Proposed Project

Follow-Up Study of Children With Developmental Disabilities (0920-0436)—Revision—National Center for Environmental Health (NCEH). In the mid-1980s, a number of 10-year-old children were identified as having one or more of five developmental disabilities: mental retardation, cerebral palsy, epilepsy, hearing impairment, or vision impairment. These children were identified (mainly from special

education records in the public schools) in the metro-Atlanta area as part of a study to develop surveillance methods for these conditions in school-age children. A follow-up study was initiated to trace, locate and interview these children, who are now in their early twenties, to assess their status with regard to educational attainment, employment, living arrangements, services received, functional limitations, adaptive behavior, social participation, health, and quality of life.

This study proposes to continue with the one-time, in-person interview and

includes a contemporaneous comparison group of persons who, at age 10 years, were in regular education classes in the same schools as were the persons with developmental disabilities. The data generated from this study will continue to be used to estimate the burden of secondary health conditions, limited social participation, and economic disadvantage among young adults with long-standing, developmental impairments. This request is for a one-year renewal of the currently-approved study. The total annual burden hours are 1,093.

Respondents	No. of respondents	No. of responses/respondent	Avg. burden of response (in hrs.)
Contacting	1,056	1	10/60
Interview	898	1	60/60
Call backs	90	1	10/60

Dated: February 14, 2000.

Charles Gollmar,

Acting Associate Director for Policy, Planning and Evaluation, Centers for Disease Control and Prevention (CDC).

BILLING CODE 4163-18-M

are introduced each year. Yet the list of environmental chemicals and agents that have been investigated to determine whether they have adverse effects on reproductive health is still limited. With the growing number of women in the work force, it is becoming increasingly important to evaluate the potential female reproductive health effects of occupational and physical agents.

This study will examine reproductive disorders among female flight attendants. Approximately 66,000 flight attendants are currently employed by U.S. commercial airlines and are potentially exposed to ionizing radiation and disruption of circadian rhythms, two exposures that may adversely affect reproductive function. Teachers will be enrolled as an external comparison group for this study.

Data from company personnel records containing demographic and work history information will be used to estimate workplace exposures. Each woman will be asked to complete a telephone questionnaire on reproductive history and other factors (such as cigarette smoking) that may influence reproductive function. Each questionnaire will take approximately 60 minutes to complete. Medical records will be requested to confirm adverse reproductive outcomes reported by the participants. The risk of adverse reproductive outcomes between the two groups of women will then be compared. The total annual burden hours are 6200.

Respondents	No. of respondents	No. of responses/respondent	Avg. burden per response
Workers	6,200	1	1.0
Medical providers	1,200	1	0.5

Dated: February 14, 2000.
