PART 264—REGISTRATION AND FINGERPRINTING OF ALIENS IN THE UNITED STATES

28. The authority citation for part 264 continues to read as follows:

§ 264.1 [Amended]
29. In § 264.1(b), the entry for the Form I–551 is amended by revising the phrase “Alien Registration Receipt Card” to read “Permanent Resident Card”.

PART 316—GENERAL REQUIREMENTS FOR NATURALIZATION

37. The authority citation for part 316 continues to read as follows:

§ 316.4 [Amended]
38. In § 316.4, paragraph (a)(2) is amended by revising the phrase “(Alien Registration Receipt Card)” to read “(Permanent Resident Card)”.

PART 338—CERTIFICATE OF NATURALIZATION

39. The authority citation for part 338 continues to read as follows:

§ 338.3 [Amended]
40. Section 338.3 is amended in the first sentence by revising the phrase “alien registration receipt card” to read “Permanent Resident Card”.

PART 341—CERTIFICATES OF CITIZENSHIP

41. The authority citation for part 341 continues to read as follows:

§ 341.4 [Amended]
42. Section 341.4 is amended by revising the phrase “alien registration receipt cards in his possession” to read “permanent resident cards in his or her possession”.

PART 299—IMMIGRATION FORMS

35. The authority citation for part 299 continues to read as follows:

36. Section 299.1 is amended in the table by revising the entry for the Form “I–551” to read as follows:

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 39
[Docket No. 97–NM–59–AD; Amendment 39–10954; AD 98–26–13]
RIN 2120–AA64
Airworthiness Directives; Boeing Model 747 Series Airplanes

AGENCY: Federal Aviation Administration, DOT.

ACTION: Final rule.

SUMMARY: This amendment adopts a new airworthiness directive (AD), applicable to certain Boeing Model 747 series airplanes, that requires a one-time inspection to determine the material type of the stop support fittings of the main entry doors. This AD also requires repetitive visual inspections to detect cracks of certain stop support fittings of the main entry doors, and replacement of any cracked stop support fitting with a certain new stop support fitting. This amendment is prompted by reports that stress corrosion cracking was found on certain stop support fittings of the main entry doors. The actions specified by this AD are intended to detect and correct such stress corrosion cracking, which could lead to failure of the stop support fittings. Failure of the stop support fittings could result in loss of a main entry door and consequent rapid decompression of the airplane.

The incorporation by reference of certain publications listed in the regulations is approved by the Director of the Federal Register as of January 25, 1999.

ADDRESSES: The service information referenced in this AD may be obtained from Boeing Commercial Airplane Group, P.O. Box 3707, Seattle, Washington 98124–2207. This information may be examined at the Federal Aviation Administration (FAA), Transport Airplane Directorate, Rules Docket, 1601 Lind Avenue, SW., Renton, Washington; or at the Office of the Federal Register, 800 North Capitol Street, NW., suite 700, Washington, DC.

SUPPLEMENTARY INFORMATION: A proposal to amend part 39 of the Federal Aviation Regulations (14 CFR part 39) to include an airworthiness directive (AD) that is applicable to certain Boeing Model 747 series airplanes was published in the Federal Register on March 20, 1998 (63 FR 13566). That action proposed to require a one-time
The FAA concur with the commenter that the HFEC inspection required by this AD should be required only for those stop support fittings. The FAA's intent is that the HFEC inspection be accomplished only at the locations specified in the referenced service bulletin, where the material type is unknown. The visual inspection must be accomplished only on those stop support fittings of the main entry doors that are made from either 7079-T651 or 7075-T651 material. The FAA has revised paragraph (a) of the final rule to clarify this point.

**Request to Extend Repetitive Inspection Intervals**

Several commenters request that the repetitive interval for accomplishment of the visual inspections to detect cracks of certain stop support fittings of the main entry doors be extended from the proposed 18 months to 36 months, as specified in Boeing Service Bulletin 747-53-2358, dated August 26, 1993 (which was referenced as the appropriate source of service information in the NPRM). One of the commenters notes that the cracks on the affected stop support fittings are attributed to stress corrosion, which is a function of environment and time. As such, the inspection interval specified in the service bulletin is based on results of inspections of the fleet of Model 747 airplane series, and on the degree of corrosion or cracking found during those inspections. Another commenter notes that the growth rate of stress corrosion cracks depends mainly on the environment and the age of the airplane, and that, in the affected stop support fittings, the growth rate is slow when corrosion prevention measures are accomplished properly in accordance with the CPCP.

Two commenters request that the proposed compliance time for the initial high frequency eddy current (HFEC) inspection to determine the material type of the stop support fittings of the main entry doors be revised from 18 months after the effective date of this AD, as stated in the proposal, to 6 years after delivery of the airplane or 18 months after the effective date of this AD, whichever occurs last. One of the commenters notes that the corrosion and stress corrosion cracking is unlikely to occur on younger airplanes.

