

Impacts of Coastal Energy Development on New Jersey's Shorefront Recreational Resources and Economy

The New Jersey Department of Environmental Protection

Study Report Appendix Volume 3

- Appendix C: Facility Impact Assessment
Matrices
- Appendix D: Environmental Change Schedules
- Appendix E: Shorefront Tourism Regions
- Appendix F: Questionnaire Used for Group
Estimation
- Appendix G: Tourism Response Coefficients
- Appendix H: Shore Municipalities' Attitudes
- Appendix I: Municipal Data File

**Rogers, Golden & Halpern
Philadelphia, Pennsylvania**

APPENDICES VOLUMES

- Volume 1. Appendix A. User's Guide
- Volume 2. Appendix B. Facility Descriptions
- Volume 3. Appendix C. Facility Impact Assessment Matrices
- Appendix D. Environmental Change Schedules for Coastal Energy Facilities
- Appendix E. New Jersey Shorefront Tourism Regions
- Appendix F. Questionnaire Used for Group Estimation
- Appendix G. Tourism Response Coefficients
- Appendix H. New Jersey Shore Municipalities' Attitudes Towards Development and Preservation
- Appendix I. Municipal Data File
- Volume 4. Appendix J. Case Studies

GB 4154

1984
APPENDIX
VOL. 3

Note to Readers

Changes in the descriptors of five of the six tourism regions used in the study **Impacts of Coastal Energy Development on New Jersey's Shorefront Recreational Resources** occurred after final editing of this appendix volume and are not included in it.

Consequently, the reader is asked to substitute the descriptors found in this volume (listed below, left) for those found in the summary report (listed below, right).

<u>Former Version</u>	<u>Final Version</u>
Densely Settled Commuter Suburb	Non-Seasonal Suburban
Northern Shorefront Year-Round and Rural Community	North Shore Non-Seasonal/Rural
Northern Shorefront Seasonal Communities	North Shore Seasonal
Southern Shore Year-Round and Rural Community	South Shore Non-Seasonal/Rural
Southern Shorefront Seasonal Communities	South Shore Seasonal

The tourism region **Resort Gambling** remains unchanged.

APPENDIX E.

NEW JERSEY SHOREFRONT TOURISM REGIONS

APPENDIX E. NEW JERSEY SHOREFRONT TOURISM REGIONS

Brief Profile of the Study Area

The following is a general description of the coastal region in the study area. It is based on interviews with the county planners, on a review of related public documents (Monmouth County Planning Board, 1978; Ocean County Planning Board, 1978; Atlantic County Department of Regional Planning, 1981; and Cape May County Planning Board, 1975), and on the local press. First is a review by county, followed by a brief discussion of the probabilities of energy facilities being located in subareas.

Monmouth County

Monmouth is the most highly urbanized county in the study area with a population of over half a million people in 1981. The coastal municipalities comprise only one quarter of the land, but their density is twice as high as the county average. The county experienced a rapid rate of growth in the 1950's and 1960's with rates of 48 percent and 37 percent. The completion of the Garden State Parkway contributed to that growth by making the county more accessible to the large centers of economic activity in the north, thus transforming the area from a rural resort to a year-round commuter suburb. During the 1970's, growth decreased to a rate of only 9 percent (see Table E1).

According to the Monmouth County Planning Board (1978), the population is expected to reach 890,000 by the year 2000, representing a 93 percent rate of growth over a 30-year period from 1970. Most of the coastal municipalities are not expected to grow at a high rate. They are almost fully developed and have little growth potential. The few open areas are still in Middletown and Wall Townships. Some of these areas are protected as parks; the remaining lands are zoned for low-density residential use.

Many of the largest towns included in the study area, such as Long Branch, Asbury Park and Ocean Grove, were thriving summer resorts before the turn of the century. Although a few coastal towns, such as Red Bank and Belmar, still have healthy central business districts, several others including Asbury Park and Long Branch have declined in recent years, and have a high concentration of minorities and welfare recipients. On the other hand, there are still some pockets of affluence such as the exclusive suburbs of Deal and Spring Lake Heights. Overall, the average per capita income in the county was

TABLE E1

Resident Population in Study Area

	COUNTY				STUDY AREA				
	POPULATION		Population Change %	Area Sq. Miles	Density Pop/Sq. Mile	POPULATION		Area Sq. Miles	Density Pop/Sq. Mile
	1970	1980				1980	1980		
Monmouth	461,849	503,173	8.9	472	1,066	254,430	116	2,193	
Ocean	208,470	346,038	66.0	637	543	258,259	388	665	
Atlantic	175,043	194,119	10.9	567	342	148,708	275	540	
Cape May	59,554	82,266	38.1	263	312	82,266	263	312	

\$9,674 in 1979, the highest of all the counties in the study area (NJ Dept. of Labor & Industry, 1981).

Over the years, the area has lost a great deal of its original tourist appeal due to high urbanization and declining ocean water quality. The racial disturbances in the 1960's in Asbury Park also contributed to its detraction. Nevertheless, the summer population increases by about 100,000-150,000, according to Planning Board estimates.

A few new energy facilities have occasionally been discussed, such as a coal or oil power plant for Union Beach (out of the study area on Raritan Bay), a deepwater port 15 miles off Long Branch--recommended by the Army Corps of Engineers (Monmouth County Planning Board, 1975), as well as pipelines considered for Asbury Park and Sea Girt. Realistically, according to county planners, any new energy facilities in the county will have to be built inland, and no major impacts are anticipated on the coastal areas.

Ocean County

Ocean County is the largest coastal county. It covers more than 50 miles of oceanfront. Its population doubled in the 1960's and increased by 66 percent in the 1970's, which represents the fastest growth rate in the state. Growth is expected to continue, but at a slower pace. Population projections prepared for the 208 Water Quality Plan (1978) range between a 646,000 high to a 560,400 low, according to varying assumptions regarding net migration.

It is anticipated that a population increase will occur along the coastal areas, following the conversion of present seasonal dwellings to year-round dwellings. The bay corridor between the Garden State Parkway and the bay waters will continue to be the main growth area through the 1980's. The county is characterized by two unique forms of housing--lagoon developments and retirement communities. Another rising phenomenon is the growth of the number of marinas on the shoreline at Barnegat Bay. This represents quite a transformation of what was once one of the poorest counties in the state in terms of personal income.

The county is comprised of two regions that are very different in terms of geographic features and socio-economic characteristics: the seasonal barrier islands and the year-round mainland area. The ratio of seasonal to permanent population varies

from 10:1 on coastal beach communities to 2:1 on bay communities (Ocean County Planning Board, 1978). Based on the above ratio, the total summer population has been estimated at approximately 600,000 persons. According to a recent poll of New Jersey residents by Eagleton (1979), Ocean County attracts about half of all Jerseyans who vacation at the shore.

The county is relatively active in energy developments. JCP&L operates a nuclear power plant in Lacey Township at Oyster Creek, and had started construction for an additional nuclear facility at the adjacent location of Forked River in 1978. A year later, the company ran into strong opposition from nearby municipal authorities for aesthetic and environmental reasons. The plant's cooling tower, a 550 foot structure (35 feet higher than the Washington Monument), was going to be the tallest structure in New Jersey, visible over a 20-mile radius. In addition, clouds of saltwater vapor could be emitted at a rate of 282 pounds of salt per hour which would land on a one acre lot near the tower. The Ocean County Freeholders came out against the construction for environmental reasons. Finally, the parent company of the plant, GPU, which also operates the TMI plant, decided to suspend construction because of financial constraints imposed by the crippling of the TMI plant in 1979 (Ocean Times Observer, 1/4/79).

The Atlantic City Electric Company operates a gas separation plant in Stafford Township. A Canadian firm proposed an underground natural gas storage facility, also in Stafford Township, but the proposal was met with strong local opposition. The concern was that it might contaminate groundwater. Another proposal involved a support base in Pt. Pleasant Beach. According to the Ocean County Planning Board (1978), the county has opposed all OCS development which would conflict with natural preservation goals, and has opposed oil lease sales in the Mid-Atlantic region (Ocean County Planning Board, 1978).

Atlantic County

The County is dominated by Atlantic City which is by far the largest (1981 population exceeded 40,000) and best-known city on the New Jersey shore. With the legalization of casino gambling, it has regained its national reputation.

The history of Atlantic City provides a classic example of a tourist city transformed through cycles of development. It was primarily changes in transport

technology that contributed to the growth, decline and shifts in clientele, and shaped the physical development of the city. During the period that followed the Second World War, the city experienced an economic decline similar to that of many other central cities, that resulted in obsolete physical structures with a poor, aged and minority population. Between 1949 and 1969 the city lost nearly 20 percent of its total hotel room stock (Stansfield, 1978). In 1976, the legalization of casino gambling opened new promising horizons for the city's economic revitalization. By 1982, Atlantic City already had nine casinos—surpassing projections by Gladstone Associates (1977) and was attracting 21 million visitors (Star Ledger, 12/10/82). Most of the visitors do not stay overnight and the beneficial effects of reduced unemployment and improved income levels have not yet materialized.

The Atlantic County Plan (1981) projects continuous casino growth to 20 by the year 2000, with an average employment of 3,400 per casino, leading to a population growth of 356,559 for the county. This represents a 100 percent increase over a 30-year-period. The plan recognizes that there are other factors to be considered, such as variations in the assumed multiplier effects, growth of other economic sectors, state policies or casino regulations, pinelands regulations, and water quality planning that may have a negative effect on population growth. The possible scenario of legalized casino gambling in neighboring states should likewise not be ignored. There is a growing consensus that Atlantic City needs to diversify and balance development to attract visitors who will stay longer and leave more money.

