

FEDERAL REGISTER

Vol. 79

Friday,

No. 70

April 11, 2014

Pages 20091–20752

OFFICE OF THE FEDERAL REGISTER

The **FEDERAL REGISTER** (ISSN 0097-6326) is published daily, Monday through Friday, except official holidays, by the Office of the Federal Register, National Archives and Records Administration, Washington, DC 20408, under the Federal Register Act (44 U.S.C. Ch. 15) and the regulations of the Administrative Committee of the Federal Register (1 CFR Ch. I). The Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402 is the exclusive distributor of the official edition. Periodicals postage is paid at Washington, DC.

The **FEDERAL REGISTER** provides a uniform system for making available to the public regulations and legal notices issued by Federal agencies. These include Presidential proclamations and Executive Orders, Federal agency documents having general applicability and legal effect, documents required to be published by act of Congress, and other Federal agency documents of public interest.

Documents are on file for public inspection in the Office of the Federal Register the day before they are published, unless the issuing agency requests earlier filing. For a list of documents currently on file for public inspection, see www.ofr.gov.

The seal of the National Archives and Records Administration authenticates the **Federal Register** as the official serial publication established under the Federal Register Act. Under 44 U.S.C. 1507, the contents of the **Federal Register** shall be judicially noticed.

The **Federal Register** is published in paper and on 24x microfiche. It is also available online at no charge at www.fdsys.gov, a service of the U.S. Government Printing Office.

The online edition of the **Federal Register** is issued under the authority of the Administrative Committee of the Federal Register as the official legal equivalent of the paper and microfiche editions (44 U.S.C. 4101 and 1 CFR 5.10). It is updated by 6:00 a.m. each day the **Federal Register** is published and includes both text and graphics from Volume 59, 1 (January 2, 1994) forward. For more information, contact the GPO Customer Contact Center, U.S. Government Printing Office. Phone 202-512-1800 or 866-512-1800 (toll free). E-mail, gpocusthelp.com.

The annual subscription price for the **Federal Register** paper edition is \$749 plus postage, or \$808, plus postage, for a combined **Federal Register**, **Federal Register** Index and List of CFR Sections Affected (LSA) subscription; the microfiche edition of the **Federal Register** including the **Federal Register** Index and LSA is \$165, plus postage. Six month subscriptions are available for one-half the annual rate. The prevailing postal rates will be applied to orders according to the delivery method requested. The price of a single copy of the daily **Federal Register**, including postage, is based on the number of pages: \$11 for an issue containing less than 200 pages; \$22 for an issue containing 200 to 400 pages; and \$33 for an issue containing more than 400 pages. Single issues of the microfiche edition may be purchased for \$3 per copy, including postage. Remit check or money order, made payable to the Superintendent of Documents, or charge to your GPO Deposit Account, VISA, MasterCard, American Express, or Discover. Mail to: U.S. Government Printing Office—New Orders, P.O. Box 979050, St. Louis, MO 63197-9000; or call toll free 1-866-512-1800, DC area 202-512-1800; or go to the U.S. Government Online Bookstore site, see bookstore.gpo.gov.

There are no restrictions on the republication of material appearing in the **Federal Register**.

How To Cite This Publication: Use the volume number and the page number. Example: 77 FR 12345.

Postmaster: Send address changes to the Superintendent of Documents, Federal Register, U.S. Government Printing Office, Washington, DC 20402, along with the entire mailing label from the last issue received.

Rules and Regulations

Federal Register

Vol. 79, No. 70

Friday, April 11, 2014

This section of the FEDERAL REGISTER contains regulatory documents having general applicability and legal effect, most of which are keyed to and codified in the Code of Federal Regulations, which is published under 50 titles pursuant to 44 U.S.C. 1510.

The Code of Federal Regulations is sold by the Superintendent of Documents. Prices of new books are listed in the first FEDERAL REGISTER issue of each week.

DEPARTMENT OF ENERGY

10 CFR Part 430

[Docket No. EERE-2013-BT-NOA-0047]

RIN 1904-AD08

Energy Conservation Program: Energy Conservation Standards for Certain Consumer Products

AGENCY: Office of Energy Efficiency and Renewable Energy, Department of Energy.

ACTION: Final rule.

SUMMARY: The U.S. Department of Energy (DOE or the “Department”) adopts into the Code of Federal Regulations the definitions for “through-the-wall central air conditioner” and “through-the-wall central air conditioning heat pump” that were established in section 5 of the American Energy Manufacturing Technical Corrections Act. This document also removes the standards for air conditioners that were superseded effective in 2006, and the now defunct references to the “through-the-wall air conditioner and heat pump” product class, including the definition and standards.

DATES: The effective date of this rule is May 12, 2014.

FOR FURTHER INFORMATION CONTACT: Mr. Lucas Adin, U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, Building Technologies Program, EE-2J, 1000 Independence Avenue SW., Washington, DC, 20585-0121, 202-287-1317, email: Lucas.Adin@ee.doe.gov.

Jennifer Tiedeman, U.S. Department of Energy, Office of the General Counsel, GC-71, 1000 Independence Avenue SW., Washington, DC 20585-0121. Telephone: (202) 287-6111. email: Jennifer.Tiedeman@hq.doe.gov.

I. Background and Authority

The American Energy Manufacturing Technical Corrections Act (AEMTCA), Public Law 112-210, was signed into law on December 18, 2012. Among its provisions are amendments to Part B¹ of Title III of the Energy Policy and Conservation Act of 1975 (EPCA or “the Act”) (42 U.S.C. 6291-6309, as codified), which provides for an energy conservation program for consumer products other than automobiles, and to Part C² of Title III of EPCA (42 U.S.C. 6311-6317, as codified), which provides for an energy conservation program for certain commercial and industrial equipment, similar to the one in Part B for consumer products.³ Some of the AEMTCA amendments to EPCA establish or modify certain energy conservation standards and related definitions, and make technical changes to the Act. Other AEMTCA amendments to EPCA prescribe criteria for the conduct of rulemakings to promulgate energy conservation standards for various consumer products and commercial and industrial equipment, or direct the Department of Energy (DOE) to undertake rulemakings under EPCA.

¹ For editorial reasons, upon codification in the U.S. Code, Part B was redesignated Part A.

² For editorial reasons, upon codification in the U.S. Code, Part C was redesignated Part A-1.

³ All references to EPCA in this document refer to the statute as amended through the enactment of the AEMTCA.

II. Discussion

In today’s final rule, DOE is adopting several changes to its regulations regarding certain types of residential central air conditioners, which DOE proposed in a notice published on December 20, 2013, 78 FR 77019. Specifically, DOE proposed to amend the Code of Federal Regulations (CFR) to include the definitions for “through-the-wall central air conditioner” and “through-the-wall central air conditioning heat pump” that were prescribed by the AEMTCA, 42 U.S.C. 6295(d)(4)(A)(ii). DOE proposed to amend the language of its regulations in 10 CFR 430.2 to adopt these statutory definitions. Although the definitions for “through-the-wall central air conditioner” and “through-the-wall central air conditioning heat pump” are new, these through-the-wall (“TTW”) products have been subject to standards since 2006.

The December 20, 2013 proposed rule also included a proposal to remove a variety of provisions from 10 CFR 430.32(c) that reference historical standards. Specifically, DOE proposed to remove paragraph (c)(1) which contains standards for certain products manufactured between 1992/1993 and 2006. DOE also proposed to amend its regulations in 10 CFR 430.32(c)(2) and (c)(3) to remove references to the “through-the-wall air conditioner and heat pump” product class, which applied to certain products manufactured prior to January 23, 2010. To avoid confusion with the new statutory definitions, DOE proposed to remove the “through-the-wall air conditioner and heat pump” product class definition currently in 10 CFR 430.2.

Although DOE is removing the outdated standards for the TTW product classes, DOE wants to be clear that the TTW products (for which this rule is adding definitions) are currently subject to standards. As discussed in a May 23, 2002 final rule that adopted amended energy conservation standards for several classes of residential central air conditioners and heat pumps, DOE initially created a separate product class for TTW products. 67 FR 36368, 36397. DOE explained that it was adopting separate standards for TTW products based on its analysis of the design characteristics of these products. Id. However, DOE also identified a concern

that separate standards for TTW products could encourage purchasers of equipment covered by more stringent standards to shift to TTW products. To address this concern, DOE defined the TTW product class as applicable to products manufactured prior to January 23, 2010, and specified that TTW products manufactured on or after that date would have to comply with the standard for other space-constrained products. 67 FR 36368, 36402.

This definition was retained in the August 17, 2004 technical amendment that addressed the ruling of the U.S. Court of Appeals for the Second Circuit, which affected the standards for split-system and single-package central air conditioners but did not affect the standards for space-constrained and TTW products. 69 FR 50997, 50998. Thus, the 2004 rule again specified that the TTW standards applied to products manufactured prior to January 23, 2010, and that TTW products manufactured on or after that date would be subject to the space-constrained product class. The 2004 rule also included a footnote to the standards table in 10 CFR 430.32(c)(2) to ensure that this limitation was clear. *Id.* Finally, in the June 27, 2011 direct final rule that amended the current energy efficiency standards for residential central air conditioners and heat pumps, DOE again affirmed the applicability of the TTW product class and amended the footnote to clarify the classification of TTW products. 76 FR 37408, 37446.

Having received no public comments on the proposals in the December 20, 2013 proposed rule, DOE is adopting the proposed changes described in this section. DOE notes that, while this final rule removes the references to the now-defunct TTW product class standards, through-the-wall central air conditioners and through-the-wall central air conditioning heat pumps must be assigned to a product class based on the product's characteristics. Product class definitions can be found in 10 CFR 430.2 and 10 CFR part 430, subpart B, appendix M. DOE believes that most, if not all, of the historically-characterized "through-the-wall" products will be assigned to one of the space-constrained product classes.

III. Procedural Requirements

A. Review Under Executive Order 12866

Today's regulatory action is not a "significant regulatory action" under section 3(f) of Executive Order 12866, Regulatory Planning and Review, 58 FR 51735 (Oct. 4, 1993). Accordingly, this action was not subject to review under that Executive Order by the Office of

Information and Regulatory Affairs (OIRA) in the Office of Management and Budget (OMB).

B. Review Under the Regulatory Flexibility Act

The Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) requires preparation of an initial regulatory flexibility analysis for any rule that by law must be proposed for public comment, unless the agency certifies that the proposed rule, if promulgated, will not have a significant economic impact on a substantial number of small entities. As required by Executive Order 13272, "Proper Consideration of Small Entities in Agency Rulemaking," 67 FR 53461 (August 16, 2002), DOE published procedures and policies on February 19, 2003, to ensure that the potential impacts of its rules on small entities are properly considered during the rulemaking process. 68 FR 7990. DOE has made its procedures and policies available on the Office of the General Counsel's Web site (<http://www.energy.gov/gc>).

DOE reviewed the amendments in the December 20, 2013 proposed rule under the provisions of the Regulatory Flexibility Act and the procedures and policies published on February 19, 2003, and tentatively concluded that the proposed rule, if adopted, would not have a significant impact on small manufacturers under the provisions of the Regulatory Flexibility Act. These amendments add new statutory definitions for currently regulated products and have no impact on the applicable standards. These amendments also remove outdated regulatory requirements and do not otherwise change the regulatory framework for consumer products or commercial and industrial equipment that is currently in place. DOE received no comments objecting to this conclusion. For these reasons, DOE concludes and certifies that the rule would not have a significant economic impact on a substantial number of small entities and has not prepared a regulatory flexibility analysis. DOE has transmitted the certification and supporting statement of factual basis to the Chief Counsel for Advocacy of the SBA for review under 5 U.S.C. 605(b).

C. Review Under the Paperwork Reduction Act of 1995

Manufacturers of residential central air conditioners and heat pumps must certify to DOE that their products comply with any applicable energy conservation standards. In certifying compliance, manufacturers must test their products according to the DOE test

procedures for residential central air conditioners and heat pumps, including any amendments to these procedures. DOE has established regulations for the certification and recordkeeping requirements for all covered consumer products and commercial equipment, including residential central air conditioners and heat pumps. (76 FR 12422 (March 7, 2011)) The collection-of-information requirement for the certification and recordkeeping is subject to review and approval by OMB under the Paperwork Reduction Act (PRA). This requirement has been approved by OMB under OMB control number 1910-1400. Public reporting burden for the certification is estimated to average 20 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

Notwithstanding any other provision of the law, no person is required to respond to, nor shall any person be subject to a penalty for failure to comply with, a collection of information subject to the requirements of the PRA, unless that collection of information displays a currently valid OMB Control Number.

D. Review Under the National Environmental Policy Act of 1969

Pursuant to the National Environmental Policy Act of 1969, DOE has determined that this rule is covered under the Categorical Exclusion found in DOE's National Environmental Policy Act regulations at paragraph A.6 of Appendix A to Subpart D, 10 CFR Part 1021, which applies to rulemakings that are strictly procedural. Therefore, DOE does not need to prepare an Environmental Assessment or Environmental Impact Statement for this rule.

E. Review Under Executive Order 13132

Executive Order 13132, "Federalism," imposes certain requirements on agencies formulating and implementing policies or regulations that preempt State law or that have Federalism implications. 64 FR 43255 (August 10, 1999). The Executive Order requires agencies to examine the constitutional and statutory authority supporting any action that would limit the policymaking discretion of the States and to carefully assess the necessity for such actions. The Executive Order also requires agencies to have an accountable process to ensure meaningful and timely input by State and local officials in the development of regulatory policies that have Federalism implications. On March 14, 2000, DOE published a

statement of policy describing the intergovernmental consultation process that it will follow in developing such regulations. 65 FR 13735. DOE examined this final rule and determined that it will not have a substantial direct effect on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. EPCA governs and prescribes Federal preemption of State regulations as to energy conservation for the products that are the subject of today's final rule. States can petition DOE for exemption from such preemption to the extent, and based on criteria, set forth in EPCA. (42 U.S.C. 6297) No further action is required by Executive Order 13132.

F. Review Under Executive Order 12988

Regarding the review of existing regulations and the promulgation of new regulations, section 3(a) of Executive Order 12988, "Civil Justice Reform," 61 FR 4729 (Feb. 7, 1996), imposes on Federal agencies the general duty to adhere to the following requirements: (1) Eliminate drafting errors and ambiguity; (2) write regulations to minimize litigation; (3) provide a clear legal standard for affected conduct rather than a general standard; and (4) promote simplification and burden reduction. Section 3(b) of Executive Order 12988 specifically requires that Executive agencies make every reasonable effort to ensure that the regulation specifies the following: (1) The preemptive effect, if any; (2) any effect on existing Federal law or regulation; (3) a clear legal standard for affected conduct while promoting simplification and burden reduction; (4) the retroactive effect, if any; (5) definitions of key terms; and (6) other important issues affecting clarity and general draftsmanship under any guidelines issued by the Attorney General. Section 3(c) of Executive Order 12988 requires Executive agencies to review regulations in light of applicable standards in sections 3(a) and 3(b) to determine whether they are met or whether it is unreasonable to meet one or more of them. DOE has completed the required review and determined that, to the extent permitted by law, this final rule meets the relevant standards of Executive Order 12988.

G. Review Under the Unfunded Mandates Reform Act of 1995

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA) (Pub. L. 104-4; 2 U.S.C. 1501 *et seq.*) requires each Federal agency to assess the effects of Federal regulatory actions on State,

local, and Tribal governments and the private sector. For a regulatory action resulting in a rule that may cause the expenditure by State, local, and Tribal governments, in the aggregate, or by the private sector of \$100 million or more in any one year (adjusted annually for inflation), section 202 of UMRA requires a Federal agency to publish estimates of the resulting costs, benefits, and other effects on the national economy. (2 U.S.C. 1532(a)-(b)) UMRA also requires a Federal agency to develop an effective process to permit timely input by elected officers of State, local, and Tribal governments on a proposed "significant intergovernmental mandate," and requires an agency plan for giving notice and opportunity for timely input to potentially-affected small governments before establishing any requirements that might significantly or uniquely affect such governments. On March 18, 1997, DOE published a statement of policy on its process for intergovernmental consultation under UMRA. 62 FR 12820. (The policy is also available at www.energy.gov/gc). Today's final rule contains neither an intergovernmental mandate nor a mandate that may result in an expenditure of \$100 million or more in any year, so these requirements do not apply.

H. Review Under the Treasury and General Government Appropriations Act, 1999

Section 654 of the Treasury and General Government Appropriations Act, 1999 (Pub. L. 105-277) requires Federal agencies to issue a Family Policymaking Assessment for any rule that may affect family well-being. Today's final rule would not have any impact on the autonomy or integrity of the family as an institution. Accordingly, DOE has concluded that it is not necessary to prepare a Family Policymaking Assessment.

I. Review Under Executive Order 12630

DOE has determined, under Executive Order 12630, "Governmental Actions and Interference with Constitutionally Protected Property Rights," 53 FR 8859 (March 18, 1988), that this regulation would not result in any takings that might require compensation under the Fifth Amendment to the U.S. Constitution.

J. Review Under the Treasury and General Government Appropriations Act, 2001

Section 515 of the Treasury and General Government Appropriations Act, 2001 (44 U.S.C. 3516 note) provides for agencies to review most

disseminations of information to the public under guidelines established by each agency pursuant to general guidelines issued by OMB. OMB's guidelines were published at 67 FR 8452 (Feb. 22, 2002), and DOE's guidelines were published at 67 FR 62446 (Oct. 7, 2002). DOE has reviewed today's final rule under OMB and DOE guidelines and has concluded that it is consistent with applicable policies in those guidelines.

K. Review Under Executive Order 13211

Executive Order 13211, "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use," 66 FR 28355 (May 22, 2001), requires Federal agencies to prepare and submit to OIRA a Statement of Energy Effects for any significant energy action. A "significant energy action" is defined as any action by an agency that promulgates or is expected to lead to promulgation of a final rule and that (1)(i) is a significant regulatory action under Executive Order 12866, or any successor order; and (ii) is likely to have a significant adverse effect on the supply, distribution, or use of energy; or (2) is designated by the Administrator of OIRA as a significant energy action. For any significant energy action, the agency must give a detailed statement of any adverse effects on energy supply, distribution, or use if the regulation is implemented, and of reasonable alternatives to the action and their expected benefits on energy supply, distribution, and use. Today's regulatory action is not a significant regulatory action under Executive Order 12866. It has likewise not been designated as a significant energy action by the Administrator of OIRA. Moreover, it would not have a significant adverse effect on the supply, distribution, or use of energy. Therefore, it is not a significant energy action, and, accordingly, DOE has not prepared a Statement of Energy Effects.

L. Review Under Section 32 of the Federal Energy Administration Act of 1974

Under section 301 of the DOE Organization Act (Pub. L. 95-91; 42 U.S.C. 7101 *et seq.*), DOE must comply with section 32 of the Federal Energy Administration Act of 1974, as amended by the Federal Energy Administration Authorization Act of 1977 (FEAA). (15 U.S.C. 788) Section 32 essentially provides in part that, where a rule authorizes or requires use of commercial standards, the rulemaking must inform the public of the use and background of such standards. In addition, section 32(c) requires DOE to consult with the

Attorney General and the Chairman of the Federal Trade Commission (FTC) concerning the impact of the commercial or industry standards on competition.

The modifications to regulatory definitions addressed by this action do not incorporate testing methods contained in any new commercial standards not already referenced by the test procedures.

IV. Approval of the Office of the Secretary

The Secretary of Energy has approved publication of today’s final rule.

List of Subjects in 10 CFR Part 430

Administrative practice and procedure, Energy conservation, Household appliances.

Issued in Washington, DC, on April 7, 2014.

David T. Danielson,

Assistant Secretary, Energy Efficiency and Renewable Energy.

For the reasons stated in the preamble, DOE amends part 430 of chapter II, subchapter D, of title 10, of the Code of Federal Regulations, as set forth below:

PART 430—ENERGY CONSERVATION PROGRAM FOR CONSUMER PRODUCTS

■ 1. The authority citation for part 430 continues to read as follows:

Authority: 42 U.S.C. 6291–6309; 28 U.S.C. 2461 note.

■ 2. Section 430.2 is amended by removing the definition of “through-the-wall air conditioner and heat pump” and by adding, in alphabetical order, definitions for “through-the-wall central air conditioner” and “through-the-wall central air conditioning heat pump” to read as follows:

§ 430.2 Definitions.

* * * * *

Through-the-wall central air conditioner means a central air conditioner that is designed to be installed totally or partially within a fixed-size opening in an exterior wall, and:

- (1) Is not weatherized;
- (2) Is clearly and permanently marked for installation only through an exterior wall;
- (3) Has a rated cooling capacity no greater than 30,000 Btu/hr;
- (4) Exchanges all of its outdoor air across a single surface of the equipment cabinet; and
- (5) Has a combined outdoor air exchange area of less than 800 square

inches (split systems) or less than 1,210 square inches (single packaged systems) as measured on the surface described in paragraph (4) of this definition.

Through-the-wall central air conditioning heat pump means a heat pump that is designed to be installed totally or partially within a fixed-size opening in an exterior wall, and:

- (1) Is not weatherized;
- (2) Is clearly and permanently marked for installation only through an exterior wall;
- (3) Has a rated cooling capacity no greater than 30,000 Btu/hr;
- (4) Exchanges all of its outdoor air across a single surface of the equipment cabinet; and
- (5) Has a combined outdoor air exchange area of less than 800 square inches (split systems) or less than 1,210 square inches (single packaged systems) as measured on the surface described in paragraph (4) of this definition.

* * * * *

- 3. Section 430.32 is amended by:
 - a. Revising the introductory text to paragraph (c);
 - b. Removing paragraph (c)(1);
 - c. Redesignating paragraphs (c)(2) through (c)(6) as (c)(1) through (c)(5) respectively;
 - d. Removing footnote 1 to the table in newly redesignated paragraph (c)(1);
 - e. Removing newly redesignated paragraphs (c)(1)(v)(A) and (v)(B);
 - f. Further redesignating newly redesignated paragraph (c)(1)(vi) as paragraph (c)(1)(v);
 - g. Further redesignating newly redesignated paragraphs (c)(1)(vii)(A) and (vii)(B) as paragraphs (c)(1)(vi)(A) and (vi)(B) respectively;
 - h. Removing footnote 1 to the table in newly redesignated paragraph (c)(2);
 - i. Amending newly redesignated paragraph (c)(3) by removing the reference to “(c)(3)” and adding in its place “(c)(2)”;
 - j. Amending newly redesignated paragraph (c)(4), by removing the references to “(c)(3)” in both places and adding in their places, “(c)(2)”.

The revision reads as follows:

§ 430.32 Energy and water conservation standards and their compliance dates.

* * * * *

(c) *Central air conditioners and heat pumps.* The energy conservation standards defined in terms of the heating seasonal performance factor are based on Region IV, the minimum standardized design heating requirement, and the sampling plan stated in § 429.16 of this chapter.

* * * * *

[FR Doc. 2014–08223 Filed 4–10–14; 8:45 am]

BILLING CODE 6450–01–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

21 CFR Part 14

[Docket No. FDA–2014–N–0355]

Advisory Committee: Bone, Reproductive and Urologic Drugs Advisory Committee

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA) is amending the standing advisory committees’ regulations to change the name and function of the Advisory Committee for Reproductive Health Drugs. This action is being taken to reflect changes made to the charter for this advisory committee.

DATES: This rule is effective April 11, 2014.

FOR FURTHER INFORMATION CONTACT: Teresa Hays, Committee Management Officer, Food and Drug Administration, 10903 New Hampshire Ave., Silver Spring, MD 20993, 301–796–8220.

SUPPLEMENTARY INFORMATION: FDA is announcing that the name of the Advisory Committee for Reproductive Health Drugs, which was established on March 23, 1978, has been changed. The Agency decided that the name “Bone, Reproductive and Urologic Drugs Advisory Committee” more accurately describes the subject areas for which the committee is responsible. The committee reviews and evaluates data on the safety and effectiveness of marketed and investigational human drug products for use in the practice of osteoporosis and metabolic bone disease, obstetrics, gynecology, urology and related specialties, and makes appropriate recommendations to the Commissioner of Food and Drugs.

The Bone, Reproductive and Urologic Drugs Advisory Committee name was changed and its functions expanded in the charter renewal dated March 23, 2014. In this final rule, FDA is revising 21 CFR 14.100(c)(9) to reflect these changes.

Publication of this final rule constitutes a final action on this change under the Administrative Procedure Act. Under 5 U.S.C. 553(b)(B) and (d) and 21 CFR 10.40(d) and (e), the Agency finds good cause to dispense with notice and public procedure and to proceed to an immediately effective regulation. Such notice and procedures are unnecessary and are not in the public

interest because the final rule is merely codifying the new name and expanded function of the advisory committee to reflect the current committee charter.

List of Subjects in 21 CFR Part 14

Administrative practice and procedure, Advisory committees, Color additives, Drugs, Radiation protection.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under the authority delegated to the Commissioner of Food and Drugs, 21 CFR part 14 is amended as follows:

PART 14—PUBLIC HEARING BEFORE A PUBLIC ADVISORY COMMITTEE

- 1. The authority citation for 21 CFR part 14 continues to read as follows:

Authority: 5 U.S.C. App. 2; 15 U.S.C. 1451–1461, 21 U.S.C. 41–50, 141–149, 321–394, 467f, 679, 821, 1034; 28 U.S.C. 2112; 42 U.S.C. 201, 262, 263b, 264, Pub. L. 107–109; Pub. L. 108–155; Pub. L. 113–54.

- 2. Section 14.100 is amended by revising the heading of paragraph (c)(9) and paragraph (c)(9)(ii) to read as follows:

§ 14.100 List of standing advisory committees.

* * * * *

(c) * * *

(9) *Bone, Reproductive and Urologic Drugs Advisory Committee.*

(i) * * *

(ii) Function: Advises the Commissioner or designee in discharging responsibilities as they relate to helping to ensure safe and effective drugs for human use and, as required, any other product for which the Food and Drug Administration has regulatory responsibility.

* * * * *

Dated: April 8, 2014.

Jill Hartzler Warner,

Acting Associate Commissioner for Special Medical Programs.

[FR Doc. 2014–08151 Filed 4–10–14; 8:45 am]

BILLING CODE 4160–01–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

21 CFR Part 73

[Docket No. FDA–2012–C–0900]

Listing of Color Additives Exempt From Certification; Spirulina Extract

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA or we) is amending the color additive regulations to provide for the expanded safe use of spirulina extract as a color additive in food. This action is in response to a petition filed by GNT USA, Inc.

DATES: This rule is effective May 13, 2014. See section X for further information on the filing of objections. Submit either electronic or written objections and requests for a hearing by May 12, 2014.

ADDRESSES: You may submit either electronic or written objections and requests for a hearing, identified by Docket No. FDA–2012–C–0900, by any of the following methods:

Electronic Submissions

Submit electronic objections in the following way:

- *Federal eRulemaking Portal:* <http://www.regulations.gov>. Follow the instructions for submitting comments.

Written Submissions

Submit written objections in the following ways:

- *Mail/Hand Delivery/Courier (for paper submissions):* Division of Dockets Management (HFA–305), Food and Drug Administration, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852.

Instructions: All submissions received must include the Agency name and Docket No. FDA–2012–C–0900 for this rulemaking. All objections received will be posted without change to <http://www.regulations.gov>, including any personal information provided. For detailed instructions on submitting objections, see the “Objections” heading of the **SUPPLEMENTARY INFORMATION** section.

Docket: For access to the docket to read background documents or objections received, go to <http://www.regulations.gov> and insert the docket number, found in brackets in the heading of this document, into the “Search” box and follow the prompts and/or go to the Division of Dockets Management, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852.

FOR FURTHER INFORMATION CONTACT:

Felicia M. Ellison, Center for Food Safety and Applied Nutrition (HFS–265), Food and Drug Administration, 5100 Paint Branch Pkwy., College Park, MD 20740–3835, 240–402–1264.

SUPPLEMENTARY INFORMATION:

I. Introduction

In a document published in the **Federal Register** of September 6, 2012 (77 FR 54862), we announced that GNT USA, Inc., c/o Hogan Lovells US LLP,

Columbia Square, 555 Thirteenth St. NW., Washington, DC 20004, had filed a color additive petition (CAP 2C0297). The petition proposed to amend the color additive regulations in part 73 *Listing of Color Additives Exempt From Certification* (21 CFR part 73) to provide for the safe use of spirulina concentrate, prepared from a filtered aqueous extract of the dried biomass of *Arthrospira platensis* (*A. platensis*) (an edible blue-green cyanobacterium also known as *Spirulina platensis*), as a color additive in food.

The spirulina concentrate that is manufactured by the petitioner is a blue colored powder or liquid produced by extracting the water soluble components of *A. platensis*, namely phycocyanins and other proteins, polysaccharides, lipids, and minor amounts of components such as vitamins, minerals, and water, followed by evaporation and the addition of sugars and other food-grade carriers (and water, if liquid form). The principal coloring components in the concentrate are the phycocyanins (not more than 2 percent), with lesser amounts of chlorophyll and carotenoids.

II. Background

In the **Federal Register** of August 13, 2013, we issued a final rule in response to a color additive petition (CAP 2C0293) approving the use of a filtered aqueous extract of the dried biomass of *A. platensis* as a color additive in candy and chewing gum (78 FR 49117). We established spirulina extract as the common or usual name for the color additive and listed it in § 73.530 (21 CFR 73.530). In addition to the identity of the color additive, the regulation in § 73.530 includes specifications that must be met for lead, arsenic, mercury, and microcystin toxin; however, the regulation does not impose a specific upper limit for spirulina extract in food or for the phycocyanin content of the color additive because FDA determined that the amount of the color additive used in food was self-limiting. Instead, FDA limited the use of spirulina extract in candy and chewing gum to amounts consistent with good manufacturing practice.

The primary difference between the spirulina extract that was the subject of CAP 2C0293 and spirulina concentrate that is the subject of CAP 2C0297 is the concentration of the components. Although spirulina concentrate is produced with an evaporation step to concentrate the components, the color additive has a lower level of phycocyanins (i.e., not more than 2 percent) than the spirulina extract that was the subject of CAP 2C0293 (i.e., not

less than 10 percent) because of a difference in the extraction process. To differentiate its color additive from this other spirulina product, the petitioner proposed that its color additive be listed separately as spirulina concentrate. However, since the regulation in § 73.530 does not have a specification or limit on the phycocyanin content of the color additive, we have determined that the subject color additive meets the specifications of identity for spirulina extract in § 73.530. Therefore, we have concluded that the petitioned uses should be added to § 73.530 for spirulina extract. The subject color additive will be referred hereinafter in this final rule as spirulina extract.

For the subject petition, spirulina extract is proposed for use in coloring confections (including candy and chewing gum), frostings, ice cream and frozen desserts, dessert coatings and toppings, beverage mixes and powders, yogurts, custards, puddings, cottage cheese, gelatin, breadcrumbs, and ready-to-eat cereals (excluding extruded cereals). The petitioner has proposed a phycocyanin limit of 2 percent in the color additive. However, we have determined that because the amount of spirulina extract used in food is self-limiting, there is no need for a specific upper limit for the phycocyanin content or the color additive (Ref. 1). Therefore, we are limiting the use of spirulina extract in the proposed foods to amounts consistent with good manufacturing practice.

III. Evaluation of Safety

Under section 721(b)(4) of the Federal Food, Drug, and Cosmetic Act (the FD&C Act) (21 U.S.C. 379e(b)(4)), a color additive may not be listed for a particular use unless the data and information available to FDA establishes that the color additive is safe for that use. Our color additive regulations at 21 CFR 70.3(i) define safe to mean that there is “convincing evidence that establishes with reasonable certainty that no harm will result from the intended use of the color additive.” To establish with reasonable certainty that a color additive intended for use in food is not harmful under its intended conditions of use, we consider the projected human dietary exposure to the additive, the additive’s toxicological data, and other relevant information (such as published literature) available to us. We compare an individual’s estimated daily intake (EDI) of the additive from all food sources to an acceptable intake level established by toxicological data. The EDI is determined by projections based on the amount of the additive proposed for use

in particular foods and on data regarding the amount consumed from all food sources of the additive. We commonly use the EDI for the 90th percentile consumer of a color additive as a measure of high chronic dietary intake.

IV. Safety of Petitioned Use of the Additive

As part of our safety evaluation, we considered the exposure to phycocyanins from both the petitioned and current uses of spirulina extract as a color additive. We estimated that the petitioned uses of spirulina extract will result in an exposure to phycocyanins of 80 milligrams/person/day (mg/p/d) for the 90th percentile consumer 2 years of age or older. We also estimated the exposure to phycocyanins from the petitioned use of the subject color additive for various age groups, including children 2 to 5 and 6 to 12 years of age, and teenagers 13 to 18 years of age, as these age groups may consume greater amounts of the foods containing spirulina extract. For these population subgroups, we estimated the exposure to phycocyanins at the 90th percentile to be 80 mg/p/d for children 2 to 5 years of age and for teenagers, and 90 mg/p/d for children 6 to 12 years of age (Ref. 2).

Regarding cumulative exposure to phycocyanins from spirulina and spirulina-derived substances, FDA discussed in the final rule for spirulina extract as a color additive in candy and chewing gum that spirulina and spirulina-derived substances have been the subject of four notices submitted by firms to FDA with their determinations that certain uses of spirulina-derived substances are generally recognized as safe (GRAS) (78 FR 49117 at 49118). We evaluated each of these GRAS notices (GRNs) and concluded that we had no reason to question the basis of these GRAS determinations (Refs. 3–6). One of the GRAS notices (GRN 424) pertains to the use of an aqueous extract of powdered *A. platensis* or *A. maxima* as an ingredient for use in all foods at levels consistent with good manufacturing practice, except for infant formula and those food products (e.g., meat, eggs, and catfish) requiring additional review by the U.S. Department of Agriculture. The spirulina substance that was the subject of GRN 424 is similar in chemical composition to the subject color additive, but with a much higher phycocyanin content, ranging from 42 to 47 percent. The notifier (the person who submits a GRAS notice) for GRN 424 estimated a conservative exposure to phycocyanins from the notified uses of

a spirulina extract to be 1,140 mg/p/d. This exposure estimate does not include exposure to spirulina and phycocyanins from dietary supplement use due to the notifier’s belief that their use is not widespread, and, therefore, would not significantly contribute to the dietary exposure of the wider population (Ref. 7).

We have concluded that the exposure that was estimated for GRN 424 continues to represent the upper bound cumulative exposure to phycocyanins from spirulina-based ingredients in food because of the high phycocyanin content of the substance that is the subject of GRN 424 (i.e., 42 to 47 percent) and its intended use in most foods. Therefore, we conclude that this cumulative exposure estimate of 1,140 mg/p/d for phycocyanins from current and proposed uses of spirulina-derived ingredients is sufficiently conservative (Ref. 2).

Consistent with how we evaluated the petition for the use of spirulina extract as a color additive in candy and chewing gum, we reviewed published animal feeding studies that evaluated the safety of spirulina powder, spirulina extract, and phycocyanins, the main coloring component of spirulina extract. We also evaluated the significance of data findings from human studies that investigated reported therapeutic effects of spirulina supplementation and considered adverse event data from case reports regarding individual humans that ingested spirulina for various time intervals of weeks to several months.

To support the safety of the proposed use of spirulina extract, the petitioner conducted a search of the peer-reviewed published literature on spirulina and submitted the published animal and human studies that they identified as being relevant to their petition. The petitioner concluded that these publications support the petitioned use of spirulina extract in food. Of the publications submitted by the petitioner, some of the papers had been previously reviewed by FDA. Our review of the new information along with the information submitted in previously reviewed publications did not reveal any new toxicological issues or concerns (Ref. 8).

In our evaluation of the petitioned use of spirulina extract to color candy and chewing gum, we had selected as the pivotal safety study a chronic feeding study that tested spirulina powder in rats for 21 months at concentrations of 10, 20, or 30 percent of the diet (equal to 5,000, 10,000 or 15,000 milligrams per kilogram bodyweight per day (mg/kg bw/day)). We determined that the results of this study showed no

indications of adverse effects in rats with prolonged consumption of the spirulina powder at any of the doses tested. Therefore, we concluded that the no-observed-effect-level (NOEL) for spirulina is 15,000 mg/kg bw/d (900,000 mg/p/d for a 60 kilogram person) based on the absence of any observed treatment-related effects at the highest dose tested in this 21-month study. The phycocyanin content in the spirulina powders that were tested in this study were reported to be in the range of 12 to 20.5 percent and, based on this range, we had determined the NOEL for phycocyanins for humans to be between 108,000 to 184,500 mg/p/d (78 FR 49117 at 49119). Taking into account the available safety information, the estimated exposure to phycocyanins from the petitioned use of the spirulina extract, and the margin of safety between the cumulative EDI and the NOEL, we conclude that the petitioned uses of spirulina extract as a color additive in food is safe.

The potential for spirulina phycocyanins to be allergenic was also discussed in the final rule for the use of spirulina extract as a color additive in candy and chewing gum (78 FR 49117 at 49119). We stated that based on our review of a comparison of the known amino acid sequences of phycocyanins with the sequences of known protein allergens, there is a low probability that the spirulina phycocyanins are protein allergens. Therefore, we concluded that the spirulina phycocyanins present an insignificant allergy risk to consumers of the color additive. We are not aware of any information that would cause us to change this conclusion.

V. Conclusion

Based on the data and information in the petition and other relevant material, we conclude that the petitioned use of spirulina extract in confections (including candy and chewing gum), frostings, ice cream and frozen desserts, dessert coatings and toppings, beverage mixes and powders, yogurts, custards, puddings, cottage cheese, gelatin, breadcrumbs, and ready-to-eat cereals (excluding extruded cereals), is safe. We further conclude that the additive will achieve its intended technical effect and is suitable for the petitioned use. Consequently, we are amending the color additive regulations in part 73 as set forth in this document. In addition, based upon the factors listed in 21 CFR 71.20(b), we conclude that certification of spirulina extract is not necessary for the protection of the public health.

VI. Public Disclosure

In accordance with § 71.15 (21 CFR 71.15), the petition and the documents that we considered and relied upon in reaching our decision to approve the petition will be made available for public disclosure (see **FOR FURTHER INFORMATION CONTACT**). As provided in § 71.15, we will delete from the documents any materials that are not available for public disclosure.

VII. Environmental Impact

We previously considered the environmental effects of this rule as stated in the September 6, 2012, notice of filing for CAP 2C0297 (77 FR 54862). We stated that we had determined, under 21 CFR 25.32(k), that this action “is of a type that does not individually or cumulatively have a significant effect on the human environment” such that neither an environmental assessment nor an environmental impact statement is required. We have not received any new information or comments that would affect our previous determination.

VIII. Paperwork Reduction Act of 1995

This final rule contains no collection of information. Therefore, clearance by the Office of Management and Budget under the Paperwork Reduction Act of 1995 is not required.

IX. Section 301(I) of the FD&C Act

Our review of this petition was limited to section 721 of the FD&C Act. This final rule is not a statement regarding compliance with other sections of the FD&C Act. For example, the Food and Drug Administration Amendments Act of 2007, which was signed into law on September 27, 2007, amended the FD&C Act to, among other things, add section 301(I) of the FD&C Act (21 U.S.C. 331(I)). Section 301(I) of the FD&C Act prohibits the introduction or delivery for introduction into interstate commerce of any food that contains a drug approved under section 505 of the FD&C Act (21 U.S.C. 355), a biological product licensed under section 351 of the Public Health Service Act (42 U.S.C. 262), or a drug or biological product for which substantial clinical investigations have been instituted and their existence has been made public, unless one of the exemptions in section 301(I)(1) to (I)(4) of the FD&C Act applies. In our review of this petition, we did not consider whether section 301(I) of the FD&C Act or any of its exemptions apply to food products containing this color additive. Accordingly, this final rule should not be construed to be a statement that a product containing this color additive, if

introduced or delivered for introduction into interstate commerce, would not violate section 301(I) of the FD&C Act. Furthermore, this language is included in all color additive final rules that pertain to food and therefore should not be construed to be a statement of the likelihood that section 301(I) of the FD&C Act applies.

X. Objections

This rule is effective as shown in the **DATES** section, except as to any provisions that may be stayed by the filing of proper objections. If you will be adversely affected by one or more provisions of this regulation, you may file with the Division of Dockets Management (see **ADDRESSES**) either electronic or written objections. You must separately number each objection, and within each numbered objection you must specify with particularity the provision(s) to which you object, and the grounds for your objection. Within each numbered objection, you must specifically state whether you are requesting a hearing on the particular provision that you specify in that numbered objection. If you do not request a hearing for any particular objection, you waive the right to a hearing on that objection. If you request a hearing, your objection must include a detailed description and analysis of the specific factual information you intend to present in support of the objection in the event that a hearing is held. If you do not include such a description and analysis for any particular objection, you waive the right to a hearing on the objection.

It is only necessary to send one set of documents. Identify documents with the docket number found in brackets in the heading of this document. Any objections received in response to the regulation may be seen in the Division of Dockets Management between 9 a.m. and 4 p.m., Monday through Friday, and will be posted to the docket at <http://www.regulations.gov>. We will publish notice of the objections that we have received or lack thereof in the **Federal Register**.

XI. References

The following references have been placed on display in the Division of Dockets Management (see **ADDRESSES**) and may be seen by interested persons between 9 a.m. and 4 p.m., Monday through Friday, and are available electronically at <http://www.regulations.gov>. (FDA has verified the Web site addresses in this reference section, but FDA is not responsible for any subsequent changes to Web sites

after this document publishes in the **Federal Register**.)

List of Subjects in 21 CFR Part 73

Color additives, Cosmetics, Drugs, Medical devices.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, and redelegated to the Director, Center for Food Safety and Applied Nutrition, 21 CFR part 73 is amended as follows:

PART 73—LISTING OF COLOR ADDITIVES EXEMPT FROM CERTIFICATION

■ 1. The authority citation for 21 CFR part 73 continues to read as follows:

Authority: 21 U.S.C. 321, 341, 342, 343, 348, 351, 352, 355, 361, 362, 371, 379e.

■ 2. Section 73.530 is amended by revising paragraph (c) to read as follows:

§ 73.530 Spirulina extract.

* * * * *

(c) *Uses and restrictions.* Spirulina extract may be safely used for coloring confections (including candy and chewing gum), frostings, ice cream and frozen desserts, dessert coatings and toppings, beverage mixes and powders, yogurts, custards, puddings, cottage cheese, gelatin, breadcrumbs, and ready-to-eat cereals (excluding extruded cereals), at levels consistent with good manufacturing practice, except that it may not be used to color foods for which standards of identity have been issued under section 401 of the Federal Food, Drug, and Cosmetic Act, unless the use of the added color is authorized by such standards.

* * * * *

Dated: April 1, 2014.

Susan M. Bernard,

Director, Office of Regulations, Policy and Social Sciences, Center for Food Safety and Applied Nutrition.

BILLING CODE 4160-01-P

FEDERAL MINE SAFETY AND HEALTH REVIEW COMMISSION

29 CFR Part 2700

Procedural Rules To Permit Parties To File and Serve Documents Electronically

AGENCY: Federal Mine Safety and Health Review Commission.

ACTION: Interim rule; extension of comment period.

SUMMARY: The Federal Mine Safety and Health Review Commission is extending the comment period for the interim rule entitled, “Procedural Rules to Permit Parties to File and Serve Documents Electronically,” that appeared in the **Federal Register** of December 23, 2013. The Commission published a correction to the interim rule in the **Federal Register** on January 17, 2014.

DATES: The Commission is extending the comment period on the interim rule published in the **Federal Register** on December 23, 2013 (78 FR 77354). Submit either electronic or written comments on the interim rule by July 31, 2014.

ADDRESSES: Electronic comments should state “Comments on Electronic Rule Changes” in the subject line and be emailed to mmccord@fmshrc.gov. Written comments should be mailed to Michael A. McCord, General Counsel, Office of the General Counsel, Federal Mine Safety and Health Review

Commission, 1331 Pennsylvania Avenue NW., Suite 520N, Washington, DC 20004-1710, or sent via facsimile to 202-434-9944.

FOR FURTHER INFORMATION CONTACT: Michael A. McCord, General Counsel, Office of the General Counsel, Federal Mine Safety and Health Review Commission, at (202) 434-9935 or mmccord@fmshrc.gov.

SUPPLEMENTARY INFORMATION: The Commission published in the **Federal Register** on December 23, 2013 (78 FR 77354), an interim rule with a request for comments. In the interim rule, the Commission amended its procedural rules to permit parties to file and serve documents electronically. The Commission is using a new electronic case management system (e-CMS) that will allow parties to file documents electronically with the Commission through a portal which may be accessed on the Commission’s Web site (www.fmshrc.gov). The Commission expects that the e-CMS will become available for electronic filing in the near future and encourages parties to check the Commission’s Web site for more specific information.

The Commission is extending the comment period on the interim rule through July 31, 2014, so that parties may include in their comments any experiences they have had using the e-CMS.

Dated: April 4, 2014.

Mary Lu Jordan,

Chairman, Federal Mine Safety and Health Review Commission.

BILLING CODE 6735-01-P

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 52

[EPA-R01-OAR-2008-0117; FRL-9908-51-Region 1]

Approval and Promulgation of Air Quality Implementation Plans; Connecticut; Reasonable Further Progress Plan and 2002 Base Year Emission Inventory

AGENCY: Environmental Protection Agency (EPA).

ACTION: Correcting amendments.

SUMMARY: The Environmental Protection Agency (EPA) published a final rule regarding reasonable further progress plans and 2002 base year emission inventories for Connecticut in the **Federal Register** on August 22, 2012. A duplicate paragraph letter was

identified and is corrected in this action.

DATES: This rule is effective on May 12, 2014.

FOR FURTHER INFORMATION CONTACT: Bob McConnell, Air Quality Planning Unit, U.S. Environmental Protection Agency, EPA New England Regional Office, 5 Post Office Square, Suite 100 (mail code: OEP05-2), Boston, MA 02109-3912, telephone number (617) 918-1046, fax number (617) 918-0046, email mccconnell.robert@epa.gov.

SUPPLEMENTARY INFORMATION: In a final rule dated August 22, 2012 (77 FR 50600), § 52.377 was amended by adding paragraph (k). However, a different action published shortly before had already used letter (k). This action corrects that error by inserting the next available paragraph letter (o).

List of Subjects in 40 CFR Part 52

Environmental protection, Air pollution control, Carbon monoxide, Incorporation by reference, Intergovernmental relations, Lead, Nitrogen dioxide, Ozone, Particulate matter, Reporting and recordkeeping requirements, Sulfur oxides, Volatile organic compounds.

Dated: April 2, 2014.

H. Curtis Spalding,

Regional Administrator, EPA New England.

Part 52 of chapter I, title 40 of the Code of Federal Regulations, is amended as follows:

PART 52—[AMENDED]

■ 1. The authority citation for part 52 continues to read as follows:

Authority: 42 U.S.C. 7401 et seq.

■ 2. Section 52.377 is amended by adding paragraph (o) to read as follows:

§ 52.377 Control strategy: Ozone.

* * * * *

(o) Revisions to the State Implementation Plan submitted by the Connecticut Department of Environmental Protection on February 1, 2008. These revisions are for the purpose of satisfying the rate of progress requirement of section 182(b)(1) from

2002 through 2008, and the contingency measure requirement of sections 172(c)(9) and of the Clean Air Act, for the Greater Connecticut moderate 8-hour ozone nonattainment area, and the Connecticut portion of the New York-New Jersey-Long Island moderate 8-hour ozone nonattainment area. These revisions establish motor vehicle emission budgets for 2008 of 29.7 tons per day of volatile organic compounds (VOCs) and 60.5 tons per day of nitrogen oxides (NOx) to be used in transportation conformity in the Connecticut portion of the New York-New Jersey-Long Island moderate 8-hour ozone nonattainment area. These revisions also establish motor vehicle emission budgets for 2008 for the Greater Connecticut moderate 8-hour ozone nonattainment area of 28.5 tons per day for VOCs, and 54.3 tons per day for NOx.

[FR Doc. 2014-07731 Filed 4-10-14; 8:45 am]

BILLING CODE 6560-50-P

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 52

[EPA-R01-OAR-2009-0451; FRL-9908-53-Region 1]

Approval and Promulgation of Air Quality Implementation Plans; New Hampshire; Reasonably Available Control Technology for the 1997 8-Hour Ozone Standard

AGENCY: Environmental Protection Agency (EPA).

ACTION: Correcting amendments.

SUMMARY: The Environmental Protection Agency (EPA) published a final rule for New Hampshire regarding reasonably available control technology for the 1997 8-hour ozone standard in the **Federal Register** on November 5, 2012. An incorrect date was identified and is corrected in this action.

DATES: This rule is effective on May 12, 2014.

FOR FURTHER INFORMATION CONTACT: Bob McConnell, Air Quality Planning Unit, U.S. Environmental Protection Agency,

EPA New England Regional Office, 5 Post Office Square, Suite 100 (mail code: OEP05-2), Boston, MA 02109-3912, telephone number (617) 918-1046, fax number (617) 918-0046, email mccconnell.robert@epa.gov.

SUPPLEMENTARY INFORMATION: In a final rule dated November 5, 2012 (77 FR 66388), the table in paragraph (d) of § 52.1520 incorrectly listed, within the third column of this table, the state effective date for the Waste Management order as 8/26/2002. As noted in the first column of page 66394 of this notice, an updated order was submitted for this facility, and it is the updated order that we approved in the November 5, 2012 action. The updated order, submitted on August 2, 2012, has a state effective date of April 27, 2012. This action corrects that error by inserting the correct date of April 27, 2012, into the table in paragraph (d) of § 52.1520, as follows:

List of Subjects in 40 CFR Part 52

Environmental protection, Air pollution control, Carbon monoxide, Incorporation by reference, Intergovernmental relations, Lead, Nitrogen dioxide, Ozone, Particulate matter, Reporting and recordkeeping requirements, Sulfur oxides, Volatile organic compounds.

Dated: April 2, 2014.

H. Curtis Spalding,

Regional Administrator, EPA New England.

Part 52 of chapter I, title 40 of the Code of Federal Regulations, is amended as follows:

PART 52—[AMENDED]

■ 1. The authority citation for part 52 continues to read as follows:

Authority: 42 U.S.C. 7401 et seq.

■ 2. Section 52.1520 is amended by revising the entry for “Waste Management” in the table in paragraph (d) to read as follows:

§ 52.1520 Identification of plan.

* * * * *

(d) *EPA-approved State Source specific requirements.*

EPA-APPROVED NEW HAMPSHIRE SOURCE SPECIFIC REQUIREMENTS

Name of source	Permit No.	State effective date	EPA approval date ²	Explanations
Waste Management	ARD-01-001	4/27/2012	11/5/2012, 77 FR 66388	Single source NO _x RACT order for facility in Rochester, NH.

² In order to determine the EPA effective date for a specific provision listed in this table, consult the FEDERAL REGISTER notice cited in this column for the particular provision.

40 CFR Part 180

[EPA-HQ-OPP-2012-0576; FRL-9907-46]

Fluoxastrobin; Pesticide Tolerances

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This regulation establishes tolerances for residues of fluoxastrobin in or on wheat, grain; and revises tolerances for milk; and milk, fat. Arysta LifeScience, North America, LLC, requested these tolerances under the Federal Food, Drug, and Cosmetic Act (FFDCA).

DATES: This regulation is effective April 11, 2014. Objections and requests for hearings must be received on or before June 10, 2014, and must be filed in accordance with the instructions provided in 40 CFR part 178 (see also Unit I.C. of the **SUPPLEMENTARY INFORMATION**).

ADDRESSES: The docket for this action, identified by docket identification (ID) number EPA-HQ-OPP-2012-0576, is available at <http://www.regulations.gov> or at the Office of Pesticide Programs Regulatory Public Docket (OPP Docket) in the Environmental Protection Agency Docket Center (EPA/DC), EPA West Bldg., Rm. 3334, 1301 Constitution Ave. NW., Washington, DC 20460-0001. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566-1744, and the telephone number for the OPP Docket is (703) 305-5805. Please review the visitor instructions and additional information about the docket available at <http://www.epa.gov/dockets>.

FOR FURTHER INFORMATION CONTACT: Lois Rossi, Registration Division (7505P), Office of Pesticide Programs, Environmental Protection Agency, 1200 Pennsylvania Ave. NW., Washington, DC 20460-0001; telephone number: (703) 305-7090; email address: RDFRNotices@epa.gov.

SUPPLEMENTARY INFORMATION:

I. General Information

A. Does this action apply to me?

You may be potentially affected by this action if you are an agricultural producer, food manufacturer, or pesticide manufacturer. The following list of North American Industrial Classification System (NAICS) codes is not intended to be exhaustive, but rather provides a guide to help readers determine whether this document applies to them. Potentially affected entities may include:

- Crop production (NAICS code 111).
- Animal production (NAICS code 112).
- Food manufacturing (NAICS code 311).
- Pesticide manufacturing (NAICS code 32532).

B. How can I get electronic access to other related information?

You may access a frequently updated electronic version of EPA's tolerance regulations at 40 CFR part 180 through the Government Printing Office's e-CFR site at http://ecfr.gpoaccess.gov/cgi/t/text/text-idx?&c=ecfr&tpl=/ecfrbrowse/Title40/40tab_02.tpl.

C. How can I file an objection or hearing request?

Under FFDCA section 408(g), 21 U.S.C. 346a, any person may file an objection to any aspect of this regulation and may also request a hearing on those objections. You must file your objection or request a hearing on this regulation in accordance with the instructions provided in 40 CFR part 178. To ensure proper receipt by EPA, you must identify docket ID number EPA-HQ-

OPP-2012-0576 in the subject line on the first page of your submission. All objections and requests for a hearing must be in writing, and must be received by the Hearing Clerk on or before June 10, 2014. Addresses for mail and hand delivery of objections and hearing requests are provided in 40 CFR 178.25(b).

In addition to filing an objection or hearing request with the Hearing Clerk as described in 40 CFR part 178, please submit a copy of the filing (excluding any Confidential Business Information (CBI)) for inclusion in the public docket. Information not marked confidential pursuant to 40 CFR part 2 may be disclosed publicly by EPA without prior notice. Submit the non-CBI copy of your objection or hearing request, identified by docket ID number EPA-HQ-OPP-2012-0576, by one of the following methods:

- *Federal eRulemaking Portal:* <http://www.regulations.gov>. Follow the online instructions for submitting comments. Do not submit electronically any information you consider to be CBI or other information whose disclosure is restricted by statute.
- *Mail:* OPP Docket, Environmental Protection Agency Docket Center (EPA/DC), (28221T), 1200 Pennsylvania Ave. NW., Washington, DC 20460-0001.
- *Hand Delivery:* To make special arrangements for hand delivery or delivery of boxed information, please follow the instructions at <http://www.epa.gov/dockets/contacts.htm>.

Additional instructions on commenting or visiting the docket, along with more information about dockets generally, is available at <http://www.epa.gov/dockets>.

II. Summary of Petitioned-for Tolerance

In the **Federal Register** of February 27, 2013 (78 FR 13296) (FRL-9380-2), EPA issued a document pursuant to

FFDCA section 408(d)(3), 21 U.S.C. 346a(d)(3), announcing the filing of a pesticide petition (PP 2F8130) by Arysta LifeScience, North America, LLC, 15401 Weston Pkwy., Suite 150, Cary, NC 27513. The petition requested that 40 CFR 180.609 be amended by establishing tolerances for residues of the fungicide, fluoxastrobin, (1*E*)-[2-[[6-(2-chlorophenoxy)-5-fluoro-4-pyrimidinyl]oxy]phenyl](5,6-dihydro-1,4,2-dioxazin-3-yl)methanone *O*-methyloxime, and its *Z*-isomer, (1*Z*)-[2-[[6-(2-chlorophenoxy)-5-fluoro-4-pyrimidinyl]oxy]phenyl](5,6-dihydro-1,4,2-dioxazin-3-yl)methanone *O*-methyloxime, in or on wheat, grain at 0.15 parts per million (ppm). The petition also requested that 40 CFR 180.609 be amended by revising tolerances for milk from 0.02 ppm to 0.03 ppm; and milk, fat from 0.50 ppm to 0.75 ppm. That document referenced a summary of the petition prepared by Arysta LifeScience, North America LLC, the registrant, which is available in the docket, <http://www.regulations.gov>. Comments were received on the notice of filing. EPA's response to these comments is discussed in Unit IV.C.

III. Aggregate Risk Assessment and Determination of Safety

Section 408(b)(2)(A)(i) of FFDCA allows EPA to establish a tolerance (the legal limit for a pesticide chemical residue in or on a food) only if EPA determines that the tolerance is "safe." Section 408(b)(2)(A)(ii) of FFDCA defines "safe" to mean that "there is a reasonable certainty that no harm will result from aggregate exposure to the pesticide chemical residue, including all anticipated dietary exposures and all other exposures for which there is reliable information." This includes exposure through drinking water and in residential settings, but does not include occupational exposure. Section 408(b)(2)(C) of FFDCA requires EPA to give special consideration to exposure of infants and children to the pesticide chemical residue in establishing a tolerance and to "ensure that there is a reasonable certainty that no harm will result to infants and children from aggregate exposure to the pesticide chemical residue. . . ."

Consistent with FFDCA section 408(b)(2)(D), and the factors specified in

FFDCA section 408(b)(2)(D), EPA has reviewed the available scientific data and other relevant information in support of this action. EPA has sufficient data to assess the hazards of and to make a determination on aggregate exposure for fluoxastrobin including exposure resulting from the tolerances established by this action. EPA's assessment of exposures and risks associated with fluoxastrobin follows.

A. Toxicological Profile

EPA has evaluated the available toxicity data and considered its validity, completeness, and reliability as well as the relationship of the results of the studies to human risk. EPA has also considered available information concerning the variability of the sensitivities of major identifiable subgroups of consumers, including infants and children.

Following repeated exposure, fluoxastrobin has mild or low toxicity in all tested species except for the dog. Repeated oral administration to dogs resulted in adverse liver toxicity at considerably lower doses than those noted in other species. Based on species sensitivity, the effects observed in the dog were used as endpoints for risk assessment. In both the 90-day and one-year oral feeding studies in dogs, the liver appeared to be the target organ. In dogs, mice, and rats, the kidney was another target organ. There was no indication of an adverse effect attributable to a single dose. Based on developmental toxicity studies (rat and rabbit) and a two-generation reproduction study (rat), there was neither increased susceptibility of pre/postnatal exposure to fluoxastrobin, nor adverse effects on reproduction. Furthermore, acute neurotoxic effects were not seen in an acute neurotoxicity study in rats up to the limit dose of 2,000 milligrams/kilogram/day (mg/kg/day). In a subchronic neurotoxicity study in rats, fluoxastrobin did not elicit any neurotoxic effects. Repeated dose studies of fluoxastrobin in the database did not show immunotoxic effects in rats. Results of genotoxicity testing were negative and there were no treatment-related carcinogenicity findings in adequately performed carcinogenicity studies in rats and mice. Therefore, fluoxastrobin is classified as "not likely

to be carcinogenic to humans." Specific information on the studies received and the nature of the adverse effects caused by fluoxastrobin as well as the no-observed-adverse-effect-level (NOAEL) and the lowest-observed-adverse-effect-level (LOAEL) from the toxicity studies can be found at <http://www.regulations.gov> in document, "Fluoxastrobin. Aggregate Human Health Risk Assessment for the Proposed New Uses on Melon Subgroup 9A and Sorghum, Along with Establishment of Permanent Tolerances on Wheat, and Amendments to Established Tolerances on Milk and Milk Fat" on pages 26–31 in docket ID number EPA-HQ-OPP-2012-0576.

B. Toxicological Points of Departure/Levels of Concern

Once a pesticide's toxicological profile is determined, EPA identifies toxicological points of departure (POD) and levels of concern to use in evaluating the risk posed by human exposure to the pesticide. For hazards that have a threshold below which there is no appreciable risk, the toxicological POD is used as the basis for derivation of reference values for risk assessment. PODs are developed based on a careful analysis of the doses in each toxicological study to determine the dose at which the NOAEL and the LOAEL are identified. Uncertainty/safety factors are used in conjunction with the POD to calculate a safe exposure level—generally referred to as a population-adjusted dose (PAD) or a reference dose (RfD)—and a safe margin of exposure (MOE). For non-threshold risks, the Agency assumes that any amount of exposure will lead to some degree of risk. Thus, the Agency estimates risk in terms of the probability of an occurrence of the adverse effect expected in a lifetime. For more information on the general principles EPA uses in risk characterization and a complete description of the risk assessment process, see <http://www.epa.gov/pesticides/factsheets/riskassess.htm>.

A summary of the toxicological endpoints for fluoxastrobin used for human risk assessment is shown in Table 1 of this unit.

TABLE 1—SUMMARY OF TOXICOLOGICAL DOSES AND ENDPOINTS FOR FLUOXASTROBIN FOR USE IN DIETARY, NON-OCCUPATIONAL, AND OCCUPATIONAL HUMAN HEALTH RISK ASSESSMENT

Exposure/scenario	Point of departure and uncertainty/safety factors	RfD, PAD, LOC for risk assessment	Study and toxicological effects
Acute dietary (General population including infants and children) and Females 13–49 years of age.	None: There is no indication of an adverse effect attributable to a single dose. An aRfD was not established.		
Chronic dietary (All populations)	NOAEL = 1.5 mg/kg/day. UF _A = 10x UF _H = 10x FQPA SF = 1x	Chronic RfD = 0.015 mg/kg/day. cPAD = 0.015 mg/kg/day.	Chronic toxicity dog LOAEL = M/F 8.1/7.7 mg/kg/day based on body weight reductions and hepatocytomegaly and cytoplasmic changes associated with increased serum liver alkaline phosphatase indicative of cholestasis.
Incidental oral short-term (1 to 30 days) and Intermediate-term (1–6 months).	NOAEL = 3.0 mg/kg/day. UF _A = 10x UF _H = 10x FQPA SF = 1x	LOC for MOE = 100.	90-day subchronic dog LOAEL = M/F 24.8/24.2 mg/kg/day based on dose-related reductions in net body weight gain and food efficiency in addition to toxicity findings in the liver (cholestasis) in both sexes, and kidneys (increased relative weights in females and degeneration of the proximal tubular epithelium in males).
Dermal short-term (1 to 30 days)	None: There were no systemic or dermal toxicity findings in a 28-day dermal toxicity study in the rat up to the limit dose (1,000 mg/kg/day) and there were no developmental or neurotoxicity concerns raised in other studies.		
Dermal intermediate-term (1 to 6 months).	NOAEL = 3.0 mg/kg/day. dermal absorption factor = 2.3%.	Residential LOC for MOE = 100. Occupational LOC for MOE = 100.	90-day subchronic dog LOAEL = M/F 24.8/24.2 mg/kg/day based on dose-related reductions in net body weight gain and food efficiency in addition to toxicity findings in the liver (cholestasis) in both sexes, and kidneys (increased relative weights in females and degeneration of the proximal tubular epithelium in males).
Inhalation ^b Short-Term (1–30 days) and Intermediate-Term (1–6 months).	NOAEL = 3.0 mg/kg/day.	Residential LOC for MOE = 100. Occupational LOC for MOE = 100.	90-day subchronic dog LOAEL = M/F 24.8/24.2 mg/kg/day based on dose-related reductions in net body weight gain and food efficiency in addition to toxicity findings in the liver (cholestasis) in both sexes, and kidneys (increased relative weights in females and degeneration of the proximal tubular epithelium in males).
Cancer (Oral, dermal, inhalation)	Classification: “Not likely to be Carcinogenic to Humans.”		

^a“Point of Departure (POD) = A data point or an estimated point that is derived from observed dose-response data and used to mark the beginning of extrapolation to determine risk associated with lower environmentally relevant human exposures.” NOAEL = no observed adverse effect level. LOAEL = lowest observed adverse effect level. UF = uncertainty factor. UF_A = extrapolation from animal to human (interspecies). UF_H = potential variation in sensitivity among members of the human population (intraspecies). FQPA SF = FQPA Safety Factor. PAD = population adjusted dose (a = acute, c = chronic). RfD = reference dose. MOE = margin of exposure. LOC = level of concern.

^bToxicity by the oral route is assumed to be equivalent to the inhalation route. A subchronic inhalation toxicity study is not required for fluoxastrobin at this time. Although no subchronic inhalation data is available EPA has waived the data requirement. In determining the need for a subchronic inhalation study, EPA’s weight of evidence decision process included both hazard and exposure considerations as well as incorporation of a presumed 10X Database Uncertainty Factor (UFdb) for the lack of this study. Specifically, with regard to exposure considerations, the Agency’s Level of Concern in the evaluating the need for the subchronic inhalation study is a Margin of Exposure (MOE) of 1,000 for inhalation exposure, which includes the 10X inter-species extrapolation factor, 10X intra-species variation factor, and the 10X UFdb. For fluoxystrobin, residential inhalation exposures resulted in MOEs higher than the LOC of 1,000 when using an oral Point of Departure (POD). This indicates that the lack of an inhalation study does not reduce the overall confidence in the risk assessment or result in an uncertainty (i.e., the study will not provide a POD sufficiently low to result in a risk of concern). Because EPA’s decision to waive the subchronic inhalation study essentially incorporates an additional 10X UFdb (i.e. the study was only waived because risks were at least 10X lower than required by use of the inter- and intraspecies safety factors), a second additional 10X FQPA safety factor is not being retained for the protection of infants and children due to the absence of this study.

C. Exposure Assessment

1. *Dietary exposure from food and feed uses.* In evaluating dietary exposure to fluoxastrobin, EPA considered exposure under the petitioned-for tolerances as well as all existing fluoxastrobin tolerances in 40 CFR 180.609. EPA assessed dietary

exposures from fluoxastrobin in food as follows:

i. *Acute exposure.* Quantitative acute dietary exposure and risk assessments are performed for a food-use pesticide, if a toxicological study has indicated the possibility of an effect of concern occurring as a result of a 1-day or single exposure. No such effects were identified in the toxicological studies

for fluoxastrobin; therefore, a quantitative acute dietary exposure assessment is unnecessary.

ii. *Chronic exposure.* A slightly refined chronic dietary exposure assessment was performed for fluoxastrobin using tolerance-level residues, average field trial residues, and 100 percent crop treated (PCT). This risk assessment was conducted using

the DEEM-FCID Version 3.16. This model uses 2003–2008 food consumption data from the U.S. Department of Agriculture's (USDA's) National Health and Nutrition Examination Survey, What We Eat in America, (NHANES/WWEIA).

iii. *Cancer*. Based on the data summarized in Unit III.A., EPA has concluded that fluoxastrobin does not pose a cancer risk to humans. Therefore, a dietary exposure assessment for the purpose of assessing cancer risk is unnecessary.

iv. *Anticipated residue and percent crop treated (PCT) information*. EPA did not use anticipated residue and/or PCT information in the dietary assessment for fluoxastrobin. Tolerance level residues and/or 100 PCT were assumed for all food commodities.

2. *Dietary exposure from drinking water*. The Agency used screening level water exposure models in the dietary exposure analysis and risk assessment for fluoxastrobin in drinking water. These simulation models take into account data on the physical, chemical, and fate/transport characteristics of fluoxastrobin. Further information regarding EPA drinking water models used in pesticide exposure assessment can be found at <http://www.epa.gov/oppefed1/models/water/index.htm>. In addition to evaluating the EDWCs from the proposed uses, EDWCs were reevaluated for all existing uses with Pesticide Root Zone Model Ground Water (PRZM-GW), which models continued use of fluoxastrobin over many years. For the chronic dietary assessment, the most conservative EDWC (137 µg/L) was based on an existing turf use modeled with a 100 year simulation of 100 years of repeated applications, using the highest single maximum application rate and the highest yearly application rate.

3. *From non-dietary exposure*. The term “residential exposure” is used in this document to refer to non-occupational, non-dietary exposure (e.g., for lawn and garden pest control, indoor pest control, termiticides, and flea and tick control on pets). Fluoxastrobin is currently registered for the following uses that could result in residential exposures: Spot treatment and/or broadcast control of diseases on turf, including lawns and golf courses. EPA assessed residential exposure using the following assumptions: Residential handler exposure for adults is expected to be short-term only. Intermediate-term and chronic exposures are not likely because of the intermittent nature of applications by homeowners. Since there are no toxicity findings for the short-term dermal route of exposure up

to the limit dose, the residential handler assessment only includes the inhalation route of exposure. There is also potential for homeowners and their families (of varying ages) to be exposed as a result of entering areas that have previously been treated with fluoxastrobin. Exposure might occur on areas such as lawns used by children or recreational areas such as golf courses used by adults and youths. Potential routes of exposure include dermal (adults and children) and incidental oral ingestion (children). Since no acute hazard has been identified, an assessment of episodic granular ingestion was not conducted. Further information regarding EPA standard assumptions and generic inputs for residential exposures may be found at <http://www.epa.gov/pesticides/science/residential-exposure-sop.html>.

4. *Cumulative effects from substances with a common mechanism of toxicity*. Section 408(b)(2)(D)(v) of FFDCA requires that, when considering whether to establish, modify, or revoke a tolerance, the Agency consider “available information” concerning the cumulative effects of a particular pesticide’s residues and “other substances that have a common mechanism of toxicity.”

EPA has not found fluoxastrobin to share a common mechanism of toxicity with any other substances, and fluoxastrobin does not appear to produce a toxic metabolite produced by other substances. For the purposes of this tolerance action, therefore, EPA has assumed that fluoxastrobin does not have a common mechanism of toxicity with other substances. For information regarding EPA’s efforts to determine which chemicals have a common mechanism of toxicity and to evaluate the cumulative effects of such chemicals, see EPA’s Web site at <http://www.epa.gov/pesticides/cumulative>.

D. Safety Factor for Infants and Children

1. *In general*. Section 408(b)(2)(C) of FFDCA provides that EPA shall apply an additional tenfold (10X) margin of safety for infants and children in the case of threshold effects to account for prenatal and postnatal toxicity and the completeness of the database on toxicity and exposure unless EPA determines based on reliable data that a different margin of safety will be safe for infants and children. This additional margin of safety is commonly referred to as the FQPA Safety Factor (SF). In applying this provision, EPA either retains the default value of 10X, or uses a different additional safety factor when reliable

data available to EPA support the choice of a different factor.

2. *Prenatal and postnatal sensitivity*. The available studies used to evaluate pre- and postnatal exposure susceptibility do not indicate increased susceptibility of rats or rabbits to fluoxastrobin. These studies include the following:

- i. Developmental toxicity studies in rats.
- ii. Developmental toxicity studies in rabbits.
- iii. A 2-generation reproduction study in rats.

3. *Conclusion*. EPA has determined that reliable data show the safety of infants and children would be adequately protected if the FQPA SF were reduced to 1X. That decision is based on the following findings:

i. The toxicity database for fluoxastrobin is complete. EPA waived the requirement for a subchronic inhalation data based on, among other things, its conclusion that even if an additional 10X safety factor was applied, inhalation exposure would not raise a risk of concern.

ii. There is no indication that fluoxastrobin is a neurotoxic chemical and there is no need for a developmental neurotoxicity study or additional UFs to account for neurotoxicity.

iii. There is no evidence that fluoxastrobin results in increased susceptibility in *in utero* rats or rabbits in the prenatal developmental studies or in young rats in the 2-generation reproduction study. The rat developmental study was tested up to the limit dose (1,000 mg/kg/day), and the rabbit developmental study was tested up to 400 mg/kg/day (highest dose tested). At the highest dose tested, there were decreases in food consumption and body weight in the maternal animals, but there were no developmental effects. Furthermore, in the rat reproduction study, there was no sensitivity in the offspring of the pups relative to the parental animals.

iv. The exposure databases are estimated based on data that reasonably account for potential exposures. The chronic dietary food exposure assessment was conservatively based on 100 PCT assumptions, tolerance-level residues, and conservative ground and surface drinking water modeling estimates. New 2012 Residential Standard Operating Procedures (SOPs) were used to assess post-application exposure to children including incidental oral exposure. The residential post-application assessment assumes maximum application rates and conservative day zero hand-to-mouth

activities. Although EPA has required additional data on transferable residues from treated turf for fluoxastrobin, EPA is confident that it has not underestimated turf exposure due to the conservativeness of the default turf transfer value and conservative assumptions in the short-term turf assessment procedures (e.g., assuming residues do not degrade over the thirty day assessment period and assuming high-end activities on turf for every day of the assessment period). All of the exposure estimates for fluoxastrobin are based on conservative high-end assumptions and are not likely to result in underestimated risk.

E. Aggregate Risks and Determination of Safety

EPA determines whether acute and chronic dietary pesticide exposures are safe by comparing aggregate exposure estimates to the acute PAD (aPAD) and chronic PAD (cPAD). For linear cancer risks, EPA calculates the lifetime probability of acquiring cancer given the estimated aggregate exposure. Short-, intermediate-, and chronic-term risks are evaluated by comparing the estimated aggregate food, water, and residential exposure to the appropriate PODs to ensure that an adequate MOE exists.

1. *Acute risk.* An acute aggregate risk assessment takes into account acute exposure estimates from dietary consumption of food and drinking water. No adverse effect resulting from a single oral exposure was identified and no acute dietary endpoint was selected. Therefore, fluoxastrobin is not expected to pose an acute risk.

2. *Chronic risk.* Using the exposure assumptions described in this unit for chronic exposure, EPA has concluded that chronic exposure to fluoxastrobin from food and water will utilize 30% of the cPAD for the general population, and 66% of the cPAD for all infants <1 year old, the population subgroup with the highest estimated chronic dietary exposure to fluoxastrobin. Based on the explanation in Unit III.C.3., regarding residential use patterns, chronic residential exposure to residues of fluoxastrobin is not expected.

3. *Short- and intermediate-term risk.* Short- and intermediate-term aggregate exposure takes into account short-term residential exposure plus chronic exposure to food and water (considered to be a background exposure level).

Fluoxastrobin is currently registered for uses that could result in short-term residential exposure, and the Agency has determined that it is appropriate to aggregate chronic exposure through food and water with short-term residential

exposures to fluoxastrobin. Because all short- and intermediate-term quantitative hazard assessments (via the dermal and incidental oral routes) for fluoxastrobin are based on the same endpoint, a screening-level, conservative aggregate risk assessment was conducted that combined the short-term incidental oral and intermediate-term exposure estimates (i.e., the highest exposure estimates) in the risk assessments for adults. The Agency believes that most residential exposure will be short-term, based on the use pattern.

There is potential short- and intermediate-term exposure to fluoxastrobin via the dietary (which is considered background exposure) and residential (which is considered primary) pathways. For adults, these pathways lead to exposure via the oral (background), and dermal and inhalation (primary) routes. For children, these pathways lead to exposure via the oral (background), and incidental oral and dermal (primary) routes.

Using the exposure assumptions described in this unit for short-term exposures, EPA has concluded the combined short-term food, water, and residential exposures result in aggregate MOEs of 610 for adults and 170 for children (1–2 years old). Because EPA's level of concern for fluoxastrobin is a MOE of 100 or below, these MOEs are not of concern.

4. *Aggregate cancer risk for U.S. population.* Based on the lack of evidence of carcinogenicity in two adequate rodent carcinogenicity studies, fluoxastrobin is not expected to pose a cancer risk to humans.

5. *Determination of safety.* Based on these risk assessments, EPA concludes that there is a reasonable certainty that no harm will result to the general population, or to infants and children from aggregate exposure to fluoxastrobin residues.

IV. Other Considerations

A. Analytical Enforcement Methodology

Adequate enforcement methodology (liquid chromatography/mass spectrometry/mass spectrometry) is available to enforce the tolerance expression. Method No. 00604 is available for plant commodities and Method No. 00691 is available for animal commodities. The method may be requested from: Chief, Analytical Chemistry Branch, Environmental Science Center, 701 Mapes Rd., Ft. Meade, MD 20755–5350; telephone number: (410) 305–2905; email address: residuemethods@epa.gov.

B. International Residue Limits

In making its tolerance decisions, EPA seeks to harmonize U.S. tolerances with international standards whenever possible, consistent with U.S. food safety standards and agricultural practices. EPA considers the international maximum residue limits (MRLs) established by the Codex Alimentarius Commission (Codex), as required by FFDCA section 408(b)(4). The Codex Alimentarius is a joint United Nations Food and Agriculture Organization/World Health Organization food standards program, and it is recognized as an international food safety standards-setting organization in trade agreements to which the United States is a party. EPA may establish a tolerance that is different from a Codex MRL; however, FFDCA section 408(b)(4) requires that EPA explain the reasons for departing from the Codex level.

There are no Codex MRLs established for fluoxastrobin. However, there are Canadian MRLs established on sorghum and milk at 0.02 ppm, milk fat at 0.15 ppm, wheat bran at 0.15 ppm, and wheat grain at 0.1 ppm. Furthermore, the Canadian tolerance expression is not harmonized with the US tolerance expression. For plants and livestock, the Canadian tolerance expression does not include the Z-isomer.

C. Response to Comments

Two comments were received to the docket from members of the public. Both comments were the same. The commenters objected to the proposed tolerance on the ground that it would result in fluoride being added to treated crops. The commenters offered no basis for this claim.

The Agency reviewed all plant, livestock, and environmental degradation data and determined that the fluorine will not be released into the environment when applied to crops or non-agricultural areas. Neither free fluorine nor de-fluorinated fluoxastrobin was observed in food or water in any of the metabolism, degradation, and magnitude of residue studies.

V. Conclusion

Therefore, tolerances are established for residues of fluoxastrobin, in or on wheat, grain at 0.15 ppm; and tolerances are revised for milk and milk, fat at 0.03 ppm and 0.75 ppm respectively. Additionally, the established tolerance for wheat bran at 0.15 ppm is no longer needed and should be revoked because the recommended tolerance of 0.15 ppm for wheat, grain will cover expected residues in wheat bran.

VI. Statutory and Executive Order Reviews

This final rule establishes tolerances under FFDCA section 408(d) in response to a petition submitted to the Agency. The Office of Management and Budget (OMB) has exempted these types of actions from review under Executive Order 12866, entitled "Regulatory Planning and Review" (58 FR 51735, October 4, 1993). Because this final rule has been exempted from review under Executive Order 12866, this final rule is not subject to Executive Order 13211, entitled "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355, May 22, 2001) or Executive Order 13045, entitled "Protection of Children from Environmental Health Risks and Safety Risks" (62 FR 19885, April 23, 1997). This final rule does not contain any information collections subject to OMB approval under the Paperwork Reduction Act (PRA) (44 U.S.C. 3501 *et seq.*), nor does it require any special considerations under Executive Order 12898, entitled "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations" (59 FR 7629, February 16, 1994).

Since tolerances and exemptions that are established on the basis of a petition under FFDCA section 408(d), such as the tolerance in this final rule, do not require the issuance of a proposed rule, the requirements of the Regulatory Flexibility Act (RFA) (5 U.S.C. 601 *et seq.*), do not apply.

This final rule directly regulates growers, food processors, food handlers, and food retailers, not States or tribes, nor does this action alter the relationships or distribution of power and responsibilities established by Congress in the preemption provisions of FFDCA section 408(n)(4). As such, the Agency has determined that this action will not have a substantial direct effect on States or tribal governments, on the relationship between the national government and the States or tribal governments, or on the distribution of power and responsibilities among the various levels of government or between the Federal Government and Indian tribes. Thus, the Agency has determined that Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999) and Executive Order 13175, entitled "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 9, 2000) do not apply to this final rule. In addition, this final rule does not impose any enforceable duty or contain any unfunded mandate as described under Title II of the

Unfunded Mandates Reform Act of 1995 (UMRA) (2 U.S.C. 1501 *et seq.*).

This action does not involve any technical standards that would require Agency consideration of voluntary consensus standards pursuant to section 12(d) of the National Technology Transfer and Advancement Act of 1995 (NTTAA) (15 U.S.C. 272 note).

VII. Congressional Review Act

Pursuant to the Congressional Review Act (5 U.S.C. 801 *et seq.*), EPA will submit a report containing this rule and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register**. This action is not a "major rule" as defined by 5 U.S.C. 804(2).

List of Subjects in 40 CFR Part 180

Environmental protection, Administrative practice and procedure, Agricultural commodities, Pesticides and pests, Reporting and recordkeeping requirements.

Dated: March 28, 2014.

Lois Rossi,
Director, Registration Division, Office of Pesticide Programs.

Therefore, 40 CFR chapter I is amended as follows:

PART 180—[AMENDED]

■ 1. The authority citation for part 180 continues to read as follows:

Authority: 21 U.S.C. 321(q), 346a and 371.

- 2. In § 180.609:
 - a. Remove "Wheat, bran" from the table in paragraph (a)(1).
 - b. Add "Wheat, grain" in alphabetical order to the table in paragraph (a)(1).
 - c. Revise "Milk" and "Milk, fat" in the table in paragraph (a)(2).

The amendments read as follows:

§ 180.609 Fluoxastrobin; tolerances for residues.

(a) *General.* (1) * * *

Commodity	Parts per million
* * * * *	
Wheat, grain	0.15
* * * * *	

(2) * * *

Commodity	Parts per million
* * * * *	
Milk	0.03
Milk, fat	0.75
* * * * *	

[FR Doc. 2014-07820 Filed 4-10-14; 8:45 am]

BILLING CODE 6560-50-P

FEDERAL COMMUNICATIONS COMMISSION

47 CFR Part 90

[WT Docket No. 96-86; DA 12-1942]

Service Rules Governing Public Safety Narrowband Operations in the 769-775/799-805 MHz Bands

AGENCY: Federal Communications Commission.

ACTION: Final rule.

SUMMARY: In this document, the Commission amends its rules to change the date of the "substantial service" benchmarks applicable to 700 MHz narrowband State licenses. This is intended to conform the dates used for the substantial service benchmarks under the Commission rules to the deadlines specified in the Commission's July 2011 Declaratory Ruling.

DATES: Effective April 11, 2014.

FOR FURTHER INFORMATION CONTACT: Difie Osborne, Esq., Policy and Licensing Division, Public Safety and Homeland Security Bureau, (202) 418-3627, or by email at Difie.Osborne@fcc.gov.

SUPPLEMENTARY INFORMATION: This is a summary of the Order in WT Docket No. 96-86, DA 12-1942, adopted on December 2, 2012, and released on December 3, 2012. The document is available for download at http://fjallfoss.fcc.gov/edocs_public/. The complete text of this document is also available for inspection and copying during normal business hours in the FCC Reference Information Center, Portals II, 445 12th Street SW., Room CY-A257, Washington, DC 20554. To request materials in accessible formats for people with disabilities (Braille, large print, electronic files, audio format), send an email to FCC504@fcc.gov or call the Consumer & Governmental Affairs Bureau at 202-418-0530 (voice), 202-418-0432 (TTY).

1. In 1998, the Commission established the initial band plan and service rules for the 24 megahertz of public safety spectrum in the 700 MHz

band that was reallocated from television broadcast use as a result of the DTV transition. In 2000, the Commission designated 2.4 megahertz of the 700 MHz narrowband spectrum for statewide geographic licensing. In addition, the Commission also established “substantial service” performance requirements for the narrowband State licenses, which included five- and ten-year benchmarks for state licensees to establish specified levels of substantial service within their statewide license areas. The Commission determined that these benchmarks would be calculated based upon the anticipated completion date of the DTV transition: January 1, 2007. Accordingly, the Commission established its five- and ten-year benchmark deadlines listed in § 90.529 based upon this January 1, 2007 date. Subsequently, however, the Commission extended the DTV transition date to June 12, 2009.

2. In July 2011, the Commission issued a *Declaratory Ruling* establishing that the five- and ten-year substantial service deadlines set forth in § 90.529 begin with the June 12, 2009 amended DTV transition date. Accordingly, the five- and ten-year substantial service deadlines occur on June 13, 2014 and June 13, 2019, respectively.

3. In this Order, the Commission’s Public Safety and Homeland Security Bureau, on delegated authority, conforms the “substantial service” deadlines in § 90.529(b) for 700 MHz public safety state-licensees to comply with the deadlines listed in the Commission’s July 2011 *Declaratory Ruling*. Thus, this Order revises the language of § 90.529(b) to accurately reflect the date determined in the *Declaratory Ruling*.

4. The Order merely revises the language in § 90.529(b) to accurately reflect the substantial service deadlines. These revisions are thus ministerial, non-substantive, and editorial. Accordingly, the Bureau found good cause to conclude that notice and comment procedures are unnecessary and would serve no useful purpose. Because the rule revisions will not affect the substantive rights or interests of any licensee, the Bureau also found good cause to make these non-substantive, editorial revisions of the rules effective upon publication in the **Federal Register**.

5. The Bureau adopted this Order pursuant to its delegated authority to “conduct[] rulemaking proceedings” in matters pertaining to public safety and homeland security. Pursuant to § 0.392 of the Commission’s rules, the Bureau Chief is “delegated authority to perform

all functions of the Bureau, described in . . . § 0.191” with certain specified exceptions. Specifically, § 0.392(e) provides that the Bureau can make ministerial amendments to rule parts, with specific exceptions “where novel questions of fact, law or policy are not involved.” None of those exceptions is present here.

Procedural Matters

A. Final Regulatory Flexibility Analysis

6. Because the Commission adopted this Order without the publication of a notice of proposed rulemaking, the Regulatory Flexibility Act, 5 U.S.C. 601 et seq., does not require the Commission to prepare a regulatory flexibility analysis.

B. Paperwork Reduction Act of 1995 Analysis

7. This document does not contain new or modified information collection requirements subject to the Paperwork Reduction Act of 1995, Public Law 104–13. Therefore, it does not contain any new or modified information collection burden for small business concerns with fewer than 25 employees, pursuant to the Small Business Paperwork Relief Act of 2002, Public Law 107–198, see 44 U.S.C. 3506(c)(4).

Ordering Clauses

8. Accordingly, *it is ordered* that, pursuant to sections 1, 2, 4(i), 303(r), 332 and 337 of the Communications Act of 1934, as amended, 47 U.S.C. 151, 152, 154(i), 303(r), 332 and 337, and §§ 0.191 and 0.392(e), 47 CFR 0.191, 0.392(e), the Order in WT Docket No. 96–86, DA 12–1942 *is hereby adopted*.

9. *It is further ordered* that, pursuant to 5 U.S.C. 553(d)(3), the rules adopted herein will *become effective upon publication in the Federal Register*.

10. *It is further ordered* that the Bureau *shall send* a copy of the Order in WT Docket No. 96–86, DA 12–1942 in a report to Congress and the General Accounting Office pursuant to the Congressional Review Act, 5 U.S.C. 801(a)(1)(A).

List of Subjects in 47 CFR Part 90

Radio.

Federal Communications Commission.

David G. Simpson,

Rear Admiral, USN (ret.), Chief, Public Safety and Homeland Security Bureau.

For the reasons discussed in the preamble, the Federal Communications Commission amends 47 CFR Part 90 to read as follows:

PART 90—PRIVATE LAND MOBILE RADIO SERVICES

■ 1. The authority citation for part 90 continues to read as follows:

Authority: Sections 4(i), 11, 303(g), 303(r), and 332(c)(7) of the Communications Act of 1934, as amended, 47 U.S.C. 154(i), 161, 303(g), 303(r), and 332(c)(7).

■ 2. Section 90.529 is amended by revising paragraphs (b)(1) and (b)(2) to read as follows:

§ 90.529 State License.

* * * * *

(b) * * *

(1) Providing or prepared to provide “substantial service” to one-third of their population or territory by June 13, 2014, i.e., within five years of the date that incumbent broadcasters are required to relocate to other portions of the spectrum;

(2) Providing or prepared to provide “substantial service” to two-thirds of their population or territory by June 13, 2019, i.e., within ten years of the date that incumbent broadcasters are required to relocate to other portions of the spectrum.

RIN 3090–AJ36

General Services Administration Acquisition Regulation (GSAR); Electronic Contracting Initiative (ECI); Correction

AGENCY: Office of Acquisition Policy, General Services Administration (GSA).

ACTION: Final rule; Correction.

SUMMARY: The General Services Administration (GSA) is issuing a correction to GSAR Change 56; GSAR Case 2012–G501; Electronic Contracting Initiative (ECI), which was published in the **Federal Register** at 79 FR 14182, March 13, 2014.

DATES: *Effective:* April 14, 2014.

FOR FURTHER INFORMATION CONTACT: Ms. Dana Munson, General Services Acquisition Policy Division, at 202–357–9652, for clarification of content. For information pertaining to status or publication schedules, contact the Regulatory Secretariat Division (MVCB), 1800 F Street NW., Washington, DC

20405, 202–501–4755. Please cite GSAR Case 2012–G501; Correction.

SUPPLEMENTARY INFORMATION: GSA published a document in the published in the **Federal Register** at 79 FR 14182, March 13, 2014, inadvertently section 552.238–81 contained typographical errors.

Correction

In the rule FR Doc. 2014–05409 published in the **Federal Register** at 79 FR 14182, March 13, 2014, make the following corrections:

- 1. On page 14184, in the second column, section 552.238–81, paragraph (b)(iii) remove “as described in 552.212–70, Preparation of Offer (Multiple Award Schedule), is required” and add “must be submitted in accordance with the request for proposal” in its place.
- 2. On page 14184, in the second column, section 552.238–81, paragraph (b)(iv) remove “GSAR 552.211–78, Commercial Delivery Schedule (Multiple Award Schedule)” and add “the request for proposal” in its place.

Authority: 40 U.S.C. 121(c).

Dated: April 7, 2014.

Jeffrey Koses,

Senior Procurement Executive, Office of Acquisition Policy, Office of Government-wide Policy.

DEPARTMENT OF THE INTERIOR

Fish and Wildlife Service

50 CFR Part 17

[Docket No. FWS–R2–ES–2012–0035; 4500030113]

RIN 1018–AY22

Endangered and Threatened Wildlife and Plants; Determination of Threatened Species Status for the Georgetown Salamander and Salado Salamander Throughout Their Ranges; Final Rule; Correction

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Correcting amendments.

SUMMARY: We, the U.S. Fish and Wildlife Service, published a final rule in the **Federal Register** on February 24, 2014, to list the Georgetown salamander and Salado salamander as threatened throughout their ranges under the Endangered Species Act of 1973 (Act), as amended (Act). Inadvertently, we made a technical error in our regulatory text. This action makes the necessary correction to the List of Endangered and Threatened Wildlife. We are also taking this opportunity to revise another entry on the List to correct a typographical error.

DATES: This correction is effective April 11, 2014.

FOR FURTHER INFORMATION CONTACT: Susan Wilkinson, (703) 358–2506.

SUPPLEMENTARY INFORMATION:

Salamander Corrections

In a final rule that published February 24, 2014 (79 FR 10236), we added the Georgetown salamander (*Eurycea naufragia*) and the Salado salamander (*Eurycea chisholmensis*) to the List of Endangered and Threatened Wildlife, which is presented in a table format in the Code of Federal Regulations at 50 CFR 17.11(h). However, we inadvertently left out the “When listed” number in the table entry for each of the two species.

A “When Listed” number is a footnote that directs readers to a list of publication dates printed in a list below the table. This field is not regulatory, but gives readers helpful information that enables them to find the final rule as it appeared in the **Federal Register**.

The Georgetown salamander and the Salado salamander should have the same “When listed” number: 829. Therefore, we are correcting the table to include the “When listed” number for both species. This change does not affect the status of either species under the Act.

Additional Correction

In this rulemaking document we also include language to correct a typographical error in the List of

Endangered and Threatened Wildlife. When the vicuña was added to the List in 2002 (67 FR 37695, May 30, 2002), an error was introduced in the “Vertebrate population where endangered or threatened” column. “Ecuador” was erroneously presented as “Ecuador”. We take this opportunity to correct this error.

List of Subjects in 50 CFR Part 17

Endangered and threatened species, Exports, Imports, Reporting and recordkeeping requirements, Transportation.

Regulation Promulgation

For the reasons given in the preamble, we amend part 17, subchapter B of chapter I, title 50 of the Code of Federal Regulations, as set forth below:

PART 17— [AMENDED]

- 1. The authority citation for part 17 continues to read as follows:

Authority: 16 U.S.C. 1361–1407; 1531–1544; 4201–4245; unless otherwise noted.

- 2. Amend § 17.11(h), the List of Endangered and Threatened Wildlife, by revising the entries for “Vicuña” under Mammals and the entries for “Salamander, Georgetown” and “Salamander, Salado” under Amphibians to read as set forth below:

§ 17.11 Endangered and threatened wildlife.

* * * * *

National Oceanic and Atmospheric Administration

50 CFR Part 635

[Docket No. 130214139-3542-02]

RIN 0648-XD222

Atlantic Highly Migratory Species; Atlantic Bluefin Tuna Fisheries

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Temporary rule; closure of Angling category southern area trophy fishery.

SUMMARY: NMFS closes the southern area Angling category fishery for large medium and giant (“trophy” (i.e., measuring 73 inches curved fork length or greater)) Atlantic bluefin tuna (BFT). This action is being taken to prevent any further overharvest of the Angling category southern area trophy BFT subquota.

DATES: Effective April 11, 2014, through December 31, 2014.

FOR FURTHER INFORMATION CONTACT: Sarah McLaughlin or Brad McHale, 978-281-9260.

SUPPLEMENTARY INFORMATION: Regulations implemented under the authority of the Atlantic Tunas Convention Act (ATCA; 16 U.S.C. 971 *et seq.*) and the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act; 16 U.S.C. 1801 *et seq.*) governing the harvest of BFT by persons and vessels subject to U.S. jurisdiction are found at 50 CFR part 635. Section 635.27 subdivides the U.S. BFT quota recommended by the International Commission for the Conservation of Atlantic Tunas (ICCAT) among the various domestic fishing categories, per the allocations established in the 2006 Consolidated Atlantic Highly Migratory Species Fishery Management Plan (2006 Consolidated HMS FMP) and in accordance with implementing regulations (71 FR 58058, October 2, 2006).

NMFS is required, under § 635.28(a)(1), to file a closure notice with the Office of the Federal Register for publication when a BFT quota is reached or is projected to be reached. On and after the effective date and time of such notification, for the remainder of the fishing year or for a specified period as indicated in the notification, retaining, possessing, or landing BFT under that quota category is prohibited until the opening of the subsequent quota period or until such date as specified in the notice.

Angling Category Large Medium and Giant Southern “Trophy” Fishery Closure

The 2014 BFT fishing year, which is managed on a calendar-year basis and subject to an annual calendar-year quota, began January 1, 2014. The

Angling category season opened January 1, 2014, and continues through December 31, 2014. The currently codified Angling category quota is 182 mt, of which 4.2 mt is allocated for the harvest of large medium and giant (trophy) BFT from the regulatory area by vessels fishing under the Angling category quota, with 1.4 mt for the area north of 39°18’ N. lat. (off Great Egg Inlet, NJ) and 2.8 mt for the area south of 39°18’ N. lat., including the Gulf of Mexico. Trophy BFT measure 73 inches (185 cm) curved fork length or greater.

Based on information from the NMFS Automated Landings Reporting System and the North Carolina Tagging Program, NMFS has determined that the codified Angling category trophy BFT subquota has been taken and that a closure of the southern area trophy BFT fishery is warranted at this time. Therefore, retaining, possessing, or landing large medium or giant BFT south of 39°18’ N. lat. by persons aboard vessels permitted in the HMS Angling category and the HMS Charter/Headboat category must cease at 11:30 p.m. local time on April 11, 2014. This action is intended to prevent any further overharvest of the Angling category southern area trophy BFT subquota, and is taken consistent with the regulations at § 635.28(a)(1). Please note, while this inseason action prohibits retention of large medium and giant BFT by persons aboard HMS Charter/Headboat category vessels while fishing recreationally, commercial retention of large medium and giant BFT on HMS Charter/Headboat category vessels is currently prohibited because the General category is closed until June 1, 2014.

HMS Angling and HMS Charter/Headboat category permit holders may catch and release (or tag and release) BFT of all sizes, subject to the requirements of the catch-and-release and tag-and-release programs at § 635.26. Anglers are also reminded that all BFT that are released must be handled in a manner that will maximize survival, and without removing the fish from the water, consistent with requirements at § 635.21(a)(1). For additional information on safe handling, see the “Careful Catch and Release” brochure available at

www.nmfs.noaa.gov/sfa/hms/.

If needed, subsequent Angling category adjustments will be published in the **Federal Register**. In addition, fishermen may call the Atlantic Tunas Information Line at (888) 872-8862 or (978) 281-9260, or access hmspermits.noaa.gov, for updates.

Classification

The Assistant Administrator for NMFS (AA) finds that it is impracticable and contrary to the public interest to

provide prior notice of, and an opportunity for public comment on, this action for the following reasons:

The regulations implementing the 2006 Consolidated HMS FMP provide for inseason retention limit adjustments and fishery closures to respond to the unpredictable nature of BFT availability on the fishing grounds, the migratory nature of this species, and the regional variations in the BFT fishery. The closure of the southern area Angling category trophy fishery is necessary to prevent any further overharvest of the southern area trophy fishery subquota. NMFS provides notification of closures by publishing the notice in the **Federal Register**, emailing individuals who have subscribed to the Atlantic HMS News electronic newsletter, and updating the information posted on the Atlantic Tunas Information Line and on hmspermits.noaa.gov.

These fisheries are currently underway and delaying this action would be contrary to the public interest as it could result in excessive trophy

BFT landings that may result in future potential quota reductions for the Angling category and potentially other BFT quota categories, depending on the magnitude of a potential Angling category overharvest. NMFS must close the southern area trophy BFT fishery before additional landings of these sizes of BFT accumulate. Therefore, the AA finds good cause under 5 U.S.C. 553(b)(B) to waive prior notice and the opportunity for public comment. For all of the above reasons, there is good cause under 5 U.S.C. 553(d) to waive the 30-day delay in effectiveness.

This action is being taken under 50 CFR 635.28(a)(1), and is exempt from review under Executive Order 12866.

Authority: 16 U.S.C. 971 *et seq.* and 1801 *et seq.*

Dated: April 8, 2014.

Emily H. Menashes,

Acting Director, Office of Sustainable Fisheries, National Marine Fisheries Service.

BILLING CODE 3510-22-P

Proposed Rules

Federal Register

Vol. 79, No. 70

Friday, April 11, 2014

This section of the FEDERAL REGISTER contains notices to the public of the proposed issuance of rules and regulations. The purpose of these notices is to give interested persons an opportunity to participate in the rule making prior to the adoption of the final rules.

DEPARTMENT OF AGRICULTURE

Federal Crop Insurance Corporation

7 CFR Part 457

[Docket No. FCIC-13-0003]

RIN 0563-AC42

Common Crop Insurance Regulations; Pear Crop Provisions

AGENCY: Federal Crop Insurance Corporation, USDA.

ACTION: Proposed rule.

SUMMARY: The Federal Crop Insurance Corporation (FCIC) proposes to amend the Common Crop Insurance Regulations, Pear Crop Provisions. The intended effect of this action is to improve coverage available to pear producers, to clarify existing policy provisions to better meet the needs of insured producers, and to reduce vulnerability to program fraud, waste, and abuse. Changes are also proposed to the Optional Coverage for Pear Quality Adjustment Endorsement to broaden coverage available to producers to manage their risk more effectively. The proposed changes will be effective for the 2015 and succeeding crop years.

DATES: Written comments and opinions on this proposed rule will be accepted until close of business May 12, 2014 and will be considered when the rule is to be made final.

ADDRESSES: FCIC prefers that comments be submitted electronically through the Federal eRulemaking Portal. You may submit comments, identified by Docket ID No. FCIC-13-0003, by any of the following methods:

- *Federal eRulemaking Portal:* <http://www.regulations.gov>. Follow the instructions for submitting comments.
- *Mail:* Director, Product Administration and Standards Division, Risk Management Agency, United States Department of Agriculture, P.O. Box 419205, Kansas City, MO 64133-6205.

All comments received, including those received by mail, will be posted without change to <http://www.regulations.gov>, including any personal information provided, and can be accessed by the public. All comments must include the agency name and docket number or Regulatory Information Number (RIN) for this rule. For detailed instructions on submitting comments and additional information, see <http://www.regulations.gov>. If you are submitting comments electronically through the Federal eRulemaking Portal and want to attach a document, we ask that it be in a text-based format. If you want to attach a document that is a scanned Adobe PDF file, it must be scanned as text and not as an image, thus allowing FCIC to search and copy certain portions of your submissions. For questions regarding attaching a document that is a scanned Adobe PDF file, please contact the RMA Web Content Team at (816) 823-4694 or by email at rmaweb.content@rma.usda.gov.

Privacy Act: Anyone is able to search the electronic form of all comments received for any dockets by the name of the individual submitting the comment (or signing the comment, if submitted on behalf of an association, business, labor union, etc.). You may review the complete User Notice and Privacy Notice for Regulations.gov at <http://www.regulations.gov/#!privacyNotice>.

FOR FURTHER INFORMATION CONTACT: Tim Hoffmann, Director, Product Administration and Standards Division, Risk Management Agency, United States Department of Agriculture, Beacon Facility, Stop 0812, Room 421, P.O. Box 419205, Kansas City, MO 64141-6205, telephone (816) 926-7730.

SUPPLEMENTARY INFORMATION:

Executive Order 12866

This rule has been determined to be not-significant for the purposes of Executive Order 12866 and, therefore, it has not been reviewed by the Office of Management and Budget (OMB).

Paperwork Reduction Act of 1995

Pursuant to the provisions of the Paperwork Reduction Act of 1995 (44 U.S.C. chapter 35), the collections of information in this rule have been approved by OMB under control number 0563-0053.

E-Government Act Compliance

FCIC is committed to complying with the E-Government Act of 2002, to promote the use of the Internet and

other information technologies to provide increased opportunities for citizen access to Government information and services, and for other purposes.

Unfunded Mandates Reform Act of 1995

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. This rule contains no Federal mandates (under the regulatory provisions of title II of the UMRA) for State, local, and tribal governments or the private sector. Therefore, this rule is not subject to the requirements of sections 202 and 205 of UMRA.

Executive Order 13132

It has been determined under section 1(a) of Executive Order 13132, Federalism, that this rule does not have sufficient implications to warrant consultation with the States. The provisions contained in this rule will not have a substantial direct effect on States, or on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government.

Executive Order 13175

This rule has been reviewed in accordance with the requirements of Executive Order 13175, Consultation, and Coordination with Indian Tribal Governments. The review reveals that this regulation will not have substantial and direct effects on Tribal governments and will not have significant Tribal implications.

Regulatory Flexibility Act

FCIC certifies that this regulation will not have a significant economic impact on a substantial number of small entities. Program requirements for the Federal crop insurance program are the same for all producers regardless of the size of their farming operation. For instance, all producers are required to submit an application and acreage report to establish their insurance guarantees and compute premium amounts, and all producers are required to submit a notice of loss and production information to determine the amount of an indemnity payment in the

event of an insured cause of crop loss. Whether a producer has 10 acres or 1000 acres, there is no difference in the kind of information collected. To ensure crop insurance is available to small entities, the Federal Crop Insurance Act authorizes FCIC to waive collection of administrative fees from limited resource farmers. FCIC believes this waiver helps to ensure that small entities are given the same opportunities as large entities to manage their risks through the use of crop insurance. A Regulatory Flexibility Analysis has not been prepared since this regulation does not have an impact on small entities, and, therefore, this regulation is exempt from the provisions of the Regulatory Flexibility Act (5 U.S.C. 605).

Federal Assistance Program

This program is listed in the Catalog of Federal Domestic Assistance under No. 10.450.

Executive Order 12372

This program is not subject to the provisions of Executive Order 12372, which requires intergovernmental consultation with State and local officials. See the Notice related to 7 CFR part 3015, subpart V, published at 48 FR 29115, June 24, 1983.

Executive Order 12988

This proposed rule has been reviewed in accordance with Executive Order 12988 on civil justice reform. The provisions of this rule will not have a retroactive effect. The provisions of this rule will preempt State and local laws to the extent such State and local laws are inconsistent herewith. With respect to any direct action taken by FCIC or action by FCIC directing the insurance provider to take specific action under the terms of the crop insurance policy, the administrative appeal provisions published at 7 CFR part 11, or 7 CFR part 400, subpart J for determinations of good farming practices, as applicable, must be exhausted before any action against FCIC for judicial review may be brought.

Environmental Evaluation

This action is not expected to have a significant economic impact on the quality of the human environment, health, or safety. Therefore, neither an Environmental Assessment nor an Environmental Impact Statement is needed.

Background

FCIC proposes to amend the Common Crop Insurance Regulations (7 CFR part 457) by revising § 457.111 Pear Crop Provisions, to be effective for the 2015

and succeeding crop years. Several requests have been made for changes to improve the coverage offered by clarifying and strengthening existing policy provisions, adding provisions to improve the integrity of the program, and revising the Optional Coverage for Pear Quality Adjustment Endorsement.

The proposed changes are as follows:

1. FCIC proposes to remove all references to section titles of the Basic Provisions. This information is currently contained in parenthesis following references to section numbers of the Basic Provisions throughout the Crop Provisions. The section numbers should provide sufficient guidance to locate the applicable provision.

2. Section 1—FCIC proposes to remove the definition of “varietal group” and replace it with the term type, the unit structure will be by type as specified in the Special Provisions.

3. Section 2—FCIC proposes to revise section 2 to allow optional units by irrigated and non-irrigated practices. Some northeastern regions have both practices available and this change will allow producers to insure their non-irrigated acreage separately from their irrigated acreage. Optional units will also be available by type if specified in the Special Provisions. This change is recommended to offer insureds additional risk management options and to be consistent with other perennial crop policies.

4. Section 3—FCIC proposes to revise section 3(a) to allow different coverage levels and price election percentages by type. The risks may not be the same for each type of pear so this gives the producer an opportunity to tailor the coverage to the specific risks associated with each type.

FCIC proposes to redesignate section 3(c) and add subparagraphs (1) through (4) for determining production to count before and after the beginning insurance period if the producer fails to notify us of circumstances that may reduce their production guarantee. This language is proposed to clarify establishment of the production guarantee.

5. Section 6—FCIC proposes a revision to section 6(c) to allow the insurance provider to consent to a different level of production than is specified in the Crop Provisions or Special Provisions. Currently the producer must get a written agreement from FCIC to obtain coverage. Under the proposed provisions, the Special Provisions may establish the production level or the insurance provider may approve a level of production in writing after completing an inspection. This change is proposed to allow the

approval of the level of production to be made without a written agreement.

6. Section 8—FCIC proposes a revision of section 8(a) for clarity of content and ease in reading. FCIC proposes to redesignate section 8(a)(2) as 8(a)(3). FCIC proposes revising the redesignated section 8(a)(3), which is the calendar date for the end of insurance by providing end of insurance dates by type. This proposed change better aligns the end of insurance period with the time the fruit will be mature and harvested. This proposed change may affect the APH databases of some insureds that have acreage of summer or fall pears currently insured as “all others” making it necessary to reconfigure their databases. However, this change will provide consistency in classification and grading standards.

7. Section 9—FCIC proposes to revise this section to clarify that losses due to insufficient or improper application of pest controls or disease controls are not covered causes of loss.

8. Section 10—FCIC proposes to add a new section 10(a), to advise insureds that representative samples must be left in the event of damage. This provision is added to be consistent with other crop policies and allows insurance providers the opportunity to verify damage and its cause.

9. Section 11—FCIC proposes to add an example at the end of section 11(b)(7) to illustrate the settlement of claim.

FCIC proposes to revise the minimum size requirement from 180 to 165 or smaller for California pear quality adjustment under section 11(c)(3)(iii)(A). This change was recommended by the California Pear Advisory Board to align with industry standards.

10. Section 13(b)—FCIC proposes to revise the coverage available under the Pear Quality Adjustment Endorsement. The current endorsement provides quality adjustment for damage caused by hail that does not grade U.S. No. 2 or better in accordance with United States Standards for Grades of Summer and Fall Pears, United States Standards for Grades of Winter Pears, or United States Standards for Grades of Pears for Processing. FCIC proposes revising the endorsement to include quality adjustment for all insured causes of loss for pears that do not grade a U.S. No. 1 in accordance with the United States Standards for Grades of Summer and Fall Pears or United States Standards for Grades of Winter Pears. The United States Standards for Grades of Pears for Processing have been removed from the endorsement because processing pears are covered in the base policy. The proposed Optional Coverage for Pear

Quality Adjustment Endorsement has also changed the grading standard from a U.S. No. 2 to a U.S. No. 1. The change to insure a higher standard should prove to be more valuable to producers. This change was made at the request of producers who want to manage their risk more effectively. Premium rating for the changes in this endorsement will also be reviewed to establish appropriate premium rates to maintain actuarial soundness.

FCIC proposes removing references pertaining to all cull production as found at the end of provision 13(b)(2), 13(c), and 13(e). Currently, pears that are knocked down to the ground by wind, or that are frozen and cannot be packed or marketed as fresh pears are considered culls. The proposed quality endorsement will include all insured causes of loss, therefore, damage caused by wind or freeze will be covered. Under the proposed quality endorsement, pears grading a U.S. No. 1 will be production to count at the full value. FCIC proposes adding a new section 13(b)(3) stating any production sold as U.S. No. 1 or better will be included as production to count under this option.

This change is proposed at the request of producers and industry personnel as the value of lower grade pears has diminished.

FCIC proposes adding a new section 13(d), stating that production to count under the endorsement will not apply in determining the producer's actual production history (APH). The APH will be based on all harvested and appraised marketable production from insurable acreage. This change is proposed in order to maintain consistency in APH reporting, as coverage is optional for the pear quality endorsement and can be cancelled in writing on or before the cancellation date; therefore, the APH can vary significantly from year to year.

FCIC proposes to include an example at the end of the endorsement to demonstrate how the quality adjustment would be administered.

Other minor editorial changes have been made to make the provisions more effective and consistent with other similar Crop Provisions.

List of Subjects in 7 CFR Part 457

Crop insurance, Pear, Reporting and recordkeeping requirements.

Proposed Rule

Accordingly, as set forth in the preamble, the Federal Crop Insurance Corporation proposes to amend 7 CFR part 457 effective for the 2015 and succeeding crop years as follows:

PART 457—COMMON CROP INSURANCE REGULATIONS

■ 1. The authority citation for 7 CFR part 457 continues to read as follows:

Authority: 7 U.S.C. 1506(l), 1506(o).

■ 2. Amend § 457.111 as follows:

■ a. In the introductory text by removing “2011” and adding “2015” in its place;

■ b. In section 1 by removing the definition of “varietal group”;

■ c. By revising section 2:

■ d. In section 3 by:

■ i. Removing the phrase “(Insurance Guarantees, Coverage Levels, and Prices for Determining Indemnities)” in the introductory text;

■ ii. Revising paragraph (a);

■ iii. Revising paragraph (b) introductory text by: removing the phrase “(Insurance Guarantees, Coverage Levels, and Prices for Determining Indemnities)”;

and removing “varietal group” and adding the term “type” in its place;

■ iv. Revising paragraph 3(b)(4)(iii);

■ v. Redesignating paragraph (c) as (d); and

■ vi. Adding new paragraph (c);

■ e. In section 4 by removing the phrase “(Contract Changes)” in the introductory text;

■ f. In section 5 by removing the phrase “(Life of Policy, Cancellation, and Termination)” in the introductory text;

■ g. Amend section 6 by:

■ i. Removing the phrase “(Insured Crop)” in the introductory text;

■ ii. Revising paragraph (c);

■ h. In section 7 by removing the phrase “(Insurable Acreage)” in the introductory text;

■ i. Amend section 8 by:

■ i. Revising paragraphs (a) introductory text and (a)(1);

■ ii. Redesignating paragraph (a)(2) as paragraph (a)(3) and revising newly redesignated paragraph (a)(3);

■ iii. Redesignating paragraph (c) as paragraph (a)(2) and revising newly redesignated paragraph (a)(2);

■ iv. Redesignating paragraph (d) as paragraph (a)(4); and

■ v. Removing the phrase “(Insurance Period)” in paragraph (b) introductory text;

■ j. Amend section 9 by:

■ i. Removing the phrase “(Cause of Loss)” in paragraph (a) introductory text;

■ ii. Adding new paragraphs (a)(6) and (7);

■ iii. Removing the phrase “(Cause of Loss)” in paragraph (b) introductory text;

■ iv. Removing paragraphs (b)(1) and (b)(1)(i) and (ii); and

■ v. Redesignating paragraphs (b)(2) and (3) as (b)(1) and (2) respectively;

■ k. Amend section 10 by:

■ i. Designating the undesignated paragraph at the beginning of the section as paragraph (b) and removing the phrase “(Duties in the Event of Damage or Loss)” in newly redesignated paragraph (b);

■ ii. Redesignating paragraphs (a), (b), and (c) as paragraphs (b)(1), (2), and (3) respectively; and

■ iii. Adding a new paragraph (a);

■ l. Amend section 11 by:

■ i. Removing the term “varietal group” in paragraph (b)(1) and replacing it with the term “type”;

■ ii. Revising paragraph (b)(2);

■ iii. Revising paragraph (b)(4);

■ iv. Removing the word “this” in paragraph (b)(6) and adding the word “the” in its place;

■ v. Revising paragraph (b)(7);

■ vi. In paragraph (c)(3)(iii)(A) by removing the number “180” and adding the number “165” in its place; and

■ vii. Removing the phrase “varietal group” in paragraph (c)(3)(iii)(B) and adding in its place the term “type”;

■ m. By revising section 13.

The revisions and additions read as follows:

§ 457.111 Pear crop insurance provisions.

* * * * *

2. Unit Division

In addition to the provisions in section 34 of the Basic Provisions, optional units may be established if each optional unit is:

(a) Located on non-contiguous land;

or

(b) A type specified in the Special Provisions.

3. * * *

(a) You may select different coverage levels and percent of price elections for each type in the county as specified in the Special Provisions. For example, if you choose 75 percent coverage level and 100 percent of the maximum price election for one type, you may choose 65 percent coverage level and 75 percent of the maximum price election for another type. If you elect the Catastrophic Risk Protection (CAT) level of insurance for any pear type, the CAT level of coverage will be applicable to all insured pear acreage for all types in the county.

(b) * * *

(4) * * *

(iii) Any other information that we request in order to establish your approved yield.

(c) We will reduce the yield used to establish your production guarantee, as necessary, based on our estimate of the

effect of any situation listed in sections 3(b)(1) through (b)(4). If the situation occurred:

(1) Before the beginning of the insurance period, the yield used to establish your production guarantee will be reduced for the current crop year regardless of whether the situation was due to an insured or uninsured cause of loss (If you fail to notify us of any circumstance that may reduce your yields from previous levels, we will reduce the yield used to establish your production guarantee at any time we become aware of the circumstance);

(2) After the beginning of the insurance period and you notify us by the production reporting date, the yield used to establish your production guarantee will be reduced for the current crop year only if the potential reduction in the yield used to establish your production guarantee is due to an uninsured cause of loss; or

(3) After the beginning of the insurance period and you fail to notify us by the production reporting date, production lost due to uninsured causes equal to the amount of the reduction in yield used to establish your production guarantee will be applied in determining any indemnity (see section 11(c)(1)(ii)). We will reduce the yield used to establish your production guarantee for the subsequent crop year.

* * * * *

6. * * *

(c) That are grown on trees that have produced an average of at least five (5) tons of pears per acre in at least one of the four most recent crop years unless the Special Provisions establishes a lower production level or we inspect such acreage and give our approval in writing; and

* * * * *

8. * * *

(a) In accordance with the provisions of section 11 of the Basic Provisions:

(1) For the year of application, coverage begins:

(i) In California, on February 1, except that if your application is received after January 22 but prior to February 1, insurance will attach on the 10th day after your properly completed application is received in our local office, unless we inspect the acreage during the 10-day period and determine that it does not meet insurability requirements (You must provide any information that we require for the crop or to determine the condition of the orchard); or

(ii) In all other states, on November 21, except that, if your application is received after November 11 but prior to November 21, insurance will attach on

the 10th day after your properly completed application is received in our local office, unless we inspect the acreage during the 10-day-period and determine that it does not meet insurability requirements (You must provide any information that we require for the crop or to determine the condition of the orchard).

(2) For each subsequent crop year that the policy remains continuously in force, coverage begins on the day immediately following the end of the insurance period for the prior crop year. Policy cancellation that results solely from transferring an existing policy to a different insurance provider for a subsequent crop year will not be considered a break in continuous coverage.

(3) The calendar date for the end of the insurance period for each crop year is:

- (i) September 15 for all types of summer or fall pears;
- (ii) October 15 for all types of winter pears; or
- (iii) As otherwise provided for specific types in the Special Provisions.

* * * * *

9. * * *

(a) * * *

(6) Insects, but not damage due to insufficient or improper application of pest control measures; or

(7) Plant disease, but not damage due to insufficient or improper application of disease control measures.

* * * * *

10. * * *

(a) In accordance with the requirements of section 14 of the Basic Provisions, you must leave representative samples in accordance with our procedures.

* * * * *

11. * * *

(b) * * *

(2) Multiplying the results of section 11(b)(1) by your price election for each type, if applicable;

* * * * *

(4) Multiplying the total production to be counted of each type, if applicable, by your price election;

* * * * *

(7) Multiplying the result of section 11(b)(6) by your share.

Basic Coverage Example: You have a 100 percent share of a 20-acre pear orchard. You elect 100 percent of the \$500/ton price election. You have a production guarantee of 15 tons/acre; you are only able to produce 10 tons of pears per acre. Your indemnity will be calculated as follows:

(1) 20 acres × 15 tons/acre = 300-ton production guarantee;

(2) \$500/ton (100 percent of the price election) × 300-ton production guarantee;

(3) = \$150,000 value of production guarantee;

(4) 20 acres × 10 tons = 200-ton production to count;

(5) \$500/ton (100 percent of the price election) × 200-ton production to count = \$100,000 value of production to count;

(6) \$150,000 value of production guarantee – \$100,000 value of production to count = \$50,000 loss; and

(7) \$50,000 × 100 percent share = \$50,000 indemnity payment.

[End of Example]

* * * * *

13. Pear Quality Adjustment Endorsement

In the event of a conflict between the Pear Crop Insurance Provisions and this option, this option will control.

(a) This endorsement applies to any crop year, provided:

(1) The insured pears are located in a State designated for such coverage on the actuarial documents and for which there is designated a premium rate for this endorsement;

(2) You have not elected to insure your pears under the Catastrophic Risk Protection (CAT) Endorsement;

(3) You elect it on your application or other form approved by us, and do so on or before the sales closing date for the initial crop year for which you wish it to be effective. By doing so, you agree to pay the additional premium designated in the actuarial documents for this optional coverage; and

(4) You or we do not cancel it in writing on or before the cancellation date. Your election of CAT coverage for any crop year after this endorsement is effective will be considered as notice of cancellation of this endorsement by you.

(b) If the fresh pear production is damaged by an insured cause of loss, and if eleven percent (11%) or more of the harvested and appraised production does not grade at least U. S. No. 1 in accordance with applicable United States Standards for Grades of Summer and Fall Pears or the United States Standards for Grades of Winter Pears as applicable, the amount of production to count will be reduced as follows:

(1) By two percent (2%) for each full one percentage point (1%) in excess of ten percent (10%), when eleven percent (11%) through sixty percent (60%) of the pears fail the grade standard; or

(2) By one hundred percent (100%) when more than sixty percent (60%) of the pears fail the grade standard.

(3) Notwithstanding sections 13(b)(1) and (2), if you sell any of your fresh pear production as U. S. No. 1 or better, all such sold production will be included as production to count under this option.

(c) Marketable production that grades less than U.S. No. 1 due to uninsurable causes not covered by this endorsement will not be reduced.

(d) Any adjustments that reduce your production to count under this option will not be applicable when determining production to count for Actual Production History purposes.

Optional Coverage for Pear Quality Adjustment Example: You have a 100 percent share of a 20-acre pear orchard. You have a production guarantee of 15 tons/acre. You elect 100 percent of the \$500/ton price election. You are only able to produce 10 tons/acre and only 7.5 tons/acre grade A U. S. No. 1 or better. Assuming you do not sell any of your fresh pear production as U. S. No. 1 or better, your indemnity would be calculated as follows:

(A) 20 acres \times 15 tons per acre = 300 tons production guarantee;

(B) 300 tons production guarantee \times \$500/ton = \$150,000 value of production guarantee;

(C) The value of fresh pear production to count is determined as follows:

(i) 200 tons harvested production minus 150 tons that graded U.S. No. 1 or better = 50 tons failing to make grade;

(ii) 50 tons failing grade/200 tons of production = 25 percent of production failing to grade U.S. No. 1 or better;

(iii) In accordance with section 13(b)(1): 25 percent minus 10 percent = 15 percent in excess of 10 percent allowance failing to make grade;

(iv) 15 percent \times 2 = 30 percent total quality adjustment for pears failing to grade U.S. No. 1;

(v) 200 tons production \times 30 percent quality adjustment = 60 tons of pears failing to make grade;

(vi) 200 tons production minus 60 tons failing to make grade = 140 tons of quality adjusted fresh pear production to count;

(vii) 140 tons of quality adjusted fresh pear production to count \times \$500/ton price election = \$70,000 value of fresh pear production to count;

(D) \$150,000 value of production guarantee minus \$70,000 value of fresh pear production to count = \$80,000 value of loss;

(E) \$80,000 value of loss \times 100 percent share = \$80,000 indemnity payment.

[End of Example]

Signed in Washington, DC, on March 25, 2014.

Brandon C. Willis,

Manager, Federal Crop Insurance Corporation.

BILLING CODE 3410-08-P

DEPARTMENT OF ENERGY

10 CFR Part 431

[Docket No. EERE-2014-BT-STD-0015]

RIN 1904-AB23

Energy Conservation Program for Certain Industrial Equipment: Energy Conservation Standards for Commercial Heating, Air-Conditioning, and Water-Heating Equipment

AGENCY: Office of Energy Efficiency and Renewable Energy, Department of Energy.

ACTION: Notice of data availability and request for public comment.

SUMMARY: The Energy Policy and Conservation Act of 1975 (EPCA), as amended, directs the U.S. Department of Energy (DOE) to establish energy conservation standards for certain commercial and industrial equipment, including commercial heating, air-conditioning, and water-heating equipment. Of particular relevance here, the statute also requires that each time the corresponding consensus standard—the American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc. (ASHRAE)/Illuminating Engineering Society (IES) Standard 90.1—is amended by the industry, DOE must assess whether there is a need to update the uniform national energy conservation standards for the same equipment covered under EPCA. ASHRAE officially released an amended version of this industry standard (ASHRAE Standard 90.1-2013), on October 9, 2013, thereby triggering DOE's related obligations under EPCA. As a first step in meeting this statutory requirement, today's notice of data availability (NODA) discusses the results of DOE's analysis of the energy savings potential of amended energy conservation standards for certain types of commercial equipment covered by ASHRAE Standard 90.1. The energy savings potentials are based upon either the efficiency levels specified in the amended industry standard (*i.e.*, ASHRAE Standard 90.1-2013) or more-stringent levels that would result in significant additional conservation of energy and are technologically feasible and economically justified. DOE is publishing this NODA to: announce the results and preliminary conclusions of DOE's analysis of potential energy savings associated with amended standards for this equipment, and request public comment on this analysis, as well as the submission of data and other relevant information.

DATES: DOE will accept written comments, data, and information regarding this NODA no later than May 12, 2014.

ADDRESSES: Any comments submitted must identify the NODA for ASHRAE Equipment and provide the docket number EERE-2014-BT-STD-0015 and/or Regulatory Information Number (RIN) 1904-AB23. Interested parties are encouraged to submit comments electronically. However, comments may be submitted by any of the following methods:

- *Federal eRulemaking Portal:* www.regulations.gov. Follow the instructions for submitting comments.
- *Email:* ComHeatingACWHEquip2014STD0015@ee.doe.gov. Include docket number EERE-2014-BT-STD-0015 and/or RIN number 1904-AB23 in the subject line of the message. All comments should clearly identify the name, address, and, if appropriate, organization of the commenter. Submit electronic comments in WordPerfect, Microsoft Word, PDF, or ASCII file format, and avoid the use of special characters or any form of encryption.
- *Postal Mail:* Ms. Brenda Edwards, U.S. Department of Energy, Building Technologies Office, Mailstop EE-5B, 1000 Independence Avenue SW., Washington, DC 20585-0121. If possible, please submit all items on a compact disc (CD), in which case it is not necessary to include printed copies. (Please note that comments sent by mail are often delayed and may be damaged by mail screening processes.)
- *Hand Delivery/Courier:* Ms. Brenda Edwards, U.S. Department of Energy, Building Technologies Office, Sixth Floor, 950 L'Enfant Plaza SW., Washington, DC 20024. Telephone: (202) 586-2945. If possible, please submit all items on a CD, in which case it is not necessary to include printed copies.

No telefacsimilies (faxes) will be accepted. For detailed instructions on submitting comments and additional information on the rulemaking process, see section IV of this document (Public Participation).

Docket: The docket is available for review at <http://www.regulations.gov>, including **Federal Register** notices, comments, and other supporting documents/materials throughout the rulemaking process. All documents in the docket are listed in the www.regulations.gov index. However, not all documents listed in the index may be publicly available, such as information that is exempt from public disclosure.

A link to the docket Web page can be found at: <http://www.regulations.gov/>

#docketDetail;D=EERE-2014-BT-STD-0015. This Web page contains a link to the docket for this notice on the www.regulations.gov site. The www.regulations.gov Web page contains simple instructions on how to access all documents, including public comments, in the docket. See section IV, “Public Participation,” for information on how to submit comments through www.regulations.gov.

For information on how to submit a comment or review other public comments and the docket, contact Ms. Brenda Edwards at (202) 586–2945 or by email: Brenda.Edwards@ee.doe.gov.

FOR FURTHER INFORMATION CONTACT: Ms. Ashley Armstrong, U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, Building Technologies Office, EE–5B, 1000 Independence Avenue SW., Washington, DC 20585–0121. Telephone: (202) 586–6590. Email: Ashley.Armstrong@ee.doe.gov.

Mr. Eric Stas, U.S. Department of Energy, Office of the General Counsel, GC–71, 1000 Independence Avenue SW., Washington, DC 20585–0121. Telephone: (202) 586–9507. Email: Eric.Stas@hq.doe.gov.

I. Introduction

A. Authority

Title III, Part C¹ of the Energy Policy and Conservation Act of 1975 (EPCA or the Act), Public Law 94–163 (42 U.S.C. 6311–6317, as codified), added by Public Law 95–619, Title IV, § 441(a), established the Energy Conservation Program for Certain Industrial Equipment, which includes the commercial heating, air-conditioning, and water-heating equipment that is the subject of this rulemaking.² In general, this program addresses the energy efficiency of certain types of commercial and industrial equipment. Relevant provisions of the Act specifically include definitions (42 U.S.C. 6311), test procedures (42 U.S.C. 6314), labelling provisions (42 U.S.C. 6315), energy conservation standards (42 U.S.C. 6313), and the authority to require information and reports from manufacturers (42 U.S.C. 6316).

In relevant part here, EPCA contains mandatory energy conservation standards for commercial heating, air-conditioning, and water-heating equipment. (42 U.S.C. 6313(a)) Specifically, the statute sets standards for small, large, and very large commercial package air-conditioning and heating equipment, packaged terminal air conditioners (PTACs) and packaged terminal heat pumps (PTHPs), warm-air furnaces, packaged boilers, storage water heaters, instantaneous water heaters, and unfired hot water storage tanks. *Id.* In doing so, EPCA established Federal energy conservation standards that generally correspond to

the levels in the American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) Standard 90.1, *Energy Standard for Buildings Except Low-Rise Residential Buildings*, as in effect on October 24, 1992 (*i.e.*, ASHRAE Standard 90.1–1989), for each type of covered equipment listed in 42 U.S.C. 6313(a). The Energy Independence and Security Act of 2007 (EISA 2007) further amended EPCA by adding definitions and setting minimum standards for single-package vertical air conditioners (SPVACs) and single-package vertical heat pumps (SPVHPs), which are collectively referred to as single-package vertical units (SPVUs). (42 U.S.C. 6313(a)(10)(A)) The standards for SPVACs and SPVHPs established by EISA 2007 corresponded to the levels contained in ASHRAE Standard 90.1–2004, which originated as addendum “d” to Standard 90.1–2001.

In acknowledgement of technological changes that yield energy efficiency benefits, Congress directed DOE through EPCA to consider amending the existing Federal energy efficiency standard for each type of equipment listed, each time ASHRAE Standard 90.1 is amended with respect to such equipment. (42 U.S.C. 6313(a)(6)(A)) For each type of equipment, EPCA directs that, if ASHRAE Standard 90.1 is amended,³

³ Although EPCA does not explicitly define the term “amended” in the context of ASHRAE Standard 90.1, DOE provided its interpretation of what would constitute an “amended standard” in a final rule published in the *Federal Register* on March 7, 2007 (hereafter referred to as the “March 2007 final rule”). 72 FR 10038. In that rule, DOE stated that the statutory trigger requiring DOE to adopt uniform national standards based on ASHRAE action is for ASHRAE to change a standard for any of the equipment listed in EPCA section 342(a)(6)(A)(i) (42 U.S.C. 6313(a)(6)(A)(i)) by increasing the energy efficiency level for that equipment type. *Id.* at 10042. In other words, if the revised ASHRAE Standard 90.1 leaves the standard level unchanged or lowers the standard, as compared to the level specified by the national standard adopted pursuant to EPCA, DOE does not have the authority to conduct a rulemaking to consider a higher standard for that equipment pursuant to 42 U.S.C. 6313(a)(6)(A). DOE subsequently reiterated this position in a final rule published in the *Federal Register* on July 22, 2009. 74 FR 36312, 36313.

However, in the AEMTCA amendments to EPCA in 2012, Congress modified several provisions related to ASHRAE Standard 90.1 equipment. In relevant part, DOE is now triggered to act whenever ASHRAE Standard 90.1’s “standard levels or design requirements under that standard” are amended. (42 U.S.C. 6313(a)(6)(A)(i)) Furthermore, DOE is now required to conduct an evaluation of each class of covered equipment in ASHRAE Standard 90.1 “every 6 years.” (42 U.S.C. 6313(a)(6)(C)(i)) For any covered equipment for which more than 6 years has elapsed since issuance of the most recent final rule establishing or amending a standard for such equipment, DOE must publish either the required notice of determination that standards do not need

Continued

¹ For editorial reasons, upon codification in the U.S. Code, Part C was redesignated Part A–1.

² All references to EPCA in this document refer to the statute as amended through the American Energy Manufacturing Technical Corrections Act (AEMTCA), Pub. L. 112–210 (Dec. 18, 2012).

DOE must adopt amended standards at the new efficiency level in ASHRAE Standard 90.1, unless clear and convincing evidence supports a determination that adoption of a more-stringent level as a national standard would produce significant additional energy savings and be technologically feasible and economically justified. (42 U.S.C. 6313(a)(6)(A)(ii)) If DOE decides to adopt as a national standard the minimum efficiency levels specified in the amended ASHRAE Standard 90.1, DOE must establish such standard not later than 18 months after publication of the amended industry standard. (42 U.S.C. 6313(a)(6)(A)(ii)(I)) However, if DOE determines that a more-stringent standard is justified under 42 U.S.C. 6313(a)(6)(A)(ii)(II), then DOE must establish such more-stringent standard not later than 30 months after publication of the amended ASHRAE Standard 90.1. (42 U.S.C. 6313(a)(6)(B))

As a preliminary step in the process of reviewing the changes to ASHRAE Standard 90.1, EPCA directs DOE to publish in the **Federal Register** for public comment an analysis of the energy savings potential of amended energy efficiency standards within 180 days after ASHRAE Standard 90.1 is amended with respect to any of the covered products specified under 42 U.S.C. 6313(a). (42 U.S.C. 6313(a)(6)(A))

On October 9, 2013, ASHRAE officially released for distribution and made public ASHRAE Standard 90.1–2013.⁴ This action by ASHRAE triggered DOE's obligations under 42 U.S.C. 6313(a)(6), as outlined previously. This notice of data availability (NODA) presents the analysis of the energy savings potential of amended energy efficiency standards, as required under 42 U.S.C. 6313(a)(6)(A)(i).

B. Purpose of the Notice of Data Availability

As explained previously, DOE is publishing today's NODA as a preliminary step pursuant to EPCA's requirements for DOE to consider amended energy conservation standards for certain types of commercial equipment covered by ASHRAE Standard 90.1, whenever ASHRAE amends its standard to increase the

energy efficiency level for that equipment type. Specifically, this NODA presents for public comment DOE's analysis of the potential energy savings for amended national energy conservation standards for these types of commercial equipment based on: (1) The amended efficiency levels contained within ASHRAE Standard 90.1–2013, and (2) more-stringent efficiency levels. DOE describes these analyses and preliminary conclusions and seeks input from interested parties, including the submission of data and other relevant information.

DOE is not required by EPCA to review additional changes in ASHRAE Standard 90.1–2013 for those equipment types where ASHRAE did not increase the efficiency level or change the design requirements compared to the existing Federal energy conservation standards. For those types of equipment for which efficiency levels or design requirements clearly did not change, DOE has conducted no further analysis. Therefore, DOE carefully examined the changes for such equipment in ASHRAE Standard 90.1 in order to thoroughly evaluate the amendments in ASHRAE 90.1–2013, thereby permitting DOE to determine what action, if any, is required under its statutory mandate.

Section II of this notice contains a discussion of DOE's evaluation of each ASHRAE equipment type for which energy conservation standards have been set pursuant to EPCA ("covered equipment"), in order for DOE to determine whether the amendments in ASHRAE Standard 90.1–2013 have resulted in increased efficiency levels or changes in design requirements. For covered equipment types determined to have increased efficiency levels or changes in design requirements in ASHRAE Standard 90.1–2013, DOE subjected that equipment to further analysis as discussed in section III of this NODA.

In summary, the energy savings analysis presented in this NODA is a preliminary step required under 42 U.S.C. 6313(a)(6)(A)(i). After review of the public comments on this NODA, if DOE determines that the amended efficiency levels in ASHRAE Standard 90.1–2013 have the potential for additional energy savings for types of equipment currently covered by uniform national standards, DOE will commence a rulemaking to consider amended standards, based upon either the efficiency levels in ASHRAE Standard 90.1–2013 or more-stringent efficiency levels that would be expected to result in significant additional conservation of energy and are technologically feasible and

economically justified. In conducting such rulemaking, DOE will address the general rulemaking requirements for all energy conservation standards, such as the anti-backsliding provision⁵ (42 U.S.C. 6316(a); 42 U.S.C. 6295(o)(1); 42 U.S.C. 6313(a)(6)(B)(iii)(I)), the criteria for making a determination that a standard is economically justified⁶ (42 U.S.C. 6316(a); 42 U.S.C. 6295(o)(2)(B)(i)–(ii); 42 U.S.C. 6313(a)(6)(B)(ii)), and the prohibition on making unavailable existing products with performance characteristics generally available in the United States.⁷ (42 U.S.C. 6316(a); 42 U.S.C. 6295(o)(4); 42 U.S.C. 6313(a)(6)(B)(iii)(II)).

C. Background

1. ASHRAE Standard 90.1–2013

As noted previously, ASHRAE released a new version of ASHRAE Standard 90.1 on October 9, 2013. The ASHRAE standard addresses efficiency levels for many types of commercial heating, ventilating, air-conditioning (HVAC), and water-heating equipment

⁵ EPCA contains what is commonly known as an "anti-backsliding" provision. (42 U.S.C. 6316(a); 42 U.S.C. 6295(o)(1)) This provision mandates that the Secretary not prescribe any amended standard that either increases the maximum allowable energy use or decreases the minimum required energy efficiency of covered equipment. The AEMTCA amendments to EPCA added this requirement to Part A–1 directly at 42 U.S.C. 6313(a)(6)(B)(iii)(I).

⁶ In deciding whether a more stringent standard is economically justified, DOE must review comments on the proposed standard, and then determine whether the benefits of the standard exceed its burdens by considering the following seven factors to the greatest extent practicable:

- (1) The economic impact on manufacturers and consumers subject to the standard;
- (2) The savings in operating costs throughout the estimated average life of the product in the type (or class), compared to any increase in the price, initial charges, or maintenance expenses of the products likely to result from the standard;
- (3) The total projected amount of energy savings likely to result directly from the standard;
- (4) Any lessening of product utility or performance likely to result from the standard;
- (5) The impact of any lessening of competition, as determined in writing by the Attorney General, likely to result from the standard;
- (6) The need for national energy conservation; and
- (7) Other factors the Secretary considers relevant.

(42 U.S.C. 6316(a); 42 U.S.C. 6295(o)(2)(B)(i)–(ii)) The AEMTCA amendments to EPCA added this requirement to Part A–1 directly at 42 U.S.C. 6313(a)(6)(B)(ii).

⁷ The Secretary may not prescribe an amended standard if interested persons have established by a preponderance of evidence that the amended standard would likely result in unavailability in the U.S. of any covered product type or class of performance characteristics, such as reliability, features, capacities, sizes, and volumes that are substantially similar to those generally available in the U.S. at the time of the Secretary's finding. (42 U.S.C. 6316(a); 42 U.S.C. 6295(o)(4)) The AEMTCA amendments to EPCA added this requirement to Part A–1 directly at 42 U.S.C. 6313(a)(6)(B)(iii)(II).

to be amended or a NOPR with proposed standards by December 31, 2013. DOE has incorporated these new statutory mandates into its rulemaking process for covered ASHRAE 90.1 equipment.

⁴ This industry standard is developed with input from a number of organizations—most prominently ASHRAE, the American National Standards Institute (ANSI), and the Illuminating Engineering Society (IES). Therefore, this document may sometimes be referred to more formally as ANSI/ASHRAE/IES Standard 90.1–2013. See www.ashrae.org for more information.

covered by EPCA. ASHRAE Standard 90.1–2013 revised the efficiency levels for certain commercial equipment, but for the remaining equipment, ASHRAE left in place the preexisting levels (*i.e.* the efficiency levels specified in EPCA or the efficiency levels in ASHRAE Standard 90.1–2010). ASHRAE Standard 90.1–2013 did not change any of the design requirements for the commercial (HVAC) and water-heating equipment covered by EPCA.

Table I.1 shows the equipment classes (and corresponding efficiency levels) for which efficiency levels in ASHRAE Standard 90.1–2013 (for metrics included in Federal energy conservation standards) differed from the previous version of ASHRAE Standard 90.1 (*i.e.*, ASHRAE Standard 90.1–2010). Table I.1 also displays the existing Federal energy conservation standards for those equipment classes. Section II of this document assesses each of these

equipment types to determine whether the amendments in ASHRAE Standard 90.1–2013 constitute increased energy efficiency levels, which would necessitate further analysis of the potential energy savings from amended Federal energy conservation standards; the conclusions of this assessment are presented in the final column of Table I.1.

TABLE I.1—FEDERAL ENERGY CONSERVATION STANDARDS AND ENERGY EFFICIENCY LEVELS IN ASHRAE STANDARD 90.1–2013 FOR SPECIFIC TYPES OF COMMERCIAL EQUIPMENT*

ASHRAE equipment class**	Energy efficiency levels in ASHRAE standard 90.1–2010	Energy efficiency levels in ASHRAE standard 90.1–2013	Federal energy conservation standards	Energy-Savings potential analysis required?
Commercial Package Air-Conditioning and Heating Equipment—Air-Cooled

Oil Storage Water Heaters, >105,000 Btu/h, <4,000 Btu/h/gal.	78% E _i ; Q/800 + 110 V ^{1/2} SL ◊, Btu/h.	80% E _i ; Q/799 + 16.6 V ^{1/2} SL ◊, Btu/h ◊◊.	78% E _i ; Q/800 + 110 V _r ^{1/2} Btu/hr.	Yes. See section II.A.5.
Gas Instantaneous Water Heaters, ≥200,000 Btu/h, ≥4,000 Btu/h/gal, ≥10 gal.	80% E _i ; Q/800 + 110 V ^{1/2} SL ◊, Btu/h.	80% E _i ; Q/799 + 16.6 V ^{1/2} SL ◊, Btu/h ◊◊.	80% E _i ; Q/800 + 110 V _r ^{1/2} Btu/hr.	No. See section II.A.5.
Oil Instantaneous Water Heaters, >210,000 Btu/h, ≥4,000 Btu/h/gal, ≥10 gal.	78% E _i ; Q/800 + 110 V ^{1/2} SL ◊, Btu/h.	78% E _i ; Q/799 + 16.6 V ^{1/2} SL ◊, Btu/h ◊◊.	78% E _i ; Q/800 + 110 V _r ^{1/2} Btu/hr.	No. See section II.A.5.

* “E_i” means thermal efficiency; “EER” means energy efficiency ratio; “SEER” means seasonal energy efficiency ratio; “HSPF” means heating seasonal performance factor; “COP” and “COP_H” mean coefficient of performance; and “Btu/h” or “Btu/hr” means British thermal units per hour.
 ** ASHRAE Standard 90.1–2013 equipment classes may differ from the equipment classes defined in DOE’s regulations, but no loss of coverage will occur (i.e., all previously covered DOE equipment classes remained covered equipment).
 *** While ASHRAE Standard 90.1–2013 added a subscript _H to COP for all heat pumps, its definition for “coefficient of performance (COP), heat pump—heating” has not changed. As a result, DOE believes the subscript to be a clarifying change of nomenclature (to differentiate from the COP metric used for refrigeration) only, rather than a change to the metric itself.
 † “Standard size” refers to PTAC equipment with wall sleeve dimensions ≥16 inches high or ≥42 inches wide. For DOE’s purposes, this equipment class applies to standard-size equipment regardless of application (e.g., new construction or replacement).
 †† “Cap” means cooling capacity in kBtu/h at 95°F outdoor dry-bulb temperature.
 ††† This may have been an editorial error in ASHRAE 90.1–2010.
 ‡ While ASHRAE Standard 90.1–2013 added this equipment class, DOE believes that equipment falling into these classes is already covered by Federal standards, most commonly in the residential space-constrained central air conditioning equipment class with minimum standards of 12.0 SEER for air conditioners and heat pumps and 7.4 HSPF for heat pumps. See section II.A.5.1 of this NODA.
 ‡‡ “V” means rated volume in gallons; “SL” means standby loss.
 ‡‡‡ “V_m” means measured volume in tank.
 ◊ “Q” means the nameplate input rate in Btu/hr; “V” means rated volume in gallons; “SL” means standby loss. DOE’s descriptor, “V_r” also means rated volume in gallons and differs only in nomenclature.
 ◊◊ As explained in section II.A of this NODA, DOE believes this level was a mistake; the formula for SI units was included instead of that for IP units.

DOE notes that ASHRAE 90.1–2013 also increased integrated energy efficiency ratio (IEER) levels for additional equipment not listed in Table I.1, including small, large, and very large air-cooled and water-cooled air conditioners and heat pumps.⁸ However, because Federal energy conservation standards for this equipment do not use IEER as a rating metric, DOE is not triggered to review this equipment. In February 2013, DOE published a request for information (RFI) and notice of document availability for commercial air-cooled equipment. 78 FR 7296 (Feb. 1, 2013). In the RFI, DOE sought information on the merits of adopting IEER as the energy efficiency descriptor for small, large, and very large air-cooled commercial air conditioners and heat pumps. Should DOE adopt new

standards using IEER as the metric, future increases in IEER levels in ASHRAE Standard 90.1–2013 as compared to the Federal energy conservation standards would trigger DOE to review its efficiency levels for that equipment?

D. Summary of DOE’s Preliminary Assessment of Equipment for Energy Savings Analysis

DOE has reached a preliminary conclusion for each of the classes of commercial equipment in ASHRAE Standard 90.1–2013 addressed in today’s NODA. For each class of commercial equipment addressed in this NODA, section II presents DOE’s initial determination as to whether ASHRAE increased the efficiency level for a given type of equipment (based on a rating metric used in the relevant Federal energy conservation standards), a change that would require an energy-savings potential analysis. As DOE is not required by EPCA to review additional changes in ASHRAE Standard 90.1–2013 for those equipment types where ASHRAE did not increase the efficiency level or change the design

requirements, DOE has conducted no further analysis for those types of equipment where efficiency levels clearly did not change. Additionally, for equipment where ASHRAE Standard 90.1–2013 has increased the level in comparison to the previous version of ASHRAE Standard 90.1, but the level does not exceed the current Federal standard level, DOE does not have the authority to conduct a rulemaking to consider a higher standard for that equipment pursuant to 42 U.S.C. 6313(a)(6)(A) and did not perform a potential energy-savings analysis. For those equipment classes where ASHRAE increased the efficiency level (in comparison to the Federal standard), DOE performed an analysis of the energy-savings potential, unless DOE found no equipment in the market in that equipment class (in which case there is no potential for energy savings).⁹

⁹ In the case where there is no equipment on the market or insufficient data for analysis, DOE would adopt the ASHRAE level, as required by the statute, without further analysis.

⁸ ASHRAE 90.1–2013 also decreased the IEER levels for small, large, and very large air-cooled variable refrigerant flow equipment; however, on December 9, 2013, ASHRAE issued errata indicating that this was an error for air conditioners. See: https://www.ashrae.org/File%20Library/docLib/StdsErrata/90-1-2013-IP_ErrataSheet_12-9-2013.pdf. DOE believes this was also an editorial error for heat pumps.

Based upon DOE's analysis, as discussed in section II, DOE has determined that ASHRAE increased the efficiency level for the following equipment categories:

- Small Three-Phase Commercial Air-Cooled Air Conditioners (Single Package Only) and Heat Pumps (Single Package and Split System) <65,000 Btu/h;
- Water Source Heat Pumps;
- Packaged Terminal Air Conditioners (Standard Size);
- Single Package Vertical Air Conditioners and Heat Pumps; and
- Oil-Fired Storage Water Heaters.

For most of those equipment classes, DOE found that equipment is available on the market and adequate information exists to reasonably estimate potential energy savings, and DOE performed an analysis of the energy-savings potential, which is described in section III. However, when DOE did not find equipment available on the market (such as for SPVACs and SPVHPs with capacities above 135,000 Btu/h), DOE did not perform a potential energy savings analysis.

II. Discussion of Changes in ASHRAE Standard 90.1–2013

Before beginning an analysis of the potential energy savings that would result from adopting the efficiency levels specified by ASHRAE Standard 90.1–2013 or more-stringent efficiency levels, DOE first determined whether or not the ASHRAE Standard 90.1–2013 efficiency levels actually represented an increase in efficiency above the current Federal standard levels or whether ASHRAE Standard 90.1–2013 adopted new design requirements, thereby triggering DOE action. This section contains a discussion of each equipment class where the ASHRAE Standard 90.1–2013 efficiency level differs from the ASHRAE Standard 90.1–2010 level (based on a rating metric used in the relevant Federal energy conservation standards),¹⁰ along with DOE's preliminary conclusion regarding the appropriate action to take with respect to that equipment. In addition, this section contains a discussion of DOE's determination with regard to newly created equipment classes in ASHRAE Standard 90.1–2013 (*i.e.*, nonweatherized, space-constrained SPVAC and SPVHP). Finally, this section provides a brief discussion of the test procedure updates contained in ASHRAE Standard 90.1–2013.

¹⁰ ASHRAE Standard 90.1–2013 did not change any of the design requirements for the commercial (HVAC) and water-heating equipment covered by EPCA, so this potential category of change is not discussed in this section.

A. Commercial Package Air-Conditioning and Heating Equipment

EPCA, as amended, defines “commercial package air conditioning and heating equipment” as air-cooled, evaporatively-cooled, water-cooled, or water source (not including ground water source) electrically operated, unitary central air conditioners and central air conditioning heat pumps for commercial use. (42 U.S.C. 6311(8)(A); 10 CFR 431.92) EPCA also defines “small,” “large,” and “very large” commercial package air conditioning and heating equipment based on the equipment's rated cooling capacity. (42 U.S.C. 6311(8)(B)-(D); 10 CFR 431.92) “Small commercial package air conditioning and heating equipment” means equipment rated below 135,000 Btu per hour (cooling capacity). (42 U.S.C. 6311(8)(B); 10 CFR 431.92) “Large commercial package air conditioning and heating equipment” means equipment rated (i) at or above 135,000 Btu per hour; and (ii) below 240,000 Btu per hour (cooling capacity). (42 U.S.C. 6311(8)(C); 10 CFR 431.92) “Very large commercial package air conditioning and heating equipment” means equipment rated (i) at or above 240,000 Btu per hour; and (ii) below 760,000 Btu per hour (cooling capacity). (42 U.S.C. 6311(8)(D); 10 CFR 431.92)

1. Air-Cooled Equipment

The current Federal energy conservation standards for the three classes of air-cooled commercial package air conditioners and heat pumps for which ASHRAE Standard 90.1–2013 amended efficiency levels are shown in Table I.1 and can be found in DOE's regulations at 10 CFR 431.97. The Federal energy conservation standards for air-cooled air conditioners and heat pumps are differentiated based on the cooling capacity (*i.e.*, small, large, or very large). For small equipment, there is an additional disaggregation into: (1) Equipment less than 65,000 Btu/h and (2) equipment greater than or equal to 65,000 Btu/h and less than 135,000 Btu/h. Three-phase equipment less than 65,000 Btu/h, although commercial equipment, is rated with the same metric as residential single-phase equipment (*i.e.*, SEER). Unlike the current Federal energy conservation standards, ASHRAE Standard 90.1 also differentiates the equipment that is less than 65,000 Btu/h into split system and single package subcategories. Historically, ASHRAE has set equivalent efficiency levels for this equipment; however, effective January 1, 2015, ASHRAE Standard 90.1–2013 increases the efficiency level for single package

air conditioners but not split system air conditioners. The increased efficiency level for single package air conditioners surpasses the current Federal energy conservation standard level for the overall equipment class, while the efficiency level for split system air conditioners meets and does not exceed the Federal energy conservation standard for the overall equipment class. ASHRAE Standard 90.1–2013 also increases the efficiency levels, effective January 1, 2015, for both single package and split system air-cooled heat pumps, for SEER and HSPF, to efficiency levels that surpass the current Federal energy conservation standard levels. ASHRAE Standard 90.1–2013 increases the HSPF level for split systems above that for single package heat pumps.

In the past, DOE has separated the equipment classes for three-phase air conditioners and heat pumps less than 65,000 Btu/h into single package and split system classes, for a total of four classes. However, when EISA 2007 increased the efficiency levels to identical levels across single package and split system equipment, effective in 2008, DOE combined the equipment classes in the Code of Federal Regulations (CFR), resulting in only two equipment classes, one for air conditioners and one for heat pumps. Because ASHRAE has increased the standard for only single package air conditioners, and has increased the HSPF level to a more-stringent level for split system heat pumps than for single package heat pumps, and DOE is obligated to adopt, at a minimum, the increased level in ASHRAE 90.1–2013 for that equipment class, DOE proposes to re-create separate equipment classes for single package and split system equipment in the overall equipment classes of small commercial package air conditioners and heat pumps (air-cooled, three-phase) less than 65,000 Btu/h. DOE requests comment on whether it should re-create these separate equipment classes, which is identified as Issue 1 in section IV.B, “Issues on Which DOE Seeks Comment.”

DOE conducted an analysis of the potential energy savings due to amended standards for single package air conditioners and single package and split system heat pumps (air-cooled, three-phase, less than 65,000 Btu/h), which is described in section III of this NODA. DOE did not conduct an analysis of the potential energy savings for split system air conditioners.

2. Water-Source Equipment

The current Federal energy conservation standards for the three classes of commercial water source heat pumps for which ASHRAE Standard 90.1–2013 amended efficiency levels are shown in Table I.1 and can be found in DOE’s regulations at 10 CFR 431.97. The Federal energy conservation standards for water source equipment are differentiated based on the cooling capacity. ASHRAE Standard 90.1–2013 increased the energy efficiency levels for all three equipment classes to efficiency levels that surpass the current Federal energy conservation standard levels. Therefore, DOE conducted an analysis of the potential energy savings due to amended standards for this equipment, which is described in section III of this NODA.

ASHRAE Standard 90.1–2013 also changed the name of this equipment class from “water source” to “water to air, water loop.” DOE believes this to be an editorial change only and that this

new nomenclature refers to the same water source heat pump equipment covered by Federal energy conservation standards. ASHRAE also changed the descriptor for this equipment from COP to COP_H. DOE believes this is also an editorial change to clarify the difference between COP for refrigeration and COP for heat pumps. DOE requests comment on whether these changes are other than editorial, which is identified as Issue 2 in section IV.B, “Issues on Which DOE Seeks Comment.”

EPCA does not define “water source heat pump” other than to exclude ground-water-source units from the definition of “commercial package air conditioning and heating equipment.” (42 U.S.C. 6311(8)(A)) However, DOE notes that there are several related types of water-source and ground-water-source heat pumps, as shown in Table II.1. ASHRAE Standard 90.1–2013 included new nomenclature for all such types of heat pumps. DOE further notes that the vast majority of water-source

(water-to-air, water-loop) heat pump models are also rated for performance in ground-loop or ground-water heat pump applications. It is DOE’s understanding that design differences of the models used in the different applications are minimal, including potentially more corrosion-resistant metal in the water coil (for open-loop systems only) and/or added insulation for ground-water or ground-loop systems. Efficiency ratings are different across these three application types primarily because of the different test conditions (ground and ground-water-source are tested with cooler entering water). Because of the similarity in models across application, DOE believes that increased efficiency standards for water-loop applications may affect heat pumps for ground-source and ground-water applications, although they are excluded from coverage. DOE is not aware of any differences between water-source heat pumps for residential and commercial applications.

TABLE II.1—NOMENCLATURE FOR TYPES OF WATER-LOOP, GROUND-LOOP, AND GROUND-WATER-SOURCE HEAT PUMPS

ASHRAE Standard 90.1–2010	ASHRAE Standard 90.1–2013	Test procedure
Water-source (86° entering water)	Water-to-air, water-loop	ISO Standard 13256–1.
Ground-water-source 59° entering water	Water-to-air, ground-water. Brine-to-air, ground-loop.	
Ground-water source 77° entering water	Water-to-water, water-loop	ISO Standard 13256–2.
Water-source water-to-water 86° entering water	Water-to-water, ground-water.	
Water-source water-to-water 59° entering water	Brine-to-water, ground-loop.	
Ground-water-source brine-to-water 77° entering water		

As noted above, DOE views these changes in nomenclature as nonsubstantive in terms of the associated standard levels. Consequently, DOE is maintaining its current requirements for these equipment classes.

However, DOE is considering adding a definition for “water-source heat pump” to the CFR that would include both single-phase and three-phase units of all capacities (up to 760,000 Btu/h) and would be applicable to water-to-air heat pumps. DOE is considering adapting the definition from that in the ASHRAE handbook: ¹¹ “A water-source heat pump is a [single-phase or three-phase] reverse-cycle heat pump that uses [a circulating water loop] as the heat source for heating and as the heat sink for cooling. The main components are a compressor, refrigerant-to-water heat exchanger, refrigerant-to-air heat exchanger, refrigerant expansion

devices, and refrigerant reversing valve.” DOE requests comment on this definition, which is identified as Issue 3 in section IV.B, “Issues on Which DOE Seeks Comment.”

3. Packaged Terminal Air Conditioners

EPCA defines a “packaged terminal air conditioner” as “a wall sleeve and a separate unencased combination of heating and cooling assemblies specified by the builder and intended for mounting through the wall. It includes a prime source of refrigeration, separable outdoor louvers, forced ventilation, and heating availability by builder’s choice of hot water, steam, or electricity.” (42 U.S.C. 6311(10)(A); 10 CFR 431.92)

In February 2013, DOE published a notice of public meeting and availability of the Framework Document regarding energy conservation standards for packaged terminal air conditioners and heat pumps standards. 78 FR 12252 (Feb. 22, 2013). This framework was published as a first step toward meeting the six-year look back requirement specified in EISA 2007. (42 U.S.C. 6313(a)(6)(C)(i)) As part of the six-year

look back, DOE expects to issue a notice of proposed rulemaking (NPR) for PTAC and PTHP equipment that will include equipment classes for which ASHRAE Standard 90.1–2013 increased efficiency levels (*i.e.*, standard-size PTACs), as well as those for which it did not. The PTACs/PTHPs NPR will be issued along a timeline that meets the six-year look back requirements (for those equipment classes where DOE was not triggered), as well as either the 18 or 30 month timeline noted previously (for those equipment classes where DOE was triggered).

The current Federal energy conservation standards for the three classes of PTACs for which ASHRAE Standard 90.1–2013 amended efficiency levels are shown in Table I.1 and are found in DOE’s regulations at 10 CFR 431.97. The Federal energy conservation standards for PTACs are differentiated based on the cooling capacity and physical dimensions (standard versus nonstandard size). ASHRAE Standard 90.1–2013 increased the energy efficiency levels for all three standard-size PTAC equipment classes to efficiency levels that meet those for

¹¹ 2012 ASHRAE Handbook, Heating, Ventilating, and Air-Conditioning Systems and Equipment. ASHRAE, Atlanta, GA. Chapter 9 (Available at: <https://www.ashrae.org/resources-publications/description-of-the-2012-ashrae-handbook-hvac-systems-and-equipment>).

PTHPs and surpass the current Federal energy conservation standard levels for PTACs. Therefore, DOE conducted an analysis of the potential energy savings due to amended standards for standard-size PTACs, which is described in section III of this NODA.

4. Small-Duct, High-Velocity, and Through-The-Wall Equipment

EPCA does not separate small-duct high-velocity (SDHV) or through-the-wall (TTW) heat pumps from other types of small commercial package air-conditioning and heating equipment in its definitions. (42 U.S.C. 6311(8)) Therefore, EPCA's definition of "small commercial package air conditioning and heating equipment" would include SDHV and TTW heat pumps.

