Myasthenia gravis is a disease that causes muscle weakness and paralysis due to an autoimmune process that attacks the muscle. So far no mouse model has been available which has limited investigation of the disease and the development of better treatments or a cure. Our inventors have created a transgenic mouse strain that manifests immunological reactivity that underlines myasthenia gravis.

Use of Transgenic Mice To Assess the Systemic Effects of Tissue Inhibitor of Metalloproteinases-1 (TIMP) on Tumor Progression, Liver Fibrosis, Rheumatoid Arthritis, Wound Healing, and Angiogenesis

NIH researchers have produced transgenic mice over expressing human tissue inhibitor of metalloproteinases-1 (hTIMP) in the liver under the control of an albumin promoter. These mice produce large amounts of hTIMP-1 for extended periods of time, resulting in high levels of biologically active inhibitor released into the systemic circulation. In considering that the sustained high levels of circulating hTIMP-1 do not appear to affect the general health of these mice, this model can be used to study the protective effects of TIMP-1 on diseases, which involve extensive proteolytic matrix degradation and tissue remodeling. Examples of such diseases include malignant tumors, liver fibrosis, wound healing, rheumatoid arthritis, and a variety of angioproliferative diseases.