The Gladstone Associates report (1977) estimated that on-shore facilities for off-shore drilling will be limited. It was anticipated that the maximum impact will be a modest support service facility providing an estimated 400 jobs by the year 1990. Because of environmental constraints in the Absecon inlet, as well as a transportation network now in place, it was anticipated that other locations in New Jersey will receive the dominant share of impact.

Cape May County

Cape May is the smallest county in the study area in terms of population size and land area. Ninety percent of the county is comprised of year-round, rural, mainland communities. Ten percent of the land is on island communities that house 50 percent of the county's permanent population and account for two-thirds to three-fourths of all

developed land. Resort land use accounts for at least 60 percent of all developed land as well as ratables in the county (Cape May County Planning Board, 1975).

The Cape May economy is highly seasonal, based almost totally on the recreation tourism industry. Ninety percent of the land value in the county is directly or indirectly invested in the resort economy. The tourist business directly produced \$300 million in 1974. Four and one-half million tourists visited the county that same year. Many are out-of-state visitors, staying in seasonal homes and camping sites.

Ocean City captures the largest number of summer visitors--118,757 according to Planning Board estimates, followed by Wildwood. Cape May City, one of the first and finest resorts to develop a national reputation in the study area, is still capitalizing on its historic architectural townscape.

Population projections prepared by the Planning Board show 109,170 permanent residents by the year 1990, representing an 83 percent increase since 1970 and 33 percent since 1980. Summer population is expected to increase six-fold to 624,143 persons by 1990, which represents an increase of 11 percent since 1980.

There is an Atlantic City Electric power plant in Upper Township on the Great Egg Harbor which supplies power to the southern New Jersey area. A small capacity, natural gas turbine energy power plant is located, for emergency purposes, in Middle Township. There is no available land on the oceanfront for energy developments, but there are some possible sites for light support bases in the backbay industrial areas.

Summary

The 120-mile long coastal zone is a very intensive, differentiated, and dynamic environment. It includes ecologically sensitive areas such as dunes, wetlands, and pinelands. The tastes of a wide variety of tourists can be satisfied by the commercialism of Ocean City, the excitement of cosmopolitan casino gambling in Atlantic City, the quiet, highly exclusive suburb of Deal, or the historic charm of Cape May.

At the same time, the coastal areas offer opportunities for offshore oil drilling and siting of nuclear power plants. The region is undergoing dramatic shifts from seasonal homes to permanent residential developments in the north (Cape May County Planning

Board 1975), marinas to condominium developments in the south, and old, unprofitable, or vacant hotels to affluent casino developments.

One common interest that the 87 municipalities share is that they have begun to recognize that the protection and preservation of the coastal area environment is important for their future development, and they will oppose all energy development which will conflict with that goal. In addition, there are state-imposed regulations and guidelines that constrain development. Since 1973, the state has been responsible for coastal zone management and planning pursuant to the federal Coastal Zone Management Act. While the Coastal Area Facilities Review Act (CAFRA) does not prohibit development, it does provide a mechanism to restrict development in ecologically sensitive areas.

The amount of vacant land suitable for development throughout the coastal areas is very limited; demand, therefore, is great. Three types of development pressures have been identified:

1. Permanent residential/commercial development on the northern shore to a limited extent, since the area is already highly urbanized;
2. Seasonal residential development and commercial/tourist facilities on the southern shore
3. Energy facility development for suitable areas

Carefully planned tourism development can be compatible with natural preservation goals. Although energy development may seem to be in conflict with the other urban activities and the natural environment, there are circumstances where, under proper controls and in appropriate locations, such development may occur with minimum impacts. Using the information available, the following typology of regions regarding the suitability of energy development in each of the area subregions can be determined:

1. Shorefront seasonal communities: Barrier Islands. They are overdeveloped with a limited amount of available land. The environment is very fragile and in need of protection. Municipal attitudes towards industrial development are very negative. There is virtually no chance of an energy facility being located there.

2. Densely settled, year-round communities. For the purposes of this analysis they will be subdivided into two subcategories:
 - (a) Affluent, well-preserved suburbs. Attitudes towards preservation in these areas are very strong and very much against any kind of development. There is, again, virtually no chance of an energy facility locating there.
 - (b) Older deteriorating urban centers. They are in financial strain, eager to seek any kind of development to revitalize their downtown and bring ratables. They prefer to attract residential/commercial development, but have occasionally considered the idea of accepting energy facilities. However, because of their high density, limited land availability, and environmental constraints, their probability as potential sites should be considered as low.
3. Rural mainland year-round communities. Those areas, facing the backbay waters, have much more available land for development and currently have light industrial uses. Many municipalities are interested in considering energy development options. Although development is subject to approval by state and regional authorities, it is likely that in these locations limited energy development will be accepted and will probably cause minor impacts on the environment and tourists.

Definition of Tourism Regions for Shorefront Municipalities

Definitions of tourism regions have been developed by taking into consideration ecological systems, land forms, tourism image regions promoted by the state, commercial and industrial development, and a series of housing and population factors provided by the 1980 Census. This information has been incorporated into the New Jersey Municipality Data Base. The process has been iterative, with adjustment of variables and thresholds leading to consideration of new sub-areas, and this leading, in turn, to readjustment of variables and thresholds. Present threshold levels tend to divide values into bimodal differences and produce readily understood municipality types.

A series of concepts describing municipality characteristics evolved from the investigation. Population density is a readily derived statistic which describes an aspect of the context for tourist response. Population density has been defined for the analysis as the population per acre of land for the entire municipality. This uses population figures reported by the 1980 Census. Another index is the equalized assessed value of non-commercial and non-industrial real property per acre of land for the entire municipality. This intensity of residential property value is a function of both the quality and density of dwelling units. Assessed value is the proportional value of property assessed for real property taxation. This value is determined by the local assessor whose jurisdiction extends over a municipal area. Equalized assessed value is a value which is comparable state-wide. It is derived from the assessed value and the equalization ratio. The equalization ratio is the ratio of assessed value to true (market) value of real property. These values are published in the Annual Report of the Division of Local Government Services (1980). The value of a typical home is used because it can be related to land values and development levels. Home value is the median for market values of an owner-occupied home, as reported by homeowners to the 1980 Census.

Rural areas have been defined for the analysis as municipalities in which 1) population density is less than two persons per acre, 2) intensity of assessed residential property value is less than \$50,000 per acre, and 3) the median value of owner-occupied homes is less than \$66,000. This definition of rural municipalities contains both population density and development indices. In order to be classified as rural, a municipality must meet all three thresholds. Except for Wall Township, which is

enclosed in the densely settled commuter suburb, all rural communities are classified under tourism regions containing year-round and rural communities.

A central concept in the delineation of tourism regions was the seasonal community. Seasonal communities have been defined as non-rural municipalities where over 30 percent of dwelling units are seasonally used. Seasonal homes have been defined using a series of categories reported in the 1980 Census of Housing. Seasonal homes include year-round housing held for occasional use and held for rent, seasonal and migratory housing, and excessive proportions of vacant-for-rent housing.

Tourism regions refine the Coastal Tourism Response Model by differentiating contexts for tourist response to environmental change. As originally proposed, the model was to use three distinct regions. This limitation was thought to be important in simplifying the estimation of tourist response coefficients. This estimation has been done by a group of professionals and experts in New Jersey's shorefront tourism. They estimated tourist response in a lengthy list of situations. During investigation of the tourism regions and preparation for the group estimation process, a decision was made to increase the sensitivity of the Coastal Tourism Response Model by extending the number of tourism regions. Emerging from the investigation were regions representing the gambling development of Atlantic City, the New York City commuter suburb, and highly developed seasonal home communities which largely are located on barrier islands. The remaining municipalities exhibited surprisingly coherent characteristics. Further investigation showed them either to contain year-round, developed communities or sparse population. These "remaining" municipalities are named for both of these characteristics. Tourism regions also maintain a north-south distinction. This division is useful for incorporating county-level census data and Eagleton Poll survey findings. The division also follows the tourism regions advertised by the state. The north-south itself division did not prove to be useful for distinguishing contexts for tourist response. The resulting six regions of shorefront tourism follow:

Densely Settled Commuter Suburb. 29 municipalities

The densely settled commuter suburb and Atlantic City have been outlined to enclose study area municipalities which are developing in response to a particular locational factor. Currently, Atlantic City is responding to legalization of gambling.

The northern portion of the study area experiences the locational advantage of employment opportunity in New York City. The densely settled commuter suburb contains shorefront (study area) municipalities within the mass-transit commuting ring of New York City. The southernmost edge of this tourism region (length of the commuting radius is determined by municipality characteristics reflecting the commuting suburb pattern. The densely settled commuter suburb contains municipalities which are year-round (non-seasonal home use) and developed (non-rural population density) with access to mass transit commuter lines and within automotive commuting distance of New York City. The tourism region is designated as a contiguous group of study area municipalities, and all but one of the enclosed municipalities meets the factor limits used below in the definition.

The densely settled commuter suburb was proposed as a tourism region in comments on previous drafts of study sub-areas. In response to these comments, the concept was examined through population density, proportion of dwelling units used as cottages or seasonal homes, and residential land development as indicated by both the homeowner's estimate of the value of his home and the ratio of equalized assessed value of residential property to size of the municipality in acres. Also considered were forms of commuter transportation to New York City.

Factor	Factor Limit	Municipality Average
Portion of dwelling units seasonal	< 30%	11.5%
Population density per acre	> 2 persons	6.6 persons
Intensity of residential land value per acre	> \$50,000	\$125,000
Median home value	> \$66,000	\$67,700

The extent of the contiguous are designated within this Tourism Region is described in the table, Listing by Municipality of Tourism Regions, in the back of this section and the Tourism Region map in Chapter 3.3.

