agency (EPA) and funded through apportionments from EPA and various other regulatory agencies. EPA has received accolades for its implementation of e-rulemaking, but the institutional structure for this project has been makeshift and cumbersome, and it has undoubtedly made it harder for the government to address concerns that have been raised about the design of FDMS. In order to sustain a government-wide docket system over the long term and ensure that it is properly upgraded as information technology progresses, a more stable funding base and institutional structure should be explored. The Congress should consider delegating development and management of e-rulemaking to a dedicated and adequately funded entity, along lines perhaps similar to the way that the *Federal Register* and *Code of Federal Regulations* are managed.

Question 3: How do you respond to the concern that the Internet/e-government rulemaking promotes “junk” comments as part of the notice and comment process?

Response to Question 3: The phrase “‘junk’ comments” presumably refers to brief, unsophisticated comments submitted by ordinary citizens that convey no information to an agency other than the submitters’ preferences. As I understand it, the concern is that e-rulemaking may result in a dramatic increase in such comments and that processing these additional comments will be time-consuming and costly for agencies, without any corresponding benefits in terms of additional information to aid with decision making.

At least when so understood, this concern appears to be overstated as an empirical matter. Agencies are simply not drowning in comments, even after they have allowed members of the public to submit comments by email. For most rules, the volume of comments appears to have remained basically at the same level as before email.

On occasion, particularly salient and controversial rules will generate, as they have always generated, large numbers of comments, most of them meeting the above definition of “junk.” With the Internet, the number of “junk” comments may well be higher for these most exceptional rules, increasing comments from the thousands to the tens or hundreds of thousands in some instances. Even these cases, though, do not appear to be generating any untenable processing burden on agencies. First, such highly salient and controversial rules are not common. Second, since “junk” comments are by definition brief and nonsubstantive, the time it takes to “weed” them out probably will never be overly excessive for an agency. Finally, some researchers are even beginning to develop software that will identify patterns in comments and at some point soon agencies may be able automatically to identify and categorize mass mail form letters.

Question 4: Some have criticized the Federal Docket Management System as imposing a one-size-fits-all standard that fails to take into account the individual needs and resources of various agencies websites. What are your views about this criticism?

Response to Question 4: There are both virtues and vices to uniformity in any domain of rules, procedures, and institutions. The challenge is to achieve an optimal level of uniformity, where the virtues can be maximized and the vices minimized (even if never eliminated). In the case of storage and retrieval of regulatory information, the federal government has favored uniformity for a very long time, thus we have had since 1936 a single *Federal Register* and it has been publishing proposed rules since 1947. We have had a “one-size-fits-all” publication called the *Code of Federal Regulations* since 1938. The rationale for creating these uniform regulatory publications also applies in the electronic age to docket information about regulatory decisions: uniformity makes it easier for citizens, affected businesses and nonprofit organizations, and Members of Congress to keep track of agency rulemaking.

As the FDMS advances this rationale for uniformity, it should be designed so as to avoid problems that can sometimes arise with standardization, even though they need not occur. One such problem comes when government standardizes on the least common denominator. Uniformity need not be based on docket systems of lower quality, but instead should maintain, if not even advance, the state-of-the-art in hardware and software. Developers of a uniform system should take the best features of existing agencies’ systems and make sure that the new system provides at least the same (if not better) level of usability and information access. So far, the current FDMS has yet to meet this criterion, at least in its interface and searching capabilities. Users do not find that it is as easy to navigate or effective at searching as the docket management system at EPA that it replaced. It is also not close to being as useable and effective as the older docket system developed by and still in use at the U.S. Department of Transportation.

A related problem can arise if uniformity is achieved by truncating information previously made available to the public by some agencies. Concerns have been raised that fields of information previously available to the public electronically will be lost as agencies move their own agency systems over to FDMS. Yet with effective design and adequate funding, FDMS can and should be developed in such a way as to ensure full retention of public information about rulemaking. A uniform system can be created that allows some flexibility, just as the *Federal Register* allows agencies to print whatever content they like in their preambles and rule sections, even while ensuring that common fields of information are tracked and published in a uniform manner.

Question 5: You state that “information technology has not caused any substantial upswing in citizen participation in agency rulemaking.” What explains this result?

Response to Question 5: I review the empirical evidence behind this result in my article, “Citizen Participation in the Rulemaking: Past, Present, and Future,” 55 *Duke Law Journal* 943-968 (2006). In that article, I also discuss in detail what explains these seemingly surprising results. The main reason is quite straightforward: most rulemakings involve issues that are of either low salience or high complexity (or both). Citizens who are not highly motivated to participate generally in politics and policymaking do not become more so, especially on even more obscure issues, simply because they can submit comments to regulatory agencies via the Internet. Furthermore, even though the Internet make it easier to learn about new rules and send in comments, information technology also makes it much easier for people to do other things that they would prefer to do, whether chatting with friends, keeping up with celebrity gossip or sports results, or playing video games. A substantial upswing in citizen participation requires not just new technology, but a substantial upswing in citizens’ motivation to get involved in the regulatory process rather than spending their time in other, more appealing ways.

Question 6: How can an agency cope with hundreds of thousands of comments received via email in response to a proposed and final rule?

Response to Question 6: Agencies do not need to cope with hundreds of thousands of comments very often. Only a small number of rules have ever generated this volume of commentary. In these rare cases, the burden is no doubt substantial but agencies have still managed. Fortunately, most of the comments usually submitted in these rules are terse form letters, whose pattern can be easily observed. In the future, advances in natural language processing and other developments in information technology are likely to make it easier for agencies to detect duplicate comments, as well as to identify issues and sort comments. The general direction appears to be one in which information technology will make things easier for agencies, even if in the occasional rulemaking it may also mean that even larger quantities of form letters are received.

**REGULATORY FLEXIBILITY
IMPROVEMENTS ACT**

THURSDAY, JULY 20, 2006

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON COMMERCIAL
AND ADMINISTRATIVE LAW,
COMMITTEE ON THE JUDICIARY,
Washington, DC.

The Subcommittee met, pursuant to notice, at 12:19 p.m., in Room 2141, Rayburn House Office Building, the Honorable Chris Cannon (Chairman of the Subcommittee) presiding.

Mr. CANNON. Now, the Subcommittee will please come to order. Thank you, all. We apologize for being long on that vote. And my understanding is Mr. Watt is on his way and will join us momentarily, but we do have Mr. Coble, though, so we will get started.

Mostly, we will avoid boring Mr. Watt by not having to listen to my opening statement, which, actually, I think is sort of interesting.

I want to begin with some fairly astounding facts. First, according to OMB, no one has ever tabulated the sheer number of Federal regulations that have been adopted since the passage of the Administrative Procedure Act of 1946.

Second, and perhaps even more astounding, is the fact that OMB states that most of these existing Federal rules have never been evaluated to determine whether they have worked as intended and what their actual benefits and costs have been. We do know their costs have been high.

Last year, the Office of Advocacy for the Small Business Administration issued a report estimating that the annual cost to comply with Federal regulations in the United States in 2004 exceeded \$1.1 trillion. It reported if every household received a bill for an equal share, each household would have owed \$10,172, an amount that exceeds what the average American household spent on health care in 2004, which was slightly under \$9,000.

I think these facts underscore several critical needs. Most importantly, we need to get the Administrative Conference of the United States up and running. As many of you know, I drafted bipartisan legislation that was signed into law in the last Congress that reauthorized ACUS. For 25 years, the Conference played an invaluable role as the Federal Government's in-house adviser on and coordinator of administrative procedural reforms.

I am in fact paraphrasing from a letter that the American Bar Association sent earlier this week to the Senate Appropriations Committee seeking funding for ACUS. With unanimous consent, I

would like to submit this letter for inclusion to the record, and hearing no objections, so ordered.

Second, these facts underscore the urgent need for continuing and aggressive congressional oversight over the regulatory process. To that end, the Subcommittee on Commercial and Administrative Law, at the request of the House Judiciary Committee Chairman Jim Sensenbrenner, with support of Ranking Member John Conyers, is conducting a comprehensive review of administrative law, process and procedure.

This project, which is being guided by the Congressional Research Service, will culminate with the issuance of a final report and the publication of the results of various studies focusing on succinct issues presented by the rule-making process. Third, these problems underscore the need for legislative redress. H.R. 682, I believe, is a very good start.

Essentially, this legislation addresses several significant shortcomings of the Regulatory Flexibility Act. Enacted in 1980, the act requires Federal agencies to assess the impact of proposed regulations on small entities, which the act defines as either a small business, small organization or small governmental jurisdiction.

One of the principal purposes of the act was to reduce unnecessary and disproportionately burdensome demands that Federal regulatory and reporting requirements placed on small entities. For example, the act requires agencies to prepare a regulatory flexibility analysis at the time certain proposed and final rules are promulgated. Among other things, the analysis must describe the reasons why action by the agency is necessary and identify any significant alternatives to the rule.

This analysis is not required, however, if the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Since its enactment in 1980, however, certain recurring deficiencies with the act have been identified. The GAO on numerous occasions has cited the act's uneven implementation and lack of clarity. I expect Mr. Mihm, who appears today on behalf of the GAO, will be able to elaborate on these concerns.

In response to these problems, Representative Don Manzullo, who Chairs the House Committee on Small Business, introduced H.R. 682, the Regulatory Flexibility Improvement Act. On unanimous consent, I ask that the record include a statement from the bill's author, Representative Manzullo.

Hearing none, so ordered.

[The prepared statement of Mr. Manzullo is published in the Appendix.]

Mr. CANNON. H.R. 682 consists of a comprehensive set of reforms intended to encourage Federal agencies to analyze and uncover less costly alternative regulatory approaches and to ensure that all effects, including foreseeable indirect effects, of proposed and final rules are considered by agencies during the rulemaking process.

The legislation currently has 18 cosponsors, including me, and is supported by the United States Chamber of Commerce and the National Federation of Independent Business. It is against this exceedingly interesting backdrop that we are holding this legislative hearing today.

When Mr. Watt arrives, we will turn to him for any comments that he would like to make. Without objection, his entire statement and any other Members who wish to submit a statement will be placed in the record.

Hearing no objection, so ordered.

Without objection, all Members may place—we just did that. Without objection, the Chair will be authorized to declare recesses at any point of the hearing.

Hearing no objection, so ordered.

I ask unanimous consent that Members have 5 legislative days to submit written statements for inclusion in today's hearing record.

Hearing no objection, so ordered.

[The prepared statement of Mr. Cannon follows:]

PREPARED STATEMENT OF THE HONORABLE CHRIS CANNON, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF UTAH, AND CHAIRMAN, SUBCOMMITTEE ON COMMERCIAL AND ADMINISTRATIVE LAW

The Subcommittee will please come to order.

I want to begin this hearing by noting some fairly astounding facts. First, according to OMB, no one has ever tabulated the sheer number of federal regulations that have been adopted since passage of the Administrative Procedure Act in 1946. Second, and perhaps even more astounding, is the fact that OMB states that "most of these existing federal rules have never been evaluated to determine whether they have worked as intended and what their actual benefits and costs have been."

Last year, the Office of Advocacy for the Small Business Administration issued a report estimating that the annual cost to comply with federal regulations in the United States in 2004 exceeded \$1.1 trillion. It reported, "Had every household received a bill for an equal share, each would have owed \$10,172, an amount that exceeds what the average American household spent on health care in 2004 (slightly under \$9,000)."

I think these facts underscore several critical needs. Most importantly, we need to get the Administrative Conference of the United States up and running. As many of you know, I drafted bipartisan legislation that was signed into law in the last Congress that reauthorized ACUS. For 25 years, the Conference played an invaluable role as the federal government's in-house advisor on—and coordinator of—administrative procedural reform. I'm in fact paraphrasing from a letter that the American Bar Association sent earlier this week to the Senate Appropriations Committee seeking funding for ACUS. With unanimous consent, I would like to submit this letter for inclusion in the record. Hearing no objection, so ordered.

Second, these facts underscore the urgent need for continuing and aggressive Congressional oversight of the regulatory process. To that end, the Subcommittee on Commercial and Administrative Law—at the request of House Judiciary Committee Chairman Jim Sensenbrenner and support of Ranking Member John Conyers—is conducting a comprehensive review of administrative law, process and procedure. This project, which is being guided by the Congressional Research Service, will culminate with the issuance of a final report and the publication of the results of various studies focusing on succinct issues presented by the rulemaking process.

Third, these problems underscore the need for legislative redress. H.R. 682, I believe, is a very good start. Essentially, this legislation addresses several significant shortcomings of the Regulatory Flexibility Act. Enacted in 1980, the Act requires federal agencies to assess the impact of proposed regulations on "small entities," which the Act defines as either a small business, small organization, or small governmental jurisdiction. One of the principal purposes of the Act was to reduce unnecessary and disproportionately burdensome demands that federal regulatory and reporting requirements place on small entities.

For example, the Act requires agencies to prepare a regulatory flexibility analysis at the time certain proposed and final rules are promulgated. Among other things, the analysis must describe the reasons why action by the agency is necessary and identify any significant alternatives to the rule. This analysis is not required, however, if the agency certifies that the rule will not have a "significant economic impact on a substantial number of small entities."

Since its enactment in 1980, however, certain recurring deficiencies with the Act have been identified. The GAO on numerous occasions has cited the Act's uneven

implementation and lack of clarity. I expect Mr. Mihm, who appears today on behalf of the GAO, will be able to elaborate on these concerns.

In response to these problems, Representative Don Manzullo, who chairs the House Committee on Small Business, introduced H.R. 682, the Regulatory Flexibility Improvements Act.

H.R. 682 consists of a comprehensive set of reforms intended to encourage federal agencies to analyze and uncover less costly alternative regulatory approaches and to ensure that all effects—including foreseeable indirect effects—of proposed and final rules are considered by agencies during the rulemaking process.

The legislation currently has 18 cosponsors, including myself, and is supported by the United States Chamber of Commerce and the National Federation of Independent Businesses.

It is against this exceedingly interesting backdrop that we are holding this legislative hearing today.

I am now pleased to introduce the witnesses for today's hearing. Our first witness is Tom Sullivan, who is the Chief Counsel for Advocacy at the Small Business Administration. The Office for Advocacy was created in 1976 to serve as the watchdog for small businesses as they interact with the Federal Government.

Last year, the office helped save America's small businesses more than \$6.6 billion they would have otherwise had to spend in order to comply with Federal regulations, a truly commendable accomplishment.

Prior to assuming his current responsibilities at the Office of Advocacy, Mr. Sullivan was the Executive Director of the National Federation of Independent Business's Legal Foundation, which provides guidance on legal issues to small businesses and promotes a pro-small business agenda in the Nation's courts. We are now a big Nation of small businesses, overwhelmingly.

Mr. Sullivan received his undergraduate degree in English from Boston College and his law degree from Suffolk University in Boston.

Our next witness is Chris Mihm, who is the Managing Director of GAO's strategic issues team, which focuses on Government-wide issues with the goal of promoting a more results-oriented and accountable Federal Government. The strategic issues team has examined such matters as Federal agency transformations, budgetary aspects of the Nation's long-term fiscal outlook, and civil service reform.

As many of you know, Mr. Mihm testified last year before our Subcommittee regarding the administrative law, process and procedure project that I previously described, and, welcome back, Mr. Mihm.

Mr. Mihm is a fellow of the National Academy of Public Administration and he received his undergraduate degree from Georgetown University.

Our next witness is J. Robert Shull, who serves as the director of regulatory policy at OMB Watch. OMB Watch is a nonprofit research and advocacy organization that seeks to promote Government accountability, citizen participation in public policy decisions and the use of fiscal and regulatory policy to serve the public interest.

Before joining OMB Watch in 2004, Mr. Shull was a training specialist and child advocate. In that capacity, he worked at Children's Rights, a nonprofit advocacy organization based in New York that represents the interests of abused and neglected children. Mr.

Shull obtained his undergraduate degree from the University of Virginia and his law degree from Stanford Law School.

David Frulla is our final witness. Mr. Frulla is a partner with the law firm of Kelley, Drye, Collier, Shannon, where he is a member of the firm's litigation, environmental law and Government relations and public policy practice groups. Prior to joining Kelley Drye, Mr. Frulla was a founding partner and principal of Brand and Frulla PC, which specialized in civil, criminal and administrative advocacy before Federal and State courts and administrative agencies.

Mr. Frulla also serves as Chair of the Criminal Process Committee of the American Bar Association's Administrative Law and Regulatory Practice Section. Mr. Frulla received his undergraduate degree *summa cum laude* from Dartmouth College and his law degree from University of Virginia Law School.

I extend to each of you my warm regards and appreciation for your willingness to participate in today's hearing. In light of the fact that your written statements will be included in the record, I request that you limit your oral remarks to 5 minutes. Accordingly, feel free to summarize and highlight the salient points of your testimony.

You will note that we have a lighting system that starts with the green. After 4 minutes, it turns to yellow and then at 5 minutes turns red. It is my habit to tap the gavel at 5 minutes. We would appreciate if you would finish up your thoughts about that time. We don't want to cut anybody off, and I find that it works much better—we are actually not overflowing with Members who have questions to ask today—so it is not as serious as sometimes it is.

So, if we could do that, we will have a significant amount of time, I think, to discuss your issues during questioning. After you present your remarks, the Subcommittee Members, in the order that they arrived, will be permitted to ask questions of the witnesses, subject to the 5-minute rule, which I will, depending upon how many people come, enforce more or less strictly.

Pursuant to the directive of the Chairman of the Judiciary Committee, I ask the witnesses to please stand and raise your right hand to take the oath.

Do you swear or affirm under penalty of perjury that the testimony you are about to give is true and correct to the best of your knowledge, information and belief?

The record should reflect that all of the witnesses answered in the affirmative.

You may be seated.

Mr. Watt, would you like to make an opening statement?

Mr. WATT. No, just welcome the witnesses. Thank you for being here.

Mr. CANNON. Mr. Sullivan, would you proceed with your testimony?

**TESTIMONY OF THE HONORABLE THOMAS M. SULLIVAN,
CHIEF COUNSEL FOR ADVOCACY, UNITED STATES SMALL
BUSINESS ADMINISTRATION, WASHINGTON, DC**

Mr. SULLIVAN. Thank you, Mr. Chairman, Ranking Member Mr. Watt. I will try to be brief and actually try to go under the 5 min-

utes. Thank you for already including my written statement in the record.

The first part of my statement really goes through the history of the Regulatory Flexibility Act, and it is, I think, an important starting point. Why do we have an act that requires agencies to especially consider their impact on small business?

Well, I think that it is no surprise that we are a Nation, a big Nation, of small businesses, and those businesses are well known for being the job creators, the innovators and the community leaders. And there was a realization in 1980 that not only is small business the economic engine of the United States, but they bear a disproportionate impact when it comes to Federal rules and regulations. So shouldn't there be a law that tries to level that playing field for small businesses?

And that law is, in fact, the Regulatory Flexibility Act. It was amended in 1996 by the Small Business Regulatory Enforcement Fairness Act. In 1996, Congress realized that the requirement, or the encouragement, for agencies to do a small business impact analysis maybe just isn't enough incentive for agencies to do that. And so in 1996, Congress actually amended the RFA to include judicial review, so that if agencies do not conduct small business impact analysis and consider less burdensome alternatives, then they can be taken to court and a court will tell them to do so.

The most recent update to the Regulatory Flexibility Act actually came in 2002, when President Bush signed an executive order—and, again, that was an affirmation of small businesses' importance to this country, and an affirmation or realization that small businesses continue to bear a disproportionate regulatory impact, and even more work needs to be done to level the playing field.

This executive order really encourages agencies even more to do the type of small business impact analysis and work with my office than ever before, and it is working. The Regulatory Flexibility Act is working, and I certainly don't want anyone to proceed in this hearing to think that we are fixing an absolutely broken law. That is just not the case.

My testimony bears out that we are saving billions of dollars by filtering out parts of rules and regulations that don't make sense for small business, and by filtering them out, you are leveling the playing field without compromising regulatory protections, while still protecting the environment, protecting workplace safety, protecting our Nation's borders.

While the Reg Flex Act is working, it is not working perfectly, and now is the time where you look at the law, much like this Committee looks at the Administrative Procedure Act and has amended it close to 60 times over the past several years. It is time to look at the Regulatory Flexibility Act and ask, "How can it work better?" And H.R. 682 plugs many, if not all, of the loopholes that are contained in the Regulatory Flexibility Act.

My office believes that the biggest loophole that needs to be closed is indirect impact. Agencies right now are required to examine how their rules will impact those who are directly regulated. But that doesn't extend to the logically foreseeable secondary impacts, tertiary impacts, and I believe it is the Government's responsibility to inform the public before finalizing rules and regulations

how will this rule work? How will it impact consumers? How will it impact the tourist industry? How will this rule impact homeowners and community leaders?

Those are the types of secondary and tertiary impacts that are sometimes ignored because the Reg Flex Act doesn't require it. H.R. 682 plugs that loophole.

There are other loopholes that exist in the Regulatory Flexibility Act. My statement goes in some detail into how H.R. 682 cures that and I am happy to answer any questions about the particulars of 682 or the Committee's curiosity on how my office works to enforce the Regulatory Flexibility Act.

[The prepared statement of Mr. Sullivan follows:]

PREPARED STATEMENT OF THE HONORABLE THOMAS M. SULLIVAN

Advocacy: the voice of small business in government

Testimony of

*The Honorable Thomas M. Sullivan
Chief Counsel for Advocacy
U.S. Small Business Administration*

*U.S. House of Representatives
Committee on the Judiciary
Subcommittee on Commercial and Administrative Law*

Date: July 20, 2006
Time: 11:30 A.M.
Location: Room 2141
Rayburn House Office Building
Washington, D.C.
Topic: Regulatory Flexibility Improvements Act – H.R. 682

Created by Congress in 1976, the Office of Advocacy of the U.S. Small Business Administration (SBA) is an independent voice for small business within the federal government. The Chief Counsel for Advocacy, who is appointed by the President and confirmed by the U.S. Senate, directs the office. The Chief Counsel advances the views, concerns, and interests of small business before Congress, the White House, federal agencies, federal courts, and state policy makers. Issues are identified through economic research, policy analyses, and small business outreach. The Chief Counsel's efforts are supported by offices in Washington, D.C., and by Regional Advocates. For more information about the Office of Advocacy, visit <http://www.sba.gov/advo>, or call (202) 205-6533.

Chairman Cannon, Ranking Member Watt, Members of the Committee, good morning and thank you for the opportunity to appear before you today to address H.R. 682, the Regulatory Flexibility Improvements Act. My name is Thomas M. Sullivan and I am Chief Counsel for the Office of Advocacy at the U.S. Small Business Administration (SBA). As Chief Counsel for Advocacy, I am charged with monitoring federal agencies' compliance with the Regulatory Flexibility Act (RFA). Because the Office of Advocacy is an independent office within SBA, the views that I express do not necessarily reflect the views of the Administration or the U.S. Small Business Administration. This statement was not circulated to the Office of Management and Budget (OMB) for comment.

Background of the RFA and the Small Business Regulatory Enforcement Fairness Act

In 1980, Congress enacted the RFA after determining that uniform federal regulations produced a disproportionate adverse economic hardship on small entities. In order to minimize the burden of regulations on small entities, the RFA mandates that federal agencies consider the potential economic impact of federal regulations on small entities. The RFA also requires agencies to examine regulatory alternatives that achieve the agencies' public policy goals while minimizing small entity impacts.

Agency compliance with the RFA, however, was not judicially reviewable. Since agencies could not be held legally accountable for their noncompliance with the statute, many agencies ignored the RFA and did not conduct full regulatory flexibility analyses in conjunction with their rulemakings. In response to this widespread agency indifference, Congress amended the RFA in 1996 by enacting the Small Business Regulatory Enforcement Fairness Act (SBREFA), which reshaped the requirements of the RFA and provided for judicial review of agencies' final decisions under the RFA.

The RFA requires agencies to prepare and publish an initial regulatory flexibility analysis (IRFA), when proposing a regulation, and a final regulatory flexibility analysis (FRFA) when issuing a final rule for each rule that may have a significant economic impact on a substantial number of small entities. The purpose of the analysis is to ensure that the agency has considered the economic impact of the regulation on small entities and that the agency has considered regulatory alternatives that would minimize the rule's economic impact on affected small entities. The RFA allows the head of an agency to certify a rule in lieu of preparing a regulatory flexibility analysis if the rule will not, if promulgated, have a significant economic impact on a substantial number of small entities. Pursuant to the RFA, the agency must provide a factual basis for the certification.

Executive Order 13272

Even with the additional requirements under SBREFA and the threat of judicial review, some agencies were not complying with the requirements of the RFA. On March 19, 2002, President George W. Bush announced his Small Business Agenda, which included

the goal of "tearing down the regulatory barriers to job creation for small businesses and giving small business owners a voice in the complex and confusing federal regulatory process." To accomplish this goal, the President sought to strengthen the Office of Advocacy by enhancing its relationship with the Office of Management and Budget's (OMB) Office of Information and Regulatory Affairs (OIRA) and creating an executive order that would direct agencies to work closely with the Office of Advocacy and properly consider the impact of their regulations on small entities. On August 13, 2002, the President signed Executive Order (E.O.) 13272, titled "Proper Consideration of Small Entities in Agency Rulemaking."¹

E.O. 13272 enhances Advocacy's RFA mandate by directing Federal agencies to implement written procedures and policies for measuring the economic impact of their regulatory proposals on small entities. It also requires agencies to notify Advocacy of draft rules that are expected to have a significant economic impact on a substantial number of small entities and to give every appropriate consideration to any comments provided by Advocacy, including publishing a response to Advocacy's comments in the *Federal Register*. The Office of Advocacy must provide periodic notification, as well as training to all federal agencies on how to comply with the RFA.

The *Report on the Regulatory Flexibility Act, FY 2005* includes information about agency compliance with E.O. 13272. With the exception of the Department of State, all Cabinet-level departments have developed written plans in compliance with E.O. 13272. The performance of the independent agencies, however, has not been as successful. Of the 75 independent regulatory agencies, only 16 responded to the requirements of the E.O. Of those 16, only eight have provided written procedures, six claimed that they do not regulate small entities, and two claimed to be exempt from the E.O.

In terms of training, Advocacy has held 55 training sessions at 45 different agencies. Agency attorneys, economists, policymakers, and other employees involved in the regulatory writing process have attended the hands-on sessions to learn how to comply with the RFA in a regulatory setting. Advocacy's current efforts are focused on rolling out an interactive electronic training module so that agencies can engage in periodic training and train new employees. Like the classroom setting, the online training program explains the steps rule writers should follow to make RFA decisions accurately.

Advocacy's training is having a noticeable impact on the way agencies develop rules. Agencies that have been through training tend to notify Advocacy earlier in the process, submit draft documents, and seek Advocacy's assistance in finding small entity data. For example, when Congress enacted the Public Health Security and Bioterrorism Preparedness and Response Act of 2002 (Act), it authorized the Food and Drug Administration (FDA) to promulgate rules in an expedited timeframe to protect the nation's food supply. In response to the Act, FDA published four final rules, each preceded by a notice of proposed rulemaking, prior notice of imported food shipments,

¹ E.O. 13272 can be found on the Office of Advocacy's website at <http://www.sba.gov/advofans/eo13272.pdf>.

registration of food facilities, establishment and maintenance of records, and administrative detention. The Act required FDA to publish the first three rules within 18 months or by December 12, 2003. FDA contacted Advocacy about the rules' impact on small businesses well before the proposed rules were published in the *Federal Register*. This allowed Advocacy to work closely with the FDA to reduce the economic effects of the rules on small businesses. As a result of the involvement of Advocacy and interested small businesses, FDA made several adjustments to the rules including the creation of the new automated commercial environment (ACE) database and a far less onerous notice requirement (twenty-four hours notice was reduced to two hours if the food is arriving by road, four hours if the food is arriving by rail, and eight hours if the food is arriving by sea); extending the registration update requirement from 30 days to 60 days; allowing those importers subject to the rule to check a food category titled "most or all" rather than requiring them to individually list food product categories that had been previously identified in the registration form; and exempting the food packaging industry, which consists primarily of small businesses, from the FDA registration and prior notice requirements. The FDA also gave small businesses more time to comply with the requirements.

Impact of the RFA, SBREFA and E.O. 13272

The SBREFA amendments to the RFA have been successful. In general, agencies are paying closer attention to their RFA obligations. As a result, they are implementing less costly regulations. Some agencies submit their draft regulations to Advocacy early in the process to obtain feedback on their RFA compliance and small business impact. Early intervention by Advocacy and improved agency compliance with the RFA have led to less burdensome regulations. For example, in FY 2001, involvement by the Office of Advocacy in agency rulemakings helped save small businesses an estimated \$4.4 billion in new regulatory compliance costs.² Similarly, in FY 2002, the Office of Advocacy's efforts to improve agency compliance with the RFA on behalf of small entities secured more than \$21 billion in first-year cost savings, with an additional \$10 billion in annually recurring cost savings.³ In FY 2003, Advocacy achieved more than \$6.3 billion in regulatory cost savings and more than \$5.7 billion in recurring annual savings on behalf of small entities. Moreover, in 2004, Advocacy helped save small entities more than \$17 billion.⁴ Most recently, in FY 2005, Advocacy's intervention resulted in \$6.6 billion in small business cost savings for a total of \$71 billion in cost savings during the course of this Administration.

Although the RFA is achieving cost savings for small entities, the RFA is needed now more than ever. In 2005, Mark Crain prepared a study on *The Impact of Regulatory Costs*

² The annual reports on the RFA can be found on the Office of Advocacy's website at <http://www.sba.gov/advocacy/ra>.

³ It should be noted that revisions made by the Environmental Protection Agency (EPA) to its Cross Media Electronic Reporting and Record-keeping rule produced an estimated savings of \$18 billion. Without that rule the cost savings for FY 2002 resulted in more than \$3 billion.

⁴ It should be noted that the withdrawal of the Department of Housing and Urban Development's rule on the Real Estate Settlement Procedures Act (RESPA) produced an estimated savings of \$10.3 billion. Without that rule, the cost savings for FY 2004 would have been approximately \$6 billion.

on Small Firms. It indicated that the overall cost of federal regulation totals \$1.1 trillion; the cost per employee for firms with fewer than 20 employees is \$7,647, 45 percent higher than their larger counterparts with 500 or more employees.⁵ Legislative action is the necessary to continue to lower regulatory costs and level the playing field for small entities.

H.R. 682 and other Suggestions for Modifying the Regulatory Process to Reduce Burdens on Small Entities

The 109th Congress has the opportunity to amend the RFA and SBREFA to improve the regulatory climate for small entities. Even though the last few years have yielded a number of successes, there are certain loopholes in the RFA that were not addressed through SBREFA. The Office of Advocacy has pursued a legislative agenda during the 109th Congress with the intention of plugging some of the major holes in the RFA and improving the overall regulatory environment for small entities. H.R. 682 is a truly comprehensive bill to address problem areas in the RFA. The Office of Advocacy supports the goals of H.R. 682 and other measures that will increase the overall effectiveness of the RFA and SBREFA. While there are many important aspects of HR 682, Advocacy believes that the following issues are the most crucial:

Foreseeable Indirect Economic Impacts

The biggest loophole in the RFA is that it does not require agencies to analyze indirect impacts. Pursuant to sections 603, 604 and 605(b) of the RFA, agencies are required to consider the economic impact of a regulatory action on small entities. Although the RFA does not define economic impact, the committee report for the RFA suggests that agencies should consider direct and indirect impacts of the proposed regulation. The courts, however, have interpreted the RFA otherwise.

The primary case on the consideration of direct versus indirect impacts for RFA purposes in promulgating regulations is Mid-Tex Electric Co-op Inc. v. Federal Energy Regulatory Commission, 249 U.S. App. D.C. 64, 773 F.2d 327 (1985) (hereinafter Mid-Tex). Mid-Tex addressed a Federal Energy Regulatory Commission (FERC) rule which stated that electric utility companies could include amounts equal to 50 percent of their investments in construction work in progress (CWIP) in their rates. In promulgating the rule, FERC certified that the rule would not have a significant economic impact on a substantial number of small entities. The basis of the certification was that virtually all of the utilities did not fall within the meaning of the term "small entities" as defined by the RFA. Plaintiffs argued that FERC's certification was insufficient because it should have considered the impact on wholesale customers of the utilities as well as the regulated utilities. The court dismissed the plaintiffs' argument. The court concluded that the

⁵ The Crain report is located at http://www.sba.gov/advo/research/rs2076e_264.pdf.

agency did not have to consider the economic impact of the rule on small entities that did not have to directly comply with the requirements of the rule.⁶

Post-SBREFEA, the U.S. Court of Appeals for the District of Columbia applied the holding of the *Mid-Tex* case to *American Trucking Associations, Inc. v. U.S. Environmental Protection Agency*, 175 F.3d 1027, 336 U.S.App.D.C.16 (D.C.Cir., May 14, 1999) (hereinafter *ATA*). In the *ATA* case, Environmental Protection Agency (EPA) established primary national ambient air quality standards (NAAQS) for ozone and particulate matter. At the time of the rulemaking, EPA certified the rule pursuant to section 605(b). The basis of the certification was that small entities were not subject to the rule because the NAAQS regulated small entities indirectly through state implementation plans (SIPs). Although the court remanded the rule to the agency, the court found that EPA had complied with the requirements of the RFA. Specifically, the court found that since the states, not EPA, had the direct authority to impose the burden on small entities, EPA's regulation did not directly impact small entities.⁷ The court also found that since the states would have broad discretion in obtaining compliance with the NAAQS, small entities were only indirectly affected by the standards.⁸

In *Mid-Tex*, compliance with FERC's regulation by the utilities was expected to have a ripple effect on customers of the small utilities. There were several unknown factors in the decision-making process that were beyond FERC's control such as whether utility companies had investments, the number of investments, costs of the investments, the decision of what would be recouped, to whom the utilities would pass the investment costs, etc. Unfortunately, the idea of the RFA not applying to indirect economic impacts is now being used by agencies even in cases where the impact is reasonably foreseeable, which undermines the spirit of the RFA.

One of the most compelling examples of the importance of considering indirect impacts on small entities can be found in 2002 Immigration and Naturalization Service's (INS) rule on B-2 tourist visas. This rulemaking illustrates the importance of having reasonably foreseeable indirect impacts analyzed under the RFA in the rulemaking process. On April 12, 2002, the Immigration and Naturalization Service (INS) published a proposed rule on *Limiting the Period of Admission for B Nonimmigrant Aliens*. The proposal eliminated the minimum six-month admission period of B-2 visitors for pleasure and placed the onus of explaining the amount of time for the length of stay on the foreign visitor. If the length of stay could not be determined, the INS agent would issue a visa for only thirty (30) days. Although it was foreseeable that small businesses in the travel industry could lose approximately \$2 billion as a result of the proposal, INS certified that the proposal would not have a significant economic impact on a substantial number of small entities. The basis for the certification was that the proposal applied only to nonimmigrant aliens visiting the United States as visitors for business or pleasure. Because the courts have interpreted the RFA as only requiring agencies to consider the economic impact of the proposal on the entities that the proposal will directly impact, the certification was not

⁶ *Id.* at 342.

⁷ *Id.*

⁸ *Id.*

technically erroneous. Advocacy asserted that from the standpoint of good public policy, the agency had a duty to perform a regulatory flexibility analysis and to consider less burdensome alternatives for achieving their goal when the potential impact of a regulation was foreseeable and economically devastating to a particular industry.⁹ Advocacy reiterated this position at a hearing before House Committee on Small Business in June 2002.¹⁰ Representatives from the travel industry also testified at that hearing about the potential economic impacts that their businesses would have experienced as a result of INS's actions. The rule was eventually withdrawn.

In addition, if the federal regulation is something that must be implemented by the states¹¹, as in the *ATA* case, the federal agencies are not required to perform the detailed analysis of economic impacts and alternatives required by the RFA. The duty of regulating is passed on to the states without any corresponding analysis or requirements for states to consider less burdensome alternatives for small business. Moreover, states with RFA-type laws on the books must perform the economic analysis, even though the states have fewer resources to conduct small business impact analysis than the federal government. This amounts to an unfunded mandate. Amending the RFA to require federal agencies to consider indirect impacts will help state officials craft less burdensome regulatory alternatives.

Because of the potentially devastating effect that not considering indirect impacts may have on small entities, Advocacy strongly supports section 3(b) of H.R. 682, which defines economic impact to include foreseeable indirect economic impacts. Requiring agencies to perform a regulatory flexibility analysis would provide the public with

⁹ The Office of Advocacy's comment letter is located at http://www.sba.gov/about/sba/advocacy/docs/reg/1632_1013.html.

¹⁰ The Office of Advocacy's testimony before the U.S. House of Representatives, Committee on Small Business is located at http://www.sba.gov/about/sba/advocacy/docs/test/02_0615.html.

¹¹ The *ATA* case is also an example of why the need for flexibility is not limited to federal regulations. At least 92 percent of businesses in every state are small businesses. These businesses bear a disproportionate share of regulatory costs and burdens. Recognizing that state and local governments can be a source of burdensome regulations on small business, Advocacy drafted model regulatory flexibility legislation for the states based on the federal RFA. Many states have some form of regulatory flexibility laws on the books. However, many of the laws do not contain the five critical elements addressed in Advocacy's model legislation. Advocacy's state model legislation recommends that successful state-level regulatory flexibility laws should address the following: 1) a small business definition that is consistent with state practices and permitting authorities; 2) a requirement that state agencies perform an economic impact analysis on the effect of a rule on small businesses before they regulate; 3) a requirement that state agencies consider alternatives that are less burdensome for small businesses while still meeting the agency's regulatory goals; 4) a provision that requires state governments to review existing regulations periodically; and 5) judicial review to give the law "teeth." Since 2002, 19 states have implemented regulatory flexibility via Executive Order or legislation based on Advocacy's model legislation. These states are Alaska, Arkansas, Colorado, Connecticut, Georgia, Indiana, Kansas, Kentucky, Massachusetts, Missouri, New Mexico, North Dakota, Oregon, Rhode Island, South Carolina, South Dakota, Tennessee, Virginia, West Virginia, and Wisconsin.

information about the potential economic impact of an agency's proposed action and, hopefully, encourage agencies to consider less burdensome alternatives.

Section 610 Review of Existing Regulations

Small businesses often complain about the difficulties in dealing with the layers of regulations that agencies issue over time. Although a single proposed rule may not impose much of a regulatory burden, that rule, when added to numerous existing rules, imposes a crippling cumulative burden. Section 610 of the RFA requires agencies to periodically review their existing rules that may have a significant economic impact on a substantial number of small entities. The purpose of the review is to determine whether such rules should be continued without change, or should be amended or rescinded, consistent with the stated objectives of applicable statutes. Unfortunately, agency compliance with section 610 has historically been poor at best.

Small entities are limited in what they can do with burdensome regulations on the books. Although there are legal avenues that can be pursued to have burdensome rules reviewed, legal recourse is costly and time consuming. The automatic review of regulations afforded through section 610 not only results in the removal of burdensome regulations, it also saves small entities and federal agencies the hassle of having to resort to the legal system to obtain relief. However, limiting the review to only those regulations that the agency deemed to have a significant economic impact at the time of promulgation is problematic. As noted above, the Crain study on *The Impact of Regulatory Costs on Small Firms* indicates that the overall cost of federal regulation totals \$1.1 trillion; the cost per employee for firms with fewer than 20 employees is \$7,647, 45 percent higher than their larger counterparts with 500 or more employees.¹² Since new regulations are promulgated each year, the cumulative impact of regulations on small entities can be staggering, even if individually the regulations may not have a significant economic impact.

Section 7 of H.R. 682 only refers to the periodic review of rules that the agency determines to have a significant economic impact on a substantial number of small entities. Advocacy recommends that the RFA be amended to review all rules periodically. This change would encourage agencies to revise their rules to ensure that regulations reflect current conditions and needs.

Section 7 also amends the RFA to require an agency to submit an annual report on the result of its plan to Congress and Office of Information and Regulatory Affairs. Advocacy recommends that H.R. 682 be amended to include the Chief Counsel for Advocacy as a recipient of the agencies' reports at the same time they are submitted to Congress.

¹² The Crain report is located at <http://www.sba.gov/odb.o/research/207tot.264.pdf>.

Codification of E.O. 13272

E.O. 13272 has increased agency knowledge of and compliance with the RFA. One of the most important elements of E.O. 13272 is Section 3. Section 3 requires agencies to notify the Office of Advocacy of draft rules that will have a significant economic impact on a substantial number of small entities. It also requires agencies to give appropriate consideration to Advocacy's comments and address the comments in final rules. Small entities would benefit by amending the RFA to codify the requirements of E.O. 13272, ensuring that independent agencies are covered and creating long-term certainty for small entities.

Advocacy recognizes that section 4(b)(3) of H.R. 682 requires agencies to respond to Advocacy's comments if an agency prepares a FRFA. However, it does not provide for Advocacy's comments to be addressed if the agency certifies the rule at the final stage of the rulemaking. This is particularly important since in FY 2005, 12 percent of Advocacy comments were on improper certifications and 17 percent of Advocacy comments were on inadequate or missing IRFAs. Under H.R. 682, anywhere from 12 percent to 29 percent of Advocacy's comments could go unaddressed, if agencies decide to certify final rules in lieu of preparing a FRFA. Advocacy suggests that H.R. 682 be amended to require agencies to provide written responses to all comments submitted by Advocacy, regardless of whether the agency prepares a FRFA or a certification for the final rule. Amending the RFA in this way sets into law a key component of E.O. 13272 and would provide further assurance that small entities have a legitimate voice in the rulemaking process.

Panel Process

In addition to having concerns over requiring SBREFA panels for all agencies, Advocacy is concerned about the changes that H.R. 682 makes to the current panel process. The panel process described in section 6 of H.R. 682 provides Advocacy with responsibility for drafting the panel report. The current process produces a consensus report negotiated between Advocacy, OMB, and EPA or Occupational Safety and Health Administration (OSHA). Because it is a consensus document, agencies typically follow the recommendations.

Establishment and Approval of Small Business Size Standards by Chief Counsel for Advocacy

Currently, section 601(3) of the RFA provides that the term "small business" has the same meaning as the term "small business concern" under section 3 of the Small Business Act, unless an agency, after consulting with the Office of Advocacy of the Small Business Administration and after an opportunity for public comment, establishes one or more definitions of such term which are appropriate to the activities of the agency and publishes the definition in the *Federal Register*. The law assumes that the SBA size standard is appropriate unless the agency pursues a different one.

Section 9 of H.R. 682 amends the Small Business Act to allow the Chief Counsel for Advocacy to specify small business size definitions or standards for the purposes of any Act other than the Small Business Act or the Small Business Investment Act of 1958. The SBA's Office of Size Standards has the necessary expertise and resources to make appropriate decisions regarding industry size determinations. I do not believe that the proposed section 9 of H.R. 682 will benefit small entities. It may be more beneficial to amend the RFA and SBA regulations to require agencies to consult with Advocacy if the agency is interested in changing the size standard for RFA purposes rather than requiring the approval of the Administrator. This would not impact SBA's authority to establish size standards for SBA loan and other programs. This change to H.R. 682 may eliminate some of the confusion that currently exists over which office determines size standards for RFA purposes only.

Compliance Guides

Section 212 of SBREFA, which is a stand-alone section and not part of the RFA, requires agencies to provide plain English compliance guides to clearly explain each final rule that has a significant economic impact on a substantial number of small entities. The intent of section 212 of SBREFA was to ensure that small businesses had a way to understand complex and technical federal regulations. Unfortunately, this is not being done and small businesses continue to be frustrated with rules that are published without adequate compliance information. SBREFA should be amended to require agencies to publish plain language small business compliance guides whenever a final rule requires a FRFA. In addition, agencies should be required to report annually on their efforts to comply with this section. H.R. 682 does not include this needed change.

Conclusion

The Office of Advocacy believes that the RFA and SBREFA can be improved legislatively and commends this Committee for examining legislation that will help small business. Thank you for allowing me to present these views. I would be happy to answer any questions.

Mr. CANNON. Thank you, Mr. Sullivan.
Mr. Mihm?

**TESTIMONY OF J. CHRISTOPHER MIHM, MANAGING DIRECTOR
FOR STRATEGIC ISSUES, UNITED STATES GOVERNMENT AC-
COUNTABILITY OFFICE, WASHINGTON, DC**

Mr. MIHM. Thank you, Mr. Chairman, Mr. Watt. It is, again, a great honor to appear before you again today and to contribute to your review of the Regulatory Flexibility Act and your continuing broad examination of administrative law processes and procedures.

My written statement provides an overview of the basic purpose and requirements of the RFA, the main impediments to the act's implementation and the elements of RFA that Congress might consider amending to improve the effectiveness of the act. In the interest of brevity, this afternoon I will just hit the highlights of those issues.

As Mr. Sullivan mentioned in his opening statement, RFA was enacted in response to concerns about the effect Federal regulations can have on small entities. Among other things, RFA prompts regulatory agencies to analyze the potential effects of the rules on those entities, consider alternatives to reduce the burden of those rules and ensure that small entities have an opportunity to participate in the rule-making process.

As you mentioned in your opening statement, Mr. Chairman, in response to congressional requests, we have reviewed RFA's implementation on many occasions over many years, going back to the early 1990's. My bottom line today is that our prior reports have illustrated both the promise and the problems associated with RFA, with the recurring theme being the varying interpretations of RFA's requirements by Federal agencies. Although some progress has undoubtedly been made to address issues we identified, the full promise of the Regulatory Flexibility Act may never be realized until Congress either clarifies terms and definitions in the act or provides an agency with the clear authority and the responsibility to do so.

It is also important to keep in mind the domino effect that an agency's initial determination of whether the Regulatory Flexibility Act is applicable to rule-making has on other statutory requirements. These other requirements can include, for example, preparing compliance guides for small entities and periodically reviewing existing regulations.

More specifically, unclear terms and definitions can affect the applicability and effectiveness of regulatory reform requirements. We have frequently cited the need to clarify key terms in RFA, particularly—and this is the 800-pound gorilla, as it were—"the significant economic impact on a substantial number of small entities." RFA's requirements do not apply, as Mr. Sullivan mentioned, if an agency head certifies that a rule will not have that significant economic impact on a substantial number of small entities.

However, RFA neither defines this key phrase, nor places responsibility on any party to determine it consistently across the Government. It is therefore not surprising that compliance with RFA has varied from one agency to another and that agencies have had different interpretations of the act's requirements.

We have examined 12 years of annual reports from the Office of Advocacy, basically Tom's shop, and that these reports showed that compliance with RFA varied across agencies, within agencies and over time, a conclusion obviously shared by the Office of Advocacy in its own reports.

We noted that some agencies have been repeatedly characterized as satisfying the requirements, but other agencies have been viewed as less compliant over time.

One of the reasons for the agencies' lack of compliance with the Regulatory Flexibility Act requirements is that the act did not expressly authorize the SBA to interpret key provisions and did not require SBA to develop criteria for agencies to follow in reviewing their rules.

It is important to note at this point that the Office of Advocacy's 2003 RFA compliance guide, while reiterating that the RFA does not define certain terms, nevertheless provides some suggestions for agencies on the subject.

While the guidance and the associated training for agencies appear to have been very helpful, the key will be the degree to which agencies effectively and consistently apply that guidance and that training. In that regard, none of us know whether or not yet the extent or if the guidance and training has really made a substantive improvement in agencies' efforts to clarify some of the longstanding confusion about RFA requirements. We believe additional scrutiny and congressional monitoring of the RFA compliance may help to answer that question.

Well, let me just conclude there and say once again that I appreciate the opportunity to testify on these important issues and obviously would be pleased to take any questions you or Mr. Watt might have.

[The prepared statement of Mr. Mihm follows:]

PREPARED STATEMENT OF J. CHRISTOPHER MIHM

GAO

United States Government Accountability Office

Testimony

**REGULATORY
FLEXIBILITY ACT**

**Congress Should Revisit
and Clarify Elements of the
Act to Improve Its
Effectiveness**

Statement of J. Christopher Mihm
Managing Director, Strategic Issues

Why GAO Did This Study

Federal regulation is one of the basic tools of government used to implement public policy. In 1980, the Regulatory Flexibility Act (RFA) was enacted in response to concerns about the effect that regulations can have on small entities, including small businesses, small governmental jurisdictions, and certain small not-for-profit organizations. Congress amended RFA in 1996, and the President issued Executive Order 13272 in 2002, to strengthen requirements for agencies to consider the impact of their proposed rules on small entities. However, concerns about the regulatory burden on small entities persist, prompting legislative proposals such as H.R. 682, the Regulatory Flexibility Improvements Act, which would amend RFA.

At the request of Congress, GAO has prepared many reports and testimonies reviewing the implementation of RFA and related policies. On the basis of that body of work, this testimony (1) provides an overview of the basic purpose and requirements of RFA, (2) highlights the main impediments to the Act's implementation that GAO's reports identified, and (3) suggests elements of RFA that Congress might consider amending to improve the effectiveness of the Act. GAO's prior reports and testimonies contain recommendations to improve the implementation of RFA and related regulatory process requirements.

July 20, 2006

REGULATORY FLEXIBILITY ACT

Congress Should Revisit and Clarify Elements of the Act to Improve Its Effectiveness

What GAO Found

RFA established a principle that agencies should endeavor to fit their regulatory requirements to the scale of small entities. Among other things, RFA requires regulatory agencies to assess the impact of proposed rules on small entities, consider regulatory alternatives that will accomplish the agencies' objectives while minimizing the impacts on small entities, and ensure that small entities have an opportunity to participate in the rulemaking process. Further, RFA requires agencies to review existing rules within 10 years of promulgation that have or will have a significant impact on small entities to determine whether they should be continued without change or amended or rescinded to minimize their impact on small entities. RFA also requires the Chief Counsel for Advocacy of the Small Business Administration (Office of Advocacy) to monitor agencies' compliance. In response to Executive Order 13272, the Office of Advocacy published guidance in 2003 on how to comply with RFA.

In response to congressional requests, GAO reviewed agencies' implementation of RFA and related requirements on many occasions, with topics ranging from specific statutory provisions to the overall implementation of RFA. Generally, GAO found that the Act's results and effectiveness have been mixed; its reports illustrated both the promise and the problems associated with RFA. On one hand, RFA and related requirements clearly affected how federal agencies regulate and produced benefits, such as raising expectations regarding the analytical support for proposed rules. However, GAO also found that compliance with RFA varied across agencies, within agencies, and over time. A recurring finding was that uncertainties about RFA's requirements and key terms, and varying interpretations by federal agencies, limited the Act's application and effectiveness.

GAO's past work suggests that Congress might wish to review the procedures, definitions, exemptions, and other provisions of RFA to determine whether changes are needed to better achieve the purposes Congress intended. In particular, GAO's reports indicate that the full promise of RFA may never be realized until Congress revisits and clarifies elements of the Act, especially its key terms, or provides an agency or office with the clear authority and responsibility to do so. Attention should also be paid to the domino effect that an agency's initial determination of whether RFA is applicable to a rulemaking has on other statutory requirements, such as preparing compliance guides for small entities and periodically reviewing existing regulations. GAO also believes that Congress should reexamine not just RFA but how all of the various regulatory reform initiatives fit together and influence agencies' regulatory actions. Recent developments, such as the Office of Advocacy's RFA guidance, may help address some of these long-standing issues and merit continued monitoring by Congress.

Mr. Chairman and Members of the Subcommittee:

I am pleased to be here today to contribute to your review of H.R. 682, the Regulatory Flexibility Improvements Act, and your continuing general agenda to review administrative law, process, and procedure issues. In my statement today, I will summarize findings from our past body of work on the Regulatory Flexibility Act (RFA), which H.R. 682 would amend, and related policies. Specifically, I will provide an overview of the basic purpose and requirements of RFA, highlight the main impediments to the Act's implementation that our work identified, and suggest elements of RFA that Congress might consider amending to improve the effectiveness of the Act.

In brief, RFA was enacted in response to concerns about the effect that federal regulations can have on small entities. Among other things, RFA prompts regulatory agencies to analyze the potential effects of their rules on small entities, consider alternatives to reduce the burden of those rules, and ensure that small entities have an opportunity to participate in the rulemaking process. In response to congressional requests, we have reviewed RFA's implementation on many occasions over the years. Our reports illustrated both the promise and the problems associated with the Act, with a recurring theme being the varying interpretations of RFA's requirements by federal agencies. Although some progress has been made to address issues we identified, the full promise of RFA may never be realized until Congress clarifies key terms and definitions in the Act, such as "a substantial number of small entities," or provides an agency or office with the clear authority and responsibility to do so. It is also important to keep in mind the domino effect that an agency's initial determination of whether RFA is applicable to a rulemaking has on other statutory requirements, such as preparing compliance guides for small entities and periodically reviewing existing regulations.

% U.S.C. §§ 601-612.

RFA and Related Requirements Are Intended to Promote Attention to Regulations' Effects on Small Entities

Federal regulation is one of the basic tools of government. Agencies issue thousands of rules and regulations each year to implement statutes enacted by Congress. The public policy goals and benefits of regulations include, among other things, ensuring that workplaces, air travel, foods, and drugs are safe; that the nation's air, water, and land are not polluted; and that the appropriate amount of tax is collected. The costs of these regulations are estimated to be in the hundreds of billions of dollars, and the benefits estimates are much higher.³ Given the size and impact of federal regulation, Congresses and Presidents have taken a number of actions to refine and reform the regulatory process within the past 25 years.⁴

In September 1980, RFA was enacted in response to concerns about the effect that federal regulations can have on "small entities," defined by the Act as including small businesses, small governmental jurisdictions, and certain small not-for-profit organizations. As we have previously noted, small businesses are a significant part of the nation's economy, and small governments make up the vast majority of local governments in the United States.⁵ However, there have been concerns that these small entities may be disproportionately affected by federal agencies' regulatory requirements. RFA established the principle that agencies should endeavor, consistent with the objectives of applicable statutes, to fit regulatory and informational requirements to the scale of these small entities.

RFA requires regulatory agencies—including the independent regulatory agencies—to assess the potential impact of their rules on small entities. Under RFA, an agency must prepare an initial regulatory flexibility analysis at the time a proposed rule is issued unless the head of the agency determines that the proposed rule would not have a "significant economic

³The Office of Management and Budget reported that the estimated quantified and monetized annual benefits of the major federal regulations it reviewed from October 1995 through September 2005 range from \$94 billion to \$449 billion, while estimated annual costs range from \$57 billion to \$44 billion. See Office of Management and Budget, *Budget 2006 Report to Congress on the Costs and Benefits of Federal Regulations* (Washington, D.C.: April 2006).

⁴See GAO, *Regulatory Reform: Prior Reviews of Federal Regulatory Process Initiatives Reveal Opportunities for Improvements*, GAO-05-533 (Washington, D.C.: July 27, 2005) for summary descriptions of major regulatory reform initiatives implemented since 1980.

⁵GAO, *Regulatory Reform: Implementation of the Small Business Advocacy Review Panel Requirements*, GAO/GG-06-55 (Washington, D.C.: Mar. 18, 1998).

impact upon a substantial number of small entities.¹⁸ Further, agencies must consider alternatives to their proposed rules that will accomplish the agencies' objectives while minimizing the impacts on small entities. The Act also requires agencies to ensure that small entities have an opportunity to participate in the rulemaking process and requires the Chief Counsel for Advocacy of the Small Business Administration (Office of Advocacy) to monitor agencies' compliance. Among other things, RFA also requires regulatory agencies to review, within 10 years of promulgation, existing rules that have or will have a significant impact on small entities to determine whether they should be continued without change or amended or rescinded to minimize their impact on small entities.

Congress amended RFA with the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA).¹⁹ SBREFA made certain agency actions under RFA judicially reviewable. Other provisions in SBREFA added new requirements. For example, SBREFA requires agencies to develop one or more compliance guides for each final rule or group of related final rules for which the agency is required to prepare a regulatory flexibility analysis, and it requires agencies to provide small entities with some form of relief from civil monetary penalties. SBREFA also requires the Environmental Protection Agency (EPA) and the Occupational Safety and Health Administration to convene advocacy review panels before publishing an initial regulatory flexibility analysis.

More recently, in August 2002, President George W. Bush issued Executive Order 13272, which requires federal agencies to establish written procedures and policies on how they would measure the impact of their regulatory proposals on small entities and to vet those policies with the Office of Advocacy. The order also requires agencies to notify the Office of Advocacy before publishing draft rules expected to have a significant small business impact, to consider its written comments on proposed rules, and to publish a response with the final rule. The order requires the Office of Advocacy to provide notification of the requirements of the Act and training to all agencies on how to comply with RFA. The Office of

¹⁸RFA generally applies only where notice and comment rulemaking under the Administrative Procedure Act (APA) is required. When promulgating a final rule, agencies must also prepare a final regulatory flexibility analysis unless the agency finds that the rule will not have a significant economic impact on a substantial number of small entities.

¹⁹5 U.S.C. § 601 note.

Advocacy published guidance on the Act in 2003 and reported training more than 20 agencies on RFA compliance in fiscal year 2005.¹

GAO Reviews Found that Varying Interpretations of RFA Requirements Hampered Effective Implementation of the Act

In response to congressional requests, we have reviewed agencies' implementation of RFA and related requirements on many occasions over the years, with topics ranging from specific statutory provisions to the overall implementation of RFA.² Generally, we found that the Act's overall results and effectiveness have been mixed. This is not unique to RFA; we found similar results when reviewing other regulatory reform initiatives, such as the Unfunded Mandates Reform Act of 1995.³ Our past reports illustrated both the promise and the problems associated with RFA. RFA and related requirements have clearly affected how federal agencies regulate, and we identified important benefits of these initiatives, such as increasing attention on the potential impacts of rules and raising expectations regarding the analytical support for proposed rules. However, a recurring theme in our findings was that uncertainties about RFA's requirements and varying interpretations of those requirements by federal agencies limited the Act's application and effectiveness.

Some of the topics we reviewed, and our main findings regarding impediments to RFA's implementation, are illustrated in the following examples:

- We examined 12 years of annual reports from the Office of Advocacy and concluded that the reports indicated variable compliance with RFA across agencies, within agencies, and over time—a conclusion that the Office of Advocacy also reached in subsequent reports on implementation of RFA (on the 20th and 25th anniversaries of RFA's enactment).⁴ We noted that some agencies had been repeatedly characterized as satisfying RFA requirements, but other agencies were

¹See U.S. Small Business Administration, Office of Advocacy, *A Guide for Government Agencies: How to Comply with the Regulatory Flexibility Act* (Washington, D.C.: May 2003).

²A list of related GAO products appears at the end of this statement.

³16 U.S.C. §§ 658-658(g), 1501-1571. See GAO, *Federal Rulemaking: Past Reviews and Emerging Trends Suggest Issues That Merit Congressional Attention*, GAO 06-226T (Washington, D.C.: Nov. 1, 2005) and GAO 05-337T.

⁴See GAO, *Regulatory Flexibility Act: Status of Agencies' Compliance*, CAIGGD-01-105 (Washington, D.C.: Apr. 27, 1991).

consistently viewed as recalcitrant. Agencies' performance also varied over time or varied by offices within the agencies. We said that one reason for agencies' lack of compliance with RFA requirements was that the Act did not expressly authorize the Small Business Administration (SBA) to interpret key provisions and did not require SBA to develop criteria for agencies to follow in reviewing their rules.

