VI. Statutory and Executive Order Reviews

Under the CAA, the Administrator is required to approve a SIP submission that complies with the provisions of the Act and applicable federal regulations (42 U.S.C. 7410(k), 40 CFR 52.02(a)). Thus, in reviewing SIP submissions, EPA’s role is to approve state choices, provided that they meet the criteria of the CAA. Accordingly, this proposed action merely approves some state law as meeting federal requirements and disapproves other state law because it does not meet federal requirements; this proposed action does not impose additional requirements beyond those imposed by state law. For that reason, this proposed action:

- Is not a “significant regulatory action” subject to review by the Office of Management and Budget under Executive Order 12866 (58 FR 51735, October 4, 1993);
- Does not impose an information collection burden under the provisions of the Paperwork Reduction Act (44 U.S.C. 3501 et seq.);
- Is certified as not having a significant economic impact on a substantial number of small entities under the Regulatory Flexibility Act (5 U.S.C. 601 et seq.);
- Does not contain any unfunded mandate or significantly or uniquely affect small governments, as described in the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4);
- Does not have Federalism implications as specified in Executive Order 13132 (64 FR 43255, August 10, 1999); is not an economically significant regulatory action based on health or safety risks subject to Executive Order 13045 (62 FR 19885, April 23, 1997);
- Is not a significant regulatory action subject to Executive Order 13211 (66 FR 28355, May 22, 2001);
- Is not subject to requirements of Section 12(d) of the National Technology Transfer and Advancement Act of 1995 (15 U.S.C. 272 note) because application of those requirements would be inconsistent with the CAA; and,
- Does not provide EPA with the discretionary authority to address, as appropriate, disproportionate human health or environmental effects, using practicable and legally permissible methods, under Executive Order 12898 (59 FR 7629, February 16, 1994).

In addition, this rule does not have Tribal implications as specified by Executive Order 13175 (65 FR 67249, November 9, 2000), because the SIP is not approved to apply in Indian country located in the State, and EPA notes that it will not impose substantial direct costs on Tribal governments or preempt Tribal law.

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Parts 52 and 81

Approval, and Promulgation of Air Quality Implementation Plans; Indiana; Redesignation of the Evansville Area to Attainment of the Fine Particulate Matter Standard

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

SUMMARY: On April 3, 2008, the Indiana Department of Environmental Management (IDEM) submitted a request for EPA to approve the redesignation of the Evansville, Indiana nonattainment area to attainment of the 1997 annual fine particulate matter (PM$_{2.5}$) standard. The air quality improvement in this area and maintenance of the standard in this area is attributable in substantial part to power plant emission reductions in the Eastern United States prompted by the Clean Air Interstate Rule (CAIR). The United States Court of Appeals for the District of Columbia Circuit (D.C. Circuit) has remanded CAIR, but EPA has proposed a replacement rule known as the Transport Rule. The Evansville area has attained the standard with only a fraction of the reductions that the proposed Transport Rule proposed to require. Therefore, EPA is proposing to approve the redesignation request for the Evansville area, along with related SIP revisions, if and when EPA takes final action to promulgate the Transport Rule, provided that the final Transport Rule requires emission reductions that are at least substantially equivalent to those of the proposed Transport Rule for purposes of maintaining the standard in the Evansville area.

DATES: Comments must be received on or before June 22, 2011.

ADDRESSES: Submit your comments, identified by Docket ID No. EPA–R05–OAR–2008–0396, by one of the following methods:

2. E-mail: mooney.john@epa.gov.
3. Fax: (312) 692–2551.

5. Hand Delivery: John M. Mooney, Chief, Air Programs Branch (AR–18), U.S. Environmental Protection Agency, 77 West Jackson Boulevard, Chicago, Illinois 60604. Such deliveries are only accepted during the Regional Office normal hours of operation, and special arrangements should be made for deliveries of boxed information. The Regional Office official hours of business are Monday through Friday, 8:30 a.m. to 4:30 p.m. excluding Federal holidays.

Instructions: Direct your comments to Docket ID No. EPA–R05–OAR–2008–0396. EPA’s policy is that all comments received will be included in the public docket without change and may be made available online at http://www.regulations.gov, including any personal information provided, unless the comment includes information claimed to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Do not submit information that you consider to be CBI or otherwise protected through http://www.regulations.gov or e-mail. The http://www.regulations.gov Web site is an “anonymous access” system, which means EPA will not know your identity or contact information unless you provide it in the body of your comment. If you send an e-mail comment directly to EPA without going through http://www.regulations.gov your e-mail address will be automatically captured and included as part of the comment that is placed in the public docket and made available on the Internet. If you submit an electronic comment, EPA recommends that you include your name and other contact information in the body of your comment and with any disk or CD–ROM you submit. If EPA cannot read your comment due to technical difficulties and cannot contact you for clarification, EPA may not be able to consider your comment. Electronic files should avoid the use of special characters, any form of encryption, and be free of any defects or viruses. For additional instructions on submitting comments, go to Section I of

Federal Register / Vol. 76, No. 99 / Monday, May 23, 2011 / Proposed Rules 29695
the SUPPLEMENTARY INFORMATION section of this document.

Docket: All documents in the docket are listed in the http://www.regulations.gov index. Although listed in the index, some information is not publicly available, e.g., CBI or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, will be publicly available only in hard copy. Publicly available docket materials are available either electronically in http://www.regulations.gov or in hard copy at the U.S. Environmental Protection Agency, Region 5, Air and Radiation Division, 77 West Jackson Boulevard, Chicago, Illinois 60604. This facility is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding Federal holidays. We recommend that you telephone John Summerhays, Environmental Scientist, at (312) 886–6067 before visiting the Region 5 office.

FOR FURTHER INFORMATION CONTACT: John Summerhays, Environmental Scientist, Attainment Planning and Maintenance Section, Air Programs Branch (AR–18J), U.S. Environmental Protection Agency, Region 5, 77 West Jackson Boulevard, Chicago, Illinois 60604, (312) 886–6067, summerhays.john@epa.gov.

SUPPLEMENTARY INFORMATION: This supplementary information section is arranged as follows:
I. What should I consider as I prepare my comments for EPA?
II. What actions is EPA proposing to take?
III. What is the background for these actions?

