

DEPARTMENT OF TRANSPORTATION**Federal Aviation Administration****14 CFR Part 25****[Docket No. 28617; Notice 96-6]****RIN 2120-AF79****Revision of Hydraulic Systems Airworthiness Standards To Harmonize With European Airworthiness Standards for Transport Category Airplanes****AGENCY:** Federal Aviation Administration (FAA), DOT.**ACTION:** Notice of proposed rulemaking.

SUMMARY: This document proposes to amend the airworthiness standards for transport category airplanes to harmonize hydraulic systems design and test requirements with standards proposed for the European Joint Aviation Requirements (JAR). These proposals were developed in cooperation with the Joint Aviation Authorities (JAA) of Europe and the U.S. and European aviation industry through the Aviation Rulemaking Advisory Committee (ARAC). These changes are intended to benefit the public interest by standardizing certain requirements, concepts, and procedures contained in the airworthiness standards without reducing, but potentially enhancing, the current level of safety.

DATES: Comments must be received on or before October 1, 1996.

ADDRESSES: Comments on this notice may be mailed in triplicate to: Federal Aviation Administration, Office of the Chief Counsel, Attention: Rules Docket (AGC-200), Docket No. 28617, 800 Independence Avenue SW., Washington, DC 20591; or delivered in triplicate to: Room 915G, 800 Independence Avenue SW., Washington, DC 20591.

Comments delivered must be marked Docket No. 28617. Comments may also be sent electronically to the following internet address:

nrmipcmts@mail.hq.faa.gov. Comments may be examined in Room 915G weekdays, except Federal holidays, between 8:30 a.m. and 5:00 p.m. In addition, the FAA is in maintaining an information docket of comments in the Transport Airplane Directorate (ANM-100), Federal Aviation Administration, Northwest Mountain Region, 1601 Lind Avenue SW., Renton, WA 98055-4056. Comments in the information docket may be examined weekdays, except Federal holidays, between 7:30 a.m. and 4:00 p.m.

FOR FURTHER INFORMATION CONTACT: Mahinder K. Wahi, Flight Test and Systems Branch, ANM-111, Transport Airplane Directorate, Aircraft Certification Service, FAA, 1601 Lind Avenue SW., Renton, WA 98055-4056; telephone (206) 227-2142; facsimile (206) 227-1320.

SUPPLEMENTARY INFORMATION:**Comment Invited**

Interested persons are invited to participate in this proposed rulemaking by submitting such written data, views, or arguments as they may desire.

Comments relating to any environmental, energy, or economic impact that might result from adopting the proposals contained in this notice are invited. Substantive comments should be accompanied by cost estimates. Commenters should identify the regulatory docket or notice number and submit comments in triplicate to the Rules Docket address above. All comments received on or before the closing date for comments will be considered by the Administrator before taking action on this proposed rulemaking. The proposals contained in this notice may be changed in light of comments received. All comments received will be available in the Rules Docket, both before and after the comment period closing date, for examination by interested persons. A report summarizing each substantive public contact with FAA personnel concerning this rulemaking will be filed in the docket. Persons wishing the FAA to acknowledge receipt of their comments must submit with those comments a self-addressed, stamped postcard on which is stated: "Comments to Docket No. 28617." The postcard will be date stamped and returned to the commenter.

Availability of the NPRM

An electronic copy of this document may be downloaded using a modem and suitable communications software from the FAA regulations section of the Fedworld electronic bulletin board service (telephone: 703-321-3339), the Federal Register's electronic bulletin board service (telephone 202-512-1661), or the FAA's Aviation Rulemaking Advisory Committee Bulletin Board service (telephone: 202-267-5948).

Internet users may reach the FAA's web page at <http://www.faa.gov> or the Federal Register's web page at <http://www.access.gpo/su-docs> for access to recently published rulemaking documents.

Any person may obtain a copy of this notice of submitting a request to the

Federal Aviation Administration (FAA), Office of Rulemaking, ARM-1, 800 Independence Avenue, S.W., Washington, D.C. 20591 or by calling (202) 267-9680. Communications must identify the notice number or docket number of this notice.

Persons interested in being placed on a mailing list for future rulemaking documents should also request a copy of Advisory Circular No. 11-2A, Notice of Proposed Rulemaking Distribution System, which describes the application procedure.