Northern Shore Year-round and Rural Communities. 15 municipalities

Municipalities classified as year-round or rural are separated from shorefront seasonal municipalities by a series of factors which relate to tourism development. The either-or test for inclusion is represented in the factor description. An area must have less than 30 percent of all dwelling units in seasonal homes or must meet all of the three factor limits which are used in the rural definition. As a result of the overall definition process, the year-round and rural tourism region includes 1) municipalities which are not Atlantic City and not enclosed in the commuter suburb and not settled with a high proportion of seasonal homes and 2) municipalities which have a high proportion of seasonal homes but are sparsely settled. The majority of municipalities classified within this tourism region are both non-seasonal and rural.

Northern tourism regions are located above the Great Bay which separates the counties and tourism regions as advertised by the State.

Factor	Factor Limit	Municipality Average
Non-Seasonal		
Portion of dwelling units seasonal or seasonal but rural	< 30%	23%
Portion of dwelling units seasonal	> 30%	23%
Population density per acre	< 2 persons	1.8 persons
Intensity of residential land value	< \$50,000	\$30,600
Median family home value	< \$66,000	\$43,900

Northern Shorefront Seasonal Communities. 12 municipalities

Municipalities classified as seasonal both have more than 30 percent of homes used for seasonal recreation and are too densely developed to meet the rural definitions. The municipalities which are not included because they are rural are below all three of the thresholds for population density, intensity of residential land value, and home value.

Factor	Factor Limit	Municipality Average
Portion of dwelling units seasonal and Non-Rural (one or more of the following)	> 30%	63%
Population density per acre	> 2 persons	3.3 persons
Intensity of residential land value	> \$50,000	\$255,600
Median family home value	> \$66,000	\$79,200

Resort Gambling. One municipality

Factor	Factor Limit	Municipality Average
Portion of dwelling units seasonal	--	11.5%
Population density per acre	--	5.3 persons
Intensity of residential land value	--	\$95,300
Median family home value	--	\$40,600

Southern Shore Year-round and Rural Communities. 18 municipalities

Factor	Factor Limit	Municipality Average
Non-Seasonal		
Portion of dwelling units seasonal or Seasonal but Rural (all of following)	< 30%	12.9%
Portion of dwelling units seasonal	> 30%	12.9%
Population density per acre	< 2 persons	2.1 persons
Intensity of residential land value	< \$50,000	\$63,200
Median family home value	< \$66,000	\$53,000

Southern Shorefront Seasonal Communities. 12 municipalities

Factor	Factor Limit	Municipality Average
Portion of dwelling units seasonal and Non-Rural (one or more of the following)	> 30%	62.4%
Population density per acre	> 2 persons	3.3 persons
Intensity of residential land value	> \$50,000	227,500
Median family home value	> \$66,000	\$67,600

QUESTIONNAIRE USED FOR GROUP ESTIMATION

ABOUT THE COASTAL TOURISM PROJECT

Delphi Workshop
Stockton State College
Pomona, New Jersey
November 22, 1982

Shoreline tourism is one of New Jersey's major industries, as in other strong coastal states. Yet the shoreline is vital to New Jersey's ecology as well, and the waterfront environment is somewhat fragile. Furthermore, many economically important enterprises other than tourism must also rely on the available coastal land. Facilities related to energy development comprise some of these.

Because changes in the coastal environment affect so many facets of our society, its economy, and the environment, careful planning about coastal impacts has become a priority for federal, state, and local governments during the past ten years. Your participation in this workshop today is part of one of the nation's first efforts to link **environmental changes**--be they temporary or permanent--caused by energy facility development, to changes in tourist response, and hence to **economic impacts** on the state's travel industry. The people in this room today have considerable professional and business experience in their individual fields; however, each participant is like the others in representing a knowledge of and concern for events occurring on New Jersey's coast.

What This Workshop Will Accomplish

An agenda is included with this package. The workshop may involve a long day for all of us: it involves completing a questionnaire in the morning, breaking for lunch, and returning for an open group discussion of your experience with the questions. During the discussion, the group's estimates will be tallied and the totals for each question will be presented and discussed. No individual's answers will be made public. If you are unsure or uncomfortable with some of your answers, discussion may bring out information from people who are more knowledgeable about those questions. Finally, the questionnaire will be repeated, and you can reconsider your estimates based on the group tally and the discussion results.

We have asked you to meet and to help us consider tourists' responses to a variety of situations because we have no better way of making an estimate. The information on tourist response that we would need to estimate related economic losses has never before been researched in any American coastal area. Current studies on tourists' preferences provide a relative scale of likes and dislikes, but they do not suggest how important these preferences are in travel plans, or how preferences influence travel expenditures. To survey tourist opinion in New Jersey would be very costly, and previous experience indicates that the resulting estimates might be less accurate than estimates based upon this approach, which uses the experience of professionals and a period of discussion. No one expects 95% accuracy. However, the sum of experience represented in this group and the well-researched economic relationships that we will combine in a computer model with your

responses will produce valuable information in an area that was previously open only to uninformed speculation.

How to Answer the Questionnaire

You will have approximately one hour to fill in about 90 blanks. The questions are arranged in groups. Each question group begins with an explanation of a situation (related to energy facility construction and operation) that may cause either **temporary** or **permanent** environmental changes. We have described these environmental changes in terms of their effects on travelers and their relation to the environmental impact categories used by the New Jersey Department of Environmental Protection. These are the categories:

- o Loss of access to a recreational resource,
- o Loss in quality or degree of recreational opportunity,
- o Lowering of visual quality (both major and minor visual intrusions),
- o Lowering of other aesthetic qualities, and
- o Introduction of a hazard to public health, safety, or the environment.

The situation posed in the questions will also include a description of an **area** in which the case study development might occur. This description of the municipality provides a context for answering the questions. Please keep in mind that these examples are only theoretical; they represent a calculated sample of subareas to be investigated in the study, but none of the municipalities discussed are now actively under consideration for these types of development, to our knowledge.

Finally, the situation description includes a profile of the **tourists** affected by the environmental change. Visitor groups are defined in terms of the **type of accommodations** they use:

- o Overnight visitors staying in seasonal housing (owned, rented, or belonging to friends or relatives),
- o Overnight visitors staying at hotels, motels or inns, and
- o People taking day trips.

Their **principal activity** at the shore is also presented: for example, the main purpose of the visit may be to enjoy bay-related outdoor recreation such as fishing or birdwatching, to visit friends, or to take part in other activities.

All these aspects of the situation interact to determine the tourist's response to environmental change. For example, a family on a day-trip to the beach for swimming would be more likely to divert its recreational activities and expenditures to another area if the beach was closed or if there was a sudden increase in turbidity than a family visiting for entertainment

activities. And a family staying at a hotel might be more likely to change accommodations than a family that was renting a seasonal home.

The **questions** concern the number of visitors in each situation who would respond to environmental changes in one of the following ways:

- o Change their location and/or activity, but retain their accommodations,
- o Change location, activity, and accommodations that year, but stay in New Jersey and return to the original location in the following year,
- o Change location, activity, and accommodations permanently within New Jersey, or
- o Not return to the New Jersey shore.

There is a group of questions pertaining to each situation. You will be asked to fill in the blanks with percentages, based on your reading of the situation and your knowledge of the New Jersey shore. Some of the answers may be more difficult for you than others, but please try your best to answer each question. Other answers may seem obvious; however, they are required to produce a comprehensive model.

You will not be asked **how many** visitors will be diverted, only **what percentage**. An answer of "50," for example, indicates that half of the group would respond to the situation in a given way. There may be 10 visitors of this type, or 10,000, and your answer indicates half of the group in either case.

In estimating the percentage of visitor groups diverted, assume that the environmental change is the only change experienced. The loss of visitors might actually be less than your estimate, because local enterprises involved in tourism could take measures such as increasing advertising or reducing prices in order to keep some visitors in the area and to attract other visitors who are less sensitive to the environmental impact. The economic loss in terms of advertising costs and other measures might work out to either less or more than the dollar loss associated with diverted tourists, or they could come out even. For your estimates, however, these other factors do not matter because the model in which your answers will be used will provide a set of equations to account for this. Although any model simplifies the event, this model will consider both consumer preferences and market response.

The first series of questions is posed in more detail than the later ones to help you understand the approach. At several later points, background information is presented to provide you with available knowledge on the municipality, the tourist group, and the response of tourists to environmental factors.

Thank you for participating.

COASTAL TOURISM RESPONSE QUESTIONNAIRE

BARNEGAT TOWNSHIP

Consider the Context of Barnegat Township

Barnegat Township is a predominately rural municipality located in Ocean County. The township's eastern boundary is 6 miles of the western shore of Barnegat Bay. The developed areas of the township consist primarily of single family residential and commercial structures which are clustered around exit 69 of the Garden State Parkway, and U.S. Route 9. Virtually the entire township lies within the Pinelands Protection Area, while the westernmost section falls within the Pinelands Preservation Area.

The northern half of the township's bay shore is developed, containing a waterfront residential development and a cluster of marinas and other recreational boating support establishments. The southern half of the bayshore is largely undeveloped, consisting primarily of wetlands lying within the Barnegat National Wildlife Refuge.

Barnegat Township is sparsely settled, with population density (four persons in ten acres) well below that of Ocean County (eight in ten) or of the barrier island municipalities. It is experiencing rapid growth, with increase in housing (350 percent between 1970 and 1980) well above the County increase (almost 60 percent). Almost all of these new housing units were single family structures. In 1980, estimates of their home's value by homeowners who are year-round residents had a median value of \$43,000. The Township has proportionally fewer elderly (10 percent over 65 years) than the County as a whole (21 percent).

