Interferon Alpha Hybrids

Description of Technology: Available for licensing are hybrid interferon alpha (INF- α) polypeptides constructed by combinations of INF α 21b and INF α 2c, and mutants of these hybrids. These hybrid constructs have resulted in novel IFNs that either combine different biological properties from the parent proteins or have significantly different biological activity from both the parents in anti-proliferative, anti-viral, or competitive binding properties. For instance, the hybrid designated HY-3 has higher anti-proliferative activity in Daudi, WISH, and primary human lymphocyte cells exhibiting approximately 6 times higher anti-proliferative activity than either parent IFN. These IFN hybrids provide a powerful tool for studying the structure-function relationship of these molecules. The engineered IFN- α proteins may have important new therapeutic applications and may provide greater insights into understanding of the clinical activities of existing IFN- α s.

Also available for licensing are hybrid INF- α nucleic acids encoding the hybrid polypeptides as well as cells, vectors, pharmaceutical compositions with these nucleic acid sequences.

Applications:

Anti-viral and cancer therapeutics.

Research tool to study IFN- α functions.

Market:

Interferon alpha market was worth \$2.1 billion in 2005.

Industry focus is novel subtype or interferon alpha variants with improved pharmacodynamic and safety properties.

Development Status: The technology is currently in the pre-clinical stage of development.
