Variable Curve Catheter

**Description of Invention:** The invention provides a deflectable tip guiding device, such as a catheter, that enables the operator to vary the radius of curvature of the tip of the catheter. This is a novel variation on the classic “fixed fulcrum” tip deflectors used in minimally invasive procedures in open surgical treatments. The described device permits a more comprehensive ability to navigate complex geometric pathways in patient's body and enables better access to target structures (e.g., to all endomyocardial walls from a transaortic approach). The guiding device can be made compatible with imaging methods like MRI. The described technology can be used as a platform for a variety of interventional devices for delivery of drugs, cells, energy, or sutures through complex trajectories of the body.

**Inventors:** Robert J. Lederman and Parag V. Karmarkar (NHLBI).

**Licensing Status:** Available for licensing.

**Licensing Contact:** Jeffrey A. James; 301–435–5474; jeffreyj@nih.gov. Collaborative Research Opportunity: The NHLBI Translational Medicine Branch Cardiovascular Intervention Program is seeking statements of capability or interest from parties interested in collaborative research to further develop, evaluate, or commercialize technology for image-guided cardiovascular interventions. Please contact Peg Koelble at koeblep@nhlbi.nih.gov for more information.

**DEPARTMENT OF HEALTH AND HUMAN SERVICES**

**National Institutes of Health**

**Government-Owned Inventions; Availability for Licensing**

**AGENCY:** National Institutes of Health, Public Health Service, HHS.

**ACTION:** Notice.

**SUMMARY:** The inventions listed below are owned by an agency of the U.S. Government and are available for licensing in the U.S. in accordance with...
35 U.S.C. 207 to achieve expeditious commercialization of results of federally-funded research and development. Foreign patent applications are filed on selected inventions to extend market coverage for companies and may also be available for licensing.

**Addresses:** Licensing information and copies of the U.S. patent applications listed below may be obtained by writing to the indicated licensing contact at the Office of Technology Transfer, National Institutes of Health, 6011 Executive Boulevard, Suite 325, Rockville, Maryland 20852–3804; telephone: 301/496–7057; fax: 301/402–0220. A signed Confidential Disclosure Agreement will be required to receive copies of the patent applications.

**Thermostable Y-Family Polymerases**

**From Fungi for Use in Forensic DNA Services and Analysis of Damaged or Ancient DNA**

**Description of Invention:** Y-family polymerases are able to bypass lesions in DNA that would otherwise block replication by high fidelity DNA polymerases and are key to the effective study of ancient DNA and for use in forensic medicine. These enzymes are ubiquitous and are found in all kingdoms of life: Bacteria, archaea and eukaryotes. The number of proteins related to the Y-family polymerases is well over 200 orthologs and despite being closely related at the phylogenetic level, the few polymerases now characterized, each show a unique set of properties including processivity, fidelity, and the ability to bypass certain types of DNA. Y-family polymerases from thermostable organisms are of particular interest because the enzymes isolated from such species tend to be more stable, easy to work with and may have more utility in assays at higher temperatures, such as Polymerase Chain Reaction (PCR). For example, the thermostable archael Sulfolobus solfataricus DinB-like polymerase Dpo4 can bypass lesions by generally inserting the correct complementary nucleotide opposite a variety of damaged bases and can, under appropriate conditions substitute for Taq polymerase in PCR applications. [Nucleic Acids Res. 2001 Nov 15;29(22):4607–4616; HHS Ref. No. E–232–2001/0]. Additionally, functional and structural organization of this family of polymerases permits domain swapping designed to optimize specific properties of use in novel applications [J Biol Chem. 2004 Jul 30;279(31):32932–32940].

Dr. Woodgate’s group at the National Institute of Child Health and Development have expanded their earlier work (HHS Ref. Nos. E–166–2004/0.1, &/2) and have now cloned and expressed full length Y-family polymerases Thermoascus auranticus Pol eta, Thermomyces lanuginosus Pol eta, Thermomyces lanuginosus Pol iota, Thermomyces lanuginosus Pol kappa, Thermomyces lanuginosus REV1, Sporotrichum thermophile Pol eta, Sporotrichum thermophile Pol iota, Sporotrichum thermophile Pol kappa, and Sporotrichum thermophile REV1. These full length enzymes may be a good substitute for Taq polymerase in applications utilizing fluorescent nucleoside triphosphate derivatives. These lesion-bypassing polymerases could also be included along with a conventional thermostable polymerase in a PCR protocol designed to amplify old or damaged DNA samples which could greatly increase recoverability, accuracy and length of products. Other applications could include labelling or tagging DNA, real-time PCR, detection of SNPs, mismatches or DNA lesions, mutagenic PCR, directed-evolution methods and expanding the "DNA alphabet" utilizing non-natural nucleotides.

Available for licensing are several full length novel Y-family polymerases. These enzymes and methods should be of interest to forensic DNA service companies as well as to research reagent companies as well as to research reagent companies as well as to research reagent companies as well as to research reagent companies as well as to research reagent companies as well as to research reagent companies as well as to research reagent companies as well as to research reagent companies as well as to research reagent companies as well as to research reagent companies as well as to research reagent companies as well as to research reagent companies. The invention relates to methods of stimulating or enhancing an immune response using 15 kD granulysin. Investigators at the NIH have discovered that 15 kD granulysin (but not 9 kD granulysin) activates monocytes and induces them to differentiate into mature dendritic cells and activates allospecific T cells. This activation and subsequent differentiation induced by 15 kD granulysin may be useful in inducing or regulating immune responses in a host. Consequently, this invention could be used treat tumors and infections, particularly as an adjuvant for vaccines immunotherapies. Further, this technology could be used to treat autoimmune disorders and organ transplant rejection.