I. What should I consider as I prepare my comments for EPA?

When submitting comments, remember to:
1. Identify the rulemaking by docket number and other identifying information (subject heading, Federal Register date, and page number).
2. Follow directions—The EPA may ask you to respond to specific questions or organize comments by referencing a Code of Federal Regulations (CFR) part or section number.
3. Explain why you agree or disagree; suggest alternatives and substitute language for your requested changes.
4. Describe any assumptions and provide any technical information and/or data that you used.
5. If you estimate potential costs or burdens, explain how you arrived at your estimate in sufficient detail to allow for it to be reproduced.
6. Provide specific examples to illustrate your concerns, and suggest alternatives.
7. Explain your views as clearly as possible, avoiding the use of profanity or personal threats.
8. Make sure to submit your comments by the comment period deadline identified.

II. What actions is EPA proposing to take?

On November 27, 2009, at 74 FR 62243, EPA made a final determination that the Evansville area has attained the 1997 annual PM_{2.5} national ambient air quality standards (NAAQS). EPA here is proposing to determine that the area continues to attain that standard. EPA is also proposing to take several additional actions related to Indiana’s request to redesignate the area to attainment for the 1997 annual PM_{2.5} NAAQS.

First, EPA is proposing to approve Indiana’s 1997 annual PM_{2.5} maintenance plan for the Evansville area as a revision to the Indiana SIP, subject to the proviso that EPA promulgates a final Transport Rule requiring power plant emission reductions substantially equivalent to the Transport Rule substantially equivalent for purposes of air quality in the Evansville area to the Transport Rule proposed on August 2, 2010.

Second, EPA is proposing to approve the 2005 emission inventory in Indiana’s maintenance plan as satisfying the requirement of section 172(c)(3) for a comprehensive emission inventory.

Third, EPA is proposing that it subject to final approval of the emissions inventory and the proviso set forth above with respect to EPA’s proposed Transport Rule, Indiana meets the requirements for redesignation of the Evansville area to attainment of the 1997 PM_{2.5} NAAQS under section 107(d)(3)(E) of the Clean Air Act.

Because CAIR was remanded, the reductions associated with that rule cannot be considered permanent and enforceable. For this reason, the submissions from Indiana do not currently demonstrate satisfaction of the requirement of section 107(d)(3)(E)(iii), that the area’s air quality improvement be due to permanent and enforceable measures. However, EPA proposes that this requirement will be met if and when EPA finalizes a Transport Rule which, for purposes of this action, is substantially equivalent to the Transport Rule that EPA proposed on August 2, 2010. Therefore, subject to this proviso, EPA is proposing to approve the request from the State of Indiana to change the designation of the Evansville area, consisting of Dubois, Vanderburgh, and Warrick Counties along with Montgomery Township in Gibson County, Ohio Township in Spencer County, and Washington Township in Pike County, from nonattainment to attainment of the 1997 PM_{2.5} NAAQS.

Finally, EPA is proposing to approve the 2015 and 2022 motor vehicle emission budgets (MVEBs) for the Evansville area into the Indiana SIP. EPA proposes to take final action on this and the other proposed actions delineated in this section if and when EPA takes final action promulgating a Transport Rule substantially equivalent for purposes of air quality in the Evansville area to the Transport Rule proposed on August 2, 2010.

III. What is the background for these actions?

The first air quality standards for PM_{2.5} were promulgated on July 18, 1997, at 62 FR 38652. EPA promulgated an annual standard at a level of 15 micrograms per cubic meter (μg/m^3), based on a three-year average of annual mean PM_{2.5} concentrations. In the same rulemaking, EPA promulgated a 24-hour standard of 65 μg/m^3, based on a three-year average of the 98th percentile of 24-hour concentrations. On October 17, 2006, at 71 FR 61144, EPA retained the annual average standard at 15 μg/m^3 but revised the 24-hour standard to 35 μg/m^3, based again on the three-year average of the 98th percentile of 24-hour concentrations.

On January 5, 2005, at 70 FR 944, as supplemented on April 14, 2005, at 70 FR 19844, EPA designated the Evansville area as nonattainment for the 1997 PM_{2.5} air quality standards. In that action, EPA defined the Evansville nonattainment area to include the entirety of Dubois, Vanderburgh and Warrick Counties and portions of three other counties, specifically including...
Montgomery Township in Gibson County, Ohio Township in Spencer County, and Washington Township in Pike County. On November 13, 2009, at 74 FR 58668, EPA promulgated redesignation for the 24-hour standard set in 2006, designating the Evansville area as attaining this standard. In that action, EPA also clarified the redesignation request by submitting the information submitted on January 28, 2011, in conjunction with evidence that the State provided a public comment period and held a public hearing on the information and received no public comments. Fine particle pollution can be emitted directly or formed secondarily through chemical reactions in the atmosphere. Sulfates are a type of secondary particle formed from sulfur dioxide (SO\textsubscript{2}) emissions from power plants and industrial facilities. Nitrates, another common type of secondary particle, are formed from emissions of nitrogen oxides (NO\textsubscript{x}) from power plants, automobiles, and other combustion sources.

Given the significance of sulfates and nitrates in the Evansville area, the area's air quality is strongly affected by regulations of SO\textsubscript{2} and NO\textsubscript{x} emissions from power plants. EPA proposed CAIR on January 30, 2004, at 69 FR 4566, promulgated CAIR on May 12, 2005, at 70 FR 25162, and promulgated the associated federal implementation plans (FIPs) on April 28, 2006, at 71 FR 25328, in order to reduce SO\textsubscript{2} and NO\textsubscript{x} emissions and improve air quality in many areas across the eastern part of the United States. However, on July 11, 2008, the D.C. Circuit Court of Appeals issued a decision to vacate and remand both CAIR and the associated CAIR FIPs in their entirety (North Carolina v. EPA, 531 F.3d 836 (D.C. Cir. 2008)). EPA petitioned for rehearing, and the court issued an order remanding CAIR and the CAIR FIPs to EPA without vacatur (North Carolina v. EPA, 550 F.3d 1176 (D.C. Cir. 2008)). The Court, thereby, left CAIR in place in order to “temporarily preserve the environmental values covered by CAIR” until EPA replaces it with a rule consistent with the court’s opinion. Id. at 1178. The court directed EPA to “remedy CAIR’s flaws” consistent with its July 11, 2008, opinion, but declined to impose a schedule on EPA for completing that action. Id. As a result of these court rulings, the power plant emission reductions that have resulted from the development, promulgation, and implementation of CAIR, and the associated air quality improvement that has occurred in the Evansville area and elsewhere, cannot be considered permanent.

