Software System for Analysis of Extremely Large Experimental Dataset and Multidimensional Drug Discovery

Description of Invention: This invention is a computer software suite that will enable its user to investigate extremely large experimental datasets in a simple yet multidimensional manner. The software, *Omnimorph*, allows multidimensional investigation of any form of data including experimental datasets in biomedical science using either gene arrays or proteomics. *Omnimorph* allows the user to look for extremely subtle correlated differences between experimental datasets which will allow the investigator to discover far more drug- or disease-specific factors than other analytical methods currently used. The software of present invention has been employed in the targeted discovery of G protein-independent receptor-based pharmacotherapeutics. These discoveries represent an entirely new GPCR-based G protein-independent pharmacopeia. Therefore, the *Omnimorph* is not only newly developed software, but the *Omnimorph* suite can also be used as a simple and unbiased tool to detect novel and unexpected modes of GPCR-based drug actions. This could potentially alter the way drugs are developed and screened in the future.

Applications:

- Development and screen for pharmaceutical drugs.

- Biomedical research.

Development Status:

- The invention has been fully developed.

- The software will be readily available if so requested.

Sound Attenuation Canopy for Reducing Noise Transmitted Through Suspended Ceilings

Description of Invention: Available for licensing and commercial implementation in commercial facilities design and construction are intellectual property rights covering a sound attenuation canopy for reducing noise transmitted through suspended ceiling systems commonly used in most office buildings. The canopy is designed to absorb sound energy and effectively reduce the direct path of sound travelling within open plenum suspended ceilings like those used in most office building environments. The canopy can also act as an umbrella to shield loose debris and dust which may be located in the plenum and potentially fall when ceiling suspended return-air grilles are moved or accessed. The canopy has an added benefit of reducing heating or cooling loss which may naturally ventilate through the return air plenum grille from a conditioned office space below. Also, the canopy controls leakage of heating and cooling, reducing loads on the central building systems thereby lessening energy costs and extending the life-cycle of the building's physical plant.

The canopy does not impede natural air flow for ventilating the plenum cavity but deters the spread of smoke or fire between the plenum and the office space below. The canopy can also act as a secondary air balancer or K Factor balancer to equate supply and return air to control room temperature. The canopy is pliable and therefore allows for ease of adjustment within varying plenum conditions as well as readily installed in ceiling plenums.

Applications:

- Building design and construction.
- Sound attenuation.
- Energy load reduction.