ASHRAE Standard 90.1–2013 appeared to change some of the efficiency levels for these classes of equipment. Specifically, ASHRAE Standard 90.1–2010 had increased the cooling efficiency requirements for TTW heat pumps to 13.0 SEER in comparison to the efficiency levels of 12.0 SEER in ASHRAE Standard 90.1–2007. However, in March 2011, ASHRAE issued Proposed Addendum h for public review that would correct the minimum SEER for this equipment to 12.0 SEER, and this addendum was approved and incorporated into ASHRAE Standard 90.1–2013. Therefore, this change in ASHRAE Standard 90.1–2013 was correcting an editorial error in ASHRAE Standard 90.1–2010.

For SDHV air conditioners and heat pumps, ASHRAE Standard 90.1–2013 increases the cooling efficiency requirement from 10.0 SEER to 11.0 SEER. It also includes a heating efficiency requirement for SDHV heat pumps of 6.8 HSPF, which was present in ASHRAE 90.1–2007 but not ASHRAE 90.1–2010 (which DOE also thought to be an editorial error). These changes were made through Addendum bj to ASHRAE 90.1–2010, which noted that the previously adopted Addendum j to ASHRAE Standard 90.1–2010 had deleted the SDHV equipment class entirely because all SDHV models sold were single-phase residential products, but that Addendum bj was re-establishing the equipment class because manufacturers had expressed an intention to introduce three-phase equipment to the market. In addition, Addendum bj noted that it contained minimum efficiency levels identical to those established by DOE for single-phase residential SDHV products.

The DOE standards for both commercial TTW and SDHV air conditioners, which are 13.0 SEER, and for heat pumps, which are 13.0 SEER

and 7.7 HSPF, were established for the overall equipment category of small commercial package air-conditioning and heating equipment by EISA 2007, which amended EPCA. (42 U.S.C. 6313(a)(7)(D)) Because the ASHRAE Standard 90.1–2013 efficiency levels for TTW and SDHV equipment are less than those in the DOE standards, DOE has tentatively concluded that it is not required to take action on this equipment at this time.

5. Single-Package Vertical Air Conditioners and Single-Package Vertical Heat Pumps

EPCA, as amended, defines "single package vertical air conditioner" as air-cooled commercial package air conditioning and heating equipment that:

(1) is factory-assembled as a single package that:

(i) has major components that are arranged vertically;

(ii) is an encased combination of cooling and optional heating components; and

(iii) is intended for exterior mounting on, adjacent interior to, or through an outside wall;

(2) is powered by a single- or 3-phase current;

(3) may contain one or more separate indoor grilles, outdoor louvers, various ventilation options, indoor free air discharges, ductwork, wall plenum, or sleeves; and

(4) has heating components that may include electrical resistance, steam, hot water, or gas, but may not include reverse cycle refrigeration as a heating means. (42 U.S.C. 6311(22);¹² 10 CFR 431.92)

EPCA, as amended, defines "single package vertical heat pump" as a single-package vertical air conditioner that

(1) uses reverse cycle refrigeration as its primary heat source; and

(2) may include secondary supplemental heating by means of electrical resistance, steam, hot water, or gas. (42 U.S.C. 6311(23); 10 CFR 431.92)

The current Federal energy conservation standards for the six classes of SPVUs for which ASHRAE

¹² In the EISA 2007 amendments to EPCA, Congress renumbered several statutory definitions to accommodate new definitions. Consequently, the definition for "harvest rate" was moved from 42 U.S.C. 6311(21) to 42 U.S.C. 6311(22). However, in a separate provision, EISA 2007 provided for a definition of "single package vertical air conditioner" at 42 U.S.C. 6311(22). Similarly, EISA 2007 added a definition for "single package vertical heat pump" at 42 U.S.C. 6311(23), which given the other definitions present, probably should have been codified at 42 U.S.C. 6311(24). DOE has implemented these statutory provisions as if the drafting error had not occurred.

Standard 90.1–2013 amended efficiency levels are shown in Table I.1 and can be found in DOE's regulations at 10 CFR 431.97. The product classes for SPVACs and SPVHPs, as well as their attendant Federal energy conservation standards, are differentiated based on cooling capacity. ASHRAE Standard 90.1–2013 increased the energy efficiency levels for all six equipment classes to efficiency levels that surpass the current Federal energy conservation standard levels. Therefore, DOE conducted an analysis of the potential energy savings due to amended standards for this equipment, which is described in section III of this NODA.

DOE reviewed the SPVU market and identified several models of SPVUs in the 65,000 Btu/h or less equipment class. However, DOE did not identify any models of SPVUs in the large category $\geq 135,000$ Btu/h and $< 240,000$ Btu/h or any models of SPVHPs in the category $\geq 65,000$ Btu/h and $< 135,000$ Btu/h. As a result of the apparent lack of a market for large SPVUs and for SPVHPs $\geq 65,000$ Btu/h and $< 135,000$ Btu/h, DOE conducted complete preliminary energy saving estimates only for the equipment classes SPVAC and SPVHP $< 65,000$ Btu/h and SPVACs $\geq 65,000$ Btu/h and $< 135,000$ Btu/h. For the equipment classes with no market, DOE would adopt the ASHRAE levels as the Federal standard, as required by the statute, without further analysis.

6. Consideration of a Space-Constrained Single-Package Vertical Unit Equipment Class

ASHRAE Standard 90.1–2013 created a new equipment class for SPVACs and SPVHPs used in space-constrained applications. Specifically, ASHRAE defined "nonweatherized space constrained single-package vertical unit" as a SPVAC or SPVHP that meets all of the following requirements:

(1) is for indoor use only;

(2) has rated cooling capacities no greater than 36,000 Btu/h;

(3) is a single-package unit requiring opening in an exterior wall with overall exterior dimensions that require or use an existing sleeve that meets one of the following criteria:

1. width of less than 32 inches and a height of less than 45 inches

2. fits inside an existing 1,310 in² opening;

(4) is commonly installed in site-built commercial buildings;

(5) is of a similar cooling capacity and, if a heat pump, similar heating capacity;

(6) draws outdoor air for heat exchange directly through an existing

opening, used for both inlet and outlet, in the exterior wall;

(7) is restricted to applications where an existing air conditioner, heat pump, or gas/electric unit, installed in an existing exterior wall opening, is to be replaced; and

(8) bears a permanent “Replacement” marking, conspicuously placed and clearly indicating that its application is limited to installations where an existing air conditioner or heat pump is to be replaced.

DOE has carefully considered the possibility of establishing an equipment class for space-constrained SPVUs. After reviewing the SPVU market, DOE identified two distinct market segments: (1) Traditional SPVUs, which are typically wall hung or installed indoors and intended for use in schools, telecommunications shelters, office buildings, and similar applications; and (2) through-the-wall units that are being classified as SPVUs and are designed to be installed through-the-wall in hotels, apartments, dormitories, assisted living facilities, and other similar applications (*i.e.*, “lodging” applications). Many of the units that are intended primarily for use in lodging applications would meet the definition of a space-constrained SPVU in ASHRAE Standard 90.1–2013, while conversely, none of the models that were intended primarily to serve traditional SPVU applications meet the criteria.

In examining the models that would meet the definition of a “space constrained SPVU” under ASHRAE Standard 90.1–2013, DOE discovered that certain models that are currently classified by manufacturers and in the Air-Conditioning, Heating, and Refrigeration Institute (AHRI) Directory¹³ as being an SPVU do not have major components arranged vertically, which is a key provision in the SPVAC and SPVHP definitions provided by EPCA (and discussed earlier in this section). For the purposes of determining the applicability of DOE energy conservation standards, the product classification is based on the applicable product and equipment definitions in EPCA and DOE’s regulations. DOE does not consider models without the major components arranged vertically to be SPVUs. Depending on the product characteristics (*e.g.*, electrical power phase, capacity), these models should be classified, tested, and certified to DOE as compliant with the applicable

standards for either central air conditioners or one of the other equipment types provided by DOE regulations. Accordingly, DOE did not consider these models in its analyses of SPVUs and did not evaluate them when making a determination regarding whether to establish a space-constrained equipment class within the SPVU equipment type.

Furthermore, while reviewing the market to consider a potential space-constrained SPVU equipment class, DOE also discovered that many models characterized by industry as SPVUs, particularly those that are primarily used for lodging applications (which were also the models that met the ASHRAE definition for “space-constrained”), are advertised for use in multiple applications including both commercial and residential applications. Many of the models characterized as SPVUs on the market are advertised to a significant extent for use in residential, multi-family applications; however, DOE notes that these products are currently classified and certified in the AHRI Directory as single-package vertical units, a type of commercial equipment. Further, DOE found that certain models of SPVUs in the AHRI Directory that would be categorized as “space-constrained” were previously classified as through-the-wall central air conditioners.¹⁴

Upon discovering the dual-market applications of these units, DOE considered whether the classification of these products as SPVUs—a type of commercial equipment—is appropriate.

¹⁴ DOE defined a product class for space-constrained central air conditioners, a consumer product type, in a January 22, 2001 final rule, which DOE stated would include through-the-wall products among several other types of space-constrained products. However, DOE did not set minimum standards for the space-constrained product class. 66 FR 7170, 7197. In a May 23, 2002 final rule, DOE established a separate product class with minimum standards for through-the-wall products. 67 FR 36368, 36406. Upon establishing that product class, DOE also provided in its definition of “through-the-wall air conditioner” that the class would cease to exist on January 23, 2010. *Id.* In a June 27, 2011 direct final rule, DOE stated that products in the through-the-wall product class of central air conditioners would meet the definition of a “space constrained central air conditioner.” 76 FR 37408, 37446. The American Energy Manufacturing Technical Corrections Act (AEMTCA), Pub. L. 112–210 (enacted Dec. 18, 2012), prescribed definitions for “through-the-wall central air conditioner” and “through-the-wall central air conditioning heat pump.” 42 U.S.C. 6295(d)(4)(A)(ii). In a proposed rule published on December 20, 2013 78FR77019, DOE proposed to eliminate the previous definition for through-the-wall products and adopted these statutory definitions. DOE noted that such products must be assigned to a product class based on the product’s characteristics and suggested that most would be assigned to one of the space-constrained product classes.

SPVUs are classified as a type of commercial air conditioner under 42 U.S.C. chapter 77, subchapter III, Part A–1, “Certain Industrial Equipment.” EPCA defines industrial equipment as any article of equipment of certain specified types that consumes, or is designed to consume, energy, which is distributed to any significant extent for industrial and commercial use, and which is not a covered product as defined in 42 U.S.C. 6291(2), without regard to whether such article is in fact distributed in commerce for industrial or commercial use. (42 U.S.C. 6311(2)(A))

EPCA defines “consumer product” as any article of a type that consumes or is designed to consume energy, and, to any significant extent, is distributed in commerce for personal use or consumption by individuals without regard to whether such article of such type is in fact distributed in commerce for personal use or consumption by an individual. (42 U.S.C. 6291(1))

Thus, consumer products and industrial equipment are mutually exclusive categories. An appliance model can only be considered commercial/industrial equipment under EPCA if it does not fit the definition of “consumer product.” Further, DOE must make a determination as to whether a model is a consumer product or commercial equipment, “without regard” to how the model is “in fact” distributed. DOE notes that many of the products that are currently classified by industry as a commercial SPVU and advertised for multi-family residential applications would meet EPCA’s definitions for “SPVUs” from a technical standpoint. (42 U.S.C. 6311(22) and (23)) However, DOE reviewed the characteristics of these products and concluded that they would also meet the definition of a “central air conditioner.” (42 U.S.C. 6291(21)) EPCA defines “central air conditioner” as a product, other than a packaged terminal air conditioner, which: (1) Is powered by single phase electric current; (2) is air-cooled; (3) is rated below 65,000 Btu per hour; (4) is not contained within the same cabinet as a furnace with a rated capacity above 225,000 Btu per hour; and (5) is a heat pump or a cooling only unit. (42 U.S.C. 6291(21); 10 CFR 430.2) DOE has concluded that, because these products meet the definition of a “central air conditioner,” are similar to products used in residential applications, and are seemingly (based on product literature and advertising of known products and manufacturers) distributed for personal use or consumption by individuals, they are appropriately categorized as

¹³ AHRI Directory of Certified Product Performance can be accessed at: <http://www.ahridirectory.org/ahridirectory/pages/home.aspx>.

consumer products under the statute.¹⁵ Because such units meet the definition for a “consumer product” under 42 U.S.C. 6291(1), they cannot meet the definition of commercial “industrial equipment” under 42 U.S.C. 6311(2). In fact, as noted above, certain products that are currently categorized by manufacturers as commercial SPVUs were at one time categorized as through-the-wall central air conditioners by their manufacturers but have since been reclassified as commercial equipment.

Through-the-wall models for commercial lodging applications that are not specifically advertised for the residential multi-family market (and that were not previously categorized as through-the-wall residential units) are appropriately classified as consumer products because they are for personal use or consumption by individuals. DOE examined the types of models that are currently characterized as SPVUs and are intended to serve the lodging market but have not been reclassified from the through-the-wall central air conditioner product class. It noted similarities in the design, construction, and applications for these products as compared to the products that were classified previously as through-the-wall central air conditioners. Given the similarities between through-the-wall units intended for installation in multi-family residential applications and those intended primarily for installation in commercial lodging applications, DOE has tentatively concluded that these products should be treated the same under its regulatory scheme.

In examining the through-the-wall models on the market that are not advertised for residential applications or were not reclassified, DOE has determined that the available models would all meet the definition of a “central air conditioner” and, more specifically, a “space constrained product.” 10 CFR 430.2. In the proceedings that led to the development of the space-constrained central air conditioner product class, DOE recognized that through-the-wall products have severe space constraints and, accordingly, established a product class with less-stringent energy conservation standards for such units.¹⁶

¹⁵ An air conditioner that cools a single apartment and is controlled by the residents of that apartment is for personal use, just like an air conditioner found in a single-family home, duplex, condo, or townhouse.

¹⁶ Through-the-wall air conditioners are typically not as wide or deep as standard air conditioning units and, in the case of units intended for replacement, must fit into a pre-existing hole in the wall. This size limitation affects the size of both the evaporator and condensing heat exchangers. Additionally, the airflow through the unit is

67 FR 36368, 36406 (May 23, 2002). Because the space-constrained central air conditioner product class has already been established to account for products whose outer dimensions are severely limited by their application and, given the similarities and overlap between models used in commercial lodging applications and models used in residential multi-family applications, DOE believes that any single-package vertical units that are “space-constrained” are appropriately categorized and regulated as central air conditioners.

As a result, DOE has determined that, based on the available product literature, as well as the governing definitions in EPCA, certain units currently listed by manufacturers as SPVUs are being misclassified and are appropriately classified as central air conditioners (and in most cases as space-constrained central air conditioners). The majority of these products are models that would meet the “space constrained” definition in ASHRAE Standard 90.1–2013. Because DOE has established a space-constrained product class to account for space-constrained through-the-wall units and because these units meet the existing definitions, DOE has tentatively concluded that there is no need to establish a separate space-constrained class for SPVUs. Therefore, DOE has not analyzed separate standards for space-constrained SPVU equipment in this NODA. DOE requests comment on this conclusion, which is identified as Issue 4 in section IV.B, “Issues on Which DOE Seeks Comment.” In making this determination, DOE was also mindful of the purposes underlying EPCA and the Department’s energy and water conservation standards regulations: To conserve energy and water supplies and to increase energy and cost savings for American businesses and consumers. Allowing a model of a product type that is sold for personal use to evade DOE’s energy conservation standards for consumer products, simply because it is sold in some instances to commercial or industrial users, would undermine this purpose.

B. Commercial Water Heaters

EPCA defines “storage water heater” as a water heater that heats and stores water within the appliance at a thermostatically controlled temperature for delivery on demand and that is industrial equipment. This term does not include units with an input rating of 4,000 Btu/h or more per gallon of

restricted by this size limitation, which reduces the heat exchanger’s effectiveness.

stored water. (42 U.S.C. 6311(12)(A); 10 CFR 431.102) EPCA defines “instantaneous water heater” as a water heater that has an input rating of at least 4,000 Btu/h per gallon of stored water and that is industrial equipment, including products meeting this description that are designed to heat water to temperatures of 180°F or higher. (42 U.S.C. 6311(12)(B); 10 CFR 431.102)

The current Federal energy conservation standards for the five classes of storage and instantaneous water heaters for which ASHRAE Standard 90.1–2013 amended efficiency levels are shown in Table I.1 and set forth in DOE’s regulations at 10 CFR 431.110. The product classes for commercial storage and instantaneous water heaters, and attendant Federal energy conservation standards, are differentiated based on fuel type. ASHRAE Standard 90.1–2013 appeared to change the standby loss levels for four equipment classes (gas-fired storage water heaters, oil-fired storage water heaters, gas-fired instantaneous water heaters, and oil-fired instantaneous water heaters) to efficiency levels that surpass the current Federal energy conservation standard levels. However, upon review of the changes, DOE believes that all changes to standby loss levels for these equipment classes were editorial errors because they are identical to SI (International System of Units; metric system) formulas rather than I-P (Inch-Pound; English system) formulas. Therefore, DOE did not conduct an analysis of the potential energy savings for this equipment. ASHRAE Standard 90.1–2013 also changed the standby loss level for electric storage water heaters, in this case in a purposeful manner to align with the current Federal energy conservation standard level. Because these levels meet and do not exceed the current Federal standards, DOE did not conduct an analysis of the potential energy savings for this equipment class. ASHRAE Standard 90.1–2013 also increased the thermal efficiency levels for oil-fired storage water heaters to efficiency levels that surpass the current Federal energy conservation standards. Therefore, DOE conducted an analysis of the potential energy savings due to amended thermal efficiency standards for oil-fired storage water heaters, which is described in section III of this NODA.

C. Test Procedures

EPCA requires the Secretary to amend the test procedures for ASHRAE equipment to the latest version generally accepted by industry or the rating procedures developed or

recognized by AHRI or by ASHRAE, as referenced by ASHRAE/IES Standard 90.1, unless the Secretary determines by clear and convincing evidence that the latest version of the industry test procedure does not meet the requirements for test procedures described in paragraphs (2) and (3) of 42 U.S.C. 6314(a).¹⁷ (42 U.S.C. 6314(a)(4)(B)) ASHRAE Standard 90.1–2013 updated several of its test procedures for ASHRAE equipment. Specifically, ASHRAE Standard 90.1–2013 updated to the most recent editions of test procedures for small commercial package air conditioners and heating equipment (AHRI 210/240–2008¹⁸ with Addendum 1 and 2, *Performance Rating of Unitary Air-Conditioning & Air-Source Heat Pump Equipment*), large and very large commercial package air conditioners and heating equipment (AHRI 340/360–2007 with Addenda 1 and 2, *Performance Rating of Commercial and Industrial Unitary Air-Conditioning and Heat Pump Equipment*), variable refrigerant flow equipment (AHRI 1230–2010 with Addendum 1, *Performance Rating of Variable Refrigerant Flow (VRF) Multi-Split Air-Conditioning and Heat Pump Equipment*), commercial warm-air furnaces (ANSI (American National Standards Institute) Z21.47–2012, *Standard for Gas-Fired Central Furnaces*), and commercial water heaters (ANSI Z21.10.3–2011, *Gas Water Heaters, Volume III, Storage Water Heaters with Input Ratings Above 75,000 Btu Per Hour, Circulating and Instantaneous*).

DOE has preliminarily reviewed each of the test procedures that were updated in ASHRAE Standard 90.1–2013 and discusses the changes to the test procedures below.

¹⁷ Specifically, the relevant provisions (42 U.S.C. 6314(a)(2)–(3)) provide that test procedures must be reasonably designed to produce test results that reflect energy efficiency, energy use, and estimated operating costs of a type (or class) of industrial equipment during a representative average use cycle and must not be unduly burdensome to conduct. Moreover, if the test procedure is for determining estimated annual operating costs, it must provide that such costs will be calculated from measurements of energy use in a representative average-use cycle, and from representative average unit costs of the energy needed to operate the equipment during such cycle. The Secretary must provide information to manufacturers of covered equipment regarding representative average unit costs of energy.

¹⁸ ASHRAE Standard 90.1–2013 technically cites “AHRI 210/240–200 with Addendum 1 and 2.” However, DOE believes that this is an editorial error and that ASHRAE meant to cite AHRI 210/240–2008, which is the most recent published year of that test procedure.

1. Updates to the AHRI 210/240 Test Method

In 2011 and 2012, AHRI published Addendum 1 and Addendum 2, updating AHRI Standard 210/240–2008. AHRI Standard 210/240, *Performance Rating of Unitary Air-Conditioning & Air-Source Heat Pump Equipment*, is incorporated by reference as the DOE test procedure for small commercial air conditioners and air-source heat pumps with a cooling capacity below 65,000 Btu/h at 10 CFR 431.95. Although ASHRAE 90.1–2013 referenced the addenda to the 2008 version for the first time, the changes contained in the addenda¹⁹ were previously evaluated by DOE and adopted as part of a seven year test procedure review (conducted pursuant to 42 U.S.C. 6314(a)(1)(A)) in a final rule for commercial heating, air-conditioning, and water heating equipment, published in the **Federal Register** on May 16, 2012. 77 FR 28928. In that test procedure amendment, DOE concluded that the addenda would not impact the Federal energy efficiency ratings for small commercial air conditioners and heat pumps, and it proceeded to incorporate AHRI Standard 210/240–2008 with Addendum 1 and Addendum 2. 77 FR 28928, 28943, 28989 (May 16, 2012). Because DOE has already incorporated by reference the most recent AHRI 210/240 addenda referenced by ASHRAE Standard 90.1–2013, DOE does not need to take action at this time.

2. Updates to the AHRI 340/360 Test Method

In 2010 and 2011, AHRI published Addendum 1 and Addendum 2, respectively, updating AHRI 340/360–2007. AHRI Standard 340/360, *Performance Rating of Commercial and Industrial Unitary Air-Conditioning and Heat Pump Equipment*, is incorporated by reference as the DOE test procedure for small, large, and very large commercial air conditioners and air-source heat pumps with a cooling capacity greater than or equal to 65,000 Btu/h at 10 CFR 431.95. Although ASHRAE 90.1–2013 referenced the addenda to the 2007 version for the first time, the changes contained in the addenda²⁰ were previously evaluated

¹⁹ The addenda to AHRI 210/240–2008 generally replace any references to the part-load metric (i.e., integrated part load value (IPLV)) with references to the new part load metric (i.e., IEER). 77 FR 28928, 28943.

²⁰ The addenda to AHRI 340/360–2007 expand the scope of the standard to include air-cooled package unitary air conditioners with cooling capacities from 250,000 Btu/h to less than 760,000 Btu/h, add a –0.00 inch H₂O to a 0.05 inch H₂O tolerance to the external static pressure test

by DOE and adopted as part of a seven-year test procedure look back in a final rule for commercial heating, air-conditioning, and water heating equipment, published in the **Federal Register** on May 16, 2012, 77 FR 28928. In that test procedure amendment, DOE concluded that the addenda would not impact the Federal energy efficiency ratings for small, large, and very large commercial air conditioners and heat pumps, and it proceeded to incorporate AHRI 340/360 with Addendum 1 and Addendum 2. 77 FR 28928, 28943, 28989 (May 16, 2012). Because DOE has already incorporated by reference the most recent AHRI 340/360 addenda referenced by ASHRAE Standard 90.1–2013, DOE does not need to take action at this time.

3. Updates to the AHRI 1230 Test Method

In 2011, AHRI published Addendum 1, updating AHRI Standard 1230–2010. AHRI Standard 1230, *Performance Rating of Variable Refrigerant Flow (VRF) Multi-Split Air-Conditioning and Heat Pump Equipment*, is incorporated by reference into the DOE test procedure for variable refrigerant flow multi-split systems at 10 CFR 431.95. Although ASHRAE 90.1–2013 referenced the addenda to the 2010 version for the first time, DOE incorporated by reference AHRI 1230–2010 with Addendum 1 in a final rule for commercial heating, air-conditioning, and water heating equipment, published in the **Federal Register** on May 16, 2012, 77 FR 28928, 28989. Because DOE has already incorporated by reference the most recent AHRI 1230 edition and addendum referenced by ASHRAE Standard 90.1–2013, DOE does not need to take action at this time.

4. Updates to the ANSI Z21.47 Test Method

In 2012, ANSI updated ANSI Z21.47, *Standard for Gas-Fired Central Furnaces*. DOE’s test procedure for measuring the energy efficiency of gas-fired warm air furnaces incorporates by reference ANSI Z21.47–2006 at 10 CFR 431.75, but the uniform test method set out at 10 CFR 431.76 only directs one to use those procedures contained in ANSI Z21.47–2006 that are relevant to the steady-state efficiency measurement (i.e., sections 1.1, 2.1 through 2.6, 2.39, and 4.2.1 of ANSI Z21.47). As a result, DOE focused its test procedure review on the relevant sections of ANSI Z21.47

condition, and add an external static pressure equation and a tolerance to the leaving dry-bulb temperature to the IEER part-load test. 77 FR 28928, 28943.

that DOE's test procedure references. In those sections referenced by DOE's test procedures, ANSI did not make any updates. Therefore, DOE has preliminarily determined that the changes to ANSI Z21.47-2012 are not relevant to the DOE test procedure for gas-fired warm air furnaces and, therefore, do not impact the energy efficiency ratings for gas-fired furnaces. Consequently, no further action is required at this time. DOE seeks comments regarding this tentative conclusion. This is identified as Issue 5 in section IV.B, "Issues on Which DOE Seeks Comment."

5. Updates to the ANSI Z21.10.3 Test Method

In 2011, ANSI updated ANSI Z21.10.3, *Gas Water Heaters, Volume III, Storage Water Heaters with Input Ratings Above 75,000 Btu Per Hour, Circulating and Instantaneous*. DOE's test procedure for gas-fired water heaters incorporates by reference ANSI Z21.10.3-2011 at 10 CFR 431.105, but the uniform test method set out at 10 CFR 431.106 only directs one to use sections G1 (Method of Test for Measuring Thermal Efficiency) and G2 (Method of Test for Measuring Standby Loss) of the ANSI Z21.10.3 test procedure. Although ASHRAE 90.1-2013 referenced the 2011 version for the first time, the version was previously evaluated by DOE and adopted²¹ as part of a 7-year test procedure review (conducted pursuant to 42 U.S.C. 6314(a)(1)(A)) in a final rule for commercial heating, air-conditioning, and water heating equipment, published in the **Federal Register** on May 16, 2012, 77 FR 28928. In that test procedure amendment, DOE concluded that the new version would not alter the DOE test method or the energy efficiency ratings for commercial water heaters as compared to adopting ANSI Z21.10.3-2004, and it proceeded to incorporate ANSI Z21.10.3-2011 by reference. 77 FR 28928, 28944, 28996 (May 16, 2012). Because DOE has already incorporated by reference ANSI Z21.10.3-2011, the test procedure referenced by ASHRAE Standard 90.1-2013, DOE does not need to take action at this time.

III. Analysis of Potential Energy Savings

As required under 42 U.S.C. 6313(a)(6)(A), DOE performed an analysis to determine the energy-savings potential of amending Federal energy

conservation standard levels to the efficiency levels specified in ASHRAE Standard 90.1-2013, as well as to more-stringent efficiency levels than those specified in ASHRAE Standard 90.1-2013. As explained previously, DOE's energy-savings analysis is limited to types of equipment covered by Federal energy conservation standards for which the amended ASHRAE Standard 90.1-2013 increase the efficiency levels and for which a market exists and sufficient data are available.²² Based upon the conclusions reached in section II, DOE is conducting the energy-savings analysis for:

- Three equipment classes of small air-cooled, three-phase commercial packaged air-conditioning and heating equipment: (1) Single-package air conditioners less than 65,000 Btu/h, (2) single-package heat pumps less than 65,000 Btu/h, and (3) split system heat pumps less than 65,000 Btu/h;
- Three equipment classes of small commercial water-source heat pumps: (1) Less than 17,000 Btu/h, (2) 17,000 to less than 65,000 Btu/h, and (3) 65,000 to less than 135,000 Btu/h;
- Three equipment classes of standard size PTACs: (1) Less than 7,000 Btu/h, (2) 7,000 to 15,000 Btu/h, and (3) greater than 15,000 Btu/h;
- Three equipment classes of SPVUs: (1) SPVACs less than 65,000 Btu/h, (2) SPVHPs less than 65,000 Btu/h, and (3) SPVACs 65,000 to less than 135,000 Btu/h; and
- One equipment class of commercial water-heating equipment: (1) Oil-fired storage water heaters greater than 105,000 Btu/h and less than 4,000 Btu/h/gal.

The following discussion provides an overview of the energy-savings analysis conducted for these 13 classes of equipment, followed by summary results of that analysis. For each efficiency level analyzed, DOE calculated the potential energy savings to the Nation as the difference between a base-case projection (without amended standards) and the standards-case projection (with amended standards). The national energy savings (NES) refers to cumulative lifetime energy savings for equipment purchased in a 30-year period that differs by equipment (*i.e.*, the compliance date

differs by equipment class because of the ASHRAE trigger legal requirements). The analysis is based on a stock accounting method. In the standards case, equipment that is more efficient gradually replaces less-efficient equipment over time. This affects the calculation of the potential energy savings, which are a function of the total number of units in use and their efficiencies. Savings depend on annual shipments and equipment lifetime. Inputs to the energy-savings analysis are presented below, and details are available in the ASHRAE NODA technical support document (TSD) on DOE's Web site.²³

A. Annual Energy Use

This section describes the energy use analysis performed for each type of equipment. The Federal standard and higher efficiency levels are expressed in terms of an efficiency metric or metrics. For each equipment class, this section describes how DOE developed estimates of annual energy consumption at the baseline efficiency level and at higher levels for each equipment type. These annual unit energy consumption (UEC) estimates form the basis of the national energy savings estimates discussed in section III.E. More detailed discussion is found in the ASHRAE NODA TSD.

1. Small Commercial Packaged Air Conditioners and Heat Pumps

To estimate the UEC for each class of small commercial packaged air conditioning and heating equipment less than 65,000 Btu/h (air-cooled, three-phase), DOE began with the cooling UECs for single-phase equipment installed in commercial buildings as presented in the national impact analysis associated with the 2010 notice of public meeting and availability of preliminary technical support document for residential central air conditioners and heat pumps. (EERE-2008-BT-STD-0006-0003). DOE believes that three-phase commercial equipment would have similar energy usage to single-phase equipment, as it would tend to be used in similar locations and in a similar manner. DOE seeks comment on this assumption, which is identified as Issue 6 in section IV.B, "Issues on Which DOE Seeks Comment."

In the 2010 analysis, the UECs for split and single-package systems were very similar (and therefore comparable), but UECs were available for higher efficiency levels for split systems than

²¹ DOE also adopted a correction regarding Figures 2 and 3 in Exhibit G of ANSI Z21.10.3-2011.

²² As discussed in section II, when no products are available on the market or no reliable data exist for calculating potential energy savings, DOE did not perform an analysis. The products for which ASHRAE Standard 90.1-2013 increase the efficiency level, but for which DOE did not perform an analysis due to lack of a market or lack of data include: (1) SPVHP 65,000 to less than 135,000 Btu/h; (2) SPVAC 135,000 to less than 240,000 Btu/h; and (3) SPVHP 135,000 to less than 240,000 Btu/h. (See section II.A.5.)

²³ The ASHRAE NODA TSD is available on the Web page for ASHRAE Products at: http://www1.eere.energy.gov/buildings/appliance_standards/rulemaking.aspx?ruleid=90

for single-package equipment. As a result, DOE used the 2010 UECs for split systems for all equipment classes analyzed for today’s NODA, including both split and single-package systems.

Although ASHRAE 90.1–2013 increased the HSPF levels for this equipment, DOE did not include heating UECs in this analysis. For commercial installations in the 2010 analysis, DOE determined that the heating UECs did not scale proportionally with HSPF. Based on these data, DOE has preliminarily determined that using available data to quantify energy savings related to increasing HSPF for small

commercial heat pumps is not possible. DOE seeks data and information related to the heating energy use of commercial heat pumps, as related to HSPF, which is identified as Issue 7 in section IV.B, “Issues on Which DOE Seeks Comment.”

Table III.1 shows the UEC estimates for the current Federal standards levels (baseline), the ASHRAE 90.1–2013 levels, and the higher efficiency levels for the three small air-cooled commercial packaged air-conditioning and heating equipment classes analyzed. DOE derived the “max-tech” level from the market maximum in the

AHRI Certified Directory²⁴ as of November 2013. However, the highest available efficiency level for split system heat pumps was only 16.2, whereas for single-package units it was 18.05. DOE believes that split system heat pumps are capable of reaching the same efficiency level as single-package units because the same technologies to increase efficiency can be employed for each type of equipment and, therefore, analyzed a “max-tech” level of 18.05 for both single package and split system heat pumps.

TABLE III.1—NATIONAL UEC ESTIMATES FOR AIR-COOLED AIR CONDITIONERS AND HEAT PUMPS

	Small three-phase air-cooled single-package air conditioners <65,000 Btu/h	Small three-phase air-cooled single-package heat pumps <65,000 Btu/h	Small three-phase air-cooled split system heat pumps <65,000 Btu/h

Efficiency Level 2	2,237	2,282	2,282
Efficiency Level 3	2,125	2,177	2,177
Efficiency Level 4	2,086	—	—
Efficiency Level 5—“Max-Tech”—	2,047	2,123	2,123

2. Water-Source Heat Pumps

To estimate the UEC for each class of water-source heat pump, DOE began with the cooling UECs for water-source heat pumps published in Appendix D of the 2000 Screening Analysis for EPACK-Covered Commercial HVAC and Water-Heating Equipment. (EERE–2006–STD–0098–0015) Where identical efficiency levels were available, DOE used the UEC directly from the screening analysis. For additional efficiency levels, DOE scaled the UECs based on the ratio of EER, as was done in the original analysis. DOE seeks comment

on the appropriateness of the cooling UECs derived from the 2000 screening analysis, adjusted based on equipment EER to be inversely proportional to EER, including whether energy use for this equipment would have changed significantly since the last analysis. This is identified as Issue 8 in section IV.B, “Issues on Which DOE Seeks Comment.”

Although ASHRAE 90.1–2013 increased the COP levels for this equipment, DOE did not include heating UEC in this analysis as a result of lack of information regarding the heating-

mode energy use of this equipment. DOE seeks data and information related to water-source heat pump heating energy use. This is identified as Issue 9 in section IV.B, “Issues on Which DOE Seeks Comment.”

Table III.2 shows the UEC estimates for the current Federal standard levels, the ASHRAE 90.1–2013 levels, and the higher efficiency levels for the three water-source heat pump classes analyzed. The “max-tech” levels represent the market maximum identified in the AHRI Certified Directory as of November 2013.²⁵

²⁴ Available at: <http://www.ahridirectory.org/ahridirectory/pages/home.aspx>.

²⁵ For variable-capacity models listed at both minimum and maximum capacity, DOE analyzed the efficiency of the maximum capacity only.

TABLE III.2—NATIONAL UEC ESTIMATES FOR WATER-SOURCE HEAT PUMPS

	Water-source heat pumps <17,000 Btu/h	Water-source heat pumps ≥17,000 and <65,000 Btu/h	Water-source heat pumps ≥65,000 and <135,000 Btu/h

3. Packaged Terminal Air Conditioners

To estimate the UEC for each class of PTACs, DOE began with the cooling UECs for PTACs used in the 2008 energy conservation standards final rule. 73 FR 58772 (Oct. 7, 2008). With the UECs given for each State, the population of each State was used to weight the UECs to obtain a nationally representative UEC. Where identical

efficiency levels and cooling capacities were available, DOE used the UEC directly from the rulemaking. For additional efficiency levels, DOE scaled the UECs based on interpolations between EERs at a constant cooling capacity. Likewise, for additional cooling capacities, DOE scaled the UECs based on interpolations between cooling capacities at constant EER.

Table III.3 shows the UEC estimates for the current Federal standard levels, the ASHRAE 90.1–2013 levels, and the higher efficiency levels for the three PTAC classes analyzed. The “max-tech” levels correspond to those in the PTAC Framework Document published in 2013. 78 FR 12252 (Feb. 22, 2013) (EERE–2012–BT–STD–0029–0002).

TABLE III.3—NATIONAL UEC ESTIMATES FOR PTACs

Efficiency Level 5	748	919	1,487
Efficiency Level 6—“Max-Tech”—	723	892	1,458

4. Single-Package Vertical Air Conditioners and Heat Pumps

Based on information received from manufacturer interviews conducted in preparation for the forthcoming SPVU NOPR, DOE has determined that

approximately 35 percent of SPVAC shipments go to educational facilities, and the majority of those installations are for space conditioning of modular classroom buildings. Another approximately 35 percent of the shipments go to providing cooling for

telecommunications and electronics enclosures. The remainder of the shipments (30 percent) is used in a wide variety of commercial buildings, including offices, temporary buildings, and some miscellaneous facilities. In almost all of these commercial building

applications, the buildings served are expected to be of modular construction, because SPVUs, as packaged air conditioners installed on external building walls, do not impact site preparation costs for modular buildings, which may be relocated multiple times over the building's life. The vertically-oriented configuration of SPVUs allows the building mounting to be unobtrusive and minimizes impacts on modular building transportation requirements. These advantages do not apply to a significant extent to site-constructed buildings. DOE further understands that shipments of SPVHP equipment would primarily be to educational facilities or office-type end uses but would be infrequently used for telecommunication or electronic enclosures for which the heating requirements are often minimal.

DOE analyzed energy use in three different classes of commercial buildings that utilize SPVU equipment: (1) modular classrooms; (2) modular offices; and (3) telecommunication shelters. To estimate the energy use of SPVU equipment in these building types, DOE developed building simulation models for use with DOE's EnergyPlus software.²⁶ A prototypical building model was developed for each building type, described by the building footprint, general building size, and design. The building types were represented by a 1,568 ft² wood-frame modular classroom, a 1,568 ft² wood-frame modular office, and a 240 ft² concrete-wall telecommunications shelter. In each case, the building construction (footprint, window-wall ratio, general design) was developed to be representative of typical designs within the general class of building. Operating schedules, internal load profiles, internal electric receptacle (plug) loads, and occupancy for the modular classroom were based upon classroom-space-type data found in the DOE Primary School commercial prototype building model.²⁷ Operating schedules, internal load profiles, internal plug loads, and occupancy for modular office buildings were those from office space in the DOE Small Office commercial prototype building model. *Id.* For the telecommunications shelter, DOE did not identify a source

for typical representative internal electronic loads as a function of building size, nor did it find information on representative internal gain profiles. However, based on feedback from shelter manufacturers, DOE used a 36,000 Btu/h (10.55 kW) peak internal load to reflect internal design load in the shelter. DOE determined that, on average over the year, this load ran at a scheduled 65 percent of peak value, reflecting estimates for computer server environments.²⁸ Each of these three building models was used to establish the energy usage of SPVAC and SPVHP equipment in the same building class.

Envelope performance (*e.g.*, wall, window, and roof insulation, and window performance) and lighting power inputs were based on requirements in ASHRAE Standard 90.1–2004.²⁹ DOE believes that the requirements in ASHRAE Standard 90.1–2004 are sufficiently representative of a mixture of both older and more recent construction and that resulting SPVU equipment loads will be representative of typical SPVU equipment loads in the building stock. Ventilation levels were based on ASHRAE Standard 62.1–2004.³⁰

DOE simulated each building prototype in 237 U.S. climate locations, taking into account variation in building envelope performance for each climate as required by ASHRAE 90.1–2004. For simulations used to represent SPVU equipment of less than 65,000 Btu/h, no outside air economizers were assumed for the modular office and modular classroom buildings.³¹ However, for simulations used to represent equipment of greater than or equal to 65,000 Btu/h but less than 135,000 Btu/h, economizer usage was presumed to be climate-dependent in these building types, based on ASHRAE Standard 90.1–2004 requirements for unitary equipment in that capacity range. For

³⁰ American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE), *Ventilation for Acceptable Indoor Air Quality*, ANSI/ASHRAE/IESNA Standard 62.1–2004 (2004).

³¹ An "outside air economizer" is a combination of ventilation and exhaust air dampers and controls that increase the amount of outside air brought in to a building when the outside air conditions (*i.e.*, temperature and humidity) are low, such that increasing the amount of ventilation air reduces the equipment cooling loads.

the telecommunications shelter, economizers were assumed for 45 percent of buildings, based on manufacturer interviews. In addition, for the telecommunications shelter, redundant identical air conditioners with alternating usage were assumed when establishing average annual energy consumption per unit.

Simulations were done for the buildings using SPVAC equipment and electric resistance heating, and then a separate set of simulations was done for buildings with SPVHP equipment. For each equipment type and building type combination, DOE simulated each efficiency level identified in the engineering analysis for each equipment class. Fan power at these efficiency levels was based on manufacturers' literature and reported fan power consumption data as developed in the engineering analysis. Brushless permanent magnet (BPM) supply air blower motors were assumed at an EER of 10.0 and higher for all classes of equipment based on results from the engineering analysis. The supply air blower motors are assumed to run at constant speed and constant power while operating.

DOE used typical meteorological weather data (TMY3) for each location in the simulations.³² DOE sized equipment for each building simulation using a design-day sizing method incorporating the design data found in the EnergyPlus design-day weather data files for each climate.³³ DOE also incorporated an additional cooling sizing factor of 1.1 for the equipment used in the modular office and modular classroom simulations, reflective of the typical sizing adjustment needed to account for discrete available equipment capacities in SPVAC and SPVHP equipment.

EER and heating COP were converted to corresponding simulation inputs for each efficiency level simulated. These inputs, along with the calculated fan power at each efficiency level, were used in the building simulations.

Further details of the building model and the simulation inputs for the SPVAC and SPVHP equipment can be found in chapter 3 of the NODA TSD.

From the annual simulation results for SPVAC equipment, DOE extracted the condenser energy use for cooling, the supply air blower energy use for

³² Wilcox S. and W. Marion, *User's Manual for TMY3 Data Sets*, National Renewable Energy Laboratory, Report No. NREL/TP–581–43156 (2008).

³³ EnergyPlus TMY3-based weather data files and design-day data files available at: http://apps1.eere.energy.gov/buildings/energyplus/weatherdata_about.cfm.

²⁶ EnergyPlus Energy Simulation Software and documentation are available at: <http://apps1.eere.energy.gov/buildings/energyplus/>.

²⁷ The commercial prototype building models are available on DOE's Web site as Energy Plus input files at: http://www.energycodes.gov/development/commercial/90.1_models. Documentation of the initial model development is provided in: Deru, M., *et al.*, U.S. Department of Energy Commercial Reference Building Models of the National Building Stock, NREL/TP–5500–46861 (2011).

both heating and cooling hours, the electric resistance heating energy, and the equipment capacity for each building type, climate, and efficiency level. From these, DOE developed corresponding normalized annual cooling energy per cooling ton and annual blower energy per ton for the efficiency levels simulated. DOE also developed the electrical heating energy per ton for the building. These per-ton cooling and blower energy values were added together and then multiplied by the average cooling capacity estimated for the equipment class simulated to arrive at an initial energy consumption estimate for SPVAC. In a deviation from the 2011 NODA analysis, DOE also noted that, where fan power was reduced for higher efficiency levels, there was a corresponding increase in the amount of heating required in each climate to make up for the loss of heat energy imparted into the supply air stream through the use of the more-efficient supply air blower during the heating season. This impact was climate dependent, with little heating impact in warm climates, and greater heating impact in cold climates where heating energy requirements dominate during the year. DOE calculated this heating “take back” effect for higher efficiency levels as a deviation from the baseline

heating energy use for each equipment capacity. The final SPVAC energy consumption estimates were then based on the calculated cooling and supply blower energy uses plus this heating take back, which allowed the resulting energy savings estimates to correctly account for the heating energy increase during the year. In addition, it was estimated that 5 percent of the market for the class of SPVAC less than 65,000 Btu/h utilize gas furnace heating. The heating take back for these systems was estimated based on the heating load of the systems with electric resistance heat and assuming an average 81-percent furnace annual fuel utilization efficiency (AFUE).

The analytical method for SPVHP was carried out in a similar fashion; however, for heat pumps, DOE included the heating energy (compressor heating and electric resistance backup) directly from the simulation results and, thus, did not separately calculate a heating take back effect. From these data, DOE developed per-ton energy consumption values for cooling, supply blower, and heating electric loads. These per-ton energy figures were summed and multiplied by the nominal capacity for the equipment class simulated to arrive at the annual per-ton energy consumption for SPVHP for each

combination of building type, climate, and efficiency level.

For each combination of equipment class, building type, climate, and efficiency level, DOE developed UEC values for each State using weighting factors to establish the contribution of each climate in each State. National average UEC estimates for each equipment class and efficiency level were also established based on population-based weighting across States and shipment weights to the different building types. With regard to the latter, while DOE established shipment weights for SPVAC equipment related to the three building types (educational, office, and telecommunications), DOE determined that SPVHP equipment was not used to a significant extent in telecommunications facilities and, thus, only allocated shipments of SPVHP equipment to two building types, educational and office.

For details of this energy use analysis, see chapter 3 of the NODA TSD.

Table III.4 shows the annual UEC estimates for SPVAC and SPVHP corresponding to the efficiency levels analyzed. For all levels above the baseline, SPVAC less than 65,000 Btu/h also include a heating take-back UEC of 53 kBtu/year.

TABLE III.4—NATIONAL UEC ESTIMATES FOR SPVUS

Efficiency Level 5—“Max-Tech”—	5,136	17,977

DOE seeks input on its analysis of UECs for these equipment classes and its use in establishing the energy savings potential for higher standards. Of particular interest to DOE is input on shipments of SPVHP equipment to telecommunications shelters and the frequency of use of economizers in equipment serving these shelters. DOE also recognizes that there may be

regional differences between the shipments of heat pumps and air conditioners to warmer or cooler climates and requests stakeholder input on how, or if, such differences can be taken into account in the energy use characterization. DOE identified these topics as Issues 10 and 11 under “Issues on Which DOE Seeks Comment” in section IV.B of this NODA.

5. Commercial Water Heaters

To provide an estimate of the UEC of commercial oil-fired storage water heaters (greater than 105,000 Btu/h and less than 4,000 Btu/h/gal), DOE calculated the shipment-weighted average UEC of gas-fired commercial storage water heaters using data in the 2000 Screening Analysis for EPACT-Covered Commercial HVAC and Water-

Heating Equipment. (EERE-2006-STD-0098-0015) DOE then calculated the ratio of UEC of oil-fired to gas-fired commercial water heaters based on the water heating information derived from the Energy Information Administration's 2003 *Commercial Buildings Energy Consumption Survey*.³⁴ DOE applied this ratio to the shipment-weighted average UEC of gas-fired commercial storage water heaters to arrive at the UEC of oil-fired commercial storage water heaters. DOE assumed this UEC corresponded to the baseline efficiency of 78 percent. For additional efficiency levels above 78 percent, DOE scaled the UECs based on the ratio of thermal efficiency at the baseline and each specific efficiency level. DOE seeks comment on its approach to estimating UECs for oil-fired commercial storage water heaters. DOE has identified this topic as Issue 12 under "Issues on Which DOE Seeks Comment" in section IV.B of this NODA.

Table III.5 shows the UEC estimates for the current Federal standard levels, the ASHRAE 90.1-2013 levels, and the higher efficiency levels for oil-fired commercial storage water heaters.

B. Shipments

1. Small Commercial Air Conditioners and Heat Pumps

DOE previously estimated shipments of air-cooled, three-phase equipment less than 65,000 Btu/h by equipment class for the year 1999 as part of the

³⁴ U.S. Department of Energy: Energy Information Administration, Commercial Buildings Energy Consumption Survey (2003) (Last accessed Jan. 2014) (Available at: <http://www.eia.doe.gov/emeu/cbecs/>).

2000 Screening Analysis for EPACT-Covered Commercial HVAC and Water-Heating Equipment. (EERE-2006-STD-0098-0015) Table III.6 shows these data. While the U.S. Census provides shipments data for air-cooled equipment less than 65,000 Btu/h, it does not disaggregate the shipments into single-phase and three-phase. Therefore, DOE used the Census data from 1999 to 2010³⁵ as a trend from which to extrapolate DOE's 1999 estimated shipments data (which is divided by equipment class) for three-phase equipment for the time period from 2000 to 2010. DOE then used the estimated shipments from 1999 to 2010 to establish a trend from which to project shipments beyond 2010. For heat pumps, DOE used a linear trend, which is slightly decreasing for single-package units and increasing for split systems. However, for single-package air conditioners, the trend was precipitously declining. As a result, for single-package air conditioners for the years after 2010, DOE used the average value from 1999 to 2010. The full time series of shipments can be found in the ASHRAE NODA TSD.

TABLE III.6—DOE ESTIMATED SHIPMENTS OF SMALL THREE-PHASE COMMERCIAL AIR CONDITIONERS AND HEAT PUMPS <65,000 Btu/h

Equipment Class	1999
Single-Package AC	213,728
Single-Package HP	27,773
Split System HP	11,903

2. Water-Source Heat Pumps

The U.S. Census published historical (1980, 1983-1994, 1997-2006, and 2008-2010) water-source heat pump shipment data.³⁶ Table III.7 exhibits the shipment data provided for a selection of years. DOE analyzed data from the years 1990-2010 to establish a trend from which to project shipments beyond 2010. DOE used a linear trend. Because the Census data do not distinguish between equipment capacities, DOE used the shipments data by equipment class provided by AHRI in 1999, and published in the 2000 Screening Analysis for EPACT-Covered Commercial HVAC and Water-Heating Equipment (EERE-2006-STD-0098-0015), to distribute the total water-

³⁵ U.S. Census Bureau. Current Industrial Reports for Refrigeration, Air Conditioning, and Warm Air Heating Equipment, MA333M. Note that the current industrial reports were discontinued in 2010, so more recent data are not available. Available at: http://www.census.gov/manufacturing/cir/historical_data/ma333m/index.html.

³⁶ *Id.*

source heat pump shipments to individual equipment classes. Table III.8 exhibits the shipment data provided for 1999. DOE assumed that this distribution of shipments across the various equipment classes remained constant and has used this same distribution in its projection of future shipments of water-source heat pumps. The complete historical data set and the projected shipments for each equipment class can be found in the ASHRAE NODA TSD.

TABLE III.7—TOTAL SHIPMENTS OF WATER-SOURCE HEAT PUMPS (CENSUS PRODUCT CODE: 333415E181)

Equipment class	1989	1999	2009
Total	157,080	120,545	180,101

TABLE III.8—TOTAL SHIPMENTS OF WATER-SOURCE HEAT PUMPS (AHRI)

Equipment class	1999	Percent
WSHP <17000 Btu/h	41,000	31
WSHP 17000-65000 Btu/h	86,000	65
WSHP 65000-135000 Btu/h	5,000	4

DOE notes that an EIA report on geothermal heat pump manufacturers³⁷ shows shipments of water-source units (defined by EIA as those tested to ARI-320) as only 22,009 in 2009 and 7,808 in 2000, which is significantly less than that reported by the Census (product code 333415E181) and by AHRI. DOE notes that both the Census data and the EIA report show consistent shipments of separately-reported ground-source and ground-water-source heat pumps (listed as Census product code 333415G and defined by EIA as those tested to ARI-325/330) at approximately 87,000 shipments in 2009; DOE is not counting these shipments in its estimates as reported in Table III.7. DOE believes that water-source heat pumps operate with a water loop using a boiler or chiller as the heat source or sink, and that, therefore, may not be considered "geothermal"; in this case, the EIA report may not include a comprehensive number of water-source heat pump shipments.

DOE seeks comment on the market for water-source heat pumps, especially what magnitude of annual shipments is most accurate, and how shipments are expected to change over time. DOE also

³⁷ U.S. Energy Information Administration, Geothermal Heat Pump Manufacturing Activities 2009 (2010) (Available at: <http://www.eia.gov/renewable/renewables/geothermalrpt09.pdf>).

seeks comment on the share of the market for ground-source and ground-water-source heat pump applications that use models also rated for water-loop application. DOE identified these as Issues 13 and 14 under “Issues on Which DOE Seeks Comment” in section IV.B of this NODA.

3. *Packaged Terminal Air Conditioners*

To estimate yearly shipments of PTACs, DOE examined new

construction and replacement shipments. New construction shipments were calculated using projected new construction floor space of healthcare, lodging, and small office buildings from the *Annual Energy Outlook 2013 (AEO 2013)*³⁸ and historical saturation data, which were calculated from historical shipments data and historical new construction floor space as shown in Table III.9. Replacement shipments

equaled the number of units that failed in a given year, based on a stock model and distribution of equipment lifetimes. DOE determined the distribution of shipments among the equipment classes using shipments data by equipment class provided by AHRI for the 2008 PTAC and PTHP rulemaking, as shown in Table III.10.³⁹

TABLE III.9—HISTORICAL PTAC AND PTHP SHIPMENTS WITH NEW CONSTRUCTION FLOOR SPACE VALUES USED TO CALCULATE SATURATION

Year	Health care (million s.f.)	Lodging (million s.f.)	Small Office (million s.f.)	Total (million s.f.)	New Construction Shipments	Saturation (units/ million s.f.)
2000	68	172	179	419	66,407	6,315

TABLE III.10—SHIPMENTS OF PTACs BY EQUIPMENT CLASS (AHRI)

	PTAC			PTHP		
	<7,000 Btu/h	≥7,000— ≤15,000 Btu/h	>15,000 Btu/h	<7,000 Btu/h	≥7,000— ≤15,000 Btu/h	>15,000 Btu/h
1998–2004 Average Shipments	12,898	205,355	15,407	7,702	168,068	13,534
Percent	3%	48%	4%	2%	40%	3%

4. *Single-Package Vertical Air Conditioners and Heat Pumps*

To develop the SPVU shipments model, DOE started with 2005 shipment estimates from the Air-Conditioning and Refrigeration Institute (ARI, now AHRI) for units less than 65,000 Btu/h as published in a previous rulemaking⁴⁰ (more recent data are not available). Table III.11 shows these data.

TABLE III.11—TOTAL SHIPMENTS OF SINGLE PACKAGE VERTICAL UNITS

Equipment class	2005
SPVAC <65,000 Btu/h, single-phase	31,976
SPVAC <65,000 Btu/h, three-phase	13,125
SPVHP <65,000 Btu/h, single-phase	14,301
SPVHP <65,000 Btu/h, three-phase	6,129

DOE added additional shipments for SPVACs greater than or equal to 65,000 Btu/h and less than 135,000 Btu/h, which make up 3 percent of the market, based on manufacturer interviews. As there are no models on the market for SPVHP greater than or equal to 65,000 Btu/h and less than 135,000 Btu/h, or for any SPVUs greater than or equal to 135,000 Btu/h, DOE did not develop shipments estimates (or generate NES) for these equipment classes. See chapter 4 of the NODA TSD for more details on the initial shipment estimates by equipment class that were used as the basis for the shipments projections discussed subsequently.

To project shipments of SPVUs for new construction (starting in 2006), DOE relied primarily on sector-based estimates of saturation and projections of floor space. Based on manufacturer interview information, DOE allocated 35 percent of shipments to the education

sector, 35 percent to telecom, and 30 percent to offices. DOE used the 2005 new construction shipments and 2005 new construction floor space for offices and education (from *AEO 2013*) to estimate a saturation rate for each end use.⁴¹ DOE applied this saturation rate to *AEO 2013* projections of new construction floor space to project shipments to new construction through 2044. For shipments to telecom, DOE developed an index based on County Business Pattern data for establishments⁴² and projected this trend forward. To allocate the total projected shipments for office, education, and telecom into the equipment classes, DOE used the fraction of shipments from 2005 for each equipment class. This fraction remained constant over time. The complete discussion of shipment allocation and projected shipments for the different

Standards for Commercial Heating, Air-Conditioning, and Water Heating Equipment Including Packaged Terminal Air-Conditioners and Packaged Terminal Heat Pumps, Small Commercial Packaged Boiler, Three-Phase Air-Conditioners and Heat Pumps <65,000 Btu/h, and Single-Package Vertical Air Conditioners and Single-Package Vertical Heat Pumps <65,000 Btu/h (March 2006) (Available at: http://www1.eere.energy.gov/buildings/appliance_standards/commercial/pdfs/ashrae_products/ashrae_products_draft_tsd_030206.pdf). This TSD was prepared for the rulemaking that resulted in the Final Rule: Energy Efficiency Program for Certain Commercial and

Industrial Equipment: Efficiency Standards for Commercial Heating, Air-Conditioning, and Water-Heating Equipment. 72 FR 10038 (March 7, 2007).

⁴¹ Manufacturers reported that in 2012, 50 percent of shipments were for new construction. DOE allocated a larger percentage of shipments to new construction in 2005 in order to arrive at 50 percent in 2012.

⁴² U.S. Census Bureau, County Business Patterns for NAICS 237130 Power and Communication Line and Related Structures Construction (Available at: <http://www.census.gov/econ/cbp/index.html>) (Last accessed May 2, 2012).

equipment classes can be found in chapter 4 of the NODA TSD.

In order to model shipments for replacement SPVUs, DOE developed historical shipments for SPVUs back to 1981 based on an index of square footage production data from the Modular Buildings Institute.⁴³ Shipments prior to 1994 were extrapolated based on a trend from 2005 to 1997. In the stock model, the lifetime of SPVUs follows a distribution with a minimum of 10 years and a maximum of 25 years (and an average of 15 years). All retired units are assumed to be replaced with new shipments. The complete discussion of the method for extrapolating historical shipments can be found in chapter 4 of the NODA TSD.

5. Commercial Water Heaters

DOE derived the shipments for commercial oil-fired storage water heaters (greater than 105,000 Btu/h and less than 4,000 Btu/h/gal) from the 2000 Screening Analysis for EFACT-Covered Commercial HVAC and Water-Heating Equipment (EERE-2006-STD-0098-0015) and the AHRI model database.⁴⁴ The PNNL study estimated the shipments of gas-fired storage water heaters in 1999. DOE estimated that the shipments in 2000 are the same as the shipments in 1999, and then applied a

1% per year growth rate after 2000. To derive the shipments of oil-fired storage water heaters, DOE calculated the ratio of oil- versus gas-fired storage water heaters using the number of models in the AHRI model database, which was 3.3 percent. DOE multiplied this ratio by the shipments of gas-fired storage water heaters to calculate the shipments of oil-fired storage water heaters. The complete series of shipments can be found in chapter 4 of the NODA TSD.

DOE seeks input and data regarding its shipments methodologies and projections for all equipment analyzed in today's NODA. DOE identified this as Issue 15 under "Issues on Which DOE Seeks Comment" in section IV.B of this NODA.

C. Base-Case Efficiency Distribution

DOE reviewed manufacturer interview data (for SPVUs) or the AHRI certified products directory for relevant equipment classes (for all other equipment) to determine the distribution of efficiency levels for commercially-available models within each equipment class analyzed in today's NODA. DOE bundled the efficiency levels into "efficiency ranges" and determined the percentage of models within each range. The distribution of efficiencies in the base

case for each equipment class can be found in the ASHRAE NODA TSD.

For the standards case for all equipment in today's NODA, DOE assumed shipments at lower efficiencies were most likely to roll up into higher efficiency levels in response to more-stringent energy conservation standards. For each efficiency level analyzed within a given equipment class, DOE used a "roll-up" scenario to establish the market shares by efficiency level for the year that standards would become effective (e.g., 2015, 2017, or 2020). DOE estimated that the efficiencies of equipment in the base case that did not meet the standard level under consideration would roll up to meet the standard level. Available information also suggests that all equipment efficiencies in the base case that were above the standard level under consideration would not be affected. Table III.12 shows an example of the distribution of efficiencies within the base-case and the roll-up scenarios to establish the distribution of efficiencies in the standards cases for oil-fired commercial storage water heaters. For all the tables of the distribution of efficiencies in the base case and standards cases by equipment class, see the ASHRAE NODA TSD.

TABLE III.12—DISTRIBUTION OF EFFICIENCIES IN THE BASE CASE AND STANDARDS CASES FOR OIL-FIRED COMMERCIAL STORAGE WATER HEATERS

	Thermal efficiency (%)			
	78	80	81	82
Base Case	52.6%	23.7%	10.5%	13.2%
ASHRAE 90.1-2013 Standard	76.3%	10.5%	13.2%
Efficiency Level 2	86.8%	13.2%
Max-Tech	100.0%

DOE seeks input on its determination of the base-case distribution of efficiencies and its projection of how amended energy conservation standards would affect the distribution of efficiencies in each standards case. DOE identified this as Issue 16 under "Issues on Which DOE Seeks Comment" in section IV.B of this NODA.

Using the distribution of efficiencies in the base case and in the standards cases for each equipment class analyzed in today's NODA, as well as the UECs for each specified EER, SEER, or thermal efficiency (discussed previously), DOE calculated market-weighted average efficiency values. The market-weighted average efficiency value represents the

average efficiency of the total units shipped at a specified amended standard level. The market-weighted average efficiency values for the base case and the standards cases for each efficiency level analyzed within the equipment classes is provided in the ASHRAE NODA TSD.

D. Other Analytical Inputs

1. Conversion of Site Energy Savings

DOE converted the annual site energy savings into the annual amount of energy saved at the source of electric generation (i.e., primary energy) using annual multiplicative factors calculated from the AEO 2013 projections.⁴⁵ For

electricity, the conversion factors vary over time because of projected changes in generation sources (i.e., the types of power plants projected to provide electricity to the country).

In response to the recommendations of a committee on "Point-of-Use and Full-Fuel-Cycle Measurement Approaches to Energy Efficiency Standards" appointed by the National Academy of Sciences, DOE announced its intention to use full-fuel-cycle (FFC) measures of energy use and greenhouse gas and other emissions in the national impact analyses and emissions analyses included in future energy conservation standards rulemakings. 76 FR 51281 (August 18, 2011). After evaluating

⁴³ Available at: <http://www.modular.org/HtmlPage.aspx?name=analysis> (Last accessed May 18, 2012).

⁴⁴ Available at: <http://www.ahridirectory.org/ahridirectory/pages/home.aspx>.

⁴⁵ AEO 2013 can be accessed at: <http://www.eia.gov/forecasts/archive/aeo13/index.cfm>.

analytical models and the approaches discussed in the August 18, 2011 notice, DOE published a statement of amended policy in which DOE explained its determination that the National Energy Modeling System (NEMS) is the most appropriate tool for its FFC analysis and its intention to use NEMS for that purpose. 77 FR 49701 (August 17, 2012). The calculations in today's notice use FFC multipliers derived from NEMS.

2. Equipment Lifetime

DOE defines "equipment lifetime" as the age when a unit is retired from service. DOE reviewed available literature to establish typical equipment lifetimes. For air-cooled equipment, water-source heat pumps, and commercial storage water heaters, DOE used the estimated product lifetimes from the 2000 screening analysis for EPACK-Covered Commercial HVAC and Water-Heating Equipment (EERE-2006-STD-0098-0015). The average lifetime for air-cooled equipment is 15 years, for water-source equipment 19 years, and for water heaters 7 years.

For PTACs, DOE used the same average lifetime of 10 years as used in the 2008 final rule for PTACs. 73 FR 58772, 58789 (Oct. 7, 2008). For SPVUs, DOE used an average of 15 years based on a review of a range of packaged cooling equipment lifetime estimates found in published studies and online documents. For further details on equipment lifetime, see the ASHRAE NODA TSD.

3. Compliance Date and Analysis Period

If DOE were to propose a rule prescribing energy conservation standards at the efficiency levels

contained in ASHRAE Standard 90.1-2013, EPCA states that any such standard shall become effective on or after a date that is two or three years (depending on equipment type or size) after the effective date of the applicable minimum energy efficiency requirement in the amended ASHRAE standard (i.e., ASHRAE Standard 90.1-2013). (42 U.S.C. 6313(a)(6)(D)) All equipment for which analysis was performed in this NODA falls into the two-year category. For all PTACs and air-cooled equipment in this rulemaking, the effective date in ASHRAE Standard 90.1-2013 is January 1, 2015. Thus, if DOE decides to adopt the levels in ASHRAE Standard 90.1-2013, the rule would apply to PTACs and air-cooled equipment manufactured on or after January 1, 2017, which is two years from the effective date specified in ASHRAE Standard 90.1-2013. For all water-source heat pumps, SPVUs, and commercial water heaters in this rulemaking, ASHRAE Standard 90.1-2013 did not specify an effective date, so the publication date of October 9, 2013 is assumed. Thus, if DOE decides to adopt the levels in ASHRAE Standard 90.1-2013, the rule would apply to water-source heat pumps, SPVUs, and commercial water heaters manufactured on or after October 9, 2015, which is two years from the publication date of ASHRAE Standard 90.1-2013.

If DOE were to propose prescribing energy conservation standards higher than the efficiency levels contained in ASHRAE Standard 90.1-2013, under EPCA, any such standard will become effective for equipment manufactured four years after the date of publication of a final rule in the **Federal Register**. (42 U.S.C. 6313(a)(6)(D)) Thus, for

equipment for which DOE might adopt a level more stringent than the ASHRAE efficiency level, the rule would apply to equipment manufactured on and after a date which is four years from the date of publication of the final rule adopting standards higher than the ASHRAE efficiency levels (with a requirement to complete that final rule no later than 30 months after publication of the revised ASHRAE Standard 90.1, which occurred on October 9, 2013). Under this timeline, compliance with such more stringent standards would be required no later than April 9, 2020.

For purposes of calculating the NES for water-source heat pumps, SPVUs, and commercial water heaters, DOE used an analysis period of 2015 (the assumed compliance date if DOE were to adopt the ASHRAE levels as Federal standards for this equipment) through 2044. For PTACs and air-cooled equipment, DOE used an analysis period of 2017 (the assumed compliance date if DOE were to adopt the ASHRAE levels as Federal standards for this equipment) through 2046. This is the standard analysis period of 30 years that DOE typically uses in its NES analysis. While the analysis periods remain the same for assessing the energy savings of Federal standard levels higher than the ASHRAE levels, those energy savings would not begin accumulating until 2020 (the assumed compliance date if DOE were to determine that standard levels more stringent than the ASHRAE levels are justified).

For each equipment class for which DOE developed a potential energy savings analysis, Table III.13 exhibits the approximate compliance dates of an amended energy conservation standard.

TABLE III.13—APPROXIMATE COMPLIANCE DATE OF AN AMENDED ENERGY CONSERVATION STANDARD FOR EACH EQUIPMENT CLASS

Equipment class	Approximate compliance date for adopting the efficiency levels in ASHRAE Standard 90.1-2013	Approximate compliance date for adopting more-stringent efficiency levels than those in ASHRAE Standard 90.1-2013
Three-Phase Air-Cooled Single Package Air Conditioners <65,000 Btu/h	01/2017	04/2020
Three-Phase Air-Cooled Single Package Heat Pumps <65,000 Btu/h	01/2017	04/2020
Three-Phase Air-Cooled Split System Heat Pumps <65,000 Btu/h	01/2017	04/2020
Water Source HP <17,000 Btu/h	10/2015	04/2020
Water Source HP ≥17,000 to <65,000 Btu/h	10/2015	04/2020
Water Source HP ≥65,000 to 135,000 Btu/h	10/2015	04/2020
PTAC <7,000 Btu/h	01/2017	04/2020
PTAC ≥7,000 to ≤15,000 Btu/h	01/2017	04/2020
PTAC >15,000 Btu/h	01/2017	04/2020
SPVAC <65,000 Btu/h	10/2015	04/2020
SPVHP <65,000 Btu/h	10/2015	04/2020
SPVAC ≥65,000 to <135,000 Btu/h	10/2015	04/2020
Oil-Fired Storage Water Heaters >105,000 Btu/h and <4,000 Btu/h/gal	10/2015	04/2020

E. Estimates of Potential Energy Savings

DOE estimated the potential primary energy savings in quads (*i.e.*, 10¹⁵ Btu) for each efficiency level considered within each equipment class analyzed. The potential energy savings for

efficiency levels more stringent than those specified by ASHRAE Standard 90.1–2013 were calculated relative to the efficiency levels that would result if ASHRAE Standard 90.1–2013 standards were adopted. Table III.14 through Table III.26 show the potential energy

savings resulting from the analyses conducted as part of this NODA. The reported energy savings are cumulative over the period in which equipment shipped in the 30-year analysis continues to operate.

TABLE III.14—POTENTIAL ENERGY SAVINGS FOR SMALL THREE-PHASE AIR-COOLED SINGLE-PACKAGE AIR CONDITIONERS <65,000 Btu/h

Efficiency level	Primary energy savings estimate* (quads)	FFC energy savings estimate* (quads)

IV. Public Participation

A. Submission of Comments

DOE will accept comments, data, and information regarding this NODA no later than the date provided in the **DATES** section at the beginning of this notice. Interested parties may submit comments, data, and other information using any of the methods described in

the **ADDRESSES** section at the beginning of this notice.

Submitting comments via www.regulations.gov. The *www.regulations.gov* Web page will require you to provide your name and contact information. Your contact information will be viewable to DOE Building Technologies staff only. Your contact information will not be publicly

viewable except for your first and last names, organization name (if any), and submitter representative name (if any). If your comment is not processed properly because of technical difficulties, DOE will use this information to contact you. If DOE cannot read your comment due to technical difficulties and cannot contact

you for clarification, DOE may not be able to consider your comment.

However, your contact information will be publicly viewable if you include it in the comment itself or in any documents attached to your comment. Any information that you do not want to be publicly viewable should not be included in your comment, nor in any document attached to your comment. Otherwise, persons viewing comments will see only first and last names, organization names, correspondence containing comments, and any documents submitted with the comments.

Do not submit to *www.regulations.gov* information for which disclosure is restricted by statute, such as trade secrets and commercial or financial information (hereinafter referred to as Confidential Business Information (CBI)). Comments submitted through *www.regulations.gov* cannot be claimed as CBI. Comments received through the Web site will waive any CBI claims for the information submitted. For information on submitting CBI, see the Confidential Business Information section below.

DOE processes submissions made through *www.regulations.gov* before posting. Normally, comments will be posted within a few days of being submitted. However, if large volumes of comments are being processed simultaneously, your comment may not be viewable for up to several weeks. Please keep the comment tracking number that *www.regulations.gov* provides after you have successfully uploaded your comment.

Submitting comments via email, hand delivery/courier, or mail. Comments and documents submitted via email, hand delivery, or mail also will be posted to *www.regulations.gov*. If you do not want your personal contact information to be publicly viewable, do not include it in your comment or any accompanying documents. Instead, provide your contact information in a cover letter. Include your first and last names, email address, telephone number, and optional mailing address. The cover letter will not be publicly viewable as long as it does not include any comments.

Include contact information each time you submit comments, data, documents, and other information to DOE. Email submissions are preferred. If you submit via mail or hand delivery/courier, please provide all items on a CD, if feasible, in which case, it is not necessary to submit printed copies. No telefacsimiles (faxes) will be accepted.

Comments, data, and other information submitted to DOE

electronically should be provided in PDF (preferred), Microsoft Word or Excel, WordPerfect, or text (ASCII) file format. Provide documents that are not secured, that are written in English, and that are free of any defects or viruses. Documents should not contain special characters or any form of encryption and, if possible, they should carry the electronic signature of the author.

Campaign form letters. Please submit campaign form letters by the originating organization in batches of between 50 to 500 form letters per PDF or as one form letter with a list of supporters' names compiled into one or more PDFs. This reduces comment processing and posting time.

Confidential business information. Pursuant to 10 CFR 1004.11, any person submitting information that he or she believes to be confidential and exempt by law from public disclosure should submit via email, postal mail, or hand delivery/courier two well-marked copies: One copy of the document marked "confidential" that includes all the information believed to be confidential, and one copy of the document marked "non-confidential" with the information believed to be confidential deleted. Submit these documents via email or on a CD, if feasible. DOE will make its own determination about the confidential status of the information and treat it according to its determination.

Factors of interest to DOE when evaluating requests to treat submitted information as confidential include: (1) A description of the items; (2) whether and why such items are customarily treated as confidential within the industry; (3) whether the information is generally known by or available from other sources; (4) whether the information has previously been made available to others without obligation concerning its confidentiality; (5) an explanation of the competitive injury to the submitting person which would result from public disclosure; (6) when such information might lose its confidential character due to the passage of time; and (7) why disclosure of the information would be contrary to the public interest.

It is DOE's policy that all comments may be included in the public docket, without change and as received, including any personal information provided in the comments (except information deemed to be exempt from public disclosure).

B. Issues on Which DOE Seeks Comment

Although DOE welcomes comments on any aspect of this notice, DOE is particularly interested in receiving

comments and views of interested parties concerning the following issues:

(1) DOE's proposal to re-create separate equipment classes for single-package and split system equipment in the overall equipment classes of small commercial package air conditioning and heating equipment (air-cooled, three-phase) less than 65,000 Btu/h;

(2) The nomenclature changes in ASHRAE 90.1-2013 from "water source" to "water to air, water loop" and from "COP" to "COP_H", and whether in fact they are editorial in nature;

(3) The proposed definition for "water-source heat pump;"

(4) DOE's tentative proposal to not establish a separate space-constrained class for SPVUs;

(5) DOE's preliminary conclusion that the updates to the most recent versions of ANSI Z21.47 do not have a substantive impact on the measurement of energy efficiency for gas-fired furnaces;

(6) Whether energy usage for three-phase commercial air-cooled equipment would be similar to that modeled for single-phase equipment in commercial buildings;

(7) Whether increasing the HSPF for commercial air-cooled equipment less than 65,000 Btu/h will result in significant energy savings, and, if so, data to support such conclusion;

(8) The appropriateness of using the cooling UECs for water-source heat pumps developed in the 2000 screening analysis, or other sources of data for this analysis;

(9) Data and information related to water-source heat pump heating energy use;

(10) DOE's analysis of UEC for SPVUs and its use in establishing the energy savings potential for more-stringent standards. Of particular interest to DOE is input on shipments of SPVHP equipment to telecommunications shelters and the frequency of use of economizers in equipment serving these shelters;

(11) Input on how or if regional differences between the shipments of heat pumps and air conditioners to warmer or cooler climates can be taken into account in the SPVU energy use characterization;

(12) DOE's derivation of UECs for oil-fired storage water heaters;

(13) Data and information related to the current shipments of water-source heat pumps and expected future trends;

(14) The share of the market for ground-source and ground-water-source heat pump applications that use models also rated for water-loop application;

(15) DOE's shipment methodologies and projections for all equipment analyzed in today's NODA, and any shipments data related to these equipment; and

(16) DOE's determination of the base-case distribution efficiencies and its prediction on how amended energy conservation standards would affect the distribution of efficiencies in the standards case for the thirteen classes of equipment for which analysis was performed.

V. Approval of the Office of the Secretary

The Secretary of Energy has approved publication of this notice of data availability.

Issued in Washington, DC, on April 7, 2014.

Kathleen B. Hogan,

Deputy Assistant Secretary for Energy Efficiency, Energy Efficiency and Renewable Energy.

[FR Doc. 2014-08214 Filed 4-10-14; 8:45 am]

BILLING CODE 6450-01-P

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 39

[Docket No. FAA-2013-0981; Directorate Identifier 2013-NM-032-AD]

RIN 2120-AA64

Airworthiness Directives; The Boeing Company Airplanes

AGENCY: Federal Aviation Administration (FAA), Department of Transportation (DOT).

ACTION: Notice of proposed rulemaking (NPRM); reopening of comment period.

SUMMARY: This document announces the reopening of the comment period for the above-referenced NPRM, which proposed the adoption of a new airworthiness directive (AD) that applies to all The Boeing Company Model MD-90-30 airplanes and that would supersede AD 97-11-07 and AD 99-18-23. The NPRM proposed to continue to require revising the Airworthiness Limitations Section (ALS) of the Instructions for Continued Airworthiness to incorporate certain compliance times for principal structural elements (PSE) inspections and replacement times for safe-life limited parts. The NPRM also proposed to require revising the maintenance or inspection program to incorporate a new PSE requirement for the rear spar caps of the horizontal stabilizer and its

associated inspections. This reopening of the comment period is necessary to ensure that all interested persons have ample opportunity to submit any written relevant data, views, or arguments regarding the proposed requirements of the NPRM.

DATES: We must receive comments on this NPRM (78 FR 73739, December 9, 2013) by May 6, 2014.

ADDRESSES: You may send comments, using the procedures found in 14 CFR 11.43 and 11.45, by any of the following methods:

- Federal eRulemaking Portal: Go to <http://www.regulations.gov>. Follow the instructions for submitting comments.

- Fax: 202-493-2251.

- Mail: U.S. Department of Transportation, Docket Operations, M-30, West Building Ground Floor, Room W12-140, 1200 New Jersey Avenue SE., Washington, DC 20590.

- Hand Delivery: Deliver to Mail address above between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

Examining the AD Docket

You may examine the AD docket on the Internet at <http://www.regulations.gov> by searching for and locating Docket No. FAA-2013-0981; or in person at the Docket Management Facility between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays. The AD docket contains this AD action, the regulatory evaluation, any comments received, and other information. The street address for the Docket Office (telephone 800-647-5527) is in the **ADDRESSES** section. Comments will be available in the AD docket shortly after receipt.

FOR FURTHER INFORMATION CONTACT:

Roger Durbin, Airframe Branch, ANM-120L, FAA, Los Angeles Aircraft Certification Office (ACO), 3960 Paramount Boulevard, Lakewood, CA 90712-4137; phone: (562) 627-5233; fax: (562) 627-5210; email: roger.durbin@faa.gov.

SUPPLEMENTARY INFORMATION: We proposed to amend 14 CFR Part 39 by adding a notice of proposed rulemaking (NPRM) that would apply to all The Boeing Company Model MD-90-30 airplanes. The NPRM was published in the **Federal Register** on December 9, 2013 (78 FR 73739). The NPRM proposed to supersede AD 97-11-07, Amendment 39-10036 (62 FR 27941, May 22, 1997); and AD 99-18-23, Amendment 39-11289 (64 FR 48284, September 3, 1999). The NPRM proposed to continue to require revising the Airworthiness Limitations Section (ALS) of the Instructions for Continued

Airworthiness to incorporate certain compliance times for principal structural elements (PSE) inspections and replacement times for safe-life limited parts. The NPRM also proposed to require revising the maintenance or inspection program to incorporate a new PSE requirement for the rear spar caps of the horizontal stabilizer and its associated inspections. The NPRM also invites comments on its overall regulatory, economic, environmental, and energy aspects.

Events Leading to the Reopening of the Comment Period

Since we issued the NPRM (78 FR 73739, December 9, 2013), we have determined that the Relevant Service Information section in the preamble of the NPRM did not adequately describe the service information. We specified to see the service information, Boeing MD-90 Airworthiness Limitations Instructions (ALI) Report No. MDC-94K9000, Revision 6, dated September 2011, at <http://www.regulations.gov>. However, we did not post the service information at <http://www.regulations.gov> because we do not have clearance to post Boeing MD-90 Airworthiness Limitations Instructions (ALI) Report No. MDC-94K9000, Revision 6, dated September 2011, at the NPRM stage of the AD process.

Description of Service Information

Boeing MD-90 Airworthiness Limitations Instructions (ALI) Report No. MDC-94K9000, Revision 6, dated September 2011, describes PSE inspections, compliance times, and replacement times for safe-life limited parts, which are required by AD 97-11-07, Amendment 39-10036 (62 FR 27941, May 22, 1997); and AD 99-18-23, Amendment 39-11289 (64 FR 48284, September 3, 1999). Boeing MD-90 Airworthiness Limitations Instructions (ALI) Report No. MDC-94K9000, Revision 6, dated September 2011, also describes a new PSE requirement for the rear spar of the horizontal stabilizer and its associated inspections.

FAA's Determination

We considered it necessary to adequately describe the service information and found it appropriate to reopen the comment period to give all interested persons additional time to examine the proposed requirements of the NPRM (78 FR 73739, December 9, 2013) and submit comments. We have determined that reopening the comment period for 25 days will not compromise the safety of these airplanes.

Extension of Comment Period

The comment period for Docket No. FAA–2013–0981, Directorate Identifier 2013–NM–032–AD, has been revised. The comment period now closes May 6, 2014.

No other part of the regulatory information has been changed; therefore, the NPRM (78 FR 73739, December 9, 2013) is not republished in the **Federal Register**.

Issued in Renton, Washington, on April 4, 2014.

Michael J. Kaszycki,

Acting Manager, Transport Airplane Directorate, Aircraft Certification Service.

[FR Doc. 2014–08144 Filed 4–10–14; 8:45 am]

BILLING CODE 4910–13–P

DEPARTMENT OF EDUCATION**34 CFR Chapter VI****Negotiated Rulemaking Committee, Notice of Additional Committee Meeting—Title IV Federal Student Aid Programs, Program Integrity and Improvement**

AGENCY: Office of Postsecondary Education, Department of Education.

ACTION: Notice of intent to establish negotiated rulemaking committee.

SUMMARY: On November 20, 2013, we announced our intention to establish a negotiated rulemaking committee to prepare proposed regulations to address program integrity and improvement issues for the Federal Student Aid Programs authorized under Title IV of the Higher Education Act of 1965, as amended (HEA), (Title IV Federal Student Aid Programs). We also announced the schedule for three sessions of committee meetings. We now announce the addition of a fourth session, consisting of two days of committee meetings to focus on the development of proposed regulations to define “adverse credit” for borrowers in the Federal Direct PLUS Loan Program.

DATES: The dates, times, and locations of the fourth session are set out in the *Schedule for Negotiations* section under **SUPPLEMENTARY INFORMATION**, below.

FOR FURTHER INFORMATION CONTACT: For information about the content of this notice, including information about the negotiated rulemaking process, contact: Wendy Macias, U.S. Department of Education, 1990 K Street NW., room 8017, Washington, DC 20006. Telephone: (202) 502–7526 or by email: wendy.macias@ed.gov.

For general information about the negotiated rulemaking process, see *The*

Negotiated Rulemaking Process for Title IV Regulations, Frequently Asked Questions at <http://www2.ed.gov/policy/highered/reg/hearulemaking/hea08/neg-reg-faq.html>.

If you use a telecommunications device for the deaf or text telephone, call the Federal Relay Service, toll free, at 1–800–877–8339.

Individuals with disabilities can obtain this document in an accessible format (e.g., braille, large print, audiotape, or compact disc) on request to the program contact person listed under **FOR FURTHER INFORMATION CONTACT**.

SUPPLEMENTARY INFORMATION: On November 20, 2013, we published a document in the **Federal Register** (78 FR 69612) announcing our intention to establish a negotiated rulemaking committee to prepare proposed regulations to address program integrity and improvement issues for the Title IV Federal Student Aid Programs. In that notice, we set a schedule for three sessions of committee meetings and requested nominations for individual negotiators who represent key stakeholder constituencies for the issues to be negotiated to serve on the committee.

At the committee meeting on March 26, 2013, the Department proposed that a fourth committee meeting be scheduled to ensure that the Committee had sufficient time to discuss the issues, in view of additional time being devoted to the gathering and consideration of data pertinent to defining “adverse credit” for borrowers in the Federal Direct PLUS Loan Program. The Committee approved the proposal by consensus.

We now announce the addition of a fourth session consisting of committee meetings to take place May 19–20, 2014, to focus on the development of proposed regulations to define “adverse credit,” but also to discuss, subject to time available, any other issues remaining open from the initial three meetings. The meetings will run from 9 a.m. to 5 p.m. The schedule for the fourth session follows.

Schedule for Negotiations: The committee will meet for its fourth and final session on May 19–20, 2014. The meetings will run from 9 a.m. to 5 p.m.

The meetings will be held at the U.S. Department of Education at: 1990 K Street NW., Eighth Floor Conference Center, Washington, DC 20006. The meetings are open to the public.

Electronic Access to This Document: The official version of this document is the document published in the **Federal Register**. Free Internet access to the

official edition of the **Federal Register** and the Code of Federal Regulations is available via the Federal Digital System at: www.gpo.gov/fdsys. At this site you can view this document, as well as all other documents of the Department published in the **Federal Register**, in text or Adobe Portable Document Format (PDF). To use PDF you must have Adobe Acrobat Reader, which is available free at the site. You may also access documents of the Department published in the **Federal Register** by using the article search feature at: www.federalregister.gov. Specifically, through the advanced search feature at this site, you can limit your search to documents published by the Department.

Program Authority: 20 U.S.C. 1098a.

Dated: April 8, 2014.

Lynn B. Mahaffie,

Senior Director, Policy Coordination, Development, and Accreditation Service, delegated the authority to perform the functions and duties of the Assistant Secretary for Postsecondary Education.

[FR Doc. 2014–08211 Filed 4–10–14; 8:45 am]

BILLING CODE 4000–01–P

ENVIRONMENTAL PROTECTION AGENCY**40 CFR Parts 52 and 81**

[EPA–R03–OAR–2014–0022; FRL–9909–41–Region 3]

Approval and Promulgation of Air Quality Implementation Plans; Delaware; Redesignation Requests, Associated Maintenance Plans, and Motor Vehicle Emissions Budgets for the Delaware Portion of the Philadelphia-Wilmington, PA-NJ-DE Nonattainment Area for the 1997 Annual and 2006 24-Hour Fine Particulate Matter Standards, and the 2007 Comprehensive Emissions Inventory for the 2006 24-Hour Fine Particulate Matter Standard

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

SUMMARY: The Environmental Protection Agency (EPA) is proposing to approve the State of Delaware’s requests to redesignate to attainment the Delaware portion of the Philadelphia-Wilmington, PA-NJ-DE nonattainment area (hereafter “the Philadelphia Area” or “the Area”) for both the 1997 annual and the 2006 24-hour fine particulate matter (PM_{2.5}) National Ambient Air Quality Standards (NAAQS or standards). EPA is also proposing to approve as revisions to the

Delaware State Implementation Plan (SIP), the associated maintenance plans to show maintenance of the 1997 annual and the 2006 24-hour PM_{2.5} NAAQS through 2025 for the Delaware portion of the Area. EPA is also proposing to approve the motor vehicle emissions budgets (MVEBs) included in Delaware's maintenance plans for the Delaware portion of the Area for both the 1997 annual and 2006 24-hour PM_{2.5} standards. EPA is also proposing to determine that the Delaware portion of the Philadelphia Area continues to attain both the 1997 annual and the 2006 24-hour PM_{2.5} NAAQS. In addition, EPA is proposing to approve the 2007 emissions inventory for the Delaware portion of the Area for the 2006 24-hour PM_{2.5} NAAQS. In this rulemaking action, EPA also addresses the effects of two decisions of the United States Court of Appeals for the District of Columbia (D.C. Circuit or Court): The Court's August 21, 2012 decision to vacate and remand to EPA the Cross-State Air Pollution Control Rule (CSAPR); and the Court's January 4, 2013 decision to remand to EPA two final rules implementing the 1997 annual PM_{2.5} standard. This rulemaking action to propose approval of the 1997 annual and 2006 24-hour PM_{2.5} NAAQS redesignation requests and associated maintenance plans for the Delaware portion of the Philadelphia Area is based on EPA's determination that Delaware has met the criteria for redesignation to attainment specified in the Clean Air Act (CAA) for both the 1997 annual and 2006 24-hour PM_{2.5} standards. EPA has taken separate rulemaking action to approve the redesignation of the New Jersey portion of the Philadelphia Area for the 1997 annual and 2006 24-hour PM_{2.5} NAAQS. See 78 FR 54396.

DATES: Written comments must be received on or before May 12, 2014.

ADDRESSES: Submit your comments, identified by Docket ID Number EPA-R03-OAR-2014-0022 by one of the following methods:

A. *www.regulations.gov*. Follow the on-line instructions for submitting comments.

B. *Email: Fernandez.cristina@epa.gov*.

C. *Mail: EPA-R03-OAR-2014-0022*, Cristina Fernandez, Associate Director, Office of Air Quality Planning, Mailcode 3AP30, U.S. Environmental Protection Agency, Region III, 1650 Arch Street, Philadelphia, Pennsylvania 19103.

D. *Hand Delivery:* At the previously-listed EPA Region III address. Such deliveries are only accepted during the Docket's normal hours of operation, and

special arrangements should be made for deliveries of boxed information.

Instructions: Direct your comments to Docket ID No. EPA-R03-OAR-2014-0022. EPA's policy is that all comments received will be included in the public docket without change, and may be made available online at *www.regulations.gov*, including any personal information provided, unless the comment includes information claimed to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Do not submit information that you consider to be CBI or otherwise protected through *www.regulations.gov* or email. The *www.regulations.gov* Web site is an "anonymous access" system, which means EPA will not know your identity or contact information unless you provide it in the body of your comment. If you send an email comment directly to EPA without going through *www.regulations.gov*, your email address will be automatically captured and included as part of the comment that is placed in the public docket and made available on the Internet. If you submit an electronic comment, EPA recommends that you include your name and other contact information in the body of your comment and with any disk or CD-ROM you submit. If EPA cannot read your comment due to technical difficulties and cannot contact you for clarification, EPA may not be able to consider your comment. Electronic files should avoid the use of special characters, any form of encryption, and be free of any defects or viruses.

Docket: All documents in the electronic docket are listed in the *www.regulations.gov* index. Although listed in the index, some information is not publicly available, i.e., CBI or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically in *www.regulations.gov* or in hard copy during normal business hours at the Air Protection Division, U.S. Environmental Protection Agency, Region III, 1650 Arch Street, Philadelphia, Pennsylvania 19103. Copies of the State submittal are available at the Delaware Department of Natural Resources and Environmental Control, 89 Kings Highway, P.O. Box 1401, Dover, Delaware 19903.

FOR FURTHER INFORMATION CONTACT: Maria A. Pino, (215) 814-2181, or by email at *pino.maria@epa.gov*.

I. Background

The first air quality standards for PM_{2.5} were established on July 16, 1997 (62 FR 38652, July 18, 1997). EPA promulgated an annual standard at a level of 15 micrograms per cubic meter (µg/m³), based on a three-year average of annual mean PM_{2.5} concentrations (the 1997 annual PM_{2.5} standard). In the same rulemaking action, EPA promulgated a 24-hour standard of 65 µg/m³, based on a three-year average of the 98th percentile of 24-hour concentrations.

On January 5, 2005 (70 FR 944, 1014), EPA published air quality area designations for the 1997 PM_{2.5} standards. In that rulemaking action, EPA designated the Philadelphia Area as nonattainment for the 1997 annual PM_{2.5} standard. The Philadelphia Area is comprised of New Castle County in Delaware (the Delaware portion of the Area); Burlington, Camden, and Gloucester Counties in New Jersey; and Bucks, Chester, Delaware, Montgomery, and Philadelphia Counties in Pennsylvania. See 40 CFR 81.308 (Delaware), 40 CFR 81.331 (New Jersey), and 40 CFR 81.339 (Pennsylvania).

On October 17, 2006 (71 FR 61144), EPA retained the annual average standard at 15 µg/m³, but revised the 24-hour standard to 35 µg/m³, based again on the three-year average of the 98th percentile of 24-hour concentrations (the 2006 annual PM_{2.5} standard). On November 13, 2009 (74 FR 58688), EPA published designations for the 2006 24-hour PM_{2.5} NAAQS, which became effective on December 14, 2009. In that rulemaking action, EPA designated the Philadelphia Area as nonattainment for the 2006 24-hour PM_{2.5} NAAQS. See 77 FR 58775 and also see 40 CFR 81.308 (Delaware), 40 CFR 81.331 (New Jersey), and 40 CFR 81.339 (Pennsylvania).

In response to legal challenges of the 2006 annual PM_{2.5} standard, the D.C. Circuit remanded this standard to EPA for further consideration. See *American Farm Bureau Federation and National Pork Producers Council, et al. v. EPA*, 559 F.3d 512 (D.C. Cir. 2009). However, given that the 1997 and 2006 annual PM_{2.5} standards are essentially identical, attainment of the 1997 annual PM_{2.5} standard would also indicate attainment of the remanded 2006 annual PM_{2.5} standard. Since the Philadelphia Area is designated nonattainment for the 1997 annual and 2006 24-hour PM_{2.5} standards, today's proposed rulemaking action addresses the redesignation to attainment of the Delaware portion of the Philadelphia Area for these standards.

On May 16, 2012 (77 FR 28782) and January 7, 2013 (78 FR 882), EPA made determinations that the entire Philadelphia Area had attained the 1997 annual and 2006 24-hour PM_{2.5} NAAQS, respectively. Pursuant to 40 CFR 51.1004(c) and based on these determinations, the requirements for the Philadelphia Area to submit an attainment demonstration and associated reasonably available control measures (RACM), a reasonable further progress (RFP) plan, contingency measures, and other planning SIPs related to the attainment of either the 1997 annual or 2006 24-hour PM_{2.5} NAAQS are suspended until such time as: The Area is redesignated to attainment for each standard, at which time the requirements no longer apply; or EPA determines that the Area has again violated any of the standards, at which time such plans are required to be submitted. However, these determinations of attainment do not preclude states from submitting and EPA from approving planning SIP revisions for the 1997 or 2006 PM_{2.5} NAAQS. Delaware submitted an attainment plan for the 1997 PM_{2.5} NAAQS, and EPA approved that plan on December 17, 2013 (78 FR 76209).

On December 12, 2012, the Delaware Department of Natural Resources and Environmental Control (DNREC) formally submitted two separate requests to redesignate the Delaware portion of the Philadelphia Area from nonattainment to attainment for the 1997 annual and the 2006 24-hour PM_{2.5} NAAQS, respectively. Each submittal included a maintenance plan as a SIP revision to ensure continued attainment of the standards throughout the Delaware portion of the Area over the next 10 years. The December 12, 2012 submittal also includes a 2007 comprehensive emissions inventory for the 2006 24-hour PM_{2.5} NAAQS.

In this proposed rulemaking action, EPA is taking into account two recent decisions of the D.C. Circuit. In the first of the two Court decisions, the D.C. Circuit, on August 21, 2012, issued *EME Homer City Generation, L.P. v. EPA*, 696 F.3d 7 (D.C. Cir. 2012), which vacated and remanded CSAPR and ordered EPA to continue administering the Clean Air Interstate Rule (CAIR) "pending . . . development of a valid replacement." *EME Homer City* at 38. The D.C. Circuit denied all petitions for rehearing on January 24, 2013. In the second decision, on January 4, 2013, in *Natural Resources Defense Council v. EPA*, the D.C. Circuit remanded to EPA the "Final Clean Air Fine Particle Implementation Rule" (72 FR 20586, April 25, 2007) and the "Implementation of the New Source Review (NSR) Program for Particulate Matter Less than 2.5 Micrometers (PM_{2.5})" final rule (73 FR 28321, May 16, 2008). 706 F.3d 428 (D.C. Cir. 2013).

II. EPA's Requirements

A. Criteria for Redesignation to Attainment

The CAA provides the requirements for redesignating a nonattainment area to attainment. Specifically, section 107(d)(3)(E) of the CAA allows for redesignation providing that: (1) EPA determines that the area has attained the applicable NAAQS; (2) EPA has fully approved the applicable implementation plan for the area under section 110(k); (3) EPA determines that the improvement in air quality is due to permanent and enforceable reductions in emissions resulting from implementation of the applicable SIP and applicable Federal air pollutant control regulations and other permanent and enforceable reductions; (4) EPA has fully approved a maintenance plan for the area as meeting the requirements of section 175A of the CAA; and (5) the state containing such area has met all requirements applicable to the area under section 110 and part D.

EPA has provided guidance on redesignation in the "State Implementation Plans; General Preamble for the Implementation of Title I of the Clean Air Act Amendments of 1990," (57 FR 13498, April 16, 1992) (the "General Preamble") and has provided further guidance on processing redesignation requests in the following documents: (1) "Procedures for Processing Requests to Redesignate Areas to Attainment," Memorandum from John Calcagni, Director, Air Quality Management Division, September 4, 1992 (hereafter the "1992 Calcagni Memorandum"); (2) "State Implementation Plan (SIP) Actions

Submitted in Response to Clean Air Act (CAA) Deadlines," Memorandum from John Calcagni, Director, Air Quality Management Division, October 28, 1992; and (3) "Part D New Source Review (Part D NSR) Requirements for Areas Requesting Redesignation to Attainment," Memorandum from Mary D. Nichols, Assistant Administrator for Air and Radiation, October 14, 1994.

B. Requirements of a Maintenance Plan

Section 175A of the CAA sets forth the elements of a maintenance plan for areas seeking redesignation from nonattainment to attainment. Under section 175A, the plan must demonstrate continued attainment of the applicable NAAQS for at least 10 years after approval of a redesignation of an area to attainment. Eight years after the redesignation, the state must submit a revised maintenance plan demonstrating that attainment will continue to be maintained for the 10 years following the initial 10-year period. To address the possibility of future NAAQS violations, the maintenance plan must contain such contingency measures, with a schedule for implementation, as EPA deems necessary to assure prompt correction of any future PM_{2.5} violations.

The 1992 Calcagni Memorandum provides additional guidance on the content of a maintenance plan. The memorandum states that a PM_{2.5} maintenance plan should address the following provisions: (1) An attainment emissions inventory; (2) a maintenance demonstration showing maintenance for 10 years; (3) a commitment to maintain the existing monitoring network; (4) verification of continued attainment; and (5) a contingency plan to prevent or correct future violations of the NAAQS.

III. Summary of Proposed Actions

EPA is proposing to take several rulemaking actions related to the redesignation of the Delaware portion of the Philadelphia Area to attainment for both the 1997 annual and the 2006 24-hour PM_{2.5} NAAQS. EPA is proposing to find that the Delaware portion of the Area meets the requirements for redesignation of the 1997 annual and the 2006 24-hour PM_{2.5} NAAQS under section 107(d)(3)(E) of the CAA. EPA is thus proposing to approve Delaware's requests to change the legal designation of the Delaware portion of the Area from nonattainment to attainment for both the 1997 annual and 2006 24-hour PM_{2.5} NAAQS. This rulemaking action does not impact the legal designation of the New Jersey and Pennsylvania portions of the Philadelphia Area. On September 4, 2013 (78 FR 54396), EPA took

separate rulemaking action to redesignate to attainment the New Jersey portion of the Area for both the 1997 annual and 2006 24-hour PM_{2.5} NAAQS.

EPA is also proposing to approve the associated maintenance plans for the Delaware portion of the Area as revisions to the Delaware SIP for the 1997 annual and 2006 24-hour PM_{2.5} NAAQS, including the MVEBs for the Delaware portion of the Area for both the 1997 annual and the 2006 24-hour PM_{2.5} standards. The approval of the maintenance plans is one of the CAA criteria for redesignation of the Delaware portion of the Area to attainment for both standards. Delaware's maintenance plans are designed to ensure continued attainment in the Delaware portion of the Area of the 1997 annual and 2006 24-hour PM_{2.5} standards, respectively, for 10 years after redesignation.

EPA previously determined that the Philadelphia Area has attained both the 1997 annual and 2006 24-hour PM_{2.5} NAAQS, and EPA is proposing to find that the Area continues to attain both standards. Furthermore, under section 172(c)(3) of the CAA, EPA is proposing to approve the 2007 comprehensive emissions inventory for the Delaware portion of the Area as part of Delaware's SIP for the 2006 24-hour PM_{2.5} NAAQS. EPA's analysis of the proposed actions is provided in section V of today's proposed rulemaking action.

IV. Effects of Recent Court Decisions on Proposed Actions

A. Effect of the August 21, 2012 D.C. Circuit Decision Regarding EPA's CSAPR

Delaware has demonstrated that attainment of the 1997 annual and 2006 24-hour PM_{2.5} NAAQS will be maintained with or without the implementation of CAIR or CSAPR. Delaware does not rely on either CAIR or CSAPR in its maintenance plans for either the 1997 or the 2006 PM_{2.5} NAAQS, and demonstrates that emission reductions from CAIR or CSAPR are not needed to maintain the 1997 annual and 2006 24-hour PM_{2.5} NAAQS. In addition, modeling conducted by EPA during the CSAPR rulemaking process also demonstrates that the counties in the Philadelphia Area will have PM_{2.5} levels below the 1997 annual and 2006 24-hour PM_{2.5} NAAQS in both 2012 and 2014 without taking into account emissions reductions from CAIR or CSAPR. See "Air Quality Modeling Final Rule Technical Support Document," App. B, B-37, B-51, B-57, B-58, B-66, B-80, B-

86. This modeling is available in the docket for this proposed redesignation action.

Moreover, in its August 2012 decision, the Court also ordered EPA to continue implementing CAIR. See *EME Homer City Generation LP v. EPA*, 696 F.3d 7 (D.C. Cir. 2012). In sum, neither the current status of CAIR nor the current status of CSAPR affects any of the criteria for proposed approval of this redesignation request for the Philadelphia Area.

B. Effect of the January 4, 2013 D.C. Circuit Decision Regarding PM_{2.5} Implementation Under Subpart 4 of Part D of Title I of the CAA

1. Background

As discussed previously, on January 4, 2013, in *Natural Resources Defense Council (NRDC) v. EPA*, the D.C. Circuit remanded to EPA the "Final Clean Air Fine Particle Implementation Rule" (72 FR 20586, April 25, 2007) and the "Implementation of the New Source Review (NSR) Program for Particulate Matter Less than 2.5 Micrometers (PM_{2.5})" final rule (73 FR 28321, May 16, 2008) (collectively, "1997 PM_{2.5} Implementation Rule"). 706 F.3d 428 (D.C. Cir. 2013). The Court found that EPA erred in implementing the 1997 annual PM_{2.5} NAAQS pursuant to the general implementation provisions of subpart 1 of part D of Title I of the CAA (subpart 1), rather than the particulate-matter-specific provisions of subpart 4 of Part D of Title I (subpart 4). Although the Court did not directly address the 2006 24-hour PM_{2.5} standard, EPA is taking into account the Court's position on subpart 4 and the 1997 annual PM_{2.5} standard in evaluating redesignations for the 2006 24-hour PM_{2.5} standard.

2. Proposal on This Issue

EPA is proposing to determine that the Court's January 4, 2013 decision does not prevent EPA from redesignating the Delaware portion of the Philadelphia Area to attainment for either the 1997 annual or the 2006 24-hour PM_{2.5} NAAQS. Even in light of the Court's decision, redesignation for this Area is appropriate under the CAA and EPA's longstanding interpretations of the CAA's provisions regarding redesignation. EPA first explains its longstanding interpretation that requirements that are imposed, or that become due, after a complete redesignation request is submitted for an area that is attaining the standard, are not applicable for purposes of evaluating a redesignation request. Second, EPA then shows that, even if EPA applies the subpart 4 requirements

to the Delaware redesignation requests and disregards the provisions of its 1997 PM_{2.5} Implementation Rule recently remanded by the Court, the State's request for redesignation of the Area still qualifies for approval. EPA's discussion takes into account the effect of the Court's ruling on the Area's maintenance plan, which EPA views as approvable when subpart 4 requirements are considered.

a. Applicable Requirements for Purposes of Evaluating the Redesignation Requests

With respect to the 1997 PM_{2.5} Implementation Rule, the Court's January 4, 2013 ruling rejected EPA's reasons for implementing the PM_{2.5} NAAQS solely in accordance with the provisions of subpart 1, and remanded that matter to EPA, so that it could address implementation of the 1997 annual PM_{2.5} NAAQS under subpart 4, in addition to subpart 1. For the purposes of evaluating Delaware's redesignation request for the Delaware portion of the Area, to the extent that implementation under subpart 4 would impose additional requirements for areas designated nonattainment, EPA believes that those requirements are not "applicable" for the purposes of CAA section 107(d)(3)(E), and thus EPA is not required to consider subpart 4 requirements with respect to the redesignation of the Delaware portion of the Philadelphia Area. Under its longstanding interpretation of the CAA, EPA has interpreted section 107(d)(3)(E) to mean, as a threshold matter, that the part D provisions which are "applicable" and which must be approved in order for EPA to redesignate an area include only those which came due prior to a state's submittal of a complete redesignation request. See 1992 Calcagni Memorandum. See also "State Implementation Plan (SIP) Requirements for Areas Submitting Requests for Redesignation to Attainment of the Ozone and Carbon Monoxide (CO) National Ambient Air Quality Standards (NAAQS) on or after November 15, 1992," Memorandum from Michael Shapiro, Acting Assistant Administrator, Air and Radiation, September 17, 1993 (Shapiro memorandum); Final Redesignation of Detroit-Ann Arbor, (60 FR 12459, 12465-66, March 7, 1995); Final Redesignation of St. Louis, Missouri, (68 FR 25418, 25424-27, May 12, 2003); *Sierra Club v. EPA*, 375 F.3d 537, 541 (7th Cir. 2004) (upholding EPA's redesignation rulemaking applying this interpretation and expressly rejecting Sierra Club's view that the meaning of

“applicable” under the statute is “whatever should have been in the plan at the time of attainment rather than whatever actually was in the plan and already implemented or due at the time of attainment”).¹ In this case, at the time that Delaware submitted its redesignation requests for both standards, the requirements under subpart 4 were not due, and indeed, were not yet known to apply.

EPA’s view that, for purposes of evaluating the redesignation of the Delaware portion of the Philadelphia Area, the subpart 4 requirements were not due at the time Delaware submitted the redesignation requests is in keeping with the EPA’s interpretation of subpart 2 requirements for subpart 1 ozone areas redesignated subsequent to the D.C. Circuit’s decision in *South Coast Air Quality Mgmt. Dist. v. EPA*, 472 F.3d 882 (D.C. Cir. 2006). In *South Coast*, the Court found that EPA was not permitted to implement the 1997 8-hour ozone standard solely under subpart 1, and held that EPA was required under the statute to implement the standard under the ozone-specific requirements of subpart 2 as well. Subsequent to the *South Coast* decision, in evaluating and acting upon redesignation requests for the 1997 8-hour ozone standard that were submitted to EPA for areas under subpart 1, EPA applied its longstanding interpretation of the CAA that “applicable requirements,” for purposes of evaluating a redesignation, are those that had been due at the time the redesignation request was submitted. See, e.g., Proposed Redesignation of Manitowoc County and Door County Nonattainment Areas (75 FR 22047, 22050, April 27, 2010). In those actions, EPA, therefore, did not consider subpart 2 requirements to be “applicable” for the purposes of evaluating whether the area should be redesignated under section 107(d)(3)(E).

EPA’s interpretation derives from the provisions of section 107(d)(3). Section 107(d)(3)(E)(v) states that, for an area to be redesignated, a state must meet “all requirements ‘applicable’ to the area under section 110 and part D.” Section 107(d)(3)(E)(ii) provides that the EPA must have fully approved the “applicable” SIP for the area seeking redesignation. These two sections read together support EPA’s interpretation of “applicable” as only those requirements that came due prior to submission of a complete redesignation request. First,

¹ Applicable requirements of the CAA that come due subsequent to the area’s submittal of a complete redesignation request remain applicable until a redesignation is approved, but are not required as a prerequisite to redesignation. Section 175A(c) of the CAA.

holding states to an ongoing obligation to adopt new CAA requirements that arose after the state submitted its redesignation request, in order to be redesignated, would make it problematic or impossible for EPA to act on redesignation requests in accordance with the 18-month deadline Congress set for EPA action in section 107(d)(3)(D). If “applicable requirements” were interpreted to be a continuing flow of requirements with no reasonable limitation, states, after submitting a redesignation request, would be forced continuously to make additional SIP submissions that in turn would require EPA to undertake further notice-and-comment rulemaking actions to act on those submissions. This would create a regime of unceasing rulemaking that would delay action on the redesignation request beyond the 18-month timeframe provided by the CAA for this purpose.

Second, a fundamental premise for redesignating a nonattainment area to attainment is that the area has attained the relevant NAAQS due to emission reductions from existing controls. Thus, an area for which a redesignation request has been submitted would have already attained the NAAQS as a result of satisfying statutory requirements that came due prior to the submission of the request. Absent a showing that unadopted and unimplemented requirements are necessary for future maintenance, it is reasonable to view the requirements applicable for purposes of evaluating the redesignation request as including only those SIP requirements that have already come due. These are the requirements that led to attainment of the NAAQS. To require, for redesignation approval, that a state also satisfy additional SIP requirements coming due after the state submits its complete redesignation request, and while EPA is reviewing it, would compel the state to do more than is necessary to attain the NAAQS, without a showing that the additional requirements are necessary for maintenance.

In the context of this redesignation, the timing and nature of the Court’s January 4, 2013 decision in *NRDC v. EPA* compound the consequences of imposing requirements that come due after the redesignation request is submitted. Delaware submitted its two redesignation requests for the 1997 annual and the 2006 24-hour PM_{2.5} NAAQS on December 12, 2012, but the Court did not issue its decision remanding EPA’s 1997 PM_{2.5} Implementation Rule concerning the applicability of the provisions of subpart 4 until January 2013.

To require Delaware’s fully-completed and pending redesignation requests for both the 1997 annual and the 2006 24-hour PM_{2.5} NAAQS to comply now with requirements of subpart 4 that the Court announced only in its January 2013 decision on the 1997 PM_{2.5} Implementation Rule, would be to give retroactive effect to such requirements when the State had no notice that it was required to meet them. The D.C. Circuit recognized the inequity of this type of retroactive impact in *Sierra Club v. Whitman*, 285 F.3d 63 (D.C. Cir. 2002),² where it upheld the District Court’s ruling refusing to make retroactive EPA’s determination that the St. Louis area did not meet its attainment deadline. In that case, petitioners urged the Court to make EPA’s nonattainment determination effective as of the date that the statute required, rather than the later date on which EPA actually made the determination. The Court rejected this view, stating that applying it “would likely impose large costs on States, which would face fines and suits for not implementing air pollution prevention plans . . . even though they were not on notice at the time.” *Id.* at 68. Similarly, it would be unreasonable to penalize the State of Delaware by rejecting its redesignation request for an area that is already attaining both the 1997 annual and 2006 24-hour PM_{2.5} standards and that met all applicable requirements known to be in effect at the time of the requests. For EPA now to reject the redesignation requests solely because the State did not expressly address subpart 4 requirements of which it had no notice, would inflict the same unfairness condemned by the Court in *Sierra Club v. Whitman*.

b. Subpart 4 Requirements and Delaware Redesignation Requests

Even if EPA were to take the view that the Court’s January 4, 2013 decision requires that, in the context of pending redesignations for either the 1997 annual or 2006 24-hour PM_{2.5} standards, subpart 4 requirements were due and in effect at the time Delaware submitted its redesignation requests, EPA proposes to determine that the Delaware portion of the Philadelphia Area still qualifies for redesignation to attainment for both the 1997 annual and 2006 24-hour PM_{2.5}

² *Sierra Club v. Whitman* was discussed and distinguished in a recent D.C. Circuit decision that addressed retroactivity in a quite different context, where, unlike the situation here, EPA sought to give its regulations retroactive effect. *National Petrochemical and Refiners Ass’n v. EPA*, 630 F.3d 145, 163 (D.C. Cir. 2010), rehearing denied 643 F.3d 958 (D.C. Cir. 2011), cert denied 132 S. Ct. 571 (2011).

standards. As explained subsequently, EPA believes that the two redesignation requests for the Delaware portion of the Philadelphia Area, though not expressed in terms of subpart 4 requirements, substantively meet the requirements of that subpart for purposes of redesignating the Delaware portion of the Area to attainment for both standards.

With respect to evaluating the relevant substantive requirements of subpart 4 for purposes of redesignating the Delaware portion of the Philadelphia Area, EPA notes that subpart 4 incorporates components of subpart 1 of part D, which contains general air quality planning requirements for areas designated as nonattainment. *See* section 172(c). Subpart 4 itself contains specific planning and scheduling requirements for coarse particulate matter (PM₁₀)³ nonattainment areas, and under the Court's January 4, 2013 decision in *NRDC v. EPA*, these same statutory requirements also apply for PM_{2.5} nonattainment areas. EPA has longstanding general guidance that interprets the 1990 amendments to the CAA, making recommendations to states for meeting the statutory requirements for SIPs for nonattainment areas. *See*, the General Preamble. In the General Preamble, EPA discussed the relationship of subpart 1 and subpart 4 SIP requirements, and pointed out that subpart 1 requirements were to an extent "subsumed by, or integrally related to, the more specific PM₁₀ requirements" (57 FR 13538, April 16, 1992). The subpart 1 requirements include, among other things, provisions for attainment demonstrations, RACM, RFP, emissions inventories, and contingency measures.

For the purposes of these redesignation requests, in order to identify any additional requirements which would apply under subpart 4, EPA is considering the Philadelphia Area to be a "moderate" PM_{2.5} nonattainment area. Under section 188 of the CAA, all areas designated nonattainment areas under subpart 4 would initially be classified by operation of law as "moderate" nonattainment areas, and would remain moderate nonattainment areas unless and until EPA reclassifies the area as a "serious" nonattainment area. Accordingly, EPA believes that it is appropriate to limit the evaluation of the potential impact of subpart 4 requirements to those that would be applicable to moderate nonattainment

areas. Sections 189(a) and (c) of subpart 4 apply to moderate nonattainment areas and include the following: (1) An approved permit program for construction of new and modified major stationary sources (section 189(a)(1)(A)); (2) an attainment demonstration (section 189(a)(1)(B)); (3) provisions for RACM (section 189(a)(1)(C)); and (4) quantitative milestones demonstrating RFP toward attainment by the applicable attainment date (section 189(c)).

The permit requirements of subpart 4, as contained in section 189(a)(1)(A), refer to and apply the subpart 1 permit provisions requirements of sections 172 and 173 to PM₁₀, without adding to them. Consequently, EPA believes that section 189(a)(1)(A) does not itself impose for redesignation purposes any additional requirements for moderate areas beyond those contained in subpart 1.⁴ In any event, in the context of redesignation, EPA has long relied on the interpretation that a fully approved nonattainment new source review program is not considered an applicable requirement for redesignation, provided the area can maintain the standard with a prevention of significant deterioration (PSD) program after redesignation. A detailed rationale for this view is described in a memorandum from Mary Nichols, Assistant Administrator for Air and Radiation, dated October 14, 1994, entitled, "Part D New Source Review Requirements for Areas Requesting Redesignation to Attainment." *See also* rulemakings for Detroit, Michigan (60 FR 12467–12468, March 7, 1995); Cleveland-Akron-Lorain, Ohio (61 FR 20458, 20469–20470, May 7, 1996); Louisville, Kentucky (66 FR 53665, October 23, 2001); and Grand Rapids, Michigan (61 FR 31834–31837, June 21, 1996).

With respect to the specific attainment planning requirements under subpart 4,⁵ when EPA evaluates a redesignation request under either subpart 1 and/or 4, any area that is attaining the PM_{2.5} standards is viewed as having satisfied the attainment planning requirements for these subparts. For redesignations, EPA has for many years interpreted attainment-linked requirements as not applicable for areas attaining the standard. In the General Preamble, EPA stated that, "The requirements for RFP will not apply in evaluating a request for redesignation to attainment since, at a minimum, the air

quality data for the area must show that the area has already attained. Showing that the State will make RFP towards attainment will, therefore, have no meaning at that point." *See* 57 FR 13564.

The General Preamble also explained that, "[t]he section 172(c)(9) requirements are directed at ensuring RFP and attainment by the applicable date. These requirements no longer apply when an area has attained the standard and is eligible for redesignation. Furthermore, section 175A for maintenance plans . . . provides specific requirements for contingency measures that effectively supersede the requirements of section 172(c)(9) for these areas." *Id.* EPA similarly stated in its 1992 Calcagni Memorandum that, "The requirements for reasonable further progress and other measures needed for attainment will not apply for redesignations because they only have meaning for areas not attaining the standard."

It is evident that even if we were to consider the Court's January 4, 2013 decision in *NRDC v. EPA* to mean that attainment-related requirements specific to subpart 4 should be imposed retroactively⁶ and, thus, are now past due, those requirements do not apply to an area that is attaining the 1997 annual and/or the 2006 24-hour PM_{2.5} NAAQS, for the purpose of evaluating a pending request to redesignate the area to attainment. EPA has consistently enunciated this interpretation of applicable requirements under section 107(d)(3)(E) since the General Preamble was published more than twenty years ago. Courts have recognized the scope of EPA's authority to interpret "applicable requirements" in the redesignation context. *See Sierra Club v. EPA*, 375 F.3d 537 (7th Cir. 2004).

Moreover, even outside the context of redesignations, EPA has viewed the obligations to submit attainment-related SIP planning requirements of subpart 4 as inapplicable for areas that EPA determines are attaining the 1997 annual and/or the 2006 24-hour PM_{2.5} standard. EPA's prior "Clean Data Policy" rulemakings for the PM₁₀ NAAQS, also governed by the requirements of subpart 4, explain EPA's reasoning. They describe the effects of a determination of attainment on the attainment-related SIP planning requirements of subpart 4. *See* "Determination of Attainment for Coso Junction Nonattainment Area," (75 FR

⁴ The potential effect of section 189(e) on section 189(a)(1)(A) for purposes of evaluating these redesignation requests is discussed in this rulemaking action.

⁵ I.e., attainment demonstration, RFP, RACM, milestone requirements, contingency measures.

⁶ As EPA has explained previously, we do not believe that the Court's January 4, 2013 decision should be interpreted so as to impose these requirements on the states retroactively. *Sierra Club v. Whitman*, *supra*.

³ PM₁₀ refers to particulates nominally 10 micrometers in diameter or smaller.

27944, May 19, 2010). *See also* Coso Junction Proposed PM₁₀ Redesignation, (75 FR 36023, 36027, June 24, 2010); Proposed and Final Determinations of Attainment for San Joaquin Nonattainment Area (71 FR 40952, 40954–55, July 19, 2006 and 71 FR 63641, 63643–47, October 30, 2006). In short, EPA in this context has also long concluded that to require states to meet superfluous SIP planning requirements is not necessary and not required by the CAA, so long as those areas continue to attain the relevant NAAQS.

Elsewhere in this notice, EPA proposes to determine that the Philadelphia Area has attained both the 1997 annual and 2006 24-hour PM_{2.5} NAAQS. Under its longstanding interpretation, EPA is proposing to determine here that the Delaware portion of the Area meets the attainment-related plan requirements of subparts 1 and 4 for both the 1997 annual and 2006 24-hour PM_{2.5} NAAQS. Thus, EPA is proposing to conclude that the requirements to submit an attainment demonstration under 189(a)(1)(B), a RACM determination under section 172(c)(1) and section 189(a)(1)(c), a RFP demonstration under 189(c)(1), and contingency measure requirements under section 172(c)(9) are satisfied for purposes of evaluating these redesignation requests.

c. Subpart 4 and Control of PM_{2.5} Precursors

The D.C. Circuit in *NRDC v. EPA* remanded to EPA the two rules at issue in the case with instructions to EPA to re-promulgate them consistent with the requirements of subpart 4. EPA in this section addresses the Court's opinion with respect to PM_{2.5} precursors. While past implementation of subpart 4 for PM₁₀ has allowed for control of PM₁₀ precursors such as NO_x from major stationary, mobile, and area sources in order to attain the standard as expeditiously as practicable, CAA section 189(e) specifically provides that control requirements for major stationary sources of direct PM₁₀ shall also apply to PM₁₀ precursors from those sources, except where EPA determines that major stationary sources of such precursors "do not contribute significantly to PM₁₀ levels which exceed the standard in the area."

EPA's 1997 PM_{2.5} implementation rule, remanded by the D.C. Circuit, contained rebuttable presumptions concerning certain PM_{2.5} precursors applicable to attainment plans and control measures related to those plans. Specifically, in 40 CFR 51.1002, EPA provided, among other things, that a state was "not required to address VOC

[and ammonia] as . . . PM_{2.5} attainment plan precursor[s] and to evaluate sources of VOC [and ammonia] emissions in the State for control measures." EPA intended these to be rebuttable presumptions. EPA established these presumptions at the time because of uncertainties regarding the emission inventories for these pollutants and the effectiveness of specific control measures in various regions of the country in reducing PM_{2.5} concentrations. EPA also left open the possibility for such regulation of VOC and ammonia in specific areas where that was necessary.

The Court in its January 4, 2013 decision made reference to both section 189(e) and 40 CFR 51.1002, and stated that, "In light of our disposition, we need not address the petitioners' challenge to the presumptions in [40 CFR 51.1002] that volatile organic compounds and ammonia are not PM_{2.5} precursors, as subpart 4 expressly governs precursor presumptions." *NRDC v. EPA*, at 27, n.10.

Elsewhere in the Court's opinion, however, the Court observed, "Ammonia is a precursor to fine particulate matter, making it a precursor to both PM_{2.5} and PM₁₀. For a PM₁₀ nonattainment area governed by subpart 4, a precursor is presumptively regulated. See 42 U.S.C. 7513a(e) [section 189(e)]." *Id.* at 21, n.7.

For a number of reasons, EPA believes that its proposed redesignation of the Delaware portion of the Philadelphia Area is consistent with the Court's decision on this aspect of subpart 4. First, while the Court, citing section 189(e), stated that "for a PM₁₀ area governed by subpart 4, a precursor is 'presumptively regulated,'" the Court expressly declined to decide the specific challenge to EPA's 1997 PM_{2.5} implementation rule provisions regarding ammonia and VOC as precursors. The Court had no occasion to reach whether and how it was substantively necessary to regulate any specific precursor in a particular PM_{2.5} nonattainment area, and did not address what might be necessary for purposes of acting upon a redesignation request.

However, even if EPA takes the view that the requirements of subpart 4 were deemed applicable at the time the state submitted the redesignation request, and disregards the implementation rule's rebuttable presumptions regarding ammonia and VOC as PM_{2.5} precursors, the regulatory consequence would be to consider the need for regulation of all precursors from any sources in the area to demonstrate attainment and to apply the section 189(e) provisions to major stationary sources of precursors. In the

case of the Delaware portion of the Philadelphia Area, EPA believes that doing so is consistent with proposing redesignation of the area for the 1997 annual and 2006 24-hour PM_{2.5} standard. The Philadelphia Area has attained the standard without any specific additional controls of VOC and ammonia emissions from any sources in the area.

Precursors in subpart 4 are specifically regulated under the provisions of section 189(e), which requires, with important exceptions, control requirements for major stationary sources of PM₁₀ precursors.⁷ Under subpart 1 and EPA's prior implementation rule, all major stationary sources of PM_{2.5} precursors were subject to regulation, with the exception of ammonia and VOC. Thus, EPA must address here whether additional controls of ammonia and VOC from major stationary sources are required under section 189(e) of subpart 4 in order to redesignate the area for the 1997 annual and 2006 24-hour PM_{2.5} standards. As explained further in this rulemaking action, EPA does not believe that any additional controls of ammonia and VOC are required in the context of this redesignation.

In the General Preamble, EPA discusses its approach to implementing section 189(e). *See* 57 FR 13538–13542. With regard to precursor regulation under section 189(e), the General Preamble explicitly stated that control of VOCs under other CAA requirements may suffice to relieve a state from the need to adopt precursor controls under section 189(e). *See* 57 FR 13542. In this proposed rulemaking action, EPA proposes to determine that the SIP has met the provisions of section 189(e) with respect to ammonia and VOCs as precursors. This proposed determination is based on EPA's findings that (1) the Delaware portion of the Philadelphia Area contains no major stationary sources of ammonia, and (2) existing major stationary sources of VOC are adequately controlled under other provisions of the CAA regulating the ozone NAAQS.⁸ In the alternative, EPA proposes to determine that, under the express exception provisions of section

⁷ Under either subpart 1 or subpart 4, for purposes of demonstrating attainment as expeditiously as practicable, a state is required to evaluate all economically and technologically feasible control measures for direct PM emissions and precursor emissions, and adopt those measures that are deemed reasonably available.

⁸ The Philadelphia Area has reduced VOC emissions through the implementation of various control programs including VOC Reasonably Available Control Technology regulations and various on-road and non-road motor vehicle control programs.

189(e), and in the context of the redesignation of the area, which is attaining the 1997 annual and 2006 24-hour PM_{2.5} standards, at present ammonia and VOC precursors from major stationary sources do not contribute significantly to levels exceeding the 1997 annual and 2006 24-hour PM_{2.5} standards in the Philadelphia Area. See 57 FR 13539–42.

EPA notes that its 1997 annual PM_{2.5} implementation rule provisions in 40 CFR 51.1002 were not directed at evaluation of PM_{2.5} precursors in the context of redesignation, but at SIP plans and control measures required to bring a nonattainment area into attainment of the 1997 PM_{2.5} NAAQS. By contrast, redesignation to attainment primarily requires the area to have already attained due to permanent and enforceable emission reductions, and to demonstrate that controls in place can continue to maintain the standard. Thus, even if we regard the Court's January 4, 2013 decision as calling for "presumptive regulation" of ammonia and VOC for PM_{2.5} under the attainment planning provisions of subpart 4, those provisions in and of themselves do not require additional controls of these precursors for an area that already qualifies for redesignation. Nor does EPA believe that requiring Delaware to address precursors differently than they have already would result in a substantively different outcome.

Although, as EPA has emphasized, its consideration here of precursor requirements under subpart 4 is in the context of a redesignation to attainment, EPA's existing interpretation of subpart 4 requirements with respect to precursors in attainment plans for PM₁₀ contemplates that states may develop attainment plans that regulate only those precursors that are necessary for purposes of attainment in the area in question, i.e., states may determine that only certain precursors need be regulated for attainment and control purposes.⁹ Courts have upheld this approach to the requirements of subpart 4 for PM₁₀.¹⁰ EPA believes that application of this approach to PM_{2.5} precursors under subpart 4 is reasonable. Because the Philadelphia Area has already attained the 1997 annual and 2006 24-hour PM_{2.5} NAAQS with its current approach to regulation of PM_{2.5} precursors, EPA believes that it is reasonable to conclude in the context of this redesignation that there is no need to revisit the attainment control

strategy with respect to the treatment of precursors. Even if the Court's decision is construed to impose an obligation, in evaluating this redesignation request, to consider additional precursors under subpart 4, it would not affect EPA's approval here of Delaware's request for redesignation of the Delaware portion of the Philadelphia Area. In the context of a redesignation, the Area has shown that it has attained the standard. Moreover, the State has shown and EPA has proposed to determine that attainment in this area is due to permanent and enforceable emissions reductions on all precursors necessary to provide for continued attainment. It follows logically that no further control of additional precursors is necessary. Accordingly, EPA does not view the January 4, 2013 decision of the Court as precluding redesignation of the Delaware portion of the Philadelphia Area to attainment for the 1997 annual and 2006 24-hour PM_{2.5} NAAQS at this time.

In sum, even if Delaware were required to address precursors for the Delaware portion of the Philadelphia Area under subpart 4 rather than under subpart 1, as interpreted in EPA's remanded PM_{2.5} implementation rule, EPA would still conclude that the area had met all applicable requirements for purposes of redesignation in accordance with section 107(d)(3)(E)(ii) and (v).

V. EPA's Analysis of Delaware's Submittals

EPA is proposing several rulemaking actions for the Area: (1) To redesignate the Delaware portion of the Area to attainment for both the 1997 annual and the 2006 24-hour PM_{2.5} NAAQS; and (2) to approve into the Delaware SIP the associated maintenance plans for both the 1997 annual and the 2006 24-hour PM_{2.5} NAAQS. EPA is also proposing in this rulemaking action to approve the 2007 comprehensive emissions inventory to satisfy section 172(c)(3) requirement for the 2006 24-hour PM_{2.5} NAAQS, which is one of the criteria for redesignation. EPA's proposed approvals of the redesignation requests and maintenance plans for the 1997 annual and 2006 24-hour PM_{2.5} NAAQS are based upon EPA's determination that the Area continues to attain both standards, which EPA is proposing in this rulemaking action, and that all other redesignation criteria have been met for the Delaware portion of the Area. The following is a description of

(approving a PM₁₀ attainment plan that impose controls on direct PM₁₀ and NO_x emissions and did not impose controls on SO₂, VOC, or ammonia emissions).

how the Delaware's December 12, 2012 submittals satisfy the requirements of section 107(d)(3)(E) of the CAA for the 1997 annual and 2006 24-hour PM_{2.5} standards.

A. Redesignation Requests

1. Attainment

On January 23, 2012, EPA published a direct final rulemaking (77 FR 3147) and companion notice of proposed rulemaking (NPR) (77 FR 3223), proposing to determine that the Philadelphia Area attained the 1997 PM_{2.5} NAAQS by its attainment date and that the Philadelphia Area continued to attain the 1997 annual PM_{2.5} standard. Because EPA received adverse comments, EPA withdrew the direct final rule on March 13, 2012 (77 FR 14697), and the direct final rule was converted to a proposed rule. In a final rulemaking action dated May 16, 2012 (77 FR 28782), EPA determined that the entire Philadelphia Area attained the 1997 annual PM_{2.5} NAAQS by its applicable attainment date, based upon quality-assured and certified ambient air quality monitoring data for the period of 2007–2009, and continued to attain that standard based upon quality-assured and certified ambient air quality monitoring data for the period of 2008–2010. In a separate rulemaking action dated January 7, 2013 (78 FR 882), EPA also determined that the Philadelphia Area has attained the 2006 24-hour PM_{2.5} standard, based on quality-assured and certified ambient air quality monitoring data for 2008–2010 and 2009–2011. The basis and effect of these determinations of attainment for both the 1997 and 2006 PM_{2.5} NAAQS were discussed in the notices of the proposed (77 FR 3147 and 77 FR 60089, respectively) and final (77 FR 28782 and 78 FR 882, respectively) rulemakings.

EPA has reviewed the ambient air quality PM_{2.5} monitoring data in the Philadelphia Area, consistent with the requirements contained at 40 CFR part 50, and recorded in EPA's Air Quality System (AQS), including quality-assured, quality-controlled, and state-certified data for the monitoring periods 2009–2011 and 2010–2012 and preliminary data for 2011–2013. The air quality data show that the Philadelphia Area continues to attain both the 1997 annual and 2006 24-hour PM_{2.5} NAAQS. The Area's annual and 24-hour PM_{2.5} design values¹¹ are provided in Tables 1 and 2, respectively.

¹⁰ See, e.g., *Assoc. of Irrigated Residents v. EPA et al.*, 423 F.3d 989 (9th Cir. 2005).

	Philadelphia	29	28	29
Area's Annual Design Value		33	31	29

Source: EPA AQS.

EPA's review of the monitoring data for 2009–2011, 2010–2012 supports EPA's previous determinations that the Area has attained the 1997 annual and 2006 24-hour PM_{2.5} NAAQS, and that the Area continues to attain both standards. Preliminary 2013 data is consistent with attainment. Please note that preliminary 2013 data is uncertified. States are required to certify 2013 data by May 1, 2014. In addition, as discussed subsequently, with respect to the maintenance plan, Delaware has committed to continue monitoring ambient PM_{2.5} concentrations in accordance with 40 CFR part 58. Thus, EPA is proposing to determine that the Philadelphia Area continues to attain the 1997 annual and 2006 24-hour PM_{2.5} NAAQS.

2. The Area has Met All Applicable Requirements Under Section 110 and Subpart 1 of the CAA and Has a Fully Approved SIP Under Section 110(k)

In accordance with section 107(d)(3)(E)(v), the SIP revisions for the 1997 annual and 2006 24-hour PM_{2.5} standards for the Delaware portion of the Philadelphia Area must be fully approved under section 110(k) and all the requirements applicable to the Area under section 110 of the CAA (general SIP requirements) and part D of Title I of the CAA (SIP requirements for nonattainment areas) must be met.

a. Section 110 General SIP Requirements

Section 110(a)(2) of Title I of the CAA delineates the general requirements for a SIP, which include enforceable emissions limitations and other control measures, means, or techniques, provisions for the establishment and

operation of appropriate devices necessary to collect data on ambient air quality, and programs to enforce the limitations. The general SIP elements and requirements set forth in section 110(a)(2) include, but are not limited to the following:

- Submittal of a SIP that has been adopted by the state after reasonable public notice and hearing;
- Provisions for establishment and operation of appropriate procedures needed to monitor ambient air quality;
- Implementation of a source permit program; provisions for the implementation of Part C requirements (PSD);
- Provisions for the implementation of Part D requirements for NSR permit programs;
- Provisions for air pollution modeling; and
- Provisions for public and local agency participation in planning and emission control rule development.

Section 110(a)(2)(D) of the CAA requires that SIPs contain certain measures to prevent sources in a state from significantly contributing to air quality problems in another state. To implement this provision for various NAAQS, EPA has required certain states to establish programs to address transport of air pollutants in accordance with EPA's Finding of Significant Contribution and Rulemaking for Certain States in the Ozone Transport Assessment Group Region for Purposes of Reducing Regional Transport of Ozone (63 FR 57356, October 27, 1998), also known as the NO_x (oxides of nitrogen) SIP Call; amendments to the NO_x SIP Call (64 FR 26298, May 14, 1999 and 65 FR 11222, March 2, 2000), and CAIR (70 FR 25162, May 12, 2005). However, section 110(a)(2)(D) requirements for a state are not linked with a particular nonattainment area's designation and classification in that state. EPA believes that the requirements linked with a particular nonattainment area's designation and classifications are the relevant measures to evaluate in reviewing a redesignation request. The transport SIP submittal requirements, where applicable, continue to apply to a state regardless of the designation of any one particular area in the state. Thus, EPA does not believe that these requirements are applicable requirements for purposes of redesignation.

In addition, EPA believes that the other section 110(a)(2) elements not connected with nonattainment plan submissions and not linked with an area's attainment status are not applicable requirements for purposes of redesignation. The Philadelphia Area will still be subject to these requirements after it is redesignated. EPA concludes that the section 110(a)(2) and part D requirements which are linked with a particular area's designation and classification are the relevant measures to evaluate in reviewing a redesignation request, and that section 110(a)(2) elements not linked to the area's nonattainment status are not applicable for purposes of redesignation. This approach is consistent with EPA's existing policy on applicability of conformity (i.e., for redesignations) and oxygenated fuels requirement. See Reading, Pennsylvania, proposed and final rulemakings (61 FR 53174, October 10, 1996), (62 FR 24826, May 7, 1997); Cleveland-Akron-Lorain, Ohio final rulemaking (61 FR 20458, May 7, 1996); and Tampa, Florida, final rulemaking (60 FR 62748, December 7, 1995). See also, the discussion on this issue in the

Cincinnati, Ohio redesignation (65 FR at 37890, June 19, 2000), and in the Pittsburgh-Beaver Valley, Pennsylvania redesignation (66 FR at 53099, October 19, 2001).

EPA has reviewed the Delaware SIP and has concluded that it meets the general SIP requirements under section 110(a)(2) of the CAA to the extent they are applicable for purposes of redesignation. EPA has previously approved provisions of Delaware's SIP addressing section 110(a)(2) requirements, including provisions addressing PM_{2.5}. See (76 FR 47068, August 4, 2011 and 76 FR 53638, August 29, 2011). These requirements are, however, statewide requirements that are not linked to the PM_{2.5} nonattainment status of the Philadelphia Area. Therefore, EPA believes that these SIP elements are not applicable requirements for purposes of review of the State's PM_{2.5} redesignation requests.

b. Subpart 4 Requirements

Subpart 1 sets forth the basic nonattainment plan requirements applicable to PM_{2.5} nonattainment areas. Under section 172, states with nonattainment areas must submit plans providing for timely attainment and must meet a variety of other requirements.

The General Preamble for Implementation of Title I discusses the evaluation of these requirements in the context of EPA's consideration of a redesignation request. The General Preamble sets forth EPA's view of applicable requirements for purposes of evaluating redesignation requests when an area is attaining the standard. See 57 FR 13498, April 16, 1992.

As mentioned previously, on May 16, 2012 (77 FR 28782), EPA made a determination that the Philadelphia Area had attained the 1997 annual PM_{2.5} NAAQS. This determination of attainment was based upon quality-assured and certified ambient air quality monitoring data for the period of 2007–2009 showing that the entire Area had attained the standard by its applicable attainment date, and 2008–2010 data showing that the Area continued to attain the standard. In a separate rulemaking action, dated January 7, 2013 (78 FR 882), EPA made a determination of attainment for the Philadelphia Area for the 2006 24-hour PM_{2.5} NAAQS, based on quality-assured and certified ambient air quality monitoring data for the 2008–2010 and 2009–2011 monitoring periods.

Pursuant to 40 CFR 51.2004(c), upon these determinations by EPA that the Area has attained the 1997 annual and

2006 24-hour PM_{2.5} NAAQS, the requirement for Delaware to submit for the Philadelphia Area an attainment demonstration and associated RACM, a RFP plan, contingency measures, and other planning SIPs related to the attainment of the 1997 annual and the 2006 24-hour PM_{2.5} NAAQS were suspended until the Area is redesignated to attainment for each standard or EPA determines that the Area has again violated any of the standards, at which time such plans are required to be submitted. Thus, because attainment has been reached for the Area for the 1997 annual and 2006 24-hour PM_{2.5} NAAQS and the Area continues to attain both standards, no additional measures are needed to provide for attainment. Therefore, the requirements of section 172(c)(1), 172(c)(2), 172(c)(6), and 172(c)(9) are no longer considered to be applicable for purposes of redesignation of the Area for both standards.

However, determinations of attainment do not preclude states from submitting and EPA from approving planning SIP revisions for the 1997 or 2006 PM_{2.5} NAAQS. On April 3, 2008, DNREC submitted an attainment plan for the Delaware portion of the Philadelphia Area for the 1997 annual PM_{2.5} NAAQS, which included a 2002 comprehensive emissions inventory. On April 25, 2012, DNREC submitted a SIP revision to replace the MVEBs in the April 3, 2008 submittal with a budget that is based on the Motor Vehicle Emissions Simulator (MOVES) model. On December 17, 2013 (78 FR 76209), EPA approved Delaware's attainment plan for the 1997 PM_{2.5} NAAQS for the Delaware portion of the Philadelphia Area and MVEBs for transportation conformity purposes for New Castle County, Delaware submitted on April 3, 2008 and April 25, 2012.

Section 172(c)(4) of the CAA requires the identification and quantification of allowable emissions for major new and modified stationary sources in an area, and section 172(c)(5) requires source permits for the construction and operation of new and modified major stationary sources anywhere in the nonattainment area. EPA has determined that, since PSD requirements will apply after redesignation, areas being redesignated need not comply with the requirement that a nonattainment NSR program be approved prior to redesignation, provided that the area demonstrates maintenance of the NAAQS without part D NSR. A more detailed rationale for this view is described in a memorandum from Mary Nichols, Assistant Administrator for Air and

Radiation, dated October 14, 1994, entitled, "Part D New Source Review Requirements for Areas Requesting Redesignation to Attainment." Nevertheless, Delaware currently has an approved NSR program, including an approved PSD program, codified in the State's regulation at 7 DE Admin. Code 1125, "Requirements for Preconstruction Review." See (77 FR 60053, October 2, 2012) and (78 FR 13496, February 28, 2013). The State's PSD program for PM_{2.5} will become effective in the Philadelphia Area upon redesignation to attainment.

Section 172(c)(7) of the CAA requires the SIP to meet the applicable provisions of section 110(a)(2). As noted previously, we believe the Delaware SIP meets the requirements of section 110(a)(2) that are applicable for purposes of redesignation.

As a result of EPA's determinations of attainment of the Area for the 1997 annual and 2006 24-hour PM_{2.5} NAAQS, respectively, the only remaining requirement under section 172 to be considered for each of the PM_{2.5} standards is the comprehensive emissions inventory required under section 172(c)(3). Section 172(c)(3) of the CAA requires submission of a comprehensive, accurate, and current inventory of actual emissions. For purposes of the PM_{2.5} NAAQS, this emissions inventory should address not only direct emissions of PM_{2.5}, but also emissions of all precursors with the potential to participate in PM_{2.5} formation, i.e., sulfur dioxide (SO₂), NO_x, volatile organic compounds (VOC) and ammonia.

DNREC's April 3, 2008 attainment plan submittal for the 1997 annual PM_{2.5} standard is relevant to this proposed rulemaking action to redesignate the Delaware portion of the Area only with

respect to the comprehensive emissions inventory requirement of section 172(c)(3) for the 1997 annual PM_{2.5} standard. On March 4, 2013 (78 FR 14020), EPA approved the 2002 comprehensive emissions inventory included in the attainment plan for the 1997 annual PM_{2.5} NAAQS, to meet the requirement of section 172(c)(3) for this standard. The 2002 comprehensive emissions inventory for the 1997 annual PM_{2.5} standard includes emissions estimates that cover the general source categories of point sources, area sources, on-road mobile sources, and non-road mobile sources. The pollutants that comprise the 2002 emissions inventory are PM_{2.5}, NO_x, SO₂, VOC, and ammonia. An evaluation of Delaware's 2002 comprehensive emissions inventory for the Philadelphia portion of the Area is provided in the Technical Support Document (TSD) prepared by EPA for the rulemaking action. See Docket ID No. EPA-R03-OAR-2010-0141.

To satisfy the 172(c)(3) requirement for the 2006 24-hour PM_{2.5} standard, Delaware's December 12, 2012 redesignation request and maintenance plan for the 2006 24-hour PM_{2.5} standard contains a 2007 comprehensive emissions inventories. DNREC had previously prepared the 2007 inventory for the Delaware portion of the Philadelphia Area for modeling and SIP purposes. DNREC is using that 2007 inventory as the base year inventory for the 2006 24-hour PM_{2.5} standard, because 2007 is one of the three years used to designate the Philadelphia nonattainment area for the 2006 24-hour PM_{2.5} standard. DNREC has submitted that 2007 emissions inventory to fulfill its obligation to submit a comprehensive inventory under Clean Air Act section 172(c)(3),

because that inventory has gone through extensive quality assurance. The 2007 emissions inventory is the most current accurate and comprehensive emissions inventory of direct PM_{2.5}, NO_x, SO₂, VOC, and ammonia for the Area. Thus, as part of this rulemaking action, EPA is proposing to approve Delaware's 2007 comprehensive emissions inventory for the 2006 24-hour PM_{2.5} NAAQS as satisfying the requirement of section 172(c)(3) of the CAA for this standard. Final approval of the 2007 base year emissions inventory will satisfy the emissions inventory requirement under section 172(c)(3) of the CAA for the 2006 24-hour PM_{2.5} NAAQS.

The 2007 comprehensive emissions inventory addresses the general source categories of point sources, area sources, on-road mobile sources, and non-road mobile sources. A summary of the 2007 comprehensive emissions inventory is provided in Table 3. EPA has reviewed the documentation provided by DNREC and found the 2007 emissions inventory to be approvable. For more information on EPA's analysis of the 2007 emissions inventory, see the TSDs prepared by the EPA Region III Office of Air Monitoring and Analysis and both dated January 28, 2014, "Technical Support Document (TSD) for the Redesignation Request and Maintenance Plan for the New Castle County Portion of the Philadelphia-Wilmington, PA-NJ-DE 1997 PM_{2.5} Nonattainment Area" and "Technical Support Document (TSD) for the Redesignation Request and Maintenance Plan for the New Castle County Portion of the Philadelphia-Wilmington, PA-NJ-DE 2006 PM_{2.5} Nonattainment Area" ("Inventory TSDs"), available in the docket for this rulemaking action at www.regulations.gov. See Docket ID No. EPA-R03-OAR-2014-0022.

TABLE 3—SUMMARY OF 2007 COMPREHENSIVE INVENTORY FOR NEW CASTLE COUNTY, IN TONS PER YEAR (TPY)

Sector	Direct PM _{2.5}	NO _x	SO ₂	VOC	Ammonia
Point	1,335	6,635	13,380	1,727	64
Non-point	1,207	1,293	630	4,795	653
On-road	324	10,577	100	4,298	243
Non-road	327	4,580	1,118	2,490	2
Total	3,193	23,084	15,228	13,310	962

Section 175A requires a state seeking redesignation to attainment to submit a SIP revision to provide for the maintenance of the NAAQS in the area "for at least 10 years after the redesignation." In conjunction with its request to redesignate the Delaware portion of the Area to attainment status,

Delaware submitted SIP revisions to provide for maintenance of the 1997 annual and 2006 24-hour PM_{2.5} NAAQS in the Delaware portion of the Area for at least 10 years after redesignation, throughout 2025. Delaware is requesting that EPA approve this SIP revision as meeting the requirement of CAA section

175A. Once approved, the maintenance plans for the Delaware portion of the Area will ensure that the SIP for Delaware meets the requirements of the CAA regarding maintenance of the 1997 annual and 2006 24-hour PM_{2.5} NAAQS for the Delaware portion of the Area. EPA's analysis of the maintenance plans

is provided in section V.B. of this rulemaking action.

Section 176(c) of the CAA requires states to establish criteria and procedures to ensure that Federally supported or funded projects conform to the air quality planning goals in the applicable SIP. The requirement to determine conformity applies to transportation plans, programs, and projects that are developed, funded or approved under title 23 of the United States Code (U.S.C.) and the Federal Transit Act (transportation conformity) as well as to all other Federally supported or funded projects (general conformity). State transportation conformity SIP revisions must be consistent with Federal conformity regulations relating to consultation, enforcement and enforceability which EPA promulgated pursuant to its authority under the CAA. EPA interprets the conformity SIP requirements as not applying for purposes of evaluating a redesignation request under CAA section 107(d) because state conformity rules are still required after redesignation, and Federal conformity rules apply where state rules have not been approved. See *Wall v. EPA*, 265 F. 3d 426 (6th Cir. 2001) (upholding this interpretation) and (60 FR 62748, December 7, 1995) (discussing Tampa, Florida).

Thus, for purposes of redesignating to attainment the Delaware portion of the Philadelphia Area for the 1997 annual

PM_{2.5} NAAQS, EPA determines that Delaware has met all the applicable SIP requirements under part D of Title I of the CAA. EPA also determines that upon final approval of the 2007 comprehensive emissions inventory as proposed in this rulemaking action, Delaware will also meet all the applicable SIP requirements under part D of Title I of the CAA for purposes of redesignating the Area to attainment for the 2006 24-hour PM_{2.5} NAAQS.

c. The Delaware Portion of the Area Has a Fully Approved Applicable SIP Under Section 110(k) of the CAA

For purposes of redesignation to attainment for the 1997 annual PM_{2.5} NAAQS, EPA has fully approved all applicable requirements of Delaware's SIP for the Area in accordance with section 110(k) of the CAA. Upon final approval of the 2007 comprehensive emissions inventory as proposed in this rulemaking action, EPA will have fully approved all applicable requirements of Delaware's SIP for the Area for purposes of redesignation to attainment for the 2006 24-hour PM_{2.5} NAAQS in accordance with section 110(k) of the CAA.

3. Permanent and Enforceable Reductions in Emissions

For redesignating a nonattainment area to attainment, section 107(d)(3)(E)(iii) requires EPA to determine that the air quality

improvement in the area is due to permanent and enforceable reductions in emissions resulting from implementation of the SIP and applicable Federal air pollution control regulations and other permanent and enforceable reductions. Delaware has calculated the change in emissions between 2002, a year showing nonattainment for the 1997 annual PM_{2.5} standard in the Delaware portion of the Philadelphia Area, and 2007, one of the years for which the Philadelphia Area monitored attainment for the 1997 annual PM_{2.5} standard. Delaware did the same analysis for the 2006 24-hour PM_{2.5} standard, using 2007 as a year showing nonattainment for the 2006 24-hour PM_{2.5} standard in the Delaware portion of the Philadelphia Area, and 2008, one of the years for which the Philadelphia Area monitored attainment for the 2006 24-hour PM_{2.5} standard.

A summary of the emissions reductions of direct PM_{2.5}, NO_x, and SO₂ from 2002 to 2007 in the Delaware portion of the Philadelphia Area, submitted by DNREC, is provided in Table 4a. A summary of the emissions reductions of direct PM_{2.5}, NO_x, and SO₂ from 2007 to 2008, submitted by DNREC, is provided in Table 4b. For more information on EPA's analysis of the 2007 and 2008 emissions inventories, see EPA's Inventory TSDs, dated January 28, 2014, available in the docket for this rulemaking action at www.regulations.gov.

The reduction in emissions and the corresponding improvement in air quality from 2002 to 2007 and from 2007 to 2008, for the 1997 annual and 2006 24-hour PM_{2.5} NAAQS, respectively, in the Philadelphia Area can be attributed to a number of regulatory control measures that have been implemented in the Area and contributing areas in recent years.

In Sections 4.3, Enforceable and Permanent PM_{2.5}, NO_x, and SO₂ Measures that Contributed to Improved Air Quality, of Delaware's redesignation requests and maintenance plans for both the 1997 annual and 2006 24-hour PM_{2.5}, DNREC makes demonstrations that numerous permanent and enforceable state and federal control measures achieved emission reductions that resulted in improved air quality in the Philadelphia Area. The following is a list of the permanent and enforceable control measures.

a. Delaware-Specific Control Measures

- 7 DE Admin. Code 1144, *Control of Stationary Generator Emissions*. This statewide regulation controls SO₂, PM, VOC, and NO_x emissions. The regulation was effective in January 2006, and was approved into Delaware's SIP on August 11, 2010 (75 FR 48566).

- 7 DE Admin. Code 1148, *Control of Stationary Combustion Turbine Electric Generating Unit Emissions*. This statewide regulation controls NO_x emissions, and was effective in July 2007. EPA approved this regulation into the Delaware SIP on August 11, 2010 (75 FR 48566).

- 7 DE Admin. Code 1142. EPA approved this rule, which controls NO_x emissions, into the Delaware SIP on November 22, 2002 (67 FR 70315). Section 1 of this rule, Control of NO_x

Emissions from Industrial Boilers, is applicable state-wide, and was effective in December 2001. Section 2, Control of NO_x Emissions from Industrial Boilers and Process Heaters at Petroleum Refineries, is applicable in New Castle County. DNREC revised Section 2, effective July 2007. EPA approved the revisions to Section 2 into the Delaware SIP on May 15, 2012 (77 FR 28489).

- 7 DE Admin. Code 1131, *Low Enhanced Inspection and Maintenance (I/M)*. Delaware's enhanced I/M program is applicable in New Castle and Kent Counties, and was approved into the Delaware SIP by EPA on September 30, 1999 (64 FR 52657). Revisions to the enhanced I/M program were approved by EPA on November 26, 2003 (68 FR 228).

Please note that for Delaware's redesignation request for the 1997 annual PM_{2.5} NAAQS, the following additional control measure was also included.

Delaware-Specific Control Measures

- *Consent Decree with Premcor Refinery at Delaware City (formerly Motiva Enterprises), New Castle County, Control of SO₂, and NO_x Emissions from Boilers and Heaters, Effective 2006*, Civil Action No. H-01-0978. This federal consent decree was lodged in the United States Court for the Southern District of Texas on March 21, 2001.

b. Federal Measures Implemented

- EPA's New Source Performance Standards for Woodstoves (NSPS), 40 CFR part 60, subpart AAA.
- Control of Emissions from New and In-Use non-road Compression Engines, 40 CFR part 89.
- Control of Air Pollution; Determination of Significance for Non-

road Sources and Emission Standards for New Non-road Compression Ignition Engines at or Above 37 Kilowatts (59 FR 31036, June 17, 1994).

- Emissions from New Non-road Spark-Ignition Engines At or Below 19 Kilowatts (60 FR 34581, July 3, 1995).

- Final Rule for New Gasoline Spark-Ignition Marine Engines; Exemptions for New Non-road Compression-Ignition Engines at or Above 37 Kilowatts and New Non-road Spark-Ignition Engines at or Below 19 Kilowatts (61 FR 52088, October 4, 1996).

- Control of Emissions of Air Pollution from Non-road Diesel Engines (63 FR 56967, October 23, 1998).

- Phase 2 Emission Standards for New Non-road Non-handheld Spark Ignition Engines At or Below 19 Kilowatts (64 FR 15207, March 30, 1999).

- Phase 2 Emission Standards for New Non-road Spark-Ignition Handheld Engines At or Below 19 Kilowatts and Minor Amendments to Emission Requirements Applicable to Small Spark-Ignition Engines and Marine Spark-Ignition Engines (65 FR 24268, April 25, 2000).

- Control of Emissions from Non-road Large Spark-Ignition Engines and Recreational Engines (Marine and Land-Based), (67 FR 68241, November 8, 2002).

- Control of Emissions of Air Pollution from Non-road Diesel Engines and Fuel (Clean Air Non-road Diesel Rule—Tier 4), (69 FR 38958, June 29, 2004).

- Control of Emissions from Non-road Spark-Ignition Engines and Equipment (Bond Rule), (73 FR 59034, October 8, 2008).

- Heavy-Duty Highway Rule, 40 CFR part 86, Subpart P.

- Federal Tier 1 New Vehicle Emission and New Federal Evaporative Emission Standards.
- The Tier 2 vehicle and gasoline sulfur program, Subpart H of 40 CFR part 80, 40 CFR part 85, and 40 CFR part 86.
- Ozone Transport Commission (OTC) National Low Emission Vehicle Program (NLEV).

EPA has reviewed both redesignation requests and maintenance plans for the 1997 annual and 2006 24-hour PM_{2.5} standards and found that DNREC has demonstrated that it has controlled emissions of PM_{2.5} and its precursors through numerous permanent and enforceable emission control measures, resulting in permanent and enforceable emission reductions adequate to attain both the 1997 annual and 2006 24-hour PM_{2.5} NAAQS. Therefore, DNREC has met this criterion for redesignation. However, in a separate rulemaking action, published on February 22, 2013, EPA identified deficiencies associated with several regulations within the approved Delaware SIP including a specific provision within 7–1100–1142 Del. Code Regs § 2 (Regulation 1142, Section 2.0, Control of Nitrogen Oxide (NO_x) Emissions from Industrial Boilers and Process Heaters at Petroleum Refineries). See 78 FR 12460. In that proposed rulemaking action, EPA identified specific Delaware regulations in which state officials are provided unbounded discretion to set alternative emission limits during periods of start-up and shutdown of equipment through a permitting process that does not entail subsequent approval of the alternative emission limits through a SIP submission. EPA has proposed to find that this process constitutes an impermissible director's discretion provision with the potential to allow impermissible discretionary exemptions from SIP emission limits. See 78 FR 12495–12496. EPA will be taking a separate final action on the February 22, 2013 proposed rulemaking action.

EPA's analysis indicates that Regulation 1142, Section 2.0 is not necessary for attainment of the Philadelphia Area. The Philadelphia Area is attaining the 1997 annual and 2006 24-hour PM_{2.5} NAAQS. The Philadelphia Area came into attainment of the 1997 annual NAAQS in 2009, considering 2007–2009 ambient air quality monitoring data (77 FR 28782), and continues to meet that standard. The Philadelphia Area came into attainment for the 2006 24-hour standard in 2010, considering 2008–2010 data (78 FR 882), and continues to meet that standard. Furthermore, actual emission reductions of PM_{2.5} and its

precursors have been achieved between the base years and the attainment years for both standards. For the 1997 NAAQS, NO_x has decreased in the Delaware portion of the Philadelphia Area from 30,748 tpy in 2002 to 23,084 tpy in 2007. For the 2006 NAAQS, NO_x has decreased in the Delaware portion of the Philadelphia Area from 23,084 tpy in 2007 to 20,504 tpy in 2008.

Regulation 1142 Section 2.0 applies to NO_x emissions at petroleum refineries. There is only one such petroleum refinery in Delaware, and it is subject to a federally-enforceable consent decree and several consent decree addendums between the source and EPA which limit NO_x emissions and require NO_x control measures at several units at the refinery. Therefore, EPA is not relying upon Regulation 1142 Section 2.0 in its evaluation of the permanent and enforceable attainment measures. Through numerous permanent and enforceable regulations, which are incorporated into Delaware's SIP, Delaware has regulated and is continuing to regulate sources of PM_{2.5} and its precursors in the Philadelphia Area. Taking into consideration existing regulations, including those listed earlier in this rulemaking action, which Delaware included in Sections 4.3 of its redesignation requests and maintenance plans, (with the exception of Regulation 1142 Section 2.0), EPA has concluded that the Philadelphia Area has attained the 1997 and 2006 PM_{2.5} NAAQS and that Delaware has shown that attainment of these standards is due to permanent and enforceable emission reductions.

For more information on EPA's analysis, please refer to EPA's TSD, available in the docket for this rulemaking action at www.regulations.gov. See Docket ID No. EPA–R03–OAR–2014–0022.

B. Maintenance Plans

On December 12, 2012, DNREC submitted maintenance plans for the 1997 annual and 2006 24-hour PM_{2.5} NAAQS, as required by section 175A of the CAA. EPA's analysis for proposing approval of the maintenance plans is provided in this section.

1. Attainment Emissions Inventories

An attainment inventory is comprised of the emissions during the time period associated with the monitoring data showing attainment. DNREC determined that the appropriate attainment inventory year for the maintenance plan for the 1997 annual PM_{2.5} NAAQS is 2007, one of the years in the periods during which the Philadelphia Area monitored attainment of the 1997

annual PM_{2.5} NAAQS. DNREC determined that the appropriate attainment inventory year for the maintenance plan for the 2006 24-hour PM_{2.5} NAAQS is 2008, one of the years in the periods during which the Philadelphia Area monitored attainment of the 24-hour PM_{2.5} NAAQS. The 2007 and 2008 inventory included in the maintenance plans contains primary PM_{2.5} emissions (including condensables), SO₂, and NO_x. The underlying emissions data DNREC submitted to support the 2007 and 2008 inventories contains the additional PM_{2.5} precursors, ammonia and VOCs.