Barnegat Township's tourist development is largely residential. The estimated summer population is almost twice the all-year population. Ten percent of homes are seasonal homes, compared to barrier island municipalities in Ocean County which typically have more than 60 percent of homes held for seasonal use. The Township's share of restaurant receipts is low, proportionally less than their share of county population. Marinas in the Township contain over 450 boat slips, with a typical seasonal rent of \$500.

Consider the Visitor Group Which is Primarily Concerned with Bay-related Outdoor Recreation and Stays in a Seasonal Home

A typical group could be a family with three children. They have rented this house for the second time and will be staying two weeks. They traveled from an area near Philadelphia to the shore in their own car.

Background on the Tourist

Tourists stay in seasonal homes, in hotels-motels-inns, and in the homes of friends and relatives. Tourists also visit the shorefront municipalities as day-trippers. The first series of questions concerns tourists in seasonal homes.

The term seasonal home refers to the shore cottage or summer home. As used here, the term seasonal home also includes the winterized or year-round house which is held for occasional use or held for seasonal rent. Of those New Jersey residents vacationing at the shore in a cottage or seasonal home, about 70 percent are renting the

home. Fifteen percent own their seasonal home, and another 15 percent stay in seasonal homes owned or rented by friends.

Boating or sailing is a recreational activity enjoyed daily by about one in seven of New Jersey residents who vacation at the shore. By comparison, almost four of five vacationers went to the beach or went swimming daily. For all shore visitors staying in seasonal homes, about 20 percent can be estimated to be primarily attracted by bay-water-inland outdoor recreation, compared to 52 percent for shorefront recreation. Others are attracted by entertainment-gambling and by visits to friends and relatives. The first series of questions concerns tourists whose principal recreational activity is boating or sailing. Before each set of questions, the type of tourist addressed in the questions will be stated as a "visitor group" defined by accommodations and principal recreational activity.

Background on Tourist Response

Most travelers take regular vacations, returning to the municipality which they visited previously (almost 90 percent of visitor groups staying in seasonal homes are returning to the area). The Eagleton Poll survey of overnite visitors to New Jersey determined that the best publicity for a tourist attraction is other people. More overnite travelers used friends and acquaintances for their travel information than any other source.

The shore environment attracts most of the tourists in the shorefront municipalities, but current information on visitor's likes does not provide direct information on their response to change. Importance of the natural resource in tourism has been studied in surveys conducted by the Eagleton Poll. When asked to name the one or two "things you liked most about your trip," 67 percent of visitors accommodated in a seasonal home noted natural environment, 54 percent noted ambiance, and the next highest response was the 10 percent who noted night-life. For a similar survey of New Jersey residents who vacation at the shore, 39 percent noted physical and natural features as the thing they liked best about their last vacation to the shore, 23 percent noted attitude and ambiance as the first response, and 23 percent gave specific activities as the first response.

QUESTION GROUP A

Consider the Environmental Change of Increased Turbidity in Back Bay Waters

Dredging activities result in increased turbidity in back bay waters. Bottom is not visible beyond a depth of two feet and clumps of water plants are floating on the water's surface and along the adjacent shorefront. This construction activity lasts the duration of the summer season and is completed before the following summer.

Questions

The categories for question group A are restated as follows:

Context: Barnegat Township

Visitor's accommodation: Seasonal home

Visitor's principal activity: Bay-related outdoor recreation

Environmental change: Increased turbidity in back bay waters.

Period: Duration of one tourist season.

- 1) Out of 100 representative visitor groups, how many would leave (or not even come to) the municipality during their vacation in response to this environmental change?

Answer A1 _____

- 2) Out of 100 representative visitor groups, how many would leave the municipality and go to another shore area for their vacation?

Answer A2 _____

- 3) Out of 100 representative visitor groups how many would leave the New Jersey shore completely, possibly going to an alternative vacation activity?

Answer A3 _____

(The number diverted to another shore area in A2 plus the number diverted away from the shore in A3 should be equal to the total diverted in A1. The following question groups will ask only the question addressing total percentage of visitor group diverted as seen in A1 and the percentage diverted along the shore, as in A2).

- 4) Out of 100 representative groups scheduled to vacation at the shore in the first year, how many will be diverted from the municipality the following year?

Answer A4: _____

QUESTION GROUP B

Loss of Access to Recreational Resource

Using the same municipality and visitor group, consider the loss of access to recreational resources due to the use of land for an energy facility. The change is the permanent loss of 400 acres of land bordering a back bay area, including 2000 feet of frontage in the area where the visitors are accommodated. This land is part of a larger block of undeveloped land which is used for hunting, hiking, and nature observation. The waterfront land consists of scattered commercial and recreational uses, and is not suitable for bathing.

Questions

Context: Barnegat Township

Visitor accommodation: Seasonal home

Visitor's principal activity: Bay-related outdoor recreation

Environmental change: Loss of access to recreational resource

Period: Permanent

What portion of the visitor groups will be diverted away from the area in the first year?

B1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

B2 _____ percent.

What portion will be diverted away from the municipality the following year?

B3 _____ percent.

Out of 100 representative groups, how many would retain their accommodations but divert enough of their recreational activities to spend at least half of their vacation expenditures (excepting cost of accommodation) outside of the municipality?

B4 _____

QUESTION GROUP C

Loss in Quality of Recreational Resource: Lowered Faunal Abundance

Consider a broad change in the abundance of water species which fishermen note as a 25 percent decrease in their flounder catch.

Questions

Context: Barnegat Township
Visitor accommodation: Seasonal home
Visitor's principal activity: Bay-related outdoor recreation
Environmental change: Lowered Faunal Abundance
Period: Permanent

What portion of the visitor groups will be diverted away from the area in the first year?

C1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

C2 _____ percent.

What portion will be diverted away from the municipality the following year?

C3 _____ percent.

QUESTION GROUP D

Lowering of Non-visual Aesthetic Quality: Increased Noise

Consider an increase in noise level due to operation of an industrial facility. At a distance of 1000 feet from the facility, the sound level is increased from that of a low-density, rural neighborhood to that of a typical urban residential neighborhood.

Questions

Context: Barnegat Township
Visitor accommodation: Seasonal home
Visitor's principal activity: Bay-related outdoor recreation
Environmental change: Increased Noise
Period: Permanent

What portion of visitor groups will be diverted away from the area in the first year?

D1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

D2 _____ percent.

What portion will be diverted away from the municipality the following year?

D3 _____ percent.

QUESTION GROUP E

Visual Intrusion

Consider the change in visual quality associated with an industrial facility located one-half mile inland and clearly visible, above a tree line, from the bay. Two structural components, a smoke stack and a cooling tower, exceed 400 feet in height.

Questions

Context: Barnegat Township
Visitor accommodation: Seasonal home
Visitor's principal activity: Bay-related outdoor recreation
Environmental change: Visual intrusion
Period: Permanent

What portion of visitor groups will be diverted away from the area in the first year?

E1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

E2 _____ percent.

What portion will be diverted away from the municipality the following year?

E3 _____ percent.

QUESTION GROUP F

Combination of Environmental Changes

Consider the visitor group response to the combined impact of three of the changes described above. An energy facility is placed in Barnegat Township along the back bay. The facility occupies 400 acres which are no longer available for recreational activities. Noise is evident in bay areas near the facility. Structural components are evident, above the tree line, for a larger portion of the bay.

Questions

Context: Barnegat Township

Visitor accommodation: Seasonal home

Visitor's principal activity: Bay-related outdoor recreation

Environmental change: Loss of access to recreational resource

Noise

Visual intrusion

Period: Permanent

What portion of visitor groups will be diverted away from the area in the first year?

F1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

F2 _____ percent.

What portion will be diverted away from the municipality the following year?

F3 _____ percent.

What portion will be diverted away to another shore area the following year.

F4 _____ percent.

QUESTION GROUP G

Consider the visitor group which is primarily concerned with bay-related and land-related outdoor recreation and on a day trip to the area.

A typical group could be a family with one or more children. They have driven from the Philadelphia area for the day. They intend to use the bay for boating and fishing. Typical recreational activities for back bay areas in New Jersey which we have included in bay-water-land related recreational activities include boating, sailing, fishing, hunting, land sports, and nature observation.

Background or Tourist Response

Over half of day visitor groups reaching Cape May and Atlantic County shore recreation areas during the summer season travel from 30 to 75 miles from their home. Between 30 and 40 percent travel greater distances. About three out of four of these groups are return visitors. At least four out of five day trippers to the area will make at least one more trip during the summer season. Most daytrippers note some aspect of ambiance as what they liked most about their trip. Other major factors noted by day travelers include natural environment and amusement (amusement not including night life).

Consider the Environmental change of Increased Turbidity in Back Bay Waters

Using the same area context and this new visitor type, consider dredging activities which result in increased turbidity in back bay waters. Bottom is not visible beyond a depth of 2', and floating substances are present on the water's surface and along the adjacent shorefront areas. This construction activity lasts the duration of the summer season and is completed before the following summer.

Questions

Context: Barnegat Township
Visitor accommodation: Day tripper
Visitor's principal activity: Bay and land related outdoor recreation
Environmental change: Increased turbidity in back bay waters.
Period: Duration of one tourist season.

What portion of visitor groups will be diverted away from the area in the first year?

G1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

G2 _____ percent.

What portion will be diverted away from the municipality the following year?

G3 _____ percent.

QUESTION GROUP H

Combination of Environmental Changes

Consider the combined impact of three changes. An energy facility is placed in Barnegat Township along the back bay. The facility occupies 400 acres which are no longer available for recreational activities. Noise is evident in bay areas near the facility. Structural components are evident, above the tree line, for a larger portion of the bay.

