SUPPLEMENTARY INFORMATION:

I. Abstract

The Billfish Angler Survey provides the only estimates of billfish angling activities in the Pacific and Indian Oceans. This collection of recreational billfish catch and effort data began in 1969 and now provides a 37 year index of fishing success in many areas of the Pacific. The catch per unit of effort (CPUE) is measured in catch of billfish per angler fishing day. This time series of angler success provides a measure of relative abundance and is the only survey independent of commercial fisheries in the Pacific. Trends tracked over time indicate changes in the health and size of billfish stocks. This index of relative abundance is an important component of stock assessments, developing management options and monitoring domestic and international fishery interactions.
