

The Agency at this time has not determined whether it will require information on the endocrine effects of this substance. Congress has allowed 3 years after August 3, 1996, for the Agency to implement a screening program with respect to endocrine effects.

C. Aggregate Exposure

1. *Dietary exposure.* Some vinyl acetate polymers may be used in contact with food as components of containers used to manufacture, process, or store food when regulated for such use under the Federal Food, Drug, and Cosmetic Act. Vinyl acetate polymers with a molecular weight greater than 1,000 daltons are not readily absorbed through the intact GI tract and are considered incapable of eliciting a toxic response.

2. *Non-dietary exposure.* Typical uses of vinyl acetate polymers are in the paints & coatings and adhesives industries. In these uses the primary exposures are dermal, however; vinyl acetate polymers with a molecular weight significantly greater than 400 are not readily absorbed through the intact skin and are considered incapable of eliciting a toxic response.

D. Cumulative Effects

There are data to support a conclusion of negligible cumulative risk for vinyl acetate polymers. Polymers with molecular weights greater than 400 generally are not absorbed through the intact skin, and substances with molecular weights greater than 1,000 generally are not absorbed through the intact GI tract. Chemicals not absorbed through the skin or GI tract generally are incapable of eliciting a toxic response. Therefore, there is no reasonable expectation of increased risk due to cumulative exposure. Based on these polymers conforming to the definition of a polymer and meeting the criteria of a low risk polymer under 40 CFR 723.250, Uniqema believes there are no concerns for risks associated with cumulative effects.