- We examined RFA implementation with regard to small governments and concluded that agencies were not conducting as many regulatory flexibility analyses for small governments as they might, largely because of weaknesses in the Act.²⁷ Specifically, we found that each agency we reviewed had a different interpretation of key RFA provisions. We also pointed out that RFA allowed agencies to interpret whether their proposed rules affected small governments and did not provide sufficiently specific criteria or definitions to guide agencies in deciding whether and how to assess the impact of proposed rules on small governments.
- We reviewed implementation of small business advocacy review panel requirements under SBREFA and found that the panels that had been convened were generally well received.²⁸ However, we also said that implementation was hindered—specifically, that there was uncertainty over whether panels should have been convened for some proposed rules—by the lack of agreed-upon governmentwide criteria as to whether a rule has a significant impact.
- We examined other related requirements regarding agencies' policies for the reduction and/or waiver of civil penalties on small entities and the publication of small entity compliance guides.²⁹ Again, we found that implementation varied across and within agencies, with some of the ineffectiveness and inconsistency traceable to definitional problems in RFA. All of the agencies' penalty relief policies that we reviewed were within the discretion that Congress provided, but the

²⁷See GAO, *Regulatory Flexibility Act: Inherent Weaknesses May Limit Its Usefulness for Small Governments*, GAO/HRD-91-16 (Washington, D.C.: Jan. 11, 1991).

²⁸See GAO, *Regulatory Reform: Implementation of the Small Business Advocacy Review Panel Requirements*, GAO/CGD-98-36 (Washington, D.C.: Mar. 18, 1998).

²⁹See GAO, *Regulatory Reform: Implementation of Selected Agencies' Civil Penalty Relief Policies for Small Entities*, GAO-01-380 (Washington, D.C.: Feb. 20, 2001), and *Regulatory Reform: Compliance Guide Requirement Has Had Little Effect on Agency Practices*, GAO-02-172 (Washington, D.C.: Dec. 28, 2001).

policies varied considerably. Some policies covered only a portion of agencies' civil penalty enforcement actions, and some provided small entities with no greater penalty relief than large entities. The agencies varied in how key terms were defined. Similarly, we concluded that the requirement for small entity compliance guides did not have much of an impact, and its implementation also varied across, and sometimes within, agencies.

- RFA is unique among statutory requirements with general applicability in having a provision, under section 610, for the periodic review of existing rules. However, it is not clear that this look-back provision in RFA has been consistently and effectively implemented. In a series of reports on agencies' compliance with section 610, we found that the required reviews were not being conducted.¹⁴ Meetings with agencies to identify why compliance was so limited revealed significant differences of opinion regarding key terms in RFA and confusion about what was required to determine compliance with RFA. At the request of the House Committee on Energy and Commerce, we have begun new work examining the subject of regulatory agencies' retrospective reviews of their existing regulations, including those undertaken in response to Section 610, and will report on the results of this engagement in the future.

We have not yet examined the effect of Executive Order 13272 and the Office of Advocacy's subsequent guidance and training for agencies on implementing RFA. Therefore, we have not done any evaluations that would indicate whether or not those developments are helping to address some of our concerns about the effectiveness of RFA.

Key Terms and Provisions of RFA Should Be Revisited and Clarified

While RFA has helped to influence how agencies regulate small entities, we believe that the full promise of the Act has not been realized. The results from our past work suggest that the Subcommittee might wish to review the procedures, definitions, exemptions, and other provisions of RFA, and related statutory requirements, to determine whether changes are needed to better achieve the purposes Congress intended. The central theme of our prior findings and recommendations on RFA has been the need to revisit and clarify elements of the Act, particularly its key terms. Although more recent developments, such as the Office of Advocacy's

¹⁴ See, for example, GAO, *Regulatory Flexibility Act: Agencies' Interpretations of Exemption Requirements Vary*, CAOIGCJ-98-56 (Washington, D.C.: Apr. 2, 1998).

detailed guidance to agencies on RFA compliance, may help address some of these long-standing issues, current legislative proposals, such as H.R. 682, make it clear that concerns remain about RFA's effectiveness—for example, that agencies are not assessing the impacts of their rules or identifying less costly regulatory approaches as expected under RFA—and the impact of federal regulations on small entities.

Unclear terms and definitions can affect the applicability and effectiveness of regulatory reform requirements. We have frequently cited the need to clarify the key terms in RFA, particularly "significant economic impact on a substantial number of small entities." RFA's requirements do not apply if an agency head certifies that a rule will not have a "significant economic impact on a substantial number of small entities." However, RFA neither defines this key phrase nor places clear responsibility on any party to define it consistently across the government. It is therefore not surprising, as I mentioned earlier, that we found compliance with RFA varied from one agency to another and that agencies had different interpretations of RFA's requirements.

We have recommended several times that Congress provide greater clarity concerning the key terms and provisions of RFA and related requirements, but to date Congress has not acted on many of these recommendations. The questions that remain unresolved on this topic are numerous and varied, including:

- Does Congress believe that the economic impact of a rule should be measured in terms of compliance costs as a percentage of businesses' annual revenues, the percentage of work hours available to the firms, or other metrics?
- If so, what percentage or other measure would be an appropriate definition of "significant?"
- Should agencies take into account the cumulative impact of their rules on small entities, even within a particular program area?
- Should agencies count the impact of the underlying statutes when determining whether their rules have a significant impact?
- What should be considered a "rule" for purposes of the requirement in RFA that agencies review rules with a significant impact within 10 years of their promulgation?

-
- Should agencies review rules that had a significant impact at the time they were originally published, or only those that currently have that effect?
 - Should agencies conduct regulatory flexibility analyses for rules that have a positive economic impact on small entities, or only for rules with a negative impact?

It is worth noting that the Office of Advocacy's 2003 RFA compliance guide, while reiterating that RFA does not define certain key terms, nevertheless provides some suggestions on the subject. Citing parts of RFA's legislative history, the guidance indicates that exact standards for such definitions may not be possible or desirable, and that the definitions should vary depending on the context of each rule and preliminary assessments of the rule's impact. For example, the guidance points out that "significance" can be seen as relative to the size of a business and its competitors, among other things. However, the guidance does identify factors that agencies might want to consider when making RFA determinations. In some ways, this mirrors other aspects of RFA, such as section 610, where Congress did not explicitly define a threshold for an agency to determine whether an existing regulation should be maintained, amended, or eliminated but rather identified the factors that an agency must consider in its reviews.¹⁹ We do not yet know whether or to what extent the guidance and associated training has helped agencies to clarify some of the long-standing confusion about RFA requirements and terms. Additional monitoring of RFA compliance may help to answer that question. Congress might also want to consider whether the factors that the Office of Advocacy suggested to help agencies define key terms and requirements are consistent with congressional intent or would benefit from having a statutory basis.

I also want to point out the potential domino effect of agencies' determinations of whether or not RFA applies to their rules. This is related to the lack of clarity on key terms mentioned above, the potential for agencies to waive or delay analysis under RFA, and the limitation of RFA's

¹⁹In conducting their reviews of existing rules under section 610, agencies are to consider the following factors: (1) the continuing need for the rule; (2) the nature of complaints or comments received concerning the rule from the public; (3) the complexity of the rule; (4) the extent to which the rule overlaps, duplicates, or conflicts with other federal rules and, to the extent feasible, with state and local government rules; and (5) the length of time since the rule has been evaluated or the degree to which technology, economic conditions, or other factors have changed since adoption of the rule.

applicability to only rules for which there was a notice of proposed rulemaking. The impact of an agency head's determination that RFA is not applicable is not only that the initial and final regulatory flexibility analyses envisioned by the Act would not be done, but also that other related requirements would not apply. These requirements include, for example, the need for agencies to prepare small entity compliance guides, convene SBREFA advocacy panels, and conduct periodic reviews of certain existing regulations. While we recognize, as provided by the Administrative Procedure Act, that notices of proposed rulemaking are not always practical, necessary, or in the public interest, this still raises the question of whether such exemptions from notice and comment rulemaking should preclude future opportunities for public participation and other related procedural and analytical requirements. Our prior work has shown that substantial numbers of rules, including major rules (for example, those with an impact of \$100 million or more), are promulgated without going through a notice of proposed rulemaking.¹⁴

We also believe it is important for Congress to reexamine, not just RFA, but how all of the various regulatory reform initiatives fit together and influence agencies' regulatory actions. As I previously testified before this Subcommittee, we have found the effectiveness of most regulatory reform initiatives to be limited and that they merit congressional attention.¹⁵ In addition, we have stated that this is a particularly timely point to reexamine the federal regulatory framework, because significant trends and challenges establish the case for change and the need to reexamine the base of federal government and all of its existing programs, policies, functions, and activities.¹⁶

Our September 2000 report on EPA's implementation of RFA illustrated the importance of considering the bigger picture and interrelationships between regulatory reform initiatives.¹⁷ On the one hand, we reported about concerns regarding the methodologies EPA used in its analyses and

¹⁴See, for example, GAO, *Federal Rulemaking: Agencies Often Published Final Actions Without Proposed Rules*, GAO/GGD-98-126 (Washington, D.C.: Aug. 31, 1998).

¹⁵GAO-06-228T.

¹⁶See GAO, *21st Century Challenges: Reexamining the Base of the Federal Government*, GAO-05-325SP (Washington, D.C., February 2005) and GAO-05-097T.

¹⁷See GAO, *Regulatory Flexibility Act: Implementation in EPA Program Offices and Proposed Lead Rule*, GAO/GGD-00-195 (Washington, D.C.: Sept. 20, 2000).

its conclusions about the impact on small businesses of a proposed rule to lower certain reporting thresholds for lead and lead compounds.³⁹ The bigger picture, though, was our finding that after SBREFA took effect EPA's four major program offices certified that almost all (96 percent) of their proposed rules would not have a significant impact on a substantial number of small entities. EPA officials told us this was because of a change in EPA's RFA guidance prompted by the SBREFA requirement to convene an advocacy review panel for any proposed rule that was not certified. Prior to SBREFA, EPA's policy was to prepare a regulatory flexibility analysis for any rule that the agency expected to have any impact on small entities. According to EPA officials, the SBREFA panel requirement made continuation of the agency's more inclusive RFA policy too costly and impractical. In other words, a statute Congress enacted to strengthen RFA caused the agency to use the discretion permitted in RFA to conduct fewer regulatory flexibility analyses.⁴⁰

In closing, I would reiterate that we believe Congress should revisit aspects of RFA and that our prior reports have indicated ample opportunities to refine the Act. Despite some progress in implementing RFA and other regulatory reform initiatives since 1980, it is clear from the introduction of H.R. 682 and related bills that Members of Congress remain concerned about the impact of regulations on small entities and the extent to which the rulemaking process encourages agencies to consider ways to reduce the burdens of new and existing rules, while still achieving the objectives of the underlying statutes.

Mr. Chairman, this concludes my prepared statement. Once again, I appreciate the opportunity to testify on these important issues. I would be pleased to address any questions you or other Members of the Subcommittee might have at this time.

³⁹EPA had certified that the proposed rule would not have a significant impact and, therefore, did not trigger RFA's analytical and procedural requirements. Although we raised questions, we concluded that the analytic methods that EPA's program office used in its original and revised economic analysis, as well as the conclusions the office drew as a result of those analyses, were within the discretion provided by both RFA and EPA guidance.

⁴⁰We made no new recommendations in GAO-06-998T, but we referred to our prior recommendations, noting that clarifying what Congress intends the term "significant economic impact on a substantial number of small entities" to mean would make the implementation of RFA more consistent and help to prevent concerns about how agencies are implementing the Act.

Mr. CANNON. Thank you, Mr. Mihm. We are actually sort of on a roll here. We had two people finish before the yellow light.

Mr. MIHM. We take your guidance, sir.

Mr. CANNON. I think you did this before, Mr. Mihm. Welcome back.

Mr. Shull, you are recognized for 5 minutes.

**TESTIMONY OF J. ROBERT SHULL, DIRECTOR OF
REGULATORY POLICY, OMB WATCH, WASHINGTON, DC**

Mr. SHULL. Thank you very much, and thank you, Mr. Chairman and Mr. Watt, for having me before you to talk about this really important issue.

I want to start from the simple proposition that no agency is in the business of producing regulations for the sake of producing regulations. We ask our agencies to produce regulations to protect the public, to protect all of us who are breathing the air, drinking the water, all of the men and women of America who have to work for a living and go to a job where they want to be safe and healthy.

And small businesses, like all businesses, contribute to the hazards that we face, when we are breathing the air, drinking the water, going on the job, driving on the highways. And it really doesn't matter to all of us, to someone who is breathing dirty air or drinking poisoned water, whether the hazards that we are suddenly experiencing have been put there into our environment by small businesses or large businesses.

But I also want to start from the proposition that small businesses want to be good corporate citizens, and that the best intention for helping small businesses and recognizing the fact that small businesses do face a different kind of hurdle than their larger counterparts when trying to comply with regulations, might need some assistance. But that the answer isn't to give them a free pass in any way, that the answer isn't to burden the agencies whose job it is to protect the public, but rather to help small businesses comply.

We did hear that regulations have produced some costs for the economy and for the businesses who have to comply with them, but I think we also have to recognize that the benefits of regulation have been extraordinary. I mean, you can even look and measure in terms of I.Q. points when we took out lead from gasoline and now that kids aren't breathing that lead in from the air. You can see the measurable benefits, and that is one of many, many examples.

I also want to recognize that, although the Reg Flex Improvements Act that we are looking at today has a lot of concerns about regulation and whether or not they are hindering the competitiveness of American business in the global marketplace, that the economics literature out there just doesn't support the case that in America our regulations are somehow hindering our businesses from competing.

You can look at evidence of, say, plant location decisions. When we have environmental regulations, do plants that manufacture goods suddenly move to areas where there are less stringent environmental regulations? Or you can look at the trade flows: when environmental regulations become more stringent, do pollution-in-

tensive goods start coming in from developing nations to developed nations? And that link just hasn't been shown.

And because of that concern, we really think that there is no basis for the Reg Flex Improvements Act that we are looking at today. And I am concerned that it will really hinder the agencies from doing the good job that they are doing of protecting the people. I am concerned that the analysis itself that agencies have to perform under the Reg Flex Act will become more burdensome.

I mean, already, there is a signal in the bill that a succinct statement is not enough, that we have to have a very detailed explanation. The burden will increase through the scope of it. It would no longer apply just to rule makings that go through the APA notice and comment process, but now it would also apply to guidance documents, general policy statements, interpretive rules, and land management plans, that the periodic re-reviews of rules under the Reg Flex Act, which were for 10-year reviews of rules found to have a SEISNOSE, a significant economic impact on a substantial number of small entities. Since the Regulatory Flexibility Act went into effect, that those now go back to all the rules on the books, even the rules that we know, like the ban on lead in gasoline, just are incredibly important, proven protections.

We are also concerned about SBREFA panels now applying not just to EPA and OSHA rules, which we think were bad enough—it is giving business interests a first bite at the apple for those rules, but also applying to a significant number of other rules. We are also concerned about the SBA Office of Advocacy being put in a compromised position: if it is given regulatory authority over implementing the new requirements of the Reg Flex Improvements Act, that will compromise their role as an independent voice of small business.

And we think that there is a better way. We have outlined some in our prepared statement, and I would like to offer a more complete version of that statement for the record after this hearing.

[The prepared statement of Mr. Shull follows:]

PREPARED STATEMENT OF J. ROBERT SHULL

Testimony of
 J. Robert Shull
 Director of Regulatory Policy
 OMB Watch

Before the
 Subcommittee on Administrative Law
 Committee on the Judiciary
 U.S. House of Representatives

July 20, 2006

Thank you for the opportunity to testify before you today. I am Robert Shull, Director of Regulatory Policy for OMB Watch. OMB Watch is a nonprofit, nonpartisan research and advocacy center promoting an open, accountable government responsive to the public's needs. Founded in 1983 to remove the veil of secrecy from the White House Office of Management and Budget, OMB Watch has since then expanded its focus beyond monitoring OMB itself. We currently address four issue areas: right to know and access to government information; advocacy rights of nonprofits; effective budget and tax policies; and the use of regulatory policy to protect the public.

We are very concerned about the bill being discussed here today, H.R. 682, 'The Regulatory Flexibility Improvements Act.' While H.R. 682 purports to address the burdens faced by small businesses, the bill will only serve to further drown regulatory agencies in needless analysis, preventing them from promulgating and enforcing the regulations created to protect working families. More effective avenues exist to help alleviate the burden on small businesses while ensuring that workplace, environmental, and civil rights protections stay intact.

- I. **The Regulatory Flexibility Improvements Act is overly broad and will result in wasted public resources and reduced public protections.**

The Regulatory Flexibility Improvements Act amends the Regulatory Flexibility Act by requiring federal agencies to conduct comprehensive analyses of the impacts of federal rules on small businesses. The bill would effect substantial changes from current law, by

1. Expanding the RFA's coverage to include all regulations on the books, even long-proven safeguards such as the ban on lead in gasoline;
2. Inviting paralysis by analysis, by requiring agencies to examine both direct *and indirect* effects of the regulations;
3. Expanding the scope of the RFA to include agency guidance documents, human services rules and land management plans; and
4. Dramatically expanding the scope of rules subject to SBREFA panels.

This far-reaching proposal could have devastating effects, calling into question longstanding health, safety and environmental protections while needlessly burdening agencies and squandering agency resources. Specifically, the bill will do the following:

A. Wastes agency resources on highly speculative assessments.

The bill requires agencies to examine not only direct effects, which are currently assessed under the RFA, but also indirect effects. Agencies face substantial difficulties in attempting to calculate indirect effects. In fact, agency representatives at a recent Senate roundtable suggested this analysis would be so speculative as to be useless for policymakers. The courts have consistently held that RFA does not impose an obligation on agencies to analyze indirect economic effects on entities it does not regulate. Requiring consideration of indirect economic effects would drown agencies in burdensome and highly speculative analyses and paperwork that would impede their ability to promulgate needed protections, such as protections for workers against exposure to deadly chemicals, like crystalline silica.

B. Burdens agencies with redundant and unnecessary analysis.

The bill also requires reviews of all existing 10-year old rules affecting small business. These look-back studies needlessly spend staff time and money to re-justify important and proven health and environmental safeguards, such as airbag safety standards in cars or food safety inspections that prevent against foodborne pathogens like e-coli or listeria. These look-back studies would add to the lengthy regimen of regulatory assessments already performed by agencies, including those required under Executive Order 12866, the Paperwork Reduction Act, the Unfunded Mandates Reform Act, and the National Environmental Policy Act, among others. The bill also expands the scope of rules subject to the Regulatory Flexibility Act by including amendments to land management plans, rules affecting Indian tribes, IRS recordkeeping requirements, and regulations governing grants to state and local governments, as well as *agency guidance documents*.

C. Threatens valuable protections.

Expanding RFA analysis to include look-backs and indirect effects could put longstanding protections in jeopardy. Agencies would be forced to re-justify proven regulatory safeguards such as lead in gasoline or arsenic in the drinking water. Industry advocates have already singled out EPA's ambient air quality standards for life-threatening soot and smog as a primary reason for expanding regulatory flexibility analysis to include indirect effects. H.R. 682 also extends analytical burdens to a whole new universe of public protections — human services rules, such as those protecting abused and neglected children in federally-funded child welfare programs — by including nonprofits in the definition of small entities and expanding the scope of the RFA to regulations governing grants to state and local governments.

D. Puts corporate special interests ahead of the public interest.

H.R. 682 gives corporate interests an even greater advantage in the regulatory process by giving the head of the Small Business Administration's Office of Advocacy a preview of proposed rules before they are published in the *Federal Register* and increased opportunities to intervene in the process. Current law requires EPA and OSHA to submit draft rules to panels of business lobbyists, and a section of this bill would expand these preview opportunities to all agencies. An additional section would actually give SBA's Office of Advocacy the power to write regulations governing all agencies' compliance with the Regulatory Flexibility Act. Given that Advocacy is a taxpayer-funded voice for business interests, this provision is particularly troubling.

II. Regulation does not always harm U.S. competitiveness and may actually improve it.

Burdensome anti-regulatory measures like H.R. 682 are born out of the idea that regulation will drive small American companies out of business. The real scholarly evidence, however, refutes this claim. While the business community may be hampered in competing in global trade, regulation is not at fault. The business community, however, has nothing to gain by publicizing the real reasons for its difficulties, such as lower wages paid in other countries with which we now have self-destructive free trade agreements. The idea that regulation causes competitive decline is the product not of careful scholarship but, rather, of a multi-million dollar public relations campaign.

These criticisms of regulation are insufficient for four reasons:

- (A) *Regulatory safeguards produce significant benefits for the public.* Citations to the high cost of regulation do not establish that regulation is unwarranted because they completely ignore what we gain from these expenditures. Protecting people and the environment may cost a lot of money, but it also produces far larger benefits. In fact, even the Office of Management and Budget, which is a main proponent of the idea that regulations are too costly, nonetheless reports every year that regulation in the United States generates aggregate benefits that greatly exceed the cost of the federal regulations.¹
- (B) *Not all costs have the same moral or ethical value.* Some regulatory costs represent the cost to industry of doing what it should have done as a good corporate citizen in the absence of regulation. For example, stunning new evidence reveals that U.S. automakers misled the government and the public for years by claiming that the strength of vehicle roofs is unrelated to the serious injuries sustained when vehicles crash and roll over. According to industry documents, Ford denied this link even though its Volvo subsidiary had conducted research demonstrating that strengthening

See 2006 Draft Report on the Costs and Benefits of Federal Regulation, (available on-line at <http://www.whitehouse.gov/OMB/inforeg/reports/2006_draft_cost_benefit_report.pdf> Previous reports on the costs and benefits of regulation available at <http://www.whitehouse.gov/OMB/inforeg/regpol-reports_congress.html>).

Testimony of J. Robert Shull
 Director of Regulatory Policy, OMB Watch
 Page 4

car roofs and other improvements are the key to preventing injuries and saving lives in rollover crashes.² If and when the National Highway Traffic Safety Administration issues a rule to safeguard against vehicle roofs caving in during rollover crashes, the cost to the automakers of complying will mean little if it is not offset by the profits earned during the period that the automakers knew of the need for stronger roofs but failed to do anything about it.

- (C) Cost estimates are overblown. Moreover, many claims about regulatory costs are suspicious because they rely on cost estimates that come from industry sources that have an incentive to overstate the costs for regulatory and public relation purposes. According to a recent influential study,

ex ante cost estimates have usually been high, sometimes by orders of magnitude, when compared to actual costs incurred. This conclusion is not at all surprising in light of the strategic environment in which the predictions are generated. In preparing regulatory impact assessments for proposed rules, agencies are heavily dependent upon the regulated entities for information about compliance costs. Knowing that the agencies are less likely to impose regulatory options with high price tags (or to support them during the review process), the regulatees have every incentive to err on the high side.³

One particular estimate of costs, the discredited Crain and Hopkins study commissioned by the Small Business Administration, is significantly overblown.⁴ For example, the familiar estimates that the manufacturing sector in 2000 “shouldered \$147 billion of the \$497 billion onus of environmental, economic, workplace, and tax-compliance regulation”⁵ suffer the same problems just discussed and actually magnify those errors significantly, based on the assumption that regulatory compliance costs should be doubled to account for industry’s public relations campaign against regulatory protections and the expenses of lobbying this very Congress.⁶

2. See Press Release, Public Citizen, “New Report on Auto Industry Data Shows Automakers Misled NHTSA and Public When Denying Link Between Roof Strength and Injuries” (Mar. 30, 2005) (available on-line at <<http://www.citizen.org/pressroom/release.cfm?ID=1909>>).

Testimony of J. Robert Shull
 Director of Regulatory Policy, OMB Watch
 Page 5

- (D) *Compliance costs are so minuscule that they have minor competitive consequences.* Finally, and most importantly for these purposes, regulation cannot be blamed for a decline in competitiveness or other economic ills because compliance costs are only a very small percentage of total value of the shipments made by manufacturers. On the basis of data from the World Bank, Professor Kevin Gallagher of Boston University finds the "sum of all marginal pollution abatement costs in the United States is less than one percent of value added production."⁷ Department of Commerce data confirm this estimate. This information indicates abatement expenditures are an average of 0.62 percent of the value of shipments of all industries. Industry sectors with high abatement costs only pay between 1.27 and 1.51 percent of the value of shipments.⁸ Indirect costs are derivative of direct compliance costs; since low direct costs generally will produce low indirect costs, regulation overall should have a minor competitive and labor impacts.

The scholarly evidence backs up this claim. Economists have considered the impact of environmental regulations on plant location decisions (do pollution-intensive industries build disproportionate number of new factories in countries or areas of the United States where there is weak environmental regulation?) and on trade flows (do exports from developing to developed countries show an increasing percentage of pollution-intensive goods?). Neither type of study supports a regulation-competitiveness link. I recommend a recent literature review by Professor Sidney Shapiro, which synthesizes the major research on the questions and comes to the following conclusions:

- The leading meta-study of plant location and trade flow studies found that "studies attempting to measure the effect of environmental regulation on net exports, overall trade flows, and plant-location-decisions have produced estimates that are either small, statistically insignificant, or not a robust to test of model specification." These authors concluded that there is "[o]verall ... relatively little evidence to support the hypothesis that environmental regulations have had a large adverse effect on competitiveness, however that elusive term is defined."⁹
- According to another survey of the literature, "The vast majority of studies have found no systematic evidence that the share of developing country exports and production is becoming more pollution-intensive. In addition, no studies have indicated that there is substantial evidence

 Page 6

that pollution-intensive industries flee developed countries with relatively high (and costly) environmental standards).¹⁰

III. The Regulatory Flexibility Improvements Act Will Not Meet the Need of Small Businesses.

H.R. 682 was put forward under the banner of relieving regulatory burden to small business, but this legislation puts public protections at stake while failing to get at the heart of what ails small business. The small business community is a major source of innovation and employment in this country. Like their larger counterparts, however, small businesses are also responsible for social ills addressed by regulations, ranging from workplace health and safety problems to environmental pollution.¹¹ Thus, we cannot simply give small businesses a free pass from regulation. At the same time, it can be relatively more expensive for small business to comply with regulations than large companies. Small businesses want to do their part and be responsible; real reforms, then, must help small businesses comply with regulations in order to level the playing field with large businesses while giving the public the protection it needs and deserves.

We already have these reforms. Small firms receive direct government subsidies such as outright and government-guaranteed loans from the Small Business Administration (SBA) as well as indirect preferential treatment through federal procurement requirements and tax provisions. Additionally, small business is treated to many exemptions or special treatment in the area of regulation. For example, employers with fewer than 15 employees are exempt from the Equal Employment Opportunity Act,¹² and OSHA levies lighter penalties for smaller firms, exempts businesses with fewer than 10 workers from recordkeeping requirements, and provides free on-site compliance consultations.¹³

Small business concerns are inscribed in law. The Small Business Regulatory Enforcement Fairness Act (SBREFA) requires agencies to give special consideration and voice to small business as part of the rulemaking process as well as expanded judicial review for small businesses wishing to challenge agency decisions.¹⁴ Likewise, the Equal Access to Justice Act gives small businesses special privileges when litigating against agencies: small businesses can recover attorney's fees if they prevail

in court against a federal agency.¹⁵

Real reforms for small businesses would make these benefits meaningful by clamping down on the ways that large businesses game the rules and claim the status of "small business." Real reform would consider the role of small business in contributing to pollution and other harms to the public and would respond by adequately funding compliance assistance offices in every congressional district, which would be given the resources they need to give small businesses the help that they, in turn, need to be good corporate citizens and comply with the law. This bill does not come close to being real reform; it is a shameful giveaway of the protections we need, and it shamelessly exploits the real needs of small businesses in order to justify this dangerous exercise.

IV. There Is a Better Way.

A. National Business Regulatory Assistance Act

There are better ways to help small business without sacrificing longstanding public protections. The National Small Business Regulatory Assistance Act (S. 1411) would be the first step to strengthening Small Business Development Centers (SBDCs) around the country by launching a pilot in which SBDCs would provide compliance assistance to small businesses. This bill would help level the playing field for small businesses by giving them specialized assistance with understanding and complying with federal regulations, without compromising the public's protections, directly or indirectly; instead, it would actually help some businesses to comply with the regulations that are in place to protect the public.

B. Strengthening Petitions for Rulemaking

Processes already exist that allow both businesses and the public interest to ask federal agencies to address particular regulatory problems. Small businesses are already well aware of the regulations that are particularly burdensome or obsolete. Rather than expanding the Regulatory Flexibility Act to review all federal regulations on the books, small businesses already have the power to petition agencies to revisit specific regulations. Strengthening the petition process by making agencies more responsive to requests from the public would use existing mechanisms to open the door to reforms without drowning agencies in reviews of existing regulations. Moreover, rather than serving a particular constituency, strengthening petitions for rulemaking would benefit all members of the public. It can be used to identify both gaps in public protections as well as areas where reform may be needed.

Problems of H.R. 682

Regulatory Flexibility Act	Regulatory Flexibility Improvements Act (H.R. 682)
<ul style="list-style-type: none"> • Applies only to rules with direct effects on small businesses • Includes regulations impacting small businesses and local governments • Requires agencies to prepare a regulatory flexibility analysis for all proposed rules and for all final rules, summarizing why the action is being taken and description of how small entities will be impacted. • The agency is required to respond to public comments. • Allows analysis to be either quantified or general. • Requires small business panel to review all rules by EPA and OSHA with a significant impact on small entities. • Periodic review of all rules, "which have or will have a significant adverse impact on a substantial number of small entities," going back to ten years before the enactment of the RFA. 	<ul style="list-style-type: none"> • Applies to rules, policy statements and guidance documents, land management plans, revisions or amendments to land management plans, recordkeeping requirements and formal rulemakings with direct and indirect effects to small businesses. • Includes regulations impacting small businesses, local governments, Tribal organizations, local labor organizations and professional and trade associations • Regulatory flexibility analysis must contain all provisions of original regulatory flexibility analysis, but must also include a description of alternatives that might maximize benefits and an estimate of "the additional cumulative economic impact of the proposed rule on small entities beyond that already imposed on the class of small entities." Final analysis is no longer required to be "succinct," and explanations are amended to be "detailed explanations." • The agency is required to specifically respond to comments filed by the Chief Counsel of Advocacy, including details of any changes made as a result of the comments. • If agency gives a general description instead of a quantified analysis, it must include detailed explanation of why quantification is not "practicable or reliable." • Eliminates procedures for agency heads to delay the analysis before promulgating proposed or final rule. • Requires small business panel to review all rules that result in "an annual effect on the economy of \$100,000,000 or more," "a major increase in costs or prices," "significant adverse effects" on a variety of economic factors, "a significant impact on a substantial number of small entities." • Periodic review of all rules, regardless of whether they have had or will have a significant impact on a substantial number of small entities. Agencies will submit a report to Congress regarding their findings. The review must include comments by the Regulatory Enforcement Ombudsman and the Chief Counsel of the Office of Advocacy and "the contribution of the rule to the cumulative economic impact of all Federal rules on the class of small entities affected by the rule."

Mr. CANNON. Thank you. Let us just ask unanimous consent that you have 5 additional days to submit that. Would that be sufficient?

Mr. SHULL. Thank you very much.

Mr. CANNON. Without objection, so ordered. And, frankly, we understand that you were drawn into this late. That was a compelling statement given what apparently was a short time to prepare, and we thank you for being here.

Mr. Frulla, you are recognized for 5 minutes. Thank you.

**TESTIMONY OF DAVID FRULLA, ESQUIRE, KELLEY DRYE
COLLIER SHANNON, WASHINGTON, DC**

Mr. FRULLA. Thank you, Mr. Chairman, Mr. Ranking Member.

My perspective on the Regulatory Flexibility Act is as a 10-year litigant. I have had over a dozen cases regarding six different agencies, rule-making proceedings, and we have prevailed about half the time. And we have gotten some substantive results. These aren't always things that are high profile, above-the-radar issues. In one case, we ended up with a settlement that involved a scientific re-review of a 67 percent reduction in a quota for sharks that were caught in the Gulf and Atlantic.

That review showed there was no scientific basis for that quota cut. Again, not every regulation is lead in gasoline. There is a lot that the Government does. Sometimes it goes awry. There needs to be checks and balances there. The Regulatory Flexibility Act is an important tool.

And I would also note that a Regulatory Flexibility Act victory is only a first step. It is often a long haul to get an agency to change course. And I also have to tell you, and it is probably not a news flash to anybody here, that Federal agencies don't always listen to Federal judges.

So SBREFA was a step in the right direction and this new legislation, H.R. 682, and equally importantly, the congressional attention that is being paid to the RFA, are right on point. Litigation does impose discipline. We get to see after 10 years weaknesses in the law that litigation shows in the same way as cross examination, but on the legal side.

I would like to applaud especially H.R. 682's efforts to clarify jurisdictional issues and timing issues. We lay this out extensively in my written testimony. To address the foreseeable indirect effects, let me give you one example. A couple of years ago, I think it was, Congress wanted to impose cost-containment standards on what they call WIC-only vendors in the Women, Infant and Children Food and Nutrition Program.

And it was clear that there were to be stores that are WIC-only vendors, that essentially service that community, that were to be regulated and were to have their costs contained. However, the States regulated that level and the directive was for the States to make these changes.

That is outside the Regulatory Flexibility Act as it currently stands, even though these small businesses were clearly the target, and the intended target. We also think it is going to be important to crystallize the Office of Advocacy's role in establishing how other agencies do reg-flex analyses. We had a case with the EPA at one

point, and the EPA's reg flex guidance asks the question in terms of determining economic impact as what the impact of the regulation is on a business's gross revenues.

They say, we don't need to look at profitability, and they said, well, you know, a 1 percent hit on gross revenues, that is not much. Well, it is a lot if you only have a 4 percent profit margin. But the court said the EPA had the discretion to use its own standards. That is something else that needs to be looked at, and that is something that the SBA has issued guidance on.

Other issues we note, the standard of review. Normally, there is essentially what they call a good-faith standard. It is kind of backing up from an arbitrary and capricious standard. That is starting to get pretty toothless in many cases.

I have addressed that in the testimony, some good results and some bad results. We submit that the arbitrary and capricious standard ought to apply to the no significant impact determinations. Clearly in the law, it is in the legislative history, and the same when the final regulatory flexibility analyses are reviewed.

It also should be stated that application of the Reg Flex Act to a particular rule ought to be handled under the *de novo* standard, as should the question of whether an agency has flexibility under a given law. Another case we had, one page of law ended up with 47 pages of regulations and the agency said that they had no flexibility, and it was all required. That doesn't seem to make sense.

Three other points I would like to mention quickly, expedition. Questions of whether the Regulatory Flexibility Act applies should be expedited. We are waiting 6 years for a final decision, when we know the answer from the D.C. circuit that the Reg Flex Act applies to nationwide permitting under the Clean Water Act. Attorneys' fees, got to put a plug in for that. If a small business prevails, they should be able to be awarded attorneys' fees. A victory on reg flex is only the start, and it shouldn't be a war of attrition. And, finally, make sure the Office of Advocacy has the resources they need.

Thank you very much.

[The prepared statement of Mr. Frulla follows:]

KELLEY DRYE
COLLIER SHANNON

Testimony of David E. Frulla
Before the Subcommittee on Commercial and Administrative Law
House of Representatives Committee on the Judiciary

July 20, 2006

Mr. Chairman and Members of the Subcommittee on Commercial and Administrative Law, I appreciate the opportunity to testify before the Subcommittee's July 20, 2006, legislative hearing on H.R. 682, the Regulatory Flexibility Improvements Act. This legislation should help ensure that the Regulatory Flexibility Act ("RFA"), as amended in 1996 by the Small Business Regulatory Enforcement and Fairness Act ("SBREFA"), is an effective and enforceable tool to require Federal agencies tailor their regulations to the scope and scale of small businesses and other small entities. H.R. 682 shows that its sponsors have been listening to the needs and concerns of small entities, with respect to RFA compliance.

EXECUTIVE SUMMARY

SBREFA made many salutary changes to the RFA, not the least of which are its judicial review provisions. As the Subcommittee knows, SBREFA added these judicial review provisions, at 5 U. S. C. § 611, to ensure federal agencies do more than pay "lip service" to the RFA. See 142 CONG. REC. S3242, S3245 (*daily ed.*, Mar. 29, 1996).

We have extensive experience litigating SBREFA cases.¹ That said, I am appearing before the Subcommittee today in my personal capacity, and not on behalf of

¹ In fact, I believe that I may have litigated as many RFA cases as anyone in the country since SBREFA was enacted. I have been involved in over a dozen RFA cases against six different agencies: the Department of Commerce (regarding various fisheries regulations), the Department of Health and Human Services (regarding the "interim payment" system for home health agency Medicare reimbursement), the Army Corps of Engineers (regarding modification of its Clean Water Act Nationwide Permit System), the Environmental Protection Agency (regarding its Lead Rule), the Federal Communications Commission (regarding its intermodal telephone number porting requirements), and the Food and Nutrition Service (as a friend of the court, regarding its cost-reduction program for so-called "WIC-only" vendors).

any client. In summary, the decade-long crucible of the litigation process has demonstrated both strengths and weaknesses in the RFA's structure and processes. Congress should now use this experience to improve the RFA and ensure it serves its intended purposes. H.R. 682 addresses many important issues but more needs to be done.

I will first address important changes to the RFA that H.R. 682 would make. Then I will identify an important situation where H.R. 682 addressed an issue, but may not have gone far enough. Finally, I will identify a few issues that H.R. 682 did not address, but that Congress should address, whether in this legislation or elsewhere (for instance, in the appropriations process).

I. H.R. 682 ADDRESSES CERTAIN CHRONIC RFA/SBREFA IMPLEMENTATION PROBLEMS VERY WELL

First, Section 8 of H.R. 682 would clarify a jurisdictional and timing issue that we confronted in *Nat'l Ass'n of Homebuilders v. U.S. Army Corps of Engineers*, 417 F.3d 1272 (D.C. Cir. 2005), reversing 297 F. Supp. 2d 74 (D.D.C. 2003). I represented the National Federation of Independent Business Legal Foundation and a small business homebuilder in their RFA challenge to a major Army Corps of Engineers Clean Water Act rulemaking that implemented new nationwide permits and supporting terms and conditions. The Army Corps had completely and, as the D.C. Circuit held, erroneously disclaimed its obligation to comply with the RFA, by baldly claiming that it was not issuing "regulations." More specifically, *NAHB* reversed a lower court decision which had dismissed RFA and APA claims on the ground that the Army Corps' issuance of these nationwide permits and their terms and conditions did not represent "final agency action." The RFA uses the term "final agency action" in its jurisdictional provisions, 5 U.S.C. § 611(a).

We were able to argue successfully at the appellate level in *NAHB* that the Army Corps' actions relating to the RFA were complete when the agency concluded its rulemaking proceedings and that no set of facts (such as the application of the nationwide permit standards in the context of an actual permit application), could or would make the RFA claim any more ready for review. By changing the finality standard in Section 611 from "final agency action" to "publication of the final rule," Section 8(c) of H.R. 682 would remove this point of confusion on jurisdiction and the timing of judicial review.

The clarity H.R. 682 would provide represents a real benefit to the small business community. We filed suit in *NAHB* in 2000, and it was not until 2005 that the appeals court made its decision. And we are still awaiting a final order from the district court effecting the settlement of the case that followed from the D.C. Circuit ruling. Meanwhile, the Army Corps is gearing up for a new permit rulemaking as these nationwide permits are only valid for five years.

Second, H.R. 682 would significantly enhance the Small Business Administration Office of Advocacy's coordinating role for Federal Government-wide RFA compliance. For instance, Section 10(a) of H.R. 682, proposing to enact a new RFA section, 5 U.S.C. § 613, would authorize the Office of Advocacy to develop omnibus RFA implementing regulations that all other agencies would be required to follow, absent approval from the Office of Advocacy. Currently, there are almost as many sets of agency RFA implementing regulations as there are Federal agencies. This is not constructive.

For instance, the Environmental Protection Agency's RFA implementing guidelines authorize the agency to conduct RFA economic impact analyses based on small businesses' revenues, rather than their profitability. While any fair assessment of a

regulation's economic impact ought to be measured against profits (and thus the entity's ability to pay for the regulation), a district court in Washington, D.C. recently deferred to the EPA guidelines. *Ad Hoc Metals Coalition v. Johnson*, 1:01cv0766 (PLF) (D.D.C., Jan. 20, 2006), *slip op.*, at 12-13.² Uniform Office of Advocacy regulations consistent with its Guide for Government Agencies would have changed the deference calculus.

More generally, the caselaw is mixed regarding the level of deference accorded to the Office of Advocacy in its efforts to ensure RFA compliance. Certain cases are very respectful of positions and submissions from the Chief Counsel. See, e.g., *Southern Offshore Fishing Ass'n v. Daley*, 995 F. Supp. 1411, 1435 (M.D. Fla. 1998) (*SOFA I*) (terming the Office of Advocacy as the Federal Government's RFA "watch dog"). However, other cases are not deferential. *American Trucking Ass'n v. EPA*, 175 F.3d 1027, 1044 (D.C. Cir. 1999) (no deference owed to either EPA's or SBA's RFA interpretations), *modified on other grounds*, 195 F.3d 4 (D.C. Cir. 1999), *aff'd in part and rev'd in part on other grounds, sub nom., Whitman v. American Trucking Ass'n*, 531 U.S. 457 (2001).

Deference ought to be accorded to the Office of Advocacy. The Chief Counsel and his experienced staff have a detailed familiarity with the RFA and its requirements, small entities' ability to accommodate regulations, and the benefit of an overall perspective on the many and varied ways that rulemaking agencies attempt to avoid or defeat their RFA obligations. By law and Executive Order, the Office of Advocacy has been an RFA teacher. In granting the Office of Advocacy an explicit regulation-writing

² The court explained, "The RFA does not define 'significant impact on a substantial number of small entities,' grants neither authority nor responsibility to any entity to develop a uniform definition of SEISNSE, and provides no guidance as to how certification decisions are made. Instead, the RFA grants federal agencies broad discretion regarding how key terms in the act should be defined and how certification decisions should be made." *Id.*, *slip op.*, at 12.

role, H.R. 682 should not only promote more consistent RFA application and compliance across the government, but also confirm that the primacy of the expert Chief Counsel for Advocacy on the RFA issues within his ken. In addition, by extending the Chief Counsel's authority to comment and intervene to Administrative Procedure Act issues more generally (*see* H.R. 682, § 10(c)), the legislation recognizes the integral links between RFA compliance and APA standards.³

Section 4(b)(3) of H.R. 682 also requires rulemaking agencies to address specifically to Office of Advocacy comments in response to a proposed rule. This measure should help the small business community, and the courts, identify when rulemaking agencies are acting in the face of, or even inconsistent with, conclusions and guidance from expert agency.

For its part, Section 8(d) of H.R. 682 constructively clarifies the Chief Counsel's authority to intervene in actions under the RFA against Federal agencies, by specifically delineating that authority as coextensive with the scope of RFA judicial review. The SBA can have a unique role to play in RFA litigation, especially given the RFA's unique and tailored remedial provisions.

For instance, in *United States Telecom Ass'n v. FCC*, 400 F.3d 29 (D.C. Cir. 2005), in my prior law firm, we represented small, generally rural wireline telephone carriers in their challenge to a Federal Communications Commission order requiring all wireline carriers to develop and maintain the infrastructure to permit their customers to transfer, or "port," their phone numbers to their wireless phones even if these customers moved from one physical location to another. In that case, the FCC had disclaimed its

³ For instance, the RFA's applicability is principally tied to the APA's standards for notice and comment rulemaking under 5 U.S.C. § 553. *See* 5 U.S.C. §§ 601(2) (defining a "rule" under the RFA); 604 (initial regulatory flexibility analysis standards); and 605 (final regulatory flexibility analysis standards).

RFA obligations, arguing that it had merely issued an interpretative ruling in response to a petition for rulemaking, which it also likened to adjudication. The D.C. Circuit disagreed, and held the agency had developed a "legislative rule" requiring RFA compliance. 400 F.3d at 40-41. The court enjoined the FCC from enforcing the rule against small entities until the agency had complied with the RFA. *Id.* at 43-44. While the injunction came approximately fifteen months after the rulemaking, with the SBA Office of Advocacy's assistance, our clients were still able to preserve enough of the *status quo* for the injunction to be effective.

More specifically, during the pendency of the case, state utility commissions had employed their limited authority to grant "waivers" to petitioning companies that were subject to the FCC's porting order. The FCC Bureau that developed the rule had preemptively informed these state commissions that they should not grant any of the waiver requests. Whether or not these state commissions would have complied with the bureau's edict, FCC Chairman Michael Powell ultimately countermanded it. He did so as part of a settlement with the SBA Office of Advocacy to resolve the SBA's intervention in our case, on the eve of the SBA's filing its *amicus* brief supporting our position. SBA's litigation role, even stopping short of briefing and argument, served an important and creative function in the overall arc of the litigation.

Third, H.R. 682 addresses another long-standing problem relating to what are called "indirect" regulatory impacts. More specifically, agencies often claim, based on a long-standing line of cases, that the impacts of their regulations should not be counted for RFA purposes if they do not directly impact small entities, or else they design their regulatory schemes to impact indirectly small entities, perhaps in part to avoid or limit

RFA requirements. See, e.g., *Nat'l Women, Infants, and Children Grocers Ass'n v. Food and Nutrition Svc.*, 416 F. Supp.2d 92, 109-10 (D.D.C. 2006) (rejecting RFA challenge because the interim final rule imposed its requirements on state agencies administering the WIC program even though small business WIC-only grocery stores were the professed "targets" of the rule). This case relied on *Cement Kiln Recycling Coalition v. EPA*, 255 F.3d 855, 869 (D.C. Cir. 2001), which held that "application of the RFA does not turn on whether particular entities are the 'targets' of a given rule." The origins of this narrowing construction of the RFA's scope are sketchy, and non-statutory, and H.R. 682 should correct this matter.⁴

Section 3(b) of H.R. 682 would constructively address this situation by extending the term "economic impact" under the RFA to "any indirect economic effect on small entities which is reasonably foreseeable and results from such rule . . ."

II. H.R. 682 COULD DO MORE TO ENSURE COURTS RECOGNIZE THEIR AUTHORITY TO REQUIRE THAT AGENCIES UNDERTAKE DETAILED, CAREFUL RFA ANALYSES

H.R. 682's findings, set forth in Section 2, state clearly that rulemaking agencies need to do more to understand the impacts their proposed regulations have on small entities, undertake outreach to small entities in the regulated community, and develop ameliorative alternatives.⁵ To address these shortcomings in agency RFA analyses, the

⁴ These RFA "indirect regulation" cases stem from *Mid-Tex Elec. Coop. v. FERC*, 773 F.2d 327, 432 (D.C. Cir. 1985). See, e.g., *Cement Kiln*, 255 F.3d at 869. For its part, *Mid-Tex* derived the standard from the RFA's preamble, rather than its operative terms. See 773 F.2d at 341. A statute's operative terms should control over its preamble. *Ass'n of American Railroads v. Condit*, 562 F.2d 1310, 1316 (D.C. Cir. 1977); *Yacco and Miss. Valley R.R. Co. v. Thomas*, 132 U.S. 174, 188 (1889), particularly when the operative language establishes a specific definition which declares what a term "means" [and] is binding upon the court." *Nat'l City Lines, Inc. v. LLC Corp.*, 687 F.2d 1122, 1133-34 (8th Cir. 1982), *relying on Colautti v. Franklin*, 439 U.S. 379, 392-93 n.10 (1979).

⁵ RFA applicability and Section 605(b) certifications have been the subject of much SBREFA litigation to date, but they are only threshold issues; ultimately, to be truly effective, as the findings

bill, in the main, imposes more detailed analytical requirements on agencies in Section 4. Section 4(a) also constructively requires agencies to affirmatively collect information to estimate the number and type of small entities to which a proposed rule would apply, rather than allowing an agency to excuse shoddy outreach and investigation based on 5 U.S.C. § 603(b)(4)'s current "feasib[ility]" limitation.⁶ The legislation would also promote more relevant RFA analyses by requiring an agency to consider the cumulative impacts of its regulations on small businesses, by adding a new sub-section (b)(6) to Section 603.

Simply requiring agencies to undertake more analyses may not, however, solve the problem that H.R. 682's Findings correctly identify. H.R. 682 does not, but should, ensure adequate enforcement authority for these new requirements. We have had success in RFA litigation when a court carefully considers an agency RFA's analyses under the APA's "arbitrary and capricious" standard. But in our experience, not all courts conduct sufficiently careful reviews of agencies' RFA analyses.

On the positive side of the ledger, in *SOFA I*, the Federal court in Tampa, Florida was able to recognize from personal, real world experience that a 50% shark fishing quota reduction would have a significant economic impact on a substantial number of small business shark fishermen, 995 F. Supp. at 1436, notwithstanding the Commerce

recognize, RFA requirements and attendant litigation must evolve to address whether agencies are conducting adequate regulatory flexibility analyses and effectively developing ameliorative alternatives.

⁶ Such an obligation has been created in certain contexts under the National Environmental Policy Act. "In general, NEPA imposes a duty on federal agencies to gather information and do independent research when missing information is 'important,' 'significant,' or 'essential' to a reasoned choice among alternatives." *Oregon Environmental Council v. Kutzman*, 817 F.2d 484,495 (9th Cir. 1987) (citations omitted). Certain courts have already found that NEPA's substantive requirements are analogous to duties imposed on resource agencies under the RFA. See *Associated Fisheries of Maine, Inc. v. Daley*, 127 F.3d 104, 114 (1st Cir. 1997).

Department's repeated rationalizations and diversionary arguments to support its flawed Section 605(b) no significant impact certification. *Id.* at 1433-37. *See also Nat'l Ass'n of Psychiatric Health Sys. v. Shalala*, 120 F. Supp.2d 32, 43-44 (D.D.C. 2000) (carefully reviewing cursory, hedged, and contradictory Section 605(b) certification and granting relief).

In so doing, *SOFA I* applied the APA's "arbitrary and capricious standard" and rejected application of the more deferential "without observance of procedure" standard of review. 995 F. Supp. at 1425.⁷ This decision is consistent with SBREFA's legislative history⁸; for its part, the RFA currently states more generally that courts are to review agency RFA compliance under Administrative Procedure Act standards. *See* 5 U.S.C. § 611(a)(1). The SBA Chief Counsel for Advocacy had intervened in *SOFA I* on this point, recognizing the hollowness of the "without observance of procedure" standard of review.

⁷ The court's commitment to ensuring the Commerce Department complied with the RFA made *SOFA I* a seminal case – and one that provided effective relief. In November 2000, after repeated, failed agency efforts to rationalize its original Section 605(b) "no significant impact" certification, two stem reported decisions and a special master finding that the agency had acted in bad faith with respect to the plaintiffs' RFA claims, the shark fishermen and the Department of Commerce settled the case. *See Southern Offshore Fishing Ass'n v. Atienza*, 2000 WL 33171065 (M.D. Fla., Dec. 7, 2000) (prior proceedings reported sub nom. at *SOFA I*, *supra*, and *Southern Offshore Fishing Ass'n v. Daley*, 55 F. Supp.2d 1336 (M.D. Fla. 1999) (*SOFA II*)). As part of the settlement, the parties agreed to an independent scientific review of the scientific data and analyses used by the Government to set these quotas. That independent review did not support the Commerce Department's scientific justifications for the quota reductions. The Committee should note that the Court lacked the expertise (and maybe the authority under the APA) to address the flaws in relevant agency scientific analyses that were so evident to the scientific review panel convened as a result of the settlement. *See SOFA I*, 995 F. Supp. at 1432-33.

⁸ According to SBREFA's legislative history: "[I]f the court finds that a final agency action was arbitrary, capricious, an abuse of discretion or otherwise not in accordance with the law, the court may set aside the rule or order the agency to take other corrective action." 142 CONG. REC. 53245 (daily ed. Mar. 29, 1996) (statement of Sen. Bond). Similarly, SBREFA's main drafter confirmed sub-section 611(a)(1) & (2)'s express terms, stating:

... Review under these sections is not limited to the agency's compliance with the procedural aspects of the RFA; final agency actions under these sections will be subject to the normal judicial review standards of Chapter 7 of Title 5.

142 CONG. REC. E571-01, E574 (daily ed. Apr. 19, 1996) (remarks of Rep. Hyde). Chairman Hyde further specifically stated that the "normal" standards include the "arbitrary and capricious" standard. *Id.*

However, the standard of review for RFA analyses in certain cases is verging on this latter-referenced, essentially toothless standard. For instance, *Nat'l Women, Infants, and Children Grocers Ass'n* concluded that, "Agencies need only engage in a 'reasonable' and 'good faith effort' to carry out the mandate of the RFA Further, the RFA is a purely procedural, as opposed to a substantive, mandate; RFA 'requires nothing more than that the agency file a final regulatory flexibility analysis demonstrating a reasonable good-faith effort to carry out the RFA's mandate.'" 416 F. Supp.2d at 108 (quoting *Alenco Communs. Inc. v. FCC*, 201 F.3d 608, 625 (5th Cir. 2000), and *United Cellular Corp. v. FCC*, 254 F.3d 78, 88 (D.C. Cir. 2001)) (citations omitted).

I am concerned that, under these latter cases, especially with the new provisions in Section 4 of H.R. 682, if it is enacted, an agency would be tempted to substitute bulk for quality in its analyses, expecting a court would consider the development of voluminous analyses to equate with a good faith effort, notwithstanding the quality of conclusions contained in the analyses. Recognizing courts are loath to tackle reams of data and analyses, some agencies are already on occasion, if not as a *modus operandi*, filling the RFA decision-making record with impenetrable layers of economic information, but failing to take the important, subsequent step of distilling and analyzing this information, so as to assist the decision-makers and the public to develop flexible regulatory alternatives.

H.R. 682 should thus amend Section 611 of the RFA to clarify the applicable standard of review: Agency decisions regarding whether the RFA applies and whether a an agency's authority to promulgate a rule under a statute permits regulatory flexibility⁹

⁹ Agencies often claim (sometimes, we believe, inappropriately) that their general statutory grants of authority do not accord them any flexibility regarding small entities as to the voluminous details of the

represent questions of law that a reviewing court should consider *de novo*. Subsequent agency analyses contained in Section 605(b) certifications and regulatory flexibility analyses should be subject to the APA's "arbitrary and capricious" standard of review.

Congress should also consider clarifying the RFA to state that agencies need to complete a full RFA analysis if there is a doubt. The RFA's legislative history makes this point. After reviewing the RFA's legislative history, a district court has explained "that '[t]he legislation is intended to be as inclusive as possible, and doubts about its applicability should be resolved in favor of complying with the provisions of the Act.'" *NAHC*, 135 F. Supp. 2d at 168 (quoting 126 CONG. REC. H24589 (Sep. 8, 1980) (House Statement of RFA Issues) (alteration in original)). Accordingly, "[t]he statement's context clearly shows that Congress intended that agencies err on the side of caution in determining whether to perform regulatory flexibility analyses." *Id.* However, the import of this important section of legislative history can be blunted, if not negated entirely, by the good faith review standard, under which certain agencies are back-stopping questionable Section 605(b) certification with cursory and flimsy regulatory flexibility analyses.

III. ADDITIONAL MATTERS THAT CONGRESS SHOULD ADDRESS

I would now like to offer some constructive, discrete steps that Congress can take to provide tools for those of us who sometimes need to secure agency RFA compliance through litigation.

regulations they implement. For instance, in *National Association for Home Care v. Shalala*, 135 F. Supp.2d 161 (D.D.C. 2001) (*NAHC*), the Health Care Financing Administration claimed that one page of statutory language in the Balanced Budget Act of 1997 accorded it essentially no flexibility in how it developed and implemented forty-seven Federal Register pages of regulatory analyses and requirements imposed on small home health care providers. See also *Greater Dallas Home Care Alliance v. United States*, 36 F. Supp.2d 765 (N.D. Tex. 1999).

First, Congress should explicitly provide for expedited judicial review regarding whether the RFA applies. Agencies are still claiming that binding, widely-applicable actions are not legislative rules subject to the RFA. *USTA* and *NAHB*, discussed above, are notable examples. In fact, in *NAHB*, we have been alternatively litigating and waiting since we filed suit in June 2000 for a final decision that the Army Corps should have applied the RFA. Indeed, we waited for well over three years for the district court to (erroneously) dismiss the case for lack of jurisdiction.

Second, the RFA's judicial review provisions should be amended to provide for attorneys' fees under the EAJA whenever a small entity prevails on an RFA/SBFEFA claim. Small entities and associations representing them often lack the funds to sustain RFA litigation, particularly once it reaches the often-protracted remedy phase. RFA litigation and compliance efforts should not become a war of attrition for these often economically marginal entities and associations representing them. See, e.g., *United States Telecom Ass'n v. FCC*, 2005 U.S. App. LEXIS 18599 (D.C. Cir., Aug. 25, 2005) (denying EAJA award to prevailing small business associations).

Finally, Congress should recognize that the Office of Advocacy will likely require more resources, especially if H.R. 682 is to expand its regulatory and oversight role. Such a public investment in RFA compliance pays dividends in terms of "more just application of the laws and more equitable distribution of economic costs, which will ultimately serve both the society's and the government's best interests." See 126 Cong. Rec. H24589 (Sep. 8, 1980).

• • •

I appreciate the opportunity to testify before the Subcommittee on Commercial and Administrative Law, and hope that the Committee on Judiciary and the Congress as a whole will act promptly and decisively to make the SBREFA-improved RFA even stronger and better.

Mr. CANNON. Thank you, Mr. Frulla.

I appreciate all your testimony, and I recognize myself for 5 minutes to ask some questions.

It sounds like there is consensus that there are some improvements we can make and we need to try and achieve that in addressing this bill.

Mr. Shull, recognizing you didn't have time to prepare, and you have heard what the other witnesses have said, I don't want to put you on the spot in this regard, but do you either have things that you would like to propose that we do better in the Regulatory Flexibility Act, or things that you have heard today—do things come to mind that you would oppose as you consider what has been said today?

Mr. SHULL. Yes, sir. I actually think that if the goal is to serve small businesses, that there are better ways other than the Reg Flex to go about serving that need. And, actually, something that would be in the jurisdiction of this Committee—and that would serve not just small businesses but really all of us—might be to look at the petitions for rule-making under the APA.

Because it can take a really long time for either public interest groups who have identified a need for new protections or more increased protections, or for business groups that have identified a standard that is out of date and they have a new way, a better way, of going about it.

With the petition for rule-making process, what we can do is bring to the agencies a specific rule that needs to be improved and call for specific improvements. But the agencies can take a really long time to respond to the petitions or to do anything about it once they have recognized the need for improvement. I mean, it took over 10 years, and I don't know how many court battles, to get OSHA, after it recognized the need for improving the standard on hexavalent chromium, to actually get about the work of doing it, of protecting workers.

So I think that that would be a better approach, something that is evenhanded that applies to business groups and public interest groups as well, and anybody else out there who sees a need for improvement, and it is more targeted. It doesn't drain the agencies' resources into going back and reopening the case for rules that we already know need to stay on the books and for just really sort of this meat ax approach, a clumsy approach, as opposed to a focused, targeted approach, where small businesses can bring up the rules they think need to be fixed, other groups can pull up needs that need to be met.

I mean, there are other approaches as well, and there I think things outside of this Committee's jurisdiction that might also be very helpful for small businesses, that would help businesses comply without burdening agencies or without giving them a free pass from regulatory compliance. And one of them would be compliance assistance and making sure that there are compliance assistance offices in every congressional district, that can go about the work of helping small businesses understand what regulations they need to comply with and to help them figure out how to go about doing it.

Plain language in regulation—if it is easier for businesses or anybody else to read the regulations and understand them. There was a bipartisan bill that Mrs. Miller and Mr. Lynch over on the Government Reform Committee proposed that would not do a thing about weakening regulatory standards, but just change the language in which they are written so that they are easier to comply with.

I think that is another way for reducing cost without reducing the level of protection. And there are other ideas—for example, the small business gateway I have heard proposed—basically, informational resources, helping small businesses get the information they need in order to go about the work of being a good corporate citizen, which I think that we all agree they want to be.

Mr. CANNON. Thank you. Have you been involved at all with our APA review process?

Mr. SHULL. Actually, I haven't, but I have followed it from afar and I look forward to getting more involved.

