BILLING CODE 7555-01-M

NUCLEAR REGULATORY COMMISSION

[Docket No. 50-353]

Exelon Generation Company, Limerick Generating Station, Unit 2

1.0 Background

The Exelon Generation Company (Exelon, the licensee) is the holder of Facility Operating License No. NPF-85 which authorizes operation of the Limerick Generating Station, Unit 2 (Limerick Unit 2). The license provides, among other things, that the facility is subject to all rules, regulations, and orders of the U.S. Nuclear Regulatory Commission (NRC, the Commission) now or hereafter in effect.

The facility consists of a boiling water reactor located in Montgomery and Chester Counties in Pennsylvania.

2.0 Purpose

Title 10 of the Code of Federal Regulations (10 CFR) Part 50, Appendix G, requires that pressure-temperature (P-T) limits be established for reactor pressure vessels (RPVs) for normal operating and hydrostatic or leak rate testing conditions. Specifically, 10 CFR Part 50, Appendix G, section IV.A.2.a, states, "The appropriate requirements on both the pressure-temperature limits and the minimum permissible temperature must be met for all conditions." Appendix G of 10 CFR Part 50 specifies that the P-T limits identified as "ASME [American Society of Mechanical Engineering Pressure and

Vessel Code (ASME Code)] Appendix G limits" in Table 1 require that the limits must be at least as conservative as the limits obtained by following the methods of analysis and the margins of safety of Appendix G of section XI of the ASME Code.

To address provisions of a proposed license amendment to the technical specification P-T limits for the Limerick facility, the licensee requested in its submittal of November 20, 2000, as supplemented December 20, 2000, that the staff exempt Limerick Unit 2 from application of specific requirements of Appendix G to 10 CFR Part 50, and substitute use of ASME Code Case N-640. Code Case N-640 permits the use of an alternate reference fracture toughness (K_{Ic} fracture toughness curve instead of K_{Ia} fracture toughness curve) for reactor vessel materials in determining the P-T limits. Since the K_{Ic} fracture toughness curve of ASME Section XI, Appendix A, Figure A-2200-1 (the K_{Ic} fracture toughness curve, K_{Ic} curve) provides greater allowable fracture toughness than the corresponding K_{Ia} fracture toughness curve of ASME Section XI, Appendix G, Figure G-2210-1 (the K_{Ia} curve), using Code Case N-640 for establishing the P-T limits would be less conservative than the methodology currently endorsed by 10 CFR Part 50, Appendix G. The regulations (10 CFR 50.60(b)) state that proposed alternatives to the requirements in Appendix G to 10 CFR Part 50 may be used when an exemption is granted by the Commission under 10 CFR 50.12.

3.0 Discussion

Code Case N-640 (formerly Code Case N-626)

The licensee has proposed an exemption to allow use of ASME Code Case N-640 in conjunction with ASME section XI, 10 CFR 50.60(a) and 10 CFR Part 50, Appendix G, to determine P-T limits.

The proposed license amendment to revise the P-T limits for Limerick Unit 2 relies in part on the requested exemption. These revised P-T limits have been developed using the K_{Ic} fracture toughness curve, in lieu of the K_{Ia} fracture toughness curve, as the lower bound for fracture toughness.

Use of the K_{Ic} curve in determining the lower bound fracture toughness in the development of P-T operating limits curve is more technically correct than use of the K_{Ia} curve, since the rate of loading during a heatup or cooldown is slow and is more representative of a static condition than a dynamic condition. The K_{Ic} curve appropriately