Questions

Context: Barnegat Township
Visitor accommodation: Day tripper
Visitor's principal activity: Bay and land-related outdoor recreation.
Environmental change: Loss of access to recreational resource
Noise
Visual intrusion

Period: Permanent

What portion of visitor groups will be diverted away from the area in the first year?

H1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

H2 _____ percent.

What portion will be diverted away from the municipality the following year?

H3 _____ percent.

MANASQUAN BOROUGH

Consider the Context of Manasquan Borough

Manasquan is a densely developed municipality located on the southern end of the headlands that comprise the oceanshore in Monmouth County. It is not located on a barrier island, but is situated on the north side of Manasquan inlet where the Manasquan River flows into the Atlantic Ocean. The Borough has over a mile of ocean frontage and almost two miles of river frontage. A boardwalk, commercial structures, and high-density residential structures have been built along the waterfront. The river shore has over 100 marina slips with a typical seasonal rent of \$550.

Manasquan Borough's level of development is suggested in high population density (six persons per acre) which is almost four times that of Monmouth County as a whole. The rate of development has been limited, with housing growing only eight percent in the period between 1970 and 1980. Most year-round families own their own home (73 percent) and estimated their home value at \$61,000 in 1980. Almost 30 percent of all housing units are used as seasonal homes. Summer season population is almost twice the year-round population.

The presence of boardwalk and its tourism-related retail establishments is shown in that Manasquan's share of total Monmouth County restaurant receipts exceeds its proportional share of total county population. Conversely, the borough's share of total county amusement receipts is less than its share of total county population. Almost fourteen percent of real property value is commercial, and very little is classified industrial.

Consider the Visitor Groups Which is Primarily Concerned with Night-Life Entertainment and Stays in a Seasonal Home.

A typical group could be a couple with one teenage child. They have rented this seasonal home several times and will be staying one week. They traveled over 40 miles in their own car to arrive at the home.

QUESTION GROUP A

Consider the Environmental Change of Pre-Emption of a Recreational Resource by Pollution

PRE-EMPTION BY POLLUTION: Malfunction of an energy facility results in a spill of 10,000 barrels of crude oil. The spill covers 2500 acres of water. The spill washes up along approximately 2 miles of beach during the early part of the summer season. The affected beach area is unusable the remainder of the season due to clean-up operations. By the beginning of the following summer season virtually all visible traces of the oil have been removed.

Questions

The categories for question group A are restated as follows:

Context: Manasquan Borough
Visitor's accommodation: Seasonal Home
Visitor's principal activity: Entertainment

Environmental change: Pre-emption of resource by Pollution
Period: Duration of one tourist season.

- 1) Out of 100 representative visitor groups, how many would leave (or not even come to) the municipality during their vacation in response to this environmental change?

Answer A1 _____

- 2) Out of 100 representative visitor groups, how many would leave the municipality and go to another shore area for their vacation?

Answer A2 _____

- 3) Out of 100 representative visitor groups how many would leave the New Jersey shore completely, possibly going to an alternative vacation activity?

Answer A3 _____

(The number diverted to another shore area in A2 plus the number diverted away from the shore in A3 should be equal to the total diverted in A1. The following question groups will ask only the question addressing total percentage of visitor group diverted as seen in A1 and the percentage diverted along the shore, as in A2).

- 4) Out of 100 representative groups scheduled to vacation at the shore in the first year, how many will be diverted from the municipality the following year?

Answer A4 _____

QUESTION GROUP B

Consider the Environmental Change of Pre-Emption of a Recreational Resource by Pollution

PRE-EMPTION BY POLLUTION: Malfunction of an energy facility results in a spill of 10,000 barrels of crude oil. The spill covers 2500 acres of water. The spill washes up along approximately 2 miles of beach during the early part of the summer season. The affected beach area is unusable the remainder of the season due to clean-up operations. By the beginning of the following summer season virtually all visible traces of the oil have been removed.

Questions

The categories for question group A are restated as follows:

Context: Manasquan Borough

Visitor's accommodation: Seasonal Home

Visitor's principal activity: Shorefront Recreation

Environmental change: Pre-emption of resource by Pollution

Period: Duration of one tourist season.

What portion of the visitor groups will be diverted away from the area in the first year?

B1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

B2 _____ percent.

What portion will be diverted away from the municipality the following year?

B3 _____ percent.

Out of 100 representative groups, how many would retain their accommodations but divert enough of their recreational activities to spend at least half of their vacation expenditures (excepting cost of accommodation) outside of the municipality?

B4 _____

Consider the Visitor Group Which Is Primarily Concerned with Shorefront Recreation and Stays in a Seasonal Home

A typical group could be a family with three children. They have rented this house for the second time and will be staying two weeks. They traveled from an area near Philadelphia to the shore in their own car.

Background on the Tourist

Swimming and sunbathing at the beach are the recreational activities is engaged in by 90% of all New Jersey residents visiting the shore who stay overnight. Similarly, approximately 80% of the overnight visitors to the shore participate in walking, shopping, and enjoying boardwalk and amusement attractions. In addition, the Eagleton Poll shows that most overnight visitors indicate the characteristics of the natural environment are what they liked most about their trips. Indications are that similar recreation activity demand patterns and perceptions are held by day visitors. The following series of questions concerns tourists whose principal recreation activities are swimming, sunbathing, visiting boardwalk or amusement attractions, and walking on the beach. Before each set of questions, the type of tourist addressed in the questions will be stated as visitor type defined by accommodations and recreational activity.

Background on Tourist Response

Most travelers take regular vacations, returning to the municipality which they visited previously (almost 90 percent of visitor groups staying in seasonal homes are returning to the area). The Eagleton Poll survey of overnite visitors to New Jersey determined that the best publicity for a tourist attraction is other people. More overnite travelers used friends and acquaintances for their travel information than any other source.

The shore environment attracts most of the tourists in the shorefront municipalities, but current information on visitor's likes does not provide direct information on their response to change. Importance of the natural resource in tourism has been studied in surveys conducted by the Eagleton Poll. When asked to name the one or two "things you liked most about your trip," 67 percent of visitors accommodated in a seasonal home noted natural environment, 54 percent noted ambiance, and the next highest response was the 10 percent who noted night-life. for a similar survey of New Jersey residents who vacation at the shore, 39 percent noted physical and natural features as the thing they liked best about their last vacation to the shore, 23 percent noted attitude and ambiance as the first response, and 23 percent gave specific activities as the first response.

QUESTION GROUP C

Aesthetics-Major Visual Intrusion on the Oceanfront

Consider the main structural components of the facility being visible over a two mile length of beach. The visible structures are slender metallic projections over 100' in height that intrude upon an existing skyline of low to medium rise (up to 4 stories) residential and resort commercial structures. The facility conducts occasional flaring and venting of gaseous wastes, and due to its continuous operation, it remains lighted during nighttime hours.

Questions

Context: Manasquan Borough

Visitor accommodation: Seasonal home

Visitor's principal activity: Shorefront Recreation

Environmental change: Major Visual Intrusion on the Oceanfront

Period: Permanent

What portion of the visitor groups will be diverted away from the area in the first year?

C1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

C2 _____ percent.

What portion will be diverted away from the municipality the following year?

C3 _____ percent.

QUESTION GROUP D

Hazardous Substances

The operation of an energy facility results in the use and storage on-site of materials whose accidental release into the adjacent surface waters could have a significant adverse impact on aquatic plant and animal species.

Questions

Context: Manasquan Borough
Visitor accommodation: Seasonal home
Visitor's principal activity: Shorefront Recreation
Environmental change: Hazardous Substances
Period: Permanent

What portion of visitor groups will be diverted away from the area in the first year?

D1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

D2 _____ percent.

What portion will be diverted away from the municipality the following year?

D3 _____ percent.

QUESTION GROUP E

Odor

The operation of an energy facility results in the intermittent release of chemical odors from a site. These odors are carried downwind to a nearby (approximately 1 mile) shorefront recreational area (i.e., a public beach with an adjacent boardwalk with amusements). Odors are perceptible along the shorefront area approximately once a week, depending upon the prevailing winds.

Questions

Context: Manasquan Borough

Visitor accommodation: Seasonal home

Visitor's principal activity: Shorefront Recreation

Environmental change: Increased odor

Period: Permanent

What portion of visitor groups will be diverted away from the area in the first year?

E1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

E2 _____ percent.

What portion will be diverted away from the municipality the following year?

E3 _____ percent.

QUESTION GROUP F

Turbidity

Dredging in an adjacent navigation channel so as to accommodate barges of deeper draft results in an increase in turbidity along an adjacent public beach located down the littoral drift from the dredging site. The dredging activities last approximately 2 months during July and August. In addition, biomass materials (i.e., wood, seaweed) stirred up by the hydraulic dredging collects along the beach. Approximately one half mile of beach is affected.

Questions

Context: Manasquan Borough
Visitor accommodation: Seasonal home
Visitor's Principal activity: Shorefront Recreation
Environmental change: Increased turbidity
Period: Temporary

What portion of visitor groups will be diverted away from the area in the first year?

F1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

F2 _____ percent.

What portion will be diverted away from the municipality the following year?

F3 _____ percent.

What portion will be diverted away to another shore area the following year.

F4 _____ percent.

QUESTION GROUP G

Consider the Visitor Group Which Is Primarily Concerned with Shorefront Recreation and on a day trip to the area.

A typical group could be a family with one or more children.

