

Dated: May 21, 2002.

Nancy E. Cheal,

Acting Associate Director for Policy,
Planning, and Evaluation, Centers for Disease
Control and Prevention.

[FR Doc. 02-13419 Filed 5-29-02; 8:45 am]

BILLING CODE 4163-18-P

**DEPARTMENT OF HEALTH AND
HUMAN SERVICES**

**Centers for Disease Control and
Prevention**

[60Day-02-57]

**Proposed Data Collections Submitted
for Public Comment and
Recommendations**

In compliance with the requirement of section 3506(c)(2)(A) of the Paperwork Reduction Act of 1995 for opportunity for public comment on proposed data collection projects, the Centers for Disease Control and Prevention (CDC) will publish periodic summaries of proposed projects. To request more information on the proposed projects or to obtain a copy of the data collection plans and instruments, call the CDC Reports Clearance Officer on (404)498-1210.

Comments are invited on: (a) Whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information shall have practical utility; (b) the accuracy of the agency's estimate of the burden of the proposed collection of information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; and (d) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or other forms of information technology. Send comments to Anne

O'Connor, CDC Assistant Reports Clearance Officer, 1600 Clifton Road, MS-D24, Atlanta, GA 30333. Written comments should be received within 60 days of this notice.

Proposed Project: Gene-Environment Interactions in Beryllium Sensitization and Disease Among Current and Former Beryllium Industry Workers (OMB No. 0920-0463)—Extension—National Institute for Occupational Safety and Health (NIOSH)—Centers for Disease Control and Prevention (CDC).

Background: Beryllium is a light weight metal with wide application in modern technology. The size of the USA workforce at risk of beryllium exposure is estimated at approximately one million, with exposed workers in primary production, nuclear power and weapons, aerospace, scrap metal reclaiming, specialty ceramics, and electronics industries. Demand for beryllium is growing worldwide, which means that increasing numbers of workers are likely to be exposed. An acute pneumonitis due to occupational exposure to beryllium was common in the 1940s and 1950s, but has virtually disappeared with improvements in work-site control measures. However, even with improved controls, as many as 5% of currently-exposed workers will develop chronic beryllium disease (CBD).

CBD is a chronic granulomatous lung disease mediated through a poorly understood immunologic mechanism in workers who become sensitized. Sensitization can be detected using a blood test, that is used by the industry as a surveillance tool. The blood test for sensitization was first reported in 1989, but many questions remain about the natural history of sensitization and disease, as well as exposure risk factors. Sensitized workers, identified through workplace surveillance programs, undergo clinical diagnostic tests to

determine whether they have CBD. The proportion of sensitized workers who have beryllium disease at initial clinical evaluation has varied from 41-100% in different workplaces. Sensitized workers often develop CBD with follow-up, but whether all sensitized workers will eventually develop beryllium disease is unknown. Early diagnosis at the subclinical stage and careful follow-up seems prudent in that CBD usually responds to corticosteroid treatment. However, the efficacy of screening in preventing adverse outcomes of the disease has not yet been evaluated. Research has indicated certain genetic determinants in the risk of CBD; follow-up studies will be invaluable for further characterizing the genetic contribution to sensitization and disease.

The National Institute for Occupational Safety and Health (NIOSH) wants to determine how beryllium workers and former workers develop beryllium disease and how to prevent it. Through the proposed study, NIOSH has the opportunity to contribute to the scientific understanding of this disease in the context of environmental and genetic etiologic factors. The goals of this investigation are to: (1) Determine the occurrence of beryllium sensitization or disease; (2) seek an association with exposure measurements; (3) explore genetic determinants of susceptibility to CBD; and (4) characterize genetic determinants to ascertain if they are associated with clinical impairment or progression of disease. Through a greater understanding of the environmental and genetic risk factors associated with the onset and progression of CBD, NIOSH will be able to develop strategies for both primary and secondary prevention applicable to beryllium-exposed workers. There is no cost to respondents.

Respondents	Number of respondents	Number of responses/respondent	Avg. burden/response (in hours)	Total burden (in hours)
Former Workers	525	1	30/60	262.5
Total	262.5

Dated: May 21, 2002.

