l. The existing Merced Falls Hydroelectric Project consists of: (1) A concrete gravity dam with a structural height of 34 feet, and a crest length of 575 feet; (2) three radial gates, each 20 feet in length and 13.5 feet high; (3) a one-mile long project impoundment has approximately 900 acre-feet of storage capacity, a useable storage capacity of approximately 579 acre-feet, a total surface area of approximately 65 acres; and a normal impoundment elevation of 344 feet msl; (4) a powerhouse housing a 3.4-megawatt (MW) turbine/generator unit and a vertical Kaplan-type four blade turbine; (5) a 1,000-foot long earthen levee with a crest width of eight feet; (6) an adjacent intake structure with a debris rack, and; (7) a non-operable fish ladder.

The Merced Falls Project is operated in a run-of-river mode dependent on water outflow from Merced ID's upstream Merced River Project. Inflow to the project passes through the impoundment, which is kept at a constant water elevation and then either through the powerhouse or through the dam's radial gates. Flows of up to approximately 1,750 cubic feet per second (cfs) are diverted through the powerhouse, and then discharged to the Merced River via the tailrace. When inflows exceed 2,200 cfs, the project spills water. During flood events with