Consider the Environmental Change of Pre-Emption of a Recreational Resource by Pollution

PRE-EMPTION BY POLLUTION: Malfunction of an energy facility results in a spill of 10,000 barrels of crude oil. The spill covers 2500 acres of water. The spill washes up along approximately 2 miles of beach during the early part of the summer season. The affected beach area is unusable the remainder of the season due to clean-up operations. By the beginning of the following summer season virtually all visible traces of the oil have been removed.

Questions

The categories for question group A are restated as follows:

Context: Manasquan Borough

Visitor's accommodation: Day tripper

Visitor's principal activity: Shorefront Recreation

Environmental change: Pre-emption of resource by Pollution

Period: Duration of one tourist season.

What portion of the visitor groups will be diverted away from the area in the first year?

G1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

G2 _____ percent.

What portion will be diverted away from the municipality the following year?

G3 _____ percent.

QUESTION GROUP H

Odor

The operation of an energy facility results in the intermittent release of chemical odors from a site. These odors are carried downwind to a nearby (approximately 1 mile) shorefront recreational area (i.e., a public beach with an adjacent boardwalk with amusements). Odors are perceptible along the shorefront area approximately once a week, depending upon the prevailing winds.

Questions

Context: Manasquan Borough

Visitor accommodations: Day tripper

Visitor's principal activity: Shorefront Recreation

Environmental change: Increased odor

Period: Permanent

What portion of visitor groups will be diverted away from the area in the first year?

H1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

H2 _____ percent.

What portion will be diverted away from the municipality the following year?

H3 _____ percent.

QUESTION GROUP 1

Combination of Environmental Changes

Consider the visitor group response to combined impacts related to an energy facility on the back bay shore. The facility occupies 400 acres which are no longer available for outdoor recreation. Odor is evident in bay areas near the facility. Structural components are evident, above the tree line, for a larger portion of the bay. The public has information on the storage of hazardous chemicals at the facility.

Questions

Context: Manasquan Borough
Visitor accommodation: Day tripper
Visitor's principal activity: Shorefront Recreation
Environmental change: Combined
Period: Permanent

What portion of visitor groups will be diverted away from the area in the first year?

11 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

12 _____ percent.

What portion will be diverted away from the municipality the following year?

13 _____ percent.

Out of 100 representative groups, how many would retain their accommodations but divert enough of their recreational activities to spend at least half of their vacation expenditures (excepting cost of accommodation) outside of the municipality?

14 _____

UPPER TOWNSHIP

Consider the Context of Upper Township

Upper Township is a predominately rural municipality located in Cape May County. Consider here the portion of the Township near and along the western shore of Pecks Bay and the southern shore of Great Egg Harbor.

Upper Township has a low population density (two persons in ten acres). It is experiencing rapid growth, with increase in housing (84 percent between 1970 and 1980) well above the County increase. In 1980, estimates of their home's value by homeowners who are year-round residents had a median value of \$66,000. The Township has proportionally fewer elderly (13 percent over 65 years) than the County as a whole.

Upper Township's tourist development is largely residential. The estimated summer population is over twice the all-year population. Twenty percent of homes are seasonal homes, compared to barrier island municipalities in Cape May County which typically have more than 60 percent held for seasonal use. The Township's share of restaurant receipts is low, proportionally less than their share of county population. Marinas in the Township contain over 400 boat slips, with a typical seasonal rent of almost \$500.

Consider the Visitor Group Which is Primarily Concerned with Bay-related Outdoor Recreation and Stays in a Seasonal Home

A typical group could be a family with three children. They have rented this house for the second time and will be staying two weeks. They traveled from an area near Philadelphia to the shore in their own car.

QUESTION GROUP A

Consider the Introduction of a Public Health, Safety or Environmental Hazard: Perceived Hazard to Health

Newspapers throughout New Jersey, Philadelphia and New York contain several articles noting the storage of 20,000 gallons of highly flammable liquid at a facility within the municipality. Under normal conditions, the probability of an accident endangering public health is extremely remote.

Questions

Context: Upper Township
Visitor's accommodation: Seasonal home
Visitor's principal activity: Bay-related outdoor recreation
Environmental change: Perceived hazard to health.
Period: Permanent

What portion of visitor groups will be diverted away from the area in the first year?

At _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

A2 _____ percent.

What portion will be diverted away from the municipality the following year?

A3 _____ percent.

QUESTION GROUP B

Lowering of Non-visual Aesthetic Quality: Increased Odor

Consider an increase of odor level due to operation of an industrial facility. Intermittent release of gasses creates odors which are occasionally perceptible one or two days a week half a mile downwind of the facility. The odors are noticeable but not of sufficient intensity so as to create a public health hazard.

Questions

Context: Upper Township
Visitor accommodation: Seasonal home
Visitor's principal activity: Bay-related outdoor recreation
Environmental change: Increased odor
Period: Permanent

What portion of visitor groups will be diverted away from the area in the first year?

B1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

B2 _____ percent.

What portion will be diverted away from the municipality the following year?

B3 _____ percent.

QUESTION GROUP C

Combination of Environmental Changes

Consider the visitor group response to combined impacts related to an energy facility on the back bay shore. The facility occupies 400 acres which are no longer available for outdoor recreation. Odor is evident in bay areas near the facility. Structural components are evident, above the tree line, for a larger portion of the bay. The public has information on the storage of hazardous chemicals at the facility.

Questions

Context: Upper Township

Visitor accommodation: Seasonal home

Visitor's principal activity: Bay-related outdoor recreation

Environmental change: Combined

Period: Permanent

What portion of visitor groups will be diverted away from the area in the first year?

C1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

C2 _____ percent.

What portion will be diverted away from the municipality the following year?

C3 _____ percent.

Out of 100 representative groups, how many would retain their accommodations but divert enough of their recreational activities to spend at least half of their vacation expenditures (excepting cost of accommodation) outside of the municipality?

C4 _____

QUESTION GROUP D

Consider the Visitor Group Which is Primarily Concerned with Shorefront Recreation and Stays in a Campground.

The typical group is a family of five staying for one week. They have traveled 75 to 100 miles by car to reach the shore area. They will participate in beach activities, evening walks, and visit a boardwalk. This is their second visit at this campground.

Lowering of Non-visual Aesthetic Quality: Increased Odor

Consider an increase of odor level due to operation of an energy facility. Intermittent release of asses creates odors which are occasionally perceptible one or two days a week at a campground located half a mile downwind of the facility. The odors are noticeable but not of sufficient intensity so as to create a public health hazard.

Questions

Context: Upper Township
Visitor accommodation: Campground
Visitor's principal activity: Shorefront recreation
Environmental change: Increased odor
Period: Permanent

What portion of visitor groups will be diverted away from the area in the first year?

D1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

D2 _____ percent.

What portion will be diverted away from the municipality the following year?

D3 _____ percent.

QUESTION GROUP E

Combination of Environmental Changes

Consider the visitor group response to combined impacts related to an energy facility on the bay shore. The facility occupies 400 acres which are no longer available for outdoor recreation. Odor becomes evident for the first time in bay areas near the facility. The odor is noticeable at a campground located a half-mile from the facility. Structural components are evident, above the tree line, for a larger portion of the bay. The public has information on the storage of hazardous chemicals at the facility.

Questions:

Context: Upper Township

Visitor accommodation: Campground

Visitor's principal activity: Shorefront recreation

Environmental change: Pre-emption of open land

Increased odor

Visual intrusion

Perception of public hazard

Period: Permanent

What portion of visitor groups will be diverted away from the area in the first year?

E1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

E2 _____ percent.

What portion will be diverted away from the municipality the following year?

E3 _____ percent.

What portion will be diverted to another shore area the following year?

E4 _____ percent.

STONE HARBOR

Consider the Context of Stone Harbor

Stone Harbor is located on the southern portion of the Seven Mile Beach barrier island. It is a densely developed shorefront seasonal community. Stone Harbor has about 3 miles of ocean frontage, and the same amount of back bay frontage, and it has a land area of 1.2 square miles. The dominant land use in the town is residential, consisting of single family units occupied by permanent residents, and rental units held for seasonal use. Stone Harbor does not have a boardwalk or other amusement attractions located along its oceanfront area. The southern end of the town is undeveloped.

The high degree of development is shown by its population density of 1.5 people per acre, as compared to Cape May County's density of 0.5 people per acre. The town's population grew by 9% between 1970 and 1980, while the number of dwelling units grew by 22.1%. Slightly less than one third of this increase in the number of housing units was in single family structures.

The seasonal population of Stone Harbor is approximately 17.5 times greater than the year-round population, clearly indicating the significance of the tourism economy to the town. Similarly, only 20% of Stone Harbor's housing units are occupied by permanent residents, with the remainder reserved for seasonal use. The town contains an estimated 233 hotel and motel rooms in major accommodations, and 201 marina slips. The town's desirability as a residentially oriented resort community is shown by the high average value of owner-occupied housing (\$101,500).

Stone Harbor's proportion of total Cape May County restaurant receipts, amusement receipts and overnight accommodation receipts significantly exceeds its proportion of total county population.

Consider the Visitor Group Which Is Primarily Concerned with Shorefront Recreation and Stays in a Seasonal Home

A typical group could be a family with three children. They have rented this house for the second time and will be staying two weeks. They traveled from an area near Philadelphia to the shore in their own car.

QUESTION GROUP A

Minor Visual Intrusion on the Oceanfront

Consider the change in visual quality associated with the structural components of an energy facility which are visible along less than a mile of oceanfront. The two structural components are approximately 100' tall. They project over a skyline composed of a mix of tourism-related, low rise (< 4 stories) residential (i.e., seasonal homes, motels) and commercial (i.e., restaurants, amusements) structures.