Mr. CANNON. It has been a little bit arcane in the sense of hidden away, boxed up in an ark with some very, very smart people working on it. I am hoping that we can move that at some phase into a Wikipedia format so that it is online and people can contribute. I think that might be an easy way for you to get engaged and see what academics and others are looking at and bring it down to the real world of advocacy that you are thinking of.

And we would invite you and you may want to talk to staff about how you can be engaged prior to that if you are interested. We appreciate your ideas.

Mr. SHULL. I appreciate that.

Mr. CANNON. I don't know if you know, we have a hearing next week on the 60th anniversary of the APA.

Mr. SHULL. I will be here.

Mr. CANNON. An arcane area of the law, but really actually, in the end, the most important. Thank you. My time has expired.

Mr. Watt, you are recognized for 5 minutes.

Mr. WATT. Thank you, Mr. Chairman, and I thank the witnesses for being here, apologize for being a little late.

At the end of the day, I guess this is about a bill that is before us and whether it is supportable as written. I think I heard Mr. Shull's opinion on that. I am not sure I heard anybody else's.

Mr. Sullivan, do you support H.R. 682 as written, or, if not, is there another, better bill? I understand there is a bill pending on the Senate side, S. 1388. Which one of those is better?

Mr. SULLIVAN. Both bills improve the Regulatory Flexibility Act. A little bit of a dilemma in H.R. 682, if it were passed into law tomorrow or next week, my office does not have the resources to implement it effectively.

The Senate bill that you refer to is a more targeted approach and contains many of the needed reforms of 682.

Mr. WATT. Mr. Mihm, does the Administration support this 682? Can you speak for the Administration?

Mr. MIHM. GAO, the Government Accountability Office. I was actually hoping Mr. Sullivan would take the whole 5 minutes, but since he didn't, I will have to answer your question.

As a congressional support agency, we don't typically support legislation—

Mr. WATT. I am sorry, and I am not trying to put you on the spot.

Mr. MIHM. But I will say, sir, that many of the types of concerns that our work has identified in the past about the lack of standardization and clarity in the RFA are, is what the bill is designed to address. In that sense, those types of legislative actions would be a step forward.

Mr. WATT. Mr. Sullivan, you have mentioned secondary and tertiary indirect impacts on small business. I was kind of shuddering to think if the current law requires an assessment of direct impact, I can't even think of anything that wouldn't have some secondary, tertiary, indirect impact on small business and whether we are setting Government agencies up to spend all their time evaluating secondary, tertiary, indirect impacts. It seems to me burdensome enough to require them, expect them to do an assessment of what is foreseeable, not an academic exercise of what may be some possible impact.

Talk to me about the cost of secondary, tertiary, indirect impact analysis, if you would.

Mr. SULLIVAN. Thank you, Congressman Watt. H.R. 682 actually balances that very question that you asked, and it does so by, I believe, expecting or mandating agencies to do impact analysis on those impacts that are reasonably foreseeable.

Let me use an actual case example of how this works, because the words secondary and tertiary I think do—

Mr. WATT. And that compares with what is the current standard?

Mr. SULLIVAN. Currently, when an agency regulates, they look at who must comply directly with a regulation. After September 11th, when the then-referenced agency, INS, decided to limit visitor visas, they were limiting foreign visitors who come to the United States the time allowed to stay in the United States. Those were the direct impact of an INS-proposed rule.

Now, how it should work, and what H.R. 682 would require INS to do, is to say, all right, is border security important? Yes. Let us look at how long we know visitors in the United States, foreign visitors, are legally in the United States, do the analysis.

Now, who is impacted by limiting that length of stay? Tourism, high-end vacation homes, pouring millions of dollars into many destination spots, millions of dollars for Canadians crossing the border and going to destination spots in the United States. That type of analysis, the analysis of looking, well, if we limit their stay to 15 days, this is the economic impact, if we limit their stay to 30 days, here is the economic impact—that type of analysis, which actually is not very difficult, is all secondary impact analysis.

And my office—

Mr. WATT. So you are talking about foreseeable under this—

Mr. SULLIVAN. Reasonably.

Mr. WATT. Reasonably foreseeable under this bill. What is the language in the current—

Mr. SULLIVAN. The language is silent on that, and, in fact, the courts have interpreted it only to require direct impact. So INS did

not violate the letter of the law as it has been interpreted in courts, and David Frulla's testimony mentions those court decisions, as well as my testimony.

But, when you step back, you have got to think, shouldn't INS have informed the public through the notice and comment process that you are more familiar with your understanding of the Administrative Procedure Act to say, we are thinking of limiting visitor stay. And we are thinking of limiting those foreign visitors for about 15 days, as opposed to the current 30-day period. This is how we believe it will impact travel agencies, tourist destinations, white water rafting and outfitting companies, and we want you, the public, to comment on that type of analysis.

That does not happen now under the Reg Flex Act, but it should happen, because it informs the regulatory process, and it informs agencies like INS on how to have a better, more well-informed regulation that is finalized. That is the need for the secondary impact analysis.

Mr. WATT. There is nothing in the bill that really requires a tertiary impact? You are just talking about reasonably foreseeable?

Mr. SULLIVAN. Reasonably foreseeable. And, again, it gets at what should agencies be doing that is responsible to inform the rule-making process? All over the country, we have States who are left in the position through delegated laws, whether that be environmental laws, safety and health laws, that passed these enormous mandates by the Federal Government that says protect the environment and you figure it out. Comply with the Clean Air Act standards, but you figure out how you regulate your own State.

And these folks don't have chief counsels for advocacy. They don't have reams of chief economists. They need help in the Federal Government to actually lay out, here is how it may impact when you choose these different decisions. So there is a responsibility, I think, to help the State regulators figure out what should they be doing that is both cost effective and protective through the regulatory regimen that they are faced with.

Mr. WATT. I am way out of time, but if the Chairman will indulge me, and I would like to get—

Mr. CANNON. I can't see the red light.

Mr. WATT. Mr. Mihm said he doesn't want to comment on which one of these bills is better. I did want to get Mr. Frulla on the record about whether he prefers the Senate bill or this bill, and even in light of Mr. Shull's disposition not to be doing any of this, I guess, even in that context, whether just kind of a straightforward one or two sentences on which one of these bills you would prefer. Just for the record.

Mr. FRULLA. I will be intensely practical. I think that the Senate bill is a little more targeted. This is obviously a little more thoroughgoing a bill. The most important thing is for folks to start to get to the business of reconciling these bills so that we can get the law fixed in a constructive way that everybody can agree on and work together on.

I think the bills ought to come together, same place as Mr. Sullivan, essentially, and I think it is an important thing to do. And I don't want a little bit of disagreement on the margins to be some-

thing that holds this up because this is important to a lot of small businesses.

Mr. WATT. Mr. Shull?

Mr. SHULL. I think maybe the way I can say it is by saying that although we object to the core elements that are there in both bills, it is worth noting that the Senate version of this bill does not have the sections that would give new regulatory authorities to the SBA Office of Advocacy, which we find a particularly additional problematic element of the bill. Because the voice of small business, we think, shouldn't be in the business of telling agencies how to comply with the law.

Mr. WATT. Rather than telling them what is too burdensome.

Mr. SHULL. Right.

Mr. WATT. Okay, thank you, Mr. Chairman.

I thank the witnesses. That was very informative.

Mr. CANNON. The gentleman yields back.

Let me also thank the witnesses.

I ask unanimous consent that the record be left open for 10 days for follow-up questions by Members of the panel. Without objection, so ordered.

Thank you for coming. This has been actually quite insightful, very interesting.

And I know, Mr. Shull in particular, the idea of speedy decisions, we are plagued today with a number of cases where agencies are just not deciding, and that is in some cases bad for business. Often, it is bad for consumers, and so we look forward to your suggestions if we ever get to a public forum with our APA review, which I think would be helpful.

Because I think, I think, is really the key to business. Industry moves so quickly, things happen so quickly in America today, a danger that didn't exist yesterday is here today and devastating.

Perhaps tomorrow, the opportunity for business to significantly improve the quality of their products by having standards like the FDA's good manufacturing practices for nutritional supplements, we are just waiting for them. It doesn't really matter much what they are. They just need to be there and then consumers will have an idea of what they are getting, what the quality is of what they are getting.

So the opportunity to improve how we regulate ourselves I think is significant. So we thank you for being here today.

And, with that, we will adjourn.

[Whereupon, at 1:06 p.m., the Subcommittee was adjourned.]

A P P E N D I X

MATERIAL SUBMITTED FOR THE HEARING RECORD
REVISED PREPARED STATEMENT OF J. ROBERT SHULL, DIRECTOR OF REGULATORY
POLICY, OMB WATCH, WASHINGTON, DC

Testimony of
J. Robert Shull
Director of Regulatory Policy
OMB Watch

Before the
Subcommittee on Administrative Law
Committee on the Judiciary
U.S. House of Representatives

July 20, 2006

Thank you for the opportunity to testify before you today. I am Robert Shull, Director of Regulatory Policy for OMB Watch. OMB Watch is a nonprofit, nonpartisan research and advocacy center promoting an open, accountable government responsive to the public's needs. Founded in 1983 to remove the veil of secrecy from the White House Office of Management and Budget, OMB Watch has since then expanded its focus beyond monitoring OMB itself. We currently address four issue areas: right to know and access to government information; advocacy rights of nonprofits; effective budget and tax policies; and the use of regulatory policy to protect the public.

We are very concerned about the bill being discussed here today, H.R. 682, "The Regulatory Flexibility Improvements Act." While H.R. 682 purports to address the burdens faced by small businesses, the bill will only serve to further drown regulatory agencies in needless analysis, preventing them from promulgating and enforcing the regulations created to protect working families. More effective avenues exist to help alleviate the burden on small businesses while ensuring that workplace, environmental, and civil rights protections stay intact.

- I. **The Regulatory Flexibility Improvements Act is overly broad and will result in wasted public resources and reduced public protections.**

The Regulatory Flexibility Improvements Act amends the Regulatory Flexibility Act by requiring federal agencies to conduct comprehensive analyses of the impacts of federal rules on small businesses. The bill would effect substantial changes from current law, by

1. Expanding the RFA's coverage to include all regulations on the books, even long-proven safeguards such as the ban on lead in gasoline;
2. Inviting paralysis by analysis, by requiring agencies to examine both direct *and indirect* effects of the regulations;
3. Expanding the scope of the RFA to include agency guidance documents, human services rules and land management plans; and
4. Dramatically expanding the scope of rules subject to SBREFA panels.

This far-reaching proposal could have devastating effects, calling into question longstanding health, safety and environmental protections while needlessly burdening agencies and squandering agency resources. Specifically, the bill will do the following:

A. Waste agency resources on highly speculative assessments.

The bill requires agencies to examine not only direct effects, which are currently assessed under the RFA, but also indirect effects. Agencies face substantial difficulties in attempting to calculate indirect effects. In fact, agency representatives at a recent Senate roundtable suggested this analysis would be so speculative as to be useless for policymakers. The courts have consistently held that RFA does not impose an obligation on agencies to analyze indirect economic effects on entities it does not regulate. Requiring consideration of indirect economic effects would drown agencies in burdensome and highly speculative analyses and paperwork that would impede their ability to promulgate needed protections, such as protections for workers against exposure to deadly chemicals, like crystalline silica.

B. Burden agencies with redundant and unnecessary analysis.

The bill also requires reviews of all existing 10-year old rules affecting small business. These look-back studies needlessly spend staff time and money to re-justify important and proven health and environmental safeguards, such as airbag safety standards in cars or food safety inspections that prevent against foodborne pathogens like e-coli or listeria. These look-back studies would add to the lengthy regimen of regulatory assessments already performed by agencies, including those required under Executive Order 12866, the Paperwork Reduction Act, the Unfunded Mandates Reform Act, and the National Environmental Policy Act, among others.

The bill also uses a more expansive definition of "rule" than used in the original Regulatory Flexibility Act. H.R. 682 amends the definition of rule to refer to 5 USC 551(4), which defines a rule as "the whole or a part of an agency statement of general or particular applicability and future effect designed to implement, interpret, or prescribe law or policy or describing the organization, procedure, or practice requirements of an agency." This expanded definition means that regulatory flexibility analysis will also apply to guidance documents and policy statements as well as proposed and final rules. The bill also expands the scope of rules subject to the Regulatory Flexibility Act by including amendments to land management plans, rules affecting Indian tribes, IRS recordkeeping requirements, and regulations governing grants to state and local governments. These changes drastically expand the scope of the Regulatory Flexibility analysis requirements and will needlessly drown agencies in burdensome analysis every time the agency seeks to act in any way.

Moreover, the Regulatory Flexibility Improvements Act has made this analysis more onerous by requiring that the analysis to be more detailed and quantitative than it was previously. Not only will agencies have to perform Reg Flex analyses more often, they will have to spend more time doing each analysis. While the current law gives equal weight to narrative rather and quantitative explanations of the burden of regulations on small entities, H.R. 682 would compel agencies to

Testimony of J. Robert Shull
Director of Regulatory Policy, OMB Watch
Page 3

perform quantitative analysis of burden by requiring agencies seeking to do non-quantitative analysis to explain why a quantitative analysis was not possible.

C. Threaten valuable protections.

Expanding RFA analysis to include look-backs and indirect effects could put longstanding protections in jeopardy. Agencies would be forced to re-justify proven regulatory safeguards such as lead in gasoline or arsenic in the drinking water. Industry advocates have already singled out EPA's ambient air quality standards for life-threatening soot and smog as a primary reason for expanding regulatory flexibility analysis to include indirect effects. H.R. 682 also extends analytical burdens to a whole new universe of public protections — human services rules, such as those protecting abused and neglected children in federally-funded child welfare programs — by including nonprofits in the definition of small entities and expanding the scope of the RFA to regulations governing grants to state and local governments.

The bill also ties the hands of agencies by eliminating procedures for delaying analysis. Under current law, the agency can continue to promulgate a regulation before it has finished the regulatory flexibility analysis, if the agency head believes it is necessary to do so. H.R. 682 eliminates these commonsense procedures, instead forcing agencies to delay needed protections until the analysis is finished. Imagine if emergency regulations to protect miners after the Sago incident, for instance, had to be delayed until the agency could finish this onerous and highly speculative analysis. Even when the need for the regulation has been clearly proven, the agency would have to wait for the regulatory flexibility analysis before it could proceed.

D. Put corporate special interests ahead of the public interest.

H.R. 682 gives corporate interests an even greater advantage in the regulatory process by giving the head of the Small Business Administration's Office of Advocacy a preview of proposed rules before they are published in the *Federal Register* and increased opportunities to intervene in the process. Current law requires EPA and OSHA to submit draft rules to panels of business lobbyists, and a section of this bill would expand these preview opportunities to all agencies. The bill would also expand the regulations that would require SBREFA panels by including all rules that result in "an annual effect on the economy of \$100,000,000 or more," "a major increase in costs or prices," "significant adverse effects" on a variety of economic factors, "a significant impact on a substantial number of small entities." An additional section would actually give SBA's Office of Advocacy the power to write regulations governing all agencies' compliance with the Regulatory Flexibility Act. Given that Advocacy is a taxpayer-funded voice for business interests, this provision is particularly troubling.

In another corporate giveaway, the bill would allow trade associations to be considered small businesses despite their net worth. This change to the current law would allow huge trade associations to masquerade as small businesses and seek the same protections and considerations as other small businesses.

Testimony of J. Robert Shull
 Director of Regulatory Policy, OMB Watch
 Page 4

II. Regulation does not always harm U.S. competitiveness and may actually improve it.

Burdensome anti-regulatory measures like H.R. 682 are born out of the idea that regulation will drive small American companies out of business. The real scholarly evidence, however, refutes this claim. While the business community may be hampered in competing in global trade, regulation is not at fault. The business community, however, has nothing to gain by publicizing the real reasons for its difficulties, such as lower wages paid in other countries with which we now have self-destructive free trade agreements. The idea that regulation causes competitive decline is the product not of careful scholarship but, rather, of a multi-million dollar public relations campaign.

These criticisms of regulation are insufficient for four reasons:

- (A) *Regulatory safeguards produce significant benefits for the public.* Citations of the high cost of regulation do not establish that regulation is unwarranted because they completely ignore what we gain from these expenditures. Protecting people and the environment may cost a lot of money, but it also produces far larger benefits. In fact, even the Office of Management and Budget, which is a main proponent of the idea that regulations are too costly, nonetheless reports every year that regulation in the United States generates aggregate benefits that greatly exceed the cost of the federal regulations.¹
- (B) *Not all costs have the same moral or ethical value.* Some regulatory costs represent the cost to industry of doing what it should have done as a good corporate citizen in the absence of regulation. For example, stunning new evidence reveals that U.S. automakers misled the government and the public for years by claiming that the strength of vehicle roofs is unrelated to the serious injuries sustained when vehicles crash and roll over. According to industry documents, Ford denied this link even though its Volvo subsidiary had conducted research demonstrating that strengthening car roofs and other improvements are the key to preventing injuries and saving lives in rollover crashes.² If and when the National Highway Traffic Safety Administration issues a rule to safeguard against vehicle roofs caving in during rollover crashes, the cost to the automakers of complying will mean little if it is not offset by the profits earned during the period that the automakers knew of the need for stronger roofs but failed to do anything about it.
- (C) *Cost estimates are overblown.* Moreover, many claims about regulatory costs are

1. See 2006 Draft Report on the Costs and Benefits of Federal Regulation, (available on-line at <http://www.whitehouse.gov/OMB/inforeg/reports/2006_draft_cost_benefit_report.pdf> Previous reports on the costs and benefits of regulation available at <http://www.whitehouse.gov/OMB/inforeg/regpol-reports_congress.html>).

2. See Press Release, Public Citizen, "New Report on Auto Industry Data Shows Automakers Misled NHTSA and Public When Denying Link Between Roof Strength and Injuries" (Mar. 30, 2005) (available on-line at <<http://www.citizen.org/pressroom/release.cfm?ID=1909>>).

Testimony of J. Robert Shull
Director of Regulatory Policy, OMB Watch
Page 5

suspicious because they rely on cost estimates that come from industry sources that have an incentive to overstate the costs for regulatory and public relation purposes. According to a recent influential study,

ex ante cost estimates have usually been high, sometimes by orders of magnitude, when compared to actual costs incurred. This conclusion is not at all surprising in light of the strategic environment in which the predictions are generated. In preparing regulatory impact assessments for proposed rules, agencies are heavily dependent upon the regulated entities for information about compliance costs. Knowing that the agencies are less likely to impose regulatory options with high price tags (or to support them during the review process), the regulatees have every incentive to err on the high side.³

One particular estimate of costs, the discredited Crain and Hopkins study commissioned by the Small Business Administration, is significantly overblown.⁴ For example, the familiar estimates that the manufacturing sector in 2000 "shouldered \$147 billion of the \$497 billion onus of environmental, economic, workplace, and tax-compliance regulation"⁵ suffer the same problems just discussed and actually magnify those errors significantly, based on the assumption that regulatory compliance costs should be doubled to account for industry's public relations campaign against regulatory protections and the expenses of lobbying this very Congress.⁶

- (1) Compliance costs are so minuscule that they have minor competitive consequences. Finally, and most importantly for these purposes, regulation cannot be blamed for a decline in competitiveness or other economic ills because compliance costs are only a very small percentage of total value of the shipments made by manufacturers. On the basis of data from the World Bank, Professor Kevin Gallagher of Boston University finds the "sum of all marginal pollution abatement costs in the United States is less than one percent of value added production."⁷ Department of Commerce data confirm this estimate. This information indicates abatement expenditures are an

 Page 6

average of 0.62 percent of the value of shipments of all industries. Industry sectors with high abatement costs only pay between 1.27 and 1.51 percent of the value of shipments.⁸ Indirect costs are derivative of direct compliance costs; since low direct costs generally will produce low indirect costs, regulation overall should have a minor competitive and labor impacts.

The scholarly evidence backs up this claim. Economists have considered the impact of environmental regulations on plant location decisions (do pollution-intensive industries build disproportionate number of new factories in countries or areas of the United States where there is weak environmental regulation?) and on trade flows (do exports from developing to developed countries show an increasing percentage of pollution-intensive goods?). Neither type of study supports a regulation-competitiveness link. I recommend a recent literature review by Professor Sidney Shapiro, which synthesizes the major research on the questions and comes to the following conclusions:

- The leading meta-study of plant location and trade flow studies found that "studies attempting to measure the effect of environmental regulation on net exports, overall trade flows, and plant-location-decisions have produced estimates that are either small, statistically insignificant, or not a robust to test of model specification." These authors concluded that there is "[o]verall ... relatively little evidence to support the hypothesis that environmental regulations have had a large adverse effect on competitiveness, however that elusive term is defined."⁹
- According to another survey of the literature, "The vast majority of studies have found no systematic evidence that the share of developing country exports and production is becoming more pollution-intensive. In addition, no studies have indicated that there is substantial evidence that pollution-intensive industries flee developed countries with relatively high (and costly) environmental standards."¹⁰

III. The Regulatory Flexibility Improvements Act will not meet the needs of small businesses.

H.R. 682 was put forward under the banner of relieving regulatory burden to small business, but this legislation puts public protections at stake while failing to get at the heart of what ails small business. The small business community is a major source of innovation and employment in this country. Like their larger counterparts, however, small businesses are also responsible for social ills addressed by regulations, ranging from workplace health and safety problems to environmental pollution.¹¹ Thus, we cannot simply give small businesses a free pass from regulation. At the same time, it can be relatively more expensive for small business to comply with regulations than large companies. Small businesses want to do their part and be responsible; real reforms, then, must help small businesses comply with regulations in order to level the playing field with large businesses while giving the public the protection it needs and deserves.

We already have these reforms. Small firms receive direct government subsidies such as outright and government-guaranteed loans from the Small Business Administration (SBA) as well as indirect preferential treatment through federal procurement requirements and tax provisions. Additionally, small business is treated to many exemptions or special treatment in the area of regulation. For example, employers with fewer than 15 employees are exempt from the Equal Employment Opportunity Act,¹² and OSHA levies lighter penalties for smaller firms, exempts businesses with fewer than 10 workers from recordkeeping requirements, and provides free on-site compliance consultations.¹³

Small business concerns are inscribed in law. The Small Business Regulatory Enforcement Fairness Act (SBREFA) requires agencies to give special consideration and voice to small business as part of the rulemaking process as well as expanded judicial review for small businesses wishing to challenge agency decisions.¹⁴ Likewise, the Equal Access to Justice Act gives small businesses special privileges when litigating against agencies: small businesses can recover attorney's fees if they prevail in court against a federal agency.¹⁵

Real reforms for small businesses would make these benefits meaningful by clamping down on the ways that large businesses game the rules and claim the status of "small business." Real reform would consider the role of small business in contributing to pollution and other harms to the public and would respond by adequately funding compliance assistance offices in every congressional district,

Testimony of J. Robert Shull
Director of Regulatory Policy, OMB Watch
Page 8

which would be given the resources they need to give small businesses the help that they, in turn, need to be good corporate citizens and comply with the law. This bill does not come close to being real reform; it is a shameful giveaway of the protections we need, and it shamelessly exploits the real needs of small businesses in order to justify this dangerous exercise.

IV. There is a better way.

A. National Business Regulatory Assistance Act

There are better ways to help small business without sacrificing longstanding public protections. The National Small Business Regulatory Assistance Act (S. 1411) would be the first step to strengthening Small Business Development Centers (SBDCs) around the country by launching a pilot in which SBDCs would provide compliance assistance to small businesses. This bill would help level the playing field for small businesses by giving them specialized assistance with understanding and complying with federal regulations, without compromising the public's protections, directly or indirectly; instead, it would actually help some businesses to comply with the regulations that are in place to protect the public.

B. Strengthening Petitions for Rulemaking

Processes already exist that allow both businesses and the public interest to ask federal agencies to address particular regulatory problems. Small businesses are already well aware of the regulations that are particularly burdensome or obsolete. Rather than expanding the Regulatory Flexibility Act to review all federal regulations on the books, small businesses already have the power to petition agencies to revisit specific regulations. Strengthening the petition process by making agencies more responsive to requests from the public would use existing mechanisms to open the door to reforms without drowning agencies in reviews of existing regulations. Moreover, rather than serving a particular constituency, strengthening petitions for rulemaking would benefit all members of the public. It can be used to identify both gaps in public protections as well as areas where reform may be needed.

Problems of H.R. 682

Regulatory Flexibility Act	Regulatory Flexibility Improvements Act (H.R. 682)
<ul style="list-style-type: none"> - Applies only to rules with direct effects on small businesses - Includes regulations impacting small businesses and local governments - Requires agencies to prepare a regulatory flexibility analysis for all proposed rules and for all final rules, summarizing why the action is being taken and description of how small entities will be impacted. - The agency is required to respond to public comments. - Allows analysis to be either quantified or general. - Requires small business panel to review all rules by EPA and OSHA with a significant impact on small entities. - Periodic review of all rules, "which have or will have a significant adverse impact on a substantial number of small entities," going back to ten years before the enactment of the RFA. 	<ul style="list-style-type: none"> - Applies to rules, policy statements and guidance documents, land management plans, revisions or amendments to land management plans, recordkeeping requirements and formal rulemakings with direct and indirect effects to small businesses. - Includes regulations impacting small businesses, local governments, Tribal organizations, local labor organizations and professional and trade associations - Regulatory flexibility analysis must contain all provisions of original regulatory flexibility analysis, but must also include a description of alternatives that might maximize benefits and an estimate of "the additional cumulative economic impact of the proposed rule on small entities beyond that already imposed on the class of small entities." Final analysis is no longer required to be "succinct," and explanations are amended to be "detailed explanations." - The agency is required to specifically respond to comments filed by the Chief Counsel of Advocacy, including details of any changes made as a result of the comments. - If agency gives a general description instead of a quantified analysis, it must include detailed explanation of why quantification is not "practicable or reliable." - Eliminates procedures for agency heads to delay the analysis before promulgating proposed or final rule. - Requires small business panel to review all rules that result in "an annual effect on the economy of \$100,000,000 or more," "a major increase in costs or prices," "significant adverse effects" on a variety of economic factors, "a significant impact on a substantial number of small entities." - Periodic review of all rules, regardless of whether they have had or will have a significant impact on a substantial number of small entities. Agencies will submit a report to Congress regarding their findings. The review must include comments by the Regulatory Enforcement Ombudsman and the Chief Counsel of the Office of Advocacy and "the contribution of the rule to the cumulative economic impact of all Federal rules on the class of small entities affected by the rule."

PREPARED STATEMENT OF THE HONORABLE DONALD A. MANZULLO, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF ILLINOIS, AND CHAIRMAN, COMMITTEE ON SMALL BUSINESS

DONALD A. MANZULLO, ILLINOIS
CHAIRMAN

NYDIA M. VELAZQUEZ, NEW YORK

Congress of the United States
House of Representatives
109th Congress
Committee on Small Business
2501 Rayburn House Office Building
Washington, DC 20515-2515

Statement for the Record of the Hon. Donald A. Manzullo
Chairman, Committee on Small Business
Before the Subcommittee on Commercial and Administrative Law
of the Committee on the Judiciary
United States House of Representatives
Washington, DC
July 20, 2005

New small businesses open every year. Buffeted by a variety of economic and financial gusts, these businesses struggle mightily against the prevailing winds in an effort to reach their destination of profitability. One very strong gale through which small businesses must navigate is unnecessary and overly burdensome federal regulation. Small businesses, according to a study by the Office of Advocacy of the United States Small Business Administration, pay \$2,000 per employee per year more than large businesses to comply with the tornado of federal regulation. In some sectors, such as manufacturing, the per-employee cost is even higher than that average. Thus, it is not surprising to learn that nearly 500,000 businesses fall to the regulatory winds buffeting them.

More than 25 years ago, Congress recognized that the gusts of regulation were transforming into a hurricane. Congress reacted with a brilliant idea; force federal regulators to examine the impact that their rules will have on small business before the winds of regulation destroy the small business. That brilliant idea was the Regulatory Flexibility Act. Passed in 1980, it not only was supposed to force federal agencies to think before they regulated but it was to direct their thinking to consider specifically the effect that the regulatory steers have on small business.

Enactment of the RFA forced a small but perceptible shift in the tack of federal regulation. Some agencies used enactment to focus their thinking and develop less burdensome regulation. To many other agencies, though, the RFA was a gentle breeze wafting by, barely ruffling them on their course for more and more burdensome, overlapping, and unnecessary regulation.

Congress tried to strengthen the winds of change in 1996 with the enactment of the Small Business Regulatory Enforcement Fairness Act or SBREFA. That act made agency compliance with the procedural requirements of the RFA judicially reviewable independent of any challenge to the underlying agency rule. With the threat of litigation hanging over them, federal agencies began paying more attention to the RFA.

The added attention did not result in a significant change in wind direction for many agencies. President Bush noted the importance of the RFA as a means to reduce the regulatory storms lashing small business in a March 19, 2002. He also said that federal agencies were ignoring the law. The President went on to state that federal regulators "will care that the law is on the books." The small business owners in attendance at that speech wildly applauded. The President ultimately assigned the task to Dr. John Graham, the former head of the Office of Information and Regulatory Affairs at the Office of Management and Budget and Thomas Sullivan, the Chief Counsel for Advocacy at the United States Small Business Administration. Fearlessly flying into the eye of the regulatory storm, they tried to tame the winds of the federal bureaucracy. While they eliminated many of the gusts, the prevailing winds have not dramatically changed. Small businesses remain buffeted by regulation.

The efforts of Dr. Graham and Chief Counsel Sullivan have been hampered by the inadequacy of the RFA. Plagued by undefined terms and vague parameters, the RFA is far from an ideal statute. Loopholes exist that permit agencies to fly their regulatory proposals to fruition without much more than an occasional bout of turbulence. Some agencies go so far as to interpret their statutory mandate and the RFA in a way as to avoid any semblance of compliance.

The absence of uniform interpretation of the RFA among federal agencies is best demonstrated by a proposed rule published in the Federal Register on July 18, 2006. Six federal agencies that regulate financial institutions and debt collection proposed a joint rule to implement certain sections of the Fair and Accurate Credit Transaction Act (FACTA). Each agency's implementation of the RFA was dramatically different. For example, the Federal Reserve and the Federal Trade Commission provided detailed analyses and requested comments on significant alternatives. 71 Fed. Reg. at 40,803, 40,805. In contrast, the National Credit Union Administration had one paragraph that simply stated the proposal would not have a significant economic impact on a substantial number of small entities – a statement that does not even comply with existing requirements to provide a factual basis for the certification.

H.R. 682 significantly strengthens the RFA so that agencies, as President Bush stated, "will care that the law is on the books." The bill makes numerous technical improvements to the RFA, eliminates loopholes, and significantly empowers the Chief Counsel to do more than simply cajole and report on agency compliance with the RFA. The primary objective of H.R. 682 is to avoid the type of ad hoc implementation of the RFA evidenced by the joint proposed rule implementing FACTA.

One of the original purposes of the RFA was to create an economic impact statement that was akin to an environmental impact statement that agencies must prepare pursuant to the National Environmental Policy Act (NEPA). Court decisions, however, determined that while parallels exist between the RFA and NEPA, those parallels could only go so far since the level of detail required by NEPA exceeds that required by the RFA. The Small Business Committee regularly sees the impact that regulations have on small businesses struggling to survive and grow. Detailed analysis of the impact of regulations on small businesses is necessary to ensure that regulators are not making irreversible decisions that will reduce the competitive ability of small businesses, prevent them from expanding, and harm the growth of the American economy. After all, even

NEPA recognizes that a major federal action affecting the environment also will have socio-economic consequences that must be measured and assessed before going forward with a major federal action. Yet, the most pervasive and far-reaching federal action – the issuance of a legislative regulation – only need have a modicum of explanation and analysis. That makes no sense, undermines the concept of rational decisionmaking, and leaves small businesses exposed to significant costs and burdens that might otherwise be alleviated without any diminution in the ability of federal agencies to meet their statutory and regulatory mandates.

The other major change relates to the Office of Advocacy and its role under the RFA. Currently, the Chief Counsel's power is quite limited. He can use the power of persuasion, enlist the assistance of Dr. Graham at OIRA, embarrass agency officials in his annual report to Congress, and threaten agencies with the prospect of filing an amicus brief in federal court. But that is all of the Chief Counsel's power. Even though the Chief Counsel is required to instruct agencies in RFA compliance and monitor such compliance, the United States Court of Appeals for the District of Columbia Circuit determined that the interpretations of the RFA by the Chief Counsel do not deserve any deference except to the extent that the comments are like any other comments – persuasive to the agency. This stands in stark contrast to the interpretations of NEPA offered by the Council on Environmental Quality (CEQ). The Supreme Court, on more than one occasion, held that CEQ's regulations implementing NEPA should be given substantial deference.

The significance of the deference paid federal agency interpretation of statutes may be an esoteric point, but it is important nonetheless. The Supreme Court grants substantial deference to federal agency interpretations of ambiguous statutes. The Chief Counsel does not get that deference because he is not considered to be implementing the RFA. By granting the Chief Counsel the authority to write regulations for implementing the RFA, the Chief Counsel's interpretations will be accorded the same deference that courts grant to CEQ's interpretation of NEPA. This will force agencies to work even more closely with the Chief Counsel to ensure that the agency's interpretation of the RFA comports with that of the Chief Counsel.

The bill does not provide bright-line definitions for the two primary parameters in the RFA – "significant economic impact" and "substantial number of small entities." That oversight was purposeful. Given the stunning breadth of the federal bureaucracy, it is not possible to define these terms by either percentages or number of businesses. For example, a statutory definition of significant economic impact that sets an impact as significant if it reduces net profits by five percent seems reasonable. Yet, for the retail food industry, whose gross margins average from 2 to 4 cents on the dollar, a bright-line statutory change amounts to an exemption from compliance with respect to food retailing. Regulations, such as country-of-origin labeling, would never meet that statutory threshold. If the primary purpose of H.R. 682 is to close the loopholes in the RFA, no rational purpose exists by creating new ones. As primary author of this legislation, I would expect the Office of Advocacy, when it drafts implementing regulations, to adopt the tactic used by CEQ when it was faced with defining the parallel amorphous terms of "major federal action" and "significantly affecting the environment."

H.R. 682 also will hold agencies accountable for analyzing both the direct and indirect impacts of their rulemaking decisions on small businesses. Current court decisions are most emphatic in stating that an agency need only analyze the impact of their rules on those entities directly regulated by their actions. An agency may certify that a rule does not substantially impact a significant number of entities by creating rules that state and local governments must implement. Although businesses may suffer harsh and burdensome effects (effects that might well be analyzed in an agency's environmental impact statement and regulatory impact analysis), the obvious impacts on small businesses in such circumstances are ignored by the agency. This practice ignores how Congress delegates responsibility to federal agencies, the real world effect of regulations, and runs contrary to the purpose of the RFA.

H.R. 682 represents a comprehensive fix to current weaknesses in the RFA. When the RFA was enacted, opponents said it would slow the promulgation of rules. A comparison of the size of the Federal Register in 1980 with that today will show that the RFA has done no such thing. During the debate over the amendments to the RFA made by SBREFA, opponents argued that judicial review would create a gust of wind that would blow down the courthouse door. Shockingly, the federal courthouse doors remain standing. Any arguments about the horrors of H.R. 682 that will be raised by opponents of the bill that the regulatory process will come to a grinding halt also have no basis in fact. Nothing in H.R. 682 changes the underlying statutory mandates of federal agencies and their responsibilities. H.R. 682 simply forces agencies to take procedural steps to understand what they are doing when they regulate and those steps will make them regulate more sensibly.

Ultimately, what is at stake is the ability of small businesses to stay in business – based not on the whims and dictates of federal bureaucrats but on their capacities in the marketplace. Better, sounder rules will be beneficial to the regulatory objectives of the agencies through increased compliance and lower costs to small businesses. For example, if the Department of Justice completes its current rulemaking process for implementing the Americans with Disabilities Act in a manner that will force the closure of small businesses, those businesses will be unable to offer services to the disabled undermining the intent of Congress.

No good reason exists to oppose those goals and objectives that the sponsors of H.R. 682 have other than the fear of the unknown. But as President Roosevelt, paraphrasing Michel de Montaigne said: "The only thing we have to fear is fear itself." I stand ready to work with Subcommittee Chairman Cannon and others to ensure that H.R. 682 becomes law. Then the RFA really will be on the books and federal agencies will care that the law is on the books.

On behalf of the American Bar Association ("ABA") and its more than 400,000 members nationwide, I write to express our strong support for funding the Administrative Conference of the United States ("ACUS") for fiscal year 2007 at the fully authorized level of \$3.2 million. As your Committee prepares to mark up the Transportation, Treasury Appropriations Bill later this week, we urge you to provide full funding for ACUS, which was just reconstituted in the last Congress by the enactment of the "Federal Regulatory Improvement Act of 2004" (P.L. 108-401, formerly, H.R. 4917). Once it is provided with this modest funding, the agency will be able to restart its operations and then begin addressing the many important tasks that may be assigned to it by Congress, including, for example, assisting the Department of Homeland Security to consolidate the administrative processes from the more than 20 federal agencies that were included in the new Department.

ACUS was originally established in 1964 as a permanent body to serve as the federal government's in-house advisor on, and coordinator of, administrative procedural reform. It enjoyed bipartisan support for over 25 years and advised all three branches of government before being terminated in 1995. In 2004, Congress held several hearings on ACUS reauthorization, and during those hearings, all six witnesses, including Supreme Court Justices Antonin Scalia and Stephen Breyer, praised the work of the agency. The written testimony of Justices Scalia and Breyer is available on the ABA's website at <http://www.abanet.org/moladv/ACUSreauthorization.html>.

July 18, 2006
Page 2

Following these hearings, H.R. 4917 was introduced by Rep. Chris Cannon (R-UT), Chairman of the House Judiciary Subcommittee on Commercial and Administrative Law, for the purpose of reauthorizing and resurrecting the agency. That bipartisan legislation ultimately garnered 34 cosponsors—including 18 Republicans and 16 Democrats—before being approved unanimously by the House and Senate at the end of the 108th Congress. President Bush then signed the measure into law on October 30, 2004.

At the request of Chairman Cannon, the Congressional Research Service (“CRS”) prepared a short study describing the many benefits of ACUS, and a copy of the CRS Memorandum of October 7, 2004 is also available at <http://www.abnnet.org/pols/dv/ACUSreauthorization.html>. As outlined by CRS, ACUS has many virtues, including the following:

- A newly-reconstituted ACUS would provide urgently needed resources and expertise to assist with difficult administrative process issues arising from the 9/11 terrorist attacks against the United States as well as other new administrative issues. The CRS Memorandum concludes that “[ACUS’s] reactivation would fill the current urgent need for an expert independent entity to render relevant, cost-beneficial assistance with respect to complex and sensitive administrative process issues raised by 9/11 restructuring and reorganization efforts,” including the creation of the Department of Homeland Security by consolidating parts of 22 existing agencies and the 9/11 Commission’s recommendations to establish a new intelligence structure. In addition, CRS noted that ACUS could provide valuable analysis and guidance on a host of other administrative issues, including public participation in electronic rulemaking, early challenges to the quality of scientific data used by agencies in the rulemaking process, and possible refinements to the Congressional Review Act. A fully-funded ACUS could effectively address these and myriad other issues involving administrative process, procedure, and practice at a cost that is minimal when compared to the benefits that are likely to result.

- ACUS enjoys strong bipartisan support and all observers agree that it has been extremely cost-effective. As CRS also noted in its Memorandum, all six of the witnesses who testified before the House Judiciary Subcommittee on Commercial and Administrative Law agreed that during the more than 25 years of its existence, “...the Conference was a valuable resource providing information and guidance on the efficiency, adequacy and fairness of the administrative procedures used by agencies in carrying out their missions.” ACUS was unique in that it brought together senior representatives of the federal government with leading practitioners and scholars of the private sector to work together to improve how our government functions. That collaboration has been sorely missed in many ways, as was so clearly brought out in the hearings. As CRS explained, ACUS produced over 180 recommendations for agency, judicial, and congressional actions over the years, and approximately three-quarters of these reforms were adopted in whole or in part. Because ACUS achieved these impressive reforms with a budget of just a few million dollars per year, CRS noted that “all observers, both before and after the demise of ACUS in 1995, have acknowledged that the Conference was a cost-effective operation.”

- Before it was terminated in 1995, ACUS brought about many significant achievements. In addition to providing a valuable source of expert and nonpartisan advice to the federal government, ACUS also played an important facilitative role for agencies in implementing changes or carrying out recommendations. In particular, Congress gave ACUS facilitative statutory responsibilities for implementing a number of statutes, including, for example, the Equal Access to Justice Act, the

July 18, 2006
Page 3

Congressional Accountability Act, the Government in the Sunshine Act, the Administrative Dispute Resolution Act, and the Negotiated Rulemaking Act. In addition, ACUS' recommendations often resulted in huge monetary savings for agencies, private parties, and practitioners. For example, CRS cited testimony from the President of the American Arbitration Association which stated that "ACUS's encouragement of administrative dispute resolution had saved 'millions of dollars' that would otherwise have been spent for litigation costs." CRS also noted that in 1994, the FDIC estimated that "its pilot mediation program, modeled after an ACUS recommendation, had already saved it \$9 million." The CRS Memorandum provides numerous additional examples of ACUS' prior successes as well.

• ACUS' role in the regulatory process is totally separate and distinct from that of OIRA. In the past, some have suggested that ACUS' activities perhaps may duplicate some of the activities of OMB's Office of Information and Regulatory Affairs ("OIRA"). This reflects a misunderstanding of ACUS' fundamental role in the regulatory process. By virtue of its history and institutional design, ACUS is uniquely in a position to achieve bi-partisan consensus on administrative and regulatory improvements; to provide a forum for executive and independent agencies to exchange "best practices" ideas; and to bring private sector lawyers and academics together with political and career government officials to address ways to improve government operations.

OIRA is a very different type of entity that is neither inclined nor equipped to address many of the issues that ACUS has focused on. For example, there is no way that OIRA could have devoted so much time and attention to developing the ADR techniques that so many government agencies adopted. Nor does OIRA play any role in agency adjudication or judicial review issues. OIRA's principal role is to represent the President in making sure that the Administration's regulatory policy is followed. ACUS's role, on the other hand, is to be an independent catalyst for seeking to reform and improve administrative and procedural issues that accessarily tend to receive less attention in Congress or the White House in the face of what are deemed more pressing day-to-day matters.

In sum, now that Congress has enacted bipartisan legislation reauthorizing ACUS, the agency should be provided with the very modest resources that it needs to restart its operations without unnecessary delay. To accomplish this goal, we urge you to provide \$3.2 million in funding for ACUS for fiscal year 2007 during your Committee's mark up of the Transportation Treasury Appropriations Bill later this week.

Thank you for considering the views of the ABA on this important issue. If you would like to discuss the ABA's views in greater detail, please feel free to contact the ABA's senior legislative counsel for administrative law issues, Larson Frisby, at 202/662-1098, or the Chair of the ACUS Task Force of the ABA Administrative Law Section, Warren Belmar, at 202/586-6758.

Sincerely,

Robert D. Evans

RESPONSE TO POST-HEARING QUESTIONS FROM THE HONORABLE THOMAS M. SULLIVAN, CHIEF COUNSEL FOR ADVOCACY, UNITED STATES SMALL BUSINESS ADMINISTRATION, WASHINGTON, DC

Advocacy: the voice of small business in government

August 11, 2006

The Honorable Chris Cannon
Chairman
Subcommittee on Commercial and Administrative Law
Committee on the Judiciary
U.S. House of Representatives
Washington, DC 20515

Dear Chairman Cannon:

Thank you for the opportunity to provide you with additional information related to my testimony on HR 682, the Regulatory Flexibility Improvements Act. This letter addresses the questions that you posed in your letter dated July 25, 2006.

Congress established the Office Advocacy pursuant to Public Law 94-305 to advocate the views of small business before Federal agencies and Congress. Because Advocacy is an independent office within the U.S. Small Business Administration (SBA), these views do not necessarily reflect the position of the Administration or the SBA. For the sake of clarity, I will repeat each of your questions, followed by our responses.

Q: What provisions of H.R. 682 stand out as the most constructive reforms?

A: H.R. 682 is a comprehensive bill that is meant to close the loopholes in the RFA. While many of the reforms are important, the most important reforms for small entities are:

- 1) Consideration of foreseeable indirect impacts
- 2) Expansion of the requirements for Section 610 review
- 3) Consideration of cumulative impacts of regulations

SBA IS AN EQUAL OPPORTUNITY EMPLOYER AND PROVIDER

4) Codification of Executive Order 13272 (i.e., a permanent mechanism to ensure that agencies respond to Advocacy's comments and provide early access to draft regulations when possible)

Q: *Some critics of the Regulatory Flexibility Act have suggested that its implementation could be improved if certain terms were better defined. For example, they note that "significant economic impact on a substantial number of small entities" should be defined with some specificity. What is your reaction to this suggestion?*

A: When the RFA was initially drafted, the lawmakers intentionally left the term "significant economic impact on a substantial number of small entities" vague to allow the agencies some flexibility to define the terms in the manner that best suit the problem that needs to be addressed, the rule's requirements, and the preliminary assessment of the rule's impact. Some latitude is necessary to assure that agencies are able to perform the best analysis for the particular situation.

Q: *In 2002, President Bush signed Executive Order 13272, which requires federal agencies to establish written procedures and policies on how they measure the impact of their regulatory proposals on small entities.*

What has been your Office's experience with Executive Order 13272?

A: Overall, Executive Order (E.O.) 13272 has been successful. With the exception of the Department of State, all Cabinet-level departments have developed written plans in compliance with E.O. 13272. The performance of the independent agencies, however, has not been as successful. Of the 75 independent regulatory agencies, only 16 responded to the requirements of the E.O. Of those 16, only eight have provided written procedures, while six claimed that they do not regulate small entities, and two claimed to be exempt from the E.O.

E.O. 13272 also requires that Advocacy provide training to the agencies on compliance with the RFA. Since the E.O. was signed, Advocacy has held 55 training sessions at 45 different agencies. Agency attorneys, economists, policymakers, and other employees involved in the regulatory writing process have attended the hands-on sessions to learn how to comply with the RFA in a regulatory setting. Advocacy's current efforts are focused on rolling out an interactive electronic training module so that agencies can engage in periodic training and train new

employees. Like the classroom setting, the online training program explains the steps rule writers should follow to make RFA decisions accurately. As a result of Advocacy's training and the implementation of agency rulemaking, agency compliance with the RFA has improved.

Moreover, E.O. 13272 requires agencies to provide Advocacy with a draft copy of rules that will have a significant economic impact on a substantial number of small entities when the rules are forwarded to Office of Information and Regulatory Affairs (OIRA) and to give appropriate consideration to Advocacy's comments and address the comments in final rules. As such, Advocacy is getting involved earlier in the rulemaking process. This allows Advocacy to achieve improved agency compliance and cost savings for small entities.

Q: *Some have suggested that it should be codified. What is your reaction to that?*

A: E.O. 13272 has increased agency knowledge of and compliance with the RFA. Small entities would benefit by amending the RFA to codify the requirements of E.O. 13272, ensuring that independent agencies are covered and creating long-term certainty for small entities.

If it is codified, Advocacy would suggest that the requirements be expanded to require agencies to address Advocacy's comments if the agency certifies the rule at the final stage of the rulemaking. Currently, agencies must only address Advocacy's comments if a final regulatory flexibility analysis (FRFA) is prepared. In FY 2005, 12 percent of Advocacy comments addressed improper certifications and 17 percent of Advocacy comments addressed inadequate or missing initial regulatory flexibility analyses (IRFAs).

Q: *Please explain whether current section 610-dealing with periodic review-is or is not working?*

A: Unfortunately, agency compliance with section 610 has historically been minimal. Agencies ignore the requirement altogether or simply issue boilerplate language to the effect that an existing rule has been reviewed, and that the rule remains useful. Small entities are limited in what they can do with burdensome regulations on the books. As noted in my testimony, the

Crain study, *The Impact of Regulatory Costs on Small Firms*, indicates that the overall cost of federal regulation totals \$1.1 trillion, the cost per employee for firms with fewer than 20 employees is \$7,647. This is 45 percent higher than their larger counterparts with 500 or more employees.¹ Since new regulations are promulgated each year, the cumulative impact of regulations on small entities can be staggering.

In addition, a number of agencies interpret section 610 as only requiring review for rules that the agency determined to have a significant economic impact on a substantial number of small entities at the time that the rule was promulgated. As such, many rules that may become costly to small business due to changes in circumstances or additional cumulative rules are not reviewed. Advocacy recommends that the RFA be amended to review all rules periodically. This change would encourage agencies to revise their rules to ensure that regulations reflect current conditions and needs.

Q: *Some have suggested that a "plain English" summary of a final rule is beneficial. Please explain.*

A: Although SBREFA required compliance guides to explain small business regulatory requirements, the compliance guides are only required for rules that have a FRFA, not for final rules that are certified. Moreover, even though a compliance guide is required for rules with FRFAs, some agencies do not comply with that requirement.

A plain English summary of a final rule, in the form of a compliance guide, would be beneficial in terms of explaining the rule to small entities in an easily cognizable manner. Improving the current compliance guide requirement by establishing a date (prior to the implementation of the final rule) for the guide to be published, and establishing minimal criteria for drafting the guides (including a plain English requirement) would provide small entities with the information that they need to comply with new regulations and reduce the penalties that are incurred due to confusion about the requirements. In addition, it would prevent small entities

¹ The Crain report is located at <http://www.sba.gov/advo/research/m207let-264.pdf>.

from having to incur legal fees to understand the rules as well as losing valuable business time trying to decipher the new requirements.

Q: *Under H.R. 682, your office would have expanded responsibilities. Would your Office have the resources to execute these additional duties?*

A: No, the Office of Advocacy would not have the resources to perform all of the duties in H.R. 682.

Q: *Please explain how your office interfaces with OIRA at OMB?*

A: The Office of Advocacy and OIRA work together closely on regulations and paperwork reviews that have a small business impact. OIRA desk officers contact Advocacy's legal/policy team directly when they spot a problematic rule, and vice versa. Using our combined resources generally results in better, less burdensome regulations that still achieve the policy goals of the underlying legislative mandates.

I appreciate the opportunity to provide the requested information. If you have any questions, please contact my office. Thank you.

Sincerely,

Thomas M. Sullivan
Chief Counsel for Advocacy

RESPONSE TO POST-HEARING QUESTIONS FROM J. CHRISTOPHER MIHM, MANAGING
DIRECTOR FOR STRATEGIC ISSUES, UNITED STATES GOVERNMENT ACCOUNTABILITY
OFFICE, WASHINGTON, DC

August 4, 2006

The Honorable Christopher B. Cannon
Chairman
The Honorable Melvin L. Watt
Ranking Minority Member
Subcommittee on Commercial and Administrative Law
Committee on the Judiciary
House of Representatives

On July 25, 2006, you requested that we respond to questions for the official record regarding your Subcommittee's July 20, 2006, hearing on H.R. 682, the Regulatory Flexibility Improvements Act. Our responses are included in this correspondence.

Responses to Questions

1. On July 20, 2006, you testified about various recurring problems regarding the implementation of the Regulatory Flexibility Act (RFA). What role—if any—could a reconstituted Administrative Conference of the United States (ACUS) play with respect to the problems you have identified regarding the Regulatory Flexibility Act?

As we have noted previously, ACUS provided a valuable forum to advise the federal government on administrative procedural reform. ACUS drew on legal experts from across the spectrum to study problems affecting federal administrative procedures and provided nonpartisan advice and recommendations on how to improve the efficiency, adequacy, and fairness of those procedures. We would expect a reconstituted ACUS to provide the same benefits if asked to review issues associated with RFA. ACUS, if funded, could plan and direct empirical research to reexamine RFA and generate a range of practical options for addressing weaknesses of the Act.

2. As you noted in your written testimony, President Bush issued Executive Order 13272 in August 2002, which requires federal agencies to establish written procedures and policies on how they measure the impact of their regulatory proposals on small entities and to vet these policies with the Small Business Administration's (SBA) Office of Advocacy. You also note that GAO has not evaluated whether the Executive Order is helping to address some of the concerns GAO has raised regarding the Act's

effectiveness. Would such an evaluation be useful to have before further reforms to the Act are considered?

In our testimony, we advocated continued monitoring of the implementation of Executive Order 13272, as well as the Office of Advocacy's related RFA guidance and training for federal agencies. Together, the Executive Order and the Office of Advocacy's guidance and training have the potential to reduce agencies' confusion about RFA and promote more effective compliance with the Act's requirements. The Office of Advocacy has reported on its and other agencies' responses to the Executive Order, but a broader independent evaluation of the effectiveness of those actions has not been conducted. Such an evaluation could help Congress to focus proposed amendments of RFA on the aspects of the Act that are still proving most troublesome to implement. As indicated in our response to the first question, such research would also be an appropriate charge for ACUS.

3. With regard to the implementation issues you have highlighted regarding the Regulatory Flexibility Act—particularly with respect to the disparate performance by various agencies—could some of these issues be addressed by more active guidance or involvement by OMB?

We have previously recommended that OMB, in consultation with SBA, take more action regarding oversight and guidance to agencies on compliance with RFA requirements.⁴ OMB acted on some of those recommendations, particularly regarding the RFA requirement for periodic reviews of existing regulations. Our reports have also documented the effects of active OMB involvement and oversight on agencies' rulemaking actions.⁵ With regard to RFA, for example, we noted in February 2000 that the Federal Emergency Management Agency (FEMA) began additional analysis of the impact of its draft regulations on small entities in response to OMB's concerns about the agency's compliance with RFA.⁶ However, there are limits to what OMB involvement could achieve. As we have pointed out in prior reports, OMB's Office of Information and Regulatory Affairs (OIRA), which has responsibility for handling a large volume of regulatory and paperwork reviews, is a relatively small office, so attention to RFA issues would compete with other priorities. Also, OIRA's oversight of rulemaking generally does not cover the rules of independent regulatory agencies.

4. Does the Office of Advocacy at the Small Business Administration provide sufficient guidance under the Regulatory Flexibility Act?

As noted in our testimony, the Office of Advocacy's 2003 RFA compliance guide appears to be helpful in addressing some of the issues we have raised regarding the Act. In particular, it discusses the interpretation of key terms in RFA and suggests factors that agencies might want to consider when making RFA determinations. The key, however, will be effective implementation, particularly the degree to which agencies successfully and consistently apply that guidance. We have not evaluated

For a summary of some of those recommendations, see GAO, *Regulatory Flexibility Act: Clarification of Key Terms Still Needed*, GAO-02-491T (Washington, D.C.: Mar. 6, 2002).
See GAO, *Rulemaking: OMB's Role in Reviews of Agencies' Draft Rules and the Transparency of Those Reviews*, GAO-03-029 (Washington, D.C.: Sept. 22, 2003).
GAO, *Disaster Assistance: Issues Related to the Development of FEMA's Insurance Requirements*, GAO/GGD/OGC-00-62 (Washington, D.C.: Feb. 25, 2000).

the implementation of the Office of Advocacy's 2003 guidance. Therefore, we have no basis to judge whether the guidance, on the whole, is sufficient.

5. Since 1996, judicial review has been available under the Regulatory Flexibility Act. What impact, if any, has judicial review had on the problems GAO has cited over the years about the Regulatory Flexibility Act?

We have only addressed the impact of judicial review indirectly; it has not been a primary objective of any of our RFA evaluations. For example, in a December 2001 report, we noted that some officials indicated that their agencies may prepare voluntary final regulatory flexibility analyses to help ensure that their rules will not be overturned via judicial review. In a September 2000 report, we outlined the development of changes in EPA's RFA guidance documents over time. We noted that an EPA official said the provision allowing judicial review of regulatory flexibility analyses meant that the agency would have to make sure that all of its initial regulatory flexibility analyses could withstand judicial scrutiny, and, therefore, EPA no longer had the option of doing a limited analysis on rules that it believed would have a minimal impact on small entities. We also pointed out that, in a report marking the 20th anniversary of RFA, the Office of Advocacy noted that the addition of judicial review had been an incentive for agencies to comply with the Act's requirements and that small entities were not hesitant to initiate court challenges in appropriate cases.

Please contact me at (202) 512-6806 or mihm@gao.gov if you, other Subcommittee members, or your staffs have additional questions or if we can provide additional help to your work on these issues.

RESPONSE TO POST-HEARING QUESTIONS FROM J. ROBERT SHULL, DIRECTOR OF
REGULATORY POLICY, OMB WATCH, WASHINGTON, DC

J. ROBERT SHULL
Director of Regulatory Policy

Responses to Subcommittee Follow-Up Questions

1. Does the current rulemaking process adequately address the needs of small businesses?

It is not at all surprising that proponents of the House and Senate bills to change the Regulatory Flexibility Act frame their initiative as a service to small business; the public believes that small businesses need some help in order to operate on a level playing field with big corporations. The small business community is a major source of innovation and employment in this country. Like their larger counterparts, however, small businesses are also responsible for social ills addressed by regulations, ranging from workplace health and safety problems to environmental pollution.¹ Thus, we cannot simply give small businesses a free pass from regulation. At the same time, it can be relatively more expensive for small business to comply with regulations than large companies. Small businesses want to do their part and be responsible; real reforms, then, must help small businesses comply with regulations in order to level the playing field with large businesses while giving the public the protection it needs and deserves.

We already have these reforms. Small firms receive direct government subsidies such as outright and government-guaranteed loans from the Small Business Administration (SBA) as well as indirect preferential treatment through federal procurement requirements and tax provisions. Additionally, small business is treated to many exemptions or special treatment in the area of regulation. For example, employers with fewer than 15 employees are exempt from the Equal Employment Opportunity Act,² and OSHA levies lighter penalties for smaller firms, exempts businesses with fewer than 10 workers from recordkeeping requirements, and provides free on-site compliance consultations.³

1. See Richard J. Pierce, Jr., *Small is Not Beautiful: The Case Against Special Regulatory Treatment of Small Firms*, 50 ADMIN. L. REV. 537 (1998).

2. See 42 U.S.C. § 2000e(b).

3. See OSHA, *OSHA Small Business Assistance: OSHA Benefits for Small Business* (available on-line at <<http://www.osha.gov/dcsy/smallbusiness/benefits.html>>).

Small business concerns are inscribed throughout the regulatory process. The Small Business Regulatory Enforcement Fairness Act (SBREFA) requires agencies to give special consideration and voice to small business as part of the rulemaking process as well as expanded judicial review for small businesses wishing to challenge agency decisions.⁴ (Note that public interest advocates are not accorded similar privileges.) Likewise, the Equal Access to Justice Act gives small businesses special privileges when litigating against agencies: small businesses can recover attorney's fees if they prevail in court against a federal agency.⁵

Of course, these benefits accrue not just to the mom-and-pop storefront that we tend to think of when we talk about small business but also to very large multimillion dollar businesses that can game the rules and claim the status of "small business."⁶

Because of all these ways that the regulatory process already serves the special interests of small businesses, the real need is not for more burdens on that process — burdens which could put the public at risk. Real reform would consider the role of small business in contributing to pollution and other harms to the public and would respond by adequately funding compliance assistance offices in every congressional district, which would be given the resources they need to give small businesses the help that they, in turn, need to be good corporate citizens and comply with the law.