Nancy E. Cheal,

Acting Associate Director for Policy, Planning and Evaluation, Centers for Disease Control and Prevention.

Agency Forms Undergoing Paperwork Reduction Act Review

The Centers for Disease Control and Prevention (CDC) publishes a list of information collection requests under review by the Office of Management and Budget (OMB) in compliance with the Paperwork Reduction Act (44 U.S.C. Chapter 35). To request a copy of these requests, call the CDC Reports Clearance Officer at (404) 498-1210. Send written comments to CDC, Desk Officer, Human Resources and Housing Branch, New Executive Office Building, Room 10235, Washington, DC 20503. Written comments should be received within 30 days of this notice.

Proposed Project: National Public Health Performance Standards Program State Public Health System Assessment—New—Public Health Practice Program Office (PHPPPO), Centers for Disease Control and Prevention (CDC).

Since 1998, the CDC National Public Health Performance Standards Program has convened workgroups with the National Association of County and City Health Officials (NACCHO), the Association of State and Territorial Health Officials (ASTHO), the National Association of Local Boards of Health (NALBOH), the American Public Health Association (APHA), and the Public Health Foundation (PHF) to develop performance standards for public health systems based on the essential services of public health. In the fall of 2000, CDC conducted field tests with the state public health survey instruments in Hawaii, Minnesota, and Mississippi.

CDC is now proposing to implement a formal, voluntary data collection, based on the lessons learned during field testing, to assess the capacity of state public health systems to deliver the Essential Services of Public Health.

Electronic data submission will be the method of choice when state and territorial health departments complete the public health assessment.

An estimated 33 percent of the 59 state and territorial health departments are expected to participate in the National Performance Standards Program during the first year. In year two, an additional 25 percent and in year three, 22 percent. The total burden hours are estimated to be 720.

Data collection period	Number of respondents	Number of responses per respondent	Average Burden per Response (in hrs.)
Year 1 ...	20	1	15
Year 2 ...	15	1	15
Year 3 ...	13	1	15

Dated: May 21, 2002.

Nancy Cheal,

Acting Associate Director for Policy, Planning, and Evaluation, Centers for Disease Control and Prevention.

Proposed Project: National Hospital Ambulatory Medical Care Survey (NHAMCS) OMB No. 0920-0278—Revision—National Center for Health Statistics, (NCHS) Centers for Disease Control and Prevention (CDC). The National Hospital Ambulatory Medical Care Survey (NHAMCS) has been

conducted annually since 1992 and is directed by the Division of Health Care Statistics, National Center for Health Statistics, CDC. The purpose of the NHAMCS is to meet the needs and demands for statistical information about the provision of ambulatory medical care services in the United States. Ambulatory services are rendered in a wide variety of settings, including physicians' offices and hospital outpatient and emergency departments. The target universe of the NHAMCS is in-person visits made in the U.S. to outpatient departments and emergency departments of non-Federal, short-stay hospitals (hospitals with an average length of stay of less than 30 days) or those whose specialty is general (medical or surgical) or children's general. The NHAMCS was initiated to complement the National Ambulatory Medical Care Survey (NAMCS, OMB No. 0920-0234) which provides similar data concerning patient visits to physicians' offices. The NAMCS and NHAMCS are the principal sources of data on approximately 90 percent of ambulatory care provided in the United States.

The NHAMCS provides a range of baseline data on the characteristics of the users and providers of ambulatory medical care. Data collected include patients' demographic characteristics and reason(s) for visit, and the physicians' diagnosis(es), diagnostic equipment and services, medications, and disposition. These data, together with trend data, may be used to monitor the effects of change in the health care system, for the planning of health services, improving medical education, determining health care work force needs, and assessing the health status of the population.

Users of NHAMCS data include, but are not limited to, congressional offices, Federal agencies such as NIH, state and local governments, schools of public health, colleges and universities, private industry, nonprofit foundations, professional associations, as well as individual practitioners, researchers, administrators, and health planners. Uses vary from the inclusion of a few selected statistics in a large research effort, to an in-depth analysis of the entire NHAMCS data set covering several years. The estimated annualized burden for this data collection is 8,809 hours.