Questions

Context: Stone Harbor
Visitor accommodation: Seasonal homes
Visitor principal activity: Shorefront Recreation
Environmental change: Visual intrusion
Period: Permanent

What portion of visitor groups will be diverted away from the area in the first year?

A1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

A2 _____ percent.

What portion of will be diverted away from the municipality the following year?

A3 _____ percent.

QUESTION GROUP B

Consider the Environmental Change of Pre-Emption of a Recreational Resource by Pollution

PRE-EMPTION BY POLLUTION: Malfunction of an energy facility results in a spill of 10,000 barrels of crude oil. The spill covers 2500 acres of water and would cover an area of approximately 2500 acres (3.9 square miles). The spill washes up along approximately 2.2 miles of beach during the early part of the summer season. The affected beach area is unusable the remainder of the season due to clean-up operations. By the beginning of the following summer season virtually all visible traces of the oil have been removed.

Questions

Context: Stone Harbor

Visitor's accommodation: Seasonal Home

Visitor's principal activity: Shorefront Recreation

Environmental change: Pre-emption of resource by Pollution

Period: Duration of one tourist season.

What portion of the visitor groups will be diverted away from the area in the first year?

B1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

B2 _____ percent.

What portion will be diverted away from the municipality the following year?

B3 _____ percent.

Out of 100 representative groups, how many would retain their accommodations but divert enough of their recreational activities to spend at least half of their vacation expenditures (excepting cost of accommodation) outside of the municipality?

B4 _____

QUESTION GROUP C

Consider the Environmental Change of Increased Turbidity in

Dredging activities result in increased turbidity in ocean waters. Bottom is not visible beyond a depth of two feet and clumps of water plants are floating on the water's surface and along the adjacent beach. This construction activity lasts the duration of the summer season and is completed before the following summer.

Questions

The categories for question group A are restated as follows:

Context: Stone Harbor

Visitor's accommodation: Seasonal home

Visitor's principal activity: Shorefront Recreation

Environmental change: Increased turbidity in Shorefront waters

Period: Duration of one tourist season.

What portion of the visitor groups will be diverted away from the area in the first year?

C1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

C2 _____ percent.

What portion will be diverted away from the municipality the following year?

C3 _____ percent.

QUESTION GROUP D

Lowering of Non-visual Aesthetic Quality: Increased Odor

Consider an increase of odor level due to operation of an energy facility. Intermittent release of gasses creates odors which are occasionally perceptible one or two days a week half a mile downwind of the facility along an oceanfront beach. The odors are noticeable but not of sufficient intensity so as to create a public health hazard.

Questions

Context: Stone Harbor
Visitor's accommodation: Seasonal Home
Visitor's principal activity: Shorefront Recreation
Environmental change: Increased odor
Period: Permanent

What portion of visitor groups will be diverted away from the area in the first year?

D1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

D2 _____ percent.

What portion will be diverted away from the municipality the following year?

D3 _____ percent.

Consider the Visitor Group Which Is Primarily Concerned with Shorefront Recreation and Stays in a Hotel or Motel

A typical group could be a couple returning to the area for the second time. They will be staying 4 days. They traveled from the heavily urbanized area of Northern New Jersey in their own car.

What portion of visitor groups will be diverted away from the area in the first year?

F1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

F2 _____ percent.

What portion will be diverted away from the municipality the following year?

F3 _____ percent.

What portion will be diverted away to another shore area the following year.

F4 _____ percent.

QUESTION GROUP G

Consider the Environmental Change of Increased Turbidity in

Dredging activities result in increased turbidity in back bay waters. Bottom is not visible beyond a depth of two feet and clumps of water plants are floating on the water's surface and along the adjacent beach. This construction activity lasts the duration of the summer season and is completed before the following summer.

Questions

The categories for question group A are restated as follows:

Context: Stone Harbor

Visitor's accommodation: Hotel/Motel/Inns

Visitor's principal activity: Shorefront Recreation

Environmental change: Increased turbidity in Shorefront waters

Period: Duration of one tourist season.

What portion of visitor groups will be diverted away from the area in the first year?

G1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

G2 _____ percent.

What portion will be diverted away from the municipality the following year?

G3 _____ percent.

QUESTION GROUP H

Lowering of Non-visual Aesthetic Quality: Increased Odor

Consider an increase of odor level due to operation of an energy facility. Intermittent release of gasses creates odors which are occasionally perceptible one or two days a week half a mile downwind of the facility along an oceanfront beach. The odors are noticeable but not of sufficient intensity so as to create a public health hazard.

Questions

Context: Stone Harbor

Visitor's accommodation: Hotel/Motel/Inns

Visitor's principal activity: Shorefront Recreation

Environmental change: Increased odor

Period: Permanent

What portion of visitor groups will be diverted away from the area in the first year?

H1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

H2 _____ percent.

What portion will be diverted away from the municipality the following year?

H3 _____ percent.

QUESTION GROUP E

Minor Visual Intrusion on the Oceanfront

Consider the change in visual quality associated with the structural components of an energy facility which are visible along less than a mile of oceanfront. The two structural components are approximately 100' tall. They project over a skyline composed of a mix of tourism-related, low rise (4 stories) residential (i.e., seasonal homes, motels) and commercial (i.e., restaurants, amusements) structures.

Questions

Context: Stone Harbor

Visitor accommodation: Hotel/Motel/Inns

Visitor principal activity: Shorefront Recreation

Environmental change: Visual intrusion

Period: Permanent

What portion of visitor groups will be diverted away from the area in the first year?

E1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

E2 _____ percent.

What portion of will be diverted away from the municipality the following year?

E3 _____ percent.

QUESTION GROUP F

Consider the Environmental Change of Pre-Emption of a Recreational Resource by Pollution

PRE-EMPTION BY POLLUTION: Malfunction of an energy facility results in a spill of 10,000 barrels of crude oil. The spill covers 2500 acres of water and would cover an area of approximately 2500 acres (3.9 square miles). The spill washes up along approximately 2.2 miles of beach during the early part of the summer season. The affected beach area is unusable the remainder of the season due to clean-up operations. By the beginning of the following summer season virtually all visible traces of the oil have been removed.

Questions

Context: Stone Harbor

Visitor's accommodation: Hotel/Motel/Inns

Visitor's principal activity: Shorefront Recreation

Environmental change: Pre-emption of resource by Pollution

Period: Duration of one tourist season.

What portion of visitor groups will be diverted away from the area in the first year?

F1 _____ percent.

What portion of the visitor groups will be diverted to another shore area the first year?

F2 _____ percent.

What portion will be diverted away from the municipality the following year?

F3 _____ percent.

What portion will be diverted away to another shore area the following year.

F4 _____ percent.

APPENDIX G

TOURISM RESPONSE COEFFICIENTS

APPENDIX G. RULES FOR ASSIGNMENT OF RESPONSE COEFFICIENTS

Values Estimated by Participants

If the response coefficient refers to a visitor group and situation presented in the questionnaire, the estimate of participants is used. The context must agree in tourism region, visitor's accommodation, visitor's principal activity, and category of environmental change. Responses are aggregated to six categories of environmental change from a series of environmental change classes. If two answers are available, an average is used. If three are available, a median is used.

Assignment by Accommodation

When the environmental change and visitor activity are identical but visitor accommodation differs, a series of rules assign a value. Accommodation influences response through the cost of changing plans. This influence is expressed as a degree of mobility. Greater mobility is experienced for day parties, campground visitors, and hotel-motel visitors. Visitors staying in seasonal homes or with friends exhibit less tendency to divert in their first year of experiencing change because they would lose a greater value by changing plans. Unknown responses can be assigned from a known response of similar mobility. To relate the two levels of mobility, the average value of six comparative response pairs (for first year response to a series of environmental change classes) was determined. The resulting ratio indicates that 14 percent of the more mobile visitors are diverted for each 10 percent of less mobile visitors in an otherwise similar situation.

Assignment by Activity

The questionnaire presents environmental changes affecting the principal activity of the tourism area in all but a few selected questions (entertainment in the densely settled commuter suburb). Principal activities of an area are determined by landform. Tourism response of visitors principally concerned with activities in other areas (e.g. bay-related recreation in a Shorefront Seasonal Community) are expected to exhibit a reduced response. For entertainment, the response is estimated at 80 percent of shorefront recreation response for percentage diverted in the first year (35/45) and 25 percent for the second year's response to an event (5/20). These were calibrated in a

situation measuring response to pre-emption of the shorefront by pollution. For the remaining activities, visiting friends and bay-water related outdoor recreation, the average of these values (50 percent) is used. Travelers concerned with secondary activities will be estimated to respond at half the rate of response of visitors concerned with the area's principal activity.

Complex Assignments

When assignment of an unestimated response value is possible through two methods, an average of the two is used. For example, the response of hotel-motel/entertainment visitors to a temporary loss of access to recreational resource due to pollution (C.6.) can be estimated as a different accommodation (total diversion first year of 35 percent times 1.4 equals 49) or as a different activity (diversion of 75 percent times 0.8 equals 60). The resulting average is 55 percent.

Due to its diffuse spatial character and lack of tie to specific land form or recreational resource, a perceived hazard to public health has an impact which is differentiated by accommodation but not by activity. Response differs with mobility, using the ratio of 1 to 1.4 for more mobile visiting groups.

For the fraction of diverted visitors lost from the shore area (1 minus the fraction diverted along the shore), unestimated values can be assigned from those determined for situations of similar tourism region, environmental change, and accommodation. Where this base is not available, assignment then will use similar tourism region, environmental change, and mobility of accommodation. Where a situation of similar mobility is not determined, assignment then will use similar tourism region and environmental change.