Background

The airworthiness standards for transport category airplanes are contained in 14 CFR part 25. Manufacturers of transport category airplanes must show that each airplane they produce of a different type design complies with the relevant standards of part 25. These standards apply to airplanes manufactured within the U.S. for use by U.S. registered operators and to airplanes manufactured in other countries and imported under a bilateral airworthiness agreement.

In Europe, the Joint Aviation Requirements (JAR) were developed by the Joint Aviation Authorities (JAA) to provide a common set of airworthiness standards for use within the European aviation community. The airworthiness standards for European type certification of transport category airplanes, JAR-25, are based on part 25 of Title 14. Airplanes certificated to the JAR-25 standards, including airplanes manufactured in the U.S. for export to Europe, receive type certificates that are accepted by the aircraft certification authorities of 23 European countries.

Although part 25 and JAR-25 are very similar, they are not identical. Differences between the FAR and the JAR can result in substantial additional costs when airplanes are type certificated to both standards. These additional costs, however, frequently do not bring about an increase in safety. For example, part 25 and JAR-25 may use different means to accomplish the same safety intent. In this case, the manufacturer is usually burdened with meeting both requirements, although the level of safety is not increased correspondingly. Recognizing that a common set of standards would not only economically benefit the aviation industry, but would also maintain the necessary high level of safety, the FAA and JAA consider harmonization to be a high priority.

In 1988, the FAA, in cooperation with the JAA and other organizations representing the American and European aerospace industries, began a

process to harmonize the airworthiness requirements of the United States and the airworthiness requirements of Europe, especially in the areas of Flight Test and Structures.

In 1992, the FAA harmonization effort was undertaken by the ARAC. A working group of industry and government hydraulic systems specialists of Europe and the United States was chartered by notice in the Federal Register (57 FR 58843, December 12, 1992). The working group was tasked to develop a draft notice of proposed rulemaking (NPRM) and any collateral documents, such as advisory circulars, concerning new or revised requirements for hydraulic systems, and the associated test conditions for hydraulic systems, installed in transport category airplanes (§ 25.1435). The JAA is to develop a similar proposal to amend JAR-25, as necessary, to achieve harmonization.

The rulemaking proposal contained in this notice is based on a recommendation developed by the Hydraulic Systems Harmonization Working Group, and was presented to the FAA by the ARAC as a recommendation.

The Aviation Rulemaking Advisory Committee

The ARAC was formally established by the FAA on January 22, 1991 (56 FR 2190) to provide advice and recommendations concerning the full range of the FAA's safety-related rulemaking activity. This advice was sought to develop better rules in less overall time using fewer FAA resources than are currently needed. The committee provides the opportunity for the FAA to obtain firsthand information and insight from interested parties regarding proposed new rules or revisions of existing rules.

There are 64 member organizations on the committee, representing a wide range of interests within the aviation community. Meetings of the committee are open to the public, except as authorized by section 10(d) of the Federal Advisory Committee Act.

The ARAC establishes working groups to develop proposals to recommend to the FAA for resolving specific issues. Tasks assigned to working groups are published in the Federal Register. Although working group meetings are not generally open to the public, all interested parties are invited to participate as working group members. Working groups report directly to the ARAC, and the ARAC must accept a working group proposal before that proposal can be presented to the FAA as

an advisory committee recommendation.

The activities of the ARAC will not, however, circumvent the public rulemaking procedures. After an ARAC recommendation is received and found acceptable by the FAA, the agency proceeds with the normal public rulemaking procedures. Any ARAC participation in a rulemaking package will be fully disclosed in the public docket.

Discussion of the Proposals

The FAA proposes to amend § 25.1435 to harmonize this section with JAR-25. The JAA intend to publish a Notice of Proposed Amendment (NPA), also developed by the Hydraulic Systems Harmonization Working Group, to revise JAR-25 as necessary to ensure harmonization in those areas for which the proposed amendments differ from the current JAR-25, Change 14. When it is published, the NPA will be placed in the docket for this rulemaking.