2. **You question the value of requiring agencies to assess the indirect effects of regulations on small businesses. Consider, for example, a situation where the Department of Homeland Security issues a regulation restricting the number of flights that can land at an airport. Under current law, the DHS would probably only have to consider the impact of the regulation on the airlines themselves. Shouldn't the DHS also be required to at least consider the indirect impact that the regulation could have on all the small shop owners and other entrepreneurs at the airport that will undoubtedly lose business as a result of this regulation?**

At the core of this question is a concern, which has been aggravated by the public relations machinery of corporate special interests and industry-funded think tanks, that regulatory protections for the public interest are a drag on the economy that impede the competitiveness of American businesses, large and small. The empirical literature tells us a much different story. I am attaching to this response an OMB Watch Issue Brief, *Regulation and Competitiveness*, which goes into more detail on this literature, as well as a more recent scholarly overview by economics professor Frank Ackerman, Ph.D. The short version of the story is that economic indicators fail to demonstrate a link between protective regulations and competitiveness, or any cost in jobs for American workers; in fact, consistent with the Porter "hypothesis," there are many cases in which regulation demonstrably *improved* business operations by inspiring companies to innovate and discover new efficiencies. Many of these cases are also briefly noted in another attached document, *The Going-Out-of-Business Myth*.

An additional driver of the concerns about the costs to small businesses of complying with regulations is a series of studies commissioned by the Small Business Administration's Office of

4. See 5 U.S.C. §§ 601 *et seq.*

5. See *id.* § 504.

6. See OMB Watch, *Small Business Not So Small*, Apr. 17, 2002, available at <<http://www.ombwatch.org/article/articleview/687/1/24371?opicID=3>>.

Advocacy that purport to estimate the burden on small businesses. This series of studies, in all its iterations, is a deeply flawed enterprise. I am attaching an excerpt from OMB Watch's comments to OMB's 2005 draft report on the costs and benefits of regulations, in which we pointed out the deep flaws of the SBA study — and repeated OMB's own criticisms of the study. The SBA study is based on other deeply flawed estimates of industry compliance costs, which a recent Public Citizen report debunked as systematically biased in an upward direction.⁷

More specific to the question posed here: if agencies were required to assess indirect effects of regulation on small businesses, where would the inquiry ever end? The small businesses operating at the hypothetical airport (which, given the rents at major airports, are most likely not small at all but actually large chain establishments, or franchise operations of larger corporate enterprises) buy supplies from other possibly small businesses, and they may contract for janitorial services from yet more small businesses. Those small businesses, in turn, have relationships with yet more small businesses. All of these attendant effects are most certainly indirect. To assess them quantitatively would be unhelpfully speculative, and it is unclear whether the resulting estimates would be helpful in the already fraught and difficult task of priority setting for policies to protect the public.

3. **Why do you cite as being particularly troubling those provisions in H.R. 682 allowing the Office for Advocacy to preview proposed rules before they are published in the Federal Register and giving that Office the power to write regulations governing agencies' compliance with the Regulatory Flexibility Act (RFA)?**

SBA's Office of Advocacy is, as the name implies, an *advocate* for the interests of business. An advocate for business has no place dictating anything to agencies charged with protecting the public health, safety, civil rights, environment, or social welfare. Moreover, a voice for business should not be given the first bite at the apple in previewing draft regulations; business interests ought to be forced to play on a level playing field with the public interest.

4. **What is your view of the value, if any, of Executive Order 13,272?**

Corporate special interests, whether or not they count as "small" under SBA rules, have an acute interest in fighting regulations and organized resources that they can bring to bear in those fights. The public, meanwhile, has a diffuse interest in regulations, and its interests are organized, if at all, in the under-resourced nonprofit sector. Accordingly, business interests are always already better organized and better resourced in their opposition to regulation than the public interest sector can ever be in its support for new protective standards. An executive order extralegally distorting the regulatory process to allow a government-funded voice for business interests to preview draft regulations and enjoy other special privileges in the regulatory process is the last thing we need. Moreover, any other layers of review before regulations can be published are delays that endanger the public, which can count the cost in lives.

7. See REITH RUFFENBERG & ASSOCS., NOT TOO COSTLY, AFTER ALL: AN EXAMINATION OF THE INFLATED COST ESTIMATES OF HEALTH, SAFETY, AND ENVIRONMENTAL PRODUCTIONS (Public Citizen, Feb. 2004), available at <<http://www.citizen.org/documents/ACF187.pdf>>.

5. Do you think that some of the implementation issues which have been cited by the GAO and others regarding the RFA could be addressed by OMB?

OMB would undoubtedly do much to distort the process further in favor of corporate special interests, if given the excuse to do so and legal cover in the name of the Regulatory Flexibility Act. For reasons stated above, we do not support any such extraordinary efforts to use the Regulatory Flexibility Act to tilt the playing field any more than it already is. Additionally, OMB, through its Office of Information and Regulatory Affairs, has demonstrated an appalling willingness over the years to weaken or eliminate protective policies. For an overview of OMB's destructive legacy during the tenure of John Graham as administrator of OIRA, see our collection of web articles at www.OMBWatch.org/rcgs/grahamfiles. OMB should not be entrusted with any more legal authorities to disrupt protective policies.

6. Do you think the Administrative Conference of the United States — if it was reconstituted — could play a role in improving the implementation of the RFA?

ACUS is fondly remembered by many who follow regulatory policy. The general consensus is that the quality and utility of ACUS's work were dependent on the quality of the staffing and the resources allotted to ACUS. Because, however, we do not share the view that the RFA needs to become any more of a burden than it already is, I cannot address whether ACUS would or would not be effective in the job envisioned by RFA proponents.

Regulation and Competitiveness

Anti-regulatory arguments claim that regulation is inherently a burden that weakens the competitiveness of American businesses in the global market. Yet a plethora of scholarly studies indicates that the opposite is true: regulation not only does not hinder U.S. competitiveness but actually may increase the competitive advantage of the United States. Overall, factors such as wages and trade agreements play a much larger role than regulation in determining U.S. competitiveness. Economists have been unable to find the strong negative correlation between regulation and competitiveness. This finding may run counter to intuition, but it suggests that protecting public health, safety and the environment can have real economic advantages; the United States does not have to sacrifice public protections in order to promote U.S. competitiveness.

1. Economic indicators fail to show an environment/competitiveness tradeoff.

Economists look at several economic indicators to determine the impact of regulation on competitiveness, such as plant location, industry imports and exports, and foreign direct investment (FDI). The argument that regulation harms U.S. competitiveness is based primarily on the theory that pollution-intensive industries will move to areas with more lax environmental regulations ("pollution havens") in order to avoid the costs of compliance with more stringent environmental protections. If the pollution haven theory holds, then firms will choose to open new plant locations in areas with less regulation. Similarly, if regulation impacts competitiveness, then there should be a positive correlation between regulation and net imports of an industry: as regulation increases, countries with more lax regulations will gain a great share of the import market. Further, if the pollution haven theory is to hold, then stringent regulation in the United States will induce high polluting firms to disproportionately invest overseas.

Though some economists have found a pollution haven effect, many economists have discovered that regulation has no negative impact on competitiveness, and some have even argued that regulation may increase competitiveness. Even in studies that have found that regulation hampers competitiveness, the effect tends to be insignificant or, at most, significant but relatively minor. A 1995 survey of economic studies by Jaffe et al., for instance, concludes that "overall, there is relatively little evidence to support the hypothesis that environmental regulations have had a large adverse effect on competitiveness, however that elusive term is defined."² Eban Goodstein not only corroborated

1. February 2006. This issue brief was written by Genevieve Smith, Regulatory Policy Analyst.

2. Jaffe et al., *Environmental Regulation and the Competitiveness of U.S. Manufacturing: What Does the Evidence Tell Us?*, 33 J. ECON. LIT. 132, 157 (1995).

Jaffe's conclusions but has also found that, between 1979-1989, the industries that spent more on regulation compliance actually exhibited superior performance compared to imports from developed and developing countries.³ Those who claim that regulation is overly burdensome tend to ignore the divergent economic opinion on regulation and competitiveness and instead focus only on inapposite evidence mischaracterized as corroborating a deregulatory agenda.

Regulation does not negatively impact plant location decisions.

The Jaffe et al. study looked at all three indicators of competitiveness and found on all accounts that regulation was not a major factor in competitiveness. In the case of plant location decisions, Jaffe et al. found that there is little evidence to support the conclusion that stringent regulation is a major determinant in plant location decisions. This finding is corroborated by a host of other economists. Timothy J. Bartik studied the impacts of state government environmental regulation expenditures on plant location decisions and found that such expenditures had an insignificant effect on plant locations.⁴ Kevin Gallagher found that plants moving to Mexico are not the ones with highest pollution abatement costs; overseas movement of industries is affected more by labor costs than by regulation.⁵ A look at plant location within India found that increased government spending on environmental regulation not only did not deter plant location but actually had a positive impact.⁶

Clark, Marchese, and Zarrilli examined industry decisions to conduct offshore assembly in developing companies. Consistent with the findings on plant location, the authors found that pollution intensive industries were less likely to conduct offshore assembly. They argued that the U.S. has a comparative advantage in highly polluting industries, while developing countries have a comparative advantage in simple assembly industries. At the same time, "the cost of pollution control and abatement are too small to influence the competitive performance of location decision of these activities."⁷

Regulation does not increase dependence on imports.

Further, several economic studies have found that stringent regulations have not led to

7. Don P. Clark, Serafino Marchese & Simonetta Zarrilli, *Do Dirty Industries Conduct Offshore Assembly in Developing Countries?*, 14 INT'L ECON. J. 75, 86 (2000).

increases in imports. Jaffe et al. examined a number of studies on the impact of regulation on imports and exports and concluded once again that regulation has no significant impact. Grossman and Krueger, for instance, looked at the impacts of NAFTA on net imports and found greater imports in industries with the lower pollution costs. Moreover, they found that "traditional determinants of trade and investment patterns" have a significant impact on net imports while environmental costs have a minor and insignificant impact.⁸

A 1997 briefing paper by Eban Goodstein confirmed the findings of Jaffe et al. Moreover, Goodstein's study also found that "over the 1979-89 period, industries that spend more money complying with environmental regulations actually demonstrated superior performance against imports from developed countries."⁹ Goodstein found the same relationship "for imports from developing countries, but the relationship was not as strong."¹⁰ Goodstein expanded on existing research on the effect of regulation on net imports by exploiting the large dataset made available by the National Bureau of Economic Research (NBER). Again, he concluded from the data that environmental regulation does not harm U.S. competitiveness. A look at the top 20 industries that experienced growth of import share by less-developed countries (LDC) from 1973-79 and 1979-89 shows that industries with high environmental costs were not the industries experiencing growth in net imports. In fact, "only three of the top 20 in the early period were industries with higher than average environmental costs; only one in the latter. It seems, then that low-wage industries, not 'dirty' ones, dominate the list of LDC import leaders."¹¹

Regulation does not send foreign investment abroad.

Despite predictions to the contrary, several economic studies have found foreign direct investment to increase with environmental stringency, implying that environmental regulation does not deter foreign investors. In a recently published article for the *International Trade Journal*, Elizabeth T. Cole and Prescott C. Ensign have found that U.S. FDI into Mexico is moving toward low polluting industries.¹² In fact, air pollution decreased in the United States at a time when foreign direct investment was increasing.¹³

13. DAVID WHEELER, RACING TO THE BOTTOM? FOREIGN INVESTMENT AND AIR POLLUTION IN DEVELOPING COUNTRIES (Development Research Group, World Bank, 2001), available at <http://papers.ssrn.com/sol3/papers.cfm?abstract_id=632594>. Wheeler's study shows a correlation and not causation.

Thus, the bulk of the economic literature contradicts the claim that regulation seriously hampers U.S. competitiveness. As Jaffe et al. conclude, “studies attempting to measure the effect of environmental regulation on net exports, overall trade flows, and plant-location decisions have produced estimates that are either small, statistically insignificant, or not robust to tests of model specification.”¹⁴ Other economic factors, such as labor costs, play a much more significant role in the movement of industries. Concludes Goodstein, “Highly polluting industries are relocating to poor countries; but the reason, overwhelmingly, is low wages.”¹⁵

Economic opinion on the existence of a pollution haven effect is by no means conclusive. Economic studies deviate broadly on the subject. According to one literature review, “much of the empirical literature that has attempted to test this assumption has arrived at differing conclusions, ranging from a modest deterrent effect of environmental regulatory stringency on economic activity to a counterintuitive modest attract effect.”¹⁶ Even in the most damning characterizations, regulation still is only said to have a modest impact on U.S. competitiveness.¹⁷

Even if *some* evidence does point to a pollution haven effect, one cannot dismiss the wide range of divergent economic opinion on the subject. As Tim Jeppesen, John List and Henk Folmer conclude in a 2002 article for the *Journal of Regional Science*, “casual perusal of the literature [on regulation and competitiveness] indicates that construction of a consensus point is akin to finding a needle in a haystack.”¹⁸

2. Regulation does not cost jobs.

Economists have also refuted the claim that increased regulation decreases jobs. Economist Eban Goodstein at the Economic Policy Institute has written substantially on the relationship of jobs and the environment. According to Goodstein, the jobs-environment trade-off is largely a myth. Goodstein’s book *Jobs and the Environment: The Myth of a National Trade-Off* finds a small positive effect of environmental regulation on overall employment, especially in the area of manufacturing

14. Jaffe et al., *supra* note 2, at 157-158.

17. See Keller & Levinson, *Pollution Abatement Costs and Foreign Direct Investment Inflows to U.S. States*, 84 REV. ECON. & STATS. 691 (2002), in which they found that environmental regulation does have significant negative impact on FDI into the United States, but the magnitude is economically small. See also Arik Levinson, *Environmental Regulation and Manufacturers’ Location Choices: Evidence from the Census of Manufacturers*, 62 J. PUB. ECON. 5 (1996), in which Levinson found that the manufacturing sector is sensitive to environmental regulation, but again the impact is small in magnitude. Though the sector was sensitive to regulation, “the degree of aversion to stringent states does not seem to increase for pollution-intensive industries.”

18. Tim Jeppesen, John A. List, & Henk Folmer, *Environmental Regulations and New Plant Location Decisions: Evidence from a Meta-Analysis*, 42 J. REGIONAL SCI. 19, 36 (2002).

workers.¹⁹ Goodstein also finds that environmental regulation does not lead to manufacturing plant shutdowns.

Regulation leads to job creation and innovation of new technologies that can then expand the economy. Government spending on environmental regulation includes "investments in pollution control equipment and personnel, scientific studies to test pesticides and chemicals, the clean-up of hazardous wastes at Superfund sites, and the bill paid to your local garbage collector."²⁰ All of these costs *create jobs*. Moreover, these jobs are overwhelmingly blue collar and, by nature, domestic.²¹ According to Goodstein, "the one comprehensive estimate available suggests that, in 1992, just under 4 million jobs were directly or indirectly related to pollution abatement and environmental protection in the United States."²²

Even the more equivocal work of Richard D. Morgenstern, William A. Pizer, and Jih-Shyang Shih cannot avoid the job-creating potential of environmental protection: they conclude that environmental regulation is *just as likely* to create jobs as to cause job losses. "While environmental spending clearly has consequences for business and labor, the hypothesis that such spending significantly reduces employment in heavily polluting industries is not supported by the data," they write.²³ Morgenstern et al. examined the pulp and paper, plastics, petroleum and steel sectors and found "that a million dollars of additional environmental expenditure is associated with an insignificant change in employment."²⁴

They explain: "Most importantly, there are strong positive employment effects in industries where environmental activities are relatively labor intensive and where demand is relatively inelastic, such as plastics and petroleum. In others, where labor already represents a large share of production costs and where demand is more elastic, such as steel and pulp and paper, there is little evidence of a significant employment consequence either way."²⁵

Berman and Bui also found that regulation had no impact on labor demands. The authors examined the impact on labor demands of increased air pollution abatement in the Los Angeles area.

25. *Id.*

In looking at data from 1979 through 1992, a period that saw sharp increases in environmental regulation, they found that increased regulation had no effect on employment in refineries.²⁶

3. Regulation can improve efficiency.

Those posing an anti-regulatory agenda are forced to dismiss entirely the Porter "hypothesis" that regulation can actually increase productivity by increasing the efficiency of operations. Porter's theory was developed in response to real-world observations, such as OSHA's Cotton Dust Rule, in which regulations to protect the public had indirect benefits of inducing technological innovations and improved efficiencies in business operations. Since Porter elaborated his argument, the real world examples have continued to multiply. His "hypothesis" is now backed by a robust body of empirical evidence:

- Though regulation certainly does result in some cost to industry, it can also spur economic growth and increased efficiency. Jaffe points to a 1990 Barbera and McConnell study that "found that lower production costs in the nonferrous metals industry were brought about by new environmental regulations that led to the introduction of new, low-polluting production practices that were also more efficient."²⁷ EPA itself has in fact argued that environmental regulations generate "more cost-effective processes that both reduce emissions and the overall cost of doing business."²⁸
- A study of the impacts on food manufacturing of trade liberalization between Mexico and the U.S. found that free trade would benefit Mexican producers because of resulting productivity growth, not because of the country's more lax environmental regulation. In fact, increased environmental regulation actually stimulated greater productivity in Mexican food manufacturing. "Pollution abatement efforts encouraged by the Mexican Government's inspection program manifestly have stimulated improvements in food processing efficiency as well as in environmental quality."²⁹ The enhanced productivity offset any consequence for the profitability of Mexican food manufacturing in the aftermath of the new pollution controls. At the same time, the authors found "U.S. pollution regulations have had no impact on the

profitability or productivity of U.S. food manufacturing.⁹⁰

- Berman and Bui also found that in meeting more stringent environmental standards, oil refineries in the Los Angeles Air Basin actually increased their productivity and efficiency. Interviews with "plant managers and environmental engineers suggested that productivity increases were not accidental. They resulted from a careful redesign of production processes induced by the need to comply with environmental regulation."⁹¹
- Stephen Meyer compared regulation across states in the United States found that environmental regulation did impact economic prosperity. In fact, "states with stronger environmental regulations tended to have higher growth in the gross domestic products."⁹² Though the correlation does not suggest causation, it does indicate that environmental regulation does not hinder state's economies. The correlation held true even during times of recession. In an update focusing on the 1990-91 recession, Meyer found states with stronger environmental regulation were not more likely to face economic decline during a period of recession than states with weaker environmental standards.⁹³

Although the United States already has the least restrictive regulation in the world⁹⁴ and is third on the list of the world's top ten economies,⁹⁵ the business community has continued to assert that health, safety and environmental regulation is overly burdensome and must therefore be repealed. Yet the evidence shows that the cost to business of complying with regulation is negligible and that factors such as wages and trade agreements have a far greater impact on the competitiveness of U.S. business or the choice of an industry to move business overseas.

The Going-Out-of-Business Myth

The public needs regulatory safeguards to protect our health, safety, environment, civil rights, and welfare. Corporate special interests, however, have an interest in avoiding spending a single dime to improve their destructive behavior. Again and again, when new regulatory protections have been proposed, corporate lobbyists have argued that business would be bankrupted and forced to go out of business. Again and again, they have been proven wrong.

Case Study	Ex ante	Ex post
Asbestos	"When the Occupational Safety and Health Administration (OSHA) instituted regulations covering exposure to asbestos in the early 1970s, [it] hired a consulting firm to estimate the cost of compliance." ⁹¹	"Two later studies found that the original prediction for the cost of compliance was more than double the actual cost, because of overly static assumptions." ⁹²
Benzene	"In the late 1970s, the chemical industry predicted that controlling benzene emissions would cost \$350,000 per plant." ⁹³	"Shortly after these predictions were made, however, the plants developed a process that substituted other chemicals for benzene and virtually eliminated control costs." ⁹⁴
CFCs	"In 1988, reducing CFC production by 50 percent within 10 years was estimated by the EPA to cost \$3.55 per kilogram. By 1993, the goal had become much more ambitious: complete elimination of CFC production, with the deadline moved up two years, to 1996." ⁹⁵	"Nevertheless, the estimated cost of compliance fell more than 30 percent, to \$2.45 per kilogram. And where substitutes for certain CFCs had not been expected to be available for eight or nine years, industry was able to identify and adopt substitutes in as little as two years." ⁹⁶ Additionally, regulated industry achieved substantial costs savings as a result of the CFC phase-out. For example, "when the international phase-out of ozone-destroying CFCs got underway, a company called Nortel began looking for substitutes. The company, which had used the chemicals as a cleaning agent, invested \$1 million to purchase and employ new hardware. Once the redesigned system was in place, however, Nortel found that it actually saved \$4 million in chemical waste-disposal costs and CFC purchases." ⁹⁷

CFCs in Automobile Air Conditioners	"In 1993 car manufacturers estimated that the price of a new car would increase by \$650 to \$1,200 due to new regulations limiting the use of CFCs." ⁸⁸	"In 1997 the actual cost was estimated to be \$40 to \$400 per car." ⁸⁹
Coke Ovens (1976/1987)	<i>OSHA Rule: Overall.</i> "The original OSHA estimate for the cost of complying with the 1976 coke oven standard was more than five times higher than estimates of actual costs. OSHA's contractor suggested that complying with the standard would cost from \$200 million to more than \$1 billion." ⁹⁰	"However, a Council on Wage-Price Stability study later estimated the actual cost of the standard to be \$160 million. . . . Ultimately, firms were able to meet the standard without incurring all of the capital costs in the first year, and actual compliance costs were dramatically lower than originally predicted." ⁹¹
	<i>OSHA Rule: RIA Sample.</i> "The OSHA consultant estimated that three steel firms in their sample would spend \$93 million on capital equipment and \$34 million in annual operating costs to comply with the regulations." ⁹²	"A later study by Arthur Andersen determined that the three firms actually spent between \$5 million and \$7 million in 1977 to comply with the standard, and only \$1 million to \$2 million on capital expenditures." ⁹³
	<i>EPA Rule.</i> "In the late 1980s, coke production again came under regulatory scrutiny, this time by the EPA. In 1987, the agency estimated that the cost of controlling hazardous air pollution from coke ovens would be roughly \$4 billion." ⁹⁴	"By 1991 that estimate fell to between \$250 million and \$400 million." ⁹⁵
Cotton Dust (1978)	<i>Total Cost.</i> "OSHA's estimate in the Final Regulatory Impact Analysis placed the textile manufacturing sector's cost of compliance at \$280.3 million annually (1982 dollars, for amortized capital spending, incremental operations and maintenance, and other new spending)." ⁹⁶	"However, actual spending is estimated to have been only about a third of this amount, \$82.8 annually (also 1982 dollars), chiefly because of the advantageous economics of the plant modernization push that was widely undertaken across the sector." ⁹⁷

	<p><i>Other Consequences.</i> "Concern was expressed in the rulemaking that smaller textile firms could encounter substantial constraints in raising capital for compliance-related improvements, and that the standard would tilt the sector's competitive center toward newer and more modern plants. . . . Also, control equipment suppliers argued during the rulemaking that serious bottlenecks would arise in trying to retrofit the industry's equipment in short order."¹⁹</p>	"Nonetheless, the actual effects in all these respects proved to be modest and generally bearable." ¹⁹
Ethylene Oxide (1984)	"There was little concern at the time of the rulemaking that the standard would entail substantial financial or economic consequences for the industry or the national economy, because average spending for compliance per hospital was estimated to total no more than \$1,500 to \$3,500 annually." ²⁰	"There is no evidence that the outcome differed from these expectations." ²¹
Formaldehyde (1987)	"OSHA's final estimate placed the industry's compliance costs at \$11.4 million annually (1987 dollars). (Cost savings of \$1.7 million annually from avoided medical expenses also were identified.)" ²²	"Actual spending appears to have been about half this level, \$6.0 million annually." ²³
Grain Handling Facilities (1987)	"OSHA estimated the sector's total compliance costs in the range of \$41.4 million to \$68.8 million annually (1985 dollars; spanning the incremental need for equipment and actions across the 13 separate provisions) and avoided property losses at \$35.4 million annually (as compliance reduced the number of facility explosions and serious fires). These calculations yielded an estimated net cost of compliance in the range of \$5.9 million to \$33.4 million annually." ²⁴	"Now that nearly five years have passed since full compliance with the terms of the 1987 standard was mandated, the evidence is that few if any facilities have ceased operation as a result of the standard—an outcome contrary to the economic impact estimates the industry submitted to the rulemaking. (The sector has, however, been subject to substantial economic pressures over this period for reasons not related to OSHA actions.)" ²⁵

Occupational Lead Exposures (1978)	<p>"OSHA did, however, outline an outer bound of about \$91 million (1976 dollars) in total capital spending, based on a complete rebuilding of the industry using the Bergsore smelter technology (then considered to be the most cost-effective option). In an early 1980s revision of the estimates, OSHA placed the cost of PEL compliance at a capital requirement of \$125 million (1982 dollars), or 1.3 cents annually per pound of production (\$150 million and 1.6 cents/lb, respectively, in 1992 dollars)."²⁶</p>	<p>"Nevertheless, the industry's actual spending to date (through early 1994) has been far below these levels. Cumulative capital investment appears to total no more than \$20 million (1992 dollars), and some of this overlaps with expenditures to meet the various environmental requirements to which the industry has also been subject. Annual compliance spending appears to be averaging 0.5 cents/lb to 1.0 cents/lb (1992 dollars), and perhaps as low as 0.3 cents/lb, i.e. well below OSHA's expectations at the time of the rulemaking and largely reflective of the industry's strategy of minimizing expenditures on engineering controls and relying much more heavily on respirator and hygiene programs to reduce exposures."²⁷</p>
Strip Mining (1978)	<p>"Prior to the passage of the 1978 Surface Mining Control and Reclamation Act, estimates for compliance costs ranged from \$6 to \$12 per ton of coal."²⁸</p>	<p>"Actual costs for eastern coal operations have been in the range of 50 cents to \$1 per ton. After the regulations were adopted, the market switched away from coal deposits with high reclamation costs. Ready substitutes included surface-minable coal in flatter areas (with lower reclamation costs), and underground deposits."²⁹</p>
Vinyl Chloride (1974)	<p>"The most credible figures put forth at the time were those of the agency's technical consultant, which estimated total costs at around \$1 billion (1974 dollars), including capital expenses for new equipment, replacement of lost capacity, and incremental operating expenses."³⁰</p>	<p>"According to the post-promulgation survey of industry members, however, actual spending amounted to only about a quarter of this estimate, \$228 million to \$278 million."³¹</p>

The Unbearable Lightness of Regulatory Costs

Frank Ackerman¹

Abstract

Will unbearable regulatory costs ruin the US economy? This specter haunts official Washington, just as fears of communism once did. Once again, the prevailing rhetoric suggests, an implacable enemy of free enterprise puts our prosperity at risk. Like anti-communism in its heyday, anti-command-and-control-ism serves to narrow debate, promoting the unregulated laissez-faire economy as the sole acceptable goal and standard for public policy. Fears of the purported costs of regulation have been used to justify a sweeping reorganization of regulatory practice, in which the Office of Management and Budget (OMB) is empowered to, and often enough does, reject regulations from other agencies on the basis of intricate, conjectural, economic calculations.

This article argues for a different perspective: what is remarkable about regulatory costs is not their heavy economic burden, but rather their lightness. Section 1 identifies two general reasons to doubt that there is a significant trade-off between prosperity and regulation: first, regulatory costs are frequently too small to matter; and second, even when the costs are larger, reducing them would not always improve economic outcomes.

The next three sections examine evidence on the size and impact of regulatory costs. Section 2 presents cost estimates for a particularly ambitious and demanding environmental regulation, REACH – the European Union's new chemicals policy. Section 3 discusses academic research on the "pollution haven" hypothesis, i.e. the assertion that firms move to developing countries in search of looser environmental regulations. Section 4 reviews the literature on ex ante overestimation of regulatory costs, including the recent claims by OMB that costs are more often underestimated (and/or benefits overestimated) in advance.

Turning to the economic context, Section 5 explains why macroeconomic constraints may eliminate any anticipated economic gains from deregulation. Section 6 introduces a further economic argument against welfare gains from deregulation, based on the surprising evidence that unemployment *decreases* mortality. Section 7 briefly concludes.

1. Two arguments against the trade-off

In theory, it would unquestionably be possible to spend so much on environmental protection that basic economic needs could not be met. At a sufficiently high level of

¹ Global Development and Environment Institute, Tufts University, Frank.Ackerman@tufts.edu. Thanks to Lisa Heinzring for comments on an earlier draft, to Susan Powers for research assistance, and to the V. Kann Rasmussen Foundation for financial support. And apologies to Milan Kundera, who meant something quite different by "unbearable lightness."

regulatory expenditures, protecting nature and cleaning up the air and water *could* absorb enough of society's resources to compete with the provision of more fundamental goods, such as food and shelter. From this it is a short leap to the conclusion that the clash between economy and environment actually *is* an urgent problem, requiring detailed analysis of regulations to prevent worsening the terms of the trade-off. But the latter statement only follows logically if environmental policy is in fact consuming substantial resources, which are transferable to other, more basic needs. That is, the assumed urgency of the trade-off rests on the implicit assumptions that the costs of environmental protection are both large and fungible. Either of these assumptions could fail in practice:

- The costs of environmental protection could be nonexistent, or too small to matter; or
- Reduction of regulatory costs might not produce the desired economic benefits.

Environmental protection with little or no costs

Costless environmental improvement is frequently assumed to be impossible by definition. The hidden premise underlying this form of the trade-off argument is that the market economy is already performing as well as possible; that is, it has reached a Pareto optimum. From this perspective, any new expenditure on environmental protection necessarily represents a loss, because it diverts resources away from the things that consumers in their wisdom have chosen for themselves. (Strong forms of this argument come close to denying the existence of public goods, or at least the possibility of efficient delivery of them. Like most discussion of environmental regulation, this article takes it for granted that the government can and should deliver public goods.)

Reverence for market outcomes is at odds with the beliefs of many environmental practitioners, who assume that environmental improvements can bring economic benefits as well. The rhetoric of joint economic and environmental progress includes such overused imagery as "win-win solutions," the "double [or triple] bottom line," and opportunities to pick the "low hanging fruit." The ubiquity of these phrases underscores the extent to which environmental advocates find that the market is improvable – implying that it could not have already been at an optimum.

In a more academic vein, the Porter hypothesis maintains that carefully crafted, moderately demanding regulations can improve economic competitiveness and success in the marketplace (Porter and van der Linde 1995). Likewise, studies of energy conservation and greenhouse gas reduction frequently find opportunities for energy savings at zero or negative net cost, as in the "no regrets" options for climate change mitigation (IPCC 2001, 474-476). The critique of these opportunities is not that they are undesirable; who could argue with free environmental improvements? Rather, economists have argued that, in their own overused metaphors, there are no free lunches, nor \$20 bills on the sidewalk. If lunch is expensive and the sidewalk is bare, then the Porter hypothesis must be impossible, and there must be hidden costs associated with energy conservation.

Without attempting a thorough review of this debate, it seems plausible that there are significant cases where essentially costless energy savings and other environmental improvements are possible. In such cases, the fears of regulatory cost burdens and concerns about trade-offs are presumably easy to resolve; there should be a broad consensus supporting the adoption of costless improvements.

However, literally costless improvements are not the only ones to escape from the trade-off; economic constraints do not immediately become relevant to real decisions as soon as regulatory costs are greater than zero. Very small costs of regulation presumably have very small impacts on the economy. Regulations could easily have costs that are too small to matter -- and Sections 2-4 will suggest that this is the case in many important instances. The theoretical consensus that supports costless environmental improvement may vanish once costs become positive, however small; but practical concerns about economic impacts need not arise until costs become large in some meaningful sense.

The question naturally arises: what counts as large? Here it is important to resist the illusion of superficially big numbers. Quantities in the billions, which are commonplace in federal programs and nationwide impact assessments, are essentially impossible to understand in isolation. Some standard of comparison is needed to bring them down to a comprehensible scale. (A million seconds is about 12 days; a billion seconds is about 32 years.) Amounts in the billions of dollars are inevitably thought of as part of a ratio: if X billion dollars is the numerator, what is the appropriate denominator? When none is specified, the default denominator tends to be the listener's personal finances -- in which case one or a few billions look very large indeed.

In contrast, a penny per person per day sounds small. But for the US with its population of about 300 million, a penny per person per day and a total of \$1 billion per year are roughly the same. Per capita impacts, as in this example, are sometimes appropriate, particularly when the costs of regulations are spread across the population as a whole. Comparison to the revenues of the affected industry is also a useful standard for evaluating regulatory impacts. For issues affecting the entire US (or the EU), or even a large industry, a few billion dollars (or euros) per year is not a large number. This issue is important in the discussion in Section 2.

Environmental costs that cannot be traded for economic gains

Even when environmental policies impose noticeable economic costs, it does not necessarily follow that these costs could be traded for greater private incomes and consumption, or for the benefits that are thought to accompany higher incomes. There are two strands to this unfamiliar argument, presented in Sections 5 and 6 below, and briefly anticipated here.

First, deregulation might not produce increased economic growth. If a regulation or other environmental policy has measurable economic costs, it consumes resources such as labor and capital that could have been used elsewhere in the economy. The

policy, then, can only be "traded" for whatever those resources could have produced elsewhere -- in economic terms, the opportunity cost of those resources.

During a recession, labor and capital are typically less than fully employed. Supplying more of resources that are already in surplus may not produce anything more; the short run opportunity cost of additional resources could be zero. On the other hand, during expansions such as the late 1990s, the Federal Reserve carefully controls the level of employment and rate of growth; making more resources available for increased growth might just lead the Fed to step harder on the brakes in order to maintain the (unchanged) target pace of expansion. Again, the short-run opportunity cost of additional resources could be zero.

Second, economic growth may not produce the expected or desired benefits. An increasingly common style of analysis converts regulatory costs into health and mortality impacts, based on correlations between income and health. In the extreme, regulatory costs that are thought to lower market incomes have been labeled "statistical murder", because richer people live longer.

This line of argument is flawed in several respects. Perhaps the most dramatic response to the "statistical murder" story is the epidemiological evidence that mortality decreases in recessions. If deregulation leads to economic growth, which boosts employment, the expected result is paradoxically not a reduction in mortality.

In the long run, the availability of resources such as labor and capital must have something to do with growth rates, economic opportunities, and improvements in health and welfare. However, the relationship is a subtler and more tenuous one than is often recognized.

2. The low cost of regulating Europe's chemicals

Expensive regulations are less likely to be adopted in the US at present, due to exaggerated fears about regulatory costs, and to an administration that is extremely sympathetic to industry's concerns. Examples of truly expensive regulations may be easier to find elsewhere, such as in the European Union. Regulation has a better name in the EU than in the US; government-imposed constraints on private business that are taken for granted in Brussels would be immediately dismissed as beyond the pale in Washington.

REACH, Europe's new chemicals policy, is one of the most ambitious and demanding EU environmental regulations. (The name is an acronym for Registration, Evaluation, and Authorization of Chemicals.) When it is adopted, likely by early 2007, REACH will require chemical manufacturers and importers to register and test their chemicals for safety. During the 11-year phase-in period, some 30,000 chemicals will likely be registered and tested. Depending on the outcome of the tests, some chemicals (probably a very small minority) may be subject to partial or complete restrictions on

their use in Europe. An appeals procedure allows economic and other arguments to be raised against restrictions on the use of a chemical.

As in the US, industry groups have claimed that the costs of regulation will be prohibitive. A German industry federation commissioned a study, performed by the consulting firm Arthur D. Little (ADL), which presented lengthy calculations purporting to show that REACH would devastate German manufacturing, and seriously weaken the German economy as a whole (Arthur D. Little 2002). A French industry group sponsored another study, to date released only in the form of PowerPoint slides, claiming that France, too, would be flattened by REACH (Mercer Management Consulting 2003).

Numerous studies done without industry funding have reached very different conclusions, finding that the costs of REACH would be much lower, and entirely manageable. The European Commission estimated that the costs of registration and testing would total €2.3 billion over the 11 year period. I directed a study sponsored by the Nordic Council of Ministers, representing the governments of the Scandinavian countries, which estimated the registration and testing costs at €3.5 billion (Ackerman and Massey 2004). Our cost estimate represents less than one euro per person per year, over the 11-year phase-in of REACH.

Perhaps a better standard of comparison is that the €3.5 billion cost, if fully passed on to customers, would increase the average prices of the European chemical industry by a ratio of .0006, or 1/16 of 1%. This is, by any reasonable standard, a very small price change. The spot price of crude oil changes by more than that, on average, 51 weeks out of the year. The cost of REACH, standing alone, might sound big (billions of euros!), but the revenues of the European chemical industry over 11 years amount to a much bigger number of euros. Even a noticeably larger ratio could still seem small: if, as industry has sometimes claimed, most of the costs of REACH will be borne by one third of the chemical industry, the affected companies would be burdened with a price increase of about 1/5 of 1%.

The German industry study, performed by ADL, is the only major study to explain why the costs might be much larger. Yet the authors used only slightly higher figures than everyone else for the direct costs of registration and testing. Their enormous estimates of the costs of REACH came from creative calculation of indirect costs such as decreases in productivity, delays in innovation, etc. In their economic model, industry displays little imagination or adaptability, and never responds to regulation by innovating or switching to safer substitutes. Rather, industry's sole answer to regulation is to notice that profits have decreased, and therefore to decide to cut back on production. A bizarre misreading of basic microeconomic theory led ADL to estimate that production losses would average 9 times any cost increase imposed on German industries. Meanwhile, they mistakenly assumed that costs of REACH would be incurred over only 7 years, rather than 11, thus inflating the annual costs during the phase-in period by more than 50%. These and other mistakes drove cost impacts sharply upward.

They identified many separate pathways by which REACH might conceivably affect industry. Specifically, ADL assumed that each regulatory impact pathway would cause a specified percentage reduction in industry output; all the separate reductions were assumed to be independent, and multiplied to obtain the cumulative reduction. Thus if one regulatory impact is believed to cause a 10% cutback in output, and another to cause a 20% cut, the combination causes output to fall to $90\% \times 80\% = 72\%$ of the original level. This strange, nonstandard methodology seems designed for exaggeration, as any mild overstatement in individual factors will be amplified through multiplication by all the other factors. If ADL has inappropriately doubled the size of one of the individual cost factors, the entire estimate of the cost and impacts of REACH will be doubled via the multiplicative method. The appendix to my Nordic Council study provides a detailed critique of both the individual impact pathways and the overall methodology of the Arthur D. Little study.

The predominant role of indirect cost impacts suggests another comparison: how large is the ratio of indirect costs of regulation to the direct compliance costs? The highest ratio that I am aware of in a government, NGO, or academic study of REACH is about 6 to 1. The implicit ratio in the Arthur D. Little study is 650 to 1. Without knowing precisely what this ratio should be, it is tempting to say that we know what it is not: in an advanced industrial economy such as Germany, there is no visible basis for the claim that regulations impose indirect costs of 650 times their direct compliance costs.

US industry and government have been emphatic in their opposition to REACH, issuing alarmist predictions of its possible impact on the US. (These, too, are greatly exaggerated; at worst, US companies exporting to Europe might face the same percentage cost increase as European companies. A small percentage is a small percentage, whether it is expressed in euros or in dollars.) It seems safe to say that no recent US regulations have approached the ambition or scope of REACH. If one of Europe's most demanding regulations will increase prices by 1/16 of 1%, imagine how much less the costs will be for the timid proposals that still pass muster in Washington.

3. Pollution havens: theory vs. reality²

If regulatory costs imposed significant burdens on the economy, it should be easy to find their footprints. Because the costs are not uniformly distributed, there should be dramatic extremes where regulations have trod most heavily on the human landscape. Companies that have closed because of environmental costs, moving to Mexico or other countries where the regulatory climate was more lenient; workers thrown out of jobs by rigid environmental strictures; formerly prosperous communities shut down by the economic burdens of command-and-control regulation -- they should be all around us. If the fabled regulations of mass destruction exist, there is no way to hide them in a bunker; they should be visible for all to see. But the actual, identifiable examples of jobs lost to regulations rarely extend beyond a handful of stories about small numbers of workers in

² This section draws heavily on the work of Eban Goodstein (Goodstein 1999) and Kevin Gallagher (Gallagher 2004).

the most directly environmentally damaging, rural industries such as logging and coal mining.

The economic impacts of environmental regulations have been intensively studied for years. As Eban Goodstein has demonstrated (Goodstein 1999), there is no evidence that significant numbers of jobs or businesses have ever been lost for environmental reasons. Companies don't move, between states or between countries, to avoid expensive environmental standards, because environmental standards aren't that expensive. Environmental compliance costs are above 2% of industry revenues only in a handful of the most polluting industries; Goodstein cites a maximum of 7% for pulp mills. Among the reasons for major layoffs, as reported by the Bureau of Labor Statistics, environmental and safety-related shutdowns are among the least common, accounting for about 0.1% of job losses (Goodstein 1999; Ackerman and Massey 2002). Contrary to predictions, the Clean Air Act Amendments of 1990 did not destroy jobs; the same is true for the stringent local air quality regulations imposed by the South Coast Air Quality Management District in Southern California. A study of the South Coast regulations concluded, "In contrast to the widespread belief that environmental regulation costs jobs, the most severe episode of air-quality regulation of industry in the [United States] probably created a few jobs." (quoted in Goodstein 1999, 54)

Economists have carried out extensive studies of the "pollution haven hypothesis," i.e. the notion that polluting industries will flee to countries with lax environmental standards. The results have been almost entirely negative. A 1995 review of the literature on the subject concluded

Overall, there is relatively little evidence to support the hypothesis that environmental regulations have had a large adverse effect on competitiveness, however that elusive term is defined... studies attempting to measure the effect of environmental regulation on net exports, overall trade flows, and plant-location decisions have produced estimates that are either small, statistically insignificant, or not robust to tests of model specification. (Jaffe et al. 1995, 157-158)

A more recent literature review reached similar conclusions (Jayadevappa and Chhatre 2000). Eric Neumayer demonstrated that neither the US nor Germany has had unusually large net outflows of investment in dirty industries; a section of his chapter on the subject is subtitled, "Why is there so little evidence for pollution havens?" (Neumayer 2001) Brian Copeland and Scott Taylor, in a very thorough theoretical and empirical analysis of trade and the environment, conclude that "the evidence does not support the notion that trade patterns are driven by pollution haven motives." (Copeland and Taylor 2003, 277) Kevin Gallagher shows that the dirtiest industries in the US have not been migrating to Mexico, either before or after NAFTA; while these industries have been declining in the US, their share of manufacturing has been declining even faster in Mexico. Moreover, a handful of major industries -- steel, aluminum, and cement -- appear to be cleaner (i.e., emit smaller amounts of criteria air pollutants per dollar of sales) in Mexico than in the US. A likely explanation for this unexpected pattern is that

the Mexican plants are newer than their US counterparts, and incorporate newer, cleaner technology (Gallagher 2004).

The economics literature is nearly, but not quite, unanimous on this question. Two recent articles have found modest empirical support for the pollution haven hypothesis. Matthew Kahn and Yutaka Yoshino use intricate and indirect methods of measuring the pollution intensity of trade inside and outside of regional trading blocs. They find that for trade outside of blocs, middle-income countries tend to expand dirty exports as they grow, while high-income countries expand cleaner exports. The effect is weaker inside regional trading blocs (Kahn and Yoshino 2004).

Matthew Cole presents superficially contradictory findings on trade between the US and Mexico (Cole 2004). (A careful reading shows that his results are not literally in conflict with each other.) On the one hand, the trade flows in both directions are becoming cleaner, but Mexico's exports to the US are becoming cleaner (declining in air pollution intensity) faster than US exports to Mexico. Since 1988, he finds, "The pollution embodied in US imports from Mexico [has been] less than that embodied in exports to Mexico and, furthermore, this gap has been widening rather than narrowing." (Cole 2004, 441) On balance, it is Mexico rather than the US that is escaping from trade-related air pollution on the other side of the Rio Grande, seemingly contradicting the pollution haven hypothesis. On the other hand, Cole also finds that US imports, from Mexico and from the world, are growing faster (as a share of US consumption) in industries that have higher pollution abatement costs, just as the pollution haven hypothesis would suggest.

Neither of these articles finds a strong effect, and neither presents a clear, easily interpreted picture of the movement of industry in response to US pollution control costs. Meanwhile, the bulk of the economics literature, as described earlier, continues to suggest that a good pollution haven is hard to find.

4. Advance overestimates of regulatory costs

By now there is a substantial literature demonstrating that the best-known claims of extraordinary costs imposed by environmental policy do not stand up to careful examination. Tales of billions of dollars spent per life saved by esoteric regulations are based on errors and misrepresentation; they represent, as Lisa Heinzerling put it, "regulatory costs of mythic proportions" (Heinzerling 1998), (Heinzerling and Ackerman 2002). No attempt will be made to summarize the full extent of that literature here.

However, one aspect of the issue is worth expanding upon, namely the biases in prospective estimates of regulatory costs. Prospective estimates are, of course, all that is available when a new policy is under discussion. And the evidence is clear: the costs of environmental protection are much more often overestimated, rather than underestimated, in advance.

A classic example is the 1974 OSHA standard for workplace exposure to vinyl chloride. Consultants to OSHA estimated the costs of reducing vinyl chloride exposure at around \$1 billion; industry estimates were even higher. Actual costs turned out to be around a quarter of OSHA's estimate, since industry quickly developed new, cost-effective technologies to comply with the regulation (U.S. Congress Office of Technology Assessment 1995).

Similar patterns have been found for many environmental standards. One study found that compliance costs for environmental regulations were overestimated in advance in 11 out of 12 cases (Hodges 1997). Another study found that advance cost estimates for environmental compliance turned out to be more than 25 percent too high in 14 out of 28 cases, while they were more than 25 percent too low in only 3 of the 28 cases (Harrington et al. 2000). A study for Environment Canada and the Ontario Ministry of Energy, Science and Technology, focusing specifically on the costs of controlling chlorinated substances, confirmed that overestimation of regulatory costs is more common than underestimation (Cheminfo Services 2000).

An in-depth examination of prospective cost estimates for regulations by Thomas McGarity and Ruth Rutenberg reviews most of these as well as quite a few other examples, and identifies a series of reasons why cost estimates are biased upward in advance: (McGarity and Rutenberg 2002)

- Regulators rely on regulated industries for empirical data, and the industries have a clear interest in secrecy and/or inflated cost estimates, either of which will discourage strict regulation.
- The likelihood of court challenges to strict regulations pushes agencies toward making conservative assumptions, again tilting in favor of the regulated industries.
- For lack of information, agency analyses often compare the costs of a proposed regulation to a zero regulation baseline, rather than the appropriate measurement of the incremental costs relative to existing regulations.
- Companies' reported costs of regulatory compliance sometimes include costs of upgrading other equipment at the same time that environmental controls are installed.
- Regulatory analyses frequently take a static approach, ignoring the learning curve effects, economies of scale, and regulation-induced productivity increases that may result from new environmental standards.

On the other hand, McGarity and Rutenberg note that there are also downward biases in cost estimates, including a tendency to ignore indirect social costs of regulation, reliance on vendors of control technologies that are eager to win new markets, and a failure to take sufficient account of "Murphy's law" in projecting responses to regulatory requirements. On balance, the factors producing upward bias appear more numerous and more powerful.

The OMB response: 2004

However, the opposite perspective continues to be argued in the annual reports from OMB's Office of Information and Regulatory Affairs (U.S. Office of Management and Budget 2004; U.S. Office of Management and Budget 2005). The 2004 report devoted three pages (U.S. Office of Management and Budget 2004, 51-53) to the discussion of ex ante versus ex post regulatory cost estimates, leading with the assertion that many commentators believe costs are underestimated in advance. OMB cites three studies in support of the view that regulatory costs are typically underestimated. Yet all three simply claim that costs are large, not that advance estimates are consistently low. The details of these claims are not impressive:

- Mark Crain and Thomas Hopkins, in a consultant report for the Small Business Administration, agonize at length over the plausible idea that there are economies of scale in regulatory compliance, so that smaller firms have a higher compliance cost per employee (Crain and Hopkins 2000). For its estimates of environmental regulatory costs, the study uses the high end of the range published by OMB. So in citing this study, OMB is effectively citing itself, not a new source of information.
- Harvey James estimates the costs of compliance with 25 OSHA regulations as of 1993 (James 1998). But he also observes that the cost per firm was 5.5 times higher in a 1974 study of OSHA compliance costs done by the National Association of Manufacturers. James then simply asserts that the costs per firm could not be lower today than in 1974. On that basis, he multiplies his 1993 numbers by 5.5 – thereby eliminating all empirical content in his study of 1993 costs, and simply recycling a 1974 estimate by an anti-regulatory industry group.³
- Finally, a detailed economic modeling exercise by Dale Jorgensen and Wilcoxon estimates the impact of the environmental regulations on US economic growth (Jorgensen and Wilcoxon 1990). They state at the outset that they have not attempted to assess any of the benefits, to consumers or to producers, of a cleaner environment. As a result, "the conclusions of this study cannot be taken to imply that pollution control is too burdensome or, for that matter, insufficiently restrictive." (Jorgensen and Wilcoxon 1990, 314-315)

Modeling costs but not benefits, they find that the growth rate was reduced by 0.19% due to regulations during 1974-1983. They analyze a scenario involving the complete absence of regulations, including removal of all limitations on the use of high sulfur coal, and all motor vehicle pollution controls. Even if one were willing to contemplate such a wholehearted embrace of smog, acid rain, and toxicity, there are two reasons why the effect on the growth rate would be smaller today: the study was based on a period when the first round of spending for compliance with the Clean Air Act and the Clean Water Act was underway; and it

³ The polemical nature of this study is suggested by its prominent table of the costs of compliance with OSHA regulations proposed in the late 1970s. Almost all of the costs in the table are for compliance with a generic carcinogen standard – presumably the standard that was rejected in the *Benzene* decision. Only in a note many pages later, at the end of the article, does James acknowledge that the generic carcinogen standard was never actually implemented.

was also a period when the dirty industries which account for most pollution control spending represented a larger fraction of the US economy than at present.

The OMB response: 2005

In its 2005 report, OMB takes a different tack. In a chapter entitled "Validation of benefit cost estimates made prior to regulation," the report reviews "47 federal rules where pre-regulation estimates of benefits and costs were made by federal agencies and some post-regulation information is published by academics or government agencies." (U.S. Office of Management and Budget 2005, 42) The bottom line judgment is that overestimates of benefit-cost ratios were more common than underestimates: 11 were declared accurate (meaning that advance estimates were within 25% of the retrospective judgments), 22 advance estimates were too high, and 14 were too low.

OMB's report is not strictly comparable to other literature on advance cost estimates. It differs from other analyses in restricting its attention to estimates made by federal agencies; many of the most controversial and politically significant estimates are made by or sponsored by industry groups. Thus it could still be the case that regulatory cost estimates that arise in political debates are typically overestimated, whether or not federal agencies have a tendency toward underestimates.

Moreover, OMB examines both costs and benefits, and finds advance estimates to be too high much more often for benefits than for costs. Evaluating OMB's judgments on benefits estimates would be a substantial task, which for the most part is not undertaken here. Regulations do not operate in a vacuum; even in hindsight, it is not immediately obvious how large the benefits from a regulation have turned out to be. If a regulation reduces the risk of death in an industry or community, it is necessary to distinguish the effects of the regulation itself from any other factors that may have altered death rates in the same period. In other words, a retrospective study would be needed to identify those benefits -- and methodological errors could bias the retrospective, as well as the prospective, estimate.

Despite these differences in approach, OMB's discussion of the 47 rules appears to be a response to the findings of advance overestimates of costs. Even on its own terms, accepting OMB's judgments on the individual rules, the report is fundamentally unpersuasive, for two reasons. First, the report does not establish a reasonable basis for inferring that federal agencies tend to overestimate; its data do not contain a statistically significant bias toward overestimates. Second, the report's main finding is entirely due to its treatment of OSHA estimates, which raise a number of unique issues unrelated to general biases in estimates.

The choice of rules was based solely on data availability, heavily skewed by a few sources that reviewed multiple rules. OMB refers to the rules as a "convenience sample" which is not necessarily representative of federal rules in general (U.S. Office of Management and Budget 2005, 48). But let us suppose for the moment that they were a

true random sample of federal rules and agency estimates, and see what the sample would imply about the overall tendency to overestimate.

With 11 advance estimates accurate, 22 over, and 14 under, OMB's sample is not terribly far from finding the average estimate to be accurate. Change just 4 of the overestimates to under, and all trace of bias would disappear. How likely is it that the appearance of bias has occurred purely by chance? For the purpose of statistical analysis, OMB's judgments can be converted to numbers: 0 for accurate, -1 for underestimates, and +1 for overestimates. Then the sample mean is 0.17, and the standard error is 0.13. The null hypothesis that the true mean is zero, i.e. no bias, cannot be rejected, with $p = .19$. In other words, if there was no bias in reality and we drew a random sample of 47 cases, there is a 19% probability that it would look at least as biased as the OMB sample. Of course, standard statistical practice, which OMB would certainly insist on in agency scientific analyses, requires $p = .05$ or less to reject the null hypothesis of no effect.

In contrast, the Harrington et al. study mentioned earlier (Harrington et al. 2000), which found 3 underestimates of costs, 14 overestimates, and 11 accurate, passes the significance test with flying colors: using the same numerical scoring, the sample mean is .38, with a standard error of .13. The null hypothesis that the true mean is zero is clearly rejected, with $p = .005$; there is less than a 1% probability of getting the Harrington et al. result by chance if there is no real bias in advance cost estimates. (Note that Harrington et al. find a tendency to overestimate regulatory costs, while OMB alleges a tendency to overestimate benefit-cost ratios. Thus "overestimate" has opposite implications in the two contexts.)

Not only does the slight appearance of bias in the OMB study turn out to be statistically insignificant; it is also entirely due to OMB's treatment of the 13 OSHA rules. As shown in Table 1, all of the tilt toward overestimates comes from the OSHA rules, where OMB believes that overestimates of benefit-cost ratios are essentially the norm. (OSHA's 1974 vinyl chloride rule, discussed above, a famous case in which advance estimates of costs were far too high, did not make it into OMB's "convenience sample.") Among the non-OSHA rules in OMB's sample, underestimates slightly outnumber overestimates, although with $p > .5$ (see table) it is completely clear that this pattern is not statistically significant.

	Total	OSHA	All other
Accurate	11	2	9
Overestimate	22	11	11
Underestimate	14	0	14
<i>p value for no bias</i>	.19	.00	.56

As can be seen from a glance at the data, there is essentially no chance that the true mean, or bias, is the same for the OSHA and non-OSHA rules (statistically, the hypothesis that the two groups have equal means is rejected with $p < .00001$).

So in the end, the scant evidence of overestimates provided by OMB comes down to their treatment of the 13 OSHA rules. In 6 of the 13 cases, OMB relied on a single source, an article by Si Kyung Seong and John Mendeloff (Seong and Mendeloff 2004). That article discusses OSHA's tendency toward prospective overestimates of benefits, suggesting several explanations. Prospective estimates from regulatory agencies typically assume complete implementation of proposed rules, whereas retrospective evaluations reflect actual, potentially incomplete implementation. The availability of data on workplace fatalities improved significantly in 1992, allowing more accurate estimates of reduced mortality due to regulations; 9 of the 13 OSHA rules in the OMB study were adopted before 1992. Seong and Mendeloff also suggest that OSHA is more likely to be inaccurate in analyzing less expensive rules, which naturally receive less analytical effort; and they conclude that OSHA systematically overestimates the benefits of training programs.

Thus the allegation that OSHA overestimates benefits could simply reflect the agency's beleaguered status. Ever since the Reagan administration, OSHA has been particularly hard-hit by industry and conservative attacks, budget cuts, and defeats in the courts. As a result, OSHA may be more constrained and powerless than other regulatory agencies. It is all too believable that OSHA is constantly planning on complete implementation of its rules but unable to achieve it, or that it has been forced to stick to small proposals, frequently involving nothing more than training programs. According to Seong and Mendeloff, the result would be a pattern of overestimation of benefits of OSHA regulations. This is an important story, but it bears no resemblance to OMB's suggestion of a pattern of systematic overestimation of benefit-cost ratios by government agencies.

5. Opportunity costs and growth-growth trade-offs

The previous sections have suggested several reasons to doubt that environmental regulations impose huge economic costs. This section turns to the economic context of the debate, arguing that even if regulatory costs look significant, deregulation might produce surprisingly little additional growth and personal consumption.

The costs of regulation do not consist of goods that would be of direct use to consumers; if regulation were rolled back, it would not be helpful to simply redistribute scrubbers, filters, catalytic converters and the like to other uses. Rather, the trade-off hypothesis must be that regulation requires the use of productive resources, principally labor and capital; in the absence of regulation, these resources could be used to produce consumer goods (or other desirable products). A related assumption, normally taken for

granted, is that expanding the available supplies of labor and capital would in fact increase the production of consumer goods.⁴

Yet the truth of that related assumption is less obvious than it might seem. Suppose that deregulation occurs during a recession. In that case, unemployed labor and capital are already available on the market; indeed, that is almost the definition of a recession. It is far from certain that increasing the surplus of idle labor and capital will produce any economic benefit in the short run.

Alternatively, suppose the deregulation occurs during an economic expansion. It is becoming increasingly standard practice for the Federal Reserve to maintain tight control of the pace of expansion, effectively preventing an acceleration of growth above a target level. In the late 1990s, for instance, economic growth was limited by Federal Reserve intervention -- not by regulations, or by the availability of labor or capital.

Again, an increase in available productive resources might not have led to any additional output, income, or consumption in the short run. If deregulation had put more labor and capital on the market, the Fed might have simply clamped down harder to achieve its targets (Goodstein 1999).

In the long run, the availability of labor and capital must have something to do with the pace of economic growth. The manner in which that long run effect occurs, however, depends on macroeconomic mechanisms about which there is no consensus. Would additional labor and capital somehow accelerate the recovery from recession, or make the next recession less deep? In an expansion, would the Fed quickly notice that increased output is now possible without risking inflation, or would it take years -- perhaps even another business cycle -- for the Fed's targets to adjust to the additional resources? Both theoretical and empirical macroeconomic analysis would be required to have confidence about the answer to these questions.

A common critique of risk-reducing regulation today is that it should examine "risk-risk" trade-offs, considering not only the risk directly addressed by regulation, but also the offsetting risks that might be indirectly created by the regulation. It is equally the case that calculations involving the costs of regulation should examine the "growth-growth" trade-offs, considering not only the resources used in regulatory compliance, but the actual benefits available from using those resources elsewhere. In the short run, there may be no foregone growth at all. If the claim is that deregulation would create additional growth only in the long run, via slow, complex pathways, then the usual arguments about the need to discount future benefits would apply to this economic gain. Not only the extent of growth, but the timing, needs to be calculated in order to determine the real opportunity cost of the resources used to comply with regulations.

⁴ The same discussion applies not just to consumer goods, but to any desirable goods that could be produced with the resources used for regulatory compliance. Likewise, it applies to the resources saved by avoiding new regulation, as well as the resources released by deregulation. For narrative simplicity, this section tells the story purely in terms of deregulation and consumer goods.

6. Is employment hazardous to your health?

A clever rhetorical strategy has appeared in recent economic arguments for deregulation. Rather than emphasizing the monetary costs of regulation per se, critics of regulation have converted these costs into numbers of deaths that supposedly result from the expenditures. Expensive regulations can thus be charged with "statistical murder." As Lisa Heinzerling and I have argued (Ackerman and Heinzerling 2004, chapter 3), the statistical murder theory is doubly fallacious. The correlation between income and mortality is weak in developed countries, except at very low income levels; different variants of the statistical murder story have used widely differing prices per life saved, resting on different indirect inferences from very limited data. Moreover, regulation does not remove money from the economy, so much as cause it to be spent in different sectors. Incomes decrease for those who produce and sell polluting products, but increase for those who develop, install, and operate pollution controls, monitor compliance, and research and debate regulatory options. Whether or not one considers this reallocation to be desirable, it is primarily a change in the composition, not the aggregate level, of national income.

But an even more decisive rebuttal is available. Remarkably enough, the statistical evidence shows that mortality decreases during recessions, and increases as employment rises. So even if the costs of regulation were large enough to matter (despite the evidence to the contrary in sections 2-4), and even if deregulation boosted economic growth and employment in the short run (despite the arguments to the contrary in section 5), the result might well be an increased death rate.

