NIST Docket No. 94-031

Title: Friction and Wear Resistant Coatings For Titanium and Its Alloys.

Description: This NIST invention is a method to control friction and wear of titanium and its alloys through the use of novel coatings. The coatings contain epoxide polymers with anti-wear fillers.

NIST Docket No. 95-034CIP

Title: Overlay Target and Measurement Procedure to Enable Self-Correction for Wafer-Induced and Tool-Induced Shift by All-Imaging-Sensor Means.

Description: The estimates of overlay extracted by a metrology instrument from standard targets on IC wafers are ordinarily burdened by difficult-to-estimate systematic errors called shifts. The first of two parts of this invention is to replacement of a standard overlay target used in normal IC fabrication practice with multiple instances of a so-called target unit. The referenced target units constitute a single so-called self-calibrating optical-overlay target structure. Each target unit is a standard target having an additional grouping of features called a null-detector subsystem. The null-detector subsystems embodied in the new self-calibrating optical-overlay target structure enable the extraction of zero-overlay indices. The second part of the invention includes modification to the metrology instrument's target scanning and imaging systems to provide supplementary inspection of the null-detector subsystems. The zero-overlay indices, when analyzed in conjunction with the burdened overlay estimates extracted from the corresponding multiple instances of the standard targets within the same self-calibrating optical-overlay target structure, enable an estimate of the shift affecting the overlay measurements. The unique novelty of providing self-calibration of the metrology instrument, with respect to shift, on the same substrate as that from which overlay estimates are sought by the user has significant commercial importance.

The Recombinant fusion proteins were purified, analyzed for antigenicity, immunogenicity, and their ability to protect mice against lethal challenge with live dengue (DEN) viruses. Antigenicity was found with anti-DEN polyclonal and monoclonal antibodies. Mice immunized with the purified fusion protein made anti-DEN antibodies measured by the hemagglutination-inhibition and