**Advantages:**

• Stimulating immunity to vaccinations, tumors or infections.
• Blocking the induction of an immune response in an autoimmune disease or organ transplant rejection.

**Development Status:**

Pre-clinical stage.

Animal data available.

**Inventors:** Alan M. Krensky and Carol Conrad, Ph.D.

**Contact:** Joseph Conrad, Ph.D. at 301–435–3107 or jmconrad@mail.nih.gov for more information.

**Compositions and Methods for Immunotherapy**

**Description of Invention:** Granulysin is a cytolytic and proinflammatory molecule expressed by activated human cytotoxic T lymphocytes (CTLs) and natural killer (NK) cells. It has been implicated in many of diseases including infection, cancer, transplantation, autoimmunity, skin and reproductive maladies. Small synthetic forms of granulysin are being developed as novel antibiotics and studies suggest that granulysin may be a useful diagnostic biomarker and/or therapeutic for a wide variety of diseases.

Investigators at the NIH have discovered that 15 kD granulysin (but not 9 kD granulysin) activates monocytes and induces them to differentiate into mature dendritic cells and activates allospecific T cells. This activation and subsequent differentiation induced by 15 kD granulysin may be useful in inducing or regulating immune responses in a host. Consequently, this invention could be used treat tumors and infections, particularly as an adjuvant for vaccines immunotherapies. Further, this technology could be used to treat autoimmune disorders and organ transplant rejection.

**Advantages:**

• An immune response activator with broad applicability to the treatment of several diseases, including cancer, atherosclerosis, diabetes, autoimmune disorders, allergies, and infections.
• Co-administering 15 kD granulysin could increase the efficacy of vaccines and immunotherapeutics.

Licensing Status: Available for licensing.  
Licensing Contact: Whitney Hastings, M.S.; 301–451–7337; hastingw@mail.nih.gov.  
Collaborative Research Opportunity: The Center for Cancer Research, Laboratory of Cellular and Molecular Biology, is seeking statements of capability or interest from parties interested in collaborative research to further develop, evaluate, or commercialize this technology. Please contact John Hewes, Ph.D. at 301–435–3131 or hewesj@mail.nih.gov.

Fully-Human Monoclonal Antibodies Against Human EphrinB2 and EphB4 for Use in the Study of Cancer Pathogenesis  
Description of Invention: Ephrin receptor tyrosine kinases and their ephrin ligands have been implicated in cancer pathogenesis. Ephrin receptors and ligands affect tumor growth, invasiveness, angiogenesis, and metastasis. Ephrin signaling activities in cancer are complex and are only now beginning to be uncovered.

Researchers at the National Cancer Institute-Frederick, NIH, have developed a set of five fully-human monoclonal antibodies against human Ephrin-B2 and Ephrin type-B receptor 4 (“EphB4”). The antibodies were identified by screening a naïve human antibody phage display library against Ephrin-B2 and EphB4. These human monoclonal antibodies have high affinity and specificity for Ephrin-B2 and EphB4.

Applications:  
• Research reagents for in vitro/in vivo investigation of Ephrin receptor and ligand interactions.  
• Targeting reagents for in vivo imaging.  
• Research reagents for protein co-crystallization.  
Advantages:  
• High affinity and antigen specificity.  
• Bind both soluble ectodomains and cell surface-expressed molecules.  
Inventors: Dimitar S. Dimitrov et al. (NCI).

New Mouse Strain With Conditional Deletion of SMAD7: Analysis of Disease Processes Involving Immunological, Fibrotic or Cardiovascular Indications  
Description of Invention: SMAD7 conditional knockout mice are available for licensing. SMAD7 can be knocked out by breeding with CRE-recombinase transgenic mice with a variety of promoters to yield tissue or cell type-specific deletions of SMAD7. SMAD7 has been shown to play a role in bone morphogenesis, cardiovascular tissue generation, immune regulation and fibrosis. Therefore, these mice provide a unique model to examine the role of the SMAD7 gene in disease processes that involve immunological, fibrotic, or cardiovascular components.

Specifically, these mice may represent a novel model of Scleroderma, a disease with both an immunological and fibrotic component.

Applications:  
• Mouse model of Scleroderma.  
• Means of studying bone morphogenesis and cardiovascular tissue generation.  
• Means of studying the role of SMAD7 in immune regulation.  
Inventors: Marilyn Diaz (NIEHS).  
Licensing Status: This technology is available as a research tool under a Biological Materials License.

ADDRESS: Licensing Contact: Steve Standley, Ph.D.; 301–435–4074; sstand@od.nih.gov.  
Collaborative Research Opportunity: The NIEHS is seeking statements of capability or interest from parties interested in collaborative research to further develop, evaluate, or commercialize this technology. Please contact Dr. Elizabeth M. Denholm, denholmme@niehs.nih.gov, for more information.

A Method of Reducing Cholesterol Biosynthesis With Specific MicroRNAs  
Description of Invention: This technology is directed to the discovery of specific microRNAs that target and downregulate enzymes within the cholesterol biosynthetic pathway and is currently being tested in vivo.

Briefly, microRNAs regulate the translation of messenger RNAs (mRNAs)