The evidence on mortality and business cycles is presented in a symposium in the December 2005 issue of the *International Journal of Epidemiology*. The lead article, by José A. Tapia Granados, presents and analyzes data for the US throughout the 20th century (Tapia Granados 2005a). Age-adjusted mortality rates are significantly, negatively correlated with unemployment rates -- meaning that death rates go up when unemployment goes down -- for the population as a whole, and separately for men and women, and for whites and nonwhites. The relationship is strongest for the working age population.

Looking at individual causes of death, in the late 20th century (after 1970) deaths from traffic accidents, major cardiovascular diseases, and cirrhosis of the liver were all significantly, negatively related to the rate of unemployment. In earlier periods, there was also a strong relationship between employment and flu and pneumonia deaths, and a weaker but significant relationship with cancer deaths, in the same "perverse" direction. Of the major causes of death examined in the article, only suicide shows the naïvely "expected" pattern of worsening when unemployment rises.

Another study, by Christopher Ruhm, similarly found that for 1972-1991, increased unemployment was associated with decreases in total mortality in eight of 10 major causes of death (Ruhm 2000). The two exceptions were Ruhm's findings of no

significant relationship between unemployment and cancer deaths, and, as in the study discussed above, more suicides at times of higher unemployment.

When more people are working, there is more traffic and therefore more traffic fatalities. There is also more stress at work and hence more cardiovascular disease. During economic upturns, alcohol and tobacco consumption increase, as does obesity; meanwhile, time spent on exercise, sleep, and social interactions all decrease. In the past, workplace contagion may have caused deaths by spreading infectious diseases such as flu and pneumonia. Even though some underlying causes of mortality, such as stress, involve chronic, long-term conditions, the timing of deaths may reflect short-term triggers related to employment. Heart attacks among the working age population are known to peak on Mondays (Willich et al. 1994).

Although counterintuitive, the finding of an association between increased employment and increased mortality is not new. Peer-reviewed publications making this point date back to 1922, and have continued throughout the intervening years. Most have been in public health journals, although at least one has appeared in a leading economics journal (Ruhm 2000). US, Canadian, and British data all support the idea that recessions are somehow better for health. One epidemiologist, M. Harvey Brenner, has long challenged this finding (Brenner 2005), but Tapia and Ruhm both provide effective critiques of Brenner's statistical methodology (Ruhm 2000; Tapia Granados 2005b). Tapia maintains that Brenner has used excessively complicated models with too little data to validate them, undermining the credibility of his time series results. Ruhm suggests that Brenner's earlier study of a 40 year span from the 1930s to the 1970s primarily reflects the decline in mortality that occurred as the US emerged from the 1930s depression. This era witnessed important medical and nutritional advances, as well as rising incomes and declining unemployment.

Two other major objections should be noted. First, at an individual level, death rates are higher for the unemployed than for the employed. This is not incompatible with the aggregate pattern. Perhaps mortality is always higher for the unemployed than for the employed, but is higher for each group during economic expansions than during recessions. Then it is easy to construct numerical examples in which overall mortality increases during expansions (Tapia Granados 2005b).

Second, over the long run it is clear that rising incomes have been associated with falling death rates. However, the correlation is not perfect; the periods of fastest declines in death rates are not the times of fastest increase in incomes. The long-run decreases in mortality may be caused by changes that are only loosely correlated with income, such as improvements in sanitation, public health, and achievement of minimum nutritional standards. Over the long run, the decrease in mortality rates is one of the most important effects of economic development; but this need not imply any relationship to short-term economic fluctuations in an already developed country. Small gains in average income, hypothesized to occur as a result of deregulation, could be associated with no improvement, or even worsening, in public health and nutritional standards for the poor.

Needless to say, there is not much left of the anti-regulatory "statistical murder" story once this perspective on unemployment and mortality is acknowledged.

7. Conclusion

This article has presented several pieces of the picture of regulatory costs; by way of conclusion, it may be helpful to briefly summarize the argument as a whole.

Reports of the economic burden imposed by regulatory costs have been greatly exaggerated. The widely imagined trade-off between economic prosperity and environmental protection rests on multiply mistaken premises. Many environmental policies impose little or no net costs on the economy; even when regulatory costs appear significant, there may be no short run opportunity to exchange those costs for additional economic growth, and even when growth occurs, it may not lead to desired outcomes such as reduced mortality.

Even a policy as ambitious as REACH will lead to very small cost increases, raising the price of chemicals sold in Europe by an estimated 1/16 of 1%. Claims of ominously greater impacts appear primarily in industry-funded studies, the most detailed of which relies on an idiosyncratic and indefensible methodology. Likewise, there is little evidence of jobs actually lost to regulations, outside of a few of the most environmentally damaging, extractive industries. The "pollution haven hypothesis," suggesting that companies move to regions or countries with more lenient environmental regulations, has been rejected by virtually all analysts who have studied the question.

Several researchers have found that prospective estimates of the costs of regulation are more likely to be too high than too low. One of the principal voices rejecting this finding is that of OMB, which has maintained in its annual reports that regulatory costs may be underestimated or benefit-cost ratios overestimated in advance. The grounds for this contrary conclusion include citation of a limited number of unconvincing studies, and manipulation of a regulatory data set which does not show a statistically significant tendency toward overestimates of benefit-cost ratios.

Even when regulations have significant costs, it is not necessarily the case that these costs are fungible. In a recession, idle economic resources are already available and are not creating short-run growth; in an expansion, the Federal Reserve may enforce predetermined limits on the pace of growth in order to prevent inflation. It is now common to discuss the need for a "risk-risk analysis," comparing old risks alleviated by policies to the new risks created by the same process. It is equally necessary to consider a "growth-growth analysis," comparing economic costs imposed by policies to the actual opportunity cost of the same resources used elsewhere.

Finally, even if growth were to occur as a result of deregulation, it is not certain that it would lead to the anticipated beneficial consequences, such as reduced mortality. A remarkable line of empirical research demonstrates that in the US and several other

countries in the 20th century, age-adjusted mortality rates increased during economic expansions and declined during recessions. The rhetorical equation of regulations with reduced growth and increased mortality, dubbed "statistical murder" by regulatory critics, turns out to be dead wrong.

Frank Ackerman is Director of the Research and Policy Program at the Global Development and Environment Institute, Tufts University; inquiries can be directed to Frank.Ackerman@tufts.edu.

David Frulla, Esquire
Kelley Dye Collier Shannon
3050 K Street, N.W., Suite 400
Washington, D.C. 20007

Dear Mr. Frulla:

Thank you for appearing at the legislative hearing on H.R. 682, the "Regulatory Flexibility Improvements Act," on July 20, 2006. Your testimony, and the efforts you made to present it, are deeply appreciated and will help guide us in whatever action we take on this matter.

We have enclosed for your review a copy of the official transcript of this hearing. The transcript is substantially a verbatim account of remarks actually made during the hearing. Accordingly, please only make corrections addressing technical, grammatical, or typographical errors. No substantive changes are permitted. Please return any corrections you have by Friday, August 11, 2006, to Leslie Prill, Staff Assistant for the Subcommittee on Commercial and Administrative Law, B353 Rayburn House Office Building, Washington, DC 20515. If you have any questions, please feel free to contact Susan Jensen, Subcommittee Counsel, at (202) 225-2825.

In addition, Subcommittee Members were given the opportunity to submit written questions to the witnesses pursuant to the unanimous consent request agreed upon at the hearing. These questions are annexed. Your responses will help inform subsequent legislative action on

Mr. David Frulla

this important topic. Accordingly, please submit your written responses to these questions by Friday, August 11, 2006, to Ms. Prill at the aforementioned address. Your responses may also be submitted by e-mail to: leslie.prill@mail.house.gov.

Thank you for your continued assistance.

Sincerely,

CHRIS CANNON
Chairman
Subcommittee on Commercial and Administrative Law

**Questions for David Frulla
Kelley Drye Collier Shannon**

1. As you may know, OMB Watch has criticized H.R. 682. I quote:

By requiring agencies to review all such rules every ten years, this bill would drain agency resources by diverting them away from protecting the public and into navel-gazing analyses. Even proven protections such as the ban on lead in gasoline and safeguards protecting workers against black lung would be subject to these reassessments. These analyses would be even more burdensome than under current law, because the bill would force agencies to calculate reasonably foreseeable indirect economic effects, which agency representatives at a recent Senate roundtable suggested would be so speculative as to be useless for policymakers.

What is your response?
2. The GAO has recommended that Congress provide greater clarity concerning the key terms and provisions of the Regulatory Flexibility Act.

To what extent does H.R. 682 address these concerns?
3. The GAO cites several questions that it says "remain unresolved." What is your response to the two questions noted below?

Should agencies review rules that had a significant impact at the time they were originally published, or only those that currently have that effect?

Should agencies conduct regulatory flexibility analyses for rules that have a positive economic impact on small entities, or only for rules with a negative impact?
4. How do you respond to OMB Watch's assertion that H.R. 682 purportedly gives corporate interests a greater advantage in the regulatory process by allowing the Office of Advocacy of the Small Business Administration to preview proposed rules before they are published in the Federal Register?

VIA HAND DELIVERY

The Honorable Chris Cannon
 Chairman
 Subcommittee on Commercial and Administrative Law
 U.S. House of Representatives Committee on the Judiciary
 2138 Rayburn House Office Building
 Washington, D.C. 20515-3951

Re: **Your July 25, 2006, Letter Regarding July 20, 2006, Hearing on H.R. 682**

Dear Chairman Cannon:

Thank you again for the opportunity to testify on July 20th before the Subcommittee on Commercial and Administrative Law regarding H.R. 682, the Regulatory Flexibility Improvements Act. As I explained in my testimony, the Regulatory Flexibility Act is an important law, and it should be amended to effectuate its long-standing congressional purposes and address issues that have arisen since enactment of the Small Business Regulatory Enforcement Fairness Act.

In this letter, I will respond, in writing, as you requested, to your follow-up questions to me contained in your July 25, 2006 letter. In the interests of conserving space, I have not reproduced your detailed questions, but have attached them to this letter. I also attach corrections to my transcript consistent with the instructions in your letter. My answers to your questions are as follows:

- I. OMB Watch may criticize agencies' duty under the RFA, 5 U.S.C. § 610, to review their regulations every ten years, but that has been the law for more than 25 years. A newly published law review article by a former Assistant Chief Counsel for Advocacy has demonstrated empirically that Federal agencies have routinely failed to meet their Section 610 review obligations. In fact, the author's research into agency review rates reveals that agencies fail to review almost all required rules. Michael R. See, *Willful Blindness: Federal Agencies' Failure to Comply with the Regulatory Flexibility Act's Periodic Review Requirement—And Current Proposals to Invigorate the Act*, 33 FORDHAM URB. L.J. 1199, 1214-18 (2006). (A copy of this law review article is attached.) Further, an agency that does conduct a Section 610 review is ten times more likely to do nothing or increase small business burdens than actually to reduce the impact of its rules on small entities. *Id.* at 1218-19; Congress should ensure that agencies comply with the laws it has passed. OMB Watch would certainly agree that agencies should comply in substance with the Nation's environmental and consumer protection laws. The RFA, and Section 610, should be accorded the same respect.

The Honorable Chris Cannon
August 11, 2006
Page 2

KELLEY DRYE
COLLIER SHANNON

Finally, with respect to the issue of indirect benefits, I explained in both my written and oral testimony, and SBA Chief Counsel for Advocacy Thomas M. Sullivan explained in his oral testimony, that the "indirect effects" standard should address reasonably foreseeable impacts on small businesses that are the targets of the agency regulation in question. This is a matter that can be addressed with careful legislative language, as well as with RFA implementing regulations developed by the SBA Chief Counsel. See my response to Question 2, *infra*.

2. For years, GAO has recommended revision of key RFA terms, such as "significant impact" and a "substantial number." Section 10(a) of H.R. 682 would, through enactment of a new 5 U.S.C. § 613, require the Chief Counsel for Advocacy to develop and promulgate "rules governing compliance with" the RFA. This important provision has two benefits that I explained in detail in my written testimony. First, it would allow the "expert" Office of Advocacy to develop a comprehensive set of definitions for the RFA's key terms and provisions. Based on its years of experience, the SBA Office of Advocacy can more effectively develop these definitions through a rulemaking process than the Congress could reasonably expect to do through legislation.

In my testimony, I also explained that, in my experience, certain agencies employ parochial and counter-statutory definitions of key RFA terms. For instance, the Environmental Protection Agency bases a determination of a significant economic impact on a small business's gross revenues, as opposed to its profitability, and a court has deferred to EPA's approach because the EPA had the authority to develop its own RFA implementing guidelines. *Ad Hoc Metals Coalition v. Johnson*, 1:01cv0766 (PLF) (D.D.C., Jan. 20, 2006). The SBA Office of Advocacy, however, correctly identifies profitability as the relevant metric in determining what impacts a business can withstand, rather than gross revenues. Small Business Administration Office of Advocacy, *A Guide for Government Agencies: How to Comply With the Regulatory Flexibility Act* (May 2003), 17-18. Second, providing such rule-writing authority to the Office of Advocacy would establish that courts should defer to the Office of Advocacy's regulations defining the types of RFA terms to which the GAO recommendations apply.

3. a. Having agencies determine in their Section 610 reviews which rules currently have a significant economic impact on a substantial number of small entities—assuming they do so in a fair and impartial way—would focus agency resources on those regulations that are burdening small businesses and other small entities at the present time. Such an approach could help tailor agency work-load to the greatest current effect. However, consideration of the current impact of rules that had a significant economic impact on a substantial number of small entities when implemented does not represent an academic exercise. For instance, industries that once had a preponderance of small entities may have changed in character through consolidation or other factors in a decade, perhaps due in whole or material part to the impactful regulatory regime. In fact, these regulations might have forced industry consolidation or served as an effective barrier to entry for small businesses. It is important for an agency to determine and recognize when its regulations are themselves either causing or contributing to a change in the economic structure of a sector of the regulated community. It may be equally important for an agency to mitigate such effects on small entities once these effects are recognized.

The Honorable Chris Cannon
August 11, 2006
Page 3

KELLEY DRYE
COLLIER SHANNON

- b. The RFA's legislative history provides that:

Agencies may undertake initiatives which would directly benefit such small entities. Thus, the term "significant economic impact" is neutral with respect to whether such impact is beneficial or adverse. The statute is designed not only to avoid harm to small entities but to promote the growth and well-being of such entities.

126 Cong. Rec. H8,468 (daily ed., Sept. 8, 1980). This is as true today as it was in 1980. Further, the law should make clear that the RFA is not designed to minimize any such beneficial impacts. Also, an economic impacts analysis that considers not only the burdens, but any benefits, of a proposed rule on small entities, would provide a fairer understanding of its impact. The Office of Advocacy has addressed this issue in detail in its *Guide for Government Agencies*, at 21-22.

4. In "corporate interests," OMB Watch appears to be including the millions of mom-and-pop businesses in the U.S. with fewer than five employees that are among the entities Congress intended to protect in the RFA. The RFA's legislative history explains that Congress found in the late 1970's that small businesses were confronting comparatively large and disproportionate regulatory burdens and that small businesses had no ability to contest or seek to ameliorate these regulatory impacts, even if they were aware that a proposed rule was being considered. Accordingly, Congress created the Office of Advocacy within the SBA to ensure these small businesses had a responsible entity available to assist them in a comprehensive and organized way. Congress reaffirmed and expanded the Office of Advocacy's leading role in SBREFA, including by developing the panel process.

Moreover, early notice can help make a rulemaking more efficient and minimize the potential for RFA analyses and regulatory adjustments to cause any potential delay in the rulemaking process—a goal OMB Watch would presumably support. Such notice can thus help ensure that a proposed rule employs accurate information and develops tailored and useful alternatives where appropriate. The rulemaking would then not have to be side-tracked to develop new alternatives or fix inaccurate information after the notice and comment stage. Furthermore, timely public input into the rulemaking process through panels and other informal means is fully consistent with recent trends in administrative law and procedure to ensure informed agency decision-making. For its part, the SBA Office of Advocacy has issued a series of reports to Congress which, among other things, detail how SBREFA has been effective in helping to tailor agency regulations overall and in specific instances.

**10TH ANNIVERSARY OF THE
CONGRESSIONAL REVIEW ACT**

THURSDAY, MARCH 30, 2006

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON COMMERCIAL
AND ADMINISTRATIVE LAW,
COMMITTEE ON THE JUDICIARY,
Washington, DC.

The Subcommittee met, pursuant to notice, at 2:43 p.m., in Room 2141, Rayburn House Office Building, the Honorable Chris Cannon (Chairman of the Subcommittee) presiding.

Mr. CANNON. I'd like to call the Subcommittee to order.

We're here to—by the way, thank you, Howard. Thank you for being here. I want to thank Mr. Coble for being with us to start the hearing.

We're here today to look at the Congressional Review Act, a law passed to provide Congress with a tool in the oversight of administrative rulemaking. In the last 10 years, more than 41,828 rules have been reported to Congress under the Congressional Review Act.

When Congress passes complex legislation, it often leaves many details to the agencies authorized to enforce the laws, and this body must remain vigilant over those details and how they are filled in by the agencies through congressional oversight.

The Congressional Review Act established a mechanism for Congress to review and disapprove Federal agency rules through an expedited legislative process. It requires agencies to report to Congress and to the Comptroller General with information to help us assess the merits of the rules.

Now, today, we have a panel of experts who are here, who are going to be discussing this process in greater detail. As our panel of expert witnesses will attest, there are some areas of the CRA that could be changed to make it a more effective tool for Congress.

Today's hearing is part of the Administrative Law Process and Procedure Project that our Subcommittee is spearheading. The objective of the project is to conduct a nonpartisan, academic analysis of the Federal rulemaking process.

Scholars and experts from academic and legal institutions and organizations across the Nation are involved in this project. The project will conclude with a detailed report, including recommendations for legislative proposals and suggested areas for further research and analysis to be considered by the Administrative Conference of the United States.

As you may recall, my legislation reauthorizing ACUS was signed into law in the fall of 2004. The Administrative Conference is a nonpartisan public think tank—public-private think tank that proposes recommendations, which, historically, have improved administrative aspects of regulatory law and practice.

ACUS served as an independent agency charged with studying the efficiency, adequacy, and the fairness of the administrative procedure used by Federal agencies. Most of the recommendations made by ACUS were implemented and, in turn, helped save taxpayers millions of dollars.

Unfortunately, ACUS has yet to receive appropriated funds. The Congress must fund ACUS so that it can continue to provide valuable recommendations for improving the administrative law process.

Justice Breyer, in his testimony to the Subcommittee, noted that the conference's recommendations resulted in huge savings to the public. Let's work to bring that savings back into reality.

I look forward to testimony from our witnesses.

[The statement of Mr. Cannon follows:]

PREPARED STATEMENT OF OPENING STATEMENT OF THE HONORABLE CHRIS CANNON, CHAIR, SUBCOMMITTEE ON COMMERCIAL AND ADMINISTRATIVE LAW, FOR THE OVERSIGHT HEARING ON THE 10TH ANNIVERSARY OF THE CONGRESSIONAL REVIEW ACT

We are here today to look at the Congressional Review Act, a law passed to provide Congress with a tool in the oversight of administrative rulemaking. In the last ten years, more than 41,828 rules have been reported to Congress under the Congressional Review Act.

When Congress passes complex legislation, it often leaves many of the details to the agencies authorized to enforce the laws. This body must remain vigilant over those details and how they are filled in by the agencies through congressional oversight.

The Congressional Review Act established a mechanism for Congress to review and disapprove federal agency rules through an expedited legislative process. It requires agencies to report to Congress and the Comptroller General with information to help us assess the merits of the rules.

Today we have a panel of experts here who are going to be discussing this process in greater detail. As our panel of expert witnesses will attest, there are some areas of the CRA that could be changed to make it a more effective tool for Congress.

Today's hearing is part of the Administrative Law, Process and Procedure Project that our Subcommittee is spearheading. The objective of the Project is to conduct a nonpartisan, academic analysis of the federal rulemaking process.

Scholars and experts from academic and legal institutions and organizations across the nation are involved in this Project.

The Project will conclude with a detailed report, including recommendations for legislative proposals and suggested areas for further research and analysis to be considered by the Administrative Conference of the United States.

As you may recall, my legislation reauthorizing ACUS was signed into law in the fall of 2004. ACUS is a nonpartisan "public-private think tank" that proposes recommendations which, historically, improved administrative aspects of regulatory law and practice. ACUS served as an independent agency charged with studying the efficiency, adequacy, and fairness of the administrative procedure used by federal agencies.

Most of the recommendations made by ACUS were implemented, and, in turn, helped save taxpayers millions of dollars. Unfortunately, ACUS has yet to receive appropriated funds. The Congress must fund ACUS so that it can continue to provide valuable recommendations for improving the administrative law process. Justice Breyer, in his testimony to the Subcommittee, noted that the Conference's recommendations resulted in a "huge" savings to the public. Let's work to bring that savings back into reality.

I look forward to the testimony from our witnesses.

Mr. CANNON. When Mr. Watt arrives, we'll recognize him for an opening statement, if he would like to do that.

And at this point, without objection, all Members may place their statements in the record. Hearing no objection, so ordered.

Mr. CANNON. Without objection, the Chair will be authorized to declare recesses of the hearing at any point. Hearing none, so ordered.

Oh, and at this point, we'd like to recognize Mr. Coble for an opening statement.

Mr. COBLE. Mr. Chairman, I will not give an opening statement. I will commend you for having assembled a very distinguished panel, and I look forward to hearing from them.

I have another meeting, however, simultaneously scheduled. So I will probably be in and out.

But I thank you, Mr. Chairman.

Mr. CANNON. I thank the gentleman.

I ask unanimous consent that Members have 5 legislative days to submit written statements for inclusion in today's hearing record. Without objection, so ordered.

I am now pleased and honored to introduce the witnesses for today's hearing.

Our first witness is Chris Mihm, who is the managing director of GAO's Strategic Issues Team, which focuses on government-wide issues with the goal of promoting a more results-oriented and accountable—

[Pause.]

Mr. CANNON. We would certainly not like this Committee to be interrupted by what happens on the floor of the House.

We were talking about the Strategic Issues Team, which focuses on government-wide issues with the goal of promoting a more results-oriented and accountable Federal Government. The Strategic Issues Team has examined such matters as Federal agency transformations, budgetary aspects of the Nation's long-term fiscal outlook, and civil service reform.

Mr. Mihm is a fellow of the National Academy of Public Administration, and he received his undergraduate degree from Georgetown University.

Our second witness is Mort Rosenberg, a specialist in American public law in the American Law Division of the Congressional Research Service. In all matters dealing with administrative law, Mort has been the Judiciary Committee's right hand. For more than 25 years, he has been associated with CRS and has appeared before this Committee a number of times.

In addition to these endeavors, Mort has written extensively on the subject of administrative law. He obtained his undergraduate degree from New York University and his law degree from Harvard Law School. And we welcome you back Mr. Rosenberg.

Todd Gaziano is our third witness. He is a senior fellow in legal studies and the director of the Center for Legal and Judicial Studies at The Heritage Foundation. Mr. Gaziano has served in all three branches of government.

In the executive branch, he worked at the U.S. Department of Justice in the Office of Legal Counsel during the Reagan, Bush, and Clinton administrations. In the judicial branch, he was a law

clerk in the 5th Circuit Court of Appeals for the Honorable Edith Jones.

And between 1995 and 1997, he was the chief counsel to the House Subcommittee on National Economic Growth, Natural Resources, and Regulatory Affairs. During that time, he was involved in regulatory reform legislation, including the Congressional Review Act of 1996. Mr. Gaziano graduated from the University of Chicago Law School.

Our fourth witness is Mr. John Sullivan, the Parliamentarian for the U.S. House of Representatives. This is an interesting experience to actually testify, isn't it?

Mr. Sullivan has served in the House of Representatives since 1984 as a counsel for the House Armed Services Committee, then as Assistant Parliamentarian and Deputy Parliamentarian before he was appointed as the Parliamentarian by the Speaker during the 108th Congress.

Prior to coming to the Hill, Mr. Sullivan served 10 years in the Air Force. He's a graduate of the U.S. Air Force Academy and earned his law degree from the Indiana University School of Law.

This is only the second time that a sitting Parliamentarian has testified in front of a House Committee. The first was on the same subject a year after the Congressional Review Act was passed. We truly appreciate your testimony today and your taking time out to do this.

Just as a side note, I understand, Mr. Sullivan, that your grandfather was Lefty Sullivan, one of the pitchers for the 1919 White Sox's. I had no idea, thank you. I am guessing that he would have been very happy with the White Sox season last year? That's great.

I extend to each of you my appreciation for your willingness to participate in today's hearing. Because your written statements will be included in the record, I request that you limit your oral remarks to 5 minutes. Accordingly, please feel free to summarize or highlight the salient points of your testimony.

You will note that we have a lighting system. Green means 4 minutes, yellow means 1 minute, and red means you're out of time. Generally, we're pretty loose with that, and depending on whether we have people here to ask questions, we may be more or less loose. But, I want to let you know that it's a travel day for some folks, and so we'd like to pay some attention to that.

After you've presented your remarks, the Subcommittee Members, in the order they arrive, will ask questions of the witnesses, and they'll be subject to the 5-minute limit. And, we're going to be quite strict with that one.

I ask unanimous consent that Members have 5 legislative days to submit additional questions for the witnesses. Hearing no objection, so ordered.

Pursuant to the directive of the Chairman of the Judiciary Committee, I ask the witnesses to please stand and raise your right hand to take the oath.

[Witnesses sworn.]

Mr. CANNON. The record should reflect that all of the witnesses answered in the affirmative. You may be seated.

Mr. Mihm, would you please go ahead with your testimony?

**TESTIMONY OF J. CHRISTOPHER MIHM, MANAGING DIRECTOR
FOR STRATEGIC ISSUES, U.S. GOVERNMENT ACCOUNT-
ABILITY OFFICE, WASHINGTON, D.C.**

Mr. MIHM. Thank you, Mr. Chairman. Mr. Chairman, Mr. Coble, it's indeed, a great honor to appear before you today to discuss the Congressional Review Act.

As you mentioned in your opening statement, Mr. Chairman, the CRA was enacted to ensure that Congress has an opportunity to review and possibly reject rules issued by executive agencies before they become effective. Under the CRA, two types of rules, major and nonmajor, must be submitted to both houses of Congress and GAO before they can be implemented.

Taking your guidance, Mr. Chairman, I'll limit my comments to discussing GAO's role under CRA and the role that the CRA plays in the broader regulatory context. First, on the first point—GAO's primary role under the CRA is to assess and to report to Congress, on each major rule, the relevant agency's compliance with certain prescribed procedural steps.

These requirements include preparation of a cost-benefit analysis when that is required, compliance with the Regulatory Flexibility Act, the Unfunded Mandates Reform Act—commonly known as UMRA, the Administrative Procedures Act, Paperwork Reduction Act, and relevant executive orders, including 12866.

GAO's report must be sent to the congressional committees of jurisdiction within 15 calendar days of the publication of the rule or submission of the rule by the agency, whichever is later.

While the CRA is silent in regard to GAO's role concerning nonmajor rules, we found that the basic information about those rules should also be collected in a manner that can be useful to Congress and the public. Specifically, since the CRA was enacted in 1996, we have received and submitted reports on 610 major rules and entered over 41,000 nonmajor rules into a database that we created and maintain.

To compile information on all of the rules—that is, major and nonmajor—submitted to us under the CRA, we established this database, available to the public through the Internet. Our database gathers basic information about the 15 to 20 major and nonmajor rules that we typically receive each day, including the title, the agency, the type of rule, proposed effective date, date published in the Federal Register, other pertinent information, and any joint resolutions of disapproval that may have been introduced.

Each year, we also seek to determine whether all final rules covered by the CRA and published in the Federal Register have been filed with both Congress and us. We do this review to both verify the accuracy of our database and to determine if agencies are complying with the CRA.

We forward a list of unfulfilled rules to OMB for their handling, and in the past, they have disseminated the list to the agencies, most of which file the rules or offer an explanation of why they do not believe the rule is covered by the CRA.

In the 10 years since the CRA was enacted, all major rules have been filed with us in a timely fashion. For nonmajor rules, the degree of compliance has remained fairly constant, but not as high, with roughly 200 nonmajor rules per year not filed with our office.

And, they're the ones that we have to go after and go back to OIRA on.

One major area of noncompliance with the CRA's requirements has been that agencies have not always delayed the effective date of the major rules for the required 60 days. More specifically, agencies did not delay the effective date for 71 of the 610 major rules filed with our office.

My written statement contains the agencies' explanation for that, and as I note in the statement, we don't view those as valid explanations.

My second broad point this afternoon is that agencies and GAO have provided Congress a considerable amount of information about the forthcoming rules in response to the CRA. The limited number of joint Congressional resolutions might suggest that this information generates little additional oversight of rulemaking.

However, as we have found in our review of the information generated on Federal mandates under UMRA, the benefits of compiling and making information available on potential Federal actions should not be underestimated. Further, as we've also found regarding UMRA, the availability of procedures for congressional disapproval may have some deterrent effect.

My good CRS colleague Mort Rosenberg has reported that several rules have been affected by the presence of the review mechanism, suggesting that the CRA review scheme does have some influence in helping Congress maintain some transparency and oversight of the regulatory process.

Let me add my statement at that point, Mr. Chairman, and I am happy to take any questions that you or any other Members of the Subcommittee may have.

[The prepared statement of Mr. Mihm follows:]

PREPARED STATEMENT OF J. CHRISTOPHER MIHM

GAO

United States Government Accountability Office

Testimony
Before the Subcommittee on Commercial
and Administrative Law, Committee on
the Judiciary, House of Representatives

For Release on Delivery
Expected at 2 p.m. EST
Thursday, March 30, 2006

FEDERAL RULEMAKING

**Perspectives on 10 Years of
Congressional Review Act
Implementation**

Statement of J. Christopher Mihm,
Managing Director, Strategic Issues

GAO
Government Accountability Office

Highlights

Highlights of GAO's 2006 testimony to the Subcommittee on Commercial and Administrative Law, Committee on the Judiciary, House of Representatives

Why GAO Did This Study

This year marks the 10th anniversary of the Congressional Review Act (CRA), Congressional oversight of rulemaking using the CRA can be an important and useful tool for monitoring the regulatory process and balancing and reconciling the concerns of American citizens and businesses with the effects of federal agencies' rules. This statement provides an overview of the purpose and provisions of CRA; GAO's role and activities in fulfilling its responsibilities under the Act; and trends on CRA within the broader context of developments in presidential and congressional oversight of federal agencies' rulemaking.

March 29, 2006

FEDERAL RULEMAKING**Perspectives on 10 Years of Congressional Review Act Implementation****What GAO Found**

CRA gives Congress an opportunity to review most rules before they take effect and to disapprove those found to be too burdensome, excessive, inappropriate, duplicative, or otherwise objectionable. Under CRA, two types of rules, major and nonmajor, must be submitted to both Houses of Congress and GAO before they can take effect. The Office of Information and Regulatory Affairs (OIRA) of the Office of Management and Budget specifies which rules are designated as major rules based on criteria set out in the CRA. Major rules cannot be effective until 60 days after publication in the *Federal Register* or submission to Congress and GAO, whichever is later. Congress may disapprove agencies' rules by introducing a resolution of disapproval that, if adopted by both Houses of Congress and signed by the President, can nullify an agency's rule. Members of Congress seldom have attempted to use this process.

GAO's role under CRA is to provide Congress with a report on each major rule concerning GAO's assessment of the promulgating federal agency's compliance with the procedural steps required by various acts and executive orders governing the regulatory process. GAO compiles information on the rules it receives under CRA in a database containing basic information about major and nonmajor rules. GAO also conducts an annual review to determine whether all final rules covered by the Act and published in the *Federal Register* have been filed with the Congress and GAO. Although we reported that agencies' compliance with CRA requirements was inconsistent during the first years after CRA's enactment, compliance improved over time.

There have been a limited number of CRA joint resolutions, but the benefits of compiling and making information available on potential federal actions should not be underestimated. The procedures for congressional disapproval also may have some deterrent effect. Efforts to enhance presidential oversight of agencies' rulemaking appear to have been more significant and widely employed in recent years than similar efforts to enhance congressional oversight. Some recent legislative proposals have focused on expanding the information and analysis available to Congress on pending rules, while others focus on enhancing the mechanisms that Congress could employ for its own review—and potential disapproval—of agencies' rules.

- Facts on CRA since its Enactment on March 29, 1996**
- 57 Joint Resolutions of Disapproval introduced affecting 28 rules
 - 1 rule nullified by Congress through Joint Resolution procedures
 - 610 major rules received and reported on by GAO
 - 41,219 nonmajor rules entered into GAO database
 - About 200 nonmajor rules per year not filed with GAO
 - 48 of 610 major rules filed with GAO in a timely fashion
 - 71 of 610 major rules—effective date not delayed for required 60 days

Mr. Chairman and Members of the Subcommittee:

I am pleased to appear before you today on the 10th anniversary of the enactment of the Congressional Review Act (CRA).¹ As you know, CRA was enacted to ensure that Congress has an opportunity to review, and possibly reject, rules before they become effective. Under CRA, two types of rules, major and nonmajor, must be submitted to both Houses of Congress and GAO before they can take effect. We are required to provide Congress with a report on each major rule concerning our assessment of the promulgating federal agency's compliance with the procedural steps required by various acts and executive orders governing the regulatory process.

Over the past 10 years, agencies have submitted information on thousands of rules as required by the CRA. Although we generally found that agencies complied with CRA's requirements, one main area of noncompliance has been that agencies have not always delayed the effective date of their major rules for 60 days, as required by the Act. While considerable information on agencies' rules has been reported under CRA, to date Congress has used the Act to disapprove only one rule, the Department of Labor's rule on ergonomics in 2001. In contrast, our reviews indicated that efforts to increase presidential influence and authority over the regulatory process have become more significant and widely used over the years.

In my statement today, I will focus on three topics. First, I will provide a quick overview of the purpose and provisions of CRA. Second, I will discuss GAO's role in fulfilling its responsibilities under the Act and summarize our CRA activities over the years. Finally, I will address CRA within the broader context of developments in presidential and congressional oversight of federal agencies' rulemaking. My statement is based on our activities and observations implementing our responsibilities under CRA over the past decade and our related body of work reviewing federal regulatory issues.

¹ U.S.C. §§ 801-808. CRA was enacted as Subtitle E of the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA), Pub. L. No. 104-121, on March 29, 1996.

Overview of CRA Purpose, Procedures, and Requirements

Congressional oversight of rulemaking using the CRA can be an important and useful tool for monitoring the regulatory process and balancing and accommodating the concerns of American citizens and businesses with the effects of federal agencies' rules. As we noted early in the implementation of CRA, it is important to assure that executive branch agencies are responsive to citizens and businesses about the reach, cost, and impact of regulations, without compromising the statutory mission given to those agencies.⁴ CRA seeks to accomplish this by giving Congress an opportunity to review most rules before they take effect and to disapprove those found to be too burdensome, excessive, inappropriate, duplicative, or otherwise objectionable.

With certain exceptions, CRA applies to most rules issued by federal agencies, including the independent regulatory agencies.⁵ Under CRA, two types of rules, major and nonmajor, must be submitted to both Houses of Congress and GAO before they can take effect. CRA defines a "major" rule as one which results or is likely to result in (1) an annual effect on the economy of \$100 million or more; (2) a major increase in costs or prices for consumers, individual industries, government agencies, or geographic regions; or (3) significant adverse effects on competition, employment, investment, productivity, innovation, or on the ability of U.S.-based enterprises to compete with foreign-based enterprises in domestic and export markets. CRA specifies that the determination of what rules are major is to be made by the Office of Information and Regulatory Affairs (OIRA) of the Office of Management and Budget (OMB). Major rules cannot be effective until 60 days after publication in the Federal Register or submission to Congress and GAO, whichever is later. Nonmajor rules become effective when specified by the agency, but not before they are filed with Congress and GAO.

CRA established a procedure by which members of Congress may disapprove agencies' rules by introducing a resolution of disapproval that, if adopted by both Houses of Congress and signed by the President, can nullify an agency's rule. If such a resolution becomes law, the rule then

⁴GAO, *Congressional Review Act*, GAO/T-OC-97-29 (Washington, D.C.: Mar. 6, 1997).

⁵In addition to some general exceptions, such as one regarding any rule relating to agency management or personnel, CRA does not apply to any rule promulgated under the Telecommunications Act of 1996 and the amendments made by that Act. Nor does CRA apply to rules that concern monetary policy proposed or implemented by the Board of Governors of the Federal Reserve System or the Federal Open Market Committee.

cannot take effect or continue in effect. In addition, CRA prohibits an agency from reissuing such a rule in substantially the same form, or a new rule that is substantially the same as the disapproved rule, unless the reissued or new rule is specifically authorized by a law enacted after the date of the joint resolution disapproving the original rule. Members of Congress seldom have attempted to use this disapproval process. Over the past decade, 37 joint resolutions of disapproval have been introduced regarding 28 rules. Only once has Congress used this disapproval process to nullify a rule, when it disapproved the Department of Labor's rule on ergonomics in 2001.⁴

GAO's Role and Activities under CRA

GAO's only stated role under CRA is to provide Congress with a report on each major rule concerning GAO's assessment of the promulgating federal agency's "compliance with the procedural steps" required by various acts and executive orders governing the regulatory process. These include preparation of a cost-benefit analysis, when required, and compliance with the Regulatory Flexibility Act, the Unfunded Mandates Reform Act of 1995 (UMRA), the Administrative Procedure Act (APA), the Paperwork Reduction Act, and Executive Order 12866. GAO's report must be sent to the congressional committees of jurisdiction within 15 calendar days of the publication of the rule or submission of the rule by the agency, whichever is later. While the CRA is silent with regard to GAO's role concerning nonmajor rules, we found that basic information about those rules also should be collected in a manner that can be of use to Congress and the public.

To compile information on all the rules submitted to us under CRA, we established a database, available to the public on the Internet.⁵ Our database gathers basic information about the 15-20 major and nonmajor rules that we receive each day, including the title, the agency, the Regulation Identification Number, the type of rule, the proposed effective date, the date published in the Federal Register, the congressional review trigger date, and any joint resolutions of disapproval that may have been introduced. We created a standardized submission form available on the Internet, which is used by almost all the agencies, to allow more consistent

⁴Pub. L. No. 107-5, 115 Stat. 7 (Mar. 20, 2001).

⁵GAO's Federal Rules Database is publicly available at www.gao.gov under the "Legal Products" link. The reports we prepare on major rules under CRA are also available on that site.

information collection. Since CRA was enacted on March 29, 1996, we have received and submitted timely reports on 610 major rules and entered 41,218 nonmajor rules into the database.⁷

As noted earlier, before a rule can become effective, it must be filed in accordance with CRA. We conduct an annual review to determine whether all final rules covered by the Act and published in the Federal Register have been filed with the Congress and us. We perform the review to both verify the accuracy of our database and to ascertain the degree of agency compliance with CRA. We forward a list of unfiled rules to OIRA for their handling, and, in the past, they have disseminated the list to the agencies, most of which file the rules or offer an explanation of why they do not believe a rule is covered by CRA.

Although we reported that agencies' compliance with CRA requirements was inconsistent during the first years after CRA's enactment, compliance improved over time. In general, we have found the degree of compliance to have remained fairly constant, with roughly 200 nonmajor rules per year not filed with our office. In the 10 years since CRA was enacted, all major rules have been filed in a timely fashion.

In the past 10 years, we also have issued eight opinions regarding what constitutes a "rule" under CRA in response to requests from congressional committees and members concerning various agency pronouncements and memorandums. CRA contains a broad definition of the term "rule," including more than the usual notice and comment rulemakings published in the Federal Register under APA. Under CRA, "rule" means the whole or part of an agency statement of general applicability and future effect designed to implement, interpret, or prescribe law or policy. For example, in 1996 we concluded that a memorandum issued by the Secretary of Agriculture in connection with the Emergency Salvage Timber Sale Program constituted a rule under CRA and should have been submitted to Congress and GAO before it could become effective.⁸ Similarly, in 2001, we concluded that a Fish and Wildlife Service Record of Decision entitled "Trinity River Mainstem Fishery Restoration" was a rule covered by CRA.⁹ We believe these opinions have strengthened the reach of CRA by insuring

⁷Number of major and nonmajor rules are as of March 21, 2006.

⁸See B-274505, Sept. 16, 1996.

⁹See B-287057, May 14, 2001.

compliance with the main thrust of the Act, which was to insure that agency actions, whether labeled a "rule" by the agency or not, are subject to congressional review. We have noted that certain congressional committees, such as the Joint Committee on Taxation, were taking an active role in overseeing agency compliance with CRA. As a result, for example, Internal Revenue Service procedures, rulings, regulations, notices, and announcements are forwarded as CRA submittals.

The one major area of noncompliance with the requirements of the Act has been that agencies have not always delayed the effective date of major rules for 60 days as required by the Act.⁵ Agencies have filed 610 major rules with our office, and, for 71 of those rules, the agencies did not delay the effective date for the required 60 days.

One reason for noncompliance with the 60-day delay is that the agencies have misapplied the "good cause" exception which waives the delay of the rule if it would be impracticable, unnecessary, or contrary to the public interest.⁶ Since the enactment of CRA, our office has consistently held that the "good cause" exception is only available if a notice of proposed rulemaking was not published and public comments were not received.⁷ Many agencies, following a notice of proposed rulemaking and receipt of comments, have stated in the preamble to the final major rule that "good cause" existed for not providing the 60-day delay.

The other reason for noncompliance is that the statute that an agency is implementing by issuing the final major rule contains a date by which the Secretary or Administrator must issue the regulation, and the date, in many instances, does not permit the 60-day delay. However, the CRA states that it shall apply notwithstanding any other provision of law.⁸

⁸ 5 U.S.C. § 806(a).

Trends in Presidential and Congressional Review of Rulemaking

Agencies and GAO have provided Congress a considerable amount of information about forthcoming rules in response to CRA. The limited number of CRA joint resolutions introduced might suggest that this information generates little additional oversight of rulemaking. However, as we found in our review of the information generated on federal mandates under UMRA, the benefits of compiling and making information available on potential federal actions should not be underestimated.¹² Further, as we also found regarding UMRA, the availability of procedures for congressional disapproval may have some deterrent effect. The Congressional Research Service has reported that several rules have been affected by the presence of the review mechanism, suggesting that the CRA review scheme has had some influence.

Still, as I noted in my testimony before this Subcommittee last November, efforts to enhance presidential oversight of agencies' rulemaking appear to have been more significant and widely employed in recent years than similar efforts to enhance congressional oversight.¹³ In particular, our reviews have noted the growing influence and authority of OIRA in the oversight of the regulatory process.¹⁴ Some of this increased activity reflects administration initiatives, but it also includes some new responsibilities assigned by Congress through statute, such as the requirement for OMB to issue governmentwide guidance to implement the Information Quality Act.¹⁵

In contrast, there does not appear to have been a similar expansion of direct congressional influence and authority over the regulatory process, although bills have been introduced over the years to enhance the mechanisms available for congressional oversight of agencies' rulemaking. Some recent legislative proposals have focused on expanding the information and analysis available to Congress on pending rules, while

¹³See GAO, *Federal Rulemaking: Past Reviews and Emerging Trends Suggest Issues That Merit Congressional Attention*, GAO-05-2287 (Washington, D.C., Nov. 1, 2005).

¹⁴See GAO, *Rulemaking: OMB's Role in Reviews of Agencies' Draft Rules and the Transparency of Those Reviews*, GAO-05-220 (Washington, D.C., Sept. 22, 2005).

¹⁵The Information Quality Act is also known as the Data Quality Act. Consolidated Appropriations Act 2001, Pub. L. No. 106-54, 111 Stat. 2763, 2763A-150-54 (Dec. 21, 2000).

others focus on enhancing the mechanisms that Congress could employ for its own review—and potential disapproval—of agencies' rules.

As the major example of the first category of proposals, Congress passed the Truth in Regulating Act (TIRA) in 2000 to provide a mechanism for it to obtain more information about certain rules.⁷ In contrast to the essentially procedural reviews that GAO now conducts under CRA, TIRA contemplated a 3-year pilot project during which GAO would perform independent evaluations of "economically significant" agency rules when requested by a chairman or ranking member of a committee of jurisdiction of either House of Congress. However, during the 3-year period contemplated for the pilot project, Congress did not enact any specific appropriation to cover TIRA evaluations, as called for in the Act, and the authority for the 3-year pilot project expired on January 15, 2004. Therefore, we have no information on the potential effectiveness of this mechanism.

Congress has considered reauthorizing TIRA, and we have strongly urged that any reauthorization of TIRA continue to contain language requiring a specific annual appropriation for GAO before we are required to undertake independent evaluations of major rulemakings. Such an expansion of GAO's current lines of business without additional dedicated resources would pose a serious problem for us, especially in light of what will likely be increasing budgetary constraints in the years ahead. It would also likely serve to adversely affect our ability to provide the same level of service to the Congress in connection with our existing statutory authorities. We have also recommended that TIRA evaluations be conducted under a pilot project basis.

Members of Congress have also introduced several bills over the past year that would provide additional mechanisms for direct review and approval (or disapproval) of agencies' rules.⁸ Some of these proposals would modify how Congress reviews information submitted under CRA and how the disapproval procedures would work. These bills could, for example, create a joint committee that would be tasked with reviewing all rules to determine whether a disapproval resolution under CRA should be introduced. We have conducted no work that would provide information on the potential effectiveness of such changes.

⁷Pub. L. No. 106-312, 114 Stat. 1218 (Oct. 17, 2000), 5 U.S.C. § 801 note.

⁸See, for example, H.R. 576, H.R. 931, and H.R. 3118.

Mr. Chairman, this concludes my prepared statement. Once again, I appreciate the opportunity to testify on these important issues. I would be pleased to address any questions you or other Members of the Subcommittee might have at this time.

If additional information is needed regarding this testimony, please contact J. Christopher Mihm, Managing Director, Strategic Issues, at (202) 512-6896 or mihmj@gao.gov.

Mr. CANNON. Thank you.
Mr. Rosenberg.

**TESTIMONY OF MORTON ROSENBERG, ESQ., SPECIALIST IN
AMERICAN PUBLIC LAW, AMERICAN LAW DIVISION OF THE
CONGRESSIONAL RESEARCH SERVICE, LIBRARY OF CON-
GRESS, WASHINGTON, D.C.**

Mr. ROSENBERG. Thank you very much, Mr. Chairman and Mr. Coble.

I'm pleased to be here again, dealing with an important issue involved in our administrative law project. I have submitted a report of the 10 years of action under the CRA and also my statement for the record. Let me just make certain points, as quickly as I'm able to. As you know, I'm verbose.

Point one is that when the House and Senate passed this legislation, they understood that they were addressing a fundamental institutional concern. That institutional concern involved the development of the administrative state, the fact that there is tremendous amount of delegation of rulemaking and law-making authority to the agencies, that those delegations are broad and vague, and that they're absolutely necessary.

Point two is that Congress, over the years, has been criticized as abdicating its responsibility with respect to oversight of those delegated authorities. The sponsors of the legislation said, and I quote, "In many cases, this criticism is well founded. Our constitutional scheme creates a delicate balance between the appropriate roles of Congress in enacting laws and the executive branch in implementing those laws. This legislation will help address the balance, reclaiming for Congress some of its policymaking authority without at the same time requiring Congress to become a super regulatory agency."

Well, the statistics that have been compiled by GAO and reflected in their testimony and in my report indicate that those hopes seem to have been dashed. That, indeed, the anticipation that the agencies, because of the existence of the CRA, become a factor in the rule development process—a key factor—and level the playing field and provide the kind of regulatory accountability to Congress and the responsibility of Congress for overseeing it, appear to have been dashed.

And indeed, events over the last decade have exacerbated very much the CRA, in addition to the flaws of the CRA. Some of the flaws—and the major ones, that I would pick out, the two major ones are the lack of a screening device for Congress to be able to identify particularly the rules that need to be looked at by Congress and the absence of an expedited procedure in the House for House consideration of a joint resolution of disapproval that is, you know, concurrent with and complementary to the Senate's procedure.

Again, as I said, compounding the problem of a flawed mechanism is the development of a strong presidential review process. That started with President Reagan's establishment of the Office of Information and Regulatory Affairs as the clearinghouse for all rules during the—in the first month of the Reagan administration.

Those executive orders were very, very effective, and Congress was well aware during the '80's and the—and the '90's of how effective those executive orders were in sensitizing the agencies to the President's agenda and diverting it from Congress' agenda and Congress' intent in delegating authority with respect to certain kinds of rulemakings.

Those executive orders and that concept of what has been called the new presidentialism have been continued—were continued during the Clinton administration and has continued today in the Bush administration. The administration of John Graham of OIRA has been even more effective than it was during the Reagan administration.

Congress passed the CRA with that in mind and with the understanding that even during the Reagan administration, there was strong congressional opposition to presidential controls that were being developed at that particular time.

More recently, what we have seen is what I would call a denigration by the Executive Branch of Congress' abilities and Congress' role in the law-making process and in the oversight process. In a very widely cited article, the current dean of the Harvard Law School posits the notions of the new presidentialism, and suggests that when Congress delegates administrative and law-making power specifically to a department or agency head, it is at the same time making a delegation of those authorities to the President himself, unless the legislative delegation specifically states otherwise.

From this, she asserts, flows the President's constitutional prerogative to supervise, direct, and control the discretionary actions of all agency officials. The author states that, and I quote, "A Republican Congress proved feckless in rebuffing Clinton's novel use of directive power, just as an earlier Democratic Congress, no less rhetorically inclined, had proved incapable of thwarting Reagan's use of a newly strengthened regulatory process."

And she goes on to explain that, "The reasons for this failure are rooted in the nature of Congress and the law-making process. The partisan and constituency interests of individual Members of Congress usually prevent them from acting collectively to preserve congressional power or, what is the same thing, to deny authority to other branches of the Government."

She then goes on to effectively deride the ability of Congress to restrain a President—a presidential intent on controlling the administration of the laws. She states, "Because Congress rarely is held accountable for agency decisions, its interest in overseeing much administrative action is uncertain. And because Congress' most potent tools of oversight require collective action and presidential agreement, its capacity to control agency discretion is restricted. But viewed from the simplest perspective, presidential control and legislative control of administration did not present an either/or choice. Presidential involvement instead superimposes an added level of political control onto the congressional oversight system. That, taken on its own and for the reasons just given, has notable holes."

Dean Kagan's observations were like a blueprint for what has been occurring during the Bush administration.

Let me conclude by saying that the CRA reflects a recognition of the need to enhance the political accountability of Congress and the perception of legitimacy and competence of the administrative rule-making process. It also rests on an understanding that broad delegations of rulemaking authority to agencies are necessary and appropriate and will continue for the indefinite future.

The Supreme Court's most recent decision, rejection of an attempted revival of the nondelegation doctrine, adds impetus for Congress to consider several facets and ambiguities of the current mechanism. Absent review, current trends of avoidance of notice and comment rulemaking, the lack of full reporting of covered rules under the CRA, limited judicial review, and what I've just pointed out, an increasing presidential control over the rulemaking process, is likely to continue.

As I said, there are two major things that I think should be done to help ameliorate this. One is a screening mechanism, and the second is expedited procedures. One might say that, you know, putting them in legislation would be subject to presidential veto. But I believe that you could accomplish this by the action of Congress alone without presidential veto, and that would be utilizing Congress' rulemaking authority.

A joint committee that has power to screen and recommend with respect to—to the jurisdictional committees and send to the jurisdictional committees in the House and the Senate recommendations for disapproval resolutions can be established by concurrent resolution.

An expedited procedure in the House needs only a resolution of the House to establish. And I think in determining whether—what the next step to do is it may be too politically difficult to pass a law, this might be a way to go.

Thank you.

[The prepared statement of Mr. Rosenberg follows:]

PREPARED STATEMENT OF MORTON ROSENBERG, ESQ.

Mr. Chairman and Members of the Subcommittee,

I am very pleased to be before you again, this time to discuss a statute, The Congressional Review Act (CRA), that I have closely monitored since its enactment ten years ago yesterday. Your commencement of oversight of this important piece of legislation is opportune and perhaps propitious.

As my CRS Report on the decade of experience under the CRA details, we know enough now to conclude that it has not worked well to achieve its original objectives: to set in place an effective mechanism to keep Congress informed about the rule-making activities of federal agencies and to allow for expeditious congressional review, and possible nullification of particular rules. The House and Senate sponsors of the legislation made clear the fundamental institutional concerns that they were addressing by the Act:

As the number and complexity of federal statutory programs has increased over the last fifty years, Congress has come to depend more and more upon Executive Branch agencies to fill out the details of the programs it enacts. As complex as some statutory schemes passed by Congress are, the implementing regulations are often more complex by several orders of magnitude. As more and more of Congress' legislative functions have been delegated to federal regulatory agencies, many have complained that Congress has effectively abdicated its constitutional role as the national legislature in allowing federal agencies so much latitude in implementing and interpreting congressional enactments.

In many cases, this criticism is well founded. Our constitutional scheme creates a delicate balance between the appropriate roles of the Congress in enacting laws, and the Executive Branch in implementing those laws. This legislation will help to redress the balance, reclaiming for Congress some of its policy-

making authority, without at the same time requiring Congress to become a super regulatory agency.

The numbers accumulated over the past ten years are telling. Almost 42,000 rules were reported to Congress over that period, including 610 major rules, and only one, the Labor Department's ergonomics standard, was disapproved in March 2001. Thirty-seven disapproval resolutions, directed at 28 rules, have been introduced during that period, and only three, including the ergonomics rule, passed the Senate. Many analysts believe the negation of the ergonomics rule was a singular event not likely to soon be repeated. Furthermore not nearly all the rules defined by the statute as covered are reported for review. That number is probably at least double those actually submitted for review. Federal appellate courts in that period have negated all or parts of 60 rules, a number, while significant in some respects, is comparatively small in relation to the number of rules issued in that period.

It was anticipated that the effective utilization of the new reporting and review mechanism would draw the attention of the rulemaking agencies and that its presence would become an important factor in the rule development process. Congress was well aware at the time of enactment of the effectiveness of President Reagan's executive orders centralizing review of agency rulemaking, from initial development to final promulgation, in the Office of Management and Budget's Office of Information and Regulatory Affairs (OIRA) in the face of aggressive challenges of congressional committees. The Clinton Administration, with a somewhat modified executive order, but with an aggressive posture of intervention into and direction of rule-making proceedings, continued a program of central control of administration.¹ The expectation was that Congress, through the CRA, would again become a major player influencing agency decisionmaking.

The ineffectiveness of the CRA review mechanism, however, soon became readily apparent to observers. The lack of a screening mechanism to identify rules that warranted review and an expedited consideration process in the House that complemented the Senate's procedures, and numerous interpretative uncertainties of key statutory provisions, may have deterred its use. By 2001, one commentator opined that if the perception of a rulemaking agency is that the possibility of congressional review is remote, "it will discount the likelihood of congressional intervention because of the uncertainty about where Congress might stand on that rule when it is promulgated years down the road," an attitude that is reinforced "so long as [the agency] believes that the president will support its rules."²

Compounding such a perception that Congress would not likely intervene in rule-making, particularly after 2001, has been the emergence of what has been called by one scholar as the "New Presidentialism,"³ that has become a profound influence in administrative and structural constitutional law. It is a combination of constitutional and pragmatic argumentation that holds that most of the government's regulatory enterprise represents the exercise of "executive power" which, under Article II, can legitimately take place only under the control and direction of the President; and the claim that the President is uniquely situated to bring to the expansive sprawl of regulatory programs the necessary qualities of "coordination, technocratic efficiency, managerial rationality, and democratic legitimacy" (because he alone is elected by the entire nation). One of the consequences of this presidentially centered theory of governance is that it diminishes the other important actors in our collaborative constitutional enterprise. Were it maintained that the Congress is constitutionally and structurally unfit for running democratic responsiveness, public-regardness, managerial efficiency and technocratic rationality, this scholar's suggested response is: why bother talking with Congress about what is the best way to improve the practice of regulatory government?

In a widely cited 2001 article,⁴ the current dean of the Harvard Law School, posits the foregoing notions and suggests that when Congress delegates administrative and lawmaking power specifically to department and agency heads, it is at the same time making a delegation of those authorities to the President, *unless the legislative delegation specifically states otherwise*. From this flows, she asserts, the President's constitutional prerogative to supervise, direct and control the discretionary actions

of all agency officials. The author states that “a Republican Congress proved feckless in rebuffing Clinton’s novel use of directive power—just as an earlier Democratic Congress, no less rhetorically inclined, had proved incapable of thwarting Reagan’s use of a newly strengthened regulatory review process.”⁵ She explains that “[t]he reasons for this failure are rooted in the nature of Congress and the lawmaking process. The partisan and constituency interests of individual members of Congress usually prevent them from acting collectively to preserve congressional power—or, what is the same thing, to deny authority to other branches of government.”⁶ She goes on to effectively deride the ability of Congress to restrain a President intent on controlling the administration of the laws:

Presidential control of administration in no way precludes Congress from conducting independent oversight activity. With or without significant presidential role, Congress can hold the same hearings, engage in the same harassment, and threaten the same sanctions in order to influence administrative action. Congress, of course, always faces disincentives and constraints in its oversight capacity as this Article earlier has noted. Because Congress rarely is held accountable for agency decisions, its interest is in overseeing much administrative action is uncertain; and because Congress’s most potent tools of oversight require collective action (and presidential agreement), its capacity to control agency discretion is restricted. But viewed from the simplest perspective, presidential control and legislative control of administration do not present an either/or choice. Presidential involvement instead superimposes an added level of political control onto a congressional oversight system that, taken on its own and for the reasons just given, has notable holes.⁷

Dean Kagan’s observations and theories appear to have been almost a blueprint for the presidential actions and posture toward Congress of the current Administration.⁸

The CRA reflects a recognition of the need to enhance the political accountability of Congress and the perception of legitimacy and competence of the administrative rulemaking process. It also rests on the understanding that broad delegations of rulemaking authority to agencies are necessary and appropriate, and will continue for the indefinite future. The Supreme Court’s most recent rejection of an attempted revival of the nondelegation doctrine⁹ adds impetus for Congress to consider several facets and ambiguities of the current mechanism. Absent review, current trends of avoidance of notice and comment rulemaking, lack of full reporting of covered rules under the CRA, judicial review, and increasing presidential control over the rulemaking process will likely continue.

There have been a number of proposals for CRA reform introduced in the 109th Congress that address more effective utilization of the review mechanism, most importantly a screening mechanism and an expedited consideration procedure in the House of Representatives. Two such bills, H.R. 3148, introduced by Rep. Ginny Brown-Waite, and H.R. 576, filed by Rep. Robert Ney, both provide for the creation of joint committees to screen rules and for expedited House consideration procedures. H.R. 3148 also suggests a modification of the CRA provision that withdraws authority from an agency to promulgate future rules in the area in which a disapproval resolution has been passed with the enactment by Congress of a new authorization. That provision has been seen as a key impediment to the review process. Both proposals are expected to receive further consideration.

Mr. CANNON. You’re always provocative, and I really enjoyed that testimony. We’ll come back in just a few minutes. But those are very good points.

Mr. GAZIANO, you’re recognized for 5 minutes.

TESTIMONY OF TODD F. GAZIANO, ESQ., SENIOR FELLOW IN LEGAL STUDIES, AND DIRECTOR, CENTER FOR LEGAL AND JUDICIAL STUDIES, THE HERITAGE FOUNDATION, WASHINGTON, D.C.

Mr. GAZIANO. Good afternoon, Mr. Chairman.

⁵ Kagan at 2314.

⁶ *Id.*

⁷ Kagan at 2347.

⁸ See Yoo at 722–30.

⁹ *Whitman v. American Trucking Assn’s*, 531 U.S. 457 (2001).