In its redesignation requests and maintenance plans for the 1997 annual and 2006 24-hour PM_{2.5} standards, DNREC described the methods used for developing its 2007 and 2008 inventories. EPA reviewed the procedures used to develop the projected inventories and found them to be reasonable. EPA has reviewed the documentation provided by DNREC and found the 2007 and 2008 emissions inventories submitted with the maintenance plans to be approvable. For more information on EPA's analysis of the 2007 and 2008 emissions inventories, see EPA's Inventory TSDs, dated January 28, 2014, available in the docket for this rulemaking action at www.regulations.gov.

2. Maintenance Demonstration

Section 175A requires a state seeking redesignation to attainment to submit a SIP revision to provide for the maintenance of the NAAQS in the area “for at least 10 years after the redesignation.” EPA has interpreted this as a showing of maintenance “for a period of ten years following redesignation.” Where the emissions inventory method of showing maintenance is used, its purpose is to show that emissions during the maintenance period will not increase over the attainment year inventory. See 1992 Calcagni Memorandum, pages 9–10.

For a demonstration of maintenance, emissions inventories are required to be projected to future dates to assess the influence of future growth and controls; however, the demonstration need not be based on modeling. See *Wall v. EPA*, *supra*; *Sierra Club v. EPA*, *supra*. See also 66 FR 53099–53100 and 68 FR 25430–32. DNREC uses projection inventories to show that the Delaware portion of the Area will remain in attainment and developed projection inventories for an interim year of 2017 and a maintenance plan end year of 2025 to show that future emissions of NO_x, SO₂, and direct PM_{2.5} will remain

at or below the attainment year 2007 and 2008 attainment-level emissions levels, for the 1997 annual and 2006 24-hour PM_{2.5}, respectively, throughout the Delaware portion of the Area through the year 2025.

EPA has reviewed the documentation provided by DNREC for developing annual 2017 and 2025 emissions inventories for the Delaware portion of the Area. EPA has determined that the 2017 and 2025 projected emissions inventories provided by DNREC are approvable. For more information on EPA's analysis of the emissions inventories, see EPA's Inventory TSDs, dated January 28, 2014, available in the docket for this rulemaking action at www.regulations.gov.

Tables 5a, 6a, and 7a provide a summary of the direct PM_{2.5}, NO_x, and SO₂, respectively, emissions inventories for the Delaware portion of the Philadelphia Area for the 2007 attainment year, the 2017 interim year, and the 2025 maintenance plan end year for the 1997 annual PM_{2.5} NAAQS.

Tables 5b, 6b, and 7b provide a summary of the direct PM_{2.5}, NO_x, and SO₂, respectively, emissions inventories for the entire Philadelphia Area for the 2007 attainment year, the 2017 interim year, and the 2025 maintenance plan end year for the 1997 annual PM_{2.5} NAAQS. The inventories show that, between 2007 and 2025, the Area is projected to reduce direct PM_{2.5} emissions by 9,055 tpy, NO_x emissions

by 106,099 tpy, and SO₂ emissions by 34,265 tpy. Thus, the projected emissions inventories show that the Delaware portion of the Philadelphia Area will continue to maintain the 1997 annual PM_{2.5} standards during the maintenance period. Note that the emission projections for the Delaware portion of the Area contain subcategories for point source and non-road emissions sources. "Non-road, MAR" refers to Marine Vessels, Aircraft and Locomotives (MAR). "Non-road, NMIM" refers to emissions sources covered by the National Mobile Inventory Model (NMIM). Point source emissions are reported as either from electric generating units (EGUs) or from non-EGU point sources.

TABLE 5a—COMPARISON OF 2007, 2017, AND 2025 EMISSIONS OF DIRECT PM_{2.5} FOR THE DELAWARE PORTION OF THE PHILADELPHIA AREA

Tables 8a, 9a, and 10a provide a summary of the direct PM_{2.5}, NO_x, and

SO₂, respectively, emissions inventories for the Delaware portion of the

Philadelphia Area for the 2008 attainment year, the 2017 interim year,

and the 2025 maintenance plan end year for the 2006 24-hour PM_{2.5} NAAQS. Tables 8b, 9b, and 10b provide a summary of the direct PM_{2.5}, NO_x, and SO₂, respectively, emissions inventories for the entire Philadelphia Area for the 2007 attainment year, the 2017 interim

year, and the 2025 maintenance plan end year for the 2006 24-hour PM_{2.5} NAAQS. The inventories show that, between 2008 and 2025, the Area is projected to reduce direct PM_{2.5} emissions by 6,287 tpy, NO_x emissions by 73,606 tpy, and SO₂ emissions by

29,990 tpy. Thus, the projected emissions inventories show that the Delaware portion of the Philadelphia Area will continue to maintain the 2006 24-hour PM_{2.5} standards during the maintenance period.

Sections 8.2.3, Control Measures for Maintenance of Good Air Quality, in Delaware’s maintenance plans and redesignation requests for both the 1997 annual and 2006 24-hour PM_{2.5} standards, summarize emission

reductions between the attainment years and the maintenance plan end years, i.e. between 2007 or 2008 and 2025 in the Delaware portion of the Area. The emissions reductions data included in Tables 8–6 of Sections 8.2.3 of

Delaware’s redesignations requests and maintenance plans for the 1997 annual and 2006 24-hour PM_{2.5} NAAQS are summarized in Tables 11a and 11b, for the 1997 annual and 2006 24-hour NAAQS, respectively.

Delaware included Regulation 1142, Section 2.0, Control of Nitrogen Oxide (NO_x) Emissions from Industrial Boilers and Process Heaters at Petroleum Refineries, in that list. However, as explained above, Regulation 1142, Section 2.0 is the subject of a separate proposed rulemaking action, published

on February 22, 2013 (78 FR 12460). Therefore, EPA has conducted an analysis to determine if the area can demonstrate maintenance without emission reductions from that regulation.

Delaware has determined that Regulation 1142, Section 2.0, also

known as the Delaware City Refinery NO_x Cap, achieves 1,157.26 tons of NO_x reductions between 2007 and 2025, and 874.7 tons of NO_x reductions between 2008 and 2025. (See Tables 8–6 of Delaware's redesignation requests for the 1997 annual and 2006 24-hour PM_{2.5} NAAQS, respectively.)

TABLE 12—MAINTENANCE DEMONSTRATION, NOT CONSIDERING EMISSION REDUCTIONS FROM DELAWARE REGULATION 1142

1997 annual PM _{2.5} NAAQS NO _x (tons)		2006 24-hour PM _{2.5} NAAQS NO _x (tons)	
2025 Maintenance Year	81,868	2025 Maintenance Year	73,640
Plus Reductions from Regulation 1142, Section 2	1,157.26	Plus Reductions from Regulation 1142, Section 2	874.7
Adjusted 2025	83,025	Adjusted 2025	74,515
2007 Attainment Year	187,967	2008 Attainment Year	147,247

In both cases, the adjusted 2025 NO_x emissions are well below the attainment year emissions. Therefore, Regulation 1142, Section 2 is not needed for maintenance of either the 1997 annual or 2006 24-hour PM_{2.5} NAAQS. Therefore, EPA is not relying upon Regulation 1142, Section 2.0 in its evaluation of Delaware’s maintenance plans for the 1997 annual or 2006 24-hour PM_{2.5} NAAQS.

3. Monitoring Network

There are four PM_{2.5} monitors in the Delaware portion of the Philadelphia Area. Delaware’s maintenance plans include a commitment to continue to operate its EPA-approved monitoring network, as necessary to demonstrate ongoing compliance with the 1997 annual and 2006 24-hour PM_{2.5} NAAQS. DNREC will consult with EPA prior to making any necessary changes to the PM_{2.5} monitoring network and will continue to quality assure the monitoring data in accordance with the requirements of 40 CFR part 58.

4. Verification of Continued Attainment

Delaware will acquire ambient monitoring and source emission data to track attainment and maintenance. Delaware will also track the progress of the maintenance demonstration by periodically updating the emissions inventory as required by the Annual Air Emissions Reporting Requirements Rule (AERR), or as required by federal regulation during the maintenance plan period. This includes developing annual inventories for major point sources and a comprehensive periodic inventory covering all source categories every three years. Tracking will include the evaluation of annual and periodic evaluations for any significant emission increases above the 2007 and 2008 attainment year levels.

5. Contingency Measures

The contingency plan provisions are designed to promptly correct a violation of either the 1997 annual or the 2006 24-hour PM_{2.5} NAAQS that occurs in the Area after redesignation. Section 175A of the CAA requires that a maintenance plan include such contingency measures as EPA deems necessary to

ensure that Delaware will promptly correct a violation of either the 1997 annual or the 2006 24-hour PM_{2.5} NAAQS that occurs in the Area after redesignation. The maintenance plan should identify the events that would “trigger” the adoption and implementation of a contingency measure(s), the contingency measure(s) that would be adopted and implemented, and the schedule indicating the time frame by which the state would adopt and implement the measure(s).

Delaware’s maintenance plans outline the procedures for the adoption and implementation of contingency measures to further reduce emissions should a violation occur. Delaware’s contingency measures include a warning level response and an action level response. An initial warning level response is triggered for the 1997 annual PM_{2.5} NAAQS when the PM_{2.5} average of the weighted annual mean for a single calendar year exceeds 15.1 µg/m³ at any monitor within the Philadelphia Area. An initial warning level response is triggered for the 2006 24-hour PM_{2.5} NAAQS when the 98th percentile 24-hour PM_{2.5} concentration for a single calendar year exceeds 35.5 µg/m³ within the Area. In addition, for both the 1997 annual and 2006 24-hour PM_{2.5}, a warning level response is also triggered if total PM_{2.5}, NO_x and SO₂ emissions in the Delaware portion of the Area increase more than 10% above attainment year levels.

For the 1997 annual PM_{2.5} NAAQS, the action level response will be prompted by any one of the following: (1) A two-year average of the weighted annual mean of 15.1 µg/m³ or greater occurs within the Area; or (2) a violation of the standard occurs in the Area (i.e. a three-year average of the weighted annual means of 15.1 µg/m³ or greater). For the 2006 24-hour PM_{2.5} NAAQS, the action level response will be prompted by any one of the following: (1) a two-year average of the 98th percentile of 35.5 µg/m³ or greater within the Area; or (2) a violation of the standard occurs in the Area (i.e. a three-year average of the 98th percentile of 35.5 µg/m³ or greater).

In order to select appropriate corrective measures for warning or action level triggers, DNREC will conduct a study to determine the causes of the violation and the control measures necessary to mitigate the problem. The study will evaluate whether the trend, if any, is likely to continue and if so, the control measures necessary to reverse the trend taking into consideration ease and timing for implementation as well as economic and social considerations. Based on the results of the analysis, contingency measures will be selected. However, if a new measure is already promulgated and scheduled to be implemented at the federal or state level at such time after the exceedance, and that measure or control is determined to be sufficient to address the upward trend in air quality, additional local measures may be unnecessary. Delaware will submit to EPA an analysis to demonstrate the proposed measures are adequate to return the area to attainment. Adoption of additional control measures is subject to necessary administrative and legal processes.

Should a warning level response be triggered, measures that can be implemented in a short time will be selected in order to be in place within 18 months from the close of the calendar year that prompted the warning level. Should an action level response be triggered, implementation of necessary control measures will take place as expeditiously as possible, but in no event later than 18 months after the DNREC makes a determination, based on quality-assured ambient data, that a violation of the NAAQS has occurred.

DNREC has indentified the following potential contingency measures for both the 1997 annual and 2006 24-hour maintenance plans.

- Lower particulate limits for No. 6 fuel oil-fired boilers.
- Working with the local metropolitan planning agencies to implement transportation control measures.
- Low-sulfur distillate and residual fuels.
- Additional PM_{2.5} controls for EGUs and large industrial boilers burning

fuels other than distillate fuel or natural gas.

- Vehicle inspection and maintenance program enhancements (increase weight limit, addition of diesel vehicles, etc.).

- Alternative fuel and additional diesel retrofit programs for fleet vehicle operations.

- Require NO_x or SO₂ emission offsets for new and modified major sources.

- Increase the ratio of emission offsets required for new sources.

- Require NO_x or SO₂ controls on new minor sources (less than 100 tons).

- Require increased recovery efficiency at sulfur recovery plants.

- Broader geographic applicability of existing measures.

- Fuel switching from coal to natural gas at the Calpine Edge Moor power plant (contingency measure only in the 24-hour PM_{2.5} NAAQS maintenance plan).

6. EPA's Evaluation of VOC and Ammonia Precursors in Delaware's Maintenance Plans

With regard to the redesignation of the Delaware portion of the Philadelphia Area in evaluating the effect of the Court's remand of EPA's 1997 PM_{2.5} Implementation Rule, which included presumptions against consideration of VOC and ammonia as PM_{2.5} precursors, EPA in this proposed rulemaking action is also considering the impact of the decision on the maintenance plan required under sections 175A and 107(d)(3)(E)(iv). To begin with, EPA notes that the Area has attained both the 1997 annual and 2006 24-hour PM_{2.5} standard and that Delaware has shown that attainment of

these standards is due to permanent and enforceable emission reductions.

EPA proposes to determine that the Delaware's maintenance plan shows continued maintenance of the 1997 annual and 2006 24-hour PM_{2.5} standards by tracking the levels of the precursors whose control brought about attainment of the standards in the Philadelphia Area. EPA, therefore, believes that the only additional consideration related to the maintenance plan requirements that results from the Court's January 4, 2013 decision is that of assessing the potential role of VOC and ammonia in demonstrating continued maintenance in this Area. As explained subsequently, based upon documentation provided by the State and supporting information, EPA believes that the maintenance plans for the Delaware portion of the Area need not include any additional emission reductions of VOC or ammonia in order to provide for continued maintenance of the 1997 annual and the 2006 24-hour PM_{2.5} NAAQS.

First, as noted previously in EPA's discussion of section 189(e), VOC emission levels in the Philadelphia Area have historically been well-controlled under SIP requirements related to ozone and other pollutants. Second, total ammonia emissions throughout the Philadelphia Area are low, especially in comparison to the total amounts of SO₂, NO_x, and even direct PM_{2.5} emissions from sources in the Area.

In the Philadelphia Area, emissions of direct PM_{2.5}, NO_x, and SO₂ are projected to decrease by 9,055 tpy, 106,099 tpy, and 34,265 tpy, respectively, over the maintenance period for the 1997 annual PM_{2.5}

NAAQS and by 6,287 tpy, 73,606 tpy, and 29,990 tpy, respectively, over the maintenance period for the 2006 24-hour PM_{2.5} NAAQS. See Tables 5b through 10b. In addition, emissions inventories used in the regulatory impact analysis (RIA) for the 2012 PM_{2.5} NAAQS¹² show that VOC and ammonia emissions are projected to decrease by 33,076 tpy and 611 tpy, respectively, between 2007 and 2020. See Table 13. While the RIA emissions inventories are only projected out to 2020, there is no reason to believe that this downward trend would not continue through 2025. Given that the Philadelphia Area is already attaining the 1997 annual and 2006 24-hour PM_{2.5} NAAQS even with the current level of emissions from sources in the area, the downward trend of emissions inventories would be consistent with continued attainment. Indeed, projected emissions reductions for the precursors that the State is addressing for purposes of the 1997 annual and 2006 24-hour PM_{2.5} NAAQS indicate that the area should continue to attain the NAAQS following the precursor control strategy that the state has already elected to pursue. Even if VOC and ammonia emissions were to increase unexpectedly between 2020 and 2025, the overall emissions reductions projected in direct PM_{2.5}, SO₂, and NO_x would be sufficient to offset any increases. For these reasons, EPA believes that local emissions of all of the potential PM_{2.5} precursors will not increase to the extent that they will cause monitored PM_{2.5} levels to violate the 1997 annual and 2006 24-hour PM_{2.5} standard during the maintenance period.

TABLE 13—COMPARISON OF 2007 AND 2020 EMISSIONS OF VOC AND AMMONIA FOR THE ENTIRE PHILADELPHIA AREA, IN TPY¹³

Sector	VOC			Ammonia		
	2007	2020	Net change 2007–2020	2007	2020	Net change 2007–2020
Point	9,475	8,906	569	905	1,085	– 180
Area	71,981	72,537	– 556	4,821	5,001	– 180
Non-road	27,267	16,032	11,234	34	40	– 6
On-road	35,169	13,340	21,829	2,005	1,029	977
Fires	1,798	1,798	0	125	125	0
Total	145,689	112,613	33,076	7,890	7,279	611

In addition, available air quality modeling analyses show continued maintenance of the standard during the

maintenance period. The current annual design value for the Area is 13.7 µg/m³ and the current 24-hour design value is 33 µg/m³, based on 2010–2012 air

quality data, which are well below the levels of the 1997 annual and 2006 24-hour PM_{2.5} NAAQS. See Tables 1 and 2. Moreover, the modeling analysis

¹² Review of the NAAQS for Particulate Matter—Regulatory Impact Analysis.” Docket ID No. EPA–HQ–OAR–2010–0955.

¹³ These emissions estimates were taken from the emissions inventories developed for the RIA for the 2012 PM_{2.5} NAAQS.

conducted for the RIA for the 2012 PM_{2.5} NAAQS indicates that the design values for the Philadelphia Area are expected to continue to decline through 2020. In the RIA analysis, the 2020 modeled annual design value for the Area is 9.4 µg/m³ and the 2020 24-hour design value is 24 µg/m³.¹⁴ Given that most precursor emissions are projected to decrease through 2025, it is reasonable to conclude that monitored PM_{2.5} levels in the Area will also continue to decrease through 2025.

Thus, EPA believes that there is ample justification to conclude that the Delaware portion of the Philadelphia Area should be redesignated, even taking into consideration the emissions of other precursors potentially relevant to PM_{2.5}. After consideration of the D.C. Circuit's January 4, 2013 decision, and for the reasons set forth in this rulemaking action, EPA proposes to approve Delaware's maintenance plans and requests to redesignate its portion of the Philadelphia Area to attainment for the 1997 annual and 2006 24-hour PM_{2.5} standards. This proposed approval is based on a showing that Delaware's maintenance plans provides for maintenance of both the 1997 annual and 2006 24-hour PM_{2.5} standards for at least ten years after redesignation, throughout 2025, in accordance with section 175A.

C. Motor Vehicle Emissions Budgets

Section 176(c) of the CAA requires Federal actions in nonattainment and maintenance areas to "conform to" the goals of SIPs. This means that such actions will not cause or contribute to violations of a NAAQS, worsen the severity of an existing violation, or delay timely attainment of any NAAQS or any interim milestone. Actions involving Federal Highway Administration (FHWA) or Federal Transit Administration (FTA) funding or approval are subject to the transportation conformity rule (40 CFR part 93, subpart A). Under this rule, metropolitan planning organizations (MPOs) in nonattainment and maintenance areas coordinate with state air quality and transportation agencies, EPA, and the FHWA and FTA to demonstrate that their long range transportation plans and transportation improvement programs (TIP) conform to applicable SIPs. This is typically determined by showing that estimated emissions from existing and planned highway and transit systems are less than or equal to the MVEBs contained in the SIP.

On December 12, 2012, Delaware submitted a SIP revision that contains the PM_{2.5} and NO_x on-road mobile source budgets. In a separate and concurrent process, EPA is conducting a process to find adequate the MVEBs for New Castle County which are associated with the Delaware maintenance plan for the Philadelphia Area. Concurrently with EPA's proposal to approve the SIP, a notice will be posted on EPA's Web site at <http://www.epa.gov/otaq/stateresources/transconf/currsips.htm> for the purpose of opening a 30-day public comment period on the adequacy of the MVEBs for New Castle County in the maintenance plan for the Philadelphia Area. That notice will inform the public of the availability of the Delaware SIP revision on DNREC's Web site. Interested members of the public can access Delaware's December 12, 2012 SIP revision on line at www.regulations.gov, Docket No. EPA-R03-OAR-2014-0022. Following EPA's public comment period, responses to any comments received will be addressed. EPA has reviewed the MVEBs and found them consistent with the maintenance plan and that the budgets meet the criteria for adequacy and approval. Additional information pertaining to the review of the MVEBs can be found in the TSD in this docket titled *Adequacy Findings for the Motor Vehicle Emissions Budgets in the Maintenance Plan for the Delaware Portion of the Philadelphia-Wilmington PA-NJ-DE 1997 Fine Particulate (PM_{2.5}) National Ambient Air Quality Standard (NAAQS) Nonattainment Area*.

VI. Proposed Actions

EPA is proposing to approve Delaware's requests to redesignate the Delaware portion of the Philadelphia Area from nonattainment to attainment for the 1997 annual and the 2006 24-hour PM_{2.5} NAAQS. EPA has evaluated Delaware's redesignation requests and determined that upon approval of the 2008 comprehensive emissions inventory for the 2006 24-hour PM_{2.5} NAAQS proposed as part of this rulemaking action, it would meet the redesignation criteria set forth in section 107(d)(3)(E) of the CAA for both standards. EPA believes that the monitoring data demonstrate that the Philadelphia Area is attaining and will continue to attain the 1997 annual and 2006 24-hour PM_{2.5} NAAQS. EPA is also proposing to approve the associated maintenance plans for the Delaware portion of the Area as a revision to the Delaware SIP for the 1997 annual and 2006 24-hour PM_{2.5} standards because it meets the requirements of CAA section 175A for both standards. For

transportation conformity purposes, EPA is also proposing to approve MVEBs for both the 1997 annual and 2006 24-hour PM_{2.5} standards. Final approval of the redesignation requests would change the official designations of the Delaware portion of the Philadelphia Area for the 1997 annual and the 2006 24-hour PM_{2.5} NAAQS, respectively, found at 40 CFR part 81, from nonattainment to attainment, and would incorporate into the Delaware SIP the associated maintenance plans ensuring continued attainment of the 1997 annual and 2006 24-hour PM_{2.5} NAAQS in the Delaware portion of the Area for the next 10 years, until 2025. EPA is soliciting public comments on the issues discussed in this document. These comments will be considered before taking final action.

VII. Statutory and Executive Order Reviews

Under the CAA, redesignation of an area to attainment and the accompanying approval of the maintenance plan under CAA section 107(d)(3)(E) are actions that affect the status of geographical area and do not impose any additional regulatory requirements on sources beyond those required by state law. A redesignation to attainment does not in and of itself impose any new requirements, but rather results in the application of requirements contained in the CAA for areas that have been redesignated to attainment. Moreover, the Administrator is required to approve a SIP submission that complies with the provisions of the Act and applicable Federal regulations. 42 U.S.C. 7410(k); 40 CFR 52.02(a). Thus, in reviewing SIP submissions, EPA's role is to approve state choices, provided that they meet the criteria of the CAA. Accordingly, this action merely proposes to approve state law as meeting Federal requirements and does not impose additional requirements beyond those imposed by state law and the CAA. For that reason, this proposed action:

- is not a "significant regulatory action" subject to review by the Office of Management and Budget under Executive Order 12866 (58 FR 51735, October 4, 1993);
- does not impose an information collection burden under the provisions of the Paperwork Reduction Act (44 U.S.C. 3501 *et seq.*);
- is certified as not having a significant economic impact on a substantial number of small entities under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*);
- does not contain any unfunded mandate or significantly or uniquely

¹⁴ The 2020 projected PM_{2.5} design values are part of the RIA for the 2012 PM_{2.5} NAAQS.

affect small governments, as described in the Unfunded Mandates Reform Act of 1995 (Public Law 104–4);

- does not have Federalism implications as specified in Executive Order 13132 (64 FR 43255, August 10, 1999);
- is not an economically significant regulatory action based on health or safety risks subject to Executive Order 13045 (62 FR 19885, April 23, 1997);
- is not a significant regulatory action subject to Executive Order 13211 (66 FR 28355, May 22, 2001);
- is not subject to requirements of Section 12(d) of the National Technology Transfer and Advancement Act of 1995 (15 U.S.C. 272 note) because application of those requirements would be inconsistent with the CAA; and
- does not provide EPA with the discretionary authority to address, as appropriate, disproportionate human health or environmental effects, using practicable and legally permissible methods, under Executive Order 12898 (59 FR 7629, February 16, 1994).

In addition, this rule, in which EPA is proposing approval of the redesignation requests and maintenance plans for the Delaware portion of the Philadelphia Area for the 1997 annual and 2006 24-hour PM_{2.5} NAAQS and the 2008 comprehensive emissions inventory for the 2006 24-hour PM_{2.5} NAAQS, does not have tribal implications as specified by Executive Order 13175 (65 FR 67249, November 9, 2000), because the SIP is not approved to apply in Indian country located in the state, and EPA notes that it will not impose substantial direct costs on tribal governments or preempt tribal law.

Fisheries of the Northeastern United States; Atlantic Bluefish Fishery; 2014 Atlantic Bluefish Specifications

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Proposed specifications; request for comments.

SUMMARY: NMFS proposes specifications for the 2014 Atlantic bluefish fishery, including an annual catch limit, total allowable landings, a commercial quota and recreational harvest limit, and a recreational possession limit. The intent of this action is to establish the allowable 2014 harvest levels and other management measures to achieve the target fishing mortality rate, consistent with the Atlantic Bluefish Fishery Management Plan.

DATES: Comments must be received on or before April 28, 2014.

ADDRESSES: You may submit comments, identified by NOAA–NMFS–2014–0026, by any one of the following methods:

- *Electronic Submissions:* Submit all electronic public comments via the Federal e-Rulemaking portal. Go to www.regulations.gov/#/docketDetail;D=NOAA-NMFS-2014-0026, click the “Comment Now!” icon, complete the required fields, and enter or attach your comments.

- *Mail:* Submit written comments to John Bullard, Regional Administrator, NMFS, Greater Atlantic Regional Fisheries Office, 55 Great Republic Drive, Gloucester, MA 01930.

Instructions: Comments sent by any other method, to any other address or individual, or received after the end of the comment period, may not be considered by NMFS. All comments received are a part of the public record and will generally be posted for public viewing on www.regulations.gov without change. All personal identifying information (e.g., name, address, etc.), confidential business information, or otherwise sensitive information submitted voluntarily by the sender will be publically accessible. NMFS will accept anonymous comments (enter “N/A” in the required fields if you wish to remain anonymous). Attachments to electronic comments will be accepted in

Microsoft Word, Excel, or Adobe PDF file formats only.

Copies of the specifications document, including the supplemental Environmental Assessment and Initial Regulatory Flexibility Analysis (EA/IRFA) and other supporting documents for the specifications, are available from Dr. Christopher M. Moore, Executive Director, Mid-Atlantic Fishery Management Council, Suite 201, 800 N. State Street, Dover, DE 19901. The specifications document is also accessible via the Internet at: <http://www.nero.noaa.gov>.

FOR FURTHER INFORMATION CONTACT: Carly Bari, Fishery Management Specialist, (978) 281–9224.

SUPPLEMENTARY INFORMATION:

Background

The Atlantic bluefish fishery is managed cooperatively by the Mid-Atlantic Fishery Management Council (Council) and the Atlantic States Marine Fisheries Commission (Commission). The management unit for bluefish specified in the Atlantic Bluefish Fishery Management Plan (FMP) is U.S. waters of the western Atlantic Ocean. Regulations implementing the FMP appear at 50 CFR part 648, subparts A and J. The regulations requiring annual specifications are found at § 648.162.

The FMP requires the Council to recommend, on an annual basis, the annual catch limit (ACL), annual catch target (ACT), and total allowable landings (TAL) that will control fishing mortality (F). An estimate of annual discards is deducted from the ACT to calculate the TAL that can be harvested during the year by the commercial and recreational fishing sectors. The FMP requires that 17 percent of the ACT be allocated to the commercial fishery, with the remaining 83 percent allocated to the recreational fishery. The Council may also recommend a research set-aside (RSA) quota, which is deducted from the bluefish TAL (after any applicable transfer) in an amount proportional to the percentage of the overall TAL as allocated to the commercial and recreational sectors.

The annual review process for bluefish requires that the Council’s Bluefish Monitoring Committee and Scientific and Statistical Committee (SSC) review and make recommendations based on the best available scientific information, including, but not limited to, commercial and recreational catch/landing statistics, current estimates of fishing mortality, stock abundance, discards for the recreational fishery, and juvenile recruitment. Based on the

recommendations of the Monitoring Committee and SSC, the Council makes a recommendation to the NMFS Greater Atlantic Regional Administrator. Because this FMP is a joint plan, the Commission also meets during the annual specification process to adopt complementary measures.

The Council's recommendations must include supporting documentation concerning the environmental, economic, and social impacts of the recommendations. NMFS is responsible for reviewing these recommendations to ensure that they achieve the FMP objectives, and may modify them if they do not. NMFS then publishes proposed specifications in the **Federal Register**, and after considering public comment, NMFS will publish final specifications in the **Federal Register**.

Proposed Specifications

Updated Model Estimates

According to Amendment 1 to the FMP, overfishing for bluefish occurs when fishing mortality exceeds the fishing mortality rate that allows maximum sustainable yield (F_{MSY}), or the maximum F threshold to be achieved. The stock is considered overfished if the biomass (B) falls below the minimum biomass threshold, which is defined as $\frac{1}{2} B_{MSY}$. Amendment 1 also established that the long-term target F is 90 percent of F_{MSY} ($F_{MSY} = 0.19$; therefore $F_{target} = 90$ percent of F_{MSY} , or 0.17), and the long-term target B is $B_{MSY} = 324$ million lb (147,052 mt).

An age-structured assessment program (ASAP) model for bluefish was approved by the 41st Stock Assessment Review Committee (SARC 41) in 2005 to estimate F and annual biomass. In September 2013, the ASAP model was updated in order to estimate the current status of the bluefish stock (i.e., 2012 biomass and F estimates) and enable the Monitoring Committee and SSC to recommend 2014 specifications using landings information and survey indices through the 2012 fishing year. The results of the assessment update were as

follows: (1) An estimated stock biomass for 2012, $B_{2012} = 277.359$ million lb (125,808 mt); and (2) an estimated fishing mortality rate for 2012, $F_{2012} = 0.097$. Based on the updated 2012 estimate of bluefish stock biomass, the bluefish stock is not considered overfished: B_{2012} is slightly less than B_{MSY} , but well above the minimum biomass threshold, $\frac{1}{2} B_{MSY}$, of 162 million lb (73,526 mt). Estimates of F have declined from 0.41 in 1991 to 0.097 in 2012. The updated model results also conclude that the Atlantic bluefish stock is not experiencing overfishing; i.e., the most recent F ($F_{2012} = 0.097$) is less than the maximum F overfishing threshold specified by SARC 41 ($F_{MSY} = 0.19$). Bluefish was declared rebuilt in 2009.

2014 Catch Limits

Following the framework implemented by the Council's ACL Omnibus Amendment, the Council recommended that ACL be set to acceptable biological catch (ABC) for 2014 (24,432 million lb, 11,082 mt). No deductions were recommended to account for management uncertainty; therefore, $ABC=ACL=ACT$. The ACT is initially allocated between the recreational fishery (83 percent) and the commercial fishery (17 percent). After deducting an estimate of recreational discards (commercial discards are considered negligible), the recreational harvest limit (RHL) would be 16.927 million lb (7,678 mt) and the commercial quota would be 4.153 million lb (1,884 mt).

The FMP specifies that, if 17 percent of the TAL is less than 10.5 million lb, and the recreational fishery is not projected to land its harvest limit for the upcoming year, the commercial fishery may be allocated up to 10.5 million lb as its quota, provided that the combination of the projected recreational landings and the commercial quota does not exceed the TAL. The RHL would then be adjusted

downward so that the TAL would be unchanged.

The Council projected an estimated annual recreational harvest for 2014 of 13.179 million lb (5,978 mt). As such, it is expected that a transfer of up to 3.340 million lb (1,515 mt) from the recreational sector to the commercial sector could be approved. This option represents the preferred alternative recommended by the Council in its specifications document. The actual transfer amount in the final rule, if any, will depend on the final 2013 recreational landings data.

RSA

The Council preliminarily approved two research projects that would utilize bluefish RSA quota and forwarded them to NOAA's Grants Management Division. The Council preliminarily approved 632,418 lb (287 mt) of RSA quota for use by these projects during 2014. Proportional adjustments of these amounts to the commercial and recreational allocations would result in a final commercial quota of 7.269 million lb (3,297 mt), and a final RHL of 13.179 million lb (5,978 mt). NMFS staff will update the commercial and recreational allocations based on the final 2014 RSA awards as part of the final rule for the 2014 specifications.

Proposed Recreational Possession Limit

The Council recommended, and NMFS proposes, to maintain the current recreational possession limit of up to 15 fish per person to achieve the RHL for 2014.

Proposed State Commercial Allocations

The proposed state commercial allocations for the recommended 2014 commercial quota are shown in Table 1, based on the percentages specified in the FMP. These quotas do not reflect any adjustments for quota overages that may have occurred in some states in 2013. Any potential deductions for states that exceeded their quota in 2013 will be accounted for in the final rule.

Classification

Pursuant to section 304(b)(1)(A) of the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act), the NMFS Assistant Administrator has determined that this proposed rule is consistent with the Atlantic Bluefish FMP, other provisions of the Magnuson-Stevens Act, and other applicable law, subject to further consideration after public comment.

These proposed specifications are exempt from review under Executive Order 12866.

An IRFA was prepared, as required by section 603 of the Regulatory Flexibility Act (RFA), which describes the economic impact this proposed rule, if adopted, would have on small entities.

Description of the Reasons Why Action by the Agency Is Being Considered

A description of the action and why it is being considered are contained at the beginning of this preamble and in the **SUMMARY**.

Statement of the Objective of, and Legal Basis for, This Proposed Rule

The statement of the objective and the legal basis for this action are contained at the beginning of this preamble and in the **SUMMARY**.

Description and Estimate of the Number of Small Entities to Which This Proposed Rule Would Apply

An active participant in the commercial sector was defined as any vessel that reported having landed 1 or more pound (0.45 kg) in the Atlantic bluefish fishery in 2011. The active participants in the commercial sector were defined using two sets of data. The Northeast seafood dealer reports were used to identify 742 vessels that landed bluefish in states from Maine through North Carolina in 2011. However, the Northeast dealer database does not provide information about fishery participation in South Carolina, Georgia, or Florida. South Atlantic Trip Ticket

reports were used to identify 768 vessels that landed bluefish in North Carolina and 791 vessels that landed bluefish on Florida's east coast in 2011.¹ Bluefish landings in South Carolina and Georgia were near zero in 2011, representing a negligible proportion of the total bluefish landings along the Atlantic Coast. Therefore, this analysis assumed that no vessel activity for these two states took place in 2011. In recent years, approximately 2,000 party/charter vessels may have been active in the bluefish fishery and/or have caught bluefish.

Description of the Projected Reporting, Recordkeeping, and Other Compliance Requirements of This Proposed Rule

There are no new reporting or recordkeeping requirements contained in any of the alternatives considered for this action.

Federal Rule Which May Duplicate, Overlap, or Conflict With This Proposed Rule

NMFS is not aware of any relevant Federal rules that may duplicate, overlap, or conflict with this proposed rule.

Description of Significant Alternatives to the Proposed Action Which Accomplish the Stated Objectives of Applicable Statutes and Which Minimize Any Significant Economic Impact on Small Entities

Small businesses operating in commercial and recreational (i.e., party and charter vessel operations) finfish fisheries have been defined by the Small Business Administration as firms with gross revenues of up to \$19.0 and \$7.0 million, respectively. The categories of small entities likely to be affected by this action include commercial and charter/party vessel owners holding an active Federal permit for Atlantic

bluefish, as well as owners of vessels that fish for Atlantic bluefish in state waters. All federally permitted vessels fall into the definition of small businesses; thus, there would be no disproportionate impacts between large and small entities as a result of the proposed rule.

When the 2014 specifications were set last year, there were three alternatives considered in the IRFA of the Original EA. Since the bluefish stock was updated in 2013, the Council recommended an additional alternative to be considered for the 2014 specifications through a supplement to the Original EA. The IRFA in the Draft Supplemental EA for this action addresses two alternatives (including a no action/status quo alternative) for the 2014 Atlantic bluefish fishing year. No additional alternatives are considered in this action because there is no other alternative that would both achieve the stated goals and objectives of the FMP and minimize cost to the fishery. Any other alternative considered would need to be more restrictive than the proposed action due to the specifications process and the National Standard 1 guideline requirement that catch limits cannot exceed the SSC's recommended ABC. Both quota alternatives considered in this analysis are based on various commercial harvest levels for bluefish (a low and medium level of harvest). For analysis of impacts of both alternatives, the maximum potential RSA quota of 3 percent of the TAL (703,385 lb (319 mt) for the No Action Alternative and 632,418 lb (287 mt) for the Preferred Action Alternative) was used. For analysis of impacts of the No Action Alternative, the recommended transfer of 4.342 million lb (1,970 mt) from the recreational sector to the commercial sector was used. For analysis of impacts of the Preferred Action Alternative, the transfer of 3.340 million lb (1,515 mt) from the recreational sector to the commercial sector was used.

The No Action Alternative would implement a TAL of 23.446 million lb

¹ Some of these vessels were also identified in the Northeast dealer data; therefore, double counting is possible.

(10,635 mt). The Preferred Action Alternative would implement a TAL of 21.081 million lb (9,562 mt). The proposed 2014 Atlantic bluefish specification alternatives are shown in Table 2, along with the resulting commercial quota and RHL after any

applicable transfer described earlier in the preamble and after deduction of the RSA quota. The Preferred Action Alternative (Council's preferred) would allocate 7.269 million lb (3,297 mt) to the commercial sector, and 13.179 million lb (5,978 mt) to the recreational

sector for 2014. The No Action Alternative would allocate 8.674 million lb (3,934 mt) to the commercial sector and leave 14.069 million lb (6,381 mt) available to the recreational sector.

TABLE 2—PROPOSED 2014 ATLANTIC BLUEFISH SPECIFICATION ALTERNATIVES FOR TAL, COMMERCIAL QUOTA, AND RHL

Year	Alternatives	TAL (million lb)	TAL (mt)	Commercial quota (million lb)	Commercial quota (mt)	RHL (million lb)	RHL (mt)
2014	No Action	23.446	10,635	8.674	3,934	14.096	6,381
	Preferred Action	21.081	9,562	7.269	3,297	13.179	5,978

Commercial Fishery Impacts

To assess the impact of the alternatives on commercial fisheries, the Council conducted a threshold analysis and analysis of potential changes in ex-vessel gross revenue that would result from each alternative, using Northeast dealer reports and South Atlantic Trip Ticket reports.

Under the No Action Alternative, nine vessels were projected to incur revenue losses of more than 5 percent, while 147 vessels would incur revenue losses of less than 5 percent, and 586 vessels would incur no revenue losses. The Preferred Action Alternative would likely result in quota reductions for vessels in New York and Massachusetts, which could have negative economic impacts. Under the Preferred Action Alternative, 69 vessels were projected to incur revenue losses of more than 5 percent, 594 vessels would incur losses of less than 5 percent, and 79 vessels would see no revenue changes. The majority of vessels with greater than 5 percent of revenue losses had gross sales of \$10,000 or less, which may indicate

that the dependence on fishing for some of these vessels is small. If commercial quota is transferred from a state or states that do not land their entire bluefish quota for 2014, as was done in 2011 and frequently in previous years, the number of affected entities could change, thus changing the adverse economic impact on vessels landing in the state(s) receiving quota transfers for both alternatives.

Recreational Fishery Impacts

Under the No Action Alternative, the recommended RHL for the recreational sector (14.069 million lb, 6,381 mt) is approximately 22 percent above the recreational landings for 2011 (11.499 million lb, 5,216 mt). The Preferred Action Alternative RHL (13.179 million lb, 5,978 mt) is approximately 14 percent above the recreational landings for 2011. It is not anticipated that the recommend RHL will result in decreased demand for party/charter boat trips or affect angler participation in a negative manner. Overall, it is not expected that the final recreational

management measures will affect gross revenues of businesses providing goods and services to anglers participating in the party/charter boat, private/rental boat, and shore fisheries for bluefish.

RSA Quota Impacts

For analysis of each alternative, the maximum RSA quota amount (3 percent of the TAL) was deducted from the initial overall TAL adjusted 2014 commercial quotas and RHLs under each alternative. Specifications of RSA quota are expected to benefit all participants in the fishery as a result of improved data and information for management or stock assessment purposes.

Notices

Federal Register

Vol. 79, No. 70

Friday, April 11, 2014

This section of the FEDERAL REGISTER contains documents other than rules or proposed rules that are applicable to the public. Notices of hearings and investigations, committee meetings, agency decisions and rulings, delegations of authority, filing of petitions and applications and agency statements of organization and functions are examples of documents appearing in this section.

DEPARTMENT OF AGRICULTURE

Office of Tribal Relations; Council for Native American Farming and Ranching

AGENCY: Office of Tribal Relations, USDA.

ACTION: Notice of public meeting.

SUMMARY: This notice announces a forthcoming meeting of The Council for Native American Farming and Ranching (CNAFR), a public advisory committee of the Office of Tribal Relations (OTR). Notice of the meetings are provided in accordance with section 10(a)(2) of the Federal Advisory Committee Act, as amended in 5 U.S.C. Appendix 2. This session will be the sixth meeting of the CNAFR and will consist of, but not be limited to, hearing public comments, updating the Council on USDA programs and activities, discussing subcommittee reports, and a discussion of committee priorities. This meeting will be open to the public.

DATES: The meeting will be held on May 2, 2014 from 1 p.m. to 5 p.m. e.s.t. The meeting will be open to the public. Note that a period for public comment will be held on May 2, 2014 2:00 p.m. to 2:30 p.m. e.s.t.

ADDRESSES: The meeting will be conducted using teleconference technology. This will not be an in-person meeting. Teleconference access information for the meeting will be posted to the OTR Web site at www.usda.gov/tribalrelations.

Written Comments: Written comments may be submitted to John Lowery, Designated Federal Officer, Office of Tribal Relations (OTR), 1400 Independence Ave., SW., Whitten Bldg., 500-A, Washington, DC 20250; by Fax: (202) 720-1058; or by email: John.Lowery@osec.usda.gov.

FOR FURTHER INFORMATION CONTACT: Questions should be directed to John Lowery, Designated Federal Officer, OTR, 1400 Independence Ave., SW.,

Whitten Bldg., 500A, Washington, DC 20250; by Fax at (202) 720-1058, or email at John.Lowery@osec.usda.gov.

SUPPLEMENTARY INFORMATION: In accordance with the provisions of the Federal Advisory Committee Act (FACA) as amended (5 U.S.C. App. 2), USDA established an advisory council for Native American farmers and ranchers. The CNAFR is a discretionary advisory committee established under the authority of the Secretary of Agriculture. In furtherance of the *Keepseagle v. Vilsack* settlement agreement, the Council was granted final approval by the District Court for the District of Columbia on April 28, 2011.

The CNAFR will operate under the provisions of the FACA and report to the Secretary of Agriculture. The purpose of the CNAFR is (1) to advise the Secretary of Agriculture on issues related to the participation of Native American farmers and ranchers in USDA farm loan programs; (2) to transmit recommendations concerning any changes to FSA regulations or internal guidance or other measures that would eliminate barriers to program participation for Native American farmers and ranchers; (3) to examine methods of maximizing the number of new farming and ranching opportunities created through the farm loan program through enhanced extension and financial literacy services; (4) to examine methods of encouraging intergovernmental cooperation to mitigate the effects of land tenure and probate issues on the delivery of USDA farm loan programs; (5) to evaluate other methods of creating new farming or ranching opportunities for Native American producers; and (6) to address other related issues as deemed appropriate.

The Secretary of Agriculture selected a diverse group of members representing a broad spectrum of persons interested in providing solutions to the challenges of the aforementioned purposes. Equal opportunity practices were considered in all appointments to the CNAFR in accordance with USDA policies. The Secretary selected the members in May 2012. Interested persons may present views, orally or in writing, on issues relating to agenda topics before the CNAFR.

Written submissions may be submitted to the contact person on or

before April 28, 2014. Oral presentations from the public will be scheduled between approximately 2:00 p.m. to 2:30 p.m. on May 2, 2014. Those individuals interested in making formal oral presentations should notify the contact person and submit a brief statement of the general nature of the issue they wish to present and the names and addresses of proposed participants by April 28, 2014. All oral presentations will be given three (3) to five (5) minutes depending on the number of participants.

OTR will also make all agenda topics available to the public via the OTR Web site: <http://www.usda.gov/tribalrelations> no later than 10 business days before the meeting and at the meeting. In addition, the minutes from the meeting will be posted on the OTR Web site. OTR welcomes the attendance of the public at the CNAFR meetings and will make every effort to accommodate persons with physical disabilities or special needs. If you require special accommodations due to a disability, please contact John Lowery, at least 10 business days in advance of the meeting.

Leslie Wheelock,

Director, Office of Tribal Relations.

BILLING CODE 3410-05-P

DEPARTMENT OF AGRICULTURE

Forest Service

21st Century Conservation Service Corps Partnership Opportunity

AGENCY: Forest Service, USDA.

ACTION: Notice of Interest to Participate in the 21st Century Conservation Service Corps.

SUMMARY: The 21st Century Conservation Service Corps (21CSC) National Council is requesting letters of interest from all conservation corps, youth, and veteran programs that would like to be identified as a 21CSC member organization. We are initiating this outreach in order to catalyze the establishment of a 21st Century Conservation Service Corps (21CSC) to engage young Americans and returning veterans in the conservation and stewardship of America public lands and water. This notice seeks to establish the 21CSC by building upon and

leveraging the experience and expertise of existing Federal, State, tribal, local and non-profit conservation and youth corps, and veterans programs, which facilitate conservation and restoration service work on public lands to include all governmental entities of cities, counties, States, and the Federal Government, and encourage a new generation of natural resource managers and environmental stewards. All principals of interested organizations are invited to submit a letter of interest that outlines the organization's and/or program's alignment with the criteria in each of the eight 21CSC principles listed below under **SUPPLEMENTARY**

INFORMATION. Letters should include the name of your organization; an address and point of contact, including email address; and a description of how your organization or program aligns with all eight principles. Organizations that respond to this request may be contacted to provide additional information to support their statements. The 21CSC National Council will oversee the review of all submissions to determine the respondent's alignment with the 21CSC principles.

Organizations that are not recognized as 21CSC member organizations may submit new letters of interest. Letters of interest may be submitted up to one year after the closing date of this notice for consideration as a 21CSC member organization, and will be reviewed and responded to on a quarterly basis (October, January, April, and July). Organizations may request to be removed from the 21CSC by submitting a written request to the email or mailing address below. *This notice is being published by the USDA Forest Service on behalf of the National Council. 21CSC member organizations recognized through this process will be acknowledged by all members' departments and agencies represented in the National Council. National Council membership includes the Departments of Agriculture, Army, Commerce, Interior, and Labor, the Environmental Protection Agency, the President's Council on Environmental Quality, and the Corporation for National and Community Service.*

DATES: Letters of interest may be submitted on a rolling basis (maximum 5 pages, double-spaced in Times/New Roman, 12 point type) before September 30, 2014. An interagency team will review submissions quarterly and respond soon thereafter. Organizations may be removed at any time by submitting a written request to the email or mailing address below. Membership will last through the 2014 calendar year.

Additional guidance about the 21CSC membership process beyond 2014 will be announced in August 2014.

ADDRESSES: Letters of interest may be submitted electronically to 21CSC@fs.fed.us. If electronic submission is not an option, please send your letter of interest to: USDA Forest Service, RHVR, ATTN: Merlene Mazyck, 1400 Independence Ave. SW., Mailstop Code: 1125, Washington, DC 20250-1125.

FOR FURTHER INFORMATION CONTACT: USDA Forest Service, RHVR, ATTN: Merlene Mazyck, 1400 Independence Ave. SW., Mailstop Code: 1125, Washington, DC 20250-1125 or email 21CSC@fs.fed.us.

Individuals who use telecommunication devices for the deaf (TDD) may call the Federal Information Relay Service (FIRS) at 1-800-877-8339 between 8:00 a.m. and 8:00 p.m., Eastern Standard Time, Monday through Friday.

SUPPLEMENTARY INFORMATION:

21CSC National Council

The implementation of the 21CSC is coordinated by a National Council of representatives from Federal agencies that formalized their mission through the signing a Memorandum of Understanding in January 2013. National Council membership includes leadership from the Departments of the Army, Interior, Agriculture, Commerce, and Labor, Environmental Protection Agency, the President's Council on Environmental Quality, and the Corporation for National and Community Service. The National Council will work to: support program expansion, including by matching natural resource management needs with 21CSC opportunities and identifying potential sources of funding and other resources; remove barriers and streamline processes for supporting 21CSC programs; support participant pathways to careers; facilitate technical assistance; develop and support partnerships; coordinate messaging; and ensure national representation.

Background

The 21CSC is a bold national effort to put America's youth and veterans to work protecting, restoring, and enhancing America's Great Outdoors. Recognizing the need for job opportunities for youth and returning veterans, the need for restoration of our natural resources, the need to connect Americans to the country's lands and waters, the need to effectively recruit the next generation of public employees, and the need to develop the next generation of conservation stewards, the

Secretary of the Department of the Interior, on behalf of the America's Great Outdoors Council, formed a Federal Advisory Committee (FAC) to develop recommendations for the establishment of the 21CSC. The FAC was comprised of representatives from Federal agencies, the outdoor industry, and non-profit youth and conservation corps. In addition to providing recommendations, the FAC also identified 21 CSC goals and principles, which were slightly modified and adopted by the federal 21 CSC National Council.

21CSC Goals

1. *Build America's future.* Through service to America, the 21CSC will develop a generation of skilled workers, educated and active citizens, future leaders, and stewards of natural and cultural resources, communities, and the nation.

2. *Put Americans to work.* The 21CSC will provide service, training, education, and employment opportunities for thousands of young Americans and veterans, including low income, disadvantaged youth and other youth with limited access to outdoor work opportunities.

3. *Preserve, protect, and promote America's greatest gifts.* The 21CSC will protect, restore, and enhance public and tribal lands and waters as well as natural, cultural, and historical resources and treasures. With high-quality, cost-effective project work, the 21CSC will increase public access and use while spurring economic development and outdoor recreation.

21CSC Principles

21CSC Member Organizations Must Be in Alignment With the Criteria in Each of the Following 21CSC Principles

1. *Population served.* Program serves young people ages 15-25 and/or military veterans up to age 35. Program may serve young people up to age 29 in an advanced capacity.

2. *Participant eligibility.* Participants must be a U.S. citizen, national, or lawful permanent resident alien of the United States, meeting the same citizenship requirements as those for serving in AmeriCorps and Public Lands Corps.

3. *Emphasis on diversity and inclusion.* Participant recruitment should make deliberate outreach efforts to traditionally underserved communities, including low-income and disadvantaged populations.

4. *Term of service.* Program minimum term of service of: 140 hours of on-the-ground, hands-on direct service for full

time students and summer only participants; or, 300 hours of on-the-ground, hands-on direct service for non-full time student participants. Program maximum term of service of 3,500 hours of on-the-ground, hands-on direct service, with a limited exception for program elements that require more than 3,500 hours to achieve highly advanced outcomes. Service is compensated (not volunteer). Compensation can be in the form of wages, stipend, educational credit, or other appropriate form.

5. *Organization of work.* Program organizes its participants as either: (a) crew-based where participants work collectively and intensely together directly supervised by trained and experienced crew leaders or conservation professionals; or (b) individual or small team-based where participants work individually or in coordinated teams under the direction of conservation professionals on initiatives that require specific skills and dedicated attention.

6. *Types of work.* Projects include significant outdoor activity and/or include “hands-on” direct impact and/or helps young people connect with America’s Great Outdoors. Some programs may include work that is primarily indoors—for example, science, policy or program internships—that have a clear benefit to natural, cultural or historic resources.

7. *Participant outcomes.* Program provides: (a) Job skill development to prepare participants to be successful in the 21st century workforce; (b) community skill development to help participants acquire an ethic of service to others and learn to become better resource and community stewards; and (c) a connection, improvement or restoration of the natural or cultural/urban environment or a greater understanding of our natural, cultural or historic resources.

8. *Leveraged investment.* Program leverages public investment through either financial or in-kind support, to the extent possible. Exceptions may be made to support new, smaller, or federal programs that increase diversity and inclusion.

21CSC Member Organization Benefits & Caveats

Through this “notice of interest” process, all respondents that currently meet each of the criteria listed in all 21CSC principles will be designated as a 21CSC member organization. Designation as a 21CSC member organization is not a commitment of funding or future partnership opportunities, however this designation

may result in the following benefits to and limitations for member organizations and the Federal agencies represented on the 21CSC National Council.

1. Access to a national network of 21CSC member organizations.
2. Identification on a Web site as a 21CSC member organization.
3. Ability to utilize the 21CSC brand to promote affiliation as a member organization.
4. Career and youth development opportunities with federal agencies for participants of member organizations, where available.

5. Opportunities to participate in webinars and other outreach to agency field staff to increase awareness of how agency natural, cultural or historic resource management needs can be supported or met by youth and veterans conservation corps, where appropriate.

6. Neither this announcement, nor letters of interest submitted in response to this announcement, obligates any Federal agency represented on the 21CSC National Council to enter into a contractual agreement with any respondent.

7. Federal agencies represented on the 21CSC National Council reserve the right to establish a partnership based on organizational priorities and capabilities found by way of this announcement or other searches, if determined to be in the best interest of the government.

8. This Notice does not preclude any Federal agencies from entering into agreements or partnerships with non-21CSC organizations.

9. The 21CSC National Council expects that aggregate data from all the participating Federal agencies regarding 21CSC accomplishments will be required for annual Performance Accountability Reports. 21CSC member organizations should be prepared to report informational data and accomplishments outcomes on an annual basis. Data collection may include information such as: project/program type; project location; project outcomes; participant outcomes; funding amount/resources; age range of participants; number of youth engaged; number of veterans engaged; number of hours participants worked; number of participants converted to jobs, etc.

Key Notice Dates & Highlights: An interagency team will review submissions and respond by September 30, 2014. Letters will be reviewed quarterly and the member organization directory will also be updated quarterly. Organizations may be removed at any time by written request. Membership will last through the 2014 calendar year; more information regarding membership

beyond this period will be forthcoming by August 2014. This notice is being published by the USDA Forest Service on behalf of the National Council, and 21CSC member organizations recognized through this process will be acknowledged by all signatories to the National Council Memorandum of Understanding.

Dated: April 7, 2014.

Leslie A.C. Weldon,

Deputy Chief, National Forest System.

[FR Doc. 2014-08101 Filed 4-10-14; 8:45 am]

BILLING CODE 3411-15-P

DEPARTMENT OF AGRICULTURE

Forest Service

Willamette National Forest, McKenzie River Ranger District; Oregon; Green Mountain Project

AGENCY: Forest Service, USDA.

ACTION: Notice of intent to prepare an environmental impact statement.

SUMMARY: The Green Mountain Project is proposed to increase stream-side vegetative diversity, increase in-stream habitat complexity and productivity, shift the age-class and structural diversity of the forest in the project area landscape, and provide forest products. Proposed activities to achieve the purpose of the project include forest management treatments across approximately 5,154 acres (~4.9% of the analyzed landscape). Treatments include ~3,588 acres of variable forest thinning (including 1,859 acres of riparian reserve thinning) and ~1,250 acres of regenerating forest habitat creation through harvests that may include shelterwood harvests, two-aged systems, group selections, variable retention harvests, and seed tree harvests. Road work would be part of the actions associated with the proposed activities and would include: Road maintenance/reconstruction (~137 miles), temporary road construction (~21 miles), new road construction (~0.5 miles), road decommissioning (~9.6), road closure amendments, and one potential bridge replacement.

DATES: Comments concerning the scope of the analysis must be received by May 12, 2014. The draft environmental impact statement is expected August 2014 and the final environmental impact statement is expected October 2014.

ADDRESSES: Send written comments to 57600 McKenzie HWY, McKenzie Bridge, OR 97413. Comments may also be sent via email to *comments-*

pacificnorthwest-willamette-mckenzie@fs.fed.us, or via facsimile to 541-822-7254. District open-house public meetings will be held at the McKenzie River district office (57600 McKenzie Hwy, McKenzie Bridge, OR 97413) on April 24, 2014 and May 1, 2014 from 1 p.m.–7 p.m. Green Mountain open-house meetings will be held on May 2, 2014 and May 9, 2014 from 5:30 p.m. to 7:30 p.m. at locations to be determined (please contact our office at 541-822-3381 for updated information). These meetings provide additional opportunity for you to submit any scoping comments you may have.

FOR FURTHER INFORMATION CONTACT: Guenther Castillon at *gcastillon@fs.fed.us* or at 541-822-7214.

Individuals who use telecommunication devices for the deaf (TDD) may call the Federal Information Relay Service (FIRS) at 1-800-877-8339 between 8 a.m. and 8 p.m., Eastern Time, Monday through Friday.

SUPPLEMENTARY INFORMATION:

Purpose and Need for Action

The Green Mountain project area is approximately 98,225 acres in size, located around Forest Road 19 above Cougar Dam. The district's resource specialists reviewed this landscape and identified it to have the greatest need across the McKenzie River District for work that would benefit riparian and aquatic resources. An analysis of the landscape also shows a lack of age-class diversity and associated habitat diversity, especially those affecting very old and very young forest-dependent species. Also approximately 79% of the forested stands in the project area are overstocked from a tree health perspective. There is opportunity to thin, reduce the number of trees, and increase the size and structure of the remaining forest over time. The productivity and site conditions of forests in the project area allow for the production of forest products while being sensitive to the ecology of the area and meeting other important natural values and services.

The Purpose of this project is to provide forest products, increase stream-side vegetative diversity, increase in-stream habitat complexity and productivity, and shift the age-class and structural diversity of the forest in the project area landscape.

Proposed Action

Vegetation—We propose to thin ~3,588 acres 9958 characters, 1526 words, 94 lines (3.7% of the Project Area) and regenerate ~1,250 acres (1.3% of the Project Area). We propose to use

thinning across the majority of the project and these treatments would incorporate some untreated areas (skips) and create gaps of up to three acres with variable spacing of remaining trees. We would design the regeneration harvest to increase forest-age diversity across the Project Area. The type of regeneration harvests would vary and may potentially include: Shelterwood harvests, two-aged systems, group selection harvests, variable retention harvests, and seed tree harvests. The age of stands proposed to be thinned ranges from 15 to 148 years, average stand age; and the age of stands proposed to be regenerated range from 15–135 years. Douglas-fir trees have an average lifespan of 500 years with individuals exceeding 1,000 years. These treatments would occur on stands that are 3 to 30% of their average maximum age. The overall total area treated under both treatment categories would be approximately 5,154 acres (~4.9% of the Project Area).

Streams—Approximately 44% of the total project area has a riparian reserve designation that overlaps with other management allocations. We are not proposing regeneration harvests within riparian reserves. We are proposing about 1,859 acres of thinning within riparian reserves (these acres include no-cut buffers adjacent to the stream channel, which reduces the actual total number of riparian acres treated). We proposed harvest or cutting within riparian reserves to increase in-stream productivity by increasing hardwood trees and light availability. We would also create snags and down wood to add structural diversity. We would use a combination of thinning, cut and leave treatments, gap creations (approximately 8 acres total across all riparian treatments), and no-cut stream buffers.

Roads—We propose to remove forest products and include associated road work across the project area. We would include approximately 137 miles of road maintenance/reconstruction that would include the install of approximately 200 culverts (primarily replacements). We would also propose to store and hydrologically stabilize approximately 21 miles of road, and decommission approximately 9.6 miles of road. The existing seasonal closure on Forest Service (FS) roads 1900–430 and 1900–431 would be proposed for removal. The current closure on FS road 1927–240 would be reduced in extent by moving the current closure (gate) location at the intersection with FS road 1927 to a new location at approximately mile point 6.7 down the 240 road. We would propose construction of 9.5 miles

of temporary road. These temporary roads would be restored to their previous function and closed after all project activities are completed. To address an existing bridge failure we would propose either installing a temporary bridge (FS road 1980–204), or we would build new road across approximately 0.5 mile and decommission 0.7 mile of road behind the old bridge.

Responsible Official: Willamette forest supervisor.

Nature of Decision To Be Made

Given the purpose and need, the scope of the decision to be made by the responsible official will be as follows:

- Do the proposed actions comply with all applicable laws governing Forest Service actions?
 - Do the proposed actions comply with the applicable Standards and Guidelines found in the Willamette Land and Resource Management Plan (LRMP)?
 - If not, will the action amend the LRMP?
 - Does the Environmental Impact Statement have sufficient site-specific environmental analysis to make an informed decision?
 - Do the proposed actions meet the purpose and need for action?
- With these assurances the responsible official must decide:
- Whether or not to select the proposed action or one of any other potential alternatives that may be developed, and what, if any, additional actions should be required.

Scoping Process

This notice of intent initiates the scoping process, which guides the development of the environmental impact statement. District open-house public meetings will be held for your convenience at the McKenzie River district office (57600 McKenzie Hwy, McKenzie Bridge, OR 97413) on April 24, 2014 and May 1, 2014 from 1 p.m.–7 p.m. Green Mountain open-house meetings will be held on May 2, 2014 and May 9, 2014 from 5:30 p.m. to 7:30 p.m. at locations to be determined (please contact our office at 541-822-3381 for updated information). All of these meetings provide an opportunity to gain more information regarding this proposed project and also provide an opportunity for you to submit any scoping comments you may have. We are interested in your comments on the following questions:

- Are there alternative ways to meet the purpose of the project other than the proposed action we offer, which you

would like the Forest Service to consider and analyze?

- Is there any information about the project area, which you believe is important in the context of the proposed activities that you would like the Forest Service to consider?

- What specifically are the potential effects of this proposal that you are particularly concerned about? For example, rather than simply stating that you would like a change in a proposed activity or that you would not like an activity to take place, it is most helpful to understand why you desire this. What are your underlying concerns with an activity or action; what are the effects from the activity that concern you? It is important that reviewers provide their comments at such times and in such manner that they are useful to the agency's preparation of the environmental impact statement. Therefore, comments should be provided prior to the close of the comment period and should clearly articulate the reviewer's concerns and contentions.

Comments received in response to this solicitation, including names and addresses of those who comment, will be part of the public record for this proposed action. Comments submitted anonymously will be accepted and considered, however.

Dated: April 3, 2014.

Meg Mitchell,

Forest Supervisor, Willamette National Forest.

[FR Doc. 2014-07968 Filed 4-10-14; 8:45 am]

BILLING CODE 3410-11-M

CHEMICAL SAFETY AND HAZARD INVESTIGATION BOARD

Sunshine Act Meeting

TIME AND DATE: April 22, 2014, 5:30 p.m.–8:30 p.m. CDT.

PLACE: Southside Community Center 205 Tokio Road, West, TX 76691.

STATUS: Open to the public.

MATTERS TO BE CONSIDERED: The Chemical Safety and Hazard Investigation Board (CSB) will convene a public meeting on April 22, 2014, starting at 5:30 p.m. at the Southside Community Center, 205 Tokio Rd, West, TX 76691. At the public meeting, the board will hear preliminary findings from the CSB's investigation team into the April 17, 2013, fire and massive explosion which occurred at the West Fertilizer Company/Adair Grain facility in West, Texas, that killed 14 people and injuring injured more than 250 neighboring residents and emergency

responders. Twelve of the fatalities were volunteer firefighters and two were members of the public.

The sudden blast at the facility led to the widespread damage and the destruction of over 150 buildings including an apartment complex, three schools, a nursing home, and a hospital in the surrounding community.

This public meeting is intended to provide the residents of West, TX and other members of the public with information into how this incident occurred and how similar future incidents can be prevented or mitigated. The CSB has invited several stakeholders in the emergency response community to provide their insights into this incident.

Following the staff presentation and expert panel presentation the Board will hear comments from the public. All staff presentations are preliminary and are intended solely to allow the Board to consider in a public forum the issues and factors involved in this case. No factual analyses, conclusions, or findings presented by staff should be considered final.

Additional Information

The meeting is free and open to the public. If you require a translator or interpreter, please notify the individual listed below as the "Contact Person for Further Information," at least five business days prior to the meeting.

The CSB is an independent federal agency charged with investigating accidents and hazards that result, or may result, in the catastrophic release of extremely hazardous substances. The agency's Board Members are appointed by the President and confirmed by the Senate. CSB investigations look into all aspects of chemical accidents and hazards, including physical causes such as equipment failure as well as inadequacies in regulations, industry standards, and safety management systems.

Public Comment

Members of the public are invited to make brief statements to the Board at the conclusion of the staff presentation. The time provided for public statements will depend upon the number of people who wish to speak. Speakers should assume that their presentations will be limited to five minutes or less, but commenters may submit written statements for the record.

Contact Person for Further Information

Hillary J. Cohen, Communications Manager, hillary.cohen@csb.gov or (202) 446-8094. General information about

the CSB can be found on the agency Web site at: www.csb.gov.

Dated: April 7, 2014.

Rafael Moure-Eraso,
Chairperson.

BILLING CODE 6350-01-P

DEPARTMENT OF COMMERCE

International Trade Administration

Proposed Information Collection; Comment Request; Information for Self-Certification Under FAQ 6 of the U.S.-European Union and U.S.-Switzerland Safe Harbor Frameworks

AGENCY: International Trade Administration, Commerce.

ACTION: Notice.

SUMMARY: The Department of Commerce, as part of its continuing effort to reduce paperwork and respondent burden, invites the general public and other Federal agencies to take this opportunity to comment on proposed and/or continuing information collections, as required by the Paperwork Reduction Act of 1995.

DATES: Written comments must be submitted on or before June 10, 2014.

ADDRESSES: Direct all written comments to Jennifer Jessup, Departmental Paperwork Clearance Officer, Department of Commerce, Room 6616, 14th and Constitution Avenue NW., Washington, DC 20230 (or via the Internet at Jjessup@doc.gov).

FOR FURTHER INFORMATION CONTACT: Requests for additional information or copies of the information collection instrument and instructions should be directed to: David Ritchie or Nick Enz, U.S. Department of Commerce, International Trade Administration, U.S.-EU & U.S.-Swiss Safe Harbor Programs, 1401 Constitution Avenue NW., Room 20007, Washington, DC 20230; (or via the Internet at safe.harbor@trade.gov); tel. 202-482-4936 or 202-482-1512.

SUPPLEMENTARY INFORMATION:

I. Abstract

The Safe Harbor self-certification form is used by U.S. organizations in order to certify their compliance with one or both of the Safe Harbor Frameworks. The form has been revised to provide additional guidance and the option to select Swiss Safe Harbor in the drop down menu.

The European Union Directive on Data Protection (EU Directive) and the Swiss Federal Act on Data Protection

(Swiss FADP) generally restrict transfers of personal data to countries that are not deemed to provide “adequate” privacy protection. In order to ensure continued flows of personal data to the United States from the EU and Switzerland, the U.S. Department of Commerce (DOC) developed similar, but separate arrangements with the European Commission and the Federal Data Protection and Information Commissioner of Switzerland (Swiss FDPIC) (i.e., the U.S.-EU Safe Harbor Framework and U.S.-Swiss Safe Harbor Framework) to provide eligible U.S. organizations with a streamlined means of complying with the relevant requirements of the EU Directive and the Swiss FADP.

On July 26, 2000, the European Commission issued a decision—in accordance with Article 25.6 of the EU Directive—finding that for all of the activities within the scope of the EU Directive, the Safe Harbor Privacy Principles, implemented in accordance with the guidance provided by the Frequently Asked Questions issued by the DOC are considered to ensure an “adequate” level of protection for personal data transferred from the EU to organizations established in the United States. The U.S.-EU Safe Harbor Framework, which the European Economic Area (EEA) also has recognized as providing adequate data protection, became operational on November 1, 2000. The U.S.-Swiss Safe Harbor Framework, which was developed later, became operational in 2009. The complete set of U.S.-EU and U.S.-Swiss Safe Harbor documents and additional guidance materials may be found at <http://export.gov/safeharbor>.

For purposes of the Safe Harbor Frameworks, “personal data” and “personal information” are data about an identified or identifiable individual that are within the scope of the EU Directive, received by a U.S. organization from the EU/EEA and/or Switzerland, and recorded in any form. “Personal data” is defined in the EU Directive as “. . . any information relating to an identified or identifiable natural person”. The scope of the EU Directive extends with a few exceptions to all “processing of data”, which is defined as “. . . any operation or set of operations which is performed upon personal data, whether or not by automatic means, such as collection, recording, organization, storage, adaptation or alteration, retrieval, consultation, use, disclosure by transmission, dissemination or otherwise making available, alignment or combination, blocking, erasure or destruction”.

The decision by an organization to self-certify its compliance with one or both of the Safe Harbor Frameworks is entirely voluntary; however, once made, the organization must comply with the requirements of the relevant Safe Harbor Framework and publicly declare that it does so. To be assured of Safe Harbor benefits, an organization must reaffirm its self-certification annually, via Form ITA-4149P, to the DOC in accordance with the requirements specified in the Framework(s) and guidance provided by the DOC. An organization’s self-certification and the appearance of the organization on the relevant Safe Harbor List(s) pursuant to the self-certification, constitutes an enforceable representation to the DOC and the public that it adheres to a privacy policy that complies with the relevant Safe Harbor Framework(s). Any public misrepresentation concerning an organization’s participation in the Safe Harbor or compliance with one or both of the Safe Harbor Frameworks may be actionable by the Federal Trade Commission (FTC) or other relevant government body (e.g. the Department of Transportation).

The Safe Harbor Frameworks provide a number of important benefits, especially predictability and continuity, to U.S. organizations that receive personal data for processing from the EU/EEA and/or Switzerland. All 28 EU Member States, and by extension all EEA Member States, are bound by the European Commission’s finding of “adequacy”. Organizations that have self-certified, appear on the relevant Safe Harbor List(s), and have not allowed their certification status to lapse are presumed to provide “adequate” data protection in accordance with the EU Directive and/or the Swiss FADP and therefore are not required to provide further documentation to European officials on this point. The Safe Harbor eliminates the need for prior approval to begin data transfers or makes approval from the appropriate national data protection authority automatic. The Safe Harbor Frameworks offer a simple and cost-effective means of complying with the relevant requirements of the EU Directive and Swiss FADP, which should particularly benefit small and medium enterprises.

The DOC maintains and updates regularly public lists of U.S. organizations that have self-certified and provides guidance on substantive requirements associated with self-certification. The Lists, referred to as the Safe Harbor Lists (i.e. U.S.-EU Safe Harbor List and U.S.-Swiss Safe Harbor List) are necessary to make the Safe

Harbor Frameworks operational, and were a key demand of the European Commission and the Swiss FDPIC in agreeing that compliance with the Safe Harbor Frameworks provide “adequate” privacy protection. The Safe Harbor Lists, which are made available to the public on the DOC’s Safe Harbor Web site, are used not only by European citizens and organizations to determine whether a U.S. organization is presumed to provide “adequate” data protection, but also by U.S. and European authorities to determine whether an organization has self-certified its compliance with one or both Safe Harbor Frameworks, especially when a complaint has been lodged against that U.S. organization.

II. Method of Collection

The self-certification form is available via the Internet on the DOC Safe Harbor Web site: <http://export.gov/safeharbor/>.

III. Data

OMB Control Number: 0625–0239.

Form Number(s): ITA-4149P.

Type of Review: Regular submission (revision of a currently approved information collection).

Affected Public: Business or for-profit organizations.

Estimated Number of Respondents: 780.

Estimated Time per Response: 40 minutes completing and making initial self-certification submission online via the DOC Safe Harbor Web site.

Estimated Total Annual Burden Hours: 520.

Estimated Total Annual Cost to Public: \$174,200 (certification fees).

IV. Request for Comments

Comments are invited on: (a) Whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information shall have practical utility; (b) the accuracy of the agency’s estimate of the burden (including hours and cost) of the proposed collection of information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; and (d) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or other forms of information technology.

Comments submitted in response to this notice will be summarized and/or included in the request for OMB approval of this information collection; they also will become a matter of public record.

Dated: April 8, 2014.

Gwellnar Banks,

Management Analyst, Office of the Chief Information Officer.

DEPARTMENT OF COMMERCE

International Trade Administration

[C-570-013]

Carbon and Certain Alloy Steel Wire Rod From the People's Republic of China: Postponement of Preliminary Determination in the Countervailing Duty Investigation

AGENCY: Enforcement and Compliance, International Trade Administration, Department of Commerce.

FOR FURTHER INFORMATION CONTACT: Rebecca Trainor at (202) 482-4007 or Irene Darzenta Tzafolias at (202) 482-0922, AD/CVD Operations, Enforcement and Compliance, International Trade Administration, Department of Commerce, 14th Street and Constitution Avenue NW., Washington, DC 20230.

SUPPLEMENTARY INFORMATION:

Background

On February 20, 2014, the Department of Commerce (the Department) initiated the countervailing duty (CVD) investigation of carbon and certain alloy steel wire rod (steel wire rod) from the People's Republic of China (PRC).¹ Currently, the preliminary determination is due no later than April 28, 2014.²

Postponement of Due Date for the Preliminary Determination

Section 703(b)(1) of the Tariff Act of 1930, as amended (the Act), requires the Department to issue the preliminary determination in a CVD investigation within 65 days after the date on which the Department initiated the investigation. However, the Department may postpone making the preliminary determination until no later than 130 days after the date on which the administering authority initiated the

¹ See *Carbon and Certain Alloy Steel Wire Rod from the People's Republic of China: Initiation of Countervailing Duty Investigation*, 79 FR 11085 (February 27, 2014) (*Initiation Notice*).

² The statutory deadline for the preliminary determination is Saturday, April 26, 2014. When the statutory deadline falls on a weekend, it is the Department's practice to issue the determination on the next business day, which in this case would be Monday, April 28, 2014. See *Notice of Clarification: Application of "Next Business Day" Rule for Administrative Determination Deadlines Pursuant to the Tariff Act of 1930, as Amended*, 70 FR 24533 (May 10, 2005).

investigation if, among other reasons, the petitioner makes a timely request for an extension pursuant to section 703(c)(1)(A) of the Act.

On March 31, 2014, the petitioner, Nucor Corporation (Nucor), timely requested that the Department postpone its preliminary CVD determination to 130 days from the initiation date.³

Pursuant to 703(c)(1)(A) of the Act and because the Department does not find any compelling reason to deny the request, we are extending the due date for the preliminary determination to no later than 130 days after the date on which this investigation was initiated, or June 30, 2014.

This notice is issued and published pursuant to section 703(c)(2) of the Act and 19 CFR 351.205(f)(1).

Dated: April 7, 2014.

Paul Piquado,

Assistant Secretary for Enforcement and Compliance.

DEPARTMENT OF COMMERCE

International Trade Administration

Meeting of the Manufacturing Council

AGENCY: International Trade Administration, U.S. Department of Commerce.

ACTION: Notice of an open meeting.

SUMMARY: The Manufacturing Council will hold a meeting on Tuesday, April 29, 2014, to discuss and deliberate on proposed recommendations addressing workforce development best practices; strategies to address misconceptions of manufacturing careers; innovation, research and development in manufacturing; and manufacturing energy policy. The Council will also hear an update from its subcommittee on tax policy and export growth. Additionally, the Council will receive updates from representatives of the U.S. government on the manufacturing initiatives taking place across federal agencies. A final agenda will be available on the Council's Web site one week prior to the meeting. The Council advises the Secretary of Commerce on government programs and policies that affect U.S. manufacturing and provide a means of ensuring regular contact between the U.S. Government and the manufacturing sector.

³ See 19 CFR 351.205(e) and Letter from Nucor, "Carbon and Certain Alloy Steel Wire Rod from the People's Republic of China: Request for Extension of Preliminary Determination" (March 31, 2014).

DATES: April 29, 2014, 10 a.m. Eastern Daylight Time (EDT).

ADDRESSES: The meeting will be held at the Department of Commerce, 1401 Constitution Avenue NW., Washington, DC 20230. Due to building security, all attendees must pre-register. This meeting will be physically accessible to people with disabilities. Seating is limited and will be on a first come, first served basis. Pre-registration and requests for sign language interpretation or other auxiliary aids should be submitted no later than Monday, April 21, 2014, to Elizabeth Emanuel, the Manufacturing Council, Room 4043, 1401 Constitution Avenue NW., Washington, DC 20230, telephone 202-482-1369, elizabeth.emmanuel@trade.gov. Last minute requests will be accepted, but may be impossible to fill.

FOR FURTHER INFORMATION CONTACT: Elizabeth Emanuel, the Manufacturing Council, Room 4043, 1401 Constitution Avenue NW., Washington, DC 20230, telephone: 202-482-1369, email: elizabeth.emmanuel@trade.gov.

SUPPLEMENTARY INFORMATION: A limited amount of time, from 12:45 p.m.-1 p.m., will be made available for pertinent brief oral comments from members of the public attending the meeting. To accommodate as many speakers as possible, the time for public comments will be limited to 5 minutes per person. Individuals wishing to reserve speaking time during the meeting must contact Ms. Emanuel and submit a brief statement of the general nature of the comments, as well as the name and address of the proposed speaker, by 5 p.m. EDT on Monday, April 21, 2014. If the number of registrants requesting to make statements is greater than can be reasonably accommodated during the meeting, the International Trade Administration may conduct a lottery to determine the speakers. Speakers are requested to bring at least 30 copies of their oral comments for distribution to the members of the Manufacturing Council and to the public at the meeting. Any member of the public may submit pertinent written comments concerning the Manufacturing Council's affairs at any time before or after the meeting. Comments may be submitted to Elizabeth Emanuel, the Manufacturing Council, Room 4043, 1401 Constitution Avenue NW., Washington, DC 20230, telephone: 202-482-1369, email: elizabeth.emmanuel@trade.gov. To be considered during the meeting, written comments must be received by 5 p.m. EDT on Monday, April 21, 2014, to ensure transmission to the Manufacturing Council prior to the meeting. Comments received after

that date will be distributed to the members but may not be considered at the meeting.

Copies of Council meeting minutes will be available within 90 days of the meeting.

Dated: April 8, 2014.

Ingrid Mitchem,

Director, Industry Trade Advisory Center.

BILLING CODE 3510-DR-P

DEPARTMENT OF COMMERCE

National Institute of Standards and Technology

Proposed Information Collection; Comment Request; Manufacturing Extension Partnership Program Management Information Reporting System for the Business and Talent Management Self-Diagnostic

AGENCY: National Institute of Standards and Technology, Commerce.

ACTION: Notice.

SUMMARY: The Department of Commerce, as part of its continuing effort to reduce paperwork and respondent burden, invites the general public and other Federal agencies to take this opportunity to comment on proposed and/or continuing information collections, as required by the Paperwork Reduction Act of 1995.

DATES: Written comments must be submitted on or before June 10, 2014.

ADDRESSES: Direct all written comments to Jennifer Jessup, Departmental Paperwork Clearance Officer, Department of Commerce, Room 6616, 14th and Constitution Avenue NW., Washington, DC 20230 (or via the Internet at jjessup@doc.gov).

FOR FURTHER INFORMATION CONTACT: Requests for additional information or copies of the information collection instrument and instructions should be directed to Stacey Wagner, Stacey.wagner@nist.gov, 301-975-4850.

SUPPLEMENTARY INFORMATION:

I. Abstract

The Manufacturing Extension Partnership (MEP), sponsored by the National Institute of Standards and Technology (NIST), is a national network of locally-based manufacturing extension centers working with small manufacturers to assist them improve productivity, improve profitability, and enhance their economic competitiveness. In order for small and medium-sized manufacturers to understand the systemic alignment

between their business goals and workforce investments, they will need to compare their internal business goals/targets and their talent management efforts. By comparing their own internal data that reflects all of their business strategies, small and medium-sized manufacturers will understand how aligned their workforce skills are with their business investments and execution. This self-diagnostic service will be offered by MEP centers to their manufacturing clients. The results of the service information will enable the NIST MEP to provide systematic business analysis assistance to their clients.

II. Method of Collection

The information will be collected from the NIST-hosted web application via the MEP Web site at www.smartalent.gov using a password-protected interface.

III. Data

OMB Control Number: None.

Form Number: None.

Type of Review: Regular submission (new information collection).

Affected Public: Business or other for-profit organizations.

Estimated Number of Respondents: 600.

Estimated Time per Response: 30 minutes.

Estimated Total Annual Burden Hours: 300.

Estimated Total Annual Cost to Public: \$0.

IV. Request for Comments

Comments are invited on: (a) Whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information shall have practical utility; (b) the accuracy of the agency's estimate of the burden (including hours and cost) of the proposed collection of information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; and (d) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or other forms of information technology.

Comments submitted in response to this notice will be summarized and/or included in the request for OMB approval of this information collection; they also will become a matter of public record.

Dated: April 8, 2014.

Gwellnar Banks,

Management Analyst, Office of the Chief Information Officer.

BILLING CODE 3510-13-P

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

RIN 0648-XZ21

Notice of Availability of a Final Programmatic Environmental Impact Statement for Hawaiian Monk Seal Recovery Actions

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Notice of Availability of a Final Programmatic Environmental Impact Statement; Request for Comments.

SUMMARY: NMFS announces the availability of the "Final Programmatic Environmental Impact Statement (PEIS) for Hawaiian monk seal Recovery Actions." Publication of this notice begins the official public comment period for the Final PEIS. The purpose of the Final PEIS is to evaluate, in compliance with the National Environmental Policy Act (NEPA), the potential direct, indirect, and cumulative impacts on the human environment from implementing the alternative approaches for funding, undertaking, and permitting research and enhancement activities on Hawaiian monk seals (*Monachus schauinslandi*).

DATES: Written comments must be received on or before May 12, 2014. While NMFS is not required to respond to comments received on the Final PEIS, we will review and consider them prior to issuing a Record of Decision. The Record of Decision will include information on the alternatives considered, the preferred alternative and why we chose it, and required mitigation and monitoring.

ADDRESSES: Comments on the Final PEIS for this action may be submitted by:

- Email: monkseal@noaa.gov.
- Fax: 301-713-0376.
- Mail: NOAA, NMFS, 1315 East-West Highway, SSMC3, F/PR1, Room 13715, Silver Spring, MD 20910 (ATTN: Monk Seal PEIS).

FOR FURTHER INFORMATION CONTACT: Amy Sloan (301-427-8401, monkseal@noaa.gov).

SUPPLEMENTARY INFORMATION: NMFS is the Federal agency responsible for management, recovery and conservation of Hawaiian monk seals under the Endangered Species Act (ESA; 16 United States Code [U.S.C.] 1531 *et seq.*) and the Marine Mammal Protection Act (MMPA; 16 U.S.C. 1361 *et seq.*). As part of their responsibilities, NMFS funds, permits, and conducts research and enhancement activities on endangered Hawaiian monk seals in the Northwestern Hawaiian Islands (NWHI), main Hawaiian Islands (MHI), and at Johnston Atoll. NMFS proposes to implement research and enhancement actions identified in the 2007 Hawaiian Monk Seal Recovery Plan, with the goal of conserving and recovering the species. This Final PEIS provides decision-makers and the public with an evaluation of the environmental, social, and economic effects of the proposed recovery actions and alternatives.

The agency's recommended Preferred Alternative is Alternative 3 (Limited Translocation). Alternative 3 encompasses a broad scope of research and enhancement activities that would yield greater recovery benefits to the species over the next several years than would be expected under the other alternatives. It is important to note that while Alternative 4 (Enhanced Implementation) was Preferred in the Draft PEIS, Alternative 3 has been selected as the Preferred Alternative in the Final PEIS. The only distinction between these two Alternatives is that Alternative 3 (Preferred) does not include any translocation option that would involve taking seals born in the NWHI and releasing them in the MHI.

Background

The Hawaiian monk seal is a critically endangered species found only in the U.S., within the Hawaiian Archipelago and at Johnston Atoll. The population is estimated to have around 1,200 individuals and is declining by roughly 4% each year. Since the 1980's, NMFS has conducted research to understand, and enhancement activities to mitigate, threats to the survival of monk seals. Most of this work has been in the NWHI where the majority of seals live and breed. More recently, a natural increase in the number of seals in the MHI has prompted researchers and managers to begin studying and aiding seals in the MHI.

Despite measures taken to save the monk seal, the species is not showing signs of recovery. In the NWHI, young seals are continuing to starve to death, nursing and newly weaned pups are being killed by sharks, seals are getting entangled in marine debris, and sea

level rise threatens terrestrial habitats. Low juvenile survival over the past two decades is the primary cause of the population's decline. There is insufficient recruitment into the breeding population, and the population decline will likely continue without additional intervention.

On October 1, 2010, NMFS provided public notice (75 FR 60721) that it would prepare a PEIS to assess the impacts of implementing specific management actions and administering a research and enhancement program to improve survival of Hawaiian monk seals. The 45-day public scoping period was extended 15 days (75 FR 69398) and ended November 30, 2010. As part of scoping, NMFS hosted public meetings to introduce the project proposal, describe the PEIS process, and solicit input on the issues and alternatives to be evaluated. Public scoping meetings were held in October 2010 on the islands of O'ahu, Hawai'i, Maui, Moloka'i, and Kaua'i. During the scoping comment period, 139 public comments were received. The Scoping Report is available on the project Web site: <http://www.nmfs.noaa.gov/pr/permits/eis/hawaiianmonkseal.htm>.

On August 19, 2011, NMFS provided public notice (76 FR 51945) that the Draft PEIS for Hawaiian Monk Seal Recovery Actions was available for public comment, and the Draft PEIS was released for public review on the project Web site listed above. The public comment period ended on October 17, 2011. A total of 341 comment submissions were received from agencies and the public on the Draft PEIS. These submissions generated 1,180 substantive comments. Comments received during the scoping process and public comment period on the Draft PEIS raised issues that have been addressed or incorporated in the Final PEIS. A Comment Analysis Report is included in Appendix C to the Final PEIS and is available on the project Web site listed above. This report includes public comments received, NMFS' responses, and where in the PEIS the comments are addressed or revisions are made.

Alternatives

NMFS has evaluated a preferred alternative (Alternative 3) and three others in the Final PEIS. These are summarized as follows:

Alternative 1: Status Quo Alternative: Under the Status Quo Alternative, research and enhancement activities would be carried out as currently permitted under the MMPA and ESA. New permits could be issued in the future to maintain the current levels of

research and enhancement activities. Some elements of this alternative include:

- Monitoring via ground, vessel, and aerial surveys;
- Marking and photo ID;
- Health screening and instrumentation;
- De-worming research;
- Specimen collection and import/export of specimens;
- Disentanglement and dehooking;
- Adult male removal for enhancement; and
- Translocation for enhancement including:
 - Translocating abandoned nursing pups to a prospective foster mother or their natural mother within their birth island or atoll;
 - Translocating weaned pups from a high risk area (e.g., known shark predation) to a low risk area within the same island or atoll in the NWHI or Johnston Atoll; translocations in the MHI may be to a different location on the same island or to a different island in the MHI;
 - Translocating weaned pups in subpopulations where juvenile survival is low to subpopulations with higher rates of juvenile survival; seals may only be translocated among subpopulations within the NWHI.

No new activities or expanded scope of existing activities would occur under the Status Quo Alternative.

Alternative 2: No Action: Under this alternative, the above-mentioned permitted research and enhancement activities would stop in June 2014 when the current permit expires. At that time, all research and enhancement activities that require a permit would cease except for those activities covered by the NMFS Marine Mammal Health and Stranding Response Program, such as responding to stranded, injured, or entangled seals in need of intervention.

Alternative 3: Limited Translocation (Preferred Alternative): Alternative 3 includes activities described in the Status Quo as well as new and expanded activities. The new and expanded activities include, but are not limited to:

- Vaccination studies and potential implementation of a vaccination program to prevent or mitigate infectious disease.
- Potential implementation of de-worming as an enhancement tool to improve juvenile Hawaiian monk seal survival.
- Expanded scope and number of seal translocations in addition to those in the status quo, including:

- Taking seals with unmanageable human interactions from the MHI to NWHI.
- Taking juvenile and older seals from the MHI to NWHI to examine their subsequent survival.
- Implementing a two-stage translocation program whereby weaned pups are taken from areas of lower survival to areas of higher survival (within the NWHI, within the MHI, or from the MHI to NWHI, but not from the NWHI to MHI), with the option of returning them to their natal location or nearest appropriate site at age 2 years and older. Note that seals originally born in the MHI and translocated to the NWHI may be returned to the MHI.
- Supplemental feeding of monk seals in NWHI locations where seals are released after being cared for in captivity (post-rehabilitation).
- Research to develop tools for modifying undesirable Hawaiian monk seal behavior related to interactions with humans and fishing gear in the MHI. If proven effective by research, these tools would be implemented.
- Chemical alteration of aggressive male monk seal behavior using a drug to reduce testosterone.

Alternative 4: Enhanced Implementation: The only difference between Alternative 4 and Alternative 3 (Preferred) is that Alternative 4 would also allow for two-stage translocation of weaned pups from the NWHI to the MHI and their subsequent return at age 2 or 3 years to the NWHI. The ability under Alternative 4 to conduct two-stage translocation from the NWHI to the MHI would allow for maximal flexibility to take advantage of the potential benefits of two-stage translocation, because weaned pups could be moved to wherever their survival chances are best. However, implementing two-stage translocations from the NWHI to the MHI would be infeasible at this time. NWHI pups, once brought to the MHI, could become involved in fishery and other human interactions, just as has occurred among some seals born in the MHI. Capacity and techniques for monitoring translocated seals, and intervening to prevent and mitigate such interactions, must be further developed before this action can be conducted without risking failure as measured both in terms of seal survival and public attitudes toward monk seal conservation. Thus, while Alternative 4 was the preferred alternative in the Draft PEIS, it is not the preferred alternative in the Final PEIS.

Authority: 16 U.S.C. 1361 *et seq.* and 16 U.S.C. 1531 *et seq.*

Dated: April 4, 2014.

National Oceanic and Atmospheric Administration

RIN 0648-XD219

Fisheries of the South Atlantic; South Atlantic Fishery Management Council (Council); Public Meeting

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Department of Commerce.

ACTION: Notice of public meetings.

SUMMARY: The South Atlantic Fishery Management Council (SAFMC) will hold meetings of its Information & Education Advisory Panel (AP) Meeting and Science Communication Workshop; Deepwater Shrimp AP; and Coral AP, in North Charleston, SC.

DATES: The meetings will be held from 8 a.m. on Monday, May 5, 2014 until 4:30 p.m. on Thursday, May 8, 2014.

ADDRESSES: The meetings will be held at the Crowne Plaza Hotel, 4831 Tanger Outlet Blvd., North Charleston, SC 29418; telephone: (877) 227-6963 or (843) 744-4422; fax: (843) 744-4472.

Council address: South Atlantic Fishery Management Council, 4055 Faber Place Drive, Suite 201, N. Charleston, SC 29405.

FOR FURTHER INFORMATION CONTACT: Kim Iverson, Public Information Officer, SAFMC; telephone: (843) 571-4366 or toll free: (866) SAFMC-10; fax: (843) 769-4520; email: kim.iverson@safmc.net.

SUPPLEMENTARY INFORMATION: The items of discussion in the individual meeting agendas are as follows:

Information & Education AP Agenda & Science Communication Workshop, Monday, May 5, 2014, 8 a.m. Until 5 p.m. Tuesday, May 6, 2014

1. Receive an update on SAFMC outreach activities 2013-14.
2. Receive an overview and update on the Council's Snapper Grouper Visioning Project and port meetings.
3. Review the draft Oculina Evaluation Team Report.
4. Receive an update on the Marine Resources Education Program (MREP) for the Southeast region.

5. Elect a new Chairperson and Vice-Chair for the AP.

6. Discuss the principles of effective science communication as well as the creation of effective science communication products.

Deepwater Shrimp AP Agenda, Tuesday May 6, 2014, 1 p.m. Through 12 Noon Wednesday, May 7, 2014

1. Receive a status update on Coral Amendment 8, pertaining to Coral Habitat Areas of Particular Concern (HAPCs) and transit through the Oculina Bank HAPC.

2. Review the draft Oculina Evaluation Team Report.

3. Provide input on potential changes to HAPCs (Coral Amendment 9).

Coral AP Agenda, Wednesday, May 7, 2014, 1 p.m. Through 4:30 p.m. Thursday, May 8, 2014

1. Receive a status update on Coral Amendment 8.

2. Receive a status update of the SAFMC's Cooperative Agreement proposal with NOAA's Coral Reef Conservation Program.

3. Review the draft Oculina Evaluation Team Report.

4. Provide input for potential changes to HAPCs (Coral Amendment 9).

Although non-emergency issues not contained in this agenda may come before this group for discussion, those issues may not be the subject of formal action during these meetings. Action will be restricted to those issues specifically identified in this notice and any issues arising after publication of this notice that require emergency action under section 305(c) of the Magnuson-Stevens Fishery Conservation and Management Act, provided the public has been notified of the Council's intent to take final action to address the emergency.

Special Accommodations

These meetings are physically accessible to people with disabilities. Requests for auxiliary aids should be directed to the council office (see **ADDRESSES**) 3 days prior to the meeting.

Note: The times and sequence specified in this agenda are subject to change.

Authority: 16 U.S.C. 1801 *et seq.*

Dated: April 8, 2014.

Takes of Marine Mammals Incidental to Specified Activities; St. George Reef Light Station Restoration and Maintenance at Northwest Seal Rock, Del Norte County, California

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Notice; issuance of an incidental harassment authorization.

SUMMARY: In accordance with the Marine Mammal Protection Act (MMPA) regulations, we hereby give notification that the National Marine Fisheries Service has issued an Incidental Harassment Authorization (Authorization) to St. George Reef Lighthouse Preservation Society (Society), to take by harassment incidental to conducting aircraft operations, lighthouse renovation, and light maintenance activities on the St. George Reef Light Station on Northwest Seal Rock in the northeast Pacific Ocean.

DATES: Effective April 11 2014, through April 10, 2015.

ADDRESSES: The public may obtain an electronic copy of the Society's application, supporting documentation, the authorization, and a list of the references cited in this document by visiting: <http://www.nmfs.noaa.gov/pr/permits/incidental.htm#applications>. In the case of problems accessing these documents, please call the contact listed here (see **FOR FURTHER INFORMATION CONTACT**).

The Environmental Assessment and associated Finding of No Significant Impact, prepared pursuant to the National Environmental Policy Act of 1969, are also available at the same site.

FOR FURTHER INFORMATION CONTACT:

Jeannine Cody, Office of Protected Resources, NMFS (301) 427–8401.

SUPPLEMENTARY INFORMATION:

Section 101(a)(5)(D) of the Marine Mammal Protection Act (MMPA; 16 U.S.C. 1361 *et seq.*) directs the Secretary of Commerce to authorize, upon request, the incidental, but not intentional, taking of small numbers of marine mammals of a species or population stock, by United States citizens who engage in a specified activity (other than commercial fishing) within a specified geographical region if: (1) NMFS makes certain findings; (2) the taking is limited to harassment; and (3) NMFS provides a notice of a proposed authorization to the public for review.

NMFS shall grant an authorization for the incidental taking of small numbers of marine mammals if we find that the taking will have a negligible impact on the species or stock(s), and will not have an unmitigable adverse impact on the availability of the species or stock(s) for subsistence uses (where relevant). Also, the authorization must set forth the permissible methods of taking and requirements pertaining to the monitoring and reporting of such takings. NMFS has defined "negligible impact" in 50 CFR 216.103 as "an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival."

Except with respect to certain activities not pertinent here, the MMPA defines "harassment" as: Any act of pursuit, torment, or annoyance which (i) has the potential to injure a marine mammal or marine mammal stock in the wild [Level A harassment]; or (ii) has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering [Level B harassment].

Summary of Request

On December 14, 2013, NMFS received an application from the Society requesting that NMFS issue an Authorization for the take of marine mammals, incidental to conducting restoration activities on the St. George Reef Light Station (Station) located on Northwest Seal Rock offshore of Crescent City, California in the northeast Pacific Ocean. NMS determined the application complete and adequate on January 13, 2014. The Society proposes to conduct aircraft operations, lighthouse renovation, and

periodic maintenance on the Station's optical light system on a monthly basis. The proposed activity would occur on a monthly basis over one weekend, April 11 through April 30, 2014 and November 1, 2014, through April 10, 2015.

The following specific aspects of the proposed activities have the potential to take marine mammals: (1) Helicopter landings/takeoffs; (2) noise generated during restoration activities (e.g., painting, plastering, welding, and glazing); (3) maintenance activities (e.g., bulb replacement and automation of the light system); and (4) human presence. Thus, we anticipate that take, by Level B harassment only, of California sea lions (*Zalophus californianus*); Pacific harbor seals (*Phoca vitulina*); Steller sea lions (*Eumetopias jubatus*), eastern distinct population segment (DPS); and northern fur seals (*Callorhinus ursinus*) could result from the specified activity.

To date, NMFS has issued four Authorizations to the Society for the conduct of the same activities from 2010 to 2013 (75 FR 4774, January 29, 2010; 76 FR 10564, February 25, 2011; 77 FR 8811, February 15, 2012; and 79 FR 6179, February 3, 2014). This is the Society's fifth request for an annual Authorization as their last Authorization expired on December 31, 2013.

Description of the Specified Activity

Overview

The Station, listed in the National Park Service's National Register of Historic Places, is located on Northwest Seal Rock (NWSR) offshore of Crescent City, California in the northeast Pacific Ocean. The Station, built in 1892, rises 45.7 meters (m) (150 feet (ft)) above sea level. The structure consists of hundreds of granite blocks topped with a cast iron lantern room and covers much of the surface of the islet.

Dates and Duration

The Authorization would be effective from April 11 through April 30, 2014 and November 1, 2014, through April 10, 2015. Following is a brief summary of the dates and duration of the activities.

The purpose of the project is to restore the lighthouse and to conduct annual and emergency maintenance on the Station's optical light system. The Society proposes to conduct the activities (aircraft operations, lighthouse restoration, and maintenance activities) from the period of April 1, 2014 through March 31, 2015, at a maximum frequency of one session per month. The proposed duration for each session

would last no more than three days (e.g., Friday, Saturday, and Sunday).

Specified Geographic Region

The Station is located on a small, rocky islet (41°50'24" N, 124°22'06" W) approximately nine kilometers (km) (6.0 miles (mi)) in the northeast Pacific Ocean, offshore of Crescent City, California (Latitude: 41°46'48" N; Longitude: 124°14'11" W). NWSR is approximately 91.4 m (300 ft) in diameter that peaks at 5.18 m (17 ft) above mean sea level.

Detailed Description of Activities

We outlined the purpose of the Society's activities in a previous notice for the proposed authorization (79 FR 9170, February 18, 2014). The proposed activities have not changed between the proposed authorization notice and this final notice announcing the issuance of the Authorization. For a more detailed description of the authorized action, we refer the reader to the notice for the proposed authorization (79 FR 9170, February 18, 2014).

Comments and Responses

We published a notice of receipt of the Society's application and proposed Authorization in the **Federal Register** on February 18, 2014 (79 FR 9170). During the 30-day comment period, we received one comment from the Marine Mammal Commission (Commission) which recommended that NMFS issue the requested Authorization, provided that the Society carries out the required monitoring and mitigation measures as described in the notice of the proposed authorization (79 FR 9170, February 18, 2014) and the application. We have included all measures proposed in the notice of the proposed authorization (79 FR 9170, February 18, 2014) in the Authorization.

Description of the Marine Mammals in the Area of the Proposed Specified Activity

The marine mammals most likely to be harassed incidental to the Society's helicopter operations, lighthouse restoration, and lighthouse maintenance on NWSR are primarily Steller and California sea lions and to a lesser extent the Pacific harbor seal and the eastern Pacific stock of northern fur seal. NMFS refers the public to Carretta *et al.*, (2013) and Allen and Angliss (2013) for general information on these species which we presented in the notice of the proposed authorization (79 FR 9170, February 18, 2014). The publications are available at: <http://www.nmfs.noaa.gov/pr/sars/pdf/po2012.pdf> and <http://www.nmfs.noaa.gov/pr/sars/pdf/ak2012.pdf>.

www.nmfs.noaa.gov/pr/sars/pdf/ak2012.pdf.

Other Marine Mammals in the Proposed Action Area

California (southern) sea otters (*Enhydra lutris nereis*), listed as threatened under the ESA and categorized as depleted under the MMPA, usually range in coastal waters within two km (1.2 mi) of the mainland shore. The Society has not encountered the species during the course of the previous four Authorizations. The U.S. Fish and Wildlife Service (USFWS) manages this species and NMFS does not consider it further in this notice of issuance of an Authorization.

Potential Effects on Marine Mammals

Acoustic and visual stimuli generated by: (1) Helicopter landings/takeoffs; (2) noise generated during restoration activities (e.g., painting, plastering, welding, and glazing); and (3) maintenance activities (e.g., bulb replacement and automation of the light system) may have the potential to cause California sea lions, Pacific harbor seals, northern elephant seals, and Steller sea lions hauled out on NWSR to flush into the surrounding water or to cause a short-term behavioral disturbance for marine mammals.

NMFS expects that acoustic and visual stimuli resulting from the Society's proposed activities have the potential to harass marine mammals. NMFS also expects that these disturbances would be temporary and result, at worst, in a temporary modification in behavior and/or low-level physiological effects (Level B harassment) of certain species of marine mammals.

We included a summary and discussion of the ways that the types of stressors associated with the Society's specified activities (i.e., visual and acoustic disturbances) have the potential to impact marine mammals in a previous notice for the proposed authorization (79 FR 9170, February 18, 2014).

Rookeries: There are no rookeries for California sea lions, Pacific harbor seals, northern elephant seals, and Steller sea lions on NWSR and there are no reports of these species breeding on the islet.

Anticipated Effects on Habitat

NMFS considered these impacts in detail in the notice for the proposed authorization (79 FR 9170, February 18, 2014). Briefly, NMFS does not anticipate that the proposed activities would result in any significant or long-term effects on the habitats used by the marine mammals in the proposed area,

including the food sources they use (i.e., fish and invertebrates). While NMFS anticipates that the specified activity could potentially result in marine mammals avoiding certain areas due to temporary ensonification and human presence, this impact to habitat is temporary and reversible. NMFS does not consider behavioral modification to cause significant or long-term consequences for individual marine mammals or their populations.

Mitigation

In order to issue an incidental take authorization under section 101(a)(5)(D) of the MMPA, NMFS must set forth the permissible methods of taking pursuant to such activity, and other means of effecting the least practicable adverse impact on such species or stock and its habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance, and on the availability of such species or stock for taking for certain subsistence uses (where relevant).

As a way to reduce or minimize adverse impacts that would result from the proposed project to the lowest level practicable, NMFS requires the following mitigation measures.

Time and Frequency

The Society would conduct restoration activities at a maximum of once per month between April 11 through April 30, 2014 and November 1, 2014, through April 10, 2015. Each restoration session would last no more than three days. Maintenance of the light beacon would occur only in conjunction with restoration activities.

Helicopter Approach and Timing Techniques

The Society would ensure that its helicopter approach patterns to the Station and timing techniques do not disturb marine mammals as most practicable. To the extent possible, the helicopter should approach NWSR when the tide is too high for the marine mammals to haul-out on NWSR. Since the most severe impacts (stampede) precede rapid and direct helicopter approaches, the Society's initial approach to the Station must be offshore from the island at a relatively high altitude (e.g., 800–1,000 ft, or 244–305 m). Before the final approach, the helicopter shall circle lower, and approach from area with the lowest pinniped density. If for any safety reasons (e.g., wind condition) the Society cannot conduct these types of helicopter approach and timing techniques, they must abort the

restoration and maintenance activities for that day.

The Authorization would limit the Society's access to NWSR from May 1, 2014, through October 31, 2014 in the event that mothers and pups haul out on the islet. NMFS estimates that the likelihood of mother-pup separation during helicopter overflights would be rare as the authorized activities would occur outside of the breeding season for the pinnipeds present on NWSR

Avoidance of Visual and Acoustic Contact With People

The Society would instruct its members and restoration crews to avoid making unnecessary noise and not present themselves visually to pinnipeds around the base of the Station. The door to the lower platform (which the pinnipeds occasionally use to rest) shall remain closed and barricaded to all tourists and other personnel.

Mitigation Conclusions

NMFS has carefully evaluated the Society's proposed mitigation measures in the context of ensuring that we prescribe the means of effecting the least practicable impact on the affected marine mammal species and stocks and their habitat. NMFS' evaluation of potential measures included consideration of the following factors in relation to one another:

- The manner in which, and the degree to which, the successful implementation of the measure is expected to minimize adverse impacts to marine mammals;
- The proven or likely efficacy of the specific measure to minimize adverse impacts as planned; and
- The practicability of the measure for applicant implementation.

Any mitigation measure(s) prescribed by NMFS should be able to accomplish, have a reasonable likelihood of accomplishing (based on current science), or contribute to the accomplishment of one or more of the general goals listed here:

1. Avoidance or minimization of injury or death of marine mammals wherever possible (goals 2, 3, and 4 may contribute to this goal).
2. A reduction in the numbers of marine mammals (total number or number at biologically important time or location) exposed to helicopter operations and human presence that we expect to result in the take of marine mammals (this goal may contribute to 1, above, or to reducing harassment takes only).
3. A reduction in the number of times (total number or number at biologically

important time or location) individuals would be exposed to helicopter operations or human presence that we expect to result in the take of marine mammals (this goal may contribute to 1, above, or to reducing harassment takes only).

4. A reduction in the intensity of exposures (either total number or number at biologically important time or location) to helicopter operations or human presence that NMFS expects to result in the take of marine mammals (this goal may contribute to 1, above, or to reducing the severity of harassment takes only).

5. Avoidance or minimization of adverse effects to marine mammal habitat, paying special attention to the food base, activities that block or limit passage to or from biologically important areas, permanent destruction of habitat, or temporary destruction/disturbance of habitat during a biologically important time.

6. For monitoring directly related to mitigation—an increase in the probability of detecting marine mammals, thus allowing for more effective implementation of the mitigation.

Based on the evaluation of the Society's proposed measures, NMFS has determined that the proposed mitigation measures provide the means of effecting the least practicable impact on marine mammal species or stocks and their habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance.

Monitoring

In order to issue an ITA for an activity, section 101(a)(5)(D) of the MMPA states that NMFS must set forth "requirements pertaining to the monitoring and reporting of such taking." The MMPA implementing regulations at 50 CFR 216.104 (a)(13) indicate that requests for Authorizations must include the suggested means of accomplishing the necessary monitoring and reporting that will result in increased knowledge of the species and of the level of taking or impacts on populations of marine mammals that NMFS expects to be present in the proposed action area.

As part of its 2013 application, the Society proposed to sponsor marine mammal monitoring during the present project, in order to implement the mitigation measures that require real-time monitoring, and to satisfy the monitoring requirements of the Authorization.

At least once during the period between April 11 through April 30, 2014 and November 1, 2014, through

April 10, 2015, a qualified biologist will be present during all three workdays at the Station. The qualified biologist hired will be subject to approval by NMFS. He/she shall document use of the island by the pinnipeds, frequency, (i.e., dates, time, tidal height, species, numbers present, and any disturbances), and note any responses to potential disturbances.

Aerial photographic surveys may provide the most accurate means of documenting species composition, age and sex class of pinnipeds using the project site during human activity periods. The Society should complete aerial photo coverage of the island from the same helicopter used to transport the Society's personnel to the island during restoration trips. The Society will take photographs of all marine mammals hauled out on the island at an altitude greater than 300 m (984 ft) by a skilled photographer, prior to the first landing on each visit included in the monitoring program. Photographic documentation of marine mammals present at the end of each three-day work session shall also be made for a before and after comparison. The Society will forward the photographs to a biologist capable of discerning marine mammal species. The Society shall provide the data to NMFS in the form of a report with a data table, any other significant observations related to marine mammals, and a report of restoration activities.

The Society complied with the mitigation and monitoring required under the previous authorizations (2010–2013). They did not conduct any operations for the 2013 season and have not exceeded activity levels analyzed under previous Authorizations. The results from previous monitoring reports support our findings that the proposed mitigation measures, which NMFS also required under the 2010–2013 Authorizations provide the means of effecting the least practicable adverse impact on the species or stock.

Reporting

The Society will submit a draft Monitoring Report to us no later than 90 days after they complete the project to the NMFS Director of Office of Protected Resources. Within 30 days after receiving comments from NMFS on the draft Final Monitoring Report, the Society must submit a Final Monitoring Report to the NMFS Director of Office of Protected Resources. If the Society receives no comments from NMFS on the draft Monitoring Report, then NMFS will consider the draft Monitoring Report to be the Final Monitoring Report. The final report will provide:

1. A summary and table of the dates, times, and weather during all helicopter operations, and restoration and maintenance activities.

2. Species, number, location, and behavior of any marine mammals, observed throughout all monitoring activities.

3. An estimate of the number (by species) of marine mammals exposed to acoustic or visual stimuli associated with the helicopter operations, restoration, and maintenance activities.

4. A description of the implementation and effectiveness of the monitoring and mitigation measures of the Authorization and full documentation of methods, results, and interpretation pertaining to all monitoring.

In the unanticipated event that the specified activity clearly causes the take of a marine mammal in a manner prohibited by the authorization (if issued), such as an injury (Level A harassment), serious injury, or mortality (e.g., vessel-strike, stampede, etc.), the Society shall immediately cease the specified activities and immediately report the incident to the Incidental Take Program Supervisor, Permits and Conservation Division, Office of Protected Resources, NMFS, at 301–427–8401 and/or by email to *Jolie.Harrison@noaa.gov* and *ITP.Cody@noaa.gov* and the Assistant Western Regional Stranding Coordinator at (562) 980–3264 (*Justin.Greenman@noaa.gov*). The report must include the following information:

- Time, date, and location (latitude/longitude) of the incident;
- Description and location of the incident (including water depth, if applicable);
- Environmental conditions (e.g., wind speed and direction, Beaufort sea state, cloud cover, and visibility);
- Description of all marine mammal observations in the 24 hours preceding the incident;
- Species identification or description of the animal(s) involved;
- Fate of the animal(s); and
- Photographs or video footage of the animal(s) (if equipment is available).

The Society shall not resume its activities until NMFS is able to review the circumstances of the prohibited take. NMFS shall work with the Society to determine what is necessary to minimize the likelihood of further prohibited take and ensure Marine Mammal Protection Act compliance. The Society may not resume their activities until notified by us via letter, email, or telephone.

In the event that the Society discovers an injured or dead marine mammal, and

the lead visual observer determines that the cause of the injury or death is unknown and the death is relatively recent (i.e., in less than a moderate state of decomposition as we describe in the next paragraph), the Society will immediately report the incident to the Incidental Take Program Supervisor, Permits and Conservation Division, Office of Protected Resources, NMFS, at 301–427–8401 and/or by email to *Jolie.Harrison@noaa.gov* and *ITP.Cody@noaa.gov* and the Assistant Western Regional Stranding Coordinator at (562) 980–3264 (*Justin.Greenman@noaa.gov*). The report must include the same information identified in the paragraph above this section. Activities may continue while NMFS reviews the circumstances of the incident. NMFS will work with the Society to determine whether modifications in the activities are appropriate.

In the event that the Society discovers an injured or dead marine mammal, and the lead visual observer determines that the injury or death is not associated with or related to the authorized activities (e.g., previously wounded animal, carcass with moderate to advanced decomposition, or scavenger damage), the Society will report the incident to the Incidental Take Program Supervisor, Permits and Conservation Division, Office of Protected Resources, NMFS, at 301–427–8401 and/or by email to *Jolie.Harrison@noaa.gov* and *ITP.Cody@noaa.gov* and the Assistant Western Regional Stranding Coordinator at (562) 980–3264 (*Justin.Greenman@noaa.gov*) within 24 hours of the discovery. The Society's staff will provide photographs or video footage (if available) or other documentation of the stranded animal sighting to NMFS.

Estimated Take by Incidental Harassment

Except with respect to certain activities not pertinent here, the MMPA defines "harassment" as:

any act of pursuit, torment, or annoyance which (i) has the potential to injure a marine mammal or marine mammal stock in the wild [Level A harassment]; or (ii) has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering [Level B harassment].

NMFS anticipates that the helicopter operations and restoration and maintenance activities have the potential to harass (Level B only) marine mammals that may be present on NWSR. Thus NMFS will only authorize take by Level B harassment as a result of the helicopter operations and

restoration and maintenance activities on NWSR.

Based on pinniped survey counts conducted the Society on NWSR in the spring of 1997, 1998, 1999, and 2000 (CCR, 2001), NMFS estimates that approximately 204 California sea lions (calculated by multiplying the average monthly abundance of California sea lions (zero in April, 1997 and 34 in April, 1998) present on NWSR by 6 months of the restoration and maintenance activities), 172 Steller sea lions (NMFS' estimate of the maximum number of Steller sea lions that could be present on NWSR with a 95-percent confidence interval), 36 Pacific harbor seals (calculated by multiplying the maximum number of harbor seals present on NWSR (6) by 6 months), and 6 northern fur seals (calculated by multiplying the maximum number of northern fur seals present on NWSR (1) by 6 months) could be potentially affected by Level B behavioral harassment over the course of the Authorization. NMFS bases these estimates of the numbers of marine mammals that might be affected on consideration of the number of marine mammals that could be disturbed appreciably by approximately 51 hours of aircraft operations during the course of the activity. These incidental harassment take numbers represent approximately 0.14 percent of the U.S. stock of California sea lion, 0.42 percent of the eastern U.S. stock of Steller sea lion, 0.11 percent of the California stock of Pacific harbor seals, and 0.06 percent of the San Miguel Island stock of northern fur seal.

Because of the required mitigation measures and the likelihood that some pinnipeds would avoid the area, NMFS does not expect any injury or mortality to pinnipeds to occur and NMFS has not authorized take by Level A harassment for this activity.

Encouraging and Coordinating Research

The Society will continue to coordinate monitoring of pinnipeds during the helicopter operations and restoration activities which contribute to the basic knowledge of marine mammal biology on NWSR.

Analysis and Determinations

Negligible Impact

Negligible impact' is "an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival" (50 CFR 216.103). The lack of likely

adverse effects on annual rates of recruitment or survival (i.e., population level effects) forms the basis of a negligible impact finding. Thus, an estimate of the number of Level B harassment takes, alone, is not enough information on which to base an impact determination. In addition to considering estimates of the number of marine mammals that might be "taken" through behavioral harassment, NMFS must consider other factors, such as the likely nature of any responses (their intensity, duration, etc.), the context of any responses (critical reproductive time or location, migration, etc.), as well as the number and nature of estimated Level A harassment takes, and the number of estimated mortalities, and effects on habitat.

In making a negligible impact determination, NMFS considers:

- The number of anticipated injuries, serious injuries, or mortalities;
- The number, nature, and intensity, and duration of Level B harassment; and
- The context in which the takes occur (e.g., impacts to areas of significance, impacts to local populations, and cumulative impacts when taking into account successive/contemporaneous actions when added to baseline data);
- The status of stock or species of marine mammals (i.e., depleted, not depleted, decreasing, increasing, stable, impact relative to the size of the population);
- Impacts on habitat affecting rates of recruitment/survival; and
- The effectiveness of monitoring and mitigation measures.

For reasons stated previously in this document and based on the following factors, the Society's specified activities are not likely to cause long-term behavioral disturbance, abandonment of the haulout area, injury, serious injury, or mortality because:

(1) The effects of the Society's operations would be limited to no responses, short-term startle responses, or temporary behavioral changes due to the short and sporadic duration of the restoration activities. Minor and brief responses, such as short-duration startle or alert reactions, are not likely to constitute disruption of behavioral patterns, such as migration, nursing, breeding, feeding, or sheltering.

(2) The availability of alternate areas for pinnipeds to avoid the resultant acoustic and visual disturbances from the restoration activities and helicopter operations. Results from previous monitoring reports also show that the pinnipeds returned to the various sites and did not permanently abandon haul-

out sites after the Society conducted their activities.

(3) There is no potential for large-scale movements leading to injury, serious injury, or mortality because the Society must delay ingress onto NWSR until after the pinnipeds present have slowly entered the water.

NMFS does not anticipate that any injuries, serious injuries, or mortalities would occur as a result of the Society's proposed activities, and NMFS is not authorizing injury, serious injury, or mortality. These species may exhibit behavioral modifications, including temporarily vacating the area during the proposed helicopter operations and restoration activities to avoid the resultant acoustic and visual disturbances. Further, these activities will not take place in areas of significance for marine mammal feeding, resting, breeding, or calving and would not adversely impact marine mammal habitat. Due to the nature, degree, and context of the behavioral harassment anticipated, the activities are not expected to impact rates of recruitment or survival.

Based on this notice's analysis of the likely effects of the specified activity on marine mammals and their habitat, and taking into consideration the implementation of the proposed monitoring and mitigation measures, NMFS finds that the Society's proposed helicopter operations and restoration/maintenance activities will have a negligible impact on the affected marine mammal species or stocks.

Small Numbers

As mentioned previously, NMFS estimates that the Society's activities could potentially affect, by Level B harassment only, four species of marine mammals under our jurisdiction. For each species, these estimates are small (each, less than or equal to one percent) relative to the population size. These incidental harassment take numbers represent approximately 0.14 percent of the U.S. stock of California sea lion, 0.42 percent of the eastern U.S. stock of Steller sea lion, 0.11 percent of the California stock of Pacific harbor seals, and 0.06 percent of the San Miguel Island stock of northern fur seal. Because of the required mitigation measures and the likelihood that some pinnipeds will avoid the area, no injury or mortality to pinnipeds is expected nor requested. The proposed taking would be limited to small numbers of marine mammals, relative to the population sizes of the affected species or stocks (i.e., for each species, these numbers are less than one percent).

Based on the analysis contained herein of the likely effects of the specified activity on marine mammals and their habitat, and taking into consideration the implementation of the mitigation and monitoring measures, NMFS finds that the Society's helicopter operations and restoration/maintenance activities will take small numbers of marine mammals relative to the populations of the affected species or stocks.

Impact on Availability of Affected Species or Stock for Taking for Subsistence Uses

There are no relevant subsistence uses of marine mammals implicated by this action.

Endangered Species Act (ESA)

NMFS does not expect that the Society's proposed helicopter operations and restoration/maintenance activities would affect any species listed under the ESA. Therefore, NMFS has determined that a section 7 consultation under the ESA is not required.

National Environmental Policy Act (NEPA)

To meet our NEPA requirements for the issuance of an Authorization to the Society, NMFS prepared an Environmental Assessment (EA) in 2010 that was specific to conducting aircraft operations and restoration and maintenance work on the St. George Reef Light Station. The EA, titled "Issuance of an Incidental Harassment Authorization to Take Marine Mammals by Harassment Incidental to Conducting Aircraft Operations, Lighthouse Restoration and Maintenance Activities on St. George Reef Lighthouse Station in Del Norte County, California," evaluated the impacts on the human environment of our authorization of incidental Level B harassment resulting from the specified activity in the specified geographic region. At that time, NMFS concluded that issuance of an annual Authorization would not significantly affect the quality of the human environment and issued a Finding of No Significant Impact (FONSI) for the 2010 EA regarding the Society's activities. In conjunction with the Society's 2014 application, NMFS has again reviewed the 2010 EA and determined that there are no new direct, indirect or cumulative impacts to the human and natural environment associated with the Authorization requiring evaluation in a supplemental EA and NMFS, therefore, intends to reaffirm the 2010 FONSI. An electronic copy of the EA and the FONSI for this activity is available upon request (see **ADDRESSES**).

Authorization

As a result of these determinations, NMFS has issued an Authorization to the Society for conducting helicopter operations and restoration activities on the St. George Light Station in the northeast Pacific Ocean, April 11 through April 30, 2014 and November 1, 2014, through April 10, 2015, provided they incorporate the previously mentioned mitigation, monitoring, and reporting requirements.

Dated: April 7, 2014.

Donna S. Wieting,

*Director, Office of Protected Resources,
National Marine Fisheries Service.*

BILLING CODE 3510-22-P

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

RIN 0648-XD110

Takes of Marine Mammals Incidental to Specified Activities; Taking Marine Mammals Incidental to Russian River Estuary Management Activities

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Notice; issuance of an incidental harassment authorization.

SUMMARY: In accordance with the regulations implementing the Marine Mammal Protection Act (MMPA) as amended, notification is hereby given that NMFS has issued an incidental harassment authorization (IHA) to the Sonoma County Water Agency (SCWA) to incidentally harass, by Level B harassment only, three species of marine mammals during estuary management activities conducted at the mouth of the Russian River, Sonoma County, California.

DATES: This IHA is effective for the period of one year, from April 21, 2014, through April 20, 2015.

FOR FURTHER INFORMATION CONTACT: Ben Laws, Office of Protected Resources, NMFS, (301) 427-8401.

SUPPLEMENTARY INFORMATION:

Availability

Electronic copies of SCWA's application and any supporting documents, as well as a list of the references cited in this document, may be obtained by visiting the Internet at: <http://www.nmfs.noaa.gov/pr/permits/incidental.htm>. In the case of problems accessing these documents, please call

the contact listed above. NMFS' Environmental Assessment (2010) and associated Finding of No Significant Impact, prepared pursuant to the National Environmental Policy Act, and NMFS' Biological Opinion (2008) on the effects of Russian River management activities on salmonids, prepared pursuant to the Endangered Species Act, are also available at the same site.

Background

Sections 101(a)(5)(A) and (D) of the MMPA (16 U.S.C. 1361 *et seq.*) direct the Secretary of Commerce (Secretary) to allow, upon request by U.S. citizens who engage in a specified activity (other than commercial fishing) within a specified area, the incidental, but not intentional, taking of small numbers of marine mammals, providing that certain findings are made and the necessary prescriptions are established.

The incidental taking of small numbers of marine mammals may be allowed only if NMFS (through authority delegated by the Secretary) finds that the total taking by the specified activity during the specified time period will (i) have a negligible impact on the species or stock(s) and (ii) not have an unmitigable adverse impact on the availability of the species or stock(s) for subsistence uses (where relevant). Further, the permissible methods of taking and requirements pertaining to the mitigation, monitoring and reporting of such taking must be set forth, either in specific regulations or in an authorization.

The allowance of such incidental taking under section 101(a)(5)(A), by harassment, serious injury, death or a combination thereof, requires that regulations be established. Subsequently, a Letter of Authorization may be issued pursuant to the prescriptions established in such regulations, providing that the level of taking will be consistent with the findings made for the total taking allowable under the specific regulations. Under section 101(a)(5)(D), NMFS may authorize such incidental taking by harassment only, for periods of not more than 1 year, pursuant to requirements and conditions contained within an IHA. The establishment of prescriptions through either specific regulations or an authorization requires notice and opportunity for public comment.

NMFS has defined "negligible impact" in 50 CFR 216.103 as ". . . an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival." Except with

respect to certain activities not pertinent here, section 3(18) of the MMPA defines “harassment” as: “. . . any act of pursuit, torment, or annoyance which (i) has the potential to injure a marine mammal or marine mammal stock in the wild; or (ii) has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering.” The former is termed Level A harassment and the latter is termed Level B harassment.

Summary of Request

On January 17, 2014, we received an adequate and complete request from SCWA for authorization of the taking of marine mammals incidental to Russian River estuary management activities in Sonoma County, California. SCWA plans to continue ongoing actions necessary to manage the naturally-formed barrier beach at the mouth of the Russian River in order to minimize potential for flooding adjacent to the estuary and to enhance habitat for juvenile salmonids, as well as to conduct biological and physical monitoring of the barrier beach and estuary. Flood control-related breaching of barrier beach at the mouth of the river may include artificial breaches, as well as construction and maintenance of a lagoon outlet channel. The latter activity, an alternative management technique conducted to mitigate impacts of flood control on rearing habitat for Endangered Species Act (ESA)-listed salmonids, occurs only from May 15 through October 15 (hereafter, the “lagoon management period”). Artificial breaching and monitoring activities may occur at any time during the one-year period of validity of the IHA.

Breaching of naturally-formed barrier beach at the mouth of the Russian River requires the use of heavy equipment (e.g., bulldozer, excavator) and increased human presence, and monitoring in the estuary requires the use of small boats. As a result, pinnipeds hauled out on the beach or at peripheral haul-outs in the estuary may exhibit behavioral responses that indicate incidental take by Level B harassment under the MMPA. Species known from the haul-out at the mouth of the Russian River or from peripheral haul-outs, and therefore anticipated to be taken incidental to the specified activity, include the harbor seal (*Phoca vitulina richardii*), California sea lion (*Zalophus californianus*), and northern elephant seal (*Mirounga angustirostris*).

This is the fifth such IHA issued to SCWA. SCWA was first issued an IHA, valid for a period of one year, effective on April 1, 2010 (75 FR 17382), and was subsequently issued one-year IHAs for incidental take associated with the same activities, effective on April 21, 2011 (76 FR 23306), April 21, 2012 (77 FR 24471), and April 21, 2013 (78 FR 23746).

Description of the Specified Activity

Additional detail regarding the specified activity was provided in our **Federal Register** notice of proposed authorization (79 FR 12472; March, 5, 2014) and in past notices cited herein; please see those documents or SCWA’s application for more information.

Overview

The planned action involves management of the estuary to prevent flooding while preventing adverse modification to critical habitat for ESA-listed salmonids. Requirements related to the ESA are described in further detail below. During the lagoon management period, this involves construction and maintenance of a lagoon outlet channel that would facilitate formation of a perched lagoon. A perched lagoon, which is an estuary closed to tidal influence in which water surface elevation is above mean high tide, reduces flooding while maintaining beneficial conditions for juvenile salmonids. Additional breaches of barrier beach may be conducted for the sole purpose of reducing flood risk. SCWA’s planned activity was described in detail in our notice of proposed authorization prior to the 2011 IHA (76 FR 14924; March 18, 2011); please see that document for a detailed description of SCWA’s estuary management activities. Aside from the additional elements of a jetty study, described below, and minor additions to SCWA’s biological and physical estuary monitoring measures, the specified activity remains the same as that described in the 2011 document.

Dates and Duration

The specified activity may occur at any time during the one-year timeframe (April 21, 2014, through April 20, 2015) of the IHA, although construction and maintenance of a lagoon outlet channel will occur only during the lagoon management period. In addition, there are certain restrictions placed on SCWA during the harbor seal pupping season. These, as well as periodicity and frequency of the specified activities, are described in further detail below.

Specific Geographic Region

The estuary is located about 97 km (60 mi) northwest of San Francisco in Sonoma County, near Jenner, California (see Figure 1 of SCWA’s application). The Russian River watershed encompasses 3,847 km² (1,485 mi²) in Sonoma, Mendocino, and Lake Counties. The mouth of the Russian River is located at Goat Rock State Beach (see Figure 2 of SCWA’s application); the estuary extends from the mouth upstream approximately 10 to 11 km (6–7 mi) between Austin Creek and the community of Duncans Mills (Heckel and McIver, 1994).

Detailed Description of Activities

Within the Russian River watershed, the U.S. Army Corps of Engineers (Corps), SCWA and the Mendocino County Russian River Flood Control and Water Conservation Improvement District (District) operate and maintain federal facilities and conduct activities in addition to the estuary management, including flood control, water diversion and storage, instream flow releases, hydroelectric power generation, channel maintenance, and fish hatchery production. As described in the notice of proposed IHA, NMFS issued a 2008 Biological Opinion (BiOp) for Water Supply, Flood Control Operations, and Channel Maintenance conducted by the Corps, SCWA and the District in the Russian River watershed (NMFS, 2008). This BiOp found that the activities—including SCWA’s estuary management activities prior to the BiOp—authorized by the Corps and undertaken by SCWA and the District, if continued in a manner similar to recent historic practices, were likely to jeopardize the continued existence of ESA-listed salmonids and were likely to adversely modify critical habitat. In part, therefore, the BiOp requires SCWA to collaborate with NMFS and modify their estuary water level management in order to reduce marine influence (i.e., high salinity and tidal inflow) and promote a higher water surface elevation in the estuary in order to enhance the quality of rearing habitat for juvenile salmonids. SCWA is also required to monitor the response of water quality, invertebrate production, and salmonids in and near the estuary to water surface elevation management in the estuary-lagoon system.

There are three components to SCWA’s ongoing estuary management activities: (1) Lagoon outlet channel management, during the lagoon management period only, required to accomplish the dual purposes of flood risk abatement and maintenance of

juvenile salmonid habitat; (2) traditional artificial breaching, with the sole objective of flood risk abatement; and (3) physical and biological monitoring in and near the estuary, required under the terms of the BiOp, to understand response to water surface elevation management in the estuary-lagoon system. The latter category (physical and biological monitoring) includes all ancillary beach and/or estuary monitoring activities, including topographic and geophysical beach surveys and biological and physical habitat monitoring in the estuary. Biological monitoring will include a new component—acoustic telemetry of tagged steelhead—during the period of this IHA. Please see the previously referenced **Federal Register** notice (76 FR 14924; March 18, 2011) for detailed discussion of lagoon outlet channel management, artificial breaching, and other physical and biological monitoring activities.

In addition to these ongoing management activities, SCWA will conduct new monitoring work at the mouth of the Russian River during the period of this IHA. This additional activity comprises a plan to study the effects of a historical, dilapidated jetty on the formation and maintenance of the Russian River estuary, as required under the 2008 BiOp. Through several phases from 1929-1948, the jetty and associated seawall, roadway, and railroad were constructed, reinforced and then abandoned by various entities. For a detailed description of the jetty

study, please see our notice of proposed authorization prior to the 2013 IHA (78 FR 14985; March 8, 2013) or SCWA’s ‘Feasibility of Alternatives to the Goat Rock State Beach Jetty for Managing Lagoon Water Surface Elevations—A Study Plan’ (ESA PWA, 2011), available online (see Addresses).

Comments and Responses

We published a notice of receipt of SCWA’s application and proposed IHA in the **Federal Register** on March 5, 2014 (79 FR 12472). During the thirty-day comment period, we received a letter from the Marine Mammal Commission (Commission). The Commission recommends that we issue the requested authorization, subject to inclusion of the proposed mitigation and monitoring measures as described in our notice of proposed IHA and the application. All measures proposed in the initial **Federal Register** notice are included within the IHA.

Description of Marine Mammals in the Area of the Specified Activity

The marine mammal species that may be harassed incidental to estuary management activities are the harbor seal, California sea lion, and the northern elephant seal. We presented a detailed discussion of the status of these stocks and their occurrence in the action area in the notice of the proposed IHA (79 FR 12472, March 5, 2013).

Ongoing monthly harbor seal counts at the Jenner haul-out were begun by J. Mortenson in January 1987, with

additional nearby haul-outs added to the counts thereafter. In addition, local resident E. Twohy began daily observations of seals and people at the Jenner haul-out in November 1989. These datasets note whether the mouth at the Jenner haul-out was opened or closed at each observation, as well as various other daily and annual patterns of haul-out usage (Mortenson and Twohy, 1994). Recently, SCWA began regular baseline monitoring of the haul-out as a component of its estuary management activity. In the notice of proposed IHA, we presented average daily numbers of seals observed at the mouth of the Russian River from 1993–2005 and from 2009–13 (see Table 1; 79 FR 12472, March 5, 2013). Here, we present additional clarifying information regarding the derivation of mean average daily numbers of harbor seals observed from 2011–13 (see Table 1 below). Averages (bottom row, Table 1) were calculated as weighted means on the basis of sample size (i.e., total number of pinniped counts conducted in given month). In order to calculate a weighted mean, the following formula is used:

$$[(n1 \times N1) + (n2 \times N2) + (n3 \times N3)] / (n1 + n2 + n3)$$

Where n = counts conducted in given month in Year x, N = average number of harbor seals observed per count in given month in Year x.

Example: For the month of January, [(35 × 116) + (35 × 108) + (26 × 51)] / (35 + 35 + 26) = 95.×

TABLE 1—AVERAGE DAILY NUMBER OF SEALS OBSERVED AT RUSSIAN RIVER MOUTH FOR EACH MONTH, 2011–13

Year	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec

Potential Effects of the Specified Activity on Marine Mammals

We provided a detailed discussion of the potential effects of the specified activity on marine mammals in the notice of the proposed IHA (79 FR 12472, March 5, 2013). A summary of anticipated effects is provided below.

A significant body of monitoring data exists for pinnipeds at the mouth of the Russian River. In addition, pinnipeds have co-existed with regular estuary management activity for decades as well as with regular human use activity at the beach, and are likely habituated to

human presence and activity. Nevertheless, SCWA’s estuary management activities have the potential to disturb pinnipeds present on the beach or at peripheral haul-outs in the estuary. During breaching operations, past monitoring has revealed that some or all of the seals present typically move or flush from the beach in response to the presence of crew and equipment, though some may remain hauled-out. No stampeding of seals—a potentially dangerous occurrence in which large numbers of animals succumb to mass panic and rush away

from a stimulus—has been documented since SCWA developed protocols to prevent such events in 1999. While it is likely impossible to conduct required estuary management activities without provoking some response in hauled-out animals, precautionary mitigation measures, described later in this document, ensure that animals are gradually apprised of human approach. Under these conditions, seals typically exhibit a continuum of responses, beginning with alert movements (e.g., raising the head), which may then escalate to movement away from the

stimulus and possible flushing into the water. Flushed seals typically re-occupy the haul-out within minutes to hours of the stimulus. In addition, eight other haul-outs exist nearby that may accommodate flushed seals. In the absence of appropriate mitigation measures, it is possible that pinnipeds could be subject to injury, serious injury, or mortality, likely through stampeding or abandonment of pups.

California sea lions and northern elephant seals, which have been noted only infrequently in the action area, have been observed as less sensitive to stimulus than harbor seals during monitoring at numerous other sites. For example, monitoring of pinniped disturbance as a result of abalone research in the Channel Islands showed that while harbor seals flushed at a rate of 69 percent, California sea lions flushed at a rate of only 21 percent. The rate for elephant seals declined to 0.1 percent (VanBlaricom, 2011). In the event that either of these species is present during management activities, they would be expected to display a minimal reaction to maintenance activities—less than that expected of harbor seals.

Although the Jenner haul-out is not known as a primary pupping beach, harbor seal pups have been observed during the pupping season; therefore, we have evaluated the potential for injury, serious injury or mortality to pups. There is a lack of published data regarding pupping at the mouth of the Russian River, but SCWA monitors have observed pups on the beach. No births were observed during recent monitoring, but were inferred based on signs indicating pupping (e.g., blood spots on the sand, birds consuming possible placental remains). Pup injury or mortality would be most likely to occur in the event of extended separation of a mother and pup, or trampling in a stampede. As discussed previously, no stampedes have been recorded since development of appropriate protocols in 1999. Any California sea lions or northern elephant seals present would be independent juveniles or adults; therefore, analysis of impacts on pups is not relevant for those species.

Similarly, the period of mother-pup bonding, critical time needed to ensure pup survival and maximize pup health, is not expected to be impacted by estuary management activities. Harbor seal pups are extremely precocious, swimming and diving immediately after birth and throughout the lactation period, unlike most other phocids which normally enter the sea only after weaning (Lawson and Renouf, 1985;

Cottrell *et al.*, 2002; Burns *et al.*, 2005). Lawson and Renouf (1987) investigated harbor seal mother-pup bonding in response to natural and anthropogenic disturbance. In summary, they found that the most critical bonding time is within minutes after birth. Although pupping season is defined as March 15–June 30, the peak of pupping season is typically concluded by mid-May, when the lagoon management period begins. As such, it is expected that most mother-pup bonding would likely be concluded as well. The number of management events during the months of March and April has been relatively low in the past, and the breaching activities occur in a single day over several hours. In addition, mitigation measures described later in this document further reduce the likelihood of any impacts to pups, whether through injury or mortality or interruption of mother-pup bonding.

In summary, and based on extensive monitoring data, we believe that impacts to hauled-out pinnipeds during estuary management activities would be behavioral harassment of limited duration (i.e., less than one day) and limited intensity (i.e., temporary flushing at most). Stampeding, and therefore injury or mortality, is not expected—nor been documented—in the years since appropriate protocols were established (see “Mitigation” for more details). Further, the continued, and increasingly heavy (Figure 4; SCWA, 2014), use of the haul-out despite decades of breaching events indicates that abandonment of the haul-out is unlikely.

Anticipated Effects on Habitat

We provided a detailed discussion of the potential effects of this action on marine mammal habitat in the notice of the proposed IHA (79 FR 12472, March 5, 2013). SCWA’s estuary management activities will result in temporary physical alteration of the Jenner haul-out. With barrier beach closure, seal usage of the beach haul-out declines, and the three nearby river haul-outs may not be available for usage due to rising water surface elevations. Breaching of the barrier beach, subsequent to the temporary habitat disturbance, will likely increase suitability and availability of habitat for pinnipeds. Biological and water quality monitoring will not physically alter pinniped habitat.

In summary, there will be temporary physical alteration of the beach. However, natural opening and closure of the beach results in the same impacts to habitat; therefore, seals are likely adapted to this cycle. In addition, the

increase in rearing habitat quality has the goal of increasing salmonid abundance, ultimately providing more food for seals present within the action area. Thus, any impacts to marine mammal habitat are not expected to cause significant or long-term consequences for individual marine mammals or their populations.

Mitigation

In order to issue an IHA under Section 101(a)(5)(D) of the MMPA, NMFS must set forth the permissible methods of taking pursuant to such activity, and other means of effecting the least practicable impact on such species or stock and its habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance, and on the availability of such species or stock for taking for certain subsistence uses.

SCWA will continue the following mitigation measures, as implemented during the previous IHAs, designed to minimize impact to affected species and stocks:

- SCWA crews will cautiously approach the haul-out ahead of heavy equipment to minimize the potential for sudden flushes, which may result in a stampede—a particular concern during pupping season.
- SCWA staff will avoid walking or driving equipment through the seal haul-out.
- Crews on foot will make an effort to be seen by seals from a distance, if possible, rather than appearing suddenly at the top of the sandbar, again preventing sudden flushes.
- During breaching events, all monitoring will be conducted from the overlook on the bluff along Highway 1 adjacent to the haul-out in order to minimize potential for harassment.
- A water level management event may not occur for more than two consecutive days unless flooding threats cannot be controlled.

In addition, SCWA will continue mitigation measures specific to pupping season (March 15–June 30), as implemented in the previous IHA:

- SCWA will maintain a one-week no-work period between water level management events (unless flooding is an immediate threat) to allow for an adequate disturbance recovery period. During the no-work period, equipment must be removed from the beach.
- If a pup less than one week old is on the beach where heavy machinery will be used or on the path used to access the work location, the management action will be delayed until the pup has left the site or the latest day possible to prevent flooding

while still maintaining suitable fish rearing habitat. In the event that a pup remains present on the beach in the presence of flood risk, SCWA will consult with NMFS to determine the appropriate course of action. SCWA will coordinate with the locally established seal monitoring program (Stewards' Seal Watch) to determine if pups less than one week old are on the beach prior to a breaching event.

- Physical and biological monitoring (including topographic and geophysical beach surveys) will not be conducted if a pup less than one week old is present at the monitoring site or on a path to the site.

- Any jetty study activities in the vicinity of the harbor seal haul-out will not occur during the pupping season.

Equipment will be driven slowly on the beach and care will be taken to minimize the number of shutdowns and start-ups when the equipment is on the beach. All work will be completed as efficiently as possible, with the smallest amount of heavy equipment possible, to minimize disturbance of seals at the haul-out. Boats operating near river haul-outs during monitoring will be kept within posted speed limits and driven as far from the haul-outs as safely possible to minimize flushing seals.

We have carefully evaluated SCWA's planned mitigation measures and considered their effectiveness in past implementation to determine whether they are likely to effect the least practicable impact on the affected marine mammal species and stocks and their habitat. Our evaluation of potential measures included consideration of the following factors in relation to one another: (1) The manner in which, and the degree to which, the successful implementation of the measure is expected to minimize adverse impacts to marine mammals, (2) the proven or likely efficacy of the specific measure to minimize adverse impacts as planned; and (3) the practicability of the measure for applicant implementation.

Any mitigation measure(s) we prescribe should be able to accomplish, have a reasonable likelihood of accomplishing (based on current science), or contribute to the accomplishment of one or more of the general goals listed below:

- Avoidance or minimization of injury or death of marine mammals wherever possible (goals 2, 3, and 4 may contribute to this goal).

- A reduction in the number (total number or number at biologically important time or location) of individual marine mammals exposed to stimuli expected to result in incidental take (this goal may contribute to 1,

above, or to reducing takes by behavioral harassment only).

- A reduction in the number (total number or number at biologically important time or location) of times any individual marine mammal would be exposed to stimuli expected to result in incidental take (this goal may contribute to 1, above, or to reducing takes by behavioral harassment only).

- A reduction in the intensity of exposure to stimuli expected to result in incidental take (this goal may contribute to 1, above, or to reducing the severity of behavioral harassment only).

- Avoidance or minimization of adverse effects to marine mammal habitat, paying particular attention to the prey base, blockage or limitation of passage to or from biologically important areas, permanent destruction of habitat, or temporary disturbance of habitat during a biologically important time.

- For monitoring directly related to mitigation, an increase in the probability of detecting marine mammals, thus allowing for more effective implementation of the mitigation.

Based on our evaluation of SCWA's planned measures and on SCWA's record of management at the mouth of the Russian River including information from monitoring of SCWA's implementation of the mitigation measures as prescribed under the previous IHAs, we have determined that the planned mitigation measures provide the means of effecting the least practicable impact on marine mammal species or stocks and their habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance.

Monitoring and Reporting

In order to issue an IHA for an activity, Section 101(a)(5)(D) of the MMPA states that NMFS must set forth "requirements pertaining to the monitoring and reporting of such taking". The MMPA implementing regulations at 50 CFR 216.104(a)(13) indicate that requests for incidental take authorizations must include the suggested means of accomplishing the necessary monitoring and reporting that will result in increased knowledge of the species and of the level of taking or impacts on populations of marine mammals that are expected to be present in the proposed action area.

Any monitoring requirement we prescribe should accomplish one or more of the following general goals:

1. An increase in the probability of detecting marine mammals, both within defined zones of effect (thus allowing

for more effective implementation of the mitigation) and in general to generate more data to contribute to the analyses mentioned below;

2. An increase in our understanding of how many marine mammals are likely to be exposed to stimuli that we associate with specific adverse effects, such as behavioral harassment or hearing threshold shifts;

3. An increase in our understanding of how marine mammals respond to stimuli expected to result in incidental take and how anticipated adverse effects on individuals may impact the population, stock, or species (specifically through effects on annual rates of recruitment or survival) through any of the following methods:

- Behavioral observations in the presence of stimuli compared to observations in the absence of stimuli (need to be able to accurately predict pertinent information, e.g., received level, distance from source);

- Physiological measurements in the presence of stimuli compared to observations in the absence of stimuli (need to be able to accurately predict pertinent information, e.g., received level, distance from source);

- Distribution and/or abundance comparisons in times or areas with concentrated stimuli versus times or areas without stimuli;

4. An increased knowledge of the affected species; or

5. An increase in our understanding of the effectiveness of certain mitigation and monitoring measures.

SCWA submitted a marine mammal monitoring plan as part of the IHA application. It can be found on the Internet at <http://www.nmfs.noaa.gov/pr/permits/incidental.htm>. The plan has been successfully implemented by SCWA under previous IHAs. The purpose of this monitoring plan, which is carried out collaboratively with the Stewards of the Coasts and Redwoods (Stewards) organization, is to detect the response of pinnipeds to estuary management activities at the Russian River estuary. SCWA has designed the plan both to satisfy the requirements of the IHA, and to address the following questions of interest:

1. Under what conditions do pinnipeds haul out at the Russian River estuary mouth at Jenner?

2. How do seals at the Jenner haul-out respond to activities associated with the construction and maintenance of the lagoon outlet channel and artificial breaching activities?

3. Does the number of seals at the Jenner haul-out significantly differ from historic averages with formation of a

summer (May 15 to October 15) lagoon in the Russian River estuary?

4. Are seals at the Jenner haul-out displaced to nearby river and coastal haul-outs when the mouth remains closed in the summer?

Monitoring Measures

In summary, monitoring includes the following:

Baseline Monitoring—Seals at the Jenner haul-out are counted twice monthly for the term of the IHA. This baseline information will provide SCWA with details that may help to plan estuary management activities in the future to minimize pinniped interaction. This census begins at local dawn and continues for eight hours. All seals hauled out on the beach are counted every thirty minutes from the overlook on the bluff along Highway 1 adjacent to the haul-out using spotting scopes. Monitoring may conclude for the day if weather conditions affect visibility (e.g., heavy fog in the afternoon). Counts are scheduled for two days out of each month, with the intention of capturing a low and high tide each in the morning and afternoon. Depending on how the sandbar is formed, seals may haul out in multiple groups at the mouth. At each thirty-minute count, the observer indicates where groups of seals are hauled out on the sandbar and provides a total count for each group. If possible, adults and pups are counted separately.

In addition to the census data, disturbances of the haul-out are recorded. The method for recording disturbances follows those in Mortenson (1996). Disturbances will be recorded on a three-point scale that represents an increasing seal response to the disturbance. The time, source, and duration of the disturbance, as well as an estimated distance between the source and haul-out, are recorded. It should be noted that only responses falling into Mortenson's Levels 2 and 3 (i.e., movement or flight) will be considered as harassment under the MMPA under the terms of the IHA. Weather conditions are recorded at the beginning of each census. These include temperature, percent cloud cover, and wind speed (Beaufort scale). Tide levels and estuary water surface elevations are correlated to the monitoring start and end times.

In an effort towards understanding possible relationships between use of the Jenner haul-out and nearby coastal and river haul-outs, several other haul-outs on the coast and in the Russian River estuary are monitored as well (see Figure 4 of SCWA's application). The peripheral haul-outs are visited for ten-

minute counts twice during each baseline monitoring day. All pinnipeds hauled out were counted from the same vantage point(s) at each haul-out using a spotting scope or binoculars.

Estuary Management Event Monitoring—Activities associated with artificial breaching or initial construction of the outlet channel, as well as the maintenance of the channel that may be required, will be monitored for disturbances to the seals at the Jenner haul-out. A one-day pre-event channel survey will be made within one to three days prior to constructing the outlet channel. The haul-out will be monitored on the day the outlet channel is constructed and daily for up to the maximum two days allowed for channel excavation activities. Monitoring will also occur on each day that the outlet channel is maintained using heavy equipment for the duration of the lagoon management period. Monitoring will correspond with that described under the "Baseline" section previously, with the exception that management activity monitoring duration is defined by event duration, rather than being set at eight hours. On the day of the management event, pinniped monitoring begins at least one hour prior to the crew and equipment accessing the beach work area and continues through the duration of the event, until at least one hour after the crew and equipment leave the beach.

In an attempt to understand whether seals from the Jenner haul-out are displaced to coastal and river haul-outs nearby when management events occur, other nearby haul-outs are monitored concurrently with monitoring of outlet channel construction and maintenance activities. This provides an opportunity to qualitatively assess whether these haul-outs are being used by seals displaced from the Jenner haul-out. This monitoring will not provide definitive results regarding displacement to nearby coastal and river haul-outs, as individual seals are not marked, but is useful in tracking general trends in haul-out use during disturbance. As volunteers are required to monitor these peripheral haul-outs, haul-out locations may need to be prioritized if there are not enough volunteers available. In that case, priority will be assigned to the nearest haul-outs (North Jenner and Odin Cove), followed by the Russian River estuary haul-outs, and finally the more distant coastal haul-outs.

For all counts, the following information will be recorded in thirty-minute intervals: (1) Pinniped counts, by species; (2) behavior; (3) time, source and duration of any disturbance; (4) estimated distances between source of

disturbance and pinnipeds; (5) weather conditions (e.g., temperature, wind); and (5) tide levels and estuary water surface elevation.

Monitoring During Pupping Season—As described previously, the pupping season is defined as March 15 to June 30. Baseline, lagoon outlet channel, and artificial breaching monitoring during the pupping season will include records of neonate (pups less than one week old) observations. Characteristics of a neonate pup include: Body weight less than 15 kg; thin for their body length; an umbilicus or natal pelage present; wrinkled skin; and awkward or jerky movements on land. SCWA will coordinate with the Seal Watch monitoring program to determine if pups less than one week old are on the beach prior to a water level management event.

If, during monitoring, observers sight any pup that might be abandoned, SCWA will contact the NMFS stranding response network immediately and also report the incident to NMFS' West Coast Regional Office and Office of Protected Resources within 48 hours. Observers will not approach or move the pup. Potential indications that a pup may be abandoned are no observed contact with adult seals, no movement of the pup, and the pup's attempts to nurse are rebuffed.

Reporting

SCWA is required to submit a report on all activities and marine mammal monitoring results to the Office of Protected Resources, NMFS, and the West Coast Regional Administrator, NMFS, 90 days prior to the expiration of the IHA if a renewal is sought, or within 90 days of the expiration of the permit otherwise. This annual report will also be distributed to California State Parks and Stewards, and would be available to the public on SCWA's Web site. This report will contain the following information:

- The number of pinnipeds taken, by species and age class (if possible);
- Behavior prior to and during water level management events;
 - Start and end time of activity;
 - Estimated distances between source and pinnipeds when disturbance occurs;
 - Weather conditions (e.g., temperature, wind);
 - Haul-out reoccupation time of any pinnipeds based on post-activity monitoring;
- Tide levels and estuary water surface elevation; and
- Seal census from bi-monthly and nearby haul-out monitoring.

The annual report includes descriptions of monitoring methodology, tabulation of estuary management events, summary of monitoring results, and discussion of problems noted and proposed remedial measures. SCWA will report any injured or dead marine mammals to NMFS' West Coast Regional Office and Office of Protected Resources.

Summary of Previous Monitoring

SCWA complied with the mitigation and monitoring required under all previous authorizations. In accordance with the 2013 IHA, SCWA submitted a Report of Activities and Monitoring Results, covering the period of January 1 through December 31, 2013. Previous monitoring reports (available at www.nmfs.noaa.gov/pr/permits/incidental.htm) provided additional analysis of monitoring results from 2009–12. A barrier beach was formed eleven times during 2013, but SCWA was required to implement artificial breaching for only five of these closure events (note that the fifth such event occurred on January 2, 2014, following bar closure on December 24, 2013, and is not discussed in SCWA's current 2013 monitoring report). The Russian River outlet was closed to the ocean for a total of 104 days in 2013, including extended closures totaling 56 days during the lagoon management period. However, these closures all culminated in natural breaches and no outlet channel management events were

required. In January 2012, the barrier beach was artificially breached after two days of breaching activity. There were also several periods over the course of the year where the barrier beach closed or became naturally perched and then subsequently breached naturally (SCWA, 2013). In 2011, no water level management activities occurred (SCWA, 2012). In 2010, one lagoon management event and two artificial breaching events occurred (SCWA, 2011). Pinniped monitoring occurred no more than three days before, the day of, and the day after each water level management activity. In addition, SCWA conducted biological and physical monitoring as described previously. During the course of these activities, SCWA did not exceed the take levels authorized under the relevant IHAs. We provided a detailed description of previous monitoring results in the notice of the proposed IHA (79 FR 12472, March 5, 2013).

Estimated Take by Incidental Harassment

Except with respect to certain activities not pertinent here, section 3(18) of the MMPA defines "harassment" as: ". . . any act of pursuit, torment, or annoyance which (i) has the potential to injure a marine mammal or marine mammal stock in the wild; or (ii) has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including, but not limited to, migration, breathing,

nursing, breeding, feeding, or sheltering." The former is termed Level A harassment and the latter is termed Level B harassment.

We are authorizing SCWA to take harbor seals, California sea lions, and northern elephant seals, by Level B harassment only, incidental to estuary management activities. These activities, involving increased human presence and the use of heavy equipment and support vehicles, are expected to harass pinnipeds present at the haul-out through behavioral disturbance only. In addition, monitoring activities prescribed in the BiOp may result in harassment of additional individuals at the Jenner haul-out and at the three haul-outs located in the estuary. Estimates of the number of harbor seals, California sea lions, and northern elephant seals that may be harassed by the activities is based upon the number of potential events associated with Russian River estuary management activities and the average number of individuals of each species that are present during conditions appropriate to the activity. As described previously in this document, monitoring effort at the mouth of the Russian River has shown that the number of seals utilizing the haul-out declines during bar-closed conditions. Tables 2 and 3 detail the total number of authorized takes. Methodology of take estimation was discussed in detail in our notice of proposed IHA (79 FR 12472, March 5, 2013).

TABLE 2—ESTIMATED NUMBER OF HARBOR SEAL TAKES RESULTING FROM RUSSIAN RIVER ESTUARY MANAGEMENT ACTIVITIES

Biological and Physical Habitat Monitoring in the Estuary		
1 ^e	121	121
Total	3,880

^a For Lagoon Outlet Channel Management and Artificial Breaching, average daily number of animals corresponds with data from Table 2. For Topographic and Geophysical Beach Surveys, average daily number of animals corresponds with 2011–13 data from Table 1.

^b For implementation of the lagoon outlet channel, an event is defined as a single, two-day episode. It is assumed that the same individual seals would be hauled out during a single event. For the remaining activities, an event is defined as a single day on which an activity occurs. Some events may include multiple activities.

^c Number of events for artificial breaching derived from historical data. The average number of events for each month was rounded up to the nearest whole number; estimated number of events for December was increased from one to two because multiple closures resulting from storm events have occurred in recent years during that month. These numbers likely represent an overestimate, as the average annual number of events is six.

^d Although implementation could occur at any time during the lagoon management period, the highest daily average per month from the lagoon management period was used.

^e Based on past experience, SCWA expects that no more than one seal may be present, and thus have the potential to be disturbed, at each of the three river haul-outs. Number of events includes addition of acoustic telemetry surveys.

TABLE 3—ESTIMATED NUMBER OF CALIFORNIA SEA LION AND ELEPHANT SEAL TAKES RESULTING FROM RUSSIAN RIVER ESTUARY MANAGEMENT ACTIVITIES

Species	Number of animals expected to occur ^a	Number of events ^a	Potential total number of individual animals that may be taken
Lagoon Outlet Channel Management (May 15 to October 15)			
California sea lion (potential to encounter once per event)	1	6	6
Northern elephant seal (potential to encounter once per event)	1	6	6
Artificial Breaching			
California sea lion (potential to encounter once per month, Oct–May)	1	8	8
Northern elephant seal (potential to encounter once per month, Oct–May)	1	8	8
Topographic and Geophysical Beach Surveys			
California sea lion (potential to encounter once per month year-round for topographical surveys; potential to encounter once per month Jul–Feb for geophysical surveys)	1	20	20
Northern elephant seal (potential to encounter once per month year-round for topographical surveys; potential to encounter once per month Jul–Feb for geophysical surveys)	1	20	20
Biological and Physical Habitat Monitoring in the Estuary			
California sea lion (potential to encounter once per month, Jul–Feb)	1	8	8

TABLE 3—ESTIMATED NUMBER OF CALIFORNIA SEA LION AND ELEPHANT SEAL TAKES RESULTING FROM RUSSIAN RIVER ESTUARY MANAGEMENT ACTIVITIES—Continued

Species	Number of animals expected to occur ^a	Number of events ^a	Potential total number of individual animals that may be taken
Northern elephant seal (potential to encounter once per month, Jul–Feb)	1	8	8
Total:			
California sea lion	42
Elephant seal	42

^aSCWA expects that California sea lions and/or northern elephant seals could occur during any month of the year, but that any such occurrence would be infrequent and unlikely to occur more than once per month.

Analyses and Determinations

Negligible Impact Analysis

NMFS has defined “negligible impact” in 50 CFR 216.103 as “. . . an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival.” A negligible impact finding is based on the lack of likely adverse effects on annual rates of recruitment or survival (i.e., population-level effects). An estimate of the number of Level B harassment takes alone is not enough information on which to base an impact determination. In addition to considering estimates of the number of marine mammals that might be “taken” through behavioral harassment, we consider other factors, such as the likely nature of any responses (e.g., intensity, duration), the context of any responses (e.g., critical reproductive time or location, migration), as well as the number and nature of estimated Level A harassment takes, the number of estimated mortalities, and effects on habitat.

Although SCWA’s estuary management activities may disturb pinnipeds hauled out at the mouth of the Russian River, as well as those hauled out at several locations in the estuary during recurring monitoring activities, impacts are occurring to a small, localized group of animals. While these impacts can occur year-round, they occur sporadically and for limited duration (e.g., a maximum of two consecutive days for water level management events). Seals will likely become alert or, at most, flush into the water in reaction to the presence of crews and equipment on the beach. While disturbance may occur during a sensitive time (during the March 15–June 30 pupping season), mitigation measures have been specifically designed to further minimize harm during this period and eliminate the

possibility of pup injury or mother-pup separation.

No injury, serious injury, or mortality is anticipated, nor is the proposed action likely to result in long-term impacts such as permanent abandonment of the haul-out. Injury, serious injury, or mortality to pinnipeds would likely result from startling animals inhabiting the haul-out into a stampede reaction, or from extended mother-pup separation as a result of such a stampede. Long-term impacts to pinniped usage of the haul-out could result from significantly increased presence of humans and equipment on the beach. To avoid these possibilities, we have worked with SCWA to develop the previously described mitigation measures. These are designed to reduce the possibility of startling pinnipeds, by gradually apprising them of the presence of humans and equipment on the beach, and to reduce the possibility of impacts to pups by eliminating or altering management activities on the beach when pups are present and by setting limits on the frequency and duration of events during pupping season. During the past fifteen years of flood control management, implementation of similar mitigation measures has resulted in no known stampede events and no known injury, serious injury, or mortality. Over the course of that time period, management events have generally been infrequent and of limited duration.

No pinniped stocks for which incidental take is authorized are listed as threatened or endangered under the ESA or determined to be strategic or depleted under the MMPA. Recent data suggests that harbor seal populations have reached carrying capacity; populations of California sea lions and northern elephant seals in California are also considered healthy.