Generally, the FAA proposes to: (1) Add appropriate existing-JAR requirements to achieve harmonization; (2) Move some of the existing regulatory text to an advisory circular; (3) Consolidate and/or separate requirement subparagraphs for clarity; and (4) Revise airplane static proof pressure test requirements to require a complete functional (dynamic) airplane test at a lower pressure. A new proposed Advisory Circular (AC) 25.1435-1 has been developed by the ARAC to ensure consistent application of these proposed revised standards. Public comments concerning the AC 25.1435-1 are invited by separate notice published elsewhere in this issue of the Federal Register. The JAA intend to publish an Advisory Material Joint (AMJ), also developed by the Harmonization Working Group, to accompany their NPA. The proposed AC and the proposed AMJ contain harmonized advisory information. The following is a discussion of the specific proposals prescribed in this NPRM.

Proposal 1. The FAA proposes to replace current § 25.1435(a)(1) to add the existing requirements of JAR 25.1435(a)(10) and associated Appendix K requirements regarding design load factors for proof and ultimate pressure conditions for elements of the hydraulic system (see proposal 2 below regarding current § 25.1435(a)(1)). The proof and ultimate pressure conditions would be defined as the design operating pressure times the factors of safety. This would be done to address unusually high pressures which may be seen in service, material defects and differences, manufacturing/construction tolerances

and the consequences of failures (e.g. pressure vessel failure). The proposed load factors, ranging between 1.5 and 4.0, relate to the design operating pressure (DOP) and would apply to tubes, fittings, pressure vessels containing gas at high pressure (e.g., accumulators) and at low pressure (e.g. hydraulic reservoirs), hoses, and all other elements.

By adopting these JAR minimum factors of safety standards which currently are not specifically stated in the FAR, the FAA intends to maintain an existing level of safety because normal U.S. Industry practices meet or exceed these standards.

DOP is the normal maximum steady pressure. Excluded are reasonable tolerances and transient pressure effects such as may arise from acceptable pump ripple or reaction to system functioning or flow demands that may affect fatigue. In localized areas of systems and system elements the DOP may be different from the DOP for the system as a whole due to the range or normally anticipated airplane operational, dynamic and environmental conditions. Such differences would be required to be taken into account. The term "design operating pressure" would be discussed in AC 25.1435-1.

Proposal 2. The FAA proposes to redesignate the current § 25.1435(a)(1) as § 25.1435(a)(2), delete the word "loads" from "pressure loads" ("loads" is redundant) and edit some text to avoid repetition. The term "limit structural load", and a recommended minimum time to hold pressure would be discussed in AC 25.1435-1.

Proposal 3. The FAA proposes to redesignate the current § 25.1435(a)(2) as a new § 25.1435(a)(3), delete the word "loads" from "pressure loads" ("loads" is redundant) and edit some text to avoid repetition. The term "ultimate structural load" and a minimum time to hold pressure would be discussed in AC 25.1435-1.

Proposal 4. The FAA proposes to add a new § 25.1435(a)(4) that would contain the current requirements of § 25.1435(b)(2)(i) and (b)(2)(ii) regarding induced loads, pressure transients, and fatigue as well as the current JAR 25.1435(a)(11) requirements regarding fatigue design considerations accounting for fluctuating or repeated external or internal loads and pressure transients. These loads could be structurally or environmentally induced. By delineating these requirements, the FAA intends to ensure that each element is designed to provide fatigue resistance capability consistent with anticipated element usage, thus maintaining the current

level of safety. The terms "fatigue", and "externally induced loads" would be discussed in AC 25.1435-1.

Proposal 5. The FAA proposes to add a new § 25.1435(a)(5) that would contain the current requirements of § 25.1435(b)(2)(i) through (b)(2)(v), except those addressed under proposal 4 above, as well as parts of the current JAR 25.1435 (a)(5) and (a)(6) requirements addressing excessive vibration, abrasion, corrosion, mechanical damage, and the ability to withstand inertia loads. These requirements would be consolidated and simplified by stating that each element must be designed to perform as intended under all environmental conditions for which the airplane is certificated. An acceptable means of compliance would be included in AC 25.1435-1.

Proposal 6. The FAA proposes to add a modified version of the existing JAR 25.1435(a)(2) as § 25.1435(a)(1), requiring means to indicate appropriate system parameters at a flight crewmember station if (1) the system performs a function necessary for continued safe flight and landing, or (2) in the event of hydraulic system malfunction, corrective action by the crew is required to ensure continued safe flight and landing. The existing JAR 25.1435(a)(2) requires fluid quantity and pressure indication under specified circumstances; prior to Amendment 25-72, § 25.2435 contained an identical requirement. It was considered at the time that this requirement is covered by § 25.1309(c), which requires that warning information must be provided to alert the crew to unsafe system operating conditions, and to enable them to take appropriate corrective action, and the § 25.1435 requirement was therefore deleted. It is, however, now recognized that there is value in defining indication requirements for hydraulic systems and implications of their loss. The existing level of safety would not be impacted since the FAA is proposing the adopt an existing industry practice. The term "appropriate system parameters" would be discussed in AC 25.1435-1. (Note: see proposal 12 below with respect to status of current § 25.1435(b)(1) requirements).

