

communication systems. The difficulty in measuring both the UWB signal characteristics and their effect on other devices exacerbates the difficulties of this coordination. The pulses are very narrow, often in the low nanosecond or picosecond range, requiring new measurement techniques and equipment to measure the signal characteristics accurately. Further, the interference effects of very narrow pulses with high repetition rates and aggregations of similar devices, such as could occur in some applications of UWB technology, are not well understood.

The NTIA has therefore undertaken this measurement program to develop information to help address the implementation and operation of UWB systems. The objectives of this test plan are to:

1. Develop measurement procedures that use commercial-off-the-shelf (COTS) measurement equipment to accurately portray UWB emission characteristics;
2. Observe effects of UWB signals in the intermediate frequency (IF) sections of selected receivers, and determine the susceptibility of conventional radio receivers to UWB emissions;
3. Provide a basis for development of a one-on-one interference analysis procedure to determine the minimum needed separation distances or the maximum peak and average effective isotropic radiated power (EIRP) of UWB devices to ensure compatibility;
4. Perform a limited set of measurements to validate the one-on-one interference analysis (above) between UWB signals and selected Federal radio receivers, particularly radio navigation and safety-of-life systems; and
5. Investigate how multiple UWB emissions add together within a single receiver.