On August 2, 2010, EPA published its proposal of the Transport Rule to address interstate transport of emissions with respect to the 1997 ozone and the 1997 and 2006 PM\textsubscript{2.5} NAAQS, to replace CAIR. (See 75 FR 45210.) This rule, as proposed, would require substantial reductions of SO\textsubscript{2} and NO\textsubscript{x} emissions from electric generating units (EGUs) across most of the Eastern United States. In particular, it would require reductions of these emissions to levels well below the levels that led to attainment in the Evansville area. The proposed Transport Rule proposed to establish permanent and enforceable limits on EGU emissions across most of the Eastern United States. Since the Transport Rule as proposed would require EGU emissions to be below the levels that led to attainment in the Evansville area, that rule would provide support for a determination that the air quality improvement may be considered permanent and enforceable.

IV. What are the criteria for redesignation to attainment?

The Clean Air Act sets forth the requirements for redesignating a nonattainment area to attainment. Specifically, section 110(i)(5)(E) of the Clean Air Act allows for redesignation provided that: (1) The Administrator determines that the area has attained the applicable NAAQS based on current air quality data; (2) the Administrator has fully approved an applicable state implementation plan for the area under section 110(k) of the Clean Air Act; (3) the Administrator determines that the improvement in air quality is due to permanent and enforceable emission reductions resulting from implementation of the applicable SIP, Federal air pollution control regulations, and other permanent and enforceable emission reductions; (4) the Administrator has fully approved a maintenance plan for the area meeting the requirements of section 175A of the Clean Air Act; and (5) the state containing the area has met all requirements applicable to the area for purposes of redesignation under section 110 and part D of the Clean Air Act.

V. What is EPA’s analysis of the State’s request?

EPA is proposing to approve the redesignation of the Evansville area to attainment of the 1997 annual PM\textsubscript{2.5} NAAQS and is proposing to approve the maintenance plan for the area and other related SIP revisions, subject to the provisos discussed in this notice. The bases for these proposed actions follow.

1. Attainment

As noted above, in a final rulemaking dated November 27, 2009, at 74 FR 62243, EPA determined that the Evansville area is attaining the 1997 annual PM\textsubscript{2.5} NAAQS.
paper
that the area continued to maintain the annual PM2.5 standard to 2022, it continued to use MOBILE6.2 rather than MOVES2010a to estimate the onroad emissions.\(^1\) EPA is proposing to approve Indiana’s continued use of MOBILE6.2 in this maintenance plan. Air quality data indicates that the area has attained the annual PM2.5 standard and large emissions reductions are expected in the coming years, which will allow the area to continue to meet the annual PM2.5 standard. If MOVES2010a had been used to estimate onroad emissions for the new last year of this maintenance plan, it would not change this conclusion. In addition, the recent submittal only extended the maintenance period by two years and it was not necessary for the submittal to revisit earlier years of the maintenance period. This extension was necessary because EPA could not act on the submittal at an earlier date due to issues related to the remand of the CAIR rule and the Clean Air Act’s requirement that maintenance plans address a period that covers 10 years after EPA approves the submitted maintenance plan. Also, consistent with Question 5 in EPA’s “Policy Guidance on the Use of MOVES 2010 for State Implementation Plan Development, Transportation Conformity, and Other Purposes” (http://www.epa.gov/otaq/models/moves/420b090406.pdf) we believe that since the bulk of the work on the maintenance plan was performed in 2008, which well before MOVES2010 was released, the continued use of MOBILE6.2 in this maintenance plan is warranted. Even the supplemental work performed to support the April 2011 revision was done relatively soon after MOVES was officially released for use in SIPs on March 2, 2010, at 75 FR 9411. It is also worth noting that the area has been attaining the standard for several years, and future anticipated emissions reductions will ensure that the area will continue to maintain the standard through the maintenance period. Based on all of these factors we believe that Indiana’s continued use of MOBILE6.2 is justified because it avoids an adverse impact on state resources as is also described in Question 5 of the MOVES SIP and Conformity guidance document.

Most of the nonroad emission estimates were derived using EPA’s NONROAD model. Nonroad activity levels reflect information compiled by the Lake Michigan Air Directors Consortium (LADCO), described at http://www.ladco.org/reports/technical_support_document/references/round_5_emissions_summary-february_2008.pdf. In addition, the inventory includes emission estimates for marine and railroad sources under contract to LADCO. Source emissions were developed using local activity level estimates and EPA emission factors as reflected in the 2005 National Emissions Inventory.

Base year emissions for EGUs for SO\(_2\) and NO\(_x\) were obtained from continuously monitored emission data that the facilities reported to EPA’s Clean Air Markets Division. Projections of these emissions were based on simulations using the Integrated Planning Model (IPM) premised on implementation of CAIR and the associated allowance allocations and trading programs. Indiana’s April 2011 submittal states that these emission projections rely on an expectation that the Transport Rule that EPA proposed on August 2, 2010, will require EGUs to achieve a similar set of reductions as has been required by CAIR. EGU emissions of PM2.5 were estimated using the same information on activity levels (i.e., baseline heat inputs reported to EPA and projected heat inputs forecast by IPM) in conjunction with EPA emission factors and current emission control levels. For other point sources, baseline emissions were obtained from routine source reports to the State, and projections were based on growth factors developed by LADCO based on appropriate economic indicators.

Table 2 summarizes the 2005 base year emissions estimates, subdivided by source type, that Indiana provided in its maintenance plan as submitted on January 28, 2011. The area has a modest number of people—the 2009 population estimate for the Evansville Metropolitan Statistical Area according to the U.S. Census Bureau is 351,911. The PM2.5 nonattainment area includes several large power plants that serve a broad area within the industrial Midwest and beyond. Therefore, point sources (in particular power plants) emit a very high fraction of the area’s emissions. Indeed, point sources are estimated to emit over 99 percent of the area’s SO\(_2\) emissions, about 86 percent of the area’s NO\(_x\) emissions, and about 71 percent of the area’s PM2.5 emissions, and most of the point source emissions are from power plants. EPA proposes to find that

\(^1\) MOVES2010a is EPA’s most recent model for estimating on-road mobile source emissions. It was officially released for use in SIPs and regional transportation conformity determinations on March 2, 2010, at 75 FR 9411.
the inventory satisfies the requirements of section 172(c)(3).