In summary, and based on extensive monitoring data, we believe that impacts to hauled-out pinnipeds during estuary management activities would be

behavioral harassment of limited duration (i.e., less than one day) and limited intensity (i.e., temporary flushing at most). Stampinged, and therefore injury or mortality, is not expected—nor been documented—in the years since appropriate protocols were established (see “Mitigation” for more details). Further, the continued, and increasingly heavy (Figure 4; SCWA, 2014), use of the haul-out despite decades of breaching events indicates that abandonment of the haul-out is unlikely. Based on the analysis contained herein of the likely effects of the specified activity on marine mammals and their habitat, and taking into consideration the implementation of the planned monitoring and mitigation measures, we find that the total marine mammal take from SCWA’s estuary management activities will have a negligible impact on the affected marine mammal species or stocks.

Small Numbers Analysis

The authorized number of animals taken for each species of pinniped can be considered small relative to the population size. There are an estimated 30,196 harbor seals in the California stock, 296,750 California sea lions, and 124,000 northern elephant seals in the California breeding population. Based on extensive monitoring effort specific to the affected haul-out and historical data on the frequency of the specified activity, we are proposing to authorize take, by Level B harassment only, of 3,880 harbor seals, 42 California sea lions, and 42 northern elephant seals, representing 12.8, 0.01, and 0.03 percent of the populations, respectively. However, this represents an overestimate of the number of individuals harassed over the duration of the IHA, because these totals represent much smaller numbers of individuals that may be harassed multiple times. Based on the analysis contained herein of the likely effects of the specified activity on marine

mammals and their habitat, and taking into consideration the implementation of the mitigation and monitoring measures, we find that small numbers of marine mammals will be taken relative to the populations of the affected species or stocks.

Impact on Availability of Affected Species for Taking for Subsistence Uses

There are no relevant subsistence uses of marine mammals implicated by this action. Therefore, we have determined that the total taking of affected species or stocks would not have an unmitigable adverse impact on the availability of such species or stocks for taking for subsistence purposes.

Endangered Species Act (ESA)

No species listed under the ESA are expected to be affected by these activities. Therefore, we have determined that a section 7 consultation under the ESA is not required. SCWA and the Corps consulted with NMFS under section 7 of the ESA regarding the potential effects of their operations and maintenance activities, including SCWA's estuary management program, on ESA-listed salmonids. As a result of this consultation, NMFS issued the Russian River Biological Opinion (NMFS, 2008), including Reasonable and Prudent Alternatives, which prescribes modifications to SCWA's estuary management activities. The effects of the planned activities and authorized take would not cause additional effects for which section 7 consultation would be required.

National Environmental Policy Act (NEPA)

In compliance with the National Environmental Policy Act of 1969 (42 U.S.C. 4321 *et seq.*), as implemented by the regulations published by the Council on Environmental Quality (40 CFR parts 1500–1508), and NOAA Administrative Order 216–6, we prepared an Environmental Assessment (EA) to consider the direct, indirect and cumulative effects to the human environment resulting from issuance of the original IHA to SCWA for the specified activities and found that it would not result in any significant impacts to the human environment. We signed a Finding of No Significant Impact (FONSI) on March 30, 2010. We have reviewed SWCA's application for a renewed IHA for ongoing estuary management activities for 2014 and the 2013 monitoring report. Based on that review, we have determined that the proposed action follows closely the IHAs issued and implemented in 2010–13 and does not present any substantial

changes, or significant new circumstances or information relevant to environmental concerns which would require a supplement to the 2010 EA or preparation of a new NEPA document. Therefore, we have determined that a new or supplemental EA or Environmental Impact Statement is unnecessary, and reaffirm the existing FONSI for this action. The 2010 EA and FONSI for this action are available for review at www.nmfs.noaa.gov/pr/permits/incidental.htm.

Authorization

As a result of these determinations, we have issued an IHA to SCWA to conduct estuary management activities in the Russian River from the period of April 21, 2014, through April 20, 2015, provided the previously mentioned mitigation, monitoring, and reporting requirements are implemented.

Dated: April 8, 2014.

Donna S. Wieting,

Director, Office of Protected Resources,
National Marine Fisheries Service.

BILLING CODE 3510–22–P

COMMITTEE FOR PURCHASE FROM PEOPLE WHO ARE BLIND OR SEVERELY DISABLED

Procurement List; Additions and Deletions

AGENCY: Committee for Purchase From People Who Are Blind or Severely Disabled.

ACTION: Additions to and deletions from the Procurement List.

SUMMARY: This action adds services to the Procurement List that will be provided by nonprofit agencies employing persons who are blind or have other severe disabilities, and deletes services from the Procurement List previously provided by such agencies.

DATES: *Effective Date:* 5/12/2014.

ADDRESSES: Committee for Purchase From People Who Are Blind or Severely Disabled, 1401 S. Clark Street, Suite 10800, Arlington, Virginia 22202–4149.

FOR FURTHER INFORMATION CONTACT: Barry S. Lineback, Telephone: (703) 603–7740, Fax: (703) 603–0655, or email CMTEFedReg@AbilityOne.gov.

SUPPLEMENTARY INFORMATION:

Additions

On 2/7/2014 (79 FR 7428), the Committee for Purchase From People Who Are Blind or Severely Disabled

published notice of proposed additions to the Procurement List.

After consideration of the material presented to it concerning capability of qualified nonprofit agencies to provide the services and impact of the additions on the current or most recent contractors, the Committee has determined that the services listed below are suitable for procurement by the Federal Government under 41 U.S.C. 8501–8506 and 41 CFR 51–2.4.

Regulatory Flexibility Act Certification

I certify that the following action will not have a significant impact on a substantial number of small entities. The major factors considered for this certification were:

1. The action will not result in any additional reporting, recordkeeping or other compliance requirements for small entities other than the small organizations that will provide the services to the Government.
2. The action will result in authorizing small entities to provide the services to the Government.
3. There are no known regulatory alternatives which would accomplish the objectives of the Javits-Wagner-O'Day Act (41 U.S.C. 8501–8506) in connection with the services proposed for addition to the Procurement List.

End of Certification

Accordingly, the following services are added to the Procurement List:

Services

Service Type/Location: Janitorial Service, Department of Homeland Security (DHS), Immigration and Customs Enforcement (ICE), Executive Office for Immigration Review, Oakdale Service Processing Center, 1010 East Whatley Road, Oakdale, LA

NPA: Calcasieu Association for Retarded Citizens, Inc., Lake Charles, LA

Contracting Activity: DEPT OF HOMELAND SECURITY, U.S. IMMIGRATION AND CUSTOMS ENFORCEMENT, COMPLIANCE & REMOVALS, WASHINGTON, DC

Service Type/Location: Furniture Design and Configuration Service, Pennsylvania National Guard, 1167 Utility Road, Fort Indiantown Gap, PA.

NPA: Industries for the Blind, Inc., West Allis, WI

Contracting Activity: DEPT OF THE ARMY, W7NX USFPO ACTIVITY PA ARNG, ANNVILLE, PA

Deletions

On 2/28/2014 (79 FR 11422–11423), the Committee for Purchase From People Who Are Blind or Severely Disabled published notice of proposed deletions from the Procurement List.

After consideration of the relevant matter presented, the Committee has

determined that the services listed below are no longer suitable for procurement by the Federal Government under 41 U.S.C. 8501–8506 and 41 CFR 51–2.4.

Regulatory Flexibility Act Certification

I certify that the following action will not have a significant impact on a substantial number of small entities. The major factors considered for this certification were:

1. The action will not result in additional reporting, recordkeeping or other compliance requirements for small entities.

2. The action may result in authorizing small entities to provide the services to the Government.

3. There are no known regulatory alternatives which would accomplish the objectives of the Javits-Wagner-O'Day Act (41 U.S.C. 8501–8506) in connection with the services deleted from the Procurement List.

End of Certification

Accordingly, the following services are deleted from the Procurement List:

Services

Service Type/Location: Janitorial/Custodial Service, Department of Veterans Affairs: Community Based Outpatient Clinic, 165 E. Apple Avenue, Muskegon, MI

NPA: Goodwill Industries of West Michigan, Inc., Muskegon, MI

Contracting Activity: DEPARTMENT OF VETERANS AFFAIRS, 515–BATTLE CREEK, BATTLE CREEK, MI

Service Type/Location: Janitorial/Custodial Service, U.S. Army Reserve Center, 9225 Peebles Road North Hills, Allison Park, PA

NPA: Life'sWork of Western PA, Pittsburgh, PA

Contracting Activity: DEPT OF THE ARMY, W6QM MICC CTR–FT DIX (RC), FORT DIX, NJ

Barry S. Lineback,

Director, Business Operations.

BILLING CODE 6353–01–P

COMMITTEE FOR PURCHASE FROM PEOPLE WHO ARE BLIND OR SEVERELY DISABLED

Procurement List; Proposed Additions and Deletion

AGENCY: Committee for Purchase From People Who Are Blind or Severely Disabled.

ACTION: Proposed Additions to and Deletion from the Procurement List.

SUMMARY: The Committee is proposing to add products and a service to the Procurement List that will be furnished

by nonprofit agencies employing persons who are blind or have other severe disabilities, and delete a service previously provided by such agency.

COMMENTS MUST BE RECEIVED ON OR BEFORE: 5/12/2014.

ADDRESSES: Committee for Purchase From People Who Are Blind or Severely Disabled, 1401 S. Clark Street, Suite 10800, Arlington, Virginia 22202–4149.

FOR FURTHER INFORMATION OR TO SUBMIT COMMENTS CONTACT: Barry S. Lineback, Telephone: (703) 603–7740, Fax: (703) 603–0655, or email CMTEFedReg@AbilityOne.gov.

SUPPLEMENTARY INFORMATION: This notice is published pursuant to 41 USC 8503 (a)(2) and 41 CFR 51–2.3. Its purpose is to provide interested persons an opportunity to submit comments on the proposed actions.

Additions

If the Committee approves the proposed additions, the entities of the Federal Government identified in this notice will be required to procure the products and service listed below from nonprofit agencies employing persons who are blind or have other severe disabilities.

The following products and service are proposed for addition to the Procurement List for production by the nonprofit agencies listed:

BILLING CODE 6353-01-P

DEPARTMENT OF DEFENSE

Department of the Army, Corps of Engineers

Notice of Intent To Prepare an Environmental Impact Statement and Conduct Scoping Meeting for the Berths 121–131 [Yang Ming] Container Terminal Redevelopment Project at the Port of Los Angeles, City and County of Los Angeles, California (SPL–2013–00810–TS).

AGENCY: U.S. Army Corps of Engineers, DOD.

ACTION: Notice of intent.

SUMMARY: The purpose of this notice is to initiate a 45-day scoping process for preparation of an Environmental Impact Statement (EIS) for the Los Angeles Harbor Department (LAHD) Berths 121–131 [Yang Ming] Container Terminal Redevelopment Project.

DATES: Submit comments concerning this notice on or before May 25, 2014. A public scoping meeting will be held on May 8, 2014 at 6:00 p.m. (PST).

ADDRESSES: The scoping meeting location is: Los Angeles Harbor Department, Board of Harbor Commissioners Hearing Room, 425 S. Palos Verdes Street, San Pedro, CA 90731.

Mail written comments concerning this notice to: U.S. Army Corps of

Engineers, Los Angeles District, Regulatory Division, Ventura Field Office, ATTN: SPL–2013–00810–TS, 2151 Alessandro Drive, Suite 110, Ventura, CA 93001. Comment letters should include the commenter's physical mailing address, the project title and the Corps file number in the subject line.

FOR FURTHER INFORMATION CONTACT:

Theresa Stevens, Ph.D., U.S. Army Corps of Engineers, Los Angeles District, Regulatory Division, Ventura Field Office, ATTN: SPL–2013–00810–TS, 2151 Alessandro Drive, Suite 110, Ventura, CA 93001, (805) 585–2146, theresa.stevens@usace.army.mil.

SUPPLEMENTARY INFORMATION:

In accordance with the National Environmental Policy Act (NEPA), the Corps is requiring the preparation of an Environmental Impact Statement (EIS) prior to any permit action. The Corps may ultimately make a determination to permit or deny the proposed project or a modified version of the proposed project. The primary Federal concerns are dredging, dredged material disposal, addition of permanent structures in and over navigable waters of the U.S., and transport of dredged material for the purpose of ocean disposal.

Pursuant to the California Environmental Quality Act (CEQA) the LAHD will serve as Lead Agency in preparing an Environmental Impact Report (EIR) for its consideration of development approvals within its jurisdiction. The Corps and LAHD have agreed to jointly prepare a Draft EIS/EIR to optimize efficiency and avoid duplication. The Draft EIS/EIR is intended to be sufficient in scope to address the Federal, state and local requirements and environmental issues concerning the proposed activities and permit approvals.

Authority: 33 U.S.C. 403; 33 U.S.C. 1344; 33 U.S.C. 1413.

1. Project Site and Background Information. The project site is located in the West Basin area of the Port of Los Angeles. The site is within the Port of Los Angeles Community Plan area in the City and County of Los Angeles, adjacent to the communities of San Pedro and Wilmington, and approximately 20 miles south of downtown Los Angeles. The purpose of the project is to improve marine shipping and maritime commerce to optimize the container-handling efficiency and capacity at Berths 121–131, and to accommodate berthing and servicing of the largest container ships that may call at the Port of Los Angeles. The existing 186-acre terminal is

operated by Yang Ming, Inc. under a lease agreement (LAHD Permit No. 787).

2. Proposed Action. The LAHD has proposed to redevelop the existing container terminal in two phases and the following actions require a Department of the Army permit. Phase 1 would take place at Berths 126–129 and would include: Demolition and reconstruction of 1,260 linear feet of concrete wharf and supporting rock dike; 10 new 100–120-foot gantry cranes (this measurement represents the spread of the crane leg supports); dredging of approximately 400,000 cubic yards (cy) of sediment. Phase 2 would take place at Berths 121–126 and would include: Demolition and reconstruction of 1,400 linear feet of concrete wharf and supporting rock dike; 10 new 100–120-foot gantry cranes; cut 3.7 acres of land and backfill 2.1 acres of waters of the United States for wharf realignment and angle point transition; dredging of approximately 500,000 cy of sediment. The depth of the proposed dredging areas would increase from –45 feet to –53 feet mean lower low water (MLLW) with an overdredge allowance of two feet, for a total depth of –55 feet MLLW. Dredged material would be beneficially reused, disposed at the Berths 243–245 confined disposal facility (CDF), or the LA–2 ocean disposal site. Construction activities for Phase 1 are scheduled to begin in 2016, would take approximately 24 months to complete and may be phased to maintain terminal operations during construction. Construction activities for Phase 2 have not been scheduled. Addition or expansion of backland facilities, such as on-dock rail, does not require a Corps permit; however all indirect and cumulative impacts associated with the proposed project will be evaluated in the EIS/EIR in accordance with NEPA.

3. Issues: Potentially significant impacts associated with the proposed project may include: Aesthetics/visual impacts, air quality emissions, biological resource impacts, environmental justice, geologic impacts related to seismicity, hazards and hazardous materials, water quality, noise, traffic and transportation, socioeconomics, and cumulative impacts from past, present and reasonably foreseeable future projects.

4. Alternatives. The Draft EIS/EIR will include a co-equal analysis of several alternatives. Project alternatives will be further developed during this scoping process. Additional alternatives that may be developed during scoping will also be considered in the Draft EIS/EIR.

5. Scoping Process. The Corps and LAHD will jointly conduct a public

scoping meeting to receive public comment regarding the appropriate scope and preparation of the Draft EIS/EIR. Participation by Federal, state, and local agencies and other interested organization and persons is encouraged. This meeting will be conducted in English and Spanish.

6. The Draft EIS/EIR is expected to be available for public review and comment in 2015, and a public meeting will be held after its publication.

Dated: March 27, 2014.

David J. Castanon,

Chief, Regulatory Division.

BILLING CODE 3720-58-P

DEPARTMENT OF ENERGY

High Energy Physics Advisory Panel

AGENCY: Office of Science, Department of Energy.

ACTION: Notice of Open Meeting.

SUMMARY: This notice announces a meeting of the High Energy Physics Advisory Panel (HEPAP). The Federal Advisory Committee Act (Pub. L. 92-463, 86 Stat. 770) requires that public notice of these meetings be announced in the **Federal Register**.

DATES: Thursday, May 22, 2014, 8:30 a.m.–6:00 p.m., Friday, May 23, 2014, 8:30 a.m.–4:00 p.m.

ADDRESSES: Doubletree Bethesda, 8120 Wisconsin Avenue, Bethesda, MD 20814.

FOR FURTHER INFORMATION CONTACT: John Kogut, Executive Secretary, High Energy Physics Advisory Panel; U.S. Department of Energy; SC-25/ Germantown Building, 1000 Independence Avenue SW., Washington, DC 20585-1290; Telephone: (301) 903-1298.

SUPPLEMENTARY INFORMATION:

Purpose of Meeting: To provide advice and guidance on a continuing basis to the Department of Energy and the National Science Foundation on scientific priorities within the field of high energy physics research.

Tentative Agenda: Agenda will include discussions of the following:

May 22–23, 2014

- Discussion of Department of Energy High Energy Physics Program
- Discussion of National Science Foundation Elementary Particle Physics Program
- Reports on and Discussions of Topics of General Interest in High Energy Physics
- Public Comment (10-minute rule)

Public Participation: The meeting is open to the public. A webcast of this meeting will be available. Please check the Web site below for updates and information on how to view the meeting. If you would like to file a written statement with the Committee, you may do so either before or after the meeting. If you would like to make oral statements regarding any of these items on the agenda, you should contact John Kogut, (301) 903-1298 or John.Kogut@science.doe.gov. You must make your request for an oral statement at least 5 business days before the meeting. Reasonable provision will be made to include the scheduled oral statements on the agenda. The Chairperson of the Panel will conduct the meeting to facilitate the orderly conduct of business. Public comment will follow the 10-minute rule.

Minutes: The minutes of the meeting will be available on the U.S. Department of Energy's Office of High Energy Physics Advisory Panel Web site at: <http://science.energy.gov/hep/hepap/meetings/>.

Issued in Washington, DC, on April 7, 2014.

La'Tanya R. Butler,

Deputy Committee Management Officer.

BILLING CODE 6450-01-P

DEPARTMENT OF ENERGY

Office of Energy Efficiency and Renewable Energy

[Docket No. EERE-2014-BT-BC-0017]

DOE Building Energy Codes Program Stakeholder Meeting

AGENCY: Office of Energy Efficiency and Renewable Energy, Department of Energy.

ACTION: Notice of public meeting.

SUMMARY: The DOE Building Energy Codes Program will host an upcoming public meeting to provide stakeholders with an update on program direction. DOE will present an overview of current activities and program organization in support of its mission to achieve energy savings through the development and implementation of building energy codes. DOE will solicit public comment and discussion surrounding information presented.

DATES: DOE will hold a public meeting on Thursday, April 24, 2014, from 8:00 a.m. to 3:30 p.m. in Arlington, VA. Advance registration is required. Parties who wish to submit official comments following the meeting must do so by May 30, 2014.

ADDRESSES: The public meeting will be held at the DoubleTree Hotel—Crystal City, 300 Army Navy Drive, Arlington, VA 22203. To participate in the meeting, please submit an official request to BuildingEnergyCodes@ee.doe.gov, including attendee name and organizational affiliation.

Comments from the public will be accepted at the meeting. Additionally, following the meeting, a docket will be made available to accept public comment on topics discussed at the stakeholder meeting. Interested parties may submit comments by any of the following methods:

- **Email:**

AprilBldgCodesMtg2014BC0017@ee.doe.gov. Include “April 2014 Building Energy Codes Stakeholder Meeting” in the subject line of the message.

- **Federal eRulemaking Portal:** www.regulations.gov. Follow the instructions for submitting comments.

- **Postal Mail:** Ms. Brenda Edwards, U.S. Department of Energy, Building Technologies Office EE-5B, 1000 Independence Avenue SW., Washington, DC 20585-0121. Phone: (202) 586-2945. Please submit one signed paper original.

- **Hand Delivery/Courier:** Ms. Brenda Edwards, U.S. Department of Energy, Building Technologies Office, 950 L'Enfant Building, 6th floor, Room 6052, 950 L'Enfant Plaza SW., Washington, DC 20024. Phone: (202) 586-2945. Please submit one signed paper original.

Instructions: All submissions must include the agency name, U.S. Department of Energy, and docket number EERE-2014-BT-BC-0017.

Docket: The docket is available for public review at www.regulations.gov. All documents in the docket are listed in the index. A link to the docket Web page can be found at <http://www.regulations.gov/#!docketDetail;D=EERE-2014-BT-BC-0017>. The Regulations.gov Web site contains instructions on how to access all documents, including public comments, in the docket.

FOR FURTHER INFORMATION CONTACT:

Jeremiah Williams, U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, Building Technologies Office, Mailstop EE-5B, 1000 Independence Ave. SW., Washington, DC 20585-0121, Telephone: (202) 287-1941, Email: jeremiah.williams@ee.doe.gov.
Ami Grace-Tardy, U.S. Department of Energy, Office of the General Counsel, Forrestal Building, Mailstop GC-71, 1000 Independence Ave. SW., Washington, DC 20585, Telephone:

(202) 586-5709, Email: *ami.grace-tardy@hq.doe.gov*.

SUPPLEMENTARY INFORMATION: The public meeting announced in today's notice is for the DOE Building Energy Codes Program to present and receive comments on its overall program direction and in anticipation of its future residential code development activities. DOE will present an overview of current program activities and organization in support of its mission to achieve energy savings through building energy codes. In addition, DOE seeks stakeholder input in anticipation of future residential code development activities. DOE will solicit public comment and discussion surrounding information presented.

There will be two sessions held:

1. General Program Input (8:00a-12:00p): This is a general session during which the program will present its current and future plans. Please bring concrete, actionable ideas regarding what activities the program should undertake.

2. Residential Code Development (1:00p-3:30p): This is a meeting in anticipation of DOE activities surrounding the 2018 International Energy Conservation Code (IECC). The Department is seeking stakeholder input into how it should participate in model code development activities, as administered by the International Code Council (ICC), as well as comments regarding the future direction of the residential model energy code.

To participate in the meeting, please submit an official request as outlined in the **ADDRESSES** section of this Notice. Note that space is limited and advanced registration is required. Requests will be honored in the order they are received. A meeting agenda and other related materials will be made available at www.energycodes.gov/events. Please check this location for additional information in anticipation of the stakeholder meeting, and for additional instructions following the event.

Issued in Washington, DC, on April 7, 2014.

Jeremiah Williams,

Acting Program Manager, Building Energy Codes, Building Technologies Office, Energy Efficiency and Renewable Energy.

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Docket No. EL14–34–000]

Public Service Commission of Wisconsin v. Midcontinent Independent System Operator, Inc.; Notice of Complaint

Take notice that on April 3, 2014, the Public Service Commission of Wisconsin (PSCW) filed a formal complaint against Midcontinent Independent System Operator, Inc. (MISO) pursuant to sections 206 and 306 of the Federal Power Act (FPA),¹ and Rule 206 of the Rules of Practice and Procedures² of the Federal Energy Regulatory Commission (Commission), alleging that a provision of Module A, section 38.2.7.k of MISO's Open Access Transmission, Energy and Operating Reserves Markets, and the provision's implementation in Rate Schedule 43G with respect to a System Support Resource Agreement between MISO and Wisconsin Electric Power Company is unjust, unreasonable, and unduly discriminatory.

The PSCW certifies that copies of the complaint were served on the contacts for MISO as listed on the Commission's list of Corporate Officials.

Any person desiring to intervene or to protest this filing must file in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR 385.211, 385.214). Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a notice of intervention or motion to intervene, as appropriate. The Respondent's answer and all interventions, or protests must be filed on or before the comment date. The Respondent's answer, motions to intervene, and protests must be served on the Complainants.

The Commission encourages electronic submission of protests and interventions in lieu of paper using the "eFiling" link at <http://www.ferc.gov>. Persons unable to file electronically should submit an original and 5 copies of the protest or intervention to the Federal Energy Regulatory Commission, 888 First Street NE., Washington, DC 20426.

This filing is accessible on-line at <http://www.ferc.gov>, using the "eLibrary" link and is available for

¹ 16 U.S.C. 824e, 825e. (2012).

² 18 CFR 385.206 (2014).

review in the Commission's Public Reference Room in Washington, DC. BILLING CODE 6717-01-P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Docket No. ER14-1656-000]

CSOLAR IV West, LLC; Supplemental Notice That Initial Market-Based Rate Filing Includes Request for Blanket Section 204 Authorization

This is a supplemental notice in the above-referenced proceeding of CSOLAR IV West, LLC's application for market-based rate authority, with an accompanying rate tariff, noting that such application includes a request for blanket authorization, under 18 CFR Part 34, of future issuances of securities and assumptions of liability.

Any person desiring to intervene or to protest should file with the Federal Energy Regulatory Commission, 888 First Street NE., Washington, DC 20426, in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR 385.211 and 385.214). Anyone filing a motion to intervene or protest must serve a copy of that document on the Applicant.

Notice is hereby given that the deadline for filing protests with regard to the applicant's request for blanket authorization, under 18 CFR Part 34, of future issuances of securities and assumptions of liability, is April 28, 2014.

The Commission encourages electronic submission of protests and

interventions in lieu of paper, using the FERC Online links at <http://www.ferc.gov>. To facilitate electronic service, persons with Internet access who will eFile a document and/or be listed as a contact for an intervenor must create and validate an eRegistration account using the eRegistration link. Select the eFiling link to log on and submit the intervention or protests.

Persons unable to file electronically should submit an original and 5 copies of the intervention or protest to the Federal Energy Regulatory Commission, 888 First Street NE., Washington, DC 20426.

The filings in the above-referenced proceeding are accessible in the Commission's eLibrary system by clicking on the appropriate link in the above list. They are also available for review in the Commission's Public Reference Room in Washington, DC. There is an eSubscription link on the Web site that enables subscribers to receive email notification when a document is added to a subscribed docket(s). For assistance with any FERC Online service, please email FERCOnlineSupport@ferc.gov, or call (866) 208-3676 (toll free). For TTY, call (202) 502-8659.

Dated: April 7, 2014.

Federal Energy Regulatory Commission

[Docket No. RM98-1-000]

Records Governing Off-the-Record Communications; Public Notice

This constitutes notice, in accordance with 18 CFR 385.2201(b), of the receipt of prohibited and exempt off-the-record communications.

Order No. 607 (64 FR 51222, September 22, 1999) requires Commission decisional employees, who make or receive a prohibited or exempt off-the-record communication relevant to the merits of a contested proceeding,

to deliver to the Secretary of the Commission, a copy of the communication, if written, or a summary of the substance of any oral communication.

Prohibited communications are included in a public, non-decisional file associated with, but not a part of, the decisional record of the proceeding. Unless the Commission determines that the prohibited communication and any responses thereto should become a part of the decisional record, the prohibited off-the-record communication will not be considered by the Commission in reaching its decision. Parties to a proceeding may seek the opportunity to respond to any facts or contentions made in a prohibited off-the-record communication, and may request that the Commission place the prohibited communication and responses thereto in the decisional record. The Commission will grant such a request only when it determines that fairness so requires. Any person identified below as having made a prohibited off-the-record communication shall serve the document on all parties listed on the official service list for the applicable proceeding in accordance with Rule 2010, 18 CFR 385.2010.

Exempt off-the-record communications are included in the decisional record of the proceeding, unless the communication was with a cooperating agency as described by 40 CFR 1501.6, made under 18 CFR 385.2201(e) (1) (v).

The following is a list of off-the-record communications recently received by the Secretary of the Commission. The communications listed are grouped chronologically, in ascending order. These filings are available for review at the Commission in the Public Reference Room or may be viewed on the Commission's Web site at <http://www.ferc.gov> using the eLibrary link. Enter the docket number,

excluding the last three digits, in the docket number field to access the document. For assistance, please contact FERC, Online Support at FERCOnlineSupport@ferc.gov or toll free at (866)208-3676, or for TTY, contact (202)502-8659.

BILLING CODE 6560-50-P

ENVIRONMENTAL PROTECTION AGENCY

[FRL-9909-38-Region-3]

Adequacy Status of the Submitted Maintenance Plan for the West Virginia Portion of the Martinsburg-Hagerstown, WV-MD 1997 Fine Particulate Matter National Ambient Air Quality Standard Nonattainment Area for Transportation Conformity Purposes

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice of adequacy.

SUMMARY: In this notice, the Environmental Protection Agency (EPA) is notifying the public that EPA has found that the Motor Vehicle Emissions Budgets (MVEBs) in the West Virginia Portion of the Martinsburg-Hagerstown, WV-MD 1997 Fine Particulate Matter (PM_{2.5}) National Ambient Air Quality

Standard (NAAQS) Nonattainment Area Maintenance Plan (Martinsburg Maintenance Plan), submitted as a State Implementation Plan (SIP) revision by the West Virginia Department of Environmental Protection (WVDEP), are adequate for transportation conformity purposes. As a result of EPA's finding, the State of West Virginia must use the 2017 and 2025 MVEBs from the Martinsburg Maintenance Plan for future conformity determinations for the 1997 PM_{2.5} NAAQS.

DATES: This notice is effective on April 28, 2014.

FOR FURTHER INFORMATION CONTACT: Asrah Khadr, Environmental Engineer, Office of Air Program Planning (3AP30), United States Environmental Protection Agency, Region III, 1650 Arch Street, Philadelphia, PA 19103, (215) 814-2071; khadr.asrah@epa.gov.

SUPPLEMENTARY INFORMATION: Today's notice is simply an announcement of a finding that EPA has already made. EPA

Region III sent a letter to WVDEP on March 6, 2014, stating that EPA has found that the MVEBs in the Martinsburg Maintenance Plan for budget years 2017 and 2025, submitted on August 5, 2013 by WVDEP, are adequate for transportation conformity purposes. As a result of EPA's finding, the State of West Virginia must use the 2017 and 2025 MVEBs from the August 5, 2013 Martinsburg Maintenance Plan for future conformity determinations in the West Virginia Portion of the Martinsburg-Hagerstown, WV-MD 1997 PM_{2.5} NAAQS Nonattainment Area. Receipt of the submittal was announced on EPA's transportation conformity Web site. No comments were received. The findings letter is available at EPA's conformity Web site: <http://www.epa.gov/otaq/stateresources/transconf/adequacy.htm>. The adequate direct particulate matter (PM)_x and nitrogen oxides (NO_x) MVEBs are provided in Table 1.

TABLE 1—MARTINSBURG MAINTENANCE PLAN MVEBS FOR DIRECT PM AND NO_x

Budget years	Mobile vehicle emissions budget for direct PM-tons per year	Mobile vehicle emissions budget for NO _x -tons per year
2017	83	2,621
2025	50	1,660

Transportation conformity is required by section 176(c) of the Clean Air Act (CAA). EPA's conformity rule requires that transportation plans, transportation improvement programs, and projects conform to SIPs and establishes the criteria and procedures for determining whether or not they do. Conformity to a SIP means that transportation activities will not produce new air quality violations, worsen existing violations, or delay timely attainment of the national ambient air quality standards.

The criteria by which we determine whether a SIP's MVEBs are adequate for conformity purposes are outlined in 40 CFR 93.118(e)(4). EPA described the process for determining the adequacy of submitted SIP budgets in a July 1, 2004 preamble starting at 69 FR 40038 and used the information in these resources in making this adequacy determination. West Virginia did not provide emission budgets for sulfur dioxide (SO₂), volatile organic compounds (VOCs), or ammonia for the West Virginia Portion of the Martinsburg-Hagerstown, WV-MD 1997 PM_{2.5} NAAQS Nonattainment Area because it concluded that emissions of these precursors from motor vehicles are

not significant contributors to the area's PM_{2.5} air quality problem. The transportation conformity rule provision at 40 CFR 93.102(b)(2)(v) indicates that conformity pdoes not apply for these precursors, due to the lack of MVEBs for these precursors and the State's conclusion that motor vehicle emissions of SO₂, VOCs, and ammonia do not contribute significantly to the area's PM_{2.5} nonattainment problem. This provision of the transportation conformity rule predates and was not disturbed by the January 4, 2013 decision in the litigation on the PM_{2.5} implementation rule.¹ EPA has preliminarily concluded that the State's decision to not include budgets for SO₂, VOCs, and ammonia is consistent with the requirements of the transportation

¹ EPA issued conformity regulations to implement the 1997 PM_{2.5} NAAQS (69 FR 40004, July 1, 2004 and 70 FR 24280, May 6, 2005, respectively). Those actions were not part of the final rule recently remanded to EPA by the Court of Appeals for the District of Columbia in *NRDC v. EPA*, No. 08-1250 (January 4, 2013), in which the Court remanded to EPA the implementation rule for the PM_{2.5} NAAQS because it concluded that EPA must implement that NAAQS pursuant to the PM-specific implementation provisions of subpart 4 of Part D of Title I of the CAA, rather than solely under the general provisions of subpart 1.

conformity rule. That decision does not affect EPA's adequacy finding for the submitted direct PM and NO_x MVEBs for the West Virginia Portion of the Martinsburg-Hagerstown, WV-MD 1997 PM_{2.5} NAAQS Nonattainment Area.

Please note that an adequacy review is separate from EPA's completeness review, and should not be used to prejudice EPA's ultimate approval action for the SIP. Even if EPA finds the budgets for the Martinsburg Maintenance Plan adequate, the SIP could later be disapproved. The finding and the response to comments are available at EPA's conformity Web site: <http://www.epa.gov/otaq/stateresources/transconf/adequacy.htm>.

Authority: 42 U.S.C. 7401-7671q.

W.C. Early,
Acting Regional Administrator, Region III.

BILLING CODE 6560-50-P

ENVIRONMENTAL PROTECTION AGENCY

[EPA-HQ-OPP-2010-0014; FRL-9908-31]

Product Cancellation Order for Certain Pesticide Registrations

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice.

SUMMARY: This notice announces EPA's order for the cancellations, voluntarily requested by the registrants and accepted by the Agency of the products listed in Table 1 of Unit II., pursuant to the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA). This cancellation order follows an August 28, 2013, **Federal Register** Notice of Receipt of Requests from the registrants listed in Table 2 of Unit II., to voluntarily cancel these product registrations. In the August 28, 2013 notice, EPA indicated that it would issue an order implementing the cancellations, unless the Agency received substantive comments within the 180 day comment period that would merit its further review of these requests, or unless the registrants withdrew their requests. The Agency received one comment on the notice but it did not merit its further review of the request. Further, the

registrants did not withdraw their requests. Accordingly, EPA hereby issues in this notice a cancellation order granting the requested cancellations. Any distribution, sale, or use of the products subject to this cancellation order is permitted only in accordance with the terms of this order, including any existing stocks provisions.

DATES: The cancellations are effective April 11, 2014.

FOR FURTHER INFORMATION CONTACT: John W. Pates, Jr., Pesticide Re-Evaluation Division (7508P), Office of Pesticide Programs, Environmental Protection Agency, 1200 Pennsylvania Ave. NW., Washington, DC 20460-0001; telephone number: (703) 308-8195; email address: pates.john@epa.gov.

SUPPLEMENTARY INFORMATION:

I. General Information

A. Does this action apply to me?

This action is directed to the public in general, and may be of interest to a wide range of stakeholders including environmental, human health, and agricultural advocates; the chemical industry; pesticide users; and members of the public interested in the sale, distribution, or use of pesticides. Since others also may be interested, the Agency has not attempted to describe all

the specific entities that may be affected by this action.

B. How can I get copies of this document and other related information?

The docket for this action, identified by docket identification (ID) number EPA-HQ-OPP-2010-0014, is available at <http://www.regulations.gov> or at the Office of Pesticide Programs Regulatory Public Docket (OPP Docket) in the Environmental Protection Agency Docket Center (EPA/DC), EPA West Bldg., Rm. 3334, 1301 Constitution Ave. NW., Washington, DC 20460-0001. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566-1744, and the telephone number for the OPP Docket is (703) 305-5805. Please review the visitor instructions and additional information about the docket available at <http://www.epa.gov/dockets>.

II. What action is the agency taking?

This notice announces the cancellation, as requested by registrants, of products registered under FIFRA section 3. These registrations are listed in sequence by registration number in Table 1 of this unit.

TABLE 1—PRODUCT CANCELLATIONS

EPA Registration number	Product name	Chemical name
000100-00736	Banner GL	Propiconazole.

III. Summary of Public Comments Received and Agency Response to Comments

During the public comment period, EPA received one comment. The Agency does not believe that the comment submitted during the comment period merits further review or a denial of the request for voluntary cancellation.

IV. Cancellation Order

Pursuant to FIFRA section 6(f), EPA hereby approves the requested cancellations of the registrations identified in Table 1 of Unit II. Accordingly, the Agency hereby orders that the product registrations identified in Table 1 of Unit II. are cancelled. The effective date of the cancellations that are the subject of this notice is April 11, 2014. Any distribution, sale, or use of existing stocks of the products identified in Table 1 of Unit II. in a manner inconsistent with any of the provisions for disposition of existing stocks set forth in Unit VI. will be a violation of FIFRA.

V. What is the Agency's authority for taking this action?

Section 6(f)(1) of FIFRA provides that a registrant of a pesticide product may at any time request that any of its pesticide registrations be cancelled or amended to terminate one or more uses. FIFRA further provides that, before acting on the request, EPA must publish a notice of receipt of any such request in the **Federal Register**. Thereafter, following the public comment period, the EPA Administrator may approve such a request. The notice of receipt for this action was published for comment in the **Federal Register** issue of August 28, 2013 (78 FR 53141) (FRL–9396–4). The comment period closed on February 24, 2014.

VI. Provisions for Disposition of Existing Stocks

Existing stocks are those stocks of registered pesticide products which are

currently in the United States and which were packaged, labeled, and released for shipment prior to the effective date of the cancellation action. The existing stocks provisions for the products subject to this order are as follows.

The registrants may continue to sell and distribute existing stocks of products listed in Table 1 of Unit II. until April 13, 2015, which is 1 year after the publication of the Cancellation Order in the **Federal Register**. Thereafter, the registrants are prohibited from selling or distributing products listed in Table 1 of Unit II., except for export in accordance with FIFRA section 17, or proper disposal. Persons other than the registrants may sell, distribute, or use existing stocks of products listed in Table 1 of Unit II., until existing stocks are exhausted, provided that such sale, distribution, or use is consistent with the terms of the previously approved labeling on, or that accompanied, the cancelled products.

BILLING CODE 6560–50–P

ENVIRONMENTAL PROTECTION AGENCY

[EPA–HQ–OPP–2010–0014; FRL–9908–81]

Notice of Receipt of Requests To Voluntarily Cancel Certain Pesticide Registrations

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice.

SUMMARY: In accordance with the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), EPA is issuing

a notice of receipt of requests by registrants to voluntarily cancel certain pesticide registrations. EPA intends to grant these requests at the close of the comment period for this announcement unless the Agency receives substantive comments within the comment period that would merit its further review of the requests, or unless the registrants withdraw their requests. If these requests are granted, any sale, distribution, or use of products listed in this notice will be permitted after the registration has been cancelled only if such sale, distribution, or use is consistent with the terms as described in the final order.

DATES: Comments must be received on or before October 8, 2014.

ADDRESSES: Submit your comments, identified by docket identification (ID) number EPA–HQ–OPP–2010–0014, by one of the following methods:

- *Federal eRulemaking Portal:* <http://www.regulations.gov>. Follow the online instructions for submitting comments. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute.

- *Mail:* OPP Docket, Environmental Protection Agency Docket Center (EPA/DC), (28221T), 1200 Pennsylvania Ave. NW., Washington, DC 20460–0001.

Submit written withdrawal request by mail to: Pesticide Re-Evaluation Division (7508P), Office of Pesticide Programs, Environmental Protection Agency, 1200 Pennsylvania Ave. NW., Washington, DC 20460–0001. ATTN: John W. Pates, Jr.

- *Hand Delivery:* To make special arrangements for hand delivery or delivery of boxed information, please follow the instructions at <http://www.epa.gov/dockets/contacts.htm>.

Additional instructions on commenting or visiting the docket, along with more information about dockets generally, is available at <http://www.epa.gov/dockets>.

FOR FURTHER INFORMATION CONTACT: John W. Pates, Jr., Pesticide Re-Evaluation Division (7508P), Office of Pesticide Programs, Environmental Protection Agency, 1200 Pennsylvania Ave. NW., Washington, DC 20460-0001; telephone number: (703) 308-8195; email address: pates.john@epa.gov.

SUPPLEMENTARY INFORMATION:

I. General Information

A. Does this action apply to me?

This action is directed to the public in general, and may be of interest to a wide range of stakeholders including environmental, human health, and agricultural advocates; the chemical industry; pesticide users; and members of the public interested in the sale, distribution, or use of pesticides.

B. What should I consider as I prepare my comments for EPA?

1. *Submitting CBI.* Do not submit this information to EPA through regulations.gov or email. Clearly mark the part or all of the information that you claim to be CBI. For CBI information in a disk or CD-ROM that you mail to EPA, mark the outside of the

disk or CD-ROM as CBI and then identify electronically within the disk or CD-ROM the specific information that is claimed as CBI. In addition to one complete version of the comment that includes information claimed as CBI, a copy of the comment that does not contain the information claimed as CBI must be submitted for inclusion in the public docket. Information so marked will not be disclosed except in accordance with procedures set forth in 40 CFR part 2.

2. *Tips for preparing your comments.* When submitting comments, remember to:

- i. Identify the document by docket ID number and other identifying information (subject heading, **Federal Register** date and page number).
- ii. Follow directions. The Agency may ask you to respond to specific questions or organize comments by referencing a Code of Federal Regulations (CFR) part or section number.
- iii. Explain why you agree or disagree; suggest alternatives and substitute language for your requested changes.
- iv. Describe any assumptions and provide any technical information and/or data that you used.

v. If you estimate potential costs or burdens, explain how you arrived at your estimate in sufficient detail to allow for it to be reproduced.

vi. Provide specific examples to illustrate your concerns and suggest alternatives.

vii. Explain your views as clearly as possible, avoiding the use of profanity or personal threats.

viii. Make sure to submit your comments by the comment period deadline identified.

II. What action is the Agency taking?

This notice announces receipt by the Agency of requests from registrants to cancel 15 pesticide products registered under FIFRA section 3 or 24(c). These registrations are listed in sequence by registration number (or company number and 24(c) number) in Table 1 of this unit.

Unless the Agency determines that there are substantive comments that warrant further review of the requests or the registrants withdraw their requests, EPA intends to issue an order in the **Federal Register** canceling all of the affected registrations.

TABLE 1—REGISTRATIONS WITH PENDING REQUESTS FOR CANCELLATION

Registration No.	Product name	Chemical name
000264-00941	Gustafson Baytan 30 Flowable Fungicide	Triadimenol.
000264-00948	Gustafson LSP Flowable Fungicide	Thiabendazole.
000264-01036	Trilex Advanced Pak	Metalaxyl, Triadimenol and Trifloxystrobin.
005383-00068	Troysan 174P	2-((Hydroxymethyl)amino) ethanol.
035935-00066	Trinexapac-ethyl Technical	Trinexapac-ethyl.
AZ-080015	Proclipse 65 WDG	Prodiamine.
CA-080022	Proclipse 65 WDG	Prodiamine.
LA-090001	Dual Magnum	S-Metolachlor.
ND-030001	Apron MAXX RTA	Fludioxonil and Metalaxyl-M.
ND-030002	Apron MAXX RTA	Fludioxonil and Metalaxyl-M.
OR-080034	Evito 480 SC Fungicide	Fluoxastrobin.
OR-100007	Bird Shield Bird Repellent Concentrate	Methyl anthranilate.
TX-090007	Gramoxone Inteon	Paraquat dichloride.
WA-090009	Retain Plant Growth Regulator Soluble Powder	3-Butenoic acid, 2-amino-4-(2-aminoethoxy)-, monohydrochloride, (S-(E))-.
WA-120013	Sevin Brand 4F Carbaryl Insecticide	Carbaryl.

Table 2 of this unit includes the names and addresses of record for all registrants of the products in Table 1 of

this unit, in sequence by EPA company number. This number corresponds to the first part of the EPA registration

numbers of the products listed in this unit.

TABLE 2—REGISTRANTS REQUESTING VOLUNTARY CANCELLATION

EPA Company No.	Company name and address
264	Bayer CropScience, LP, 2 T.W. Alexander Drive, P.O. Box 12014, Research Triangle Park, NC 27709.
5383	Troy Chemical Corporation, 8 Vreeland Road, P.O. Box 955, Florham Park, NJ 07932-4200.

TABLE 2—REGISTRANTS REQUESTING VOLUNTARY CANCELLATION—Continued

EPA Company No.	Company name and address
OR-100007	Bird Shield Repellent Corporation, 254 E. Main St., Suite 226A, P.O. Box 785, Pullman, WA 99163.
WA-090009	Valent BioSciences Corporation, 870 Technology Way, Libertyville, IL 60048-6316.
WA-120013	Tessenderlo Kerley, Inc., Agent: Pyxis Regulatory Consulting, Inc., 4110 136th Street NW., Gig Harbor, WA 98332.

III. What is the Agency’s authority for taking this action?

Section 6(f)(1) of FIFRA provides that a registrant of a pesticide product may at any time request that any of its pesticide registrations be canceled. FIFRA further provides that, before acting on the request, EPA must publish a notice of receipt of any such request in the **Federal Register**.

Section 6(f)(1)(B) of FIFRA requires that before acting on a request for voluntary cancellation, EPA must provide a 30-day public comment period on the request for voluntary cancellation or use termination. In addition, FIFRA section 6(f)(1)(C) requires that EPA provide a 180-day comment period on a request for voluntary cancellation or termination of any minor agricultural use before granting the request, unless:

1. The registrants request a waiver of the comment period, or
2. The EPA Administrator determines that continued use of the pesticide would pose an unreasonable adverse effect on the environment.

The registrants in Table 2 of Unit II. have not requested that EPA waive the 180-day comment period. Accordingly, EPA will provide a 180-day comment period on the proposed requests.

IV. Procedures for Withdrawal of Request

Registrants who choose to withdraw a request for cancellation should submit such withdrawal in writing to the person listed under **FOR FURTHER INFORMATION CONTACT**. If the products have been subject to a previous cancellation action, the effective date of cancellation and all other provisions of any earlier cancellation action are controlling.

V. Provisions for Disposition of Existing Stocks

Existing stocks are those stocks of registered pesticide products that are currently in the United States and that were packaged, labeled, and released for shipment prior to the effective date of the cancellation action. Because the Agency has identified no significant potential risk concerns associated with these pesticide products, upon

cancellation of the products identified in Table 1 of Unit II., EPA anticipates allowing registrants to sell and distribute existing stocks of these products for 1 year after publication of the Cancellation Order in the **Federal Register**. Thereafter, registrants will be prohibited from selling or distributing the pesticides identified in Table 1 of Unit II., except for export consistent with FIFRA section 17 or for proper disposal. Persons other than registrants will generally be allowed to sell, distribute, or use existing stocks until such stocks are exhausted, provided that such sale, distribution, or use is consistent with the terms of the previously approved labeling on, or that accompanied, the canceled products.

List of Subjects

Environmental protection, Pesticides and pests.

EXPORT-IMPORT BANK

[Public Notice 2014-3002]

Agency Information Collection Activities: Correction to Comment Request—Federal Register Number 2014-07682, Monday, April 7, 2014/ Notices

AGENCY: Export-Import Bank of the United States.
ACTION: This Notice supersedes an erroneous Public Notice **Federal Register** Number 2014-07682, Monday, April 7, 2014/Notices.

Submission for OMB review and comments request.
Form Title: EIB 10-04 Notice of Claim and Proof of Loss, Working Capital Guarantee.
SUMMARY: The Export-Import Bank of the United States (Ex-Im Bank), as part of its continuing effort to reduce paperwork and respondent burden, invites the general public and other

Federal Agencies to comment on the proposed information collection, as required by the Paperwork Reduction Act of 1995.

By neutralizing the effect of export credit support offered by foreign governments and by absorbing credit risks that the private sector will not accept, Ex-Im Bank enables U.S. exporters to compete fairly in foreign markets on the basis of price and product. Under the Working Capital Guarantee Program, Ex-Im Bank provides repayment guarantees to lenders on secured, short-term working capital loans made to qualified exporters. The guarantee may be approved for a single loan or a revolving line of credit. In the event that a borrower defaults on a transaction guaranteed by Ex-Im Bank the guaranteed lender may seek payment by the submission of a claim.

This collection of information is necessary, pursuant to 12 U.S.C. 635 (a)(1), to determine if such claim complies with the terms and conditions of the relevant working capital guarantee. The Notice of Claim and Proof of Loss, Working Capital Guarantee is used to determine compliance with the terms of the guarantee and the appropriateness of paying a claim. Export-Import Bank customers are able to submit this form on paper or electronically.

The information collection tool can be reviewed at: <http://www.exim.gov/pub/pending/eib10-04.pdf>

DATES: Comments must be received on or before May 12, 2014 to be assured of consideration.

ADDRESSES: Comments may be submitted electronically on WWW.REGULATIONS.GOV or by mail to Office of Information and Regulatory Affairs, 725 17th Street NW., Washington, DC 20038 Attn: OMB 3048-0035.

SUPPLEMENTARY INFORMATION:

Title and Form Number: EIB 10-04 Notice of Claim and Proof of Loss, Working Capital Guarantee.

OMB Number: 3048-0035.

Type of Review: Regular.

Need and Use: This collection of information is necessary, pursuant to 12

U.S.C. 635(a)(1), to determine if such claim complies with the terms and conditions of the relevant insurance policy.

Affected Public: This form affects entities involved in the export of U.S. goods and services.

Annual Number of Respondents: 20.
Estimated Time per Respondent: 1 hour.

Annual Burden Hours: 20 hours.
Frequency of Reporting of Use: As needed to request a claim payment.

Government Expenses:

Reviewing time per year: 20 hours.
Average Wages per Hour: \$42.50.
Average Cost per Year (time*wages) : \$850.

Benefits and Overhead: 20%.

Total Government Cost: \$1,020.

Bonita Jones,

Agency Clearance Officer, Office of the Chief Information Officer.

FEDERAL MARITIME COMMISSION

Sunshine Act Meeting

AGENCY HOLDING THE MEETING: Federal Maritime Commission.

TIME AND DATE: April 16, 2014; 10:00 a.m.

PLACE: 800 N. Capitol Street NW., First Floor Hearing Room, Washington, DC.

STATUS: The first portion of the meeting will be held in Open Session; the second in Closed Session.

MATTERS TO BE CONSIDERED:

Open Session

1. Direct Final Rulemaking on Parts 501 and 503 of the Commission's Regulations Concerning Public Information and Delegation of Authority
2. Staff Briefing on Consumer Affairs and Dispute Resolution Services' Activities

Closed Session

1. Discussion on Nondisclosure Provision of Section 6(j) of the Shipping Act
2. Docket No. 12-03: *The Auction Block Company, et al. v. The City of Homer, et al.*

CONTACT PERSON FOR MORE INFORMATION: Karen V. Gregory, Secretary, (202) 523-5725.

Karen V. Gregory,
Secretary.

BILLING CODE 6730-01-P

FEDERAL RESERVE SYSTEM

Change in Bank Control Notices; Acquisitions of Shares of a Bank or Bank Holding Company

The notificants listed below have applied under the Change in Bank Control Act (12 U.S.C. 1817(j)) and § 225.41 of the Board's Regulation Y (12 CFR 225.41) to acquire shares of a bank or bank holding company. The factors that are considered in acting on the notices are set forth in paragraph 7 of the Act (12 U.S.C. 1817(j)(7)).

The notices are available for immediate inspection at the Federal Reserve Bank indicated. The notices also will be available for inspection at the offices of the Board of Governors. Interested persons may express their views in writing to the Reserve Bank indicated for that notice or to the offices of the Board of Governors. Comments must be received not later than April 28, 2014.

A. Federal Reserve Bank of Chicago (Colette A. Fried, Assistant Vice President) 230 South LaSalle Street, Chicago, Illinois 60690-1414:

1. *Joe D. Van Tol Revocable Trust, Joe D. Van Tol, as Trustee, individually, and in conjunction with the Van Tol Family, which consists of Joe D. Van Tol Revocable Trust; Todd J. Van Tol, Joe E. Van Tol, all of Rock Valley, Iowa; David J. Van Tol, Boulder, Colorado; and Ryan J. Van Tol, Harrisburg, South Dakota;* to retain voting shares of Peoples Bancorp, and thereby indirectly retain voting shares of Peoples Bank, both in Rock Valley, Iowa.

2. *The Kooima Family, which consists of Myron Kooima, Inwood, Iowa; Vernon Kooima, Doon, Iowa; and Dale Kooima, Rock Valley, Iowa;* to retain voting shares of Peoples Bancorp, and thereby indirectly retain voting shares of Peoples Bank, both in Rock Valley, Iowa.

Board of Governors of the Federal Reserve System, April 8, 2014.

Michael J. Lewandowski,

Associate Secretary of the Board.

BILLING CODE 6210-01-P

FEDERAL RESERVE SYSTEM

Formations of, Acquisitions by, and Mergers of Bank Holding Companies

The companies listed in this notice have applied to the Board for approval, pursuant to the Bank Holding Company Act of 1956 (12 U.S.C. 1841 *et seq.*) (BHC Act), Regulation Y (12 CFR Part 225), and all other applicable statutes

and regulations to become a bank holding company and/or to acquire the assets or the ownership of, control of, or the power to vote shares of a bank or bank holding company and all of the banks and nonbanking companies owned by the bank holding company, including the companies listed below.

The applications listed below, as well as other related filings required by the Board, are available for immediate inspection at the Federal Reserve Bank indicated. The applications will also be available for inspection at the offices of the Board of Governors. Interested persons may express their views in writing on the standards enumerated in the BHC Act (12 U.S.C. 1842(c)). If the proposal also involves the acquisition of a nonbanking company, the review also includes whether the acquisition of the nonbanking company complies with the standards in section 4 of the BHC Act (12 U.S.C. 1843). Unless otherwise noted, nonbanking activities will be conducted throughout the United States.

Unless otherwise noted, comments regarding each of these applications must be received at the Reserve Bank indicated or the offices of the Board of Governors not later than May 8, 2014.

A. Federal Reserve Bank of St. Louis (Yvonne Sparks, Community Development Officer) P.O. Box 442, St. Louis, Missouri 63166-2034:

1. *First Citizens Bancshares, Inc., Dyersburg, Tennessee;* to merge with Southern Heritage Bancshares, Inc., and thereby indirectly acquire Southern Heritage Bank, both in Cleveland, Tennessee.

B. Federal Reserve Bank of Minneapolis (Jacqueline K. Brunmeier, Assistant Vice President) 90 Hennepin Avenue, Minneapolis, Minnesota 55480-0291:

1. *Peoples Bankshares, Inc., Mora, Minnesota;* to merge with Douglas County Bancshares, Inc., and thereby indirectly acquire Neighborhood National Bank, both in Alexandria, Minnesota.

Board of Governors of the Federal Reserve System, April 8, 2014.

Michael J. Lewandowski,

Associate Secretary of the Board.

[60Day-14-0950]

Proposed Data Collections Submitted for Public Comment and Recommendations

In compliance with the requirement of Section 3506(c)(2)(A) of the Paperwork Reduction Act of 1995 for opportunity for public comment on proposed data collection projects, the Centers for Disease Control and Prevention (CDC) will publish periodic summaries of proposed projects. To request more information on the proposed projects or to obtain a copy of the data collection plans and instruments, call 404-639-7570 or send comments to LeRoy Richardson, 1600 Clifton Road, MS-D74, Atlanta, GA 30333 or send an email to omb@cdc.gov.

Comments are invited on: (a) Whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information shall have practical utility; (b) the accuracy of the agency's estimate of the burden of the proposed collection of information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; and (d) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or other forms of information technology. Written comments should be received within 60 days of this notice.

Proposed Project

The National Health and Nutrition Examination Survey (NHANES) (OMB No. 0920-0950, expires 11/30/2015)—Revision—National Center for Health Statistics (NCHS), Centers for Disease Control and Prevention (CDC).

Background and Brief Description

Section 306 of the Public Health Service (PHS) Act (42 U.S.C. 242k), as amended, authorizes that the Secretary of Health and Human Services (DHHS), acting through NCHS, shall collect statistics on the extent and nature of illness and disability; environmental, social and other health hazards; and determinants of health of the population of the United States.

The National Health and Nutrition Examination Surveys (NHANES) have been conducted periodically between

1970 and 1994, and continuously since 1999 by the National Center for Health Statistics, CDC. Annually, approximately 15,613 respondents participate in some aspect of the full survey. About 10,735 respondents complete the screener for the survey. About 209 respondents complete the household interview only. About 4,669 respondents complete both the household interview and the Mobile Exam Center (MEC) examination. Up to 2,500 additional persons might participate in tests of procedures, special studies, or methodological studies (Table 1). Participation in NHANES is completely voluntary and confidential. A three-year approval is requested.

NHANES programs produce descriptive statistics which measure the health and nutrition status of the general population. Through the use of physical examinations, laboratory tests, and interviews NHANES studies the relationship between diet, nutrition and health in a representative sample of the United States. NHANES monitors the prevalence of chronic conditions and risk factors. NHANES data are used to produce national reference data on height, weight, and nutrient levels in the blood. Results from more recent NHANES can be compared to findings reported from previous surveys to monitor changes in the health of the U.S. population over time. NCHS collects personal identification information. Participant level data items will include basic demographic information, name, address, social security number, Medicare number and participant health information to allow for linkages to other data sources such as the National Death Index and data from the Centers for Medicare and Medicaid Services (CMS).

A variety of agencies sponsor data-collection components on NHANES. To keep burden down, NCHS cycles in and out various components. The 2015-2016 NHANES physical examination includes the following components: oral glucose tolerance test (ages 12 and older), anthropometry (all ages), 24-hour dietary recall (all ages), physician's examination (all ages, blood pressure is collected here), oral health examination (ages 1 and older), hearing (ages 20-59), dual X-ray absorptiometry (total body composition ages 6-59 and osteoporosis, vertebral fractures and aortic calcification ages 40 and older).

While at the examination center additional interview questions are asked (6 and older), a second 24-hour dietary recall (all ages) is scheduled to be

conducted by phone 3-10 days later, and an appointment is made to return to the MEC to begin a 24-hour urine collection (one-half sample of ages 20-69). In 2014, a 24-hour urine collection was added to the NHANES protocol to better understand sodium intake and provide a population baseline for use in monitoring trends in sodium intake in the future. In 2015, FDA is scheduled to implement a plan to promote broad, gradual reduction of added sodium in the food supply. One half of those successfully completing the initial collection will be asked to complete a second 24-hour urine. After completing the 24-hour urine participants are asked to provide 2 home urine collections (first morning and an evening) and mail them back. The urines collected in the morning and evening will be compared to the 24-hour urine collection.

The bio-specimens collected for laboratory tests include urine, blood, vaginal and penile swabs, oral rinses and household water collection. Serum, plasma and urine specimens are stored for future testing if the participant consents.

The following major examination or laboratory items, that had been included in the 2013-2014 NHANES, were cycled out for NHANES 2015-2016: physical activity monitor, taste and smell component and upper body muscle strength (grip test).

Most sections of the NHANES interviews provide self-reported information to be used either in concert with specific examination or laboratory content, as independent prevalence estimates, or as covariates in statistical analysis (e.g., socio-demographic characteristics). Some examples include alcohol, drug, and tobacco use, sexual behavior, prescription and aspirin use, and indicators of oral, bone, reproductive, and mental health. Several interview components support the nutrition monitoring objective of NHANES, including questions about food security and nutrition program participation, dietary supplement use, and weight history/self-image/related behavior.

NHANES data users include the U.S. Congress; numerous Federal agencies such as other branches of the Centers for Disease Control and Prevention, the National Institutes of Health, and the United States Department of Agriculture; private groups such as the American Heart Association; schools of public health; and private businesses. There is no cost to respondents other than their time.

TABLE 1—ESTIMATED ANNUALIZED BURDEN HOURS

Type of Respondent	Form	Number of respondents	Number of responses per respondent	Average burden per response (in hours)	Total burden hours
Individuals in households	NHANES Questionnaire	15,613	1	2.5	39,033
Individuals in households	Special Studies	2,500	1	3	7,500
Total	46,533

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Centers for Disease Control and Prevention

[30Day-14-0889]

Agency Forms Undergoing Paperwork Reduction Act Review

The Centers for Disease Control and Prevention (CDC) publishes a list of information collection requests under review by the Office of Management and Budget (OMB) in compliance with the Paperwork Reduction Act (44 U.S.C. Chapter 35). To request a copy of these requests, call (404) 639-7570 or send an email to omb@cdc.gov. Send written comments to CDC Desk Officer, Office of Management and Budget, Washington, DC 20503 or by fax to (202) 395-5806. Written comments should be received within 30 days of this notice.

Proposed Project

Using Traditional Foods and Sustainable Ecological Approaches for Health Promotion and Diabetes Prevention in American Indian/Alaska Native Communities (OMB No. 0920-0889, exp. 6/30/2014)—Revision—National Center for Chronic Disease Prevention and Health Promotion (NCCDPHP), Centers for Disease Control and Prevention (CDC).

Background and Brief Description

In 2008, the CDC's Native Diabetes Wellness Program (NDWP), in consultation with American Indian/Alaska Native (AI/AN) tribal elders, issued a funding opportunity

announcement (FOA) entitled, "Using Traditional Foods and Sustainable Ecological Approaches for Health Promotion and Diabetes Prevention in American Indian/Alaska Native Communities." The Traditional Foods program was designed to build on what is known about traditional ways in order to inform culturally relevant, contemporary approaches to diabetes prevention for AI/AN communities. The program supports activities that enhance or re-introduce indigenous foods and practices drawn from each grantee's landscape, history, and culture. Example activities include the cultivation of community gardens, organization of local farmers' markets, and the dissemination of culturally appropriate health messages through storytelling, audio and video recordings, and printed materials. In addition, the program promotes physical activity initiatives, provides social support for healthy lifestyles, and supports collaboration with other agencies and programs.

Seventeen (17) tribal organizations received cooperative agreement funding under the initial FOA. Sixteen tribal organizations applied for a one-year extension that ends September 30, 2014.

CDC currently collects information from awardees about the activities supported with Traditional Foods funding. Each awardee submits a shared data elements (SDE) report to CDC through a Web-based interface. Information has been collected twice per year, in spring and fall. CDC anticipates that the spring 2014 report will be submitted to CDC under the current OMB clearance (OMB No. 0920-0889, exp. 6/30/2014). In order to receive a final report in the fall of 2014, CDC is requesting a six-month continuation of OMB approval, through approximately December 31, 2014. Because of the variety of food- and lifestyle-related programs that take place in the late spring, summer, and early fall, CDC wants to ensure complete and

accurate reporting of awardee activities conducted the final months of cooperative agreement funding.

There are no proposed changes to the data collection instrument, data collection methodology, or the estimated burden per response. The SDE will continue to be submitted to CDC using Survey Monkey, an electronic Web-based interface. The estimated burden per response is two hours. Each grantee will receive a personalized advance notification letter, followed by an email with a link to the Survey Monkey site. Changes to be implemented in this Revision request include: 1) A reduction in the number of respondents, from 17 to 16, 2) a change in the frequency of reporting (only one SDE report will be received during the six-month extension period), and 3) discontinuation of the one-time retrospective data collection that was part of the initial three-year clearance request.

CDC will continue to use the SDE reports to compile a systematic, quantifiable inventory of activities, products, and outcomes associated with the Traditional Foods program. The SDE also allow CDC to analyze aggregate data for improved technical assistance and overall program improvement, reporting, and identification of outcomes; allow CDC and grantees to create a comprehensive inventory/resource library of diabetes primary prevention ideas and approaches for AI/AN communities and identify emerging best practices; and improve dissemination of success stories.

Respondents will be 16 Tribes and Tribal organizations that receive funding through the Traditional Foods program. Participation in this information collection is required for Traditional Foods program awardees. There are no costs to respondents other than their time.

The total estimated annualized burden hours are 32.

ESTIMATED ANNUALIZED BURDEN HOURS

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Centers for Disease Control and Prevention

[30Day-14-0591]

Agency Forms Undergoing Paperwork Reduction Act Review

The Centers for Disease Control and Prevention (CDC) publishes a list of information collection requests under review by the Office of Management and Budget (OMB) in compliance with the Paperwork Reduction Act (44 U.S.C. Chapter 35). To request a copy of these requests, call (404) 639-7570 or send an email to omb@cdc.gov. Send written comments to CDC Desk Officer, Office of Management and Budget, Washington, DC 20503 or by fax to (202) 395-5806. Written comments should be received within 30 days of this notice.

Proposed Project

Select Agent Distribution Activity (SADA): Request for Select Agent (OMB Control No. 0920-0591 exp. 7/31/2014)—Extension—National Center for Emerging and Zoonotic Infectious Diseases (NCEZID), Centers for Disease Control and Prevention (CDC).

Background and Brief Description

The Centers for Disease Control and Prevention is requesting approval to continue data collection under the Select Agent Distribution Activity (SADA). The purpose of this data collection is to provide a systematic and consistent mechanism to review requests that come to CDC for Select Agents. The term select agents is used to describe a limited group of viruses, bacteria, rickettsia, and toxins that have the potential for use as agents of bioterrorism, inflicting significant morbidity and mortality on susceptible populations. The SADA form is scheduled to expire on 07/31/2014.

SADA was originally created for the anticipated large number of requests for select agents by investigators seeking National Institutes of Health grants. The process was established to lessen the burden on CDC Subject Matter Experts

(SMEs) who would be receiving requests for access to select agents housed within NCEZID. The SADA application is a Material Transfer Agreement that is specific to select agent requests. Although the SADA Office has not received a new application since the last OMB request, they have received several inquiries and provided assistance to both internal SMEs as well as outside requestors.

CDC has deposited a variety of strains into the BEI Resources repository and requestors now have the option of requesting materials using this mechanism. However, CDC would like to maintain the ability to process requests if they receive them and is therefore making a request to use the SADA application indefinitely.

The number of potential respondents in a given year is unknown. The estimates below are based on *if* they were to receive requests from 900 respondents.

A user fee will be collected to recover costs for materials, handling and shipping (except for public health laboratories). The cost to the respondent will vary based on which agent is requested. The total hour burden is 450 hours.

ESTIMATED ANNUALIZED BURDEN HOURS

Type of respondents	Form name	Number of respondents	Number of responses per respondent	Avg. burden per response (in hrs.)
Researcher	SADA Request for Select Agent	900	1	30/60
				Total

LeRoy Richardson

Proposed Data Collections Submitted for Public Comment and Recommendations

In compliance with the requirement of Section 3506(c)(2)(A) of the Paperwork Reduction Act of 1995 for

opportunity for public comment on proposed data collection projects, the Centers for Disease Control and Prevention (CDC) will publish periodic summaries of proposed projects. To request more information on the proposed projects or to obtain a copy of the data collection plans and instruments, call 404-639-7570 or send comments to Leroy Richardson, 1600 Clifton Road, MS D-74, Atlanta, GA 30333 or send an email to omb@cdc.gov.

Comments are invited on: (a) Whether the proposed collection of information

is necessary for the proper performance of the functions of the agency, including whether the information shall have practical utility; (b) the accuracy of the agency's estimate of the burden of the proposed collection of information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; and (d) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or other forms of information technology. Written comments should be received within 60 days of this notice.

Proposed Project

CDC Diabetes Prevention Recognition Program (DPRP) (OMB No. 0920-0909, exp. 11/30/2014)—Revision—National Center for Chronic Disease Prevention and Health Promotion (NCCDPHP), Centers for Disease Control and Prevention (CDC).

Background and Brief Description

Evidence from efficacy and effectiveness research studies has shown that lifestyle modifications leading to weight loss and increased physical activity can prevent or delay type 2 diabetes in individuals with prediabetes or those at high risk of developing diabetes. To translate these research findings into practice, section 399V-3 of Public Law 111-148, directed Centers for Disease Control "to determine eligibility of entities to deliver community-based type 2 diabetes prevention services," monitor and evaluate the services, and provide technical assistance. To this end, CDC's Division of Diabetes Translation (DDT) established and administers the Diabetes Prevention Recognition Program (DPRP), which recognizes organizations that deliver diabetes prevention programs according to requirements set forth in the "Centers for Disease Control and Prevention Recognition Program Standards and Operating Procedures" (*DPRP Standards*). Two levels of recognition are provided: Pending recognition, for new applicants that have submitted an application and meet eligibility criteria defined by the *DPRP Standards*, and

Full recognition, for programs that have demonstrated effectiveness according to *DPRP standards*. DDT maintains a public registry of these organizations, which can be used by people at high risk of type 2 diabetes, their health care providers, and health payers to locate organizations that offer DPRP-recognized diabetes prevention programs or are in the processing of obtaining recognition through the DPRP.

In 2011, CDC received Office of Management and Budget (OMB) approval to collect information needed to administer the DPRP (CDC Diabetes Prevention Recognition Program, OMB No. 0920-0909, exp. 11/30/2014). Two types of information are collected from organizations seeking DPRP recognition: Application data and evaluation data. The one-time application form can be completed on-line at any time. In addition, organizations submit de-identified process and outcome evaluation data to CDC electronically twice per year. The due dates for these submissions are determined by the date of the organization's initial application. CDC uses the process and outcome data to monitor and evaluate program effectiveness and to provide targeted technical assistance to applicants.

CDC requests an additional three years of OMB approval to continue collecting the information needed to administer the DPRP. Based on experience with the DPRP from 2011-2014, and feedback from applicant organizations and internal and external partners, CDC plans to revise the *DPRP Standards* and the associated information collection. A key change relates to incorporation of a new mode of service delivery. Because future programs will be allowed to deliver lifestyle programs in a virtual or electronic mode, DPRP requirements for hour-long sessions and written materials for participants have been dropped. A new program mode data element (in-person, virtual, other) will be added to the DPRP application form to facilitate the identification and evaluation of programs, by mode. This information will also be published in the DPRP registry. Additionally, CDC plans to initiate the following changes in the

data elements collected: (1) Add fields, if applicable, for contact information for an additional organizational contact and data preparer to the application form. These additional organization contacts are necessary to facilitate communication in light of a large volume of turnover in recognized organizations and to enable DPRP staff to provide technical assistance directly to the data preparer. (2) Add Participant State [of residence] to the evaluation data. This information will allow DPRP to capture the reach of virtual programs and allow for reporting by state or region. (3) Change the Core Course Code to Class Code. This change will allow DPRP to track each one-year lifestyle program when participants move from one participant group to another, even when the change involves a different mode of delivery. (4) Simplify the codes for Participation Prediabetes Determination by reducing the number of required responses from five to three. (5) Discontinue the collection of the Location Code, Lifestyle Coach ID, Session Type and Session ID.

Additional changes to the *DPRP Standards* or DPRP information collection may be requested during the period of the Revision request, as CDC continues discussions with recognized programs and potential applicants and reviews results from ongoing studies.

During the period of this Revision, CDC estimates receipt of approximately 350 DPRP application forms per year. The estimated burden per response is one hour. In addition, CDC estimates receipt of semi-annual evaluation data submissions from 1,200 organizations. Evaluation data will be received from a mix of new DPRP applicant organizations as well as previous applicants whose performance is being assessed for compliance with the *DPRP Standards*. The estimated burden per response is one hour. The estimated burden per response is modest since the information requested for DPRP recognition is routinely collected by most organizations that deliver lifestyle programs.

Participation in the DPRP is voluntary, and there are no costs to respondents other than their time.

ESTIMATED ANNUALIZED BURDEN HOURS

Type of respondent	Form name	Number of respondents	Number of responses per respondent	Avg. burden per response (in hr)	Total burden (in hr)
Organizations that deliver type 2 diabetes prevention programs.	DPRP Application Form	350	1	1	350
	DPRP Evaluation Data	1,200	2	1	2,400

ESTIMATED ANNUALIZED BURDEN HOURS—Continued

Type of respondent	Form name	Number of respondents	Number of responses per respondent	Avg. burden per response (in hr)	Total burden (in hr)
Total	2,750

Leroy A. Richardson,

Proposed Project

Application of a Web-based Health Survey Tool in Schools—New—National Institute for Occupational Safety and Health (NIOSH), Centers for Disease Control and Prevention (CDC).

Background and Brief Description

The mission of the National Institute for Occupational Safety and Health (NIOSH) is to promote safety and health at work for all people through research and prevention. The Occupational Safety and Health Act, Public Law 91-596 (section 20[a] [1]), authorizes NIOSH to conduct research to advance the health and safety of workers. NIOSH is proposing to conduct a health questionnaire of employees in 50 elementary schools in a large school district in the Northeastern United States.

According to the 2012 Bureau of Labor Statistics survey, the educational services sector employs approximately 12.9 million workers, with 8.4 million working in elementary and secondary schools. A 2010 analysis of data on U.S. working adults indicated that the educational services sector had one of the highest prevalences of current asthma at 13.1%.

In 1995, the Government Accounting Office reported that about 33% of schools in the U.S. needed extensive repair or replacement of one or more buildings, which includes problems related to dampness and mold. A better understanding of school building conditions related to dampness and mold, as well as associated health effects, is essential for the prevention of work-related illness in school staff.

NIOSH requests OMB approval to administer an internet-based questionnaire to collect health information on staff from 50 schools within this school district. The survey

will be conducted concurrently with a field-based environmental survey using a dampness and mold assessment tool, which was developed by NIOSH to collect information on dampness and mold in buildings. NIOSH will collaborate with the school district and local teachers union to recruit a broad range of school staff as participants, including teachers, administrative staff, facilities and maintenance staff, nurses and counselors, and kitchen staff for this study. Results will be used to determine possible relationships between health outcomes and environmental conditions, specifically conditions related to dampness and mold. Results will also help to validate the dampness and mold assessment tool.

Overall results will benefit many stakeholders, including school-affiliated and general administrative personnel, facilities and maintenance representatives, building owners, and safety and health professionals charged with the prevention, identification, and remediation of environmental issues when occupant health concerns are raised.

NIOSH anticipates that the internet-based questionnaire will begin in the spring of 2014. All participants will be asked to complete the same questionnaire, which will take approximately 20 minutes to complete. All questionnaire results will be stored and analyzed the CDC.

The total estimated burden for this one-time collection of data is 1,567 hours.

ESTIMATED ANNUALIZED BURDEN HOURS

Type of participants	Testing	Number of participants	Number of responses per participants	Average burden per response (in hours)
Elementary School Employees	Questionnaire	4,700	1	20/60

Leroy Richardson,
Chief, Information Collection Review Office, Office of Scientific Integrity, Office of the Associate Director for Science, Office of the Director, Centers for Disease Control and Prevention.

BILLING CODE 4163-18-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Centers for Disease Control and Prevention (CDC)

[CDC–2014–0006, Docket Number NIOSH–273]

Notice of Draft Document for Public Comment

AGENCY: National Institute for Occupational Safety and Health (NIOSH) of the Centers for Disease Control and Prevention (CDC), Department of Health and Human Services (HHS).

ACTION: Notice of draft document for public comment.

SUMMARY: The National Institute for Occupational Safety and Health of the Centers for Disease Control and Prevention announces the availability of a draft method to be published in the NIOSH Manual of Analytical Methods (NMAM) entitled “Method 8324: 3-Bromopropionic acid in urine; A metabolite of 1-bromopropane” now available for public comment. To view the notice and related materials, visit <http://www.regulations.gov> and enter CDC–2014–0006 in the search field and click “Search.”

Public comment period: Comments must be received June 10, 2014.

ADDRESSES: You may submit comments, identified by CDC–2014–0006 and Docket Number NIOSH–273, by either of the following two methods:

- *Federal eRulemaking Portal:* <https://www.regulations.gov> Follow the instructions for submitting comments.
- *Mail:* NIOSH Docket Office, Robert A. Taft Laboratories, 4676 Columbia Parkway, MS C–34, Cincinnati, Ohio 45226.

Instructions: All information received in response to this notice must include the agency name and docket number [CDC–2014–0006; NIOSH–273]. All relevant comments received will be posted without change <http://www.regulations.gov>, including any personal information provided. All information received in response to this notice will also be available for public examination and copying at the NIOSH Docket Office, 4676 Columbia Parkway, Room 109, Cincinnati, OH 45226.

SUPPLEMENTARY INFORMATION:

Background: The NIOSH Manual of Analytical Methods (NMAM) was first published in 1974 and currently contains over 300 methods that can be used by the occupational safety and health community to measure worker exposures. 1-Bromopropane is an industrial solvent often used as a

substitute for a number of chlorofluorocarbon solvents which were withdrawn from use because of their possible damaging effects to the ozone layer. 3-Bromopropionic acid is a human metabolite of 1-bromopropane and a proposed biomarker of exposure. An accurate and precise method was developed for the detection and quantitation of 3-bromopropionic acid in human urine. This method was published in the literature (B’Hymer CB, Cheever KL [2004]. J Chromatogr B 802:361–366). The method was validated by a second laboratory and is proposed for inclusion in NMAM’s 5th Edition.

FOR FURTHER INFORMATION CONTACT: Dale Shoemaker, Ph.D., NIOSH DART, 4676 Columbia Parkway MS R–7, Cincinnati, OH 45226. (513) 841–4523.

Dated: April 7, 2014.

John Howard,

Director, National Institute for Occupational Safety and Health, Centers for Disease Control and Prevention.

BILLING CODE 4163–19–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Centers for Disease Control and Prevention

Board of Scientific Counselors, National Center for Health Statistics

In accordance with section 10(a)(2) of the Federal Advisory Committee Act (Pub. L. 92–463), the Centers for Disease Control and Prevention (CDC), National Center for Health Statistics (NCHS) announces the following meeting of the aforementioned committee:

Times and Dates: 11:00 a.m.–5:30 p.m., May 12, 2014, 8:30 a.m.–1:00 p.m., May 13, 2014

Place: NCHS Headquarters, 3311 Toledo Road, Hyattsville, Maryland 20782.

Status: This meeting is open to the public; however, visitors must be processed in accordance with established federal policies and procedures. For foreign nationals or non-US citizens, pre-approval is required (please contact Gwen Mustaf, 301–458–4500, glm4@cdc.gov, or Virginia Cain, vcain@cdc.gov at least 10 days in advance for requirements). All visitors are required to present a valid form of picture identification issued by a state, federal or international government. As required by the Federal Property Management Regulations, Title 41, Code of Federal Regulation, Subpart 101–20.301, all persons entering in or on Federal controlled property and their packages, briefcases, and other containers in their immediate possession are subject to being x-rayed and inspected. Federal law prohibits the knowing possession or the causing to be present of

firearms, explosives and other dangerous weapons and illegal substances. The meeting room accommodates approximately 100 people.

Purpose: This committee is charged with providing advice and making recommendations to the Secretary, Department of Health and Human Services; the Director, CDC; and the Director, NCHS, regarding the scientific and technical program goals and objectives, strategies, and priorities of NCHS.

Matters For Discussion: The agenda will include welcome remarks by the Director, NCHS; the March 4–5, 2014 Office of Analysis and Epidemiology Program Review; report from the February 10–11, 2014 National Academy of Sciences Workshop on Guidelines for Returning Individual Results from Genome Research Using Population-Based Specimens; program updates.

Requests to make oral presentations should be submitted in writing to the contact person listed below. All requests must contain the name, address, telephone number, and organizational affiliation of the presenter.

Written comments should not exceed five single-spaced typed pages in length and must be received by April 25, 2014.

The agenda items are subject to change as priorities dictate.

Contact Person For More Information:

Virginia S. Cain, Ph.D., Director of Extramural Research, NCHS/CDC, 3311 Toledo Road, Room 7208, Hyattsville, Maryland 20782, telephone (301) 458–4500, fax (301) 458–4020. The Director, Management Analysis and Services Office, has been delegated the authority to sign **Federal Register** notices pertaining to announcements of meetings and other committee management activities for both the Centers for Disease Control and the Agency for Toxic Substances and Disease Registry.

Gary J. Johnson,

Acting Director, Management Analysis and Services Office, Centers for Disease Control and Prevention.

Agency Information Collection Activities: Submission for OMB Review; Comment Request

ACTION: Notice.

SUMMARY: The Centers for Medicare & Medicaid Services (CMS) is announcing an opportunity for the public to comment on CMS’ intention to collect information from the public. Under the Paperwork Reduction Act of 1995

(PRA), federal agencies are required to publish notice in the **Federal Register** concerning each proposed collection of information, including each proposed extension or reinstatement of an existing collection of information, and to allow a second opportunity for public comment on the notice. Interested persons are invited to send comments regarding the burden estimate or any other aspect of this collection of information, including any of the following subjects: (1) The necessity and utility of the proposed information collection for the proper performance of the agency's functions; (2) the accuracy of the estimated burden; (3) ways to enhance the quality, utility, and clarity of the information to be collected; and (4) the use of automated collection techniques or other forms of information technology to minimize the information collection burden.

DATES: Comments on the collection(s) of information must be received by the OMB desk officer by May 12, 2014.

ADDRESSES: When commenting on the proposed information collections, please reference the document identifier or OMB control number. To be assured consideration, comments and recommendations must be received by the OMB desk officer via one of the following transmissions: OMB, Office of Information and Regulatory Affairs, Attention: CMS Desk Officer, Fax Number: (202) 395-5806 or Email: OIRA_submission@omb.eop.gov.

To obtain copies of a supporting statement and any related forms for the proposed collection(s) summarized in this notice, you may make your request using one of following:

1. Access CMS' Web site address at <http://www.cms.hhs.gov/PaperworkReductionActof1995>.

2. Email your request, including your address, phone number, OMB number, and CMS document identifier, to Paperwork@cms.hhs.gov.

3. Call the Reports Clearance Office at (410) 786-1326.

FOR FURTHER INFORMATION CONTACT: Reports Clearance Office at (410) 786-1326.

SUPPLEMENTARY INFORMATION: Under the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3501-3520), federal agencies must obtain approval from the Office of Management and Budget (OMB) for each collection of information they conduct or sponsor. The term "collection of information" is defined in 44 U.S.C. 3502(3) and 5 CFR 1320.3(c) and includes agency requests or requirements that members of the public submit reports, keep records, or provide information to a third party. Section

3506(c)(2)(A) of the PRA (44 U.S.C. 3506(c)(2)(A)) requires federal agencies to publish a 30-day notice in the **Federal Register** concerning each proposed collection of information, including each proposed extension or reinstatement of an existing collection of information, before submitting the collection to OMB for approval. To comply with this requirement, CMS is publishing this notice that summarizes the following proposed collection(s) of information for public comment:

1. *Type of Information Collection Request:* Extension of a currently approved collection; *Title of Information Collection:* Quarterly Statement of Budget for Medical Assistance; *Use:* We require that each State Medicaid agency quarterly submit the Form CMS-37 via the web-based Medicaid and State Children's Health Insurance Program Budget and Expenditure System (MBES/CBES). Due dates are November 15, February 15, May 15 and August 15 of each fiscal year. The addendum provides a description of forms contained in this package. All submissions represent equally important components of the grant award cycle, but the May and November submissions are particularly significant for budget formulation. The November submission introduces a new fiscal year to the budget cycle and serves as the basis for the formulation of the Medicaid portion of the President's Budget, which is presented to Congress in January. The February and August submissions are used primarily for budget execution in providing interim updates to our Office of Financial Management, the Department of Health and Human Services, the Office of Management and Budget and Congress depending on the scheduling of the national budget review process in a given fiscal year. These submissions provide us with base information necessary to track current year obligations and expenditures in relation to the current year appropriation and to notify senior managers of any impending surpluses or deficits. *Form Number:* CMS-37 (OCN: 0938-0101); *Frequency:* Quarterly; *Affected Public:* State, Local, or Tribal Governments; *Number of Respondents:* 56; *Total Annual Responses:* 224; *Total Annual Hours:* 7,616. (For policy questions regarding this collection contact Abraham John at 410-786-4519).

2. *Type of Information Collection Request:* Extension of a currently approved collection; *Title of Information Collection:* Quarterly Statement of Expenditure for Medical Assistance; *Use:* Section 1903 of the Social Security Act provides the

authority for collecting this information. States are required to submit the form CMS-64 quarterly to us no later than 30 days after the end of the quarter being reported. These submissions provide us with the information necessary to issue the quarterly grant awards, monitor current year expenditure levels, determine the allowability of State claims for reimbursement, develop Medicaid financial management information provide for State reporting of waiver expenditures, ensure that the federally-established limit is not exceeded for HCBS waivers, and to allow for the implementation of the Assignment of Rights and Part A and Part B Premium (i.e., accounting for overdue Part A and Part B Premiums under State buy-in agreements)—Billing Offsets. *Form Number:* CMS-64 (OCN: 0938-0067); *Frequency:* Quarterly; *Affected Public:* State, Local, or Tribal Governments; *Number of Respondents:* 56; *Total Annual Responses:* 224; *Total Annual Hours:* 16,464. (For policy questions regarding this collection contact Abraham John at 410-786-4519).

3. *Type of Information Collection Request:* Revision of a currently approved collection; *Title:* Health Care Reform Insurance Web Portal Requirements; *Use:* This information collection is mandated by Sections 1103 and 10102 of the Patient Protection and Affordability Care Act, Public Law 111-148 (ACA). Once all of the information is collected from insurance issuers of major medical health insurance (hereon referred to as issuers) and other affected parties, it will be displayed at <http://www.healthcare.gov>. Issuers are required to provide information quarterly, and [healthcare.gov](http://www.healthcare.gov) will be updated on a periodic schedule during each quarter. The information provided will help the general public make educated decisions about organizations providing private health care insurance. We are currently updating a system (hereon referred to as web portal) where state Departments of Insurance and issuers may log in using a custom user ID and password validation. The states may be asked to provide information on issuers in their state and various Web sites maintained for consumers. The issuers will be tasked with providing information on their major medical insurance products and plans. They will ultimately be given the choice to download a basic information template to enter data then upload into the web portal; to manually enter data within the web portal itself; or to submit .xml files containing their information. Once the states and issuers submit their data, they

will receive an email notifying them of any errors, and that their submission was received. We are both mandating the issuers verify and update their information on a quarterly basis and requesting that States verify State-submitted information on an annual basis. In the event that an issuer enhances its existing plans, proposes new plans, or deactivates plans, the organization would be required to update the information in the web portal. Changes occurring during the three month quarterly periods will be allowed utilizing effective dates for both the plans and rates associated with the plans. *Form Number:* CMS-10320 (OCN: 0938-1086); *Frequency:* Annually, Quarterly; *Affected Public:* Private sector—Business or other for-profits; *Number of Respondents:* 801; *Total Annual Responses:* 3,051; *Total Annual Hours:* 27,833. (For policy questions regarding this collection contact Kim Heckstall at 410-786-1647.)

4. *Type of Information Collection Request:* Extension of a currently approved collection; *Title of Information Collection:* Medication Therapy Management Program Improvements; *Use:* Information collected by Part D medication therapy management programs (as required by the standardized format for the comprehensive medication review summary) will be used by beneficiaries or their authorized representatives, caregivers, and their healthcare providers to improve medication use and achieve better healthcare outcomes. Subsequent to the publication of the 60-day **Federal Register** notice (January 17, 2014; 79 FR 3207) non-substantive changes have been made to the information collection request. *Form Number:* CMS-10396 (OCN: 0938-1154); *Frequency:* Occasionally; *Affected Public:* Private sector (Business or other for-profits); *Number of Respondents:* 682; *Total Annual Responses:* 280,352; *Total Annual Hours:* 186,901. (For policy questions regarding this collection contact Gary Wirth at 410-786-3977).

5. *Type of Information Collection Request:* Extension without change of a currently approved collection; *Title of Information Collection:* Clinical Laboratory Improvement Amendments of 1988 (CLIA) Budget Workload Reports and Supporting Regulations; *Use:* We will use the collected information to determine the amount of Federal reimbursement for surveys conducted. Use of the information includes program evaluation, audit, budget formulation and budget approval. Form CMS-102 is a multi-

purpose form designed to capture and record all budget and expenditure data. Form CMS-105 captures the annual projected CLIA workload that the State survey agency will accomplish. Our regional offices also use the information to approve the annual projected CLIA workload. The information is required as part of the section 1864 agreement with the state. *Form Numbers:* CMS-102 and CMS-105 (OCN: 0938-0599); *Frequency:* Quarterly; *Affected Public:* State, Local, or Tribal Governments; *Number of Respondents:* 50; *Total Annual Responses:* 50; *Total Annual Hours:* 4,500. (For policy questions regarding this collection contact Angela Stancel at 410-786-4876.)

6. *Type of Information Collection Request:* Revision of a currently approved collection; *Title of Information Collection:* Medicaid Drug Program—Monthly and Quarterly Drug Reporting Format; *Use:* Labelers must transmit drug data to us within 30 days after the end of each calendar month and quarter. We calculate the unit rebate amount (URA) for each National Drug Code and distributes to all state Medicaid agencies. States use the URA to invoice the labeler for rebates. The monthly data is used to calculate Federal Upper Limit prices for applicable drugs and for states that opt to use this data to establish their pharmacy reimbursement methodology. *Form Number:* CMS-367 (OCN: 0938-0578); *Frequency:* Monthly and quarterly; *Affected Public:* Private sector—Business or other for-profits; *Number of Respondents:* 610; *Total Annual Responses:* 9,760; *Total Annual Hours:* 144,448. (For policy questions regarding this collection contact Samone Angel at 410-786-1123.)

Dated: April 8, 2014.

Martique Jones,

Deputy Director, Regulations Development Group, Office of Strategic Operations and Regulatory Affairs.

Agency Information Collection Activities: Proposed Collection; Comment Request

AGENCY: Centers for Medicare & Medicaid Services, HHS.

ACTION: Notice.

SUMMARY: The Centers for Medicare & Medicaid Services (CMS) is announcing an opportunity for the public to comment on CMS' intention to collect information from the public. Under the Paperwork Reduction Act of 1995 (the PRA), federal agencies are required to publish notice in the **Federal Register** concerning each proposed collection of information (including each proposed extension or reinstatement of an existing collection of information) and to allow 60 days for public comment on the proposed action. Interested persons are invited to send comments regarding our burden estimates or any other aspect of this collection of information, including any of the following subjects: (1) The necessity and utility of the proposed information collection for the proper performance of the agency's functions; (2) the accuracy of the estimated burden; (3) ways to enhance the quality, utility, and clarity of the information to be collected; and (4) the use of automated collection techniques or other forms of information technology to minimize the information collection burden.

DATES: Comments must be received by June 10, 2014.

ADDRESSES: When commenting, please reference the document identifier or OMB control number (OCN). To be assured consideration, comments and recommendations must be submitted in any one of the following ways:

1. *Electronically.* You may send your comments electronically to <http://www.regulations.gov>. Follow the instructions for "Comment or Submission" or "More Search Options" to find the information collection document(s) that are accepting comments.

2. *By regular mail.* You may mail written comments to the following address: CMS, Office of Strategic Operations and Regulatory Affairs, Division of Regulations Development, Attention: Document Identifier/OMB Control Number ____, Room C4-26-05, 7500 Security Boulevard, Baltimore, Maryland 21244-1850.

To obtain copies of a supporting statement and any related forms for the proposed collection(s) summarized in this notice, you may make your request using one of following:

1. Access CMS' Web site address at <http://www.cms.hhs.gov/PaperworkReductionActof1995>.

2. Email your request, including your address, phone number, OMB number, and CMS document identifier, to Paperwork@cms.hhs.gov.

3. Call the Reports Clearance Office at (410) 786-1326.

FOR FURTHER INFORMATION CONTACT: Reports Clearance Office at (410) 786-1326.

SUPPLEMENTARY INFORMATION:

Contents

This notice sets out a summary of the use and burden associated with the following information collections. More detailed information can be found in each collection's supporting statement and associated materials (see **ADDRESSES**).

CMS-10463 Cooperative Agreement To Support Navigators in Federally-Facilitated and State Partnership Exchanges

CMS-10521 Improving Quality of Care in Medicaid and CHIP through Increased Access to Preventive Services, State Survey

Under the PRA (44 U.S.C. 3501-3520), federal agencies must obtain approval from the Office of Management and Budget (OMB) for each collection of information they conduct or sponsor. The term "collection of information" is defined in 44 U.S.C. 3502(3) and 5 CFR 1320.3(c) and includes agency requests or requirements that members of the public submit reports, keep records, or provide information to a third party. Section 3506(c)(2)(A) of the PRA requires federal agencies to publish a 60-day notice in the **Federal Register** concerning each proposed collection of information, including each proposed extension or reinstatement of an existing collection of information, before submitting the collection to OMB for approval. To comply with this requirement, CMS is publishing this notice.

Information Collection

1. *Type of Information Collection Request:* Revision of a currently approved collection; *Title of Information Collection:* Cooperative Agreement to Support Navigators in Federally-facilitated and State Partnership Exchanges; *Use:* Section 1311(i) of the Affordable Care Act requires Exchanges to establish a Navigator grant program as part of its function to provide consumers with assistance when they need it. Navigators will assist consumers by providing education about and facilitating selection of qualified health plans (QHPs) within Exchanges, as well as other required duties. Section 1311(i) requires that an Exchange operating as of January 1, 2014, must establish a Navigator Program under which it

awards grants to eligible individuals or entities who satisfy the requirements to be Exchange Navigators. For Federally-facilitated Exchanges (FFE) and State Partnership Exchanges (SPEs), we will be awarding these grants. Navigator awardees must provide weekly, monthly, quarterly, and annual progress reports to us on the activities performed during the grant period and any sub-awardees receiving funds. *Form Number:* CMS-10463 (OCN: 0938-1215); *Frequency:* Annually; Quarterly, Monthly, Weekly; *Affected Public:* Private sector; *Number of Respondents:* 99; *Total Annual Responses:* 5,148; *Total Annual Hours:* 35,640. (For policy questions regarding this collection contact Julia Dreier at 301-492-4123.)

2. *Type of Information Collection Request:* New collection (Request for a new OMB control number); *Title of Information Collection:* Improving Quality of Care in Medicaid and CHIP through Increased Access to Preventive Services State Survey; *Use:* This survey will be used to gain a better understanding of state efforts to increase utilization of preventive services and to develop resources (including educational and outreach resources) to help states increase utilization of preventive services. The results will provide a baseline on regarding coverage of preventive services and will help us identify ways to assist states with materials focusing on prevention and technical assistance. *Form Number:* CMS-10521 (OCN: 0938-New); *Frequency:* Once; *Affected Public:* State, Local, or Tribal Governments; *Number of Respondents:* 51; *Total Annual Responses:* 51; *Total Annual Hours:* 128. (For policy questions regarding this collection contact Mary Beth Hance at 410-786-4299).

Dated: April 8, 2014.

Martique Jones,

Deputy Director, Regulations Development Group, Office of Strategic Operations and Regulatory Affairs.

BILLING CODE 4120-01-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Administration for Community Living

Agency Information Collection Activities; Proposed Collection; Comment Request; Reinstatement With Changes to Title III Supplemental Form to the Financial Status Report

AGENCY: Administration for Community Living, HHS

ACTION: Notice.

SUMMARY: The Administration for Community Living (ACL) is announcing an opportunity for public comment on the proposed collection of certain information by the agency. Under the Paperwork Reduction Act of 1995 (the PRA), Federal agencies are required to publish notice in the **Federal Register** concerning each proposed collection of information and to allow 60 days for public comment in response to the notice. This notice solicits comments on the information collection requirements relating to the Supplemental Form to the Financial Status Report for all ACL/AoA Title III Grantees.

DATES: Submit written or electronic comments on the collection of information by June 10, 2014.

ADDRESSES: Submit electronic comments on the collection of information to: *Alice.Kelsey@acl.hhs.gov*. Submit written comments on the collection of information to the Administration for Community Living, attn: Alice Kelsey, 233 N. Michigan Ave., Suite 790, Chicago, IL 60661.

FOR FURTHER INFORMATION CONTACT: Alice Kelsey, Financial Operations Specialist, Administration for Community Living, attn: Alice Kelsey, 233 N. Michigan Ave., Suite 790, Chicago, IL 60661.

SUPPLEMENTARY INFORMATION: Under the PRA (44 U.S.C. 3501-3520), Federal agencies must obtain approval from the Office of Management and Budget (OMB) for each collection of information they conduct or sponsor. "Collection of information" is defined in 44 U.S.C. 3502(3) and 5 CFR 1320.3(c) and includes agency request or requirements that members of the public submit reports, keep records, or provide information to a third party. Section 3506(c)(2)(A) of the PRA (44 U.S.C. 3506(c)(2)(A)) requires Federal agencies to provide a 60 day notice in the **Federal Register** concerning each proposed collection of information, before submitting the collection to OMB for approval. To comply with this requirement, ACL is publishing notice of the proposed collection of information set forth in this document. With respect to the following collection of information, ACL invites comments on: (1) Whether the proposed collection of information is necessary for the proper performance of ACL's functions, including whether the information will have practical utility; (2) the accuracy of ACL's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used; (3)

ways to enhance the quality, utility, and clarity of the information to be collected; and (4) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques when appropriate, and other forms of information technology. The template may be found on the ACL Web site at http://www.acl.gov/NewsRoom/NewsInfo/docs/FFR-ACL-AoA-TitleIII-Supplemental_SF-425.pdf.

The supplemental form to the Financial Status Report for all ACL/AoA Title III Grantees provides an understanding of how projects funded by the Older Americans Act are being administered by grantees, in conformance with legislative requirements, pertinent Federal regulations and other applicable instructions and guidelines issued by the Administration for Community Living (ACL). This information will be used for Federal oversight of Title III projects. ACL estimates the burden of this collection of information as follows: 56 State Units on Aging (SUA) respond semi-annually which should have an average burden of 2 hours per grantee for a total of 112 hours per submission.

Dated: April 8, 2014.

Kathy Greenlee,

Administrator and Assistant Secretary for Aging.

BILLING CODE 4154-01-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Administration for Community Living

Paralysis Resource Center

Summary: The Administration for Community Living (ACL) is proud to announce the Paralysis Resource Center (PRC) is moving to ACL as a result of the 2014 budget recently signed by President Obama.

ACL was formed in April 2012 to advance policy and implement programs that support the rights of older Americans and people with disabilities to live in their communities throughout their lifespan. The mission of the PRC aligns perfectly with ACL's mission and provides the Administration with important new programmatic opportunities to help persons with physical disabilities as well as older adults and people with developmental disabilities.

The PRC provides a comprehensive, national source of information for people living with paralysis and their families to promote health, foster

involvement in the community, and improve quality of life. Resources on spinal cord injury, paralysis and mobility-related disabilities, including information and referral by phone and email are available in English and Spanish. The PRC currently operates through a cooperative agreement between the Christopher & Dana Reeve Foundation and the U.S. Department of Health and Human Services (HHS) Centers for Disease Control and Prevention (CDC). ACL will be working with the CDC on transitioning the program to ACL.

Program Name: Paralysis Resource Center.

Award Amount: Up to \$6,683,000.

Project Period: 6/1/2014 to 5/31/2015.

Award Type: Cooperative Agreement.

Statutory Authority: This program is authorized under Section 301 of the Public Health Service Act (42 U.S.C. 241, 247b(k)(2)).

Catalog of Federal Domestic Assistance (CFDA) Number: 93.325 Discretionary Projects.

Dates:

- *Application Submission deadline:* May 12, 2014.

- The anticipated budget period start date is June 1, 2014.

I. Program Description

The purpose of the program is to provide funding to support a national Paralysis Resource Center to improve the health and quality of life of individuals living with paralysis and their families by raising awareness of and facilitating access to a broad range of services relevant to individuals with paralysis. The Paralysis Resource Center will work to remove environmental barriers to health for individuals living with paralysis and expand the knowledge base of proven, successful health promotion strategies leading to improved physical and emotional health for this population, improving the understanding of the true burden of paralysis by disease category, injury, and quality of life indicators and to measure secondary complications, and conducting evaluation projects to translate clinical rehabilitation treadmill therapy to community-based settings and training health care professionals to deliver this intervention. This program addresses the "Healthy People 2020" focus area(s): Access to Health Services; Adolescent Health; Disability and Health; Early and Middle Childhood; Educational and Community-Based Programs; Health Communication and Health IT; Healthcare-Associated Infections; Nutrition and Weight Status; Older Adults; Physical Activity and

Fitness; Quality of Life and Well-Being; Social Determinants of Health; and Tobacco Use.

Justification for the Exception to Competition

The PRC currently operates through a cooperative agreement between the Christopher & Dana Reeve Foundation and the U.S. Department of Health and Human Services (HHS) Centers for Disease Control and Prevention (CDC). To ensure uninterrupted continuation of the grant goals and objectives and given the administrative burden of holding an open competition and awarding a new grant given the short time since the funds were appropriated, ACL will award a one year continuation to the incumbent Paralysis Resource Center at the Christopher & Dana Reeve Foundation. Failure to move forward with this deviation would disrupt ACL's ability to improve and advance the PRC program as one cohesive and consistent program nationally.

- *Eligible Applicants:* Incumbent Paralysis Resource Center with award expiration date of 5/31/14.

II. Evaluation Criteria

Information previously provided in semi-annual reports, as well as information in the non-competing extension application will be considered to determine satisfactory progress of the grantee project and ensure that proposed activities are within the approved scope and budget of the grant. Areas that will be evaluated include:

- Project Relevance & Current Need.*
- Approach.*
- Budget.*
- Project Impact.*
- Organizational Capacity.*

III. Application and Submission Requirements

- SF 424—Application for Federal Assistance.
- SF 424A—Budget Information.
- Separate Budget Narrative/Justification.
- SF 424B—Assurances. **Note:** Be sure to complete this form according to instructions.
- Lobbying Certification.
- Program narrative—no more than 10 pages.

- The project narrative must be submitted to GrantSolutions. The narrative must be submitted in the following format:

- Maximum number of pages: 10—If the narrative exceeds the page limit, only the first pages which are within the page limit will be reviewed.

- Font size: 12 point unredacted; Times New Roman is preferred.

- Double spaced.
- Page margin size: One inch.
- Number all narrative pages; not to exceed the maximum number of pages.
- Include a table of contents.
- Application should be submitted through Grantsolutions at www.grantsolutions.gov.

The narrative should address activities to be conducted over the entire project period and must include the following items in the order listed:

- i. Plan.
- ii. Methods.
- iii. Objectives.
- iv. Timeline.
- v. Staff.
- vi. Understanding.
- vii. Need.
- viii. Evaluation and Performance Measures.

The budget and budget justification will be included as a separate attachment, not to be counted in the narrative page limit. Additional information may be included in the application appendices. The appendices will not be counted toward the narrative page limit. This additional information includes:

- Curriculum Vitae, Resumes, Organizational Charts, and Letters of Support. Additional information submitted via GrantSolutions.gov should be uploaded in a PDF file format, and should be named as appropriate, such as publications, reports, etc.

- No more than 15 attachments should be uploaded per application.

G. Work Plan.

H. Grantees will be required to access the non-competing application kit in GrantSolutions.gov to submit all materials for this application.

IV. Application Review Information

Applications will be objectively reviewed by Federal staff utilizing the evaluation criteria listed above in Section II.

V. Agency Contact

For further information or comments regarding this program expansion supplement, contact Ophelia M. McLain, U.S. Department of Health and Human Services, Administration for Community Living, Administration on Intellectual and Developmental Disabilities, Office of Innovation, One Massachusetts Avenue NW., Washington, DC 20001; telephone (202) 690-7025; fax (202) 357-3560; email Ophelia.McLain@acl.hhs.gov.

Dated: April 8, 2014.

Kathy Greenlee,

Administrator and Assistant Secretary for Aging.

BILLING CODE 4154-01-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

[Docket No. FDA-2013-P-1515]

Determination That ZOVIRAX (Acyclovir Sodium) Injection, Equivalent to 250 Milligrams Base/Vial, 500 Milligrams Base/Vial, and 1 Gram Base/Vial, Was Not Withdrawn From Sale for Reasons of Safety or Effectiveness

AGENCY: Food and Drug Administration, HHS.

ACTION: Notice.

SUMMARY: The Food and Drug Administration (FDA) has determined that ZOVIRAX (acyclovir sodium) Injection, equivalent to (EQ) 250 milligrams (mg) base/vial, 500 mg base/vial, and 1gram (g) base/vial, was not withdrawn from sale for reasons of safety or effectiveness. This determination will allow FDA to approve abbreviated new drug applications (ANDAs) for ZOVIRAX (acyclovir sodium) Injection, EQ 250 mg base/vial, 500 mg base/vial, and 1 g base/vial, if all other legal and regulatory requirements are met.

FOR FURTHER INFORMATION CONTACT:

Darren Eicken, Center for Drug Evaluation and Research, Food and Drug Administration, 10903 New Hampshire Ave., Bldg. 51, Rm. 6206, Silver Spring, MD 20993-0002, 240-402-0978.

SUPPLEMENTARY INFORMATION: In 1984, Congress enacted the Drug Price Competition and Patent Term Restoration Act of 1984 (Pub. L. 98-417) (the 1984 amendments), which authorized the approval of duplicate versions of drug products under an ANDA procedure. ANDA applicants must, with certain exceptions, show that the drug for which they are seeking approval contains the same active ingredient in the same strength and dosage form as the “listed drug,” which is a version of the drug that was previously approved. ANDA applicants do not have to repeat the extensive clinical testing otherwise necessary to gain approval of a new drug application (NDA).

The 1984 amendments include what is now section 505(j)(7) of the Federal

Food, Drug, and Cosmetic Act (21 U.S.C. 355(j)(7)), which requires FDA to publish a list of all approved drugs. FDA publishes this list as part of the “Approved Drug Products With Therapeutic Equivalence Evaluations,” which is known generally as the “Orange Book.” Under FDA regulations, drugs are removed from the list if the Agency withdraws or suspends approval of the drug’s NDA or ANDA for reasons of safety or effectiveness or if FDA determines that the listed drug was withdrawn from sale for reasons of safety or effectiveness (21 CFR 314.162).

A person may petition the Agency to determine, or the Agency may determine on its own initiative, whether a listed drug was withdrawn from sale for reasons of safety or effectiveness. This determination may be made at any time after the drug has been withdrawn from sale, but must be made prior to approving an ANDA that refers to the listed drug (§ 314.161 (21 CFR 314.161)). FDA may not approve an ANDA that does not refer to a listed drug.

ZOVIRAX (acyclovir sodium) Injection, EQ 250 mg base/vial, 500 mg base/vial, and 1g base/vial, is the subject of NDA 18-603, held by GlaxoSmithKline and initially approved on October 22, 1982. ZOVIRAX (acyclovir sodium) is indicated for the treatment of herpes and varicella-zoster (shingles) in immunocompromised patients.

In a letter dated June 20, 2005, GlaxoSmithKline notified FDA that ZOVIRAX (acyclovir sodium) Injection, EQ 250 mg base/vial, 500 mg base/vial, and 1g base/vial, was being discontinued, and FDA moved the drug product to the “Discontinued Drug Product List” section of the Orange Book.

Lachman Consultant Services, Inc., submitted a citizen petition dated November 15, 2013 (Docket No. FDA-2013-P-1515), under 21 CFR 10.30, requesting that the Agency determine whether ZOVIRAX (acyclovir sodium) Injection, EQ 1 g base/vial, was withdrawn from sale for reasons of safety or effectiveness. Although the citizen petition did not address the 250 mg and 500 mg strengths, those strengths have also been discontinued. On our own initiative, we have also determined whether those strengths were withdrawn for safety or effectiveness reasons.

After considering the citizen petition and reviewing Agency records and based on the information we have at this time, FDA has determined under § 314.161 that ZOVIRAX (acyclovir sodium) Injection, EQ 250 mg base/vial, 500 mg base/vial, and 1g base/vial, was

not withdrawn for reasons of safety or effectiveness. The petitioner has identified no data or other information suggesting that ZOVIRAX (acyclovir sodium) Injection, EQ 250 mg base/vial, 500 mg base/vial, and 1 g base/vial, was withdrawn for reasons of safety or effectiveness. We have carefully reviewed our files for records concerning the withdrawal of ZOVIRAX (acyclovir sodium) Injection, EQ 250 mg base/vial, 500 mg base/vial, and 1g base/vial, from sale. We have also independently evaluated relevant literature and data for possible postmarketing adverse events. We have reviewed the available evidence and determined that these products were not withdrawn from sale for reasons of safety or effectiveness.

Accordingly, the Agency will continue to list ZOVIRAX (acyclovir sodium) Injection, EQ 250 mg base/vial, 500 mg base/vial, and 1g base/vial, in the "Discontinued Drug Product List" section of the Orange Book. The "Discontinued Drug Product List" delineates, among other items, drug products that have been discontinued from marketing for reasons other than safety or effectiveness. ANDAs that refer to ZOVIRAX (acyclovir sodium) Injection, EQ 250 mg base/vial, 500 mg base/vial, and 1g base/vial, may be approved by the Agency as long as they meet all other legal and regulatory requirements for the approval of ANDAs. If FDA determines that labeling for this drug product should be revised to meet current standards, the Agency will advise ANDA applicants to submit such labeling.

Dated: April 7, 2014.

Leslie Kux,

Assistant Commissioner for Policy.

BILLING CODE 4160-01-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

[Docket No. FDA-2014-N-0001]

Nonprescription Drugs Advisory Committee; Notice of Meeting

AGENCY: Food and Drug Administration, HHS.

ACTION: Notice.

This notice announces a forthcoming meeting of a public advisory committee of the Food and Drug Administration (FDA). The meeting will be open to the public.

Name of Committee: Nonprescription Drugs Advisory Committee.

General Function of the Committee: To provide advice and recommendations to the Agency on FDA's regulatory issues.

Date and Time: The meeting will be held on May 2, 2014, from 8 a.m. to 4:30 p.m.

Location: Hilton Washington DC North/Gaithersburg, The Ballrooms, 620 Perry Pkwy., Gaithersburg, MD. The hotel phone number is 301-977-8900.

Contact Person: Kalyani Bhatt, Center for Drug Evaluation and Research, Food and Drug Administration, 10903 New Hampshire Ave., Bldg. 31, Rm. 2417, Silver Spring, MD 20993-0002, 301-796-9001, FAX: 301-847-8533, email: NDAC@fda.hhs.gov, or FDA Advisory Committee Information Line, 1-800-741-8138 (301-443-0572 in the Washington, DC area). A notice in the **Federal Register** about last minute modifications that impact a previously announced advisory committee meeting cannot always be published quickly enough to provide timely notice. Therefore, you should always check the Agency's Web site at <http://www.fda.gov/AdvisoryCommittees/default.htm> and scroll down to the appropriate advisory committee meeting link, or call the advisory committee information line to learn about possible modifications before coming to the meeting.

Agenda: The committee will discuss data submitted by MSD Consumer Care, Inc., to support new drug application (NDA) 204804, for over-the-counter (OTC) marketing of montelukast 10 milligram (mg) tablets (proposed trade name SINGULAIR Allergy). The proposed OTC use is "temporarily relieves these symptoms due to hay fever or other upper respiratory allergies: Nasal congestion, runny nose, itchy, watery eyes, sneezing, itching of the nose." The applicant proposes to label the product for OTC use in adults 18 years and older. Efficacy and safety data, as well as results of consumer studies, will be discussed. The committee will be asked to consider whether the data support an acceptable risk/benefit profile for the nonprescription use of montelukast tablets by OTC consumers.

FDA intends to make background material available to the public no later than 2 business days before the meeting. If FDA is unable to post the background material on its Web site prior to the meeting, the background material will be made publicly available at the location of the advisory committee meeting, and the background material will be posted on FDA's Web site after the meeting. Background material is available at <http://www.fda.gov/>

AdvisoryCommittees/Calendar/default.htm. Scroll down to the appropriate advisory committee meeting link.

Procedure: Interested persons may present data, information, or views, orally or in writing, on issues pending before the committee. Written submissions may be made to the contact person on or before April 25, 2014. Oral presentations from the public will be scheduled between approximately 1 p.m. to 2 p.m. Those individuals interested in making formal oral presentations should notify the contact person and submit a brief statement of the general nature of the evidence or arguments they wish to present, the names and addresses of proposed participants, and an indication of the approximate time requested to make their presentation on or before April 17, 2014. Time allotted for each presentation may be limited. If the number of registrants requesting to speak is greater than can be reasonably accommodated during the scheduled open public hearing session, FDA may conduct a lottery to determine the speakers for the scheduled open public hearing session. The contact person will notify interested persons regarding their request to speak by April 18, 2014.

Persons attending FDA's advisory committee meetings are advised that the Agency is not responsible for providing access to electrical outlets.

FDA welcomes the attendance of the public at its advisory committee meetings and will make every effort to accommodate persons with physical disabilities or special needs. If you require special accommodations due to a disability, please contact Kalyani Bhatt at least 7 days in advance of the meeting.

FDA is committed to the orderly conduct of its advisory committee meetings. Please visit our Web site at <http://www.fda.gov/AdvisoryCommittees/AboutAdvisoryCommittees/ucm111462.htm> for procedures on public conduct during advisory committee meetings.

Notice of this meeting is given under the Federal Advisory Committee Act (5 U.S.C. app. 2).

Dated: April 8, 2014.

Jill Hartzler Warner,

Acting Associate Commissioner for Special Medical Programs.

[FR Doc. 2014-08154 Filed 4-10-14; 8:45 am]

BILLING CODE 4160-01-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Health Resources and Services Administration

Notice of Availability of Final Policy Document

AGENCY: Health Resources and Services Administration (HRSA), HHS.

ACTION: Final Agency guidance and response to public comments.

SUMMARY: On January 27, 2014, HRSA published Policy Information Notice (PIN) 2014–01 to convey and clarify statutory and regulatory governance requirements for section 330-funded health centers and look-alikes. The PIN, “Health Center Program Governance,” and HRSA’s “Comments and Response on Draft PIN: Health Center Program Governance” are available on the Internet at <http://www.bphc.hrsa.gov/policiesregulations/policies/pin201401.html>, and constitutes final agency guidance.

DATES: The effective date of this final agency guidance was January 27, 2014.

FOR FURTHER INFORMATION CONTACT: For questions regarding this notice, please contact the Office of Policy and Program Development, Bureau of Primary Health Care, HRSA, at BPHCPolicy@hrsa.gov.

SUPPLEMENTARY INFORMATION: HHS’ Health Resources and Services Administration (HRSA) provides grants to eligible health centers under section 330 of the Public Health Service Act to support the delivery of preventive and primary care services to medically underserved communities and vulnerable populations. In 2012, grants helped fund more than 1,200 health center grantees that provided services at nearly 9,000 health care delivery sites and served more than 21 million people. There are also over 100 organizations known as Federally Qualified Health Center (FQHC) look-alikes (look-alikes). As described in section 1861(aa)(4) and section 1905(l)(2)(B) of the Social Security Act, look-alikes do not receive federal funding under section 330 of the PHS Act; however, to receive the look-alike designation and associated FQHC benefits, look-alikes must meet the statutory, regulatory, and policy requirements for health centers under section 330.

The purpose of this PIN is to: (a) Convey and clarify statutory and regulatory requirements regarding the structure and functioning of governing boards for all Health Center Program grantees (e.g., section 330(e), (g), (h), and/or (i) grantees) and look-alikes; (b) provide clarification regarding board

requirements for public centers under co-applicant arrangements, including public centers funded or designated solely under sections 330(g), 330(h), and/or 330(i) to serve special populations; and (c) outline the eligibility and qualifying requirements for HRSA approval of a governance waiver for the 51 percent patient majority governance requirement for eligible section 330 grantees and look-alikes. This PIN also establishes HRSA policy that eliminates the monthly meeting requirement from waiver consideration.

On August 20, 2009, HRSA made the draft PIN, “Health Center Governance Requirements and Expectations,” available for public comment. HRSA also published a notice in the **Federal Register** of September 18, 2009, requesting comments on this draft PIN. Fifty-one parties, including both individuals and groups, submitted a total of 251 comments regarding the draft PIN. After review and careful consideration of all comments received, HRSA has amended the PIN to incorporate certain recommendations from the public. The final PIN reflects these changes.

In addition to making the final PIN available on HRSA’s Web site, HRSA is also posting HRSA’s “Comments and Response on Draft PIN: Health Center Program Governance.” The purpose of this document is to summarize the major comments received and describe HRSA’s response, including any corresponding changes made to the PIN. Where comments did not result in a revision to the PIN, explanations are provided.

Dated: March 28, 2014.

Mary K. Wakefield,
Administrator.

BILLING CODE 4165–15–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Health Resources and Services Administration

Discretionary Advisory Committee on Heritable Disorders in Newborns and Children; Notice of Meeting

In accordance with section 10(a)(2) of the Federal Advisory Committee Act (Pub. L. 92–463, codified at 5 U.S.C. App.), notice is hereby given of the following meeting:

Name: Discretionary Advisory Committee on Heritable Disorders in Newborns and Children.

Dates and Times: May 29, 2014, 9:30 a.m. to 4:30 p.m. May 30, 2014, 9:30 a.m. to 3:00 p.m.

Place: Webinar and In-Person, U.S. Pharmacopeial Convention (USP) Headquarters, 12601 Twinbrook Parkway, Rockville, Maryland 20852.

Status: The meeting will be open to the public with attendance limited to space availability. Participants also have the option of viewing the meeting via webinar. Whether attending in-person or via webinar, all participants must register for the meeting at <https://www.blsmeeetings.net/ACHDNCMay2014>. The registration deadline is Friday, May 2, 2014, 11:59 p.m. Eastern Time. If there are technical problems gaining access to the Web site, please contact Anthony Rodell, Director of Client Relations, at arodell@SeamonCorporation.com.

Purpose: The Discretionary Advisory Committee on Heritable Disorders in Newborns and Children (Committee), as authorized by Public Health Service Act (PHS), 42 U.S.C. 217a: Advisory councils or committees, was established to advise the Secretary of the Department of Health and Human Services about the development of newborn screening activities, technologies, policies, guidelines, and programs for effectively reducing morbidity and mortality in newborns and children having, or at risk for, heritable disorders. Note: the Committee’s recommendations regarding additional conditions/inherited disorders for screening that have been adopted by the Secretary are included in the Recommended Uniform Screening Panel and constitute part of the comprehensive guidelines supported by the Health Resources and Services Administration (HRSA). Pursuant to section 2713 of the Public Health Service Act, codified at 42 U.S.C. 300gg–13, non-grandfathered health plans are required to cover screenings included in the HRSA-supported comprehensive guidelines without charging a co-payment, co-insurance, or deductible for plan years (i.e., policy years) beginning on or after the date that is 1 year from the Secretary’s adoption of the condition for screening.

Agenda: The meeting will include: (1) A discussion and vote on a systematic approach to evaluate the impact of adding newborn screening conditions on state public health systems; (2) a presentation on the impact of the rapid implementation of electronic health records on the Early Hearing Detection and Intervention State programs; (3) a discussion on a potential national infrastructure to conduct research on population-based screening; (4) a presentation on the impact of new CPT codes for molecular diagnostics on laboratories; and (5) updates from the Committee’s Laboratory Standards and Procedures, Follow-up and Treatment, and Education and Training subcommittees. Tentatively, the Committee is expected to review and/or vote on a systematic approach to evaluate the impact of adding newborn screening conditions on state public health systems. This tentative vote does not involve any proposed addition of a condition to the Recommended Uniform Screening Panel.

Agenda items are subject to change as necessary or appropriate. The agenda,

webinar information, Committee Roster, Charter, presentations, and other meeting materials are located on the Advisory Committee's Web site at <http://www.hrsa.gov/advisorycommittees/mchbadvisory/heritabledisorders>.

Public Comments: Members of the public may present oral comments and/or submit written comments. Comments are part of the official Committee record. Public comment periods are tentatively scheduled for both May 29 and May 30, 2014. Advance registration is required to present oral comments and/or submit written comments at <https://www.blsmetings.net/ACHDNCMay2014>. The registration deadline is Friday, May 2, 2014, 11:59 p.m. Eastern Time. Written comments must be received by the deadline in order to be included in the May meeting briefing book. Written comments should identify the individual's name, address, email, telephone number, professional or business affiliation, type of expertise (i.e., parent, researcher, clinician, public health, etc.), and the topic/subject matter of comments. To ensure that all individuals who have registered to make oral comments can be accommodated, the allocated time may be limited. Individuals who are associated with groups or have similar interests may be requested to combine their comments and present them through a single representative. No audiovisual presentations are permitted. For additional information or questions on public comments, please contact Lisa Vasquez, Maternal and Child Health Bureau, Health Resources and Services Administration; email: lvasquez@hrsa.gov.

For Further Information Contact: Anyone interested in obtaining other relevant information should contact Debi Sarkar, Maternal and Child Health Bureau, Health Resources and Services Administration, Room 18A-19, Parklawn Building, 5600 Fishers Lane, Rockville, Maryland 20857; email: dsarkar@hrsa.gov.

More information on the Advisory Committee is available at <http://www.hrsa.gov/advisorycommittees/mchbadvisory/heritabledisorders>.

Dated: April 3, 2014.

Jackie Painter,

Deputy Director, Division of Policy and Information Coordination.

Collaborative Workshop on Aquatic Models and 21st Century Toxicology; Notice of Public Meeting and Registration Information

SUMMARY: The National Toxicology Program (NTP) Interagency Center for the Evaluation of Alternative Toxicological Methods (NICEATM) announces a "Collaborative Workshop

on Aquatic Models and 21st Century Toxicology." The workshop proposes to explore and discuss how small aquarium fish species may be used as model organisms to screen and prioritize compounds for further *in vivo* testing and assess mechanisms of chemical toxicity. Discussions will focus on the application of these models to the field of environmental health while leveraging the techniques and knowledge of broad-based, interdisciplinary research.

DATES: Meeting: May 5-6, 2014, from 8:00 a.m. to approximately 5:00 p.m. Eastern Daylight Time (EDT) on May 5 and 8:00 a.m. to approximately 4:15 p.m. EDT on May 6. A poster session will be held on May 5.

Meeting Registration: Registration is open through April 25, 2014.

ADDRESSES: *Meeting Location:* James B. Hunt Jr. Library, Centennial Campus, North Carolina State University (NCSU), 1070 Partners Way, Raleigh, NC 27606.

Meeting Web page: The preliminary agenda, registration, and other meeting materials are at <http://ntp.niehs.nih.gov/go/41308>.

FOR FURTHER INFORMATION CONTACT: Dr. Warren S. Casey, Director, NICEATM; email: warren.casey@nih.gov; telephone: (919) 316-4729.

SUPPLEMENTARY INFORMATION:

Background: The need to screen thousands of environmental chemicals for their potential effects on human health has propelled the use of high-throughput cell-based screens to the forefront of toxicology. Key to the use of these screens is the availability of model organisms that recapitulate human development, physiology, and disease processes while avoiding the limitations of current rodent-based models.

Incorporating small aquarium fish models into modern toxicological investigations could yield significant scientific and economic benefits. This workshop highlights the potential of these organisms in toxicological research and enables scientists to discuss strategies for leveraging aquatic models in understanding the role of environmental exposures on human health.

The workshop is cosponsored by the NTP and NCSU; the organizing committee includes members from the NTP, NCSU, the National Institute of Environmental Health Sciences, the U.S. Food and Drug Administration, the U.S. Environmental Protection Agency, and Duke University.

Preliminary Agenda and Other Meeting Information: A preliminary agenda and additional information are

available at <http://ntp.niehs.nih.gov/go/41308>.

Meeting and Registration: This meeting is open to the public, free of charge, with attendance limited only by the space available. Individuals who plan to attend should register on the NTP Web site (<http://ntp.niehs.nih.gov/go/41308>) by April 25, 2014, to facilitate meeting planning. Interested individuals are encouraged to visit this Web page to stay abreast of the most current information about the meeting.

Information for visitors to the Hunt Library is available at <http://www.lib.ncsu.edu/huntlibrary>. Individuals with disabilities who need accommodation to participate in this event should contact Dr. Elizabeth Maull at phone: (919) 316-4668 or email: maull@niehs.nih.gov. TTY users should contact the Federal TTY Relay Service at 800-877-8339. Requests should be made at least five business days in advance of the event.

Background Information on NICEATM: NICEATM conducts data analyses, workshops, independent validation studies, and other activities to assess new, revised, and alternative test methods and strategies and provides support for the Interagency Coordinating Committee on the Validation of Alternative Methods (ICCVAM). The ICCVAM Authorization Act of 2000 (42 U.S.C. 285f-3) provides authority for ICCVAM and NICEATM in the development of alternative test methods. Information about NICEATM and ICCVAM is found at <http://ntp.niehs.nih.gov/go/niceatm> and <http://ntp.niehs.nih.gov/go/iccvam>.

Dated: April 3, 2014.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

National Institutes of Health

National Cancer Institute; Notice of Closed Meeting

Pursuant to section 10(d) of the Federal Advisory Committee Act, as amended (5 U.S.C. App.), notice is hereby given of the following meeting.

The meeting will be closed to the public in accordance with the provisions set forth in sections 552b(c)(4) and 552b(c)(6), Title 5 U.S.C., as amended. The grant applications and the discussions could disclose confidential trade secrets or commercial

property such as patentable material, and personal information concerning individuals associated with the grant applications, the disclosure of which would constitute a clearly unwarranted invasion of personal privacy.

Name of Committee: National Cancer Institute Special Emphasis Panel Bridging the Gap from Cancer Mechanisms to Population Science.

Date: April 28, 2014.

Time: 4:00 p.m. to 5:00 p.m.

Agenda: To review and evaluate grant applications.

Place: National Cancer Institute Shady Grove, Room 7W264, 9609 Medical Center Drive, Rockville, MD 20850 (Telephone Conference Call).

Contact Person: Ellen K. Schwartz, EDD, MBA, Scientific Review Officer, Special Review and Logistics Branch, Division of Extramural Activities, National Cancer Institute, NIH, 9609 Medical Center Drive, Room 7W264, Bethesda, MD 20892-9750, 240-276-6384, schwarel@mail.nih.gov.

Information is also available on the Institute's/Center's home page: <http://deainfo.nci.nih.gov/advisory/irg/irg.htm>, where an agenda and any additional information for the meeting will be posted when available.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

National Institutes of Health

National Institute on Aging; Notice of Meeting

Pursuant to section 10(d) of the Federal Advisory Committee Act, as amended (5 U.S.C. App.), notice is hereby given of a meeting of the National Advisory Council on Aging.

The meeting will be open to the public as indicated below, with attendance limited to space available. Individuals who plan to attend and need special assistance, such as sign language interpretation or other reasonable accommodations, should notify the Contact Person listed below in advance of the meeting.

The meeting will be closed to the public in accordance with the provisions set forth in sections 552b(c)(4) and 552b(c)(6), Title 5 U.S.C., as amended. The grant applications and the discussions could disclose confidential trade secrets or commercial property such as patentable material, and personal information concerning individuals associated with the grant applications, the disclosure of which would constitute a clearly unwarranted invasion of personal privacy.

Name of Committee: National Advisory Council on Aging.

Date: May 20-21, 2014.

Closed: May 20, 2014, 3:00 p.m. to 5:00 p.m.

Agenda: To review and evaluate grant applications.

Place: National Institutes of Health, Building 45, P2 Level, Conference Room E1/E2, 45 Center Drive, Bethesda, MD 20892.

Open: May 21, 2014, 8:00 a.m. to 12:45 p.m.

Agenda: Call to order and report from the Director; discussion of future meeting dates; consideration of minutes of last meeting; reports from the Task Force on Minority Aging Research and Working Group on Program; Council Speaker; Program Highlights.

Place: National Institutes of Health, Building 45, P2 Level, Conference Room E1/E2, 45 Center Drive, Bethesda, MD 20892.

Contact Person: Robin Barr, Ph.D., Director, National Institute On Aging, Office of Extramural Activities, Gateway Building, 7201 Wisconsin Avenue, Bethesda, MD 20814, (301) 496-9322, barr@nia.nih.gov.

Any interested person may file written comments with the committee by forwarding the statement to the Contact Person listed on this notice. The statement should include the name, address, telephone number and when applicable, the business or professional affiliation of the interested person.

In the interest of security, NIH has instituted stringent procedures for entrance onto the NIH campus. All visitor vehicles, including taxicabs, hotel, and airport shuttles will be inspected before being allowed on campus. Visitors will be asked to show one form of identification (for example, a government-issued photo ID, driver's license, or passport) and to state the purpose of their visit.

Information is also available on the Institute's/Center's home page: www.nih.gov/nia/naca/, where an agenda and any additional information for the meeting will be posted when available.

BILLING CODE 4140-01-P

DEPARTMENT OF HOMELAND SECURITY

U.S. Citizenship and Immigration Services

[OMB Control Number 1615-0069]

Agency Information Collection Activities: Application by Refugee for Waiver of Grounds of Excludability, Form I-602; Extension, Without Change, of a Currently Approved Collection

ACTION: 30-Day Notice.

SUMMARY: The Department of Homeland Security (DHS), U.S. Citizenship and Immigration Services (USCIS) will be submitting the following information collection request to the Office of Management and Budget (OMB) for review and clearance in accordance with the Paperwork Reduction Act of 1995. The information collection notice was previously published in the **Federal Register** on January 30, 2014, at 79 FR 4952, allowing for a 60-day public comment period. USCIS received one public comment in connection with the 60-day notice.

DATES: The purpose of this notice is to allow an additional 30 days for public comments. Comments are encouraged and will be accepted until May 12, 2014. This process is conducted in accordance with 5 CFR 1320.10.

ADDRESSES: Written comments and/or suggestions regarding the item(s) contained in this notice, especially regarding the estimated public burden and associated response time, must be directed to the OMB USCIS Desk Officer via email at oir_submission@omb.eop.gov. The comments submitted to the OMB USCIS Desk Officer may also be submitted to DHS via the Federal eRulemaking Portal Web site at <http://www.regulations.gov> under e-Docket ID number USCIS-2006-0042 or via email at uscisfrcomment@uscis.dhs.gov. All submissions received must include the agency name and the OMB Control Number 1615-0069.

Regardless of the method used for submitting comments or material, all submissions will be posted, without change, to the Federal eRulemaking Portal at <http://www.regulations.gov>, and will include any personal information you provide. Therefore, submitting this information makes it public. You may wish to consider limiting the amount of personal information that you provide in any voluntary submission you make to DHS. For additional information please read the Privacy Act notice that is available

via the link in the footer of <http://www.regulations.gov>.

Note: The address listed in this notice should only be used to submit comments concerning this information collection. Please do not submit requests for individual case status inquiries to this address. If you are seeking information about the status of your individual case, please check "My Case Status" online at: <https://egov.uscis.gov/cris/Dashboard.do>, or call the USCIS National Customer Service Center at 1-800-375-5283.

Written comments and suggestions from the public and affected agencies should address one or more of the following four points:

(1) Evaluate whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility;

(2) Evaluate the accuracy of the agency's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used;

(3) Enhance the quality, utility, and clarity of the information to be collected; and

(4) Minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology, e.g., permitting electronic submission of responses.

Overview of This Information Collection

(1) *Type of Information Collection Request:* Extension, Without Change, of a Currently Approved Collection.

(2) *Title of the Form/Collection:* Application by Refugee for Waiver of Grounds of Excludability.

(3) *Agency form number, if any, and the applicable component of the DHS sponsoring the collection:* I-602; USCIS.

(4) *Affected public who will be asked or required to respond, as well as a brief abstract:* Primary: Individuals or households. Form I-602 is necessary to establish eligibility for waiver of excludability based on humanitarian, family unity, or public interest.

(5) *An estimate of the total number of respondents and the amount of time estimated for an average respondent to respond:* 2,500 responses at 0.25 hours (15 minutes) per response.

(6) *An estimate of the total public burden (in hours) associated with the collection:* 625 annual burden hours.

If you need a copy of the information collection instrument with supplementary documents, or need

additional information, please visit <http://www.regulations.gov>. We may also be contacted at: USCIS, Office of Policy and Strategy, Regulatory Coordination Division, 20 Massachusetts Avenue NW., Washington, DC 20529-2140; Telephone 202-272-8377.

Dated: April 7, 2014.

Laura Dawkins,

Chief, Regulatory Coordination Division, Office of Policy and Strategy, U.S. Citizenship and Immigration Services, Department of Homeland Security.

[FR Doc. 2014-08083 Filed 4-10-14; 8:45 am]

BILLING CODE 9111-97-P

DEPARTMENT OF HOMELAND SECURITY

U.S. Customs and Border Protection

[CBP Dec. 14-04]

Tuna-Tariff Rate Quota; the Tariff-Rate Quota for Calendar Year 2014 Tuna Classifiable Under Subheading 1604.14.22, Harmonized Tariff Schedule of the United States (HTSUS)

AGENCY: U.S. Customs and Border Protection, Department of Homeland Security.

ACTION: Announcement of the quota quantity of tuna in airtight containers for Calendar Year 2014.

SUMMARY: Each year, the tariff-rate quota for tuna described in subheading 1604.14.22, Harmonized Tariff Schedule of the United States (HTSUS), is based on the apparent United States consumption of tuna in airtight containers during the preceding Calendar Year. This document sets forth the tariff-rate quota for Calendar Year 2014.

DATES: *Effective Dates:* The 2014 tariff-rate quota is applicable to tuna fish entered, or withdrawn from warehouse, for consumption during the period January 1, through December 31, 2014.

FOR FURTHER INFORMATION CONTACT: Headquarters Quota Branch, Textile/Apparel Policy and Programs Division, Trade Policy and Programs, Office of International Trade, U.S. Customs and Border Protection, Washington, DC 20229-1155, (202) 863-6560.

Background

It has been determined that 15,833,343 kilograms of tuna in airtight containers may be entered, or withdrawn from warehouse, for consumption during the Calendar Year 2014, at the rate of 6.0 percent *ad valorem* under subheading 1604.14.22,

HTSUS. Any such tuna which is entered, or withdrawn from warehouse, for consumption during the current calendar year in excess of this quota will be dutiable at the rate of 12.5 percent *ad valorem* under subheading 1604.14.30 HTSUS.

Dated: April 7, 2014.

Richard F. DiNucci,

Acting Assistant Commissioner Office of International Trade.

[FR Doc. 2014-08204 Filed 4-10-14; 8:45 am]

BILLING CODE 9111-14-P

DEPARTMENT OF HOUSING AND URBAN DEVELOPMENT

[Docket No. FR-5752-N-38]

30-Day Notice of Proposed Information Collection: Operating Fund Formula: Data Collection

AGENCY: Office of the Chief Information Officer, HUD.

ACTION: Notice.

SUMMARY: HUD has submitted the proposed information collection requirement described below to the Office of Management and Budget (OMB) for review, in accordance with the Paperwork Reduction Act. The purpose of this notice is to allow for an additional 30 days of public comment.

DATES: *Comments Due Date:* May 12, 2014.

ADDRESSES: Interested persons are invited to submit comments regarding this proposal. Comments should refer to the proposal by name and/or OMB Control Number and should be sent to: HUD Desk Officer, Office of Management and Budget, New Executive Office Building, Washington, DC 20503; fax: 202-395-5806. Email: OIRA_Submission@omb.eop.gov.

FOR FURTHER INFORMATION CONTACT:

Colette Pollard, Reports Management Officer, QDAM, Department of Housing and Urban Development, 451 7th Street SW., Washington, DC 20410; email Colette Pollard at Colette.Pollard@hud.gov or telephone 202-402-3400. Persons with hearing or speech impairments may access this number through TTY by calling the toll-free Federal Relay Service at (800) 877-8339. This is not a toll-free number. Copies of available documents submitted to OMB may be obtained from Ms. Pollard.

SUPPLEMENTARY INFORMATION: This notice informs the public that HUD has submitted to OMB a request for approval of the information collection described in Section A.

The **Federal Register** notice that solicited public comment on the information collection for a period of 60 days was published on February 6, 2014.

A. Overview of Information Collection

Title of Information Collection: Operating Fund Formula: Data Collection.

OMB Approval Number: 2577-0029.

Type of Request: Extension of a currently approved collection.

Form Number: HUD-52722, HUD-52723.

Description of the need for the information and proposed use: Public Housing Agencies (PHAs) use this information in budget submissions which are reviewed and approved by HUD field offices as the basis for obligating operating subsidies. This

information is necessary to calculate the eligibility for operating subsidies under the Operating Fund Program regulation, as amended. The Operating Fund Program is designed to provide the amount of operating subsidy that would be needed for well-managed PHAs. PHAs will submit the information electronically with a form.

Respondents: (i.e. affected public): State, Local, and Tribal Governments.

Information collection	Number of respondents	Frequency of response	Responses per annum	Burden hour per response	Annual burden hours	Hourly cost per response	Annual cost
HUD-52722	6,997	1	1	5,247.75	5,247.75	\$30.23	\$158,639
HUD-52723	6,997	1	1	5,247.75	5,247.75	30.23	158,639
Total	\$10,495	317,278

B. Solicitation of Public Comment

This notice is soliciting comments from members of the public and affected parties concerning the collection of information described in Section A on the following:

(1) Whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility;

(2) The accuracy of the agency's estimate of the burden of the proposed collection of information;

(3) Ways to enhance the quality, utility, and clarity of the information to be collected; and

(4) Ways to minimize the burden of the collection of information on those who are to respond; including through the use of appropriate automated collection techniques or other forms of information technology, e.g., permitting electronic submission of responses.

HUD encourages interested parties to submit comment in response to these questions.

Authority: Section 3507 of the Paperwork Reduction Act of 1995, 44 U.S.C. Chapter 35

Dated: April 4, 2014.

Colette Pollard,

Department Reports Management Officer, Office of the Chief Information Officer.

BILLING CODE 4210-67-P

DEPARTMENT OF HOUSING AND URBAN DEVELOPMENT

[Docket No. FR-5752-N-37]

30-Day Notice of Proposed Information Collection: Baseline Assessment of Renewable Energy Capacity Within HUD's Public Housing and Federally-Assisted Multifamily Housing Portfolios

AGENCY: Office of the Chief Information Officer, HUD.

ACTION: Notice.

SUMMARY: HUD has submitted the proposed information collection requirement described below to the Office of Management and Budget (OMB) for review, in accordance with the Paperwork Reduction Act. The purpose of this notice is to allow for an additional 30 days of public comment.

DATES: *Comments Due Date:* May 12, 2014.

ADDRESSES: Interested persons are invited to submit comments regarding this proposal. Comments should refer to the proposal by name and/or OMB Control Number and should be sent to: HUD Desk Officer, Office of Management and Budget, New Executive Office Building, Washington, DC 20503; fax: 202-395-5806. Email: OIRA_Submission@omb.eop.gov.

FOR FURTHER INFORMATION CONTACT: Colette Pollard, Reports Management Officer, QDAM, Department of Housing and Urban Development, 451 7th Street SW., Washington, DC 20410; email Colette.Pollard@hud.gov or telephone 202-402-3400. Persons with hearing or speech impairments may access this number through TTY by calling the toll-free Federal Relay Service at (800) 877-8339. This is not a toll-free number. Copies of

available documents submitted to OMB may be obtained from Ms. Pollard.

SUPPLEMENTARY INFORMATION: This notice informs the public that HUD has submitted to OMB a request for approval of the information collection described in Section A. The **Federal Register** notice that solicited public comment on the information collection for a period of 60 days was published on January 21, 2014.

A. Overview of Information Collection

Title of Information Collection: Baseline Assessment of Renewable Energy Capacity Within HUD's Public Housing and Federally-Assisted Multifamily Housing Portfolios.

OMB Approval Number: 2528-New.

Type of Request: New collection.

Form Number: None.

Description of the need for the information and proposed use: The information is being collected to establish a baseline assessment of the renewable energy capacity in HUD's public housing and federally-assisted multifamily housing portfolios. The assessment will support President Obama's Climate Action Plan, which calls for the installation of 100 megawatts (MW) of renewable energy generation capacity by 2020 at LIHTC properties (Treasury), Rural Development properties (USDA), and public housing and multifamily-assisted properties (HUD). The proposed data collection instrument is a web-based census survey that will be supported by follow-up telephone interviews to all non-respondents.

Respondents: (i.e. affected public): Employees of housing organizations receiving funding from HUD, specifically public housing agencies and HUD-assisted multifamily properties.

Estimated Number of Respondents: 20,370.

Estimated Number of Responses:
16,296 (based on a 80% response rate).
Frequency of Response: 1.

Average Hours per Response: 0.467
(weighted average).
Total Estimated Burdens: 9,507.

Information collection	Number of respondents	Frequency of response	Responses per annum	Burden hour per response	Annual burden hours	Hourly cost per response	Annual cost
Web Survey only	16,296	1	1	0.4	6,114	\$42.66	\$260,823
Telephone Interview & Web Survey	3,821	1	1	0.733	2,802	42.66	119,533
Total	20,370	9,507	405,526

B. Solicitation of Public Comment

This notice is soliciting comments from members of the public and affected parties concerning the collection of information described in Section A on the following:

- (1) Whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility;
- (2) The accuracy of the agency's estimate of the burden of the proposed collection of information;
- (3) Ways to enhance the quality, utility, and clarity of the information to be collected; and
- (4) Ways to minimize the burden of the collection of information on those who are to respond; including through the use of appropriate automated collection techniques or other forms of information technology, e.g., permitting electronic submission of responses.

HUD encourages interested parties to submit comment in response to these questions.

Authority: Section 3507 of the Paperwork Reduction Act of 1995, 44 U.S.C. Chapter 35

Dated: April 4, 2014.

60-Day Notice of Proposed Information Collection: Manufactured Home Construction and Safety Standards Act Reporting Requirements

AGENCY: Office of the Assistant Secretary for Housing—Federal Housing Commissioner, HUD.

ACTION: Notice.

SUMMARY: HUD is seeking approval from the Office of Management and Budget (OMB) for the information collection

described below. In accordance with the Paperwork Reduction Act, HUD is requesting comment from all interested parties on the proposed collection of information. The purpose of this notice is to allow for 60 days of public comment.

DATES: *Comments Due Date:* June 10, 2014.

ADDRESSES: Interested persons are invited to submit comments regarding this proposal. Comments should refer to the proposal by name and/or OMB Control Number and should be sent to: Colette Pollard, Reports Management Officer, QDAM, Department of Housing and Urban Development, 451 7th Street SW., Room 4176, Washington, DC 20410-5000; telephone 202-402-3400 (this is not a toll-free number) or email at Colette.Pollard@hud.gov for a copy of the proposed forms or other available information. Persons with hearing or speech impairments may access this number through TTY by calling the toll-free Federal Relay Service at (800) 877-8339.

FOR FURTHER INFORMATION CONTACT:

Cynthia Smith, Associate Deputy Assistant Secretary for Risk Management and Regulatory Affairs, Office of Risk Management and Regulatory Affairs, Department of Housing and Urban Development, 451 7th Street SW., Washington, DC 20410, telephone 202-402-5216. This is not a toll-free number. Persons with hearing or speech impairments may access this number through TTY by calling the toll-free Federal Relay Service at (800) 877-8339.

Copies of available documents submitted to OMB may be obtained from Ms. Smith.

SUPPLEMENTARY INFORMATION: This notice informs the public that HUD is seeking approval from OMB for the information collection described in Section A.

A. Overview of Information Collection

Title of Information Collection: Manufactured Home Construction and Safety Standards Act Reporting.

OMB Approval Number: 2502-0253.

Type of Request: Extension of currently approved collection.

Form Number: None.

Description of the need for the information and proposed use: The Federal Standards and Procedural Regulations require manufactured home producers to place labels and notices in and on manufactured homes and mandate State and Private agencies participating in the Federal program to issue reports. These Standards will protect the HUD's interests by requiring certain features of design and construction. In addition, some information collected assists both HUD and State Agency's in locating manufactured homes with defects, which then would create the need for notification and/or correction by the manufacturer.

Respondents (i.e. affected public): Business or other for-profit.

Estimated Number of Respondents: 165.

Estimated Number of Responses: 59,304.

Frequency of Response: Monthly.

Average Hours per Response: 5.

Total Estimated Burdens: 120,618.

B. Solicitation of Public Comment

This notice is soliciting comments from members of the public and affected parties concerning the collection of information described in Section A on the following: (1) Whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility; (2) The accuracy of the agency's estimate of the burden of the proposed collection of information; (3) Ways to enhance the quality, utility, and clarity of the information to be collected; and (4) Ways to minimize the burden of the collection of information on those who are to respond; including

through the use of appropriate automated collection techniques or other forms of information technology, e.g., permitting electronic submission of responses.

HUD encourages interested parties to submit comment in response to these questions.

Authority: Section 3507 of the Paperwork Reduction Act of 1995, 44 U.S.C. Chapter 35.

Dated: April 3, 2014.

Laura M. Marin,

Associate General Deputy Assistant Secretary for Housing-Associate Deputy Federal Housing Commissioner.

[FR Doc. 2014-08185 Filed 4-10-14; 8:45 am]

BILLING CODE 4210-67-P

DEPARTMENT OF HOUSING AND URBAN DEVELOPMENT

[Docket No. FR-5750-N-15]

Federal Property Suitable as Facilities To Assist the Homeless

AGENCY: Office of the Assistant Secretary for Community Planning and Development, HUD.

ACTION: Notice.

SUMMARY: This Notice identifies unutilized, underutilized, excess, and surplus Federal property reviewed by HUD for suitability for use to assist the homeless.

FOR FURTHER INFORMATION CONTACT:

Juanita Perry, Department of Housing and Urban Development, 451 Seventh Street SW., Room 7266, Washington, DC 20410; telephone (202) 402-3970; TTY number for the hearing- and speech-impaired (202) 708-2565 (these telephone numbers are not toll-free), or call the toll-free Title V information line at 800-927-7588.

SUPPLEMENTARY INFORMATION: In accordance with 24 CFR part 581 and section 501 of the Stewart B. McKinney Homeless Assistance Act (42 U.S.C. 11411), as amended, HUD is publishing this Notice to identify Federal buildings and other real property that HUD has reviewed for suitability for use to assist the homeless. The properties were reviewed using information provided to HUD by Federal landholding agencies regarding unutilized and underutilized buildings and real property controlled by such agencies or by GSA regarding its inventory of excess or surplus Federal property. This Notice is also published in order to comply with the December 12, 1988 Court Order in *National Coalition for the Homeless v. Veterans Administration*, No. 88-2503-OG (D.D.C.).

Properties reviewed are listed in this Notice according to the following categories: Suitable/available, suitable/unavailable, and suitable/to be excess, and unsuitable. The properties listed in the three suitable categories have been reviewed by the landholding agencies, and each agency has transmitted to HUD: (1) Its intention to make the property available for use to assist the homeless, (2) its intention to declare the property excess to the agency's needs, or (3) a statement of the reasons that the property cannot be declared excess or made available for use as facilities to assist the homeless.

Properties listed as suitable/available will be available exclusively for homeless use for a period of 60 days from the date of this Notice. Where property is described as for "off-site use only" recipients of the property will be required to relocate the building to their own site at their own expense. Homeless assistance providers interested in any such property should send a written expression of interest to HHS, addressed to Theresa Ritta, Ms. Theresa M. Ritta, Chief Real Property Branch, the Department of Health and Human Services, Room 5B-17, Parklawn Building, 5600 Fishers Lane, Rockville, MD 20857, (301)-443-2265 (This is not a toll-free number.) HHS will mail to the interested provider an application packet, which will include instructions for completing the application. In order to maximize the opportunity to utilize a suitable property, providers should submit their written expressions of interest as soon as possible. For complete details concerning the processing of applications, the reader is encouraged to refer to the interim rule governing this program, 24 CFR part 581.

For properties listed as suitable/to be excess, that property may, if subsequently accepted as excess by GSA, be made available for use by the homeless in accordance with applicable law, subject to screening for other Federal use. At the appropriate time, HUD will publish the property in a Notice showing it as either suitable/available or suitable/unavailable.

For properties listed as suitable/unavailable, the landholding agency has decided that the property cannot be declared excess or made available for use to assist the homeless, and the property will not be available.

Properties listed as unsuitable will not be made available for any other purpose for 20 days from the date of this Notice. Homeless assistance providers interested in a review by HUD of the determination of unsuitability should call the toll free information line at 1-

800-927-7588 for detailed instructions or write a letter to Ann Marie Oliva at the address listed at the beginning of this Notice. Included in the request for review should be the property address (including zip code), the date of publication in the **Federal Register**, the landholding agency, and the property number.

For more information regarding particular properties identified in this Notice (i.e., acreage, floor plan, existing sanitary facilities, exact street address), providers should contact the appropriate landholding agencies at the following addresses: *Agriculture:* Ms. Debra Kerr, Department of Agriculture, Reporters Building, 300 7th Street SW., Room 300, Washington, DC 20024, (202)-720-8873; *Air Force:* Ms. Connie Lotfi, Air Force Real Property Agency, 143 Billy Mitchell Blvd., San Antonio, TX 78226, (210) 925-3047; *Army:* Ms. Veronica Rines, Office of the Assistant Chief of Staff for Installation Management, Department of Army, Room 5A128, 600 Army Pentagon, Washington, DC 20310, (571)-256-8145; *COE:* Mr. Scott Whiteford, Army Corps of Engineers, Real Estate, CEMP-CR, 441 G Street NW., Washington, DC 20314; (202) 761-5542; *Energy:* Mr. David Steinau, Department of Energy, Office of Property Management, 1000 Independence Ave. SW., Washington, DC 20585 (202) 287-1503; *GSA:* Mr. Flavio Peres, General Services Administration, Office of Real Property Utilization and Disposal, 1800 F Street NW., Room 7040 Washington, DC 20405, (202) 501-0084; *Interior:* Mr. Michael Wright, Acquisition & Property Management, Department of the Interior, 3960 N. 56th Ave. #104, Hollywood, FL 33021; (443) 223-4639; (These are not toll-free numbers).

Dated: April 3, 2014.

Mark Johnston,

Deputy Assistant Secretary for Special Needs.

Notice of Availability of the Proposed Southline Transmission Line Project Draft Environmental Impact Statement and Draft Resource Management Plan Amendment, New Mexico and Arizona

AGENCY: Bureau of Land Management, Interior; Western Area Power Administration, Department of Energy.
ACTION: Notice of availability.

SUMMARY: In accordance with the National Environmental Policy Act of 1969, as amended (NEPA), and the Federal Land Policy and Management Act of 1976, as amended (FLPMA), the Bureau of Land Management (BLM) and the Western Area Power Administration (Western), have prepared a Draft Environmental Impact Statement (EIS) and Draft Resource Management Plan (RMP) Amendment for the proposed Southline Transmission Line Project (Project), and by this notice are announcing the opening of the comment period.

DATES: To ensure that comments will be considered, the BLM must receive written comments on the Draft EIS and Draft RMP Amendment within 90 days following the date the Environmental Protection Agency publishes its Notice of Availability in the **Federal Register**. The BLM and Western will hold public hearings on the Draft EIS and Draft RMP Amendment at various locations in New Mexico and Arizona during the public comment period, and will announce future meetings or hearings and any other public involvement activities at least 15 days in advance through direct mailings to the Project mailing list, local news media, newsletters, and posting on the BLM Web site at <http://www.blm.gov/nm/southline>.

ADDRESSES: You may submit comments related to the Southline Transmission Line Project by any of the following methods:

- Web site: <http://www.blm.gov/nm/southline>.
- Email: BLM_NM_Southline@blm.gov.

- Fax: 575-525-4412.

• Mail: BLM, Las Cruces District Office, Southline Transmission Project, Attention: Frances Martinez, 1800 Marquess Street, Las Cruces, NM 88005.

FOR FURTHER INFORMATION CONTACT:

Mark Mackiewicz, PMP, BLM Senior National Project Manager; telephone 435-636-3616; email: mmackiew@blm.gov. For information about Western's involvement contact Mark Wieringa, Western NEPA Document Manager; telephone 800-336-7288 or 720-962-7448; email: wieringa@wapa.gov. For general information on the Department of Energy's (DOE) NEPA review procedures or on the status of a NEPA review, contact Carol M. Borgstrom, Director of NEPA Policy and Compliance, GC-54, U.S. Department of Energy, 1000 Independence Avenue SW., Washington, DC 20585-0119, telephone 202-586-4600 or toll free at 800-472-2756, fax 202-586-7031.

Persons who use a telecommunications device for the deaf (TDD) may call the Federal Information Relay Service (FIRS) at 1-800-877-8339 to contact the above individuals during normal business hours. The FIRS is available 24 hours a day, 7 days a week, to leave a message or question with the above individuals. You will receive a reply during normal business hours.

SUPPLEMENTARY INFORMATION: Copies of the Southline Draft EIS/Draft RMP Amendment are available at the following BLM locations: Las Cruces District Office (see **ADDRESSES**); New Mexico State Office, 301 Dinosaur Trail, Santa Fe, NM 87508; Arizona State Office, One North Central Avenue Suite 800, Phoenix, AZ 85004; Safford Field Office, 711 14th Avenue, Safford, AZ 85546; and Tucson Field Office, 3201 East Universal Way, Tucson, AZ 85756. The Draft EIS/Draft RMP Amendment and supporting documents will be available electronically on the Project Web site at <http://www.blm.gov/nm/southline>.

Southline has filed a right-of-way (ROW) application with the BLM pursuant to Title V of FLPMA, proposing to construct, operate, maintain, and eventually decommission a high-voltage, alternating current electric transmission line. The BLM and Western have agreed to be joint lead agencies under NEPA, 40 CFR 1501.5(b). Western is a power-marketing agency within the DOE, and has been a participant in the proposed Project with the applicant, Southline Transmission, LLC (Southline). The proposed Project would consist of two sections. The first section would entail construction of about 240 miles of new double-circuit

345-kV transmission line in a 200-foot ROW between the Afton Substation, south of Las Cruces, New Mexico, and Western's Apache Substation, south of Willcox, Arizona (Afton-Apache or New Build Section). The second section would entail the upgrade of about 120 miles of Western's existing Saguario-Tucson and Tucson-Apache 115-kV transmission lines in a 100-foot existing ROW to a double-circuit 230-kV transmission line in a 150-foot ROW, where feasible (Apache-Saguario or Upgrade Section). The Upgrade Section would originate at the Apache Substation and terminate at the Saguario Substation northwest of Tucson, Arizona. Both new permanent ROW and temporary construction ROW would be required in the New Build Section and in some portions of the Upgrade Section for the transmission line, substations, access roads, and other permanent and temporary Project components. The proposed Project would also include installation of new communications equipment, and connect to 14 substations distributed throughout southern New Mexico and Arizona, including expanding/upgrading existing substations and potentially constructing a new substation in New Mexico.

The New Build Section (Afton-Apache) would include construction and operation of:

- 205 miles of 345-kV double-circuit electric transmission line in New Mexico and Arizona with a planned bidirectional capacity of up to 1,000 MW. This section is defined by endpoints at the existing Afton Substation, south of Las Cruces in Doña Ana County, New Mexico, and Western's existing Apache Substation, south of Willcox in Cochise County, Arizona;

- 5 miles of 345-kV single-circuit electric transmission line between the existing Afton Substation and the existing Luna-Diablo 345-kV transmission line;

- 30 miles of 345-kV double-circuit electric transmission line between New Mexico State Route 9 and Interstate 10 east of Deming in Luna County, New Mexico, to provide access for potential renewable energy generation sources in southern New Mexico. This segment of the proposed Project is included in the analysis, however, development of this segment would be determined at a later date; and

- A new substation (proposed Midpoint Substation) in Luna County, New Mexico, to provide an intermediate connection point for future interconnection requests.

The Upgrade Section (Apache-Saguario) would include:

- Replacing 120 miles of Western's existing Saguario-Tucson and Tucson-Apache 115-kV single-circuit electric wood-pole H-frame transmission lines with a 230-kV double-circuit electric steel-pole transmission line. This section is defined by endpoints at the existing Apache Substation, south of Willcox in Cochise County, Arizona, to the existing Saguario Substation, northwest of Tucson in Pima County, Arizona; and

- Two miles of new build double-circuit 230-kV electric transmission line to interconnect with the existing Tucson Electric Power Company Vail Substation, located southeast of Tucson and just north of the existing 115-kV Tucson-Apache line.

Because Southline's proposed Project may involve action in floodplains or wetlands, this Notice of Availability also serves as a notice of proposed floodplain or wetland action, in accordance with 10 CFR 1022.12(a). The Draft EIS includes a floodplain/wetland assessment and floodplain/wetland statement of findings following DOE regulations for compliance with floodplain and wetlands environmental review (10 CFR 1022).

As part of its agency mission, Western routinely studies power system requirements; plans for transmission line upgrades and additions; facilitates and finances transmission projects; and constructs, owns, operates, and maintains transmission infrastructure. Such projects may be solely Western's projects or may be projects undertaken with the participation of others. Southline is proposing to upgrade about 120 miles of Western's existing transmission line between Saguario and Apache substations as part of its proposed Project.

An interdisciplinary approach was used to develop the Draft EIS to consider a variety of resource issues and concerns. The issues addressed in the Draft EIS that shaped the Project's scope and alternatives include, but are not limited to:

- Air and climate;
- Biological resources;
- Cultural resources;
- Health and safety;
- Noise;
- Land use (including farmlands and military operations);
- Recreation;
- Socioeconomics and environmental justice;
- National Conservation Lands or other special designations;
- Wilderness characteristics units;
- National Scenic and Historic Trails and trails under study;
- Visual resources; and

- Transportation.

