NATIONAL ARCHIVES AND RECORDS ADMINISTRATION

Records Schedules; Availability and Request for Comments

AGENCY: National Archives and Records Administration, Office of Records Administration.

ACTION: Notice of availability of proposed records schedules; request for comments.

SUMMARY: The National Archives and Records Administration (NARA)

publishes notice at least once monthly of certain Federal agency requests for records disposition authority (records schedules). Records schedules identify records of sufficient value to warrant preservation in the National Archives of the United States. Schedules also authorize agencies after a specified period to dispose of records lacking administrative, legal, research, or other value. Notice is published for records schedules that (1) propose the destruction of records not previously authorized for disposal, or (2) reduce the retention period for records already authorized for disposal. NARA invites public comments on such schedules, as required by 44 USC 3303a(a).

DATES: Request for copies must be received in writing on or before January 11, 1996. Once the appraisal of the records is completed, NARA will send a copy of the schedule. The requester will be given 30 days to submit comments.

ADDRESSES: Address requests for single copies of schedules identified in this notice to the Records Appraisal and Disposition Division (NIR), National Archives and Records Administration, College Park, MD 20740. Requesters must cite the control number assigned to each schedule when requesting a copy. The control number appears in the parentheses immediately after the name of the requesting agency.

SUPPLEMENTARY INFORMATION: Each year U.S. Government agencies create billions of records on paper, film, magnetic tape, and other media. In order to control this accumulation, agency records managers prepare records schedules specifying when the agency no longer needs the records and what happens to the records after this period. Some schedules are comprehensive and cover all the records of an agency or one of its major subdivisions. These comprehensive schedules provide for the eventual transfer to the National Archives of historically valuable records and authorize the disposal of all other records. Most schedules, however, cover records of only one office or program or a few series of records, and many are updates of previously approved schedules. Such schedules also may include records that are designated for permanent retention.

Destruction of records requires the approval of the Archivist of the United States. This approval is granted after a thorough study of the records that takes into account their administrative use by the agency of origin, the rights of the Government and of private persons directly affected by the Government's activities, and historical or other value.

This public notice identifies the Federal agencies and their subdivisions requesting disposition authority, includes the control number assigned to each schedule, and briefly describes the records proposed for disposal. The records schedule contains additional information about the records and their disposition. Further information about the disposition process will be furnished to each requester.

Schedules Pending

1. Department of Health and Human Services, Administration for Health Care Policy and Research (N1-510-94-2). Hardcopy data collected for the Medical Treatment Effectiveness Program.

2. Department of Housing and Urban Development (N1-196-95-1). Public Housing Administration Legal Opinions, 1937-1971, relating to administrative matters.

NUCLEAR REGULATORY COMMISSION

Report to Congress on Abnormal Occurrences April-June, 1995; Dissemination of Information

Section 208 of the Energy Reorganization Act of 1974, as amended, requires NRC to disseminate information on abnormal occurrences (AOs) (i.e., unscheduled incidents or events that the Commission determines

are significant from the standpoint of public health and safety). During the second quarter of CY 1995, the following incidents at NRC licensed facilities were determined to be AOs and are described below, together with the remedial actions taken. Each event is also being included in NUREG-0090, Vol. 18, No. 2, ("Report to Congress on Abnormal Occurrences: April-June 1995"). This report will be available at NRC's Public Document Room, 2120 L Street NW. (Lower Level), Washington, DC, about three weeks after the publication date of this Federal Register Notice.

Nuclear Power Plants

95-2 Reactor Coolant System Blowdown at Wolf Creek Nuclear Generating Station

One of the AO reporting guidelines notes that major deficiencies in design, construction, use of, or management controls for licensed facilities or material can be considered an AO.

Date and Place—September 17, 1994; Wolf Creek Nuclear Generating Station, a Westinghouse-designed pressurized water reactor nuclear power plant, operated by Wolf Creek Nuclear Operating Corporation and located about 5.63 kilometers (3.5 miles) northeast of Burlington, Kansas.

Nature and Probable Consequences—An inadvertent blowdown of approximately 34,868 liters (9200 gallons) of reactor coolant through the residual heat removal (RHR) system to the refueling water storage tank (RWST) occurred because of incompatible, concurrent RHR valve manipulations. At the time of the event, the reactor had been shutdown for 28 hours and was on RHR cooling (2413 kPa gauge and 149 C [350 psi gauge and 300 F]). The event was successfully terminated in 1 minute by operator intervention. There was only minimal interruption to heat removal processes, and no core damage or fission product release occurred. However, if the blowdown continued, the licensee estimated that RHR cooling could have failed in about 3.5 minutes, the RWST header could have filled with steam in about 6 minutes, and uncovering of the core could have begun in about 30 minutes.

All of the emergency core cooling system (ECCS) pumps take their suction from the RWST header line. If the ECCS pumps were started to mitigate the blowdown after the RWST header filled with steam, a common-mode failure of all ECCS pumps could have occurred as a result of steam binding. The ECCS pumps could also have failed as a result of pressure pulses caused by cold RWST