Second Year Tourism Response

Tourist response coefficients for the second year (next year) of the environmental change is assigned to situations not represented in the questionnaire by a set of rules which are similar to those used for first year total response. Accommodation differences are evident between the more mobile and the less mobile types of accommodation. An average of the differences evident between seven pairs of comparative values provides a ratio. For each percentage point diverted in seasonal

homes or visitors in friends homes, 1.25 percentage points are diverted in the more mobile accommodation.

Visitors principally concerned with entertainment respond with a ratio of .25 percentage points to those concerned with shorefront recreation in Manasquan, the principal activity. In other comparisons between the response of a visitor concerned with a non-principal recreational activity and the response associated with the principal activity, a ratio of .5 is used, as in the first year response. Again, this ratio is determined by averaging the values from both years for this situation.

Only four questions were allocated to the determination of the second year fraction of visitors diverted which are lost from the shore area. It was assumed that the first year fraction is representative of the second year. Comparison of first year and second year fractions for these four indicates that the answers are related in scale but show considerable variance. However, the first year fraction is an acceptable estimate for the second year.

*Visitor group response coefficient determined by meeting participants.

**Visitor group response based upon another tourism context.

***Response calculated from estimates for shorefront area and shorefront tourism activities. Response shifted to bay-water activity visitors responding to pollution event in bay through use of assignment rules for projection by differences in activity. Only visitor type 3 used directly in diverted responses.

APPENDIX H.

NEW JERSEY SHORE MUNICIPALITIES' ATTITUDES

TOWARDS DEVELOPMENT AND PRESERVATION

APPENDIX H. NEW JERSEY SHORE MUNICIPALITIES' ATTITUDES TOWARDS DEVELOPMENT AND PRESERVATION

Objectives and Methods of Data Collection

Community attitudes towards development and preservation are critical in the identification and evaluation of social impacts of potential energy facilities. Such information can also assist agencies concerned with the siting of energy facilities in choosing locations that will be least likely to generate opposition. For those reasons, attitudinal data was gathered for New Jersey shorefront municipalities as part of this study. Community attitudes were not directly assessed; instead, a member of the study team made field trips during August 1982 to the four coastal counties and interviewed professional staff on the planning boards.

During interviews, county planners were asked to rate each municipality in their county, using a five-point scale (1 being very positive, 5 being very negative, and 3 being indifferent), according to their perceptions of that municipality's attitudes towards development and preservation. Five types of attitudes were solicited. The first three were related to development: heavy industrial, including energy facilities, and manufacturing; light industrial, including fisheries, and marinas; and commercial/residential including high density residential and hotel development. The last two attitudes dealt with such preservation issues as the historic preservation of structures and old sections of towns as revealed by the municipalities' record of historic ordinances, and natural preservation, as revealed by how eager a municipality is to enact and enforce environmental laws.

In two of the counties the opinions reflected only those of one person interviewed, while in the other two the combined opinion of two or three planners was provided. Interviewed persons were given the opportunity to reconfirm their responses. Monmouth County planners expressed the desire that their ratings on individual municipalities be kept confidential. While it is expected that intracounty comparisons are valid, intercounty ratings may be more difficult to compare, since they rely on perceptions of

individuals. Table H1 presents a summary of New Jersey shore attitudes towards development and preservation by county. All the raw data are available in Tables H2-H5. Additional comments by MCD, that resulted from the interviews, are also provided.

Results

Attitudes towards Development. There is a general attitude among coastal municipalities against heavy industrial development. Seventy-two percent of all MCDs (87) were rated as very negative. Only 5 percent or 5 MCDs were rated as very positive, and only 10 MCDs were rated as positive at all. Seven out of the ten are located within Ocean County facing the bay. The other two are in Atlantic County. Monmouth County is very urbanized with limited available land for this type of development. Cape May depends too much on tourism to be willing to take the risks associated with such development.

Many more municipalities are willing to accept light industrial development. Only about 38 percent are very negative toward it, with 18 percent very much in favor. Cape May is the county with the highest number of municipalities favoring light industry. Since marinas and fisheries are included in this category, the county's tourist orientation correlates with that finding. As we go north toward Monmouth County, there are more densely settled municipalities with no space for growth.

There are overall positive attitudes towards commercial and high density residential development. Forty-six percent of all MCDs were rated as very positive. No major differences were detected among county average responses. Ocean County ranked on the top of the list, followed closely by Cape May, while Monmouth ranked last again. Table H1 presents the MCD's attitudes aggregated by county.

Attitudes Towards Preservation. There is an inverse correlation between development and preservation attitudes as illustrated in table H2. The mode for both historic and natural preservation score distribution was point 3 on the scale, signifying indifferent attitudes. The mode of attitudes towards historic preservation was 10 percentage points higher than that of the natural preservation attitudes. It is important to note that according to county planners, almost all municipalities have become more sensitive to preservation issues--with Cape May leading again, probably because of its tourist trade

dependency. The State Wetland Act of 1970 and the pinelands preservation ordinance have probably contributed to that effect. According to the Pinelands' Comprehensive Management Plan, adopted in 1980, municipalities are required to revise their master plans and zoning ordinances in accordance with the plan. The Wetlands Act restricts the types of developments allowed to locate on coastal wetlands.

TABLE H1

NJ Shore Attitudes Towards Development and Preservation by County

	(Mean Sources)				
	Cape May	Atlantic	Ocean	Monmouth	All
Development					
Heavy Industrial	2.4	3.8	3.3	3.7	3.3
Light Industrial	5.0	4.4	3.9	4.6	4.5

TABLE H2

New Jersey Shore Municipalities' Attitudes Towards Development and Preservation

Source: Edward Filipiski, Jim Smith

Municipality	Development		Preservation		Comments
	Light Industry	Heavy Industry	Historic	Natural	
<u>CAPE MAY COUNTY</u>					
Ocean City	1	5	1	1	Family resort/amusements. Dry community.
Upper Township	1	5	4	1	Older community. Coal-Fired Plant, A.C. Electric.
Dennis Township	2	5	4	1	Dry community.
Sea Isle City	2	5	1	1	Mayor interested in pipeline.
Avalon	3	5	1	3	Dune preservation. Family, quiet resort.
Middle Township	1	5	3	1	Older Community. Natural gas turbine power plant.
Stone Harbor	4	5	2	1	Family resort. No hotel developments.
N. Wildwood City	3	5	1	2	Hotels with high use by tourists.
W. Wildwood Boro	5	5	2	3	Dry community.
Wildwood City	1	5	1	2	Older 1900's. Early part of the century (i.e., 1900-1910)
Wildwood Crest Boro	3	5	1	2	Highly touristic/hotels.
Lower Township	1	5	4	1	Airport/industrial park.
West Cape May Boro	1	5	1	3	Hotels with high use by tourists.
Cape May City	3	5	1	1	Older resort, historic register.
Cape May Point	5	5	5	1	Older, exclusive. Dry community.

KEY

Scale: 1 = very positive; 3 = indifferent; 5 = very negative
 light industrial = fisheries
 heavy industrial = energy facilities
 commercial = tourist development hotel/motel
 residential = high density residential/condominiums
 historic preservation = historic preservation ordinance, appearance and design board
 natural preservation = enforcement of environmental regulations

Municipality	Development		Preservation		Comments	
	Light Industry	Heavy Industry	Historic	Natural		
<u>OCEAN COUNTY</u>						
Point Pleasant Beach	5	5	1	3	3	Boardwalk/amusement area.
Bay Head	5	5	5	1	1	Exclusive, older hotels, family resort.
Mantoloking	5	5	5	1	1	Exclusive, no tourist facilities.
Lavallette	5	5	2	2	2	Family resort, revised ordinance to reduce condominium development.
Seaside Heights	5	5	1	3	4	Very popular resort, tourists/day-trippers. Pro-commercial, recreation development.
Seaside Park	5	5	2	1	1	Family resort, older community.
Barnegat Light	3	5	4	1	1	Commercial fishing facilities, oriented towards historic enviro. preservation.
Harvey Cedars	5	5	5	3	1	Exclusive, heavily damaged in 1962 storm.
Island Heights	5	5	2	1	1	Mainland, Victorian-era houses. Residential/family resort.
Surf City	5	5	2	3	2	Family resort.
Ship Bottom	5	5	1	3	3	Touristic, concentrated, commercial.
Long Beach	5	5	3	1	1	Segmented community, difficult to characterize.
Beach Haven	5	5	2/3	1	2	Older community which has maintained identity. Family resort.
Point Pleasant Boro	2	5	2	2	3	Developed year-round community.
Brick Township	2	1	1	4	4	Developed year-round community.
Dover Township	1	2	1	1	1	Developed year-round community, largest population, county seat.
South Toms River	2	4	1	3	2	Developed year-round community.
Pine Beach	4	5	1	2	1	Residential community-some seasonal.
Beachwood	3	4	1	2	3	Developed year-round community.
Ocean Gate	3	5	1	2	3	Year-round/seasonal residential.

TABLE H3 (Cont'd.)

OCEAN COUNTY						
Berkeley	1	2	1	3	2	Beach area, commercial, rental development.
Lacey	1	1	1	2	3	JCP&L Oyster Creek nuclear facility, Pinelands Plan limits development.
Ocean Township	1	3	1	2	1	Residential along bayfront.
Barnegat Township	2	3	4	1	2	Historic old bayfront town, several large developments.
Stafford	1	2	1	2	3	Residential emerging as regional shopping center. A.C. Electric, gas separation plant.
Eagleswood	1	2	4	1	3	Rural, low population, West Creek historic residential area.
Little Egg Harbor	1	1	1	3	4	Growing residential area.
Tuckerton	2	5	4	1	3	Historic community, largely developed.
<u>BURLINGTON COUNTY</u>						
Bass River
