

be published to notify interested parties of any public hearings that are held. At least one public hearing must be held in each adjacent coastal state. Pursuant to 33 U.S.C. 1508, we designate California as an adjacent coastal state for this application. Other states may apply for adjacent coastal state status in accordance with 33 U.S.C. 1508(a)(2). After the last public hearing, Federal agencies have 45 days in which to comment on the application, and approval or denial of the application must follow within 90 days of the last public hearing. Details of the application process are described in 33 U.S.C. 1504 and in 33 CFR part 148.

Summary of the application. The application plan calls for construction of a deepwater port and associated anchorages in an area situated in the Pacific Ocean, approximately 14 miles offshore of Ventura County, California, between the cities of Oxnard and Port Hueneme. There are no Mineral Management Service lease blocks involved with this project and the nearest lease block is Lease OCS-P 0202, Platform Gina, which is located in OCS waters 3.7 miles offshore of Port Hueneme. The facility would be adjacent to the existing San Pedro Channel shipping lane.

Port Cabrillo's terminal would be a turret moored, ship hull-like offshore Floating, Storage and Regasification Unit (FSRU), and an interconnected send-out pipeline that would tie into the existing onshore natural gas distribution system of Southern California Gas

(SoCalGas). The FSRU would include three independent Moss spherical storage tanks mounted within the vessel's hull, which would provide a total storage capacity of 276,000 cubic meters of LNG. The FSRU's deck would support LNG receiving and submerged combustion vaporization equipment and utilities, berthing accommodations for personnel, ship berthing and mooring system, and facilities for delivery of natural gas to a 30" pipeline. The pipeline would be 21 miles in length and connect onshore at Ormond Beach (near Oxnard, CA) to an existing gas supply for distribution throughout the Southern California region.

The mooring turret would be fixed to the seabed with an 8-point anchoring system, and consist of 3 flexible riser pipes and a Pipeline Ending Manifold (PLEM).

The facility would be able to receive LNG carriers between 100,000 and 220,000 cubic meter capacities. All marine systems, communication, navigation aids and equipment necessary to conduct safe LNG carrier operations and receipt of product during specified atmospheric and sea states would be provided at the port. LNG offload would be accomplished through use of up to 4, 16" diameter standard loading arm connections, and at a rate of up to 80,000 gallons per minute.

The regasification process would consist of lifting the LNG from storage tanks, pumping the cold liquid to pipeline pressure, subsequent vaporization across heat exchanging equipment and, finally, send-out

through an interconnected pipeline. No gas conditioning would be required for the terminal since the incoming LNG would be pipeline quality. Port Cabrillo expects the terminal would vaporize and deliver up to 0.9 billion cubic feet per day (Bcfd) of natural gas to the pipeline.

Dated: January 12, 2004.

Joseph J. Angelo,
Director of Standards, Marine Safety, Security, and Environmental Protection, Coast Guard.

Raymond R. Barberesi,
Director, Office of Ports and Domestic Shipping, U.S. Maritime Administration.