Proposal 7. The FAA proposes to replace the current § 25.1435(b)(2) by adding a modified version of the current JAR 25.1435 (a)(4) and (a)(7) to require that each system have means to ensure that system pressures remain within the design capabilities of each element. Prior to Amendment 25-72, § 25.1435 contained a requirement that was identical to the current JAR

requirement, but it was characterized as both containing arbitrary pressure transient limits and unnecessary because the intent is covered under § 25.1309. The requirement was therefore deleted from § 25.1435. The proposed version deletes the arbitrary limits but would require that the intent be specifically addressed by § 25.1435(b)(2) to ensure consideration of the pressure and volume related transients that are unique to the hydraulic systems. There would be no impact on level of safety since an existing industry practice is being adopted. An acceptable means of compliance with § 25.1435(b)(2) would be included in AC 25.1435-1.

Proposal 8. The FAA proposes to add a new § 25.1435(b)(3) which would contain a modified version of the existing JAR 25.1435(a)(5) requirements regarding the means to minimize harmful or hazardous concentrations of the hydraulic fluid or vapors, if liberated in any form, into the crew and passenger compartments during flight. Prior to Amendment 25-72, § 25.1435 contained an identical requirement. It was considered at the time that § 25.831(b) covers this requirement under a general statement that the ventilation air must be free of hazardous or harmful gases or vapors. However, § 25.831(b) specifies allowable limits for carbon monoxide and carbon dioxide, but no other products. It could be construed that those two gases are the only hazardous products. Section 25.1435 would therefore be revised to state the specific requirement with respect to the hydraulic fluid or vapors.

The JAR requirement currently states, in relevant part, that "there must be a means to prevent harmful or hazardous concentration of fluid. * * *" In recognition of the fact that absolute prevention of such concentrations is not an achievable objective, the FAA proposes that the hydraulic system must have "means to minimize the release of harmful or hazardous concentrations * * *" To show compliance with this requirement, an applicant would have to show, both that the likelihood of releases has been minimized, and that, if there is such a release, the concentrations from the release would also be minimized. The level of safety would remain unaffected because it's an existing industry practice to address this issue. An acceptable means of compliance with § 25.1435(b)(3) and a discussion of the terms "harmful" and "hazardous" would be included in AC 25.1435-1.

Proposal 9. The FAA proposes to redesignate the existing § 25.1435(c) as § 25.1435(b)(4); this is identical to the

existing JAR 25.1435(c) requirements regarding use of flammable hydraulic fluid and fire protection. A discussion of the term "flammable hydraulic fluid" would be included in AC 25.1435-1.

Proposal 10. The FAA proposes to add a new § 25.1435(b)(5), containing the current JAR 25.1435(d) requirements that the airplane manufacturer must specify the approved hydraulic fluid(s) suitable to be used in the system(s) and ensure that the system(s) meet the applicable placarding requirements of the current § 25.1541. Although it is a standard U.S. industry practice to identify the compatible hydraulic fluid on each component's name plate, the practice may not be universal. In order to minimize the potential use of incompatible fluids, seals, etc. in any system, it is necessary to include this requirement. A discussion of mixability of hydraulic fluids would be included in AC 25.1435-1.

Proposal 11. Current § 25.1435(b)(2) requirements for hydraulic system compliance by test and analysis would be separated into §§ 25.1435 (c), (c)(1) and (c)(2); the list of environmental factors [current § 25.1435 (b)(2)(ii) through (b)(2)(v)] would be moved to AC 25.1435-1; and, text in the aforementioned sections would be clarified. In addition, analysis would be permitted in place of or to supplement testing, where shown to be reliable and appropriate. A discussion on endurance and fatigue testing, and simulated failures would be included in AC 25.1435-1.