### c. Other Nonattainment Area Requirements

EPA is proposing to determine that, if EPA issues final approval of the emission inventories discussed above, the Indiana SIP will meet the SIP requirements for the Evansville area applicable for purposes of redesignation under Part D of the Clean Air Act. Subpart 1 of Part D, sections 172 to 176 of the Clean Air Act, set forth the basic nonattainment plan requirements applicable to \( \text{PM}_{2.5} \) nonattainment areas.

Under section 172, states with nonattainment areas must submit plans providing for timely attainment and meeting a variety of other requirements. However, pursuant to 40 CFR 51.1004(c), EPA’s November 27, 2009, determination that the Evansville area is attaining the \( \text{PM}_{2.5} \) standard suspended Indiana’s obligation to submit most of the attainment planning requirements that would otherwise apply. Specifically, the determination of attainment suspended Indiana’s obligation to submit an attainment demonstration, and requirements to provide for reasonable further progress, reasonable available control measures, and contingency measures under section 172(c)(9).

The General Preamble for Implementation of Title I (57 FR 13498, April 16, 1992) also discusses the evaluation of these requirements in the context of EPA’s consideration of a redesignation request. The General Preamble sets forth EPA’s view of applicable requirements for purposes of evaluating redesignation requests when an area is attaining the standard. General Preamble for Implementation of Title I (57 FR 13498, April 16, 1992).

Because attainment has been reached, no additional measures are needed to provide for attainment, and section 172(c)(1) requirements for an attainment demonstration and RACM are no longer considered to be applicable for purposes of redesignation as long as the area continues to attain the standard until redesignation. See also 40 CFR 51.1004(c). The RFP requirement under section 172(c)(2) and contingency measures requirement under section 172(c)(9) are similarly not relevant for purposes of redesignation.

Section 172(c)(3) requires submission and approval of a comprehensive, accurate and current inventory of actual emissions. As part of Indiana’s redesignation request for the Evansville area, the State submitted a 2005 emissions inventory. As discussed above, EPA is proposing to approve this inventory as meeting the section 172(c)(3) emissions inventory requirement.

Section 172(c)(4) requires the identification and quantification of allowable emissions for major new and modified stationary sources in an area, and section 172(c)(5) requires source permits for the construction and operation of new and modified major stationary sources anywhere in the nonattainment area. EPA has determined that, since prevention of significant deterioration (PSD) requirements will apply after redesignation, areas being redesignated need not comply with the requirement that a nonattainment new source review (NSR) program be approved prior to redesignation, provided that the area demonstrates maintenance of the NAAQS without part D NSR. A more detailed rationale for this view is described in a memorandum from Mary Nichols, Assistant Administrator for Air and Radiation, dated October 14, 1994, entitled, “Part D New Source Review Requirements for Areas Requesting Redesignation to Attainment.” Indiana has demonstrated that emissions will remain sufficiently low even without part D NSR in effect for the Evansville area to be able to maintain the standard; therefore, the State need not have a fully approved part D NSR program prior to approval of the redesignation request. The State’s PSD program will become effective in the Evansville area upon redesignation to attainment. See rulemakings for Detroit, Michigan (March 7, 1995, at 60 FR 12467–12468); Cleveland-Akron-Lorain, Ohio (May 7,
Evansville area are currently maintenance plan approval. After the effective date of the maintenance plan in any conformity area must use the MVEBs from the Evansville area for 2015 and 2022. The onroad motor vehicle budgets for the respectively. Indiana has submitted transportation conformity SIPs on 62748, 62749–62750 (Dec. 7, 1995) this interpretation.

Applying for purposes of evaluating a maintenance plan. Second, EPA’s Federal conformity rules require the performance of conformity analyses in the absence of Federally-approved state rules. Therefore, because areas are subject to the conformity requirements regardless of whether they are redesignated to attainment and, because they must implement conformity under Federal rules if state rules are not yet approved, EPA believes it is reasonable to interpret the conformity SIP requirements as not applying for purposes of evaluating the redesignation request under section 107(d) for two reasons. First, the requirement to submit SIP revisions to comply with the conformity provisions of the CLEAN AIR ACT continues to apply to areas after redesignation to attainment, since such areas would be subject to a section 175A maintenance plan. Second, EPA’s Federal conformity rules require the performance of conformity analyses in the absence of Federally-approved state rules.

The CAA requires states to establish criteria and procedures to ensure that Federally-supported or funded activities, including highway projects, conform to the air quality planning goals in the applicable SIPs. EPA believes that it is reasonable to interpret the conformity SIP requirements as not applying for purposes of evaluating the redesignation request under section 107(d) for two reasons. First, the requirement to submit SIP revisions to comply with the conformity provisions of the CLEAN AIR ACT continues to apply to areas after redesignation to attainment, since such areas would be subject to a section 175A maintenance plan. Second, EPA’s Federal conformity rules require the performance of conformity analyses in the absence of Federally-approved state rules. Therefore, because areas are subject to the conformity requirements regardless of whether they are redesignated to attainment and, because they must implement conformity under Federal rules if state rules are not yet approved, EPA believes it is reasonable to view these requirements as not applying for purposes of evaluating a redesignation request. See Wall v. EPA, 265 F.3d 426 (6th Cir. 2001), upholding this interpretation. See also 60 FR 62748, 62749–62750 (Dec. 7, 1995) (Tampa, Florida).

EPA approved Indiana’s general and transportation conformity SIPs on January 14, 1998, at 63 FR 2146, and August 17, 2010, at 75 FR 50730, respectively. Indiana has submitted onroad motor vehicle budgets for the Evansville area for 2015 and 2022. The area must use the MVEBs from the maintenance plan in any conformity determination that is effective on or after the effective date of the maintenance plan approval. No conformity projections relevant to the Evansville area are currently disapproved, conditionally approved, or partially approved. If EPA approves the Evansville area emission inventory as proposed, EPA believes that Indiana will have a fully approved SIP for all requirements applicable for purposes of redesignation.

3. Permanent and Enforceable Emission Reductions

Indiana’s original redesignation submission cited a number of regulatory programs that it believed resulted in the air quality improvement in the Evansville area between the period that was the basis of the area’s 1997 PM2.5 nonattainment designation (2002 to 2004), and the period that the Evansville area began attaining the 1997 annual PM2.5 standard (2004 to 2006). These programs included the EPA NOX Budget Trading Program, the acid rain program, mobile source rules such as Heavy-duty Highway Vehicle standards and Non-road Diesel Engine standards, and CAIR. Indiana subsequently supplemented its request with submittals intended to demonstrate that the Evansville area could be expected to continue to attain the standard even if the emission reductions associated with the promulgation of CAIR did not continue. In particular, on December 7, 2009, Indiana submitted the results of modeling purporting to show PM2.5 concentrations that Indiana estimated would occur in the Evansville area in the absence of CAIR. For most power plants, this modeling was based on projections derived from actual emission rates for 2007. For the power plants within the Evansville nonattainment area, this modeling used the highest emission rates from 2000 to 2007. Indiana’s modeling showed that these emission rates yielded Evansville area concentrations below the PM2.5 NAAQS.