In addition to the Proponent-Proposed Action, Southline also submitted the Proponent Alternative route for the New Build Section of the proposed Project, both of which were the product of extensive stakeholder outreach. In addition to the Proponent-Proposed Action, the Proponent Alternative and the No Action Alternative, the BLM and Western are considering other local alternatives that provide additional route options. To simplify the analysis of alternatives, the Project area has been divided into four major route groups: (1) Afton Substation to Hidalgo Substation; (2) Hidalgo Substation to Apache Substation; (3) Apache Substation to Pantano Substation; and (4) Pantano Substation to Saguaro Substation.

Route Group 1: Afton to Hidalgo (New Build Section). Under the Proponent-Proposed Action, the agencies considered 4 route segments that would cover about 146.9 miles between the Afton and Hidalgo substations. Under the Proponent Alternative, a southern alternative along the international border, the agencies considered 8 route segments that cover about 141.1 miles. A total of five local routing alternatives were considered for this route group. The route group crosses portions of Doña Ana, Luna, and Hidalgo Counties in New Mexico.

Route Group 2: Hidalgo to Apache (New Build Section). Under the Proponent-Proposed Action, the agencies considered nine route segments that would cover about 95.5 miles between the Hidalgo and Apache substations. Under the Proponent Alternative, the agencies considered seven route segments that altogether cover about 95.9 miles. A total of eight local routing alternatives were considered for this route group. The route group crosses portions of Hidalgo County in New Mexico and Cochise, Greenlee, and Graham Counties in Arizona.

Route Group 3: Apache to Pantano (Upgrade Section). Under the Proponent-Proposed Action, the agencies considered four route segments that would cover about 70.3 miles of the existing Western transmission line between Apache and Pantano substations. One local routing alternative was considered for this route group. The route group crosses portions of Cochise and Pima Counties in Arizona.

Route Group 4: Pantano to Saguaro (Upgrade Section). Under the Proponent-Proposed Action, the agencies considered 13 route segments that would cover about 48.3 miles of the existing Western transmission line

between Pantano and Saguaro substations. A total of 10 local routing alternatives were considered for this route group. The route group crosses portions of Pima and Pinal counties in Arizona.

The Draft EIS also considers two substation alternatives (Midpoint North and Midpoint South) proposed by Southline; they are options for the location of the proposed Midpoint Substation located within Route Group 1. Both alternative locations would be in Luna County, New Mexico.

The BLM and Western Agency-Preferred Alternative for the New Build Section consists of a combination of the Proponent-Proposed Action, Proponent Alternative, and agency local alternative segments within Route Groups 1 and 2. The route was selected by the BLM and Western as the Agency-Preferred Alternative because it would maximize use of existing and linear ROWs by paralleling existing and proposed infrastructure and transmission lines; eliminate the need for plan amendments through conformance with existing land use plans; minimize impacts to military operations at and near the Willcox Playa; and minimize impacts to sensitive resources.

The Agency-Preferred Alternative for the Upgrade Section consists of a combination of Proponent-Proposed Action and local alternatives at Tumamoc Hill, and near the Marana Airport, within Route Groups 3 and 4. The route was selected because it would maximize the use of the existing ROW and facilities currently used for Western's Saguaro-Tucson and Tucson-Apache 115-kV transmission lines; minimize impacts to sensitive resources at Tumamoc Hill; and minimize impacts to military training operations at the Marana Airport.

The BLM, Western, Southline, and cooperating agencies worked together to identify routes that would conform to existing BLM land use plans. However, this objective was not reached for all of the routes analyzed in the Draft EIS. A plan amendment for the Mimbres RMP may be required to bring the proposed Project into conformance, depending on the final route selected. The prospective plan amendment will comply with applicable Federal laws and regulations, be analyzed in the Final EIS, and apply only to Federal land administered by the BLM.

Potential changes to the Mimbres RMP would include:

- An amendment may be needed to change the visual resource management (VRM) Class II to a Class III or IV for segments that intersect VRM Class II lands.

- An amendment may be needed for the portion of the alternative route segment that parallels an avoidance area designated for the Butterfield Trail.

The BLM and Western will use and coordinate the NEPA comment period to assist the agencies in satisfying the public involvement requirements under Section 106 of the National Historic Preservation Act (16 U.S.C. 470(f)), as provided for in 36 CFR 800.2(d)(3). In accordance with policy, the BLM will continue to conduct Native American tribal consultations on tribal concerns such as impacts on Indian trust assets. Federal, State, and local agencies, along with other stakeholders that may be interested or affected by the BLM's and Western's decisions on this proposed Project, are invited to participate in the public comment process.

The BLM and Western have determined that public hearings to solicit comments on the Draft EIS and Draft RMP Amendment are necessary. Accordingly, the BLM and Western invite all interested parties to participate in the public hearings held throughout southern New Mexico and Arizona. Interested parties are invited to present oral statements at the hearings. For information on facilities or services for persons with disabilities or to request special assistance at the hearing, contact Ellen Carr at 480-629-4705 or email ellen.carr@galileoaz.com or in writing at 4700 South McClintock Drive, Tempe, AZ 85282, at least 5 business days before the date of the hearing. The hearings will be conducted in accordance with 455 DM 1 and the BLM NEPA Handbook by a representative designated by the BLM.

Please note that public comments and information submitted including names, street addresses, and email addresses of persons who submit comments will be available for public review and disclosure at the above address during regular business hours (8 a.m. to 4 p.m.), Monday through Friday, except holidays.

Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time. While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

Authority: 40 CFR 1506.6, 40 CFR 1506.10, 43 CFR 1610.2.

Jesse J. Juen,
State Director, New Mexico.

Mark A. Gabriel,
Administrator, Western Area Power Administration.

BILLING CODE 4310-FB-P

DEPARTMENT OF THE INTERIOR

Bureau of Land Management

[LLCAD07000; L16100000.DU0000;
14XL1109AF]

Notice of Intent To Prepare an Environmental Assessment and an Associated Land Use Plan Amendment To Close the Airport Mesa Target Shooting Area, Imperial, CA

AGENCY: Bureau of Land Management, Interior.

ACTION: Notice of Intent.

SUMMARY: In compliance with the National Environmental Policy Act (NEPA) of 1969, as amended, and the Federal Land Policy and Management Act (FLPMA) of 1976, as amended, the Bureau of Land Management (BLM) El Centro Field Office, California, intends to prepare an Environmental Assessment (EA) to consider amending the Eastern San Diego County (ESDC) Resource Management Plan (RMP) to close the Airport Mesa to recreational target shooting. This notice announces the beginning of the scoping process to solicit public comments and identify issues.

DATES: Comments on issues may be submitted in writing until May 12, 2014. The date(s) and location(s) of any scoping meetings will be announced at least 15 days in advance through local media, newspapers and the BLM Web site at: <http://www.blm.gov/ca/st/en/fo/elcentro.html>. In order to be included in the analysis, all comments must be received prior to the close of the 30-day scoping period or 30 days after the last public meeting, whichever is later. The BLM will provide additional opportunities for public participation as appropriate.

ADDRESSES: You may submit comments on issues and planning criteria related to the proposed Airport Mesa target shooting closure by any of the following methods:

- Web site: <http://www.blm.gov/ca/st/en/fo/elcentro.html>.
- Email: ngaddis@blm.gov.
- Fax: 760-337-4490.

- Mail: BLM El Centro Field Office, Attn: Nicollee Gaddis, 1661 S. 4th Street, El Centro, CA 92243.

Documents pertinent to this proposal may be examined at the El Centro Field Office at the above address.

FOR FURTHER INFORMATION CONTACT: Nicollee Gaddis, BLM Planning and Environmental Coordinator; telephone 760-337-4427; address 1661 S. 4th Street, El Centro, CA 92243; or email ngaddis@blm.gov. Contact Ms. Gaddis if you wish to add your name to our mailing list. Persons who use a telecommunications device for the deaf (TDD) may call the Federal Information Relay Service (FIRS) at 1-800-877-8339 to contact Ms. Gaddis during normal business hours. The FIRS is available 24 hours a day, 7 days a week, to leave a message or question for Ms. Gaddis. You will receive a reply during normal business hours.

SUPPLEMENTARY INFORMATION: This publication provides notice that the BLM El Centro Field Office, El Centro, California, intends to prepare an amendment to the 2008 ESDC RMP and an associated EA; announces the beginning of the scoping process; and seeks public input on issues and planning criteria. Airport Mesa is located in Eastern San Diego County, east of the town of Jacumba, south of U.S. Highway 80. The area described as the Airport Mesa/Carrizo Creek shooting area covers approximately 210 acres along the eastern slope of Airport Mesa.

San Bernardino Base and Meridian (SBBM)

Township 18 South, Range 8 East,
Section 3, S $\frac{1}{2}$ SW $\frac{1}{4}$ SE $\frac{1}{4}$ and S $\frac{1}{2}$ SE $\frac{1}{4}$ SE $\frac{1}{4}$
(20 acres, more or less);
Section 10, Lot 9 (17.15 acres); N $\frac{1}{2}$ NE $\frac{1}{4}$
(80 acres); SE $\frac{1}{4}$ NE $\frac{1}{4}$ (40 acres);
Section 11, Lot 12 (13.05 acres);
SW $\frac{1}{4}$ NW $\frac{1}{4}$ (40 acres).

The Secure Border Initiative (SBI) congressionally authorized and funded the California Border Patrol (U.S. Border Patrol) to increase its presence along the US/Mexico Border to improve our national security. The U.S. Border patrol has indicated that the Airport Mesa area is critical to its efforts to protect this area because the high elevation of the mesa gives agents the ability to monitor the nearby valleys for illegal activities. As part of this effort to increase its effectiveness in this area, the U.S. Border Patrol has constructed pedestrian and vehicle border barriers, as well as roads for access and maintenance. One of these access roads traverses the east slope of Airport Mesa. The U.S. Border Patrol now uses the top of the mesa as a vantage point to monitor this area. The Airport Mesa area

has historically been an important recreational shooting area for residents of San Diego and Imperial Counties. The eastern slope of the mesa is easily accessible and provides a safe back-stop for target shooting. The U.S. Border Patrol's new access road crosses this eastern slope and is within the line-of-fire for recreational target shooters. This has created an unsafe situation, subjecting U.S. Border Patrol agents to the dangers of stray bullets or ricochets.

Since construction of the road in October 2009, the U.S. Border Patrol has worked to inform shooters of the dangers associated with shooting in this area and has requested that shooters move elsewhere to shoot. On August 18, 2009, the U.S. Border Patrol issued a letter to the BLM requesting that the BLM formally close Airport Mesa to target shooting in order to protect its agents in the area.

A temporary closure has been in place since October 2009. This proposal for an area closure would initiate a land use plan amendment to the ESDC RMP with an associated EA. The plan amendment would be limited to closure of target shooting only and not consider use restriction of approved hunting or hiking in the area.

The purpose of the public scoping process is to determine relevant issues that will influence the scope of the EA, including alternatives, and guide the process for developing the EA.

You may submit comments on issues and planning criteria in writing to the BLM at any public scoping meeting, or you may submit them to the BLM using one of the methods listed in the **ADDRESSES** section above. To be most helpful, you should submit comments by the close of the 30-day scoping period.

A preliminary list of the potential planning criteria that will be used to help guide and define the scope of the plan amendment includes:

1. The plan amendment will be completed in compliance with FLPMA, NEPA, and all other relevant Federal laws, executive orders, and BLM policies;
2. Existing valid plan decisions will not be changed and any new plan decisions will not conflict with existing plan decisions; and
3. The plan amendment(s) will recognize valid existing rights.

The BLM will evaluate identified issues to be addressed in the plan amendment and will place them into one of three categories:

1. Issues to be resolved in the plan amendment;
2. Issues to be resolved through policy or administrative action; or

3. Issues beyond the scope of this plan amendment.

The BLM will provide an explanation in the Scoping Report or the EA as to why an issue was placed in category two or three. The public is also encouraged to help identify any management questions and concerns that should be addressed in the plan. The BLM will work collaboratively with interested parties to identify the management decisions that are best suited to local, regional, and national needs and concerns.

The BLM will use the NEPA public participation requirements to assist the agency in satisfying the public involvement requirements under Section 106 of the National Historic Preservation Act (NHPA) (16 U.S.C. 470(f)) pursuant to 36 CFR 800.2(d)(3). The information about historic and cultural resources within the area potentially affected by the proposed action will assist the BLM in identifying and evaluating impacts to such resources in the context of both NEPA and Section 106 of the NHPA.

The BLM will consult with Indian tribes on a government-to-government basis in accordance with Executive Order 13175 and other policies. Tribal concerns, including impacts on Indian trust assets and potential impacts to cultural resources, will be given due consideration. Federal, State, and local agencies, along with tribes and other stakeholders that may be interested in or affected by the proposed action that the BLM is evaluating, are invited to participate in the scoping process and, if eligible, may request or be requested by the BLM to participate in the development of the environmental analysis as a cooperating agency.

Authority: 40 CFR 1501.7 and 43 CFR 1610.2.

Thomas F. Zale,

Field Manager, El Centro Field Office.

BILLING CODE 4312-51-P

INTERNATIONAL TRADE COMMISSION

[Investigation No. 337-TA-861/867]

Certain Cases for Portable Electronic Devices; Commission Determination Not To Review an Initial Determination Granting Complainant's Motion for Summary Determination of Violation by the Defaulting Respondents; Request for Written Submissions

AGENCY: U.S. International Trade Commission.

ACTION: Notice.

SUMMARY: Notice is hereby given that the U.S. International Trade Commission has determined not to review the presiding administrative law judge's ("ALJ") initial determination ("ID") (Order No. 28) granting summary determination that the following defaulting respondents have violated section 337: Anbess Electronics Co. Ltd. of Shenzhen, China ("Anbess"); ROCON Digital Technology Corp. of Shenzhen, China ("Rocon"); Trait Technology (Shenzhen) Co., Ltd. (d/b/a Trait-Tech) of Shenzhen, China ("Trait"); Hongkong Wexun Ltd. (Wexun Tech (Hong Kong) Co., Ltd.) of Guangdong, China ("Wexun"); SW-Box.com (*aka* Cellphonezone Limited) of Sheung Wan, Hong Kong ("SW-Box"); and Global Digital Star Industry, Ltd. of Shenzhen City, China ("Global").

FOR FURTHER INFORMATION CONTACT: Panyin A. Hughes, Office of the General Counsel, U.S. International Trade Commission, 500 E Street SW.,

Washington, DC 20436, telephone (202) 205-3042. Copies of non-confidential documents filed in connection with this investigation are or will be available for inspection during official business hours (8:45 a.m. to 5:15 p.m.) in the Office of the Secretary, U.S. International Trade Commission, 500 E Street, SW., Washington, DC 20436, telephone (202) 205-2000. General information concerning the Commission may also be obtained by accessing its Internet server at <http://www.usitc.gov>. The public record for this investigation may be viewed on the Commission's electronic docket (EDIS) at <http://edis.usitc.gov>. Hearing-impaired persons are advised that information on this matter can be obtained by contacting the Commission's TDD terminal on (202) 205-1810.

SUPPLEMENTARY INFORMATION: The Commission instituted Inv. No. 337-TA-861 on November 16, 2012, based on a complaint filed by Speculative Product Design, LLC of Mountain View, California ("Speck"). 77 FR 68828 (Nov. 16, 2012). The complaint alleged violations of section 337 of the Tariff Act of 1930, as amended, (19 U.S.C. 1337) in the importation into the United States, the sale for importation, and the sale within the United States after importation of certain cases for portable electronic devices by reason of infringement of various claims of United States Patent No. 8,204,561 ("the '561 patent"). The complaint named several respondents.

The Commission instituted Inv. No. 337-TA-867 on January 31, 2013, based on a complaint filed by Speck. 78 FR 6834 (Jan. 31, 2013). That complaint also alleged violations of section 337 of the Tariff Act of 1930 (19 U.S.C. 1337) in the importation into the United States, the sale for importation, and the sale within the United States after importation of certain cases for portable electronic devices by reason of infringement of various claims of the '561 patent. The complaint named several additional respondents. On January 31, 2013, the Commission consolidated the two investigations. *Id.*

All of the respondents that participated in the investigation have been terminated from the investigation. Specifically, respondents JWIN Electronics Corp., dba iLuv of Port Washington, New York and Fellowes, Inc. of Itsaca, Illinois were terminated from the investigation based upon settlement agreements. Respondents Project Horizon, Inc., d/b/a/InMotion Entertainment of Jacksonville, Florida and En Jinn Industrial Co., Ltd. of New Taipei City, Taiwan were terminated

from the investigation based upon consent order stipulations. Respondents Superior Communications, Inc. of Irwindale, California and Shengda Huanqiu Shijie of Shenzhen, China were terminated from the investigation based upon withdrawal of allegations pertaining to them from the complaint. Respondent Jie Sheng Technology of Tainan City, Taiwan was terminated from the investigation based upon amendment to the complaint and notice of investigation. Respondent Body Glove International, LLC of Redondo Beach, California was terminated from the investigation based upon a finding that it had committed no acts in violation of section 337.

The following respondents were found in default: Anbess, Rocon, Trait, Wexun, SW-Box, and Global. Accordingly, the only parties remaining active in this investigation are Speck and the Commission investigative attorney ("IA").

On August 19, 2013, Speck filed a motion for summary determination that it has satisfied the domestic industry requirement under sections 337(a)(3)(A), (B), and (C) (not including licensing). On August 19, 2013, the IA filed a response in support of Speck's motion that it has satisfied the domestic industry requirement under section 337(a)(3)(C). On September 10, 2013, the ALJ issued an ID (Order No 15) granting Speck's motion in part. Specifically, the ALJ found that Speck established a domestic industry for the '561 patent under section 337(a)(3)(C). On October 23, 2013, the Commission determined not to review the ID.

On September 30, 2013, the ALJ granted a motion by Speck to terminate the investigation as to claims 1-3, 6-8, 10, and 12-16 of the '561 patent. On November 11, 2013, the Commission determined not to review. Thus, claims 4, 5, 9, and 11 remain pending in the investigation.

On November 15, 2013, Speck filed a motion for summary determination of violation with respect to the defaulting respondents. On November 26, 2013, the IA filed a response in support of Speck's motion. On February 21, 2014, the presiding ALJ issued the subject ID, Order No. 28, granting the motion. He also recommended issuance of a general exclusion order and the imposition of a bond of 100 percent of entered value during the period of Presidential review.

Having considered the subject ID and the relevant portions of the record, the Commission has determined not to review the ID based on the substantial, reliable, and probative evidence establishing a violation by the defaulting respondents.

In connection with the final disposition of this investigation, the Commission may (1) issue an order that could result in the exclusion of the subject articles from entry into the United States, and/or (2) issue one or more cease and desist orders that could result in the respondent being required to cease and desist from engaging in unfair acts in the importation and sale of such articles. Accordingly, the Commission is interested in receiving written submissions that address the form of remedy, if any, that should be ordered. If a party seeks exclusion of an article from entry into the United States for purposes other than entry for consumption, the party should so indicate and provide information establishing that activities involving other types of entry either are adversely affecting it or likely to do so. For background, see *Certain Devices for Connecting Computers via Telephone Lines*, Inv. No. 337-TA-360, USITC Pub. No. 2843 (December 1994) (Commission Opinion).

If the Commission contemplates some form of remedy, it must consider the effects of that remedy upon the public interest. The factors the Commission will consider include the effect that an exclusion order and/or cease and desist orders would have on (1) the public health and welfare, (2) competitive conditions in the U.S. economy, (3) U.S. production of articles that are like or directly competitive with those that are subject to investigation, and (4) U.S. consumers. The Commission is therefore interested in receiving written submissions that address the aforementioned public interest factors in the context of this investigation.

If the Commission orders some form of remedy, the U.S. Trade Representative, as delegated by the President, has 60 days to approve or disapprove the Commission's action. See Presidential Memorandum of July 21, 2005. 70 FR 43251 (July 26, 2005). During this period, the subject articles would be entitled to enter the United States under bond, in an amount determined by the Commission and prescribed by the Secretary of the Treasury. The Commission is therefore interested in receiving submissions concerning the amount of the bond that should be imposed if a remedy is ordered.

Written Submissions: Parties to the investigation, interested government agencies, and any other interested parties are encouraged to file written submissions on the issues of remedy, the public interest, and bonding. Complainant and the Commission investigative attorney are also requested

to submit proposed remedial orders for the Commission's consideration. Complainant is also requested to state the date on which the '561 patent expires and the HTSUS subheadings under which the accused products are imported.

Written submissions must be filed no later than close of business on April 23, 2014. Reply submissions must be filed no later than the close of business on April 30, 2014. Such submissions should address the ALJ's recommended determinations on remedy and bonding which were made in Order No. 28. No further submissions on any of these issues will be permitted unless otherwise ordered by the Commission.

Persons filing written submissions must file the original document electronically on or before the deadlines stated above and submit eight true paper copies to the Office of the Secretary by noon the next day pursuant to section 210.4(f) of the Commission's Rules of Practice and Procedure (19 CFR 210.4(f)). Submissions should refer to the investigation number ("Inv. No. 337-TA-861/867") in a prominent place on the cover page and/or the first page. (See Handbook for Electronic Filing Procedures, http://www.usitc.gov/secretary/fed_reg_notices/rules/handbook_on_electronic_filing.pdf). Persons with questions regarding filing should contact the Secretary (202-205-2000).

Any person desiring to submit a document to the Commission in confidence must request confidential treatment. All such requests should be directed to the Secretary to the Commission and must include a full statement of the reasons why the Commission should grant such treatment. See 19 CFR 201.6. Documents for which confidential treatment by the Commission is properly sought will be treated accordingly. A redacted non-confidential version of the document must also be filed simultaneously with the any confidential filing. All non-confidential written submissions will be available for public inspection at the Office of the Secretary and on EDIS.

The authority for the Commission's determination is contained in section 337 of the Tariff Act of 1930, as amended (19 U.S.C. 1337), and in Part 210 of the Commission's Rules of Practice and Procedure (19 CFR Part 210).

By order of the Commission.

Issued: April 8, 2014.

Lisa R. Barton,

Acting Secretary to the Commission.

[FR Doc. 2014-08164 Filed 4-10-14; 8:45 am]

BILLING CODE 7020-02-P

INTERNATIONAL TRADE COMMISSION

[Investigation Nos. 731-TA-1140-1142 (Review)]

Uncovered Innerspring Units from China, South Africa, and Vietnam

Determinations

On the basis of the record¹ developed in the subject five-year reviews, the United States International Trade Commission (Commission) determines,² pursuant to section 751(c) of the Tariff Act of 1930 (19 U.S.C. 1675(c)), that revocation of the antidumping duty orders on uncovered innerspring units from China, South Africa, and Vietnam would be likely to lead to continuation or recurrence of material injury to an industry in the United States within a reasonably foreseeable time.

Background

The Commission instituted these reviews on November 1, 2013 (78 FR 65711) and determined on February 4, 2014 that it would conduct expedited reviews (79 FR 11466, February 28, 2014).

The Commission completed and filed its determinations in these reviews on April 7, 2014.³ The views of the Commission are contained in USITC Publication 4459 (April 2014), entitled *Uncovered Innerspring Units from China, South Africa, and Vietnam: Investigation Nos. 731-TA-1140-1142 (Review)*.

By order of the Commission.

Issued: April 8, 2014.

Lisa R. Barton,

Acting Secretary to the Commission.

[FR Doc. 2014-08161 Filed 4-10-14; 8:45 am]

BILLING CODE 7020-02-P

¹ The record is defined in sec. 207.2(f) of the Commission's Rules of Practice and Procedure (19 CFR 207.2(f)).

² Commissioner Shara L. Aranoff did not participate in these reviews.

³ The Commission has the authority to toll statutory deadlines during a period when the government is closed. Because the Commission was closed on December 10, 2013, January 21, 2014, February 13, 2014, March 10, 2014, and March 17, 2014 due to inclement weather in Washington, DC, the statutory deadlines reflect the tolling of deadlines by five days.

DEPARTMENT OF JUSTICE

[OMB Number 1121-NEW]

Agency Information Collection Activities; Proposed eCollection eComments Requested; New Collection; 2014 Census of Adult Probation Supervising Agencies

AGENCY: Bureau of Justice Statistics, Department of Justice.

ACTION: 30-day notice.

SUMMARY: The Department of Justice (DOJ), Office of Justice Programs, will be submitting the following information collection to the Office of Management and Budget (OMB) for review and approval in accordance with the Paperwork Reduction Act of 1995. The proposed information collection was previously published in the **Federal Register** Volume 79, Number 27, pages 7701-7702, on February 10, 2014, allowing a 60-day comment period.

DATES: Comments are encouraged and will be accepted for "thirty days" until May 12, 2014.

FOR FURTHER INFORMATION CONTACT:

Written comments and/or suggestions regarding the items contained in this notice, especially the estimated public burden or associated response time, should be directed to the Office of Management and Budget, Office of Information and Regulatory Affairs, Attention Department of Justice Desk Officer, Washington, DC 20503 or send to OIRA_submission@omb.eop.gov.

SUPPLEMENTARY INFORMATION: This process is conducted in accordance with 5 CFR 1320.10. Request written comments and suggestions from the public and affected agencies concerning the proposed collection of information are encouraged. Your comments should address one or more of the following four points:

- Evaluate whether the collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility;
- Evaluate the accuracy of the agency's estimate of the burden of the collection of information, including the validity of the methodology and assumptions used;
- Enhance the quality, utility and clarity of the information to be collected; and
- Minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology, e.g.

permitting electronic submission of responses.

Overview of This Information Collection:

(1) *Type of Information Collection:* New Collection. While the Bureau of Justice Statistics conducted a census of probation and parole agencies in 1991, the 2014 Census of Adult Probation Supervising Agencies is now a standalone collection. This collection's scope is narrower and only includes adult probation agencies. The scope of the 1991 census was broader and included both adult probation and parole agencies.

(2) *Title of the Form/Collection:* 2014 Census of Adult Probation Supervising Agencies.

(3) *Agency form number:* CAPSA-AIF is the Agency Information Form (AIF) for public agencies, CAPSA-CIF is the Company Information Form (CIF) for private probation companies, CAPSA-1A is the questionnaire for public probation agencies, and CAPSA-1B is the questionnaire for private probation companies.

(4) *Affected public who will be asked to respond, as well as a brief abstract:* *Primary:* State or local government. *Other:* Federal government or private companies. The primary goals of the work under this clearance are to: (1) Enhance and validate a national roster of probation agencies that supervise adults on probation for a felony (or those that supervise felons and misdemeanants) and private companies that directly supervise adult probationers; and (2) collect information from those agencies to report national and state-level statistics that provide a clear understanding of how adult probation in the United States is currently organized, the supervision policies and practices agencies have established to administer adult probation, the various types of functions adult probation agencies perform, and the different types of individuals supervised by adult probation agencies. The Bureau of Justice Statistics will use this information in published reports and for the U.S. Congress, Executive Office of the President, practitioners, researchers, students, the media, and others interested in community corrections statistics.

All agencies and companies that are believed to supervise adult probationers are on a preliminary roster that BJS, Westat, and the American Probation and Parole Association (APPA) developed by reviewing and compiling data and information from various available resources. (Westat and APPA are the data collection agents for the 2014

CAPSA) The CAPSA-AIF or CAPSA-CIF will be mailed to the head of each agency/company on the preliminary roster and the head of the agency/company will be asked to confirm the contact information for the agency/company and designate a respondent to complete the CAPSA questionnaire. Agency/company heads will be asked to fax, email, or mail the AIF or CIF to Westat. Designated respondents from public probation agencies will receive the CAPSA-1A questionnaire and will be asked to report via the Internet through a web survey with telephone reporting as a secondary mode. Designated respondents from private probation companies will receive the CAPSA-1B questionnaire and will be asked to return the paper questionnaire by fax, email, or mail. Telephone will also serve as a secondary mode of data collection for private probation companies.

The CAPSA-1A will collect information from public probation agencies about their branch and level of government, the various functions they perform, the policies and practices they have in place to administer adult probation related to both adult probationers and the community corrections officers that supervise them, the extent to which agencies have supervision authority, the various populations they serve, the size of their adult probation population, the use of and number of adult probationers held in community-based correctional facilities, and funding sources for adult probation. In an effort to validate the roster of probation agencies and companies, respondents will also be asked to review a list of public probation agencies in their state to identify any that may be missing from the list. They will also be asked to report any private probation companies that supervise adult probationers in their state.

The CAPSA-1B will collect information from private probation companies about the various functions they perform, the number of states for which they supervise adult probationers, the branches and levels of government from which they receive adult probationers to supervise, the extent to which any governmental entity conducts oversight of their supervision activities, the various populations they serve, the size of their adult probation population, and the practices and methods they use to administer adult probation.

Both the CAPSA-1A and CAPSA-1B questionnaires will include questions to confirm that the agencies/companies supervise adult probationers and are

therefore correctly included on the roster and fall within the scope of the CAPSA. In addition, because the organization of adult probation varies drastically not only by state but within particular states, as part of the work under this clearance to enhance and validate the roster of adult probation agencies and companies, one informant in each state, the District of Columbia, and the Federal system will be asked to complete a telephone interview. These contacts are necessary to assist in: (1) Identifying any agencies that may be missing or should be removed from the roster (e.g., agencies that are no longer in operation); (2) updating information contained in the resources that have been used to develop the preliminary roster since some of the source material was only available from publications that were published 5 to 10 years ago; and (3) resolving questions about how probation is organized in the jurisdiction that stem from differences in the way probation in particular jurisdictions has been described in some of the materials used to develop the preliminary roster.

(5) *An estimate of the total number of respondents and the amount of time needed for an average respondent to respond:*

(a) CAPSA-AIF form: Approximately 1,760 respondents, each taking an average of 5 minutes to respond with 2 minutes of follow-up.

(b) CAPSA-CIF form: Approximately 204 respondents, each taking an average of 5 minutes to respond with 2 minutes of follow-up.

(c) CAPSA-1A form: Approximately 1,760 respondents, each taking an average of 65 minutes to respond with 10 minutes of follow-up.

(d) CAPSA-1B form: Approximately 204 respondents, each taking an average of 30 minutes to respond with 5 minutes of follow-up.

(e) 52 telephone calls to informants in each jurisdiction, each taking an average of 30 minutes with 5 minutes of follow-up.

(6) *An estimate of the total public burden (in hours) associated with the collection:* 2,578 total burden hours.

If additional information is required contact: Jerri Murray, Department Clearance Officer, United States Department of Justice, Justice Management Division, Policy and Planning Staff, Two Constitution Avenue, 145 N Street NE., Room 3E.405B, Washington, DC 20530.

Dated: April 8, 2014.

Jerri Murray,

Department Clearance Officer for PRA, U.S. Department of Justice.

[FR Doc. 2014-08175 Filed 4-10-14; 8:45 am]

BILLING CODE 4410-18-P

DEPARTMENT OF JUSTICE

[OMB Number 1110-0021]

Proposed eCollection, eComments Requested; Approval for a Revised Collection; FBI National Academy Post-Graduate Questionnaires, FBI National Academy Post-Graduate Questionnaire for Graduates, FBI National Academy Post-Graduate Questionnaire for Supervisors of Graduates

AGENCY: Training Division, Federal Bureau of Investigation, Department of Justice.

ACTION: 30-day notice.

SUMMARY: The Department of Justice (DOJ), Federal Bureau of Investigation (FBI), Training Division's Curriculum Management Section (CMS) will be submitting the following information collection request to the Office of Management and Budget (OMB) for review and approval in accordance with the Paperwork Reduction Act of 1995. The proposed information collection is published to obtain comments from the public and affected agencies. This proposed information collection was previously published in the **Federal Register** Volume, Number 23, page 6628, on February 4, 2014, allowing for a 60 day comment period.

DATES: Comments are encouraged and will be accepted for 30 days until May 12, 2014.

FOR FURTHER INFORMATION CONTACT: If you have comments (especially on the estimated public burden or associated response time), suggestions, or need a copy of the proposed information collection instrument with instructions or additional information, please contact *Keith Shirley, Unit Chief, Evaluation and Accreditation Unit, Training Division, Federal Bureau of Investigation, Quantico, Virginia 22135*. Written comments and/or suggestions can also be directed to the Office of Management and Budget, Office of Information and Regulatory Affairs, Attention Department of Justice Desk Officer, Washington, DC 20503 or send to *OIRA_submission@omb.eop.gov*.

SUPPLEMENTARY INFORMATION: This process is conducted in accordance with 5 CFR 1320.10. Written comments and suggestions from the public and affected

agencies concerning the proposed collection of information are encouraged. Your comments should address one or more of the following three points:

(1) Evaluate whether the proposed collection of information is necessary for the proper performance of the functions of the agency/component, including whether the information will have practical utility;

(2) Evaluate the accuracy of the agency's/component's estimate of the burden of the proposed collection of the information, including the validity of the methodology and assumptions used;

(3) Enhance the quality, utility, and clarity of the information to be collected; and

(4) Minimize the burden of the collection of information on those who are to respond, including the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology, e.g., permitting electronic submission of responses.

Overview of This Information

1. *Type of Information Collection:* Approval of a Revised Collection.

2. *Title of the Forms:*

FBI National Academy Post-Graduate Questionnaire for Graduates.

FBI National Academy Post-Graduate Questionnaire for Supervisors of Graduates.

3. *Agency Form Number, if any, and the applicable component of the department sponsoring the collection:*

Form Number: 1110-0021.

Sponsor: Training Division of the Federal Bureau of Investigation (FBI), Department of Justice (DOJ).

4. *Affected Public who will be asked or required to respond, as well as a brief abstract:*

Primary: FBI National Academy graduates and their identified supervisors represents state and local police departments, sheriffs' departments, military police organizations, and federal law enforcement agencies from the United States and over 150 foreign nations.

Brief Abstract: This collection is requested by FBI National Academy. These questionnaires have been designed to collect feedback from FBI National Academy students regarding their courses and instructors. The results are used to help determine if the FBI National Academy program is functioning as intended and meeting its goals and objectives. We will utilize the students' comments to improve the current curriculum.

5. *An estimate of the total number of respondents and the amount of time*

estimated for an average respondent to respond:

Approximately 1,000 FBI National Academy graduates per year will respond to the FBI National Academy Post-Graduate Questionnaire for Graduates. It is predicted that we will receive a 50% response rate. The average response time for reading the questionnaire directions for the FBI National Academy Post-Graduate Questionnaire for Graduates is estimated to be two (2) minutes; time to complete the questionnaire is estimated to be 30 minutes. Thus the total time to complete the Post-Graduate Questionnaire for Graduates is 32 minutes.

There are approximately 1,000 FBI National Academy graduates who have identified their supervisors that will respond to the FBI National Academy Post-Graduates Questionnaire for Supervisors of Graduates. It is predicted that we will receive a 50% response rate. The average response time for reading the directions for the FBI National Academy Post-Graduate Questionnaire for Supervisors of Graduates is estimated to be 2 minutes; time to complete the questionnaire is estimated to be 30 minutes. Thus the total time to complete the Post-Graduate Questionnaire for Supervisors for Graduates is 32 minutes.

The total estimated time to complete each questionnaire per respondent for each group is 32 minutes.

6. *An estimate of the total public burden (in hours) associated with the collection:*

Given that approximately 50% of those surveyed (or 500 from each group) will respond, the total public burden for completing questionnaires is 533 hours.

For additional information, contact: Jerri Murray, Department Clearance Officer, United States Department of Justice, Policy and Planning Staff, Justice Management Division, Two Constitution Square, 145 N Street NE., Room 3E-405B, Washington, DC 20530.

Dated: April 8, 2014.

Jerri Murray,

Department Clearance Officer for PRA, United States Department of Justice.

BILLING CODE 4410-02-P

DEPARTMENT OF JUSTICE

[OMB Number 1110-0050]

Agency Information Collection Activities; Proposed eCollection Comments Requested; Approval for a Revised Collection; FBI National Academy: End-of-Session Questionnaires, FBI National Academy: End-of-Session Student Course Questionnaire, FBI National Academy: General Remarks Questionnaire**AGENCY:** Training Division, Federal Bureau of Investigation, Department of Justice.**ACTION:** 30-day notice.

SUMMARY: The Department of Justice (DOJ), Federal Bureau of Investigation (FBI), Training Division's Curriculum Management Section (CMS) will be submitting the following information collection request to the Office of Management and Budget (OMB) for review and approval in accordance with the Paperwork Reduction Act of 1995. The proposed information collection is published to obtain comments from the public and affected agencies. This proposed information collection was previously published in the **Federal Register** Volume 79, Number 23, page 6629, on February 4, 2014, allowing for a 60 day comment period.

DATES: The purpose of this notice is to allow for an additional 30 days for public comments until May 12, 2014.

FOR FURTHER INFORMATION CONTACT: If you have comments (especially on the estimated public burden or associated response time), suggestions, or need a copy of the proposed information collection instrument with instructions or additional information, please contact Keith Shirley, Unit Chief, Evaluation and Accreditation Unit, Training Division, FBI Academy, Federal Bureau of Investigation, Quantico, Virginia 22135. Written comments and/or suggestions can also be directed to the Office of Management and Budget, Office of Information and Regulatory Affairs, Attention Department of Justice Desk Officer, Washington, DC 20530, or send to OIRA_submission@omb.eop.gov.

SUPPLEMENTARY INFORMATION: This process is conducted in accordance with 5 CFR 1320.10. Written comments and suggestions from the public and affected agencies concerning the proposed collection of information are encouraged. Your comments should address one or more of the following:

(1) Evaluate whether the proposed collection of information is necessary

for the proper performance of the function of the agency/component, including whether the information will have practical utility;

(2) Evaluate the accuracy of the agency's/component's estimate of the burden of the proposed collection of the information, including the validity of the methodology and assumptions used;

(3) Enhance the quality, utility, and clarity of the information to be collected; and

(4) Minimize the burden of the collection of information on those who are to respond, including the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology, e.g., permitting electronic submission of responses.

Overview of This Information

1. *Type of Information Collection:* Approval of a Revised Collection.

2. *Title of the Forms:*

FBI National Academy: End-of-Session Student Course Questionnaire.
FBI National Academy: General Remarks Questionnaire.

3. *Agency Form Number, if any, and the applicable component of the department sponsoring the collection:*
Form Number: 1110-0050.

Sponsor: Training Division, Federal Bureau of Investigation (FBI), Department of Justice (DOJ).

4. *Affected Public who will be asked or required to respond, as well as a brief abstract:*

Primary: FBI National Academy students that represent state and local police and sheriffs' departments, military police organizations, and federal law enforcement agencies from the United States and over 150 foreign nations.

Brief Abstract: This collection is requested by FBI National Academy. These questionnaires have been designed to collect feedback from National Academy students regarding their courses and instructors. The results are used to help determine if the National Academy program is functioning as intended and meeting its goals and objectives. We will utilize the students' comments to improve the current curriculum.

5. *An estimate of the total number of respondents and the amount of time estimated for an average respondent to respond:*

Approximately 1,000 FBI National Academy students per year will respond to two types of questionnaires. (1) FBI National Academy: End-of-Session Student Course Questionnaire and (2) FBI National Academy: General Remarks Questionnaire. It is predicted

we will receive a 75% response rate for both questionnaires.

Each student will respond to seven Student Course questionnaires—one for each course they completed. The average time for reading the questionnaire directions is estimated to be two (2) minutes; the time to complete each questionnaire is estimated to be approximately 13 minutes. Thus the total time to complete one Student Course questionnaire is 15 minutes and 105 minutes to complete all seven questionnaires.

For the FBI National Academy: General Remarks Questionnaire, students will respond to one questionnaire. The average time for reading the questionnaire directions is estimated to be two (2) minutes; the time to complete the questionnaire is estimated to be approximately 10 minutes. Thus the total time to complete the General Remarks Questionnaire is 12 minutes.

The total estimated time for both questionnaires per respondent is approximately 117 minutes or about 2 hours.

6. *An estimate of the total public burden (in hours) associated with the collection:*

1. Given that the approximately 75% of those surveyed (or 750) will respond, to the total public burden for completing all questionnaires is 1,462.5 hours.

For additional information, contact: Jerri Murray, Department Clearance Officer, United States Department of Justice, Policy and Planning Staff, Justice Management Division, Two Constitution Square, 145 N Street NE., Room 3E.405B, Washington, DC 20530.

Dated: April 8, 2014.

BILLING CODE 4410-02-P

DEPARTMENT OF JUSTICE

[OMB Number 1140-0049]

Agency Information Collection Activities; Proposed eCollection Comments Requested; Application for National Firearms Examiner Academy**AGENCY:** Bureau of Alcohol, Tobacco, Firearms and Explosives, Department of Justice.**ACTION:** 60-Day notice.

SUMMARY: The Department of Justice (DOJ), Bureau of Alcohol, Tobacco,

Firearms and Explosives (ATF), will submit the following information collection request to the Office of Management and Budget (OMB) for review and approval in accordance with the Paperwork Reduction Act of 1995. The proposed information collection is published to obtain comments from the public and affected agencies.

DATES: Comments are encouraged and will be accepted for 60 days until June 10, 2014.

FOR FURTHER INFORMATION CONTACT: If you have additional comments especially on the estimated public burden or associated response time, suggestions, or need a copy of the proposed information collection instrument with instructions or additional information, please contact Sheila Hopkins, Bureau of Alcohol, Tobacco, Firearms and Explosives, National Laboratory Center, 6000 Ammendale Road, Ammendale, MD 20705.

SUPPLEMENTARY INFORMATION: This process is conducted in accordance with 5 CFR 1320.10. Written comments and suggestions from the public and affected agencies concerning the proposed collection of information are encouraged. Your comments should address one or more of the following four points:

- Evaluate whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility;
- Evaluate the accuracy of the agency's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used;
- Evaluate whether and if so how the quality, utility, and clarity of the information to be collected can be enhanced; and
- Minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology, e.g., permitting electronic submission of responses.

Overview of this information collection:

1. *Type of Information Collection:* Revision of an existing collection.
2. *The Title of the Form/Collection:* Application for National Firearms Examiner Academy.
3. *The agency form number, if any, and the applicable component of the Department sponsoring the collection:*

Form number: ATF Form 6330.1.

Component: Bureau of Alcohol, Tobacco, Firearms and Explosives, U.S. Department of Justice.

4. *Affected public who will be asked or required to respond, as well as a brief abstract:*

Primary: State, Local, or Tribal Government.

Other: Federal Government.

Abstract: The information requested on this form is necessary to process requests from prospective students to attend the ATF National Firearms Examiner Academy and to acquire firearms and tool-mark examiner training. The information collection is used to determine the eligibility of the applicant.

5. *An estimate of the total number of respondents and the amount of time estimated for an average respondent to respond:* An estimated 75 respondents will take 12 minutes to complete the form.

6. *An estimate of the total public burden (in hours) associated with the collection:* The estimated annual public burden associated with this collection is 15 hours.

If additional information is required contact: Jerri Murray, Department Clearance Officer, United States Department of Justice, Justice Management Division, Policy and Planning Staff, Two Constitution Square, 145 N Street NE., 3E.405B, Washington, DC 20530.

Dated: April 7, 2014.

BILLING CODE 4410-FY-P

DEPARTMENT OF JUSTICE

[OMB Number 1140-0096]

Agency Information Collection Activities; Proposed eCollection eComments Requested; Environmental Information

AGENCY: Bureau of Alcohol, Tobacco, Firearms and Explosives, Department of Justice.

ACTION: 60-Day notice.

SUMMARY: The Department of Justice (DOJ), Bureau of Alcohol, Tobacco, Firearms and Explosives (ATF), will submit the following information collection request to the Office of Management and Budget (OMB) for review and approval in accordance with the Paperwork Reduction Act of 1995. The proposed information collection is

published to obtain comments from the public and affected agencies.

DATES: Comments are encouraged and will be accepted for 60 days until June 10, 2014.

FOR FURTHER INFORMATION CONTACT: If you have additional comments especially on the estimated public burden or associated response time, suggestions, or need a copy of the proposed information collection instrument with instructions or additional information, please contact Christopher Reeves, Bureau of Alcohol, Tobacco, Firearms and Explosives, Federal Explosives Licensing Center, 244 Needy Road, Martinsburg, WV 25405, Telephone 1-877-283-3352.

SUPPLEMENTARY INFORMATION: This process is conducted in accordance with 5 CFR 1320.10. Written comments and suggestions from the public and affected agencies concerning the proposed collection of information are encouraged. Your comments should address one or more of the following four points:

- Evaluate whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility;
- Evaluate the accuracy of the agency's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used;
- Evaluate whether and if so how the quality, utility, and clarity of the information to be collected can be enhanced; and
- Minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology, e.g., permitting electronic submission of responses.

Overview of This Information Collection

1. *Type of Information Collection:* Extension without change of an existing collection.

2. *The Title of the Form/Collection:* Environmental Information.

3. *The agency form number, if any, and the applicable component of the Department sponsoring the collection:* Form number: ATF Form 5000.29.

Component: Bureau of Alcohol, Tobacco, Firearms and Explosives, U.S. Department of Justice.

4. *Affected public who will be asked or required to respond, as well as a brief*

abstract: Primary: Individual or households.

Other: None.

Abstract: The information will help ATF identify any waste product(s) generated as a result of the operations by the applicant and the disposal of the products. The information will help determine if there is any adverse impact on the environment.

5. *An estimate of the total number of respondents and the amount of time estimated for an average respondent to respond*: An estimated 680 respondents will take 30 minutes to complete the form.

6. *An estimate of the total public burden (in hours) associated with the collection*: The estimated annual public burden associated with this collection is 340 hours.

If additional information is required contact: Jerri Murray, Department Clearance Officer, United States Department of Justice, Justice Management Division, Policy and Planning Staff, Two Constitution Square, 145 N Street NE., 3E.305B, Washington, DC 20530.

Dated: April 7, 2014.

BILLING CODE 4410-FY-P

DEPARTMENT OF LABOR

Employment and Training Administration Program Year (PY) 2014 Workforce Investment Act (WIA) Allotments; PY 2014 Wagner-Peyser Act Final Allotments and PY 2014 Workforce Information Grants

AGENCY: Employment and Training Administration, Labor.

ACTION: Notice.

SUMMARY: This notice announces allotments for PY 2014 for WIA Title I Youth, Adults and Dislocated Worker Activities programs; final allotments for Employment Service (ES) activities under the Wagner-Peyser Act for PY 2014 and Workforce Information Grants allotments for PY 2014.

WIA allotments for States and the State final allotments for the Wagner-Peyser Act are based on formulas defined in their respective statutes. The WIA allotments for the outlying areas are based on a formula determined by the Secretary of Labor (Secretary). As required by WIA section 182(d), on February 17, 2000, a notice of the discretionary formula for allocating PY 2000 funds for the outlying areas (American Samoa, Guam, Marshall Islands, Micronesia, Northern Marianas, Palau, and the Virgin Islands) was published in the **Federal Register** at 65 FR 8236 (Feb. 17, 2000,) which included both the rationale for the formula and methodology. The formula that the Department of Labor (Department) developed for PY 2014 is the same formula as used for PY 2000 and is

described in the section on Youth Activities program allotments. Comments are invited on the formula used to allot funds to the outlying areas.

DATES: Comments on the formula used to allot funds to the outlying areas must be received by May 12, 2014.

ADDRESSES: Submit written comments to the Employment and Training Administration (ETA), Office of Financial Administration, 200 Constitution Avenue NW., Room N-4702, Washington, DC 20210, Attention: Ms. Anita Harvey, email: harvey.anita@dol.gov.

Commenters are advised that mail delivery in the Washington area may be delayed due to security concerns. Hand-delivered comments will be received at the above address. All overnight mail will be considered to be hand-delivered and must be received at the designated place by the date specified above.

Please submit your comments by only one method. The Department will not review comments received by means other than those listed above or that are received after the comment period has closed.

Comments: The Department will retain all comments on this notice and will release them upon request via email to any member of the public. The Department also will make all the comments it receives available for public inspection by appointment during normal business hours at the above address. If you need assistance to review the comments, the Department will provide you with appropriate aids such as readers or print magnifiers. The Department will make copies of this notice available, upon request, in large print, Braille and electronic file. The Department also will consider providing the notice in other formats upon request. To schedule an appointment to review the comments and/or obtain the notice in an alternative format, contact Ms. Harvey using the information provided above. The Department will retain all comments received without making any changes to the comments, including any personal information provided. The Department therefore cautions commenters not to include their personal information such as Social Security Numbers, personal addresses, telephone numbers, and email addresses in their comments; this information would be released with the comment if the comments are requested. It is the commenter's responsibility to safeguard his or her information.

Adult and Dislocated Worker Activities and ES final allotments—Robert Kight at (202) 693-3937; Workforce Information Grant allotments—Anthony Dais at (202) 693-2784. Individuals with hearing or speech impairments may access the telephone numbers above via TTY by calling the toll-free Federal Information Relay Service at 1-877-889-5627 (TTY/TDD).

SUPPLEMENTARY INFORMATION: The Department is announcing WIA allotments for PY 2014 for Youth Activities, Adults and Dislocated Worker Activities, Wagner-Peyser Act PY 2014 final allotments, and PY 2014 Workforce Information Grant allotments. This notice provides information on the amount of funds available during PY 2014 to States with an approved WIA Title I and Wagner-Peyser Act Strategic Plan for PY 2014, and information regarding allotments to the outlying areas.

On January 17, 2014, the Consolidated Appropriations Act, 2014, Pub. L. 113-76 was signed into law ("the Act"). The Act, Division H, Title I, Section 108 of the Act allows the Secretary of Labor (Secretary) to set aside up to 0.5 percent of most operating funds. The evaluation provision is consistent with the Federal government's priority on evidence-based policy and programming and provides important opportunities to expand evaluations and demonstrations in the Department to build solid evidence about what works best. In the past, funds for ETA evaluations and demonstrations were separately appropriated and managed by ETA. This year, that separate authority has been replaced by the set aside provision. Funds are transferred to the Department's Chief Evaluation Office to implement formal evaluations and demonstrations in collaboration with ETA. For 2014, the Secretary has set aside .25 percent of the WIA Adult, Youth and Dislocated Worker program budgets for evaluation. The funding available to the Wagner-Peyser Employment Service and Workforce Information Grant programs was not reduced.

We also have attached tables listing the PY 2014 allotments for programs under WIA Title I Youth Activities (Table A), Adult and Dislocated Workers Employment and Training Activities (Tables B and C, respectively), and the PY 2014 Wagner-Peyser Act final allotments (Table D). We also have attached the PY 2014 Workforce Information Grant table (Table E).

Youth Activities Allotments. The appropriated level for PY 2014 for WIA Youth Activities totals \$820,430,000.

After reducing the appropriation by \$2,261,000 for evaluations, \$818,169,000 is available for Youth Activities. Table A includes a breakdown of the Youth Activities program allotments for PY 2014 and provides a comparison of these allotments to PY 2013 Youth Activities allotments for all States, and outlying areas. Before determining the amount available for States, the total funding available for the outlying areas was reserved at 0.25 percent of the amount appropriated for Youth Activities (after the evaluations set aside). On December 17, 2003, Public Law 108-188, the *Compact of Free Association Amendments Act of 2003* ("the Compact"), was signed into law. The Compact provided for consolidation of WIA Title I funding, for the Marshall Islands and Micronesia into supplemental grants provided from the Department of Education's appropriation. See 48 U.S.C. 1921 d (f)(1)(B)(iii). The Compact also specified that the Republic of Palau remained eligible for WIA Title I funding. See 48 U.S.C. 1921d(f)(1)(B)(ix). The Consolidated Appropriations Act, 2014 (Division H, Title III, Section 306 of Pub. L. 113-76) authorized WIA Title I funding to Palau through FY 2014.

Under WIA, the Secretary has discretion for determining the methodology for distributing funds to all outlying areas. The Department used the same methodology since PY 2000 (i.e., we distribute funds among the remaining areas by formula based on relative share of number of unemployed, a 90 percent hold-harmless of the prior year share, a \$75,000 minimum, and a 130 percent stop-gain for the state for the previous year). For the relative share calculation in PY 2014, the Department continued to use the data obtained from the 2010 Census for American Samoa, Guam, Commonwealth of Northern Marianas Islands, and Virgin Islands. For Palau, the Department continued to use data from Palau's 2005 Census.

For the Native American Youth program, the total amount available is 1.5 percent of the total amount for Youth Activities (after the evaluations set aside), in accordance with WIA section 127. After the Department calculated the amount for the outlying areas and Native Americans, we determined that the amount available for PY 2014 allotments to the States is \$803,851,042. This total amount was below the required \$1 billion threshold specified in WIA section 127(b)(1)(C)(iv)(IV); therefore, as in PY 2013, the Department did not apply the WIA additional minimum provisions. Instead, as required by WIA, the

Department used the Job Training Partnership Act (JTPA) (Pub. L. 97–300), section 262(a)(3) (as amended by section 207 of the Job Training Reform Amendments of 1992, Pub. L. 102–367) minimums of 90 percent hold-harmless of the prior year allotment percentage and 0.25 percent State minimum floor. WIA also provides that no state may receive an allotment that is more than 130 percent of the allotment percentage for the State for the previous year. The three data factors required by WIA for the PY 2014 Youth Activities State formula allotments are:

(1) The average number of unemployed individuals for Areas of Substantial Unemployment (ASUs) for the 12-month period, July 2012–June 2013;

(2) Number of excess unemployed individuals or the ASU excess (depending on which is higher) averages for the same 12-month period used for ASU unemployed data; and

(3) Number of economically disadvantaged Youth (age 16 to 21, excluding college students in the workforce and military) from special tabulations of data from the American Community Survey (ACS), which the Department obtained from the Bureau in 2012. The Bureau collected the data used in the special tabulations for economically disadvantaged Youth between January 1, 2006–December 31, 2010.

Beginning this year, for purposes of identifying ASUs for the within-State Youth Activities allocation formula, States should use the data made available by BLS (as described in LAUS Technical Memorandum No. S–13–17). For purposes of determining the number of economically disadvantaged Youth for the statutory within-state allocation formula, States should continue to use the special tabulations of ACS data made available to them in 2013 and available at <http://www.doleta.gov/budget/disadvantagedYouthAdults.cfm>.

See TEGL No. 21–12 for further information.

Adult Employment and Training Activities Allotments. The total appropriated funds for Adult Activities in PY 2014 is \$766,080,000. After reducing the appropriated amount by \$2,111,000 for evaluations, \$763,969,000 remains for Adult Activities, of which \$762,059,077 is for States and \$1,909,923 is for outlying areas. Table B shows the PY 2014 Adult Employment and Training Activities allotments and a State by State comparison of the PY 2014 allotments to PY 2013 revised allotments (after removing the sequestration applicable to the FY 2013 advance).

Like the Youth Activities program, the Department reserved the total available for the outlying areas at 0.25 percent of the full amount appropriated for Adult Activities (after the evaluations set aside). As discussed in the Youth Activities section above, WIA funding for the Marshall Islands and Micronesia is no longer provided; instead, funding is provided for these territories in the Department of Education's appropriation.

The Department distributed the Adult Activities funding for the remaining outlying areas (for which the distribution methodology is at the Secretary's discretion), using the same principles, formula and data as used for outlying areas for Youth Activities. After determining the amount for the outlying areas, the Department used the statutory formula to distribute the remaining amount available for allotments to the States. The Department did not apply the WIA minimum provisions for the PY 2014 allotments because the total amount available for the States was below the \$960 million threshold required for Adult Activities in WIA section 132(b)(1)(B)(iv)(IV). Instead, as required by WIA, the Department calculated minimum allotments using the JTPA section 202(b)(2) (as amended by section 202 of the Job Training Reform Amendments of 1992) minimums of 90 percent hold-harmless of the prior year allotment percentage and 0.25 percent State minimum floor. WIA also provides that no State may receive an allotment that is more than 130 percent of the allotment percentage for the State for the previous year. The three formula data factors for the Adult Activities program are the same as those used for the Youth Activities formula, except the Department used data for the number of economically disadvantaged Adults (age 18 to 72, excluding college students in the workforce and military).

As noted above, updated data for within-state ASU calculations is available from BLS, and States should continue to use the economically disadvantaged Adults data made available to States by the Department in 2013.

Dislocated Worker Employment and Training Activities Allotments. The amount appropriated for Dislocated Worker activities in PY 2014 totals \$1,222,457,000. The total appropriation includes formula funds for the States, while the National Reserve is used for National Emergency Grants, technical assistance and training, demonstration projects, and the outlying areas' Dislocated Worker allotments. After reducing the appropriated amount by

\$3,370,000 for evaluations, a total of \$1,219,087,000 remains available for Dislocated Worker activities. The amount available for outlying areas is \$3,047,718, leaving \$217,201,282 for the National Reserve and a total of \$998,838,000 available for States. Like the Adult program, Table C shows the PY 2014 Dislocated Worker activities allotments and a by State comparison of the PY 2014 allotments to PY 2013 revised allotments (after removing the sequestration applicable to the FY 2013 advance).

Like the Youth and Adult Activities programs, the Department reserved the total available for the outlying areas at 0.25 percent of the full amount appropriated for Dislocated Worker Activities (after the evaluations set aside). WIA funding for the Marshall Islands and Micronesia is no longer provided, as discussed above. The Department distributed the Dislocated Worker Activities funds for grants to the remaining outlying areas, over which the Secretary maintains discretion for choosing the distribution methodology, using the same *pro rata* share as the areas received for the PY 2014 WIA Adult Activities program, the same methodology used in PY 2013.

The three data factors required in WIA for the PY 2014 Dislocated Worker State formula allotments are:

(1) Number of unemployed, averages for the 12-month period, October 2012–September 2013;

(2) Number of excess unemployed, averages for the 12-month period, October 2012–September 2013; and

(3) Number of long-term unemployed, averages for the 12-month period, October 2012–September 2013.

Since the Dislocated Worker Activities formula has no floor amount or hold-harmless provisions, funding changes for States directly reflect the impact of changes in unemployment related data listed above.

Wagner-Peyser Act ES Final Allotments. The appropriated level for PY 2014 for ES grants totals \$664,184,000. After determining the funding for outlying areas, the Department calculated allotments to States using the formula set forth at section 6 of the Wagner-Peyser Act (29 U.S.C. 49e). The Department based PY 2014 formula allotments on each State's share of calendar year 2013 monthly averages of the civilian labor force (CLF) and unemployment. Section 6(b)(4) of the Wagner-Peyser Act requires the Secretary to set aside up to three percent of the total funds available for ES to ensure that each State will have sufficient resources to maintain statewide ES activities. In accordance

with this provision, the Department included the three percent set-aside funds in this total allotment. The Department distributed the set-aside funds in two steps to States that have experienced a reduction in their relative share of the total resources available this year from their relative share of the total resources available the previous year. In Step 1, States that have a CLF below one million and are also below the median CLF density were maintained at 100 percent of their relative share of prior year resources. ETA calculated the median CLF density based on CLF data provided by BLS for calendar year 2013. All remaining set-aside funds were

distributed on a *pro-rata* basis in Step 2 to all other States experiencing reductions in relative share from the prior year but not meeting the size and density criteria for Step 1. The distribution of ES funds (Table D) includes \$662,564,950 for States, as well as \$1,619,050 for outlying areas.

Under section 7 of the Wagner-Peyser Act, ten percent of the total sums allotted to each State must be reserved for use by the Governor to provide performance incentives for ES offices, services for groups with special needs, and for the extra costs of exemplary models for delivering job services.

Workforce Information Grants Allotments. Total PY 2014 funding for

Workforce Information Grants allotments to States is \$32,000,000. The allotment figures for each State are listed in Table E. Funds are distributed by administrative formula, with a reserve of \$176,800 for Guam and the Virgin Islands. Guam and the Virgin Islands allotment amounts are partially based on CLF data, which the Department updated last year with data from the 2010 Census. The Department distributes the remaining funds to the States with 40 percent distributed equally to all States and 60 percent distributed based on each State's share of CLF for the 12 months ending September 2013.

TABLE A—U.S. DEPARTMENT OF LABOR EMPLOYMENT AND TRAINING ADMINISTRATION WIA YOUTH ACTIVITIES STATE ALLOTMENTS COMPARISON OF PY 2014 VS PY 2013

State	PY 2013	PY 2014	Difference	% Difference
Total with Evaluations	\$781,375,289	\$820,430,000	\$39,054,711	5.00

BILLING CODE P

LEGAL SERVICES CORPORATION

Notice of Availability of Calendar Year 2015 Competitive Grant Funds

AGENCY: Legal Services Corporation.

ACTION: Request for proposals for the provision of civil legal services.

SUMMARY: The Legal Services Corporation (LSC) is the national organization charged with administering Federal funds provided for civil legal services to low-income people.

LSC hereby announces the availability of competitive grant funds and is soliciting grant proposals from interested parties who are qualified to provide effective, efficient and high quality civil legal services to eligible clients in the service area(s) of the states and territories identified below. The exact amount of congressionally appropriated funds and the date, terms, and conditions of their availability for calendar year 2015 have not been determined.

DATES: See **SUPPLEMENTARY INFORMATION** for grants competition dates.

ADDRESSES: Legal Services Corporation—Competitive Grants, 3333 K Street NW., Third Floor, Washington, DC 20007-3522.

FOR FURTHER INFORMATION CONTACT: LSC Office of Program Performance by email at competition@lsc.gov, or visit the grants competition Web site at www.grants.lsc.gov.

SUPPLEMENTARY INFORMATION: The Request for Proposals (RFP) will be available the week of April 7, 2014. Applicants must file a Notice of Intent to Compete (NIC) to participate in the competitive grants process. Applicants must file the NIC by May 9, 2014, 5:00 p.m. E.D.T. Other key application and filing dates, including the dates for filing grant applications, are published at www.grants.lsc.gov/resources/notices.

LSC is seeking proposals from: (1) Non-profit organizations that have as a purpose the provision of legal assistance to eligible clients; (2) private attorneys; (3) groups of private attorneys or law firms; (4) state or local governments; and 5) sub-state regional planning and coordination agencies that are composed of sub-state areas and whose governing boards are controlled by locally elected officials.

The RFP, containing the NIC and grant application, guidelines, proposal content requirements, service area descriptions, and specific selection criteria, will be available from www.grants.lsc.gov the week of April 7, 2014.

Below are the service areas for which LSC is requesting grant proposals. Service area descriptions will be available at www.grants.lsc.gov/about-grants/where-we-fund. LSC will post all updates and/or changes to this notice at www.grants.lsc.gov. Interested parties

are asked to visit www.grants.lsc.gov regularly for updates on the LSC competitive grants process.

BILLING CODE 7050-01-P

MARINE MAMMAL COMMISSION

Sunshine Act Notice

TIME AND DATE: The Marine Mammal Commission and its Committee of Scientific Advisors on Marine Mammals will meet on Tuesday, 6 May 2013, from 9:00 a.m. to 5:30 p.m.; Wednesday, 7 May 2013, from 9:00 a.m. to 5:30 p.m.; Thursday, 8 May 2013, from 9:30 a.m. to 5:00 p.m. The Commission and the Committee also will meet in executive session on Monday, 5 May 2013, from 2:00 to 6:00 p.m.

PLACE: Tuesday and Wednesday, 6 and 7 May: Fellowship Hall, Mt. Vernon Place United Methodist Church, 900 Massachusetts Ave. NW., Washington, DC 20001. Thursday, 8 May: Capitol Hill Visitor's Center, located underground on the east side of the Capitol, at the East Front plaza of the U.S. Capitol, First Street and East Capitol Street NE., Washington, DC, 20001.

STATUS: The executive session will be closed to the public in accordance with the provisions of the Government in the Sunshine Act (5 U.S.C. 552b) and applicable regulations. The session will be limited to discussions of internal agency practices, personnel, and the budget of the Commission. All other portions of the meeting will be open to the public. Public participation will be allowed as time permits and as determined to be desirable by the Chairman.

MATTERS TO BE CONSIDERED: The Commission and Committee will meet in public session to discuss a broad range of marine mammal science and conservation policy issues, with a particular focus on partnerships and prioritization in order to address growing challenges in ensuring healthy marine mammal populations and the ecosystems in which they live. An opening session will feature the leaders of the major federal agencies engaged in marine mammal science and conservation. Five themed sessions will reflect the Objectives in the Commission's Strategic Plan for 2015-19: The Changing Arctic; Offshore Energy Development; Marine Mammal Health and Stranding; Impacts on Marine Mammals from Fishing; and Recovery of Marine Mammal Stocks: Next Steps. The third day of the

meeting, which will be held on Capitol Hill, will feature introductory remarks from members of Congress, discussion of the outcome of the five themed sessions, a series of short presentations on the latest technological advances in marine mammal science, and a public comment session.

CONTACT PERSON FOR MORE INFORMATION:

Michael L. Gosliner, General Counsel, Marine Mammal Commission, 4340 East-West Highway, Room 700, Bethesda, MD 20814; (301) 504-0087; email: mgosliner@mmc.gov.

Dated: 9 April 2014.

Rebecca J. Lent,

Executive Director.

BILLING CODE 6820-31-P

NATIONAL SCIENCE FOUNDATION

Notice of Intent To Seek Approval To Renew an Information Collection

AGENCY: National Science Foundation.

ACTION: Notice and Request for Comments.

SUMMARY: The National Science Foundation (NSF) is announcing plans to request renewal of this collection. In accordance with the requirement of Section 3506(c)(2)(A) of the Paperwork Reduction Act of 1995 (Pub. L. 104-13), we are providing an opportunity for public comment on this action. After obtaining and considering public comment, NSF will prepare the submission requesting that OMB approve clearance of this collection for no longer than 3 years.

DATES: Written comments on this notice must be received by June 10, 2014 to be assured of consideration. Comments received after that date will be considered to the extent practicable.

ADDRESSES: Written comments regarding the information collection and requests for copies of the proposed information collection request should be addressed to Suzanne Plimpton, Reports Clearance Officer, National Science Foundation, 4201 Wilson Blvd., Suite 1265, Arlington, VA 22230, or by email to splimpto@nsf.gov.

FOR FURTHER INFORMATION CONTACT:

Contact Suzanne H. Plimpton, Reports Clearance Officer, National Science Foundation, 4201 Wilson Boulevard, Suite 1265, Arlington, Virginia 22230; telephone 703-292-7556; or send email to splimpto@nsf.gov. Individuals who use a telecommunications device for the deaf (TDD) may call the Federal Information Relay Service (FIRS) at 1-800-877-8339, which is accessible 24

hours a day, 7 days a week, 365 days a year (including Federal holidays).

SUPPLEMENTARY INFORMATION:

Title Of Collection: National Science Foundation-Managed Honorary Awards.

OMB Approval Number: 3145-0035.

Expiration Date of Approval: August 31, 2014.

Type of Request: Intent to seek approval to renew an information collection for three years.

Abstract: The National Science Foundation (NSF) administers several honorary awards, among them the President's National Medal of Science, the Alan T. Waterman Award, the National Science Board (NSB) Vannevar Bush Award, the NSB Public Service Award, the Presidential Awards for Excellence in Science, Mathematics and Engineering Mentoring (PAESMEM) program, and the Presidential Awards for Excellence in Mathematics and Science Teaching (PAEMST) program.

In 2003, to comply with E-government requirements, the nomination processes were converted to electronic submission through the National Science Foundation's (NSF) FastLane system or via other electronic systems as described in the individual nomination process. Individuals can now prepare nominations and references through www.fastlane.nsf.gov/honawards/. First-time users must register on the Fastlane Web site using the link found in the upper right-hand corner above the "Log In" box before accessing any of the honorary award categories. The nominations for PAESMEM also may be submitted via www.grants.gov. Nominations and applications are submitted on the PAEMST portal at www.PAEMST.org.

Use of the Information: The Foundation has the following honorary award programs:

- President's National Medal of Science. Statutory authority for the President's National Medal of Science is contained in 42 U.S.C. 1881 (Pub. L. 86-209), which established the award and stated that "(t)he President shall . . . award the Medal on the recommendations received from the National Academy of Sciences or on the basis of such other information and evidence as . . . appropriate."

Subsequently, Executive Order 10961 specified procedures for the Award by establishing a National Medal of Science Committee which would "receive recommendations made by any other nationally representative scientific or engineering organization." On the basis of these recommendations, the Committee was directed to select its candidates and to forward its recommendations to the President.

In 1962, to comply with these directives, the Committee initiated a solicitation form letter to invite these nominations. In 1979, the Committee initiated a nomination form as an attachment to the solicitation letter. A slightly modified version of the nomination form was used in 1980.

The Committee has established the following considerations for selection of candidates:

a. The impact of an individual's body of work on the current state of his or her field of science or engineering;

b. Whether the individual's achievements are of an unusually significant nature in relation to the potential effects on the development of thought in his or her field of science or engineering;

c. Whether the nominee has demonstrated unusually distinguished service in the general advancement of science and/or engineering for the Nation, especially when accompanied by substantial contributions to the content of science;

d. The recognition of the nominee by peers within his or her community, and whether s/he is recognized for substantial impact in fields in addition to his/her discipline;

e. If the nominee has made contributions to innovation and industry;

f. Whether the nominee has demonstrated sustained influence on education through publications, teaching activities, outreach, mentoring, etc., and;

g. Whether the nominee's contributions have created significant positive impact for the Nation.

In 2003, the Committee changed the active period of eligibility to three years, including the year of nomination. After that time, candidates must be renominated with a new nomination package for them to be considered by the Committee.

Narratives are now restricted to three pages of text, as stipulated in the guidelines at: <https://www.fastlane.nsf.gov/honawards/medalHome.do>.

• Alan T. Waterman Award. Congress established the Alan T. Waterman Award in August 1975 (42 U.S.C. 1881a (Pub. L. 94-86) and authorized NSF to "establish the Alan T. Waterman Award for research or advanced study in any of the sciences or engineering" to mark the 25th anniversary of the National Science Foundation and to honor its first Director. The annual award recognizes an outstanding young researcher in any field of science or engineering supported by NSF. In addition to a medal, the awardee receives a grant of

\$1,000,000 over a five-year period for scientific research or advanced study in the mathematical, physical, medical, biological, engineering, social, or other sciences at the institution of the recipient's choice.

The Alan T. Waterman Award Committee was established by NSF to comply with the directive contained in Public Law 94-86. The Committee solicits nominations from members of the National Academy of Sciences, National Academy of Engineering, scientific and technical organizations, and any other source, public or private, as appropriate.

In 1976, the Committee initiated a form letter to solicit these nominations. In 1980, a nomination form was used which standardized the nomination procedures, allowed for more effective Committee review, and permitted better staff work in a short period of time. On the basis of its review, the Committee forwards its recommendation to the Director, NSF, and the National Science Board (NSB).

Candidates must be U.S. citizens or permanent residents and must be 35 years of age or younger or not more than seven years beyond receipt of the Ph.D. degree by December 31 of the year in which they are nominated. Candidates should have demonstrated exceptional individual achievements in scientific or engineering research of sufficient quality to place them at the forefront of their peers. Criteria include originality, innovation, and significant impact on the field.

• Vannevar Bush Award. The NSB established the Vannevar Bush Award in 1980 to honor Dr. Bush's unique contributions to public service. The award recognizes an individual who, through public service activities in science and technology, has made an outstanding "contribution toward the welfare of mankind and the Nation."

The NSB *ad hoc* Committee on Honorary Awards annually solicits nominations from science, engineering and educational societies. A candidate must be a senior stateperson who is an American citizen and meets two or more of the following criteria:

1. Distinguished himself/herself through public service activities in science and technology.
2. Pioneered the exploration, charting, and settlement of new frontiers in science, technology, education, and public service.
3. Demonstrated leadership and creativity that have inspired others to distinguished careers in science and technology.

4. Contributed to the welfare of the Nation and mankind through activities in science and technology.

5. Demonstrated leadership and creativity that have helped mold the history of advancements in the Nation's science, technology, and education.

Nominations must include a narrative description about the nominee, a curriculum vitae (without publications), and a brief citation summarizing the nominee's scientific or technological contributions to our national welfare in promotion of the progress of science. Nominations must also include two reference letters, submitted separate from the nomination through www.fastlane.nsf.gov/honawards/. Nominations remain active for three years, including the year of nomination. After that time, candidates must be renominated with a new nomination for them to be considered by the selection committee.

• NSB Public Service Award. The NSB Public Service Award Committee was established in November 1996. This annual award recognizes people and organizations that have increased the public understanding of science or engineering. The award is given to an individual and to a group (company, corporation, or organization), but not to members of the U.S. Government.

Eligibility includes any individual or group (company, corporation, or organization) that has increased the public understanding of science or engineering. Members of the U.S. Government are not eligible for consideration.

Candidates for the individual and group (company, corporation, or organization) award must have made contributions to public service in areas other than research, and should meet one or more of the following criteria:

1. Increased the public's understanding of the processes of science and engineering through scientific discovery, innovation and its communication to the public.
2. Encouraged others to help raise the public understanding of science and technology.
3. Promoted the engagement of scientists and engineers in public outreach and scientific literacy.
4. Contributed to the development of broad science and engineering policy and its support.
5. Influenced and encouraged the next generation of scientists+ and engineers.
6. Achieved broad recognition outside the nominee's area of specialization.
7. Fostered awareness of science and technology among broad segments of the population.

Nominations must include a summary of the candidate's activities as they relate to the selection criteria; the nominator's name, address and telephone number; the name, address, and telephone number of the nominee; and the candidate's vita, if appropriate (no more than three pages).

The selection committee recommends the most outstanding candidate(s) for each category to the NSB, which approves the awardees.

Nominations remain active for a period of three years, including the year of nomination. After that time, candidates must be renominated with a new nomination for them to be considered by the selection committee.

• **Presidential Awards for Excellence in Science, Mathematics and Engineering Mentoring (PAEMEM) Program**

In 1996, the White House, through the National Science and Technology Council (NSTC) and the Office of Science and Technology Policy (OSTP), established the Presidential Awards for Excellence in Science, Mathematics and Engineering Mentoring (PAEMEM) program. The program, administered on behalf of the White House by the National Science Foundation, seeks to identify outstanding mentoring efforts or programs designed to enhance the participation of groups (women, minorities and persons with disabilities as well as groups from low socioeconomic regions) underrepresented in science, mathematics and engineering. The awardees will serve as exemplars to their colleagues and will be leaders in the national effort to more fully develop the Nation's human resources in science, mathematics and engineering. This award is managed at NSF by the Directorate for Education and Human Resources (EHR).

The award will be made to U.S. citizens or U.S. permanent residents based on the following: (1) An individual who has demonstrated outstanding and sustained mentoring and effective guidance to a significant number of early career STEM professionals, students at the K–12, undergraduate, or graduate education level or (2) to an organization that, through its programming, has enabled a substantial number of students underrepresented in science, mathematics and engineering to successfully pursue and complete the relevant degree programs as well as mentoring of early career STEM professionals. Nominees must have served in a mentoring role for at least five years. Nominations are reviewed for impact, significance of the mentoring

activity and quality of the mentoring activity. Nominations for organizational awards must demonstrate rigorous evaluation and/or assessment during the five-year period of the mentoring activity.

Award Ceremony

The awardees are hosted for two days in Washington, DC, for celebratory activities. Recipients of the PAEMEM award receive a monetary award in the amount of \$10,000 from NSF and a commemorative Presidential certificate. If scheduling permits, the President meets with the mentors for a photo opportunity at the White House. The Director of OSTP and the Director of NSF present the awards to the mentors at an awards ceremony.

• **Presidential Award for Excellence in Mathematics and Science Teaching**

The Presidential Award for Excellence in Mathematics and Science Teaching (PAEMST) is the highest recognition that a kindergarten through 12th-grade mathematics or science teacher may receive for outstanding teaching in the United States. Enacted by Congress in 1983, this program authorizes the President to bestow 108 awards, assuming there are qualified applicants. In even-numbered years, nominations are accepted for elementary teachers (grades K–6); in odd-numbered years, secondary teachers (grades 7–12) are nominated. This award is managed at NSF by the Directorate for Education and Human Resources (EHR).

Nomination Criteria

A teacher may be nominated by a principal, another teacher, students, members of the community, or the general public. Self-nominations are allowed. Awardees must be either U.S. Citizens or U.S. Permanent Residents. A Nominee must meet the following criteria to apply:

- Be highly qualified as deemed by their states, districts, or schools;
- Teach in one of the 50 States, the District of Columbia, the Commonwealth of Puerto Rico, and the four U.S. territories, including the Department of Defense Schools (DoDEA).
- Hold a degree or appropriate credentials in the category for which they are applying.
- Be a full-time employee of the school or school district.
- Have at least 5 years of mathematics or science teaching (including computer science) experience prior to application.
- Teach mathematics or science at the kindergarten through 6th grade level or

at the 7th through 12th grade level in a public or private school.

- Not have received the national PAEMST award in any prior competition or category.

Application Process

• Applicants complete a 12-page written document on five dimensions of outstanding teaching (content knowledge, pedagogy, assessment, leadership and professional development) and submit a video of one class. Three letters of reference including one from a school official are required, along with a resume or biographical sketch.

- The applicant has a 7-month period (October to May) to complete applications and submit them for state review. The nomination period is from October to April.

Review of Nominations

• State coordinators convene state selection committees of prominent mathematicians, scientists, mathematics and science educators, and past awardees to select up to five mathematics and five science finalists for recognition at the state level and for submission to NSF. To ensure consistency, state selection committees review their applications using the same criteria and scoring information that was approved by OSTP.

- NSF (EHR) convenes a National Selection Committee of prominent mathematicians, scientists, mathematics and science educators, and past awardees that review the application packets of the state finalists and make recommendations to NSF. NSF reviews these recommendations and recommends one awardee in both mathematics and science for all eligible jurisdictions, when possible, to OSTP. Alternatively, NSF may recommend two awardees from a discipline in a jurisdiction, when warranted.

Award Ceremony

The awardees are hosted for 3–4 days in Washington, DC, for a variety of professional development sessions and celebratory activities. Each awardee receives a citation signed by the President and \$10,000 from NSF. If scheduling permits, the President meets the teachers for a photo opportunity at the White House. The Director of OSTP and the Director of NSF present the citations to the teachers at an awards ceremony. Awardees also have the opportunity to meet their congressional representatives and education representatives from other federal agencies.

Estimate of Burden: These are annual award programs with application deadlines varying according to the program. Public burden also may vary according to program; however, across all the programs, it is estimated that each submission will average 19 hours per respondent. If the nominator is thoroughly familiar with the disciplinary background of the nominee, time spent to complete the nomination may be considerably reduced.

Respondents: Individuals, businesses or other for-profit organizations, universities, non-profit institutions, and Federal and State governments.

Estimated Number of Responses per Award: 1782 responses, broken down as follows: For the President's National Medal of Science, 80; for the Alan T. Waterman Award, 70; for the Vannevar Bush Award, 12; for the Public Service Award, 20; for the PAESMEM, 200; and 1400 for the PAEMST.

Estimated Total Annual Burden on Respondents: 41,080 hours, broken down by 1,600 hours for the President's National Medal of Science (20 hours per 80 respondents); 1,400 hours for the Alan T. Waterman Award (20 hours per 70 respondents); 180 hours for the Vannevar Bush Award (15 hours per 12 respondents); 300 hours for the Public Service Award (15 hours per 20 respondents); 4,000 hours for the PAESMEM (20 hours per 200 respondents); and 33,600 hours for the PAEMST (24 hours per 1400 respondents).

Frequency of Responses: Annually.

Comments: Comments are invited on (a) whether the proposed collection of information is necessary for the proper performance of the functions of the Agency, including whether the information shall have practical utility; (b) the accuracy of the Agency's estimate of the burden of the proposed collection of information; (c) ways to enhance the quality, utility, and clarity of the information on respondents, including through the use of automated collection techniques or other forms of information technology; or (d) ways to minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology.

Dated: April 7, 2014.

Suzanne H. Plimpton,

Reports Clearance Officer, National Science Foundation.

[FR Doc. 2014-08105 Filed 4-10-14; 8:45 am]

BILLING CODE 7555-01-P

NATIONAL SCIENCE FOUNDATION

Advisory Committee for Education and Human Resources; Notice of Meeting

In accordance with the Federal Advisory Committee Act (Pub. L. 92-463, as amended), the National Science Foundation announces the following meeting:

Name: Advisory Committee for Education and Human Resources (#1119).

Date/Time: April 30, 2014; 8:30 a.m.–6:00 p.m. May 1, 2014; 8:30 a.m.–2:30 p.m.

Place: NSF Headquarters, Room 1235, 4201 Wilson Boulevard, Arlington, VA 22230.

Operated assisted teleconference is available for this meeting. Call 888-324-9561 with password 1189785 and you will be connected to the audio portion of the meeting.

To attend the meeting in person, all visitors must contact the Directorate for Education and Human Resources (ehr_ac@nsf.gov) at least 24 hours prior to the teleconference to arrange for a visitor's badge. All visitors must report to the NSF visitor desk located in the lobby at the 9th and N. Stuart Streets entrance on the day of the teleconference to receive a visitor's badge.

Meeting materials and minutes will also be available on the EHR Advisory Committee Web site at <http://www.nsf.gov/ehr/advvisory.jsp>.

Type of Meeting: Open, Teleconference.

Contact Person: Teresa Caravelli, National Science Foundation, 4201 Wilson Boulevard, Arlington, VA 22230; (703) 292-8600, tcaravel@nsf.gov.

Purpose of Meeting: To provide advice with respect to the Foundation's science, technology, engineering, and mathematics (STEM) education and human resources programming.

Agenda

Wednesday, April 30, 2014 8:30 a.m.–6 p.m.

- Remarks by the Committee Chair and NSF Assistant Director for Education and Human Resources (EHR).
- Re-Imagining an EHR for the Future.
- Panel Discussion on Partnerships and Networks.
- Panel Discussion on Beyond the "Pipeline" Metaphor.
- New Business from NSF Advisory Committees and Directorates.
- Panel Discussion with Outgoing Committee Members.
- Synthesis of the Day.

Thursday, May 1, 2014 8:30 a.m.–2:30 p.m.

- Panel Discussion on NSF's Role in the National Dialogue on Standards, Instruction, and Indicators.
- Remarks by Director, NSF; Dr. France Cordova.
- Plenary Panel: STEM Workforce Development: labor market demand for STEM competencies, long-term occupational projections, and industrial productivity.
- Adjournment.

Dated: April 8, 2014.

Suzanne Plimpton,

Acting Committee Management Officer.

[FR Doc. 2014-08138 Filed 4-10-14; 8:45 am]

BILLING CODE 7555-01-P

OFFICE OF SPECIAL COUNSEL

Agency Information Collection Activities, Request for Comment

AGENCY: Office of Special Counsel.

ACTION: First Notice.

SUMMARY: In accordance with the Paperwork Reduction Act of 1995 (44 U.S.C. Chapter 35), and implementing regulations at 5 CFR part 1320, the U.S. Office of Special Counsel (OSC), plans to request approval from the Office of Management and Budget (OMB) for use of three previously approved information collections consisting of three complaint forms. These collections are listed below. The current OMB approval for Forms OSC-11, OSC-12, OSC-13 expired on 2/28/14. We are submitting all three forms for renewal, based on the actual date of expiration.

We are currently collecting requirements for future modifications to these forms; however, currently there are no changes being submitted with this request for renewal of the use of these forms. Current and former Federal employees, employee representatives, other Federal agencies, state and local government employees, and the general public are invited to comment on this information collection for the first time. Comments are invited on: (a) Whether the proposed collection of information is necessary for the proper performance of OSC functions, including whether the information will have practical utility; (b) the accuracy of OSC's estimate of the burden of the proposed collections of information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; and (d) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or other forms of information technology.

DATES: Comments should be received by June 10, 2014.

FOR FURTHER INFORMATION CONTACT: Karl Kammann, Director of Finance, at the address shown above; by facsimile at (202) 254-3711.

SUPPLEMENTARY INFORMATION: OSC is an independent agency responsible for, among other things, (1) investigation of allegations of prohibited personnel practices defined by law at 5 U.S.C. 2302(b), protection of whistleblowers,

and certain other illegal employment practices under titles 5 and 38 of the U.S. Code, affecting current or former Federal employees or applicants for employment, and covered state and local government employees; and (2) the interpretation and enforcement of Hatch Act provisions on political activity in chapters 15 and 73 of title 5 of the U.S. Code.

Title of Collections: (1) Form OSC–11, (Complaint of Possible Prohibited Personnel Practice of Other Prohibited Activity); (2) Form OSC–12 (Information about filing a Whistleblower Disclosure with the Office of Special Counsel); (3) Form OSC–13 (Complaint of Possible Prohibited Political Activity (Violation of the Hatch Act)); OMB Control Number 3255–0002, Expiration 02/28/14.

Copies of the OSC Forms 11, 12, and 13 can be found at: http://www.osc.gov/RR_OSCFORMS.htm.

Type of Information Collection Request: Approval of previously approved collection of information that expires on February 28, 2014, with no revisions.

Affected Public: Current and former Federal employees, applicants for Federal employment, state and local government employees, and their representatives, and the general public.

Respondent's Obligation: Voluntary.
Estimated Annual Number of OSC Form Respondents: 3,950.

Frequency of Use of OSC Forms: Daily.

Estimated Average Amount of Time for a Person To Respond Using OSC Forms: 64 minutes.

Estimated Annual Burden for the OSC Forms: 2,899 hours.

Abstract: These forms are used by current and former Federal employees and applicants for Federal employment to submit allegations of possible prohibited personnel practices or other prohibited activity for investigation and possible prosecution by OSC.

Dated: April 3, 2014.

Carolyn N. Lerner,
Special Counsel.

[FR Doc. 2014–08210 Filed 4–10–14; 8:45 am]

BILLING CODE 7405–01–P

PENSION BENEFIT GUARANTY CORPORATION

Proposed Submission of Information Collection for OMB Review; Comment Request; Generic Clearance for the Collection of Qualitative Feedback on Agency Service Delivery

AGENCY: Pension Benefit Guaranty Corporation.

ACTION: Notice of intent to request extension of OMB approval.

SUMMARY: Pension Benefit Guaranty Corporation (“PBGC”) intends to request that the Office of Management and Budget (“OMB”) extend approval under the Paperwork Reduction Act of 1995 of this collection of information on qualitative feedback on PBGC’s service delivery (OMB Control Number 1212–0066; expires June 30, 2014). This notice informs the public of PBGC’s intent and solicits comments on the proposed information collection. This collection of information was developed as part of a Federal Government-wide effort to streamline the process for seeking feedback from the public on service delivery.

DATES: Comments should be submitted by June 10, 2014.

ADDRESSES: Comments may be submitted by any of the following methods:

- *Federal eRulemaking Portal:* <http://www.regulations.gov>. Follow the Web site instructions for submitting comments.

- *Email:* paperwork.comments@pbgc.gov.

- *Fax:* 202–326–4224.

- *Mail or Hand Delivery:* Office of General Counsel, Pension Benefit Guaranty Corporation, 1200 K Street NW., Washington, DC 20005–4026 PBGC will make comments submitted in response to this notice available on its Web site at www.pbgc.gov.

Copies of the collection of information may be obtained without charge by writing to the Disclosure Division of the Office of the General Counsel of PBGC at the above address or by visiting that office or calling 202–326–4040 during normal business hours. (TTY and TDD users may call the Federal relay service toll-free at 1–800–877–8339 and ask to be connected to 202–326–4040.)

FOR FURTHER INFORMATION CONTACT: Jo Amato Burns, Attorney, or Catherine B. Klion, Assistant General Counsel, Office of the General Counsel, Pension Benefit Guaranty Corporation, 1200 K Street NW., Washington, DC 20005–4026, 202–326–4024. (For TTY and TDD, call 800–877–8339 and ask to be connected to 202–326–4024.)

SUPPLEMENTARY INFORMATION:

Title: Generic Clearance for the Collection of Qualitative Feedback on Agency Service Delivery

Abstract: The information collection activity will gather qualitative customer and stakeholder feedback in an efficient, timely manner, in accordance with the Administration’s commitment to

improving service delivery. By qualitative feedback PBGC means information that provides useful insights on perceptions and opinions, but the information requests are not statistical surveys that yield quantitative results that generalizable to the population of interest. This feedback provides insights into customer or stakeholder perceptions, experiences and expectations, provide an early warning of issues with service, or focus attention on areas where changes in PBGC’s communication with the public, training of staff or in operations might improve delivery of products or services. These collections will allow for ongoing, collaborative and actionable communications between PBGC and its customers and stakeholders. These collections also allow feedback to contribute directly to the improvement of program management.

The solicitation of feedback targets areas such as: Timeliness, appropriateness, accuracy of information, courtesy, efficiency of service delivery, and resolution of issues with service delivery. Responses will be assessed to plan and inform efforts to improve or maintain the quality of service offered to the public. If this information were not collected, vital feedback from customers and stakeholders on PBGC’s services would be unavailable.

PBGC only submits a collection for approval under this generic clearance if it meets the following conditions:

- The collections are voluntary;
- The collections are low-burden for respondents (based on considerations of total burden hours, total number of respondents, or burden-hours per respondent) and are low-cost for both the respondents and the Federal Government;
- The collections are non-controversial and do not raise issues of concern to other Federal agencies;
- Any collection is targeted to the solicitation of opinions from respondents who have experience with the program or may have experience with the program in the near future;
- Personally identifiable information (PII) is collected only to the extent necessary and is not retained;
- Information gathered will be used only internally for general service improvement and program management purposes and is not intended for release outside of the agency;
- Information gathered will not be used for the purpose of substantially informing influential policy decisions; and

- Information gathered will yield qualitative information; the collections will not be designed or expected to yield statistically reliable results or used as though the results are generalizable to the population of interest.

As noted, feedback collected under this generic clearance does not produce results generalizable to the population of interest. This type of generic clearance for qualitative information will not be used for quantitative information collections that are designed to yield reliably actionable results, such as monitoring trends over time or documenting program performance. Collections with such objectives require more rigorous designs that address: The target population to which generalizations will be made, the sampling frame, the sample design (including stratification and clustering), the precision requirements or power calculations that justify the proposed sample size, the expected response rate, methods for assessing potential non-response bias, the protocols for data collection, and any testing procedures that were or will be undertaken prior to fielding the study.

As a general matter, information collections will not result in any new system of records containing privacy information and will not ask questions of a sensitive nature, such as sexual behavior and attitudes, religious beliefs, and other matters that are commonly considered private.

Current Action: Extension of approval for a collection of information (OMB Control Number 1212-0066; expires June 30, 2014).

Type of Review: Regular.

Affected Public: Individuals and households, businesses and organizations, State, Local or Tribal Government.

Estimated Annual Number of Respondents: 1180.

Below are projected average annual estimates for the next three years:

Average Expected Annual Number of Activities: Three.

Average Number of Respondents per Activity (varies by activity):

- Usability Testing: 40.
- Focus Group: 90 (nine groups of ten respondents).

- Customer Satisfaction Survey: 1050.

Frequency of Response: Once per request.

Annual Responses: 1,180 (based on one response per respondent).

Average Time per Response (varies by activity):

- Two hours per response for Usability Testing and Focus Groups;
- 15 minutes for Customer Satisfaction Survey.

Burden Hours (varies by activity):

- Usability Testing, 80 hours.
- Focus Group, 180 hours.
- Customer Satisfaction Survey, 263 hours.

Total: 523 hours.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid Office of Management and Budget control number.

Request for Comments: PBGC is soliciting public comments to—

- Evaluate whether the collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility;
- Evaluate the accuracy of the agency's estimate of the burden of the collection of information, including the validity of the methodology and assumptions used;
- Enhance the quality, utility, and clarity of the information to be collected; and
- Minimize the burden of the collection of information on those who are to respond, including the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology, e.g., permitting electronic submission of responses.

Issued in Washington, DC, this 8th day of April 2014.

Judith Starr,

General Counsel, Pension Benefit Guaranty Corporation.

BILLING CODE 7709-02-P

POSTAL SERVICE

Privacy Act of 1974; System of Records

AGENCY: Postal Service™.

ACTION: Notice of modification to existing systems of records.

SUMMARY: The United States Postal Service® is proposing to modify one General Privacy Act Systems of Records. These updates are being made to facilitate the implementation of a complex, self-service password and to account for the collection of additional data elements including challenge questions, challenge answers, and optional email addresses to be used in the password reset process.

DATES: These revisions will become effective without further notice on May 12, 2014 unless comments received on or before that date result in a contrary determination.

ADDRESSES: Comments may be mailed or delivered to the Records Office, United States Postal Service, 475 L'Enfant Plaza SW., Room 9431, Washington, DC 20260-1101. Copies of all written comments will be available at this address for public inspection and photocopying between 8 a.m. and 4 p.m., Monday through Friday.

FOR FURTHER INFORMATION CONTACT: Matthew J. Connolly, Chief Privacy Officer, Privacy and Records Office, 202-268-8582 or privacy@usps.gov.

SUPPLEMENTARY INFORMATION: This notice is in accordance with the Privacy Act requirement that agencies publish their amended systems of records in the **Federal Register** when there is a revision, change, or addition. The Postal Service™ has reviewed these systems of records and has determined that this General Privacy Act System of Records should be revised to modify categories of records in the system and purpose(s).

I. Background

Currently, Postal Service employees use their Postal Service-issued Employee Identification Number (EIN) and personal identification number (PIN) to access data pertaining to them in postal information systems such as PostalEASE, LiteBlue and other sites that they use EINs and PINs to access. To improve protection of employee privacy by strengthening the authentication process for accessing postal information systems, the Postal Service intends to implement a new, complex, self-service password to replace the existing self-service PIN.

II. Rationale for Changes to USPS Privacy Act Systems of Records

The system of records 500.000, Property Management Records, is being modified to account for the collection of an employee's challenge questions, challenge answers, and optionally, email addresses. These elements will be provided by the employee, collected during the initial establishment of the password, and will be used to authenticate the user in any subsequent requests by the user to reset his or her password.

III. Description of Changes to Systems of Records

The Postal Service is modifying one system of records listed below. Pursuant to 5 U.S.C. 552a(e)(11), interested persons are invited to submit written data, views, or arguments on this proposal. A report of the proposed modifications has been sent to Congress and to the Office of Management and Budget for their evaluation. The Postal Service does not expect this amended

notice to have any adverse effect on individual privacy rights. The affected systems are as follows:

USPS 500.000**SYSTEM NAME:**

Property Management Records

Accordingly, for the reasons stated, the Postal Service proposes changes in the existing systems of records as follows:

USPS 500.000**SYSTEM NAME:**

Property Management Records

CATEGORIES OF RECORDS IN THE SYSTEM:

* * * * *

[ADD TEXT]

4. Identity verification information: Question, answer, and email address.

* * * * *

[RENUMBER REMAINING TEXT]

PURPOSE:

* * * * *

[ADD TEXT]

4. To authenticate user identity for the purpose of accessing USPS information systems.

* * * * *

BILLING CODE 7710-12-P

RAILROAD RETIREMENT BOARD**Agency Forms Submitted for OMB Review, Request for Comments**

Summary: In accordance with the Paperwork Reduction Act of 1995 (44 U.S.C. Chapter 35), the Railroad Retirement Board (RRB) is forwarding an Information Collection Request (ICR) to the Office of Information and Regulatory Affairs (OIRA), Office of Management and Budget (OMB). Our ICR describes the information we seek to collect from the public. Review and approval by OIRA ensures that we impose appropriate paperwork burdens.

The RRB invites comments on the proposed collection of information to determine (1) the practical utility of the collection; (2) the accuracy of the estimated burden of the collection; (3) ways to enhance the quality, utility, and clarity of the information that is the subject of collection; and (4) ways to minimize the burden of collections on respondents, including the use of automated collection techniques or other forms of information technology. Comments to the RRB or OIRA must contain the OMB control number of the ICR. For proper consideration of your comments, it is best if the RRB and OIRA receive them within 30 days of the publication date.

Section 2 of the Railroad Retirement Act (RRA) provides for the payment of disability annuities to qualified employees. Section 2 also provides that if the Railroad Retirement Board (RRB) receives a report of an annuitant working for a railroad or earning more than prescribed dollar amounts from either nonrailroad employment or self-employment, the annuity is no longer payable, or can be reduced, for the months worked. The regulations related to the nonpayment or reduction of the annuity by reason of work are prescribed in 20 CFR 220.160-164.

Some activities claimed by the applicant as "self-employment" may actually be employment for someone else (e.g. training officer, consultant, salesman). 20 CFR 216.22(c) states, for example, that an applicant is considered an employee, and not self-employed, when acting as a corporate officer, since the corporation is the applicant's employer. Whether the RRB classifies a

particular activity as self-employment or as work for an employer depends upon the circumstances in each case. The circumstances are prescribed in 20 CFR 216.21-216-23.

Certain types of work may actually indicate an annuitant's recovery from disability. Regulations related to an annuitant's recovery from disability of work are prescribed in 20 CFR 220.17-220-20.

In addition, the RRB conducts continuing disability reviews, (also known as a CDR) to determine whether the annuitant continues to meet the disability requirements of the law. Payment of disability benefits and/or a beneficiary's period of disability will end if medical evidence or other information shows that an annuitant is not disabled under the standards prescribed in Section 2 of the RRA. Continuing disability reviews are generally conducted if one or more of the following conditions are met: (1) The annuitant is scheduled for a routine periodic review, (2) the annuitant returns to work and successfully completes a trial work period, (3) substantial earnings are posted to the annuitant's wage record, or (4) information is received from the annuitant or a reliable source that the annuitant has recovered or returned to work. Provisions relating to when and how often the RRB conducts disability reviews are prescribed in 20 CFR 220.186.

To enhance program integrity activities, the RRB utilizes Form G-252, Self-Employment/Corporate Officer Work and Earnings Monitoring. Form G-252 obtains information from a disability annuitant who claims to be self-employed or a corporate officer or who the RRB determines to be self-employed or a corporate officer after a continuing disability review. The continuing disability review may be prompted by a report of work, return to railroad service, an allegation of a medical improvement or a routine disability review call-up. The information gathered is used to determine entitlement and/or continued entitlement to, and the amount of, the disability annuity, as prescribed in 20 CFR 220.176. Completion is required to retain benefits. One response is required of each respondent.

Previous Requests for Comments: The RRB has already published the initial 60-day notice (79 FR 5471 on January 31, 2014) required by 44 U.S.C. 3506(c)(2). That request elicited no comments.

Information Collection Request (ICR)
Title: Self-Employment/Corporate Officer Work and Earnings Monitoring.
OMB Control Number: 3220-0202.
Form(s) submitted: G-252.
Type of request: Extension without change of a currently approved collection.

Affected public: Individuals or Households.
Abstract: To determine entitlement or continued entitlement to a disability annuity, the RRB will obtain information from disability annuitants who claim to be self-employed or a corporate officer or who the RRB

determines to be self-employed or a corporate officer after a continuing disability review.
Changes proposed: The RRB proposes no changes to Form G-252.
The burden estimate for the ICR is as follows:

Form number	Annual responses	Time (minutes)	Burden (hours)
G-252	100	20	33
Total	100	33

Additional Information or Comments: Copies of the forms and supporting documents can be obtained from Dana Hickman at (312) 751-4981 or Dana.Hickman@RRB.GOV. Comments regarding the information collection should be addressed to Charles Mierzwa, Railroad Retirement Board, 844 North Rush Street, Chicago, Illinois, 60611-2092 or Charles.Mierzwa@RRB.GOV and to the OMB Desk Officer for the RRB, Fax: 202-395-6974, Email address: OIRA_Submission@omb.eop.gov.

Charles Mierzwa,
 Chief of Information Resources Management.

BILLING CODE 7905-01-P

RAILROAD RETIREMENT BOARD

Proposed Collection; Comment Request

Summary: In accordance with the requirement of Section 3506 (c)(2)(A) of the Paperwork Reduction Act of 1995 which provides opportunity for public

comment on new or revised data collections, the Railroad Retirement Board (RRB) will publish periodic summaries of proposed data collections. *Comments are invited on:* (a) Whether the proposed information collection is necessary for the proper performance of the functions of the agency, including whether the information has practical utility; (b) the accuracy of the RRB's estimate of the burden of the collection of the information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; and (d) ways to minimize the burden related to the collection of information on respondents, including the use of automated collection techniques or other forms of information technology.
 1. *Title and purpose of information collection:* Financial Disclosure Statement; OMB 3220-0127.
 Under Section 10 of the Railroad Retirement Act and Section 2(d) of the Railroad Unemployment Insurance Act, the RRB may recover overpayments of annuities, pensions, death benefits, unemployment benefits, and sickness benefits that were made erroneously. An

overpayment may be waived if the beneficiary was not at fault in causing the overpayment and recovery would cause financial hardship. The regulations for the recovery and waiver of erroneous payments are contained in 20 CFR 255 and CFR 340.
 The RRB utilizes Form DR-423, Financial Disclosure Statement, to obtain information about the overpaid beneficiary's income, debts, and expenses if that person indicates that (s)he cannot make restitution for the overpayment. The information is used to determine if the overpayment should be waived as wholly or partially uncollectible. If waiver is denied, the information is used to determine the size and frequency of installment payments. The beneficiary is made aware of the overpayment by letter and is offered a variety of methods for recovery. One response is requested of each respondent. Completion is voluntary. However, failure to provide the requested information may result in a denial of the waiver request. The RRB proposes no changes to Form DR-423.

ESTIMATE OF ANNUAL RESPONDENT BURDEN

Form number	Annual responses	Time (minutes)	Burden (hours)
DR-423	1,200	85	1,700

2. *Title and purpose of information collection:* Representative Payee Parental Custody Monitoring; OMB 3220-0176.
 Under Section 12(a) of the Railroad Retirement Act (RRA), the Railroad Retirement Board (RRB) is authorized to select, make payments to, and to conduct transactions with, a beneficiary's relative or some other

person willing to act on behalf of the beneficiary as a representative payee. The RRB is responsible for determining if direct payment to the beneficiary or payment to a representative payee would best serve the beneficiary's interest. Inherent in the RRB's authorization to select a representative payee is the responsibility to monitor the payee to assure that the beneficiary's

interests are protected. The RRB utilizes Form G-99d, Parental Custody Report, to obtain information needed to verify that a parent-for-child representative payee still has custody of the child. One response is required from each respondent. The RRB proposes minor non-burden impacting formatting and editorial changes.

ESTIMATE OF ANNUAL RESPONDENT BURDEN

Form number	Annual responses	Time (minutes)	Burden (hours)
G-99d	1,030	5	86

3. Title and purpose of information collection: Statement Regarding Contributions and Support of Children; OMB 3220-0195.

Section 2(d)(4) of the Railroad Retirement Act (RRA), provides, in part, that a child is deemed dependent if the conditions set forth in Section 202(d)(3),(4) and (9) of the Social Security Act are met. Section 202(d)(4) of the Social Security Act, as amended by Public Law 104-121, requires as a condition of dependency, that a child receives one-half of his or her support from the stepparent. This dependency impacts upon the entitlement of a spouse or survivor of an employee

whose entitlement is based upon having a stepchild of the employee in care, or on an individual seeking a child's annuity as a stepchild of an employee. Therefore, depending on the employee for at least one-half support is a condition affecting eligibility for increasing an employee or spouse annuity under the social security overall minimum provisions on the basis of the presence of a dependent child, the employee's natural child in limited situations, adopted children, stepchildren, grandchildren and step-grandchildren and equitably adopted children. The regulations outlining child support and dependency

requirements are prescribed in 20 CFR 222.50-57.

In order to correctly determine if an applicant is entitled to a child's annuity based on actual dependency, the RRB uses Form G-139, Statement Regarding Contributions and Support of Children, to obtain financial information needed to make a comparison between the amount of support received from the railroad employee and the amount received from other sources. Completion is required to obtain a benefit. One response is required of each respondent. The RRB proposes no changes to Form G-139.

ESTIMATE OF ANNUAL RESPONDENT BURDEN

Form number	Annual responses	Time (minutes)	Burden (hours)
G-139	500	60	500

Additional Information or Comments:
To request more information or to obtain a copy of the information collection justification, forms, and/or supporting material, contact Dana Hickman at (312) 751-4981 or Dana.Hickman@RRB.GOV. Comments regarding the information collection should be addressed to Charles Mierzwa, Railroad Retirement Board, 844 North Rush Street, Chicago, Illinois 60611-2092 or emailed to Charles.Mierzwa@RRB.GOV. Written comments should be received within 60 days of this notice.

Charles Mierzwa,
Chief of Information Resources Management.
[FR Doc. 2014-08137 Filed 4-10-14; 8:45 am]
BILLING CODE 7905-01-P

Extension:
Form ADV.
Notice is hereby given that pursuant to the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*) the Securities and Exchange Commission ("Commission") has submitted to the Office of Management and Budget ("OMB") a request for extension of the previously approved collection of information discussed below.

The title for the collection of information is "Form ADV" (17 CFR 279.1). Form ADV is the investment adviser registration form and exempt reporting adviser reporting form filed electronically with the Commission pursuant to rules 203-1 (17 CFR 275.203-1), 204-1 (17 CFR 275.204-1) and 204-4 (17 CFR 275.204-4) under the Investment Advisers Act of 1940 (15 U.S.C. 80b-1 *et seq.*) by advisers registered with the Commission or applying for registration with the Commission or by exempt reporting advisers filing reports with the Commission. The information collected takes the form of disclosures to the adviser's clients and potential clients. The purpose of this collection of information is to provide advisory clients, prospective clients, and the Commission with information about the adviser, its business, its conflicts of interest and personnel. Clients use

certain of the information to determine whether to hire or retain an adviser.

The information collected provides the Commission with knowledge about the adviser, its business, its conflicts of interest and personnel. The Commission uses the information to determine eligibility for registration with the Commission and to manage its regulatory, examination, and enforcement programs.

Respondents to the collection of information are investment advisers registered with the Commission or applying for registration with the Commission or exempt reporting advisers filing reports with the Commission. The Commission estimates that the total annual reporting and recordkeeping burden of the collection of information for each respondent is 11.42 hours.

This collection of information is found at 17 CFR 279.1 and it is mandatory.

The information collected pursuant to Form ADV are filings with the Commission. These disclosures are not kept confidential and must be preserved until at least three years after termination of the enterprise.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information

BILLING CODE 8011-01-P

SECURITIES AND EXCHANGE COMMISSION

[Investment Company Act Release No. 31009; 812-14172]

ARK ETF Trust, et al.; Notice of Application

April 7, 2014.

AGENCY: Securities and Exchange Commission (the "Commission").

ACTION: Notice of an application for an order under section 6(c) of the Investment Company Act of 1940 (the "Act") for an exemption from sections 2(a)(32), 5(a)(1), 22(d) and 22(e) of the Act and rule 22c-1 under the Act, and under sections 6(c) and 17(b) of the Act for an exemption from sections 17(a)(1) and (2) of the Act, and under section 12(d)(1)(J) for an exemption from sections 12(d)(1)(A) and (B) of the Act.

APPLICANTS: ARK ETF Trust (the "Trust"), ARK Investment Management LLC (the "Adviser") and Foreside Fund Services, LLC (the "Foreside Fund Services").

SUMMARY: *Summary of Application:* Applicants request an order that permits: (a) Actively-managed series of the Trust to issue shares ("Shares") redeemable in large aggregations only ("Creation Units"); (b) secondary market transactions in Shares to occur at negotiated market prices; (c) certain series to pay redemption proceeds, under certain circumstances, more than seven days after the tender of Creation Units for redemption; (d) certain

affiliated persons of the series to deposit securities into, and receive securities from, the series in connection with the purchase and redemption of Creation Units; (e) certain registered management investment companies and unit investment trusts outside of the same group of investment companies as the series to acquire Shares; and (f) certain series to perform creations and redemptions of Creation Units in-kind in a master-feeder structure.

DATES: *Filing Dates:* The application was filed on June 25, 2013, and amended on December 2, 2013, March 12, 2014, and March 28, 2014.

HEARING OR NOTIFICATION OF HEARING: An order granting the requested relief will be issued unless the Commission orders a hearing. Interested persons may request a hearing by writing to the Commission's Secretary and serving applicants with a copy of the request, personally or by mail. Hearing requests should be received by the Commission by 5:30 p.m. on April 28, 2014, and should be accompanied by proof of service on applicants, in the form of an affidavit or, for lawyers, a certificate of service. Hearing requests should state the nature of the writer's interest, the reason for the request, and the issues contested. Persons who wish to be notified of a hearing may request notification by writing to the Commission's Secretary.

ADDRESSES: Secretary, U.S. Securities and Exchange Commission, 100 F Street NE., Washington, DC 20549. Applicants: ARK Investment Management LLC, 104 Olmstead Hill Road, Wilton, Connecticut 06897.

FOR FURTHER INFORMATION CONTACT: Steven I. Amchan, Senior Counsel, at (202) 551-6826 or David P. Bartels, Branch Chief, at (202) 551-6821 (Division of Investment Management, Chief Counsel's Office).

SUPPLEMENTARY INFORMATION: The following is a summary of the application. The complete application may be obtained via the Commission's Web site by searching for the file number, or for an applicant using the Company name box, at <http://www.sec.gov/search/search.htm> or by calling (202) 551-8090.

Applicants' Representations

1. The Trust is registered as an open-end management investment company under the Act and is organized as a Delaware statutory trust. The Trust will offer Funds (as defined below), each of which, or its respective Master Fund (as defined below), will have distinct investment strategies and will attempt

to achieve its investment objective by utilizing an active management strategy.

2. ARK Investment Management LLC, a Delaware limited liability company, is, and any other Adviser will be, registered as an investment adviser under the Investment Advisers Act of 1940 (the "Advisers Act"). The Adviser will be the investment adviser to each Fund, or its respective Master Fund (as defined below), and will, in each case, possess full discretionary investment authority with respect to the Fund or its respective Master Fund (as defined below), or discrete portions of a Fund or its respective Master Fund (as defined below) that includes the ability to appoint sub-advisers (each, a "Sub-Adviser") to a Fund or its respective Master Fund (as defined below). Any Sub-Adviser will be registered or not subject to registration under the Advisers Act. Foreside Fund Services, a Delaware limited liability company is, and any other Distributor will be, registered as a broker-dealer ("Broker") under the Securities Exchange Act of 1934 (the "Exchange Act").¹ A Distributor will serve as the principal underwriter and distributor for each of the Funds.

3. Applicants request that the order apply to future series of the Trust or of any other open-end investment company that may be created in the future that, in each case, (a) is an actively managed exchange-traded fund ("ETF"), (b) is advised by ARK Investment Management LLC or an entity controlling, controlled by, or under common control with ARK Investment Management LLC (each such entity or any successor entity thereto, an "Adviser")² and (c) complies with the terms and conditions of the application (individually a "Fund," and collectively, the "Funds").³

4. The Funds, or their respective Master Funds, may invest in equity securities or fixed income securities traded in the U.S. or non-U.S. markets. Funds, or their respective Master Funds, that invest in equity securities or fixed income securities traded in the U.S. or non-U.S. markets are "Global Funds." Funds, or their respective Master Funds,

¹ For purposes of the requested order, the term "Distributor" shall include any other entity that acts as the distributor and principal underwriter of the Creation Units of Shares of the Funds in the future and complies with the terms and conditions of the application.

² For the purposes of the requested order, "successor" is limited to an entity that would result from a reorganization into another jurisdiction or a change in the type of business organization.

³ All entities that currently intend to rely on the order are named as applicants. Any entity that relies on the order in the future will comply with the terms and conditions of the application.

that invest solely in foreign equity securities or foreign fixed income securities are "Foreign Funds." The Funds, or their respective Master Funds, may also invest in "Depository Receipts"⁴ and may engage in TBA Transactions (defined below).

Applicants further state that, in order to implement each Fund's investment strategy, the Adviser and/or Sub-Advisers of a Fund may review and change the securities, or instruments, or other assets or positions held by the Fund, or its respective Master Fund ("Portfolio Positions") daily.⁵

5. Applicants also request that any exemption under section 12(d)(1)(J) of the Act from sections 12(d)(1)(A) and (B) apply to: (i) Any Fund; (ii) any Acquiring Fund (as defined below); and (iii) any Brokers selling Shares of a Fund to an Acquiring Fund or any principal underwriter of a Fund. A management investment company or unit investment trust registered under the Act that is not part of the same "group of investment companies" as the Fund within the meaning of section 12(d)(1)(G)(ii) of the Act and that acquires Shares of a Fund in excess of the limits of Section 12(d)(1)(A) of the Act is referred to as an "Acquiring Management Company" or an "Acquiring Trust," respectively, and the Acquiring Management Companies and Acquiring Trusts are referred to collectively as "Acquiring Funds."⁶

6. Applicants further request that the order permit a Fund to operate as a feeder fund ("Feeder Fund") ("Master-Feeder Relief"). Under the order, a Feeder Fund would be permitted to acquire shares of another registered investment company in the same group of investment companies having

⁴ Depository Receipts are typically issued by a financial institution (a "Depository") and evidence ownership in a security or pool of securities that have been deposited with the Depository. A Fund (or its respective Master Fund) will not invest in any Depository Receipts that the Adviser or any Sub-Adviser deems to be illiquid or for which pricing information is not readily available. No affiliated persons of applicants or any Sub-Adviser will serve as the Depository for any Depository Receipts held by a Fund (or its respective Master Fund).

⁵ If a Fund (or its respective Master Fund) invests in derivatives, then (a) the Fund's board of trustees or directors (for any entity, the "Board") will periodically review and approve the Fund's (or, in the case of a Feeder Fund, its Master Fund's) use of derivatives and how the Fund's investment adviser assesses and manages risk with respect to the Fund's (or, in the case of a Feeder Fund, its Master Fund's) use of derivatives and (b) the Fund's disclosure of its (or, in the case of a Feeder Fund, its Master Fund's) use of derivatives in its offering documents and periodic reports will be consistent with relevant Commission and staff guidance.

⁶ An Acquiring Fund may rely on the order only to invest in a Fund and not in any other registered investment company.

substantially the same investment objectives as the Feeder Fund ("Master Fund") beyond the limitations in section 12(d)(1)(A) of the Act,⁷ and the Master Fund, and any principal underwriter for the Master Fund, would be permitted to sell shares of the Master Fund to the Feeder Fund beyond the limitations in section 12(d)(1)(B) of the Act. Applicants request that the Master-Feeder Relief apply to any Feeder Fund, any Master Fund and any principal underwriter for the Master Funds selling shares of a Master Fund to a Feeder Fund. Applicants state that creating an exchange-traded feeder fund may be preferable to creating entirely new series for several reasons, including avoiding additional overhead costs and economies of scale for the Feeder Funds.⁸ Applicants assert that, while certain costs may be higher in a master-feeder structure and there may possibly be lower tax efficiencies for the Feeder Funds, the Feeder Funds' Board will consider any such potential disadvantages against the benefits of economies of scale and other benefits of operating within a master-feeder structure.

7. A Creation Unit will consist of at least 25,000 Shares and applicants expect that the trading price of a Share will range from \$20 to \$100. All orders to purchase Creation Units must be placed with the Distributor by or through an "Authorized Participant," which is either (a) a Broker or other participant in the Continuous Net Settlement System of the National Securities Clearing Corporation ("NSCC"), and such process the "NSCC Process"), or (b) a participant in the Depository Trust Company ("DTC," such participant "DTC Participant" and such process the "DTC Process"), which, in either case, has executed an agreement with the Distributor with respect to the purchase and redemption of Creation Units.

8. In order to keep costs low and permit each Fund to be as fully invested as possible, Shares will be purchased and redeemed in Creation Units and generally on an in-kind basis.⁹ Except where the purchase or redemption will

⁷ A Feeder Fund managed in a master-feeder structure will not make direct investments in any security or other instrument other than the securities issued by its respective Master Fund.

⁸ In a master-feeder structure, the Master Fund, rather than the Feeder Fund, would invest its portfolio in compliance with the order. There would be no ability by Fund shareholders to exchange shares of Feeder Funds for shares of another feeder series of the Master Fund.

⁹ Feeder Funds will redeem shares from the appropriate Master Fund and then deliver to the redeeming shareholder the applicable redemption payment.

include cash under the limited circumstances specified below, purchasers will be required to purchase Creation Units by making an in-kind deposit of specified instruments ("Deposit Instruments"), and shareholders redeeming their Shares will receive an in-kind transfer of specified instruments ("Redemption Instruments").¹⁰ On any given Business Day¹¹ the names and quantities of the instruments that constitute the Deposit Instruments and the names and quantities of the instruments that constitute the Redemption Instruments will be identical, and these instruments may be referred to, in the case of either a purchase or a redemption, as the "Creation Basket." In addition, the Creation Basket will correspond pro rata to the positions in a Fund's portfolio (including cash positions),¹² except: (a) In the case of bonds, for minor differences when it is impossible to break up bonds beyond certain minimum sizes needed for transfer and settlement; (b) for minor differences when rounding is necessary to eliminate fractional shares or lots that are not tradeable round lots¹³; or (c) TBA Transactions,¹⁴ short positions and other positions that cannot be transferred in kind¹⁵ will be excluded from the Creation Basket.¹⁶ If there is a difference between the NAV attributable to a Creation Unit and the aggregate market value of the Creation Basket exchanged for the Creation Unit, the party conveying instruments with the

¹⁰ The Funds must comply with the federal securities laws in accepting Deposit Instruments and satisfying redemptions with Redemption Instruments, including that the Deposit Instruments and Redemption Instruments are sold in transactions that would be exempt from registration under the Securities Act of 1933 ("Securities Act"). In accepting Deposit Instruments and satisfying redemptions with Redemption Instruments that are restricted securities eligible for resale pursuant to Rule 144A under the Securities Act, the Funds will comply with the conditions of Rule 144A.

¹¹ Each Fund will sell and redeem Creation Units on any day that the Trust is open, including as required by section 22(e) of the Act (each, a "Business Day").

¹² The portfolio used for this purpose will be the same portfolio used to calculate the Fund's net asset value ("NAV") for that Business Day.

¹³ A tradeable round lot for a security will be the standard unit of trading in that particular type of security in its primary market.

¹⁴ A TBA Transaction is a method of trading mortgage-backed securities. In a TBA Transaction, the buyer and seller agree on general trade parameters such as agency, settlement date, par amount and price.

¹⁵ This includes instruments that can be transferred in kind only with the consent of the original counterparty to the extent the Fund does not intend to seek such consents.

¹⁶ Because these instruments will be excluded from the Creation Basket, their value will be reflected in the determination of the Balancing Amount (defined below).

lower value will also pay to the other an amount in cash equal to that difference (the "Balancing Amount").

9. Purchases and redemptions of Creation Units may be made in whole or in part on a cash basis, rather than in kind, solely under the following circumstances: (a) To the extent there is a Balancing Amount, as described above; (b) if, on a given Business Day, a Fund announces before the open of trading that all purchases, all redemptions or all purchases and redemptions on that day will be made entirely in cash; (c) if, upon receiving a purchase or redemption order from an Authorized Participant, a Fund determines to require the purchase or redemption, as applicable, to be made entirely in cash; (d) if, on a given Business Day, a Fund requires all Authorized Participants purchasing or redeeming Shares on that day to deposit or receive (as applicable) cash in lieu of some or all of the Deposit Instruments or Redemption Instruments, respectively, solely because: (i) Such instruments are not eligible for transfer through either the NSCC Process or DTC Process; or (ii) in the case of Global Funds and Foreign Funds, such instruments are not eligible for trading due to local trading restrictions, local restrictions on securities transfers or other similar circumstances; or (e) if a Fund permits an Authorized Participant to deposit or receive (as applicable) cash in lieu of some or all of the Deposit Instruments or Redemption Instruments, respectively, solely because: (i) Such instruments are, in the case of the purchase of a Creation Unit, not available in sufficient quantity; (ii) such instruments are not eligible for trading by an Authorized Participant or the investor on whose behalf the Authorized Participant is acting; or (iii) a holder of Shares of a Global Fund or Foreign Fund would be subject to unfavorable income tax treatment if the holder receives redemption proceeds in kind.¹⁷

10. Each Business Day, before the open of trading on a national securities exchange, as defined in section 2(a)(26) of the Act (a "Listing Market"), on which Shares are listed and traded, each Fund will cause to be published through the NSCC the names and quantities of the instruments comprising the Creation Basket, as well as the estimated Balancing Amount (if any), for that day. The published Creation Basket will apply until a new Creation Basket is announced on the following Business

Day, and there will be no intra-day changes to the Creation Basket except to correct errors in the published Creation Basket. The Listing Market will disseminate, every 15 seconds throughout the regular trading hours, through the facilities of the Consolidated Tape Associate, an estimated NAV, which is an amount per Share representing the current value of the Portfolio Positions that were publicly disclosed prior to the commencement of trading in Shares on the Listing Market.

11. Each Fund will recoup the settlement costs charged by NSCC and DTC by imposing a fee (the "Transaction Fee") on investors purchasing or redeeming Creation Units.¹⁸ Where a Fund permits an in-kind purchaser or redeemer to deposit or receive cash in lieu of one or more Deposit or Redemption Instruments, the purchaser or redeemer may be assessed a higher Transaction Fee to offset the cost of buying or selling those particular Deposit or Redemption Instruments. In all cases, such Transaction Fees will be limited in accordance with requirements of the Commission applicable to management investment companies offering redeemable securities. All orders to purchase Creation Units must be placed with the Distributor by or through an Authorized Participant and the Distributor will transmit such orders to the Funds. The Distributor will be responsible for maintaining records of both the orders placed with it and the confirmations of acceptance furnished by it.

12. Purchasers of Shares in Creation Units may hold such Shares or may sell such Shares into the secondary market. Shares will be listed and traded at negotiated prices on a Listing Market and it is expected that the relevant Listing Market will designate one or more member firms to maintain a market for the Shares.¹⁹ The price of

¹⁸ Applicants are not requesting relief from section 18 of the Act. Accordingly, a Master Fund may require a Transaction Fee payment to cover expenses related to purchases or redemptions of the Master Fund's shares by a Feeder Fund only if it requires the same payment for equivalent purchases or redemptions by any other feeder fund. Thus, for example, a Master Fund may require payment of a Transaction Fee by a Feeder Fund for transactions for 20,000 or more shares so long as it requires payment of the same Transaction Fee by all feeder funds for transactions involving 20,000 or more shares.

¹⁹ If Shares are listed on The NASDAQ Stock Market LLC ("Nasdaq") or a similar electronic Listing Market (including NYSE Arca, Inc.), one or more member firms of that Listing Market will act as market maker (a "Market Maker") and maintain a market for Shares trading on that Listing Market. On Nasdaq, no particular Market Maker would be contractually obligated to make a market in Shares. However, the listing requirements on Nasdaq

Shares trading on a Listing Market will be based on a current bid-offer in the secondary market. Purchases and sales of Shares in the secondary market will not involve a Fund and will be subject to customary brokerage commissions and charges.

13. Applicants expect that purchasers of Creation Units will include institutional investors and arbitrageurs. Applicants expect that secondary market purchasers of Shares will include both institutional and retail investors.²⁰ Applicants believe that the structure and operation of the Funds will be designed to enable efficient arbitrage and, thereby, minimize the probability that Shares will trade at a material premium or discount to a Fund's NAV.

14. Shares will not be individually redeemable and owners of Shares may acquire those Shares from a Fund, or tender such shares for redemption to the Fund, in Creation Units only. To redeem, an investor must accumulate enough Shares to constitute a Creation Unit. Redemption requests must be placed by or through an Authorized Participant. As discussed above, redemptions of Creation Units will generally be made on an in-kind basis, subject to certain specified exceptions under which redemptions may be made in whole or in part on a cash basis, and will be subject to a Transaction Fee.

15. Neither a Trust nor any Fund will be advertised or marketed or otherwise held out as a traditional open-end investment company or mutual fund. Instead, each Fund will be marketed as an "actively-managed exchange-traded fund." All marketing materials that describe the features or method of obtaining, buying, or selling Creation Units, or Shares traded on a Listing Market, or refer to redeemability, will prominently disclose that Shares are not individually redeemable and that the owners of Shares may acquire those Shares from a Fund or tender those Shares for redemption to the Fund in Creation Units only.

16. The Trust's Web site ("Web site"), which will be publicly available prior to the offering of Shares, will include each

stipulate that at least two Market Makers must be registered in Shares to maintain a listing. Registered Market Makers are required to make a continuous two-sided market or subject themselves to regulatory sanctions. No Market Maker will be an affiliated person, or an affiliated person of an affiliated person, of the Funds, except within the meaning of section 2(a)(3)(A) or (C) of the Act due solely to ownership of Shares.

²⁰ Shares will be registered in book-entry form only. DTC or its nominee will be the registered owner of all outstanding Shares. Beneficial ownership of Shares will be shown on the records of DTC or DTC Participants.

¹⁷ A "custom order" is any purchase or redemption of Shares made in whole or in part on a cash basis in reliance on clause (e)(i) or (e)(ii).

Fund's prospectus ("Prospectus"), statement of additional information ("SAI"), and summary prospectus, if used. The Web site will contain, on a per Share basis for each Fund, the prior Business Day's NAV and the market closing price or mid-point of the bid/ask spread at the time of calculation of such NAV ("Bid/Ask Price"), and a calculation of the premium or discount of the market closing price or the Bid/Ask Price against such NAV. On each Business Day, prior to the commencement of trading in Shares on a Listing Market, each Fund shall post on the Web site the identities and quantities of the Portfolio Positions held by the Fund, or its respective Master Fund, that will form the basis for the calculation of the NAV at the end of that Business Day.²¹

Applicants' Legal Analysis

1. Applicants request an order under section 6(c) of the Act granting an exemption from sections 2(a)(32), 5(a)(1), 22(d) and 22(e) of the Act and rule 22c-1 under the Act; and under sections 6(c) and 17(b) of the Act granting an exemption from sections 17(a)(1) and (2) of the Act, and under section 12(d)(1)(j) for an exemption from sections 12(d)(1)(A) and (B) of the Act.

2. Section 6(c) of the Act provides that the Commission may exempt any person, security or transaction, or any class of persons, securities or transactions, from any provision of the Act, if and to the extent that such exemption is necessary or appropriate in the public interest and consistent with the protection of investors and the purposes fairly intended by the policy and provisions of the Act. Section 17(b) of the Act authorizes the Commission to exempt a proposed transaction from section 17(a) of the Act if evidence establishes that the terms of the transaction, including the consideration to be paid or received, are reasonable and fair and do not involve overreaching on the part of any person concerned, and the proposed transaction is consistent with the policies of the registered investment company and the general provisions of the Act. Section 12(d)(1)(j) of the Act provides that the Commission may exempt any person, security, or transaction, or any class or classes of persons, securities or transactions, from

any provision of section 12(d)(1) if the exemption is consistent with the public interest and the protection of investors.

Sections 5(a)(1) and 2(a)(32) of the Act

3. Section 5(a)(1) of the Act defines an "open-end company" as a management investment company that is offering for sale or has outstanding any redeemable security of which it is the issuer. Section 2(a)(32) of the Act defines a redeemable security as any security, other than short-term paper, under the terms of which the holder, upon its presentation to the issuer, is entitled to receive approximately a proportionate share of the issuer's current net assets, or the cash equivalent. Because Shares will not be individually redeemable, applicants request an order that would permit the Trust to register as an open-end management investment company and issue Shares that are redeemable in Creation Units only.²² Applicants state that investors may purchase Shares in Creation Units from each Fund and that Creation Units will always be redeemable in accordance with the provisions of the Act. Applicants further state that because the market price of Shares will be disciplined by arbitrage opportunities, investors should be able to sell Shares in the secondary market at prices that do not vary materially from their NAV.

Section 22(d) of the Act and Rule 22c-1 Under the Act

4. Section 22(d) of the Act, among other things, prohibits a dealer from selling a redeemable security that is currently being offered to the public by or through a principal underwriter, except at a current public offering price described in the prospectus. Rule 22c-1 under the Act generally requires that a dealer selling, redeeming, or repurchasing a redeemable security do so only at a price based on its NAV. Applicants state that secondary market trading in Shares will take place at negotiated prices, not at a current offering price described in the Prospectus, and not at a price based on NAV. Thus, purchases and sales of Shares in the secondary market will not comply with section 22(d) of the Act and rule 22c-1 under the Act. Applicants request an exemption under section 6(c) from these provisions.²³

²² The Master Funds will not require relief from sections 2(a)(32) and 5(a)(1) because the Master Funds will issue individually redeemable securities.

²³ The Master Funds will not require relief from section 22(d) or rule 22c-1 because shares of the Master Funds will not trade at negotiated prices in the secondary market.

5. Applicants state that, while there is little legislative history regarding section 22(d), its provisions, as well as those of rule 22c-1, appear to have been designed to (a) to prevent dilution caused by certain riskless-trading schemes by principal underwriters and contract dealers, (b) to prevent unjust discrimination or preferential treatment among buyers and (c) to ensure an orderly distribution system of shares by contract dealers by eliminating price competition from non-contract dealers who could offer investors shares at less than the published sales price and who could pay investors a little more than the published redemption price.

6. Applicants assert that the protections intended to be afforded by Section 22(d) and rule 22c-1 are adequately addressed by the proposed methods for creating, redeeming and pricing Creation Units and pricing and trading Shares. Applicants state that (a) secondary market trading in Shares does not involve the Funds as parties and cannot result in dilution of an investment in Shares and (b) to the extent different prices exist during a given trading day, or from day to day, such variances occur as a result of third-party market forces but do not occur as a result of unjust or discriminatory manipulation. Finally, applicants assert that competitive forces in the marketplace should ensure that the margin between NAV and the price for the Shares in the secondary market remains narrow.

Section 22(e) of the Act

7. Section 22(e) of the Act generally prohibits a registered investment company from suspending the right of redemption or postponing the date of payment of redemption proceeds for more than seven days after the tender of a security for redemption. Applicants observe that the settlement of redemptions of Creation Units of the Foreign and Global Funds is contingent not only on the settlement cycle of the U.S. securities markets but also on the delivery cycles present in foreign markets for underlying foreign Portfolio Positions in which those Funds invest. Applicants have been advised that, under certain circumstances, the delivery cycles for transferring Portfolio Positions to redeeming investors, coupled with local market holiday schedules, will require a delivery process of up to fifteen (15) calendar days. Applicants therefore request relief from section 22(e) in order to provide payment or satisfaction of redemptions within a longer number of calendar days as required for such payment or satisfaction in the principal local

²¹ Under accounting procedures followed by the Fund, trades made on the prior Business Day ("T") will be booked and reflected in NAV on the current Business Day (T+1). Accordingly, the Funds will be able to disclose at the beginning of the Business Day the portfolio that will form the basis for the NAV calculation at the end of the Business Day.

markets where transactions in the Portfolio Positions of each Foreign and Global Fund customarily clear and settle, but in all cases no later than fifteen (15) days following the tender of a Creation Unit.²⁴

8. Applicants state that section 22(e) was designed to prevent unreasonable, undisclosed or unforeseen delays in the actual payment of redemption proceeds. Applicants assert that the protections intended to be afforded by Section 22(e) are adequately addressed by the proposed method and securities delivery cycles for redeeming Creation Units. Applicants state that allowing redemption payments for Creation Units of a Fund to be made within a maximum of fifteen (15) calendar days²⁵ would not be inconsistent with the spirit and intent of section 22(e).²⁶ Applicants represent that each Fund's Prospectus and/or SAI will identify those instances in a given year where, due to local holidays, more than seven calendar days, up to a maximum of fifteen (15) calendar days, will be needed to deliver redemption proceeds and will list such holidays. Applicants are not seeking relief from section 22(e) with respect to Foreign and Global Funds that do not effect redemptions in-kind.

Section 12(d)(1) of the Act

9. Section 12(d)(1)(A) of the Act prohibits a registered investment company from acquiring shares of an investment company if the securities represent more than 3% of the total outstanding voting stock of the acquired company, more than 5% of the total assets of the acquiring company, or, together with the securities of any other investment companies, more than 10% of the total assets of the acquiring company. Section 12(d)(1)(B) of the Act prohibits a registered open-end investment company, its principal underwriter, or any other broker or dealer from selling its shares to another investment company if the sale will cause the acquiring company to own more than 3% of the acquired company's voting stock, or if the sale will cause more than 10% of the acquired company's voting stock to be

²⁴ Applicants acknowledge that no relief obtained from the requirements of Section 22(e) of the Act will affect any obligations that it may otherwise have under Rule 15c6-1 under the Exchange Act. Rule 15c6-1 requires that most securities transactions be settled within three business days of the trade date.

²⁵ Certain countries in which a Fund may invest have historically had settlement periods of up to 15 calendar days.

²⁶ Other feeder funds invested in any Master Fund are not seeking, and will not rely on, the section 22(e) relief requested herein.

owned by investment companies generally.

10. Applicants request relief to permit Acquiring Funds to acquire Shares in excess of the limits in section 12(d)(1)(A) of the Act and to permit the Funds, their principal underwriters and any Broker to sell Shares to Acquiring Funds in excess of the limits in section 12(d)(1)(B) of the Act. Applicants submit that the proposed conditions to the requested relief address the concerns underlying the limits in section 12(d)(1), which include concerns about undue influence, excessive layering of fees and overly complex structures.

11. Applicants submit that their proposed conditions address concerns regarding the potential for undue influence. To limit the control that an Acquiring Fund may have over a Fund, applicants propose a condition prohibiting the adviser of an Acquiring Management Company ("Acquiring Fund Advisor"), sponsor of an Acquiring Trust ("Sponsor"), any person controlling, controlled by, or under common control with the Acquiring Fund Advisor or Sponsor, and any investment company or issuer that would be an investment company but for sections 3(c)(1) or 3(c)(7) of the Act that is advised or sponsored by the Acquiring Fund Advisor, the Sponsor, or any person controlling, controlled by, or under common control with the Acquiring Fund Advisor or Sponsor ("Acquiring Fund's Advisory Group") from controlling (individually or in the aggregate) a Fund within the meaning of section 2(a)(9) of the Act. The same prohibition would apply to any sub-adviser to an Acquiring Fund ("Acquiring Fund Sub-Advisor"), any person controlling, controlled by or under common control with the Acquiring Fund Sub-Advisor, and any investment company or issuer that would be an investment company but for sections 3(c)(1) or 3(c)(7) of the Act (or portion of such investment company or issuer) advised or sponsored by the Acquiring Fund Sub-Advisor or any person controlling, controlled by or under common control with the Acquiring Fund Sub-Advisor ("Acquiring Fund's Sub-Advisory Group").

12. Applicants propose a condition to ensure that no Acquiring Fund or Acquiring Fund Affiliate²⁷ (except to

²⁷ An "Acquiring Fund Affiliate" is any Acquiring Fund Advisor, Acquiring Fund Sub-Advisor, Sponsor, promoter and principal underwriter of an Acquiring Fund, and any person controlling, controlled by or under common control with any of these entities. "Fund Affiliate" is an investment adviser, promoter, or principal underwriter of a Fund or any person controlling,

the extent it is acting in its capacity as an investment adviser to a Fund) will cause a Fund to purchase a security in an offering of securities during the existence of an underwriting or selling syndicate of which a principal underwriter is an Underwriting Affiliate ("Affiliated Underwriting"). An "Underwriting Affiliate" is a principal underwriter in any underwriting or selling syndicate that is an officer, director, member of an advisory board, Acquiring Fund Advisor, Acquiring Fund Sub-Advisor, employee or Sponsor of the Acquiring Fund, or a person of which any such officer, director, member of an advisory board, Acquiring Fund Advisor, Acquiring Fund Sub-Advisor, employee or Sponsor is an affiliated person (except any person whose relationship to the Fund is covered by section 10(f) of the Act is not an Underwriting Affiliate).

13. Applicants propose several conditions to address the potential for layering of fees. Applicants note that the Board of any Acquiring Management Company, including a majority of the directors or trustees who are not "interested persons" within the meaning of section 2(a)(19) of the Act (for any Board, the "Independent Trustees"), will be required to find that the advisory fees charged under the contract are based on services provided that will be in addition to, rather than duplicative of, services provided under the advisory contract of any Fund in which the Acquiring Management Company may invest. Applicants also state that any sales charges and/or service fees charged with respect to shares of an Acquiring Fund will not exceed the limits applicable to a fund of funds as set forth in NASD Conduct Rule 2830.²⁸

14. Applicants submit that the proposed arrangement will not create an overly complex fund structure. Applicants note that a Fund will be prohibited from acquiring securities of any investment company or company relying on section 3(c)(1) or 3(c)(7) of the Act in excess of the limits contained in section 12(d)(1)(A) of the Act, except to the extent permitted by exemptive relief from the Commission permitting the Fund to purchase shares of other investment companies for short-term cash management purposes.

15. To ensure that an Acquiring Fund is aware of the terms and conditions of the requested order, the Acquiring

controlled by or under common control with any of these entities.

²⁸ Any reference to NASD Conduct Rule 2830 includes any successor or replacement rule that may be adopted by the Financial Industry Regulatory Authority.

Funds must enter into an agreement with the respective Funds (“Acquiring Fund Agreement”). The Acquiring Fund Agreement will include an acknowledgement from the Acquiring Fund that it may rely on the order only to invest in a Fund and not in any other investment company.

16. Applicants also are seeking relief from sections 12(d)(1)(A) and 12(d)(1)(B) to the extent necessary to permit the Feeder Funds to perform creations and redemptions of Shares in-kind in a master-feeder structure. Applicants assert that this structure is substantially identical to traditional master-feeder structures permitted pursuant to the exception provided in section 12(d)(1)(E) of the Act. Section 12(d)(1)(E) provides that the percentage limitations of sections 12(d)(1)(A) and (B) will not apply to a security issued by an investment company (in this case, the shares of the applicable Master Fund) if, among other things, that security is the only investment security held in the investing fund’s portfolio (in this case, the Feeder Fund’s portfolio). Applicants believe the proposed master-feeder structure complies with section 12(d)(1)(E) because each Feeder Fund will hold only investment securities issued by its corresponding Master Fund; however, the Feeder Funds may receive securities other than securities of its corresponding Master Fund if a Feeder Fund accepts an in-kind creation. To the extent that a Feeder Fund may be deemed to be holding both shares of the Master Fund and other securities, applicants request relief from sections 12(d)(1)(A) and (B). The Feeder Funds would operate in compliance with all other provisions of section 12(d)(1)(E).

Section 17(a) of the Act

17. Section 17(a) of the Act generally prohibits an affiliated person of a registered investment company, or an affiliated person of such person (“Second Tier Affiliates”), from selling any security to or purchasing any security from the company. Section 2(a)(3) of the Act defines “affiliated person” to include any person directly or indirectly owning, controlling, or holding with power to vote 5% or more of the outstanding voting securities of the other person and any person directly or indirectly controlling, controlled by, or under common control with, the other person. Section 2(a)(9) of the Act defines “control” as “the power to exercise a controlling influence over the management or policies” of the fund and provides that a control relationship will be presumed where one person owns more than 25% of another

person’s voting securities. The Funds may be deemed to be controlled by the Adviser or an entity controlling, controlled by or under common control with the Adviser and hence affiliated persons of each other. In addition, the Funds may be deemed to be under common control with any other registered investment company (or series thereof) advised by the Adviser or an entity controlling, controlled by or under common control with the Adviser (an “Affiliated Fund”).

18. Applicants request an exemption under sections 6(c) and 17(b) of the Act from sections 17(a)(1) and 17(a)(2) of the Act to permit in-kind purchases and redemptions of Creation Units from the Funds by persons that are affiliated persons or Second Tier Affiliates of the Funds solely by virtue of one or more of the following: (a) Holding 5% or more, or more than 25%, of the Shares of a Trust of one or more Funds; (b) having an affiliation with a person with an ownership interest described in (a); or (c) holding 5% or more, or more than 25%, of the shares of one or more Affiliated Funds. Applicants also request an exemption in order to permit each Fund to sell Shares to and redeem Shares from, and engage in the in-kind transactions that would accompany such sales and redemptions with, any Acquiring Fund of which the Fund is an affiliated person or Second-Tier Affiliate.²⁹

19. Applicants assert that no useful purpose would be served by prohibiting such affiliated persons or Second Tier Affiliates from making in-kind purchases or in-kind redemptions of Shares of a Fund in Creation Units. Both the deposit procedures for in-kind purchases of Creation Units and the redemption procedures for in-kind redemptions will be the same for all purchases and redemptions. Deposit Instruments and Redemption Instruments will be valued in the same manner as those Portfolio Positions

²⁹ Applicants anticipate that most Acquiring Funds will purchase Shares in the secondary market and will not purchase or redeem Creation Units directly from a Fund. To the extent that purchases and sales of Shares occur in the secondary market and not through principal transactions directly between an Acquiring Fund and a Fund, relief from section 17(a) would not be necessary. However, the requested relief would apply to direct sales of Shares in Creation Units by a Fund to an Acquiring Fund and redemptions of those Shares in Creation Units. The requested relief is intended to cover transactions that would accompany such sales and redemptions. Applicants are not seeking relief from section 17(a) for, and the requested relief will not apply to, transactions where a Fund could be deemed an affiliated person, or an affiliated person of an affiliated person of an Acquiring Fund because an investment adviser to the Funds is also an investment adviser to that Acquiring Fund.

currently held by the relevant Funds, or their respective Master Funds, and the valuation of the Deposit Instruments and Redemption Instruments will be made in an identical manner regardless of the identity of the purchaser or redeemer. Applicants do not believe that in-kind purchases and redemptions will result in abusive self-dealing or overreaching of the Fund.

20. Applicants also submit that the sale of Shares to and redemption of Shares from an Acquiring Fund satisfies the standards for relief under sections 17(b) and 6(c) of the Act. Applicants note that any consideration paid for the purchase or redemption of Shares directly from a Fund will be based on the NAV of the Fund.³⁰ The Acquiring Fund Agreement will require any Acquiring Fund that purchases Creation Units directly from a Fund to represent that the purchase will be in compliance with its investment restrictions and consistent with the investment policies set forth in its registration statement.

21. In addition, to the extent that a Fund operates in a master-feeder structure, applicants also request relief permitting the Feeder Funds to engage in in-kind creations and redemptions with the applicable Master Fund. Applicants state that the request for relief described above would not be sufficient to permit such transactions because the Feeder Funds and the applicable Master Fund could also be affiliated by virtue of having the same investment adviser. However, applicants believe that in-kind creations and redemptions between a Feeder Fund and a Master Fund advised by the same investment adviser do not involve “overreaching” by an affiliated person. Applicants represent that such transactions will occur only at the Feeder Fund’s proportionate share of the Master Fund’s net assets, and the distributed securities will be valued in the same manner as they are valued for the purposes of calculating the applicable Master Fund’s NAV. Further, all such transactions will be effected with respect to pre-determined securities and on the same terms with respect to all investors. Finally, such transaction would only occur as a result of, and to effectuate, a creation or redemption transaction between the Feeder Fund and a third-party investor.

³⁰ Applicants acknowledge that the receipt of compensation by (a) an affiliated person of an Acquiring Fund, or an affiliated person of such person, for the purchase by the Acquiring Fund of Shares of a Fund or (b) an affiliated person of a Fund, or an affiliated person of such person, for the sale by the Fund of its Shares to an Acquiring Fund, may be prohibited by section 17(e)(1) of the Act. The Acquiring Fund Agreement also will include this acknowledgment.

Applicants state that, in effect, the Feeder Fund will serve as a conduit through which creation and redemption orders by Authorized Participants will be effected.

22. Applicants believe that: (a) With respect to the relief requested pursuant to section 17(b), the proposed transactions are fair and reasonable, and do not involve overreaching on the part of any person concerned, the proposed transactions are consistent with the policy of each Fund and, where applicable, Acquiring Fund, and the proposed transactions are consistent with the general purposes of the Act; and (b) with respect to the relief requested pursuant to section 6(c), the requested exemption for the proposed transactions is appropriate in the public interest and consistent with the protection of investors and the purposes fairly intended by the policy and provisions of the Act.

Applicants' Conditions

Applicants agree that any order of the Commission granting the requested relief will be subject to the following conditions:

A. Actively-Managed Exchange-Traded Fund Relief

1. Neither the Trust nor any Fund will be advertised or marketed as an open-end investment company or mutual fund. Any advertising material that describes the purchase or sale of Creation Units or refers to redeemability will prominently disclose that the Shares are not individually redeemable and that owners of the Shares may acquire those Shares from the Fund and tender those Shares for redemption to the Fund in Creation Units only.

2. The Web site, which is and will be publicly accessible at no charge, will contain, on a per Share basis for each Fund, the prior Business Day's NAV and the market closing price or the Bid/Ask Price, and a calculation of the premium or discount of the market closing price or Bid/Ask Price against such NAV.

3. As long as a Fund operates in reliance on the requested order, its Shares will be listed on a Listing Market.

4. On each Business Day, before commencement of trading in Shares on a Fund's Listing Market, the Fund will disclose on the Web site the identities and quantities of the Portfolio Positions held by the Fund, or its respective Master Fund, that will form the basis for the Fund's calculation of NAV at the end of the Business Day.

5. The Adviser or any Sub-Advisers, directly or indirectly, will not cause any Authorized Participant (or any investor

on whose behalf an Authorized Participant may transact with the Fund) to acquire any Deposit Instrument for a Fund, or its respective Master Fund, through a transaction in which the Fund, or its respective Master Fund, could not engage directly.

6. The requested relief to permit ETF operations will expire on the effective date of any Commission rule under the Act that provides relief permitting the operation of actively-managed exchange-traded funds, other than the Master-Feeder Relief.

B. Section 12(d)(1) Relief

7. The members of an Acquiring Fund's Advisory Group will not control (individually or in the aggregate) a Fund, or its respective Master Fund, within the meaning of section 2(a)(9) of the Act. The members of an Acquiring Fund's Sub-Advisory Group will not control (individually or in the aggregate) a Fund, or its respective Master Fund, within the meaning of section 2(a)(9) of the Act. If, as a result of a decrease in the outstanding voting securities of a Fund, the Acquiring Fund's Advisory Group or the Acquiring Fund's Sub-Advisory Group, each in the aggregate, becomes a holder of more than 25 percent of the outstanding voting securities of a Fund, it will vote its Shares of the Fund in the same proportion as the vote of all other holders of that Fund's Shares. This condition does not apply to the Acquiring Fund's Sub-Advisory Group with respect to a Fund, or its respective Master Fund, for which the Acquiring Fund Sub-Advisor or a person controlling, controlled by, or under common control with the Acquiring Fund Sub-Advisor acts as the investment adviser within the meaning of section 2(a)(20)(A) of the Act.

8. No Acquiring Fund or Acquiring Fund Affiliate will cause any existing or potential investment by the Acquiring Fund in a Fund to influence the terms of any services or transactions between the Acquiring Fund or an Acquiring Fund Affiliate and the Fund, or its respective Master Fund, or a Fund Affiliate.

9. The Board of an Acquiring Management Company, including a majority of the Independent Trustees, will adopt procedures reasonably designed to ensure that the Acquiring Fund Advisor and any Acquiring Fund Sub-Advisor are conducting the investment program of the Acquiring Management Company without taking into account any consideration received by the Acquiring Management Company or an Acquiring Fund Affiliate from a Fund, or its respective Master Fund, or

a Fund Affiliate in connection with any services or transactions.

10. Once an investment by an Acquiring Fund in the Shares of a Fund exceeds the limits in section 12(d)(1)(A)(i) of the Act, the Board of the Fund, or its respective Master Fund, including a majority of the Independent Trustees, will determine that any consideration paid by the Fund, or its respective Master Fund, to an Acquiring Fund or an Acquiring Fund Affiliate in connection with any services or transactions: (i) Is fair and reasonable in relation to the nature and quality of the services and benefits received by the Fund, or its respective Master Fund; (ii) is within the range of consideration that the Fund would be required to pay to another unaffiliated entity in connection with the same services or transactions; and (iii) does not involve overreaching on the part of any person concerned. This condition does not apply with respect to any services or transactions between a Fund, or its respective Master Fund, and its investment adviser(s), or any person controlling, controlled by or under common control with such investment adviser(s).

11. No Acquiring Fund or Acquiring Fund Affiliate (except to the extent it is acting in its capacity as an investment adviser to a Fund) will cause the Fund, or its respective Master Fund, to purchase a security in any Affiliated Underwriting.

12. The Board of a Fund, or its respective Master Fund, including a majority of the Independent Trustees, will adopt procedures reasonably designed to monitor any purchases of securities by the Fund, or its respective Master Fund, in an Affiliated Underwriting, once an investment by an Acquiring Fund in the securities of the Fund exceeds the limit of section 12(d)(1)(A)(i) of the Act, including any purchases made directly from an Underwriting Affiliate. The Board of the Fund will review these purchases periodically, but no less frequently than annually, to determine whether the purchases were influenced by the investment by the Acquiring Fund in the Fund. The Board of the Fund will consider, among other things: (i) Whether the purchases were consistent with the investment objectives and policies of the Fund, or its respective Master Fund; (ii) how the performance of securities purchased in an Affiliated Underwriting compares to the performance of comparable securities purchased during a comparable period of time in underwritings other than Affiliated Underwritings or to a benchmark such as a comparable market index; and (iii) whether the amount of

securities purchased by the Fund, or its respective Master Fund, in Affiliated Underwritings and the amount purchased directly from an Underwriting Affiliate have changed significantly from prior years. The Board of the Fund will take any appropriate actions based on its review, including, if appropriate, the institution of procedures designed to ensure that purchases of securities in Affiliated Underwritings are in the best interest of shareholders of the Fund.

13. Each Fund, or its respective Master Fund, will maintain and preserve permanently in an easily accessible place a written copy of the procedures described in the preceding condition, and any modifications to such procedures, and will maintain and preserve for a period of not less than six years from the end of the fiscal year in which any purchase in an Affiliated Underwriting occurred, the first two years in an easily accessible place, a written record of each purchase of securities in Affiliated Underwritings, once an investment by an Acquiring Fund in the securities of the Fund exceeds the limit of section 12(d)(1)(A)(i) of the Act, setting forth from whom the securities were acquired, the identity of the underwriting syndicate's members, the terms of the purchase, and the information or materials upon which the determinations of the Board of the Fund were made.

14. Before investing in Shares of a Fund in excess of the limits in section 12(d)(1)(A), each Acquiring Fund and the Fund will execute an Acquiring Fund Agreement stating, without limitation, that their Boards and their investment adviser(s), or their Sponsors or trustees ("Trustee"), as applicable, understand the terms and conditions of the requested order, and agree to fulfill their responsibilities under the requested order. At the time of its investment in Shares of a Fund in excess of the limit in section 12(d)(1)(A)(i), an Acquiring Fund will notify the Fund of the investment. At such time, the Acquiring Fund will also transmit to the Fund a list of the names of each Acquiring Fund Affiliate and Underwriting Affiliate. The Acquiring Fund will notify the Fund of any changes to the list of the names as soon as reasonably practicable after a change occurs. The Fund and the Acquiring Fund will maintain and preserve a copy of the requested order, the Acquiring Fund Agreement, and the list with any updated information for the duration of the investment and for a period of not less than six years thereafter, the first two years in an easily accessible place.

15. The Acquiring Fund Advisor, Trustee or Sponsor, as applicable, will waive fees otherwise payable to it by the Acquiring Fund in an amount at least equal to any compensation (including fees received pursuant to any plan adopted under rule 12b-1 under the Act) received from the Fund, or its respective Master Fund, by the Acquiring Fund Advisor, Trustee or Sponsor, or an affiliated person of the Acquiring Fund Advisor, Trustee or Sponsor, other than any advisory fees paid to the Acquiring Fund Advisor, Trustee or Sponsor, or its affiliated person by the Fund, or its respective Master Fund, in connection with the investment by the Acquiring Fund in the Fund. Any Acquiring Fund Sub-Advisor will waive fees otherwise payable to the Acquiring Fund Sub-Advisor, directly or indirectly, by the Acquiring Management Company in an amount at least equal to any compensation received from a Fund, or its respective Master Fund, by the Acquiring Fund Sub-Advisor, or an affiliated person of the Acquiring Fund Sub-Advisor, other than any advisory fees paid to the Acquiring Fund Sub-Advisor or its affiliated person by the Fund, or its respective Master Fund, in connection with any investment by the Acquiring Management Company in the Fund made at the direction of the Acquiring Fund Sub-Advisor. In the event that the Acquiring Fund Sub-Advisor waives fees, the benefit of the waiver will be passed through to the Acquiring Management Company.

16. Any sales charges and/or service fees charged with respect to shares of an Acquiring Fund will not exceed the limits applicable to a fund of funds as set forth in NASD Conduct Rule 2830.

17. No Fund, or its respective Master Fund, will acquire securities of any other investment company or company relying on section 3(c)(1) or 3(c)(7) of the Act in excess of the limits contained in section 12(d)(1)(A) of the Act, except to the extent (i) the Fund, or its respective Master Fund, acquires securities of another investment company pursuant to exemptive relief from the Commission permitting the Fund, or its respective Master Fund, to acquire securities of one or more investment companies for short-term cash management purposes or (ii) the Fund acquires securities of the Master Fund pursuant to the Master-Feeder Relief.

18. Before approving any advisory contract under section 15 of the Act, the Board of each Acquiring Management Company, including a majority of the Independent Trustees, will find that the advisory fees charged under such advisory contract are based on services

provided that will be in addition to, rather than duplicative of, the services provided under the advisory contract(s) of any Fund, or its respective Master Fund, in which the Acquiring Management Company may invest. These findings and their basis will be recorded fully in the minute books of the appropriate Acquiring Management Company.

For the Commission, by the Division of Investment Management, under delegated authority.

Kevin M. O'Neill,
Deputy Secretary.

BILLING CODE 8011-01-P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34-71886; File No. SR-DTC-2014-04]

Self-Regulatory Organizations; The Depository Trust Company; Notice of Filing of Proposed Rule Change To Effect Changes to the DTC Settlement Service Guide Relating to the Automated Customer Account Transfer Service of National Securities Clearing Corporation

April 7, 2014.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 ("Act")¹ and Rule 19b-4 thereunder,² notice is hereby given that on March 28, 2014, The Depository Trust Company ("DTC") filed with the Securities and Exchange Commission ("Commission") the proposed rule change described in Items I, II and III below, which Items have been prepared primarily by DTC. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The proposed rule change consists of conforming changes to the DTC Settlement Service Guide (the "Guide")³ with respect to proposed changes in the Automated Customer Account Transfer Service ("ACATS") of its affiliate, National Securities Clearing Corporation ("NSCC").⁴

¹ 15 U.S.C. 78s(b)(1).

² 17 CFR 240.19b-4.

³ The Guide is available at <http://www.dtcc.com/~media/Files/Downloads/legal/service-guides/Settlement.ashx>.

⁴ Terms not defined herein have the meaning set forth in DTC's Rules & Procedures (the "Rules") available at <http://www.dtcc.com/en/legal/rules-and-procedures.aspx>.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, DTC included statements concerning the purpose of and basis for the proposed rule change, and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. DTC has prepared summaries, set forth in sections (A), (B), and (C) below, of the most significant aspects of such statements.

(A) Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

i. Background

ACATS is an NSCC service that interfaces with DTC for the delivery of customer⁵ securities from the account of one DTC Participant (that is also an NSCC Member) to another DTC Participant (that is also an NSCC Member). NSCC has proposed a redesign of ACATS (under NSCC rule filing SR-NSCC-2014-04, the "NSCC Proposal") which, if approved, will require conforming changes to DTC's Procedures. Under the NSCC Proposal, customer account transfers with respect to two types of DTC-eligible securities will be processed through a new NSCC accounting operation (to be known as the "ACATS Settlement Accounting Operation") on an ACATS Settlement Date (as defined therein).

The key provision of the NSCC Proposal impacting DTC is that ACATS transactions will no longer have an associated incentive charge in NSCC's system so that such an ACATS transfer will have no related funds settlement risk to either NSCC or DTC. In this regard, ACATS transfers will be entirely free of payment on the books of DTC. Accordingly, DTC proposes to change its procedures set forth in the Guide as described below. The proposal also includes clarifications in the Guide with respect to the protection of customer securities processed through ACATS.

ii. Proposed DTC Rule Changes

Elimination of Short Cover Charge

An "ACATS short cover charge" is a dollar amount guaranteed by NSCC to DTC for the value of securities delivered

⁵ For purposes of this rule filing, "customer" refers to an accountholder of a DTC Participant whose account is transferred to another DTC Participant by an ACATS transaction.

from a Participant's DTC account to NSCC for processing by NSCC through its Continuous Net Settlement system ("CNS"). Because ACATS transfers will be entirely free of payment under the NSCC proposal as described above, a provision in the Guide relating to the processing of "ACATS short cover charges" will be deleted, with related adjustments to references to the DTC Collateral Monitor.⁶

Long Allocations

At NSCC, under current rules, long allocations of securities made via CNS may be reversed if the NSCC Member receiving the securities fails to meet its NSCC money settlement obligation. Because ACATS transactions will not generate any funds settlement obligations, this reversal is eliminated. The provision in the Guide describing the NSCC reversal will be deleted.

Memo Seg Optionality

Memo Seg is a systemic mechanism that allows Participants to prevent inventory that is not subject to a lien or claim of DTC ("Minimum Amount" or "MA") from falling below a certain number of units.⁷ In order to extend the Memo Seg option to securities received in ACATS transfers, the Guide would be revised to provide that a Participant may increase its number of units designated for protection under Memo Seg to reflect ACATS receipts.⁸

Clarification With Respect to MA Securities

ACATS transfers are not subject to any lien or claims by DTC because they are transferred free of payment on the books of DTC. Upon receipt into a Participant account, the securities constitute MA securities pursuant to the Rules.⁹ The Guide uses the term "Deemed MA" to reflect this condition. This terminology is no longer necessary because, under the NSCC Proposal, no funds obligations attach to the ACATS transaction. Accordingly, the term

⁶ These adjustments reduce a Participant's Collateral Monitor with respect to its net ACATS short positions on at the start of ACATS settlement date. The Participant then receives credit in its Collateral Monitor for ACATS deliveries as they occur throughout the day.