Thank you for inviting me to talk about the operation of a law that too often is neglected.

In my written testimony, I talk about some of the democratic and separation of powers theory that supports this legislation. But I'm going to try to confine my oral testimony to more practical concerns.

I want to first turn to an evaluation of the effectiveness of the CRA, and I want to talk about the three purposes of the CRA. And the first is, as Mr. Mihm has suggested, is to advance public record-keeping of agency rulemaking.

The CRA's legislative history makes clear that the broad definition of a rule was chosen for several reasons; one of them was to help Congress and its supporting agencies better catalogue the corpus of agency rules that affect the public.

I am somewhat disappointed that compliance has not been complete, and I actually think that the incidence of noncompliance may be higher than that which GAO has been able to record. Anecdotal evidence and investigation by other Committees of this House has suggested as much.

Nevertheless, the catalogue of nearly 42,000 rules and the public database that GAO has set up, together with the required reports, is no doubt a very valuable resource for Congress and for scholars of the regulatory process.

The second purpose of the Congressional Review Act is to change agency rulemaking behavior. Now it's true that the CRA has not been invoked as often as its sponsors and early commentators expected. But as opposed to the "glass is half empty" conclusion that Mort talked about, I think that it is not wise to conclude that it's necessary that it's had no impact on agency behavior and legislative accountability.

In fact, there is anecdotal evidence that when Congress invokes the CRA, particularly during the rulemaking process, it can have an effect. What that evidence suggests to me, Mr. Chairman, is that it can be a tool to increase Congress' leverage when Members choose to use it.

Now some point to the ergonomics rulemaking and say the only time that we can enact a law is when a rule is issued, unpopular rule is issued at the end of an Administration that isn't supported by the incoming Administration.

In my written testimony, I explain why I'm not sure that that is the case. But even if that is one limitation to the rule, that's an important use of the CRA: to put a stop to such midnight regulations.

But I do want to address one other limitation that I think has been exaggerated, and that is the assumption that Presidents will veto any resolution of disapproval for rules that come out of their Administrations. Certainly, it is the case that Presidents might consider such vetoes. But in my written testimony, I mention three reasons why a President might not veto such resolutions of disapproval.

But even if a President does veto such resolutions of disapproval, let me suggest two positive outcomes from the standpoint of democratic theory. The first is that the President would be more directly accountable for the regulation—both he and his Administration

would not be able to hide behind the “Congress made me do it. We had no discretion, but to issue this particular regulation” excuse.

The second benefit, even of a presidential veto, of course, that isn’t immediately overridden is that once Congress expresses its will in that way, it usually can get its—have its will enacted in some other way, by adding a rider to a different piece of legislation or through other means. Creative minds, of course, can certainly influence the enforcement of a particular rule and change its operation in the future.

The third major purpose of the Congressional Review Act is to enhance legislative accountability for agency rulemaking. And I submit to you that by its action or inaction, Congress is now more accountable for agency rules. I think that the CRA was designed by its sponsors and does make it harder for both the President and Congress to evade their particular share of responsibility.

To the extent that the CRA does have some limitations, I certainly believe Congress should make further reforms. But Congress is, ultimately, responsible.

In my remaining time, I just want to mention one interpretive issue and three possible reforms, just almost by name. The first interpretive issue is that that the courts have somewhat disagreed on, and that’s the scope of the limitation on judicial review that’s contained in section 805.

The key question is this. May a court consider whether a rule that has never been submitted to a Congress is in effect? And I submit that the better interpretation of the statute is that the courts can properly pass on that issue.

But I’m requesting this Committee or suggesting to this Subcommittee, respectfully, that this issue merits special attention in the future. No matter what the courts decide about this issue, I suggest that this Subcommittee should ensure that there’s at least limited judicial review of that triggering mechanism in the future, even if it requires future legislative amendment.

The other matters that I would commend to this Subcommittee’s further consideration is I do think that there is a desperate need for an OIRA-like organization in Congress. I feel somewhat presumptuous—it would be somewhat presumptuous of me to suggest exactly what that is, but I also think that it makes no sense from a separation of powers standpoint for you to be so seriously outmanned in the regulatory review. So I think the Committees of jurisdiction also need to significantly increase their staff.

The two other, more dramatic proposals that I would suggest are that Congress consider requiring congressional approval of major rules. Not make them subject to disapproval, but actually require affirmative congressional approval.

And the final reform that I certainly think is justified is to prevent the proliferation of crimes from being defined in regulations. I think that if it is worthy to criminalize, Congress ought to define the contours of crimes.

Thank you, Mr. Chairman.

TESTIMONY OF

TODD F. GAZIANO

SENIOR FELLOW IN LEGAL STUDIES, AND
DIRECTOR, CENTER FOR LEGAL AND JUDICIAL STUDIES,
THE HERITAGE FOUNDATION¹

214 MASSACHUSETTS AVENUE, NE
WASHINGTON, DC 20002

BEFORE THE UNITED STATES HOUSE OF REPRESENTATIVES

COMMITTEE ON THE JUDICIARY

SUBCOMMITTEE ON COMMERCIAL AND ADMINISTRATIVE LAW

REGARDING

“THE TENTH ANIVERSARY OF THE CONGRESSIONAL REVIEW ACT”

30 MARCH 2006

¹The title and affiliation are for identification purposes. Staff of The Heritage Foundation testify as individuals. The views expressed are our own, and do not reflect an institutional position for The Heritage Foundation or its board of trustees. The Heritage Foundation, is a public policy, research, and educational organization. It is privately supported, and receives no funds from government at any level, nor does it perform any government or other contract work. The Heritage Foundation is the most broadly supported think tank in the United States. During the past two years, it had approximately 275,000 individual, foundation, and corporate supporters representing every state. Its 2005 contributions came from the following sources: individuals (63%), foundations (21%), corporations (4%), investment income (9%), publication sales and other (3%). I would like to gratefully acknowledge my reliance on the valuable CRS Report by Morton Rosenberg and the cheerful assistance of my Heritage colleagues Erica Little and Andrew Grossman.

Good afternoon, Mr. Chairman and other distinguished Members of the Subcommittee. Thank you for inviting me to testify today on the operation of a law that is too often neglected. For the record, I am a Senior Fellow in Legal Studies and Director of the Center for Legal and Judicial Studies at The Heritage Foundation, a nonpartisan public policy, research, and educational organization. I am a graduate of the University of Chicago Law School and a former law clerk to the U.S. Fifth Circuit Court of Appeals. During different periods in the Reagan, Bush, and Clinton Administrations, I served in the U.S. Department of Justice, Office of Legal Counsel, where I provided legal advice to the White House and four Attorneys General on a variety of matters, including administrative law issues related to the rulemaking process.

As the Subcommittee Members also may know, I was honored to serve as a Subcommittee Chief Counsel in this body in 1996 when the Congressional Review Act (CRA) was debated and enacted. The original House version of the CRA was introduced as an amendment to another bill by Rep. David M. McIntosh, then-chair of the Subcommittee on National Economic Growth, Natural Resources and Regulatory Affairs, which employed me. I also had the privilege of working closely with Senator Nickles, the original Senate sponsor, and his legislative staff, as well as with House Judiciary Committee Chairman Henry Hyde and his senior staff, on the final language of the bill before it was added as a subtitle to a larger bill that was signed into law ten years ago yesterday.

I mention my personal involvement as an agent of Congress not to relate long-irrelevant details regarding the legislative debate over the CRA—and certainly not to claim any more credit than that of one of several scriveners—but simply as bearing on my detailed familiarity with its text, structure, and legislative history. To the extent that I discuss the legislative intent of the CRA and the expectations of its sponsors, I attempt to confine myself to the public record, including the joint legislative history introduced in the House and the Senate by all of the principal legislative sponsors.

Nevertheless, my personal experience probably has also caused me to think, write, and speak about the CRA more than I otherwise would as an administrative law scholar. It is therefore a special pleasure to share with you some of my thoughts about its successes, limitations, and promise as a part of our administrative law. My testimony begins with a brief statement regarding the democratic theory behind the Congressional Review Act. I then touch on the effectiveness of the CRA, discuss some interpretive issues and possible reforms to make it more powerful, and conclude with additional thoughts on how the CRA (and more extensive congressional review of agency rulemaking in general) could better approximate the separation of powers ideal.

Democratic Theory and the Separation of Powers

The Congressional Review Act requires executive agencies to submit covered rules to Congress before they may go into effect. The Act provides special procedures in both Houses that enable Congress to expeditiously consider special, unamendable resolutions of disapproval that would overrule the regulation. If passed by Congress, such resolutions of disapproval are then presented to the President for his signature or veto as is the case with any other bill.¹

Before turning to more practical issues, it is helpful to note that the Congressional Review Act was intended to increase democratic accountability for rulemaking and to reinvigorate, at least in a minor way, one aspect of the constitutional separation of powers that has been weakened over time. In

¹ For a more detailed discussion of the operation of the Act, see Morton Rosenberg, "Congressional Review of Agency Rulemaking: An Update and Assessment of the Congressional Review Act After Ten Years," CRS (March 27, 2006).

short, the Framers would have approved of a device like the CRA because it reinforces the constitutional scheme that they so carefully crafted.

The Framers' concern was tyranny, not just by a monarch, but by his many administrative officials as well. One of my favorite passages of the Declaration of Independence lists this as a justification for revolution: "He has erected a multitude of new Offices, and sent hither Swarms of Officers to harass our People, and eat out their Substance." Agency bureaucrats can be as dangerous and harassing today as they were in 1776—unless they are constrained in some meaningful way.

One of the most important devices adopted by the Framers to prevent tyrannical government was the separation of powers. The Framers were familiar with Montesque's admonition that there can be no liberty where the legislative and executive powers are united in the same official. This idea of separating government powers had begun to be implemented in the colonial governments and later in the state governments at the time of the framing of the United States Constitution.

The separation of powers is expressed in various ways in the Constitution, including the structure of the Constitution and several of its explicit provisions. Nevertheless, Madison acknowledged a common fear of the proposed government when he noted in *Federalist 46* that, "The accumulation of all power, legislative, executive and judiciary in the same hands may justly be pronounced as the very definition of tyranny." (This formulation actually trumps Montesque's.) In several of the subsequent *Federalist Papers*, Madison explained that citizens need not fear that the new Constitution neglected the separation of powers. The Constitution, he argued, would keep the powers of government more effectively separated than the early state governments because it pitted ambition against ambition to keep the different branches of government perpetually in check.

The clearest expression of the separation of powers can be found in the vesting clauses, which are the first sentences of Articles I, II, and III. Article I begins thus: "All legislative Powers herein granted shall be vested in a Congress of the United States..." Article II begins in a similar fashion: "The executive Power shall be vested in a President..." And Article III begins with an analogous grant of power: "The judicial Power of the United States shall be vested in one supreme Court, and in such inferior Courts as the Congress may from time to time ordain and establish." Note there is no mention of independent agencies, or anything else "independent" for that matter.²

As this Subcommittee knows, the purpose of the separation of powers was not to protect government officials' power for sake of those officials, but to protect individual liberty. Power was understood to be corrupting, and the more power concentrated in one person or branch, the greater the threat to liberty. It was for this reason that the Framers struggled to divide the necessary powers of the government. But they also paid special attention to keeping them separate for the long run.

What legal scholars and historians refer to as the delegation (or nondelegation) doctrine is a necessary corollary to this separation of powers framework. As it applies to Congress, it is the simple notion that Congress may not delegate its core legislative power to the executive or judicial branches or to other entities. Congress must write the laws itself. It cannot delegate the law-writing power because that would upset the balance of powers and ultimately endanger our individual liberties.

² Executive branch agencies include many so-called "independent" agencies. Congress may designate an agency as "independent" for various statutory purposes, but all agencies that exercise significant discretion under the laws of the United States are in the executive branch for constitutional purposes. *Cf. Morrison v. Olson*, 487 U.S. 654 (1988).

When does Congress's delegation of rulemaking authority to executive branch agencies cross the line between filling in administrative gaps in the laws Congress has enacted and actually writing what are the equivalent of new laws? This is one of the more difficult questions of constitutional law. The Supreme Court once policed this line actively, but it has largely abdicated this responsibility since the late 1930s.³ Nevertheless, there are still some clear limits on delegated authority beyond which Congress cannot go.⁴ Although Congress's delegation of rulemaking power may be very broad, it cannot be completely standardless. Recent decisions of the Supreme Court have held that a law that authorizes rulemaking must contain an "intelligible principle" to guide agency action.

The most significant recent pronouncement by the Supreme Court was a disappointment to those who had hoped for a minor re-invigoration of the nondelegation doctrine. In *Whitman v. American Trucking Association*, the Court found an "intelligible principle" in the Clean Air Act that grants the EPA extremely broad discretion to regulate thousands of potential pollutants, even if those rules impose billions of dollars in costs and bankrupt entire industries.⁵ Some might reasonably wonder whether the discretion accorded to the EPA amounts to "the accumulation of [practically] all power, legislative, executive and judiciary in the same hands" that Madison equated with the "very definition of tyranny."⁶ No matter how well meaning it might be, the EPA decides what pollutants to regulate, how specifically to control those pollutants, and when and where its regulations apply. It then writes voluminous rules, enforces its own regulations, and adjudicates many actions subject to a very limited and deferential standard of judicial review.

Only Justice Thomas expressed serious concern with the delegation in *Whitman*, though he cast his opinion as a concurrence because the issue was not properly raised by the litigants. Thomas's opinion is wonderful, as usual. My paraphrase of his opinion is this: "I agree the Clean Air Act has an intelligible principle, like other laws the Court has heretofore approved. But that is not the relevant test under the Constitution. The Constitution confers *all* legislative powers to Congress. The real question is whether the delegation is anything other than legislative."⁶ According to a solid majority of justices still on the Court, however, Congress need only provide vague but intelligible principles to enable the executive to legislate as it sees fit. This is not the separation of powers ideal.

That the courts allow Congress to delegate sweeping regulatory power to executive agencies does not mean it *should* do so, especially when it exercises no further control over the matters delegated. With broad delegation now the norm, Congress ought to increase oversight and control over the agency rulemaking process. In other words, if the delegation doctrine is on life support, then Congress must devise other procedures to approach and reinforce the separation of powers ideal. The Congressional Review Act was a small step to restore constitutional government and the constitutional separation of powers. The joint statement of its principal sponsors expresses that intent:

As the number and complexity of federal statutory programs has (sic) increased over the last fifty years, Congress has come to depend more and more upon Executive Branch agencies to fill out the details of the programs it enacts. As complex as some statutory schemes passed by Congress are, the implementing regulation is often more complex by several orders of magnitude. As more and

³ Legal scholars continue to debate the appropriateness of this change, but almost all agree that the courts have significantly increased the deference they accord to congressional delegations of regulatory authority since the late 1930s.

⁴ For example, the Supreme Court still has not overruled its early New Deal cases of *Panama Refining Co. v. Ryan*, 293 U.S. 388 (1935), and *Schechter Poultry Corp. v. United States*, 295 U.S. 495 (1935).

⁵ 531 U.S. 457, 472-76 (2001).

⁶ 531 U.S. at 486-87 (Thomas, J., concurring). Thomas ends his three-paragraph concurrence expressing a willingness to address that specific question in a future case.

more of Congress[s] legislative functions have been delegated to federal regulatory agencies, many have complained that Congress has effectively abdicated its constitutional role as the national legislature in allowing federal agencies so much latitude in implementing and interpreting congressional enactments.

In many cases, this criticism is well founded. Our constitutional scheme creates a delicate balance between the appropriate roles of the Congress in enacting laws, and the Executive Branch in implementing those laws. This legislation will help to redress the balance, reclaiming for Congress some of its policymaking authority, without at the same time requiring Congress to become a super regulatory agency.

* * *

Because Congress often is unable to anticipate the numerous situations to which the laws it passes must apply, Executive Branch agencies sometimes develop regulatory schemes at odds with congressional expectations. Moreover, during the time lapse between passage of legislation and its implementation, the nature of the problem addressed, and its proper solution, can change. Rules can be surprisingly different from the expectations of Congress or the public. Congressional review gives the public the opportunity to call the attention of politically accountable, elected officials to concerns about new agency rules. If these concerns are sufficiently serious, Congress can stop the rule.⁷

Evaluating the Effectiveness of the CRA

1. Enhanced public recordkeeping of agency rulemaking.

Prior to the CRA, the public record of agency rulemaking was even spottier than it is today. Only certain regulations must be published in the *Federal Register*, and the *Federal Register* includes many proposals and other materials that are not final rules. The CRA's broad definition of a rule was chosen for several reasons, among them to help Congress and its supporting agencies to catalogue the corpus of agency rules that affect the public. As its text and legislative history make clear, the CRA was not designed to cover matters related to agency internal management or organization but was intended to cover any "agency statement of general applicability and future effect" that substantially affects the rights or obligations of those outside the agency.⁸ Notice-and-comment rules, interpretive rules, and guidance documents all fall within this standard.⁹

Although this broad definition should encompass almost every final agency statement that affects the public, investigations by GAO and the Government Reform and Oversight Committee have confirmed that agencies are not submitting all covered rules as the CRA requires, and instead, are principally submitting only those that are published in the *Federal Register*.⁹ It is also problematic that OMB has not satisfactorily complied with a separate mandate that it issue guidance to the agencies to improve compliance with the CRA.¹⁰ That could change if the regulated community prevails in one or more high profile challenges to, for example, an agency guidance document or handbook that was never sent to Congress.

I defer to the other witnesses to describe the number and nature of the rules that have been filed

¹⁰ *Id.* at 27 and note 46.

with Congress pursuant to the CRA. Undoubtedly, though, the catalogue of approximately 41,800 major and non-major rules, together with required reports on agencies compliance with various statutory and presidential review requirements, is a valuable resource for Congress and scholars of the regulatory process.

2. Changing agency rulemaking behavior.

The CRA probably has not been invoked as often as its sponsors and early commentators had expected, but that does not mean that it has had no impact on agency behavior and legislative accountability. Anecdotal evidence suggests that Congress has influenced controversial rules by invoking the CRA. Even if the number of rules so influenced has not been large, this evidence demonstrates that the CRA gives Congress some additional leverage with agencies—when Members choose to use it. This may influence agencies' work on controversial rules even when the CRA is not invoked and even though Congress has made little direct use of its power to overturn rules.

The Occupational Safety and Health Administration's ergonomics rule is the only rule overturned by a resolution of disapproval that became law.¹¹ Some, including my distinguished co-panelist Morton Rosenberg, argue that the ergonomics rule is a *sui generis* example because it was promulgated at the end of one administration and was not supported by the incoming administration. There is much truth to this observation, but that is still an important use of the CRA. Putting a check on midnight regulations that might bankrupt entire industries and needlessly strain our economy is valuable. Regulations should not be rushed to publication in the face of expected opposition by the democratically elected President-elect. Among its other purposes, the CRA exists to undo such regulations that a lame-duck administration has attempted to finalize.

There are other advantages to using the CRA to overturn a controversial major rule rather than relying on the next administration to attempt a repeal of the rule. An agency repeal is costly and time-consuming, and depending on the statute that authorized the rule, the attempt might be subject to lengthy litigation. If successful, repeal may create inequities between citizens who were subject to agency enforcement actions before and after the repeal. Under the CRA, however, rules may be overturned relatively quickly, with little legal uncertainty. Moreover, rules disapproved pursuant to the CRA are treated as if they were never in effect, eliminating any inconsistencies in treatment.

Nevertheless, the effect of the CRA is lessened over time if it is used in only rare cases. The CRA would have a greater impact on agency behavior if Congress used it even a few times to invalidate rules during the middle of an administration. In geopolitical terms, just a few missiles in the hands of an emerging state can change the balance of power in an entire region. One OMB official described the CRA as a Minuteman Missile, deterring conduct by its mere existence. For this analogy to ring true, however, there would have to be a credible threat of that missile being launched.

One reason Congress may not have used the CRA as often as anticipated is that Congress has other tools at its disposal, such as legislative riders on appropriations bills, to accomplish the same end. With recent interest in reforming the appropriations process, these other tools may become disfavored.

One clear limitation of the CRA is that a president might be inclined to veto any resolution disapproving a rule that made it through his own regulatory review process. Yet, this limitation should not be exaggerated to the point that it becomes a self-fulfilling prophesy—or is never tested because

¹¹ See Public Law 107-5 (2001).

Congress offers no resolutions to veto. There are at least three reasons why a president might not veto a resolution of disapproval regarding a rule issued by his administration:

- (a) The rulemaking may be one mandated by Congress that the president is not particularly fond of. In short, a president may not like each rule some long-ago Congress set in motion just because it came to fruition in his administration.
- (b) The rule may be issued by one of the so-called “independent” agencies Congress has attempted to insulate from direct presidential control. In such case, the president may have had fewer opportunities to shape the rule’s final development. For this or similar reasons, the president might prefer to have the particular agency (which may soon have more of his own appointees in office) start over and draft a substantially different rule.
- (c) A president may simply be reluctant to veto any legislation and decide that a particular resolution of disapproval is not worth making an exception to his usual practice.

But even if a president did veto a resolution of disapproval for a rule issued by his administration and the Congress could not immediately override his veto, there are two positive outcomes from the standpoint of democratic theory. The first is that the president would be more directly accountable for the regulation. His administration could not hide behind the “Congress-made-do-it/we-had-no-discretion-but-to-issue-the-regulation” excuse.

The Framers intended that the president be personally responsible and accountable for his administration. To this end, the Framers rejected several proposals at the Constitutional Convention for a Council of Revision and for a constitutional Privy Council for fear that the president would hide behind their advice and that would diminish his accountability to the people.¹² The Framers even changed early drafts of the Opinion Clause of the Constitution to ensure that any advice to the president and any cabinet government was initiated and dispensed with at the president’s choosing.¹³ With the growth of the administrative state, Congress must restore of the lines of accountability so that modern presidents are not able to hide behind agency officials with supposed technical expertise.

The second beneficial result of a veto would be to set other democratic forces in motion. Congress often can find ways to enforce its will without directly overriding the president’s veto, such as by including a vetoed measure in a must-pass bill or employing other political means. CRS recently estimated that 95 percent of all recent earmarks were contained in report language or other non-binding legislative documents.¹⁴ The president could legally ignore all of these earmarks, especially if he seeks (as all modern presidents do) line-item veto authority. Nevertheless, modern presidents abide by almost all report-language earmarks for the simple reason that upsetting powerful members of Congress is costly. Creative minds can craft a variety of exceptions, interpretations, and other enforcement guidelines than can significantly alter the enforcement decisions of a particular agency.

3. Enhancing legislative accountability for agency rulemaking.

The CRA has enhanced legislative accountability for agency rulemaking even if it could be

¹² See Todd Gaziano, “Opinion Clause,” in *The Heritage Guide to the Constitution*, pp. 201-03 (Edwin Meese III, et al., eds., Regnery 2005).

¹³ *Id.* The Opinion Clause is Art. II, § 2, cl. 1.

¹⁴ See Robert Novak, “Bush cool to idea to cut spending,” *Chicago Sun-Times*, March 27, 2006.

shown that the CRA has not substantially changed agency behavior or improved the regulations that are issued. By its action or inaction, Congress is now more accountable for agency rules. This is analogous to the increased presidential accountability when Congress does pass a resolution of disapproval. The president is directly accountable, whether he signs or vetoes the resolution.

In short, the CRA makes it much more difficult for the president and for Congress to avoid their respective share of responsibility. Like the president, Members of Congress sometimes play the blame game to the detriment of responsible government. Public choice theory suggests that congressional authorizers have the most to gain if they can claim credit for doing something about a perceived public problem but shift the costs of decision-making to someone else. By passing a vague law, they may claim credit for the perceived good, and if the agency writes regulations that are unpopular, they can often shift the blame onto the "out-of-control" agency. That's the best of both worlds for a politician but the worst of all worlds for the body politic.

The predictable, and sometimes truthful, response from an agency official who issues an unpopular regulation is "Congress made me do it." As discussed, the president can hide behind this response as well, unless Congress takes positive steps to disapprove the regulation. As ever, success has a thousand fathers, but no one takes responsibility for a misguided or unpopular regulation. The CRA makes it harder for Congress to claim that an agency is "out of control" because Congress can more clearly control the rules agencies write now.

Some in Congress never liked the Congressional Review Act because it does help, in a minor way, to increase political accountability for agency rulemaking. After overturning the ergonomics regulation in 2001, many Members now appropriately see the CRA as a double-edged sword. The CRA's congressional sponsors always understood this.

Agency claims that they have no discretion in the issuance of particular regulations present special concerns, and the CRA applies to them in a unique way. If such a claim is true, the CRA refocuses attention on who is responsible and gives Congress an easy opportunity to reconsider the underlying mandate. Too often, however, an agency's claim of limited discretion is overstated. With enactment of the CRA, trying to shift blame to Congress became riskier. If Congress accepts the agency's claim and disapproves the rule anyway, the agency's future range of discretion is narrowed even more, and possibly eliminated, because the agency is forbidden from re-issuing a substantially similar rule without express congressional authorization.

Agencies' attempts to avoid responsibility will not disappear, but they are now more difficult, as they should be in a functioning democracy. Likewise, Congress has made itself more accountable for agencies' rules, whether it exercises its authority under the CRA or not. To the extent that the CRA has serious limitations, Congress should consider further reforms.

Even without changes to the statute, Congress can take several steps to make better use of the CRA. Members, especially committee chairs, should conduct oversight during the rulemaking process of particularly problematic rules and cite the potential for CRA disapproval when communicating with agency officials. Congress should not cross the line and attempt to micromanage proper executive functions under other chapters of the Administrative Procedure Act, but it ought to express itself forcefully if an agency proposes a rule that is strongly opposed by a majority in Congress. After the ergonomics rule disapproval, this threat carries some weight.

The earlier Congress engages in the rulemaking process, the more effective Congress's

engagement will be. Although some tools Congress has used to investigate enforcement actions are inappropriate (such as depositions of career staff), broad oversight of the rulemaking process is justified because modern rulemaking is at least quasi-legislative to begin with. It is arguably Congress's power that is being exercised. Active congressional involvement is appropriate to rein in agency excess or simply a few bad regulations.

And if a statute really does require an agency to issue a particularly draconian rule, Congress still can use the expedited procedures of the CRA to change course or make corrections. No one is immune from the law of unintended consequences. Congress should not pretend that it has perfect foresight either. In sum, Congress should use the CRA to correct its own mistakes as well as those of executive agencies.

Resolving Interpretive Issues

Morton Rosenberg's report for the Congressional Research Service on the CRA is helpful in discussing various issues of CRA statutory interpretation that remain unresolved.¹⁵ For the most part, I agree with his analysis and conclusions regarding the proper resolution of those issues, but I add a few thoughts here as well.

(a) Courts should not consult legislative history unless the text of the statute is inherently ambiguous, and courts should give some types of legislative history evidence more weight than others. Nevertheless, there are several reasons why the courts should accord the Joint Explanatory Statement of the House and Senate Sponsors of the CRA greater weight than is normally granted to post-enactment legislative material.

First, the Joint Explanatory Statement is the only document written by the sponsors and relevant committee chairmen responsible for the legislation. It does not conflict with other committee reports because there are none. Second, it is found in the Congressional Record in the House on the day of passage. See 142 Cong. Rec. 6922-6930 (March 28, 1996). My own memory is unreliable and I have not found a unanimous consent request that would have permitted such a placement, but without contrary evidence, the courts should accord a presumption of regularity to the proceedings of the coordinate branches. Thus, there is every reason to conclude that at least the House collectively wanted the Joint Explanatory Statement to be treated as a contemporaneous legislative history. Third, even if deemed "post-enactment" legislative history, it is only a few weeks post-enactment. Some of the reasons to be distrustful of such material remain, but the Statement was not written in the midst of litigation or an ongoing battle with the executive branch. The Statement is not a mere "litigation position." Finally, it has many of the hallmarks of a joint conference report, explaining the nature of the compromises between earlier House and Senate versions and containing a brief legislative history, a summary of major provisions, definitions, etc. It was not written with a narrow purpose to affect one provision or change the legislative debate. Indeed, its general purpose, to substitute for a conference report on the CRA, is set forth at the beginning of the Statement's coverage of the Act.

(b) The most important unresolved issue may be the scope of the limitation on judicial review in section 805. The key question is this: may a court recognize that a rule has no legal effect due to the undisputed fact that it was not delivered to Congress as required by the CRA? The text of the limitations provision is somewhat ambiguous, and the text of other sections of the CRA further compounds the ambiguity. For example, section 801(g) contains a separate prohibition on courts

¹⁵ Morton Rosenberg, CRS Report, *supra* note 1, at pp.23-39.

inferring any intent from Congress's failure to enact a resolution of disapproval. If the limitation on judicial review in section 805 were absolute, there would have been no reason for Congress to include section 801(g).

Where possible, statutes must be read not to render one of their provisions irrelevant. I agree with Morton Rosenberg that the Department of Justice's interpretation and two early court decisions on section 805 are not persuasive and that court decisions on analogous statutes are on point. The legislative history explains how to resolve the apparent ambiguity. The courts may consider pure issues of law relating to whether certain rules or laws are in effect—e.g., what legal effect to give enacted resolutions of disapproval and whether regulations are or are not in effect as a matter of law. Subsidiary determinations of fact or matters involving internal congressional procedure, such as a major rule determination by the Office of Information and Regulatory Affairs or each House's determinations regarding its calendar and the applicability of the expedited review provisions, are not subject to judicial review.

This issue merits special attention by this Subcommittee in the future. To the extent that the courts are not consistent in interpreting the limitation on judicial review in this way and read it as a complete bar on any judicial review of the effectiveness of a rule that was never submitted to Congress, the Judiciary Committee should consider legislation to clarify the matter and affirm the judgment of the court in *United States v. Southern Indiana Gas and Electric Co.*¹⁶ Mort Rosenberg's analysis is persuasive that the absence of any judicial review on the triggering mechanism of the CRA would permit the complete frustration of its purpose. The legislative history shows that the original sponsors did not expect that result. Whether the limitation on judicial review currently is ambiguous or not, this Subcommittee should ensure that limited judicial review is available in the future.

Potential Improvements in Congressional Review Procedures

Proposals for improved screening mechanisms to pinpoint rules that need congressional review also are worthy of serious consideration. As a separation of powers matter, it makes no sense for Congress to be so seriously outmanned compared to the executive branch when it comes to the review of regulations issued by the ever-expanding administrative state—especially when rulemaking is at least a quasi-legislative endeavor. (In my view, some regulations are purely legislative and beyond the constitutional power of Congress to delegate, but a majority of the Supreme Court is not currently persuaded of this view. See *infra*.)

Congress does not need as many people to review final rules as the executive branch employs formulating them. In my view, Congress needs the equivalent of an Office of Information and Regulatory Affairs and it needs to increase the regulatory staff of its substantive authorizing committees. Evaluating a cost-benefit analysis does not take the same manpower as performing it originally, but evaluation does require a similar expertise and management direction. At the committee level, it does not even require the same level of technical expertise as that relied upon by an agency to identify the outside witnesses and experts who can help the committee examine a particular rulemaking record and agency determinations. An additional number of smart and dedicated generalists who can aid the committee to find the right experts is all that is essential.

H.R. 1704 in the 105th Congress and H.R. 3356 in the 108th Congress would create different congressional institutions to focus attention on rules that need congressional review, and both are

¹⁶ 55 ERC (BNA) 1597 (D. S.D. Ind. 2002).

respectful of existing lines of committee jurisdiction. H.R. 3356 has the additional advantage of meshing well with the CRA by amending its review provisions. It seems presumptuous of me to comment further on what is best for your internal organization. Moreover, the perfect often is the enemy of the good in such reform debates. But Congress should do something, both to create more effective centralized management of congressional review responsibilities and to increase the total number of committee staff devoted to the review of agency regulations.

Reinvigorating The Separation of Powers Ideal

1. Congressional approval of agency rules

H.R. 931 in the 109th Congress and similar bills introduced by different Members over the past ten years would go much further than focusing Congress's attention on particular rules for possible disapproval. They would require that certain covered rules must be statutorily ratified or approved before they could go into effect. To avoid constitutional problems, such a reform statute would have to amend existing and future grants of regulatory authority so that the affected agencies could not issue certain types of final rules. Instead, agency authority for certain matters would be to conduct hearings, formulate, and propose final rules to Congress.

One disadvantage with the language of H.R. 931 is that it would not amend the CRA but would supersede it. Proposals from prior Congresses would use the major rule definition in the CRA and amend the Act to require that major rules receive congressional approval. A practical argument for such a change is that major rules often have a bigger impact on the American economy than many of the laws Congress enacts. This Subcommittee conducted hearings on at least one such proposal in the year after the Congressional Review Act was enacted. These extremely valuable proposals have already received commentary in the administrative law literature, not the least of which by two of us on this panel.¹⁷ With a further expression of interest by the Subcommittee, I would be happy to elaborate on the virtues of such proposals in reinvigorating the separation of powers ideal.

2. Preventing abuses of the criminal law

The House and Senate Judiciary Committees should also act to curb the disturbing trend of agencies (aided in large part by other authorizing committees) creating a host of new regulatory offenses punishable by criminal sanctions. The operation of the criminal law is the government's most awesome and fearful tool from the standpoint of individual liberty. Traditionally, crimes were limited to offenses that were known to be inherently wrongful and done with a malicious intent (e.g., intentional killing, theft, battery). It makes sense to punish these traditional and knowingly culpable acts with special sanctions, but special protections of liberty were developed as well.

Some of those protections are still present in the courts, but Montesque's old fear did not extend to the trial process. Montesque's admonition was that there can be no liberty where the legislative and executive powers are united. That warning haunts us today as criminal offenses are increasingly being written and enforced by the same administrative agencies. At least in this one area, Congress should reserve to itself the power to write criminal laws and thereby separate the drafting and enforcement of the criminal code.

¹⁷ See Todd Gaziano, "Can the Separation of Powers Endure the Age of Muddled Thinking?," *Regulation*, vol. 20, no. 1 (1997); Morton Rosenberg, "Whatever Happened to Congressional Review of Agency Rulemaking?: A Brief Overview, Assessment, and Proposal for Reform," 51 *Admin. L. Rev.* 1051 (Fall 1999).

The U.S. Constitution mentions only three federal crimes, and yet it has been estimated that there are now some 4,000 federal crimes and that this is an increase of roughly 1,000 federal crimes in the last decade alone.¹⁸ Many of these offenses do not fit within the traditional categories of criminal law, and unfortunately, many of them do not concern inherently wrongful conduct (what the law refers to as *malum in se*) but violations of norms that are only wrongful because Congress has declared them to be so (what the law would label *malum prohibitum*). As bad as the proliferation of federal statutory crimes is—particularly the newer crimes that are not inherently wrongful—the proliferation of regulations punishable by criminal sanctions is even more troubling.

Typically, Congress passes a statute that makes the violation of some future agency regulation a crime. Such laws may even include criminal penalties for violations of permitting schemes, with the terms of every permit being different. Often the only intent requirement is that the defendant knew that he was taking certain actions and not that the actions violated the permit or the regulation. The civil liberties concerns associated with these schemes make those raised in the homeland security context pale in comparison.

The Congressional Research Service seemingly is unable to estimate how many federal regulations now carry criminal penalties.¹⁹ The American public has no chance of mapping the contours of regulatory criminal law, a basic prerequisite to following the law and avoiding criminal punishment.

Congress should enact a prohibition against crimes being defined in agency regulations. If it is serious enough to criminalize, Congress should define the offense. In the alternative, agencies should only be allowed to propose such crimes, which Congress could then enact with resolutions of approval.

Conclusion

Those who would declare the Congressional Review Act moribund mistake dormancy for a lack of any potential vitality. Reconstruction era statutes enacted to protect the civil rights of newly freed slaves lay largely dormant for about 100 years before private litigants rediscovered them. They have been used extensively ever since to vindicate fundamental civil rights for all Americans. The Alien Tort Claims Statute (really just one brief section of a larger act) was passed by an early Congress in the eighteenth century and has been rediscovered by private litigants almost 200 years later and validated by the Supreme Court. The CRA's impact in its first ten years has not been dramatic, but that does not dictate its future course.

Both Congress and private litigants have an opportunity to make better use of the CRA in the next decade (the latter if the effectiveness of a rule that was not submitted to Congress is subject to judicial review). Congress has both an institutional interest to re-assert its legislative primacy and an obligation to the American people to safeguard our liberties. The constitutional separation of powers requires no less vigilance.

¹⁸ John S. Baker, Jr., "Measuring the Explosive Growth of Federal Criminal Legislation," The Federalist Society for Law and Public Policy Studies, available at www.fed-soc.org.

¹⁹ See Paul S. Rosenzweig, "The Over-criminalization of Social and Economic Conduct," Heritage Foundation Legal Memorandum No. 7, at 2 and note 3 (2003). Our understanding is based in part on conversations we have had with congressional staff, who have supposedly requested the information, and in part on informal conversations we have had with senior CRS officials. We would be happy to be proven wrong about CRS's ability to reliably estimate the number of crimes defined in regulations, e.g., if they provided a reliable number.

Mr. CANNON. Thank you.
Mr. Sullivan, you're recognized for 5 minutes.

**TESTIMONY OF JOHN V. SULLIVAN, ESQ., PARLIAMENTARIAN,
OFFICE OF THE PARLIAMENTARIAN, U.S. HOUSE OF REP-
RESENTATIVES, WASHINGTON, D.C.**

Mr. SULLIVAN. Thank you, Mr. Chairman.

May it please the Committee, thank you for the welcome and for the kind words about the Office of the Parliamentarian, most especially for the gracious acknowledgment of Lefty Sullivan, who I'm told in his Major League career lost but one game.

My predecessor, Charlie Johnson, was with you in 1997, and he assured me that this was a very pleasant experience. So I'm pleased to be here.

I am glad for the opportunity to help illuminate maybe one part of the factual predicate on which the Committee might decide whether to adjust the CRA or whether it's currently optimized to meet its desired ends.

As I indicate graphically in my written testimony, the CRA has engendered a tripling of the executive communications traffic to the Speaker. This flow of paper poses a significant increment of workload in the institution of the House. But, of course, this paperwork, mass though it may be, does serve a purpose.

When I read the testimony of my learned colleagues about a desirable deterrent effect of the act, it rings true to me. But I'm also reminded of the last 10 or 15 years of the Cold War, when we saw the key to our own nuclear deterrent shift dramatically away from megatonnage and in favor of accuracy.

I think that the Committee may want to assess whether a lesser volume of communications traffic might better optimize the oversight of the regulatory Committees of the rulemaking process, dwelling greater attention on a more selective universe of rule-making actions.

I note that the act already differentiates among rulemaking actions on the basis of certain hallmarks of salience, and it might be time to consider whether additional discriminators might be sensible to constrict the flow and dwell stronger focus on the remaining stream.

Certainly, the Office of the Parliamentarian would be pleased to work with the Committee and with the staff on trying to identify ways to avoid any duplication of effort or any undue weight of paper.

I won't reiterate the rest of the written testimony, brief though it may be. I'm pleased to be here and happy to engage any questions you might have.

[The prepared statement of Mr. Sullivan follows.]

PREPARED STATEMENT OF THE HONORABLE JOHN V. SULLIVAN

Committee on the Judiciary)	Hon. John V. Sullivan
Subcommittee on Commercial)	Parliamentarian
and Administrative Law)	U.S. House of Representatives
U.S. House of Representatives)	
)	
)	
)	
March 30, 2006)	Testimony
)	Congressional Review Act

Mr. Chairman, members of the committee: I appreciate the opportunity to participate in your review of this important matter.

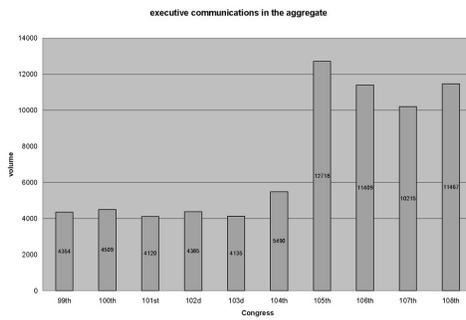

Several laws within the jurisdiction of the Committee on the Judiciary ensure that the exercise of quasi-legislative authority by the executive branch is subject to rigorous scrutiny. Some have long ensured that the public can follow and react to rulemaking actions as they develop. For 10 years now, chapter 8 of title 5, United States Code — colloquially known as the Congressional Review Act (CRA) — has separately focused on Congressional review of executive regulations. I am pleased to help illuminate one part of the factual predicate on which the Committee might judge whether the CRA is optimized to achieve its desired ends.

In the 103d Congress — the last full Congress before the enactment of the CRA — the executive departments transmitted 4,135 communications to the Speaker that warranted referral to committee.¹ In the 108th Congress — the most recent full Congress under the CRA — that number rose to 11,467.² The following pair of graphs depict the effects of the CRA on executive communications traffic.

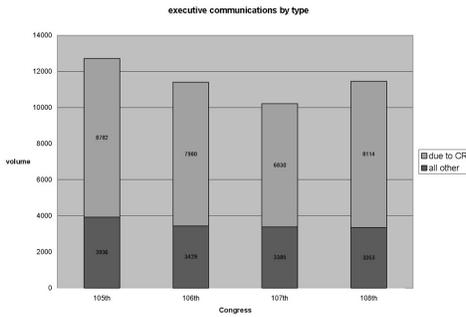

¹ See *Calendars of the United States House of Representatives and History of Legislation*, Final Edition, 108th Congress, 2003-2004, at p. 19-71.

² *Id.* at p. 19-76.

The first graph shows that executive communications have roughly tripled.

The second graph shows that, in each of the past three Congresses, the number of CRA communications has, indeed, been more than twice the number of other executive communications.

These communications transmit regulations promulgated by executive agencies for Congressional review. Under rule XII, they are received by the Speaker. Under rule XIV, the Speaker refers them to the committees having jurisdiction over their subject matters. The Speaker delegates to the Parliamentarian the task of identifying committees of referral — typically the committees having jurisdiction over the enabling statutes for the particular rulemaking actions.

This flow of paper poses a significant increment of workload. Although it is relatively easy to identify the appropriate committees of referral for the vast majority of these communications, the sheer volume of them affects not only the parliamentarians who must assess their subject matter but also the clerks who must move the paper and account for dates of transmittal. Some of the processing of this paper has been streamlined. Unlike other executive communications, multiple rules submitted by a single agency pursuant to the CRA may be bundled under a single cover letter.

Of course, this mass of paperwork has a purpose. The fundamental fulcrum of the CRA is that rulemaking agencies must submit proposed regulations to each House of Congress and to the Comptroller General and wait a statutory interval³ before major rules may be given effect. During this interval, Congress may deliberate on whether a proposed regulation might merit legislative disapproval.

In the first decade under the CRA, 21 joint resolutions of disapproval were introduced in the House and 16 were introduced in the Senate. None of the House joint resolutions passed the House. Three of the Senate joint resolutions passed the Senate. One of those also passed the House. Thus, the disapproval mechanism established by the Act has yielded one Congressional disapproval.⁴

³ Because of the need to track this interval, the date of receipt of a rule submitted pursuant to the CRA is published in the Congressional Record. With most other executive communications, only the date of referral to committee is published.

⁴ Public Law 107-5.

The Committee may want to assess whether a lesser volume of executive communications traffic might better optimize Congressional oversight of a more selective universe of rulemaking actions. The Act already differentiates among various rules on the basis of their salience. Some additional discrimination might be sensible. The Office of the Parliamentarian will be pleased to continue to consult with the Committee and its staff on initiatives to eliminate duplication of effort and reduce paperwork like those proposed in H.R. 5380 of the 106th Congress.⁵

Mr. Chairman, I am grateful for your attention and will be pleased to try to answer any questions you might have.

⁵ H.R. 5380 of the 106th Congress was introduced by Mr. Hyde (for himself, Mr. Conyers, Mr. Gekas, and Mr. Nadler) and referred to the Committee on the Judiciary. It proposed that the CRA be amended to no longer require separate submission to Congress of rules that are published in the Federal Register and to require the Comptroller General to submit weekly reports to each House of rules published in the Federal Register to the end that they be noted in the Congressional Record with a statement of referral to committee.

Mr. CANNON. Thank you, Mr. Sullivan.

If I might, Mr. Sullivan, I have just a couple of questions. Then we have a series of questions that we'll probably send you all that you can use to help us understand a little more about what we're doing here.

But if I might, Mr. Sullivan, you talked about Committees of jurisdiction, meaning I suppose authorizing Committees. And so, when you're talking about this amazing—and I just looked at your chart—this tripling of communications. And of course, we're organized by Committees now and have some more and less vague Committee jurisdictions. We have Government Reform, for instance, which would have some role here.

But if you—so when talking about the rules of jurisdiction and whether or not it makes sense, I think Mr. Rosenberg was talking about a Committee or Committees, would it make sense to have a Committee that is fairly heavily staffed deal with these issues of CRA? And that way, you don't put limiters or, I forget the term you used for it, but some way to describe the importance of this, but rather you have a Committee that is in place that reviews all of it, and we go through a—maybe a Committee process?

So instead of all the Committees of jurisdiction who would have a person assigned, does it make sense to have a Committee, for instance, obviously, I think this Committee, which oversees these activities generally, would have staff to review and deal with the paperwork and then focus, as is appropriate, politically on what some of these regulations are and, therefore, make the determination of importance based upon a single Committee overseeing the complex process?

Do you have any thoughts on that?

Mr. SULLIVAN. That sounds worthy of your consideration, Mr. Chairman.

As I understand it right now, until such time as the Speaker refers the communication to the Committee of jurisdiction over the enabling statute for the rulemaking, the only filtering that occurs really is by the words of the statute. The discriminators that exist under the status quo are just textually recited in the statute.

And as I understand Mr. Rosenberg's idea, it would be to achieve a higher level of granularity in that filtering process by having live experts applying their notions of discrimination, their own discriminatory sense to rulemakings as they come in.

And that certainly is one way to refine the flow to the regulatory Committees so that when they do hit the Committee of jurisdiction over the Clean Water Act, the counsel who specialize in that area will be able to bring the full force of their more concentrated expertise on it.

Any kind of filtering process I think is worthy of consideration. And as I said, right now, the filter is just the text of the statute, it might be worth considering putting an organ there.

Mr. CANNON. What I'm wondering is—I've spent a lot of my life doing administrative procedure, rulemaking stuff. I worked in the Reagan administration on coal mining and really created a third-tier of coal mine reclamation regulations. It was an amazing process early in my career.

But I'm wondering if—two things, Mr. Sullivan. First of all, what would the rules have to—how would they have to be changed for the House to do what I'm about to suggest? And then how would it actually, as a practical matter, work?

As I understand, you have communications now coming to the Speaker from the Administration, and those have increased significantly. Would it not be fairly simple, and I'm wondering about the effectiveness of the process to take those communications from the Speaker and then send them to a Committee, and that Committee would tend to look at all regulations? And to the degree that you needed the expertise of an authorizing Committee, there could be some sort of joint procedure.

Now that has to be done in a way that there is actually an appropriate use of discretion. But at some point, you have to say this is not worth something, and somebody has to—a Chairman has to say, "This is not worth it, this is worth it," and then follow up on that.

It would seem to me that that Committee would also require a lot of expertise over time, and we have a rule currently that term limits chairmen. So I'm giving you sort of an amorphous question.

But just wondering, given the rules today, could we take a pathway where you take all of these communications. They go through a well staffed process, but a political process that then works its will with the majority and minority and also works with other Committees, authorizing Committees that have the specific or special area expertise and possibly also with the appropriating Committees.

What changes would you see that would have to be made to do that? And does it make sense to even pursue that idea?

Mr. SULLIVAN. I think that that sort of thing could be pursued without touching the statute, although it would be in the jurisdiction of the Committee on Rules. The House could ordain a 21st standing Committee and confer on it, call it the Committee on Filtering Rulemakings.

Mr. CANNON. Let me just say that it would seem to me that making a 21st Committee, maybe it would justify it. But what you would have in that Committee, it would not—let me just ask you this.

If you took a sitting Committee, either Government Reform would be possibly appropriate or Judiciary, where I think it actually is appropriate, and expanded one of the Subcommittees, and maybe you got rid of term limits or something like that. So you could have somebody who actually liked doing it, would do it over a longer period of time and add some continuity. It would seem to me that that makes some sense as opposed to creating a new Committee. So I realize we're now dealing with some pretty big things here.

Mr. SULLIVAN. Conceptually, it's exactly the same thing. The House could just add a new element to the subject matter jurisdiction of the Judiciary Committee or of the Government Reform Committee that said "review of executive rulemaking actions" and tell that Committee to have one of its Subcommittees or a new Subcommittee become expert at filtering and at ushering recommendations to the Committees of regulatory jurisdiction.

Mr. CANNON. And would the House need a rule change—part of that rule change would be and so communications to the Speaker would then be delegated to that Committee?

Mr. SULLIVAN. If Rule X said that that was the Committee that had jurisdiction over executive tenders of rulemaking actions under the CRA, then the Speaker would refer them to that new jurisdiction instead of his current practice of referring them to the sundry Committees who have enacted the enabling statutes for these rule-making powers.

Mr. CANNON. Do you have a recommendation in mind? Your job—I don't mean to put you in an uncomfortable position, but your job is to figure out how the rules work, and we're now suggesting a new context rule.

Would you put jurisdiction in all of the authorizing Committees to review regulations, or would you see it better working through either a new Committee or as a new Subcommittee of one of the existing Committees?

Mr. SULLIVAN. I think that's too substantive a question for a proceduralist like me.

Mr. CANNON. But procedurally, we don't have a problem doing that if we decide to do something like that?

Mr. SULLIVAN. No. And the basic philosophy of the Committee system is to develop and apply expertise in compartments, and maybe this is a compartment in which the House would like to develop and apply expertise on a special basis.

Mr. CANNON. And what we have now is just untenable, as your charts show. We have this massive communication with no—we haven't changed how we operate in the context of this massive communication, and then we get back to what Mr. Rosenberg called our dashed hopes or the dashed hopes of people who wanted to see a little more of this happening. So there is some high inconsistency here.

Let me just say, anybody else want to comment on how we should do this? That is, a new Committee or using existing Committees and having a new Subcommittee or as opposed to using the current—the authorizing Committees?

Sorry, Morton?

Mr. ROSENBERG. I could comment on that, just to be provocative.

What we have here is a congressional process. You know, in order to do what the framers of this legislation wanted to do, they had two houses involved. And what they—what wasn't thought through or didn't realize the problems at the time is that in order to—there are so many authorizing Committees, jurisdictional Committees out there, as you're pointing out, what might be a solution is not simply a special Committee, but a joint Committee, which has only the authority to recommend with respect to who will screen, has staff enough to make some analyses of rules that come over, pick out the particular ones that appear to be appropriate for congressional review.

There would be House Members and Senate Members. And the recommendations would be sent to the jurisdictional Committees of each House with a recommendation, if it's such, that they exercise their authority and issue a—you know, file a resolution of disapproval.

It has a lot of benefits, it seems to me, because, one, it provides the screening mechanism necessary, it provides some necessary expertise, and it also may take care of the political problem of taking away jurisdiction from current jurisdictional Committees.

What happens is those Committees have recommendations, and those recommendations are up to the jurisdictional Committees to go to the expedited procedures, you know, to formulate that.

I think that while your Committee would be a good one with regard to looking at this, it would probably be very difficult to get everybody to agree, even a House resolution, you know, of vesting you with all that authority. It's a problem that we see with the House Homeland Security Committee.

Mr. CANNON. I'm hoping most people think this is boring and not worthy of their attention. [Laughter.]

Mr. ROSENBERG. Just one idea. I'm for a separate Committee, and I'm much more for a joint Committee that helps both houses do the job.

Mr. CANNON. Thank you.

Mr. GAZIANO. In my written testimony, I said that I'm reluctant to say too much about this because the perfect sometimes is the enemy of the good in reform. And I think that the imperative is that you do something, that you create some sort of structure and increase staff to help with this.

But I—but I do think I know why, and here I may be stepping out of my—you know, into my personal memory versus the public record—why the parliamentarian was given the task of making referrals because: that was who everyone could agree with. That's the parliamentarian's traditional job.

I think there was an understanding that it would significantly increase their office workload. But let me suggest a couple of possibilities. One certainly is that Congress recognize that the parliamentarian's office at least needs sufficient increased manpower and staff or an adjunct or whatever to help with those referrals.

There is a concern by the authorizers that any other Committee but their Committee wouldn't have the expertise to know when the rulemaking is a good or bad rulemaking. So I think that you want to avoid the perfect being the enemy of the good.

Another possibility is to create more expertise somewhere else in Congress, whether it then advises the parliamentarian's office or the individual Committees. But I think part of what the permanent structure of that Committee would be is expertise in cost-benefit analysis and some cost-cutting expertise about the rulemaking process.

So there would be some permanent staff like the OIRA staff. And beyond that, you know, I think that there are these other issues and concerns that might come up. I would love for this Committee or any Committee to retain the jurisdiction, but I would fear that your "below the radar screen" approach might not go unnoticed as the legislation moved forward.

Mr. CANNON. And here I thought you were a person of great historical perspective. Given the attention these matters have had, I'm fairly sure the radar screen is not so sensitive.

I'd like to apologize for Mr. Watt, who—we had late votes and then an emergency meeting, and so he was not able to get down here and join us.

And I have just one other question sort of following up on this question and going back, I think, really to Mr. Mihm and Mr. Rosenberg talking about dashed hopes or talking about the number of reviews and these sorts of things.

What if you changed the premise of CRA away from a disapproval and to a requirement that Congress affirmatively act. Now that changes the nature of this discussion about what Committee it would go through. What it would mean, as a practical matter, is that we pass a lot of legislation all at a time, but it would—it would meet many of the criticisms we've had of the CRA.

Assume for a moment, it's politically possible. Does that make sense? And I think that most of you all would have some comment on that.

Do you want to start? Go ahead, Mort. Sure.

Mr. ROSENBERG. Seven years ago I suggested that in an article in the Administrative Law Review, That the most effective way of controlling administrative regulations is through a process whereby there has to be affirmative approval of regulations.

This creates some problems. If you have all rules that are subject to it, you have an enormous volume of rules that are going to come across. But I think that problem could be solved, and I addressed that in the article that I wrote in 1999. I believe that a screening committee that would deal with this could use a deeming process and take care of about 99.9 percent of the rules.

That is, deeming that rules that are sent over passed on a particular day, a CRA Wednesday that takes place each month, and you wouldn't have more than a 30- or a 60-day delay for 99.9 percent of the rules. And those that are pinpointed as needing more review would then go through a more rigorous approval process.

I think it could be created. I think it's constitutional. And assuming it's politically possible, I think that is the most viable way to go and the most effective way from Congress' institutional point of view.

Mr. CANNON. Would you get us a copy of the article you referred to for the record?

Mr. ROSENBERG. Certainly.

Mr. CANNON. I'd appreciate that. Chris?

Mr. MIHM. Mr. Chairman, we haven't looked at this issue directly, but I'd offer just two kind of broad observations on this.

One is that in response to your earlier question and some of Mr. Sullivan's charts, we talked about the enormous increase in workload and burden on the Congress that was required to review these things after the fact. It probably, that would be augmented several fold perhaps if Congress wanted to review them before implementation, that is, to pass on them.

Again, it's Congress' judgment as to whether or not it wants to go down that road. But I would just observe that it would probably entail quite a bit of additional work on behalf of the Congress, even taking, I think, context, some point that you could just focus on the major rules which would be the 610 or so.

The second thing that I would just observe, and this gets back to the broader agenda of this Subcommittee and in particular the hearing that you held last November, is that the Congress may want to spend more time looking more at the back end of the regulatory process.

That is, you know, one of the things that's really flown below the radar screen is after regulations are put in place, we almost never go back and say, "Gee, did we get what was promised as a result of this?" You know, we were promised either savings or better health or increased, you know, safety or whatever the case may be.

And in many cases, that probably plays out, but I'm willing to bet in some cases it does not. And we never go back and look at that. And so, a kind of a more retrospective analysis or focus on retrospective analysis we think would be very beneficial.

Mr. CANNON. Does that mean like a 3-year sunset? So suppose for a moment you had a joint Committee or each house had a Committee, and we had an expedited process. So something worked here. Would it make sense then to add a sunset to regulations so they came up automatically for political/congressional review?

Mr. MIHM. I'm not sure that I can go so far—I mean, we haven't done the work to justify whether or not there would be sunset. But certainly, it would be beneficial to require at least a periodic re-examination and perhaps in a report to the Congress. And that's something that we could be helpful in, in GAO, and we've tried to be in the past. To look at this, are we actually getting from a particular rule that was promised when we promulgated it, especially some of these major rules?

Mr. GAZIANO. Mr. Chairman, 10 years ago almost, last month, the House was set to vote on H.R. 994, the Sunset and Review Act, which, by the way, is maybe something you want to look at again, which would have sunsetted regulations in the congressional—in the CFR by part. So that's one option.

As far as the major rule, I think that what Mort has suggested is one approach. I think that this Subcommittee held a hearing about 9 years ago where the alternative to require major rules to receive affirmative authorization was discussed. I know that the sponsors of the CRA 10 years ago anticipated that, and that's why they created in the statute that distinction between major and nonmajor rules.

That did not exist in the statute at the time. It was only a function of executive order, and they codified that distinction so that some future Congress could make that. That would be roughly 61 rules a year divided between all the relevant authorizing Committees.

And it was understood by those who hoped that that would some day be considered by Congress that, of course, it wouldn't—it doesn't take as much legislative record to decide whether a rule should be enacted into law or not. That's already received the agency's attention. So it would not—let's say if a given Committee had five or so a year, it would not take the same level of attention as passing five other pieces of legislation.

But the democratic theory was major rules have bigger impact on the American economy than most laws Congress passes, at least if

it's in a major rule. Maybe you could define it in some other way. But at least if it's a major rule, Congress ought to enact it into law.

Mr. ROSENBERG. There's a problem here that can be overcome perhaps. Right now, under the CRA, a major rule is defined as major by OIRA, the OIRA Administrator. Who is going to do this differentiating between major and nonmajor rules? Congress can't do it on a piecemeal basis. That would probably be Chadha and be a problem.

That's why I struggled with that in writing the article about how you could do this. I've often thought of a tiered kind of structure where, but who would designate what it is? Could you write a definition that would cover all the rules that you want to come over?

There are some rules that nobody's going to think of as major until they explode upon you or they're looked at. So that's a problem that has to be addressed from a constitutional point of view, as well as a pragmatic point.

Mr. CANNON. Which is why you focus on a joint Committee. Personally, I'm not sure that works as well as two Committees that would have responsibility.

Mr. ROSENBERG. Well, you don't have a joint Committee if you have—

Mr. CANNON. But you have a single—

Mr. ROSENBERG. Joint Resolution of approval, then you don't need a joint Committee. But you still have—

Mr. CANNON. You have the underlying problem?

Mr. ROSENBERG. Yes.

Mr. CANNON. Which means you don't—it doesn't work through all the—the authorizing Committees because there's no way to have coherence.

Mr. ROSENBERG. But there can be a process whereby there can be a screening of all rules that come over as proposed rules. Then there can be a deeming process which gets rid of most of them and puts them into law after 30 or 60 days.

Mr. GAZIANO. I don't know that some people would like the effect of 42,000 laws, and courts having to interpret them. But there are—but Mort is right about the problem. There are two other possible solutions. Right now, there is no—Congress, in its wisdom for various reasons of expediency, decided not to make the OIRA determination subject to judicial review.

The two alternatives, if you were going to enact this, I think, very important reform, would be to make the OIRA determination subject to judicial review. So there is some risk, and that does avoid the *Chadha* problem. And that's why all regulations still have to come to Congress so that circumvention can be dealt with.

So that—and then you still need, I think, these other Committees because major rules are the minimum that Congress should be enacting into law. But then you make the nonmajor ones subject to—still subject to disapproval, but more effectively.