**Request to Amend Aging Fleet**

One commenter requests that the proposal be revised to allow cracked stop support fittings of the main entry doors to be replaced with new stop support fittings that are made from either 7079-T651 or 7075-T651 material, provided that repetitive inspections of the replacement parts are performed at intervals of 36 months. The commenter states that a non-cracked stop support fitting made from 7079-T651 or 7075-T651 material provides the required strength capability. The commenter also notes that discarding all spares of stop support fittings made from 7079-T651 or 7075-T651 material is a waste of resources.

The FAA infers that the commenter is requesting that paragraph (a)(2)(ii) of the proposal be revised to allow installation of new parts made from either 7079-T651 or 7075-T651 material, or parts made from 7075-T73 material, and that paragraph (c) of the proposal not be included in the final rule. The FAA does not concur with the commenter's request to allow continued use of the subject stop support fittings. The FAA has determined that the cracking of the stop support fittings of the main entry doors is caused by a combination of internal residual stress resulting from the manufacturing process, clamp-up stress from the installation of the fittings, operational stress due to pressurization of the airplane, and stress corrosion. Other parts made from 7079-T651 or 7075-T651 material previously have been found to crack while in storage, due to internal residual stress. While the FAA is not requiring the replacement of uncracked stop support fittings of the main entry doors, the FAA will not promote long-term inspections of the stop support fittings by approving the installation of replacement parts that are subject to the same unsafe condition. No change to the final rule is necessary in this regard.

**Request to Amend Aging Fleet Inspection and Modification Program**

One commenter suggests that Boeing Service Bulletin 747-53-2358 be reviewed by the 747 Structures Task Group (STG) for possible inclusion in

---

**Inspection to determine the material type of the stop support fittings of the main entry doors. That action also proposed to require repetitive visual inspections to detect cracks of certain stop support fittings of the main entry doors, and replacement of any cracked stop support fitting with a certain new stop support fitting. Interested persons have been afforded an opportunity to participate in the making of this amendment. Due consideration has been given to the comments received.**

**Support for the Proposal**

Several commenters support the proposed rule.

**Request to Include a Threshold for Initial Inspection**

Two commenters request that the proposed compliance time for the initial high frequency eddy current (HFEC) inspection to determine the material type of the stop support fittings of the main entry doors be revised from 18 months after the effective date of this AD, as stated in the proposal, to 6 years after delivery of the airplane or 18 months after the effective date of this AD, whichever occurs last. One of the commenters notes that the corrosion and stress corrosion cracking is unlikely to occur on younger airplanes.

The FAA does not concur with the commenters' request to include a threshold for the initial inspection. As stated previously in the notice of proposed rulemaking (NPRM), the FAA has determined that all affected airplanes are older than 6 years since the date of manufacture of the airplane.

**Request to Limit the Area of Inspection**

One commenter requests that the proposed HFEC inspection to determine the material type of the stop support fittings of the main entry doors should be required only if the material of the stop support fitting is unknown, as specified in Figure 3, Table 1, of the referenced service bulletin.
the aging aircraft inspection or modification program. The FAA infers that the commenter is requesting that the FAA delay issuance of the final rule until the STG has reviewed Boeing Service Bulletin 747–53–2358 and considered including that service bulletin in Boeing Document No. D6–35999, dated March 1989, “Aging Airplane Service Bulletin Structural Modification Program, Model 747.”

[The FAA previously issued AD 90–06–06, amendment 39–6490 (55 FR 8374, March 7, 1990), which requires incorporation of certain structural modifications in accordance with Boeing Document No. D6–35999.]

The FAA does not concur. The FAA has determined that rulingmaking is necessary to address the unsafe condition (stress corrosion cracking on certain stop support fittings of the main entry doors, which could result in failure of the stop support fittings, loss of a main entry door, and consequent rapid decompression of the airplane). By issuing this new rule, the FAA has taken action to ensure that the stop support fittings of the main entry doors on the affected Boeing Model 747 series airplanes are inspected and replaced, if necessary, in a timely manner. This action does not preclude a review of Boeing Service Bulletin 747–53–2358 by the STG for possible inclusion in Boeing Document No. D6–35999. However, the FAA finds that to delay this action would be inappropriate in light of the identified unsafe condition. Therefore, no change to the final rule is necessary in this regard.

Explanation of Additional Changes Made to This Final Rule

In the proposal, paragraph (a)(1) reads, “If the fitting is made from 7075-T73 material, no further action is required by this A.D.” Since the issuance of the NPRM, the FAA has determined that such language could be misleading to operators, because follow-on actions are required for any stop support fitting of the main entry door that is made from 7079-T651 or 7075-T651 material, regardless of whether other stop support fittings are made from 7075-T73 material. Therefore, paragraph (a)(1) of the final rule has been revised to read, “. . . no further action is required by this A.D. for that fitting.”