⁷ Memo Seg is offered by DTC to its Participants to support their control of fully-paid customer securities, although its effectiveness for that purpose depends entirely on the Participant's management of its accounts.

⁸ Please see the Guide for additional information regarding Memo Seg under the "Memo Segregation" section available at www.dtcc.com.

⁹ Securities received through the ACATS Settlement Accounting Operation are not counted as part of the Participant's Collateral Monitor, unless and until the receiving Participant, in accordance with the Rules, designates those securities as Net Additions (NA).

"Deemed MA" will be deleted from the Guide; a new section of the Guide will confirm that ACATS securities received by a Participant will, by virtue of this transfer, be credited to the receiving account as MA.¹⁰

Other Clarifications

The Guide will be revised to clarify the descriptions of CNS Short Covers and Long Allocations and their effect on Participant collateral and the Collateral Monitor.

iii. Implementation Timeframe

The effective date of the proposed Rule change will be announced via a DTC Important Notice and will be implemented concurrently with the implementation by NSCC of the ACATS enhancements, if approved.

2. Statutory Basis

The proposed rule change provides for enhancements relating to the processing of customer securities which would support finality of transfers of customer securities. Therefore, DTC believes the proposed rule change is consistent with the requirements of the Act and the rules and regulations thereunder applicable to DTC, in particular Section 17A(b)(3)(F)¹¹ of the Act which requires that the Rules be designed to promote the prompt and accurate clearance and settlement of securities transactions and, in general, to protect investors and the public interest.

(B) Self-Regulatory Organization's Statement on Burden on Competition

DTC believes that the proposed rule change would not impose any burden on competition as it applies to all Participants that utilize the ACATS service and the new process has been developed in close coordination with the industry.

(C) Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

Written comments relating to the proposed rule change have not yet been solicited or received with respect to this filing.

¹⁰ In this regard, a Participant accepting an ACATS free delivery automatically designates the subject securities as MA securities, not subject to any lien or claim of DTC. Therefore, such securities are not counted in the Collateral Monitor of the Participant. It should be noted that the Participant may re-designate the securities as NA or deliver them versus payment in which case these securities would be counted in the Collateral Monitor.

¹¹ 15 U.S.C. 78q-1(b)(3)(F).

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Within 45 days of the date of publication of this notice in the **Federal Register** or within such longer period up to 90 days (i) as the Commission may designate if it finds such longer period to be appropriate and publishes its reasons for so finding or (ii) as to which the self-regulatory organization consents, the Commission will:

- (A) By order approve or disapprove such proposed rule change, or
- (B) institute proceedings to determine whether the proposed rule change should be disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (<http://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include File No. SR-DTC-2014-04 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE., Washington, DC 20549-1090.
- All submissions should refer to File No. SR-DTC-2014-04. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (<http://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission's Public Reference Room, 100 F Street NE., Washington, DC 20549, on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of such filings also will be available for

inspection and copying at the principal office of DTC and on DTC's Web site at <http://dtcc.com/legal/sec-rule-filings.aspx>. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File No. SR-DTC-2014-04 and should be submitted on or before May 2, 2014.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.¹²

Kevin M. O'Neill,

Deputy Secretary.

BILLING CODE 8011-01-P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34-71892; File No. SR-NASDAQ-2014-027]

Self-Regulatory Organizations; The NASDAQ Stock Market LLC; Notice of Filing of Proposed Rule Change Relating to the Listing and Trading of the Shares of the PowerShares Multi-Strategy Alternative Portfolio, a series of PowerShares Actively Managed Exchange-Traded Fund Trust

April 7, 2014.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 ("Act"),¹ and Rule 19b-4 thereunder,² notice is hereby given that on March 24, 2014, The NASDAQ Stock Market LLC ("Nasdaq" or the "Exchange") filed with the Securities and Exchange Commission ("Commission") the proposed rule change as described in Items I, II, and III below, which Items have been prepared by Nasdaq. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of the Substance of the Proposed Rule Change

Nasdaq proposes to list and trade the shares of the PowerShares Multi-Strategy Alternative Portfolio (the "Fund"), a series of PowerShares Actively Managed Exchange-Traded Fund Trust (the "Trust"), under Nasdaq Rule 5735 ("Managed Fund Shares"). The shares of the Fund are collectively referred to herein as the "Shares."

The text of the proposed rule change is available at <http://nasdaq.cchwallstreet.com/>, at Nasdaq's principal office, and at the Commission's Public Reference Room.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, Nasdaq included statements concerning the purpose of, and basis for, the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. Nasdaq has prepared summaries, set forth in Sections A, B, and C below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

The Exchange proposes to list and trade the Shares of the Fund under Nasdaq Rule 5735, which governs the listing and trading of Managed Fund Shares³ on the Exchange.⁴ The Fund will be an actively managed exchange-traded fund ("ETF") that will use proprietary portfolio management techniques in an effort to exceed a

³ A Managed Fund Share is a security that represents an interest in an investment company registered under the Investment Company Act of 1940 (15 U.S.C. 80a-1) (the "1940 Act") organized as an open-end investment company or similar entity that invests in a portfolio of securities selected by its investment adviser consistent with its investment objectives and policies. In contrast, an open-end investment company that issues Index Fund Shares, listed and traded on the Exchange under Nasdaq Rule 5705, seeks to provide investment results that correspond generally to the price and yield performance of a specific foreign or domestic stock index, fixed income securities index or combination thereof.

⁴ The Commission approved Nasdaq Rule 5735 (formerly Nasdaq Rule 4420(o)) in Securities Exchange Act Release No. 57962 (June 13, 2008), 73 FR 35175 (June 20, 2008) (SR-NASDAQ-2008-039). There are already multiple actively-managed funds listed on the Exchange; *see, e.g.*, Securities Exchange Act Release Nos. 69464 (April 26, 2013), 78 FR 25774 (May 2, 2013) (SR-NASDAQ-2013-036) (order approving listing and trading of First Trust Senior Loan Fund); 66489 (February 29, 2012), 77 FR 13379 (March 6, 2012) (SR-NASDAQ-2012-004) (order approving listing and trading of WisdomTree Emerging Markets Corporate Bond Fund). Additionally, the Commission has previously approved the listing and trading of a number of actively-managed funds on NYSE Arca, Inc. pursuant to Rule 8.600 of that exchange. *See, e.g.*, Securities Exchange Act Release No. 68870 (February 8, 2013), 78 FR 11245 (February 15, 2013) (SR-NYSEArca-2012-139) (order approving listing and trading of First Trust Preferred Securities and Income ETF). The Exchange believes the proposed rule change raises no significant issues not previously addressed in those prior Commission orders.

¹² 17 CFR 200.30-3(a)(12).

¹ 15 U.S.C. 78s(b)(1).

² 17 CFR 240.19b-4.

benchmark index comprised of securities and other investments similar to those held by the Fund (the “benchmark”). The Shares will be offered by the Trust, which was established as a Delaware statutory trust on November 6, 2007. The Trust is registered with the Commission as an investment company and has filed a post-effective amendment to its registration statement on Form N-1A (“Registration Statement”) with the Commission.⁵ The Fund is a series of the Trust. All of the exchange-listed securities and derivatives held by the Fund, or indirectly held through a wholly-owned subsidiary controlled by the Fund and organized under the laws of the Cayman Islands (referred to herein as the “Subsidiary”), will be traded in a principal trading market that is a member of the Intermarket Surveillance Group (“ISG”) or a market with which the Exchange has a comprehensive surveillance sharing agreement.

Invesco PowerShares Capital Management LLC will be the investment adviser (“Adviser”) to the Fund. Invesco Distributors, Inc. (the “Distributor”) will be the principal underwriter and distributor of the Fund’s Shares. The Bank of New York Mellon will act as the administrator, accounting agent, custodian (“Custodian”) and transfer agent for the Fund. The Fund may use one or more sub-advisers (“Sub-Advisers”).⁶

Paragraph (g) of Rule 5735 provides that if the investment adviser to the investment company issuing Managed Fund Shares is affiliated with a broker-dealer, such investment adviser shall erect a “fire wall” between the investment adviser and the broker-dealer with respect to access to information concerning the composition and/or changes to such investment company portfolio.⁷ In addition,

⁵ See Registration Statement for the Trust, filed on November 27, 2013 (File Nos. 333-147622 and 811-22148). The descriptions of the Fund and the Shares contained herein are based, in part, on information in the Registration Statement. In addition, the Commission has issued an order granting certain exemptive relief to the Trust under the 1940 Act. See Investment Company Act Release No. 28171 (February 27, 2008) (File No. 812-13386) (“Exemptive Order”).

⁶ No sub-adviser has been selected as of the date of this filing.

⁷ An investment adviser to an open-end fund is required to be registered under the Investment Advisers Act of 1940 (the “Advisers Act”). As a result, the Adviser and any Sub-Adviser and their related personnel are subject to the provisions of Rule 204A-1 under the Advisers Act relating to codes of ethics. This Rule requires investment advisers to adopt a code of ethics that reflects the fiduciary nature of the relationship to clients as well as compliance with other applicable securities laws. Accordingly, procedures designed to prevent

paragraph (g) further requires that personnel who make decisions on the open-end fund’s portfolio composition must be subject to procedures designed to prevent the use and dissemination of material, non-public information regarding the open-end fund’s portfolio. Rule 5735(g) is similar to Nasdaq Rule 5705(b)(5)(A)(i); however, paragraph (g) in connection with the establishment of a “fire wall” between the investment adviser and the broker-dealer reflects the applicable open-end fund’s portfolio, not an underlying benchmark index, as is the case with index-based funds. The Adviser is not a broker-dealer, although it is affiliated with the Distributor, a broker-dealer. The Adviser has implemented a fire wall with respect to its broker-dealer affiliate regarding access to information concerning the composition and/or changes to the portfolio. In the event (a) the Adviser becomes newly affiliated with a broker-dealer (or becomes a registered broker-dealer), or (b) any new adviser or sub-adviser is a registered broker-dealer or becomes affiliated with a broker-dealer, it will implement a fire wall with respect to its relevant personnel and/or such broker-dealer affiliate, if applicable, regarding access to information concerning the composition and/or changes to the portfolio and will be subject to procedures designed to prevent the use and dissemination of material non-public information regarding such portfolio.⁸

Principal Investment Strategies

The Fund’s investment objective will be to seek positive total returns that have low correlation to the broader securities markets. The Fund seeks to achieve its investment objective by actively investing in a combination of a varying number of market neutral and other investment strategies (each, a

the communication and misuse of non-public information by an investment adviser must be consistent with Rule 204A-1 under the Advisers Act. In addition, Rule 206(4)-7 under the Advisers Act makes it unlawful for an investment adviser to provide investment advice to clients unless such investment adviser has (i) adopted and implemented written policies and procedures reasonably designed to prevent violation, by the investment adviser and its supervised persons, of the Advisers Act and the Commission rules adopted thereunder; (ii) implemented, at a minimum, an annual review regarding the adequacy of the policies and procedures established pursuant to subparagraph (i) above and the effectiveness of their implementation; and (iii) designated an individual (who is a supervised person) responsible for administering the policies and procedures adopted under subparagraph (i) above.

⁸ No Sub-Adviser will be a broker-dealer. Any Sub-Adviser to the Fund will comply with these representations and undertakings as a condition to acting as sub-adviser to the Fund.

“Strategy,” and together, the “Strategies”) that aim to capture non-traditional risk premia across asset classes.

The Adviser will allocate the weightings of the Fund’s investments across the multiple Strategies according to a rules-based methodology and will reallocate the Fund’s assets among Strategies to achieve the Fund’s investment objective. The Strategies may include, but are not limited to, quantitative, volatility risk premium and carry Strategies. The Fund’s Strategies are similar to the strategies included in its benchmark and the Fund may hold the same types of instruments in similar weightings as the benchmark. However, the Adviser is not obliged to track the performance of the benchmark and will use proprietary portfolio management techniques to seek to exceed the benchmark’s performance.

In pursuing its investment objective, under normal market conditions,⁹ the Fund as part of investing according to the various Strategies, may take both long and short positions in exchange-traded equity securities and equity index futures.¹⁰ The Fund also may take a long and a short position in various currencies by investing in currency forward and/or futures contracts.¹¹

Additionally, the Fund may invest in index options.¹² In following various Strategies, the Fund may purchase and sell interest rate futures, including Eurodollar interest rate futures or Euro Euribor interest rate futures, and Chicago Board Options Exchange Volatility Index (“VIX”) futures contracts.¹³

⁹ The term “under normal market conditions” as used herein includes, but is not limited to, the absence of adverse market, economic, political or other conditions, including extreme volatility or trading halts in the securities markets or the financial markets generally; operational issues causing dissemination of inaccurate market information; or *force majeure* type events such as systems failure, natural or man-made disaster, act of God, armed conflict, act of terrorism, riot or labor disruption or any similar intervening circumstance. In periods of extreme market disturbance, the Fund may take temporary defensive positions, by overweighting its portfolio in cash/cash-like instruments; however, to the extent possible, the Adviser would continue to seek to achieve the Fund’s investment objective.

¹⁰ These equity securities, including exchange-traded equity securities of registered investment companies, and equity index futures will be traded on U.S. exchanges or non-U.S. exchanges that are ISG members.

¹¹ Currency futures contracts will be traded on U.S. exchanges or non-U.S. exchanges that are ISG members. Currency forward contracts will be traded over-the-counter.

¹² Index options will be traded on U.S. exchanges or non-U.S. exchanges that are ISG members.

¹³ These futures contracts will be traded on U.S. exchanges or non-U.S. exchanges that are ISG members.

The Subsidiary

The Fund may seek to gain exposure to these various derivative investments through investments in the Subsidiary, which in turn would make investments in those derivatives and other instruments. If utilized, the Subsidiary would be wholly-owned and controlled by the Fund, and its investments would be consolidated into the Fund's financial statements.

Should the Fund invest in the Subsidiary, that investment may not exceed 25% of the Fund's total assets at each quarter-end of the Fund's fiscal year. Further, should the Fund invest in the Subsidiary, it would be expected to provide the Fund with exposure to futures contracts and other derivatives within the limits of Subchapter M of the Internal Revenue Code applicable to investment companies, such as the Fund, which limit the ability of investment companies to invest directly in derivative instruments.

The Subsidiary would be able to invest in the same asset classes in which the Fund may invest. The Subsidiary, accordingly, would be subject to the same general investment policies and restrictions as the Fund, except that unlike the Fund, which must invest in derivatives in compliance with the requirements of Subchapter M of the Internal Revenue Code, federal securities laws and the Commodity Exchange Act, the Subsidiary may invest without limitation in futures contracts. References to the investment strategies and risks of the Fund include the investment strategies and risks of the Subsidiary.

The Subsidiary will be advised by the Adviser.¹⁴ The Fund may utilize the Subsidiary, but is not required to do so. If it is utilized, the Subsidiary will not be registered under the 1940 Act. As an investor in the Subsidiary, the Fund, as the Subsidiary's sole shareholder, would not have the protections offered to investors in registered investment companies. However, because the Fund would wholly own and control the Subsidiary, and the Fund and Subsidiary would be managed by the Adviser, the Subsidiary would not take action contrary to the interests of the Fund or the Fund's shareholders. The Board of Trustees of the Trust (the "Board") has oversight responsibility for the investment activities of the Fund, including any investments in the Subsidiary, and oversees the Fund's role

¹⁴ The Subsidiary also will enter into separate contracts for the provision of custody, transfer agency, and accounting agent services with the same or with affiliates of the same service providers that provide those services to the Fund.

as the sole shareholder of the Subsidiary. The Adviser will receive no additional compensation for managing the assets of the Subsidiary. Also, in managing the Subsidiary's portfolio, the Adviser would be subject to the same investment restrictions and operational guidelines that apply to the management of the Fund, except that the Subsidiary would not be subject to the limitations imposed by Subchapter M of the Internal Revenue Code with respect to the amount of assets that can be invested in futures contracts and derivatives. Changes in the laws of the United States, under which the Trust is organized, or of the Cayman Islands, under which the Subsidiary is organized, could result in the inability of the Fund or the Subsidiary to operate as described in this filing or in the Registration Statement and could negatively affect the Fund and its shareholders.

Other Investments

The Fund may invest in U.S. government securities, money market instruments, cash and cash equivalents (e.g., corporate commercial paper) to provide liquidity and to collateralize its investments in derivative instruments.

The Fund may invest in: (i) Short-term obligations issued by the U.S. Government¹⁵; (ii) short term negotiable obligations of commercial banks, fixed time deposits and bankers' acceptances of U.S. and foreign banks and similar institutions¹⁶; and (iii) commercial paper rated at the date of purchase "Prime-1" by Moody's Investors Service, Inc. or "A-1+" or "A-1" by Standard & Poor's or, if unrated, of comparable quality, as the Adviser of the Fund determines.

In addition, the Fund may invest in non-exchange listed securities of other investment companies (including money market funds) beyond the limits permitted under the 1940 Act, subject to certain terms and conditions set forth in a Commission exemptive order issued pursuant to Section 12(d)(1)(J) of the 1940 Act.¹⁷

¹⁵ The Fund may invest in U.S. government obligations. Obligations issued or guaranteed by the U.S. Government, its agencies and instrumentalities include bills, notes and bonds issued by the U.S. Treasury, as well as "stripped" or "zero coupon" U.S. Treasury obligations representing future interest or principal payments on U.S. Treasury notes or bonds.

¹⁶ Time deposits are non-negotiable deposits maintained in banking institutions for specified periods of time at stated interest rates. Banker's acceptances are time drafts drawn on commercial banks by borrowers, usually in connection with international transactions.

¹⁷ Investment Company Act Release No. 30238 (October 23, 2012) (File No. 812-13820).

Investment Restrictions

The Fund may not concentrate its investments (*i.e.*, invest more than 25% of the value of its net assets) in securities of issuers in any one industry or group of industries. This restriction will not apply to obligations issued or guaranteed by the U.S. government, its agencies or instrumentalities.¹⁸

The Subsidiary's shares will be offered only to the Fund and the Fund will not sell shares of the Subsidiary to other investors. The Fund and the Subsidiary will not invest in any non-U.S. equity securities (other than shares of the Subsidiary).

The Fund may hold up to an aggregate amount of 15% of its net assets in illiquid securities or other illiquid assets (calculated at the time of investment). The Fund will monitor its portfolio liquidity on an ongoing basis to determine whether, in light of current circumstances, an adequate level of liquidity is being maintained, and will consider taking appropriate steps in order to maintain adequate liquidity if, through a change in values, net assets, or other circumstances, more than 15% of the Fund's net assets are held in illiquid securities or other illiquid assets. Illiquid securities and other illiquid assets include those subject to contractual or other restrictions on resale and other instruments or assets that lack readily available markets as determined in accordance with Commission staff guidance.¹⁹

The Fund intends to qualify for and to elect to be treated as a separate regulated investment company under Subchapter M of the Internal Revenue Code.²⁰

¹⁸ See Form N-1A, Item 9. The Commission has taken the position that a fund is concentrated if it invests more than 25% of the value of its total assets in any one industry. See, e.g., Investment Company Act Release No. 9011 (October 30, 1975), 40 FR 54241 (November 21, 1975).

¹⁹ The Commission has stated that long-standing Commission guidelines have required open-end funds to hold no more than 15% of their net assets in illiquid securities and other illiquid assets. See Investment Company Act Release No. 28193 (March 11, 2008), 73 FR 14618 (March 18, 2008), FN 34. See also Investment Company Act Release No. 5847 (October 21, 1969), 35 FR 19989 (December 31, 1970) (Statement Regarding "Restricted Securities"); Investment Company Act Release No. 18612 (March 12, 1992), 57 FR 9828 (March 20, 1992) (Revisions of Guidelines to Form N-1A). A fund's portfolio security is illiquid if it cannot be disposed of in the ordinary course of business within seven days at approximately the value ascribed to it by the fund. See Investment Company Act Release No. 14983 (March 12, 1986), 51 FR 9773 (March 21, 1986) (adopting amendments to Rule 2a-7 under the 1940 Act); Investment Company Act Release No. 17452 (April 23, 1990), 55 FR 17933 (April 30, 1990) (adopting Rule 144A under the Securities Act of 1933).

²⁰ 26 U.S.C. 851.

The Fund's and the Subsidiary's investments will be consistent with the Fund's investment objective. Additionally, the Fund may engage in frequent and active trading of portfolio securities to achieve its investment objective. One or more of the Strategies may utilize instruments or investment techniques that have a leveraging effect on the Fund. This effective leverage occurs when the Fund's market exposure exceeds the amounts actually invested. Any instance of effective leverage will be covered in accordance with guidance promulgated by the Commission and its staff.²¹ The Fund does not presently intend to engage in any form of borrowing for investment purposes, and will not be operated as a "leveraged ETF," *i.e.*, it will not be operated in a manner designed to seek a multiple of the performance of an underlying reference index.

Net Asset Value

The Fund's administrator will calculate the Fund's net asset value ("NAV") per Share as of the close of regular trading (normally 4:00 p.m., Eastern time ("E.T.)) on each day the New York Stock Exchange ("NYSE") is open for business. NAV per Share will be calculated for the Fund by taking the value of the Fund's total assets, including interest or dividends accrued but not yet collected, less all liabilities, and dividing such amount by the total number of Shares outstanding. The result, rounded to the nearest cent, will be the NAV per Share (although creations and redemptions will be processed using a price denominated to the fifth decimal point, meaning that rounding to the nearest cent may result in different prices in certain circumstances). Under normal market conditions, the Fund's holdings will be priced as follows: (a) The value of the currency forwards will be calculated using the spot price and the forward spread of the subject currency; (b) index options will be valued at the official closing price on the market on which they primarily trade; (c) investment company shares will be valued at net asset value, unless the shares are exchange traded, in which case they will be valued at the last sale or official closing price on the market on which they primarily trade; (d) U.S. government securities will be valued at the mean price provided by a third party vendor for U.S. government securities; (e) short term money market instruments and cash equivalents (*e.g.*, corporate commercial paper or bank

instruments) will be valued in accordance with the Trust's valuation policies and procedures approved by the Trust's Board; and (f) all other securities held by the Fund will be valued at the last sales price or official closing price as of the close of the exchange where the security primarily is traded. All valuations will be subject to review by the Board or its delegate.

In determining NAV, expenses will be accrued and applied daily and securities and other assets for which market quotations are readily available will be valued at market value. Futures and securities listed or traded on an exchange generally will be valued at the last sales price or official closing price that day as of the close of the exchange where the security primarily is traded. The NAV for the Fund will be calculated and disseminated daily. If a security's market price is not readily available, the security will be valued using pricing provided from independent pricing services or by another method that the Adviser, in its judgment, believes will better reflect the security's fair value in accordance with the Trust's valuation policies and procedures approved by the Trust's Board and with the 1940 Act.

Creation and Redemption of Shares

The Trust will issue and redeem Shares of the Fund at NAV only with authorized participants ("APs") and only in aggregations of 50,000 shares (each, a "Creation Unit"), on a continuous basis through the Distributor, without a sales load, at the NAV next determined after receipt, on any business day, of an order in proper form.

The consideration for purchase of Creation Unit aggregations of the Fund may consist of (i) cash in lieu of all or a portion of the Deposit Securities, as defined below, or (ii) an "in-kind" deposit of a designated portfolio of securities determined by the Adviser that generally will conform to the holdings of the Fund consistent with its investment objective (the "Deposit Securities") per each Creation Unit aggregation and generally an amount of cash (the "Cash Component") computed as described below. Together, the Deposit Securities and the Cash Component (including the cash in lieu amount) will constitute the "Fund Deposit," which will represent the minimum initial and subsequent investment amount for a Creation Unit aggregation of the Fund.

The consideration for redemption of Creation Unit aggregations of the Fund may consist of (i) cash in lieu of all or a portion of the Fund Securities as

defined below, or (ii) a designated portfolio of securities determined by the Adviser that generally will conform to the holdings of the Fund consistent with its investment objective per each Creation Unit aggregation ("Fund Securities") and generally a Cash Component, as described below.

The Fund typically will issue and redeem Creation Units principally for cash,²² calculated based on the NAV per Share, multiplied by the number of Shares representing a Creation Unit ("Deposit Cash"), plus a fixed and/or variable transaction fee; however, the Fund also reserves the right to permit or require Creation Units to be issued in exchange for the Deposit Securities together with the Cash Component. The Cash Component is sometimes also referred to as the Balancing Amount. The Cash Component will serve the function of compensating for any differences between the NAV per Creation Unit aggregation and the Deposit Amount (as defined below). For example, for a creation the Cash Component will be an amount equal to the difference between the NAV of Fund Shares (per Creation Unit aggregation) and the "Deposit Amount"—an amount equal to the market value of the Deposit Securities and/or cash in lieu of all or a portion of the Deposit Securities. If the Cash Component is a positive number (*i.e.*, the NAV per Creation Unit aggregation exceeds the Deposit Amount), the AP will deliver the Cash Component. If the Cash Component is a negative number (*i.e.*, the NAV per Creation Unit aggregation is less than the Deposit Amount), the AP will receive the Cash Component.

To the extent that the Fund permits Creation Units to be issued in-kind, the Custodian, through the National Securities Clearing Corporation ("NSCC"), will make available on each business day, prior to the opening of business of the NYSE (currently 9:30 a.m., E.T.), the list of the names and the quantity of each Deposit Security to be included in the current Fund Deposit (based on information at the end of the previous business day) for the Fund. Such Fund Deposit will be applicable, subject to any adjustments as described below or in the Registration Statement, to effect creations of Creation Units of the Fund until such time as the next-

²² The Fund reserves the right to issue and redeem Creation Units in-kind in instances in which a certain security or other asset can be delivered in-kind, and when such in-kind issuance and redemptions are in the best interest of the Fund, such as instances in which receipt or payment of in-kind assets would facilitate the orderly management of the Fund.

²¹ *In re Securities Trading Practices of Investment Companies*, SEC Rel. No. IC-10666 (April 27, 1979).

announced composition of the Deposit Securities is made available.

To the extent that the Fund permits Creation Units to be redeemed in-kind, the Custodian, through the NSCC, will make available on each business day, prior to the opening of business of NYSE (currently 9:30 a.m., E.T.), the identity of the Fund Securities that will be applicable (subject to possible amendment or correction) to redemption requests received in proper form on that day. Fund Securities received on redemption may not be identical to Deposit Securities that are applicable to creations of Creation Units.

When applicable, during times that the Fund permits in-kind creations, the identity and quantity of the Deposit Securities required for a Fund Deposit for the Shares may change as rebalancing adjustments and corporate action events occur and are reflected within the Fund from time to time by the Adviser, consistent with the investment objective of the Fund. In addition, the Trust reserves the right to permit or require the substitution of an amount of cash—*i.e.*, a “cash in lieu” amount—to be added to the Cash Component to replace any Deposit Security that may not be available in sufficient quantity for delivery or which might not be eligible for trading by an AP or the investor for which it is acting or other relevant reason.

In addition to the list of names and numbers of securities constituting the current Deposit Securities of a Fund Deposit, the Custodian, through the NSCC, also will make available on each business day, the estimated Cash Component, effective through and including the previous business day, per Creation Unit aggregation of the Fund.

To be eligible to place orders with respect to creations and redemptions of Creation Units, an entity must be (i) a “Participating Party,” *i.e.*, a broker-dealer or other participant in the clearing process through the continuous net settlement system of the NSCC or (ii) a Depository Trust Company (“DTC”) Participant (a “DTC Participant”). In addition, each Participating Party or DTC Participant (each, an AP) must execute an agreement that has been agreed to by the Distributor and the Custodian with respect to purchases and redemptions of Creation Units.

All orders to create Creation Unit aggregations must be received by the transfer agent no later than the closing time of the regular trading session on the NYSE (ordinarily 4:00 p.m., E.T.) in each case on the date such order is placed in order for creations of Creation Unit aggregations to be effected based

on the NAV of Shares of the Fund as next determined on such date after receipt of the order in proper form.

In order to redeem Creation Units of the Fund, an AP must submit an order to redeem for one or more Creation Units. All such orders must be received by the Fund’s transfer agent in proper form no later than the close of regular trading on the NYSE (ordinarily 4:00 p.m. E.T.) in order to receive that day’s closing NAV per Share.

Availability of Information

The Fund’s Web site (www.invescopowershares.com), which will be publicly available prior to the public offering of Shares, will include a form of the prospectus for the Fund that may be downloaded. The Web site will include the Share’s ticker, CUSIP and exchange information, along with additional quantitative information updated on a daily basis, including, for the Fund: (1) Daily trading volume, the prior business day’s reported NAV and closing price, mid-point of the bid/ask spread at the time of calculation of such NAV (the “Bid/Ask Price”),²³ and a calculation of the premium and discount of the Bid/Ask Price against the NAV; and (2) data in chart format displaying the frequency distribution of discounts and premiums of the daily Bid/Ask Price against the NAV, within appropriate ranges, for the most recently completed calendar year and each of the four most recently completed calendar quarters since that year (or the life of the Fund if shorter). On each business day, before commencement of trading in Shares in the Regular Market Session²⁴ on the Exchange, the Fund will disclose on its Web site the identities and quantities of the portfolio of securities and other assets (the “Disclosed Portfolio” as defined in Nasdaq Rule 5735(c)(2)) held by the Fund and, if applicable, the Subsidiary that will form the basis for the Fund’s calculation of NAV at the end of the business day.²⁵

²³ The Bid/Ask Price of the Fund will be determined using the mid-point of the highest bid and the lowest offer on the Exchange as of the time of calculation of the Fund’s NAV. The records relating to Bid/Ask Prices will be retained by the Fund and its service providers.

²⁴ See Nasdaq Rule 4120(b)(4) (describing the three trading sessions on the Exchange: (1) Pre-Market Session from 4 a.m. to 9:30 a.m. E.T.; (2) Regular Market Session from 9:30 a.m. to 4 p.m. or 4:15 p.m. E.T.; and (3) Post-Market Session from 4 p.m. or 4:15 p.m. to 8 p.m. E.T.).

²⁵ Under accounting procedures to be followed by the Fund, trades made on the prior business day (“T”) will be booked and reflected in NAV on the current business day (“T+1”). Notwithstanding the foregoing, portfolio trades that are executed prior to the opening of the Exchange on any business day may be booked and reflected in NAV on such business day. Accordingly, the Fund will be able to

The Disclosed Portfolio will include, as applicable, the names, quantity, percentage weighting and market value of securities and other assets held by the Fund and the Subsidiary and the characteristics of such assets. The Web site information will be publicly available at no charge.

In addition, for the Fund, an estimated value, defined in Rule 5735(c)(3) as the “Intraday Indicative Value,” that reflects an estimated intraday value of the Fund’s portfolio (including the Subsidiary’s portfolio), will be disseminated. Moreover, the Intraday Indicative Value, available on the NASDAQ OMX Information LLC proprietary index data service²⁶ will be based upon the current value for the components of the Disclosed Portfolio and will be updated and widely disseminated by one or more major market data vendors and broadly displayed at least every 15 seconds during the Regular Market Session.

The dissemination of the Intraday Indicative Value, together with the Disclosed Portfolio, will allow investors to determine the value of the underlying portfolio of the Fund on a daily basis and will provide a close estimate of that value throughout the trading day.

Intra-day, executable price quotations on the securities and other assets held by the Fund and the Subsidiary will be available from major broker-dealer firms or on the exchange on which they are traded, as applicable. Intra-day price information on the securities and other assets held by the Fund will also be available through subscription or free services that can be accessed by APs and other investors: (a) Pricing information for equity securities, investment company securities, and equity index futures will be publicly available on public financial Web sites, and through subscription services such as Bloomberg and Thompson Reuters; and (b) pricing information related to currency forward and futures contracts, index options, VIX futures contracts, and interest rate futures contracts will be available through subscription services such as Bloomberg and Thompson Reuters. Pricing information for U.S. Government securities and cash equivalents will be available through

disclose at the beginning of the business day the portfolio that will form the basis for the NAV calculation at the end of the business day.

²⁶ Currently, the NASDAQ OMX Global Index Data Service (“GIDS”) is the NASDAQ OMX global index data feed service, offering real-time updates, daily summary messages, and access to widely followed indexes and Intraday Indicative Values for ETFs. GIDS provides investment professionals with the daily information needed to track or trade NASDAQ OMX indexes, listed ETFs, or third-party partner indexes and ETFs.

subscription services such as Bloomberg, Markit and Thompson Reuters.

Investors will also be able to obtain the Fund's Statement of Additional Information ("SAI"), the Fund's Shareholder Reports, and its Trust's Form N-CSR and Form N-SAR, each of which is filed twice a year except the SAI which is filed at least annually. The Fund's SAI and Shareholder Reports will be available free upon request from the Trust, and those documents and the Form N-CSR and Form N-SAR may be viewed on-screen or downloaded from the Commission's Web site at www.sec.gov. Information regarding market price and trading volume of the Shares will be continually available on a real-time basis throughout the day on brokers' computer screens and other electronic services. Information regarding the previous day's closing price and trading volume for the Shares will be published daily in the financial section of newspapers. Quotation and last sale information for the Shares will be available via Nasdaq proprietary quote and trade services, as well as in accordance with the Unlisted Trading Privileges and the Consolidated Tape Association plans or through the Options Price Reporting Authority, as applicable, for the Shares. Similarly, quotation and last sale information for any underlying exchange-traded products will also be available via the quote and trade services of their respective primary exchanges, as well as in accordance with the Unlisted Trading Privileges and the Consolidated Tape Association plans for any such underlying exchange-traded products.

Additional information regarding the Fund and the Shares, including investment strategies, risks, creation and redemption procedures, fees, portfolio holdings disclosure policies, distributions and taxes will be included in the Registration Statement.

Initial and Continued Listing

The Shares will conform to the initial and continued listing criteria applicable to Managed Fund Shares, as set forth under Rule 5735. The Exchange represents that, for initial and/or continued listing, the Fund and the Subsidiary will be in compliance with Rule 10A-3²⁷ under the Act. A minimum of 100,000 Shares will be outstanding at the commencement of trading on the Exchange. The Exchange will obtain a representation from the issuer of the Shares that the NAV per Share will be calculated daily and that the NAV and the Disclosed Portfolio

will be made available to all market participants at the same time.

Trading Halts

With respect to trading halts, the Exchange may consider all relevant factors in exercising its discretion to halt or suspend trading in the Shares of the Fund. Nasdaq will halt trading in the Shares under the conditions specified in Nasdaq Rules 4120 and 4121, including the trading pauses under Nasdaq Rules 4120(a)(11) and (12). Trading may be halted because of market conditions or for reasons that, in the view of the Exchange, make trading in the Shares inadvisable. These may include: (1) The extent to which trading is not occurring in the securities and other assets constituting the Disclosed Portfolio of the Fund and the Subsidiary; or (2) whether other unusual conditions or circumstances detrimental to the maintenance of a fair and orderly market are present. Trading in the Shares also will be subject to Rule 5735(d)(2)(D), which sets forth circumstances under which Shares of the Fund may be halted.

Trading Rules

Nasdaq deems the Shares to be equity securities, thus rendering trading in the Shares subject to Nasdaq's existing rules governing the trading of equity securities. Nasdaq will allow trading in the Shares from 4:00 a.m. until 8:00 p.m. E.T. The Exchange has appropriate rules to facilitate transactions in the Shares during all trading sessions. As provided in Nasdaq Rule 5735(b)(3), the minimum price variation for quoting and entry of orders in Managed Fund Shares traded on the Exchange is \$0.01.

Surveillance

The Exchange represents that trading in the Shares will be subject to the existing trading surveillances, administered by both Nasdaq and also the Financial Industry Regulatory Authority ("FINRA"), on behalf of the Exchange, which are designed to detect violations of Exchange rules and applicable federal securities laws.²⁸ The Exchange represents that these procedures are adequate to properly monitor Exchange trading of the Shares in all trading sessions and to deter and detect violations of Exchange rules and applicable federal securities laws.

The surveillances referred to above generally focus on detecting securities trading outside their normal patterns, which could be indicative of

manipulative or other violative activity. When such situations are detected, surveillance analysis follows and investigations are opened, where appropriate, to review the behavior of all relevant parties for all relevant trading violations. FINRA, on behalf of the Exchange, will communicate as needed regarding trading in the Shares and other exchange-traded securities and instruments held by the Fund and the Subsidiary with other markets and other entities that are members of the ISG,²⁹ and FINRA may obtain trading information regarding trading in the Shares and other exchange-traded securities and instruments held by the Fund and the Subsidiary from such markets and other entities. In addition, the Exchange may obtain information regarding trading in the Shares and other exchange-traded securities and instruments held by the Fund and the Subsidiary from markets and other entities that are members of ISG, which includes securities and futures exchanges, or with which the Exchange has in place a comprehensive surveillance sharing agreement.

In addition, to the extent that the Fund or the Subsidiary were to invest in derivative instruments, such instruments held by the Fund or the Subsidiary shall have their principal trading market be a member of ISG or a market with which the Exchange has a comprehensive surveillance sharing agreement.

In addition, the Exchange also has a general policy prohibiting the distribution of material, non-public information by its employees.

Information Circular

Prior to the commencement of trading, the Exchange will inform its members in an Information Circular of the special characteristics and risks associated with trading the Shares. Specifically, the Information Circular will discuss the following: (1) The procedures for purchases and redemptions of Shares in Creation Units (and that Shares are not individually redeemable); (2) Nasdaq Rule 2111A, which imposes suitability obligations on Nasdaq members with respect to recommending transactions in the Shares to customers; (3) how information regarding the Intraday Indicative Value is disseminated; (4) the risks involved in trading the Shares during the Pre-Market and Post-Market

²⁹ For a list of the current members of ISG, see www.isgportal.org. The Exchange notes that not all components of the Disclosed Portfolio may trade on markets that are members of ISG or with which the Exchange has in place a comprehensive surveillance sharing agreement.

²⁷ See 17 CFR 240.10A-3.

²⁸ FINRA surveils trading on the Exchange pursuant to a regulatory services agreement. The Exchange is responsible for FINRA's performance under this regulatory services agreement.

Sessions when an updated Intraday Indicative Value will not be calculated or publicly disseminated; (5) the requirement that members deliver a prospectus to investors purchasing newly issued Shares prior to or concurrently with the confirmation of a transaction; and (6) trading information.

In addition, the Information Circular will advise members, prior to the commencement of trading, of the prospectus delivery requirements applicable to the Fund. Members purchasing Shares from the Fund for resale to investors will deliver a prospectus to such investors. The Information Circular will also discuss any exemptive, no-action and interpretive relief granted by the Commission from any rules under the Act.

Additionally, the Information Circular will reference that the Fund is subject to various fees and expenses described in the Registration Statement. The Information Circular will also disclose the trading hours of the Shares of the Fund and the applicable NAV calculation time for the Shares. The Information Circular will disclose that information about the Shares of the Fund will be publicly available on the Fund's Web site.

2. Statutory Basis

Nasdaq believes that the proposal is consistent with Section 6(b) of the Act in general, and Section 6(b)(5)³⁰ of the Act in particular, in that it is designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, to foster cooperation and coordination with persons engaged in facilitating transactions in securities, and to remove impediments to and perfect the mechanism of a free and open market and in general, to protect investors and the public interest.

The Exchange believes that the proposed rule change is designed to prevent fraudulent and manipulative acts and practices in that the Shares will be listed and traded on the Exchange pursuant to the initial and continued listing criteria in Nasdaq Rule 5735. The Exchange represents that trading in the Shares will be subject to the existing trading surveillances, administered by both Nasdaq and FINRA, on behalf of the Exchange, which are designed to detect violations of Exchange rules and applicable federal securities laws and are adequate to properly monitor trading in the Shares in all trading sessions. The Adviser is affiliated with a broker-dealer and has implemented a fire wall with

respect to its broker-dealer affiliate regarding access to information concerning the composition and/or changes to the Fund's portfolio.³¹ In addition, paragraph (g) of Nasdaq Rule 5735 further requires that personnel who make decisions on an open-end fund's portfolio composition must be subject to procedures designed to prevent the use and dissemination of material, non-public information regarding the open-end fund's portfolio. The Fund's and the Subsidiary's investments will be consistent with the Fund's investment objective.

Additionally, the Fund may engage in frequent and active trading of portfolio securities to achieve its investment objective. One or more of the Strategies may utilize instruments or investment techniques that have a leveraging effect on the Fund. This effective leverage occurs when the Fund's market exposure exceeds the amounts actually invested. Any instance of effective leverage will be covered in accordance with guidance promulgated by the Commission and its staff.³² The Fund does not presently intend to engage in any form of borrowing for investment purposes, and will not be operated as a "leveraged ETF," *i.e.*, it will not be operated in a manner designed to seek a multiple of the performance of an underlying reference index.

FINRA may obtain information via ISG from other exchanges that are members of ISG. In addition, the Exchange may obtain information regarding trading in the Shares and other exchange-traded securities and instruments held by the Fund and the Subsidiary from markets and other entities that are members of ISG, which includes securities and futures exchanges, or with which the Exchange has in place a comprehensive surveillance sharing agreement. In addition, to the extent that the Subsidiary were to invest in derivative instruments, such instruments held by the Subsidiary shall have their principal trading market be a member of ISG or a market with which the Exchange has a comprehensive surveillance sharing agreement.

If the Fund invests in the Subsidiary, it will invest no more than 25% of its total assets in the Subsidiary. The Fund may hold up to an aggregate amount of 15% of its net assets in illiquid

³¹ To the extent the Fund uses a Sub-Adviser, that Sub-Adviser will also implement a fire wall with respect to its broker-dealer affiliates, if any, regarding access to information concerning the composition and/or changes to the Fund's portfolio.

³² *In re Securities Trading Practices of Investment Companies*, SEC Rel. No. IC-10666 (April 27, 1979).

securities or other illiquid assets (calculated at the time of investment).

The proposed rule change is designed to promote just and equitable principles of trade and to protect investors and the public interest in that the Exchange will obtain a representation from the issuer of the Shares that the NAV per Share will be calculated daily and that the NAV and the Disclosed Portfolio will be made available to all market participants at the same time. In addition, a large amount of information will be publicly available regarding the Fund and the Shares, thereby promoting market transparency. Moreover, the Intraday Indicative Value, available on the NASDAQ OMX Information LLC proprietary index data service will be widely disseminated by one or more major market data vendors at least every 15 seconds during the Regular Market Session. On each business day, before commencement of trading in Shares in the Regular Market Session on the Exchange, the Fund will disclose on its Web site the Disclosed Portfolio of the Fund and the Subsidiary that will form the basis for the Fund's calculation of NAV at the end of the business day. Information regarding market price and trading volume of the Shares will be continually available on a real-time basis throughout the day on brokers' computer screens and other electronic services, and quotation and last sale information for the Shares will be available via Nasdaq proprietary quote and trade services, as well as in accordance with the Unlisted Trading Privileges and the Consolidated Tape Association plans for the Shares. Similarly, quotation and last sale information for any underlying exchange-traded products will also be available via the quote and trade services of their respective primary exchanges, as well as in accordance with the Unlisted Trading Privileges and the Consolidated Tape Association plans or through the Options Price Reporting Authority, as applicable, for any such underlying exchange-traded products. Intra-day price information will be available through public financial Web sites or subscription services, such as Bloomberg, Markit and Thomson Reuters, which can be accessed by Authorized APs and other investors.

The Fund's Web site will include a form of the prospectus for the Fund and additional data relating to NAV and other applicable quantitative information. Moreover, prior to the commencement of trading, the Exchange will inform its members in an Information Circular of the special characteristics and risks associated with

³⁰ 15 U.S.C. 78(f)(b)(5).

trading the Shares. Trading in Shares of the Fund will be halted under the conditions specified in Nasdaq Rules 4120 and 4121 or because of market conditions or for reasons that, in the view of the Exchange, make trading in the Shares inadvisable, and trading in the Shares will be subject to Nasdaq Rule 5735(d)(2)(D), which sets forth circumstances under which Shares of the Fund may be halted. In addition, as noted above, investors will have ready access to information regarding the Fund's holdings, the Intraday Indicative Value, the Disclosed Portfolio, and quotation and last sale information for the Shares.

The proposed rule change is designed to perfect the mechanism of a free and open market and, in general, to protect investors and the public interest in that it will facilitate the listing and trading of an additional type of actively-managed exchange-traded product that will enhance competition among market participants, to the benefit of investors and the marketplace. As noted above, FINRA, on behalf of the Exchange, has in place surveillance procedures relating to trading in the Shares and will communicate as needed regarding trading in the Shares and other exchange-traded securities and instruments held by the Fund and the Subsidiary with other markets and other entities that are members of the ISG. FINRA also may obtain trading information regarding trading in the Shares and other exchange-traded securities and instruments held by the Fund and the Subsidiary from such markets and other entities. In addition, the Exchange may obtain information regarding trading in the Shares and other exchange-traded securities and instruments held by the Fund and the Subsidiary from markets and other entities that are members of ISG, which includes securities and futures exchanges, or with which the Exchange has in place a comprehensive surveillance sharing agreement. Furthermore, as noted above, investors will have ready access to information regarding the Fund's holdings, the Intraday Indicative Value, the Disclosed Portfolio, and quotation and last sale information for the Shares.

For the above reasons, Nasdaq believes the proposed rule change is consistent with the requirements of Section 6(b)(5) of the Act.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange does not believe that the proposed rule change will impose any burden on competition that is not necessary or appropriate in furtherance

of the purposes of the Act. The Exchange believes that the proposed rule change will facilitate the listing and trading of an additional type of actively-managed exchange-traded fund that will enhance competition among market participants, to the benefit of investors and the marketplace.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

Written comments were neither solicited nor received.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Within 45 days of the date of publication of this notice in the **Federal Register** or within such longer period (i) as the Commission may designate up to 90 days of such date if it finds such longer period to be appropriate and publishes its reasons for so finding or (ii) as to which the Exchange consents, the Commission shall: (a) By order approve or disapprove such proposed rule change, or (b) institute proceedings to determine whether the proposed rule change should be disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (<http://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include File Number SR-NASDAQ-2014-027 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE., Washington, DC 20549-1090. All submissions should refer to File Number SR-NASDAQ-2014-027. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (<http://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the

Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission's Public Reference Room, 100 F Street, NE., Washington, DC 20549 on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of such filing also will be available for inspection and copying at the principal office of the Exchange. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR-NASDAQ-2014-027, and should be submitted on or before May 2, 2014.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.³³

Kevin M. O'Neill,
Deputy Secretary.

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34-71884; File No. SR-ISE-2014-22]

Self-Regulatory Organizations; International Securities Exchange, LLC; Notice of Filing and Immediate Effectiveness of a Proposed Rule Change Relating to Rule 703A

April 7, 2014.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (the "Act"),¹ and Rule 19b-4 thereunder,² notice is hereby given that, on April 4, 2014, the International Securities Exchange, LLC ("Exchange" or "ISE") filed with the Securities and Exchange Commission (the "Commission") the proposed rule change as described in Items I and II below, which Items have been prepared by the Exchange. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

³³ 17 CFR 200.30-3(a)(12).

¹ 15 U.S.C. 78s(b)(1).

² 17 CFR 240.19b-4.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The ISE proposes to extend a pilot program under Rule 703A(d) that suspends Rule 720 regarding obvious errors during Limit and Straddle States in securities that underlie options traded on the ISE. The text of the proposed rule change is available on the Exchange's Web site (<http://www.ise.com>), at the principal office of the Exchange, and at the Commission's Public Reference Room.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the self-regulatory organization included statements concerning the purpose of, and basis for, the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The self-regulatory organization has prepared summaries, set forth in sections A, B and C below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

On April 5, 2013,³ the Commission approved a proposed rule change designed to address certain issues related to the Plan to Address Extraordinary Market Volatility Pursuant to Rule 608 of Regulation NMS under the Act (the "Limit Up-Limit Down Plan" or the "Plan").⁴ The rules adopted in that filing established a one year pilot program to exclude transactions executed during a Limit State⁵ or Straddle State⁶ from the obvious error provisions of Rule 720. The purpose of this filing is to extend

³ See Securities Exchange Act Release No. 69329 (April 5, 2013), 78 FR 21657 (April 11, 2014) (SR-ISE-2013-22) (Approval Order); 69110 (March 11, 2013) 78 FR 16726 (March 18, 2013) (SR-ISE-2013-22) (Notice of Filing).

⁴ See Securities Exchange Act Release No. 67091 (May 31, 2012), 77 FR 33498 (June 6, 2012) (the "Limit Up-Limit Down Release").

⁵ The term "Limit State" means the condition when the national best bid or national best offer for an underlying security equals an applicable price band, as determined by the primary listing exchange for the underlying security. See ISE Rule 703A.

⁶ The term "Straddle State" means the condition when the national best bid or national best offer for an underlying security is non-executable, as determined by the primary listing exchange for the underlying security, but the security is not in a Limit State. See ISE Rule 703A.

the effectiveness of this pilot program to coincide with the proposed extension of the Limit Up-Limit Down Plan to February 20, 2015.⁷

The Exchange believes the benefits to market participants from this provision should continue on a pilot basis. The Exchange continues to believe that adding certainty to the execution of orders in Limit or Straddle States will encourage market participants to continue to provide liquidity to the Exchange, and, thus, promote a fair and orderly market during these periods. Barring this provision, the obvious error provisions of Rule 720 would likely apply in many instances during Limit and Straddle States. The Exchange believes that continuing the pilot will protect against any unanticipated consequences in the options markets during a Limit or Straddle State. Thus, the Exchange believes that the protections of current rule should continue while the industry gains further experience operating the Plan.

Pursuant to a letter filed in connection with the order approving the establishment of the pilot,⁸ the Exchange committed to submit monthly data regarding the program. In addition, the Exchange agreed to submit an overall analysis of the pilot in conjunction with the data submitted under the Plan and any other data as requested by the Commission. The Exchange now notes that each month, the Exchange shall provide to the Commission, and the public, a dataset containing the data for each Straddle and Limit State in optionable stocks that had at least one trade on the Exchange.⁹ For each trade on the Exchange, the Exchange will provide (a) the stock symbol, option symbol, time at the start of the Straddle or Limit State, an indicator for whether it is a Straddle or Limit State, and (b) for the trades on the Exchange, the executed volume, time-weighted quoted bid-ask spread, time-weighted average quoted depth at the bid, time-weighted average quoted depth at the offer, high execution price, low execution price, number of trades for which a request for review for error was received during Straddle and Limit States, an indicator variable for whether those options outlined above have a

⁷ See Exchange Act Release No. 71649 (March 5, 2014), 79 FR 13696 (March 11, 2014) (Seventh Amendment to the Limit-Up Limit-Down Plan).

⁸ See letter from Michael Simon, General Counsel, International Securities Exchange, LLC, dated April 4, 2013.

⁹ The Exchange also notes that it will be supplying the Commission this data retroactively from April 2013-March 2014 as soon as practicable. The Exchange will also provide the Commission with this data on a monthly basis from March 2014 through the end of the pilot.

price change exceeding 30% during the underlying stock's Limit or Straddle State compared to the last available option price as reported by OPRA before the start of the Limit or Straddle State (1 if observe 30% and 0 otherwise), and another indicator variable for whether the option price within five minutes of the underlying stock leaving the Limit or Straddle State (or halt if applicable) is 30% away from the price before the start of the Limit or Straddle State.

In addition, the Exchange will provide to the Commission, no later than September 30, 2014, assessments relating to the impact of the operation of the obvious error rules during Limit and Straddle States including: (1) an evaluation of the statistical and economic impact of Limit and Straddle States on liquidity and market quality in the options markets, and (2) an assessment of whether the lack of obvious error rules in effect during the Straddle and Limit States are problematic. This data will be submitted under separate cover. Confidential treatment under the Freedom of Information Act is requested regarding the analysis.

2. Statutory Basis

The Exchange believes that its proposal is consistent with the requirements of the Act and the rules and regulations thereunder that are applicable to a national securities exchange, and, in particular, with the requirements of Section 6(b) of the Act.¹⁰ In particular, the proposal is consistent with Section 6(b)(5) of the Act,¹¹ because it is designed to promote just and equitable principles of trade, remove impediments to and perfect the mechanisms of a free and open market and a national market system and, in general, to protect investors and the public interest. Additionally, the Exchange believes the proposed rule change is consistent with the Section 6(b)(5)¹² requirement that the rules of an exchange not be designed to permit unfair discrimination between customers, issuers, brokers, or dealers.

In particular, the Exchange further believes that it is necessary and appropriate in the interest of promoting fair and orderly markets to exclude transactions executed during a Limit or Straddle State from certain aspects of Rule 720. The Exchange believes the application of the current rule will be impracticable given the lack of a reliable national best bid or offer in the options market during Limit and Straddle

¹⁰ 15 U.S.C. 78f(b).

¹¹ 15 U.S.C. 78f(b)(5).

¹² *Id.*

States, and that the resulting actions (i.e., nullified trades or adjusted prices) may not be appropriate given market conditions. Extension of this pilot would ensure that limit orders that are filled during a Limit or Straddle State would have certainty of execution in a manner that promotes just and equitable principles of trade, removes impediments to, and perfects the mechanism of a free and open market and a national market system. Thus, the Exchange believes that the protections of the pilot should continue while the industry gains further experience operating the Plan.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange does not believe that the proposed rule change will impose any burden on competition that is not necessary or appropriate in furtherance of the purposes of the Act. Specifically, the Exchange believes that, by extending the expiration of the pilot, the proposed rule change will allow for further analysis of the pilot and a determination of how the pilot shall be structured in the future. In doing so, the proposed rule change will also serve to promote regulatory clarity and consistency, thereby reducing burdens on the marketplace and facilitating investor protection. The Exchange further notes that other options exchanges have filed to extend their own obvious error pilots to coincide with the proposed extension of the Limit Up-Limit Down Plan.¹³

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

The Exchange has not solicited, and does not intend to solicit, comments on this proposed rule change. The Exchange has not received any unsolicited written comments from members or other interested parties.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Because the proposed rule change does not (i) significantly affect the protection of investors or the public interest; (ii) impose any significant burden on competition; and (iii) become operative for 30 days from the date on which it was filed, or such shorter time as the Commission may designate if consistent with the protection of investors and the public interest, the proposed rule change has become effective pursuant to Section 19(b)(3)(A)

of the Act¹⁴ and Rule 19b-4(f)(6)(iii) thereunder.¹⁵

The Exchange has asked the Commission to waive the 30-day operative delay so that the proposal may become operative immediately upon filing. The Exchange stated that waiver of this requirement will allow the Exchange to extend the pilot program prior to its expiration on April 8, 2014. The Exchange also stated that the proposal will allow for the least amount of market disruption as the pilot will continue as it currently does, maintaining the status quo. For these reasons, the Commission believes that the proposed rule change presents no novel issues and that waiver of the 30-day operative delay is consistent with the protection of investors and the public interest. Therefore, the Commission designates the proposed rule change to be operative upon filing.¹⁶

At any time within 60 days of the filing of the proposed rule change, the Commission summarily may temporarily suspend such rule change if it appears to the Commission that such action is necessary or appropriate in the public interest, for the protection of investors, or otherwise in furtherance of the purposes of the Act. If the Commission takes such action, the Commission shall institute proceedings to determine whether the proposed rule should be approved or disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (<http://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include File Number SR-ISE-2014-22 on the subject line.

¹⁴ 15 U.S.C. 78s(b)(3)(A).

¹⁵ 17 CFR 240.19b-4(f)(6)(iii). As required under Rule 19b-4(f)(6)(iii), the Exchange provided the Commission with written notice of its intent to file the proposed rule change, along with a brief description and the text of the proposed rule change, at least five business days prior to the date of filing of the proposed rule change, or such shorter time as designated by the Commission.

¹⁶ For purposes only of waiving the 30-day operative delay, the Commission has also considered the proposed rule's impact on efficiency, competition, and capital formation. See 15 U.S.C. 78c(f).

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE., Washington, DC 20549-1090.

All submissions should refer to File Number SR-ISE-2014-22. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (<http://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission's Public Reference Room, 100 F Street NE., Washington, DC 20549, on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the filing also will be available for inspection and copying at the principal office of the Exchange. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR-ISE-2014-22 and should be submitted on or before May 2, 2014.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.¹⁷

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34-71893; File No. SR-OCC-2014-08]

Self-Regulatory Organizations; The Options Clearing Corporation; Notice of Filing and Immediate Effectiveness of Proposed Rule Change To Provide Certain Enhancements and Clarifications With Respect to OCC's Indemnification of Its Directors, Officers and Other Personnel

April 7, 2014.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 ("Act")¹ and Rule 19b-4 thereunder,² notice is hereby given that on April 1, 2014, The Options Clearing Corporation ("OCC") filed with the Securities and Exchange Commission ("Commission") the proposed rule change as described in Items I and II below, which Items have been prepared by the clearing agency. OCC filed the proposal pursuant to Section 19(b)(3)(A) of the Act³ and Rule 19b-4(f)(6) thereunder.⁴ The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Clearing Agency's Statement of the Terms of Substance of the Proposed Rule Change

This proposed rule change by OCC would amend OCC's By-Laws to provide certain enhancements and clarifications with respect to OCC's indemnification of its directors, officers and other personnel.

II. Clearing Agency's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, OCC included statements concerning the purpose of and basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. OCC has prepared summaries, set forth in sections (A), (B), and (C) below, of the most significant aspects of these statements.

(A) Clearing Agency's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

OCC is proposing to modify its By-Laws to provide certain enhancements and clarifications with respect to OCC's indemnification of its directors, officers and other personnel and generally bring the indemnification provisions in OCC's By-Laws in line with current best practices for Delaware corporations in an effort to be able to continue to attract qualified individuals to be directors and officers of OCC. The proposed changes would include mandatory advancement of expenses to an indemnified party and certain other provisions that are now frequently included in the by-laws of a Delaware business corporation. The proposed changes also include certain permissive provisions regarding indemnification and related matters that are implied within OCC's power and authority under the Delaware General Corporation Law ("DGCL") and OCC's charter and By-Laws, but not currently stated in the By-Laws. OCC proposes to specifically incorporate these provisions into the By-Laws for the purpose of including a comprehensive statement of OCC's policies for indemnification and related matters in a single location.

The proposed changes would provide a number of enhancements to the existing indemnification provisions in OCC's By-Laws. First, OCC proposes to revise Section 1 of Article X of the By-Laws to (i) add mandatory advancement of expenses to directors and officers who have indemnification rights; (ii) require an undertaking to repay advanced expenses if the indemnified person is ultimately not entitled to indemnity; (iii) clearly state that the rights of a director or officer inure to the benefit of his or her heirs and representatives; and (iv) exclude from indemnification actions initiated by the director or officer, unless authorized by OCC's board of directors. Further, proposed revisions to Section 2 would remove a clause relating to amendment or repeal of the indemnification provisions in the By-Laws, because proposed Section 2, together with proposed Section 8 described below, would protect potentially indemnified parties from having their rights retroactively adversely altered.

OCC is also proposing to add a number of new sections regarding indemnification and related matters to Article X of its By-Laws. Specifically, new proposed Section 3 would, among other things, make clear that OCC can purchase insurance coverage against any liability asserted against current and former directors and officers whether or

not OCC would have the power to indemnify the person against such liability. New proposed Section 4 would replace existing Section 3 relating to indemnification of persons other than directors and officers of OCC. While existing Section 3 is limited to employees and agents of OCC, proposed Section 4 would permit OCC to indemnify any person other than directors and officers as approved by OCC's board of directors. New proposed Section 5 would give an indemnified party the express right to recover unpaid indemnification or expense claims and would require that OCC pay the indemnified party's costs of prosecuting such right if the indemnified party is successful. New proposed Section 6 would provide an "offset" to OCC if an OCC indemnified person is serving in some capacity at another entity at OCC's request and that indemnified person collects from the other entity. The purpose of the proposed offset is to prevent the indemnified person from being compensated twice for the same situation.

OCC is proposing to add two new sections to Article X of its By-Laws relating to the structure of the indemnification provisions therein. First, proposed new Section 7 would expressly state that the indemnification rights set forth in Article X of OCC's By-Laws are non-exclusive, but would not otherwise expand or contract the substance of those provisions. Second, proposed new Section 8 would prohibit any amendments or changes to Article X that would adversely affect the rights of current or former directors or officers by requiring that any such amendment operate only prospectively.

OCC believes the proposed rule change is consistent with Section 17A(b)(3)(F) of the Act,⁵ and the rules and regulations thereunder, including Rule 17Ad-22.⁶ By enhancing the indemnification provisions in OCC's By-Laws such that OCC can continue to attract and retain qualified directors, officers and other personnel, and these individuals can effectively perform their duties, the proposed rule change would foster cooperation and coordination with persons engaged in the clearance and settlement of securities transactions, and generally would provide for the prompt and accurate clearance and settlement of securities transactions and the protection of securities investors and the public interest.⁷ Additionally, bringing the indemnification provisions in OCC's By-

⁵ 15 U.S.C. 78q-1(b)(3)(F).

⁶ 17 CFR 240.17Ad-22.

⁷ 15 U.S.C. 78q-1(b)(3)(F).

¹ 15 U.S.C. 78s(b)(1).

² 17 CFR 240.19b-4.

³ 15 U.S.C. 78s(b)(3)(A).

⁴ 17 CFR 240.19b-4(f)(6). As required by Rule 19b-4(f)(6)(iii) of the Act, OCC has given the Commission written notice of its intent to file the proposed rule change, along with a brief description and text of the proposed rule change, at least five business days prior to the date of filing of the proposed rule change, or such shorter time as designated by the Commission.

Laws in line with current best practices for Delaware corporations as well as clarifying certain of those provisions furthers OCC's goal of maintaining written policies and procedures that provide for a well-founded, transparent and enforceable legal framework for its activities and therefore is consistent with Rule 17Ad-22(d)(1).⁸ The proposed rule change is not inconsistent with the existing rules of OCC, including any other rules proposed to be amended.

(B) Clearing Agency's Statement on Burden on Competition

OCC does not believe that the proposed rule change would impose any burden on competition. Changes to the rules of a clearing agency may have an impact on the participants in a clearing agency, their customers and the markets that the clearing agency serves. This proposed rule change affects current and future OCC directors and officers, and OCC believes that the proposed modifications would not disadvantage or favor any particular user in relationship to another user because the proposed modifications relate to internal corporate matters at OCC and would not impose any burdens on users and prospective users.

For the foregoing reasons, OCC believes that the proposed rule change is in the public interest, would be consistent with the requirements of the Act applicable to clearing agencies, and would not impose a burden on competition.

(C) Clearing Agency's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

Written comments on the proposed rule change were not and are not intended to be solicited with respect to the proposed rule change and none have been received.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Because the foregoing proposed rule change does not: (i) Significantly affect the protection of investors or the public interest; (ii) impose any significant burden on competition; and (iii) become operative for 30 days from the date on which it was filed, or such shorter time as the Commission may designate, if consistent with the protection of investors and the public interest, it has become effective pursuant to Section

19(b)(3)(A) of the Act⁹ and Rule 19b-4(f)(6) thereunder.¹⁰

At any time within 60 days of the filing of the proposed rule change, the Commission summarily may temporarily suspend such rule change if it appears to the Commission that such action is necessary or appropriate in the public interest, for the protection of investors, or otherwise in furtherance of the purposes of the Act. If the Commission takes such action, the Commission shall institute proceedings under Section 19(b)(2)(B) of the Act¹¹ to determine whether the proposed rule should be approved or disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (<http://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include File Number SR-OCC-2014-08 on the subject line.

Self-Regulatory Organizations; NYSE Arca, Inc.; Notice of Filing of Proposed Rule Change Relating to Listing and Trading Shares of Hull Tactical US ETF Under NYSE Arca Equities Rule 8.600

April 7, 2014.

Pursuant to Section 19(b)(1)¹ of the Securities Exchange Act of 1934 ("Act")² and Rule 19b-4 thereunder,³ notice is hereby given that, on March 24, 2014, NYSE Arca, Inc. ("Exchange" or "NYSE Arca") filed with the Securities and Exchange Commission (the "Commission") the proposed rule change as described in Items I and II below, which Items have been prepared by the self-regulatory organization. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The Exchange proposes to list and trade shares of the following under NYSE Arca Equities Rule 8.600 ("Managed Fund Shares"): Hull Tactical US ETF. The text of the proposed rule change is available on the Exchange's Web site at www.nyse.com, at the

principal office of the Exchange, and at the Commission's Public Reference Room.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the self-regulatory organization included statements concerning the purpose of, and basis for, the proposed rule change and discussed any comments it received on the proposed rule change. The text of those statements may be examined at the places specified in Item IV below. The Exchange has prepared summaries, set forth in sections A, B, and C below, of the most significant parts of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and the Statutory Basis for, the Proposed Rule Change

1. Purpose

The Exchange proposes to list and trade the shares ("Shares") of Hull Tactical US ETF (the "Fund") under NYSE Arca Equities Rule 8.600, which governs the listing and trading of Managed Fund Shares⁴ on the Exchange.⁵ The Shares will be offered by the Exchange Traded Concepts Trust ("Trust"), a Delaware statutory trust. The Trust is registered with the Commission as an investment company.⁶

⁴ A Managed Fund Share is a security that represents an interest in an investment company registered under the Investment Company Act of 1940 (15 U.S.C. 80a-1) ("1940 Act") organized as an open-end investment company or similar entity that invests in a portfolio of securities selected by its investment adviser consistent with its investment objectives and policies. In contrast, an open-end investment company that issues Investment Company Units, listed and traded on the Exchange under NYSE Arca Equities Rule 5.2(j)(3), seeks to provide investment results that correspond generally to the price and yield performance of specific foreign or domestic stock index, fixed income securities index, or combination thereof.

⁵ The Commission has previously approved listing and trading on the Exchange of a number of actively managed funds under Rule 8.600. See, e.g., Securities Exchange Act Release Nos. 61842 (April 5, 2010), 75 FR 18554 (April 12, 2010) (SR-NYSEArca-2012-10) (order approving Exchange listing and trading of Mars Hill Global Relative Value ETF (f/k/a HTE Global Relative Value ETF)); 67559 (Aug. 1, 2012), 77 FR 47482 (Aug. 8, 2012) (SR-NYSEArca-2012-57) (order approving Exchange listing and trading of QAM Equity Hedge ETF); and 67552 (Aug. 1, 2012), 77 FR 47131 (Aug. 7, 2012) (SR-NYSEArca-2012-55) (notice of filing of proposed rule change to list and trade shares of STAR Global Buy-Write ETF).

⁶ The Trust is registered under the 1940 Act. On July 26, 2013, the Trust filed with the Commission a post-effective amendment to its registration statement on Form N-1A relating to the Fund (File Nos. 333-156529 and 811-22263) (the "Registration

Statement"). The descriptions of the operation of the Trust and the Shares contained herein are based, in part, on the Registration Statement. In addition, the Commission has issued an order granting certain exemptive relief to the Trust under the 1940 Act. See Investment Company Act Release No. 30445 (April 2, 2013) (File No. 812-13969) ("Exemptive Order").

Exchange Traded Concepts, LLC will be the investment adviser ("Adviser") to the Fund. HTAA, LLC will be the sub-adviser to the Fund (the "Sub-Adviser"). SEI Investments Co. will serve as the administrator of the Fund ("Administrator"). JP Morgan Chase Bank N.A. will serve as the custodian, transfer agent and dividend disbursing agent of the Fund. SEI Investments Distribution Co. will serve as the distributor ("Distributor") for the Trust. Commentary .06 to Rule 8.600 provides that, if the investment adviser to the investment company issuing Managed Fund Shares is affiliated with a broker-dealer, such investment adviser shall erect a "fire wall" between the investment adviser and the broker-dealer with respect to access to information concerning the composition and/or changes to such investment company portfolio. In addition, Commentary .06 further requires that personnel who make decisions on the open-end fund's portfolio composition must be subject to procedures designed to prevent the use and dissemination of material nonpublic information regarding the open-end fund's portfolio.⁷ Commentary .06 to Rule 8.600 is similar to Commentary .03(a)(i) and (iii) to NYSE Arca Equities Rule 5.2(j)(3); however, Commentary .06 in connection with the establishment of a "fire wall" between the investment adviser and the broker-dealer reflects

Statement"). The descriptions of the operation of the Trust and the Shares contained herein are based, in part, on the Registration Statement. In addition, the Commission has issued an order granting certain exemptive relief to the Trust under the 1940 Act. See Investment Company Act Release No. 30445 (April 2, 2013) (File No. 812-13969) ("Exemptive Order").

⁷ An investment adviser to an open-end fund is required to be registered under the Investment Advisers Act of 1940 (the "Advisers Act"). As a result, the Adviser and Sub-Adviser and their related personnel are subject to the provisions of Rule 204A-1 under the Advisers Act relating to codes of ethics. This Rule requires investment advisers to adopt a code of ethics that reflects the fiduciary nature of the relationship to clients as well as compliance with other applicable securities laws. Accordingly, procedures designed to prevent the communication and misuse of non-public information by an investment adviser must be consistent with Rule 204A-1 under the Advisers Act. In addition, Rule 206(4)-7 under the Advisers Act makes it unlawful for an investment adviser to provide investment advice to clients unless such investment adviser has (i) adopted and implemented written policies and procedures reasonably designed to prevent violation, by the investment adviser and its supervised persons, of the Advisers Act and the Commission rules adopted thereunder; (ii) implemented, at a minimum, an annual review regarding the adequacy of the policies and procedures established pursuant to subparagraph (i) above and the effectiveness of their implementation; and (iii) designated an individual (who is a supervised person) responsible for administering the policies and procedures adopted under subparagraph (i) above.

the applicable open-end fund's portfolio, not an underlying benchmark index, as is the case with index-based funds. Neither the Adviser nor the Sub-Adviser is or is affiliated with a broker-dealer. In the event (a) the Adviser or Sub-Adviser becomes, or becomes newly affiliated with, a broker-dealer, or (b) any new manager, adviser, or sub-adviser is, or becomes affiliated with, a broker-dealer, it will implement a fire wall with respect to its relevant personnel or broker-dealer affiliate, as applicable, regarding access to information concerning the composition and/or changes to the portfolio, and will be subject to procedures designed to prevent the use and dissemination of material, non-public information regarding such portfolio.

According to the Registration Statement, the investment objective of the Fund will be to seek long-term capital appreciation. The Fund will be actively managed.

According to the Registration Statement, under normal market conditions⁸ the Fund will seek to achieve its investment objective by taking long and short positions⁹ in one or more exchange traded funds ("ETFs")¹⁰ that seek to track the performance of the S&P 500 Index (each, an "S&P 500-related ETF"). The ETFs the Fund invests in all will be listed and traded in the U.S. on registered exchanges. Under normal market conditions, substantially all of the Fund's assets will be invested in one or more S&P 500-related ETFs, ETFs that provide leveraged or inverse exposure to the S&P 500 Index and, to seek the desired exposure to the S&P 500 Index,

⁸ The term "under normal market conditions" includes, but is not limited to, the absence of adverse market, economic, political or other conditions, including extreme volatility or trading halts in the equity markets or the financial markets generally; operational issues causing dissemination of inaccurate market information; or force majeure type events such as systems failure, natural or man-made disaster, act of God, armed conflict, act of terrorism, riot or labor disruption or any similar intervening circumstance.

⁹ According to the Registration Statement, short sales are transactions in which the Fund sells a security it does not own. To complete the transaction, the Fund must borrow or otherwise obtain the security to make delivery to the buyer. The Fund is then obligated to replace the security borrowed by purchasing the security at the market price at the time of replacement. The Fund may use repurchase agreements to satisfy delivery obligations in short sales transactions. The Fund may use up to 100% of its net assets to engage in short sales transactions and collateralize its open short positions.

¹⁰ ETFs are securities registered under the 1940 Act such as those listed and traded on the Exchange under NYSE Arca Equities Rules 5.2(j)(3) (Investment Company Units), 8.100 (Portfolio Depositary Receipts) and 8.600 (Managed Fund Shares).

futures contracts, as well as, as described below, cash instruments.

According to the Registration Statement, the Sub-Adviser will utilize a proprietary, analytical investment model that examines current and historical market data to attempt to predict the performance of the S&P 500 Index. The model will deliver investment signals that the Sub-Adviser will use to make investment decisions for the Fund. Depending on the investment signal delivered by the model, the Sub-Adviser will take certain long or short positions in one or more S&P 500-related ETFs: (1) If the model indicates bull-market conditions, the Sub-Adviser will take long positions; or (2) if the model indicates bear-market conditions, the Sub-Adviser will take short positions. When the Fund takes long positions, it may maintain long exposure of up to 200% of net assets; exposure to short positions will be limited to no more than 100% of net assets. The Sub-Adviser will adjust the Fund's long and short positions when necessary to take into account new data from the model that reflects changing market conditions. Positions may be adjusted as the model predictions fluctuate.

According to the Registration Statement, the Fund will enter into futures contracts to seek the desired exposure to the S&P 500 Index.¹¹ The Fund will limit its investment in futures contracts such that either (1) the aggregate net notional value of its futures investments will not exceed the value of the Fund's net assets, after taking into account unrealized profits and unrealized losses on the futures positions it has entered into; or (2) the aggregate initial margin and premiums required to establish positions in its futures investments will not exceed 5% of the Fund's net assets, after taking into account unrealized profits and unrealized losses on any such positions. The Fund will only enter into futures contracts traded on a national futures

¹¹ To the extent the Fund enters into futures contracts or invests in underlying ETFs that invest in futures, options on futures or other instruments subject to regulation by the U.S. Commodity Futures Trading Commission ("CFTC"), it will do so in reliance upon and in accordance with CFTC Rule 4.5. The Trust has filed a notice of eligibility for exclusion from the definition of the term "commodity pool operator" in accordance with CFTC Rule 4.5. Therefore, neither the Trust nor any of its series is deemed to be a "commodity pool" or "commodity pool operator" under the Commodity Exchange Act ("CEA"), and they are not subject to registration or regulation as such under the CEA. In addition, neither the Adviser nor the Sub-Adviser is deemed to be a "commodity pool operator" or "commodity trading adviser" with respect to the advisory services it provides to the Fund.

exchange regulated by the CFTC. The Fund will trade futures when the Sub-Adviser determines that doing so may provide an efficient means of seeking exposure to the S&P 500 Index that is complimentary to its investment in shares of one or more S&P 500-related ETFs.

According to the Registration Statement, in addition to investments in the S&P 500-related ETFs and futures contracts, the Fund may invest up to 10% of its total assets in leveraged ETFs or inverse ETFs that seek to deliver multiples, or the inverse, of the performance of the S&P 500 Index, respectively (collectively with S&P 500-related ETFs, the "Underlying ETFs"). Such investments will be made in accordance with the 1940 Act and consistent with the Fund's investment objective and policies, and will not be used to seek performance that is the multiple or inverse multiple (e.g., 2x or 3x) of any securities market index. The inverse and leveraged ETFs held by the Fund may utilize leverage (i.e. borrowing) to acquire their underlying portfolio investments.¹²

According to the Registration Statement, the Fund may invest in Underlying ETFs that are primarily index-based ETFs that hold substantially all of their assets in securities representing a specific index. The Fund also may invest in Underlying ETFs that are actively managed.

According to the Registration Statement, the Underlying ETFs in which the Fund may invest may invest in equity securities. Equity securities consist of common stocks, preferred stocks, warrants to acquire common stock, securities convertible into common stock,¹³ investments in master limited partnerships ("MLPs")¹⁴ and rights.¹⁵

According to the Registration Statement, the Underlying ETFs in which the Fund may invest may engage in futures and options transactions. The

¹² The use of leverage may exaggerate changes in an ETF's share price and the return on its investments. Inverse and leveraged ETFs are designed to achieve their objectives for a single day only.

¹³ According to the Registration Statement, convertible securities are bonds, debentures, notes, preferred stocks or other securities that may be converted or exchanged (by the holder or by the issuer) into shares of the underlying common stock (or cash or securities of equivalent value) at a stated exchange ratio.

¹⁴ According to the Registration Statement, MLPs are limited partnerships in which the ownership units are publicly traded. MLP units are registered with the SEC and are freely traded on a securities exchange or in the over-the-counter market.

¹⁵ According to the Registration Statement, a right is a privilege granted to existing shareholders of a corporation to subscribe to shares of a new issue of common stock before it is issued. Rights normally have a short life of usually two to four weeks.

Fund will only invest in Underlying ETFs that engage in futures contracts if such futures contracts are traded on a national futures exchange regulated by the CFTC. Underlying ETFs in which the Fund may invest may use futures contracts and related options for bona fide hedging; attempting to offset changes in the value of securities held or expected to be acquired or be disposed of; attempting to gain exposure to a particular market, index or instrument; or other risk management purposes. When an Underlying ETF purchases or sells a futures contract, or sells an option thereon, it is required to cover its position in order to limit leveraging and related risks.

According to the Registration Statement, the Underlying ETFs in which the Fund may invest may buy and sell index futures contracts with respect to any index that is traded on a recognized exchange or board of trade.

According to the Registration Statement, the Underlying ETFs in which the Fund may invest may purchase and write (sell) put and call options on indices and enter into related closing transactions.¹⁶ All such options written on indices or securities must be covered by the Underlying ETF.

According to the Registration Statement, an Underlying ETF in which the Fund may invest may trade put and call options on securities, securities indices and currencies, as the Underlying ETF's investment adviser determines is appropriate in seeking the ETF's investment objective, and except as restricted by the Underlying ETF's investment limitations. An Underlying ETF may purchase put and call options on securities to protect against a decline in the market value of the securities in its portfolio or to anticipate an increase in the market value of securities that the Fund may seek to purchase in the future. An Underlying ETF may write covered call options on securities as a means of increasing the yield on its assets and as a means of providing limited protection against decreases in its market value. An Underlying ETF may purchase and write options on an exchange or over-the-counter.

¹⁶ According to the Registration Statement, a put option on a security gives the purchaser of the option the right to sell, and the writer of the option the obligation to buy, the underlying security. A call option on a security gives the purchaser of the option the right to buy, and the writer of the option the obligation to sell, the underlying security. Put and call options on indices are similar to options on securities except that options on an index give the holder the right to receive, upon exercise of the option, an amount of cash if the closing level of the underlying index is greater than (or less than, in the case of puts) the exercise price of the option.

According to the Registration Statement, the Underlying ETFs in which the Fund may invest may enter into swaps, including, but not limited to, total return swaps, index swaps, and interest rate swaps. An Underlying ETF may utilize swaps in an attempt to gain exposure to the securities in a market without actually purchasing those securities, or to hedge a position.¹⁷ The Underlying ETFs in which the Fund may invest may enter into swaps to invest in a market without owning or taking physical custody of the underlying securities in circumstances in which direct investment is restricted for legal reasons or is otherwise impracticable.

During periods when the Fund's assets (or portion thereof) are not fully invested in one or more S&P 500-related ETFs or otherwise exposed to the S&P 500 Index, all or a portion of the Fund may be invested in cash instruments ("Cash Instruments"), which include U.S. Treasury obligations; cash and cash equivalents including commercial paper, certificates of deposit and bankers' acceptances; repurchase agreements;¹⁸ shares of money market mutual funds; and high-quality, short-term debt instruments including, in addition to U.S. Treasury obligations, other U.S. government securities.¹⁹

¹⁷ Forms of swaps include interest rate caps, under which, in return for a premium, one party agrees to make payments to the other to the extent that interest rates exceed a specified rate, or "cap," interest rate floors, under which, in return for a premium, one party agrees to make payments to the other to the extent that interest rates fall below a specified level, or "floor," and interest rate collars, under which a party sells a cap and purchases a floor or vice versa in an attempt to protect itself against interest rate movements exceeding given minimum or maximum levels.

¹⁸ According to the Registration Statement, the Fund may enter into repurchase agreements with financial institutions, which may be deemed to be loans. The Fund will effect repurchase transactions only with large, well-capitalized and well established financial institutions whose condition will be continually monitored by the Sub-Advisor. In addition, the value of the collateral underlying the repurchase agreement will always be at least equal to the repurchase price, including any accrued interest earned on the repurchase agreement.

¹⁹ Securities issued or guaranteed by the U.S. government or its agencies or instrumentalities include U.S. Treasury securities, which are backed by the full faith and credit of the U.S. Treasury and which differ only in their interest rates, maturities, and times of issuance. Certain U.S. government securities are issued or guaranteed by agencies or instrumentalities of the U.S. government including, but not limited to, obligations of U.S. government agencies or instrumentalities such as the Federal National Mortgage Association ("Fannie Mae"), the Federal Home Loan Mortgage Corporation ("Freddie Mac"), the Government National Mortgage Association ("Ginnie Mae"), the Federal Home Loan Banks and other agencies or instrumentalities. Some obligations issued or guaranteed by U.S. government agencies and instrumentalities, including, for example, Ginnie Mae pass-through

Other Investments

According to the Registration Statement, in addition to the investments described above, the Fund may invest in other investments, as described below.

According to the Registration Statement, in the absence of normal market conditions²⁰ the Fund may invest 100% of its assets, without limitation, in Cash Instruments. The Fund may be invested in this manner for extended periods, depending on the Sub-Advisor's assessment of market conditions.

According to the Registration Statement, in addition to the Underlying ETFs discussed above, which are primary investments of the Fund, the Fund will invest in money market mutual funds, to the extent that such an investment would be consistent with the requirements of Section 12(d)(1) of the 1940 Act, or any rule, regulation or order of the SEC or interpretation thereof.

Restrictions on Investment

According to the Registration Statement, the Fund may not purchase or sell commodities or commodity contracts unless acquired as a result of ownership of securities or other instruments issued by persons that purchase or sell commodities or commodities contracts; but this shall not prevent the Fund from entering into futures contracts.

The Fund will not directly enter into swaps or engage in options transactions.

According to the Registration Statement, the Fund may not, with respect to 75% of its total assets, purchase securities of any issuer (except securities issued or guaranteed by the U.S. government, its agencies or instrumentalities or shares of investment companies) if, as a result, more than 5% of its total assets would be invested in the securities of such issuer.

According to the Registration Statement, the Fund may not acquire more than 10% of the outstanding voting securities of any one issuer.

According to the Registration Statement, the Fund may not invest

certificates, are supported by the full faith and credit of the U.S. Treasury. Other obligations issued by or guaranteed by federal agencies, such as those securities issued by Fannie Mae, are supported by the discretionary authority of the U.S. government to purchase certain obligations of the federal agency, while other obligations issued by or guaranteed by federal agencies, such as those of the Federal Home Loan Banks, are supported by the right of the issuer to borrow from the U.S. Treasury. The Fund may invest in U.S. Treasury zero-coupon bonds.

²⁰ See note 8, *supra*.

25% or more of its total assets in the securities of one or more issuers conducting their principal business activities in the same industry or group of industries.²¹ This limitation does not apply to investments in securities issued or guaranteed by the U.S. government, its agencies or instrumentalities, or shares of investment companies.

According to the Registration Statement, the Fund may hold up to an aggregate amount of 15% of its net assets in illiquid securities (calculated at the time of investment), including securities deemed illiquid by the Adviser or Sub-Advisor consistent with Commission guidance²² and repurchase agreements that do not mature within seven days. The Fund will monitor its portfolio liquidity on an ongoing basis to determine whether, in light of current circumstances, an adequate level of liquidity is being maintained, and will consider taking appropriate steps in order to maintain adequate liquidity, if through a change in values, net assets, or other circumstances, more than 15% of the Fund's net assets are held in illiquid securities. Illiquid securities include securities subject to contractual or other restrictions on resale and other instruments that lack readily available markets as determined in accordance with Commission staff guidance.²³

²¹ See Form N-1A, Item 9. The Commission has taken the position that a fund is concentrated if it invests more than 25% of the value of its total assets in any one industry. See, e.g., Investment Company Act Release No. 9011 (October 30, 1975), 40 FR 54241 (November 21, 1975).

²² In reaching liquidity decisions, the Adviser and Sub-Advisor may consider the following factors: The frequency of trades and quotes for the security; the number of dealers wishing to purchase or sell the security and the number of other potential purchasers; dealer undertakings to make a market in the security; and the nature of the security and the nature of the marketplace in which it trades (e.g., the time needed to dispose of the security, the method of soliciting offers, and the mechanics of transfer).

²³ See Investment Company Act Release No. 18612 (March 12, 1992), 57 FR 9828 (March 20, 1992) (Revisions of Guidelines to Form N-1A) (stating that Guide 4 "permit[s] a fund to invest up to 15% of its assets in illiquid securities"). The Commission has stated that long-standing Commission guidelines have required open-end funds to hold no more than 15% of their net assets in illiquid securities and other illiquid assets. See Investment Company Act Release No. 28193 (March 11, 2008), 73 FR 14618 (March 18, 2008), footnote 34. See also, Investment Company Act Release No. 5847 (October 21, 1969), 35 FR 19989 (December 31, 1970) (Statement Regarding "Restricted Securities"); Investment Company Act Release No. 18612 (March 12, 1992), 57 FR 9828 (March 20, 1992) (Revisions of Guidelines to Form N-1A). A fund's portfolio security is illiquid if it cannot be disposed of in the ordinary course of business within seven days at approximately the value ascribed to it by the fund. See Investment Company Act Release No. 14983 (March 12, 1986), 51 FR 9773 (March 21, 1986) (adopting amendments to

According to the Registration Statement, the Fund intends to qualify each year as a regulated investment company (a "RIC") under Subchapter M of the Internal Revenue Code of 1986, as amended.²⁴

Creations and Redemptions of Shares

According to the Registration Statement, the Fund will offer and issue Shares at net asset value ("NAV") only in aggregated lots initially of 25,000 (each, a "Creation Unit"), on a continuous basis through the Distributor, at their NAV next determined after receipt, on any business day, of an order received in proper form.

The consideration for purchase of a Creation Unit of the Fund will generally consist of an in kind deposit of a designated portfolio of securities (the "Deposit Securities") per each Creation Unit constituting a substantial replication, or a representation, of the securities included in the Fund's portfolio and an amount of cash (the "Cash Component") computed as described below.²⁵ Together, the Deposit Securities and the Cash Component will constitute the "Fund Deposit," which represents the minimum initial and subsequent investment amount for a Creation Unit of the Fund. The Cash Component will be an amount equal to the difference between the NAV of the Shares (per Creation Unit) and the market value of the Deposit Securities. The Cash Component will serve the function of compensating for any differences between the NAV per Creation Unit and the market value of the Deposit Securities.

All orders to create Creation Units must be received by the Distributor no later than 3:00 p.m., Eastern Time ("E.T."), an hour earlier than the close of the regular trading session on the Exchange (ordinarily 4:00 p.m., E.T.), in each case on the date such order is placed in order for the creation of Creation Units to be effected based on the NAV of Shares of the Fund as next

determined on such date after receipt of the order in proper form.

Shares may be redeemed only in Creation Units at their NAV next determined after receipt of a redemption request in proper form by the Fund through the Administrator and only on a business day. Unless cash redemptions are available or specified for the Fund, the redemption proceeds for a Creation Unit will generally consist of an in-kind transfer of a designated portfolio of securities ("Fund Securities") plus cash in an amount equal to the difference between the NAV of the Shares being redeemed, as next determined after receipt of a request in proper form, and the value of the Fund Securities (the "Cash Redemption Amount"), less a redemption transaction fee. Cash redemptions will only be made available in accordance with the Exemptive Order.

An order to redeem Creation Units is deemed received on the transmittal date if (i) such order is received by the Administrator not later than 3:00 p.m., E.T. on such transmittal date; and (ii) all other procedures set forth in the participant agreement are properly followed; such order will be effected based on the NAV of the Fund as next determined.

The Administrator, through the National Securities Clearing Corporation ("NSCC"), will make available on each business day, immediately prior to the opening of business on the Exchange (currently 9:30 a.m., E.T.), (a) the list of the names and the required number of shares of each Deposit Security to be included in the current Fund Deposit (based on information at the end of the previous business day) for the Fund, and (b) the Fund Securities that will be applicable to redemption requests received in proper form on that day. In addition, the Administrator, through the NSCC, will also make available on each business day, the estimated Cash Component and Cash Redemption Amount, effective through and including the previous business day, per outstanding Creation Unit of the Fund.

Net Asset Value

According to the Registration Statement, the Fund will calculate NAV by: (i) Taking the current market value of its total assets; (ii) subtracting any liabilities; and (iii) dividing that amount by the total number of Shares owned by shareholders. The Fund will calculate NAV once each business day as of the regularly scheduled close of normal trading on the Exchange (normally, 4:00 p.m., E.T.). The value of the Fund's Shares bought and sold in the secondary market will be driven by market price.

The price of these Shares, like the price of all traded securities, will be subject to factors such as supply and demand, as well as the current value of the portfolio securities held by the Fund. Secondary market Shares, available for purchase or sale on an intraday basis, do not have a fixed relationship either to the previous day's NAV nor the current day's NAV. Prices in the secondary market, therefore, may be below, at, or above the most recently calculated NAV of such Shares.

In calculating NAV, the Fund will generally value its portfolio investments at market prices or, in the absence of market value with respect to any investment, at fair value in accordance with valuation procedures adopted by the Board of Trustees of the Trust (the "Board") and in accordance with the 1940 Act.

The Underlying ETFs will be valued at the official closing price, if available, or the last reported sale price or, if no sale has occurred, at the last quoted bid price on the primary market or exchange on which they are traded.

Futures contracts will be valued at the settlement or closing price determined by the applicable exchange.

The Cash Instruments may be valued at market values, as furnished by recognized dealers in such securities or assets. Cash Instruments also may be valued on the basis of information furnished by an independent pricing service that uses a valuation matrix which incorporates both dealer-supplied valuations and electronic data processing techniques.

Short-term debt securities with remaining maturities of sixty days or less for which market quotations and information furnished by an independent pricing service are not readily available will be valued at amortized cost, which approximates current value. The reliability of valuations provided by independent pricing agents is subject to certain review procedures.

Shares of money market mutual funds held by the Fund will be valued at their respective NAVs. Prices described above will be obtained from independent pricing services that have been approved by the Administrator. A number of independent pricing services are available and the Fund may use more than one of these services. The Fund may also discontinue the use of any pricing service at any time. The Sub-Adviser engages in oversight activities with respect to the Fund's independent pricing services, which includes, among other things, testing the prices provided by pricing services prior to calculation of the Fund's NAV,

Rule 2a-7 under the 1940 Act); Investment Company Act Release No. 17452 (April 23, 1990), 55 FR 17933 (April 30, 1990) (adopting Rule 144A under the Securities Act).

²⁴ 26 U.S.C. 851.

²⁵ According to the Registration Statement, the Trust reserves the right to permit or require the substitution of an amount of cash—i.e., a "cash in lieu" amount—to be added to the Cash Component to replace any Deposit Security which may not be available in sufficient quantity for delivery or which may not be eligible for transfer through the clearing process, or which may not be eligible for trading by an authorized participant or the investor for which it is acting. The Trust also reserves the right to offer an "all cash" option for creations of Creation Units for the Fund.

conducting periodic due diligence meetings, and periodically reviewing the methodologies and inputs used by these services.

Other portfolio securities and assets for which market quotations, official closing prices, or information furnished by an independent pricing service are not readily available or, in the opinion of the Fund, are deemed unreliable will be fair valued in good faith by the Fund in accordance with applicable fair value pricing policies and in accordance with the 1940 Act. For example, if, in the opinion of the Fund, a security's value has been materially affected by events occurring before the Fund's pricing time but after the close of the exchange or market on which the security is principally traded, that security will be fair valued in good faith by the Fund in accordance with applicable fair value pricing policies approved by the Board. In fair valuing a security, the Fund may consider factors including price movements in futures contracts, market and trading trends, the bid/ask quotes of brokers, and off-exchange institutional trading.

Availability of Information

The Fund's Web site (www.hulltacticalfunds.com), which will be publicly available prior to the public offering of Shares, will include a form of the Prospectus for the Fund that may be downloaded. The Web site will include additional quantitative information updated on a daily basis, including, for the Fund: (1) The prior business day's reported NAV, mid-point of the bid/ask spread at the time of calculation of such NAV (the "Bid/Ask Price"),²⁶ and a calculation of the premium and discount of the Bid/Ask Price against the NAV; and (2) data in chart format displaying the frequency distribution of discounts and premiums of the daily Bid/Ask Price against the NAV, within appropriate ranges, for each of the four previous calendar quarters. On each business day, before commencement of trading in Shares in the Core Trading Session²⁷ on the Exchange, the Fund will disclose on its Web site the identities and quantities of the portfolio of securities and other assets (the "Disclosed Portfolio")²⁸ held

²⁶ The Bid/Ask Price of the Fund will be determined using the mid-point of the highest bid and the lowest offer on the Exchange as of the time of calculation of the Fund's NAV. The records relating to Bid/Ask Prices will be retained by the Fund and its service providers.

²⁷ The Core Trading Session is 9:30 a.m. to 4:00 p.m. E.T.

²⁸ The Exchange notes that NYSE Arca Equities Rule 8.600(d)(2)(B)(ii) provides that the Reporting Authority that provides the Disclosed Portfolio must implement and maintain, or be subject to,

by the Fund that will form the basis for the Fund's calculation of NAV at the end of the business day.²⁹

The Disclosed Portfolio will include each portfolio security and other financial instruments of the Fund with the following information on the Fund's Web site: Ticker symbol (if applicable), name of security and financial instrument, number of shares (if applicable) and dollar value of securities and financial instruments held in the Fund, and percentage weighting of the security and financial instrument in the Fund. The Web site information will be publicly available at no charge.

In addition, for the Fund, an estimated value, defined in Rule 8.600 as the "Portfolio Indicative Value," that reflects an estimated intraday value of the Fund's portfolio, will be disseminated. The Portfolio Indicative Value will be comprised of the estimates of the value of the Fund's NAV per Share using market data converted into U.S. dollars at the current currency rates. The Portfolio Indicative Value will be based upon the current value for the components of the Disclosed Portfolio. In addition, the Portfolio Indicative Value, as defined in NYSE Arca Equities Rule 8.600(c)(3), will be widely disseminated by one or more major market data vendors at least every 15 seconds during the Core Trading Session.³⁰ The Portfolio Indicative Value will be based on quotes and closing prices from the securities' local market and may not reflect events that occur subsequent to the local market's close. Premiums and discounts between the Portfolio Indicative Value and the market price may occur. This should not be viewed as a "real-time" update of the NAV per Share of the Fund, which is calculated once per day. All asset classes in which the Fund will invest will be included in the calculation of the Portfolio Indicative Value.

Investors can also obtain the Trust's Statement of Additional Information ("SAI"), the Fund's Shareholder

procedures designed to prevent the use and dissemination of material non-public information regarding the actual components of the portfolio.

²⁹ Under accounting procedures to be followed by the Fund, trades made on the prior business day ("T") will be booked and reflected in NAV on the current business day ("T+1"). Notwithstanding the foregoing, portfolio trades that are executed prior to the opening of the Exchange on any business day may be booked and reflected in NAV on such business day. Accordingly, the Fund will be able to disclose at the beginning of the business day the portfolio that will form the basis for the NAV calculation at the end of the business day.

³⁰ Currently, it is the Exchange's understanding that several major market data vendors display and/or make widely available Portfolio Indicative Values published on CTA or other data feeds.

Reports, and its Form N-CSR and Form N-SAR, filed twice a year. The Trust's SAI and Shareholder Reports are available free upon request from the Trust, and those documents and the Form N-CSR and Form N-SAR may be viewed on-screen or downloaded from the Commission's Web site at www.sec.gov. Information regarding market price and trading volume of the Shares will be continually available on a real-time basis throughout the day on brokers' computer screens and other electronic services. Information regarding the previous day's closing price and trading volume information will be published daily in the financial section of newspapers.

Quotation and last sale information for the Shares and underlying U.S. exchange-traded equities, including the Underlying ETFs, will be available via the Consolidated Tape Association ("CTA") high-speed line and from the national securities exchange on which they are listed. Quotations and last sale information for the Fund's futures will be available from the futures exchange on which the futures are listed. Quotation information from brokers and dealers or pricing services will be available for Cash Instruments and non-exchange traded securities of money market mutual funds held by the Fund. Pricing information regarding each asset class in which the Fund will invest is generally available through nationally recognized data service providers through subscription arrangements.

The dissemination of the Portfolio Indicative Value, together with the Disclosed Portfolio, will allow investors to determine the approximate value of the underlying portfolio of the Fund on a daily basis and to provide a close estimate of that value throughout the trading day. The intra-day, closing and settlement prices of the Fund investments will also be readily available from the exchanges trading such securities, automated quotation systems, published or other public sources, or on-line information services such as Bloomberg or Reuters.

Additional information regarding the Trust and the Shares, including investment strategies, risks, creation and redemption procedures, fees, Fund holding disclosure policies, distributions and taxes is included in the Registration Statement. All terms relating to the Fund that are referred to, but not defined in this proposed rule change, are defined in the Registration Statement.

Initial and Continued Listing

The Shares will be subject to Rule 8.600, which sets forth the initial and

continued listing criteria applicable to Managed Fund Shares. The Exchange represents that, for initial and/or continued listing, the Fund must be in compliance with Rule 10A-3³¹ under the Exchange Act, as provided by NYSE Arca Equities Rule 5.3. A minimum of 100,000 Shares will be outstanding at the commencement of trading on the Exchange. The Exchange will obtain a representation from the issuer of the Shares that the NAV per Share will be calculated daily and that the NAV and the Disclosed Portfolio will be made available to all market participants at the same time.

Trading Halts

With respect to trading halts, the Exchange may consider all relevant factors in exercising its discretion to halt or suspend trading in the Shares of the Fund. Shares of the Fund will be halted if the “circuit breaker” parameters in NYSE Arca Equities Rule 7.12 are reached. Trading may be halted because of market conditions or for reasons that, in the view of the Exchange, make trading in the Shares inadvisable. These may include: (1) The extent to which trading is not occurring in the securities and/or the financial instruments comprising the Disclosed Portfolio of the Fund; or (2) whether other unusual conditions or circumstances detrimental to the maintenance of a fair and orderly market are present. Trading in the Shares will be subject to NYSE Arca Equities Rule 8.600(d)(2)(D), which sets forth circumstances under which trading in Shares of the Fund may be halted.

Trading Rules

The Exchange deems the Shares to be equity securities, thus rendering trading in the Shares subject to the Exchange’s existing rules governing the trading of equity securities. Shares will trade on the NYSE Arca Marketplace from 4 a.m. to 8 p.m. E.T. in accordance with NYSE Arca Equities Rule 7.34 (Opening, Core, and Late Trading Sessions). The Exchange has appropriate rules to facilitate transactions in the Shares during all trading sessions. As provided in NYSE Arca Equities Rule 7.6, Commentary .03, the minimum price variation (“MPV”) for quoting and entry of orders in equity securities traded on the NYSE Arca Marketplace is \$0.01, with the exception of securities that are priced less than \$1.00 for which the MPV for order entry is \$0.0001.

³¹ See 17 CFR 240.10A-3.

Surveillance

The Exchange represents that trading in the Shares will be subject to the existing trading surveillances, administered by the Financial Industry Regulatory Authority (“FINRA”) on behalf of the Exchange, which are designed to detect violations of Exchange rules and applicable federal securities laws. The Exchange represents that these procedures are adequate to properly monitor Exchange trading of the Shares in all trading sessions and to deter and detect violations of Exchange rules and applicable federal securities laws.³²

The surveillances referred to above generally focus on detecting securities trading outside their normal patterns, which could be indicative of manipulative or other violative activity. When such situations are detected, surveillance analysis follows and investigations are opened, where appropriate, to review the behavior of all relevant parties for all relevant trading violations.

FINRA, on behalf of the Exchange, will communicate as needed regarding trading in the Shares and underlying equity securities (including, without limitation, ETFs) and futures contracts with other markets and other entities that are members of the Intermarket Surveillance Group (“ISG”) and FINRA, on behalf of the Exchange, may obtain trading information regarding trading in the Shares and underlying equity securities (including, without limitation, ETFs) and futures contracts from such markets and other entities. In addition, the Exchange may obtain information regarding trading in the Shares and underlying equity securities (including, without limitation, ETFs) and futures contracts from markets and other entities that are members of ISG or with which the Exchange has in place a comprehensive surveillance sharing agreement.³³ In addition, FINRA, on behalf of the Exchange, is able to access, as needed, trade information for certain fixed income securities held by the Fund reported to FINRA’s Trade Reporting and Compliance Engine (“TRACE”).

In addition, the Exchange also has a general policy prohibiting the

³² FINRA surveils trading on the Exchange pursuant to a regulatory services agreement. The Exchange is responsible for FINRA’s performance under this regulatory services agreement.

³³ For a list of the current members of ISG, see www.isgportal.org. The Exchange notes that not all components of the Disclosed Portfolio for the Fund may trade on markets that are members of ISG or with which the Exchange has in place a comprehensive surveillance sharing agreement.

distribution of material, non-public information by its employees.

Information Bulletin

Prior to the commencement of trading, the Exchange will inform its Equity Trading Permit Holders in an Information Bulletin (“Bulletin”) of the special characteristics and risks associated with trading the Shares. Specifically, the Bulletin will discuss the following: (1) The procedures for purchases and redemptions of Shares in Creation Unit aggregations (and that Shares are not individually redeemable); (2) NYSE Arca Equities Rule 9.2(a), which imposes a duty of due diligence on its Equity Trading Permit Holders to learn the essential facts relating to every customer prior to trading the Shares; (3) the risks involved in trading the Shares during the Opening and Late Trading Sessions when an updated Portfolio Indicative Value will not be calculated or publicly disseminated; (4) how information regarding the Portfolio Indicative Value is disseminated; (5) the requirement that Equity Trading Permit Holders deliver a prospectus to investors purchasing newly issued Shares prior to or concurrently with the confirmation of a transaction; and (6) trading information.

In addition, the Bulletin will reference that the Fund is subject to various fees and expenses described in the Registration Statement. The Bulletin will discuss any exemptive, no-action, and interpretive relief granted by the Commission from any rules under the Exchange Act. The Bulletin will also disclose that the NAV for the Shares will be calculated after 4:00 p.m. E.T. each trading day.

2. Statutory Basis

The basis under the Exchange Act for this proposed rule change is the requirement under Section 6(b)(5)³⁴ that an exchange have rules that are designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, to remove impediments to, and perfect the mechanism of a free and open market and, in general, to protect investors and the public interest.

The Exchange believes that the proposed rule change is designed to prevent fraudulent and manipulative acts and practices in that the Shares will be listed on the Exchange pursuant to the initial and continued listing criteria in NYSE Arca Equities Rule 8.600. The Exchange has in place surveillance procedures that are adequate to properly monitor trading in the Shares in all

³⁴ 15 U.S.C. 78f(b)(5).

trading sessions and to deter and detect violations of Exchange rules and applicable federal securities laws. Neither the Adviser nor the Sub-Adviser is or is affiliated with a broker-dealer. In the event (a) the Adviser or a Sub-Adviser becomes, or becomes newly affiliated with, a broker-dealer, or (b) any new manager, adviser, or sub-adviser is, or becomes affiliated with, a broker-dealer, it will implement a fire wall with respect to its relevant personnel or broker-dealer affiliate, as applicable, regarding access to information concerning the composition and/or changes to the portfolio, and will be subject to procedures designed to prevent the use and dissemination of material, non-public information regarding such portfolio. FINRA, on behalf of the Exchange, will communicate as needed regarding trading in the Shares and underlying equity securities (including, without limitation, ETFs) and futures contracts with other markets and other entities that are members of ISG and FINRA, on behalf of the Exchange, may obtain trading information regarding trading in the Shares and underlying equity securities (including, without limitation, ETFs) and futures contracts from such markets and other entities. In addition, the Exchange may obtain information regarding trading in the Shares and underlying equity securities (including, without limitation, ETFs) and futures contracts from markets and other entities that are members of ISG or with which the Exchange has in place a comprehensive surveillance sharing agreement.³⁵ In addition, FINRA, on behalf of the Exchange, is able to access, as needed, trade information for certain fixed income securities held by the Fund reported to TRACE.

The ETFs the Fund invests in all will be listed and traded in the U.S. on registered exchanges. The Fund will only enter into futures contracts traded on a national futures exchange regulated by the CFTC. The Fund will limit its investment in futures contracts such that either (1) the aggregate net notional value of its futures investments will not exceed the value of the Fund's net assets, after taking into account unrealized profits and unrealized losses on the futures positions it has entered into; or (2) the aggregate initial margin and premiums required to establish positions in its futures investments will not exceed 5% of the Fund's net assets, after taking into account unrealized profits and unrealized losses on any such positions. The Fund may invest up to 10% of its total assets in leveraged

ETFs or inverse ETFs that seek to deliver multiples, or the inverse, of the performance of the S&P 500 Index, respectively. Such investments will be made in accordance with the 1940 Act and consistent with the Fund's investment objective and policies, and will not be used to seek performance that is the multiple or inverse multiple (e.g., 2x or 3x) of any securities market index. The Fund will not directly enter into swaps or engage in options transactions. The Fund may not, with respect to 75% of its total assets, purchase securities of any issuer (except securities issued or guaranteed by the U.S. government, its agencies or instrumentalities or shares of investment companies) if, as a result, more than 5% of its total assets would be invested in the securities of such issuer. The Fund may not acquire more than 10% of the outstanding voting securities of any one issuer. The Fund may not invest 25% or more of its total assets in the securities of one or more issuers conducting their principal business activities in the same industry or group of industries. The Fund may hold up to an aggregate amount of 15% of its net assets in illiquid securities (calculated at the time of investment), including securities deemed illiquid by the Adviser or Sub-Adviser consistent with Commission guidance and repurchase agreements that do not mature within seven days.

The proposed rule change is designed to promote just and equitable principles of trade and to protect investors and the public interest in that the Exchange will obtain a representation from the issuer of the Shares that the NAV per Share will be calculated daily every day the NYSE is open, and that the NAV and Disclosed Portfolio will be made available to all market participants at the same time. In addition, a large amount of information will be publicly available regarding the Fund and the Shares, thereby promoting market transparency. Quotation and last sale information for the Shares and underlying U.S. exchange-traded equities, including the Underlying ETFs, will be available via the CTA high-speed line and from the national securities exchange on which they are listed. Quotations and last sale information for the Fund's futures will be available from the futures exchange on which the futures are listed. Quotation information from brokers and dealers or pricing services will be available for Cash Instruments and non-exchange traded securities of money market mutual funds held by the Fund. Pricing information regarding each asset

class in which the Fund will invest is generally available through nationally recognized data service providers through subscription arrangements. Pricing information regarding the Fund's futures asset class will be available from the relevant exchange on which the futures are listed.

The Exchange believes that the proposed rule change will facilitate the listing and trading of additional types of exchange-traded products that will enhance competition among market participants, to the benefit of investors and the marketplace. In addition, the listing and trading criteria set forth in Rule 8.600 are intended to protect investors and the public interest. The Fund's portfolio holdings that will form the basis for the Fund's calculation of NAV will be disclosed on its Web site daily after the close of trading on the Exchange and prior to the opening of trading of Shares in the Core Trading Session on the Exchange the following day. In addition, the Portfolio Indicative Value, as defined in NYSE Arca Equities Rule 8.600(c)(3), will be disseminated by the CTA or by one or more major market data vendors at least every 15 seconds during the Core Trading Session. Information regarding market price and trading volume of the Shares is and will be continually available on a real-time basis throughout the day on brokers' computer screens and other electronic services, and quotation and last sale information will be available via the CTA high speed line. In addition, the Exchange has in place surveillance procedures that are adequate to properly monitor trading in the Shares. The Web site for the Fund will include a form of the prospectus for the Fund and additional data relating to the NAV and other applicable quantitative information. Moreover, prior to the commencement of trading, the Exchange will inform its Exchange Trading Permit holders in an Information Bulletin of the special characteristics and risks associated with trading the Shares. Trading in Shares of the Fund will be halted if the circuit breaker parameters in NYSE Arca Rule 7.12 have been reached or because of market conditions or for reasons that, in the view of the Exchange, make trading in the Shares inadvisable, and trading in the Shares will be subject to NYSE Arca Equities Rule 8.600(d)(2)(D), which sets forth circumstances under which trading in Shares of the Fund may be halted. In addition, as noted above, investors will have ready access to information regarding the Fund's holdings, the Portfolio Indicative Value,

³⁵ See note 33, *supra*.

the Disclosed Portfolio, and quotation and last-sale information for the Shares.

The proposed rule change is designed to perfect the mechanism of a free and open market and, in general, to protect investors and the public interest in that it will facilitate the listing and trading of an actively-managed exchange-traded product that will enhance competition among market participants, to the benefit of investors and the marketplace. As noted above, FINRA, on behalf of the Exchange, will communicate as needed regarding trading in the Shares and underlying equity securities (including, without limitation, ETFs) and futures contracts with other markets and other entities that are members of ISG and FINRA, on behalf of the Exchange, may obtain trading information regarding trading in the Shares and underlying equity securities (including, without limitation, ETFs) and futures contracts from markets and other entities. In addition, the Exchange may obtain information regarding trading in the Shares and underlying equity securities (including, without limitation, ETFs) and futures contracts from markets and other entities that are members of ISG and with which the Exchange has in place a comprehensive surveillance sharing agreement. In addition, FINRA, on behalf of the Exchange, is able to access, as needed, trade information for certain fixed income securities held by the Fund reported to TRACE.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange does not believe that the proposed rule change will impose any burden on competition that is not necessary or appropriate in furtherance of the purpose of the Exchange Act. The Exchange notes that the proposed rule change will facilitate the listing and trading of an additional actively-managed exchange-traded product that will enhance competition among market participants, to the benefit of investors and the marketplace.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

No written comments were solicited or received with respect to the proposed rule change.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Within 45 days of the date of publication of this notice in the **Federal Register** or within such longer period up to 90 days after publication (i) as the Commission may designate if it finds

such longer period to be appropriate and publishes its reasons for so finding or (ii) as to which the self-regulatory organization consents, the Commission will:

- (A) By order approve or disapprove the proposed rule change, or
- (B) institute proceedings to determine whether the proposed rule change should be disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (<http://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include File Number SR-NYSEArca-2014-30 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE., Washington, DC 20549-1090.
- All submissions should refer to File Number SR-NYSEArca-2014-30. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (<http://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission's Public Reference Room, 100 F Street NE., Washington, DC 20549, on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the filing also will be available for inspection and copying at the principal office of the Exchange. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions

should refer to File Number SR-NYSEArca-2014-30 and should be submitted on or before May 2, 2014.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.³⁶

Kevin M. O'Neill,
Deputy Secretary.

BILLING CODE 8011-01-P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34-71889; File No. SR-NYSEMKT-2014-29]

Self-Regulatory Organizations; NYSE MKT LLC; Notice of Filing and Immediate Effectiveness of Proposed Rule Change Amending Its Price List for Certain Executions at the Opening

April 7, 2014.

Pursuant to Section 19(b)(1) ¹ of the Securities Exchange Act of 1934 ("Act") ² and Rule 19b-4 thereunder,³ notice is hereby given that, on March 26, 2014, NYSE MKT LLC ("Exchange" or "NYSE MKT") filed with the Securities and Exchange Commission ("Commission") the proposed rule change as described in Items I, II, and III below, which Items have been prepared by the self-regulatory organization. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The Exchange proposes to amend its Price List for certain executions at the opening. The Exchange proposes to implement the fee change effective April 1, 2014. The text of the proposed rule change is available on the Exchange's Web site at www.nyse.com, at the principal office of the Exchange, and at the Commission's Public Reference Room.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the self-regulatory organization included statements concerning the purpose of, and basis for, the proposed rule change and discussed any comments it received on the proposed rule change. The text

³⁶ 17 CFR 200.30-3(a)(12).

¹ 15 U.S.C. 78s(b)(1).

² 15 U.S.C. 78a.

³ 17 CFR 240.19b-4.

of those statements may be examined at the places specified in Item IV below. The Exchange has prepared summaries, set forth in sections A, B, and C below, of the most significant parts of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and the Statutory Basis for, the Proposed Rule Change

1. Purpose

The Exchange proposes to amend its Price List for certain executions at the opening.⁴ The Exchange proposes to implement the fee change effective April 1, 2014.

The Exchange currently charges a fee of \$0.0005 per share for executions of at the opening or at the opening only orders, subject to a monthly fee cap of \$15,000 per member organization for such executions. The Exchange proposes to raise the fee to \$0.0010 per share and decrease the monthly fee cap to \$10,000 per member organization.

The proposed change is not otherwise intended to address any other issues, and the Exchange is not aware of any problems that members and member organizations would have in complying with the proposed change.

2. Statutory Basis

The Exchange believes that the proposed rule change is consistent with Section 6(b) of the Act,⁵ in general, and furthers the objectives of Sections 6(b)(4) and 6(b)(5) of the Act,⁶ in particular, because it provides for the equitable allocation of reasonable dues, fees, and other charges among its members, issuers and other persons using its facilities and does not unfairly discriminate between customers, issuers, brokers or dealers.

The Exchange believes that it is reasonable to increase the fee for executions at the opening because members and member organizations benefit from the substantial amounts of liquidity that are present on the Exchange during such time. The proposed new rate of \$0.0010 for the fee is reasonable because it will strike a more appropriate balance between encouraging liquidity at the opening and generating adequate revenues for the Exchange. The Exchange notes that it has not increased the fee in nearly two

years.⁷ The proposed new rate for the fee is also reasonable because it is comparable to the rate for executions at the opening on other markets.⁸

The pricing at the opening is only applicable to NYSE MKT-listed securities, and the fee cap was implemented on the Exchange nearly two years ago.⁹ Based on a review of such time period the Exchange has determined that the current fee cap level of \$15,000 may be too high for certain member organizations to reach. A decreased fee cap is therefore reasonable because it would be set at a level that is more representative of the volume during the opening on the Exchange, which is significantly lower than, for example, the opening on the Exchange's affiliate NYSE.¹⁰ The decrease to the fee cap is also reasonable because it would incentivize member organizations to submit additional liquidity at the open so that they may reach the fee cap as quickly as possible. In this regard, a member organization that reaches the fee cap would continue to be charged a marginal [sic] rate for its transactions at the opening that is lower than the \$0.0010 rate that would be applicable without the cap (i.e., once a member organization reaches the cap, its per-transaction rate thereafter will be zero and its marginal [sic] rate will decrease for each additional transaction at the open thereafter). It is also reasonable to increase the fee and decrease the fee cap because member organizations would pay a higher per-transaction fee for opening executions than they currently do, but could benefit over the course of the month by potentially reaching the lower fee cap quicker.

The proposed new rate of \$0.0010 for the fee and the decreased fee cap of \$10,000 are equitable and not unfairly discriminatory because this pricing would continue to encourage robust levels of liquidity at the opening, which benefits all market participants. This pricing is also equitable and not unfairly discriminatory because it would apply

⁷ See Securities Exchange Act Release No. 66959 (May 10, 2012), 77 FR 28912 (May 16, 2012) (SR-NYSEAmex-2012-28).

⁸ For example, the Nasdaq Stock Market, LLC ("NASDAQ") similarly charges \$0.0010 per share for certain orders executed in the NASDAQ Opening Cross. See NASDAQ Rule 7018(e). The Exchange's affiliate, New York Stock Exchange LLC ("NYSE") has also proposed an increase for its fee at the opening from \$0.0005 to \$0.0010 per share. See SR-NYSE-2014-18.

⁹ See *supra* note 7.

¹⁰ The Exchange notes that, while NYSE has similarly proposed to increase its fee for executions at the opening from \$0.0005 to \$0.0010 per share, NYSE has proposed to increase the corresponding fee cap from \$15,000 to \$20,000 rather than the decrease that is proposed herein. See SR-NYSE-2014-18, *supra* note 8.

equally to all similarly situated member organizations.¹¹

Finally, the Exchange believes that it is subject to significant competitive forces, as described below in the Exchange's statement regarding the burden on competition.

For these reasons, the Exchange believes that the proposal is consistent with the Act.

B. Self-Regulatory Organization's Statement on Burden on Competition

In accordance with Section 6(b)(8) of the Act,¹² the Exchange believes that the proposed rule change would not impose any burden on competition that is not necessary or appropriate in furtherance of the purposes of the Act. Instead, the Exchange believes that the proposed change would contribute to the Exchange's market quality and ultimately competition. The proposed change would also lead to increased competition among execution venues, including by permitting the Exchange to compete with other markets that apply comparable pricing for executions at the opening.¹³ The proposed change also would not impose any burden on competition among market participants. Instead, the pricing for executions at the opening would remain at relatively low levels and would continue to reflect the benefit that market participants receive through the ability to have their orders interact with other liquidity at the opening. The decreased fee cap would also be set at a level that would make it easier to reach for all member organizations and could therefore contribute to competition between member organizations with varying levels of liquidity and executions at the opening.

Finally, the Exchange notes that it operates in a highly competitive market in which market participants can readily favor competing venues if they deem fee levels at a particular venue to be excessive or rebate opportunities available at other venues to be more favorable. In such an environment, the Exchange must continually adjust its fees and rebates to remain competitive with other exchanges and with alternative trading systems that have been exempted from compliance with the statutory standards applicable to

¹¹ As noted in note 4 above, DMM executions at the opening would continue to not be charged. The Exchange believes that this is reasonable because of the liquidity-providing function that DMMs serve. This is also equitable and not unfairly discriminatory because DMMs are subject to certain obligations to which other members and member organizations are not.

¹² 15 U.S.C. 78f(b)(8).

¹³ See *supra* note 8.

⁴ The proposed pricing would only apply to securities priced \$1.00 or greater. The existing pricing for executions at the opening in securities priced below \$1.00 would remain unchanged (i.e., 0.3% of the total dollar value of the transaction). Designated Market Maker ("DMM") executions at the opening would continue to not be charged.

⁵ 15 U.S.C. 78f(b).

⁶ 15 U.S.C. 78f(b)(4) and (5).

exchanges. Because competitors are free to modify their own fees and credits in response, and because market participants may readily adjust their order routing practices, the Exchange believes that the degree to which fee changes in this market may impose any burden on competition is extremely limited. As a result of all of these considerations, the Exchange does not believe that the proposed changes will impair the ability of member organizations or competing order execution venues to maintain their competitive standing in the financial markets.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

No written comments were solicited or received with respect to the proposed rule change.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

The foregoing rule change is effective upon filing pursuant to Section 19(b)(3)(A)¹⁴ of the Act and subparagraph (f)(2) of Rule 19b-4¹⁵ thereunder, because it establishes a due, fee, or other charge imposed by the Exchange.

At any time within 60 days of the filing of such proposed rule change, the Commission summarily may temporarily suspend such rule change if it appears to the Commission that such action is necessary or appropriate in the public interest, for the protection of investors, or otherwise in furtherance of the purposes of the Act. If the Commission takes such action, the Commission shall institute proceedings under Section 19(b)(2)(B)¹⁶ of the Act to determine whether the proposed rule change should be approved or disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (<http://www.sec.gov/rules/sro.shtml>); or

- Send an email to rule-comments@sec.gov. Please include File Number SR-NYSEMKT-2014-29 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE., Washington, DC 20549-1090.

All submissions should refer to File Number SR-NYSEMKT-2014-29. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (<http://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission's Public Reference Room, 100 F Street NE., Washington, DC 20549, on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of such filing also will be available for inspection and copying at the principal office of the Exchange. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR-NYSEMKT-2014-29 and should be submitted on or before May 2, 2014.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.¹⁷

Kevin M. O'Neill,

Deputy Secretary.

BILLING CODE 8011-01-P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34-71890; File No. SR-NYSE-2014-18]

Self-Regulatory Organizations; New York Stock Exchange LLC; Notice of Filing and Immediate Effectiveness of Proposed Rule Change Amending Its Price List for Certain Executions at the Opening

April 7, 2014.

Pursuant to Section 19(b)(1)¹ of the Securities Exchange Act of 1934 ("Act")² and Rule 19b-4 thereunder,³ notice is hereby given that, on March 26, 2014, New York Stock Exchange LLC ("NYSE" or "Exchange") filed with the Securities and Exchange Commission ("Commission") the proposed rule change as described in Items I, II, and III below, which Items have been prepared by the self-regulatory organization. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The Exchange proposes to amend its Price List for certain executions at the opening. The Exchange proposes to implement the fee change effective April 1, 2014. The text of the proposed rule change is available on the Exchange's Web site at www.nyse.com, at the principal office of the Exchange, and at the Commission's Public Reference Room.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the self-regulatory organization included statements concerning the purpose of, and basis for, the proposed rule change and discussed any comments it received on the proposed rule change. The text of those statements may be examined at the places specified in Item IV below. The Exchange has prepared summaries, set forth in sections A, B, and C below, of the most significant parts of such statements.

¹⁴ 15 U.S.C. 78s(b)(3)(A).

¹⁵ 17 CFR 240.19b-4(f)(2).

¹⁶ 15 U.S.C. 78s(b)(2)(B).

¹⁷ 17 CFR 200.30-3(a)(12).

¹ 15 U.S.C. 78s(b)(1).

² 15 U.S.C. 78a.

³ 17 CFR 240.19b-4.

A. Self-Regulatory Organization's Statement of the Purpose of, and the Statutory Basis for, the Proposed Rule Change

1. Purpose

The Exchange proposes to amend its Price List for certain executions at the opening.⁴ The Exchange proposes to implement the fee change effective April 1, 2014.

The Exchange currently charges a fee of \$0.0005 per share for executions at the opening or at the opening only orders, subject to a monthly fee cap of \$15,000 per member organization for such executions. The Exchange proposes to raise the fee to \$0.0010 per share and the monthly fee cap to \$20,000 per member organization.

The proposed change is not otherwise intended to address any other issues, and the Exchange is not aware of any problems that members and member organizations would have in complying with the proposed change.

2. Statutory Basis

The Exchange believes that the proposed rule change is consistent with Section 6(b) of the Act,⁵ in general, and furthers the objectives of Sections 6(b)(4) and 6(b)(5) of the Act,⁶ in particular, because it provides for the equitable allocation of reasonable dues, fees, and other charges among its members, issuers and other persons using its facilities and does not unfairly discriminate between customers, issuers, brokers or dealers.

The Exchange believes that it is reasonable to increase the fee and corresponding fee cap for executions at the opening because members and member organizations benefit from the substantial amounts of liquidity that are present on the Exchange during such time. The proposed new rate of \$0.0010 for the fee is reasonable because it will strike a more appropriate balance between encouraging liquidity at the opening and generating adequate revenues for the Exchange. The Exchange notes that it has not increased the fee in nearly five years or the fee cap in more than two years.⁷ The increase to the fee cap is also reasonable in light of

the proposed increase in the fee because member organizations would otherwise reach the fee cap twice as quickly. The Exchange believes that it is reasonable to increase the fee cap for executions at the opening because a member organization that reaches the cap would continue to be charged a marginal [sic] rate for its transactions at the opening that is lower than the \$0.0010 rate that would be applicable without the cap (i.e., once a member organization reaches the cap, its per-transaction rate thereafter will be zero and its marginal rate [sic] will decrease for each additional transaction at the open thereafter). The proposed new rate for the fee and the corresponding new level for the fee cap are also reasonable because they are comparable to those for executions at the opening on other markets.⁸

The proposed new rate of \$0.0010 for the fee and the increased fee cap of \$20,000 are equitable and not unfairly discriminatory because, even at such increased levels, this pricing would continue to encourage robust levels of liquidity at the opening, which benefits all market participants. This pricing is also equitable and not unfairly discriminatory because it would apply equally to all similarly situated member organizations.⁹

Finally, the Exchange believes that it is subject to significant competitive forces, as described below in the Exchange's statement regarding the burden on competition.

For these reasons, the Exchange believes that the proposal is consistent with the Act.

B. Self-Regulatory Organization's Statement on Burden on Competition

In accordance with Section 6(b)(8) of the Act,¹⁰ the Exchange believes that the proposed rule change would not impose any burden on competition that is not necessary or appropriate in furtherance of the purposes of the Act. Instead, the Exchange believes that the proposed change would contribute to the Exchange's market quality and ultimately competition. The proposed

change would also lead to increased competition among execution venues, including by permitting the Exchange to compete with other markets that apply comparable pricing for executions at the opening.¹¹ The proposed change also would not impose any burden on competition among market participants. Instead, the pricing for executions at the opening would remain at relatively low levels and would continue to reflect the benefit that market participants receive through the ability to have their orders interact with other liquidity at the opening.

Finally, the Exchange notes that it operates in a highly competitive market in which market participants can readily favor competing venues if they deem fee levels at a particular venue to be excessive or rebate opportunities available at other venues to be more favorable. In such an environment, the Exchange must continually adjust its fees and rebates to remain competitive with other exchanges and with alternative trading systems that have been exempted from compliance with the statutory standards applicable to exchanges. Because competitors are free to modify their own fees and credits in response, and because market participants may readily adjust their order routing practices, the Exchange believes that the degree to which fee changes in this market may impose any burden on competition is extremely limited. As a result of all of these considerations, the Exchange does not believe that the proposed changes will impair the ability of member organizations or competing order execution venues to maintain their competitive standing in the financial markets.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

No written comments were solicited or received with respect to the proposed rule change.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

The foregoing rule change is effective upon filing pursuant to Section 19(b)(3)(A)¹² of the Act and subparagraph (f)(2) of Rule 19b-4¹³ thereunder, because it establishes a due, fee, or other charge imposed by the Exchange.

⁴ The proposed pricing would only apply to securities priced \$1.00 or greater. The existing pricing for executions at the opening in securities priced below \$1.00 would remain unchanged (i.e., 0.3% of the total dollar value of the transaction). Designated Market Maker ("DMM") executions at the opening would continue to not be charged.

⁵ 15 U.S.C. 78f(b).

⁶ 15 U.S.C. 78f(b)(4) and (5).

⁷ See Securities Exchange Act Release Nos. 60436 (August 5, 2009), 74 FR 40252 (August 11, 2009) (SR-NYSE-2009-77); and 66600 (March 14, 2012), 77 FR 16298 (March 20, 2012) (SR-NYSE-2012-07).

⁸ For example, the Nasdaq Stock Market, LLC ("NASDAQ") similarly charges \$0.0010 per share for certain orders executed in the NASDAQ Opening Cross and applies a \$20,000 fee cap per month per firm for such executions. See NASDAQ Rule 7018(e).

⁹ As noted in note 1 [sic] above, DMM executions at the opening would continue to not be charged. The Exchange believes that this is reasonable because of the liquidity-providing function that DMMs serve. This is also equitable and not unfairly discriminatory because DMMs are subject to certain obligations to which other members and member organizations are not.

¹⁰ 15 U.S.C. 78f(b)(8).

¹¹ See *supra* note 8.

¹² 15 U.S.C. 78s(b)(3)(A).

¹³ 17 CFR 240.19b-4(f)(2).

At any time within 60 days of the filing of such proposed rule change, the Commission summarily may temporarily suspend such rule change if it appears to the Commission that such action is necessary or appropriate in the public interest, for the protection of investors, or otherwise in furtherance of the purposes of the Act. If the Commission takes such action, the Commission shall institute proceedings under Section 19(b)(2)(B)¹⁴ of the Act to determine whether the proposed rule change should be approved or disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (<http://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include File Number SR-NYSE-2014-18 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE., Washington, DC 20549-1090.
- All submissions should refer to File Number SR-NYSE-2014-18. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (<http://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission's Public Reference Room, 100 F Street NE., Washington, DC 20549, on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of such filing also will be available for inspection and copying at the principal

office of the Exchange. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR-NYSE-2014-18 and should be submitted on or before May 2, 2014.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.¹⁵

Kevin M. O'Neill,

Deputy Secretary.

BILLING CODE 8011-01-P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34-71895; File No. SR-NYSEArca-2014-10]

Self-Regulatory Organizations; NYSE Arca, Inc.; Notice of Designation of a Longer Period for Commission Action on a Proposed Rule Change To Adopt NYSE Arca Equities Rule 8.900, Which Permits the Listing and Trading of Managed Portfolio Shares, and To List and Trade Shares of the ActiveSharesSM Large-Cap Fund, ActiveSharesSM Mid-Cap Fund, and ActiveSharesSM Multi-Cap Fund Pursuant to That Rule

April 7, 2014.

On February 7, 2014, NYSE Arca, Inc. ("Exchange") filed with the Securities and Exchange Commission ("Commission"), pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 ("Act")¹ and Rule 19b-4 thereunder,² a proposed rule change to adopt new NYSE Arca Equities Rule 8.900, which would govern the listing and trading of Managed Portfolio Shares, and to list and trade shares of the ActiveSharesSM Large-Cap Fund, ActiveSharesSM Mid-Cap Fund, and ActiveSharesSM Multi-Cap Fund (collectively, "Funds") under proposed NYSE Arca Equities Rule 8.900. The proposed rule change was published for comment in the **Federal Register** on February 26, 2014.³ The Commission has received one comment letter on the proposed rule change.⁴

Section 19(b)(2) of the Act⁵ provides that, within 45 days of the publication

¹⁵ 17 CFR 200.30-3(a)(12).

¹⁴ 15 U.S.C. 78s(b)(1).

² 17 CFR 240.19b-4.

³ See Securities Exchange Act Release No. 71588 (Feb. 20, 2014), 79 FR 10848.

⁴ See Letter from Gary L. Gastineau, President, ETF Consultants.com, Inc., to Elizabeth M. Murphy, Secretary, Commission, dated March 18, 2014.

⁵ 15 U.S.C. 78s(b)(2).

of notice of the filing of a proposed rule change, or within such longer period up to 90 days as the Commission may designate if it finds such longer period to be appropriate and publishes its reasons for so finding, or as to which the self-regulatory organization consents, the Commission shall either approve the proposed rule change, disapprove the proposed rule change, or institute proceedings to determine whether the proposed rule change should be disapproved. The Commission is extending this 45-day time period.

The Commission finds that it is appropriate to designate a longer period within which to take action on the proposed rule change so that it has sufficient time to consider the proposed rule change and the comment received. The proposed rule change would permit the Exchange to adopt new NYSE Arca Equities Rule 8.900, which would set forth the initial and continued listing standards applicable to Managed Portfolio Shares. In addition, the proposed rule change would permit the listing and trading of shares of the Funds pursuant to proposed NYSE Arca Equities Rule 8.900.

Accordingly, the Commission, pursuant to Section 19(b)(2) of the Act,⁶ designates May 27, 2014, as the date by which the Commission shall either approve or disapprove or institute proceedings to determine whether to disapprove the proposed rule change (File Number SR-NYSEArca-2014-10).

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.⁷

Kevin M. O'Neill,

Deputy Secretary.

BILLING CODE 8011-01-P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34-71888; File No. SR-DTC-2014-02]

Self-Regulatory Organizations; The Depository Trust Company; Notice of Filing and Immediate Effectiveness of Proposed Rule Change to Amend the DTC Settlement Service Guide to Clarify the Largest Provisional Net Credit Procedures

April 7, 2014.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934

⁶ *Id.*

⁷ 17 CFR 200.30-3(a)(31).

¹⁴ 15 U.S.C. 78s(b)(2)(B).

(“Act”)¹ and Rule 19b-4² thereunder, notice is hereby given that on March 27, 2014, the Depository Trust Company (“DTC”) filed with the Securities and Exchange Commission (“Commission”) the proposed rule change³ as described in Items I, II and III below, which Items have been prepared primarily by DTC. DTC filed the proposed rule change pursuant to Section 19(b)(3)(A)⁴ of the Act and Rule 19b-4(f)(4)⁵ thereunder, which renders the proposal effective upon filing with the Commission. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization’s Statement of the Terms of Substance of the Proposed Rule Change

As discussed below, the proposed rule change would clarify DTC’s existing Largest Provisional Net Credit (“LPNC”)⁶ Procedures within DTC’s Settlement Service Guide (the “Service Guide”).⁷

II. Self-Regulatory Organization’s Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, DTC included statements concerning the purpose of and basis for the proposed rule change, and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. DTC has prepared summaries, set forth in sections (A), (B), and (C) below, of the most significant aspects of such statements.

(A) Self-Regulatory Organization’s Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

With regard to processing of Money Market Instruments (“MMI”), DTC employs the LPNC risk management control to mitigate the risks associated, on the same business day, with: (i) the insolvency of an MMI issuer or refusal to pay (“RTP”) on a MMI maturity

obligation by the applicable MMI Issuing and Paying Agent, and (ii) a DTC Participant’s (“Participant”) failure to settle or DTC’s ceasing to act for the Participant. In this regard, on each processing day, DTC withholds intraday credit from each MMI Participant for the sum of the two largest aggregate net credits with respect to an issuer’s acronym for purposes of calculating the Participant’s net settlement balance and collateral monitor. This provides protection in the event that MMI transactions are reversed in DTC’s system in accordance with the DTC Rules & Procedures (“Rules”) as a result of an issuer failure or RTP.⁸

DTC most recently updated its Rules relating to LPNC in 2013.⁹

Pursuant to this rule filing, DTC proposes clarifications to the LPNC Procedures in the Service Guide, including: (i) providing an example illustrating the composition of the LPNC calculation; and (ii) making other technical changes relating to the description of the LPNC process and timeframes.

2. Statutory Basis

The proposed rule change clarifies the terms associated with processing of MMI transactions and associated risk controls. As a result, the proposed rule change is consistent with the requirements of the Act and the rules and regulations thereunder applicable to DTC, and in particular, with Section 17A(b)(3)(F)¹⁰ of the Act. This section requires that the Rules be designed to promote the prompt and accurate clearance and settlement of securities transactions and, in general, to protect investors and the public interest.

3. Implementation Timeframe

The proposed rule change is effective immediately.

(B) Self-Regulatory Organization’s Statement on Burden on Competition

DTC does not believe that the proposed rule change will have any impact, or impose any burden, on competition. As stated above, the proposed change merely provides clarifications to the Service Guide and will not impact any Participant’s access to, or use of, DTC services. In addition, the proposal does not impact the costs of Participants’ use of DTC services.

⁸ Such reversals override DTC’s net debit cap and collateral monitor risk controls.

⁹ Securities Exchange Act Release No. 68983 (Feb. 25, 2013), 78 FR 13924 (Mar. 1, 2013) (SR-DTC-2012-10).

¹⁰ 15 U.S.C. 78q-1(b)(3)(F).

(C) Self-Regulatory Organization’s Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

Written comments relating to the proposed rule change have not yet been solicited or received with respect to this filing.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

The forgoing [sic] rule change has become effective pursuant to Section 19(b)(3)(A)¹¹ of the Act and paragraph (f)(4)¹² of Rule 19b-4 thereunder. At any time within 60 days of the filing of the proposed rule change, the Commission summarily may temporarily suspend such rule change if it appears to the Commission that such action is necessary or appropriate in the public interest, for the protection of investors, or otherwise in furtherance of the purposes of the Act.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission’s Internet comment form (<http://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include File No. SR-DTC-2014-02 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE., Washington, DC 20549-1090.

All submissions should refer to File No. SR-DTC-2014-02. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission’s Internet Web site (<http://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than

BILLING CODE 8011-01-P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34-71891; File No. SR-Phlx-2013-113]

Self-Regulatory Organizations; NASDAQ OMX PHLX LLC; Request for Comment and Notice of Designation of Longer Period for Commission Action on Proceedings To Determine Whether To Approve or Disapprove a Proposed Rule Change To Offer a Customer Rebate

April 7, 2014.

On October 31, 2013, NASDAQ OMX PHLX LLC ("Exchange" or "Phlx") filed with the Securities and Exchange Commission ("Commission"), pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 ("Act")¹ and Rule 19b-4 thereunder,² a proposed rule change to amend the Customer Rebate Program in Section B of the Exchange's Pricing Schedule to increase Customer rebates available to certain market participants that transact Customer orders on Phlx. The proposed rule change was published for comment in the **Federal Register** on November 19, 2013.³ On November 25, 2013, the

Commission temporarily suspended and initiated proceedings to determine whether to approve or disapprove the proposed rule change.⁴ The Commission has received six comment letters on the proposal⁵ and one rebuttal letter from Phlx.⁶

Section 19(b)(2) of the Act⁷ provides that, after instituting proceedings to determine whether to approve or disapprove a proposed rule change, within 180 days of the publication of notice of the filing of a proposed rule change, the Commission shall either approve the proposed rule change or disapprove the proposed rule change. The Commission may extend the period for issuing an order approving or disapproving the proposed rule change, however, by not more than 60 days if the Commission determines that a longer period is appropriate and publishes the reasons for such determination. The 180th day for this filing is May 18, 2014.

The Commission finds that it is appropriate to designate a longer period within which to take action on the proposed rule change so that it has sufficient time to review comment letters submitted in response to the Order Instituting Proceedings, to review the Exchange's response to such comments, and to consider and take action on the Exchange's proposed rule change.

The Commission also seeks additional comment to help further inform its analysis of the proposed rule change. Specifically, the Commission invites interested persons to submit data, views, and arguments concerning the proposed rule change, including whether the proposed rule change is consistent with the Act. In particular, the Commission seeks comment on the following.

⁴ See Securities Exchange Act Release No. 70940 (November 25, 2013), 78 FR 71700 (November 29, 2013) ("Order Instituting Proceedings").

⁵ See letters to Elizabeth M. Murphy, Secretary, Commission, from: Michael J. Simon, Secretary, International Securities Exchange, LLC, dated November 11, 2013; William O'Brien, Chief Executive Officer, Direct Edge Holdings LLC, dated November 13, 2013; Brian O'Neill, Vice President and Senior Counsel, Miami International Securities Exchange, LLC, dated November 27, 2013; John C. Nagel, Managing Director and General Counsel, Citadel Securities, dated December 18, 2013; Angelo Evangelou, Associate General Counsel, Chicago Board Options Exchange, Inc., dated December 20, 2013; and Michael J. Simon, Secretary, International Securities Exchange, LLC, dated December 20, 2013.

⁶ See letter to Elizabeth M. Murphy, Secretary, Commission, from Joan C. Conley, Senior Vice President & Corporate Secretary, NASDAQ OMX PHLX LLC, dated January 24, 2014 ("Phlx Response Letter").

⁷ 15 U.S.C. 78s(b)(2).

Phlx states in its January 24, 2014 response to comments ". . . if an exchange believes that it would be attractive to customers to have a choice between multiple affiliated exchanges, it may create such exchanges as some self-regulatory exchanges—including commenters CBOE and ISE—have already done."⁸ Phlx further states that "[t]here are no significant barriers to SROs creating additional options exchanges."⁹ Phlx's response suggests that, if the proposal were approved, there is a potential for entities to create new options exchanges in order to compete with Phlx.¹⁰

The Commission has previously stated that its task has been to facilitate an appropriately balanced market structure that promotes competition among markets, while minimizing the potentially adverse effects of fragmentation on efficiency, price transparency, best execution of investor orders, and order interaction.¹¹ In that Concept Release, the Commission discussed the impact of competition among trading venues and market fragmentation.¹² The Commission also stated that when many trading centers compete for order flow in the same security, however, such competition can lead to the fragmentation of order flow in that security.¹³ The Commission further stated that fragmentation can inhibit the interaction of investor orders and thereby impair certain efficiencies and the best execution of investors' orders.¹⁴ On the other hand, the Commission stated that mandating the consolidation of order flow in a single venue would create a monopoly and thereby lose the important benefits of completion among markets.¹⁵ The Commission stated that the benefits of such competition include incentives for trading centers to create new products, provide high quality trading services that meet the needs of investors, and keep trading fees low.¹⁶

As a result, the Commission has stated that such market fragmentation concerns have presented challenges to the Commission's objective to protect investors and maintain fair and orderly markets.¹⁷

1. What are commenters' views on the impact that Phlx's proposal would have on the current options market structure? Please explain. What would the impact be, if any, on the current equity market structure? Please explain.

2. What are commenters' views on the impact the proposal would have, if any, on the trading of options orders across multiple options exchanges? Please explain. Specifically, what are commenters' views as to the impact, if any, on order interaction, quote competition, liquidity (both top of book and depth of book) on each options exchange or across all options exchanges, and/or short-term and long-term volatility? Please explain. What are commenters' views on the impact the proposal would have, if any, on the best execution of investor orders, including the implicit costs of executing their orders (such as spreads and price impact)? Please explain.

3. What are commenters' views on the impact the proposal would have, if any, on the current total number of options exchanges? Please explain. Do commenters believe that the total number of exchanges that list and trade standardized options would likely increase, decrease, or remain unchanged? Please explain.

4. What are commenters' views on how the proposal would impact the incentives for existing exchanges or new entities to create multiple exchanges under one group? What are commenters' views on how, if any, the proposal would impact the incentives for: (1) Entities that currently operate multiple options exchanges under common ownership ("exchange group") to create additional options exchanges under their existing exchange group; (2) stand-alone options exchanges to create new options exchanges under an exchange group; or (3) stand-alone exchanges and/or exchange groups to consolidate and form new options exchange groups. Please elaborate.

5. What are commenters' views on the potential explicit costs (e.g., connectivity costs, routing costs) or benefits of increasing or decreasing the total number of options exchanges? Please identify such potential costs or benefits and explain why they would change.

6. Commenters are requested to provide empirical data and other factual support for their views.

Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (<http://www.sec.gov/rules/sro.shtml>); or

- Send an email to rule-comments@sec.gov. Please include File Number SR-Phlx-2013-113 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE., Washington, DC 20549-1090.

All submissions should refer to File Number SR-Phlx-2013-113. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (<http://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission's Public Reference Room, 100 F Street, NE., Washington, DC 20549, on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the filing also will be available for inspection and copying at the principal office of the Exchange. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR-Phlx-2013-113 and should be submitted on or before April 25, 2014. Any person who wishes to file a rebuttal to any other person's submission must file that rebuttal by May 9, 2014.

Accordingly, pursuant to Section 19(b)(2)(B)(ii)(II) of the Act and for the reasons stated above, the Commission designates July 17, 2014, as the date by which the Commission should either approve or disapprove the proposed rule change (File No. SR-Phlx-2013-113).

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.¹⁸

Kevin M. O'Neill,

Deputy Secretary.

BILLING CODE 8011-01-P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34-71883; File No. SR-CBOE-2014-034]

Self-Regulatory Organizations; Chicago Board Options Exchange, Incorporated; Notice of Filing and Immediate Effectiveness of a Proposed Rule Change Relating to Market-Maker Appointment Adjustments

April 7, 2014.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (the "Act"),¹ and Rule 19b-4 thereunder,² notice is hereby given that on April 1, 2014 Chicago Board Options Exchange, Incorporated (the "Exchange" or "CBOE") filed with the Securities and Exchange Commission (the "Commission") the proposed rule change as described in Items I and II below, which Items have been prepared by the Exchange. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The Exchange proposes to add language to Rule 8.3 (Appointment of Market-Makers) to add clarity to when a Market-Maker must notify the Exchange of an appointment adjustment in advance of an upcoming tier rebalance. The text of the proposed rule change is available on the Exchange's Web site (<http://www.cboe.com/AboutCBOE/CBOELegalRegulatoryHome.aspx>), at the Exchange's Office of the Secretary, at the Commission's Public Reference Room, and on the Commission's Web site (<http://www.sec.gov>).

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the Exchange included statements concerning the purpose of and basis for the proposed rule change and discussed

¹⁸ 17 CFR 200.30-3(a)(57).

¹ 15 U.S.C. 78s(b)(1).

² 17 CFR 240.19b-4.

any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The Exchange has prepared summaries, set forth in sections A, B, and C below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

The Exchange proposes to amend Exchange Rule 8.3 regarding Market-Maker appointment cost rebalances and the resulting assignment of additional Trading Permits when necessary. Currently, Rule 8.3 provides that appointments to act as a Market-Maker "cost" different amounts for different classes (with no classes costing more than 1.0). Each Trading Permit held by a Market-Maker has an appointment credit of 1.0. The Exchange, on a quarterly basis, can rebalance the tiers into which different classes fall, which means that the Exchange can elect to move a class from one tier to another. As a result, the appointment costs for the corresponding classes could change.

The Exchange recently added to Rule 8.3(c)(iv) language stating that "If a Market-Maker with a VTC appointment holds a combination of appointments whose aggregate revised appointment cost is greater than the number of Trading Permits that Market-Maker holds, the Market-Maker will be assigned as many Trading Permits as necessary to ensure that the Market-Maker no longer holds a combination of appointments whose aggregate revised appointment cost is greater than the number of Trading Permits that Market-Maker holds."³ However, this proposed change can be read to give Market-Makers until 11:59 p.m. on the day before a rebalance takes effect to change their appointments in order to no longer hold a combination of appointments whose aggregate revised appointment cost is greater than the number of Trading Permits that Market-Maker holds. Under this reading, the Exchange's Registration Department may not be provided enough time to review and manage such changes. As such, the Exchange proposes to set a cutoff time of 3:30 p.m. Central Time to

make such changes in order to provide the Exchange with the requisite time.⁴

2. Statutory Basis

The Exchange believes the proposed rule change is consistent with Act and the rules and regulations thereunder applicable to the Exchange and, in particular, the requirements of Section 6(b) of the Act.⁵ Specifically, the Exchange believes the proposed rule change is consistent with the Section 6(b)(5)⁶ requirements that the rules of an exchange be designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, to foster cooperation and coordination with persons engaged in regulating, clearing, settling, processing information with respect to, and facilitating transactions in securities, to remove impediments to and perfect the mechanism of a free and open market and a national market system, and, in general, to protect investors and the public interest. Additionally, the Exchange believes the proposed rule change is consistent with the Section 6(b)(5)⁷ requirement that the rules of an exchange not be designed to permit unfair discrimination between customers, issuers, brokers, or dealers.

The proposed rule change will ensure that the Exchange's Registration Department will be provided enough time to review and manage appointment changes without imposing an unnecessary burden on Market-Makers (since they will still be provided with at least ten business days of notice prior to a rebalance taking effect), thereby removing impediments to and perfecting the mechanism of a free and open market and a national market system. The proposed change will apply to all Market-Makers (who are the only market participants who have class appointments).

B. Self-Regulatory Organization's Statement on Burden on Competition

CBOE does not believe that the proposed rule change will impose any burden on competition that is not

⁴ Following the proposed change, the last sentence of Rule 8.3(c)(iv) would read:

"If, after 3:30 p.m. (Central Time) on the business day before a rebalance is to take effect, a Market-Maker with a VTC appointment holds a combination of appointments whose aggregate revised appointment cost is greater than the number of Trading Permits that Market-Maker holds, the Market-Maker will be assigned as many Trading Permits as necessary to ensure that the Market-Maker no longer holds a combination of appointments whose aggregate revised appointment cost is greater than the number of Trading Permits that Market-Maker holds."

⁵ 15 U.S.C. 78f(b).

⁶ 15 U.S.C. 78f(b)(5).

⁷ *Id.*

necessary or appropriate in furtherance of the purposes of the Act. CBOE does not believe that the proposed rule change will impose any burden on intramarket competition that is not necessary or appropriate in furtherance of the purposes of the Act because it will apply to all Market-Makers (who are the only market participants who have class appointments). CBOE does not believe that the proposed rule change will impose any burden on intermarket competition that is not necessary or appropriate in furtherance of the purposes of the Act because the proposed rule change only applies to the Market-Maker appointment process on CBOE and is not intended for competitive purposes, but to streamline an Exchange process.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

The Exchange neither solicited nor received comments on the proposed rule change.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

The Exchange has filed the proposed rule change pursuant to Section 19(b)(3)(A) of the Act⁸ and Rule 19b-4(f)(6) thereunder.⁹ Because the proposed rule change does not (i) significantly affect the protection of investors or the public interest; (ii) impose any significant burden on competition; and (iii) become operative for 30 days from the date on which it was filed, or such shorter time as the Commission may designate, the proposed rule change has become effective pursuant to Section 19(b)(3)(A) of the Act and Rule 19b-4(f)(6) thereunder.¹⁰

At any time within 60 days of the filing of the proposed rule change, the Commission summarily may temporarily suspend such rule change if it appears to the Commission that such action is: (i) Necessary or appropriate in the public interest; (ii) for the protection of investors; or (iii) otherwise in furtherance of the purposes of the Act. If the Commission takes such action, the Commission shall institute proceedings

⁸ 15 U.S.C. 78s(b)(3)(A).

⁹ 17 CFR 240.19b-4(f)(6). In addition, Rule 19b-4(f)(6)(iii) requires the Exchange to give the Commission written notice of the Exchange's intent to file the proposed rule change, along with a brief description and text of the proposed rule change, at least five business days prior to the date of filing of the proposed rule change, or such shorter time as designated by the Commission. The Exchange has satisfied this requirement.

¹⁰ 17 CFR 240.19b-4(f)(6).

³ See Securities Exchange Act No. 71223 (January 2, 2014), 79 FR 1412 (January 8, 2014) (SR-CBOE-2013-109), which also stated that the Exchange shall announce rebalances via Regulatory Circular at least ten (10) business days before the rebalance takes effect.

under Section 19(b)(2)(B)¹¹ of the Act to determine whether the proposed rule should be approved or disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views and arguments concerning the foregoing, including whether the proposal is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (<http://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include File Number SR-CBOE-2014-034 on the subject line.

Paper Comments:

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE., Washington, DC 20549-1090.
- All submissions should refer to File Number SR-CBOE-2014-034. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (<http://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission's Public Reference Room, 100 F Street NE., Washington, DC 20549, on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the filing also will be available for inspection and copying at the principal office of the Exchange. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR-CBOE-2014-034 and should be submitted on or before May 2, 2014.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.¹²

Kevin M. O'Neill,

Deputy Secretary.

BILLING CODE 8011-01-P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34-71887; File No. SR-NSCC-2014-04]

Self-Regulatory Organizations; National Securities Clearing Corporation; Notice of Filing of Proposed Rule Change To Effect Processing Enhancements to the NSCC Automated Customer Account Transfer Service

April 7, 2014.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 ("Act")¹ and Rule 19b-4 thereunder,² notice is hereby given that on March 27, 2014, National Securities Clearing Corporation ("NSCC") filed with the Securities and Exchange Commission ("Commission") the proposed rule change as described in Items I, II and III below, which Items have been prepared primarily by NSCC. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The proposed rule change consists of modifications to the Rules & Procedures ("Rules") of NSCC regarding processing enhancements that it proposes to undertake with respect to its Automated Customer Account Transfer Service ("ACATS").³

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, NSCC included statements concerning the purpose of and basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. NSCC has prepared summaries, set forth in sections (A), (B), and (C) below, of the most significant aspects of such statements.

¹ 15 U.S.C. 78s(b)(1).

² 17 CFR 240.19b-4.

³ Terms not defined herein have the meaning set forth in the Rules.

(A) Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

i. Introduction

ACATS⁴ enables Members to transfer customer accounts among themselves in an automated fashion.⁵ Since its inception in 1985, ACATS has provided Members with an efficient automated means for the prompt transfer of customer accounts. ACATS is a non-guaranteed service and transfers are not subject to risk management by NSCC.

NSCC and The Depository Trust Company ("DTC") have been engaged with the industry in a series of initiatives designed to improve the efficiency and reduce risks associated with transactions processed through ACATS.⁶ As a next step in this series of initiatives, and as more fully described below, NSCC is proposing a new ACATS process (separate from CNS) for enhanced efficiency and risk reduction and to support final completion of settlement for ACATS transfers of: (i) CNS-eligible securities and (ii) securities that are otherwise eligible for settlement at DTC ("Non-CNS DTC-Eligible Securities").

The new process would facilitate completion of ACATS transactions as described below regardless of the fact that: (i) A Member that is party to the transfer may fail to meet its money settlement obligation to NSCC, or (ii) if NSCC ceases to act for such Member (collectively, "Fails to Settle"). The revised processing would also ensure that Non-CNS DTC-Eligible Securities

⁴ Currently, through ACATS, an NSCC Member ("Member") to whom a customer's securities account is to be transferred (the "Receiving Member") may initiate the account transfer process by submitting a Transfer Initiation Request (a "TIF") to NSCC. When a Member who is delivering securities through ACATS (a "Delivering Member") accepts a customer account transfer (and all other preconditions to the processing of an ACATS transfer pursuant to NSCC's Rules have been met), NSCC will cause CNS-eligible items in that account to enter NSCC's CNS Accounting Operation ("CNS") prior to the settlement cycle on the day before Settlement Date. "Non-CNS ACATS" transactions may be settled either through or away from NSCC depending on the asset type. See Rules, Rule 50 (Automated Customer Account Transfer Service), available at <http://www.dtcc.com/en/legal/rules-and-procedures.aspx>.

⁵ ACATS complements Financial Industry Regulatory Authority ("FINRA") Rule 11870 requiring FINRA members to use automated clearing agency customer account transfer services to effect customer account transfers within specified time frames.

⁶ Previous initiatives in this regard focused on improvements relating to tracking of assets eligible for processing through NSCC's Continuous Net Settlement Accounting Operation ("CNS") and mutual fund ACATS obligations.

¹¹ 15 U.S.C. 78s(b)(2)(B).

¹² 17 CFR 200.30-3(a)(12).

are credited to a no lien location, as CNS eligible items are currently.

ii. Discussion

Current Treatment of CNS-Eligible ACATS Transactions

Today, when a CNS ACATS transaction is staged for delivery on Settlement Date, in order to incent the Delivering Member to make delivery of the securities, the Delivering Member is charged with a money settlement debit and the Receiving Member with a money settlement credit. These charges are reversed when the securities transfer is complete.

ACATS transfers settled via CNS are fungible with all other CNS activity. Specifically, CNS ACATS receives and delivers are netted with guaranteed settling trades in the same securities. NSCC tracks ACATS receive and deliver obligations in CNS so that NSCC is able to reverse the uncompleted CNS ACATS obligations of a Member that Fails to Settle.⁷ However, if two or more Members Fail to Settle, because of the fungibility of ACATS securities with other CNS activity, NSCC may not be able to identify completed versus uncompleted transactions. As a result, NSCC would then reverse all ACATS transactions relating to those Members whether or not the transactions are completed in order to eliminate the debits and credits generated as described above. This adds uncertainty as to the finality of any given CNS-eligible ACATS transaction until money settlement is complete.

Current Treatment of Transfers in Non-CNS DTC-Eligible Securities

Similar to CNS ACATS transactions, the Delivering Member for a non-CNS eligible transaction that fails to make securities delivery receives a money debit for the full value of the securities. Under current processing, NSCC does not track which of these transactions has been completed. Thus, if at the end of the day the Delivering Member Fails to Settle, NSCC would reverse the Member's ACATS transactions in order to erase the associated money debit. This also adds uncertainty as to the finality of any given non-CNS DTC-eligible ACATS transaction until money settlement is complete.

New Process for ACATS Transfers of CNS-Eligible Securities and Non-CNS DTC-Eligible Securities

The proposed rule change would create a new ACATS process for both

CNS-eligible and Non-CNS DTC-Eligible Securities.

In this new design, ACATS would send obligations in CNS-eligible securities and Non-CNS DTC-Eligible Securities into a new, non-guaranteed ACATS process for such obligations on ACATS settlement date. The process would be known as the "ACATS Settlement Accounting Operation." All transfers through this new accounting operation would be made "free-of-value" without the application of incentive charges applied in the current process (as described above).⁸

Each Member participating in ACATS would maintain two NSCC subaccounts with respect to the ACATS Settlement Accounting Operation to accommodate the processing of receive obligations and deliver obligations, respectively. Under this process, the impacted ACATS transactions would be aggregated into one receive obligation and one deliver obligation per security per Member and included in either the Member's "receive" or "deliver" subaccounts established for this purpose. NSCC would not net the obligations between a Member's subaccounts. These accounting measures would allow NSCC to track obligations at the Member level, so NSCC may identify and reverse only uncompleted securities obligations if one or more Members default on the scheduled ACATS settlement date.⁹ The fact that deliveries would be made free-of-value would obviate any need to reverse completed transactions. Also, as more fully described below, NSCC's guaranty to DTC for short cover payment obligations would no longer be applicable because the deliveries no longer present risk to DTC.

Delivery Exemptions

The new process would also provide for "Level 1" delivery exemptions that would allow Members to indicate that deliver obligations in the ACATS Settlement Accounting Operation should not be automatically settled against their current DTC position. With respect to same day settling transactions, Members may select a standing exemption to permit all such short positions to be delivered. Additionally, during the daytime cycle, a Member may override the one day settling exemption as well as other

⁸ An NSCC account at DTC would be established to accommodate processing of these transfers.

⁹ DTC would provide information to NSCC through the DTC/NSCC interface as to when deliveries are complete. Please note such reversals of uncompleted transactions for defaulting Members would remain necessary due to the application of NSCC charges for failed securities deliveries as described below.

exemptions entered by the Member the previous evening. To do so, the Member should prepare a Delivery Order ("DO") and submit it to DTC in the normal manner.

ACATS Settlement Accounting Operation Allocation Algorithm

The proposed rule change would provide that after securities are received by NSCC from Delivering Members, they would be allocated to Receiving Members. The allocation of these securities would be governed by an algorithm as formulated by NSCC from time to time as to not to benefit any one Member. In addition, to maximize customer account deliveries, the default process would be for NSCC to instruct DTC to first deliver shares out of a Delivering Member's account to satisfy its ACATS obligations and then outstanding CNS obligations.