Proposal 12. Current § 25.1435(b)(1) requirements for static testing of a complete hydraulic system to 1.5 times the design operating pressure (without deformation of any part of the system that would prevent performance of intended function) would be replaced with a new § 25.1435(c)(3) requirement that "the complete hydraulic system must be functionally tested on the airplane over the range of motion of all associated user systems." Also, the section would require that "the test must be conducted at the system relief pressure or 1.25 times the DOP if a system pressure relief device is not part of the system design." This proposal reflected the recently granted petition for exemption to the Boeing Company, Regulatory Docket No. 27384. The petition, any comments received, and a copy of the final disposition are filed in the assigned regulatory docket and are available for examination in the Rules Docket (AGC 200), room 915G, FAA Headquarters Building (FOB 10A), 800 Independence Avenue SW., Washington, DC 20591; telephone (202) 267-3132. A discussion on relief

pressure settings and an acceptable means of compliance with § 25.1435(c)(3) would be included in AC 25.1435-1.

The FAA considers that the proposed functional (i.e., dynamic) test more closely approximates actual operating conditions than the existing static test. This is because for the static test, several parts of the system and associated relief valves (including return lines) may need to be disabled to allow system pressurization at 1.5 times the design operating pressure because the relief valves are designed to open at a pressure lower than 1.5 times the design operating pressure. Although the proposed test pressure would be lower than 1.5 times the design operating pressure, all elements would still be required to be able to withstand at least 1.5 times the design operating pressure per current § 25.1435(a)(2) (proposed § 25.1435(a)(3)), at least retaining and potentially enhancing the current level of safety by identification of additional dynamic interference problems.

Regulatory Evaluation Summary

Regulatory Evaluation, Regulatory Flexibility Determination, and Trade Impact Assessment

Changes to federal regulations must undergo several economic analyses. First, Executive Order 12866 directs Federal agencies to promulgate new regulations or modify existing regulations only if the potential benefits to society outweigh the potential costs. Second, the Regulatory Flexibility Act of 1980 requires agencies to analyze the economic impact of regulatory changes on small entities. Finally, the Office of Management and Budget directs agencies to assess the effect of regulatory changes on international trade. In conducting these assessments, the FAA has determined that this proposed rule: (1) Would generate benefits exceeding its costs and is not "significant" as defined in Executive Order 12866; (2) Is not "significant" as defined in DOT's Policies and Procedures; (3) would not have a significant impact on a substantial number of small entities; and (4) would lessen restraints on international trade. These analyses, available in the docket, are summarized below.

Although several revisions would be made to § 25.1435, only three of them would impose additional costs (see below—proposals 1, 4, and 12, with the latter having potential cost savings for some manufacturers). Most of the changes codify current industry practice or conform § 25.1435 to corresponding sections of the JAR. Adoption of the

proposed changes would increase harmonization and commonality between American and European airworthiness standards. Harmonization would eliminate unnecessary duplication of airworthiness requirements, thus reducing manufacturers' certification costs. One manufacturer of part 25 large airplanes estimated such cost-savings could range between \$60,000 and 600,000 per type certification (pertaining to hydraulic systems only); a manufacturer of part 25 small airplanes estimated such savings at \$30,000 to \$90,000 per type certification; Potential safety benefits resulting from specification of minimum accepted standards would supplement these cost-savings.

Proposal 1. These changes codify existing industry standards. As such, they would not result in additional costs for most manufacturers. However, one manufacturer of small transport category airplanes estimated increased testing costs of approximately \$25,000 per type certification. Codification of the proposed standards would ensure that current safety levels are retained.

Proposals 2, 3, and 9. There would be no additional costs associated with these minor changes.

Proposal 4. Although some of the changes described are new requirements in the FAR, most American manufacturers of large transport category airplanes are already in compliance with the similar current European standards, which had to be met in order to market airplanes in JAA member countries. The modified testing and analysis regime is already in place. Initial first-time costs have already been incurred; such costs have diminished in recent certifications. Consequently, actual incremental costs would be negligible. One manufacturer, however, indicated that additional testing and analysis costs, ranging between \$100,000 and \$200,000 per type certification, would be incurred for the first one or two type certifications. Learning curve efficiencies would likely reduce these costs thereafter. Manufacturers of small transport category airplanes, on the other hand, expect no or negligible additional costs attributable to the new fatigue-related proposals. Codification of the proposed standards would ensure that minimum acceptable fatigue requirements are specified with potential for safety enhancement.

