

species. Key conservation areas would need to support at least 500 reproducing individuals of *Silene spaldingii*, be composed of at least 80 percent native vegetation, have adjacent habitat to support pollinating insects, and are not small or fragmented (intact habitat, preferably at least 40 acres [16 hectares] in size). Delisting of *Silene spaldingii* would be considered when 26 populations occur rangewide at key conservation areas. Populations at these key conservation areas would have to demonstrate stable or increasing population trends for at least 20 years, nonnative plants would have to be successfully controlled, and prescribed burning must be conducted to mimic historical fire regimes and with care not to impact *Silene spaldingii* or to exacerbate invasive nonnative plant populations. Seed banking would have to also occur across the species' range, and a post-delisting monitoring program would be developed and ready for implementation at the time of delisting.