EPA has reviewed Indiana’s submission and believes that Indiana’s modeling does not properly reflect power plant emissions that would occur in the absence of CAIR. Although the compliance deadlines in CAIR were 2009 for the first phase of NOX reductions and 2010 for the first phase of SO2 reductions, CAIR provided significant incentives for earlier emission reductions. Indeed, especially for SO2, a comparison of 2007 emissions for states in the CAIR region against 2003 emissions shows a significant decline in emissions. For example, according to continuous emission monitoring data submitted by EGUs to EPA’s Clean Air Markets Division, EGU emissions of SO2 in Indiana declined from 804,800 tons per year in 2003 to 714,500 tons per year in 2007, a decline of 93,000 tons per year. Similarly, according to the same set of data, EGU emissions of NOX in Indiana declined from 261,000 tons per year to 196,600 tons per year, a decline of 64,400 tons per year. Similar declines occur in other states influencing Evansville area air quality. These declines can reasonably be attributed to the incentives of CAIR, such that even the 2004 to 2006 air quality data underlying Indiana’s request would reflect benefits from EPA’s development, proposal, and promulgation of CAIR.

Given that the DC Circuit has now remanded CAIR to EPA, it will not remain in force indefinitely. As a consequence, the emission reductions associated with CAIR cannot be considered to be permanent.

EPA’s proposed Transport Rule would, in a manner consistent with the D.C. Circuit opinion on CAIR, among other things identify emission reductions in the Eastern United States necessary to address significant interference with attainment and maintenance pursuant to section 110(a)(2)(D)(i) of the Clean Air Act with respect to the 1997 ozone and 1997 and 2006 PM2.5 NAAQS. The comment period on this proposed rule closed on October 1, 2010. EPA is reviewing all comments received. EPA may not prejudge the requirements of the final Transport Rule, and so cannot complete final rulemaking on Indiana’s redesignation request in a manner that relies on Transport Rule requirements unless and until EPA has promulgated a final Transport Rule.

In the proposed Transport Rule, EPA proposed to quantify the reductions needed in specific states to address each covered state’s significant contribution to nonattainment and interference with maintenance of specific NAAQS. In that action, EPA also proposed to establish FIPs to ensure that the significant contribution to nonattainment and interference with maintenance identified by EPA is prohibited.

The Evansville area is notable for having several sizable electric generating facilities, and most of these facilities are operating with new or upgraded SO2 and NOX controls for their coal-fired units. Vectron’s A.B. Brown facility operates a dual alkali system for SO2 control and select catalytic reduction (SCR) of NOX. Alcoa’s Warrick Power Plant uses wet lime scrubbing to control SO2 emissions and combustion controls, and uses SCR for one unit and low NOX burners (LNB) and over-fire air (OFA) for all units to limit its NOX emissions. Vectron’s F.B. Culley generating station uses wet limestone scrubbing for SO2 control and SCR with LNB for NOX control at its two
units. Hoosier Energy uses LNB to reduce NO\textsubscript{X} emissions from both Frank E. Ratts Generating Station units. Duke Energy’s Gibson plant uses wet limestone scrubbing with SCR, LNB, and OFA on all five units. Indianapolis Power and Light operates wet limestone scrubbers along with SCR, LNB, and OFA on the four units of its Petersburg power plant. Indiana-Michigan Power uses LNB on the two coal-fired units at the Rockport plant.

These emission controls, along with similar controls at many other plants in the Eastern United States, are providing substantial air quality benefits. As explained above, some of the reductions were associated with the now-remanded CAIR. The proposed Transport Rule, if finalized, would similarly require reductions in NO\textsubscript{X} and SO\textsubscript{2} from EGUs. The reductions associated with the Transport Rule, if and when it is finalized, may be considered permanent and enforceable.

The modeling for the proposed Transport Rule identified 13 states, including Indiana, that have emissions that significantly affect Evansville area air quality. Table 4 shows state-wide emission estimates for SO\textsubscript{2} and NO\textsubscript{X} for 2005, 2012, and 2014 for these states. The values for 2005 reflect base year emissions estimates. Given the timing of attainment in the Evansville area, these values reflect an approximation of statewide emission levels at which the Evansville area attained the PM\textsubscript{2.5} standard. The values for 2012 reflect estimates for a scenario in which neither CAIR nor a replacement Transport Rule is in effect, reflecting a baseline that EPA used in developing its proposed rule. The values for 2014 reflect estimates for a scenario in which the proposed Transport Rule is finalized as proposed. These estimates are taken from Tables 6–1 (NO\textsubscript{3}) and 6–2 (SO\textsubscript{2}) of the emissions technical support document for the proposed Transport Rule, available at http://www.epa.gov/airquality/transport/pdfs/TR_Proposal_Emissions_TSD.pdf. These estimates exclude emissions from fires, which are a small fraction of the inventory (well under 0.1 percent) that is projected to remain constant and does not materially affect the comparison here.

In Table 4, 2005 emissions represent an approximation of emissions at which Evansville attains the standard. Table 4 shows that, in comparison, the proposed Transport Rule would establish enforceable emission restrictions that would be expected to result in emissions in the most pertinent states (as listed in Table 4) that for SO\textsubscript{2} are 4,830,172 tons per year (59 percent) lower and that for NO\textsubscript{X} are 2,716,062 tons per year (39 percent) lower. That is, the proposed Transport Rule would provide for permanent and enforceable emission reductions in the Eastern United States that are significantly greater than the reductions needed to assure maintenance in the Evansville area.

Similar results are obtained by comparing emission estimates in 2012 without the proposed Transport Rule to emission estimates in 2014 with the proposed Transport Rule. In the proposed Transport Rule, EPA estimated that total emissions across these states would reflect 5,320,173 tons per year lower SO\textsubscript{2} emissions and 933,133 tons per year lower NO\textsubscript{X} emissions in the 2014 controlled case than in the 2012 base case, i.e., emissions that are 61 percent and 18 percent lower, respectively. According to EPA modeling for the proposed Transport Rule, concentrations projected in 2014 with the proposed Transport Rule in place against concentrations projected in 2012 in the absence of a Transport Rule, the Transport Rule achieves approximately a 4 μg/m\textsuperscript{3} air quality improvement in the Evansville area, yielding concentrations well below the annual PM\textsubscript{2.5} NAAQS and below the concentrations that have been achieved by power plant emission reductions to date.

