

FFP's Mississippi Lock and Dam #14 Project (Project No. 13814-000) would consist of: (1) Two to four modular generation units placed in 12 of the existing gate bays of the Corps' lock and dam structure. These units would contain compact bulb turbines with individual unit capacities of 0.35 MW and 0.70 MW and have a combined capacity of 16.8 MW; (2) a 30-foot x 40-foot control building located on the south side of the river; (3) a 13,100-foot-long transmission line extending south from the switchyard near the proposed powerhouse to an interconnection point on the Illinois shore with an existing transmission line; and (4) appurtenant facilities. The proposed operating voltage would be in the 34 to 138-kV range. FFP is also exploring an alternative that would involve construction of a new 220-foot-long x 250-foot-wide x 50-foot-high conventional powerhouse, intake channel, and tailrace opposite the south side of the river. The new proposed powerhouse would contain four horizontal bulb turbines rated at 4.2 MW each. Each design would have a total energy generation of 145 gigawatt-hours per year. The project would utilize Corps designated flows from the Mississippi Lock and Dam #14 structure and operate as directed by the Corps.
