Permit No. 1557 authorizes the permit holder to investigate leatherback sea turtle regional behavior and movements in near-shore waters off the northeastern United States and to identify their dispersal in relation to oceanographic conditions and fishing activities. The research will also help establish baseline health assessments, genetic identities, sex ratios, and stable isotope composition of leatherback sea turtle tissues and prey. Researchers are authorized to conduct research on up to 12 leatherback sea turtles annually that have been disentangled from fishing gear by the stranding network or that researchers have captured using a breakaway hoop net. Turtles are measured, weighed, photographed and video taped, flipper and passive integrated transponder (PIT) tagged, blood sampled, cloacal swabbed, nasal swabbed, skin sampled, tagged with electronic instruments (e.g., satellite transmitters), and released. The research permit was issued for 5 years. The permit holder currently conducts research in waters off Cape Cod, Buzzard's Bay, Nantucket Sound, Vineyard Sound, and Atlantic waters off Monomoy Island and requests authorization also work in the area between Cape Canaveral, Florida to Savannah, Georgia. The permit holder currently conducts research June to October and requests

authorization to conduct research during February and March as well. No increase in take numbers is requested and all other aspects of the research would remain the same.

Patrick Opaty or Amy Hapeman, (301)713-2289.

SUPPLEMENTARY INFORMATION: The subject permit is requested under the authority of the Endangered Species Act of 1973, as amended (ESA; 16 U.S.C. 1531 *et seq.*) and the regulations governing the taking, importing, and exporting of endangered and threatened species (50 CFR 222-226).

The researchers propose to continue long-term monitoring of the status of leatherback sea turtles off the coasts of California, Oregon, and Washington to determine their abundance, distribution, size ranges, sex ratio, health status, diving behavior, local movements, habitat use, and migration routes. Up to 38 animals would be captured using a breakaway hoop net and be measured, weighed, blood and tissue sampled, photographed, and flipper and passive integrated transponder (PIT) tagged. A subset of animals would have biotelemetry devices (e.g., transmitters) attached to them. An additional 40 animals would be approached (but not captured) and have a VHF/TDR/sonic tag unit attached to them by suction cup using a long pole or these animals would be tissue sampled with a biopsy pole. The primary goal is to address priorities outlined in the U.S. Pacific leatherback Recovery Plan and identify critical forage habitats, genetic stock structure, migratory corridors, and potential fishery impacts on this species in the Pacific. This information is necessary to make informed management decisions concerning these turtles and their habitat. The permit would be issued for 5 years.