The modeling for the proposed Transport Rule also projects an Evansville area concentration of about 11 μg/m\textsuperscript{3} in 2014 based on implementation of the proposed Transport Rule, whereas for purposes of this proposed redesignation it is only necessary for the Transport Rule to help provide for the Evansville area to maintain a concentration at or below 15 μg/m\textsuperscript{3}.

This proposal is premised on the expectation that the final Transport Rule will be similarly effective as the proposed Transport Rule would be in providing for maintenance of the 1997 PM\textsubscript{2.5} standard in the Evansville area. Given the substantial margin by which EPA expects the Evansville area to maintain the standard, numerous details
of the final Transport Rule could differ from corresponding features of the proposed Transport Rule without causing changes in the impact on Evansville air quality that are significant for purposes of this proposal to redesignate the Evansville area. This proposal to redesignate the Evansville area is predicated on the final Transport Rule being substantially equivalent for purposes of air quality in the Evansville area to the Transport Rule proposed on August 2, 2010. In EPA’s view, this premise will be met if the emission levels expected under the final Transport Rule in states most pertinent to Evansville, and the associated expected air quality benefits in Evansville, are sufficiently similar to the emission levels and associated air quality benefits expected under the proposed rule so as to provide a comparable degree of confidence that the Evansville area will maintain the standard.

In summary, a limited set of reductions of SO\textsubscript{2} and NO\textsubscript{X} contributed significantly to the air quality improvement in the Evansville area. Given the remanded status of CAIR, this air quality improvement cannot be considered permanent. However, the proposed Transport Rule proposed to mandate even greater reductions than have already occurred and, more importantly, proposed to mandate more reductions than are needed to maintain the standard in the Evansville area. Therefore, with the final promulgation of a Transport Rule that is substantially equivalent to the proposed rule for purposes of maintaining the standard in the Evansville area, in combination with the other measures cited by Indiana, EPA believes that the emission reductions that led the Evansville area to attain the PM\textsubscript{2.5} air quality standard could be considered as permanent and enforceable for purposes of section 107(d)(3)(E)(iii).

4. Maintenance Plan

Sections 107(d)(3)(E)(iv) and 175A require that the State demonstrate that the area to be redesignated will continue to meet the PM\textsubscript{2.5} NAAQS for at least a ten-year maintenance period after redesignation in 2011. Indiana’s maintenance plan includes emission inventories discussed in section V.2.c above. The sizeable reductions in SO\textsubscript{2} and NO\textsubscript{X} emissions by 2015 and 2022 shown in Table 3 above are due in significant part to restrictions mandated by EPA to reduce power plant emissions of SO\textsubscript{2} and NO\textsubscript{X} in the Eastern United States in order to reduce pollutant transport in this region. In this inventory, Indiana used emission projections premised on the implementation of CAIR requirements as an approximation of the emissions levels the State projects to occur following the promulgation of the Transport Rule. As explained above, the DC Circuit found CAIR unlawful and remanded it to EPA. Because CAIR is not in place permanently, and because EPA has not completed final promulgation of the Transport Rule, EPA cannot currently grant final approval to a maintenance plan that relies in significant part on either of these rules.

On the other hand, as noted above, EPA’s recently proposed Transport Rule would, if finalized, achieve substantial regional reductions of SO\textsubscript{2} and NO\textsubscript{X} emissions. While EPA has not made emission estimates for 2022 that are premised on the implementation of the proposed Transport Rule, Table 4 above shows emission estimates that EPA has made for 2014 that assume the implementation of the proposed Transport Rule. These emission estimates show a substantial decline in SO\textsubscript{2} and NO\textsubscript{X} emissions compared to that shown in Indiana’s maintenance plan. Given the substantial degree of control of the various EGUs in the Evansville area both currently and projected into the future, EPA finds Indiana’s projection of such emission declines through 2022 to be appropriate for the purpose of this analysis. EPA promulgates a final Transport Rule whose requirements are substantially equivalent to those in the proposed rule with respect to continued maintenance of the PM\textsubscript{2.5} annual standard in the Evansville area.

In conjunction with the projections for dramatic declines in Evansville area emissions of SO\textsubscript{2} and NO\textsubscript{X} emissions, Indiana’s maintenance plan shows an increase in PM\textsubscript{2.5} emissions. Therefore, further evaluation is needed to judge whether the increase in PM\textsubscript{2.5} emissions, in combination with the decreases in SO\textsubscript{2} and NO\textsubscript{X} emissions, is likely to provide for maintenance of the standard.

Each of these pollutants is characterized by a different relationship between emissions and air quality. Therefore, simply summing up the emissions of these various pollutants does not provide a meaningful indicator of the combined air quality impact of these emission changes. Instead, a more appropriate indicator is the percentage change in emissions for each emitted pollutant, weighted according to the air quality impact for each component.

For this purpose, EPA examined speciation data available from its Air Explorer Web site for 2007 and 2008 for the Evansville area. These data suggest that PM\textsubscript{2.5} in the Evansville area consists of approximately 54 percent sulfate, 7 percent nitrate, 32 percent organic particulate, 4 percent miscellaneous inorganic particulate (sometime labeled “crustal particles”), and 4 percent other types of particulate matter.