Proposals 5, 6, 7, 8, and 10. These changes codify existing industry standards and would not result in additional certification/production costs. Codification of the proposed

standards would ensure that current safety levels are retained.

Proposal 11. There would be no additional costs associated with these revisions. The use of analysis in lieu of or supplemental to testing may reduce certification costs in some cases.

Proposal 12. Most manufacturers of part 25 airplanes would not experience additional costs associated with dynamic testing of hydraulic systems. In fact, testing time and associated costs could be reduced to some small extent since, unlike static testing, the proposed dynamic testing would not entail disabling any system(s) or otherwise reconfiguring the airplane. One manufacturer of part 25 large airplanes estimated potential savings between \$100,000 and \$200,000 per type certification in this regard (another estimated such savings at only \$25,000). However, a manufacturer of part 25 small transport category airplanes estimates \$25,000 in additional testing, analysis, and report preparation costs per type certification attributable to this proposal. The proposed requirements would at least retain, and potentially enhance, the current level of safety by identification of additional dynamic interference problems.

Summary of Costs and Benefits

Manufacturers of part 25 small airplanes could experience additional costs totalling approximately \$50,000 per type certification resulting from proposals 1 (design load factors) and 12 (dynamic testing). The estimated \$30,000–\$90,000 harmonization cost savings, coupled with potential safety benefits from proposals 4 and 12, would exceed these costs.

For manufacturers of part 25 large airplanes, the cost differential could range from a \$25,000–\$200,000 reduction (resulting from proposal 12) to a \$100,000–\$200,000 increase (resulting from proposal 4). The proposal 12 cost savings coupled with the estimated \$60,000–\$600,000 harmonization cost savings would exceed the additional costs of proposal 4; potential safety benefits from proposals 4 and 12 would supplement the cost-savings.

The FAA finds the proposed rule, therefore, to be cost-beneficial for both part 25 small and large transport manufacturers.

Regulatory Flexibility Determination

The Regulatory Flexibility Act of 1980 (RFA) was enacted by Congress to ensure that small entities are not unnecessarily or disproportionately burdened by government regulations. The RFA requires a Regulatory

Flexibility Analysis if a rule would have a significant economic impact, either detrimental or beneficial, on a substantial number of small entities. FAA Order 2100.14A, Regulatory Flexibility Criteria and Guidance, prescribes standards for complying with RFA review requirements in FAA rulemaking actions. The order defines "small entities" in terms of size thresholds, "significant economic impact" in terms of annualized cost threshold, and "substantial number" as a number which is not less than eleven and which is more than one-third of the small entities subject to the proposed or final rule.

The proposed rule would affect manufacturers of transport category airplanes produced under future new airplane type certifications. For manufacturers, Order 2100.14A specifies a size threshold for classification as a small entity as 75 or fewer employees. Since no transport category airplane manufacturer has 75 or fewer employees, the proposed rule would not have a significant economic impact on a substantial number of small manufacturers.

International Trade Impact Assessment

The proposed rule would not constitute a barrier to international trade, including the export of American airplanes to foreign countries, and the import of foreign airplanes into the United States. Instead, the proposed changes to the FAR would harmonize with corresponding existing or proposed standards in the JAR, thereby lessening restraints on trade.

Federalism Implications

The amended regulations proposed in this rulemaking would not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. Therefore, in accordance with Executive Order 12612, it is determined that this proposal would not have sufficient federalism implications to warrant preparing a Federalism Assessment.

International Compatibility

In keeping with U.S. obligations under the Convention on International Civil Aviation, it is FAA policy to comply with International Civil Aviation Organization (ICAO) standards and recommended practices to the maximum extent practicable. The FAA has determined that this rule does not conflict with any international agreement of the United States.

Paperwork Reduction Act

In accordance with the Paperwork Reduction Act of 1980 (Pub. L. 96-511), there are no requirements for information collection associated with this proposed rule.