Failures To Deliver or Receive Securities through the ACATS Settlement Accounting Operation

If a scheduled securities delivery or receive through the ACATS Settlement Accounting Operation for a transaction fails at the end of the day (a "Fail-to-Deliver or Receive") but has not Failed to Settle, NSCC would apply a funds settlement debit to the Delivering Member and a funds settlement credit to the Receiving Member prior to final settlement. The money amount would be 100 percent of the CNS market value of the fail for each CNS-eligible item (unless a market price is unavailable in which case NSCC would use the value provided by the Delivering Member), and 100 percent of the ACATS market value for each Non-CNS DTC-Eligible Securities. When the Member pays final money settlement, ACATS obligations for which there was a Fail-to-Deliver or Receive securities would take one of two paths depending on whether they involve CNS-eligible or Non-CNS DTC-Eligible Securities:

- *For uncompleted CNS-eligible ACATS obligations:* An ACATS obligation in a CNS-eligible security where there has been a Fail-to-Deliver or Receive securities (but a Member to the transaction does not Fail to Settle) would enter the applicable Member's general CNS account. The obligation would then be netted with regular CNS processing. Because NSCC has collected the full mark on these transactions, NSCC would guaranty [sic] settlement for the obligations upon their inclusion in CNS.

- *For uncompleted non-CNS DTC ACATS obligations:* For non-CNS DTC-eligible transactions, NSCC would provide instructions to both the

⁷ Completed transactions, however, are not reversed.

Delivering Member and Receiving Member to settle the failed obligation directly with each other. These transactions would be automatically entered into NSCC's Obligation Warehouse system, if eligible.

If one or more Members Fail(s) to Settle, the tracking and reversal functionality associated with the ACATS Settlement Accounting Operation would allow NSCC to reverse uncompleted ACATS obligations as necessary. This would enable NSCC to reverse pending ACATS obligations for only uncompleted transfers of Member(s) that Fail to Settle and allow assets associated with completed ACATS transfers to remain with the Receiving Member, thus ensuring that customer account transfers to new firms are maximized. This enhances NSCC's ACATS process for CNS-eligible securities and Non-CNS DTC-Eligible Securities by allowing for tracking of obligations and reversal of only uncompleted transactions in the event of a multiple Member default scenario.¹⁰

For purposes of this proposal, an ACATS transfer of a Member that Fails to Settle would be deemed uncompleted if the Member is: (i) the Delivering Member and it has Failed to Deliver to NSCC all or a portion of the securities associated with the ACATS transfer, or (ii) the Receiving Member and it has Failed to Receive from NSCC all or a portion of the securities associated with the ACATS transfer. However, in either such case, where the Delivering Member has made a partial delivery for an amount of the securities to NSCC (the "Delivered Amount") the transfer would be: (i) Deemed completed for any amount of the securities received from NSCC by the Receiving Member up to an amount not to exceed the Delivered Amount (the "Received Amount"), and (ii) uncompleted for any amount of the securities scheduled for delivery other than the Received Amount (in which case, only the uncompleted portion of the item would be subject to reversal). In the event either a Delivering Member and Receiving Member to the same ACATS transfer Fails to Settle on the same settlement day, then any transfer deemed uncompleted for the Delivering Member would also be deemed uncompleted as to the Receiving Member, and vice versa. NSCC would notify firms with the details associated with the assets subject to the reversal and firms would need to reestablish customer positions accordingly.

¹⁰ The current process only provides for tracking for this purpose if there is a single Member default.

Elimination of Short Cover Charge

An "ACATS short cover charge" is a dollar amount guaranteed by NSCC to DTC for the value of securities delivered from a Participant's DTC account to NSCC for CNS processing by NSCC. NSCC's guaranty to DTC for the short cover charge will no longer be applicable because the deliveries no longer present risk to DTC. In a related rule filing, SR-DTC-2014-04, DTC proposes to eliminate the provision in its procedures relating to ACATS short charges. No change to NSCC's rules text is required in respect to short charges.

Long Allocations

At NSCC, under current rules, long allocations may be reversed if the NSCC Member fails to meet its settlement obligation. Because ACATS transactions would not generate any funds settlement obligations, this reversal is eliminated. In its related filing, DTC proposes to delete a provision describing the reversal of ACATS long allocations from its procedures. No change to NSCC's rules text is required in this regard.

Delivery of Securities to a "No Lien" Location

The associated changes would also ensure that neither DTC nor NSCC has a lien on shares delivered to a receiver as a result of ACATS transfers. As this new process allocates shares to the long broker via an algorithm that NSCC would establish for this purpose, DTC would credit the shares to the broker's Minimum Amount ("MA") or non-lien/non-collateral account at DTC.

Reporting of Transactions

Final accounting reports for the ACATS Settlement Accounting Operation would be provided in conjunction with the final CNS accounting reports, however, reporting along with the CNS accounting reports would have no effect on the status of the reported ACATS transactions as non-guaranteed.

iii. Implementation Timeframe

NSCC proposes to implement the changes set forth in this rule filing during the second quarter of 2014. Pending Commission approval, Members will be advised of the implementation date through issuance of NSCC Important Notices.

2. Statutory Basis

The proposed rule change provides for enhancements relating to the processing of customer securities which would enable the implementation of: (i) The tracking of receive and deliver

obligations associated with ACATS activity, and (ii) preclude the reversal of completed ACATS transfers in the event that Member Fails to Settle. Therefore, NSCC believes the proposed rule change is consistent with the requirements of the Act and the rules and regulations thereunder applicable to NSCC, and in particular Section 17A(b)(3)(F)¹¹ of the Act which requires that NSCC's Rules be designed to promote the prompt and accurate clearance and settlement of securities transactions and, in general, to protect investors and the public interest.

(B) Self-Regulatory Organization's Statement on Burden on Competition

NSCC believes that the proposed rule change would not impose any burden on competition as it applies to all Members that utilize the ACATS service and the new process has been developed in close coordination with the industry.

(C) Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

Written comments relating to the proposed rule change have not yet been solicited or received with respect to this filing.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Within 45 days of the date of publication of this notice in the **Federal Register** or within such longer period up to 90 days (i) as the Commission may designate if it finds such longer period to be appropriate and publishes its reasons for so finding or (ii) as to which the self-regulatory organization consents, the Commission will:

(A) by order approve or disapprove such proposed rule change, or

(B) institute proceedings to determine whether the proposed rule change should be disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (<http://www.sec.gov/rules/sro.shtml>); or

¹¹ 15 U.S.C. 78q-1(b)(3)(F).

- Send an email to rule-comments@sec.gov. Please include File No. SR–NSCC–2014–04 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE., Washington, DC 20549–1090.

All submissions should refer to File No. SR–NSCC–2014–04. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission’s Internet Web site (<http://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission’s Public Reference Room, 100 F Street NE., Washington, DC 20549, on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the filing also will be available for inspection and copying at the principal office of NSCC and on NSCC’s Web site at (<http://www.dtcc.com/legal/sec-rule-filings.aspx>). All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File No. SR–NSCC–2014–04 and should be submitted on or before May 2, 2014.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.¹²

Kevin M. O’Neill,
Deputy Secretary.

BILLING CODE 8011–01–P

SMALL BUSINESS ADMINISTRATION

[Disaster Declaration #13920]

Pennsylvania Disaster #PA–00066 Declaration of Economic Injury

AGENCY: U.S. Small Business Administration.
ACTION: Notice.

SUMMARY: This is a notice of an Economic Injury Disaster Loan (EIDL) declaration for the Commonwealth of Pennsylvania, dated 04/02/2014.
Incident: Severe Winter Storms.
Incident Period: 02/03/2014 through 02/28/2014.
Effective Date: 04/02/2014.
EIDL Loan Application Deadline Date: 01/02/2015.

ADDRESSES: Submit completed loan applications to: U.S. Small Business Administration, Processing and Disbursement Center, 14925 Kingsport Road, Fort Worth, TX 76155.

FOR FURTHER INFORMATION CONTACT: A. Escobar, Office of Disaster Assistance, U.S. Small Business Administration, 409 3rd Street SW., Suite 6050, Washington, DC 20416.

SUPPLEMENTARY INFORMATION: Notice is hereby given that as a result of the Administrator’s EIDL declaration, applications for economic injury disaster loans may be filed at the address listed above or other locally announced locations.

The following areas have been determined to be adversely affected by the disaster:

Primary Counties: Chester; Montgomery.

Contiguous Counties:

- Pennsylvania: Berks; Bucks; Delaware; Lancaster; Lehigh; Philadelphia.
- Delaware: New Castle.
- Maryland: Cecil.

The Interest Rates are:

	Percent
Businesses And Small Agricultural Cooperatives Without Credit Available Elsewhere	4.000
Non-Profit Organizations Without Credit Available Elsewhere	2.625

The number assigned to this disaster for economic injury is 139200.

The States which received an EIDL Declaration # are Pennsylvania; Delaware; Maryland.

(Catalog of Federal Domestic Assistance Number 59002)

Dated: April 2, 2014.

Marianne O’Brien Markowitz,
Acting Administrator.

[FR Doc. 2014–08087 Filed 4–10–14; 8:45 am]

BILLING CODE 8025–01–P

SMALL BUSINESS ADMINISTRATION

[Disaster Declaration #13924 and #13925]

Washington Disaster #WA–00039

AGENCY: U.S. Small Business Administration.
ACTION: Notice.

SUMMARY: This is a Notice of the Presidential declaration of a major disaster for the State of WASHINGTON (FEMA–4168–DR), dated 04/02/2014.
Incident: Flooding and Mudslides.
Incident Period: 03/22/2014 and continuing.

Effective Date: 04/02/2014.
Physical Loan Application Deadline Date: 06/02/2014.

Economic Injury (EIDL) Loan Application Deadline Date: 01/02/2015.

ADDRESSES: Submit completed loan applications to: U.S. Small Business Administration, Processing and Disbursement Center, 14925 Kingsport Road, Fort Worth, TX 76155.

FOR FURTHER INFORMATION CONTACT: A. Escobar, Office of Disaster Assistance, U.S. Small Business Administration, 409 3rd Street SW., Suite 6050, Washington, DC 20416.

SUPPLEMENTARY INFORMATION: Notice is hereby given that as a result of the President’s major disaster declaration on 04/02/2014, applications for disaster loans may be filed at the address listed above or other locally announced locations.

The following areas have been determined to be adversely affected by the disaster:

Primary Counties (Physical Damage and Economic Injury Loans):

- Snohomish, including The Sauk-Suiattle, Stillaguamish, and Tulalip Tribes

Contiguous Counties (Economic Injury Loans Only):

- Washington: Chelan, Island, King, Skagit.

The Interest Rates are:

	Percent
For Physical Damage:	
Homeowners With Credit Available Elsewhere	4.500
Homeowners Without Credit Available Elsewhere	2.250
Businesses With Credit Available Elsewhere	6.000
Businesses Without Credit Available Elsewhere	4.000
Non-Profit Organizations With Credit Available Elsewhere ...	2.625
Non-Profit Organizations Without Credit Available Elsewhere	2.625
For Economic Injury:	

¹² 17 CFR 200.30–3(a)(12).

	Percent
Businesses & Small Agricultural Cooperatives Without Credit Available Elsewhere	4.000
Non-Profit Organizations Without Credit Available Elsewhere	2.625

The number assigned to this disaster for physical damage is 139249 and for economic injury is 139250.

SMALL BUSINESS ADMINISTRATION

[Disaster Declaration #13926]

Washington Disaster #WA-00040 Declaration of Economic Injury

AGENCY: U.S. Small Business Administration.

ACTION: Notice.

SUMMARY: This is a notice of an Economic Injury Disaster Loan (EIDL) declaration for the State of Washington, dated 04/03/2014.

Incident: Seattle International District Fire.

Incident Period: 12/24/2013.

Effective Date: 04/03/2014.

EIDL Loan Application Deadline Date: 01/05/2015.

ADDRESSES: Submit completed loan applications to: U.S. Small Business Administration, Processing And Disbursement Center, 14925 Kingsport Road, Fort Worth, TX 76155.

FOR FURTHER INFORMATION CONTACT: A. Escobar, Office of Disaster Assistance, U.S. Small Business Administration, 409 3rd Street, SW., Suite 6050, Washington, DC 20416.

SUPPLEMENTARY INFORMATION: Notice is hereby given that as a result of the Administrator's EIDL declaration, applications for economic injury disaster loans may be filed at the address listed above or other locally announced locations.

The following areas have been determined to be adversely affected by the disaster:

Primary Counties: King.

Contiguous Counties:

Washington: Chelan; Kitsap; Kittitas; Pierce; Snohomish; Yakima.

The Interest Rates are:

	Percent
Businesses And Small Agricultural Cooperatives Without Credit Available Elsewhere	4.000
Non-Profit Organizations Without Credit Available Elsewhere	2.625

The number assigned to this disaster for economic injury is 139260.

The State which received an EIDL Declaration # is Washington.

BILLING CODE 8025-01-P

SMALL BUSINESS ADMINISTRATION

Small Business Size Standards: Waiver of the Nonmanufacturer Rule

AGENCY: U.S. Small Business Administration.

ACTION: Notice of rescission of four class waivers of the Nonmanufacturer Rule under North American Industry Classification System (NAICS) code 335999 and granting of three new class waivers under NAICS codes 335122, 335110, and 335311.

SUMMARY: The U.S. Small Business Administration (SBA) is rescinding four class waivers of the Nonmanufacturer Rule which were classified under NAICS code 335999 (All Other Miscellaneous Electrical Equipment and Component Manufacturing) and which were further classified under Product Service Codes (PSCs) 5999, 6210, 6240, and 6250. The class waiver applicable to PSC 5999 (Miscellaneous Electrical and Electronic Components) is being rescinded because it has been determined that several small business manufacturers of miscellaneous electrical equipment are currently available to participate in the Federal marketplace. The class waivers applicable to PSCs 6210, 6240, and 6250 are being rescinded because it has been determined that they were each improperly classified under NAICS code 335999. In order to correct this error, SBA is granting three new class waivers under the correct NAICS codes. Specifically, SBA is granting class waivers for the following: (1) NAICS code 335122 (Commercial, Industrial, and Institutional Electric Lighting Fixture Manufacturing), PSC 6210 (Indoor and Outdoor Electrical Lighting Fixtures); (2) NAICS code 335110 (Electric Lamp Bulb and Part

Manufacturing), PSC 6240 (Electric Lamps); and (3) NAICS Code 335311 (Power, Distribution, and Specialty Transformer Manufacturing), PSC 6250 (Ballasts, Lampholders, and Starters). SBA is taking these actions in response to public comments and SBA's independent analysis. The effect of the rescission of the four class waivers will be to require recipients of Federal supply contracts assigned NAICS code 335999 that are set aside for small businesses, service-disabled veteran-owned small businesses, women-owned small businesses, or Participants in the SBA's 8(a) Business Development (BD) program to provide the products of a domestic small business manufacturer or processor, unless an individual waiver of the Nonmanufacturer Rule is granted by SBA. The effect of the three new class waivers will be to allow otherwise qualified small business regular dealers to supply products of a domestic manufacturer on a Federal contract set aside for small businesses, service-disabled veteran-owned small businesses, women-owned small businesses, or Participants in the SBA's 8(a) BD program, where the class of products being procured is classified under PSC 6210, 6240, or 6250.

DATES: This action is effective the date of publication in the **Federal Register**.

FOR FURTHER INFORMATION CONTACT: Edward Halstead, (202) 205-9885, Edward.halstead@sba.gov.

SUPPLEMENTARY INFORMATION: Sections 8(a)(17) and 46 of the Small Business Act (Act) and SBA's implementing regulations generally require that recipients of Federal supply contracts that are set aside for small businesses, service-disabled veteran-owned small businesses, women-owned small businesses, or Participants in the SBA's 8(a) BD program provide the product of a small business manufacturer or processor if the recipient is other than the actual manufacturer or processor of the product. 15 U.S.C. 637(a)(17), 657s; 13 CFR 121.406(b). This requirement is commonly referred to as the Nonmanufacturer Rule. The Act authorizes SBA to waive the Nonmanufacturer Rule for any "class of products" for which there are no small business manufacturers or processors available to participate in the Federal market. SBA defines "class of products" as an individual subdivision within a NAICS code as established by the Office of Management and Budget in the NAICS Manual. 13 CFR 121.1202(d). In addition, SBA uses Product Service Codes (PSCs) to further identify particular products within the NAICS code to which a waiver would apply.

SBA may then identify a specific item within a PSC and NAICS code to which a class waiver would apply. "Available to participate" in the context of the Federal market means that contractors exist that have been awarded or have performed a contract to supply a specific class of products to the Federal Government within 24 months from the date of the request for waiver, either directly or through a dealer, or that have submitted an offer on a solicitation for that class of products within that time frame. 13 CFR 121.1202(c).

On November 2, 2004, SBA granted a class waiver of the Nonmanufacturer Rule for Miscellaneous Electrical Equipment and Component Manufacturing, classified under NAICS code 335999 (All Other Miscellaneous Electrical Equipment and Component Manufacturing), PSC 5999 (Miscellaneous Electrical and Electronic Components). 69 FR 61429. On January 28, 2008, SBA granted a class waiver for Fluorescent Lamps, Incandescent Lamps, etc., classified under NAICS code 335999, PSC 6240 (Electric Lamps). 73 FR 4940. The same day, SBA granted a class waiver for Electric Lamp Starters and Lamp Holders, etc., classified under NAICS code 335999, PSC 6250 (Ballasts, Lampholders, and Starters). 73 FR 4941. On March 21, 2008, SBA granted a class waiver for Indoor and Outdoor Electric Lighting Fixtures, classified under NAICS code 335999, PSC 6210 (Indoor and Outdoor Electrical Lighting Fixtures). 73 FR 15251.

In 2013, SBA received a request from a small business manufacturer to rescind the class waiver of the Nonmanufacturer Rule for Miscellaneous Electrical Equipment and Component Manufacturing (classified under NAICS code 335999, PSC 5999). According to the request, there was at least one small business manufacturer that had conducted business with the Federal Government within the previous 24 months and provided at least one of the various supplies listed under the class waiver applicable to Miscellaneous Electrical Equipment and Component Manufacturing. SBA's independent research resulted in the discovery of other small business manufacturers of various items listed under the descriptors applicable to Miscellaneous Electrical Equipment and Component Manufacturing.

On July 17, 2013, SBA published a notice in the **Federal Register** stating that SBA intended to rescind the class waiver for NAICS code 335999. 78 FR 42817. The public comment period for this notice closed on August 1, 2013. Soon after it closed, a small business

manufacturer requested that the public comment period be reopened to allow submission of additional data. SBA reopened the comment period from August 20, 2013 to September 19, 2013. 78 FR 51263. During the comment periods, five respondents submitted eight comments.

Two commenters strongly supported rescinding the class waiver for NAICS code 335999, PSC 5999. These commenters also stated that the three other previously granted class waivers under NAICS code 335999 were misclassified and recommended that SBA reclassify them under different NAICS codes. Another respondent, a small business manufacturer of electrical equipment, fully supported the rescission of the class waiver for NAICS code 335999, PSC 5999. A fourth commenter opposed the rescission but insisted that SBA adopt the above revisions and reclassifications of the class waivers under NAICS code 335999. A fifth respondent, a small distributor of lighting, electrical and voice and data products, opposed rescinding the waiver and commented that the rescission of this waiver would negatively impact his business. However, the commenter did not provide an explanation or evidence as to how rescission of this waiver would negatively impact his business. That same commenter also recommended that the class waivers for PSCs 6210, 6240, and 6250 be reclassified under different NAICS codes. A small business distributor of electrical supplies supported the rescission of the class waiver for NAICS code 335999, PSC 5999 on the grounds that contracting officers are justifying their refusal to set aside contracts for the procurement of miscellaneous electrical equipment based on this waiver being in place. Another respondent, a small business lighting products distributor, supported rescission of all of the class waivers classified under NAICS code 335999. This respondent commented that a class waiver should never have been granted for PSC 5999 and that the waivers for PSCs 6210, 6240, and 6250 are misclassified under NAICS code 335999, resulting in contracting officials refusing to set aside these procurements for small business and instead choosing to procure through unrestricted procedures. One commenter's request was not relevant to the purpose of this class waiver and therefore is not addressed here.

Based on the public comments received, SBA's analysis of data submitted, and independent market research performed by SBA, it has been determined that several small business

manufacturers of miscellaneous electrical equipment are currently available to participate in the Federal marketplace. In addition, SBA's research validated the commenters' assertions regarding the improper NAICS code classification of the class waivers for PSCs 6210, 6240, and 6250. Therefore, SBA has decided to take the following actions: (1) Rescind the class waiver for Miscellaneous Electrical Equipment and Component Manufacturing, classified under NAICS code 335999, PSC 5999 (*see* 69 FR 61429); (2) rescind the class waiver for Indoor and Outdoor Electric Lighting Fixtures, classified under NAICS code 335999, PSC 6210 (*see* 73 FR 15251), and replace it by granting a class waiver for Indoor and Outdoor Electrical Lighting Fixtures, under NAICS code 335122 (Commercial, Industrial, and Institutional Electric Lighting Fixture Manufacturing), PSC 6210 (Indoor and Outdoor Electrical Lighting Fixtures); (3) rescind the class waiver for Fluorescent Lamps, Incandescent Lamps, etc., classified under NAICS code 335999, PSC 6240 (*see* 73 FR 4940) and replace it by granting a class waiver for Electric Lamps, under NAICS code 335110 (Electric Lamp Bulb and Part Manufacturing), PSC 6240 (Electric Lamps); and (4) rescind the class waiver for Electric Lamp Starters and Lamp Holders, etc., classified under NAICS code 335999, PSC 6250 (*see* 73 FR 4941) and replace it by granting a class waiver for Ballasts, Lampholders, and Starters, under NAICS code 335311 (Power, Distribution, and Specialty Transformer Manufacturing), PSC 6250 (Ballasts, Lampholders, and Starters).

Dated: March 31, 2014.

Judith A. Roussel,

Director, Office of Government Contracting.

[FR Doc. 2014-08088 Filed 4-10-14; 8:45 am]

BILLING CODE 8025-01-P

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

Aviation Rulemaking Advisory Committee—Transport Airplane Performance and Handling Characteristics—Continuing a Task

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Notice of phase 2 task assignment for the Aviation Rulemaking Advisory Committee (ARAC).

SUMMARY: The FAA assigned the Aviation Rulemaking Advisory Committee (ARAC) a new phase 2 task to provide recommendations regarding

new or updated standards in the highest priority topic areas for airplane performance and handling characteristics. This task addresses the Flight Test Harmonization Working Group's recent recommendations. This notice informs the public of phase 2 ARAC activity and does not solicit membership for the existing Flight Test Harmonization Working Group (FTHWG).

FOR FURTHER INFORMATION CONTACT: Joe Jacobsen, Airplane & Flight Crew Interface Branch, ANM-111, Transport Airplane Directorate, Federal Aviation Administration, 1601 Lind Avenue SW., Renton, Washington 98057-3356; telephone 425-227-2011, facsimile 425-227-1149; email joe.jacobsen@faa.gov.

SUPPLEMENTARY INFORMATION:

ARAC Acceptance of Task

As a result of the March 20, 2014, ARAC meeting, the FAA has assigned and ARAC has accepted this task and will use the existing FTHWG. The FTHWG will serve as staff to ARAC and provide advice and recommendations on the assigned task. ARAC will review and approve the recommendation report that will be sent to the FAA.

Background

The FAA established ARAC to provide advice and recommendations to the FAA Administrator, through the Associate Administrator of Aviation Safety, on the FAA's rulemaking activities. ARAC's objectives are to improve the development of the FAA's regulations by providing information, advice, and recommendations related to aviation issues.

The FTHWG will provide advice and recommendations to ARAC on new and updated standards for the highest priority topic areas for airplane performance and handling characteristics.

In March 2013, the FAA tasked ARAC to provide advice and recommendations in prioritizing potential topic areas for the development of new or revised standards for airplane performance and handling characteristics in new transport category airplanes. The output of that task is now complete and is the basis for this new task. The highest priority topic areas were determined to be new or updated standards for fly-by-wire (FBW) flight controls, wet runway stopping performance, runway excursion hazard classification, stall speed in ground effect, steep approach, flight test methods used to determine maximum tailwind and crosswind capability, susceptibility to pilot-

induced oscillations/airplane-pilot coupling (PIO/APC), and guidance material for assessing handling qualities. This task will be to develop these high priority topic areas.

The Task

The working group should develop recommended standards in the following topic areas. If there are disagreements within the working group, these should be documented, including the reasons for the disagreement and rationale from each party. The following subject areas should be worked upon within this task:

1. Fly-by-wire Flight Controls. Regulatory requirements and associated guidance material for airworthiness certification of airplane designs using fly-by-wire technology to remove the need for longstanding, repetitively-used fly-by-wire special conditions. Specific areas include:

- a. Applicability/adaptation of Amendment 25-121 airplane performance and handling characteristics in icing conditions requirements,
- b. Lateral/directional/longitudinal stability,
- c. Out of trim requirements,
- d. Side stick controls, and
- e. Flight envelope protection.

2. Takeoff and Landing Performance. Regulatory requirements and associated guidance material for airworthiness certification in the following areas listed below. (Note: This topic area excludes items addressed by the Takeoff and Landing Performance Assessment Aviation Rulemaking Committee.)

a. Flight test methods used to determine maximum tailwind and crosswind capability. For crosswind testing, better define intended operational use of demonstrated maximum steady and gusting crosswind performance.

b. Wet runway stopping performance. Recent landing overruns on wet runways have raised questions regarding current wet runway stopping performance requirements and methods. Analyses indicate that the braking coefficient of friction in each case was significantly lower than expected for a wet runway (i.e., lower than the level specified in FAA regulations). Consideration should also be given to the scheduling of landing performance on wet porous friction course and grooved runway surfaces. Recommendations may include the need for additional data gathering, analysis, and possible rulemaking.

c. Steep approach landing performance. Current airplane certification standards are not

harmonized among the U.S., Canadian, Brazilian, and European airworthiness authorities.

d. Guidance material addressing the adverse effects on stall speed in ground effect.

e. Runway excursion hazard classification. Current safety assessments are not harmonized among the U.S., Canadian, Brazilian, and European airworthiness authorities.

3. Handling Characteristics. Guidance material for airworthiness certification in the following areas:

a. Guidance material for assessing handling qualities. Current Advisory Circular 25-7, "Flight Test Guide for Certification of Transport Category Airplanes," provides an FAA Handling Quality Rating Method that is intended to provide a systematic way of determining appropriate minimum handling qualities requirements and evaluating those handling qualities for conditions affecting an airplane's flying qualities. The FAA handling quality rating system is not universally accepted within industry, nor is it accepted by EASA.

b. Guidance for assessing susceptibility to pilot-induced oscillations/airplane-pilot coupling (PIO/APC). Guidance provided in Advisory Circular 25-7C for evaluating PIO/APC is also not well accepted by airplane manufacturers, is not harmonized with EASA, and has been superseded to some extent in recent certification programs. Modified guidance is needed to both simplify and standardize the methods for evaluating an airplane's susceptibility to PIO/APC.

Schedule

The recommendation report must be submitted to the FAA for review and acceptance no later than 3 years from the publication date of this tasking. The FAA expects to publish additional ARAC taskings for follow-on phases to develop other topic areas which were lower in priority.

Working Group Activity

The FTHWG must comply with the procedures adopted by ARAC. As part of the procedures, the working group must:

1. Conduct a review and analysis of the assigned task and any other related materials or documents.

2. Draft and submit a work plan for completion of the task, including the rationale supporting such a plan, for consideration by the Transport Airplane and Engine (TAE) Subcommittee.

3. Provide a status report at each TAE Subcommittee meeting.

4. Draft and submit the recommendation report based on the review and analysis of the assigned tasks.

5. Present the recommendation report at the TAE Subcommittee meeting.

Participation in the Working Group

The existing FTHGW is comprised of technical experts having an interest in the assigned task. A working group member need not be a representative or a member of the full committee. In accordance with the June 18, 2010, memorandum entitled "Lobbyists on Agency Boards and Commissions," members are not federally registered lobbyists, who are subject to the registration and reporting requirements of the Lobbying Disclosure Act of 1995 (LDA) as amended, 2 U.S.C. 1603, 1604, and 1605, at the time of appointment or reappointment to an advisory committee, and has not served in such a role for three consecutive quarters prior to appointment. (For further information see the Office of Management and Budget final guidance on appointment of lobbyists to federal boards and commissions (76 FR 61756, October 5, 2011).

All existing FTHWG members who wish to participate in this task must actively participate by attending all meetings, and providing written comments when requested to do so. Each member must devote the resources necessary to support the working group in meeting any assigned deadlines. Each member must keep their management chain, and those they may represent, advised of working group activities and decisions to ensure the proposed technical solutions do not conflict with their sponsoring organization's position when the subject is presented to ARAC for approval. Once the FTHWG has begun deliberations, members will not be added or substituted without the approval of the FAA and the Working Group Chair.

The Secretary of Transportation determined the formation and use of ARAC is necessary and in the public interest in connection with the performance of duties imposed on the FAA by law.

ARAC meetings are open to the public. However, meetings of the FTHWG are not open to the public, except to the extent individuals with an interest and expertise are selected to participate. The FAA will make no public announcement of FTHWG meetings.

Issued in Washington, DC, on April 8, 2014.

Lirio Liu,

Designated Federal Officer, Aviation Rulemaking Advisory Committee.

[FR Doc. 2014-08139 Filed 4-10-14; 8:45 am]

BILLING CODE 4910-13-P

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

Approval of Noise Compatibility Program; Southwest Florida International Airport, Fort Myers, FL

AGENCY: Federal Aviation Administration, DOT.

ACTION: Notice.

SUMMARY: The Federal Aviation Administration (FAA) announces its findings on the Noise Compatibility Program submitted by the Lee County Port Authority under the provisions of 49 U.S.C. (the Aviation Safety and Noise Abatement Act, hereinafter referred to as "the Act") and 14 CFR part 150. These findings are made in recognition of the description of Federal and nonfederal responsibilities in Senate Report No. 96-52 (1980). On January 30, 2013, the FAA determined that the noise exposure maps submitted by the Lee County Port Authority under Part 150 were in compliance with applicable requirements. On April 4, 2014, the FAA approved the Southwest Florida International Airport Noise Compatibility Program. Some of the recommendations of the Program were approved by FAA.

DATES: Effective Date: The effective date of the FAA's approval of the Southwest Florida International Airport Noise Compatibility Program is April 4, 2014.

FOR FURTHER INFORMATION CONTACT: Allan Nagy, Federal Aviation Administration, Orlando Airports District Office, 5950 Hazeltine National Drive, Suite 400, Orlando, FL 32822, phone number: (407) 812-6331. Documents reflecting this FAA action may be reviewed at this same location.

SUPPLEMENTARY INFORMATION: This notice announces that the FAA has given its overall approval to the Noise Compatibility Program for Southwest Florida International Airport, effective April 4, 2014.

Under Section 47504 of the Act, an airport operator who has previously submitted a Noise Exposure Map may submit to the FAA a Noise Compatibility Program which sets forth the measures taken or proposed by the airport operator for the reduction of existing non-compatible land uses and

prevention of additional non-compatible land uses within the area covered by the Noise Exposure Maps. The Act requires such programs to be developed in consultation with interested and affected parties including local communities, government agencies, airport users, and FAA personnel.

Each airport Noise Compatibility Program developed in accordance with Title 14 Code of Federal Regulations (CFR) Part 150 is a local program, not a Federal Program. The FAA does not substitute its judgment for that of the airport operator with respect to which measure should be recommended for action. The FAA's approval or disapproval of 14 CFR Part 150 Program recommendations is measured according to the standards expressed in 14 CFR Part 150 and the Act, and is limited to the following determinations:

a. The Noise Compatibility Program was developed in accordance with the provisions and procedures of 14 CFR Part 150;

b. Program measures are reasonably consistent with achieving the goals of reducing existing non-compatible land uses around the airport and preventing the introduction of additional non-compatible land uses;

c. Program measures would not create an undue burden on interstate or foreign commerce, unjustly discriminate against types or classes of aeronautical uses, violate the terms of airport grant agreements, or intrude into areas preempted by the Federal government; and

d. Program measures relating to the use of flight procedures can be implemented within the period covered by the program without derogating safety, adversely affecting the efficient use and management of the navigable airspace and air traffic control systems, or adversely affecting other powers and responsibilities of the Administrator prescribed by law.

Specific limitations with respect to FAA's approval of an airport Noise Compatibility Program are delineated in 14 CFR Part 150, Section 150.5. Approval is not a determination concerning the acceptability of land uses under Federal, state, or local law. Approval does not by itself constitute an FAA implementing action. A request for Federal action or approval to implement specific noise compatibility measures may be required, and an FAA decision on the request may require an environmental assessment of the proposed action. Approval does not constitute a commitment by the FAA to financially assist in the implementation of the Program nor a determination that all measures covered by the Program are

eligible for grant-in-aid funding from the FAA. Where Federal funding is sought, requests for project grants must be submitted to the FAA Airports District Office in Orlando, FL.

Lee County Port Authority submitted to the FAA on January 30, 2013, the Noise Exposure Maps, descriptions, and other documentation produced during the noise compatibility planning study conducted from May 10, 2012, through March 3, 2014. The Southwest Florida International Airport Noise Exposure Maps were determined by FAA to be in compliance with applicable requirements on January 30, 2013. Notice of this determination was published in the **Federal Register** on February 8, 2013.

The Southwest Florida International Airport study contains a proposed Noise Compatibility Program comprised of actions designed for phased implementation by airport management and adjacent jurisdictions from April 19, 2014 to the year 2018. It was requested that FAA evaluate and approve this material as a Noise Compatibility Program as described in Section 47504 of the Act. The FAA began its review of the Program on October 21, 2013, and was required by a provisions of the Act to approve or disapprove the program within 180-days (other than the use of new or modified flight procedures for noise control). Failure to approve or disapprove such program within the 180-day period shall be deemed to be an approval of such program.

The submitted program contained sixteen (16) proposed actions for noise mitigation on and/or off the airport. The FAA completed its review and determined that the procedural and substantive requirements of the Act and 14 CFR Part 150 have been satisfied. The overall Program, therefore, was approved by the FAA effective April 4, 2014.

Outright approval was granted for five of the specific Program elements. Eleven of the Proposed measures in the NCP were disapproved for purposes of 14 CFR Part 150 because the analysis in the NCP does not demonstrate the measures' noise benefits on the DNL 65 dBA noise contour and they did not result in achieving the goals of reducing existing noncompatible land uses around the airport and preventing the introduction of additional noncompatible land uses in the area around the airport. However, these measures can be implemented by the Airport Sponsor on a voluntary basis.

These determinations are set forth in detail in a Record of Approval signed by the FAA on April 4, 2014. The Record

of Approval, as well as other evaluation materials and the documents comprising the submittal, are available for review at the FAA office listed above and at the administrative office of the Lee County Port Authority. The Record of Approval also will be available on-line at: http://www.faa.gov/airports_airtraffic/airports/environmental/airport_noise/part_150/states/.

Issued in Orlando, FL, on April 7, 2014.

Bart Vernace,

P.E., Manager, Orlando Airports District Office.

BILLING CODE 4910-13-P

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

Notice of a Non-Aeronautical Land-Use Change Effecting the Quitclaim Deed and Federal Grant Assurance Obligations at A.B. Won Pat Guam International Airport, Tamuning, Guam

AGENCY: Federal Aviation Administration, DOT.

ACTION: Notice of a Non-Aeronautical Land-Use Change.

SUMMARY: The Federal Aviation Administration (FAA) proposes to rule and invites public comment on the application for a non-aeronautical land-use change of approximately 23.06 acres of airport property at A.B. Won Pat Guam International Airport, Tamuning, Guam from the aeronautical use provisions of the Quitclaim Deed and Grant Agreement Assurances since the land is not needed for the purpose for which it was conveyed. The property will be used to grant an easement to the Government of Guam for the construction of a roadway in exchange for which the Airport Authority will be fairly compensated. The project will improve traffic flow and better utilize the airport property to enhance transportation at and around the airport. The use of the land for a roadway represents a compatible land use that will not interfere with the airport or its operation, thereby protecting the interests of civil aviation.

DATES: Comments must be received on or before May 12, 2014.

FOR FURTHER INFORMATION CONTACT:

Comments on the request may be mailed or delivered to the FAA at the following address. Mr. Gordon Wong, Lead Program Manager, **Federal Register** Comment, Federal Aviation Administration, Honolulu Airports District Office, P.O. Box 50244, Honolulu, HI 96850-0001. In addition,

one copy of the comment submitted to the FAA must be mailed or delivered to Mr. Charles H. Ada II, Executive Director, Federal Register Comment, A. B. Won Pat Guam International Airport Authority, P.O. Box 8770, Tamuning, Guam 96931.

SUPPLEMENTARY INFORMATION: In accordance with the Wendell H. Ford Aviation Investment and Reform Act for the 21st Century (AIR 21), Public Law 10-181 (Apr. 5, 2000; 114 Stat. 61), this notice must be published in the **Federal Register** 30 days before the DOT Secretary may waive any condition imposed on a federally obligated airport by surplus property conveyance deeds or grant agreements.

The following is a brief overview of the request:

The Guam International Airport Authority (GIAA) requested a modification of the conditions in the Quitclaim Deed and Grant Agreement Assurances to permit non-aeronautical use of approximately 23.06 acres of land at A.B. Won Pat Guam International Airport, Tamuning, Guam to grant a roadway easement. The property subject to the easement is located northeast of the airfield and extends to the west side of the airport. The Government of Guam will be granted an easement to permit construction of the Tiyan Parkway along airport land that is not presently fully developed using local government and federal highway financing. The first phase of the project will provide an arterial roadway connection between Routes 8 and 10A that will improve airport access, create more efficient surface transportation to and from the airport, and ease traffic congestion around the airport. In addition, it will also permit Central Avenue to be permanently closed to eliminate the street's encroachment into the airport Runway Protection Zone. The second phase of the project will extend the Parkway eastward and occupy both on-airport and off-airport land. Phase 2 will proceed after funding and off-airport land is acquired for the additional right of way. The extended easement will not be granted until Phase 2 is actually begun. The Airport Authority will receive fair compensation for the easement, which will be devoted to airport purposes. Use of the land for the Tiyan Parkway is a compatible land use that will not interfere with or impede the operations and development of the airport. Based on the benefits of fair compensation and improved traffic circulation, the interests of civil aviation will be properly served.

Issued in Hawthorne, California, on April 3, 2014.

Steven Oetzell,

*Acting Manager, Safety and Standards
Branch, Airports Division, Western-Pacific
Region.*

BILLING CODE 4910-13-P

DEPARTMENT OF TRANSPORTATION

Maritime Administration

[Docket No. MARAD-2014-0055]

Requested Administrative Waiver of the Coastwise Trade Laws: Vessel Burning Daylight II; Invitation for Public Comments

AGENCY: Maritime Administration, Department of Transportation.

ACTION: Notice.

SUMMARY: As authorized by 46 U.S.C. 12121, the Secretary of Transportation, as represented by the Maritime Administration (MARAD), is authorized to grant waivers of the U.S.-build requirement of the coastwise laws under certain circumstances. A request for such a waiver has been received by MARAD. The vessel, and a brief description of the proposed service, is listed below.

DATES: Submit comments on or before May 12, 2014.

ADDRESSES: Comments should refer to docket number MARAD-2014-0055. Written comments may be submitted by hand or by mail to the Docket Clerk, U.S. Department of Transportation, Docket Operations, M-30, West Building Ground Floor, Room W12-140, 1200 New Jersey Avenue SE., Washington, DC 20590. You may also send comments electronically via the Internet at <http://www.regulations.gov>. All comments will become part of this docket and will be available for inspection and copying at the above address between 10 a.m. and 5 p.m., E.T., Monday through Friday, except federal holidays. An electronic version of this document and all documents entered into this docket is available on the World Wide Web at <http://www.regulations.gov>.

FOR FURTHER INFORMATION CONTACT: Linda Williams, U.S. Department of Transportation, Maritime Administration, 1200 New Jersey Avenue SE., Room W23-453, Washington, DC 20590. Telephone 202-366-0903, Email Linda.Williams@dot.gov.

SUPPLEMENTARY INFORMATION: As described by the applicant the intended

service of the vessel BURNING DAYLIGHT II is:

Intended Commercial Use of Vessel: "Carrying passengers"

Geographic Region: "California"

The complete application is given in DOT docket MARAD-2014-0055 at <http://www.regulations.gov>. Interested parties may comment on the effect this action may have on U.S. vessel builders or businesses in the U.S. that use U.S.-flag vessels. If MARAD determines, in accordance with 46 U.S.C. 12121 and MARAD's regulations at 46 CFR Part 388, that the issuance of the waiver will have an unduly adverse effect on a U.S.-vessel builder or a business that uses U.S.-flag vessels in that business, a waiver will not be granted. Comments should refer to the docket number of this notice and the vessel name in order for MARAD to properly consider the comments. Comments should also state the commenter's interest in the waiver application, and address the waiver criteria given in § 388.4 of MARAD's regulations at 46 CFR Part 388.

Privacy Act

Anyone is able to search the electronic form of all comments received into any of our dockets by the name of the individual submitting the comment (or signing the comment, if submitted on behalf of an association, business, labor union, etc.). You may review DOT's complete Privacy Act Statement in the **Federal Register** published on April 11, 2000 (Volume 65, Number 70; Pages 19477-78).

By Order of the Maritime Administrator.

Dated: April 7, 2014.

Julie P. Agarwal,

Secretary, Maritime Administration.

Written comments may be submitted by hand or by mail to the Docket Clerk, U.S. Department of Transportation, Docket Operations, M-30, West Building Ground Floor, Room W12-140, 1200 New Jersey Avenue SE., Washington, DC 20590. You may also send comments electronically via the Internet at <http://www.regulations.gov>. All comments will become part of this docket and will be available for inspection and copying at the above address between 10 a.m. and 5 p.m., E.T., Monday through Friday, except federal holidays. An electronic version of this document and all documents entered into this docket is available on the World Wide Web at <http://www.regulations.gov>.

FOR FURTHER INFORMATION CONTACT:

Linda Williams, U.S. Department of Transportation, Maritime Administration, 1200 New Jersey Avenue SE., Room W23-453, Washington, DC 20590. Telephone 202-366-0903, Email Linda.Williams@dot.gov.

SUPPLEMENTARY INFORMATION: As described by the applicant the intended service of the vessel *DESIDERATA* is *Intended Commercial Use Of Vessel: "Small group passenger charters on San Francisco Bay and tributaries"* *Geographic Region: "California"*

The complete application is given in DOT docket MARAD-2014-0054 at <http://www.regulations.gov>. Interested parties may comment on the effect this action may have on U.S. vessel builders or businesses in the U.S. that use U.S.-flag vessels. If MARAD determines, in accordance with 46 U.S.C. 12121 and MARAD's regulations at 46 CFR Part 388, that the issuance of the waiver will have an unduly adverse effect on a U.S.-vessel builder or a business that uses U.S.-flag vessels in that business, a waiver will not be granted. Comments should refer to the docket number of this notice and the vessel name in order for MARAD to properly consider the comments. Comments should also state the commenter's interest in the waiver application, and address the waiver criteria given in § 388.4 of MARAD's regulations at 46 CFR Part 388.

Privacy Act

Anyone is able to search the electronic form of all comments received into any of our dockets by the name of the individual submitting the comment (or signing the comment, if submitted on behalf of an association, business, labor union, etc.). You may review DOT's complete Privacy Act Statement in the **Federal Register** published on April 11, 2000 (Volume 65, Number 70; Pages 19477-78).

By Order of the Maritime Administrator.
Dated: April 7, 2014.

Julie P. Agarwal,

Secretary, Maritime Administration.

BILLING CODE 4910-81-P

DEPARTMENT OF TRANSPORTATION**National Highway Traffic Safety Administration**

[Docket No. NHTSA-2013-0147; Notice 2]

Reports, Forms, and Recordkeeping Requirements Agency Information Collection Activity Under OMB Review

AGENCY: National Highway Traffic Safety Administration (NHTSA), Department of Transportation (DOT).

ACTION: Notice.

SUMMARY: In compliance with the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*), this notice announces that the Information Collection Request (ICR) abstracted below has been forwarded to the Office of Management and Budget (OMB) for review and comment. The ICR describes the nature of the information collections and their expected burden. The **Federal Register** Notice soliciting public comment on the ICR, with a 60-day comment period was published on January 21, 2014, at 79 FR 3467.

DATES: Comments must be submitted on or before May 12, 2014.

FOR FURTHER INFORMATION CONTACT: George Stevens, NHTSA 1200 New Jersey Avenue SE., Room W43-490, Washington, DC 20590. Mr. Steven's telephone number is (202) 366-5308. Please identify the relevant collection of information by referring to its OMB Control Number.

ADDRESSES: Send comments, within 30 days, to the Office of Information and Regulatory Affairs, Office of Management and Budget, 725-17th Street NW., Washington, DC 20503, Attention NHTSA Desk Officer.

SUPPLEMENTARY INFORMATION:**National Highway Traffic Safety Administration**

Title: 49 CFR Part 556, Exemption for Inconsequential Defect or Noncompliance.

OMB Number: 2127-0045.

Type of Request: Extension of a Currently Approved Collection.

Abstract: The National Highway Traffic Safety Administration's statute at 49 U.S.C. 30118, *Notification of Defects and Noncompliance*, and 49 U.S.C. 30120, *Remedies for Defects and Noncompliance*, generally requires manufacturers of motor vehicles and items of replacement equipment to conduct a notification and remedy campaign (recall) when their products are determined to contain a safety-related defect or a noncompliance with a Federal motor vehicle safety standard

(FMVSS). Those sections require a manufacturer of motor vehicles or motor vehicle equipment to notify distributors, dealers, and purchasers if any of the manufacturer's products are determined to either contain a safety-related defect or fail to comply with an applicable FMVSS. The manufacturer is under a concomitant obligation to remedy such defect or noncompliance. Pursuant to 49 U.S.C. 30118(d) and 30120(h), Exemptions, a manufacturer may seek an exemption from these notification and remedy requirements on the basis that the defect or noncompliance is inconsequential as it relates to motor vehicle safety. NHTSA exercised this statutory authority to excuse inconsequential defects or noncompliances when it promulgated 49 CFR part 556, Exemption for Inconsequential Defect or Noncompliance. This regulation establishes the procedures for manufacturers to submit exemption petitions to the agency and the procedures the agency will use in evaluating those petitions. The petition must state the full name and address of the applicant, the nature of its organization (e.g., individual, partnership, or corporation), and the name of the State or country under the laws of which it is organized. See 49 CFR 556.4(b)(3). The petition must also describe the motor vehicle or item of replacement equipment, including the number involved and the period of production, and the defect or noncompliance concerning which an exemption is sought. See 49 CFR 556.4(b)(4). The petition must also set forth all data, views, and arguments of the petitioner supporting the petition, and be accompanied by three copies of the report the manufacturer has submitted, or is submitting, to NHTSA in accordance with 49 CFR part 573, relating to its determination of the existence of the safety-related defect or noncompliance that is the subject of the petition. See 49 CFR 556.4(b)(5) and (6). These requirements allow the agency to ensure that inconsequentiality petitions are both properly substantiated and efficiently processed.

Affected Public: Businesses or other for-profit entities that manufacture or import motor vehicles or motor vehicle replacement equipment.

Estimated Total Annual Burden: 150 hours.

Comments are Invited On: Whether the proposed collection of information is necessary for the proper performance of the functions of the Agency, including whether the information will have practical utility; the accuracy of the Agency's estimate of the burden of

the proposed information collection; ways to enhance the quality, utility and clarity of the information to be collected; and ways to minimize the burden of the collection of information on respondents, including the use of automated collection techniques or other forms of information technology.

A comment to OMB is most effective if OMB receives it within 30 days of publication.

Jeffrey M. Giuseppe,

Acting Director, Office of Vehicle Safety Compliance.

BILLING CODE 4910-59-P

DEPARTMENT OF TRANSPORTATION

National Highway Traffic Safety Administration

[Docket No. NHTSA-2014-0004; Notice 2]

Extension of Comment Period on Whether Nonconforming 2012 McLaren MP4[12C] Passenger Cars Are Eligible for Importation

AGENCY: National Highway Traffic Safety Administration (NHTSA), DOT.

ACTION: Extension of comment period.

SUMMARY: This document announces the extension of the comment period on a petition for NHTSA to decide that 2012 McLaren MP4[12C] passenger cars that were not originally manufactured to comply with all applicable Federal motor vehicle safety standards are eligible for importation into the United States.

DATES: The closing date for comments on the petition is April 16, 2014.

ADDRESSES: Comments should refer to the docket and notice numbers above and be submitted by any of the following methods:

- *Federal eRulemaking Portal:* Go to <http://www.regulations.gov>. Follow the online instructions for submitting comments.
- *Mail:* Docket Management Facility: U.S. Department of Transportation, 1200 New Jersey Avenue SE., West Building Ground Floor, Room W12-140, Washington, DC 20590-0001.
- *Hand Delivery or Courier:* West Building Ground Floor, Room W12-140, 1200 New Jersey Avenue SE., between 9 a.m. and 5 p.m. e.t., Monday through Friday, except Federal holidays.
- *Fax:* 202-493-2251

Instructions: Comments must be written in the English language, and be no greater than 15 pages in length, although there is no limit to the length of necessary attachments to the

comments. If comments are submitted in hard copy form, please ensure that two copies are provided. If you wish to receive confirmation that your comments were received, please enclose a stamped, self-addressed postcard with the comments. Note that all comments received will be posted without change to <http://www.regulations.gov>, including any personal information provided. Please see the Privacy Act heading below.

Privacy Act: Anyone is able to search the electronic form of all comments received into any of our dockets by the name of the individual submitting the comment (or signing the comment, if submitted on behalf of an association, business, labor union, etc.). You may review DOT's complete Privacy Act Statement in the **Federal Register** published on April 11, 2000 (65 FR 19477-78).

How to Read Comments submitted to the Docket: You may read the comments received by Docket Management at the address and times given above. You may also view the documents from the Internet at <http://www.regulations.gov>. Follow the online instructions for accessing the dockets. The docket ID number and title of this notice are shown at the heading of this document notice. Please note that even after the comment closing date, we will continue to file relevant information in the Docket as it becomes available. Further, some people may submit late comments. Accordingly, we recommend that you periodically search the Docket for new material.

FOR FURTHER INFORMATION CONTACT: George Stevens, Office of Vehicle Safety Compliance, NHTSA (202 366 5308).

SUPPLEMENTARY INFORMATION: On March 3, 2014, NHTSA published a notice (at 79 FR 11869) that it had received a petition to decide that nonconforming 2012 McLaren MP4[12C] passenger cars are eligible for importation into the United States. The notice solicited public comments on the petition and stated that the closing date for comments is April 2, 2014.

This is to notify the public that NHTSA is extending the comment period on this petition, and allowing it to run until April 16, 2014. This reopening is based on a request dated March 27, 2014, from McLaren Automotive, Inc. ("McLaren") the vehicle's manufacturer. McLaren stated that the extension was needed because, in McLaren's view, the petitioner cannot satisfy the statutory criteria, since it would be very difficult, if not impossible, to bring nonconforming MP4[12C] vehicles into compliance

with all applicable FMVSSs. However, because many of the compliance issues that are raised by the subject petition are complex, McLaren will not be able to complete the preparation of its comments in time to meet the current due date. McLaren believes that this short extension will allow the preparation of a response that will address the relevant issues, and that it will not cause any hardship to the petitioner or to any other interested person.

NHTSA has granted McLaren's request. All comments received before the close of business on the closing date indicated above will be considered, and will be available for examination in the docket at the above address both before and after that date. To the extent possible, comments filed after the closing date will also be considered. Notice of final action on the petition will be published in the **Federal Register** pursuant to the authority indicated below.

Authority: 49 U.S.C. 30141(a)(1)(A), (a)(1)(B), and (b)(1); 49 CFR 593.7; delegation of authority at 49 CFR 1.95 and 501.8.

Jeffrey Giuseppe,

Acting Director, Office of Vehicle Safety Compliance.

[FR Doc. 2014-08094 Filed 4-10-14; 8:45 am]

BILLING CODE 4910-59-P

DEPARTMENT OF TRANSPORTATION

Surface Transportation Board

Notice and Request for Comments

AGENCY: Surface Transportation Board, DOT.

ACTION: 60-day notice of request for approval: Applications for Land-Use Exemption Permits.

SUMMARY: As required by the Paperwork Reduction Act of 1995, 44 U.S.C. 3501-3519 (PRA), the Surface Transportation Board (STB or Board) gives notice of its intent to seek from the Office of Management and Budget (OMB) an extension of approval for the collection of Applications for Land-Use Exemption Permits (for Solid Waste Rail Transfer Facilities).

Pursuant to 49 U.S.C. 10501(c)(2), as amended by the Clean Railroads Act of 2008 (CRA), the Board issued rules in *Solid Waste Rail Transfer Facilities*, EP 684 (served on March 24, 2011). Under these rules, a person seeking a Land-Use Exemption Permit must file an application including substantial facts and argument as to why a permit is necessary and, as required by the National Environmental Policy Act, an

environmental report and/or an environmental impact statement.

Under 49 CFR 1155.20, an applicant is required to file a notice of intent to apply for a land-use-exemption permit before filing its application. A suggested form for this notice may be found in Appendix A to part 1155. Further, under 49 CFR 1155.21(e), an application must include a draft **Federal Register** notice. A suggested form for the draft **Federal Register** notice may be found at Appendix B to part 1155.

Comments are requested concerning: (1) The accuracy of the Board's burden estimates; (2) ways to enhance the quality, utility, and clarity of the information collected; (3) ways to minimize the burden of the collection of information on the respondents, including the use of automated collection techniques or other forms of information technology when appropriate; and (4) whether the collection of information is necessary for the proper performance of the functions of the Board, including whether the collection has practical utility. Submitted comments will be summarized and included in the Board's request for OMB approval.

Description of Collection

Title: Applications for Land-Use Exemption Permits.

OMB Control Number: 2140-0018.

STB Form Number: None.

Type of Review: Extension without change.

Respondents: Any applicant seeking a land-use-exemption permit.

Number of Respondents: One.

Estimated Time per Response: 160 hours.

Frequency: On occasion.

Total Burden Hours (annually including all respondents): 160 hours.

Total "Non-hour Burden" Cost: An estimated \$200,000 to hire an environmental consultant to work with Board staff on the required environmental report.

Needs and Uses: This collection is needed to develop a record in land-use-exemption-permit proceedings, a process mandated by Congress in the CRA. The Board uses the information in this collection to accurately assess the merits of a permit application.

Retention Period: Information in this report will be maintained on the Board's Web site for a minimum of one year and will be otherwise maintained until transferred to NARA as a permanent record.

DATES: Comments on this information collection should be submitted by June 10, 2014.

ADDRESSES: Direct all comments to Chris Oehrle, Surface Transportation Board, 395 E Street SW., Washington, DC 20423-0001, or to PRA@stb.dot.gov. When submitting comments, please refer to "Applications for Land-Use Exemption Permits." For further information regarding Land-Use Exemption Permits, contact PRA@stb.dot.gov or submit your question through E-FILING on the Board's Web site by selecting "Environmental Comments." [Federal Information Relay Service (FIRS) for the hearing impaired: (800) 877-8339.]

SUPPLEMENTARY INFORMATION: Under the PRA, a federal agency conducting or sponsoring a collection of information must display a currently valid OMB control number. A collection of information, which is defined in 44 U.S.C. 3502(3) and 5 CFR 1320.3(c), includes agency requirements or requests that persons submit reports, keep records, or provide information to the agency, third parties, or the public. Under § 3506(c)(2)(A) of the PRA, federal agencies are required to provide, prior to an agency's submitting a collection to OMB for approval, a 60-day notice and comment period through publication in the **Federal Register** concerning each proposed collection of information, including each proposed extension of an existing collection of information.

Dated: April 8, 2014.

Jeffrey Herzig,
Clearance Clerk.

[FR Doc. 2014-08150 Filed 4-10-14; 8:45 am]

BILLING CODE 4915-01-P

DEPARTMENT OF THE TREASURY

Alcohol and Tobacco Tax and Trade Bureau

[Docket No. TTB-2014-0002]

Proposed Information Collections; Comment Request (No. 47)

AGENCY: Alcohol and Tobacco Tax and Trade Bureau; Treasury.

ACTION: Notice and request for comments.

SUMMARY: As part of our continuing effort to reduce paperwork and respondent burden, and as required by the Paperwork Reduction Act of 1995, we invite comments on the proposed or continuing information collections listed below in this notice.

DATES: We must receive your written comments on or before June 10, 2014.

ADDRESSES: Please note that the Alcohol and Tobacco Tax and Trade Bureau

(TTB) has adopted a new method for receiving public comments on its information collections. As described below, you may submit comments to TTB on the information collections listed in this document using the "Regulations.gov" online comment form for this document, or you may send written comments to TTB via U.S. mail or hand delivery. TTB no longer accepts public comments via email or fax.

- <http://www.regulations.gov>: Use the comment form for this document posted within Docket No. TTB-2014-0002 on "Regulations.gov," the Federal e-rulemaking portal, to submit comments via the Internet;

- *U.S. Mail:* Mary Wood, Regulations and Rulings Division, Alcohol and Tobacco Tax and Trade Bureau, 1310 G Street NW., Box 12, Washington, DC 20005.

- *Hand Delivery/Courier in Lieu of Mail:* Mary Wood, Regulations and Rulings Division, Alcohol and Tobacco Tax and Trade Bureau, 1310 G Street NW., Suite 200-E, Washington, DC 20005.

Please submit separate comments for each specific information collection listed in this document that you wish to comment upon. You must reference the information collection's title, form or recordkeeping requirement number, and OMB control number (if any) in your comment.

You may view copies of this document, the information collections listed in it, and all comments received in response to this document within Docket No. TTB-2014-0002 at <http://www.regulations.gov>. A link to that docket is posted on the TTB Web site at <http://www.ttb.gov/forms/comment-on-form.shtml>. If you are unable to obtain a copy of this or any of the other above mentioned documents, contact Mary Wood at the addresses or telephone number shown below.

FOR FURTHER INFORMATION CONTACT: Mary Wood, Regulations and Rulings Division, Alcohol and Tobacco Tax and Trade Bureau, 1310 G Street NW., Box 12, Washington, DC 20005; telephone 202-453-1039, ext. 165; or email informationcollections@ttb.gov (please do not submit comments on this notice to this email address).

SUPPLEMENTARY INFORMATION:

Request for Comments

The Department of the Treasury and its Alcohol and Tobacco Tax and Trade Bureau (TTB), as part of their continuing effort to reduce paperwork and respondent burden, invite the general public and other Federal agencies to comment on the proposed or

continuing information collections listed below in this notice, as required by the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*).

Comments submitted in response to this notice will be included or summarized in our request for Office of Management and Budget (OMB) approval of the relevant information collection. All comments are part of the public record and subject to disclosure. Please do not include any confidential or inappropriate material in your comments.

We invite comments on: (a) Whether this information collection is necessary for the proper performance of the agency's functions, including whether the information has practical utility; (b) the accuracy of the agency's estimate of the information collection's burden; (c) ways to enhance the quality, utility, and clarity of the information collected; (d) ways to minimize the information collection's burden on respondents, including through the use of automated collection techniques or other forms of information technology; and (e) estimates of capital or start-up costs and costs of operation, maintenance, and purchase of services to provide the requested information.

Information Collections Open for Comment

Currently, we are seeking comments on the following forms or recordkeeping requirements:

Title: Drawback on Beer Exported.

OMB Number: 1513-0017.

TTB Form Number: 5130.6.

Abstract: When taxpaid beer is removed from a brewery and ultimately exported, the brewer exporting the beer is eligible for a drawback (refund) of the Federal excise taxes paid. By completing this form and submitting documentation of exportation, the brewer may receive a refund of the taxes paid.

Current Actions: We are submitting this information collection for extension purposes only. The information collection, estimated number of respondents, and estimated total annual burden hours remain unchanged.

Type of Review: Extension of a currently approved collection.

Affected Public: Business or other for-profit.

Estimated Number of Respondents: 100.

Estimated Total Annual Burden Hours: 5,000.

Title: Application for an Industrial Alcohol User Permit.

OMB Number: 1513-0028.

TTB Form Number: 5150.22.

Abstract: TTB F 5150.22 is used to determine the eligibility of the applicant to engage in certain operations involving specially denatured spirits and tax-free alcohol. Among other things, this form identifies the location of the premises and helps to establish whether the premises are in conformity with Federal laws and regulations.

Current Actions: We are submitting this information collection as a revision. The form itself remains unchanged; however, we are updating the number of respondents and burden hours to reflect an increase in the number of industrial alcohol users.

Type of Review: Revision of a currently approved collection.

Affected Public: Business or other for-profit; Not-for-profit institutions; State, local, or tribal government.

Estimated Number of Respondents: 575.

Estimated Total Annual Burden Hours: 435.

Title: Inventory—Manufacturer of Tobacco Products or Processed Tobacco.

OMB Number: 1513-0032.

TTB Form Number: 5210.9.

Abstract: TTB F 5210.9 is used by manufacturers of tobacco products or processed tobacco to report the beginning and ending inventories of tobacco products and processed tobacco and at other times required by the TTB regulations. The information reported on this form is used by TTB to determine tax liability and compliance with regulations, and for protection of the revenue.

Current Actions: We are submitting this information collection as a revision. The form remains unchanged; however, we are updating the number of respondents and burden hours to reflect an increase in the number of manufacturers.

Type of Review: Revision of a currently approved collection.

Affected Public: Business or other for-profit.

Estimated Number of Respondents: 250.

Estimated Total Annual Burden Hours: 500.

Title: Report—Manufacturer of Tobacco Products or Cigarette Papers and Tubes; and Report—Manufacturer of Processed Tobacco.

OMB Number: 1513-0033.

TTB Form Number: 5210.5 and 5250.1.

Abstract: Manufacturers of tobacco products and cigarette papers and tubes use the TTB F 5210.5 to report on the taxable articles manufactured, received, and removed per month. Manufacturers of processed tobacco use TTB F 5250.1

to account for all processed tobacco manufactured, received, and removed per month. TTB uses this information to ensure that Federal excise taxes have been properly paid and that manufacturers have complied with applicable Federal laws and regulations.

Current Actions: We are submitting this information collection as a revision. TTB is not making any changes to TTB F 5210.5. However, we are revising TTB F 5250.1 to clarify the instructions and update them to reflect amendments made to the regulations by T.D. TTB-104, published in the **Federal Register** (77 FR 37287) on June 21, 2012. Also, in response to a comment TTB received asking for a clarification, we are amending a heading on the form itself to clarify its scope and better align it with the regulatory requirement.

Type of Review: Revision of a currently approved collection.

Affected Public: Business or other for-profit.

Estimated Number of Respondents: 250.

Estimated Total Annual Burden Hours: 6,000.

Title: Schedule of Tobacco Products, Cigarette Papers or Tubes Withdrawn from the Market.

OMB Number: 1513-0034.

TTB Form Number: 5200.7.

Abstract: TTB F 5200.7 is used by persons who intend to withdraw tobacco products from the market and file a claim for credit, refund, or abatement of tax on those products for which Federal excise taxes have already been paid or determined. The industry member uses this form to describe the products that are to be withdrawn from the market. Through the use of this form, the industry member notifies TTB when a withdrawal or destruction is to take place, and TTB may elect to supervise the withdrawal or destruction.

Current Actions: We are submitting this information collection as a revision. The form remains unchanged; however, we are updating the number of respondents and burden hours to reflect an increase in the number of tobacco manufacturers.

Type of Review: Revision of a currently approved collection.

Affected Public: Business or other for-profit.

Estimated Number of Respondents: 250.

Estimated Total Annual Burden Hours: 2,250.

Title: Usual and Customary Business Records Relating to Denatured Spirits.

OMB Control Number: 1513-0062.

TTB REC Number: 5150/1.

Abstract: Denatured spirits are used for nonbeverage industrial purposes in

the manufacture of personal and household products. These records are maintained at the premises of the regulated individual and are routinely inspected by TTB personnel during field tax compliance examinations. These examinations are necessary to verify that all specially denatured spirits can be accounted for and are being used only for purposes authorized by laws and regulations. By ensuring that spirits have not been diverted to beverage use, tax revenue and public safety are protected. No additional recordkeeping is imposed on the respondent, as this information collection requires the maintenance only of the usual and customary business records of the regulated individual.

Current Actions: We are submitting this information collection for extension purposes only. The information collection, estimated number of respondents, and estimated total annual burden hours remain unchanged.

Type of Review: Extension of a currently approved collection.

Affected Public: Business or other for-profit; and State, local, or tribal government.

Estimated Number of Respondents: 3,430.

Estimated Total Annual Burden Hours: One (1).

Title: Marks and Notices on Packages of Tobacco Products, TTB REC 5210/13.

OMB Number: 1513-0101.

TTB REC Number: 5210/13.

Abstract: TTB requires that tax-related information appear on tobacco product packages and, in some cases, on shipping containers used for tobacco products. TTB uses this information to ensure that the tax is paid on tobacco products, and to ensure that products removed without payment of tax for export are easily identifiable if diverted into the domestic market.

Current Actions: We are submitting this information collection for extension purposes only. The information collection, estimated number of respondents, and estimated total annual burden hours remain unchanged.

Type of Review: Extension of a currently approved collection.

Affected Public: Business or other for-profit.

Estimated Number of Respondents: 120.

Estimated Total Annual Burden Hours: One (1).

Title: Special Tax Renewal Registration and Return/Special Tax Location Registration Listing.

OMB Number: 1513-0113.

TTB Form Number: 5630.5R.

Abstract: Chapter 52 of the Internal Revenue Code of 1986, as amended

(IRC), imposes an occupational tax on persons engaging in certain tobacco businesses. Section 5731 of the IRC (26 U.S.C. 5731) requires persons to register and/or pay a special occupational tax before conducting business in certain tobacco categories. TTB F 5630.5R is used both to compute and report the tax and as an application for registry as required by statute. TTB F 5630.5R is computer-generated by TTB with known taxpayer identifying information (e.g., name, trade name, address, employer identification number, etc.) along with tax computations reflecting tax class(es), number of business locations, tax rate(s), and total tax due. The taxpayer corrects or supplies any inaccurate or incomplete information.

Current Actions: We are submitting this information collection for extension purposes only. The information collection, estimated number of respondents, and estimated total annual burden hours remain unchanged.

Type of Review: Extension of a currently approved collection.

Affected Public: Business or other for-profit.

Estimated Number of Respondents: 400.

Estimated Total Annual Burden Hours: 100.

Title: Labeling of Major Food Allergens.

OMB Control Number: 1513-0121.

TTB REC or Form Number: None.

Abstract: The collection of information involves voluntary labeling of major food allergens used in the production of alcohol beverages and also involves petitions for exemption from full allergen labeling. The collection corresponds to the amendments to the Food, Drug and Cosmetics Act (FD&C Act) in Title II of Public Law 108-282, 118 Stat. 905.

Current Actions: We are submitting this information collection for extension purposes only. The information collection, estimated number of respondents, and estimated total annual burden hours remain unchanged.

Type of Review: Extension of a currently approved collection.

Affected Public: Business or other for-profit.

Estimated Number of Respondents: 500.

Estimated Total Annual Burden Hours: 730.

Title: Report of Removal, Transfer, or Sale of Processed Tobacco.

OMB Number: 1513-0130.

TTB Form Number: 5250.2.

Abstract: Unregulated transfers or sales of processed tobacco to persons who do not hold TTB permits could

lead to processed tobacco falling into the hands of persons who would be unknown and unaccountable to TTB, including illegal manufacturers. In order to better regulate processed tobacco and prevent diversion, TTB requires the filing of a report covering all such transfers or sales. This report is used to protect the revenue.

Current Actions: We are submitting this information collection as a revision. We are revising TTB F 5250.2 to remove two data elements which TTB has determined to be no longer necessary. The form instructions also are being amended to reflect changes made to the regulations by T.D. TTB-104, which was published in the **Federal Register** (77 FR 37287) on June 21, 2012.

Type of Review: Revision of a currently approved collection.

Affected Public: Business or other for-profit.

Estimated Number of Respondents: 800.

Estimated Total Annual Burden Hours: 2,400.

Dated: April 7, 2014.

Rochelle E. Stern,

Director, Regulations and Rulings Division.

SUMMARY: This is Supplement No. 5 to the Treasury Department Circular 570, 2013 Revision, published July 1, 2013, at 78 FR 39440.

FOR FURTHER INFORMATION CONTACT: Surety Bond Branch at (202) 874-6850.

SUPPLEMENTARY INFORMATION: A Certificate of Authority as an acceptable surety on Federal bonds is hereby issued under 31 U.S.C. 9305 to the following company:

CUMIS Specialty Insurance Company, Inc. (NAIC# 12758).

BUSINESS ADDRESS: Post Office Box 1084, Madison, WI 53701.

PHONE: (608) 238-5851. **UNDERWRITING LIMITATION b/:** \$6,465,000.

SURETY LICENSES c/: IA INCORPORATED IN: Iowa.

Federal bond-approving officers should annotate their reference copies of the

Treasury Circular 570 ("Circular"), 2013 Revision, to reflect this addition.

Certificates of Authority expire on June 30th each year, unless revoked prior to that date. The Certificates are subject to subsequent annual renewal as long as the companies remain qualified (see 31 CFR part 223). A list of qualified companies is published annually as of July 1st in the Circular, which outlines details as to the underwriting limitations, areas in which companies are licensed to transact surety business, and other information.

The Circular may be viewed and downloaded through the Internet at <http://www.fms.treas.gov/c570>.

Questions concerning this Notice may be directed to the U.S. Department of the Treasury, Bureau of the Fiscal Service, Financial Accounting and Services Branch, Surety Bond Branch, 3700 East-West Highway, Room 6F01, Hyattsville, MD 20782.

Dated: April 3, 2014.

Kevin McIntyre,

Manager, Financial Accounting and Services Branch.

BILLING CODE 4810-35-P

DEPARTMENT OF VETERANS AFFAIRS

Determinations Concerning Illnesses Discussed in National Academy of Sciences Report: Veterans and Agent Orange: Update 2012

ACTION: Notice.

SUMMARY: As required by law, the Department of Veterans Affairs (VA) hereby gives notice that the Secretary of Veterans Affairs, under the authority granted by the Agent Orange Act of 1991, codified at 38 U.S.C. 1116, has determined that there is no basis to establish a presumption of service connection at this time, based on exposure to herbicide agents, including the substance commonly known as Agent Orange, for several health effects discussed in the December 4, 2013, National Academy of Sciences (NAS) report titled: *Veterans and Agent Orange: Update 2012* (hereinafter, "Update 2012"). This determination does not in any way preclude VA from granting service connection for any disease, including those specifically discussed in this notice, nor does it change any existing rights or procedures.

FOR FURTHER INFORMATION CONTACT: Michael Ford, Regulatory Specialist (10B4), Office of Regulatory and

Administrative Affairs, Veterans Health Administration, Department of Veterans Affairs, 810 Vermont Avenue NW., Washington, DC 20420, email michael.ford2@va.gov.

SUPPLEMENTARY INFORMATION:

I. Statutory Requirements

The Agent Orange Act of 1991, Public Law 102-4 (codified in part at 38 U.S.C. 1116), directed the Secretary to seek to enter into an agreement with the National Academy of Sciences (NAS) to conduct a comprehensive review of scientific and medical literature on potential health effects of exposure to Agent Orange. Congress mandated that NAS determine, to the extent possible: (1) Whether there is a statistical association between suspect diseases and herbicide exposure, taking into account the strength of the scientific evidence and the appropriateness of the scientific methodology used to detect the association; (2) the increased risk of disease among individuals exposed to the herbicides during service in the Republic of Vietnam during the Vietnam era; and (3) whether a plausible biological mechanism or other evidence of a causal relationship exists between exposure to herbicides and suspect disease.

Section 2 of Public Law 102-4, codified in pertinent part at 38 U.S.C. 1116(b) and (c), provides that whenever the Secretary determines, based on sound medical and scientific evidence, that a positive association (i.e., the credible evidence for the association is equal to or outweighs the credible evidence against the association) exists between exposure of humans to an herbicide agent (i.e., a chemical in an herbicide used in support of the United States and allied military operations in the Republic of Vietnam during the Vietnam era) and a disease, the Secretary will publish regulations establishing presumptive service connection for that disease. If the Secretary determines that a presumption of service connection is not warranted, he is to publish a notice of that determination, including an explanation of the scientific basis for that determination.

Although 38 U.S.C. 1116 does not define "credible," it does instruct the Secretary to "take into consideration whether the results [of any study] are statistically significant, are capable of replication, and withstand peer review." The Secretary reviews studies that report a positive relative risk and studies that report a negative relative risk of a particular health outcome. He then determines whether the weight of evidence supports a finding that there is

or is not a positive association between herbicide exposure and the subsequent health outcome. The Secretary does this by taking into account the statistical significance, capability of replication, and whether that study will withstand peer review. Because of differences in statistical significance, confidence levels, control for confounding factors, bias, and other pertinent characteristics, some studies are more credible than others. The Secretary gives weight to more credible studies in evaluating the overall evidence concerning specific health outcomes.

II. Prior NAS Reports

NAS has issued ten previous biennial reports under the Agent Orange Act. Based on those reports and the requirements of the Agent Orange Act, VA has established presumptions of service connection for 14 categories of disease, which are listed at 38 CFR 3.309(e). Additionally, following each prior NAS report, VA has published a notice explaining the Secretary's determination that presumptions of service connection are not warranted for several diseases discussed in those reports. Those notices are published at: 59 FR 341 (Jan. 4, 1994), 61 FR 41442 (Aug. 8, 1996), 64 FR 59232 (Nov. 2, 1999), 67 FR 42600 (June 4, 2002), 68 FR 27630 (May 30, 2003), 72 FR 32395 (May 20, 2007), 75 FR 32540 (June 8, 2010), 75 FR 81332 (Dec. 27, 2010), and 77 FR 47924 (Aug. 10, 2012). The Secretary's determination that there is not a positive association between herbicide exposure and the diseases addressed in this notice is based upon the prior NAS reports, as discussed in VA's prior **Federal Register** notices, and upon the additional information and analysis in *Update 2012*, as discussed below.

III. Veterans and Agent Orange: Update 2012

On December 4, 2013, NAS publicly released *Veterans and Agent Orange: Update 2012*, which describes the relevant scientific and medical evidence identified subsequent to the last prior NAS review, *Veterans and Agent Orange: Update 2010* (hereinafter, "Update 2010"). NAS reviewed, evaluated, and summarized scientific and medical literature addressing several conditions and the health status of Veterans.

Consistent with its prior reviews, NAS concentrated its review on epidemiologic studies to fulfill its charge of assessing whether specific human health effects are associated with exposure to at least one of the herbicides utilized or to a chemical

component of herbicides, such as TCDD (2,3,7,8-tetrachlorodibenzo-p-dioxin; referred to as TCDD to represent a single—and the most toxic—congener of the tetrachlorodibenzo-p-dioxins, also commonly referred to as dioxin). NAS also considered controlled laboratory investigations that provided information on whether the association between the chemicals of interest and a given effect is biologically plausible.

In *Update 2012*, NAS endeavored to emphasize and clarify the relationship among the succession of publications that have provided ever increasing insight into the health responses of particular exposed populations that have been studied for many years. The information that the present Committee reviewed was identified through a comprehensive search of relevant databases, including databases covering biologic, medical, toxicologic, chemical, historical, and regulatory information. NAS conducted a comprehensive search of all medical and scientific studies on health effects of herbicides used in the Vietnam War, including more than 6,800 potentially relevant studies. Of this group, NAS selected 1,100 studies for careful review. It ultimately identified 61 epidemiologic studies as well as several score of toxicologic studies and exposure evaluations that contributed new information. Relevant animal studies, as with previous biennial “Agent Orange Updates,” were also reviewed to determine biological plausibility and possible mechanisms of action.

The epidemiologic information evaluated in *Update 2012* was integrated with that previously assembled including Veterans studies, occupational studies, and environmental studies. NAS noted that few studies concerning the health of Vietnam Veterans were identified as having been published since the studies evaluated in *Update 2010*, and almost all addressed mental health issues that are not within the scope of its report. There were no new studies of Vietnam Veterans and only a single case-control study on Vietnam era South Korean Veterans with cardiac disease, some of whom had served in Vietnam. This study examined whether a history of Vietnam service is associated with the clinical course of coronary disease, not with the occurrence of coronary disease itself.

Since *Update 2010*, several occupational studies have been published which may show potential health effects of herbicide exposure. For instance, studies focused on cancer mortality in pentachlorophenol (PCP) workers who are part of the National

Institute for Occupational Safety and Health (NIOSH) cohort, and cancer incidence in a NIOSH subcohort of chemical workers in a Dow Chemical Company plant in Michigan. Another study investigated plasma dioxin concentrations and cause-specific mortality in German production workers in a plant included in the International Agency for Research on Cancer (IARC) cohort in Hamburg, Germany. Three new studies of IARC subcohorts in the Netherlands that collectively reported on cancer mortality, ischemic heart disease, humoral immunity, atopic disease, and immune suppression in herbicide workers. The incidence of gliomas in pesticide applicators in participants in the Upper Midwest Health Study was reviewed. Also, eight reports from the Agricultural Health Study (AHS) examined cancer incidence, body-mass index, amyotrophic lateral sclerosis, and mortality in private pesticide applicators (farmers), their spouses, and commercial pesticide applicators in Iowa and North Carolina.

Since *Update 2010*, numerous studies on environmental exposures to chemicals of interest have been published. Researchers reported on cancer incidence and reproductive factors in people who lived near the site of the industrial accident in Seveso, Italy. Five new studies published by the Prospective Investigations of the Vasculature in Uppsala Seniors (PIVUS) group reported on stroke, atherosclerosis, diabetes, and obesity. Several new studies from Taiwan examined hypertension, cardiovascular disease, and insulin resistance in people who lived in the vicinity of a closed PCP factory. Other studies looked at hypertension, bone mineral density, and environmental exposures via the National Health and Nutrition Examination Survey, and diabetes and hypertension in the Anniston (Alabama) Community Health Survey. Another study focused on reproductive outcomes in mother–infant pairs exposed to TCDD and other chemicals that have dioxin-like biologic activity in Japan, Finland, the Netherlands, United States, and Vietnam. New case-control studies examined environmental exposures to the chemicals of interest and several types of cancer, myelodysplastic syndromes, endometriosis, menstrual cycles, and Parkinson’s disease.

As in its prior reports, NAS placed each health outcome it reviewed in one of four categories based on the strength of the evidence of association between herbicide exposure and the health outcome. The four categories are: Sufficient Evidence of Association;

Limited or Suggestive Evidence of Association; Inadequate or Insufficient Evidence to Determine Whether an Association Exists; and Limited or Suggestive Evidence of No Association. VA has established presumptions of service connection for all diseases NAS placed in the first category and for most of the diseases NAS placed in the second category. However, VA will not establish a presumption of service connection for a condition solely on the basis that NAS has placed the condition in one of the two highest categories of association used by NAS. Rather, each condition is considered individually, based on available evidence, and informed by conclusions and recommendations of NAS. The “limited or suggestive evidence” category used by NAS may encompass a potentially wide range of evidentiary circumstances, and NAS’ placement of a disease in that category is not intended to express any view on policy matters or on the outcome of VA’s application of the “positive association” standard prescribed by 38 U.S.C. 1116(b). This notice explains the basis for VA’s determination that no new presumptions of service connection are warranted for the diseases discussed in *Update 2012*.

Limited or Suggestive Evidence of an Association

NAS has defined this category of association to mean that the “evidence suggests an association between exposure to herbicides and the outcome, but a firm conclusion is limited because chance, bias, and confounding could not be ruled out with confidence.”

Hypertension

NAS placed hypertension in the “Limited or Suggestive Evidence of Association” category. Hypertension affects more than 70 million adult Americans and is a major risk factor for coronary artery disease, myocardial infarction, stroke, and heart and renal failure. A recent study of the Framingham cohort (The Seventh Report of the Joint National Committee on Prevention, Detection, Evaluation, and Treatment of High Blood Pressure 2004) showed that in both 55 and 65-year-old participants, the cumulative lifetime risk for the development of hypertension (at or above 140/90 mm Hg, regardless of treatment) was 90 percent. The lifetime risk statistic is the probability that an individual will develop a disease over a lifetime. Major risk factors are well established and include tobacco use, diet, physical inactivity, obesity, diabetes mellitus, alcohol, and heredity.

In its reports prior to 2006, NAS placed hypertension in the “Inadequate or Insufficient Evidence” category. In *Veterans and Agent Orange: Update 2006* (hereinafter, “*Update 2006*”), *Update 2008*, and *Update 2010*, NAS elevated hypertension to the “Limited or Suggestive Evidence” category, but could not clearly distinguish the possibility of a small increased risk for hypertension due to herbicide exposure from more prevalent scientifically established risk factors in evaluating the risk to individual Veterans. NAS noted the limitations of the studies regarding hypertension. In the **Federal Register** of June 8, 2010, December 27, 2010, and August 10, 2012, VA explained why the studies reviewed in *Update 2006*, *Update 2008*, and *Update 2010* did not, in VA’s view, warrant a presumption of service connection for hypertension in Veterans exposed to herbicides in service. 75 FR 32540 (June 8, 2010), 75 FR 81332 (Dec. 27, 2010), and 77 FR 47924 (Aug. 10, 2012).

NAS identified no Vietnam Veteran studies addressing exposure to the chemicals of interest and hypertension published since *Update 2010*. One group of researchers performed a retrospective study of outcomes of Vietnam-era South Korean Veterans undergoing coronary angiography because of acute coronary syndrome according to whether they served or did not serve in Vietnam. This study examined whether a history of Vietnam service is associated with the clinical course of coronary disease, not with the occurrence of coronary disease itself. NAS concluded that this study was not helpful in assessing whether herbicide exposure was a factor in the development of hypertension.

Medical research studies related to Agent Orange generally fall into one of three categories—environmental studies, occupational studies, and case-control studies. Environmental studies focus on exposure outside of the workplace (i.e., in the surrounding environment), usually due to an industrial incident or accidental release of Agent Orange or other related chemicals of interest. Occupational studies focus on workplace exposure to Agent Orange or related chemicals of interest. Case-control studies identify individuals with the health outcome of interest (cases) and individuals without the health outcome (controls), then compare the exposure experience (often self-reported) of the two groups.

NAS did not identify any occupational studies or case-control studies of exposure to chemicals of interest and hypertension published since *Update 2010*.

In *Update 2012*, NAS identified three environmental studies published since *Update 2010* focusing on environmental exposure to chemicals of interest and hypertension. Researchers reported findings from the cross-sectional sample of residents of Taiwan living in an area with a high level of industrial contamination from various compounds including dioxins, furans, and mercury. This study updated and extended an earlier report discussed in *Update 2010*. The updated report extended the survey period for an additional 7 months increasing the number of surveyed residents from 1,478 to 1,812. Data were reviewed using factor analysis and multivariate models. Factor analysis was used to determine which components of metabolic syndrome appeared to be most strongly associated with dioxin toxic equivalency concentrations, based on serum dioxin and furan levels. The authors of the study concluded that dioxin toxic equivalencies were more strongly associated with blood pressure than other syndrome components. Based on multivariate analysis, the researchers concluded that there was a highly statistically significant association between toxic equivalency concentrations and diastolic blood pressure but not systolic blood pressure after adjustment for age, sex, obesity, smoking status, alcohol use, and family history of hypertension or diabetes.

NAS considered the strengths and weaknesses of the study. It stated that the strengths of the study are the large number of potential confounding variables addressed and the clear exposure to the chemicals of interest. The weaknesses are that it is a cross-sectional survey which precludes making a strong causal inference since the temporal relationship between exposure and the outcome is unknown. Additionally, NAS noted that surveys are prone to selection factors that may bias relationships between exposures and outcomes.

Another study examined data on 394 residents of Anniston, Alabama, who were living in an area with high levels of polychlorinated biphenyls (PCB). The purpose of the study was to determine the relationship between blood pressure and serum concentrations of 35 PCBs and nine chlorinated pesticides. Individuals taking antihypertensive medications were excluded from the study. The authors concluded that, other than age, total serum PCB concentrations were the strongest correlate of blood pressure after adjustment for age, body mass index, sex, race, smoking status, and exercise. They saw a weak, not statistically

significant, association between blood pressure and mono-ortho PCBs. PCBs with more potent dioxin-like activity were not measurable within the limits of the assay used. NAS concluded that this study shares strengths and weaknesses with the Taiwanese survey, but exposures to chemicals of interest and specifically TCDD were lower in the Alabama sample.

A study examining urinary arsenic concentrations and hypertension in the 2003–2008 National Health and Nutrition Examination Survey showed no statistically significant association. NAS stated that it did not consider this study because the relationship between urinary arsenic and the arsenic-containing chemical that the Veterans were exposed to, cacodylic acid, is unclear.

Based on its analysis of these studies published since *Update 2010*, NAS concluded that the new relevant data are consistent with a relationship between the chemicals of interest and blood pressure, and continued its placement of hypertension in the limited or suggestive category.

VA has reviewed this additional information in relation to the information in prior NAS reports analyzing studies concerning hypertension. Based on this review, the Secretary has determined that the available evidence is not sufficient to establish a new presumption of service connection for hypertension in Veterans exposed to herbicides. As noted in VA’s evaluation of prior NAS reports, 75 FR 32540 (June 8, 2010), 75 FR 81332 (Dec. 27, 2010), and 77 FR 47924 (Aug. 10, 2012), the evidence overall includes a wide variety of results. While some Veteran studies have reported increased incidence of hypertension, others have found no increase. Similarly, numerous environmental and occupational studies have found no significant increased risk of hypertension. Two environmental studies published since *Update 2010* examining environmental exposures in Taiwan and Alabama suggested a possible association between serum concentration of dioxin-like compounds and elevated blood pressure. Based on this limited amount of new information, NAS reaffirmed its decision to place hypertension in “limited or suggestive evidence of an association” category. The two studies that provide evidence of an increased risk are limited by the design of the study or the type of assay used to measure exposure. Accordingly, the Secretary has determined that the available evidence does not at this time establish a positive association between herbicide exposure and hypertension

that would warrant a presumption of service connection.

Stroke

NAS placed stroke in the “Limited or Suggestive Evidence of Association” category. Stroke is the third leading cause of death and the second leading cause of disability among adults in the United States. The incidence of stroke increases with age and varies according to ethnicity and gender. The cumulative lifetime risk for development of stroke is about 1 in 6 for men and 1 in 5 for women. Black and Latino men are at the highest risk for stroke. The incidence of stroke for people over 75 years of age is more than twice that of people 55–65 years old. Other factors that increase the risk of stroke include: Smoking, diabetes, hypertension, and obesity. Based on these factors alone, some members of the aging Vietnam Veteran cohort can be expected to experience stroke in their lifetime. A recently completed 25-year follow up of the National Vietnam Veterans Readjustment Study cohort found a 0.6 percent mortality rate from stroke, a rate which is comparable to that of the U.S. general population experience.

In prior reports NAS placed stroke in the “Inadequate or Insufficient Evidence” category. This determination was made based on its analysis of relevant studies. In *Update 2012*, NAS identified three new occupational studies and one environmental study addressing exposure to chemicals of interest and stroke.

No Vietnam Veteran studies addressing exposure to the chemicals of interest and cerebrovascular disease and stroke have been published since *Update 2010*. No case-control studies of exposure to the chemicals of interest and cerebrovascular disease or stroke have been published since *Update 2010*.

One study reported findings on mortality in 2,122 production workers engaged in the manufacture of PCP in four midwestern plants. PCP contains dioxin and furan contaminants that do not include the most toxic 2,3,7,8-TCDD congener. The cohort was partitioned into a subcohort of 1,402 workers (PCP-only group) who were employed only in production of PCP and a separate subcohort of 720 workers (PCP-plus-TCDD group) who also worked in PCP production and were exposed to TCDD. The cohort was followed through the end of 2005. The authors did not observe an increase in cerebrovascular deaths among the workers compared to the general population. NAS noted that the researchers used the U.S. population as a referent group, which would tend to

understate associations because of confounding by the healthy-worker effect.

Another study reported an updated mortality analysis of workers exposed to TCDD at two Dutch chlorophenoxy-herbicide production facilities. Results of that cohort have been included in previous NAS Updates. Workers in plant A were exposed to high concentrations of dioxin both as a contaminant of 2,4,5-Trichlorophenoxyacetic acid (2,4,5-T) production and through accidental exposure after the explosion of a kiln. Plant B was involved in 2,4-Dichlorophenoxyacetic acid (2,4-D) production, but TCDD exposure was assumed to be minimal. The study followed all male employees of either factory during their years of operation, which lasted until 1985 for plant A and 1986 for plant B. Mortality was ascertained through the end of 2006. The authors did not observe an increase in cerebrovascular deaths among the workers compared to the general population. NAS concluded that the study has good exposure measurement, using non-exposed workers in the same plants as the referent population, and 39 total stroke deaths were observed; but no association with cerebrovascular death was observed.

Researchers reported on a 23-year follow up of workers exposed to dioxins in a chemical plant in Hamburg, Germany, that manufactured herbicides and pesticides, including 2,4,5-T. Results on that cohort have been included in previous NAS Updates. The study included 1,191 men and 398 women who were employed full-time at the plant for at least 3 months during 1952–1984. Individual cumulative exposure was estimated from work history on the basis of company records, and the intensity of TCDD exposure in workplaces was based on previous analyses of serum and fat-tissue dioxin concentrations. The authors found a statistically significant higher risk of cerebrovascular-disease mortality than expected in men, but not in women.

NAS relied primarily on the results of research on the PIVUS study in placing stroke in the limited or suggestive category. The PIVUS study recruited participants, within 2 months after their 70th birthdays, randomly from the registry of residents of the community of Uppsala, Sweden, from April 2001 to June 2004. The primary aim was to investigate cardiovascular disease in an elderly population with adjustment for sex. All participants answered a questionnaire about medical history, medication, diet, and smoking habits. The burden of persistent organic

pollutants (POPs) including several dioxin-like PCBs, was assessed from blood serum or plasma. The investigators examined the relationship between POPs in 898 70-year-old residents of Uppsala, Sweden, and their incidence of stroke 5 years later. The investigators measured 16 PCBs, Octachlorodibenzodioxin (OCDD), and four other pollutants. Thirty-five participants developed stroke; stroke subtype was not determined. All odds ratios discussed below were adjusted for gender, body mass index, cigarette smoking, exercise, alcohol consumption, hypertension, diabetes, triglycerides, and serum cholesterol. Plasma concentrations of OCDD and of most PCBs with fewer than seven chlorine atoms were positively related to stroke risk. A total of 35 study participants suffered strokes. Participants in the highest 25th percentile of OCDD had 3.5 times the odds of developing stroke compared with those in the lowest 25th percentile. Both chemicals that had dioxin-like properties and ones that did not were positively associated with stroke. Total toxic equivalencies, however, were strongly associated with stroke risk. Those with toxic equivalencies at or above the 90th percentile had 4.2 times the odds of developing stroke. Stroke risk was also greater in participants that had higher concentrations of chlorine-containing pesticides.

NAS also summarized relevant previous studies that addressed stroke or cerebrovascular disease. It noted that two existing studies found an increased incidence of cerebrovascular mortality in Vietnam Veterans, but neither achieved statistical significance, and one of the studies failed to control for important potential confounders.

NAS discussed an environmental study published in 2008, in which researchers reported on the 25-year mortality experience of residents exposed to dioxin through an accidental industrial release in Seveso, Italy. The mortality from cerebrovascular disease was assessed in residents of areas of high, medium, and low exposure to TCDD compared with residents of non-exposed areas in this region of Italy. Because of the relatively small number of residents in the high-exposure zone and the rarity of stroke, NAS noted that the precision of the estimate for that zone was quite low. However, the study did show an increase in stroke mortality in medium-exposure and low-exposure zones. NAS concluded that the strengths of the study are the documented exposure to a chemical of interest and measured TCDD concentrations that support the geographic exposure

classification. The associations were adjusted for age, sex, and time but were not adjusted for other stroke risk factors.

NAS also discussed a 1998 IARC study, in which researchers pooled data on 36 populations of workers involved in the manufacture of chemicals associated with dioxin contamination. There were 263 stroke deaths among the 21,863 included phenoxy herbicide or chlorophenol workers. Workers who were exposed to dioxin had 54 percent higher cerebrovascular-disease mortality than workers who were not. However, the study's finding was not statistically significant at the 95 percent confidence interval.

NAS reviewed data that updated results from several of the populations included in the IARC report. In addition to the Dutch and Hamburg chemical-worker studies, two articles published before *Update 2010* provided updated information on stroke mortality in cohorts that had been included in the IARC analysis. Neither publication reported a significant increase in stroke mortality in exposed workers compared with the general population. None of the studies could adjust for relevant risk factors, such as smoking and body mass index.

VA has reviewed this additional information in relation to the information in prior NAS reports analyzing studies concerning stroke. Based on this review, the Secretary has determined that the available evidence is not sufficient to establish a new presumption of service connection for stroke in Veterans exposed to herbicides. In prior reports NAS placed stroke in the Inadequate or Insufficient Evidence to Determine Whether an Association Exists category. It moved stroke to the "limited or suggestive" category based largely on the results of the PIVUS study. Although VA agrees with NAS that the PIVUS study is generally well designed, it also has a number of limitations for purposes of evaluating the potential health effects of exposure to herbicides used in Vietnam. As noted by the authors of the study, there were only 35 cases of strokes documented and the confidence intervals were wide, so interpretation of the results should be cautious and associations might be chance findings. NAS noted that follow up for the incidence of stroke was incomplete (about 80 percent), which potentially could bias the results. NAS also noted that the study methodology theoretically could have led to some exposure misclassification. Additionally, the study analyzed nearly 60 data comparisons and, with that large number of comparisons, one would

expect at least three to reach statistical significance at the 95 percent confidence level by chance alone.

Conclusions based on the PIVUS study are further limited because the chemicals being measured in the serum levels of PIVUS study participants are not those found in Agent Orange, and there is significant uncertainty as to whether the associations found for the chemicals studied can support any conclusions regarding the health effects of dioxin or other chemicals in herbicides used in Vietnam. The assumption underlying comparison of those chemicals (primarily PCBs) to dioxin is that both are capable of binding to the "Ah" receptor found on the surface of vascular endothelial cells and that this binding can be measured in the form of a total Toxic Equivalency. However, the authors of the PIVUS study noted that their data indicated that the associations found were not clearly related to this dioxin-like activity of the chemicals studied. Thus, because the associations detected in the PIVUS study were not clearly related to the dioxin-like properties of the chemicals studied, the study has limited value for determining the extent to which dioxin may be associated with stroke.

On consideration of the available scientific and medical evidence, including the PIVUS study, VA has determined that the evidence does not currently establish a positive association between herbicide exposure and stroke. Of the five studies previously identified by NAS relating to stroke or cerebrovascular disease in Vietnam Veterans, only one study published in 1985 showed a statistically significant increase in risk for stroke mortality. However, that study did not control for important potential confounders. Of the 12 relevant occupational studies identified by NAS, only one showed a statistically significant higher risk of cerebrovascular-disease mortality and that finding is limited somewhat by the fact that the increased risk was observed only in exposed men, while no increased risk was observed in exposed women. Thus, most of the relevant studies do not provide statistically significant evidence of an association between exposure to chemicals of interest and stroke, and the few studies that provide such evidence are limited by methodological concerns and other factors as discussed above. Accordingly, the Secretary has determined that the available evidence does not at this time establish a positive association between herbicide exposure and stroke that would warrant a presumption of service connection.

Inadequate or Insufficient Evidence To Determine an Association

NAS has defined this category of association to mean that available epidemiologic studies are of insufficient quality, consistency, or statistical power to permit a conclusion regarding the presence or absence of an association. For example, these studies may fail to control for confounding factors, have inadequate exposure assessment, or fail to address latency.

Consistent with its findings in *Update 2010*, NAS in *Update 2012*, found inadequate or insufficient evidence to determine whether an association exists between herbicide exposure and the following conditions: (1) Cancers of the oral cavity (including lips and tongue), pharynx (including tonsils), and nasal cavity (including ears and sinuses); (2) cancers of the pleura, mediastinum, and other unspecified sites within the respiratory system and intrathoracic organs; (3) cancers of the digestive organs (esophageal cancer; stomach cancer; colorectal cancer (including small intestine and anus), hepatobiliary cancers (liver, gallbladder, and bile ducts), and pancreatic cancer); (4) bone and joint cancer; (5) melanoma; (6) nonmelanoma skin cancer (basal cell and squamous cell); (7) breast cancer; (8) cancers of the reproductive organs (cervix, uterus, ovary, testes, and penis; excluding prostate); (9) urinary bladder cancer; (10) renal cancer (kidney and renal pelvis); (11) cancers of the brain and nervous system (including eye); (12) endocrine cancers (including thyroid and thymus); (13) leukemia (other than all chronic B-cell leukemias including chronic lymphocytic leukemia and hairy cell leukemia); (14) cancers at other and unspecified sites (other than those as to which the Secretary has already established a presumption); (15) reproductive effects (including infertility; spontaneous abortion other than after paternal exposure to TCDD; and—in offspring of exposed people—neonatal death, infant death, stillborn, low birth weight, birth defects [other than spina bifida], and childhood cancer [including acute myeloid leukemia]); (16) neurobehavioral disorders (cognitive and neuropsychiatric); (17) neurodegenerative diseases (including amyotrophic lateral sclerosis (ALS) but excluding Parkinson's disease); (18) chronic peripheral nervous system disorders (other than early-onset peripheral neuropathy); (19) respiratory disorders (wheeze or asthma, chronic obstructive pulmonary disease, and farmer's lung); (20) gastrointestinal, metabolic, and digestive disorders (including changes in liver enzymes,

lipid abnormalities, and ulcers); (21) immune system disorders (immune suppression, allergy, and autoimmunity); (22) circulatory disorders (other than hypertension, ischemic heart disease, and stroke); (23) endometriosis; (24) effects on thyroid homeostasis; (25) hearing loss; (26) eye problems; and (27) bone conditions.

With respect to the 27 categories of disease considered in its prior reports, NAS identified no new Vietnam Veteran studies, occupational studies, environmental studies, or case studies published since *Update 2010* addressing the potential relationship between the chemicals of interest and basal cell carcinoma, squamous cell carcinoma, and chronic lymphocytic leukemia. It identified 31 studies published since *Update 2010* that addressed the relationship between the chemicals of interest and at least one of the remaining types of cancer listed above. It identified no new Vietnam Veteran studies, occupational studies, environmental studies, or case studies published since *Update 2010* addressing the potential relationship between the chemicals of interest and thyroid homeostasis, eye problems, hearing loss, or chronic peripheral nervous system disorders. A total of 27 studies were published since *Update 2010* that addressed the relationship between the chemicals of interest and the remaining non-cancer conditions list above. After analyzing the results of research

published since the last update, NAS found that the studies published since *Update 2010* generally did not contain statistically significant findings or other significant evidence of association between herbicide exposures and those health outcomes.

In notices following prior NAS reports, cited in section II above, VA has explained the basis for the Secretary's determination that a positive association does not exist between herbicide exposure and the health conditions identified in *Update 2012* in the "inadequate or insufficient evidence" category. For the reasons explained above, VA has determined that the additional studies discussed in *Update 2012* do not change the Secretary's determination that a positive association does not currently exist between herbicide exposure and those health conditions.

Limited or Suggestive Evidence of No Association

NAS has previously concluded that there is limited or suggestive evidence of no association between paternal herbicide exposure and spontaneous abortion. In *Update 2012*, NAS identified no new studies relevant to that health outcome. Accordingly, the Secretary has determined that there is no positive association between paternal herbicide exposure and spontaneous abortion.

Detailed information on NAS' findings may be found at [http://](http://www.iom.edu/Reports/2013/Veterans-and-Agent-Orange-Update-2012.aspx)

www.iom.edu/Reports/2013/Veterans-and-Agent-Orange-Update-2012.aspx. After selecting the link titled: "Read Report Online for Free," report findings, organized by category, may be found under the heading, "Table of Contents."

Conclusion

After careful review of the findings of the 2012 NAS report, *Veterans and Agent Orange: Update 2012*, the Secretary has determined that based on the scientific evidence presented in this report and prior NAS reports, no new presumptions of service connection are warranted at this time for any of the conditions discussed in this notice.

Signing Authority

The Secretary of Veterans Affairs, or designee, approved this document and authorized the undersigned to sign and submit the document to the Office of the Federal Register for publication electronically as an official document of the Department of Veterans Affairs. Jose D. Riojas, Chief of Staff, Department of Veteran Affairs, approved this document on March 25, 2014, for publication.

Dated: April 4, 2014.

William F. Russo,

Deputy Director, Regulation Policy and Management, Office the General Counsel, Department of Veterans Affairs.

[Docket No. OSHA-S215-2006-0063]

RIN 1218-AB67

Electric Power Generation, Transmission, and Distribution; Electrical Protective Equipment

AGENCY: Occupational Safety and Health Administration (OSHA), Labor.

ACTION: Final rule.

SUMMARY: OSHA last issued rules for the construction of transmission and distribution installations in 1972. Those provisions are now out of date and inconsistent with the more recently promulgated general industry standard covering the operation and maintenance of electric power generation, transmission, and distribution lines and equipment. OSHA is revising the construction standard to make it more consistent with the general industry standard and is making some revisions to both the construction and general industry requirements. The final rules for general industry and construction include new or revised provisions on host employers and contractors, training, job briefings, fall protection, insulation and working position of employees working on or near live parts, minimum approach distances, protection from electric arcs, deenergizing transmission and distribution lines and equipment, protective grounding, operating mechanical equipment near overhead power lines, and working in manholes and vaults. The revised standards will ensure that employers, when appropriate, must meet consistent requirements for work performed under the construction and general industry standards.

The final rule also revises the general industry and construction standards for electrical protective equipment. The existing construction standard for the design of electrical protective equipment, which applies only to electric power transmission and distribution work, adopts several national consensus standards by reference. The new standard for electrical protective equipment, which matches the corresponding general industry standard, applies to all construction work and replaces the incorporation of out-of-date consensus standards with a set of performance-oriented requirements that is consistent

with the latest revisions of the relevant consensus standards. The final construction rule also includes new requirements for the safe use and care of electrical protective equipment to complement the equipment design provisions. Both the general industry and construction standards for electrical protective equipment will include new requirements for equipment made of materials other than rubber.

OSHA is also revising the general industry standard for foot protection. This standard applies to employers performing work on electric power generation, transmission, and distribution installations, as well as employers in other industries. The final rule removes the requirement for employees to wear protective footwear as protection against electric shock.

DATES: The final rule becomes effective on July 10, 2014. (Certain provisions have compliance deadlines after this date as explained later in this preamble.)

ADDRESSES: In accordance with 28 U.S.C. 2112(a), the Agency designates the Associate Solicitor of Labor for Occupational Safety and Health, Office of the Solicitor of Labor, Room S4004, U.S. Department of Labor, 200 Constitution Avenue NW., Washington, DC 20210, to receive petitions for review of the final rule.

FOR FURTHER INFORMATION CONTACT:

General information and press inquiries: Mr. Frank Meilinger, Office of Communications, Room N3647, OSHA, U.S. Department of Labor, 200 Constitution Avenue NW., Washington, DC 20210; telephone (202) 693-1999.

Technical information: Mr. David Wallis, Directorate of Standards and Guidance, Room N3718, OSHA, U.S. Department of Labor, 200 Constitution Avenue NW., Washington, DC 20210; telephone (202) 693-1950 or fax (202) 693-1678.

Executive Summary*A. Introduction*

OSHA last issued rules for the construction of transmission and

distribution installations in 1972. Those provisions are now out of date and inconsistent with the more recently promulgated general industry standard covering the operation and maintenance of electric power generation, transmission, and distribution lines and equipment. OSHA is revising the construction standard to make it more consistent with the general industry standard and is making some revisions to both the construction and general industry requirements. The final rules for general industry and construction include new or revised provisions on host employers and contractors, training, job briefings, fall protection, insulation and working position of employees working on or near live parts, minimum approach distances, protection from electric arcs, deenergizing transmission and distribution lines and equipment, protective grounding, operating mechanical equipment near overhead power lines, and working in manholes and vaults. The revised standards will ensure that employers, when appropriate, must meet consistent requirements for work performed under the construction and general industry standards.

The new provisions on host employers and contractors include requirements for host employers and contract employers to exchange information on hazards and on the conditions, characteristics, design, and operation of the host employer's installation. These new provisions also include a requirement for host employers and contract employers to coordinate their work rules and procedures to protect all employees. The revised provisions on training add requirements for the degree of training to be determined by the risk to the employee for the hazard involved and for training line-clearance tree trimmers and remove the existing requirement for the employer to certify training. The revised requirements for job briefings include a new requirement for the employer to provide information about existing characteristics and conditions to the employee in charge. The revised fall protection provisions include new requirements for the use of fall restraint systems or personal fall arrest systems in aerial lifts and for the use of fall protection equipment by qualified employees climbing or changing location on poles, towers, or similar structures. The revised provisions on insulation and working position of employees working on or near live parts include new requirements relating to where an employee who is not using

electrical protective equipment may work. The revised provisions on minimum approach distances include a new requirement for the employer to determine maximum anticipated per-unit transient overvoltages through an engineering analysis or, as an alternative, assume certain maximum anticipated per-unit transient overvoltages. These provisions also replace requirements for specified minimum approach distances with requirements for the employer to establish minimum approach distances using specified formulas. The new provisions for protection from electric arcs include new requirements for the employer to: Assess the workplace to identify employees exposed to hazards from flames or from electric arcs, make reasonable estimates of the incident heat energy to which the employee would be exposed, ensure that the outer layer of clothing worn by employees is flame resistant under certain conditions, and generally ensure that employees exposed to hazards from electric arcs wear protective clothing and other protective equipment with an arc rating greater than or equal to the estimated heat energy. The revised provisions on deenergizing transmission and distribution lines and equipment clarify the application of those provisions to multiple crews and to deenergizing network protectors. The revised requirements for protective grounding now permit employers to install and remove protective grounds on lines and equipment operating at 600 volts or less without using a live-line tool under certain conditions. The revised provisions for operating mechanical equipment near overhead power lines clarify that the exemption from the requirement to maintain minimum approach distances applies only to the insulated portions of aerial lifts. The revised provisions on working in manholes and vaults clarify that all of the provisions for working in manholes also apply to working in vaults and include a new requirement for protecting employees from electrical faults when work could cause a fault in a cable.

The final rule also revises the general industry and construction standards for electrical protective equipment. The existing construction standard for the design of electrical protective equipment, which applies only to electric power transmission and distribution work, adopts several national consensus standards by reference. The new standard for electrical protective equipment applies to all construction work and replaces

the incorporation of out-of-date consensus standards with a set of performance-oriented requirements that is consistent with the latest revisions of the relevant consensus standards. The final construction rule also includes new requirements for the safe use and care of electrical protective equipment to complement the equipment design provisions. Both the general industry and construction standards for electrical protective equipment will include new requirements for equipment made of materials other than rubber.

OSHA is also revising the general industry standard for foot protection. This standard applies to employers performing work on electric power generation, transmission, and distribution installations, as well as employers in other industries. The final rule removes the requirement for employees to wear protective footwear as protection against electric shock.

B. Need for Regulation

Employees doing work covered by the final rule are exposed to a variety of significant hazards that can and do cause serious injury and death. As explained fully in Section II.B, Need for the Rule, later in this preamble, after carefully weighing the various potential advantages and disadvantages of using a regulatory approach to reduce risk, OSHA concludes that in this case mandatory standards represent the best choice for reducing the risks to employees. In addition, rulemaking is necessary in this case to replace older existing standards with updated, clear, and consistent safety standards. Inconsistencies between the construction and general industry standards can create difficulties for employers attempting to develop appropriate work practices for their employees. For example, an employer replacing a switch on a transmission and distribution system is performing construction work if it is upgrading the cutout, but general industry work if it is simply replacing the cutout with the same model. Under the existing standards, different requirements apply depending upon whether the work is construction or general industry work. Under the final rule, the requirements are the same.

C. Affected Establishments

The final rule affects establishments in a variety of different industries involving electric power generation, transmission, and distribution. The rule primarily affects firms that construct, operate, maintain, or repair electric power generation, transmission, or distribution installations. These firms

include electric utilities, as well as contractors hired by utilities and primarily classified in the construction industry. In addition, potentially affected firms are found in a variety of manufacturing and other industries that own or operate their own electric power generation, transmission, or distribution installations as a secondary part of their business operations. The rule also affects establishments performing line-clearance tree-trimming operations.

D. Benefits, Net Benefits, and Cost Effectiveness

OSHA expects the final rule to result in an increased degree of safety for the affected employees, thereby reducing the numbers of accidents, fatalities, and injuries associated with the relevant tasks and reducing the severity of certain injuries, such as burns or injuries that employees could sustain as a result of an arrested fall, that may still

occur during the performance of some of the affected work procedures.

An estimated 74 fatalities and 444 serious injuries occur annually among employees involved in the electric power generation, transmission, and distribution work addressed by the provisions of this rulemaking. Based on a review and analysis of the incident reports associated with the reported injuries and fatalities, OSHA expects full compliance with the final rule to prevent 79.6 percent of the relevant injuries and fatalities, compared with 52.9 percent prevented with full compliance with the existing standards. Thus, OSHA estimates that the final rule will prevent approximately 19.75 additional fatalities and 118.5 additional serious injuries annually. Applying an average monetary value of \$62,000 per prevented injury and a value of \$8.7 million per prevented fatality results in estimated monetized benefits of \$179.2 million annually.

OSHA estimated the net monetized benefits of the final rule to be about \$129.7 million annually when costs are annualized at 7 percent (\$179.2 million in benefits minus \$49.5 million in costs), and \$132.0 million when costs are annualized at 3 percent (\$179.2 million in benefits minus \$47.1 million in costs). Note that these net benefits exclude any unquantified benefits associated with revising existing standards to provide updated, clear, and consistent regulatory requirements for electric power generation, transmission, and distribution work. OSHA believes that the updated standards are easier to understand and to apply. Accordingly, the Agency expects the final rule to improve safety by facilitating compliance.

Table 1 summarizes the costs, benefits, net benefits, and cost effectiveness of the final rule.

TABLE 1—NET BENEFITS AND COST EFFECTIVENESS *

	7 percent	3 percent
Annualized Costs:		
Calculating Incident Energy and Arc-Hazard Assessment (Arc-Hazard Assessment)	\$2.2 million	\$1.8 million.
Provision of Arc-Flash Protective Equipment	\$17.3 million	\$15.7 million.
Fall Protection	\$0.6 million	\$0.4 million.
Host-Contractor Communications	\$17.8 million	\$17.8 million.
Expanded Job Briefings	\$6.7 million	\$6.7 million.
Additional Training	\$3.0 million	\$2.7 million.
Other costs for employees not already covered by § 1910.269	\$0.2 million	\$0.2 million.
MAD Costs	\$1.8 million	\$1.8 million.
Total Annual Costs	\$49.5 million	\$47.1 million.
Annual Benefits:		
Number of Injuries Prevented	118.5	118.5.
Number of Fatalities Prevented	19.75	19.75.
Monetized Benefits (Assuming \$62,000 per injury and \$8.7 million per fatality prevented)	\$179.2 million	\$179.2 million.
OSHA standards that are updated and consistent	Unquantified	Unquantified.
Total Annual Benefits	118.5 injuries and 19.75 fatalities prevented.	118.5 injuries and 19.75 fatalities prevented.
Net Benefits (Benefits minus Costs):	\$129.7 million	\$132.0 million.

* Totals may not equal the sum of the components due to rounding. Source: Office of Regulatory Analysis, OSHA. Details provided in text.

E. Cost Effectiveness

OSHA estimates that compliance with the final rule will result in the prevention of an one fatality and six injuries per \$2.4 million in costs (using a 7-percent annualization rate) and one fatality and six injuries per \$2.2 million in costs (using a 3-percent annualization rate).

F. Compliance Costs

The estimated costs of compliance with this rule represent the additional costs necessary for employers to achieve full compliance. They do not include costs for employers that are already in

compliance with the new requirements imposed by the final rule; nor do they include costs employers must incur to achieve full compliance with existing applicable requirements.

OSHA based the Preliminary Regulatory Impact Analysis and Initial Regulatory Flexibility Analysis (PRIA) for the proposed rule, in part, on a report prepared by CONSAD Corp. (Exhibit 0080) under contract to OSHA. Eastern Research Group, Inc., (ERG) under contract to OSHA, assisted in preparing the analysis of the final rule presented here. With ERG's assistance, OSHA updated data on establishments, employment, wages, and revenues, and

updated the analyses in the final rule with these new cost inputs. OSHA also calculated costs for provisions of the final rule not accounted for in the PRIA. These costs are for the use of upgraded fall protection equipment resulting from revised fall protection requirements, the provision of arc-rated head and face protection for some employees, the training of employees in the use of new fall protection equipment, the calculation of minimum approach distances, and, in some cases, the use of portable protective gaps (PPGs) to comply with the new minimum approach-distance requirements. The FEA also modifies the PRIA's approach

to estimating costs for arc-hazard assessments.

OSHA estimated the total annualized cost of compliance with the present rulemaking to be between about \$47.1 million (when costs are annualized at 3 percent) and \$49.5 million (when costs are annualized at 7 percent). The final rule's requirements for employers to provide arc-flash protective equipment account for the largest component of the total compliance costs, at approximately \$15.7 million to \$17.2 million (when costs are annualized at 3 and 7 percent, respectively). Other nonnegligible compliance costs associated with the final rule include costs related to host-contractor communications (\$17.8 million), job briefings (\$6.7 million), training (\$2.7 million to \$3.0 million), minimum approach distances (\$1.8 million to \$1.8 million), fall protection (\$0.4 million to \$0.6 million), compliance with existing § 1910.269 for employees not already covered by that standard (\$0.2 million), and arc-hazard assessments (\$1.8 million to \$2.2 million).

G. Economic Impacts

To assess the economic impacts associated with compliance with the final rule, OSHA developed quantitative estimates of the potential economic impact of the requirements in this rule on entities in each affected industry. OSHA compared the estimated costs of compliance with industry revenues and profits to provide an assessment of potential economic impacts.

The costs of compliance for the final rule are not large in relation to the corresponding annual financial flows associated with the regulated activities. The estimated costs of compliance (when annualized at 7 percent) represent about 0.007 percent of revenues and 0.06 percent of profits, on average, across all entities; compliance costs do not represent more than 0.1 percent of revenues or more than about 2 percent of profits in any affected industry.

The economic impact of the present rulemaking is most likely to consist of a small increase in prices for electricity, of about 0.007 percent on average. It is unlikely that a price increase on the magnitude of 0.007 percent will significantly alter the services demanded by the public or any other affected customers or intermediaries. If employers can substantially recoup the compliance costs of the present rulemaking with such a minimal increase in prices, there may be little effect on profits.

In general, for most establishments, it is likely that employers can pass some

or all of the compliance costs along in the form of increased prices. In the event that unusual circumstances may inhibit even a price increase of 0.1 percent (the highest estimated cost as a percent of revenue in any of the affected industries), profits in any of the affected industries would be reduced by a maximum of about 2 percent.

OSHA concludes that compliance with the requirements of the final rule is economically feasible in every affected industry sector.

In addition, based on an analysis of the costs and economic impacts associated with this rulemaking, OSHA concludes that the effects of the final rule on international trade, employment, wages, and economic growth for the United States are negligible.

H. Final Regulatory Flexibility Analysis

The Regulatory Flexibility Act, as amended in 1996 by the Small Business Regulatory Enforcement Fairness Act, requires the preparation of a Final Regulatory Flexibility Analysis for certain rules promulgated by agencies (5 U.S.C. 601–612). Under the provisions of the law, each such analysis must contain: (1) A succinct statement of the need for, and objectives of, the rule; (2) A summary of the significant issues raised by the public comments in response to the initial regulatory flexibility analysis, a summary of the assessment of the agency of such issues, and a statement of any changes made in the final rule as a result of such comments; (3) a description and an estimate of the number of small entities to which the rule will apply or an explanation of why no such estimate is available; (4) a description of the projected reporting, recordkeeping, and other compliance requirements of the rule, including an estimate of the classes of small entities that will be subject to the requirement, and the type of professional skills necessary for preparation of the report or record; and (5) a description of the steps the agency took to minimize the significant economic impact on small entities consistent with the stated objectives of applicable statutes, including a statement of the factual, policy, and legal reasons for selecting the alternative adopted in the final rule, and why the agency rejected each one of the other significant alternatives to the rule considered by the agency which affect the impact on small entities.

OSHA analyzed the potential impact of the final rule on small and very small entities, as described further under the heading “Final Regulatory Flexibility Analysis,” in Section VI, Final

Economic Analysis and Regulatory Flexibility Analysis, later in this preamble. OSHA concludes that the compliance costs are equivalent to approximately 0.086 percent of profits for affected small entities generally, and less than approximately 2.9 percent of profits for small entities in any particular industry, and approximately 0.39 percent of profits for affected very small entities generally, and less than approximately 5.61 percent of profits for very small entities in any particular industry.

Record citations. References in parentheses are to exhibits or transcripts in the rulemaking record. Documents from the Subpart V rulemaking record are accessible at the Docket Office under Docket OSHA–S215–2006–0063 (originally Docket S–215). (The 2006 transcripts, abbreviated as “Tr.,” are listed in this docket as “exhibits” 0509 through 0515. The 2009 transcript, abbreviated as “Tr2.,” is listed as “exhibit” 0571.) Because the subpart V proposal was based in large part on existing § 1910.269, OSHA has also relied on the record developed during the earlier rulemaking for that general industry standard (the 1994 § 1910.269 rulemaking). EEI “incorporate[d] into [the subpart V] record the entire record in . . . the record underlying existing Section 1910.269” (Ex. 0227). References in this preamble that are prefixed by “269” are to exhibits and transcripts in the rulemaking record from OSHA’s 1994 rulemaking on § 1910.137 and § 1910.269 (59 FR 4320–4476, Jan. 31, 1994). These documents are accessible at the Docket Office under Docket OSHA–S015–2006–0645 (originally Docket S–015).⁵

Some exhibits (see, for example, Exs. 0002, 0003, 0004, and 0400) contain records of accidents that are relevant to work covered by the final rule. In several instances in this preamble, OSHA has included hyperlinks to accident descriptions from those exhibits. Those hyperlinks link to one or more accident records in OSHA’s IMIS system. The hyperlinked pages contain the most recent version of those records, which might have been edited since being placed in the record for this rulemaking. Consequently, the accident descriptions could differ slightly from the description included in the rulemaking record. However, the accident record numbers in the

hyperlinked page match the accident record numbers in the relevant exhibit.

B. Need for the Rule

Employees performing work involving electric power generation, transmission, and distribution are exposed to a variety of hazards, including fall, electric shock, and burn hazards, that can and do cause serious injury and death. These workers are often exposed to energized parts of the power system, and the voltages involved are generally much higher than voltages encountered in other types of work. OSHA estimates that, on average, 74 fatalities and 444 serious injuries occur annually among these workers. (See Section VI, Final Economic Analysis and Regulatory Flexibility Analysis, later in the preamble, for a detailed discussion of the methodology used to develop these estimates.)

Although some of these incidents may have been prevented with better compliance with existing safety standards, OSHA concludes that many, in fact almost half of, fatal and nonfatal injuries among employees covered by the final rule would continue to occur even if employers were in full compliance with existing standards. Discounting incidents that would potentially have been prevented with compliance with existing standards, an estimated additional 19.75 fatalities and 118.5 serious injuries will be prevented each year through full compliance with the final rule. (See Section VI, Final Economic Analysis and Regulatory Flexibility Analysis, later in the preamble, for a detailed discussion of the methodology used to develop these estimates.)

This rulemaking will have the additional benefit of providing updated, clear, and consistent safety standards for electric power generation, transmission, and distribution work. OSHA currently has different standards covering construction and general industry work on electric power transmission and distribution systems. In most instances, the work practices used by employees are the same whether they are performing construction or general industry work. Which standard applies to a particular job depends upon whether the employer is altering the system (construction work) or maintaining the system (general industry work). For example, an employer replacing a cutout (disconnect switch) on a transmission and distribution system is performing construction work if it is upgrading the cutout, but general industry work if it is simply replacing the cutout with the same model. Since the work practices used by the employees would most

⁴ Exhibit number 0571.

⁵ Documents in the records, with the exception of copyrighted material such as ASTM standards, are also generally available electronically at www.regulations.gov. The subpart V and 1994 § 1910.269 dockets are available at: <http://www.regulations.gov/#!docketDetail; dct=FR+PR+N+O+SR+PS;rpp=250;po=0;D=OSHA-S215-2006-0063> and <http://www.regulations.gov/#!docketDetail; dct=FR+PR+N+O+SR+PS;rpp=250;po=0;D=OSHA-S015-2006-0645>, respectively.

³ Exhibit numbers 0509 through 0515.

likely be identical, the applicable OSHA standards should be as similar as possible. Inconsistencies between the construction and general industry standards can create difficulties for employers attempting to develop appropriate work practices for their employees. Currently, it is conceivable that, for work involving two or more cutouts, different and conflicting OSHA standards (that is, one for construction work, the other for general industry work) might apply. For this reason, employers and employees have told OSHA that it should make the two standards more consistent with each other. This final rule does so. (This issue is addressed in greater detail in the summary and explanation for § 1926.950, in Section V, Summary and Explanation of the Final Rule, later in this preamble.)

Moreover, the final rule adds important updates to, and clarifies, existing standards. The existing standards for the construction of electric power transmission and distribution lines and equipment and for electrical protective equipment are contained in subpart V of OSHA's construction standards (29 CFR 1926.950 through 1926.960). Subpart V was promulgated on November 23, 1972, around 40 years ago (37 FR 24880, Nov. 23, 1972). Some of the technology involved in electric power transmission and distribution work has changed since then, and the current standards do not reflect those changes. For example, methods for determining minimum approach distances have become more exact since 1972, and the minimum approach distances in existing § 1926.950(c)(1) are not based on the latest methodology. The minimum approach distances in the final rule are more protective and more technologically sound than the distances specified in the existing standard. Even the newer general industry standards on the operation and maintenance of electric power generation, transmission, and distribution installations (29 CFR 1910.269) and electrical protective equipment (29 CFR 1910.137) are not entirely consistent with the latest advances in technology.

Finally, the final rule clarifies certain confusing parts of the regulations. See, for example, *Wisconsin Elec. Power Co. v. OSHRC*, 567 F.2d 735, 738 (7th Cir. 1977) (“[r]evision of the regulations by any competent draftsman would greatly improve their clarity”).

C. Accident Data

OSHA has looked to several sources for information on accidents in the electric utility industry in preparing this

final rule. Besides OSHA's own accident investigation files (recorded in the Agency's Integrated Management Information System (IMIS)), statistics on injuries are compiled by the Edison Electric Institute (EEI) and by the International Brotherhood of Electrical Workers (IBEW). Additionally, the Bureau of Labor Statistics (BLS) publishes accident data, including incidence rates for total cases, lost-workday cases, and lost workdays, and the National Institute for Occupational Safety and Health (NIOSH) publishes accident data as part of its Fatality Assessment and Control Evaluation Program.

To develop estimates of the potential benefits associated with the standards during the proposal stage, CONSAD Corp., under contract to OSHA, researched and reviewed potential sources of useful data. CONSAD, in consultation with the Agency, determined that the most reliable data sources for this purpose were OSHA's IMIS data and the Census of Fatal Occupational Injuries developed by BLS. A majority of the accidents reviewed by CONSAD involved electrocutions or shocks. In addition, a significant percentage of victims (5.5 percent) suffered from burns to their arms, abdomen, or legs from electric arc blasts and flashes, and another sizeable group of victims (3.2 percent) died or sustained injuries after falling out of vehicle-mounted aerial lifts.⁶

D. Significant Risk and Reduction in Risk

Section 3(8) of the Occupational Safety and Health Act of 1970 (OSH Act or the Act) defines an “occupational safety and health standard” as “a standard which requires conditions, or the adoption or use of one or more practices, means, methods, operations, or processes, reasonably necessary or appropriate to provide safe or healthful employment and places of employment.” 29 U.S.C. 652(8). This definition has been interpreted to require OSHA to make a threshold showing of “significant risk” before it can promulgate a safety or health standard. See, for example, *Industrial Union Dept., AFL-CIO v. American Petroleum Institute (Benzene)*, 448 U.S. 607 (1980) (plurality opinion); see also, for example, *UAW v. OSHA (Lockout/Tagout II)*, 37 F.3d 665 (D.C. Cir. 1994).

⁶ “Analytical Support and Data Gathering for a Preliminary Economic Analysis for Proposed Standards for Work on Electric Power Generation, Transmission, and Distribution Lines and Equipment (29 CFR 1910.269 and 29 CFR 1926—Subpart V),” 2005, CONSAD Research Corp. (Ex. 0080).

The Agency's obligation to show significant risk is not, however, a “mathematical straitjacket.” *Benzene*, 448 U.S. at 655. In fact, the Agency has discretion to “determine, in the first instance, what it considers to be a ‘significant’ risk[,]” and it “is not required to support its finding that a significant risk exists with anything approaching scientific certainty.” *Id.* at 655–56; see also, for example, *Public Citizen Health Research Group v. Tyson (Ethylene Oxide)*, 796 F.2d 1479, 1486 (D.C. Cir. 1986).

Although OSHA makes significant risk findings for both health and safety standards, see *Lockout/Tagout II*, 37 F.3d 665, the methodology used to evaluate risk in safety rulemakings is more straightforward. Unlike the risks related to health hazards, which “may not be evident until a worker has been exposed for long periods of time to particular substances,” the risks associated with safety hazards such as burns and falls, “are generally immediate and obvious.” *Benzene*, 448 U.S. at 649, n.54. See also 59 FR 28594, 28599 (June 2, 1994) (proposed rule for longshoring and marine terminals, explaining that health hazards “are frequently undetectable because they are subtle or develop slowly or after long latency periods,” whereas safety hazards “cause immediately noticeable physical harm”). As OSHA explained in its lockout-tagout rulemaking:

For health standards, such as benzene, risk estimates are commonly based upon mathematical models (e.g., dose response curves) and the benefits are quantified by estimating the number of future fatalities that would be prevented under various exposure reductions. [In contrast, f]or safety standards risk is based upon the assumption that past accident patterns are representative of future ones. OSHA estimates benefits [for safety standards] by determining the percentage of accidents that will be prevented by compliance with the standard. . . . [58 FR 16612, 16623, Mar. 30, 1993]

OSHA's Final Economic and Regulatory Flexibility Analysis presents the Agency's assessment of the risks and benefits of this final rule. (See Section VI, Final Economic Analysis and Regulatory Flexibility Analysis, later in the preamble.) In these analyses, as previously mentioned, OSHA estimates that there are 74 fatalities and 444 serious injuries among employees covered by this final rule each year. The Agency has determined that almost half of those injuries and fatalities would have occurred even if employers were in full compliance with existing standards. (See Section VI, Final Economic Analysis and Regulatory Flexibility Analysis, later in the preamble, in

which OSHA estimates that 53 percent of injuries and fatalities could have been prevented through full compliance with existing standards.) The accident data reviewed during this rulemaking, as explained in detail in the economic and regulatory analyses, reveals that the injuries and fatalities suffered by workers in power generation, transmission, and distribution result from electric shocks, burns from electric arcs, and falls, as well as other types of harmful incidents, including ones in which employees are struck by, struck against, or caught between, objects. Based on the large number of injuries and fatalities occurring in this industry each year, and the fact that existing standards are inadequate to prevent almost half of those incidents, OSHA has determined that employees working on electric power generation, transmission, and distribution installations are currently exposed to a significant risk of injury or death.⁷

The Agency estimates that the changes implemented in this final rule will prevent 19.75 fatalities and 118.5 serious injuries each year. (See Section VI, Final Economic Analysis and Regulatory Flexibility Analysis, later in the preamble.) OSHA, therefore, concludes that this final standard substantially reduces the significant risk that currently exists at power generation, transmission, and distribution worksites. As noted in Section VI, Final Economic Analysis and Regulatory Flexibility Analysis, later in the preamble, the various new provisions and amendments being adopted target the hazards the Agency has identified as contributors to the significant risk associated with electric power generation, transmission, and distribution work. Therefore, each element of this final rule is reasonably

necessary and appropriate to achieve the anticipated reduction in overall risk.

No rulemaking participants meaningfully disputed OSHA's conclusion that the aforementioned estimates establish a significant risk for power generation, transmission, and distribution work. EEI, however, argued that OSHA has an obligation to make an independent significant risk showing for each of the hazards addressed by this rulemaking (See, for example, Exs. 0227, 0501; see also Ex. 0237 (comments of the American Forest & Paper Association).) OSHA does not agree that it is required to make multiple, hazard-specific significant risk findings.

As OSHA has explained in prior rulemakings, “[v]ertical standards [such as § 1910.269 and subpart V of part 1926] apply specifically to a given industry” or type of work (59 FR 28596 (proposed rule for longshoring and marine terminals)). They generally address multiple hazards faced by employees performing the covered work. See, for example, 66 FR 5196 (Jan. 18, 2001) (steel erection standards address, among other hazards, risks from working under loads, dangers associated with landing and placing decking, and falls to lower levels); 62 FR 40142 (July 25, 1997) (standards covering longshoring and marine terminals address multiple hazards, including hazards associated with manual cargo handling and exposure to hazardous atmospheres); 52 FR 49592 (Dec. 31, 1987) (standard covering grain-handling facilities includes provisions related to fire and explosion hazards, as well as other safety hazards, such as the danger associated with entering bins, silos, and tanks). OSHA believes that vertical “standards can encourage voluntary compliance because they are directed to the particular problems of [an] industry” (59 FR 28596). The adoption of vertical standards is recognized as a legitimate exercise of OSHA's standard-setting authority under the OSH Act. See *Forging Indus. Ass'n v. Secretary of Labor (Noise)*, 773 F.2d 1436, 1455 (4th Cir. 1985) (“[T]he Agency has determined that a particular industry should be made the subject of a vertical standard. . . . That decision was not arbitrary or capricious. . . . Nor does the use of a comprehensive vertical standard amount to a prohibited special treatment”).

Although the Agency can identify the general types of hazards addressed by its vertical standards, and has done so in this rulemaking, there is no legal requirement for hazard-by-hazard significant risk findings in vertical standards. First, the DC Circuit Court of Appeals has already rejected the

argument “that *Benzene* requires that the agency find that each and every aspect of its standard eliminates a significant risk faced by employees.” *Ethylene Oxide*, 796 F.2d at 1502, n. 16. Once OSHA makes a general finding of significant risk, the question becomes whether the requirements of the standard are reasonably related to the standard's purpose. See, for example, *Noise*, 773 F.2d at 1447. Second, when the Supreme Court first construed the OSH Act as imposing a significant risk requirement, it spoke in terms of the Agency making findings about unsafe workplaces, not individual hazards. *Benzene*, 448 U.S. at 642 (“before promulgating any standard, the Secretary must make a finding that the workplaces in question are not safe [and] a workplace can hardly be considered ‘unsafe’ unless it threatens the workers with a significant risk of harm”). See also, for example, *id.* (framing the “significant risk” requirement as obligating OSHA “to make a threshold finding that a place of employment is unsafe—in the sense that significant risks are present and can be eliminated or lessened by a change in practices”); *Texas Indep. Ginners Ass'n v. Marshall*, 630 F.2d 398, 400 (5th Cir. 1980) (“[t]he Supreme Court recently ruled that the Act requires OSHA to provide substantial evidence that a significant risk of harm arises from a workplace or employment”). Third, courts have held that the OSH Act does not require the disaggregation of significant risk analyses along other lines. See, for example, *Lockout/Tagout II*, 37 F.3d at 670 (upholding OSHA's decision not to conduct individual significant risk analyses for various affected industries); *American Dental Ass'n v. Martin*, 984 F.2d 823, 827 (7th Cir. 1993) (OSHA is not required to evaluate risk “workplace by workplace”); *Associated Builders and Contractors*, 862 F.2d at 68 (“the significant risk requirement must of necessity be satisfied by a general finding concerning all potentially covered industries”).

Requiring OSHA to make multiple, hazard-specific significant risk findings would place an unwarranted burden on OSHA rulemaking because of difficulties in specifically defining each of the hazards addressed by a vertical standard.⁸ Hazards can be defined

⁷ In industries in which worker exposure is less frequent than in other industries, the number of injuries or fatalities associated with the hazards covered by the final rule will most likely be less than that of industries that have a higher rate of exposure. But even for industries with low, negligible, or even no reported injuries or fatalities, the workers exposed to the hazards covered by the final rule face a “significant risk of material harm.” As such, there is a significant risk to any worker of any industry exposed to the hazards covered by the final rule. See, for example, *Lockout/Tagout II*, 37 F.3d at 670 (“even in industries with low or negligible overall accident rates, the workers who engage in the operations covered by the standard face a ‘significant risk of material harm’”); *Associated Builders and Contractors, Inc. v. Brock*, 862 F.2d 63, 67–68 (3d Cir. 1988) (where the Court ordered OSHA to expand its rule to cover additional industries, there was no need to make separate significant risk findings for those industries because “the significant risk requirement must of necessity be satisfied by a general finding concerning all potentially covered industries”).

⁸ Indeed, disputes over how to define hazards are commonplace in enforcement cases under the general duty clause of the OSH Act. See, for example, *Secretary of Labor v. Arcadian Corp.*, 20 BNA OSHC 2001 (OSHRC, Sept. 30, 2004); *Secretary of Labor v. Inland Steel Co.*, 12 BNA OSHC 1968 (OSHRC, July 30, 1986); *Secretary of*

broadly, for example, falling from an elevation, or more narrowly, for example, falling from an elevated aerial lift while performing tree-trimming work. The outcome of the significant risk analysis called for by EEI would be largely (and somewhat arbitrarily) dependent on where along this vast spectrum OSHA defined the relevant dangers.

OSHA reviewed the authority EEI relied on in support of the purported requirement for hazard-specific risk findings, but does not find it persuasive. First, EEI argued that the Supreme Court, in its *Benzene* decision, held that the Agency had to make separate significant risk findings for the air-contaminant and dermal-contact provisions of that standard (Ex. 0227). A close reading of the decision in that case reveals no such holding. Instead, the dermal-contact provisions in that case were remanded on the same basis that the air-contaminant provisions were rejected—namely that the provisions were not supported by any significant risk findings. See *Benzene*, 448 U.S. at 661–62. While the Court did suggest that OSHA needed to find that a prohibition on dermal contact was reasonably necessary and appropriate to address a significant risk, that is, that preventing dermal contact would reduce the overall risk associated with workplace exposure to benzene, it did not address whether a single significant risk finding could ultimately support both the dermal-contact and air-contaminant provisions in the standard. *Id.*

Second, EEI relied on the Eleventh Circuit's decision in *AFL-CIO v. OSHA (PELs)*, 965 F.2d 962 (11th Cir. 1992), which vacated and remanded OSHA's Air Contaminants Standard (Ex. 0227). That rule set permissible exposure limits for more than 400 toxic substances. Although in that case the court said that OSHA needed to explain its assessment of risk for each regulated substance, that rulemaking is readily distinguished from this final rule. In *PELs*, the various regulated substances were “unrelated” and had “little [in] common.” 965 F.2d at 972. Here, in contrast, the various hazards addressed by this final rule are closely related. They all arise at power generation, transmission, and distribution worksites and jointly contribute to the large number of injuries and fatalities suffered by covered workers. OSHA does not believe that the *PELs* decision limits its discretion to adopt provisions it deems reasonably necessary and

appropriate to abate the existing electrocution, burn, fall, and other hazards that, together, result in covered employees being exposed to an overall workplace risk that is significant.

Finally, EEI's reliance on the Agency's ergonomics rulemaking is misplaced. EEI pointed out that OSHA's risk assessment in its ergonomics rulemaking considered only accidents that resulted from hazards covered by that standard (Ex. 0227). But this interpretation offers no support for EEI's position, as the risk assessment in this rulemaking similarly considered only injuries and fatalities that occurred during the performance of work covered by this final rule (Ex. 0080). (See also Section VI, Final Economic Analysis and Regulatory Flexibility Analysis, later in the preamble.)

Although OSHA does not agree that hazard-specific significant risk findings are necessary, the Agency believes that the record supports such findings for the critical hazards addressed in this rulemaking—namely electrocutions and electric shocks, burns from arc flashes, and falls. The Agency has found that a significant number of injuries and fatalities occur every year as a result of employee exposure to each of these hazards. (See Section VI, Final Economic Analysis and Regulatory Flexibility Analysis, later in the preamble.) Moreover, as EEI points out, “most of the hazards” addressed in this rulemaking “are already covered by the existing standards that OSHA [is] now . . . modify[ing] and supplement[ing]” (Ex. 0227). Furthermore, some of the hazards addressed by this rulemaking are already the subject of generally applicable hazard-specific horizontal standards. See, for example, 29 CFR part 1926, subpart K (electrical hazards) and subpart M (fall hazards). All of these existing standards were supported by findings of significant risk, and OSHA simply concludes that the additional provisions of this final rule are reasonably necessary and appropriate to reduce a substantial portion of the remaining significant risk at power generation, transmission, and distribution worksites.

III. Development of the Final Rule

A. History of the OSHA Standards

OSHA first adopted standards for the construction of power transmission and distribution lines and equipment in 1972 (subpart V of 29 CFR part 1926). OSHA defines the term “construction work” in 29 CFR 1910.12(b) as “work for construction, alteration, and/or repair, including painting and decorating.” The term “construction” is

broadly defined in § 1910.12(d) and existing § 1926.950(a)(1) to include the original installation of, as well as the alteration, conversion, and improvement of electric power transmission and distribution lines and equipment.

The general industry standard at 29 CFR 1910.269 applies to the operation and maintenance of electric power generation, transmission, and distribution installations. OSHA adopted § 1910.269 on January 31, 1994. That standard is a companion standard to subpart V of the construction standards and addresses work to which subpart V did not apply. When promulgated, § 1910.269 was also based on the latest technology and national consensus standards.

OSHA revised its Electrical Protective Equipment Standard in § 1910.137 at the same time § 1910.269 was promulgated. The revision of § 1910.137 eliminated the incorporation by reference of national consensus standards for rubber insulating equipment and replaced it with performance-oriented rules for the design, manufacture, and safe care and use of electrical protective equipment.

OSHA published a proposed rule (the subpart V proposal) on June 15, 2005 (70 FR 34822). That document proposed revising the construction standard for electric power transmission and distribution work (29 CFR part 1926, subpart V) and the general industry standards for electric power generation, transmission, and distribution work (29 CFR 1910.269). That document also proposed a new construction standard for electrical protective equipment (29 CFR 1926.97) and revisions to the general industry standards for foot protection (29 CFR 1910.136) and electrical protective equipment (29 CFR 1910.137). Public comments were originally due by October 13, 2005, but in response to requests from interested parties, including EEI, OSHA extended the comment period 90 days to January 11, 2006 (70 FR 59290, Oct. 12, 2005). OSHA held an informal public hearing beginning on March 6, 2006, and ending on March 14, 2006. After the hearing, interested parties had until May 15, 2006, to submit additional information and until July 14, 2006, to file posthearing briefs (Tr. 1415).

On October 22, 2008, OSHA reopened the record for 30 days to gather information from the public on specific questions related to minimum approach distances (73 FR 62942). EEI requested a public hearing and an additional 60 days to submit comments on the issues raised in the reopening notice (Ex. 0530). On September 14, 2009, OSHA

opened the record for an additional 30 days to receive more comments on minimum approach distances and announced a public hearing to be held on October 28, 2009, addressing the limited issues raised in the two reopening notices (74 FR 46958). After the hearing, interested parties had until December 14, 2009, to submit additional information and until February 10, 2010, to file posthearing briefs (Tr2. 199).

The record for this rulemaking consists of all prehearing comments, the transcripts of the two public hearings, all exhibits submitted prior to and during the two hearings, and posthearing submissions and briefs. Administrative Law Judge Stephen Purcell issued an order closing the record and certified the record to the Assistant Secretary of Labor for Occupational Safety and Health. The Agency carefully considered the entire record in preparing this final standard.

B. Relevant Consensus Standards

The National Electrical Safety Code (American National Standards Institute (ANSI) Standard ANSI/IEEE C2, also known as the NESC) contains provisions specifically addressing electric power generation, transmission, and distribution work. ANSI/IEEE C2 does not, however, address the full range of hazards covered by this final rule. It is primarily directed to the prevention of electric shock, although it does contain a few requirements for the prevention of falls and burns from electric arcs.

The American Society for Testing and Materials (ASTM) has adopted standards related to electric power generation, transmission, and distribution work. ASTM Committee F18 on Electrical Protective Equipment for Workers has developed standards on rubber insulating equipment, climbing equipment, protective grounding equipment, fiberglass rod and tube used in live-line tools, and clothing for workers exposed to electric arcs.

The National Fire Protection Association (NFPA) has adopted a standard on electrical safety for employees, NFPA 70E, *Standard for Electrical Safety in the Workplace*. Although it does not apply to electric power generation, transmission, or distribution installations, the NFPA standard contains provisions addressing work near such installations performed by unqualified employees, that is, employees who have not been trained to work on or with electric power generation, transmission, or distribution installations. It also contains methods for estimating heat energy levels from electric arcs and describes ways to

protect employees from arc-flash hazards.

The Institute of Electrical and Electronic Engineers (IEEE) writes standards for electric power generation, transmission, and distribution installations and for work on those installations. Many of these standards have been adopted by ANSI. Among these IEEE standards are: IEEE Std 516, *IEEE Guide for Maintenance Methods on Energized Power-Lines*, and IEEE Std 1048, *IEEE Guide for Protective Grounding of Power Lines*.

OSHA recognizes the important role consensus standards can play in ensuring worker safety. A comprehensive list of consensus standards relating to electric power generation, transmission, and distribution work can be found in existing Appendix E to § 1910.269. OSHA proposed to add the same list as Appendix E to subpart V. OSHA considered the latest editions of all the standards listed in Appendix E in the development of this final rule. Any substantial deviations from these consensus standards are explained in Section V, Summary and Explanation of the Final Rule, later in this preamble.

C. Advisory Committee on Construction Safety and Health

Under 29 CFR parts 1911 and 1912, OSHA must consult with the Advisory Committee on Construction Safety and Health (ACCSH or the Committee), established pursuant to Section 107 of the Contract Work Hours and Safety Standards Act (40 U.S.C. 3701 *et seq.*), in setting standards for construction work. Specifically, § 1911.10(a) requires the Assistant Secretary to provide ACCSH with a draft proposed rule (along with pertinent factual information) and give the Committee an opportunity to submit recommendations. See also § 1912.3(a) (“[W]henver occupational safety or health standards for construction activities are proposed, the Assistant Secretary [for Occupational Safety and Health] shall consult the Advisory Committee.”).

OSHA has a long history of consulting with ACCSH on this rulemaking. On May 25, 1995, OSHA took a draft of the proposed construction standards to ACCSH, providing the Committee with a draft of the proposal and with a statement on the need to update the standards. The Committee formed a workgroup to review the materials, and the workgroup provided comments to OSHA. The Agency gave a status report on the proposal to the Committee on August 8, 1995, and an updated draft of the proposal to ACCSH on December 10,

1999. On February 13, 2003, OSHA gave ACCSH another status report and summarized the major revisions it had made to the proposal. On May 22, 2003, OSHA provided the Committee with the same copy of the draft proposal that had been provided to the small entity representatives who were participating in the Small Business Regulatory Enforcement and Fairness Act (SBREFA) proceedings, which were being conducted at that time. OSHA also explained the major issues being raised by the small entity representatives on the draft proposal.

On May 18, 2004, ACCSH gave the Agency formal recommendations on the proposal. OSHA sought ACCSH’s recommendations on the proposal generally, as well as on issues specifically related to host employer-contractor communications and flame-resistant clothing. ACCSH voted unanimously that: (1) The construction standards for electric power transmission and distribution work should be the same as the general industry standards for the same type of work; (2) it was necessary to require some safety-related communications between host employers and contractors; and (3) employees need to be protected from hazards posed by electric arcs through the use of flame-retardant clothing. ACCSH recommended, by unanimous vote, that OSHA issue its proposal, consistent with these specific recommendations.⁹

EI suggested that OSHA had to seek additional input from ACCSH if it decided to rely on the recent work of the IEEE technical committee responsible for revising IEEE Std 516, which has not been presented to ACCSH, in developing the final rule’s minimum approach-distance provisions (Tr2. 18–19). EI is not correct. In making its assertion, EI relies on *Nat’l Constructors Ass’n. v. Marshall (Nat’l Constructors)*, 581 F.2d 960 (D.C. Cir. 1978). EI’s reliance on this case is misplaced. Although the court stated that the OSH Act and OSHA’s procedural regulations (29 U.S.C. 655(b)(1); 29 CFR 1911.10(a)) place “a ‘stricter’ requirement on when, and how often, the agency must utilize the advisory committee procedure than does the [Administrative Procedure Act (APA)] with respect to public comment during informal rulemaking,” *id.* at 970, that statement in the decision is nonprecedential *dicta*. The court did not “decide how much stricter the requirement is” because, the court

⁹ ACCSH transcript for May 18, 2004, pages 224–239. This document can be viewed in the OSHA Docket Office or online at <http://www.osha.gov>.

concluded, the rule at issue did not meet “even the APA’s . . . standard.” *Id.* at 971 n.27. As such, the case stands, at most, for the proposition that OSHA must return to ACCSH where the final rule at issue does not meet the APA’s “logical outgrowth” test.

OSHA’s consultation with ACCSH in this rulemaking was consistent with the *Nat’l Constructors* decision. The *Nat’l Constructors* court stated that OSHA had to engage in further consultation with ACCSH regarding its ground-fault circuit protection standard where the final rule recognized “assured equipment grounding conductor programs” as a method of compliance, but ACCSH had never had the opportunity to comment on that particular form of employee protection. The DC Circuit concluded that the compliance program in question was neither presented to ACCSH, nor “gr[e]w logically out of anything that was presented to, or heard from, the Committee.” *Id.* at 970–971. In this Subpart V rulemaking, in contrast, the basic requirement to adhere to minimum approach distances was presented to ACCSH. (See, for example, ACCSH Docket ACCSH 1995–2.) The Agency is simply refining the method used to establish the minimum approach distances¹⁰ in light of technical progress that has been made since the proposal was reviewed by ACCSH. (For a complete discussion of the minimum approach-distance requirements and OSHA’s rationale for adopting them, see the summary and explanation for final § 1926.960(c)(1), in Section V, Summary and Explanation of the Final Rule, later in this preamble.)

In any event, ACCSH had an opportunity to comment on whether OSHA should rely on the work of the IEEE committee generally. ACCSH knew that OSHA might base the minimum approach distances for subpart V on existing § 1910.269. (See, for example, Exhibit 12 in Docket ACCSH 1995–2 and Exhibit 101–X in Docket ACCSH 1995–3.) In fact, ACCSH ultimately concluded in its recommendation that the construction standards for electric power transmission and distribution work should be the same as the general industry standards for the same type of work. As existing § 1910.269’s minimum approach-distance requirements were derived from IEEE Std 516 (59 FR 4320, 4382–4384 (Jan. 31, 1994)), ACCSH was on notice that the work of the IEEE 516 committee

might be used by the Agency in formulating the minimum approach-distance requirements for this final rule.

That ACCSH did not specifically pass on the question of whether OSHA should derive its minimum approach-distance requirements from work done in the formulation of an IEEE standard that was not yet issued at the time of the ACCSH consultation is of no consequence. The OSH Act and OSHA’s procedural regulation (29 U.S.C. 655(b)(1); 29 CFR 1911.10(a)) “make clear that the Assistant Secretary need only supply whatever information he has available to him at the time he submits his proposal to the Committee.” *Nat’l Constructors*, 581 F.2d at 968. As the *Nat’l Constructors* Court recognized, “by designing the Advisory Committee option as a procedural step that must precede public notice, comment, and the informal hearing, [Congress] assumed that the Committee would not be provided with all information that the Labor Department eventually developed on the subject.” *Id.* at 968 n.16. Thus, OSHA’s action in the final rule is consistent with *Nat’l Constructors*.

IV. Legal Authority

The purpose of the OSH Act, 29 U.S.C. 651 *et seq.*, is “to assure so far as possible every working man and woman in the Nation safe and healthful working conditions and to preserve our human resources.” 29 U.S.C. 651(b). To achieve this goal, Congress authorized the Secretary of Labor to promulgate and enforce occupational safety and health standards. 29 U.S.C. 654, 655(b), 658.

A safety or health standard “requires conditions, or the adoption or use of one or more practices, means, methods, operations, or processes, reasonably necessary or appropriate to provide safe or healthful employment and places of employment.” 29 U.S.C. 652(8). A safety standard is reasonably necessary or appropriate within the meaning of 29 U.S.C. 652(8) if:

- It substantially reduces a significant risk of material harm in the workplace;
- It is technologically and economically feasible;
- It uses the most cost-effective protective measures;
- It is consistent with, or is a justified departure from, prior Agency action;
- It is supported by substantial evidence; and
- It is better able to effectuate the purposes of the OSH Act than any relevant national consensus standard.

Lockout/Tagout II, 37 F.3d at 668. In addition, safety standards must be

highly protective. See, for example, *id.* at 669.

A standard is technologically feasible if the protective measures it requires already exist, can be brought into existence with available technology, or can be created with technology that can reasonably be expected to be developed. See, for example, *American Iron and Steel Inst. v. OSHA (Lead II)*, 939 F.2d 975, 980 (D.C. Cir. 1991) (*per curiam*). A standard is economically feasible when industry can absorb or pass on the costs of compliance without threatening industry’s long-term profitability or competitive structure. See, for example, *American Textile Mfrs. Inst. v. Donovan*, 452 U.S. 490, 530 n. 55 (1981); *Lead II*, 939 F.2d at 980. A standard is cost effective if the protective measures it requires are the least costly of the available alternatives that achieve the same level of protection. See, for example, *Lockout/Tagout II*, 37 F.3d at 668.

Section 6(b)(7) of the OSH Act authorizes OSHA to include among a standard’s requirements labeling, monitoring, medical testing, and other information-gathering and information-transmittal provisions. 29 U.S.C. 655(b)(7). Finally, the OSH Act requires that when promulgating a rule that differs substantially from a national consensus standard, OSHA must explain why the promulgated rule is a better method for effectuating the purposes of the Act. 29 U.S.C. 655(b)(8). Deviations from relevant consensus standards are explained elsewhere in this preamble.

V. Summary and Explanation of the Final Rule

OSHA is adopting a new construction standard on electrical protective equipment, 29 CFR 1926.97, and is revising the standard on the construction of electric power transmission and distribution lines and equipment, 29 CFR part 1926, subpart V. The Agency is also revising the general industry counterparts to these two construction standards, 29 CFR 1910.137 and 1910.269, respectively. Finally, OSHA is revising its general industry standard on foot protection, 29 CFR 1910.136, to require employers to ensure that each affected employee uses protective footwear when the use of protective footwear will protect the affected employee from an electrical hazard, such as a static-discharge or electric-shock hazard, that remains after the employer takes other necessary protective measures.

This section discusses the important elements of the final rule, explains the individual requirements, and explains

¹⁰The basic equation for computing minimum approach distances in the final rule is the same as the one used in existing § 1910.269 and in the draft proposal submitted to ACCSH.

any differences between the final rule and existing standards. This section also discusses issues that were raised at the two public hearings, significant comments received as part of the rulemaking record, and substantive changes from the language of the proposed rule. Unless otherwise noted, paragraph references in the summary and explanation of the final rule fall under the section given in the heading for the discussion. For example, except as otherwise noted, paragraph references in V.A, Section 1926.97, Electrical Protective Equipment, are to paragraphs in final § 1926.97. Except as noted, the Agency has carried proposed provisions into the final rule without substantive change.

The final rule contains several differences from the proposal and existing §§ 1910.137 and 1910.269 that are purely editorial and nonsubstantive. For example, the Agency amended the language of some provisions to shift from passive to active voice, thereby making the standard easier to read. OSHA does not discuss explicitly in the preamble all of these differences. The purpose of these differences, unless otherwise noted, is to clarify the final standard.

A. Section 1926.97, Electrical Protective Equipment

Workers exposed to electrical hazards face a risk of death or serious injury from electric shock. According to BLS, there were 192 and 170 fatalities involving contact with electric current in 2008 and 2009, respectively (<http://www.bls.gov/iif/oshwc/foi/cftb0240.pdf> and <http://www.bls.gov/iif/oshwc/foi/cftb0249.pdf>). About half of these fatalities (89 in both years) occurred in construction (*id.*).¹¹

The use of properly designed, manufactured, and cared-for electrical protective equipment helps protect employees from this risk. Therefore, OSHA is issuing final § 1926.97, Electrical protective equipment, which addresses the design, manufacture, and proper care of electrical protective equipment. In addition, OSHA is revising existing § 1910.137, which also contains provisions addressing the design, manufacture, and proper care of electrical protective equipment. For reasons described at length in this section of the preamble, OSHA concludes that the final rule will be a more effective means of protecting employees from the risk of electric shock than existing OSHA standards.

The existing requirements for electrical protective equipment in construction work are in § 1926.951(a)(1), which only applies to the construction of electric power transmission and distribution lines and equipment. However, employers throughout the construction industry use electrical protective equipment, and OSHA believes that provisions for electrical protective equipment, as specified by final § 1926.97, should apply, not only to electric power transmission and distribution work, but to all construction work. Therefore, OSHA is issuing new § 1926.97, Electrical protective equipment, which applies to all construction work.

Existing § 1926.951(a)(1) incorporates by reference the following six American National Standards Institute (ANSI) standards:

Item	ANSI Standard
Rubber insulating gloves	J6.6–1971
Rubber matting for use around electric apparatus.	J6.7–1935 (R1971)
Rubber insulating blankets.	J6.4–1971
Rubber insulating hoods	J6.2–1950 (R1971)
Rubber insulating line hose.	J6.1–1950 (R1971)
Rubber insulating sleeves.	J6.5–1971

These standards contain detailed specifications for manufacturing, testing, and designing electrical protective equipment. However, these standards have undergone several revisions since the 1971 publication date of existing subpart V and are now seriously out of date. Following is a complete list of the corresponding current national consensus standards:

ASTM D120–09, *Standard Specification for Rubber Insulating Gloves.*

ASTM D178–01 (Reapproved 2010), *Standard Specification for Rubber Insulating Matting.*

ASTM D1048–12, *Standard Specification for Rubber Insulating Blankets.*

ASTM D1049–98 (Reapproved 2010), *Standard Specification for Rubber Insulating Covers.*

ASTM D1050–05 (Reapproved 2011), *Standard Specification for Rubber Insulating Line Hose.*

ASTM D1051–08, *Standard Specification for Rubber Insulating Sleeves.*

Additionally, there are now standards on the in-service care of insulating line hose and covers (ASTM F478–09), insulating blankets (ASTM F479–06

(2011)), and insulating gloves and sleeves (ASTM F496–08), which OSHA did not incorporate or reference in existing § 1926.951(a)(1).¹²

OSHA derived proposed new § 1926.97 from these national consensus standards, but drafted it in performance terms. OSHA is carrying this approach forward into the final rule. The final rule relies on provisions from the consensus standards that are performance based and necessary for employee safety, but the final rule does not contain many of the detailed specifications from those standards. Thus, the final rule will provide greater flexibility for compliance.

BGE commented that OSHA's performance-based approach leaves the standards "vague" and creates "opportunities for unsafe practices" (Ex. 0126).

OSHA disagrees with this comment for the following reasons.

The Agency recognizes the importance of the consensus standards in defining basic requirements for the safe design and manufacture of electrical protective equipment for employees. To this end, OSHA will allow employers to comply with the final rule by following specific provisions in the consensus standards. OSHA believes that the option of following these specific provisions addresses the commenter's concern about vagueness.

However, OSHA determined that it would be inappropriate to adopt the consensus standards *in toto* in this rulemaking. First, each of the currently referenced standards has undergone several revisions since OSHA adopted the standards in existing § 1926.951(a)(1). Because of the continual process by which the consensus standards development organizations periodically revise their consensus standards, any specific editions that OSHA might adopt likely would be outdated within a few years. Additionally, since OSHA's rulemaking process is lengthy, it would not be practical for OSHA to revise its standards as often as necessary to keep pace with the changes in the consensus

¹² The relevant ASTM standards are in the record as Exs. 0048, 0049, 0050, 0051, 0066, 0067, 0068, 0069, 0070. In several cases, the version of the consensus standard in the record is older than the version listed in the preamble. However, OSHA based final §§ 1926.97 and 1910.137 only on the ASTM documents and other data in the record. The preamble lists editions of the consensus standards not in the record because OSHA evaluated them for consistency with the final rule. OSHA determined that these later ASTM standards conform to the requirements of final §§ 1926.97 and 1910.137. See the discussion of the notes following paragraphs (a)(3)(ii)(B) and (c)(2)(ix) for the significance of this determination.

¹¹ Similar data are available at <http://www.bls.gov/iif/oshwcfoi1.htm#2009> for each year back to 2003.

standards. Final § 1926.97 is flexible enough to accommodate changes in technology, obviating the need for constant revision. Wherever possible, OSHA wrote the final rule in performance terms to allow alternative methods of compliance that provide comparable safety to employees.

Another difficulty with incorporating the consensus standards by reference is that they contain details that go beyond the scope of the OSHA standard and are not directly related to employee safety. In final § 1926.97, OSHA relied only on consensus standard provisions that are relevant to employee safety in the workplace. Furthermore, to make the requirements easier for employers and employees to use and understand, OSHA adopted language in the final rule that is simpler than that in the consensus standards. Because all relevant requirements are in the text of the regulations, employers will not need to refer to the consensus standards to determine their obligations under final § 1926.97. Although OSHA is no longer incorporating the consensus standards by reference, notes throughout the rule clarify that OSHA will deem compliance with the consensus standards listed in the notes to be compliance with the performance requirements of final § 1926.97.