EPA used a conservative approach that assumes that the full ambient concentration of organic particulate matter plus miscellaneous inorganic particulate matter will vary in accordance with changes in total nonattainment area emissions of directly emitted PM\textsubscript{2.5}. This analysis thus assumes that the entirety of this component of ambient PM\textsubscript{2.5} will increase by the 24 percent that Indiana’s maintenance plan projects that directly emitted PM\textsubscript{2.5} emissions will increase. In this analysis, the baseline concentration is conservatively assumed to be 15.0 \mu g/m\textsuperscript{3}, of which directly emitted PM\textsubscript{2.5} is estimated to include 32 plus 4 or 36 percent, or 5.4 \mu g/m\textsuperscript{3}. Indiana estimates that emissions of directly emitted PM\textsubscript{2.5} will increase by 24 percent from 2005. EPA’s assessment assumes that this increase will cause a corresponding increase in ambient concentrations of PM\textsubscript{2.5}, which would suggest an increase in the concentration of this component by 1.3 \mu g/m\textsuperscript{3}. However, EPA believes that this potential increase will be fully compensated by a greater decrease in sulfate and nitrate concentrations. The precise decrease in sulfate and nitrate concentrations is a complicated result of emission reductions not just in the Evansville area but also in many other parts of the Eastern United States. Nevertheless, modeling conducted by EPA for the proposed Transport Rule estimated that future Evansville area concentrations with the Transport Rule as proposed in place would be about 4 \mu g/m\textsuperscript{3} below the standard, and the emission reductions that have already occurred have already brought Evansville area concentrations to about 12.0 \mu g/m\textsuperscript{3} (as shown in Table 4 above). Therefore, the 1.3 \mu g/m\textsuperscript{3} increase in the components associated with directly emitted PM\textsubscript{2.5} would not be expected to yield concentrations above the standard. That is, EPA expects that the trends in direct emissions of PM\textsubscript{2.5} in the Evansville area will not prevent the area from maintaining the standard.

Maintenance of the 1997 annual PM\textsubscript{2.5} air quality standard in the Evansville area is a function of regional as well as local emissions trends. The regional impacts are dominated by the impacts of SO\textsubscript{2} and NO\textsubscript{X} emissions. The previous section (discussing permanent and
enforceable emission reductions) showed that the proposed Transport Rule could be expected to provide for substantial SO\textsubscript{2} and NO\textsubscript{X} emission reductions through 2014, reductions that would be maintained throughout and well beyond the period (through 2022) addressed in Indiana’s maintenance plan. While EPA in its Transport Rule rulemaking developed emission projections extending to 2020 only for a scenario without regional emission limitations and not for a scenario with a Transport Rule in place, the ongoing downward emission trend evident in EPA’s 2020 emission projections in absence of regional emission limitations lends support to Indiana’s projection that the scenario with regional emission limitations in place will continue to have low emissions in 2022. With a Transport Rule as proposed, the caps on emissions of SO\textsubscript{2} and NO\textsubscript{X} from the power sector will ensure against growth in SO\textsubscript{2} and NO\textsubscript{X} emissions from these sources, and in combination with motor vehicle rules and other rules will assure a continuing decline in SO\textsubscript{2} and NO\textsubscript{X} emissions. Therefore, EPA believes that available emissions data indicate that, with a Transport Rule substantially equivalent to the one proposed, for purposes of maintaining the standard in the Evansville area, the Evansville area can be expected to maintain the standard through 2022.

Under section 175A of the Clean Air Act, maintenance plans must demonstrate attainment through at least 10 years beyond the date of EPA approval of a state’s redesignation request. Indiana’s maintenance plan, demonstrating maintenance through 2022, satisfies this requirement.

EPA also has modeling evidence indicating that the Evansville area will continue to attain the PM\textsubscript{2.5} NAAQS well into the future, provided that EPA promulgates a Transport Rule substantially equivalent for purposes of demonstrating maintenance in the Evansville area to its recently proposed rule. The modeling evidence is the modeling analysis, referenced above, that Indiana has submitted. As discussed above, EPA disputes Indiana’s contention that its modeling demonstrates attainment in the Evansville area in the absence of CAIR, insofar as the analysis was predicated on 2007 emission levels that already include a set of emission reductions attributable to CAIR. However, EPA believes that Indiana’s modeling analysis, showing attainment with implementation of a subset of the emission reductions expected from CAIR, supports the conclusion that implementation of the full set of reductions that were expected from CAIR (or a relatively similar set of reductions from a Transport Rule) will also assure that the standard is maintained.

EPA has also conducted its own modeling, provided in support of the Transport Rule proposed rulemaking. This modeling projects that the Evansville area will achieve a PM\textsubscript{2.5} concentration of 11.1 \textmu g/m\textsuperscript{3} by 2014 if the Transport Rule as proposed is made final. Although EPA did not perform modeling for years later than 2014, the Transport Rule as proposed would provide for utility emissions in 2022 to be similar and in fact slightly lower than emissions in 2014, and more generally EPA expects total emissions to be similar or slightly lower in 2022 than in 2014, so that air quality in 2022 is likely to be similar or slightly better than air quality in 2014 as well. Therefore, these two modeling analyses support the conclusion that should EPA finalize a transport rule that provides for relatively similar air quality in the Evansville area, the Evansville area will maintain the PM\textsubscript{2.5} standard throughout the maintenance plan period.

Indiana’s maintenance plan includes additional elements. These include a commitment to continue to operate an EPA-approved monitoring network, as necessary to demonstrate ongoing compliance with the NAAQS. Indiana currently operates six PM\textsubscript{2.5} monitors in the Evansville area. Indiana remains obligated to continue to quality assure monitoring data in accordance with 40 CFR part 58 and enter all data into the Air Quality System in accordance with Federal guidelines. Indiana will use these data, supplemented with additional information if necessary, to assure that the area continues to attain the standard. Indiana will also continue to develop and submit periodic emission inventories as required by the Federal Consolidated Emissions Reporting Rule (codified at 40 CFR part 51 subpart A) to track future levels of emissions.

Indiana’s maintenance plan also includes a contingency plan as required by section 175A(d). The contingency plan provisions are designed to correct promptly or to prevent a violation of the NAAQS that might occur after redesignation. Section 175A of the Clean Air Act requires that a contingency plan satisfies the pertinent requirements of section 175A(d). Consequently, Indiana’s redesignation request provides MVEBs, conformance with which will assure that motor vehicle emissions are at or below levels that can be expected to provide for attainment and maintenance of the PM\textsubscript{2.5} NAAQS. Indiana’s submittal of April 2008 included emission budgets for NO\textsubscript{X} and PM\textsubscript{2.5} for 2010 and 2020. EPA initiated an adequacy review of the budgets that Indiana included in its 2008 submittal. As such, a notice of the submission of these budgets was posted on its adequacy web page (http:
Table 5 shows substantial decreases in on-road NO\textsubscript{X} and PM\textsubscript{2.5} emissions from 2005 to 2015 and additional reductions between 2015 and 2022. The emission reductions are expected because newer vehicles, subject to more stringent emission standards, are continually replacing older, dirtier vehicles. Indiana provided emission budgets that for 2015 include a safety margin of 5 percent above projected levels and that for 2022 include a safety margin of 10 percent above projected levels.

