Abstract: The number of light geese (lesser snow, greater snow, and Ross’ geese) in the midcontinent region has nearly quadrupled during the past several decades, due to a decline in adult mortality and an increase in winter survival. We refer to these species and subspecies as light geese because of their light coloration, as opposed to dark geese, such as white-fronted or Canada geese. Because of their feeding activity, light geese have become seriously injurious to their habitat, as well as to habitat important to other migratory birds. This poses a serious threat to the short- and long-term health and status of some migratory bird populations. We believe that the number of light geese in the midcontinent region has exceeded long-term sustainable levels for their arctic and subarctic breeding habitats, and that the populations must be reduced. Title 50 Code of Federal Regulations (CFR) part 21 provides authority for the management of overabundant light geese.

Regulations at 50 CFR 21.60 authorize States and tribes in the midcontinent and Atlantic flyway regions to control light geese within the United States through the use of alternative regulatory strategies. The conservation order authorizes States and tribes to implement population control measures without having to obtain a Federal permit, thus significantly reducing their administrative burden. The conservation order is a streamlined process that affords an efficient and