Mr. CANNON. Let me ask, John, suppose you had a single Committee of jurisdiction without the subject matter expertise. Is it possible to have a rule that allows or requires the joint Committee or the single Committee to work with other Committees? You know, we do that currently with the concurrent jurisdiction in Committees on some matters.

Is there a way to do that with a Committee that handles all of them and then somehow coordinates with Committees of expertise?

Mr. SULLIVAN. Yes, Mr. Chairman.

For example, you could contemplate that this panel would report not to the House, but to its sister Committees. It would make recommendations to the Committees that enacted the enabling statutes in the first instance.

Mr. CANNON. So serial jurisdiction?

Mr. SULLIVAN. Yes, sir.

Mr. CANNON. Interesting. All right.

Can I ask one other question? This is sort of technical, but if we had reports submitted electronically, is it possible to speed up this process, from your perspective as the parliamentarian, so that you take and delegate electronically some of this material? Would that speed up the referral process out of your office?

Mr. SULLIVAN. It might speed up the referral process. It certainly would make more efficient the movement of the paper and the tracking of submittal dates and so forth, the things that the clerk's office has to do with the flow.

The parliamentarian would still have to examine the substance of the rulemakings to discern the Committee jurisdictions in them, but I think it would materially assist the Legislative Resource Center and the others who have to move this paper.

Mr. CANNON. So do we need to do something to establish a requirement by the Administration to in some consistent manner submit these things electronically?

Mr. SULLIVAN. I assume that that might require that you visit the statutory text. I'm personally leery about going virtual on anything. Committees frequently want to teleconference instead of meet together face to face, or poll their Members instead of having them in the same room and voting, we constantly try to impress on them notion of Jeffersonian collegiality and the importance of Members being together in the flesh. So crossing the threshold of a virtual submission I would want to be very cautious about that.

But in terms of batch processing, if the comptroller bundled communications and had a covering electronic submission that could manage the submittal dates and the tracking and that sort of thing, I think that would be very helpful.

Mr. CANNON. Great. Thank you.

Obviously, this is a panel of experts who've been here before, and you all have given very thoughtful, insightful testimony on this issue. We appreciate your involvement in the broader APA review.

And with that, we will stand adjourned.

[Whereupon, at 3:43 p.m., the Subcommittee was adjourned.]

A P P E N D I X

MATERIAL SUBMITTED FOR THE HEARING RECORD

May 12, 2006

The Honorable Christopher B. Cannon
Chairman
The Honorable Melvin L. Watt
Ranking Minority Member
Subcommittee on Commercial and Administrative Law
Committee on the Judiciary
House of Representatives

On April 25, 2006, you requested that we respond to questions for the official record regarding your subcommittee's March 30, 2006, hearing on the Congressional Review Act. Our responses are included in this correspondence.

Responses to Questions from Chairman Cannon

1. Your testimony mentions that GAO has issued eight opinions regarding what constitutes a rule under the Congressional Review Act (CRA). Could you expand on how the GAO has defined what a rule is under the CRA, and what may be left out under that definition?

The CRA definition of what constitutes a rule is based on the meaning, with some exclusions, given the term in 5 U.S.C. 551(4) which defines rules subject to the Administrative Procedure Act (APA). As noted in our opinions, a rule is the whole or part of an agency statement of general or particular applicability and future effect designed to implement, interpret, or prescribe law or policy.

The CRA's enumerated exclusions from being a covered rule are found at 5 U.S.C. 804(3):

(A) any rule of particular applicability, including a rule that approves or prescribes for the future rates, wages, prices, services or allowances therefore, corporate or financial structures, reorganizations, mergers or acquisitions thereof, or accounting practices or disclosure bearing on any of the foregoing;

(B) any rule relating to agency management or personnel, or

(C) any rule of agency organization, procedure, or practice that does not substantially affect the rights or obligations of non-agency parties.¹

The APA exception is much broader, including "interpretive rules, general statements of policy, or rules of agency organization, procedure or practice."²

According to the legislative history, the CRA deliberately narrowed the exclusions to capture those agency actions which attempted to circumvent notice and comment requirements and affected the rights or obligations of nonagency parties.

Most of our opinions in this area have involved an agency's claim that an agency statement or action is not a rule because it falls under the exclusion concerning agency procedure or practice. The agency argues that the statement only instructs agency personnel what to consider in a certain decision-making process. However, when we looked at the impact of the rules, it was clear that they had a substantial effect on the rights or obligations of nonagency parties. Such a finding was reached regarding the Tongass National Forest Land and Resource Management Plan, the Farm Credit Administration's National Charter Initiative, and the Trinity River Record of Decision.³

2. When you receive information required under the CRA from the agencies on a rule, are the agencies across the administration consistent in the information they provide? Is there consistency within the agencies?

Approximately 90 percent of the rules we receive from the agencies are submitted with the CRA Rule Submission Form developed by GAO and found on the GAO Web site. The agencies that use their own forms still supply our office with the information needed to comply with the CRA and enable GAO to enter the rule in our database.

Consistency within an agency has not been a problem because most of the executive agencies and independent regulatory agencies that submit the majority of the rules have designated a central control person who oversees the submission of the rules to our office and Congress to assure compliance with the CRA. This practice has also allowed our office to have a single contact person if we have further questions or need additional information concerning a submission.

3. Is there additional information, not currently required by the CRA, that GAO would find beneficial for the assessments of the reported rules?

Our office finds that the information required by the CRA and submitted by the agencies with the rule is sufficient for our assessment of the rule's compliance with the various regulatory statutes' and executive orders' requirements.

Prepared for Members and
Committees of Congress

Congressional Review of Agency Rulemaking: An Update and Assessment of the Congressional Review Act After Ten Years

Summary

On March 29, 1996, the President signed into law the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA), P.L. 104-121, 110 Stat. 857-874, Subtitle E of which for the first time established a mechanism by which Congress can review and disapprove, by means of an expedited legislative process, virtually all federal agency rules. In its current form, however, some have questioned the efficacy of the review scheme as a vehicle to control agency rulemaking through the exercise of legislative oversight. These questions have been raised despite the use of the CRA to nullify OSHA's controversial ergonomics standards in March 2001. In the view of some observers, the OSHA action was the result of a unique confluence of circumstances not likely to soon recur: the White House and both Houses of Congress in the hands of the same political party, a contentious rule promulgated in the waning days of an outgoing administration; longstanding opposition to the rule by some in Congress and by a broad coalition of business interests; and encouragement of repeal by the President. On the other hand, some maintain that a number of major rules have been affected by the Agency recognition of the existence of the review mechanism, and argue that the review scheme has had a significant influence.

Among potential impediments to the law's use, the scheme provides no expedited consideration procedure in the House of Representatives; there is no screening mechanism to identify rules that may require special congressional attention; and a disapproval resolution of a significant or politically sensitive rule is likely to need a supermajority to be successful if control of the White House and the Congress are in different political hands, as was the case between April 1996 and January 2001. Moreover, a number of critical interpretive issues remain to be resolved, including the scope of the provisions' coverage of rules; whether an agency failure to report a covered rule is subject to court review and sanction; whether a joint resolution of disapproval may be utilized to veto parts of a rule or only may be directed at the rule in its entirety; and what is the scope of the limitation that precludes an agency from promulgating a "substantially similar" rule after disapproval of a rule. Some might argue that these potential impediments and uncertainties have contributed to the fact that of a total of 37 joint resolutions of disapproval that have been introduced to date since April 1996, only one has succeeded in passing and that one may have been *sui generis* because of the unique circumstances accompanying its passage. During that period 41,218 major and non-major rules have been reported and become effective.

This report will provide a brief explanation of how the structure of review scheme describes the criticisms of some observers concerning the way it has been utilized.

This report will be updated as warranted.

Congressional Review of Agency Rulemaking: An Update and Assessment of the Congressional Review Act After Ten Years

Introduction

On March 29, 1996, the President signed into law the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA), P.L. 104-121, 110 Stat. 857-874, Subtitle E of which for the first time established a mechanism by which Congress can review and disapprove, by means of an expedited legislative process, virtually all federal agency rules. In its current form, however, some have questioned the efficacy of the review scheme as a vehicle to control agency rulemaking through the exercise of legislative oversight. These questions have been raised despite the use of the CRA to nullify OSHA's controversial ergonomics standard in March 2001. It has been argued that the action on the OSHA proposal was the result of a unique confluence of circumstances not likely to soon recur: the White House and both Houses of Congress in the hands of the same political party, a contentious rule promulgated in the waning days of an outgoing administration; longstanding opposition to the rule by some in Congress and by a broad coalition of business interests; and encouragement of repeal by the President. On the other hand, some maintain that a number of major rules have been affected by Agency recognition of the availability of the review mechanism, and argue that the review scheme has had a significant influence.

Those who maintain that the CRA has not been appropriately utilized assert that the current procedure provides no expedited consideration procedure in the House of Representatives; lack of screening mechanism to identify rules that may require special congressional attention; and, that a disapproval resolution of a significant or politically sensitive rule is likely to need a supermajority to be successful if control of the White House and the Congress are in different political hands. They further maintain that a number of critical interpretive issues and questions remain to be resolved, including the scope of the provisions' coverage of rules; whether an agency failure to report a covered rule is subject to court review and sanction; whether a joint resolution of disapproval may be utilized to veto parts of a rule or only may be directed at the rule in its entirety; and what is the scope of the limitation that precludes an agency from promulgating a "substantially similar" rule after disapproval of a rule. From these critics' perspective potential impediments and uncertainties have contributed to the fact that of a total of 37 joint resolutions of disapproval that have been introduced to date since April 1996, only one has passed. They point out that during that period over 41,828 major and non-major rules have been reported and become effective.

CRS-2

This report will provide a brief explanation of how the review scheme was expected to operate and describe how it has been utilized. The possible reasons for the relatively limited use of the formal review mechanism thus far are assessed and congressional possible proposals are discussed.

Obviously, there are those who do not support increased utilization of the CRA review process. Those holding this opinion may represent a number of views including concern that expanded use of the process will lead to the disproportionate influence on Federal regulations by powerful interest groups or that many regulations have become too technical to be judged by "non-experts". However, since those holding these or similar views have been notably silent during recent discussions of CRA issues, this report does not attempt to predict or describe these positions.

Review of Agency Rules

The congressional review mechanism, codified at 5 U.S.C. 801-808, and popularly known as the Congressional Review Act (CRA), requires that all agencies promulgating a covered rule must submit a report to each House of Congress and to the Comptroller General (CG) that contains a copy of the rule, a concise general statement describing the rule (including whether it is deemed to be a major rule), and the proposed effective date of the rule. A covered rule cannot take effect if the report is not submitted. Section 801(a)(1)(A). Each House must send a copy of the report to the chairman and ranking minority member of each jurisdictional committee. Section 801(a)(1)(C). In addition, the promulgating agency must submit to the CG (1) a complete copy of any cost-benefit analysis; (2) a description of the agency's actions pursuant to the requirements of the Regulatory Flexibility Act and the Unfunded Mandates Reform Act of 1995; and (3) any other relevant information required under any other act or executive order. Such information must also be made "available" to each House. Section 801(a)(1)(B).

Section 804(3) adopts the definition of "rule" found at 5 U.S.C. 551(4) which provides that the term rule "means the whole or part of an agency statement of general . . . applicability and future effect designed to implement, interpret, or prescribe law or policy."¹ The legislative history of Section 551(4) indicates that the term is to be broadly construed: "The definition of rule is not limited to substantive rules, but embraces interpretive, organizational and procedural rules as well."² The courts have recognized the breadth of the term, indicating that it encompasses "virtually every statement an agency may make,"³ including interpretive and substantive rules, guidelines, formal and informal statements, policy

¹ Section 804(3) excludes from the definition "(A) any rule of particular applicability, including a rule that approves or prescribes for the future rates, wages, prices, services, or allowances therefor, corporate or financial structures, reorganizations, mergers, or acquisitions thereof, or accounting practices or disclosures bearing on any of the foregoing; (B) any rule relating to agency management or personnel; or (C) any rule of agency organization, or practice that does not substantially affect the rights or obligations on non-agency parties."

² Attorney General's Manual on the Administrative Procedure Act 13 (1948).

CRS-3

proclamations, employee manuals and memoranda of understanding, among other types of actions. Thus a broad range of agency action is potentially subject to congressional review.

The Comptroller General and the Administrator of the Office of Information and Regulatory Affairs (OIRA) of the Office of Management and Budget have particular responsibilities with respect to a "major rule," defined as a rule that will likely have an annual effect on the economy of \$100 million or more, increase costs or prices for consumers, industries or state and local governments, or have significant adverse effects on the economy. The determination of whether a rule is major is assigned exclusively to the Administrator of OIRA, Section 804(2). If a rule is deemed major by the OIRA Administrator, the CG must prepare a report for each jurisdictional committee within 15 calendar days of the submission of the agency report required by Section 801(a)(1) or its publication in the Federal Register, whichever is later. The statute requires that the CG's report "shall include an assessment of the agency's compliance with the procedural steps required by Section 801(a)(1)(B)." Section 801(a)(2)(A). The CG has interpreted his duty under this provision relatively narrowly as requiring that he determine whether the prescribed action has been taken, i.e., whether a required cost-benefit analysis has been provided, and whether the required actions under the Regulatory Flexibility Act, the Unfunded Mandates Reform Act of 1995, and any other relevant requirements under any other legislation or executive orders were taken, not to examine the substantive adequacy of the actions.

The designation of a rule as major also affects its effective date. A major rule may become effective on the latest of the following scenarios: (1) 60 calendar days after Congress receives the report submitted pursuant to Section 801(a)(1)⁴ or after the rule is published in the Federal Register; (2) if Congress passes a joint resolution of disapproval and the President vetoes it, the earlier of when one House votes and fails to override the veto, or 30 calendar days after Congress receives the veto

⁴ See, e.g., *Chem Service, Inc. v. EPA*, 12 F.3d 1256 (3d Cir. 1993)(memorandum of understanding); *Caddill v. Blue Cross and Blue Shield of North Carolina*, 999 F.2d 74 (4th Cir. 1993)(interpretative rules); *National Treasury Employees Union v. Reagan*, 685 F.Supp 1346 (E.D. La. 1988)(federal personnel manual letter issued by OPM); *New York City Employment Retirement Board v. SEC*, 45 F.3d 7 (2d Cir. 1995)(affirming lower court's ruling that SEC "no action" letter was a rule within section 551(4)).

⁵ The General Counsel of the Government Accountability Office (GAO) has ruled that the 60-day period does not begin to run until both Houses of Congress receive the required report. See B-289880, April 5, 2002, opinion letter to Hon. Edward M. Kennedy, Chairman, Senate Committee on Health, Education, Labor and Pensions from Anthony H. Gamboa, General Counsel. The situation involved a Department of Health and Human Service's (HHS) major rule published in the Federal Register on January 18, 2002 with an announced effective date of March 29, 2002. The House of Representatives, however, did not receive the rule until February 14, 2002. HHS thereafter delayed the effective date of the rule until April 15, 2002, in an attempt to comply with the CRA. But the Senate did not receive the rule until March 15, 2002. The General Counsel determined that the rule could not become effective until May 15, 2002, 60 days following the Senate's receipt, relying on the language of Section 801(a)(1)(A) of the act requiring that a copy of a covered rule must be submitted "to each House of Congress" in order to become effective.

CRS-4

message; or (3) the date the rule would otherwise have taken effect (unless a joint resolution is enacted), Section 801(a)(3).

Thus the earliest a major rule can become effective is 60 calendar days after the later of the submission of the report required by Section 801(a)(1) or its publication in the Federal Register, unless some other provision of the law provides an exception for an earlier date. Three possibilities exist. Under Section 808(2) an agency may determine that a rule should become effective notwithstanding Section 801(a)(3) where it finds "good cause that notice and public procedure thereon are impracticable, unnecessary, or contrary to the public interest."⁶ Second, the President may determine that a rule should take effect earlier because of an imminent threat to health or safety or other emergency; to insure the enforcement of the criminal laws; for national security purposes; or to implement an international trade agreement. Section 801(c). Finally, a third route is available under Section 801(a)(5) which provides that "the effective date of a rule shall not be delayed by operation of this chapter beyond the date on which either House of Congress votes to reject a joint resolution of disapproval under Section 802."⁷

All other rules take effect "as otherwise allowed by law" after having been submitted to Congress under Section 801(a)(1). Section 801(a)(4). Under the Administrative Procedure Act, a final rule may go into effect 30 days after it is published in the Federal Register in final form. 5 U.S.C. 553(d). An agency, in its discretion, may delay the effectiveness of a rule for a longer period; or it may put it into effect immediately if good cause is shown.

All covered rules are subject to disapproval even if they have gone into effect. Congress has preserved for itself a review period of at least 60 days. Moreover, if a rule is reported within 60 session days of adjournment of the Senate or 60 legislative days of adjournment of the House, the period during which Congress may consider and pass a joint resolution of disapproval is extended to the next succeeding session of the Congress. Section 801(d)(1). Such held over rules are treated as if they were published on the 15th session day of the Senate and the 15th legislative day of the

⁶ Reviewing courts have generally applied the Administrative Procedure Act's good cause exemption, from which this language is obviously taken, narrowly in order to prevent agencies from using it as an escape clause from notice and comment requirements. See, e.g., *Action on Smoking and Health v. CAS*, 713 F.2d 795, 800 (D.C. Cir. 1987). However, since Section 805 precludes judicial review for any "determination, finding, action or omission under this chapter", there could be no court condemnation of a good cause determination. But the rule would still be subject to congressional vacation and retroactive nullification.

⁷ In *Leisegang v. Sec'y of Veterans Affairs*, 312 F.3d 1368, 1373-1376 (Fed. Cir. 2002), the appeals court held that Section 801(a)(3) "does not change the date on which [a major rule] becomes effective. It only affects the date when the rule becomes operative. In other words, the CRA merely provides a 60-day waiting period before the agency may enforce the major rule so that Congress has the opportunity to review the regulation." At issue in the case was the date from which certain veterans benefits would be calculated. The benefit statute provided that it would be the date of the issuance of the rule. The government argued that the CRA was a superseding statute and that the effective date was when the CRA allowed it to be operative. The appeals court agreed with the veterans that the date of issuance, as prescribed by the law, was determinative.

CRS-5

House in the succeeding session and as though a report under Section 801(a)(1) was submitted on that date. Section 801(d)(2)(A), (e)(2). But a held over rule takes effect as otherwise provided. 801(d)(3). The opportunity for Congress to consider and disapprove is simply extended so that it has a full 60 session or legislative days to act in any session.

If a joint resolution of disapproval is enacted into law, the rule is deemed not to have had any effect at any time. Section 801(f). If a rule that is subject to any statutory, regulatory or judicial deadline for its promulgation is not allowed to take effect, or is terminated by the passage of a joint resolution, any deadline is extended for one year after the date of enactment of the joint resolution. Section 803. A rule that does not take effect, or is not continued because of passage of a disapproval resolution, may not be reissued in substantially the same form. Indeed, before any reissued or new rule that is "substantially the same" as a disapproved rule can be issued it must be specifically authorized by a law enacted subsequent to the disapproval of the original rule. Section 801(b)(2).

Section 802(a) spells out the process for an up or down vote on a joint resolution of disapproval.⁸ A joint resolution of disapproval must be introduced within 60 calendar days (excluding days either House of Congress is adjourned for more than three days during a session of Congress) after the agency reports the rule to the Congress in compliance with Section 801(a)(1). Timely introduction of a disapproval resolution allows each House 60 session or legislative days to pass it and thereby get the benefit of expedited consideration procedures, retroactive nullification of an effective rule, and the limitation on an agency from promulgating a "substantially similar" rule without subsequent congressional authorization to do so by law.

The law provides an expedited consideration procedure for the Senate. If the committee to which a joint resolution is referred has not reported it out within 20 calendar days after referral, it may be discharged from further consideration by a written petition of 30 Members of the Senate, at which point the measure is placed on the calendar. After committee report or discharge it is in order at any time for a motion to proceed to consideration. All points of order against the joint resolution (and against consideration of the measure) are waived, and the motion is not subject to debate, amendment, postponement, or to a motion to proceed to other business. If the motion to consider is agreed to, it remains as unfinished business of the Senate until disposed of. Section 802(d)(1). Debate on the floor is limited to 10 hours. Amendments to the resolution and motions to postpone or to proceed to other business are not in order. Section 802(d)(2). At the conclusion of debate an up or down vote on the joint resolution is to be taken. Section 802(d)(3).⁹

⁸ For an in-depth discussion of procedural issues that may arise during House and Senate consideration of disapproval resolutions, see Richard S. Beth, CRS Report RL31160, *Disapproval of Regulations by Congress: Procedure Under the Congressional Review Act*, October 10, 2001 (CRA Procedure).

⁹ There is some question whether a motion to proceed is nondebatable because of the absence of language so stating. Arguably, the nondebatability of the motion is integral both to the scheme of the expedited procedure provisions as well as to the overall efficacy of the (continued...)

CRS-6

There is no special procedure for expedited consideration and processing of joint resolutions in the House. But if one House passes a joint resolution before the other House acts, the measure of the other House is not referred to a committee. The procedure of the House receiving a joint resolution "shall be the same as if no joint resolution had been received from the other House, but . . . the vote on final passage shall be on the joint resolution of the other House." Section 802(f)(1)(2).

Section 805 precludes judicial review of any "determination, finding, action or omission under this chapter." This would insulate from court review, for example, a determination by the OIRA Administrator that a rule is major or not, a presidential determination that a rule should become effective immediately, an agency determination that "good cause" requires a rule to go into effect at once, or a question as to the adequacy of a Comptroller General's assessment of an agency's report. The legislative history of this provision indicates that this preclusion of judicial review would not apply to a court challenge to a failure of an agency to report a rule. This appears not to be a judicially settled matter.⁹

Finally, the law provides a rule of construction providing that a reviewing court shall not draw any inference from a congressional failure to enact a joint resolution of disapproval with respect to such rule or a related statute. Section 801(g).

Utilization of the Review Mechanism Since 1996

As of March 24, 2006, the Comptroller General had submitted reports pursuant to section 801(a)(2)(A) to Congress on 610 major rules.¹¹ In addition, GAO had cataloged the submission of 41,218 non-major rules as required by Section 801 (a) (1)(A). To date, 37 joint resolutions of disapproval have been introduced relating to 28 rules. One rule, OSHA's ergonomics standard in March 2001, has been disapproved, an action that some believe to be unique to the circumstances of its passage. Two other rules have been disapproved by the Senate. One, the Federal Communication Commission's 2003 rule relating to broadcast media ownership was disapproved by the Senate during the 108th Congress but was not acted upon by the House. The second, a 2005 Department of Agriculture rule relating to the establishment of minimal risk zones for introduction of bovine spongiform

⁹ (...continued)

CRA's statutory scheme and thus may be implied. Alternatively, debate on such a motion may be limited by Section 803(d)(2) which limits debate on joint resolutions, as well as "all debatable motions," to 10 hours. Ultimately, a resolution of this question by the Senate Parliamentarian, or the Senate itself, may be necessary. However, at the commencement of the debate on S.J. Res. 6, to disapprove the ergonomics rule, the presiding officer declared that "The motion to proceed is not debatable. The question is on agreeing to the motion." The motion was agreed to. 147 Cong. Rec. S 1831 (daily ed. March 6, 2001). At least one other precedent exists in which it was ruled that a motion to proceed to a budget resolution under the Budget Act was nondebatable despite the silence of the act on the matter. See, 127 Cong. Rec. S 4871 (May 12, 1981).

CRS-7

encephalopathy (Mad Cow Disease) was disapproved on March 3, 2005, but its counterpart, H.J.Res. 23, has not yet been acted upon by the House. A third joint resolution, S.J.Res. 20, seeking disapproval of a rule promulgated by the Environmental Protection Agency to delist coal and oil-direct utility units from the new source category list under the Clean Air Act, was defeated in the Senate by a vote of 47-51 on September 13, 2005. The following chart details the subjects and actions taken on the introduced resolutions.

**Resolutions of Disapproval Introduced Under the Congressional Review Act
(April 1996 - March 2006)**

Date of Resolution	Number	Sponsor	Agency	Subject	Last Action
104th Congress					
9/17/1996	S.J.Res. 60	Sen. Trent Lott	HCEA/ HHS	Hospital reimbursement under Medicare	Failed in passage in Senate by UC
105th Congress					
3/4/1997	H.J.Res. 59	Rep. Don Young (+5)	USFWS/ DOI	Polar bear trophies from Canada	Hearing (House Committee on Resources)
3/20/1997	H.J.Res. 67 (Same as S.J.Res. 25)	Rep. Roger Wicker (+54)	OSHA/ DOL	Occupational exposure to methylene chloride	Referred to Subcommittee of House Committee on Education and the Workforce
4/10/97	S.J.Res. 25 (Same as H.J.Res. 67)	Sen. Thad Cochran (+5)	OSHA/ DOL	Occupational exposure to methylene chloride	Referred to Senate Committee on Labor and Human Resources
6/18/1997	H.J.Res. 81	Rep. Joe Scarborough	FCC	Revision of cable television leased commercial access rules	Referred to Subcommittee of House Committee on Commerce
6/10/98	S.J.Res. 50 (Same as H.J.Res. 123)	Sen. Christopher Bond	HCEA/ HHS	Surety bond requirements for home health agencies under Medicare and Medicaid programs	Referred to Senate Committee on Finance

CRS-8

Date of Resolution	Number	Sponsor	Agency	Subject	Last Action
6/17/1998	H.J. Res. 123 (Same as S.J. Res. 50)	Rep. Jim Nussle (+65)	HCFA/ HHS	Surety bond requirements for home health agencies under Medicare and Medicaid programs	Referred to Subcommittees of House Committees on Ways and Means and Commerce
106th Congress					
5/20/1999	H.J. Res. 55	Rep. Ron Paul (+68)	USPS	Delivery of mail to a commercial mail receiving agency	Referred to Subcommittee of House Committee on Government Reform
7/13/2000	H.J. Res. 104	Rep. Ron Paul	EPA	National pollutant discharge elimination system program and federal antidegradation policy and the water quality planning and management regulations concerning total maximum daily load	Referred to Subcommittee of House Committee on Transportation and Infrastructure
7/17/2000	S.J. Res. 50 (Same as H.J. Res. 106)	Sen. Michael Crapo (+18)	EPA	Water pollution under the total maximum daily load program	Referred to Senate Committee on Environment and Public Works
7/18/2000	H.J. Res. 105	Rep. Marion Berry (+23)	EPA	Total maximum daily loads under the Federal Water Pollution Control Act	Referred to Subcommittee of House Committee on Transportation and Infrastructure
7/18/2000	H.J. Res. 106 (Same as S.J. Res. 50)	Rep. Jay Dickey	EPA	Water pollution under the total maximum daily load program	Referred to Subcommittee of House Committee on Transportation and Infrastructure

Date of Resolution	Number	Sponsor	Agency	Subject	Last Action
109th Congress					
2/14/2005	S.J.Res. 4 (Same as H.J.Res. 24)	Sen. Kent Conrad (+8)	Agriculture	Establishment of minimal risk zones for introduction of mad cow disease	Passed Senate by 52-46 Yea-Nay vote 3/3/05; not acted on by House
2/17/2005	H.J.Res. 23 (Same as S.J.Res. 4)	Rep. Herseth (+1)	Agriculture	Establishment of minimal risk zones for introduction of mad cow disease	Referred to House Agriculture Committee. No action taken
6/29/2005	S.J.Res. 20 (Same as H.J.Res. 56)	Sen. Leahy (+31)	EPA	Removal of coal and oil-fired generating units from list of major sources of hazardous pollutants	Defeated in Senate by 47-51 vote, 9/13/05
6/29/2005	H.J.Res. 56 (Same as S.J.Res. 20)	Rep. Meacham (+4)	EPA	Removal of coal and oil-fired generating units from list of major sources of hazardous pollutants	Referred to Committee on Energy and Commerce. No action taken

Note: Not included in this tabulation are bills designed to disapprove agency rules but that were not joint resolutions under the Congressional Review Act. For example, H.R. 3735, introduced on April 28, 1998, by Rep. Ron Paul, was intended to disapprove a rule requiring the use of bycatch reduction devices in the shrimp fishery of the Gulf of Mexico. The bill was in response to Amendment 9 to the Fishery Management Plan for the Shrimp Fishery of the Gulf of Mexico, issued as a final rule implementing the amendment on April 14, 1998. The bill's findings section indicated that approval of the amendment was inconsistent with the requirements of the Magnuson-Stevens Fishery Conservation Act and the Administrative Procedure Act. The disapproval section indicated that the rule "shall have no force or effect."

1. On June 22, 2001, Senator Boxer also introduced S.J.Res. 17, which was intended to disapprove a memorandum issued by the President on March 29, 2001, (66 FR 17301) restoring the Mexico City Policy. However, the Congressional Review Act does not apply to actions by the President. See text at pp. 16-17.

OSHA's ergonomics standard had been controversial since the publication of its initial proposal for rulemaking in 1992 during the Bush Administration.¹² OSHA circulated a draft proposal in 1994 which was met with strong opposition from business interests and the formation of an umbrella organization, the National

¹² The turbulent history of the development of the ergonomics standard is recounted in CRS Report 97-724, *Ergonomics in the Workplace: Is It Time for an OSHA Standard?*

CRS-13

Coalition on Ergonomics, to oppose its adoption. In 1995 OSHA circulated a modified draft proposal, particularly with respect to coverage and regulatory requirements. At the same time, congressional opposition resulted in appropriations riders that prohibited OSHA from promulgating proposed or final ergonomics proposals during the fiscal years 1995, 1996, and 1998.¹³ The riders did not prohibit OSHA from continuing its development work, however, which included responding to concerns that scientific knowledge of ergonomics was inadequate for rulemaking and that the cost of industry implementation of a broad standard would be extraordinarily costly. Congress mandated reports from the National Academy of Sciences which found a significant statistical link between workplace exposures and musculoskeletal disorders, but also noted that the exact causative factors and mechanisms are not understood. In 2000, congressional attempts to pass another appropriation rider, as well as stand alone prohibitory legislation, failed, and on November 14, 2000, OSHA issued its final standard which became effective on January 16, 2001.¹⁴ Most employer responsibilities under the new standard, however, were not to begin until October, 2001.

As soon as the rule was issued two industry groups filed suit in the Court of Appeal for the District of Columbia Circuit challenging OSHA's authority to issue the rule, its failure to follow proper procedures, the rationality of its provisions, and the adequacy of its scientific and economics analyses. The intervening 2000 elections also altered the political situation with the election of a president and effective control of both Houses of Congress in the same political party. Opponents of the standard introduced a resolution of disapproval under the CRA, S.J. Res. 16, on March 1, 2001. A discharge petition was filed on March 5, and debate on and passage of the resolution occurred on March 6 by a vote of 56-44. That evening the House Rules Committee issued a rule for floor action the next day, and after an hour of debate H.J. Res. 35 was passed on March 7 by a vote of 223-206. The President signed the nullifying measure into law on March 20, 2002.¹⁵

In sum, the veto of the ergonomics standards could be seen as the product of an unusual, confluence of factors and events: control of both Houses of Congress and the presidency by the same party, the longstanding opposition by these political actors, as well as by broad components of the industry to be regulated, to the ergonomics standards, and the willingness and encouragement of a president seeking to undo a contentious, end-of-term rule from a previous administration.

In all other cases, if there is any discernible pattern to the introduced resolutions, it is to exert pressure on the subject agencies to modify or withdraw the rule, or to elicit support of members, which in some instances was successful. For example, H.J. Res. 67 (1997) was aimed at disapproving an Occupational Health and Safety Administration (OSHA) rule setting exposure limits on methylene chloride, a paint stripper used in the furniture and airplane industries. Its sponsor, Representative Roger Wicker, contended that the rule would harm small businesses without

¹³ In a close floor vote, the rider proposed for FY1997 was deleted.

CRS-14

increasing protections for workers. The disapproval resolution never received a floor vote. But the Congressman succeeded in effecting a compromise through the inclusion of provisions in the FY1998 Labor, HHS and Education appropriations measure¹⁶ which required OSHA to provide on-site assistance for companies to comply with the new rules without fear of penalty. Mr. Wicker is reported to have stated that he used the disapproval resolution as a vehicle to gather support from influential members, including the chairs of the House Appropriations and Commerce Committees.¹⁷

The disapproval resolution mechanism was effectively utilized to accomplish the suspension of a highly controversial rulemaking by the then Health Care Financing Administration (HCFA). In January 1998, HCFA issued a rule requiring that home health agencies (HHAs) participating in the Medicare program must obtain a surety bond that is the greater of \$50,000 or 15 percent of the annual amount paid to the HHA by the Medicare program. In addition, a new HHA entering the Medicare or Medicaid program after January 1, 1998, had to meet a capitalization requirement by showing it actually had available sufficient capital to start and operate the HHA for the first three months. The rule was issued without the usual public participation through notice and comment and was made immediately effective. Substantial opposition to the rule quickly surfaced from both surety and HHA industry representatives. HCFA attempted to remedy the complaints by twice amending the rule, in March and in June, but was unsuccessful in quelling the industry-wide concerns. On June 10, Senator Bond, for himself and 13 other co-sponsors, introduced S.J. Res. 50 to disapprove the June 1 HCFA rule. Within a short period, the disapproval resolution had garnered 52 sponsors. On June 17, a companion bill, H.J. Res. 123, was introduced in the House. Thereafter, members of the staffs of Senators Bond, Baucus, and Grassley (all members of the Senate Finance Committee with jurisdiction over the agency) met with HCFA officials and concluded an agreement that (1) the agency would suspend its June 1, 1998 rule indefinitely; (2) a General Accounting Office report would be requested by the committee that would study the issues surrounding the surety bond requirement; (3) on completion and issuance of the GAO report, HCFA would work in consultation with the Congress about the surety bond requirement; and (4) any new rule would not be effective earlier than February 15, 1999, and would be preceded by at least 60 days prior notice. The agreement was memorialized in a June 26 letter to HCFA signed by Senators Bond, Baucus and Grassley.¹⁸ The GAO report was issued on January 29, 1999, but the rule suspension was never lifted. No floor vote on the disapproval resolutions occurred in either House.

Another illustration of the manner in which the review mechanism has been utilized is shown by S.J. Res. 60 (1996), concerning another HCFA rule, this one dealing with the agency's annual revision of the rates for reimbursement of Medicare providers (doctors and hospitals), which normally would have been effective on

CRS-15

October 1, 1996. HCFA, however, submitted the rule to Congress on August 30, 1996, and since it was a major rule, it could not go into effect for 60 days, or until October 29, which meant there would be a significant loss of revenues because the differential rate increases could not be imposed for most of the month of October. Section 801(a)(5), however, provides that if a joint resolution of disapproval is rejected by one House, "the effective date of a rule shall not be delayed by operation of this chapter..." On the morning of September 17, 1996, Senator Lott introduced S.J.Res. 60 and that afternoon, by unanimous consent, the resolution "was deemed not passed."¹⁹ The HCFA rule went into effect on October 1 as scheduled.

A final interesting utilization of the CRA process that had an impact and resulted in an unusual outcome, involved President George W. Bush's restoration, on February 15, 2001, of President Reagan's so-called Mexico City Policy, which limited the use of federal and non-federal monies by non-governmental organizations (NGOs) to directly fund foreign population planning programs which support abortion or abortion-related activities. President Clinton had rescinded the 1984 Reagan policy when he took office in January 1993.²⁰ A president's authority to determine the terms and conditions on which such NGOs may engage in foreign population planning programs derives from the Foreign Assistance Act of 1961.²¹ The provision vests the authority to make these determinations exclusively in the Chief Executive. President Reagan delegated his authority to make the determinations to the Administrator of the U.S. Agency for International Development (AID), who issued regulations that specified the conditions upon which grants would be given to NGOs. Thus, when the Mexico City Policy was rescinded in 1993, it was the AID Administrator that did it, at the direction of President Clinton. When President Bush restored it in 2001, he did it in a directive to the AID Administrator²² who simply revived the old conditions by internal agency administrative action.

A number of Senate opponents of the policy filed a disapproval resolution on March 20, 2001, S.J.Res. 9, to nullify the Administrator's action, reasoning that it was a covered rule under the CRA since the implementing action was taken by an executive agency official and not by the President himself, and thus was reviewable by Congress.²³ The President responded by rescinding his earlier directive to the AID Administrator and thereafter issuing an executive directive under his statutory authority personally implementing the necessary conditions and limitations for NGO

CRS-16

grants.²⁴ The presidential action mooted the disapproval resolution, and rendered a subsequent attempt to veto by S.J.Res. 17 ineffective because the CRA does not reach such actions by the President.

Discussion

In the ten years since its passage, the CRA process has been used sparingly. Several criticisms and questions concerning the process have been raised by those supporting the wider use of the regulatory disapproving mechanism. These have included a need for a screening mechanism for submitted rules; the absence of an expedited procedure in the House of Representatives' or consideration of disapproval resolutions; the deterrent effect of the need for a supermajority to overcome a veto; the scope of the law's coverage; the judicial enforceability of its key requirements; whether a disapproval resolution may be directed at part of a rule; and the effect of a rule nullification on future agency rulemaking in the same area, which, critics believe, have introduced uncertainties and impediments to concerning the use of the process.

1. Lack of a Screening Mechanism to Pinpoint Rules That Need Congressional Review; Proposals for Change.

Proponents of an expanded use of the CRA process have called for screening mechanism that will alert committees to rules that may raise important or sensitive substantive issues. In this view, their perceived lack prevents busy committees from prioritizing such issues. As indicated above, the Comptroller General's reports on major rules serve as check lists as to whether legally required agency tasks have been done and not as substantive assessments of whether they were done properly or whether the rules accord with congressional intent.

Lack of knowledge of the existence of such sensitive rules by jurisdictional committees or interested Members is rarely the case. What critics say is absent is in-depth scrutiny and analysis of individual rules by an authoritative and presumably neutral source that may provide the basis for triggering meaningful congressional review.

Support for an independent substantive screening body was signaled by the introduction by Representative Sue Kelly of H.R. 1704 in the 105th Congress, a bill that would have established a Congressional Office of Regulatory Analysis.²⁵ The bill was referred to the House Judiciary and Governmental Reform and Oversight Committees both of which favorably reported differing versions of the legislation.²⁶ Both versions would have established an independent Congressional Office of Regulatory Analysis (CORA) to be headed by a director appointed by the House

²⁴ See, Restoration of the Mexico City Policy; Memorandum for the Administrator of the U.S. Agency for International Development, March 28, 2001, 66 Fed. Reg. 17303-17313 (March 29, 2001).

²⁵ A companion bill, S. 1675, was introduced in the Senate by Senators Shelby and Bond, 143 Cong. Rec. S1007 (daily ed. Feb. 25, 1998).

CRS-17

Speaker and the Senate Majority Leader for a term of four years, with service in the office limited to no more than three terms. The current review functions of the Comptroller General under the CRA and the Congressional Budget Office under the Unfunded Mandates Act of 1995 would be transferred to the proposed CORA. The Judiciary Committee's version, in addition to having the Office make "an assessment of an agency's compliance with the procedural steps for "major rules" required by CRA, directs the proposed CORA to "conduct its own regulatory impact of these "major rules."²⁷ The bill as reported by the Government Reform Committee would have allowed the CORA director to use "any data and analyses generated by the Federal agency and any data of the Office" in analyzing the submitted rule. Both bills provided that a similar analysis of non-major rules was to be conducted when requested to do so by a House or Senate Committee or by individual members of either House. First priority for the conduct of such analyses was given to all major rules. Secondary priority was assigned to committee requests. Tertiary priority was given individual member requests. Finally, under the Judiciary Committee version, the report was to be furnished within 45 days after Congress receives notification of the rule; the Governmental Reform bill would have allowed 30 days. H.R. 1704 received no floor action during the 105th Congress.

Critics maintain that an independent office of regulatory analysis would serve the congressional need for objective information necessary to evaluate agency regulations. In their view, it would also provide credibility and impetus for wider utilization of the review mechanism. Further, by providing intensive review of certain non-major rules, the possibility of OIRA "hiding" significant rules by not designating them as "major" is forestalled. Those opposing the establishment of an office of this kind might argue that creation of a new congressional bureaucracy for review purposes would be unnecessarily duplicative of what the agencies have already done as well as extraordinarily expensive. The requirement of the Judiciary Committee's version that a CORA do its own cost-benefit analysis from scratch could be pointed to as an unknown cost factor, as well as a task that may not be possible to perform adequately within the allotted 45 days.

Congress agreed upon a limited test of the CORA concept, late in the 106th Congress, with the passage of the Truth in Regulating Act of 2000.²⁸ That legislation established a three year pilot project for the General Accounting Office (now renamed the Government Accountability Office (GAO)) to report to Congress on economically significant rules. Under this pilot program, whenever an agency published an economically significant proposed or final rule a chairman or ranking minority member of a committee of jurisdiction of either House of Congress may request the Comptroller General (CG) to review the rule. The CG was to report on each rule within 180 calendar days. The report had to contain an "independent evaluation" by the CG of the agency's cost-benefit analysis. We are aware of only one request ever made pursuant to the provision. That was submitted in January 2001 by the chairs of the jurisdictional committees of the House and Senate with respect to the Department of Agriculture's forest planning and roadless area rule. GAO advised the requesters that although Act authorized \$5.2 million per year for

²⁷ Section 4 (a)(3)(A).

²⁸ P.L. 106-312, 114 Stat. 1248-50, 5 U.S.C. 801 note.

CRS-18

the program, no monies had been appropriated and it could not proceed with the request. No further action was taken on the request and Congress never enacted an appropriation, thereby forestalling implementation of the project. It may be noted that the 180-day reporting period did not mesh exactly with the time period under the CRA for consideration of rules subject to resolution of disapproval, although completed requests for analyses of proposed rules might coincide with such reviews. In any event, the pilot program established by the act expired in January 2004.

In the 109th Congress, Representative Sue Kelly introduced H.R. 1167, which would make permanent the authority of Congress to request GAO to perform regulatory analyses. The new Truth in Regulating Act (TIRA), if enacted as a permanent responsibility of GAO, would not appear that require a specific appropriation to require agency performance of the vested task as was the case when it was established as a "pilot project." It would, in effect, be an unfunded mandate. Although GAO currently does (and historically has always done) some reviews of agencies' rules at Members' requests under its current appropriations, both the volume and nature of the reviews are likely to be substantially different and may affect its ability to conduct other agency reviews. A similar bill, H.R. 725, section 5, would also make TIRA permanent, but would authorize up to \$5 million for the reviews. Although GAO may view this bill as preferable, if the authorized funds are not appropriated, GAO could be in the same "unfunded mandate" situation as it would under H.R. 1167.

In an apparent attempt to avoid the criticisms of the CORA model and to remedy some of the perceived impediments to the effectiveness of the CRA, Representative Ginny Brown-Waite introduced H.R. 3356, the Joint Administrative Procedures Committee Act of 2003, in the 108th Congress which would amend the CRA by establishing a joint congressional committee with broad authority to investigate, evaluate and recommend actions with respect to the development of proposed rules, the amendment or repeal of existing rules, and disapproval of final rules submitted for review under the CRA.²⁰ The responsibilities are in addition to the current statutory framework providing for review of new rules that are required to be reported. A new provision permits the joint committee to recommend disapproval of new rules to jurisdictional committees. The proposed Joint Administrative Procedures Committee (JAPC) would be composed of 12 members from each House with no more than 7 from one political party, selected by the Senate Majority Leader and the Speaker of the House. The JAPC would receive all agency submissions of covered rules and provide copies to all jurisdictional committees. The JAPC has sixty days to consider the rule. The agency could be required to submit such reports as is required by the joint committee such as a cost-benefit analysis or risk assessment. If no action is taken by JAPC, the rule may go into effect. If a majority determines that rule is inconsistent with congressional intent in the area, JAPC may recommend a disapproval resolution to the House and Senate jurisdictional committees. In its report to the jurisdictional committees JAPC is to pinpoint the objectionable provisions of the rule. The proposal would establish a new expedited consideration procedure for disapproval resolutions in the House of

²⁰ See introductory remarks on the measure at 147 Cong. Rec. H 2454 (daily ed. Oct. 21, 2003).

CRS-19

Representatives. On the third legislative day after a joint resolution is recommended by JACP, it is in order for any member of the House to move to proceed to consideration of the disapproval resolution. It is a privileged, non-debatable motion and once agreed to must be considered before any other business under expedited procedures. Only one hour of debate would be allowed. Finally, Section 801(b)(2) of the CRA is amended to provide that an agency may promulgate a new rule without new statutory authorization if it carries out the recommendation set forth in the report submitted by the JACP to the jurisdictional committees. The bill was referred to the House Committees on Rules and Judiciary. The Judiciary Committee referred it to its Subcommittee on Commercial and Administrative Law. No action was taken by either Committee. Representative Brown-Waite's proposal was reintroduced in the 109th Congress as H.R. 3148 but has received no action as yet.

Another bill, H.R. 576, introduced by Representative Ney in the 109th Congress, is similar in many respects to H.R. 3148, but quite different in certain fundamental ways. Both would create a 24 member House-Senate joint committee capable of holding hearings, requiring the attendance of witnesses, and making rules regarding its organization and procedures. Both also provide for an expedited consideration procedure in the House. Significant differences appear, however, with respect to the roles assigned to the joint committees. Under H.R. 3148, the current process established by the CRA for congressional review of new agency rules is maintained: required reports on new rulemakings are submitted to each House and such reports are sent to the jurisdictional committees of each House for action. Rules required to be reported are also sent to the joint committee. Special rules are provided for discharge from committees in the Senate and, under proposed H.R. 3148, from House committees. Expedited procedures are in effect for floor proceedings in each House. The only part to be played by the joint committee in the new rule review process under H.R. 3148 is to recommend to jurisdictional committees that certain submitted new rules be subject to disapproval resolutions. Deference to the current roles of jurisdictional committees is also maintained under H.R. 3148 with respect to the new duties given to the joint committee to selectively review existing federal agency rules in effect before the enactment of the CRA and existing major rules of federal agencies promulgated since April 1996. The joint committee may only recommend to jurisdictional committees that they take appropriate legislative action to amend or repeal such laws.

Under H.R. 576, the joint committee, rather than the jurisdictional committees of each House, receives the report of covered rules submitted for review by federal agencies as well as cost-benefit analyses and other materials. Jurisdictional committees receive copies of these materials from the joint committee. GAO is to submit its report on major rules to the joint committee, not the jurisdictional committees concerned. Major rules take effect no earlier than 60 days after the rule is published in the Federal Register or is received by the joint committee. Joint resolutions of disapproval are reported by the joint committee to the respective Houses for action. The joint committee may also report "by bill ... recommendations with respect to matters within the jurisdiction of their respective Houses which are referred to the joint committee or otherwise within the jurisdiction of the joint committee." It would appear, then, that the joint committee would have the predominant role in the congressional review process, which might inject a highly controversial issue - - diminution of the role of jurisdictional committees - - in a

CRS-20

reform debate already freighted with difficult and sensitive political and legal considerations.

A third bill introduced in the 109th Congress is H.R. 931, by Representative Hayworth, would prohibit any regulation proposed by a federal agency from going into effect until a bill enacted under expedited consideration procedures applicable to the rule is signed into law. The term "regulation" is given the broad meaning of the term "rule" as defined in 5 U.S.C. 551(4). The bill does not specifically reference the current CRA process. In fact, it would supersede it and require rulemaking agencies to seek approval of all covered "regulations." There is no provision for congressional processing in a timely and expeditious manner a potentially huge number of proposed regulations.

2. Lack of an Expedited House Procedure.

Those unsatisfied with the current procedure indicate that the current absence of an expedited consideration procedure in the House of Representatives may well be a factor affecting use of the process in that body since, as a practical matter, it will mean engaging the House leadership each time a rule is deemed important enough by a committee or group of Members to seek speedy access to the floor. In view of the limits both on floor time and the ability to gain the attention of the leadership, it is argued that only the most well situated in the body will be able to gain access within the limited period of review.³⁰ It is also maintained that a perception that no action will be taken in the House might deter Senate action.

3. The Deterrent Effect of the Ultimate Need for a Supermajority to Veto a Rule.

A consideration that critics maintain limits expanded use of the full CRA review mechanism has been the realization that any joint resolution disapproving a rule that does not have the support of the administration would be vetoed and require a two-thirds vote in each House to override. The deterrent potential of the need for a supermajority in each House to overcome a presidential veto is likely to be significant, unless the object of the exercise is simply to provide the impetus for informal accommodations, such as occurred in the FCFA surety bond matter, or to influence Members to support alternative legislation. Critics assert that a realization by agencies over time that passage of a disapproval resolution is highly unlikely could substantially reduce the efficacy of such a threat. Additionally, they maintain that a possible consequence of such an assumption is that agencies will not factor in congressional disapproval as part of the rule development process.³¹ Since the

³⁰ The experience with respect to the repeal of the ergonomics standard, discussed *supra* at 12-13, would appear to bear this out.

³¹ See, Mark Seidenfeld, *The Psychology of Accountability and Political Review of Agency Rules*, 51 *Duke L.J.* 1059, 1089 (2001) ("The paucity of motions for disapproval resolutions indicates that agencies are not apt to focus on fast-track review as a check on their rulemaking discretion at least until late in the rulemaking process. Agencies might be likely to focus on such review when they adopt rules that they know will be unpopular in (continued...)")

CRS-21

ergonomics veto, 19 resolutions of disapproval with respect to 14 rules have been introduced, only one of which has been acted upon (by one House),²⁷ which some see as a return to the prior practice of using the mechanism to facilitate bargaining.

Thus, even with the successful disapproval of the ergonomics standard, critics are concerned that the supermajority hurdle still remains. One solution they have proposed is to establish a multi-tiered disapproval mechanism. That is, instead of all rules, major or non-major, being treated equally in that they can only be overturned by a joint resolution of disapproval, a process in which the entire burden of action is on the Congress, some rules might be designated for more selective, special review. For example, they argue that major or significant rules might be subject to a joint resolution of *approval*. Under such a scheme a major or significant rule would not become effective unless a joint resolution approving it passed both Houses within a specified period of time.²⁸ To make such a scheme effective someone or some body, other than the OIRA Administrator or a congressional agency, such as the proposed CORA, might be vested with the authority to designate which rules are "major" or "significant" and thereby subject to the affirmative approval requirement. A benefit from the critics' standpoint is that the burden for supporting and justifying such rules falls on the promulgating agencies. All other rules would be subject to disapproval resolutions. Another proposal is to subject all covered rules to congressional approval and establish an expedited procedure whereby non-controversial rules may be sped through leaving only a few for close consideration.²⁹

4. The Reluctance to Disapprove an Omnibus Rule Where Only One Part of the Rule Raises Objection.

Section 808 of the review provision sets forth the mandatory text of any joint resolution of disapproval: "That Congress disapproves the rule submitted by the _____ relating _____, and such rule shall have no force or effect. (The blank spaces being appropriately filled in)." The quoted text refers to "the rule" and

²⁷ (...continued)

Congress, but even then they need not fear the ramifications of fast-track review unless they also believe that the president opposes the rule or is willing to compromise it to win other political battles. Fast-track review may have greater significance for midnight rules that are subject to review when a different president is in office." (Skidlenfeld).

²⁸ S.J. Res. 17, dealing with the FCC's media ownership rule, which passed in the Senate but was not acted upon in the House.

²⁹ See e.g., Reorganization Act Amendments of 1984, providing that both Houses of Congress had to pass a joint resolution approving a reorganization plan within 90 days of continuous session after the date of presidential submission or else it is deemed disapproved. 5 U.S.C. 906 (a) (1994).

³⁰ Two bills introduced in the 106th Congress to revise the CRA utilized the joint resolution of approval approach. See S. 1348, 106th Cong., 1st Sess. (1999)(Sen. Brownback) S. 2670, 106th Cong., 2nd Sess. (2000)(Sen. Thomas). A similar approach is reflected in H.R. 110 introduced by Rep. Hayworth (with 25 co-sponsors) in the 108th Congress. All agency rules must be reported to Congress and may become effective only on passage, by means of a fast-track procedure applicable to both Houses, of an approval law, which is not subject to judicial review.

CRS-22

"such rule," indicating a rule in its entirety. The experience of 33 joint resolutions of disapproval thus far introduced is that the first blank is filled with the name of the promulgating agency and the second with a generic title or description of the rule.⁵⁵ Similarly, the text of the review provision refers to "such rule," "a rule," or "the rule," with no language expressly referring to a part of any rule under review. The procedure leading to a vote on the proposed disapproval resolution allows for no amendments, and the final vote is up or down on the joint resolution as introduced.

The legislative history of the provision is similarly uniform in using language that would ordinarily indicate a reference to a submitted rule in its entirety, except in one instance. During a discussion of the Section 802 procedure that would obtain when one House completes its action on a joint resolution and sends it to the other House before the second House has yet to complete any action, the following comment is made:

... Subsection 802(f) sets forth one unique provision that does not expire in either House. Subsection 802(f) provides procedures for passage of a joint resolution of disapproval when one House passes a joint resolution and transmits it to the other House that has not yet completed action. In both Houses, the joint resolution of the first House to act shall not be referred to a committee but shall be held at the desk. In the Senate, a House-passed resolution may be considered directly only under normal Senate procedures, regardless of when it is received by the Senate. A resolution of disapproval if originated in the Senate may be considered under the expedited procedures only during the period specified in subsection 802(c). Regardless of the procedures used to consider a joint resolution in either House, the final vote of the second House shall be on the joint resolution of the first House (no matter when that vote takes place). *If the second House passes the resolution, no conference is necessary and the joint resolution will be presented to the President for his signature. Subsection 802(f) is justified because subsection 802(a) sets forth the required language of a joint resolution in each House, and thus, permits little variance in the joint resolutions that could be introduced in each House.*⁵⁶ (Emphasis supplied).

⁵⁵ S.J.Res. 50 and H.J.Res. 123, "relating to surty bond requirements for home health agencies under the medicare and medicaid programs..."

⁵⁶ Joint Explanatory Statement of House and Senate Sponsors, 142 Cong. Rec. E 571, at E 577 (daily ed. April 19, 1996); 142 Cong. Rec. S 3683, at S 3686 (daily ed. April 18, 1996) [Legislative History] (emphasis added). These identical detailed explanations by the legislative sponsors of the intent and scope of the CRA's provisions appeared in the daily editions of the Congressional Record some three weeks after SBREFA was signed into law. In the absence of committee hearings and the sparse commentary during floor debate, these explanations represent the most authoritative contemporary understanding of the provisions of the law. It is, however, post-enactment legislative history and does not carry the weight that committee report explanations and floor debates provide. As one court dealing with the interpretation of a CRA provision stated, the post-enactment legislative history "buttresses the 'limited scope' of the CRA judicial review provision" but warned that "the lack of formal legislative history for the CRA makes reliance on this joint statement troublesome." See *United States v. Southern Indiana Gas & Electric Co.*, discussed *infra* at note 54 and accompanying text. It has recently come to our attention that the permanent edition of the Congressional Record for the 104th Congress places the Senate sponsors Joint Explanation at April 18, 1996, the same date it appeared in daily edition. See 142 Cong. Rec. 8196- (continued...)

CRS-23

The last two sentences as seen by some as raising uncertainty. The next to last sentence would appear to contemplate the possibility of a conference to resolve differences in resolutions. The last sentence minimizes what those differences could be. Some have suggested that the explanation contemplates that parts of rules may be the subject of disapproval resolutions, arguing that the framers of the provision would have known that many rules are complex and contain a variety of provisions, only one or a few of which may be objectionable, and would not have required a whole rulemaking to be brought down simply because of one offending portion out of many. It has also been argued that in light of the Section 801(b)(2) prohibition against agency issuance of a rule "in substantially the same form" after passage of a disapproval resolution unless Congress by subsequent law authorizes it, not allowing rejection of part of a rule would have a draconian result.

In fact, an up or down vote on the entire rule would appear to have been the intent of the framers of the review provision. The language and structure of the provision, and the supporting explanation of the legislative history, contemplates a speedy, definitive and limited process. It is not unlike the legislative processes created for congressional actions dealing with military base closings,³⁷ international trade agreements,³⁸ and presidential reorganization plans,³⁹ among others. Each dealt with complex, politically sensitive decisions which allowed only an up or down vote by the Congress on the entire package presented. It was understood that piecemeal consideration would delay and perhaps obstruct legislative resolution of the issues before it. For similar reasons, the statutory structure and legislative history of the review provision strongly indicate that Congress intended the process to focus on submitted rules as a whole and not to allow veto of individual parts. Perhaps a proper reading of the quoted portion of the legislative history is that it was contemplating the possibility that the blank to be filled in after "relating to" might have different generic descriptions of the rule subject to disapproval. A broader reading of these sentences would not otherwise appear warranted by either the legislative language itself or the rest of the explanatory legislative history.

As a practical matter, if this reading is correct it may be a factor in the limited use of the mechanism. As indicated, nullifying a rule means disabling an agency from regulating in the area covered by the rule unless Congress passes further authorization legislation, a significant consequence of any disapproval action. On the other hand, expressly authorizing nullification of portions of a rule might allow

³⁶ (...continued)

8201. The House sponsors' Joint Explanation, which originally appeared in the daily edition of April 19, 1996, is now placed during the floor debate on SBREFA on March 28, 1996, the date of its passage. See 142 Cong. Rec. 6922-6930. There is no explanation for the earlier placement. As a consequence, we have determined to continue to treat the Joint Explanation as post-enactment legislative history that arguably merits close consideration by a reviewing court as a contemporaneous, detailed, in-depth statement of purpose and intent by the principal sponsors of the law. See discussion, *infra*, at pp. 27-33.

³⁷ Defense Base Closure and Realignment Act of 1990, P.L. 101-510, sec. 2908(b) 104 Stat. 1808, in note following 10 U.S.C. 2687 (2000).

CRS-24

competing disapproval resolutions within each House and the certainty of a long, drawn out conference with the possibility of no agreement.

5. The Uncertainty of Which Rules Are Covered By the CRA.

The framers of the congressional review provision intentionally adopted the broadest possible definition of the term "rule" when they incorporated Section 551(4) of the APA. As indicated previously,⁴⁶ the legislative history of Section 551(4) and the case law interpreting it make it clear that it was meant to encompass all substantive rulemaking documents — such as policy statements, guidances, manuals, circulars, memoranda, bulletins and the like — which as a legal or practical matter an agency wishes to make binding on the affected public.

The legislative history of the CRA emphasizes that by adoption of the Section 551 (4) definition of rule, the review process would not be limited only to coverage of rules required to comply with the notice and comment provisions of the APA or any other statutorily required variation of notice and comment procedures, but would rather encompass a wider spectrum of agency activities characterized by their effect on the regulated public: "The committee's intent in these subsections is . . . to include matters that substantially affect the rights or obligations of outside parties. The essential focus of this inquiry is not on the type of rule but on its effect on the rights and obligations of non-agency parties."⁴⁷ The framers of the legislation indicated their awareness of the practice of agencies avoiding the notification and public participation requirements of APA notice-and-comment rulemaking by utilizing the issuance of other, non-legislative documents as a means of binding the public, either legally or practically,⁴⁸ and noted that it was the intent of the legislation to subject just such documents to congressional scrutiny:

. . . The committees are concerned that some agencies have attempted to circumvent notice-and-comment requirements by trying to give legal effect to general statements of policy, "guidelines," and agency policy and procedure manuals. The committees admonish the agencies that the APA's broad definition of "rule" was adopted by the authors of this legislation to discourage circumvention of the requirements of chapter 8.⁴⁹

It is likely that virtually all the 35,490 no 1-major rules thus far reported to the Comptroller General have been either notice and comment rules or agency documents required to be published in the Federal Register. This would mean that

⁴⁶ See footnotes 1-4, *supra*, and accompanying text.