Conclusion

After careful review of the available data, including the comments noted above, the FAA has determined that air safety and the public interest require the adoption of the rule with the changes described previously. The FAA has determined that these changes will neither increase the economic burden on any operator nor increase the scope of the AD.

Cost Impact

There are approximately 515 Boeing Model 747 series airplanes of the affected design in the worldwide fleet. The FAA estimates that 164 airplanes of U.S. registry will be affected by this AD. It will take approximately 1 work hour per door to accomplish the required HFEC inspection, at an average labor rate of $60 per work hour. Based on these figures, the cost impact of the HFEC inspection required by this AD on U.S. operators is estimated to be $60 per door.

The cost impact figure discussed above is based on assumptions that no operator has yet accomplished any of the requirements of this AD action, and that no operator would accomplish those actions in the future if this AD were not adopted.

Should an operator be required to accomplish the required visual inspection, it will take approximately 2 work hours per door to accomplish the required actions, at an average labor rate of $60 per work hour. Based on these figures, the cost impact of the visual inspection required by this AD on U.S. operators is estimated to be $120 per door.

Should an operator elect to accomplish the optional terminating action that is provided by this AD action, the number of hours required to accomplish it would be approximately 124 work hours per door, at an average labor rate of $60 per work hour. Required parts would cost approximately $13,000 per door. Based on these figures, the cost impact of the optional terminating action on U.S. operators is estimated to be $20,440 per door.

Regulatory Impact

The regulations adopted herein will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. Therefore, in accordance with Executive Order 12612, it is determined that this final rule does not have sufficient federalism implications to warrant the preparation of a Federalism Assessment.

For the reasons discussed above, I certify that this action (1) is not a “significant regulatory action” under Executive Order 12866; (2) is not a “significant rule” under DOT Regulatory Policies and Procedures (44 FR 11034, February 26, 1979); and (3) will not have a significant economic impact, positive or negative, on a substantial number of small entities under the criteria of the Regulatory Flexibility Act. A final evaluation has been prepared for this action and is contained in the Rules Docket. A copy of it may be obtained from the Rules Docket at the location provided under the caption ADDRESSES.

Air transportation, Aircraft, Aviation safety, Incorporation by reference, Safety.

Adoption of the Amendment

Accordingly, pursuant to the authority delegated to me by the Administrator, the Federal Aviation Administration amends part 39 of the Federal Aviation Regulations (14 CFR part 39) as follows:

PART 39—AIRWORTHINESS DIRECTIVES

1. The authority citation for part 39 continues to read as follows:

Authority: 49 U.S.C. 106(q), 40113, 44701.

§ 39.13 [Amended]
2. Section 39.13 is amended by adding the following new airworthiness directive:

Docket 97–NM–59–AD.

Applicability: Model 747–100, ±100B, ±200, ±200B, ±200C, ±300, ±400, and 747SR series airplanes; having line numbers 1 through 830 inclusive; certificated in any category.

Note 1: This AD applies to each airplane identified in the preceding applicability provision, regardless of whether it has been modified, altered, or repaired in the area subject to the requirements of this AD.

For airplanes that have been modified, altered, or repaired so that the performance of the requirements of this AD is affected, the owner/operator must request approval for an alternative method of compliance in accordance with paragraph (d) of this AD. The request should include an assessment of the effect of the modification, alteration, or repair on the unsafe condition addressed by this AD; and, if the unsafe condition has not been eliminated, the request should include specific proposed actions to address it.

Compliance: Required as indicated, unless accomplished previously.

To detect and correct stress corrosion cracking of the stop support fittings of the main entry doors and the resultant failure of the stop support fittings which could result in loss of a main entry door and consequent rapid decompression of the airplane, accomplish the following:

(a) Within 18 months after the effective date of this AD, perform a high frequency eddy current inspection to determine the material type of the stop support fittings of
the main entry doors, in accordance with the Accomplishment Instructions of Boeing Service Bulletin 747–53–2358, dated August 26, 1993. Perform the inspection only at those locations where the material type of the stop support fittings is unknown, as specified in Figure 3, Table 1, of the service bulletin.

(1) If the fitting is made from 7075–T73 material, no further action is required by this AD for that fitting.

(2) If the fitting is NOT made from 7075–T73 material, prior to further flight, perform a visual inspection to detect cracks of the stop support fitting of the main entry doors, in accordance with the service bulletin.

(i) If no crack is detected, repeat the visual inspection thereafter at intervals not to exceed 36 months or 2,000 flight cycles, whichever occurs first.

(ii) If any crack is detected, replace the fitting with a stop support fitting made from 7075–T73 material, in accordance with the service bulletin.

