

safety, up to 10-fold, for added protection for infants and children in the case of threshold effects unless EPA determines that a different margin of safety will be safe for infants and children.

The toxicological data base for evaluating prenatal and postnatal toxicity for clethodim is complete with respect to current data requirements. There are no special prenatal or postnatal toxicity concerns for infants and children, based on the results of the rat and rabbit developmental toxicity studies or the 3-generation reproductive toxicity study in rats. Valent U.S.A. Corporation concludes that reliable data support use of the standard 100-fold UF and that an additional uncertainty factor is not needed for clethodim to be further protective of infants and children.

ii. *Chronic exposure and risk.* Using the conservative exposure assumptions described above (anticipated residues and percent of crop treated), the percentage of the cPAD that will be utilized by dietary (food only) exposure to residues of clethodim ranges from 0.7% for nursing infants (<1 year old), up to 4.5% for children (1–6 years). Adding the worst case potential incremental exposure to infants and children from clethodim in drinking water (0.001 mg/kg bwt/day) greatly increases the aggregate, chronic dietary exposure and the occupancy of the cPAD by 10.0% to 14.5% for children (1–6 years). EPA generally has no concern for exposures below 100% of the cPAD because the cPAD represents the level at or below which daily aggregate dietary exposure over a lifetime will not pose appreciable risks to human health. It can be concluded that there is a reasonable certainty that no harm will result to infants and children from aggregate, chronic exposure to clethodim residues.

iii. *Acute dietary exposure and risk.* An acute dietary endpoint was not identified. Thus, the risk from acute aggregate dietary exposure to clethodim is considered to be negligible.

iv. *Non-dietary exposure and aggregate risk.* Acute, short-term, and intermediate-term dermal and inhalation risk assessments for residential exposure to clethodim are not required because no significant toxicological effects were observed.

F. International Tolerances

Codex, Canadian, or Mexican maximum residue levels (MRLs) have been established or proposed for residues of clethodim in/on sugar beets (0.1 ppm), potatoes (0.2 ppm), rape seed (0.5 ppm), rape seed oils (0.5 ppm), sunflower seed (0.5 ppm), and

sunflower seed oils (0.05 ppm). There are no conflicts between this proposed action and international residue limits. [FR Doc. 01-7640 Filed 3-27-01; 8:45 am]