In the Evansville area, the motor vehicle budgets and motor vehicle emission projections for both NO\textsubscript{X} and PM\textsubscript{2.5} are lower than base year levels, but the overall emissions of PM\textsubscript{2.5} summed across all source types is projected to increase. This requires further examination of the question of whether an increase in PM\textsubscript{2.5} emissions by the amounts requested by Indiana as safety margins would still provide for maintenance of the PM\textsubscript{2.5} standard. However, EPA is proposing to approve the budgets submitted in February 2008 that were subject to the maintenance review for Evansville.

Table 5 shows the updated budgets as well as the 2005, 2015, and 2022 emission projections on which these budgets are based. Illinois did not provide emission budgets for SO\textsubscript{2}, VOCs, and ammonia because it concluded, consistent with EPA’s presumptions regarding these precursors, that emissions of these precursors from motor vehicles are not significant contributors to the area’s PM\textsubscript{2.5} air quality problem.
increase in emission estimates due to the use of MOVE2010 may affect an area’s ability to demonstrate conformity for its transportation plan and/or TIP. Therefore, state and local planners should carefully consider whether the SIP and motor vehicle emissions budget(s) should be revised with MOVE2010 or if transportation plans and TIPs should be revised before the end of the conformity grace period, since doing so may be necessary to ensure conformity determinations in the future.

We would expect that states and metropolitan planning organizations would work closely with EPA and the local Federal Highway Administration and Federal Transit Administration offices to determine an appropriate course of action to address this type of situation if it is expected to occur. If Indiana chooses to revise the Evansville maintenance plan, it should consult Question 7 of the December 2009 Policy Guidance on the Use of MOVE2010 for State Implementation Plan Development, Transportation Conformity, and Other Purposes for information on requirements related to such revisions.

6. Summary of Proposed Actions

In its rulemaking of November 27, 2009, EPA determined that the Evansville area is attaining the 1997 annual PM$_{2.5}$ NAAQS. EPA’s review of more recent data indicates that the area continues to attain this standard. Thus EPA is proposing to determine that the area continues to attain the 1997 annual PM$_{2.5}$ standard. EPA is proposing to approve Indiana’s maintenance plan, provided EPA promulgates a final Transport Rule substantially equivalent to the Transport Rule as proposed with respect to maintenance of the standard in the Evansville area. EPA proposes to approve the emissions inventory included in Indiana’s maintenance plan as satisfying the requirement in section 172(c)(3) for a comprehensive emission inventory. With respect to two criteria for redesignation—permanent enforceable emissions reductions and a fully approvable maintenance plan—EPA believes that Indiana is currently relying on CAIR for a significant portion of the air quality improvement leading to attainment and a significant portion of the reductions needed to maintain the standard. EPA believes, however, that these two prerequisites for redesignation will be satisfied if and when the Transport Rule that EPA proposed on August 2, 2010 is finalized in a form that is equivalent to the rule as proposed, for purposes of maintenance of the annual PM$_{2.5}$ standard in Evansville. Therefore, EPA proposes that the Evansville area will qualify for redesignation to attainment at such time as the Transport Rule in such a form is finalized and takes effect. Finally, EPA is proposing to approve motor vehicle emission budgets for the Evansville area.

VI. What are the effects of EPA’s proposed actions?

If finalized, approval of the redesignation request would change the legal designation of the Evansville area for the 1997 annual PM$_{2.5}$ NAAQS, found at 40 CFR part 81, from nonattainment to attainment. EPA is also proposing to approve several revisions to the Indiana SIP for the Evansville area, including the maintenance plans, the emission inventory submitted with the maintenance plan, and the 2015 and 2022 MVEBs. EPA is proposing to take these actions if and when EPA promulgates the Transport Rule limiting SO$_{2}$ and NO$_{x}$ emissions in the Eastern United States to an extent substantially equivalent in pertinent respects to the Transport Rule proposed August 2, 2010 for purposes of maintaining air quality in Evansville.

VII. Statutory and Executive Order Reviews

Under the Clean Air Act, redesignation of an area to attainment and the accompanying approval of a maintenance plan under section 107(d)(3)(E) are actions that affect the status of a geographical area and do not impose any additional regulatory requirements on sources beyond those imposed by state law. A redesignation to attainment does not in and of itself create any new requirements, but rather results in the applicability of requirements contained in the Clean Air Act for areas that have been redesignated to attainment. Moreover, the Administrator is required to approve a SIP submission that complies with the provisions of the Act and applicable Federal regulations. 42 U.S.C. 7410(k); 40 CFR 52.02(a). Thus, in reviewing SIP submissions, EPA’s role is to approve state choices, provided that they meet the criteria of the Clean Air Act. Accordingly, this action merely approves state law as meeting Federal requirements and does not impose additional requirements beyond those imposed by state law. For that reason, these actions:

- Are not a “significant regulatory action” subject to review by the Office of Management and Budget under Executive Order 12866 (58 FR 51735, October 4, 1993);
- Do not impose an information collection burden under the provisions of the Paperwork Reduction Act (44 U.S.C. 3501 et seq.);
- Are certified as not having a significant economic impact on a substantial number of small entities under the Regulatory Flexibility Act (5 U.S.C. 601 et seq.);
- Do not contain any unfunded mandate or significantly or uniquely affect small governments, as described in the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4);
- Do not have Federalism implications as specified in Executive Order 13132 (64 FR 43255, August 10, 1999);
- Are not economically significant regulatory actions based on health or safety risks subject to Executive Order 13045 (62 FR 19885, April 23, 1997);
- Are not significant regulatory actions subject to Executive Order 13211 (66 FR 28355, May 22, 2001);
- Are not subject to requirements of Section 12(d) of the National Technology Transfer and Advancement Act of 1995 (15 U.S.C. 272 note) because application of those requirements would be inconsistent with the Clean Air Act; and
- Do not provide EPA with the discretionary authority to address, as appropriate, disproportionate human health or environmental effects, using practicable and legally permissible methods, under Executive Order 12898 (59 FR 7629, February 16, 1994).

In addition, this rule does not have tribal implications as specified by Executive Order 13175 (65 FR 67249, November 9, 2000), because the SIP is not approved to apply in Indian country located in the state, and EPA notes that it will not impose substantial direct costs on tribal governments or preempt tribal law.

List of Subjects in 40 CFR Part 52

Environmental protection, Air pollution control, Intergovernmental relations, Particulate matter.

Dated: May 6, 2011.