(b) Replacement of the stop support fitting of the main entry doors with a stop support fitting made from 7075–T73 material, in accordance with Boeing Service Bulletin 747–53–2358, dated August 26, 1993, constitutes terminating action for the repetitive inspection requirements of this AD for the replaced fitting.

(c) As of the effective date of this AD, no person shall install a stop support fitting made from either 7079–T651 or 7075–T651 material on any airplane.

(d) An alternative method of compliance or adjustment of the compliance time that provides an acceptable level of safety may be used if approved by the Manager, Seattle Aircraft Certification Office (ACO), FAA, Transport Airplane Directorate. Operators shall submit their requests through an appropriate FAA Principal Maintenance Inspector, who may add comments and then send it to the Manager, Seattle ACO.

Note 2: Information concerning the existence of approved alternative methods of compliance with this AD, if any, may be obtained from the Seattle ACO.

(e) Special flight permits may be issued in accordance with sections 21.197 and 21.199 of the Federal Aviation Regulations (14 CFR 21.197 and 21.199) to operate the airplane to a location where the requirements of this AD can be accomplished.

(f) The actions shall be done in accordance with Boeing Service Bulletin 747–53–2358, dated August 26, 1993. This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies may be obtained from Boeing Commercial Airplane Group, P.O. Box 3707, Seattle, Washington 98124–2207. Copies may be inspected at the FAA, Transport Airplane Directorate, 1601 Lind Avenue, SW., Renton, Washington; or at the Office of the Federal Register, 800 North Capitol Street, NW., suite 700, Washington, DC.

(g) This amendment becomes effective on January 25, 1999.

Issued in Renton, Washington, on December 14, 1998.

Darrell M. Pederson,
Acting Manager, Transport Airplane Directorate, Aircraft Certification Service.

Airworthiness Directives; Bombardier Model CL–600–2B19 (Regional Jet Series 100 and 200) Series Airplanes

AGENCY: Federal Aviation Administration, DOT.

ACTION: Final rule; request for comments.

SUMMARY: This amendment adopts a new airworthiness directive (AD) that is applicable to certain Bombardier Model CL–600–2B19 (Regional Jet Series 100 and 200) series airplanes. This action requires a one-time visual inspection to detect chafing or cracking of all electrical wiring conduits located in the center fuel tank, and inadequate clearance between the tube assemblies and adjacent structures; and corrective actions, if necessary. This action also requires a modification to reinforce the right wing crossflow shutoff valve conduit. This amendment is prompted by issuance of mandatory continuing airworthiness information by a foreign civil airworthiness authority. The actions specified in this AD are intended to detect and correct chafing or cracking of the electrical conduits in the center fuel tank and inadequate clearance between tube assemblies and adjacent structures, which could result in electrical arcing and consequent fire or explosion in the center fuel tank.

DATES: Effective January 5, 1999.

The incorporation by reference of certain publications listed in the regulations is approved by the Director of the Federal Register as of January 5, 1999.

Comments for inclusion in the Rules Docket must be received on or before January 20, 1999.

The service information referenced in this AD may be obtained from Bombardier, Inc., Canadair, Aerospace Group, P.O. Box 6087, Station Centreville, Montreal, Quebec H3C 3G9, Canada. This information may be examined at the FAA, Transport Airplane Directorate, 1601 Lind Avenue, SW., Renton, Washington; or at the FAA, Engine and Propeller Directorate, New York Aircraft Certification Office, 10 Fifth Street, Third Floor, Valley Stream, New York; or at the Office of the Federal Register, 800 North Capitol Street, NW., suite 700, Washington, DC.

SUPPLEMENTARY INFORMATION: Transport Canada Aviation (TCA), which is the airworthiness authority for Canada, recently notified the FAA that an unsafe condition may exist on certain Bombardier Model CL–600–2B19 (Regional Jet Series 100 and 200) series airplanes. TCA advises that two cases of chafing on the electrical wiring conduits of the right wing crossflow valve in the center fuel tank have been reported. Findings indicate that chafing of those electrical wiring conduits may be caused by inadequate clearance between the tube assemblies and adjacent structures. These conditions, if not corrected, could result in electrical arcing and consequent fire or explosion in the center fuel tank.

Explanation of Relevant Service Information

Bombardier has issued Alert Service Bulletin SB A601R–28–036, Revision “A,” dated September 4, 1998, which describes procedures for a one-time inspection to detect chafing or cracking of all electrical wiring conduits in the center fuel tank, and inadequate clearance between the tube assemblies and adjacent structures. The alert service bulletin also describes procedures for corrective actions, which include repairing or replacing any damaged conduit that is outside specified limits with a tube assembly (as specified in the service bulletin), and relocating and reforming the conduits to provide adequate clearance. In addition, the alert service bulletin specifies procedures for a modification to reinforce the crossflow shutoff valve conduit with a bracket to ensure the continued safety of the electrical
