SUPPLEMENTARY INFORMATION:

Proposed Project
Improving Sickle Cell Transitions of Care through Health Information Technology Phase I

This project is the first phase in AHRQ’s effort toward the development of a health information technology (HIT) enabled tool designed to aid adolescents and young adults with sickle cell disease (SCD) during transitions of care. SCD is a serious, genetic blood disorder that affects approximately 70,000–100,000 Americans, including one out of every 500 African American and one out of every 36,000 Hispanic American births. Persons with SCD produce abnormal, “sickle-shaped” red blood cells that obstruct blood vessels, leading to life-long anemia, organ damage, increased potential for infections, chronic episodes of pain, and substantially shortened life spans. SCD has been noted to be understudied relative to its prevalence resulting in a lack of knowledge about the important variables and domains that determine health outcomes for patients. Furthermore, patients with SCD, typically young, minority, and often of lower income status, have had few opportunities to voice their needs and concerns about their health and health care.

As recently as 30 years ago, children with SCD usually did not survive into adulthood. Now, as a result of advances in screening and treatment, more than 90 percent of individuals with SCD reach adulthood, and life expectancy is typically into the fifth decade. Persons with SCD experience multiple transitions of care as a result of the chronicity of SCD, frequency of both acute and chronic-events requiring care,
