SUPPLEMENTARY INFORMATION: The Driftless Area National Wildlife Refuge was established in 1989 to protect habitat for the threatened northern monkshood plant and endangered Iowa Pleistocene snail. The Refuge was authorized to acquire land in eight counties of northeast Iowa, northwest Illinois, and southwest Wisconsin. The Refuge is situated within the driftless geologic land form, an area never glaciated or missed by the most recent glacial advance.

Refuge land conservation focuses on conservation of algific (cold producing) talus slope systems, a landform/habitat feature unique to karst terrain that provides cold microclimate required by northern monkshood, Pleistocene snails, and other glacial relict species. Refuge land conservation consists of acquisition and management easements. Driftless Area NWR now consists of 781 acres within nine units in four northeastern Iowa counties. The Final CCP/EIS preferred alternative proposes conservation of additional lands (through fee title purchase from willing sellers, or other means, such as management easements) in the counties initially authorized, and proposes conservation of suitable habitat in five additional counties in Iowa, four additional counties in Wisconsin, and five counties in Minnesota. Additional information gained about the target species since listing, and the listing of Leedy's roseroot, which occupies similar habitat in southeast Minnesota, indicate the need to increase the geographic area of conservation.