⁴⁷ Legislative History, *supra* n. 36, at E 579, S 3687.

⁴⁸ This practice has been long recognized and criticized in administrative law commentaries. See, e.g., Robert A. Anthony, *Interpretive Rules, Policy Statements, Guidances, Manuals, and the Like — Should Federal Agencies Use Them To Bind The Public?*, 41 Duke L.J. 1311 (1992). Cf. also, General Accounting Office, *Federal Rulemaking: Agencies Often Published Final Actions Without Proposed Rules*, GAO/GGD-98-126 (August 1998).

⁴⁹ Legislative History, *supra* n. 36, at E 578, S 3687.

CRS-25

perhaps thousands of covered rules have not been submitted for review.⁴⁴ Pinning down a concrete number is difficult since such covered documents are rarely if ever published in the Federal Register and thus will come to the attention of committees or Members only serendipitously.

Eight such agency actions have come to the attention of committee chairmen and Members and were referred to the Comptroller General for determinations whether they were covered rules. In five of the eight cases the CG determined the action documents to be covered rules. See letter to Honorable Lane Evans, Ranking Minority Member, House Committee on Veterans' Affairs, B-292045 (May 19, 2003) (Department of Veterans Affairs memorandum terminating the Department's Vendee Loan Program is not a rule that must be submitted to Congress because it is exempt under Section 804(3)(B) and (C) as a rule relating to "agency management" or "agency organization, procedure, or practice that does not substantially affect the rights or obligations of non-agency parties."); letter to Honorable Ted Strickland, B-291906 (February 28, 2003) (Department of Veterans Affairs memorandum instructing all directors of health care networks to cease any marketing activities to enroll new veterans in such networks is excluded from CRA coverage by Section 804(3)(C) which excludes "any agency rule of agency organization, procedure, or practice that does not substantially affect the rights or obligations of non-agency parties."); letter to Honorable Doug Ose, Chairman, House Subcommittee on Energy Policy, Natural Resources, and Regulatory Affairs, Committee on Government Reform, B-287557 (May 14, 2001) (Department of Interior's Fish and Wildlife Service's Trinity River "Record of Decision" is a rule covered by the CRA because it is an agency statement of general applicability and future effect designed to implement, interpret, or prescribe law or policy and is an "agency action[] that substantially affect[s] the rights and obligations of outside parties."); letter to the Hon. James A. Leach, Chairman, House Banking Committee, B-286338 (October 17, 2000) (Farm Credit Administration's national charter initiative held to be a rule under the CRA); letter to Honorable David M. McIntosh, Chairman, Subcommittee on National Economic Growth, Natural Resources, and Regulatory Affairs, House Committee on Government Reform and Oversight, B-281575 (January 20, 1999) (EPA "Interim Guidance for Investigating Title VI Administrative Complaints Challenging Permits" held to be covered because it created new, mandatory steps in the procedure for handling disparate impact assessments which gave recipients new rights they did not previously possess for obtaining complaint dismissals, a substantive alteration of the previous regulation.); letter to Senator Conrad Burns, B-278224 (November 10, 1997) (the American Heritage River Initiative announced by the Council on Environmental Quality was not a covered rule because it was established by presidential executive order and direction and the President is not an

⁴⁴ An indication of the vast number of unreported covered rules came as a result of an investigation by the House Subcommittee on National Economic Growth, Natural Resources, and Regulatory Affairs (Government Reform) which revealed that 7,523 guidance documents issued by the Department of Labor, the Environmental Protection Agency, and the Department of Transportation which were of general applicability and future effect had not been submitted for CRA review during the period March 1996 through November 1999. See "Non-Binding Legal Effect of Agency Guidance Documents," [http://www.congress.gov/cgi-bin/cpquery/T?&report=hr1009&dynamic=ep106&JH.Rept.106-1009,106⁹Cong.,2ndSess.\(2000\).](http://www.congress.gov/cgi-bin/cpquery/T?&report=hr1009&dynamic=ep106&JH.Rept.106-1009,106⁹Cong.,2ndSess.(2000).)

CRS-26

"agency" under the APA and is not subject to the provisions of the APA); letter to Honorable Ted Stevens, Chairman, Senate Appropriations Committee, et al, B-275178 (July 3, 1997) (Tongass National Forest Land and Resources Management Plan held an agency statement of general applicability and future effect that implements, interprets, and prescribes law and policy); letter to Honorable Larry Craig, Chairman, Senate Committee on Energy and Resources, B-274505 (September 16, 1996) (memorandum of Secretary of Agriculture concerning the Emergency Salvage Timber Sale Program held to be a covered rule because it is of general applicability and interprets and implements the statutory program.).

The GAO opinion on the American Heritage River Initiative rests its rationale that a presidential directive to an agency that results in substantive action by that agency is not thereby covered by the CRA based on the Supreme Court's rulings in *Franklin v. Massachusetts*, 505 U.S. 788, 800 (1992) and *Dalton v. Spector*, 511 U.S. 462, 469 (1994). In light of *Chamber of Commerce v. Reich*, 74 F. 3d 1322 (D.C. Cir. 1996) and *National Family Planning v. Sullivan*, 979 F. 2d 227 (1992), which successfully challenged substantive changes in rules that were directed by a presidential directive, the GAO General Counsel's conclusions may be problematic.

Also questionable is the General Counsel's analysis in its February 28, 2003 opinion concluding that a Department of Veterans Affairs (DVA) memo terminating a long-time veterans health outreach program was an exempt agency practice that had no substantial effect on the rights of non-agency parties. In contrast with its May 19, 2004, opinion dealing with a termination of a DVA vendee loan program, where it closely examined the statutory basis of the loan program and found that it was established on the basis of discretionary authority of the Secretary and provided no direct benefits to veterans, the General Counsel made no mention that the Congress had charged the Secretary of DVA "with the affirmative duty of seeking out eligible veterans and eligible dependants and providing them" with federal benefits and services. Representative Strickland joined with the Vietnam Veterans of American in a suit seeking declaratory and injunctive relief to restore the program. In *Vietnam Veterans of America v. Principi*, 2005 WL 961133 (D.D.C. March 11, 2005), the district court found that "[u]nder 38 U.S.C. 7721, 7722, and 7227, Congress charges the Secretary of the Department of Veterans Affairs with the affirmative duty to 'provide outreach services.' This duty is not discretionary but must be done in accordance with Congress' wishes." The court concluded, however, that since Congress appropriated a lump-sum for both outreach services and health care services, and the record showed that some monies had been expended for outreach services, it indicated that Congress meant to allow the Secretary the discretion to decide "the manner in which [outreach services] are to be provided." The critique here is that the Comptroller General's failure to examine the Secretary's duty under the statute in question eliminated the possibility finding a substantial effect of the agency's action on the rights or obligations of non-agency parties, thereby forestalling the opportunity for legislative review under CRA procedures. It is interesting to note that subsequent to the CG's decision and the filing of the lawsuit, Congress enacted a limitation on the Fiscal Year 2004 VA appropriation stating, "[n]one of the funds made available may be used to implement any policy prohibiting the Directors of the Veterans Integrated Service Networks from conducting outreach or marketing to enroll new veterans within their respective networks," an apparent

CRS-27

indication that Congress thought the controverted policy could be having an impact on potential beneficiaries. See Pub.L. 108-199, H.R. 2673, sec. 418 (2004).

Believing such instances to be only a small portion of unreported agency actions, GAO, at the behest of the House Government Reform and Oversight Subcommittee on National Economic Growth, Natural Resources, and Regulatory Affairs, engaged in discussions with the Office of Management (OMB) during 1998 for the creation of a uniform reporting form for use by agencies in reporting covered rules to the CG, and for the promulgation of an OMB guidance document covering such matters under the review provision as the definition of a covered rule, reporting requirements, the good cause exemption, and the consequences of failing to report a rule, among others. The failure to issue such guidance prompted insertion of the following directive in the FY1999 appropriation for OMB: "OMB is directed to submit a report by March 31, 1999, to the Committees on Appropriations, the Senate Committee on Governmental Affairs, and the House Committee on Government Reform and Oversight that . . . issues guidance on the requirements of 5 U.S.C. Sec. 801 (a) (1) and (3); sections 804 (3), and 808 (2), including a standard new rule reporting form for use under section 801 (a)(1)(A)-(B)."⁴⁵ OMB, in the view of the Subcommittee, has failed to substantially comply with that statutory directive.⁴⁶

If the guidance issued in compliance with the statutory direction is not consonant with the congressional understanding of the intent, meaning and scope of the congressional review provision, it might be considered as a vehicle for oversight hearings and possible remedial legislation.

6. The Uncertainty of the Effect of An Agency's Failure to Report a Covered Rule to Congress.

Section 801(a)(1)(A) of the CRA provides that "[b]efore a rule can take effect," the Federal agency promulgating such rule shall submit to each House of Congress and the Comptroller General a report containing the text of the rule, a description of the rule, including whether it is a major rule, and its proposed effective date. Section 805 states that "no determination, finding, action or omission under this chapter shall be subject to judicial review." The Department of Justice (DOJ) has broadly hinted that the language of Section 805 "precluding judicial review is unusually sweeping" so that it would presumably prevent judicial scrutiny and sanction of an agency's failure to report a covered rule.⁴⁷ DOJ has succeeded with its preclusion argument in two federal district court rulings. More recently the rationale of those opinions has been called into question and rejected by a third district court.

CRS 28

In *Texas Savings and Community Bankers Assoc. v. Federal Housing Finance Board*,⁴⁸ three thrift associations and two of their trade associations sued the Federal Housing Finance Board challenging one of its policies regarding the home mortgage lending industry. The plaintiff's argued, *inter alia*, that the policy was a rule required to be reported to Congress under the CRA and the failure to report it precluded its enforcement. The government argued that Section 805 was a blanket preclusion of judicial review. In response to plaintiff's contention that Section 805 only precluded review of any "determination, finding, or omission" by Congress, the court held that "the statute provides for no judicial review of any 'any determination, finding, action or omission under this chapter,' not 'by Congress under this chapter.'" The court must follow the plain English. Apparently, Congress seeks to enforce the [CRA] without the able assistance of the courts.⁴⁹ The court made no reference to the scheme of the act or its legislative history.

The Texas district court's "plain meaning" rationale was cited with approval by an Ohio district in *United States v. American Electric Power Service Corp.*⁵⁰ That case was one of many involving an extensive litigation campaign by the Environmental Protection Agency (EPA), begun in the mid-1990's to establish the extent to which a power plant or factory may alter its facilities or operations without bringing about a "modification" of that emission source so as to trigger the Clean Air Act's New Source Performance Standards and pre-construction "new source review."⁵¹ Among the issues common in these cases, and raised in this case, was whether EPA's determination to begin a campaign of litigation enforcement after many years of no enforcement was a substantive change that had to be reported to Congress under the CRA. It was among 123 affirmative defenses raised by defendants, nine coal-fired power plants in Ohio, Virginia, and West Virginia, which the Government moved to dismiss. Citing the *Texas Savings* case approvingly, the district court agreed "that the language of Section 805 is plain" and that "[d]eparture from the plain language is appropriate in the 'rare cases [in which] the literal application of a statute would produce a result demonstrably at odds with the intention of its drafters ... or when the statutory language is ambiguous.' ... In all other cases, the plain meaning of the statute controls."⁵² The court did not indicate whether it had attempted to discern whether there was any evidence of congressional intent at odds with the court's plain meaning reading. It did, however, provide an alternative rationale: "Furthermore, this Court is not convinced that the instant

CRS-29

enforcement action amounts to rulemaking which would be covered by 5 U.S.C. 801 *et. seq.*, in the first instance," without elaboration.⁵³

In *United States v. Southern Indiana Gas and Electric Co.*,⁵⁴ the court faced the same issue in a motion for summary judgment by the power company defendant. Rejecting the *Texas Savings* and *American Electric Power* precedents, it found that Section 805 is ambiguous and susceptible to two possible meanings: that Congress did not intend for any court review of an agency's compliance with the CRA or that Congress only intended to preclude judicial review of its own determination, findings, actions or omissions made under the CRA *after* a rule had been submitted to it for review. Adopting the first alternative, argued for by the Government and adopted by the *Texas Savings* and *American Electric Power* courts, would, according to the court, allow agencies "to evade the strictures of the CRA by simply not reporting new rules and courts would be barred from reviewing their lack of compliance. This result would be at odds with the purpose of the CRA, which is to provide a check on administrative agencies' power to set policies and essentially legislate without Congressional oversight. The CRA has no enforcement mechanism, and to read it to preclude a court from reviewing whether an agency rule is in effect that should have been reported would render the statute ineffectual.⁵⁵ The court found that the post-enactment legislative history "buttresses the 'limited scope' of the CRA's judicial review provision" but was careful to acknowledge that "the lack of formal legislative history for the CRA makes reliance on this joint statement troublesome." However, the court made it clear that "this court reached its conclusion about the limited scope of the judicial review provision of the CRA based on the text of the statute and overall purpose of the act. The legislative history only serves to further reinforce the Court's conclusion."⁵⁶

It is certainly arguable that the *Southern Indiana* court's view of the limited preclusiveness of Section 805 is plausible and persuasive. Indeed, an even stronger case can be made from a closer analysis of the text and structure of the act taken as a whole. Moreover, although the court was correct as a general matter that post-enactment legislative history normally is given less weight, there are a number of Supreme Court rulings that recognize that under certain circumstances, arguably applicable here, contemporaneous explanations of key provisions' intent have been found to be an "authoritative guide" to a statute's construction. In one instance the Court relied on an explanation given eight years after the passage of the legislation.

The plain, overarching purpose of the review provision of the CRA was to assure that all covered final rulemaking actions of agencies would come before Congress for scrutiny and possible nullification through joint resolutions of disapproval.⁵⁷ The scheme provides for the delayed effectiveness of some rules

⁵⁷ "This legislation establishes a government-wide congressional review mechanism for most (continued...)

CRS-30

deemed innately important ("major rules"), Section 801(a)(3), and temporarily waives the submission requirement of Section 801 for rules establishing, modifying, opening, closing or conducting a regulatory program for a commercial, recreational, or subsistence activity related to hunting, fishing, or camping, or for a rule an agency "for good cause" finds that notice and public procedure are impractical, unnecessary, or contrary to the public interest. Section 808 Rules promulgated pursuant to the Telecommunications Act of 1996 are excluded from the definition of "major rule". But all such rules must ultimately be submitted for review. And while the scheme anticipates that some (or even most) rules will go into effect before a joint resolution of disapproval is passed, the law provides that enactment of a joint resolution terminates the effectiveness of the rule and that the rule will be treated as though it had never taken effect. Sections 801(b)(1), 801(f). Further, a rule that has been nullified cannot be reissued by an agency in substantially the same form unless it is specifically authorized to do so by law after the date of the disapproval. Section 801(b)(2).

The review scheme also requires a variety of actions by persons or agencies in support of the review process, and time for such actions to be scrutinized by both Houses to implement the scheme. Thus, the Comptroller General must submit a report to Congress on each major rule submitted within 15 calendar days after its submission or publication of the rule (Section 801(a)(2)(A)); the Administrator of OIRA determines whether a rule is a "major rule" (Section 804(2)); and after a rule is reported the Senate has 60 session days, and the House 60 legislative days, to pass a disapproval resolution under expedited procedures. Section 802. But Congress has preserved for itself a period of review of at least 60 session or legislative days. Therefore, if a rule is reported within 60 session days of the Senate (or 60 legislative days of the House) prior to the date Congress adjourns a session of the Congress, the period during which Congress may consider and pass a joint resolution of disapproval is extended to the next succeeding session of the Congress. Section 801(d)(1).

Thus the statutory scheme is geared toward congressional review of all covered rules at some time; and a reading of the statute that allows for easy avoidance defeats that purpose. Interpreting the judicial review preclusion provision to prevent court scrutiny of the validity of administrative enforcement of covered but non-submitted rules appears to be neither a natural nor warranted reading of the provision. Section 805 speaks to "determination[s], finding[s], action[s], or omission[s] *under this chapter*," a plain reference to the range of actions authorized or required as part of the review process. Thus Congress arguably did not intend, as is more fully described below, to subject to judicial scrutiny, its own internal procedures, the validity of Presidential determinations that rules should become effective immediately for specified reasons, the propriety of OIRA determinations whether rules are major or not, or whether the Comptroller General properly performed his reporting function. These are matters that Congress can remedy by itself. However,

¹⁷ (Continued)
new rules. This allows Congress the opportunity to review a rule before it takes effect and to disapprove any rule to which Congress objects." Legislative History, *supra* note 36, at E 575 and S 3683.

CRS-31

without the potential of court invalidation of enforcement actions based on the failure to submit covered rules, agencies are not likely to comply with submission requirements. If Section 805 is read so broadly, it would arguably render ineffective as well the Section 801(b)(2) prohibition against an agency promulgating a new rule that is "substantially the same" as a disapproved rule unless it "is specifically reauthorized by a law enacted after" the passage of a disapproval resolution. It is more than likely that a determination whether a new or reissued rule is "substantially the same" as a disapproved rule is one that a court will be asked to make.⁵⁸ Congress appears to have contemplated (and approved) judicial review in this and other situations when it provided in Section 801(g) that "[i]f Congress does not enact a joint resolution of disapproval under section 802 respecting a rule, no court or agency may infer any interest of the Congress from any action or inaction of the Congress with regard to such rule, related statute, or joint resolution of disapproval."

The legislative history of the review provision confirms this view of the limited reach of the judicial review preclusion language. A key sponsor (Representative Hyde) of the legislation, Representative McIntosh, explained during the floor debate on H.R. 3136 that "Under Section 8(a)(1)(A), covered rules may not go into effect until the relevant agency submits a copy of the rule and an accompanying report to both Houses of Congress."⁵⁹

Shortly thereafter, the principal Senate and House sponsors of H.R. 3136 published a Joint Explanatory Statement in the Congressional Record providing a detailed explanation of the provisions of the congressional review provision of the CRA and its legislative history. Senator Nickles explained:

Mr. NICKLES. Mr. President, I will submit for the RECORD a statement which serves to provide a detailed explanation and a legislative history for the congressional review title of H.R. 3136, the Small Business Regulatory Enforcement Fairness Act of 1996. H.R. 3136 was passed by the Senate on March 28, 1996, and was signed by the President the next day. . . . Because title III of H.R. 3136 was the product of negotiation with the Senate and did not go through the committee process, no other expression of its legislative history exists other than the joint statement made by Senator REID and myself immediately before passage of H.R. 3136 on March 28. I am submitting a joint statement to be printed in the RECORD on behalf of myself, as the sponsor of the S. 219, Senator REID, the prime co-sponsor of S. 219, and Senator STEVENS, the chairman of the Committee on Governmental Affairs. This joint statement is intended to provide guidance to the agencies, the courts, and other interested parties when interpreting the act's terms. The same statement has been

⁵⁸ The disapproval of the ergonomics rule underlines a possible need for judicial review in certain instances where enforcement is necessary and appropriate to support the statutory scheme. That rule, which was broad and encompassing in its regulatory scope, raises the question as to how far can the agency go before it reaches the point of substantial similarity in its promulgation of a substitute. This issue is addressed in the next section.

⁵⁹ 142 Cong. Rec. H3005 (daily ed. March 28, 1996).

CRS-32

submitted today in the House by the chairmen of the committees of jurisdiction over the congressional review legislation.⁶⁰

The Joint Explanatory Statement is clear as to the scope and limitation of the judicial review provision:

Limitation on judicial review of congressional or administrative actions

Section 805 provides that a court may not review any congressional or administrative "determination, finding, action, or omission under this chapter". Thus, the major rule determinations made by the Administrator of the Office of Information and Regulatory Affairs of the Office of Management and Budget are not subject to judicial review. Nor may a court review whether Congress complied with the congressional review procedures in this chapter. This latter limitation on the scope of judicial review was drafted in recognition of the constitutional right of each House of Congress to "determine the Rules of its Proceedings". U.S. Const. art. I, §5, cl. 2, which includes each house being the final arbiter of compliance with such Rules.

The limitation on a court's review of subsidiary determinations or compliance with congressional procedures, however, does not bar a court from giving effect to a resolution of disapproval that was enacted into law. A court with proper jurisdiction may treat the congressional enactment of a joint resolution of disapproval as it would treat the enactment of any other federal law. Thus, a court with proper jurisdiction may review the resolution of disapproval and the law that authorized the disapproved rule to determine whether the issuing agency has the legal authority to issue a substantially different rule. The language of subsection 801(g) is also instructive. Subsection 801(g) prohibits a court or agency from inferring any intent of the Congress only when "Congress does not enact a joint resolution of disapproval", or by implication, when it has not yet done so. In deciding cases or controversies properly before it, a court or agency must give effect to the intent of the Congress when such a resolution is enacted and becomes the law of the land. The limitation on judicial review in no way prohibits a court from determining whether a rule is in effect. For example, the authors expect that a court might recognize that a rule has no legal effect due to the operation of subsections 801(a)(1)(A) or 801(a)(2).⁶¹

The Justice Department has suggested that such post-enactment legislative history should not carry any weight, particularly in view of the unambiguous nature of the preclusion language at issue.⁶² However, as discussed below, the courts appear to have taken a contrary view in analogous interpretive situations.

The Joint Explanatory Statement is a contemporaneous explanation of the congressional review provision by the legislative sponsors of the legislation which is consonant with the text and structure of the legislation. Such statements by legislative sponsors have been described by the Supreme Court as an "authoritative guide to the statute's construction." *North Haven Bd. of Education v. Bell*, 456 U.S.

⁶⁰ Legislative History, *supra* note 36, at 142 Cong. Rec. S 3683.

CRS-33

512, 526-27 (1982)(citing a bill summary placed in the Congressional Record by the bill's sponsor after passage, and explanatory remarks made two years later by the same sponsor); *Pacific Gas & Electric Co. v. Energy Resources Conservation and Development Commission*, 461 U.S. 190, 211 n. 23 (1983)(relying on a 1965 explanation by "an important figure in the drafting of the 1957 [Atomic Energy Act]"); *Grove City College v. Bell*, 465 U.S. 555, 567 (1984)(remarks of sponsors deemed authoritative when they are consistent with the language of the legislation).

Finally it may be noted that analogous preclusion of judicial review provisions in the original Paperwork Reduction Act of 1980, P.L. 96-511 and in the 1995 revision of the act, P.L. 104-13, have been uniformly construed by the courts to allow enforcement of its public protection provision. Thus 44 U.S.C. 3504 (1994), which authorized the Director of OMB to review and approve or disapprove information collection requirements in agency rules, and to assign control numbers to such forms, provided that "there shall be no judicial review of any kind of the Director's decision to approve or not to act upon a collection of information requirement contained in an agency rule." 44 U.S.C. 3504(b)(9). A similar provision appears in the 1995 revision of the Paperwork Reduction Act.⁶³ The 1980 legislation also contained a "public protection" provision which absolved a person from any penalty for not complying with an information collection request if the form did not display an OMB control number or failed to state that the request was not subject to the act.⁶⁴ The public protection provision, Section 3512, has been the subject of numerous court actions, some finding it applicable and providing a complete defense to noncompliance, others finding it inapplicable. But no court has ever raised a question with respect to preclusion of judicial review.⁶⁵

A reviewing court construing the language of the congressional review provision, the structure of the legislation, and its legislative history, including post-enactment statements, is therefore likely to hold that a court is not precluded from preventing an agency from enforcing a covered rule that was not reported to Congress in compliance with Section 801(a)(1)(A).

7. The Uncertainty of the Breadth of the Prohibition Against An Agency's Promulgation of a "Substantially Similar" Rule After the Original Rule Has Been Vetoed.

Enactment into law of a disapproval resolution has several important consequences. First, a disapproved rule is deemed not to have had any effect at any time. Thus, even a rule that has become effective for any period of time is

⁶³ 44 U.S.C. 3507(d)(6)(2000).

⁶⁴ See 44 U.S.C. 3512 (1994).

⁶⁵ Compare *United States v. Smith*, 866 F.2d 1092 (9th Cir. 1980)(failure of Forest Service to file a plan of operations with OMB control number precluded conviction for failure to file) and *Cameron v. IRS*, 593 F.Supp. 1540, *aff'd* 773 F.2d 126 (6th Cir. 1984)(failure of IRS forms to have OMB control numbers did not violate section since it was a collection of information during the investigation of a specific individual or entity which is exempt under the provision).

CRS-34

retroactively negated.⁶⁶ Second, a rule that does not take effect, or is not continued because of the passage of a disapproval resolution, cannot be "reissued in the same form" nor can a "new rule" that is "substantially the same" as the disapproved rule be issued unless such action is specifically authorized by a law enacted subsequent to the disapproval of the original rule.⁶⁷ The full text of this provision states:

(2) A rule that does not take effect (or does not continue) under paragraph (1) may not be reissued in substantially the same form, and a new rule that is substantially the same as such a rule may not be issued, unless the reissued or new rule is specifically authorized by a law enacted after the date of the joint resolution disapproving the original rule.

Finally, if a rule that is subject to any statutory, regulatory or judicial deadline for its promulgation is not allowed to take effect, or is terminated by the passage of a joint resolution, any deadline is extended for one year after the date of enactment of the disapproval resolution.⁶⁸

It can be anticipated that opponents of a disapproval resolution will argue that successful passage of a resolution may disable an agency from ever promulgating rules in the "area" covered by the resolution without future legislative reauthorization since a successful disapproval resolution must necessarily bring down the entire rule. Or, at the very least, it may be contended that any future attempt by the agency to promulgate new rules with respect to the subject matter will be subject to judicial challenge by regulated persons who may claim that either the new rules are substantially the same as those disapproved or that the statute provides no meaningful standard to discern whether a new rule is substantially the same and that the agency must await congressional guidance in the form of a statute before it can engage in further rulemaking in the area. The practical effect of these arguments, then, may be to dissuade an agency from taking any action until Congress provides clear authorization.

A review of the CRA's statutory scheme and structure, the contemporaneous congressional explanation of the legislative intent with respect to the provisions in question, the lessons learned from the experience of the March 2001 disapproval of the OSHA ergonomics rule, and the application of pertinent case law and statutory construction principles suggests that (1) It is doubtful that Congress intended that all disapproved rules would require statutory reauthorization before further agency action could take place. For example, it appears that Congress anticipated further rulemaking, without new authorization, where the statute in question established a deadline for promulgating implementing rules in a particular area. In such instances, the CRA extends the deadline for promulgation for one year from the date of disapproval. (2) A close reading of the statute, together with its contemporaneous congressional explanation, arguably provides workable standards for agencies to reform disapproved regulations that are likely to be taken into account by reviewing courts. Those standards would require a reviewing court to assess both the nature of

⁶⁶ 5 U.S.C. 801(f).

⁶⁷ 5 U.S.C. 801(b)(2).

⁶⁸ 5 U.S.C. 803.

CRS-35

the rulemaking authority vested in the agency that promulgated the disapproved rule and the specificity with which the Congress identified the objectionable portions of a rule during the floor debates on disapproval. An important factor in a judicial assessment may be the CRA's recognition of the continued efficacy of statutory deadlines for promulgating specified rules by extending such deadlines for one year after disapproval. (3) The novelty of the issue, the uncertainty of the weight a court will accord the post enactment congressional explanation, and the current judicial inclination to give deference to the "plain meaning" of legislative language, make it difficult to reliably anticipate what a court is likely to hold.

A blanket contention that enactment of a joint resolution disapproving an agency's rules would disable that agency from promulgating future rules in the "area" of concern until Congress passes new legislation authorizing it to issue rules on that subject would not appear to have a substantial basis in the CRA. Such argumentation would apparently be based on the notion that the "plain meaning" of the CRA's disapproval mechanism forecloses further rulemaking with respect to that subject matter unless Congress specifically reauthorizes such action in subsequent legislation. That is, since Congress can apparently only disapprove a rule as a whole, rather than pinpointing any particular portions, there is no sound basis for the agency to act without further legislative guidance where a rule deals exclusively with an integrated subject matter. The statute gives no indication as to how an agency is to discern what actions would be "substantially the same" and it would run the risk of a successful court challenge if it guessed wrong. It might be further argued that even if the agency promulgates new rules, which of course would be subject to CRA scrutiny, and Congress did not act to disapprove the new rules, that would not provide the necessary reauthorization since Section 301(g) of the act provides as a rule of construction that in the event of the failure of Congress to disapprove a rule "no court ... may infer any intent of Congress from any action or inaction of the Congress with regard to such, related statute, or joint resolution of disapproval."

It is, of course, fundamental that statutory language is the starting point in any case of statutory construction. In recent years, the Supreme Court has shown a strong disposition to hold Congress to the letter of the language it uses in its enactments. In its ruling in *Barnhardt v. Sigmon Coal Co.*⁶⁹ the Court advised that the first step "is to determine whether the language at issue has a plain and unambiguous meaning with regard to the particular dispute in the case."⁷⁰ "The inquiry ceases 'if the statutory language is unambiguous and the statutory scheme is coherent and consistent.'⁷¹ In such cases, the Court has held, resort to "legislative history is irrelevant to the interpretation of an unambiguous statute."⁷² In *Barnhardt* the Court

CRS-36

warned, "parties should not seek to amend [a] statute by appeal to the Judicial Branch."⁷³

The plain meaning rule, however, is not an unalterable, rigid rule of construction and has been held inapplicable where it would "lead to an absurd result,"⁷⁴ or "would bring about an end completely at variance with the purpose of the statute."⁷⁵ "It is 'a fundamental canon of statutory construction that the words of a statute must be read in their context and with a view to their place in the overall statutory scheme' ... Thus it is a more faithful construction of [a statute] to read it as a whole, rather than as containing two unrelated parts. It is the classic judicial task of construing related statutory provisions to make sense in combination."⁷⁶ In the instant situation, it is arguably not likely that a court would hold that the "substantially the same" language of Section 801(b)(2) is unambiguous, either on its face or in the context of the statutory scheme. The direction of the provision is not a self-enforcing mandate; it clearly requires a further determination whether rules have been reissued in "substantially the same form" or whether a new rule is "substantially the same" as the one disapproved. The ambiguity raised is who makes those determinations and on what basis.

The language of the provision, however, does not naturally or ineluctably lead to the conclusion that no further remedial rulemaking can take place unless Congress passes a new law. This reasoning is buttressed by Section 803(a) which contemplates that agency rulemaking must take place after a disapproval action if the authorizing legislation of the agency mandates that rules disapproved had to have been promulgated by a date certain. That provision extends the deadline for promulgation for one year "after the date of enactment of this joint resolution," not one year after Congress reauthorizes action in the area. The reasonable conclusion is that Congress understood that after disapproval, an agency, if it was under a mandate to produce a particular rule, had to try again. The question then is, how was it to perform this task. The answer lies in the legislative history of the act.

The Congressional Review Act was part of Title II of the Small Business Regulatory Enforcement Fairness Act of 1996. That Title was a product of negotiation between the Senate and House and did not go through the committee process. Thus there is no detailed expression of its legislative history, apart from floor statements by key House and Senate sponsors, before its passage by the Congress on March 28, 1996 and its signing into law by the President on March 29. Thereafter, the principal sponsors of the legislation in the Senate (Senators Nickles, Reid and Stevens) and House (Representative Hyde) submitted identical joint explanatory statements for publication in the Congressional Record "intended to provide guidance to the agencies, the courts, and other interested parties when

CRS-37

interpreting the act's terms.⁸⁷⁷ Although it is a post-enactment explanation of the legislation, it is likely to be accorded some weight as a contemporaneous, detailed, in-depth statement of purpose and intent by the principal sponsors of the law.⁸⁷⁸

The Joint Explanatory Statement directly addresses a number of issues that may arise upon enactment of a disapproval resolution and attempts to provide guidance for both Congress and agencies faced with repromulgation questions. At the outset, the Statement notes that disapprovals may have differing impacts on promulgating agencies depending on the nature and scope of the rulemaking authority that was utilized. For example, if an agency's authorizing legislation did not mandate the promulgation of the disapproved rule, and the legislation gives the agency broad discretion, the authors deem it likely that it has the discretion whether or not to promulgate a new rule. On the other hand, the Statement explains that "if an agency is mandated to promulgate a particular rule and its discretion is narrowly circumscribed, the enactment of a resolution of disapproval for that rule may work to prohibit the reissuance of any rule."⁸⁷⁹ By implication, a congressional mandate to issue regulations that is not circumscribed would still be operative. But how would the agency be guided in that circumstance? The Statement addresses that very question: it is the obligation of Congress during the debate on the disapproval resolution "to focus on the law that authorized the rule and make the congressional intent clear regarding the agency's options or lack thereof after the enactment of a joint resolution of disapproval."⁸⁸⁰ Thereafter, "the agency must give effect to the resolution of disapproval."⁸⁸¹ The full statement on the issue is as follows:

Effect of enactment of a joint resolution of disapproval

Subsection 801(b)(1) provides that "A rule shall not take effect (or continue), if the Congress enacts a joint resolution of disapproval, described under section 802, of the rule." Subsection 801(b)(2) provides that such a disapproval rule "may not be reissued in substantially the same form, and a new rule that is substantially the same as such a rule may not be issued, unless the reissued or new rule is specifically authorized by a law enacted after the date of the joint resolution disapproving the original rule." Subsection 801(b)(2) is necessary to prevent circumvention of a resolution disapproval. Nevertheless, it may have a different impact on the issuing agencies depending on the nature of the underlying law that authorized the rule.

If the law that authorized the disapproved rule provides broad discretion to the issuing agency regarding the substance of such rule, the agency may exercise its broad discretion to issue a substantially different rule. If the law that authorized the disapproved rule did not mandate the promulgation of any rule, the issuing

agency may exercise its discretion not to issue any new rule. Depending on the law that authorized the rule, an issuing agency may have both options. But if an agency is mandated to promulgate a particular rule and its discretion in issuing the rule is narrowly circumscribed, the enactment of a resolution of disapproval for that rule may work to prohibit the reissuance of any rule. The authors intend the debate on any resolution of disapproval to focus on the law that authorized the rule and make the congressional intent clear regarding the agency's options or lack thereof after enactment of a joint resolution of disapproval. It will be the agency's responsibility in the first instance when promulgating the rule to determine the range of discretion afforded under the original law and whether the law authorizes the agency to issue a substantially different rule. Then, the agency must give effect to the resolution of disapproval.

The congressional experience with the disapproval of the OSHA ergonomics standard provides a useful lesson.⁸² This rule became the first, and only, rule to be disapproved thus far under the CRA. The principal sponsor of the resolution, Senator Jeffords, at the outset of the debate addressed the issue whether disapproval would disable OSHA from promulgating a new rule. Senator Jeffords referred to the above-discussed Joint Statement and noted that OSHA "has enormously broad regulatory authority," citing pertinent sections of the OSH Act providing expansive rulemaking authority. The Senator concluded that "I am convinced that the CRA will not act as an impediment to OSHA *should* the agency decide to engage in ergonomics rulemaking."⁸³ What Senator Jeffords apparently understood was that while the agency had broad authority to promulgate rules, there was no congressional mandate to issue an ergonomics rule in the underlying law. As a consequence it was possible that no further rulemaking would occur, as implied by a letter to Senator Jeffords from Secretary Chao which indicated that a new rulemaking was only one of many options available to the Department should the rule be disapproved.⁸⁴ In fact, OSHA made it clear on April 5, 2002, that no rulemaking was in the offing.⁸⁵ On April 17, 2002, Senator Breaux and 26 co-sponsors, many of whom had voted in favor of the disapproval resolution, introduced S. 2184, which would direct the Secretary of Labor to promulgate a new ergonomics rule and specifies in detail what should be included, what should not be included, and what evidence should be considered. Section 1 (b)(4) of the bill deems the direction to issue the rule "a specific authorization by Congress in accordance with Section 801 (b)(2)" of the CRA.⁸⁶

An interesting contrast with the ergonomics situation was the consideration given by the key Senate sponsors of the Bipartisan Campaign Reform Act 2002 (BCRA),⁸⁷ which requires that the Federal Election Commission (FEC) promulgate rules implementing the soft money limitations and prohibitions of Title I of the act

⁸² See CRS Ergonomics Report, *supra* note 12.

CRS-39

no later than 90 days after its date of enactment,⁸⁸ whether to introduce a CRA disapproval resolution with respect to the rules issued by the FEC on July 17, 2002.⁸⁹ The Senate sponsors believed that the new rules, which became effective on November 6, 2002, undermine the BCRA's ban on the raising and spending of soft money by federal candidates and officeholders and on national party use of soft money. Since the FEC was mandated to promulgate rules to implement the BCRA by a date certain, it could have been argued that, in contrast with the general discretion OSHA has with respect to whether to issue any ergonomics standard, if Congress disapproved the FEC's soft money rule, the agency would be obligated to undertake a new rulemaking (to be completed within a year after the disapproval resolution was signed into law) that would reflect congressional objections to the rule. At the same time, in accordance with the understanding of the Joint Statement, it would have been arguably incumbent on Congress in its debates on any such resolution to clearly identify those provisions of the rule that are objectionable as well as those that are not.

Whether this line of argument will be sufficient to withstand a challenge in the courts cannot be answered with any degree of certainty. Foreseeable obstacles may be the novelty of the issue, the amount of weight, if any, that a court will accord the post-enactment congressional explanation of the CRA, and the current inclination of the courts to give deference to the plain meaning of statutory language and to eschew legislative history. A new rule may be challenged on grounds of lack of authority as a consequence of the disapproval resolution either because Congress failed to articulate its objections to the rule, thereby providing no standards for the agency to apply in its rulemaking, or that the new rules were "substantially the same" as the old, disapproved rules and therefore invalid under the CRA.

In the future, if Congress, considers a disapproval resolution, it should be mindful of the guidance provided by the Joint Statement. The Joint Statement declares that it is the congressional intent to make clear and specific identification of the options available to the agency, including identification of objectionable provisions in the proposed rule during the floor debates. In this way Congress provides an agency clear and direct guidance as to what it expects in the repromulgation process as well as a possible defense to a challenge based on the "substantially the same" language of the CRA.

Conclusion

This report identifies structural and interpretive issues affecting use of the CRA. While there have been some instances of the law apparently influencing the implementation of certain rules, the limited utilization of the formal disapproval process in the ten years since enactment has arguably reduced the threat of possible congressional scrutiny and disapproval as a factor in agency rule development. The

⁸⁸ Section 402 (c)(2).

CRS-40

one instance in which an agency rule was successfully negated is likely a singular event not soon to be repeated. Presently, the Congress and the White House are in the hands of the same political party, the rules of the previous administration are no longer subject to the CRA, and the current administration appears to be establishing firm control of the agency rulemaking process through its administration of Executive Order 12,866.⁶⁰ One commentator has observed that if the perception of a rulemaking agency is that the possibility of congressional review is remote "it will discount the likelihood of congressional intervention because of the uncertainty about where Congress might stand on that rule when it is promulgated years down the road," an attitude that is reinforced "so long as [the agency] believes that the president will support its rule."⁶¹ Indeed, there is growing evidence that a significant number of covered rules are not being submitted for review at all. Also, a potentially effective support mechanism, the in-depth, individualized scrutiny of selected agency cost-benefit and risk assessment analyses by GAO authorized under the Truth in Regulating Act of 2000, was never implemented for lack of appropriated funds.

The CRA reflects a recognition of the need to restore the political accountability of Congress and the perception of legitimacy and competence of the administrative rulemaking process. It also rests on the understanding that broad delegations of rulemaking authority to agencies are necessary and appropriate, and will continue for the indefinite future. The Supreme Court's most recent rejection of an attempted revival of the nondelegation doctrine⁶² adds impetus for Congress to consider several facets and ambiguities of the current mechanism. Absent review, current trends of avoidance of notice and comment rulemaking, lack of full reporting of covered rules under the CRA, intrusive judicial review, and increasing presidential control over the rulemaking process will likely continue.

**ADMINISTRATIVE LAW, PROCESS AND
PROCEDURE PROJECT**

TUESDAY, NOVEMBER 1, 2005

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON COMMERCIAL
AND ADMINISTRATIVE LAW,
COMMITTEE ON THE JUDICIARY,
Washington, DC.

The Subcommittee met, pursuant to notice, at 10 a.m., in Room 2141, Rayburn House Office Building, the Honorable Chris Cannon (Chair of the Subcommittee) presiding.

Mr. CANNON. If you would all like to take your seats. Thank you all for coming this morning.

I don't have a gavel. We are now in order. Don't worry about it. It is not life or death here.

The current Federal regulatory process faces many significant challenges. Earlier this year the head of OMB's Office of Information and Regulatory Affairs testified that "no one has ever tabulated the sheer number of Federal regulations that have been adopted since passage of the Administrative Procedure Act," which I might add parenthetically was in 1946. He further acknowledged, "Sad as it is to say, most of these existing Federal rules have never been evaluated to determine whether they have worked as intended and what their actual benefits and costs have been." A rather depressing statement.

In September 2005, the SBA's Office of Advocacy reported that the annual cost to comply with Federal regulations in the United States in 2004 exceeded \$1.1 trillion, about 10 percent of our whole economy, which means that if every household received a bill for its equal share, each would have owed \$10,172, an amount that exceeds what the average American household spent on health care in 2004, which is just under \$9,000.

Other problematic trends include the absence of transparency in certain stages of the rulemaking process, the increasing incidence of agencies publishing final rules without having them first promulgated on a proposal basis, the stultification of certain aspects of the rulemaking process, and the need for more consistent enforcement by agencies.

Given the fact that the EPA was enacted nearly 60 years ago, a fundamental question that arises is whether the act is still able to facilitate effective rulemaking in the 21st century.

In an attempt to answer that question, House Judiciary Chairman Sensenbrenner earlier this year requested that our Sub-

committee spearhead the Administrative Law, Process and Procedure Project.

The object of the project is to conduct a nonpartisan, academically credible analysis of Federal rulemaking that will focus on process, not policy concerns. Some of the areas that will be studied include the role of public participation in the rulemaking process, judicial review of rulemaking, and the utility of regulatory analysis and the accountability requirements.

For the purpose of soliciting scholarly papers and promoting a robust dialogue, the Subcommittee intends to facilitate colloquia at various academic institutions and organizations that analyze Federal rulemaking.

In addition, the Congressional Research Service has been asked to make some of its leading administrative law experts available to guide the project, one of whom is testifying today. Under the auspices of CRS, several independent empirical studies of various issues conducted by some of the most respected members of academia are already underway as part of the project, and we will hear about one of those ongoing studies as part of today's hearing.

The project will also benefit from the wealth of expertise that the Government Accountability Office provides. To date, GAO has produced more than 60 reports on various aspects of the Federal regulatory process, and one of our witnesses will explain the work of GAO in this critical area.

The project will culminate with the preparation of a detailed report with recommendations for legislative proposals and suggested areas for further research and analysis to be considered by the Administrative Conference of the United States.

As you may recall legislation reauthorizing ACUS was signed into law last fall. ACUS was a nonpartisan, private-public think tank that proposed many valuable recommendations which improved administrative aspects of regulatory law and practice. Over its 28-year existence ACUS has served as an independent agency charged with studying the efficiency, adequacy and fairness of the administrative procedure used by Federal agencies. Most of its approximately 200 recommendations were implemented. They in turn helped save taxpayers millions of dollars.

In a rare expression of unanimity, the Supreme Court Justices Scalia and Breyer jointly testified before our Subcommittee last year in support of ACUS. In complete unison they extolled the Conference's virtues. Justice Breyer in particular cited the value of the Conference's recommendations, noting that they resulted in "huge" savings to the public. Likewise Judge Scalia stated the Conference was "an enormous bargain." Accordingly, it is critical that ACUS be appropriated its funding if not before, at least by the time the project report is completed.

This is truly an exciting undertaking. I look forward—can you imagine an exciting undertaking in administrative procedures? It actually really is, and I look forward to the testimony from our witnesses as we get this project going.

I now turn to my colleague, Mr. Watt, the distinguished Ranking Member of my Subcommittee, and ask him if he has any opening remarks.

[The prepared statement of Mr. Cannon follows:]

PREPARED STATEMENT OF THE HONORABLE CHRIS CANNON, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF UTAH, AND CHAIRMAN, SUBCOMMITTEE ON COMMERCIAL AND ADMINISTRATIVE LAW

The current federal regulatory process faces many significant challenges. Earlier this year, the head of OMB's Office of Information and Regulatory Affairs testified that "no one has ever tabulated the sheer number of federal regulations that have been adopted since passage of the Administrative Procedure Act," which I might add parenthetically was in 1946. He further acknowledged, "Sad as it is to say, most of these existing federal rules have never been evaluated to determine whether they have worked as intended and what their actual benefits and costs have been." A rather depressing statement.

In September 2005, the SBA's Office of Advocacy reported that the annual cost to comply with federal regulations in the United States in 2004 exceeded \$1.1 trillion, which means that if every household received a bill for its equal share, each would have owed \$10,172, an amount that exceeds what the average American household spent on health care in 2004, which is just under \$9,000.

Other problematic trends include the absence of transparency at certain stages of the rulemaking process, the increasing incidence of agencies publishing final rules without having them first promulgated on a proposed basis, the stultification of certain aspects of the rulemaking process, and the need for more consistent enforcement by agencies.

Given the fact that the APA was enacted nearly 60 years ago, a fundamental question that arises is whether the Act is still able to facilitate effective rulemaking in the 21st Century?

To help us answer that question, House Judiciary Committee Chairman Sensenbrenner earlier this year requested our Subcommittee to spearhead the Administrative Law, Process and Procedure Project. The objective of the Project is to conduct a nonpartisan, academically credible analysis of federal rulemaking that will focus on process, not policy concerns.

Some of the areas that will be studied include the role of public participation in the rulemaking process, judicial review of rulemaking, and the utility of regulatory analysis and accountability requirements.

For the purpose of soliciting scholarly papers and promoting a robust dialogue, the Subcommittee intends to facilitate colloquia at various academic institutions and organizations that analyze federal rulemaking. In addition, the Congressional Research Service has been asked to make some of its leading administrative law experts available to guide the Project, one of whom is testifying today. Under the auspices of CRS, several independent empirical studies of various issues conducted by some of the most respected members of academia are already underway as part of the Project, and we'll hear about one of those ongoing studies as part of today's hearing. The Project will also benefit from the wealth of expertise that the Government Accountability Office provides. To date, GAO has produced more than 60 reports on various aspects of the federal regulatory process. And, one of our witnesses will explain the work of the GAO in this critical area.

The Project will culminate with the preparation of a detailed report with recommendations for legislative proposals and suggested areas for further research and analysis to be considered by the Administrative Conference of the United States. As you may recall, legislation reauthorizing ACUS was signed into law last fall. ACUS was a nonpartisan "private-public think tank" that proposed many valuable recommendations which improved administrative aspects of regulatory law and practice. Over its 28-year existence, ACUS served as an independent agency charged with studying the efficiency, adequacy, and fairness of the administrative procedure used by federal agencies. Most of its approximately 200 recommendations were implemented, and they, in turn, helped save taxpayers many millions of dollars.

In a rare expression of unanimity, Supreme Court Justices Scalia and Breyer jointly testified before our Subcommittee last year in support of ACUS. In complete unison, they extolled the Conference's virtues. Justice Breyer, in particular, cited the value of the Conference's recommendations, noting that they resulted in "huge" savings to the public. Likewise, Justice Scalia stated that the Conference was "an enormous bargain." Accordingly, it is critical that ACUS be appropriated its funding, if not before, at least by the time the Project report is completed.

This is a truly exciting undertaking and I look forward to the testimony from our witnesses.

Mr. WATT. Thank you, Mr. Chairman, and thank you for convening this hearing, and thank Chairman Sensenbrenner and Ranking Member Conyers for enlisting the able assistance of the

Congressional Research Service to provide guidance, supervision and a structural framework for this important, massive, bipartisan undertaking.

As I indicated last year in our hearing in which Justices Scalia and Breyer offered their insights on the role that the defunct Administrative Conference of the United States had played prior to its demise, I found it somewhat ironic that the agency that had actively worked to make Government smaller, more efficient and more accountable was itself a victim of the end of the era of big Government mantra of the 90's by reauthorizing the Administrative Conference last term. Congress has now taken the first steps toward restoring an invaluable mechanism created to improve the content, implementation and processes of Federal administrative law.

Now, if we could get funding appropriated to fund the Administrative Conference, this project will serve as a useful device to sort through and prioritize those systematic issues in the administrative law arena that cry out for examination and possible reform.

There is no greater example, as noted by several of our witnesses in their written testimony, of the need for review of the effectiveness of administrative law and procedures before us today than the bureaucratic morass that seemingly and tragically undermined efforts to save and provide prompt relief to the countless families and individuals caught in the path of Hurricane Katrina.

While there will be probing investigations into what went wrong in the aftermath of Katrina, bureaucratic flexibility in the face of national disasters or emergencies together with the interoperability and coordination of efforts at all levels of Government are vitally important to be considered in this examination of the current state of administrative process and procedure.

In addition to disaster-related areas of inquiry, there are other areas that are deserving of the in-depth review the project seeks to provide. I believe that overall review not only of our administrative agencies themselves but also of the judicial, presidential and congressional roles in the administrative process, will provide us with a thorough understanding of how each branch of Government contributes to furthering or impeding the goals of that process.

As the project progresses to evaluate e-Government and e-rule-making, I believe the questions of security, privacy and access must be considered. While technological advances have broadened the possibilities of delivering and managing some governmental services quicker with greater efficiency, these advances have also broadened the potential for abuse, misuse, and exclusion.

For example, transparency may invite security concerns, assembly of vast amounts of personal data may invite privacy concerns, and the mere use of advanced technology to administer governmental programs and policies might invite access concerns for small, disadvantaged or minority stakeholders who have yet to cross the digital divide.

There are many other issues, privatization, attorneys fees, judicial comity and the role of executive orders to name a few, that are important aspects of our system of administrative law and procedure.

I look forward to continuing to work with you, Mr. Chairman, on this comprehensive and balanced bipartisan examination of the state of our administrative law system, and I thank the witnesses for the insights they will provide to us today and yield back the balance of my time.

Mr. CANNON. Thank you, Mr. Watt. I have often said that the most interesting questions of our day are not partisan questions. This is certainly, I believe, one of them. When we consider a tenth of the economy is involved in the Federal regulatory process it is amazing.

Without objection, all Members may place their statements in the record at this point. Without objection, so ordered.

Without objection, the Chair will be authorized to declare recesses at any point in this hearing. Hearing none, so ordered.

I ask unanimous consent that Members have 5 legislative days to submit written statements for inclusions in today's hearing record. Without objection, so ordered.

I am now pleased and honored to introduce our witnesses for today's hearing. Our first witness is Mort Rosenberg, Specialist in American Public Law in the American Law Division of the Congressional Research Service. In all matters dealing with administrative law, Mort has been the Judiciary Committee's right hand. For more than 25 years, he has been associated with CRS. Prior to his service with that office he was Chief Counsel for the House Select Committee on Professional Sports, among other public servant positions he has held.

In addition to these endeavors, Mort has written extensively on the subject of administrative law. We are proud that he will later this month receive the American Bar Association's Mary C. Lawton Award for Outstanding Government Service. Mort obtained his undergraduate degree from New York University and his law degree from Harvard Law School. Thank you for being here with us.

Our second witness is Chris Mihm, who is the Managing Director of GAO's Strategic Issues team, which focuses on government-wide issues with the goal of promoting more results-oriented and accountable Federal Government. The strategic issues team has examined such matters as Federal agency transformation, budgetary aspects of the Nation's long-term fiscal outlook and civil service reform. Sort of the easy things, right? Government reform?

Mr. Mihm is a Fellow of the National Academy of Public Administration, and he received his undergraduate degree from Georgetown University.

Professor Jeffrey Lubbers is our third witness. A Fellow in Law and Government at American University Washington College of Law, Professor Lubbers brings a unique perspective to today's hearing with respect to ACUS. As many of you know, Professor Lubbers worked at ACUS for 20 years, including 13 years as the Conference's Research Director. A prolific writer on the subject of administrative law, Professor Lubbers obtained his undergraduate degree from Cornell University and his law degree from University of Chicago Law School.

I would also like to mention that about 3 years ago, Professor Lubbers testified before this Subcommittee at an oversight hearing regarding the administrative law and privacy ramifications in-

volved in establishing the Department of Homeland Security. As a result of this hearing, our Subcommittee spearheaded the creation of the first statutorily mandated privacy officer as part of DHS's enabling legislation.

Welcome back, Professor Lubbers. We appreciate that. That actually has worked out awfully well, we think.

Our fourth witness is Professor Jody Freeman. Professor Freeman teaches administrative law and environmental law at Harvard Law School, where she is the Director of the Environmental Law Program. Prior to joining Harvard Law School, Professor Freeman taught at UCLA for 10 years. I appreciate some good Western perspective here. Currently, she serves as Vice Chair of the ABA Administrative Law Section Subcommittee on both Dispute Resolution and Environmental Law and Natural Resources. She also chairs the AALS Executive Committee on Administrative Law.

Professor Freeman received her undergraduate degree from Stanford University and her law degree from the University of Toronto, where I have a son living now. She thereafter received her master's and doctorate of law from the Harvard Law School.

I extend to each of you my warm regards and appreciation for your willingness to participate in today's hearing. In light of the fact that your written statement is being included in the record, I request that you limit your remarks to 5 minutes. Accordingly, please feel free to summarize or highlight the salient points of your testimony.

You will note that we have a lighting system that starts with a green light. After 4 minutes, it turns to a yellow light and then 5 minutes it turns to a red light. It is my habit, interestingly it is actually captured here in my notes, to tap the gavel at 5 minutes. We would appreciate it if you would finish up your thoughts within that time frame. We don't want to cut people off in the middle of their thinking, but it works better if everybody has that rule. It is not a hard rule, just so you know recognizing 5 minutes has gone by. We are actually quite interested in what you have to say and if it goes beyond that, I don't think today anybody is doing to be very exercised.

We would appreciate that, and I if really start tapping hard then you know I am bored or Mel is nudging me or something. After you have presented your remarks, Subcommittee Members, in the order they arrive, will be permitted to ask questions of the witnesses subject to the 5-minute limit and possibly subject to more than one round.

Pursuant to the direction of the Chairman of the Judiciary Committee, I ask that the witnesses please stand and raise your right hand to take the oath.

[Witnesses sworn.]

Thank you. You may be seated. The record should reflect that the witnesses answered in the affirmative.

And Mr. Rosenberg, we would be pleased if you proceed with your testimony.

**TESTIMONY OF MORTON ROSENBERG, ESQUIRE, SPECIALIST
IN AMERICAN PUBLIC LAW, AMERICAN LAW DIVISION OF
THE CONGRESSIONAL RESEARCH SERVICE, LIBRARY OF
CONGRESS**

Mr. ROSENBERG. Thank you, Mr. Chairman. Mr. Chairman, Mr. Watt, I am very pleased to be here today. I have enjoyed for many, many years working with your Subcommittee and Raymond Smietanka and Susan Jensen and with other parts of your full Committee. I am a wonk in administrative law. I get off on these kind of things and I have for over 30 years in CRS.

You have asked me here today to discuss and describe the background, development and goals of your Committee's Administrative Law, Process and Procedure Project, CRS's role in that project, what we've done so far, and what we hope to accomplish in the future.

In my prepared remarks, I have detailed the genesis of your project, from the coincidence of the briefing that T.J. Halstead, one of the CRS team, and I gave a full Committee staff briefing on emerging issues in law and ad process and your first hearing in the attempt to revive ACUS with Justices Scalia and Thomas [sic].

My sense at that time was that there was a close nexus between the demise of ACUS in 1995 and the growing number of seemingly insoluble process and practice issues over the last decade, a sense that I tried to convey to the Committee. I was perhaps influenced by an unknowing dependence upon ACUS. I do not exaggerate when I say that I have always had within arm's reach in my 33 years at CRS a full and, until 1995, complete growing set of ACUS reports and recommendations, which were often my first resource in responding to clients such as your Committee.

I was fortunate in the 80's and 90's, when I was deeply involved in issues involving Executive Order 12291, presidential review of rulemaking, and some of the first major efforts at regulatory reform that were going on in those days, and I was fortunate to call upon for assistance and occasionally work with Jeff Lubbers when he was Research Director at ACUS. In any event, I was excited—and I am excited—at the prospect of working with your Subcommittee, with the CRS team that includes T.J. Halstead of the American Law Division and Curtis Copeland, of our Government and Finance Division, in which to assist in the two-track effort that you have started. That is, by providing it with background materials and information to inform the bipartisan effort to reauthorize ACUS and identifying the issues that might be the subject of either further study by a revived ACUS and/or legislative action by the Committee during the 109th Congress.

As you mentioned, success was achieved with regard to the first effort with the enactment of the Federal Regulatory Improvement Act of 2004 in October of 2004. But as of this date, funding legislation has not been passed.

The Subcommittee, however, anticipated the possibility of an extended delay in the operational startup of ACUS after passage of the reauthorization legislation and directed its staff to consider, with the assistance of the CRS team, the options that would be available to it to accumulate the information and the data necessary to determine whether action on a particular issue required

immediate legislative attention or was best referred to ACUS for further in-depth studies and recommendations.

And after extended discussions, such traditional approaches that have been used in the past, such as a series of informative hearings by the Committee, possible establishment of a study commission, or the creation by the Committee of a study group, were rejected in favor of seeking and utilizing the assistance of resources outside of Congress and the Committee, such as academic institutions, think tanks, CRS, the Government Accountability Office, among others, and the potentiality of utilizing forums for the airing of issues outside of Washington were deemed important.

The staff proposed and the Committee adopted a unique course of action. And I underline that what you're doing here is pretty unique. It is novel in the way it is reaching out beyond the Beltway to try to get a diversity of opinions and compile a record outside which might be more reflective of what is really going on and what real practical thoughts are out there.

What you did was pursuant to the House rule requiring Committee adoption of an oversight plan for the 109th Congress. The full Committee made a study of emergent administrative law and process issues a priority oversight agenda item for the Subcommittee. Among the benefits of so identifying the study as a Subcommittee priority was to give it the imprimatur of official legislative legitimacy and importance which might, in turn, be useful in enlisting the voluntary assistance and services of individuals and institutions throughout the Nation.

The oversight plan identified seven general areas for study: public participation in the rulemaking process, congressional review of rules, presidential review of agency rulemaking, judicial review of rulemaking, the adjudicatory process, the utility of regulatory analyses and accountability requirements, and the role of science in the regulatory process.

The CRS team was designated by the Chairman and Ranking Minority Member to coordinate this project. Its first task was to take these seven broad study areas and identify or define potential questions or issues for research. The thought was not to limit research to those matters within the combined experience and expertise of the team members, but to develop theme packages in order to sell a package or a particular issue to a law school or university graduate school, a public agency or a consortium of those institutions for systematic, in-depth studies by means of empirical studies and papers conducted and prepared by leading experts in the particular areas which might be followed by public presentations and findings of symposia that would reflect these competing views.

Hopefully, the end product of that exercise is to be a compilation of the papers and the transcripts of the various public symposia similar to the two-volume working papers of the National Commission on Reform of Federal Criminal Laws published by your Committee in 1970, which contains 59 studies covering all aspects of the then current issues in criminal law reform. Those studies actually informed Congress' subsequent successful reform efforts.

As of this date, two major empirical studies are underway, and one forum is scheduled for this room on December 5th.

One, being conducted under the direction of Professor Jody Freeman of Harvard Law School, is looking at the nature and impact of judicial review of agency rulemaking over what appears to be now a 13-year period in the 11 Federal Circuit Courts of Appeals. Professor Freeman is a fellow panelist today and will describe her plan for this very daunting and important undertaking.

The second study is being led by Professor William West of the Bush School of Government and Public Service at Texas A&M and will be looking into the influences on the initiation, design and development of new rules at 20 agencies during the period prior to the publication of notices of proposed rulemaking for public comment in the Federal Register. Professor West will be assisted by eight graduate students, and the study is in part funded by CRS's Capstone Program grant.