Conclusion

Because the proposed changes to standardize specific hydraulic systems test requirements of part 25 are not expected to result in substantial economic cost, the FAA has determined that this proposed regulation would not be significant under Executive Order 12866. Because this is an issue which has not prompted a great deal of public concern, the FAA has determined that this action is not significant under DOT Regulatory Policies and Procedures (44 FR 11034, February 25, 1979). In addition since there are no small entities affected by this proposed rulemaking, the FAA certifies, under the criteria of the Regulatory Flexibility Act, that this rule, if adopted, will not have a significant economic impact, positive or negative, on a substantial number of small entities. An initial regulatory evaluation of the proposal, including a Regulatory Flexibility Determination and Trade Impact Analysis, has been placed in the docket. A copy may be obtained by contacting the person identified under **FOR FURTHER INFORMATION CONTACT**.

List of Subjects in 14 CFR Part 25

Aircraft, Aviation safety, Reporting and recordkeeping requirements.

The Proposed Amendments

Accordingly, the Federal Aviation Administration proposes to amend 14 CFR part 25 as follows:

PART 25—AIRWORTHINESS STANDARDS—TRANSPORT CATEGORY AIRPLANES

1. The authority citation for part 25 continues to read as follows:

Authority: 49 U.S.C. 106(g), 40113, 44701, 44702, 44704.

2. Section 25.1435 is revised to read as follows:

§ 25.1435 Hydraulic systems.

(a) *Element design.* Each element of the hydraulic system must be designed to:

(1) Withstand the proof pressure without leakage or permanent deformation that prevents it from performing its intended function, and the ultimate pressure without rupture. The proof and ultimate pressures are defined in terms of the design operating pressure (DOP) as follows:

Element	Proof (xDOP)	Ultimate (xDOP)
1. Tubes & fittings	1.5	3.0
2. Pressure vessels containing gas: High pressure (e.g., accumulators)	3.0	4.0
Low pressure (e.g., reservoirs)	1.5	3.0
3. Hoses	2.0	4.0
4. All other elements	1.5	2.0

(2) Withstand, without deformation that would prevent it from performing its intended function, the design operating pressure in combination with limit structural loads that may be imposed;

(3) Withstand, without rupture, the design operating pressure multiplied by a factor of 1.5 in combination with ultimate structural load that can reasonably occur simultaneously;

(4) Withstand the fatigue effects of all cyclic pressures, including transients, and associated externally induced loads, taking into account the consequences of element failure; and

(5) Perform as intended under all environmental conditions for which the airplane is certificated.

(b) *System design.* Each hydraulic system must:

(1) Have means located at a flightcrew station to indicate appropriate system parameters.

(i) It performs a function necessary for continued safe flight and landing; or

(ii) In the event of hydraulic system malfunction, corrective action by the crew to ensure continued safe flight and landing is necessary;

(2) Have means to ensure that system pressures, including transient pressures and pressures from fluid volumetric changes in elements that are likely to remain closed long enough for such changes to occur, are within the design capabilities of each element, such that they meet the requirements defined in § 25.1435(a)(1) through (a)(5);

(3) Have means to minimize the release of harmful of hazardous concentrations of hydraulic fluid or vapors into the crew and passenger compartments during flight;

(4) Meet the applicable requirements of §§ 25.863, 25.1183, 25.1185, and 25.1189 if a flammable hydraulic fluid is used; and

(5) Be designed to use any suitable hydraulic fluid specified by the airplane manufacturer, which must be identified by appropriate markings as required by § 25.1541.

(c) *Tests.* To demonstrate compliance with § 25.1435 and support compliance with § 25.1309, tests must be conducted on the hydraulic system(s), and/or

subsystem(s) and elements, except that analysis may be used in place of or to supplement testing, where the analysis is shown to be reliable and appropriate. All internal and external influences must be taken into account to an extent necessary to evaluate their effects, and to assure reliable system and element functioning and integration. Failure or unacceptable deficiency of an element or system must be corrected and be sufficiently retested, where necessary.

(1) The system(s), subsystem(s), or element(s) must be subjected to

performance, fatigue, and endurance tests representative of airplane ground flight operations.

(2) The complete system must be tested to determine proper functional performance and relation to the other systems, including simulation of relevant failure conditions, and to support or validate element design.

(3) The complete hydraulic system(s) must be functionally tested on the airplane in normal operation over the range of motion of all associated user systems. The test must be conducted at

the system relief pressure 1.25 times the DOP if a system pressure relief device is not part of the system design.

Clearances between hydraulic system elements and other systems or structural elements must remain adequate and there must be no detrimental effects.

Issued in Washington, DC, on June 26, 1996.

Ava L. Robinson,

Acting Director, Aircraft Certification Service.
