Collaborative Research Opportunity: The NIH Chemical Genomics Center is seeking statements of capability or interest from parties interested in collaborative research to further develop, evaluate, or commercialize appropriate lead compounds described in U.S. Provisional Application No. 61/199,763. Please contact Dr. Craig J. Thomas via e-mail (craig@nhgri.nih.gov) for more information.

Polyclonal Antibodies to the Kidney Protein Sodium-Hydrogen Exchanger 3 (NHE3)

Description of Technology: Antibodies to NHE3, useful for immunoblotting and immunocytochemistry, are available to resell for research purposes. NHE3 is a membrane Na+/H+ exchanger involved in maintenance of fluid volume homeostasis in the kidney. It is expressed on the apical membrane of the renal proximal tubule and plays a major role in NaCl and HCO₃⁻ absorption. The inventor has developed rabbit polyclonal antibodies directed against a peptide sequence common to human, rat and mouse NHE3.

Applications: Western blotting and immunocytochemistry.

Inventor: Mark A. Knepper (NHLBI).
Related Publication: Unpublished.
Licensing Status: This technology is available as a research tool under a Biological Materials License.
Licensing Contact: Steve Standley, Ph.D.; 301–435–4074; sstand@od.nih.gov.
Polyclonal Antibodies to NKCC2, a Kidney-Specific Member of the Cation Chloride Co-transporter Family, SLC12A1

Description of Technology: Antibodies to NKCC2, useful for immunoblotting and immunocytochemistry, are available to resell for research purposes. NKCC2 is found on the apical surface of the thick ascending limb of the loop of Henle, where it facilitates transport of sodium, potassium, and chloride ions from the lumen of the renal thick ascending limb into the cell. Transport of sodium dilutes the luminal fluid, decreasing its osmolality creating an osmotic driving force for water reabsorption in the connecting tubule and cortical collecting duct under the influence of the hormone vasopressin. NKCC2 is blocked by loop diuretics such as furosemide. The inventor has developed rabbit polyclonal antibodies directed against a peptide sequence in the N-terminal tail of NKCC2.

Applications: Western blotting and immunocytochemistry.

Inventor: Mark A. Knepper (NHLBI).
Related Publications:
Licensing Status: This technology is available as a research tool under a Biological Materials License.

Licensing Contact: Steve Standley, Ph.D.; 301–435–4074; sstand@od.nih.gov.

Polyclonal Antibodies to the Kidney Protein Urea Transporter 1 (UTA1)

Description of Technology: Antibodies to UTA1, useful for immunoblotting and immunocytochemistry, are available to resell for research purposes. Urea Transporter 1 (UTA1) is activated by vasopressin and is responsible for urea transport across the apical membrane into the intracellular space within the renal inner medullary collecting duct. The inventor has developed rabbit polyclonal antibodies directed against a peptide sequence in human UTA1. Antibody also recognizes UTA3, another product of the same gene.

Applications: Western blotting and immunocytochemistry.

Inventor: Mark A. Knepper (NHLBI).
Licensing Status: This technology is available as a research tool under a Biological Materials License.

Licensing Contact: Steve Standley, Ph.D.; 301–435–4074; sstand@od.nih.gov.

Dated: April 28, 2009.

National Institutes of Health

Government-Owned Inventions; Availability for Licensing

AGENCY: National Institutes of Health, Public Health Service, HHS.

ACTION: Notice.

SUMMARY: The inventions listed below are owned by an agency of the U.S. Government and are available for licensing in the U.S. in accordance with 35 U.S.C. 207 to achieve expeditious commercialization of results of federally-funded research and
development. Foreign patent applications are filed on selected inventions to extend market coverage for companies and may also be available for licensing.

**ADDRESSES:** Licensing information and copies of the U.S. patent applications listed below may be obtained by writing to the indicated licensing contact at the Office of Technology Transfer, National Institutes of Health, 6011 Executive Boulevard, Suite 325, Rockville, Maryland 20852–3804; telephone: 301/496–7057; fax: 301/402–0220. A signed Confidential Disclosure Agreement will be required to receive copies of the patent applications.

**Genetic Mutations Associated With Stuttering**

**Description of Technology:** NIH investigators, for the first time, identified specific mutations associated with stuttering. These mutations are located within the genes encoding three enzymes, Glic-Nac phosphotransferase catalytic subunit [GNPTAB], Glic-Nac phosphotransferase recognition subunit [GNPTG], and N-acetylglycosamine-1-phosphodiester alpha-N-acetylglycosaminidase [NAGPA]. Together these constitute the pathway that targets lysosomal enzymes to their proper location. This pathway is associated with lysosomal storage disorders, and thereby this discovery provides potential novel therapeutic targets for amelioration of stuttering. This discovery has the potential to facilitate DNA-based (micro-array) testing among individuals who stutter, as well as enzyme-replacement therapy and small-molecule chaperone therapy for treatment of stuttering. The mutations described in this invention may account for up to 5–10% of this disorder in individuals who stutter, estimated to represent 60,000–120,000 individuals in the United States.

**Applications:** Genetic diagnosis of stuttering disorder; Therapeutics for stuttering disorder.

**Development Status:** Early stage.

**Market:** According to the Stuttering Foundation of America, stuttering affects over 3 million individuals in the United States.

**Inventors:** Dennis T. Drayna (NIDCD), Changsoo P. Kang (NIDCD), et al.

**Licensing Status:** Available for licensing.

**Licensing Contact:** Suryanarayana (Sury) Vepa, Ph.D., J.D.; 301–435–5020; vepas@mail.nih.gov.

**Novel Means of Regulation of Gene Expression: Modular and Artificial Splicing Factors**

**Description of Technology:** This discovery provides a new therapeutic approach for treatment of diseases caused by altered gene regulation resulting from defective alternative splicing of genes. This technology offers the following advantages over currently available methods for regulating splicing: (a) Delivery can be through standard gene therapy methods, such as viral vectors, (b) site of delivery of the artificial splicing factors can be controlled, which enables targeted expression and limited side effects, and (c) the artificial splicing factors described here can be readily adapted to a variety of splicing effector modules. This invention provides proteins that combine an RNA recognition module that can specifically target an endogenous pre-mRNA with splicing effector modules that alter splicing to favor a particular isoform of a mature mRNA.

The artificial splicing factors disclosed here can be used to treat conditions requiring directed alternative splicing. For example, the artificial splicing factors described here can be used in combination with other anti-tumor drugs as a cancer treatment. Other examples where this technology may find use include diabetes (insulin receptor), psoriasis (fibronectin), polycystic kidney disease (PKD2), and prostate cancer (fibroblast growth factor receptor 2).

**Applications:** Therapeutics for diabetes, psoriasis, polycystic kidney disease, and prostate cancer; Research Tools.

**Development Status:** Early stage.

**Licensing Status:** Available for licensing.

**Licensing Contact:** Suryanarayana (Sury) Vepa, Ph.D., J.D.; 301–435–5020; vepas@mail.nih.gov.

**Collaborative Research Opportunity:** The National Institute of Dental and Craniofacial Research, Oral Infection and Immunity Branch, Receptors and Signal Transduction Section, is seeking statements of capability or interest from parties interested in collaborative research to further develop, evaluate, or commercialize Modular and Artificial Splicing Factors. Please contact Elizabeth M. Denholm, Ph.D. at 919–541–0981 or denholm@niehs.nih.gov or Traci Hall, Ph.D. at hall4@niehs.nih.gov for more information.

**Dated:** April 29, 2009.
