

towers with height determined by specific meteorological and geographic characteristics. The WTGs are variable speed, up-wind, three-fiberglass-bladed machines with a rotor diameter of 108 feet (33 meters). The WTGs will be spaced approximately 162 to 216 feet (49 to 66 meters) apart with approximately 1,080 to 1,620 feet (329 to 494 meters) between each row.

The electrical utility interconnection is with the PacifiCorp 230 kV system at the Miner's substation at Hanna, Wyoming. A wood pole 230 kV line would be erected from the project site northwest, approximately 29 miles (40 Km), to the Miner's substation.

The DEIS analyzes impacts from the proposed action, a 300 MW alternative (Alternative A), and the No Action Alternative. Alternative project locations, reduced project area, construction phasing alternatives, and alternative generating sources were considered but not analyzed in detail.

The DEIS identifies potentially significant impacts to:

1. Big game crucial habitat and movement patterns
2. Avian mortality from collisions with turbine blades
3. Loss of sage grouse habitat
4. Disturbance of native American religious or culturally significant sites
5. Modification of basic elements of visual resources in the project area
