

- Calculating and estimating the values of these vulnerability indicators, including establishing important indicator thresholds that reflect abrupt or large changes in the vulnerability of water quality or aquatic ecosystems;

- Mapping these vulnerability indicators nationally, including data availability and spatial aggregation of the data; and

- Combining and compositing indicators and developing multi-indicator indices of vulnerability.

This report is intended to be a building block for future work on multi-stressor global change vulnerability assessments. Hopefully, it will contribute to improve links between the decision support needs of the water quality and aquatic ecosystem management communities and the priorities and capabilities of the global change science data and modeling communities.
