[Docket Nos. 50-266 and 50-301]

### Wisconsin Electric Power Co., (Point Beach Nuclear Plant, Units 1 and 2); Exemption

#### I.

Wisconsin Electric Power Company (WEPCO, the licensee) is the holder of Facility Operating License Nos. DPR-24 and DPR-27 which authorize operation of Point Beach Nuclear Plant (PBNP), Unit Nos. 1 and 2. The units are pressurized water reactors (PWR) located in Manitowoc County, Wisconsin. The licenses provide, among other things, that the facilities are subject to all rules, regulations, and orders of the Nuclear Regulatory Commission (the Commission) now or hereafter in effect.

#### II

Section III.G.1 of Appendix R to 10 CFR Part 50 requires, in part, that fire protection features shall be provided for structures, systems, and components important to safe shutdown and that one train of systems necessary to achieve and maintain hot shutdown conditions be free of fire damage.

Section III.G.2 of Appendix R requires that (except as provided for in Section III.G.3), where cables or equipment (including associated nonsafety circuits that could prevent operation or cause maloperation due to hot shorts, open circuits, or shorts to ground) of redundant trains of systems necessary to achieve and maintain hot shutdown

conditions are located within the same fire area outside of primary containment, certain specified means be provided to ensure that one of the redundant trains is free of fire damage.

Pursuant to 10 CFR 50.12(a), the NRC may grant exemptions from the requirements of the regulations (1) which are authorized by law, will not present an undue risk to the public health and safety, and are consistent with the common defense and security; and (2) where special circumstances are present.

By letter dated August 5, 1994, as supplemented by letters dated September 9, 1994, October 31, 1994, and February 28, 1995, the licensee requested an exemption from Section III.G.2.b of Appendix R to 10 CFR Part 50, to the extent that it requires the separation of redundant trains of safe shutdown cables and equipment by a horizontal distance of more than 20 feet, with no intervening combustibles, in the auxiliary feedwater pump fire area. Intervening combustibles in the form of cable fill in three cable trays, added as part of the diesel generator addition project, are located within the separation space between redundant trains of cables and equipment required to achieve and maintain safe shutdown after a fire. In addition, the horizontal separation provided between redundant auxiliary feedwater pumps is only 14 feet.

The staff previously granted an exemption for intervening combustibles in this fire area in a Safety Evaluation dated July 3, 1985. This evaluation stated that the minimum separation between redundant trains was 26 feet with a maximum separation of 60 feet. However, this space contains cable trays installed horizontal and parallel to the trays containing redundant cables. Based on the wide separation of the redundant trains, the configuration and limited amount of intervening combustibles, and the installed automatic Halon suppression system, the staff concluded that it is unlikely that an exposure fire or electrically initiated fire of the sufficient magnitude to prevent safe shutdown could develop prior to actuation of the Halon system and the arrival of the fire brigade. The three new cable trays (GW01-03, GN 01-03, and GC01-02), installed as part of the diesel generator addition project, are routed perpendicular to the redundant trains and provide a continuous path of combustibles between the redundant trains of equipment and cabling. This new configuration is outside the scope of the exemption granted to the licensee on July 3, 1985.
