The existing Overton Dam is a concrete gravity structure that is 104 feet in height and 914 feet in length. The spillway consists of five 60-foot-wide Tainter gates. The navigation lock is 84 feet wide by 685 feet long. The primary purpose of the Corps’ lock and dam system is navigation. The upper pool above the dam is commonly referred to as “Pool 2,” and the Corps maintains it at an elevation of 64 feet NGVD. Pool 2 has a surface area of approximately 3,750 acres and a storage capacity of about 67,300 acre-feet at an elevation of 64 feet NGVD.

The proposed Overton Lock and Dam Project would consist of: (1) A powerhouse located on the southwest bank of the river at the existing dam’s right abutment; (2) a headrace; (3) a tailrace; (4) a switchyard; (5) 3.9 miles of 138-kilovolt (kV) above-ground transmission line; (6) three turbine-generator units for a combined installed capacity of 78 megawatts; and (7) appurtenant facilities. The projected annual energy generation would be 255.7 gigawatt-hours.

The project would operate in a run-of-river mode by utilizing releases from Pool 2 as they are dictated by the Corps, with no proposed change to the Corps’ operation. In addition, no changes to the reservoir pool elevations or downstream river flows are proposed. The project would generate power using flows between 2,700 and 49,800 cubic feet per second (cfs). If flows are less than 2,700 cfs, all flow would go through the Corps’ gates, and the project would then be offline. When flows are greater than 49,800 cfs, the excess flow would be directed through the Corps’ gates.
