

peptide from the cytoplasm to the ER. Once in the ER, the other portion of the chimeric peptide associates with class I MHC molecules and together they form a complex which is presented on the surface of the cell. The complex activates cytotoxic lymphocytes which react with the complex, leading to expansion of CTLs which kill cells presenting the particular complex. The MHC complexing portion of the chimeric peptide is taken from cancer antigens or viral antigens. Thus the invention is a broad general method of vaccination that activates the cellular immune system. DNA constructs and expression vectors encoding the chimeric peptides are also claimed. The method has been shown to work as a treatment for cancer in mice. It has been PCT filed, PCT/US94/02897.