OSHA notes that it recently decided not to adopt a proposed performance-based approach when it revised the design requirements contained in several personal protective equipment standards (74 FR 46350, Sept. 9, 2009). In issuing that final rule, OSHA reasoned that “widespread opposition” to, and misunderstanding of, the proposal indicated “possible misapplication . . . if adopted” (74 FR 46352).

This rationale does not apply to this rulemaking. First, there was no widespread opposition to the proposed performance-based approach in this rulemaking. A number of commenters did request that OSHA deem employers that are in compliance with all future revisions of the listed consensus standards as being in compliance with the final rule (see, for example, Exs. 0156, 0180, 0183, 0202, 0206, 0229, 0231, 0239). The Agency believes that the performance-based approach it adopts in final § 1926.97 will provide these commenters with the flexibility they requested by permitting employers to follow future versions of consensus standards so long as those future versions meet the final rule’s performance-based criteria. Second, OSHA adopted a performance-based approach when it previously revised existing § 1910.137 in 1994 (59 FR

4323–4325). Several participants in the 1994 rulemaking supported a performance-based approach (59 FR 4324). Third, OSHA believes that harmonizing § 1926.97 and § 1910.137 will reduce misapplication by the regulated community and, thereby, reduce the risk of electric shock. Promulgating inconsistent standards would increase misapplication by the regulated community and, consequently, increase the risk of electric shock. Finally, OSHA has had no difficulty enforcing § 1910.137 since issuing it in 1994.

Regarding the commenters’ requests that OSHA deem employers that are in compliance with all future revisions of the listed consensus standards as being in compliance with the final rule, OSHA has no basis on which to find that future revisions of the consensus standards will provide suitable guidance for compliance with the performance criteria of the final rule. Revised consensus standards may or may not meet the final rule’s performance criteria. If a revised consensus standard does not satisfy this final rule’s performance criteria, however, the Agency may consider compliance with that consensus standard to be a *de minimis* condition if the consensus standard clearly provides protection equal to, or greater than, the protection provided by § 1926.97.¹³

An employer seeking to rely on an updated consensus standard may evaluate for itself whether the consensus standard meets the performance criteria contained in final § 1926.97. An employer that is unsure about whether a revised consensus standard meets the OSHA standard’s performance criteria may seek guidance from OSHA. If a revised consensus standard does not appear to meet the OSHA standard’s performance criteria, but the employer nonetheless wants to follow the revised consensus standard, the employer should seek guidance from OSHA as to whether the Agency would consider an employer’s following the

¹³ *De minimis* conditions are conditions in which an employer implemented a measure different from one specified in a standard, but that has no direct or immediate relationship to safety or health. The Agency does not issue citations or penalties for *de minimis* conditions, nor is the employer required to bring the workplace into compliance, that is, there are no abatement requirements. Pursuant to OSHA’s *de minimis* policy, which is set forth in OSHA Instruction CPL 02–00–148 (“Field Operations Manual”), a *de minimis* condition exists when an employer complies with a consensus standard rather than with the standard in effect at the time of the inspection and the employer’s action clearly provides equivalent or more effective employee protection.

revised consensus standard to be a *de minimis* condition.¹⁴

Some rulemaking participants asked OSHA to provide the applicable consensus standards to employers at no cost. (See, for example, Exs. 0156, 0161, 0183, 0202, 0206, 0229, 0231, 0233; Tr. 1287–1288.) For instance, Mr. Terry Williams with the Electric Cooperatives of South Carolina stated: “If OSHA is to rely on procedures that it does not describe in full, . . . the agency should provide a cost-free way for employers to review these procedures to make sure they are following them” (Ex. 0202). Mr. Don Adkins with Davis H. Elliot Construction Co. stated that the “cost of securing and reviewing these voluntary standards place[s] a financial burden on small employers” (Ex. 0156).

OSHA is rejecting these requests. The Agency stated the rule in performance-based terms, which allows employers flexibility in complying with the rules. The Agency understands that employers may want additional guidance in terms of precise procedures or detailed specifications to follow. Final § 1926.97 references relevant consensus standards to provide such additional guidance, but those standards are not mandatory.

In any event, even when OSHA incorporates consensus standards by reference, the Agency does not provide those consensus standards to employers at no cost. Many consensus standards are copyrighted documents; and, in those cases, the copyright holder has certain legal rights regarding the public distribution of those documents. Note that some consensus standards development organizations, for example, NFPA, do provide free, view-only access to their standards (<http://www.nfpa.org/itemDetail.asp?categoryID=279&itemID=18123&URL=Codes%20&%20Standards/Code%20development%20process/Online%20access>).¹⁵ OSHA also will continue to explore other ways of informing the regulated community

¹⁴ Note that this approach applies to the use of any consensus standard referenced in the final rule. Moreover, the same principles described with respect to subsequent versions of the consensus standards also apply to earlier versions of the consensus standards.

¹⁵ For instance, NFPA 70E, *Standard for Electrical Safety in the Workplace*, one of the documents listed in Appendix G to Subpart V, described later in this section of the preamble, is available at http://www.nfpa.org/aboutthecodes/AboutTheCodes.asp?DocNum=70E&cookie_test=1. Select either the 2009 or 2012 edition from the drop-down box labeled “Edition to display” and click the link labeled “View [selected] edition online.” Note that registration with NFPA is required to view the standard.

about applicable compliance obligations specified by the final rule.

Moreover, employers can often rely on the assurances of third parties that equipment or test methods meet the listed consensus standards. First, OSHA expects that employers will typically get the assurance of manufacturers that electrical protective equipment is capable of withstanding the appropriate electrical proof tests required by final paragraphs (a) and (b). In this regard, an employer can simply look for equipment labeled as meeting the listed consensus standards. Manufacturers attest, through such a label, typically required by the relevant consensus standard, that their equipment passed the requisite tests.

Second, it is OSHA's understanding that many employers, particularly small employers, do not test their own equipment to determine whether employees can use the equipment, as required by final paragraph (c). Instead, these employers send the equipment to an electrical laboratory for testing (see, for example, the testimony of Mr. Frank Brockman of Farmers Rural Electric Cooperative Corporation about the use of testing laboratories, Tr. 1301–1302). It is OSHA's understanding that, as a matter of practice, such laboratories follow the test methods in the applicable consensus standards for testing a wide range of products (see, for example, Ex. 0211).¹⁶ To determine whether employees can use the equipment in accordance with final paragraph (c), employers can rely on the assurance of these testing laboratories that they followed the listed consensus standards, as well as the requirements of OSHA's standard.

OSHA expects that, when consensus standards development organizations revise their consensus standards, manufacturers' labels will certify that the equipment meets the latest consensus standards, and that testing laboratories will use the test methods in the latest consensus standards, rather than the consensus standards listed in the notes. OSHA is sympathetic to concerns that employers, especially small businesses, do not have the resources to purchase and check whether revised consensus standards meet the final rule's performance criteria. As discussed previously, an employer that does not have the resources to purchase and review an updated consensus standard (indeed, any employer) may request guidance from OSHA on whether compliance

¹⁶ When a question arises as to the validity of a test method a laboratory is using, OSHA will investigate the validity of the method.

with an updated consensus standard would conform to this final rule or bring the employer within OSHA's *de minimis* policy.

In the final rule, OSHA reworded the headings for paragraphs (a), (b), and (c) to more accurately reflect the content of the respective paragraphs. *Paragraph (a)*. Paragraph (a) of § 1926.97 addresses the design and manufacture of the following types of rubber insulating equipment: Blankets, matting, covers, line hose, gloves, and sleeves.¹⁷ (Paragraph (b) of § 1926.97 contains general requirements for other types of insulating equipment (see the discussion of this paragraph later in this section of the preamble.) Paragraphs (a) and (c) of proposed § 1926.97 were based on existing § 1910.137(a) and (b); however, the proposal added Class 00 equipment to the classes addressed by the existing provisions to reflect the coverage of this new class of equipment in the consensus standards (Exs. 0048, 0051). This class of electrical protective equipment is used with voltages of 500 volts or less. OSHA received no comments on the proposed addition of Class 00 electrical protective equipment.

Paragraph (a)(1)(i), which is being adopted without change from the proposal, requires blankets, gloves, and sleeves to be manufactured without seams. This method of making the protective equipment minimizes the chance that the material will split. Because they are used when workers handle energized lines, gloves and sleeves are the only defense an employee has against electric shock. Additionally, the stresses placed on blankets, gloves, and sleeves by the flexing of the rubber during normal use could cause a seam to separate from tensile or shear stress.

The prohibition on seams does not apply to the other three types of electrical protective equipment covered by paragraph (a) (covers, line hose, and matting). These types of equipment generally provide a more indirect form of protection because they insulate the live parts from accidental, rather than intended, contact. Moreover, they are not usually subject to similar amounts or types of flexing and, thus, are not subject to the same stress.¹⁸

¹⁷ The language in proposed paragraph (a) has been editorially revised in the final rule to make it clearer that the paragraph applies to *rubber insulating* equipment only.

¹⁸ Flexing can cause different types of stress on rubber, including tensile, compression, and shear stress. Rubber insulating line hose and covers are subject to the greatest amount of flexing while employees are installing them on an energized part. However, employees install this equipment either with live-line tools or while wearing rubber insulating gloves and sleeves. Thus, when seam

Paragraph (a)(1)(ii), which is being adopted with one modification from the proposal, requires electrical protective equipment to be marked to indicate its class and type. The class marking indicates the voltage with which the equipment can be used;¹⁹ the type marking indicates whether the equipment is ozone resistant. These markings enable employees to know the uses and voltages for which the equipment is suited. This provision also permits equipment to contain other relevant markings, for example, the manufacturer's name, the size of the equipment, or a notation that the equipment is manufactured in accordance with the relevant consensus standards.

Proposed paragraphs (a)(1)(ii)(G) and (a)(1)(ii)(H) would have required rubber insulating equipment "other than matting" to be marked as Type I or Type II to indicate whether or not it was ozone-resistant. Mr. James Thomas, President of ASTM International, submitted comments recommending that the quoted language be deleted from these paragraphs because the "type classification denotes the manufacturing material being either Nonresistant to Ozone (Type I) or Resistant to Ozone (Type II) and applies to all [rubber insulating equipment], including [m]atting" (Ex. 0148).

OSHA agrees that the ASTM standards require matting to be marked with the type to indicate whether or not it is ozone-resistant, and the Agency has adopted the commenter's recommendation in the final rule.

Mr. Leo Muckerheide of Safety Consulting Services recommended that OSHA require marking the maximum use voltage on electrical protective equipment, stating:

Many electrical workers work with multiple voltages and are infrequent users of electrical protective equipment. Therefore, expecting them to remember which class to use with which voltage is a potentially hazardous problem. This problem can be easily eliminated by having the maximum use voltage marked on the electrical protective equipment. [Ex. 0180]

OSHA rejects this recommendation. First, workers using electrical protective equipment receive training that ensures that they know which class of equipment to use on which voltage. The

separation is likely, the employee is protected by other means.

Rubber insulating matting is generally laid on the floor and is not subject to the type of flexing that is likely to cause separation.

¹⁹ The maximum use voltages for individual classes of equipment are provided in Table E–4, discussed under the summary and explanation for paragraph (c)(2)(i), *infra*.

record demonstrates that most of the workers covered by § 1910.269 and subpart V are highly trained (see, for example, Tr. 1228) and use electrical protective equipment to work on energized lines on a regular, often daily, basis (see, for example, Tr. 394, 889, 1218–1219). Furthermore, several OSHA standards require training for employees working on or near exposed energized parts, when electrical protective equipment would also be required. For instance, final §§ 1910.269(a)(2)(ii)(D) and 1926.950(b)(2)(iv) require training in the use of electrical protective equipment for qualified employees performing electric power generation, transmission, and distribution work. Paragraph (c)(2) of § 1910.333 contains a similar requirement for workers performing other types of general industry electrical work. Paragraph (b)(2) of § 1926.21 contains training requirements for workers performing construction work. Although this requirement is more general than the training requirement in this final standard, § 1926.21 requires training in OSHA standards applicable to the employee's work environment.

Second, electrical protective equipment meeting the applicable consensus standards is manufactured with the Class ratings included, but generally without labels for maximum use voltages. (See, for example, Exs. 0048, 0049, 0050, 0066, 0067, 0068.) Requiring electrical protective equipment to be marked with its maximum use voltage would likely force employers to mark the equipment themselves. OSHA believes that the permanent class-rating marking placed on electrical protective equipment by the manufacturer provides adequate information and is less likely to wear off over the useful life of the equipment than any marking put in place by an employer. Thus, the Agency concludes that a requirement for marking the maximum use voltage on electrical protective equipment is unnecessary.

Mr. Frank Owen Brockman, representing Farmers Rural Electric Cooperative Corporation, recommended that OSHA also require that the markings include the company testing the equipment, the test date, and owners of the equipment (Ex. 0173). He did not explain how including this additional information in the markings would better protect employees. Moreover, although requiring the employer to note the date equipment is tested does enhance worker protection, final paragraph (c)(2)(xii) of § 1926.97 addresses this matter by requiring the employer to certify that equipment has successfully passed the periodic testing

required by the final rule and by requiring this certification to identify the equipment that passed the test and the date it was tested. OSHA agrees with Mr. Brockman that keeping workers aware of the date of last testing would enhance worker protection. Therefore, OSHA revised the language in final paragraph (c)(2)(xii) to also require that the certification required by the rule be made available to employees or their authorized representatives.

It should be noted that, although not required, the markings suggested by Mr. Muckerheide and Mr. Brockman are permitted under paragraph (a)(1)(ii)(I).

Paragraph (a)(1)(iii) requires all markings to be nonconductive and to be applied so as not to impair the insulating properties of the equipment. OSHA did not receive any comments on this provision in the proposal and has carried it forward without change into the final rule. This requirement ensures that no marking interferes with the protection to be provided by the equipment.

Paragraph (a)(1)(iv), which is being adopted without change from the proposal, requires markings on gloves to be confined to the cuff area.²⁰ As OSHA explained in the preamble to the proposed rule, markings in other areas could possibly wear off (70 FR 34828). Moreover, having the markings in one place will allow the employee to determine the class and type of glove quickly. Finally, as discussed later in this section of the preamble, final paragraph (c)(2)(vii) requires that rubber gloves normally be worn under protector gloves. Because a protector glove is almost always shorter than the corresponding rubber glove with which it is worn, and because the cuff of the protector glove can easily be pulled back without removal, it is easy to see markings on the cuff portion of the rubber glove beneath. Any marking provided on the rubber glove in an area outside of the cuff could not be seen with the protector glove in place.

Paragraph (a)(2) of final § 1926.97 contains electrical requirements for rubber insulating blankets, matting, line hose, gloves, and sleeves. As previously discussed, this provision uses performance language, and does not contain a lengthy discussion of specific test procedures.

Paragraph (a)(2)(i), which is being carried forward from the proposed rule, requires electrical protective equipment to be capable of withstanding the ac proof-test voltages in Table E–1 or the dc proof-test voltages in Table E–2 of

²⁰ The cuff area is the area near the reinforced edge of the glove.

the standard.²¹ The proof-test voltages listed in these tables have been derived from the current ASTM standards, which also contain detailed test procedures that can be used to determine whether electrical protective equipment is capable of withstanding these voltages. As previously discussed, these details were not included in the proposed rule, and this approach is being carried forward in the final rule. Paragraph (a)(2)(i)(A) replaces those details with a performance-oriented requirement that any proof test can be used as long as it reliably indicates that the equipment can withstand the proof-test voltage involved.

Mr. Muckerheide with Safety Consulting Services stated that the standard for rubber insulating gloves, ASTM D120, lists a 280-millimeter glove instead of the 267-millimeter glove listed in Table E–1 in the proposed rule (Ex. 0180). He recommended making OSHA's standard consistent with the ASTM standard or explaining the difference in the standard.

OSHA is revising Table E–1 from the proposal in response to this comment.

OSHA based proposed Table E–1 on Table I–2 in existing § 1910.137, which, in turn, was based on the 1987 edition of ASTM D120. Section 10.3.1 of ASTM D120–1987 lists four standard lengths for Class 0 rubber insulating gloves: 279, 356, 406, and 457 millimeters. Table 2 in that edition, however, listed 267 millimeters as the shortest length glove even though the shortest standard length was 279 millimeters.

Unlike the 1987 edition of the consensus standard, the latest edition, ASTM D120–2009, rounds up the standard metric sizes. Thus, the relevant consensus standards for rubber insulating gloves list four standard sizes of 280, 360, 410, and 460 millimeters for Classes 00, 0, 1, 2, 3, and 4 gloves. The table in the 2009 edition of the consensus standard corresponding to Table 2 in the 1987 edition lists a 280-millimeter glove as the shortest one.

Based on this information, OSHA concludes that the appropriate length for the shortest glove is 280 millimeters. In addition, the Agency does not consider the difference between the 280-millimeter length recommended by Mr.

²¹ Existing § 1910.137 contains Table I–2 through Table I–6, and the proposal did not redesignate those tables. The final rule revises all of § 1910.137 so as to redesignate the tables, starting with Table I–1. Consequently, existing Table I–2 corresponds to Table I–1 in the final rule, existing Table I–3 corresponds to Table I–2 in the final rule, existing Table I–4 corresponds to Table I–3 in the final rule, existing Table I–5 corresponds to Table I–4 in the final rule, and existing Table I–6 corresponds to Table I–5 in the final rule.

Muckerheide and the 267-millimeter proposed length to be substantial. The 1987 and 2009 editions of the consensus standard each permit a glove to vary from the standard length by as much as 13 millimeters. Thus, a 280-millimeter glove can be as short as 267 millimeters. However, to ensure consistency with the latest consensus standard, OSHA is adopting, in Table E-1, both the 280-millimeter glove length in place of the proposed 267-millimeter length and the rounded-up metric sizes, as listed in the latest edition of the consensus standard.

Paragraph (a)(2)(i)(B), which is being adopted as proposed, requires the proof-test voltage to be applied continuously for 1 minute for insulating matting and 3 minutes for other insulating equipment. These times are derived from on the proof-test times given in the ASTM design standards and are appropriate for testing the design capabilities of electrical protective equipment.

Paragraph (a)(2)(i)(C), which is being adopted as proposed, requires rubber insulating gloves to be capable of withstanding the ac proof-test voltage indicated in Table E-1 of the standard after a 16-hour water soak. If rubber insulating gloves absorb water, a reduction in insulating properties will result. Electrical work is sometimes performed in the rain, and an employee's perspiration is often present while the gloves are in use, so water absorption is a critical property. The soak test is needed to ensure that rubber insulating gloves can withstand the voltage involved under these conditions.

It should be noted that the soak test is a separate test from the initial proof test. Gloves must be capable of passing both tests.

Paragraph (a)(2)(ii), which is being adopted as proposed, prohibits the 60-hertz ac proof-test current from exceeding the values specified in Table E-1 at any time during the test period. The currents listed in the table have been taken from ASTM D120-09. This provision in the final rule is important because, when an ac proof test is used on gloves, the resulting proof-test current gives an indication of the validity of the gloves' make-up, the dielectric constant of the type of material used, its thickness, and the total area under test.

Under paragraph (a)(2)(ii)(A), which is being adopted without change from the proposal, the maximum current for ac voltages at frequencies other than 60 hertz is computed from the direct ratio of the frequencies. This provision ensures that maximum current is equivalent for varying frequencies.

Paragraph (a)(2)(ii)(B), which is being adopted as proposed, specifies that gloves to be tested be filled with and immersed in water to the depth given in Table E-3 and that water be added to or removed from the glove as necessary to ensure that the water level is the same inside and outside the glove. Table E-3 is derived from ASTM D120 and is valid for the proof-test currents listed in Table E-1. During the ac proof test, a glove is filled with, and immersed in, water, and the water inside and outside the glove forms the electrodes. The ac proof-test current is dependent on the length of the portion of the glove that is out of the water. Because the proof-test current is a function of immersion depth, it is important to specify the depth in the rule.²²

Paragraph (a)(2)(ii)(C) requires that, after the 16-hour water soak specified in paragraph (a)(2)(i)(C), the 60-hertz proof-test current not exceed the values given in Table E-1 by more than 2 milliamperes. The allowable proof-test current must be increased for proof tests on gloves after a 16-hour water soak because the gloves absorb a small amount of water, which results in slightly increased current during the test. The final rule was derived from ASTM D120, which allows an increase in the proof-test current of 2 milliamperes. If the proof-test current increases more than 2 milliamperes, it indicates that the gloves absorbed too much water. OSHA has revised this provision in the final rule to indicate more clearly that it is a requirement rather than an exception.

Paragraph (a)(2)(iii), which is being adopted without change from the proposed rule, prohibits electrical protective equipment that has been subjected to a minimum breakdown voltage test from being used to protect employees from electrical hazards. The relatively high voltages used in testing electrical protective equipment for minimum breakdown voltage can damage the insulating material under test (even if the equipment passes). The intent of this rule is to prohibit the use of equipment that has been tested for minimum breakdown voltage under

²² Atmospheric conditions might invalidate the test results at the clearances specified in Table E-3. For instance, under certain atmospheric conditions, the air between the water inside and outside the glove, which forms the two electrodes, might flash over, and thereby invalidate the test results and damage the glove. As another example, some atmospheric conditions can lead to excessive corona and the formation of ozone that ventilation cannot sufficiently dissipate. To account for these atmospheric conditions, final Table E-3 contains a note that provides that, if atmospheric conditions make these clearances impractical, the clearances may be increased by a maximum of 25 mm. (1 in.)

conditions equivalent to those in the ASTM standards, because minimum breakdown tests are destructive. Such tests are performed only on equipment samples that are to be discarded.

Paragraph (a)(2)(iv), which is being adopted as proposed, requires ozone-resistant material (Type II) to be capable of withstanding an ozone test that can reliably indicate that the material will resist ozone exposure in actual use. Standardized ozone tests are given in the ASTM specifications listed in the note following paragraph (a)(3)(ii)(B), and compliance with these specifications will be deemed compliance with this OSHA requirement. Around high-voltage lines and equipment, a luminous discharge, called electric corona, can occur due to ionization of the surrounding air caused by a voltage gradient that exceeds a certain critical value. The blue corona discharge is accompanied by a hissing noise and by ozone, which can cause damage to certain types of rubber insulating materials. Therefore, when there is a chance that ozone may be produced at a work location, electrical protective equipment made of ozone-resistant material is frequently used. The final rule ensures that ozone-resistant material will, in fact, be resistant to the deteriorating effects of the gas. The final rule also provides that visible signs of ozone deterioration, such as checking, cracking, breaks, and pitting, are evidence of failure to meet the requirements for ozone-resistant material.²³

Paragraph (a)(3) addresses the workmanship and finish of electrical protective equipment. Because physical irregularities can interfere with the insulating properties of the equipment and thus reduce the protection it affords, paragraph (a)(3)(i) prohibits the presence of physical irregularities that can adversely affect the insulating properties of the equipment and that can be detected by the tests or inspections required under other provisions in § 1926.97. In the final rule, OSHA has revised the language for this provision to clarify that "harmful physical irregularities" (the term used in the proposal) means "physical irregularities that can adversely affect the insulating properties of the equipment."

OSHA recognizes that some minor irregularities are nearly unavoidable in the manufacture of rubber goods, and

²³ ASTM F819-10, *Standard Terminology Relating to Electrical Protective Equipment for Workers*, which is listed in the note following paragraph (a)(3)(ii)(B), defines "ozone cutting and checking" as: "Cracks produced by ozone in a material under mechanical stress."

these imperfections may be present in the insulating materials without significantly affecting the insulation. Paragraph (a)(3)(ii), which is being adopted without change from the proposal, describes the types of imperfections that are permitted. Even with these imperfections, electrical protective equipment must be capable of passing the electrical tests specified in paragraph (a)(2).

Since paragraph (a) of final § 1926.97 is written in performance-oriented language, OSHA has included a note at the end of the paragraph stating that rubber insulating equipment meeting the requirements of the listed ASTM standards will be deemed in compliance with the performance requirements of final § 1926.97(a). This list of ASTM standards references the latest revisions of those documents. The Agency has reviewed the referenced ASTM standards and has found them to provide suitable guidance for compliance with the performance criteria of § 1926.97(a).²⁴

Paragraph (b). Paragraph (b) of final § 1926.97 addresses electrical protective equipment other than the rubber insulating equipment addressed in paragraph (a). Equipment falling under this paragraph includes plastic guard equipment, insulating barriers, and other protective equipment intended to provide electrical protection to employees.

Mr. Steven Theis, representing MYR Group, requested that OSHA clarify that equipment complying with the ASTM and IEEE consensus standards mentioned in the proposal would constitute compliance with the final rule (Ex. 0162). In the proposal, OSHA pointed to ASTM F712. OSHA has reviewed ASTM F712–06 (2011) and has found that it provides suitable guidance for plastic guard equipment that employers can use to comply with final § 1926.97(b). To clarify the standard, OSHA has added a new note to paragraph (b) to indicate that OSHA will consider plastic guard equipment to conform to the performance requirements of paragraph (b) if it meets, and is used in accordance with, ASTM F712–06 (2011).

In the proposal, the Agency also pointed to IEEE Std 516, *Guide for Maintenance Methods on Energized Power Lines*, as support for the electrical criteria in proposed paragraph (b). The Agency has not referenced this consensus standard in the final rule.

The IEEE standard does not contain specifications or test methods for electrical protective equipment. Instead, that consensus standard contains work methods for live-line work, including criteria for evaluating insulating tools and equipment. The Agency notes that the criteria for evaluating insulating tools and equipment specified in the IEEE standard are equivalent to the design criteria for electrical protective equipment contained in paragraph (b) in the final rule.

Paragraph (b)(1), which is being adopted without substantive change from the proposed rule, requires electrical protective equipment to be capable of withstanding any voltage that might be imposed on it. The voltage that the equipment must withstand includes transient overvoltages, as well as the nominal voltage that is present on an energized part of an electric circuit. Equipment withstands a voltage if it maintains its integrity without flashover or arc through.

Equipment conforming to a national consensus standard for that type of equipment will generally be considered as complying with this rule if that standard contains proof testing requirements for the voltage involved. In the proposal, OSHA considered accepting electrical protective equipment that was capable of passing a test equivalent to that described in ASTM F712 or IEEE Std 516 for types of equipment not addressed by any consensus standard. OSHA invited comments on whether these standards contain suitable test methods and whether equipment passing those tests should be acceptable under the OSHA standard.

Rulemaking participants generally agreed that the consensus standards provide suitable guidance for the equipment they addressed. (See, for example, Exs. 0162, 0230.) For instance, IBEW stated:

The test methods referenced in these standards are suitable for the types of equipment they are designed for . . . [This] equipment [has] proven to be acceptable for use in this industry. [Ex. 0230]

Mr. Steven Theis of MYR Group agreed that the “specified standards contain suitable test methods” (Ex. 0162).

As noted previously, OSHA has reviewed ASTM F712–06 (2011) and found that it provides suitable guidance for compliance with final paragraph (b). The Agency has included a note in the final rule to indicate that plastic guard equipment is deemed to conform to the performance requirements of paragraph (b) if the equipment conforms to that consensus standard.

ASTM maintained that none of the ASTM standards listed in the proposed standard contain an impulse test method for transient overvoltages (Ex. 0148). The organization recommended that the final rule reflect the current referenced consensus standards.

ASTM misconstrues paragraph (b)(1) of the final rule. Paragraph (b)(1) of the final rule does not require impulse testing as ASTM alleges. Rather, it is a performance requirement that equipment be capable of withstanding both the steady-state voltages and transient (or impulse) overvoltages, to which it will be subjected. Both types of voltages can appear across the equipment during use. (See the summary and explanation for final § 1926.960(c)(1), later in this section of the preamble, for a discussion of maximum transient overvoltages that can appear on electric power lines and equipment.)

The typical test method contained in the ASTM standards for determining minimum breakdown voltage (or withstand voltage) requires testing at substantially higher voltages than those on which the equipment will be used. (See, for example, Exs. 0048, 0053, 0071.) In addition, minimum breakdown voltage testing is performed using a steadily rising ac voltage, in contrast to impulse testing, in which the overvoltage is applied for a very short period (*id.*). As noted in IEEE Std 516–2009, the existing standards for insulating tools and equipment do not address whether equipment passing the ac withstand voltage tests in those standards will also withstand transient voltage stresses (Ex. 0532). However, the IEEE standard suggests the use of a 1.3 ratio to convert ac withstand voltages to impulse, or transient, voltages (*id.*). While the IEEE standard notes that research in this area is ongoing, OSHA concludes that, in the absence of better information, employers may rely on this ratio and multiply the ac minimum breakdown voltage for protective equipment by this value to determine if that equipment can withstand the expected transient overvoltages on energized circuits. For example, insulating equipment with a minimum breakdown, or withstand, voltage of 20,000 volts is capable of withstanding a maximum transient overvoltage of 26,000 volts. This equipment would be acceptable for use to protect employees from phase-to-ground exposures on a circuit operating at 15-kilovolt, phase-

²⁴ See the extended discussion, earlier in this section of the preamble, on how to address future revisions of the listed consensus standards, as well as earlier versions of the listed consensus standards.

to-phase, with a 3.0 per unit maximum transient overvoltage.²⁵

The Alabama Rural Electric Association of Cooperatives, requested that OSHA provide a definition of "transient overvoltage" and a suggested method of calculation (Ex. 0224).

IEEE Std 516–2009 contains the following suitable guidance (although, as stated earlier, the standard does not contain specifications or test methods for electrical protective equipment). First, the IEEE standard contains the industry-recognized definition of "transient overvoltage," which reads as follows:

Voltage that exceeds the maximum operating line-to-ground voltage. This voltage may be the result of a transient or switching surge. [Ex. 0532²⁶]

Second, the IEEE consensus standard contains methods of determining the maximum transient overvoltage on an electric power generation, transmission, or distribution system and, as noted earlier, discusses comparing the ability of insulation equipment to withstand a transient overvoltage based on its ability to withstand voltages under more typical testing conditions (Ex. 0532). OSHA has not duplicated this information in § 1926.97. It is copyrighted information that is publicly available. However, OSHA concludes that the IEEE standard provides suitable guidance that can assist employers in complying with paragraph (b)(1) and has added a reference to that consensus standard in the note following that paragraph in the final rule.

The proposed rule invited comments on the need to set specific electrical performance values in the standard and on whether the electrical test criteria in ASTM F968²⁷ (which were summarized in Table IV–1 and Table IV–2 of the preamble to the proposal (70 FR 34830)) could be applied to all types of electrical protective equipment covered by proposed paragraph (b). IBEW commented that the test values and use values in ASTM F968 are appropriate for electrically insulating plastic guard

equipment, but suggested that the values are not suitable for other types of equipment because plastic guard equipment is designed to perform differently than other types of electrical protective equipment (Ex. 0230). Based on the IBEW comment, OSHA has not included in the final rule the values from Table IV–1 and Table IV–2. Moreover, since the final rule is written in performance terms, inclusion of values like those included in these tables is unnecessary.

Final paragraph (b)(2) addresses the properties of insulating equipment that limit the amount of current to which an employee is exposed. Paragraph (b)(2)(i), which is being adopted without change from the proposal, requires electrical protective equipment used as the primary insulation of employees from energized parts to be capable of passing a test for current (that is, a proof test) when subjected to the highest nominal voltage on which the equipment is to be used. Paragraph (b)(2)(ii), which is also being adopted as proposed, provides that during the test, the equipment current may not exceed 1 microampere per kilovolt of phase-to-phase applied voltage. This requirement will prevent dangerous electric shock to employees by prohibiting use of both poor insulating materials and good insulating materials that are contaminated with conductive substances (for example, fiberglass-reinforced plastic coated with a conductive finish). The limit for current has been derived from IEEE Std 516, and OSHA believes such a limit is reasonable and appropriate.

In the preamble to the proposed rule, the Agency invited comments on whether another value would better protect employees. IBEW commented on this issue as follows:

The IEEE Standard 516 limit of 1 microampere per kilovolt of phase-to-phase applied voltage is appropriate for testing equipment used for primary insulation of employees from energized parts. This limit has apparently worked to keep inferior protective equipment off the market. [Ex. 0230]

One commenter was concerned that the proposed current limit might not protect employees in the event that a fault occurred (Ex. 0126). OSHA believes that this concern is unfounded. During a fault, the voltage on a circuit typically falls, and the equipment current would fall with it. Although it is possible that transient overvoltages may occur, either during a fault on an adjacent phase or during switching operations, such overvoltages are extremely short in duration, and the possible resulting increase in equipment

current should not prove life-threatening to employees.

ASTM stated that the only one of its standards that includes a 1-microampere per kilovolt requirement is ASTM F712 on plastic guard equipment (Ex. 0148). The organization recommended that OSHA limit this provision to this type of equipment.

OSHA is not adopting ASTM's recommendation. The Agency notes that ASTM F712 is not the only ASTM standard that limits equipment current to values less than 1 microampere per kilovolt of test voltage. ASTM F711, *Standard Specification for Fiberglass-Reinforced Plastic (FRP) Rod and Tube Used in Live Line Tools*, limits maximum current during the dielectric testing prescribed in that standard to values substantially less than 1 microampere per kilovolt of test voltage (Ex. 0053).²⁸ Further, as noted previously, this limit has been derived from IEEE Std 516. Thus, OSHA concludes that the 1-microampere limit is reasonable and appropriate.²⁹

Note 1 to paragraph (b)(2), which is being adopted without substantive change from the proposal, emphasizes that this paragraph applies to equipment that provides primary insulation from energized parts, which is consistent with the plain language of paragraph (b)(2)(i). The note also clarifies that paragraph (b)(2) does not apply to equipment used for secondary insulation or equipment used for brush contact only. OSHA considers primary insulation to be the insulation that is placed directly between an employee and an energized part or, for live-line barehand work, between an employee and ground. Insulation that supplements the primary insulation, for example, a second form of insulation placed between the employee and ground (in addition to the primary insulation), is secondary insulation.

Note 2 to paragraph (b)(2), which is being adopted without change from the proposal, provides that when equipment is tested with ac voltage, the current measured during the test consists of three components: (1) Capacitive

²⁵ The maximum impulse voltage for this equipment is 20 kilovolts times 1.3, or 26 kilovolts. The maximum phase-to-ground use voltage for the equipment is 26 kilovolts divided by the maximum transient overvoltage in kilovolts, or 8.7 kilovolts. The phase-to-phase circuit voltage for this exposure is 8.7 kilovolts times $\sqrt{3}$, or 15 kilovolts.

²⁶ This is the definition of "overvoltage," for which "transient overvoltage" is a synonym.

²⁷ The proposal noted that there were two ASTM standards addressing plastic guard equipment, F712, which contained test methods, and F968, which contained specifications (70 FR 34829–34830, June 15, 2005). ASTM has since combined those two standards into a single one, F712–06 (2011), which contains both test methods and specifications for plastic guard equipment.

²⁸ Table 2 in ASTM F711–02 sets maximum leakage current for different types of rod and tube used in live-line tools (Ex. 0053). The highest value in this table is 14 microamperes. A note to the table provides that, for special applications, the maximum acceptable leakage current is twice the value listed in the table, so that 28 microamperes is the highest acceptable leakage current. The voltage applied during this test is 50 kilovolts. Thus, the maximum current is less than 1 microampere per kilovolt.

²⁹ It should be noted that the equipment current requirement contained in paragraph (b)(2) does not apply to rubber insulating equipment, which is covered by paragraph (a).

current caused by the dielectric properties of the equipment being tested, (2) conduction current through the equipment, and (3) leakage current passing along the surface of the equipment. The conduction current is negligible for materials typically used in insulating equipment, and the leakage current should be small for clean, dry insulating equipment. The capacitive component usually predominates when insulating equipment is tested in good condition.

OSHA expects that the tests required under final paragraphs (b)(1) and (b)(2) will normally be performed by the manufacturer during the design process and periodically during the manufacturing process. The Agency recognizes, however, that some employers might want to use equipment that is made of insulating materials but that was not intended by the manufacturer to be used as insulation. For example, a barrier made of rigid plastic may be intended for use as a general purpose barrier. An employer could test the barrier under paragraphs (b)(1) and (b)(2), and, if the equipment passes the tests, it would be acceptable for use as insulating electrical protective equipment.

Paragraph (c). Although existing construction standards do not contain provisions for the care and use of insulating equipment, OSHA believes provisions of this type can contribute greatly to employee safety. Electrical protective equipment is, in large part, manufactured in accordance with the latest ASTM standards. This would probably be the case even in the absence of OSHA regulation. However, improper use and care of this equipment can easily reduce, or even eliminate, the protection afforded by this equipment. Therefore, OSHA proposed to add new requirements for the in-service care and use of electrical protective equipment to the design standards already contained in existing § 1926.951(a)(1). These new provisions are being adopted in the final rule and will help ensure that these safety products retain their insulating properties.

Paragraph (c)(1), which is being adopted without change from the proposal, requires electrical protective equipment to be maintained in a safe and reliable condition. This general, performance-oriented requirement, which applies to all equipment addressed by final § 1926.97, helps ensure that employees are fully protected from electric shock.

Detailed criteria for the use and care of specific types of electrical protective equipment are contained in the following ASTM standards:

ASTM F478–09, *Standard Specification for In-Service Care of Insulating Line Hose and Covers.*

ASTM F479–06 (2011), *Standard Specification for In-Service Care of Insulating Blankets.*

ASTM F496–08, *Standard Specification for In-Service Care of Insulating Gloves and Sleeves.*

The requirements in final paragraph (c)(2) are derived from these standards.

Paragraph (c)(2) applies only to rubber insulating blankets, covers, line hose, gloves, and sleeves. No consensus standards address the care and use of other types of electrical protective equipment. Whereas the material design specifications for rubber insulating matting is addressed in § 1926.97(a), the in-service care of this matting is not covered by any ASTM standard or by existing § 1910.137(b)(2). This type of equipment is generally permanently installed to provide supplementary protection against electric shock. Employees stand on the matting, and they are insulated from the floor, which is one of the grounds present in the work area. This provides a degree of protection from phase-to-ground electric shock. Because this type of equipment is normally left in place after it is installed, and because it is not relied on for primary protection from electric shock (the primary protection is provided by other insulating equipment or by insulating tools), it does not need to be tested on a periodic basis and need not be subject to the same careful inspection before use that other insulating equipment must receive. It should be noted, however, that rubber insulating matting is still required to be maintained in a safe, reliable condition under paragraph (c)(1).

In final paragraph (c)(2)(i) and Table E–4, which are being adopted without substantive change from the proposal, OSHA is incorporating the margins of safety recognized in the ASTM standards by restricting the use of insulating equipment to voltages lower than the proof-test voltages given in Table E–1 and Table E–2. The rubber insulating equipment addressed in § 1926.97(a) is to be used at lower voltages than the voltages the equipment is designed to withstand. For instance, although Class 4 equipment is currently designed to be capable of withstanding voltages of up to 40 kilovolts, the maximum use voltage for such equipment is 36 kilovolts (see also, for example, ASTM F496 on the care and use of rubber insulating gloves and sleeves). The use of insulating equipment at voltages less than the actual breakdown voltage provides a margin of safety for the employee.

The maximum use voltage for class 3 equipment in Table E–4 in the final rule is being corrected to 26,500. OSHA proposed that the maximum use voltage for this class of equipment be 26,000. OSHA intended this cell in the proposed table to read 26,500, as it is in Table I–5 in existing § 1910.137 and in the applicable consensus standards, but an inadvertent error in printing resulted in the wrong number being entered in the table.

In the proposed rule, Note 1 to Table E–4 explained how the maximum use voltage of electrical protective equipment varies depending on whether multiphase exposure exists. In the general case, electrical protective equipment must be rated for the full phase-to-phase voltage of the lines or equipment on which work is being performed. This requirement ensures that employees are protected against the most severe possible exposure, that is, contact between one phase conductor and another. However, if the employee is only exposed to phase-to-ground voltage, then the electrical protective equipment selected can be based on this lower voltage level (nominally, the phase-to-phase voltage divided by $\sqrt{3}$). For example, a three-phase, solidly grounded, Y-connected overhead distribution system could be run as three phase conductors with a neutral or as three single-phase circuits with one phase conductor and a neutral each. If only one phase conductor is present on a pole, there is no multiphase exposure. If all three phase conductors are present, the multiphase exposure can be removed by insulating two of the phases or by isolating two of the phases.³⁰ After the insulation is in place or while the employee is isolated from the other two phase conductors, there is no multiphase exposure, and electrical protective equipment rated for the phase-to-ground voltage could be used.³¹

In the proposal, the Agency requested information about whether employees can be insulated or isolated from multiphase exposure to ensure safe use of electrical protective equipment. The

³⁰ Depending on the configuration of the system, an employee could be isolated from two of the phases on the pole by approaching one of the outside phase conductors and working on it from a position where there is no possibility of coming too close to the other two phase conductors. Isolation of the employee may be impossible for some line configurations.

³¹ It should be noted that, until the multiphase exposure has actually been removed, the phase-to-phase voltage remains the maximum use voltage. Thus, the maximum use voltage of any insulation used to “remove phase-to-phase exposure” must be greater than or equal to the phase-to-phase voltage on the system.

comments generally supported the note to proposed Table E-4 and previously codified in Table I-5 in existing § 1910.137. (See, for example, Exs. 0155, 0175, 0177, 0227.) Mr. Charles Kelly of EEI explained:

[T]he typical practice in the industry is for employees to cover the first phase from a position where the other phases cannot be reached. This practice isolates employees from multiphase exposure. Thus, the use of phase-to-ground voltage-rated equipment is safe.

Many utilities use a class of equipment which is rated for the phase to ground voltage and rely on isolation and, to a lesser extent, cover-up equipment, to remove the potential for a multiphase exposure. Multiphase exposure is always avoided regardless of whether protective equipment (gloves or gloves and sleeves) is rated for the phase to phase voltage. Outside of rubber blankets, cover-up equipment is considered secondary protection against brush contact. Isolation from phases different than the one being worked on has always and will continue to be the primary form of defense against a phase to phase contact. The administrative control of *cover on the way in and uncover on the way out* ensures the cover-up equipment is placed from a position which isolates the worker. A worker will always cover the first phase from a position where he cannot reach the other phases. . . .

The terminology for maximum use voltage in ASTM F-819 has always recognized this work practice: Thus, the ability to use phase to ground voltage rated equipment is considered by the industry to be both prudent and safe. [Ex. 0227; emphasis included in original]

Mr. Thomas Taylor of Consumers Energy agreed that these practices isolate employees from multiphase exposure so that using equipment based on the phase-to-ground voltage is safe (Ex. 0177). Ms. Salud Layton of the Virginia, Maryland & Delaware Association of Electric Cooperatives similarly believed that using isolating work practices can minimize employee exposure. She stated that, while “isolation or insulation of the employee from differing potentials in the work zone is limited to the ability of the insulating equipment to cover exposed parts,” work practices can greatly minimize employee exposure (Ex. 0175).

IBEW did not specifically object to the language in the note to proposed Table E-4, but cautioned:

To ensure a worker is isolated from contact to an energized circuit, the isolating device has to physically prohibit the worker from making contact, and the device has to maintain the electrical integrity of the energized circuit. Although the isolating device does not need to be permanent, the device should have the physical strength to ensure isolation in the case of a slip or fall,

and other types of unintentional movements. [Ex. 0230]

The union also maintained that “the insulating value of the equipment would have to be . . . rated at the phase-to-phase voltage of the circuit being worked” (*id.*).

Another commenter, however, objected to the preamble statements that permitted using phase-to-ground rated insulation, stating: “Industry practice has always been to use protective equipment rated for the phase-to-phase rms voltage” (Ex. 0184).

After considering the rulemaking record on this issue, OSHA concludes that the note to proposed Table E-4 is necessary and appropriate and has carried it forward into the final rule without substantive change. The comments broadly supported the proposed note. In addition, the note is identical to Note 1 to Table I-5 of existing § 1910.137. As observed by the commenters, when multiphase exposure has been removed, by either isolating or insulating the employee, the worker is adequately protected against electric shock from the remaining phase-to-ground exposure by using phase-to-ground rated electrical protective equipment. The extent to which the note was supported contradicts the comment that industry practice is to use phase-to-phase rated electrical protective equipment. To address IBEW’s concerns, OSHA emphasizes that any insulation used to remove multiphase exposure must adequately protect workers carrying out their tasks from factors that could negate the insulation’s purpose. These factors include, among other things, worker movements such as reaching for tools, adjusting clothing or personal protective equipment, and slips and falls. Finally, OSHA agrees with IBEW that insulation used to protect employees from phase-to-phase exposure must be rated for the phase-to-phase exposure. After all, until this protective equipment is installed, there is phase-to-phase exposure.

Paragraph (c)(2)(ii), which is being adopted substantially as proposed, requires insulating equipment to be visually inspected before use each day and immediately after any incident that can reasonably be suspected of causing damage. In this way, obvious defects can be detected before an accident occurs. Possible damage-causing incidents include exposure to corona and direct physical damage. Additionally, rubber gloves must be subjected to an air test, along with the visual inspection. In the field, this test usually consists of rolling the cuff towards the palm so that air is

trapped within the glove. In a testing facility, a mechanical inflator is typically used. In either case, punctures and cuts can easily be detected. The note following paragraph (c)(2)(ii) indicates that ASTM F1236-96 (2012), *Standard Guide for Visual Inspection of Electrical Protective Rubber Products*, contains information on how to inspect rubber insulating equipment and descriptions and photographs of potential irregularities in the equipment.

Electrical protective equipment could become damaged during use and lose some of its insulating value. Final paragraph (c)(2)(iii), which is being adopted without substantive change from the proposal, lists types of damage that cause the insulating value of rubber insulating equipment to drop, for example, a hole, tear, puncture, or cut, or an embedded foreign object. The equipment may not be used if any of the defects listed here or in paragraph (c)(2)(iii), or any other defect that damages its insulating properties, is present.

Defects other than those listed in paragraph (c)(2)(iii) might develop during use of the equipment and could also affect the insulating or mechanical properties of the equipment. If such defects are found, paragraph (c)(2)(iv), which is being adopted without change from the proposal, requires the equipment to be removed from service and tested in accordance with other requirements in paragraph (c)(2). The results of the tests will determine if it is safe to return the items to service.

Foreign substances on the surface of rubber insulating equipment can degrade the material and lead to damage to the insulation. Paragraph (c)(2)(v), which is being adopted as proposed, requires the equipment to be cleaned as needed to remove any foreign substances.

Over time, certain environmental conditions can also cause deterioration of rubber insulating equipment. Final paragraph (c)(2)(vi), which is being adopted without substantive change from the proposal, requires insulating equipment to be stored so that it is protected from damaging conditions and substances, such as light, temperature extremes, excessive humidity, and ozone. This requirement helps the equipment retain its insulating properties as it ages. OSHA has replaced the proposed term “injurious substances and conditions” with “damaging substances and conditions” to make it clear that the equipment must be protected from substances and conditions that might damage it rather

than substances and conditions that could injure workers.

In connection with this requirement, the Agency does not believe that it is safe to store equipment on trucks for extended periods between use if such storage would expose the equipment to extremes of temperature or humidity. It may be necessary, under some circumstances, to store equipment indoors during prolonged periods when employees are not using the equipment. Workers are dependent upon electrical protective equipment for their safety, and all reasonable means of protecting it from unnecessary damage must be employed.

Rubber insulating gloves are particularly sensitive to physical damage during use. Through handling conductors and other electrical equipment, an employee can damage the gloves and lose the protection they provide. For example, a sharp point on the end of a conductor could puncture the rubber. To protect against damage, protector gloves (made of leather) are worn over the rubber gloves. Paragraph (c)(2)(vii) recognizes the extra protection afforded by leather gloves and requires their use over rubber gloves, except under limited conditions.

Proposed paragraph (c)(2)(vii)(A) provided that protector gloves are not required with Class 0 or Class 00 gloves under limited-use conditions, that is, when unusually high finger dexterity is needed for small equipment and parts manipulation. This exception is necessary to allow work to be performed on small energized parts. The Agency is adopting the proposed provision with one revision. Under paragraph (c)(2)(i) and Table E-4, which are being adopted without substantive change from the proposal, the maximum voltage on which Class 0 and Class 00 gloves can be used is 1,000 volts and 500 volts, respectively. Mr. James A Thomas, President of ASTM International, pointed out that Section 8.7.4 of ASTM F496 restricts the use of Class 00 rubber insulating gloves to voltages of 250 volts, ac, or less when they are used without protectors (Ex. 0148). Moreover, the consensus standard also includes a maximum dc voltage for Class 00 gloves used without protectors. Section 8.7.4 of ASTM F496-02a, *Standard Specification for In-Service Care of Insulating Gloves and Sleeves*, states:

Protector gloves may be omitted for Class 0 gloves, under limited use conditions, where small equipment and parts manipulation require unusually good finger dexterity. Under the same conditions, Class 00 gloves may be used without protectors, but only at voltages up to and including 250 V a-c or 375 V d-c. Other classes of gloves may be used

without protector gloves for similar conditions only where the possibility of physical damage to the gloves is unlikely and provided the voltage class of the glove used is one class above the voltage exposure. Rubber insulating gloves that have been used without protectors shall not be used with protectors until given an inspection and electrical retest. [Ex. 0051]

Based on Section 8.7.4 of ASTM F496-02a, the Agency concludes that using Class 00 gloves without protectors on voltages above 250 volts, ac, or 375 volts, dc, is considered to be unsafe by the experts on the consensus standards committee.³² In the final rule, OSHA has therefore included a new paragraph (c)(2)(vii)(B) addressing the use of Class 00 gloves and incorporating these two voltage restrictions on the use of Class 00 gloves without protectors. Consequently, OSHA renumbered proposed paragraphs (c)(2)(vii)(B) and (c)(2)(vii)(C) as paragraphs (c)(2)(vii)(C) and (c)(2)(vii)(D), respectively, and is adopting them without substantive change.

As noted earlier, if protector gloves are not worn, there is a danger a sharp object could puncture the rubber. The resulting hole could endanger employees handling live parts because of the possibility that current could arc through the hole to the employee's hand or that leakage could develop and expose the employee to electric shock. At 250 volts, ac, or less, or 375 volts, dc, or less, for Class 00 gloves, and at 1,000 volts or less for Class 0 gloves, the danger of current passing through a hole is low, and an employee is protected against electric shock as long as the live part itself does not puncture the rubber and contact the employee's hand (59 FR 4328). Although the type of small parts, such as small nuts and washers, encountered in work covered by the exception are not likely to do this, the danger still exists (*id.*). OSHA, therefore, is adopting, without substantive change from the proposal, a note to final paragraph (c)(2)(vii)(A) that provides that persons inspecting rubber insulating gloves used under these conditions need to take extra care in visually examining them and that employees using the gloves under these conditions need to take extra care to avoid handling sharp objects.

Under paragraph (c)(2)(vii)(C), classes of rubber insulating gloves other than Class 0 and Class 00 may be used without protector gloves only if: (1) The employer can demonstrate that the possibility for physical damage to the glove is small, and (2) gloves at least one

class higher than required for the voltage are used. For example, if a Class 2 glove is used at 7,500 volts or less (the maximum use voltage for Class 1 equipment pursuant to Table E-4) and the employer can demonstrate that the possibility of damage is low, then protector gloves need not be used. The final rule ensures that, under the conditions imposed by the exception, damage is unlikely, and the rule further reduces the risk to the employee by requiring thicker insulation as a measure of extra physical protection that will better resist puncture during use.³³ In addition, the consensus standard permits these classes of rubber insulating gloves to be used without protectors under the same conditions (Ex. 0051). This exception does not apply when the possibility of damage is significant, such as when an employee is using a knife to trim insulation from a conductor or when an employee has to handle moving parts, such as conductors being pulled into place.

Mr. Brockman with Farmers Rural Electric Cooperative Corporation recommended, without explanation, that there should be no exception permitting the use of rubber insulating gloves above Class 0 without protectors (Ex. 0173).

The Agency rejects this recommendation. OSHA has explained that it is safe to use Class 1 and higher rubber insulating gloves without protectors under the conditions imposed by final paragraph (c)(2)(vii)(C). OSHA notes, however, that electric power generation, transmission, and distribution work covered by § 1910.269 and subpart V will nearly always pose a substantial probability of physical damage to rubber insulating gloves worn without protectors. Thus, the exception contained in paragraph (c)(2)(vii)(C) will rarely apply when rubber insulating gloves are used for that type of work. However, electrical protective equipment covered by § 1926.97 is used outside of electric power generation, transmission, and distribution work, and there may be rare cases in these other types of work, for example, in product manufacturing or testing laboratories, in which the possibility of damage is slight.

To ensure that no loss of insulation has occurred, paragraph (c)(2)(vii)(D) prohibits any rubber insulating gloves used without protector gloves from being reused until the rubber gloves have been tested in accordance with paragraphs (c)(2)(viii) and (c)(2)(ix),

³² ASTM F496-08 contains an identical requirement in Section 8.7.4.

³³ The thickness of the rubber increases with increasing class of rubber insulating glove (for example, from Class 0 to Class 1).

which address required test voltages and the adequacy of the test method, respectively. It should be noted that this testing is required regardless of whether the glove is Class 0 or 00, as permitted in paragraphs (c)(2)(vii)(A) and (c)(2)(vii)(B), or is Class 1 or higher, as permitted in paragraph (c)(2)(vii)(C).

The National Electrical Contractors Association (NECA) and several NECA chapters objected to the requirement to test rubber insulating gloves after use without protectors. (See, for example, Exs. 0127, 0171, 0172, 0188.) They argued that there was no safety benefit and that the increased frequency of testing would be a burden on employers. For example, NECA stated:

The preamble doesn't include any information on electrical injuries resulting from the failure of insulated gloves used without leather protectors. Thus, requiring insulating gloves to be retested after each use without a protector is a burden upon the employer without offering any additional safety to employees. When using gloves in Classes 1–4, protectors often must be removed for reasons of manual dexterity, but the parts being worked on are fairly large which minimizes the likelihood for damage. Current techniques of inspecting and air-testing insulating gloves are sufficient to identify damaged gloves. [Ex. 0171]

Another commenter, Mr. Tom Chappell of the Southern Company, argued that an accelerated testing schedule (every 90 days instead of every 6 months) should be an acceptable alternative to testing each time a rubber insulating glove is used without a protector (Ex. 0212).

OSHA disagrees with these objections. First, the consensus standard also contains this requirement, which indicates that the consensus of expert opinion considers that the requirement provides necessary additional safety to employees (Ex. 0051). Second, a visual inspection and air test may not detect minor damage that a voltage test will. Even Mr. Chappell believes that additional testing is required to supplement the visual inspection. Third, testing on an accelerated schedule would allow such damage to go undetected until the next test, which could be as long as 89 days under Mr. Chappell's recommended testing regimen. Fourth, OSHA believes that the requirement to test rubber insulating gloves used without protectors will strongly discourage any unnecessary use of the gloves without protectors because of the expense of the test and because testing gloves shortens their useful life. Finally, any additional burden on employers is insubstantial, as employers are already required to do much of the testing specified by the final rule. In

addition, existing § 1910.137(b)(2)(vii)(B) already requires gloves used without protectors to be tested before being used at a higher voltage.³⁴ Therefore, OSHA has carried forward proposed paragraph (c)(2)(vii)(C) into the final rule without change.

Paragraph (c)(2)(viii), which is being adopted as proposed, requires insulating equipment to be tested periodically at the test voltages and testing intervals specified in Table E–4 and Table E–5, respectively. These tests will verify that electrical protective equipment retains its insulating properties over time. Table E–4 lists the retest voltages that are required for the various classes of protective equipment, and Table E–5 presents the testing intervals for the different types of equipment. These test voltages and intervals were derived from the relevant ASTM standards.

Mr. Thomas Frank of Ameren Company objected to the inclusion of rubber insulating line hose in proposed Table E–4 and Table E–5 (Ex. 0209). He argued that the applicable consensus standard does not designate a test method for this equipment.

OSHA disagrees with this objection. Contrary to Mr. Frank's assertion, ASTM D1050, *Standard Specification for Rubber Insulating Line Hose*, does contain test methods for rubber insulating line hose (Ex. 0068).³⁵ Table E–5, which specifies test intervals for rubber insulating equipment, only requires testing of line hose either when the insulating value is suspect³⁶ or after repair. In these cases, testing is the only way of ensuring that the insulating properties of the equipment are at an acceptable level (*id.*). After all, paragraph (a)(2)(i) requires rubber insulating equipment to be capable of passing electrical tests. When the insulating value of the equipment is suspect, or when the equipment has been altered, as it will have been during any repair, there is simply no way other than testing to determine whether the

equipment retains the required insulating value. Therefore, OSHA has carried proposed Table E–4 and Table E–5 into the final rule without substantive change.

Paragraph (c)(2)(ix), which is being adopted without change from the proposal, establishes a performance-oriented requirement that the method used for the tests required by paragraphs (c)(2)(viii) and (c)(2)(xi) (the periodic and postrepair tests, respectively) give a reliable indication of whether the electrical protective equipment can withstand the voltages involved. As this is a performance-oriented standard, OSHA does not spell out detailed procedures for the required tests, which will obviously vary depending on the type of equipment being tested.

Following paragraph (c)(2)(ix) is a note stating that the electrical test methods in various listed ASTM standards on rubber insulating equipment will be deemed to meet the performance requirement. As mentioned earlier, this note does not mean that OSHA is adopting the listed ASTM standards by reference. In enforcing § 1926.97(c)(2)(ix), the Agency will accept any test method that meets the performance criteria of the OSHA standard.

Once equipment has undergone in-service inspections and tests, it is important to ensure that any failed equipment is not returned to service. Final paragraph (c)(2)(x), which is being adopted without change from the proposal, prohibits the use of electrical protective equipment that failed the required inspections and tests. Paragraph (c)(2)(x) does, however, list the following acceptable means of eliminating defects and rendering the equipment fit for use again.

The final standard permits defective portions of rubber line hose and blankets to be removed in some cases. The result would be a smaller blanket or a shorter length of line hose. Under the standard, Class 1, 2, 3, and 4 rubber insulating blankets may only be salvaged by severing the defective portions of the blanket if the resulting undamaged area is at least 560 millimeters by 560 millimeters (22 inches by 22 inches). For these classes, smaller sizes cannot be reliably tested using standard test methods. Although the standard does not restrict the size of Class 0 blankets, OSHA believes that practical considerations in testing and using Class 0 blankets will force employers to similarly limit the size of these blankets when they have been repaired by cutting out a damaged portion.

³⁴ Existing § 1910.137(b)(2)(vii)(B) only requires gloves to be tested before being used on a higher voltage. The final rule adopts the proposed revision to this requirement so that rubber insulating gloves used without protectors must be tested before reuse after any use without protector gloves. For the purposes of §§ 1926.97(c)(2)(vii)(D) and 1910.137(c)(2)(vii)(D), "reuse" means any use after the limited use permitted without protector gloves.

³⁵ Both the 1990 edition of ASTM D1050 referenced in the note to existing § 1910.137(b)(2)(ix) and the 2005 edition referenced in the note to final § 1926.97(c)(2)(ix) contain test methods for rubber insulating line hose.

³⁶ The insulating value of rubber insulating equipment is suspect when the inspection required by final paragraph (c)(2)(ii) leads to questions about the quality of the insulation or uncovers any damage to the insulating equipment.

Obviously, gloves and sleeves cannot be repaired by removing a defective portion; however, the final standard permits patching rubber insulating gloves and sleeves if the defects are minor. Blankets may also be patched under certain circumstances. Moreover, rubber insulating gloves and sleeves with minor surface blemishes may be repaired with a compatible liquid compound. In all cases (that is, whether a patch is applied or a liquid compound is employed), the repaired area must have electrical and physical properties equal to those of the material being repaired.

Repairs performed in accordance with the standard are unlikely to fail because the rule requires the use of compatible patches or compatible liquid compounds and requires the repaired area to have electrical and physical properties equal to those of the surrounding material. However, to minimize the possibility that glove repairs will fail, repairs to rubber insulating gloves outside the gauntlet area (that is, the area between the wrist and the reinforced edge of the opening) are not allowed. OSHA stresses that the final rule does not permit repairs in the working area of the glove, where the constant flexing of the rubber during the course of work could loosen an ill-formed patch. A failure of a patch or liquid compound in this area of the glove would likely lead to injury very quickly. On the other hand, the gauntlet area of rubber insulating gloves is not usually in direct contact with energized parts. If a patch fails in this area, a worker is much less likely to be injured.

Farmers Rural Electric Cooperative Corporation recommended, without explanation, that OSHA not permit patching of rubber insulating gloves and sleeves (Ex. 0173). OSHA rejects this recommendation. OSHA has explained that it is safe only to patch insulating gloves and sleeves under the conditions imposed by final paragraph (c)(2)(x)(D).

Once the insulating equipment has been repaired, it must be retested to ensure that any patches are effective and that there are no other defects present. Such retests are required under paragraph (c)(2)(xi), which is being adopted without change from the proposal.

Employers, employees, and OSHA compliance staff must have a method of determining whether the tests required under this section have been performed. Paragraph (c)(2)(xii) requires this determination to be accomplished by means of certification by the employer that equipment has been tested in accordance with the standard. The certification is required to identify the

equipment that passed the test and the date it was tested. Typical means of meeting this requirement include logs and stamping test dates on the equipment. A note following paragraph (c)(2)(xii) explains that these means of certification are acceptable. As explained under the summary and explanation for paragraph (a)(1)(ii) earlier in this section of the preamble, the final rule, unlike the proposal, includes an explicit requirement that employers make this certification available upon request to employees and their authorized representatives. OSHA has also clarified the requirement to indicate that the certification records must be made available upon request to the Assistant Secretary for Occupational Safety and Health.

B. Subpart V, Electric Power Transmission and Distribution

OSHA is revising subpart V of its construction standards. This subpart contains requirements designed to prevent deaths and other injuries to employees performing construction work on electric power transmission and distribution installations. OSHA based the revision of subpart V primarily on the general industry standard at § 1910.269, *Electric power generation, transmission, and distribution*, which the Agency promulgated in January 1994. The final standard revises the title of subpart V from “Power Transmission and Distribution” to “Electric Power Transmission and Distribution” to make it clear that the subpart addresses “electric” power transmission and distribution (and not mechanical power transmission) and to match the title of § 1910.269 more closely.

1. Section 1926.950, General

Section 1926.950 defines the scope of final subpart V and includes, among other provisions, general requirements for training and the determination of existing workplace conditions. Paragraph (a)(1)(i) of final § 1926.950 is adopted without change from proposed § 1926.950(a)(1) and sets the scope of revised subpart V. This paragraph has been taken largely from existing § 1926.950(a) and (a)(1). Subpart V applies to the construction of electric power transmission and distribution installations. In accordance with existing § 1926.950(a)(1) and § 1910.12(d), paragraph (a)(1)(i) of final § 1926.950 provides that “construction” includes the erection of new electric transmission and distribution lines and equipment, and the alteration, conversion, and improvement of

existing electric transmission and distribution lines and equipment.

As noted in Section II, Background, earlier in this preamble, rulemaking participants generally supported OSHA’s goal of providing consistency between § 1910.269 and subpart V. However, many commenters urged the Agency to combine § 1910.269 and subpart V into a single standard applicable to all electric power generation, transmission, and distribution work. (See, for example, Exs. 0099, 0125, 0127, 0146, 0149, 0151, 0152, 0153, 0156, 0159, 0161, 0164, 0172, 0175, 0179, 0180, 0183, 0186, 0188, 0202, 0206, 0225, 0226, 0229, 0231, 0233, 0239, 0241, 0401; Tr. 291–294, 542–543, 1235–1236, 1282–1283, 1322, 1332.) These rulemaking participants argued that several benefits would result from combining § 1910.269 and subpart V into a single standard, including:

- Lessening confusion—a single standard would eliminate questions about whether work is construction or maintenance and ensure uniform interpretations for all generation, transmission, and distribution work (see, for example, Exs. 0146, 0151, 0152, 0156, 0175, 0183, 0202, 0233);
- Facilitating compliance and reducing costs—under a single standard, employers would be able to train workers in a single set of rules rather than one set for construction and another set for maintenance (Tr. 293–294); and
- Eliminating the need to maintain and update two standards over time (see, for example, Exs. 0127, 0149, 0152, 0179).

OSHA is rejecting these recommendations to combine § 1910.269 and subpart V into a single standard. First, OSHA does not believe that employers will have to maintain separate sets of rules for construction and maintenance. Because the final rule largely adopts identical requirements for construction and maintenance, OSHA expects that employers will be able to fashion a single set of rules, consistent with both § 1910.269 and subpart V, that apply regardless of the type of work being performed. In the final standard, OSHA is adopting different rules in a few cases, based on fundamental differences between the other construction standards in part 1926 and the general industry standards in part 1910. For example, § 1910.269 and subpart V reference the general industry and construction standards on medical services and first aid in §§ 1910.151 and 1926.50, respectively. These general industry and construction standards set slightly different requirements for

medical services and first aid. Similarly, § 1910.269 and subpart V separately reference the general industry and construction standards on ladders. The differences between the construction and general industry standards that may apply to electric power generation, transmission, and distribution work go well beyond the few examples described here. It is beyond the reach of this rulemaking to unify all of the different general industry and construction standards that apply to electric power generation, transmission, and distribution work. Consequently, any employer that performs both general industry and construction work will need to ensure compliance with applicable provisions in both part 1910 and part 1926. Even if OSHA were to adopt one electric power generation, transmission, and distribution standard, employers would still be faced with differences between other requirements in the general industry and construction standards.

Second, commenters' concerns over differences in language and interpretation are largely unfounded. As noted in the preamble to the proposal, one of the primary goals of this rulemaking is to make the requirements for construction and maintenance consistent with one another. The Agency will take steps to ensure that interpretations of identical requirements in the two standards are the same. Toward this end, the Agency is including a note to final § 1926.950(a)(1)(i) to indicate that an employer that complies with § 1910.269 generally will be considered in compliance with the requirements in subpart V. There is a minor exception for provisions in subpart V that incorporate by reference requirements from other subparts of part 1926. For those provisions of subpart V, the employer must comply with the referenced construction standards; compliance with general industry standards referenced in comparable provisions of § 1910.269 will not be sufficient. The new note to § 1926.950(a)(1) should allay the concerns of commenters about potentially inconsistent interpretations of identical requirements in § 1910.269 and subpart V. The note should also assure employers that they can adopt uniform work practices for the construction, operation, and maintenance of electric power generation, transmission, and distribution installations with regard to these requirements.

Ameren Corporation was concerned that OSHA would "make significant and costly changes to the current 1910.269

standard without adequately providing the opportunity for utilities to study and comment on the impact to these changes" (Ex. 0209). The company requested that the Agency provide the utility industry with an opportunity to comment on any changes to existing § 1910.269 that were not identified in the proposal.

OSHA does not believe additional notice and opportunity for comment is necessary for any of the revisions to § 1910.269 being made in this final rule. In the preamble to the proposed rule, the Agency stated:

OSHA expects that final Subpart V will differ from proposed Subpart V because of changes adopted based on the rulemaking record. When the final rule is published, the Agency intends to make corresponding changes to § 1910.269 to keep the two rules the same, except to the extent that substantial differences between construction work and general industry work warrant different standards. [70 FR 34892]

The Agency met this objective in this final rule. OSHA concludes that any revisions to existing § 1910.269 adopted in the final rule are based on the record considered as a whole and are a logical outgrowth of the rulemaking record.

Mr. Anthony Ahern with Ohio Rural Electric Cooperatives recommended that OSHA combine §§ 1910.137 and 1926.97, or simply reference § 1910.137, instead of creating a new section on electrical protective equipment in the construction standards (Ex. 0186).

OSHA rejects this request. New § 1926.97 applies to all of construction, not just electric power generation, transmission, and distribution work. Final § 1926.97 imposes no additional burden on employers beyond what would apply under § 1910.137. Duplicating the § 1910.137 requirements in part 1926 meets the needs of construction employers and employees for ready access to the protective equipment standards that are applicable to their work.

Ms. Salud Layton of the Virginia, Maryland & Delaware Association of Electric Cooperatives objected to the word "improvement" in proposed § 1926.950(a)(1) (Ex. 0175). Ms. Layton also expressed concern about a part of the preamble to the proposed rule in which OSHA used the term "repair" to describe construction activities (*id.*). She commented:

As defined in the regulation, "construction" includes "erection of new transmission and distribution lines and equipment, and the alteration, conversion, and improvement of existing electric transmission and distribution lines and equipment.["] While "alteration" and "conversion" can be construed as

construction activities, the term "improvement" is too broad. Many maintenance activities are considered improvements. Additionally, the preamble uses the term "repair" in describing construction activities. Repairs are typically considered maintenance activities in our industry, further complicating this issue. [*id.*]

OSHA considered Ms. Layton's comments, but decided to adhere to its longstanding practice of treating "improvements" and "repairs" as construction. The term "improvement" has been a part of the definition of construction work under Subpart V for decades. Furthermore, as noted earlier, this definition is codified in 29 CFR 1910.12(d). In addition, removing the term would have no practical effect on the definition, as all improvements are "alterations," a term to which she did not object. OSHA has consistently treated "repairs" as construction work as well. See § 1910.12(b) ("Construction work means work for construction, alteration, and/or repair. . . ."). OSHA recognizes that there may not always be a clear distinction between construction repair and general industry maintenance and has provided clarification in numerous letters of interpretation, including the Agency's Memorandum for Regional Administrators dated August 11, 1994.³⁷ That memorandum explains construction work as follows:

[C]onstruction work is not limited to new construction. It includes the repair of existing facilities. The replacement of structures and their components is also considered construction work.

* * * * *

There is no specified definition for "maintenance", nor a clear distinction between terms such as "maintenance", "repair", or "refurbishment." "Maintenance activities" can be defined as making or keeping a structure, fixture or foundation (substrates) in proper condition in a routine, scheduled, or anticipated fashion. This definition implies "keeping equipment working in its existing state, i.e., preventing its failure or decline." However, this definition, (taken from the directive on confined spaces) is not dispositive; and, consequently, determinations of whether a contractor is engaged in maintenance operations rather than construction activities must be made on a case-by-case basis, taking into account all information available at a particular site. [Emphasis included in original.]

(See also, for example, letter to Raymond Knobbs (Nov. 18, 2003) and letter to Randall Tindell (Feb. 1, 1999).³⁸) In addition, the Occupational

³⁷ This document is available at http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=21569.

³⁸ The Knobbs and Tindell letters are available at http://www.osha.gov/pls/oshaweb/owadisp.show_

Safety and Health Review Commission (OSHC) has addressed this issue. (See, for example, *Gulf States Utilities Co.*, 12 BNA OSHC 1544 (No. 82–867, Nov. 20, 1985).) In any event, one of OSHA's primary objectives in this rulemaking is to make § 1910.269 and subpart V more consistent with each other. Therefore, going forward, the distinction between construction and maintenance will be of much less significance to employers covered by these standards. Even Ms. Layton recognized that her concern about the definition of construction was only relevant “[i]f the regulations are not the same” (Ex. 0175). The proposed definition of “construction” in § 1926.950(a)(1) is, therefore, being carried forward into the final rule without change.

Mr. Kenneth Stoller of the American Insurance Association inquired about the applicability of the revised standards to insurance industry employees, stating:

AIA is concerned that the new contractor obligations contemplated by the proposal with respect to training, reporting, record-keeping and personal protective equipment may unintentionally apply to insurance industry employees, whose only obligation is to inspect—but not work on—some of the electrical equipment in question. While our members are neither electrical utilities nor electrical construction companies, some of their commissioned inspectors are required to visit and inspect equipment that is both energized and open. In addition, some state laws identify certain equipment (such as pressure vessels) located within close proximity to energized and open electrical apparatus that must be inspected periodically.

Subjecting insurers to these new requirements would require individual companies to spend tens of thousands of dollars per year for additional training and equipment, notwithstanding the fact that the proposal's preamble indicates that these obligations should only apply to entities performing maintenance and repairs, not simply inspections. Accordingly, we recommend that the proposal be amended to explicitly exempt insurance industry employees from any obligations it places on contractors. [Ex. 0198]

OSHA considered this comment, but will not be exempting insurance industry employees from the final rule. Existing § 1910.269 already covers inspections of electric power generation, transmission, and distribution installations performed by insurance company workers as work “directly associated with” these installations. In this regard, existing

[document?p_table=INTERPRETATIONS&p_id=24789](http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=24789) and http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=22687, respectively.

§ 1910.269(a)(1)(i)(D) states that “[§ 1910.269 applies to:] (D) Work on or directly associated with [electric power generation, transmission, and distribution and other covered] installations. . . .” OSHA, therefore, interprets existing § 1910.269(a)(1)(i)(D) as applying to inspections conducted by insurance company employees because the purpose of these inspections is to assure the safety of these installations and employees working on or near them. Insurance inspections are similar to inspections conducted by electric utilities and their contractors. The preamble to the 1994 final rule adopting § 1910.269 specifically listed “inspection” as an activity covered by that standard (59 FR 4333). Section 1910.269 applies to this type of work without regard to the industry of the employer that has employees performing the inspections.³⁹ Thus, existing § 1910.269 covers this work as it pertains to general industry and will continue to cover this work after the final rule becomes effective. However, insurance inspections may fall under subpart V, instead of § 1910.269, to the extent the inspections are construction work. Whether an insurance inspection constitutes construction depends on the characteristics of the work performed. (See, for example, *CH2M Hill, Inc. v. Herman*, 192 F.3d 711 (7th Cir. 1999).)

OSHA does not believe that the final rule will impose substantial additional costs on the insurance industry. Existing § 1910.269 currently covers the vast majority of insurance inspections on electric power installations. Of the new provisions this final rule is adding to § 1910.269, the ones that impose the greatest costs on all employers are unlikely to impose significant economic burdens on inspections conducted by insurance industry workers. First, the minimum approach distance and arc-flash-protection requirements usually will not apply to the insurance industry because insurance industry inspectors will almost never be qualified employees (see final §§ 1910.269(l) and 1926.960).⁴⁰

Second, the host-contractor provisions in §§ 1910.269(a)(3) and 1926.950(c) should not impose significant costs on the insurance

industry. As explained in Section VI, Final Economic Analysis and Regulatory Flexibility Analysis, later in this preamble, OSHA estimated the costs of the host-contractor provisions on a per-project basis; that is, employers will incur costs once for each project. OSHA believes that its estimate of the number of projects fully accounts for projects that involve inspections, including insurance inspections, of electric power generation, transmission, and distribution installations, though OSHA allocated the costs to contract employers generally. OSHA anticipates that the number of insurance inspections will be a small fraction of the number of overall projects. If 1 in every 1,000 projects involves an insurance inspection, then the total costs related to employers' complying with the host-contractor provisions for insurance inspections would be less than \$20,000 per year, half of which host employers would bear. The Agency deems such costs an inconsequential portion of the overall costs of the final rule and not significant for the insurance industry.

Third, OSHA does not believe that insurance inspections will typically involve employees working from aerial lifts or on poles, towers, or similar structures covered by the personal protective equipment requirements in final §§ 1910.269(g)(2)(iv)(C) and 1926.954(b)(3)(iii). Mr. Stoller's lone example of work potentially affected by the final rule, the inspection of pressure vessels, is not generally covered by those provisions, which primarily affect work involving overhead transmission and distribution lines. OSHA is unaware of any other insurance inspection work that would involve employees working from aerial lifts or on poles, towers, or similar structures. Even if such inspections are taking place, they should be rare, and the Agency deems costs associated with such inspections an inconsequential portion of the overall costs of the final rule, and inconsequential as well for the insurance industry.

Paragraph (a)(1)(ii) of final § 1926.950 provides that subpart V does not apply to electrical safety-related work practices for unqualified employees. Electrical safety-related work-practice requirements for these employees are contained in other subparts of part 1926, including subparts K, N, and CC. For example, § 1926.416(a)(1) in subpart K prohibits employers from permitting an employee to work in such proximity to any part of an electric power circuit that the employee could contact the electric power circuit in the course of work, unless the employee is protected against

³⁹ See the letter of interpretation dated June 9, 1999, to Mr. G. William Doody, which is available at http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=22749.

⁴⁰ According to final § 1910.269(a)(1)(ii)(B), § 1910.269 does not apply to electrical safety-related work practices covered by Subpart S. Subpart S applies to work performed by unqualified persons on, near, or with electric power generation, transmission, and distribution installations (see § 1910.331(b)).

electric shock by deenergizing the circuit and grounding it or by guarding it effectively by insulation or other means. Deenergizing circuits and insulating them from employees protects unqualified employees from electric shock. By contrast, subpart V, in final § 1926.960(b)(1)(i), permits only qualified employees to work on or with exposed energized lines or parts of equipment. Final § 1926.960(c)(1)(iii) requires the employer to ensure that no employee approaches or takes any conductive object closer to exposed energized parts than the minimum approach distances, established by the employer under final § 1926.960(c)(1)(i), unless the employee is insulated from the energized part (for example, with rubber insulating gloves and sleeves), or the energized part is insulated from the employee and from any other conductive object at a different potential, or the employee is performing live-line barehand work in accordance with § 1926.964(c).

Subpart CC generally requires employers to ensure that employees maintain minimum clearances when operating cranes or derricks near overhead power lines. Paragraph (a)(6) of § 1926.600 also generally requires minimum clearances when mechanical equipment is operated near overhead power lines. In part because subpart V establishes requirements for qualified employees operating mechanical equipment, § 1926.959(d)(1) of this final rule generally requires mechanical equipment, including cranes and derricks, to maintain minimum approach distances that are significantly less than the minimum clearance distances in either § 1926.600(a)(6) or subpart CC.

OSHA did not expressly propose to exempt electrical safety-related work practices used by unqualified employees from subpart V; however, the preamble to the proposal made it clear that subpart V's requirements did not apply to electrical safety-related work practices used by unqualified employees. (See, for example, 70 FR 34857.) Specifically, the Agency stated: "The general approach taken in the proposed revision of Subpart V is to provide safety-related work practices for qualified employees to follow when they are performing electric power transmission and distribution work. Safe work practices for unqualified employees are not addressed in proposed Subpart V . . ." (70 FR 34857). Information in the record shows that the requirements in subpart V are not sufficiently protective for unqualified employees. (See, for example, Exs. 0077, 0134.) For example,

NFPA 70E contains electrical safety-related work practice requirements to protect unqualified employees from electrical hazards posed by electric power transmission and distribution installations (Ex. 0134).⁴¹ The consensus standard requires unqualified employees to maintain minimum approach distances that are substantially greater than the minimum approach distances in Subpart V.

OSHA designed subpart V to mirror the requirements in § 1910.269. Existing § 1910.269(a)(1)(i)(A), which is being adopted in the final rule without substantive change, provides that § 1910.269 applies to "[p]ower generation, transmission, and distribution installations, including related equipment for the purpose of communication or metering, which are accessible only to qualified employees." Existing (and final)

§ 1910.269(a)(1)(ii)(B) explicitly excludes "electrical safety-related work practices . . . covered by subpart S of this part" from coverage. According to § 1910.331(b), subpart S covers electrical safety-related work practices for unqualified employees working on, near, or with installations for the generation, transmission, or distribution of electric energy. Thus, § 1910.269 does not apply to electrical safety-related work practices for unqualified employees.

In conclusion, OSHA notes that the electrical safety-related work practices required by Subpart V do not provide sufficient protection for unqualified employees. Therefore, Subpart V does not and should not cover such work practices. The final rule, in § 1926.950(a)(1)(ii), expressly clarifies that Subpart V does not cover electrical safety-related work practices for unqualified employees.

Paragraph (a)(2) of final § 1926.950, which is being adopted without change from the proposal, explains that subpart V applies in addition to all other applicable standards contained in part 1926. This paragraph also provides that employers doing work covered by subpart V are not exempt from complying with other applicable provisions in part 1926 by the operation of § 1910.5(c). Paragraph (a)(2) also clarifies that specific references in subpart V to other sections of part 1926 are provided for emphasis only. In accordance with this provision, all construction industry standards continue to apply to work covered by subpart V unless there is an applicable

exception in subpart V or elsewhere in part 1926. For example, § 1926.959(a)(2) requires the critical safety components of mechanical elevating and rotating equipment to be visually inspected before each shift. This provision does not supersede § 1926.1412(d), which details specific requirements for the visual inspection of cranes each shift by a competent person. In a change that OSHA considers nonsubstantive, § 1910.269(a)(1)(iii) is being amended to include language equivalent to that in § 1926.950(a)(2).

Subpart V has never applied to work on electric power generation installations. Proposed § 1926.950(a)(3) provided that § 1910.269 would cover all work, including construction, involving electric power generation installations. In the preamble to the proposal, the Agency explained that the construction of an electric power generation station normally poses only general construction hazards, that is, hazards not addressed by subpart V (70 FR 34833). OSHA recognized, however, the following two exceptions to this conclusion: (1) during the final phase of construction of a generating station, when electrical and other acceptance testing of the installation is being performed, and (2) during "reconstruction," when portions of the generating station not undergoing construction are still in operation (*id.*). In both of these scenarios, construction work at a generation station exposes workers to hazards akin to those posed by the operation and maintenance of a generation plant. Because the Agency believed that these two operations were more like general industry work than construction, it deemed it appropriate for employers to follow § 1910.269 in those situations (*id.*). Rather than repeat the relevant portions of § 1910.269 in subpart V, OSHA proposed that § 1910.269 apply to all work involving electric power generation installations.

The Agency requested comments on whether § 1910.269 should apply to all work involving electric power generation installations, as proposed, or whether instead the relevant requirements from § 1910.269 should be contained in final subpart V for purposes of construction work involving electric power generation installations. OSHA received numerous responses to this request. (See, for example, Exs. 0125, 0127, 0130, 0149, 0151, 0155, 0159, 0162, 0163, 0172, 0177, 0179, 0186, 0188, 0201, 0208, 0209, 0212, 0213, 0227, 0230.) Commenters largely supported OSHA's proposed approach and the language making § 1910.269 applicable to all work involving electric power generation installations. For

⁴¹ See NFPA 70E-2004, Section 110.1, which sets the scope for Article 110, General Requirements for Electrical Safety-Related Work Practices (Ex. 0134).

example, Mason County Public Utility District 3 commented: “We believe the proposed language referencing 1910.269 for all work involving electric power generation installations should be adopted” (Ex. 0125). Siemens Power Generation responded similarly, explaining, “Subpart V should not apply to the electric power generation installations [because m]aintenance in these installations is covered adequately by 1910.269 and construction is covered adequately by general construction requirements” (Ex. 0163). In addition, Mr. Tom Chappell of Southern Company agreed with OSHA that “[a]pplying 1910.269 during the ‘final phase of construction’ or ‘reconstruction work’ would be preferable to recreating the same requirements in Subpart V” (Ex. 0212).

On the other hand, NIOSH suggested that it “would be less burdensome” for employers if the relevant requirements for construction at generation installations were incorporated in subpart V (Ex. 0130). In addition, MYR Group was concerned that OSHA’s proposed approach could lead to confusion, explaining:

[A]pplying part 1910 electrical standards [to construction work involving generation installations] would cause confusion as to whether other applicable general industry or construction standards would govern the remaining aspects of such work. Thus, OSHA’s proposal—based on an alleged simplification—does itself create confusion. (Ex. 0162)

OSHA considered these comments, but does not believe that applying § 1910.269 to construction involving generation installations is likely to result in any heavy burdens or confusion. OSHA’s construction standards (29 CFR part 1926) apply to general construction activities performed at generation installation sites. As previously explained, § 1910.269 generally will not apply to the original construction of a generating station until the final phase of construction, when many of the provisions in § 1910.269 become applicable. For example, in the early construction phases, the generation installation would contain no energized circuits, so the provisions for working near energized parts in § 1910.269(l) would not apply. Similarly, in the construction of a coal-fired generating station, the requirements in § 1910.269(v)(11) on coal handling would have no application until coal is present. To the extent an employer is performing late-stage construction or reconstruction of a generation installation and § 1910.269 applies, the provisions of § 1910.269 supplement,

but do not replace, any relevant general construction requirements. (See §§ 1910.269(a)(1)(iii) and 1926.950(a)(2).) For example, the training requirements in § 1910.269(a)(2) apply in addition to any applicable training requirements in part 1926.⁴²

With this additional clarification and the support of most of the commenters who provided feedback on this issue, the Agency is adopting proposed § 1926.950(a)(3) as it relates to the construction of electric power generation installations.⁴³

Another coverage issue raised in the proposal relates to line-clearance tree trimming, which is currently addressed in § 1910.269.⁴⁴ (See existing § 1910.269(a)(1)(i)(E).) As OSHA explained in the preamble to the proposal, line-clearance tree trimming is not normally performed as part of the construction of electric power transmission or distribution installations (70 FR 34833). One exception occurs when trees are trimmed along an existing overhead power line to provide clearance for a new transmission or distribution line that is under construction (*id.*). While this type of work by line-clearance tree trimmers is properly classified as construction work, it shares many similarities with the work done by line-clearance tree trimmers that is properly classified as general industry work.⁴⁵ For this reason, as well as for ease of compliance and enforcement, proposed § 1926.950(a)(3) provided that § 1910.269 would apply to all line-clearance tree-trimming operations,

⁴² Paragraph (e) of § 1910.269 contains requirements for work in enclosed spaces. OSHA recently proposed a standard covering confined spaces in construction, which will cover many of the same hazards. OSHA will consider how to apply these new confined space provisions to the construction of power generation installations in the development and promulgation of that final rule.

⁴³ Current § 1910.269(a)(1)(ii)(A) provides that § 1910.269 does not apply to construction work. In the final rule, OSHA is revising this paragraph to indicate that § 1910.269 does not apply to construction work, as defined in § 1910.12, except for line-clearance tree-trimming operations and work involving electric power generation installations as specified in § 1926.950(a)(3). This change makes the application of § 1910.269 consistent with the coverage of work involving electric power generation installations in subpart V.

⁴⁴ Line-clearance tree trimming is also addressed in § 1910.268 when the lines involved are telecommunications lines. (See 29 CFR 1910.268(q).)

⁴⁵ Throughout the preamble discussion of this final rule, OSHA generally refers to line-clearance tree trimmers who are not qualified employees under § 1910.269 or subpart V as “line-clearance tree trimmers,” and to qualified employees who also meet the definition of “line-clearance tree trimmers” as “qualified employees.”

even those that might be considered construction. OSHA requested comments on whether § 1910.269 should apply to all work involving line-clearance tree trimming, as proposed, or whether the relevant requirements from § 1910.269 should be contained in subpart V.

The Agency received a handful of comments on this issue. (See, for example, Exs. 0175, 0186, 0201, 0213, 0230.) These comments generally supported OSHA’s proposed approach. For example, Mr. Anthony Ahern of Ohio Rural Electric Cooperatives agreed that OSHA need not duplicate the line-clearance tree-trimming requirements from § 1910.269 in subpart V (Ex. 0186). Also, Mr. James Gartland of Duke Energy commented that the requirements for line-clearance tree-trimming operations should be covered exclusively under § 1910.269, explaining that line-clearance tree-trimming operations are the same whether one considers the work to be general industry or construction (Ex. 0201).

IBEW asked OSHA to clarify whether § 1910.269 would apply even to tree-trimming operations that could be considered “construction,” for example clearing around existing energized facilities for a new right of way (Ex. 0230). OSHA is applying § 1910.269 in those circumstances. Given that clarification, IBEW agreed that the § 1910.269 requirements for line-clearance tree-trimming operations do not need to be repeated in subpart V (Ex. 0230). In light of the commenters’ support, OSHA is adopting § 1926.950(a)(3) as proposed with respect to line-clearance tree trimming.⁴⁶

Although the tree trimming industry did not object to covering all line-clearance tree trimming in § 1910.269, representatives of the industry urged the Agency to expand the scope of covered line-clearance tree-trimming activities by broadening the definition of that term. (See, for example, Exs. 0174, 0200, 0502, 0503; Tr. 620–628, 765–769.) The proposed definition of “line-clearance tree trimming” in § 1926.968, which was based on existing § 1910.269(x), read as follows:

⁴⁶ Current § 1910.269(a)(1)(ii)(A) provides that § 1910.269 does not apply to construction work. In the final rule, OSHA is revising this paragraph to indicate that § 1910.269 does not apply to construction work, as defined in § 1910.12, except for line-clearance tree-trimming operations and work involving electric power generation installations as specified in § 1926.950(a)(3). This change makes the application of § 1910.269 consistent with the coverage of line-clearance tree-trimming operations in subpart V.

The pruning, trimming, repairing, maintaining, removing, or clearing of trees or the cutting of brush that is within 3.05 m (10 feet) of electric supply lines and equipment.

The Utility Line Clearance Coalition (ULCC) commented that the definition of line-clearance tree trimming should not be limited to trees within 3.05 meters (10 feet) of an electric supply line. ULCC requested that OSHA expand the definition of “line-clearance tree trimming” to include all vegetation management work done by line-clearance tree trimmers and trainees for the construction or maintenance of electric supply lines or for electric utilities (Ex. 0502). The Tree Care Industry Association (TCIA) proposed the same change to the definition of “line-clearance tree trimming” (Ex. 0503). Both tree trimming trade associations recommended that the definition of “line-clearance tree trimming” be revised to read as follows:

The pruning, trimming, repairing, maintaining, removing, treating or clearing of trees or the cutting of brush (vegetation management) that is within 10 feet (305 cm) of electric supply lines and equipment, or vegetation management work performed by line clearance tree trimmer/trainees for the construction or maintenance of electric supply lines and/or for electric utilities. [Exs. 0502, 0503]

The industry provided three main arguments in support of its recommendation to expand the scope of tree-trimming work covered by § 1910.269. For the reasons described later, OSHA is not persuaded by the industry’s arguments and will not be expanding the definition of “line-clearance tree trimming” to include all vegetation management work for the construction or maintenance of electric supply lines or for electric utilities. However, OSHA is making some changes to the definition of “line-clearance tree trimming” that will broaden, in a limited manner, the scope of tree-trimming operations covered by § 1910.269. These changes are discussed later in this section of the preamble.

The tree trimming industry’s first argument in support of its recommended definition is that the “10-foot rule” (as they described it) contradicts other portions of § 1910.269. Joe Tommasi of the Davey Tree Expert Company, testifying on behalf of ULCC, noted:

[T]he minimum separation distances tables in the standard requires [sic] a line clearance arborist to maintain more than ten feet from some lines depending on the voltage exposures, but at the same time, the definition says that such work is not subject to [the] line clearance tree trimming standard because the standard [applies] only to trees

that are within the ten feet of overhead conductors. [Tr. 622]

Mr. Tommasi also suggested that some requirements, such as those for spraying herbicides and stump cutting, may apply to work that takes place more than 3.05 meters away from power lines (Tr. 622–623).

OSHA does not find this argument persuasive. This first of the tree trimmers’ arguments reflects a basic misunderstanding of the way the proposed standard worked. Under the proposed rule, tree-trimming work was covered by § 1910.269 only to the extent it was done on trees or brush within 3.05 meters of electric supply lines and equipment. If it was done on trees or brush more than 3.05 meters away from lines and equipment, none of the provisions in proposed § 1910.269 applied. The proposed “10-foot rule” did not create any internal conflicts in § 1910.269. For work done outside of the 3.05-meter boundary, the proposed provisions the industry was concerned about, that is, minimum approach distances and requirements for spraying herbicides and stump cutting, did not apply.

The tree trimmers’ second justification for expanding the definition of line-clearance tree trimming in § 1910.269 is that the “10-foot rule” undermines safety by causing different safety requirements to apply to line-clearance tree trimmers depending on their distance from the line. Mr. Tommasi testified that “experience teaches that a single set of safety rules applicable to the line tree arborist achieves the highest rate of compliance and thus the highest safety” (Tr. 625). Mr. Tommasi maintained that Federal and State OSHA compliance officials have enforced other standards, such as OSHA’s logging standard (29 CFR 1910.266), during arborist operations more than 3.05 meters from power lines (*id.*). Further, ULCC commented that “the foundation of worker safety in line clearance tree trimming is adherence to a single predictable set of safety standards in which employees can be trained and repeatedly drilled” (Ex. 0174).

OSHA appreciates the industry’s desire for a single set of safety-related work practices, but changing the definition of “line-clearance tree trimming” in § 1910.269 would not necessarily achieve the industry’s goal. As stated previously, even work covered by § 1910.269 and subpart V must comply with all other applicable general industry and construction standards. In any event, the Agency does not believe that it is necessary to employee safety to

address in § 1910.269 every hazard faced by line-clearance tree trimmers. Employers in every industry, including line-clearance tree trimming firms, must identify all OSHA standards applicable to their work, along with their general duty clause obligations, and then set, communicate, and enforce a set of work rules that meets all of the applicable requirements. For example, if a line-clearance tree trimming contractor performs work that falls under the logging or site-clearing standards (§§ 1910.266 and 1926.604, respectively), the contractor will have to ensure that its work rules meet those standards, in addition to § 1910.269.⁴⁷

The provisions on brush chippers, sprayers and related equipment, stump cutters, gasoline-engine power saws, backpack units for use in pruning and clearing, rope, and fall protection (§ 1910.269(r)(2), (r)(3), (r)(4), (r)(5), (r)(6), (r)(7), and (r)(8), respectively) in existing § 1910.269 were taken, in part, from the EEL-IBEW draft on which § 1910.269 was based. Those provisions were “checked against the equivalent ANSI standard, ANSI Z133.1–1982[, *American National Standard for Tree Care Operations—Pruning, Trimming, Repairing, Maintaining, and Removing Trees, and Cutting Brush—Safety Requirements*] ([269]-[Ex. 2–29], to be sure that OSHA’s regulations would better effectuate safety than the national consensus standard” (59 FR 4322). However, OSHA did not incorporate a comprehensive tree-trimming standard in § 1910.269. Thus, many important safety provisions included in applicable consensus standards and in other OSHA standards were not included in § 1910.269, and that section does not address some important safety hazards faced by workers performing tree care operations. For example, § 1910.269 does not contain any specific requirements to protect workers felling trees. Those requirements are in OSHA’s logging standard. Furthermore, even with respect to the nonelectrical hazards that are regulated in the § 1910.269 tree-trimming provisions, the OSHA standards do not cover those hazards as comprehensively as the current version,

⁴⁷ ULCC suggested that the references in § 1910.269(r)(5) to specific requirements in the logging standard “shows OSHA’s intent to not apply [the] logging standard to line clearance unless so-designated” (Ex. 0174). This is an erroneous interpretation that overlooks existing § 1910.269(a)(1)(iii), which explains that “[s]pecific references in this section to other sections of part 1910 are provided for emphasis only.” Other relevant provisions in part 1910 continue to apply, including other provisions in the logging standard, if the work being performed falls within the scope of those standards and within the scope of § 1910.269 at the same time.

or even the 1982 version, of ANSI Z133.1.⁴⁸ For example, the new and old consensus standards include additional requirements for brush chippers and provisions on hand tools such as axes, pruners, and saws that are not contained in § 1910.269. For these reasons, adopting the industry's recommendation to have § 1910.269 be the exclusive source of requirements for tree-trimming work would not improve employee safety. Instead, it would jeopardize the workers performing those operations. For example, an employer may perform a logging operation near an overhead power line under contract with an electric utility to remove trees along the right of way for the power line. Applying the tree care industry's recommendation and logic to this work would place that work exclusively under § 1910.269, eliminating the protection provided by the logging standard's tree-felling provisions.

The Agency has published an advance notice of proposed rulemaking to gather information to use in developing a comprehensive standard on tree care operations (73 FR 54118–54123, Sept. 18, 2008). In that rulemaking, OSHA will consider whether, and to what extent, any new standard on tree care operations should cover line-clearance tree trimming.

The tree trimmers' third justification for expanding the definition of line-clearance tree trimming in § 1910.269 is that the electrical hazards regulated by § 1910.269 exist at distances greater than 3.05 meters from the line. ULCC argued that there are many circumstances that expose line-clearance tree trimmers to electrical hazards at distances beyond 3.05 meters from the line, such as when a tree or section of a tree can fall into the line even though the tree itself is farther than 3.05 meters away (Ex. 0174). To illustrate this point, Mr. Tommasi provided an example of a 15.2-meter tall oak tree located 4.6 meters from an overhead power line (Tr. 623).

OSHA has considered this argument, but has concluded that the 3.05-meter rule is generally reasonable and consistent with provisions in 29 CFR part 1910, subpart S, OSHA's general industry electrical standards. An examination of the different requirements that apply to the electrical

hazards posed by tree-trimming operations will illuminate the need to set a locus within which § 1910.269 should apply.

The line-clearance tree-trimming provisions in existing § 1910.269 contain several requirements to protect line-clearance tree trimmers from electrical hazards. First, to be considered line-clearance tree trimmers under § 1910.269, employees must, through training or experience, be familiar with the special techniques and hazards involved in line-clearance tree trimming.⁴⁹ (See existing § 1910.269(a)(1)(i)(E)(2) and the definition of "line-clearance tree trimmer" in existing § 1910.269(x).) Second, there must be at least two line-clearance tree trimmers present under any of the following conditions: (1) If a line-clearance tree trimmer is to approach any conductor or electric apparatus energized at more than 750 volts more closely than 3.05 meters, (2) if branches or limbs being removed are closer than the applicable minimum approach distances to lines energized at more than 750 volts, or (3) if roping is necessary to remove branches or limbs from such conductors or apparatus. (See existing § 1910.269(r)(1)(ii).) Third, when the voltage on the lines is 50 volts or more and two or more employees are present, generally at least two employees must be trained in first aid, including cardiopulmonary resuscitation.⁵⁰ (See existing § 1910.269(b)(1).) Fourth, employees must maintain minimum approach distances appropriate for qualified employees. (See existing § 1910.269(r)(1)(iii) and (r)(1)(v).) Fifth, employees must use insulating equipment to remove branches that are contacting exposed, energized conductors or equipment or that are within the applicable minimum approach distances of energized conductors or equipment. (See existing § 1910.269(r)(1)(iv).) Sixth, line-clearance tree-trimming work may not be performed when adverse weather conditions make the work hazardous in

spite of the work practices required by § 1910.269. (See existing § 1910.269(r)(1)(vi).) Seventh, mechanical equipment must maintain appropriate minimum approach distances, and certain measures must be taken to protect employees on the ground from hazards that might arise from equipment contact with energized lines. (See existing § 1910.269(p)(4).)

Requirements for tree trimmers who are not performing line-clearance tree trimming (as defined in final § 1910.269(x)), that is, "regular tree trimmers," are contained in Subpart S of the general industry standards in part 1910. It is important to note that, for the purposes of Subpart S, tree trimmers fall into two categories: (1) Regular tree trimmers, whom OSHA treats as unqualified persons, and (2) line-clearance tree trimmers (as defined in § 1910.269), whom OSHA considers qualified persons under subpart S. Line-clearance tree trimmers under § 1910.269 are exempt from the electrical safety-related work practice requirements in subpart S and must comply with the § 1910.269 requirements described previously.⁵¹ (See § 1910.331(c)(1).) In contrast, regular tree trimmers are subject to the subpart S requirements, but are not covered by § 1910.269.⁵²

Subpart S sets some basic requirements for regular tree trimmers.

⁵¹ Note 2 to the definition of "line-clearance tree trimmer" in existing § 1910.269(x) explains that line-clearance tree trimmers are considered qualified employees for purposes of the electrical safety-related work practices in Subpart S (§§ 1910.331 through 1910.335). Paragraph (c)(1) of § 1910.331 provides that §§ 1910.331 through 1910.335 do not apply to work performed by qualified persons, including line-clearance tree trimmers under § 1910.269, on or directly associated with generation, transmission, and distribution installations. In addition, Note 3 to § 1910.331(c)(1) clarifies that the agency considers line-clearance tree trimming to be work directly associated with such installations.

⁵² Currently, an employee must meet the definition of "line-clearance tree trimmer" in existing § 1910.269(x) and have training meeting § 1910.332(b)(3) to be considered a line-clearance tree trimmer who is a qualified employee for the purposes of subpart S. (See Note 1 to § 1910.332(b)(3), which states that a person must have the training required by that paragraph to be considered a qualified person.) As explained in the summary and explanation for §§ 1926.950(b)(2) and 1910.269(a)(2)(iii), later in this section of the preamble, OSHA added to § 1910.269 appropriate training requirements for line-clearance tree trimmers. Consequently, under this final rule, an employee must meet the definition of "line-clearance tree trimmer" and have training meeting § 1910.269(a)(2)(iii) to be considered a line-clearance tree trimmer who is a qualified employee for the purposes of subpart S. Under both the existing standards and the final rule, any given tree trimmer is either a line-clearance tree trimmer, who is considered a qualified employee under subpart S, or a regular tree trimmer, who is considered an unqualified employee under subpart S.

⁴⁸ As stated earlier, in its review of the EEI-IBEW draft, OSHA checked provisions of that draft against equivalent provisions in ANSI Z133.1-1982. However, because § 1910.269 is a standard for electric power generation, transmission, and distribution work and not a comprehensive standard on tree trimming, the Agency did not examine provisions in the ANSI standard that had no counterpart in the EEI-IBEW draft.

⁴⁹ Throughout this preamble, OSHA differentiates between line-clearance tree trimmers (as defined in § 1910.269) and other workers involved in tree-trimming operations. OSHA refers to employees doing tree-related work who are not line-clearance tree trimmers under § 1910.269 as "regular tree trimmers" (that is, all other tree trimmers) or "tree workers who are not line-clearance tree trimmers" (that is, all other tree trimmers and ground workers). See also the summary and explanation for § 1926.950(b)(2), later in this section of the preamble.

⁵⁰ See the summary and explanation for final § 1926.951(b)(1), later in this section of the preamble, for a discussion of the requirements for first-aid training for field work, such as line-clearance tree-trimming operations.

(Other requirements also apply, but are not germane to this discussion.) First, regular tree trimmers must be appropriately trained (see § 1910.332(b)(1) and (b)(2)), although the training required for regular tree trimmers is not as extensive as that required for line-clearance tree trimmers. Second, regular tree trimmers must generally maintain a minimum separation of 3.05 meters from overhead power lines (see § 1910.333(c)(3)(i) and (c)(3)(iii)). Finally, regular tree trimmers working on the ground may not contact vehicles or mechanical equipment capable of having parts of its structure elevated near energized overhead lines, except under certain conditions (see § 1910.333(c)(3)(iii)(B)).

As a general matter, OSHA believes that workers performing line-clearance tree-trimming operations under existing § 1910.269 are afforded more protection than workers performing regular tree-trimming operations under Subpart S. Under existing § 1910.269, line-clearance tree-trimming operations generally require the presence of at least two line-clearance tree trimmers trained in first aid, including cardiopulmonary resuscitation. Subpart S does not have a comparable requirement. Existing § 1910.269 forbids line-clearance tree-trimming operations from being performed when adverse weather conditions make work unsafe. Subpart S does not address weather conditions. Furthermore, in comparison with subpart S, existing § 1910.269 contains additional requirements to protect workers in case mechanical equipment contacts a power line. OSHA believes that these important protections in existing § 1910.269 must be required only when tree-trimming operations expose employees to the most serious electrical hazards, not any time electrical hazards are present, as posited by ULCC.

OSHA believes that the seriousness of electrical hazards posed by tree trimming depends on how close the tree is to the power line. The closer the tree is to the power line, the more difficulty the worker has in maintaining minimum approach distances. For example, roping may be necessary to maintain the required minimum approach distances. (This practice is addressed in existing § 1910.269(r)(1)(ii)(C).) Furthermore, when the tree is close to the power line, a worker trimming trees from an aerial lift has to be more concerned with the distances between the power line and the tree, the aerial lift, and himself or herself. The farther the tree is from the power line, the more room an employee has in which to maneuver the aerial lift.

Therefore, the Agency has only to decide how close the tree needs to be to a power line before the protections required by § 1910.269 are necessary. The Agency concludes that those protections should start when the tree is 3.05 meters from a power line. Under Subpart S, unqualified employees are not permitted within that distance, but they are permitted to work in compliance with subpart S outside of that distance (plus 100 millimeters (4 inches) of additional distance for every 10 kilovolts over 50 kilovolts). (See § 1910.333(c)(3)(i).) OSHA believes that it would be inconsistent to expand the definition of “line-clearance tree trimming” to the point that line-clearance tree trimmers working on trees or brush more than 3.05 meters from the lines would be entitled to the enhanced protections of § 1910.269, while employees doing other types of work closer to the lines (between 3.05 meters from the line and where the line-clearance tree trimmers are working) would be governed by the more limited protections afforded by subpart S. The Agency generally believes that any electrical hazards that are present when a tree is more than 3.05 meters from power lines are addressed adequately by subpart S.

Nevertheless, changes to the existing definition of “line-clearance tree trimming” in § 1910.269 (which is identical to the definition proposed for subpart V) are necessary to ensure consistency with the 3.05-meter rule that applies to unqualified employees under § 1910.331(c)(3)(i). As noted previously, under § 1910.333(c)(3)(i)(A)(1), 3.05 meters is the minimum distance an unqualified employee must maintain from overhead power lines. If the voltage is higher than 50 kilovolts, the required distance under § 1910.333(c)(3)(i)(A)(2) increases by 100 millimeters for every 10 kilovolts of voltage above 50 kilovolts. OSHA believes that this increase in distance reasonably captures the relationship between the severity of the electrical hazard and voltage. Therefore, OSHA decided that, although it is not expanding the definition of “line-clearance tree trimming” to the extent recommended by the tree trimming industry, it will add this extra distance to the definition of “line-clearance tree trimming” to accord with § 1910.333(c)(3)(i)(A). The revised definition appears in §§ 1910.269(x) and 1926.968.

Paragraph (b) of final § 1926.950 addresses training for employees. Subpart V currently contains no general provisions related to training employees in the safety practices necessary to

perform electric power transmission and distribution work. It is widely recognized that the types of work covered by this standard require special knowledge and skills. Additionally, final subpart V contains many safety-related work practice requirements that are necessary for the protection of employees. To gain the requisite knowledge and skills to use these work practices, employees must be adequately trained. Therefore, in the proposed revision of subpart V, OSHA included training requirements mirroring those already in § 1910.269, with a few changes and additions (discussed later). OSHA notes that editorial changes are being made throughout paragraph (b) to clarify that employers must ensure that “each” employee covered by a specific training provision receives the training required by that provision.⁵³

Paragraph (b)(1) contains training requirements applying to all employees performing work covered by subpart V. Siemens Power Generation and ORC Worldwide suggested deleting the heading “All employees” from proposed paragraph (b)(1). They expressed concern that the provision could be construed to require training for clerical employees or other workers doing tasks not covered by subpart V (Exs. 0163, 0208, 0235). Siemens commented:

By adding the word “ALL” the Agency is implying that training must be conducted for any and all employees regardless of their scope of task. It implies for example, that even for clerical employees that have no risk, there must be some documented training conducted to comply with this requirement. [Ex. 0163]

OSHA appreciates these concerns, but has elected to retain the title in paragraph (b)(1) as proposed. The Agency thinks that it is important to distinguish the training requirements in

⁵³ Several provisions in the proposed rule and existing § 1910.269 require employers to provide personal protective equipment (PPE) and training for “employees” or for “all employees.” The final rule amends these provisions to require PPE and training for “each employee.” These editorial, nonsubstantive changes emphasize that the standards’ training and PPE requirements impose a compliance duty to each and every employee covered by the standards and that noncompliance may expose the employer to liability on a per-employee basis. This action is in accord both with OSHA’s longstanding position and OSHA standards addressing employers’ duties. (See §§ 1910.9 and 1926.20(f); see also 73 FR 75568 (Dec. 12, 2008)). It should be noted that, if any provision in the final rule continues to require training or PPE for “employees” or for “all employees,” rather than for “each employee,” as described above, this was an unintentional omission on OSHA’s part and should not be interpreted as amending OSHA’s longstanding position, or the general standards, addressing employers’ duties to provide training and PPE to each employee.

paragraph (b)(1), which is broadly applicable to workers doing work covered by subpart V, from the requirements in paragraph (b)(2), which is applicable only to “qualified employees.” OSHA clarified in the proposal, and is reiterating here, that paragraph (b)(1) does not impose training requirements on employees who are not performing work covered by subpart V. The text of paragraph (b)(1) is self-limiting—employers need only ensure that each employee receives safety training that “pertain[s] to his or her job assignments” and that is “related to his or her work.”

As clerical workers do not perform the types of hazardous work covered by subpart V, this provision does not require employers to train such employees in live-line barehand or other work techniques addressed by this final rule. Employees performing clerical work or other work not covered by subpart V would not need to receive the same electrical safety training required for workers involved in the construction of transmission and distribution lines and equipment. However, employers must train clerical workers performing work covered by subpart V in the hazards to which they might be exposed.

Proposed paragraphs (b)(1)(i) and (b)(1)(ii) were borrowed in large part from provisions in existing § 1910.269. Paragraph (b)(1)(i) requires each employee to be trained in, and be familiar with, the safety-related work practices, safety procedures, and other safety requirements in subpart V that pertain to his or her job assignments. OSHA considers this training necessary to ensure that employees use the safety-related work practices outlined in subpart V. It should be noted that this provision requires employers to train employees not only in the content of the applicable requirements of the final rule but in how to comply with those requirements. OSHA received no comments on proposed paragraph (b)(1)(i) and is carrying it forward into the final rule without substantive change.

Proposed paragraph (b)(1)(ii) additionally provided that employees had to be trained in, and be familiar with, any other safety practices related to their work and necessary for their safety, including applicable emergency procedures, such as pole-top and manhole rescue. Proposed paragraph (b)(1)(ii) required that safety training be provided in areas that are not directly addressed by subpart V, but that are related to the employee’s job. This training fills in the gaps left when the final rule does not specify requirements

for every hazard the employee may encounter in performing electric power generation, transmission, or distribution work. OSHA explained in the preamble to the proposal that if more than one set of work practices could be used to accomplish a task safely, the employee would only need to be trained in the work methods to be used (70 FR 34833). For example, an insulator on a power line could be replaced by an employee using live-line tools or rubber insulating equipment or by an employee working without electrical protective equipment after deenergizing and grounding the line. The employee would only need to be trained in the method actually used to replace that insulator.

The Agency received numerous comments suggesting that the training requirement proposed in paragraph (b)(1)(ii) was too broad (Exs. 0156, 0160, 0168, 0170, 0202, 0206, 0207, 0229, 0233, 0237). Mr. Don Adkins of Davis H. Elliot Company, an electrical contractor, commented, for example, that this proposed provision was “impermissibly broad” and offered “no guidance as to what safety practices are ‘related’ to the work of those covered by the standard” (Ex. 0156). Mr. Robert Matuga of the National Association of Home Builders (NAHB) believed that paragraph (b)(1)(ii) was “overly broad,” potentially “creating an obligation for employers to provide training to workers . . . on almost every hazard that could conceivably be encountered on a construction jobsite” (Ex. 0168). He also argued that proposed paragraph (b)(1)(ii) is duplicative of § 1926.21(b)(2), which requires “[t]he employer [to] instruct each employee in the recognition and avoidance of unsafe conditions and the regulations applicable to his work environment to control or eliminate any hazards or other exposure to illness or injury” (*id.*). Also, the U.S. Small Business Administration’s (SBA) Office of Advocacy commented:

The scope of this mandatory employee training is not limited to work practices required by the proposed electrical standards, but extends to any other safety practices that are related to their work and necessary for their safety. The SBREFA panel was concerned that this language was overly broad and could be viewed as covering other, non-specified hazards on the worksite, such as ergonomic injuries from overhead work.

* * * * *

The proposed training language remains vague and OSHA should clarify what training is necessary to comply with the standard (as well as what alternative training is acceptable for compliance) [Ex. 0207]

Despite these comments, OSHA continues to believe that the requirement in proposed paragraph

(b)(1)(ii) is essential to the safety and welfare of employees and is adopting it without significant change in this final rule. Mr. Brian Erga of Electrical Safety Consultants International (ESCI) supported the proposed training requirements and attributed an increase in employee proficiency, and safer work environments, to the adoption of these provisions in existing § 1910.269. He explained:

It has been shown time and time again that high quality training and retraining not only provides a safer work site, but returns dividends in financial contributions and long term productivity to the employer. The proposed [1926.950(b) and associated verbiage in the preamble, if followed, will, in our opinion, move the industry to a safer work site. The current training requirements in 1910.269 and [the] proposed training requirements are not unduly burdensome, and will provide a more educated and experienced work force. [Ex. 0155]

Further, Mr. Donald Hartley with IBEW testified at the 2006 public hearing that “ensur[ing] that . . . employees are trained in the safety-related work practices, procedures, and requirements that pertain to their . . . assignments . . . is necessary to ensure that employees are equipped to deal with potential hazards associated with this dangerous work” (Tr. 876). He did not suggest that this training be limited only to the safety practices and other safety requirements in subpart V. Several rulemaking participants recognized that subpart V does not specifically address all hazards faced by employees performing covered work and suggested that training is an important factor in employee safety. For example, Mr. Lee Marchessault testified about the importance of training in substation rescue procedures, stating, “You should do rescue training from substation structures” (Tr. 572). Also, Energy United EMC commented that “proper training is necessary” to prevent employees in insulated aerial lifts from touching conductors (Ex. 0219). The record also indicates that employers train employees to protect them from heat-stress hazards (see, for example, Tr. 1129–1130), to ensure proper maintenance of protective clothing (see, for example, Tr. 471), and to supplement the line-clearance tree-trimming requirements in existing § 1910.269 (see, for example, Tr. 683).

Existing § 1910.269(a)(2)(i) already contains a requirement identical to the one proposed in § 1926.950(b)(1)(ii), and OSHA has successful enforcement experience with this provision. First, except for two questions addressing who needs to be trained in emergency and rescue procedures, the Agency has

not received any letters requesting interpretation or clarification of this provision, leading the Agency to believe that the requirement is not as ambiguous as the commenters claim. Second, OSHA has issued only a few citations under existing § 1910.269(a)(2)(i) (for example, in 2008, OSHA issued only 2 citations of § 1910.269(a)(2)(i) in 362 inspections of electric utilities), which supports OSHA's conclusion that employees performing work under existing § 1910.269 are generally being trained as required. Third, even EEI admits that "EEI members have generally found the training requirements of paragraph 1910.269(a)(2) to be workable for their employees" (Ex. 0227). Thus, it appears that electric utilities have not had difficulty complying with the identical requirement in existing § 1910.269(a)(2)(i).

On the other hand, the Agency agrees with these commenters that § 1926.950(b)(1)(ii) of the final rule sets a broad, general requirement to train employees. This is not an uncommon approach for an OSHA standard to take. OSHA's personal protective equipment (PPE) standards in §§ 1910.132(a) and 1926.95(a) require the employer to provide and ensure the use of protective equipment wherever it is necessary by reason of hazards of processes or environment, chemical hazards, radiological hazards, or mechanical irritants encountered in a manner capable of causing injury or impairment in the function of any part of the body through absorption, inhalation or physical contact. An employer is deemed to be in violation of the PPE standards when it fails to provide PPE despite having actual or constructive knowledge of a hazard in its facility for which protective equipment is necessary. (See, for example, *Cape & Vineyard Div. of the New Bedford Gas & Edison Light Co. v. OSHRC*, 512 F.2d 1148, 1152 (1st Cir.1975).) The general construction training requirement contained in § 1926.21(b)(2) is similarly broad, requiring employers to instruct each employee in the recognition and avoidance of unsafe conditions and the regulations applicable to his or her work environment to control or eliminate any hazards or other exposure to illness or injury. That standard has been interpreted to require employers to provide employees with "the instructions that a reasonably prudent employer would have given in the same circumstances." (*El Paso Crane & Rigging Co., Inc.*, 16 BNA OSHC 1419 (No. 90-1106, Sept. 30, 1993); see also *Pressure Concrete Constr. Co.*, 15 BNA

OSHC 2011 (No. 90-2668, Dec. 7, 1992) ("Because section 1926.21(b)(2) does not specify exactly what instruction the employees must be given, the Commission and the courts have held that an employer must instruct its employees in the recognition and avoidance of those hazards of which a reasonably prudent employer would have been aware.") The applicability of § 1926.21(b)(2) turns on an employer's actual or constructive knowledge of hazards, just as under the general PPE requirements. (See, for example, *W.G. Fairfield Co. v. OSHRC*, 285 F.3d 499 (6th Cir. 2002).)

OSHA is applying final paragraph (b)(1)(ii) in the same manner. Therefore, if an employer has actual knowledge of a hazard (for example, through safety warnings from equipment manufacturers or through injury experience), or if the employer has constructive knowledge of a hazard (for example, when industry practice recognizes particular hazards), then each employee exposed to the hazard must be trained. For the training to comply with this provision, it must be sufficient to enable the employee to recognize the hazard and take reasonable measures to avoid or adequately control it.

In addition, OSHA agrees with Mr. Matuga that, except to the extent that it only covers Subpart V work, paragraph (b)(1)(ii) requires the same training as § 1926.21(b)(2). Consequently, employers who meet § 1926.21(b)(2) also meet final § 1926.950(b)(1)(ii). Even though the final rule duplicates the general construction training provision, the Agency is adopting paragraph (b)(1)(ii) to maintain consistency with existing § 1910.269.

Mr. Lee Marchessault with Workplace Safety Solutions recommended that paragraph (b)(1)(ii) refer to rescues at heights generally, rather than just pole-top rescue, in the parenthetical listing examples of potentially applicable emergency procedures (Tr. 572). He noted that rescue procedures are performed from wind turbines, towers, and substation structures, as well as utility poles (*id.*).

OSHA has decided not to adopt this recommendation because no change is necessary. The types of emergency procedures listed in paragraph (b)(1)(ii) in the final rule are examples only. Pole-top rescue is listed because it is a widely recognized and used emergency procedure. The Agency notes, however, that training in these other types of emergency procedures is required if it is necessary for employee safety during the work in question.

OSHA proposed to add a new provision to both subpart V and § 1910.269 clarifying that the degree of training required is based on the risk to the employee for the task involved. OSHA explained that, under this proposed paragraph, the training provided to an employee would need to be commensurate with the risk he or she faces (70 FR 34834). The two provisions, proposed §§ 1910.269(a)(2)(i)(C) and 1926.950(b)(1)(iii), were based on § 1910.332(c), although § 1910.332(c) does not contain the "for the task involved" language. The purpose of these new training paragraphs was to ensure that an appropriate level of training is provided to employees. Employees who face little risk in their job tasks need less training than those whose jobs expose them to more danger. OSHA believed that this provision would ensure that employers direct their training resources where they will provide the greatest benefit, while still making sure that all employees receive adequate training to protect them against the hazards they face in their jobs (*id.*). OSHA noted in the preamble to the proposal that training already provided in compliance with existing § 1910.269 would be considered sufficient for compliance with these paragraphs (*id.*). The provisions would not require employers to make changes to existing training programs that comply with § 1910.269; rather, they would provide employers with options to tailor their training programs and resources to employees with particularly high-risk jobs (*id.*).

OSHA received several comments regarding paragraph (b)(1)(iii) of proposed § 1926.950. (See, for example, Exs. 0128, 0162, 0163, 0169, 0177, 0201, 0209, 0210, 0212, 0221, 0225, 0227, 0235; Tr. 873-874, 1316-1319, 1332-1333.)⁵⁴ Some commenters maintained that this provision was unnecessary or too vague. For example, Mr. Pat McAlister of Henry County REMC requested additional guidance to "clarify generally when and how risks link with training and [how to assign] the appropriate level of training to offset those risks" (Ex. 0210). EEI commented that this proposed training provision was unnecessary, explaining:

We question the soundness of changing the [current] requirements [in § 1910.269] because if compliance with existing Section 1910.269 training requirements is sufficient, there is no reason to add another regulatory

⁵⁴ The remaining discussion of these provisions refers to the proposed construction requirement. However, the comments and OSHA's resolution of those comments applies equally to the corresponding general industry provision as is generally the case throughout this preamble.

requirement, and the proposed provisions demonstrably have no purpose. The stated explanation is that the standard is intended to “provide employers with options,” but employers have those options without the added regulation. No additional provisions are necessary to preserve existing options. [Ex. 0227]

EEl went on to suggest that the added requirement would create confusion, commenting:

EEl’s concern is that the new language will likely create confusion among many employers who do not have access to or regularly consult the preambles to OSHA standards. All but the most sophisticated readers likely will assume that the revised standard imposes a requirement to modify existing training programs. Moreover, the proposal is unclear: The meaning of the term “degree of training” is difficult to discern in that it is not evident how OSHA would classify and evaluate a “degree” of training. [*Id.*]

Many of the comments received on proposed paragraph (b)(1)(iii) expressed concern only about the language tying training to “the task involved.” For example, Mr. Mark Spence with Dow Industries generally supported the proposed provision, but stated that the similar requirement in § 1910.332(c), which does not contain the “for the task involved” language, “has been in effect since 1990 without causing significant problems for employers” (Ex. 0128). Mr. Spence had concerns about the additional language in proposed paragraph (b)(1)(iii), explaining:

[T]he proposal refers to training “for the task involved”. Training programs typically are broad, rather than task-specific. [T]he present wording could be interpreted to indicate an unmanageable requirement to train affected employees on the details of each individual task. OSHA should consider re-wording this provision or clarifying that it means that, where necessary, additional training may be required for a particular task . . . [*Id.*]

Mr. Tom Chappell of Southern Company similarly noted that “[d]ue to the large number of different tasks that an employee may need to perform, it would be difficult to evaluate each task and identify the level of training that would be required” (Ex. 0212). Consumers Energy commented that, in its experience, “employees can safely complete hundreds of specific tasks” without the need for training in each task individually (Ex. 0177). Mr. Donald Hartley of IBEW testified that the requirement “to tie the degree of training to the risk to the employee for the task involved . . . is both an unworkable and inappropriate standard” (Tr. 873–874). Mr. William Mattiford with Henkels & McCoy testified:

[I]t’s not very clear as to what by definition, the degree of training shall be determined by the risk to the employee for the task involved. And that’s where we see it’s very confusing.

And if it’s literally taken that way, then it’s each individual task. So it’s not just setting a pole, but it’s digging a hole, to set the pole, to prefab the pole. Each one of those things could be, I guess, understood as being training for each one of those tasks.

And I feel as though, many of us feel as though that by the design of the training programs today that have redundancy and overlapping in them, you do cover all of those.

But to actually spell out perhaps a lesson plan for each one of those tasks I think would be just too difficult to do, if not impossible. [Tr. 1339]

Mr. Wilson Yancey with Quanta Services agreed with these comments:

I agree with Bill’s comments, too. I think most of that is being covered today. If we have to go down and copy it and put lesson plans for everything, we will never get it accomplished and it will be too costly to the contractor. [Tr. 1340]

OSHA continues to believe that it is important that the level of training provided to employees be commensurate with the risk they encounter. Focusing training where the risk is greatest maximizes the benefits to be achieved. In addition, providing no more training than is necessary for hazards that pose less risk can conserve valuable, and often limited, safety and health resources. OSHA successfully used this general approach in § 1910.332(c), allowing employers flexibility in providing training to employees, yet ensuring that employees most at risk receive the most training. This approach is recognized by the Agency’s publication “Training Requirements in OSHA Standards and Training Guidelines.”⁵⁵

On the other hand, the Agency understands the rulemaking participants’ concerns. Most commenters objected to providing a level of training determined by “the task involved.” Although employees are trained to perform the various tasks involved in their jobs, as noted by Mr. Mattiford (Tr. 1339), examining each task to determine the relative risk may seem daunting and unworkable as claimed by Mr. Hartley (Tr. 873–874). Employers should, however, be capable of determining the relative risk of the various hazards encountered by their

⁵⁵ This document can be obtained by contacting OSHA’s Office of Publications as directed in the ADDRESSES section of this preamble or from OSHA’s Web page: <http://www.osha.gov/pls/publications/publication.html>. See, in particular, Section III of the voluntary guidelines, “Matching Training to Employees,” on pp. 6–8.

employees. To clarify this requirement, OSHA replaced the phrase “for the task involved” from the proposal with the phrase “for the hazard involved” in paragraph (b)(1)(iii) of the final rule.

To determine the relative risk encountered by employees, employers are encouraged to follow the guidelines in OSHA’s publication “Training Requirements in OSHA Standards and Training Guidelines,” Voluntary Training Guidelines, Section III. In any event, employers may allocate training resources in accordance with their own determination of relative risk, provided that each affected employee receives the minimum training required under subpart V.

Paragraph (b)(2) contains additional requirements for training qualified employees. Because qualified employees may work extremely close to electric power lines and equipment and, therefore, encounter a high risk of electrocution, it is important that they be specially trained. Towards this end, the standard requires that these employees be trained in: distinguishing exposed live parts from other parts of electric equipment; determining nominal voltages of exposed live parts; applicable minimum approach distances and how to maintain them; the techniques, protective equipment, insulating and shielding materials, and tools for working on or near exposed live parts; and the knowledge necessary to recognize electrical hazards and the techniques to control or avoid these hazards. The language in paragraph (b)(2) generally mirrors language in existing § 1910.269(a)(2)(ii). However, paragraph (b)(2)(v), which requires training in how to recognize and control or avoid electrical hazards, has no counterpart in existing § 1910.269. In addition, OSHA has added language to paragraph (b)(2)(iii) of the final rule explicitly requiring employers to train qualified employees in the skills and techniques necessary to maintain minimum approach distances. See the summary and explanation of final § 1926.960(c)(1), later in this section of the preamble, for an explanation of this change.

NIOSH commented that qualified and unqualified employees are exposed to the same electrical hazards and should receive the same training (Ex. 0130). NIOSH suggested that “[a]ll workers potentially exposed to electrocution hazards should be trained in hazard awareness and the identification and control of these hazards, as qualified employees are trained” (*id.*). NIOSH specifically noted that line-clearance tree trimmers and ground workers face

electrical hazards comparable to those of qualified employees (*id.*).

OSHA does not believe that is appropriate to adopt requirements in this final rule for the training of ground workers on tree crews or other tree workers who are neither qualified employees under § 1910.269 nor line-clearance tree trimmers. Subpart S, not § 1910.269 or subpart V, applies to electrical safety-related work practices of ground workers on tree crews and other tree workers who are not line-clearance tree trimmers. (See § 1910.331(b).) The preamble to the 1994 § 1910.269 final rule makes this clear as follows:

Other tree workers do not have the training necessary for them to be either “qualified employees” or “line-clearance tree trimmers”, as defined under § 1910.269(x). These employees are not covered under § 1910.269 at all. The work practices these employees must use are contained in Subpart S of Part 1910. Under Subpart S, tree workers must maintain a 10-foot minimum approach distance from overhead lines. (In fact, trimming any branch that is within 10 feet of an overhead power line is prohibited by Subpart S.) [59 FR 4410; footnotes omitted.]

Existing § 1910.269(a)(1)(ii)(B) states that § 1910.269 does not cover “electrical safety-related work practices . . . covered by subpart S.” Consequently, addressing the training of ground workers on tree crews or other tree workers who are neither qualified employees nor line-clearance tree trimmers in § 1910.269 or subpart V would be inappropriate.

On the other hand, OSHA believes that the final rule should address the training of line-clearance tree trimmers. However, not all of the training requirements in final § 1910.269(a)(2)(ii), which are applicable to qualified employees, are appropriate for line-clearance tree trimmers. Qualified employees are trained to work on energized parts. Specifically, the final rule requires qualified employees to be trained in, among other topics, the proper use of the special precautionary techniques, personal protective equipment, insulating and shielding materials, and insulated tools for working on or near exposed energized parts of electric equipment (§ 1926.950(b)(2)(iv)). This training enables qualified employees to work directly on energized parts of electric circuits, which line-clearance tree trimmers do not do.

Line-clearance tree trimmers work close to, but not on, energized, overhead power lines. (See, for example, Ex. 0502; Tr. 611.) Consequently, the Agency believes that these employees have different training needs than qualified

employees covered by § 1910.269. Under existing § 1910.269, OSHA has addressed the training for line-clearance tree trimmers in the definition of “line-clearance tree trimmer” and in the notes to that definition. The definition and notes appear in existing § 1910.269(x). Note 2 to that definition explains that while line clearance tree trimmers are not considered qualified employees for purposes of § 1910.269, they are considered to be qualified employees exempt from the electrical safety-related work practice requirements in subpart S (§§ 1910.331 through 1910.335). The note following § 1910.332(b)(3) indicates that, for the purposes of §§ 1910.331 through 1910.335, a person must have the training required by § 1910.332(b)(3) for OSHA to consider that person a qualified person. Therefore, to be considered a line-clearance tree trimmer under § 1910.269 and, thus, a qualified person under subpart S, a tree trimmer needs the training specified by § 1910.332(b)(3). Any tree trimmer who has not had such training is considered an unqualified person under subpart S, and the electrical safety-related work practices in that standard apply instead of those in § 1910.269 as explained previously.

The training required by § 1910.332(b)(3) is virtually identical to the training required by final § 1910.269(a)(2)(ii)(A) through (a)(2)(ii)(C) for qualified employees, except that § 1910.332(b)(3)(iii) requires training in the clearance (that is, minimum approach) distances specified in § 1910.333(c), whereas § 1910.269(a)(2)(ii)(C) requires training in the minimum approach distances in § 1910.269 and in the skills and techniques necessary to maintain those distances. Considering NIOSH’s recommendation, OSHA believes that putting appropriate training requirements for line-clearance tree trimmers directly in § 1910.269 rather than applying them indirectly through definitions and scope statements will make the standards more transparent and make the obligation to train these workers clearer. Consequently, the Agency is adopting a new § 1910.269(a)(2)(iii) requiring line-clearance tree trimmers to be trained in: (1) The skills and techniques necessary to distinguish exposed live parts from other parts of electric equipment (final § 1910.269(a)(2)(iii)(A)), (2) the skills and techniques necessary to determine the nominal voltage of exposed live parts (final § 1910.269(a)(2)(iii)(B)), and (3) the minimum approach distances in the final rule corresponding to the voltages to which the line-clearance tree

trimmer will be exposed and the skills and techniques necessary to maintain those distances (final § 1910.269(a)(2)(iii)(C)).⁵⁶ The first two training requirements, final § 1910.269(a)(2)(iii)(A) and (a)(2)(iii)(B), are identical to § 1910.332(b)(3)(i) and (b)(3)(ii). The remaining requirement, final § 1910.269(a)(2)(iii)(C), is comparable to § 1910.332(b)(3)(iii), except that line-clearance tree trimmers need to be trained in the minimum approach distances required under § 1910.269 rather than those in subpart S and need to be trained in the skills and techniques necessary to maintain those distances. OSHA concludes that the minimum approach distances required under § 1910.269 are the more appropriate reference for final § 1910.269(a)(2)(iii)(C) because line-clearance tree trimmers are required to comply with the minimum approach distances in § 1910.269.⁵⁷ The Agency also concludes that line-clearance tree trimmers need to be trained in the skills and techniques necessary to maintain the required minimum approach distances for the same reasons that qualified employees must be trained in these subjects. (See the discussion of minimum approach distances under the summary and explanation for final § 1926.960(c)(1), later in this section of the preamble.) OSHA believes that training in these skills and techniques are even more important for line-clearance tree trimmers, who, unlike qualified employees, generally work without electrical protective equipment (see, for example, Ex. 0503).

Paragraph (b)(2)(v), which is being adopted without change from the proposal, requires qualified employees to be trained in the recognition of electrical hazards to which the employee may be exposed and the skills and techniques necessary to control or avoid those hazards. Commenting on proposed § 1910.269(a)(2)(ii)(E), which is the general industry counterpart to proposed § 1926.950(b)(2)(v), Mr. Kevin Taylor of Lyondell Chemical Company requested clarification of the training required for workers who operate, but do not maintain, 480-volt circuit breakers (Ex. 0218). Workers operating these circuit breakers need not be

⁵⁶ Line-clearance tree trimming firms may need to train their employees in the more protective of the minimum approach distances in subpart S and § 1910.269 to ensure compliance both during work that is covered by subpart S and work that is covered by § 1910.269.

⁵⁷ Even though line-clearance tree trimmers are not generally qualified employees under § 1910.269, paragraph (f)(1)(iii) of final § 1910.269 requires them to maintain the minimum approach distances specified in Table R-5, Table R-6, Table R-7, and Table R-8.

qualified employees unless the devices are in areas restricted to qualified employees (final §§ 1910.269(u)(4) and (v)(4) and 1926.966(e)) or otherwise expose the employees to contact with live parts (final § 1910.269(l)(1) and 1926.960(b)(1)). Thus, assuming that these workers are not qualified employees, they would need to be trained only as required by final §§ 1910.269(a)(2)(i) and 1926.950(b)(1). The scope of this training is described earlier in this section of the preamble under the discussion of final § 1926.950(b)(1).

OSHA proposed to supplement the training requirements in paragraphs (b)(1) and (b)(2) with requirements for supervision and additional training in paragraphs (b)(3) and (b)(4). These requirements were taken directly from existing § 1910.269(a)(2)(iii) and (a)(2)(iv). The Agency explained in the proposal that initial instruction in safe techniques is not sufficient to ensure that employees will use safe work practices all of the time (70 FR 34834). Continual reinforcement of this initial training must be provided to ensure that the worker uses the procedures he or she has been taught. This reinforcement can take the form of supervision, safety meetings, prejob briefings or conferences, and retraining.

Paragraph (b)(3), which is being adopted without change from the proposal, requires the employer to determine, through regular supervision (that is, supervision that takes place on a periodic basis throughout the year) and inspections conducted at least annually, that each employee is complying with the safety-related work practices required by subpart V. Paragraph (b)(4), also being adopted without change from the proposal, requires additional training (or retraining) whenever:

- Regular supervision or an annual inspection required by paragraph (b)(3) indicates that the employee is not following the safety-related work practices required by subpart V,
- New technology, new types of equipment, or changes in procedures necessitate the use of safety-related work practices that are different from practices that the employee would normally use, or
- The employee must use safety-related work practices that are not normally used during his or her regular job duties.

A note to paragraph (b)(4)(iii) explains that retraining must be provided before an employee performs a task that is done less frequently than once a year. Instruction provided in prejob briefings is acceptable if it is detailed enough to

fully inform the employee of the procedures involved in the job and to ensure that he or she can accomplish them in a safe manner.

Mr. Leo Muckerheide of Safety Consulting Services commented that the requirements for retraining in proposed paragraph (b)(4) were reactive rather than proactive (Ex. 0180). He recommended that the standard require 4 to 8 hours of retraining every 2 to 3 years, arguing that workers follow proper safety practices immediately after training, but drift away from those practices as time goes on.

OSHA does not agree that the retraining requirements in paragraph (b) are exclusively reactive. Employees performing work covered by the final rule typically employ the safety-related work practices required by the standard on a daily or other regular basis. The Agency believes that workers generally will continue to follow these practices over time and has no evidence that a lack of regularly scheduled retraining contributes to a failure to follow safe work practices that are used frequently. OSHA does recognize, however, that retraining is important for work practices that are employed infrequently. Thus, paragraphs (b)(4)(ii) and (b)(4)(iii) require employees to receive additional training if they need to use new or different safety-related work practices or safety-related work practices that are not part of their regular job duties. For example, under paragraph (b)(4)(iii), an employee who is expected to administer CPR in the event of an emergency needs retraining if he or she has not used those emergency practices over the course of the previous year. Retraining would also be required for an employee who needs to climb a pole if it has been more than a year since he or she has used pole-climbing practices.⁵⁸ OSHA does not believe that any changes to paragraph (b)(4) are necessary and is adopting that paragraph without change from the proposal.

Under paragraph (b)(5), training required by paragraph (b) can be provided in a classroom or on-the-job, or in both places. This paragraph is taken directly from existing § 1910.269(a)(2)(v). The Agency has found these types of instruction, which provide workers an opportunity to ask questions and have the employer respond to them, to be most effective. (See, for example, OSHA's publication

“Training Requirements in OSHA Standards and Training Guidelines.”) OSHA received no comments on this provision, and it is being adopted as proposed.

Paragraph (b)(6) provides that training given in accordance with § 1926.950(b) has to result in employee proficiency in required work practices and introduce procedures necessary for subpart V compliance. OSHA did not receive any comments on this paragraph, which is borrowed from existing § 1910.269(a)(2)(vi), and is adopting it without change from the proposal. Unless a training program establishes an employee's proficiency in safe work practices and that employee then demonstrates his or her ability to perform the necessary work practices, there will be no assurance that the employee will work safely. An employee who has attended a single training class on a complex procedure, for example lockout and tagging procedures used in an electric generating plant, will not generally be deemed proficient in that procedure. Paragraph (b)(6), and the demonstration of proficiency requirement contained in paragraph (b)(7) (discussed later), will ensure that employers do not try to comply with § 1926.950(b) by simply distributing training manuals to employees. These provisions require employers to take steps to assure that employees comprehend what they have been taught and that they are capable of performing the work practices mandated by the standard. OSHA believes that this maximizes the benefits of the training required under the final rule.

Existing § 1910.269(a)(2) requires employers to certify that each employee has received required training. The certification has to be made when the employee demonstrates proficiency in the relevant work practices and maintained for the duration of the employee's employment. OSHA proposed to eliminate this certification requirement and to replace it with paragraphs in both § 1910.269 (paragraph (a)(2)(vii)) and subpart V (§ 1926.950(b)(7)) that simply require the employer to determine that each employee has demonstrated proficiency in the necessary work practices. In proposing this change, the Agency aimed to reduce unnecessary paperwork burdens on employers (70 FR 34835). In the preamble to the proposal, OSHA explained that, in the absence of training certifications, compliance with training requirements could be determined through employee interviews (*id.*). A note following this proposed paragraph explained that, although not required, employee

⁵⁸ OSHA interprets the phrase “must employ” in paragraph (b)(4)(iii) to include both practices the employer specifically assigns to the employee and practices the employer expects the employee to be prepared to use, such as emergency response procedures.

training records could continue to be used by employers to track when employees demonstrate proficiency. OSHA specifically requested comments on whether the existing certification requirement is necessary and whether the proposed standard, without a certification requirement, was adequately protective.

OSHA received a lot of feedback on this issue. Many rulemaking participants supported OSHA's proposal. (See, for example, Exs. 0125, 0127, 0159, 0169, 0171, 0175, 0177, 0179, 0186, 0212, 0222, 0227.) For instance, Mr. Brian Skeahan of Public Utility District No. 1 of Cowlitz County commented that the change from the certification requirement to the requirement to demonstrate proficiency was an "acceptable modification," pointing out that recording on-the-job training can be burdensome (Ex. 0159). Mr. Wilson Yancey of Quanta Services provided similar comments, expressing "support [for] OSHA's proposal to require only that the employer ensure that the employee is able to demonstrate proficiency" (Ex. 0169). He commented that the "certification requirement is an unnecessary recordkeeping burden that would be difficult to administer in practice because of the way that crews are spread out and would not advance employee safety and health in any material way" (*id.*). Mr. Brooke Stauffer of the National Electrical Contractors Association also supported the proposal: "NECA supports the proposed changes from certification of training to demonstration of proficiency. We do not support a requirement to keep records of employee training, due to high turnover in the line construction industry. Such record-keeping also isn't feasible to document on-the-job training" (Ex. 0171). EEI commented that "in the experience of EEI members, the existing training certification requirement in paragraph 1910.269(a)(2)(vii) has proven to be of no value, and is unnecessary and should be eliminated" (Ex. 0227). Also, Southern Company told OSHA:

Since on-the-job training is recognized as a method for training employees, it would be difficult or impossible to maintain records for this type of training. We agree that records of training that are normally maintained (classroom instruction or hands-on training exercises) should be recognized as a method for determining if an employee has been trained. However, it is the employee's ability to demonstrate their proficiency which should be the measure of the employee's ability to work safely. [Ex. 0212]

Other commenters objected to the proposed move away from the certification requirement, stressing the importance of recordkeeping. (See, for

example, Exs. 0200, 0213, 0230, 0505.) For instance, Mr. Tommy Lucas of TVA commented:

To ensure that employees have been trained and demonstrated proficiency, the training should be documented. Documented training is necessary for managers and supervisors to know whether or not the employee is proficient in the skills required for tasks being assigned. Having training records available to managers and supervisors will better protect employees. [Ex. 0213]

IBEW similarly supported a recordkeeping requirement for training, commenting as follows:

The standard should require employers to record employee training. The question that needs [to be] asked is how, if training records are not kept, can an employer comply with requirements for initial and ongoing training? Most training that is offered in this industry is structured using somewhat universal subjects and methods. Those employers that are engaged in this type of training are most likely recording initial training and any other additional training that they may offer. Recording of employee training will not impose any unnecessary or costly requirement on employers that they are not currently doing. [Ex. 0230]

Mr. Donald Hartley with IBEW further explained the union's position in his testimony during the 2006 public hearing:

OSHA should require employers to certify that employees are proficient in the tasks that they are assigned to perform and to maintain records documenting their demonstrated proficiency. There is simply no way to ensure that employers are actually certifying employees if documentation is not required. Moreover, the records can be used over time to determine whether employees have satisfied the training requirements in the past and whether retraining or recertification is necessary. [Tr. 874]

Mr. Steven Semler, counsel for ULCC, asked that OSHA retain the existing training certification requirement because it "works well . . . and has enhanced safety . . . by requiring the checkoff of certification of employees in writing" (Tr. 743). Mr. Scott Packard of Wright Tree Service testified on behalf of TCIA that the certification requirement "has clearly raised the level of safety in the line clearance tree trimming industry overall" (Tr. 751). The TCIA further commented:

The current and existing "shall certify" language *has raised the level of safety* in the line clearance tree trimming industry as well as in non-line clearance firms with exposure to the electrical hazard and hence the need to train and to certify. This requirement is particularly important among smaller employers with less sophisticated safety programs.

Requiring "certification" of employees having received the required safety training

has imposed internally within line clearance contractors' and others' training procedures creation of failsafe mechanisms to unambiguously assure the employee has received the required safety training. The newly-proposed method is a more subjective—hence looser—requirement. [Ex. 0200; footnote omitted; emphasis included in original.]

Mr. Peter Gerstenberger, also testifying on behalf of TCIA, suggested that "it's the connotation of the word 'certify' that just accords the whole process more importance" (Tr. 811–812).

OSHA has carefully considered the feedback it received on this issue and has decided to adopt the requirement as proposed, without a certification requirement. OSHA believes this gives employers maximum flexibility, while still ensuring that employees have demonstrated required proficiencies. The Agency concludes that it is particularly important to provide flexibility for employers using less formal (that is, on-the-job) methods to train workers because, as noted by Messrs. Stauffer and Yancey, it could be challenging for these employers to record training that occurs sporadically and in circumstances that are not conducive to the preparation of written certifications. In addition, as noted in the preamble to the proposal, the Agency does not need training certifications for enforcement purposes under final § 1910.269 and subpart V because compliance with the training requirements can be determined through interviews with management and workers (70 FR 34835). Therefore, the Agency believes that the plain language of the final rule will be at least as effective in protecting workers as a requirement to certify these records; in this regard, the plain language of the final rule still requires employers to determine that each employee demonstrates necessary proficiencies.

OSHA also points out that Note 1 to paragraph (b)(7) specifically clarifies that the rule does not prohibit the keeping of training records. In light of the comments received, OSHA expects that some employers will voluntarily elect to prepare and maintain training records for their own purposes in tracking who has received training and demonstrated the requisite level of proficiency.

OSHA proposed a second note to paragraph (b)(7) of § 1926.950 that described how an employer may treat training that an employee has received previously (for example, through previous employment). OSHA explained in the preamble to the proposal that employers relying on training provided by others would need

to take steps to verify that the employee had been trained and to ensure that the previous training was adequate for the work practices the employee would be performing (70 FR 34835). The proposed note read:

Employers may rely on an employee's previous training as long as the employer: (1) Confirms that the employee has the job experience appropriate to the work to be performed, (2) through an examination or interview, makes an initial determination that the employee is proficient in the relevant safety-related work practices before he or she performs any work covered by this subpart, and (3) supervises the employee closely until that employee has demonstrated proficiency in all the work practices he or she will employ.

Several rulemaking participants noted that some employees receive training from third parties, such as unions, and supported OSHA's effort to recognize the potential portability of training. (See, for example, Exs. 0162, 0169, 0234.) For example, MYR Group stated: "MYR Group . . . supports allowing reliance on prior training through demonstration of proficiency—in the circumstance of prior training not conducted by the employer a proficiency demonstration is a reasonable means of avoiding duplicative training" (Ex. 0162).

The line-clearance tree trimming industry, however, claimed that the new note would make it too difficult for an employer to rely on training that its employees received elsewhere. The tree trimmers argued that closely supervising all newly hired employees would be unworkable. (See, for example, Exs. 0174, 0200; Tr. 753–754.) For instance, Mr. Steven Semler representing ULCC argued that the note would unnecessarily require the close scrutiny of experienced and already-trained employees and suggested that the high rate of turnover in the line-clearance tree trimming industry made close supervision of all new hires administratively impractical (Ex. 0174). ULCC preferred existing § 1910.269(a)(2)(vii), which contained the training certification requirement, because, in its view, the existing standard permitted an employer to "verify the [previous employer's] certification records and observe the demonstrated proficiency of the newly hired employee staff" (*id.*). According to ULCC, "the current standard desirably enable[d] continuity of operations with trained personnel whose proficiency is determined by verification of training and observance of work" (*id.*). TCIA echoed these arguments and stated that the proposed new note "adds a new

hardship to the employer without any offset whatsoever in safety" (Ex. 0200).

OSHA did not impose any new burdens on employers through proposed Note 2 to paragraph (b)(7). The proposed note simply explained one way for an employer to comply with the proficiency-demonstration requirement in final paragraph (b)(7). Tree care industry witnesses described the process they use to determine the proficiency of newly hired experienced employees, and OSHA believes that process is similar to the steps for determining proficiency that were described in proposed Note 2 (Tr. 715–717, 805–806). For example, one tree-care industry witness described his company's process for hiring an experienced employee as follows:

[T]here would be face-to-face interviews. There will be verification of prior certifications and/or training. There will be observations done and there will be field evaluations [to verify] that . . . the certification that they claim to possess they do. [Tr. 805–806]

Although the tree care industry appears to use the process that OSHA envisioned in drafting the proposed note, OSHA reworded the note in the final rule to more closely match the process described by the tree care industry. The note in the final rule explains that for an employee with previous training, an employer may determine that that employee has demonstrated the required proficiency using the following process: (1) Confirm that the employee has the training required by final § 1926.950(b), (2) use an examination or interview to make an initial determination that the employee understands the relevant safety-related work practices before he or she performs any work covered by subpart V, and (3) supervise the employee closely until that employee has demonstrated the required proficiency.

The revised note makes it clearer than the proposed note that the process described in the note is not mandatory. Any process that ensures that the employee is not treated as having completed training until the employer confirms that he or she has had the training required by paragraph (b), and has demonstrated proficiency as required by paragraph (b)(7), is acceptable. The revised language also replaces the phrase "in all the work practices he or she will employ" with "as required by this paragraph" at the end of the note to make it clear that the process is designed to ensure that the employee demonstrates proficiency to the employer as required by the final rule.

Since subpart V covers some transient workers, and training is often provided by previous employers or third parties (for example, unions), some commenters suggested that employers could benefit from the development of a system for storing and accessing training information for all covered workers (Exs. 0196, 0227). EEI noted the potential value of such a system, but did not think it should be an OSHA requirement (Ex. 0227). Also, Mr. Lee Marchessault with Workplace Safety Solutions recommended that OSHA consider recognizing a universal training booklet, called a training passport in some countries, that workers would carry to prove to employers that they have been trained and have demonstrated their abilities (Ex. 0196; Tr. 573–574).

OSHA understands the third-party process by which many line workers are trained. The Agency has adopted Note 2 to paragraph (b)(7) in the final rule partly in recognition that this type of training takes place. The final rule is designed to allow employers to rely on previous training conducted by unions, previous employers, or other third parties. In fact, it would be permissible for employer groups, unions, or other third parties to design and implement a system such as the training passport recommended by Mr. Marchessault, provided that employers using the system complied with relevant OSHA training requirements. OSHA stresses that it is the employer's, not the employee's, obligation to determine that the employee demonstrates proficiency before he or she is deemed to have completed the required training.

OSHA proposed to add provisions to both subpart V and § 1910.269 concerning communication between host employers (utilities) and the contractors they hire to work on their systems.⁵⁹ As OSHA explained in the preamble to the proposal, the work covered by Subpart V is frequently done by an employer working under contract to an electric utility (70 FR 34835). Traditionally, employers with electric power generation, transmission, and distribution systems have had a workforce sufficient for the day-to-day maintenance of their systems. These employers usually hire contractors when the work to be performed goes beyond routine maintenance. Thus, contractors typically construct new transmission and distribution lines,

⁵⁹In this discussion, OSHA uses the term "electric utility" and "host employer" synonymously. In some cases, however, the host employer may not be an electric utility. See the discussion of the definition of "host employer" later in this section of the preamble.

perform extensive renovations of transmission and distribution lines (such as replacing a large number of utility poles or upgrading a line to a higher voltage), do line-clearance tree trimming, overhaul generation plants, and repair extensive storm damage. Mr. Donald Hartley of IBEW testified at the 2006 public hearing in this rulemaking that “utilities are increasingly contracting out work, both because contractors bring expertise that the utilities do not themselves possess and as a cost-saving measure to reduce their overall payroll and overhead” (Tr. 875).

In proposing the host-contractor provisions, OSHA explained that, in many (if not all) instances, sharing of information between the electric utility employer and the contractor is necessary to adequately protect the contractor’s employees from hazards associated with work on the utility’s facilities (70 FR 34838–34839). For example, if the host employers and contract employers do not coordinate their procedures for deenergizing lines and equipment, then contractor employees could mistakenly believe that a line is deenergized when it is not. This mistake could have potentially fatal results for contractor employees. In a similar fashion, as OSHA also explained in the preamble to the proposal, the safety of electric utility employees is affected by the contract employer’s work (*id.*). For example, a contractor’s work could cause an overhead energized line to fall on a deenergized line on which an electric utility employee is working, creating hazards for the electric utility employee. Although electric utility employees do not typically work with contract employees, sometimes they do work together. For example, it is common practice for contract employees and electric utility employees to work side by side during emergency-restoration operations, such as after a big storm (Ex. 0505; Tr. 392, 1379–1380). Additionally, contractors in electric power generation plants will be working near utility employees who work in the plant (Tr. 985). The record also indicates that utility and contract employees work side by side in other situations, including during outages on transmission lines (Ex. 0505; Tr. 1380) and while working in the same substation (Ex. 0505; Tr. 313–314, 559).

Because in this host-contractor relationship the work of (or information possessed by) one affects the safety of the other’s employees, OSHA believed that it was necessary for host employers and contractors to cooperate and communicate with each other to provide adequate protection for all employees

maintaining or constructing electric power generation, transmission, or distribution facilities. Thus, OSHA proposed requirements in § 1926.950 (as well as in § 1910.269) to ensure the necessary exchange of information between host employers and contract employers. The requirements in the proposal were loosely based on similar provisions in the Agency’s standard for process safety management (PSM), § 1910.119(h).

IBEW agreed that there was a need for host-contractor requirements in these standards, explaining that it “fully supports the basic principles underlying OSHA’s proposals regarding the reciprocal obligations of the host employers and contract employers to provide one another with information necessary to safeguard their workforces” (Tr. 878).

Mr. Donald Hartley of IBEW testified about the importance of host employers and contract employers exchanging “critically important” information (Tr. 877–878). He elaborated that for contractor employees to be “equipped to deal with potential hazards associated with this dangerous work, [they require] access to information that may be in the sole possession of the host employer” (Tr. 876). He continued:

[W]hile some contract employers report that utilities routinely provide this information with every job they contract out, as we have heard, others have found that utilities refuse to disclose that information about operating conditions even when the contract employers specifically request it.

Just as the host employer possesses information critically important to the safety of contract employees, the contract employees may in the course of their work discover conditions about which the host is unaware, also recently testified to. This is particularly true when contract employees are working out in the field on equipment that the host employer may not regularly inspect. [Tr. 877–878]

OSHA received a number of comments suggesting that it should not include host-contractor provisions in the final rule. The Agency has considered these comments and concluded that, although some changes to the proposed regulatory text are necessary (as described later in this section of the preamble), the information-sharing requirements in § 1926.950(c) of this final rule are reasonably necessary and appropriate.

Some commenters took the position that the extent to which host employers and contract employers exchange information with each other is an issue best left to private contracts between the parties. (See, for example, Exs. 0149, 0151, 0159, 0172, 0179, 0188.) For

example, the Lewis County Public Utility District commented:

We feel that any arrangement between a contractor and host employer is best handled by contractual language between the two parties without OSHA involvement. This includes how the host employer and contractor communicate and exchange information. [Ex. 0149].

Evidence in the record makes clear, however, that relying on private contracts has proven to be an ineffective method of ensuring the adequate exchange of information between hosts and contractors. A number of participants at the 2006 public hearing explained that there are times when contractors are unable to get the information they need from utilities to permit the contractors’ employees to work safely. For example, Mr. Donald Hartley of IBEW testified that “complying with [OSHA standards] requires access to information that may be in the sole possession of the host employer” (Tr. 876). As noted earlier, he also stated that some “utilities refuse to disclose . . . information about operating conditions even when the contract employers specifically request it” (Tr. 877). An ESCI representative agreed, testifying: “I work with a number of utility contractors that tell me that [t]here are a number of things that they are not provided that they need” (Tr. 1240). Also, MYR noted that “although . . . the transfer of information between utilities and contractors has improved tremendously over the last several years, issues still exist in the industry today” (Tr. 1333). In light of this evidence, OSHA concludes that relying on the parties’ private contracts to serve this function is unlikely to ensure that host employers and contract employers receive all of the information they need to protect their workers.

Some commenters suggested that OSHA does not have statutory authority to adopt host-contractor provisions. (See, for example, Exs. 0168, 0177, 0209, 0227, 0501.) For instance, EEI commented:

The fundamental point is that the OSH Act simply does not confer authority upon OSHA to require one employer to be responsible for the safety or health of another employer’s employees. Any final rule that seeks to impose duties on host employers and contractors vis-à-vis each other will be legally vulnerable. [Ex. 0227]

OSHA has clear authority to include the host-contractor provisions in the final rule. First, the plain language of the OSH Act and its underlying purpose support OSHA’s authority to place requirements on employers that are necessary to protect the employees of

others.⁶⁰ Second, congressional action subsequent to passage of the OSH Act recognizes this authority. Third, OSHA has consistently interpreted its statutory authority as permitting it to impose obligations on employers that extend beyond their own employees, as evidenced by the numerous standards, including several construction standards, that OSHA has promulgated with multiemployer provisions. Finally, OSHA's authority to place obligations on employers that reach beyond their own employees has been upheld by numerous courts of appeals and the OSHRC.

The purpose of the OSH Act is to assure so far as possible safe and healthful working conditions for every working man and woman in the nation (29 U.S.C. 651(b)). To achieve this goal, Congress authorized the Secretary of Labor to establish mandatory occupational safety and health standards. The Act broadly defines an OSHA standard as a rule that "requires conditions, or the adoption or use of one or more practices, means, methods, operations, or processes, reasonably necessary or appropriate to provide safe or healthful employment and places of employment" (29 U.S.C. 652(8)). (See *Building & Constr. Trades Dep't., AFL-CIO v. Brock*, 838 F.2d 1258, 1278 (D.C. Cir. 1988).) OSHA standards must prescribe measures that are appropriate to protect "places of employment;" nothing in the statutory language suggests that OSHA may do so only by regulating an employer's interactions with its own employees. On the contrary, the OSH Act's broad language gives OSHA almost "unlimited discretion" to devise means to reach the statutory goal. (See *United Steelworkers v. Marshall (Steelworkers)*, 647 F.2d 1189, 1230 (D.C. Cir. 1980).)

Similarly, Section 5(a)(2) of the OSH Act provides that each employer "shall comply with occupational safety and health standards promulgated under" the OSH Act (29 U.S.C. 654(a)(2)).⁶¹ Nothing in this language suggests that compliance is required only when necessary to protect the employer's own

employees or that the employer is entitled to endanger other employer's employees at the worksite.

Section 6(b)(7) of the OSH Act specifically permits the Secretary to "prescribe the use of labels or other appropriate forms of warning as are necessary to insure that employees are apprised of all hazards to which they are exposed . . . and proper conditions and precautions of safe use or exposure" (29 U.S.C. 655(b)(7)). (Notably, the Agency's authority to require warnings is not limited to information that would warn the employer's own employees of hazards.) Finally, Section 8(g)(2) of the OSH Act generally affords the Secretary authority to "prescribe such rules and regulations as he may deem necessary to carry out . . . responsibilities under" the OSH Act (29 U.S.C. 657(g)(2)).

In short, the statute focuses on workplace conditions to effectuate the OSH Act's congressional mandate and not on a particular employment relationship. The OSH Act's underlying purpose is broad—to assure safe and healthful working conditions for working men and women—and Congress made clear that it expected the Act to protect all employees. (See H. Rep. No. 91–1291, 91st Cong., 2d Sess., pp.14–16 (July 9, 1970).) Numerous references in the legislative history of the OSH Act discuss requiring employers to provide a safe and healthful "place of employment." (See for example, S. Rep. No. 91–1282, 91st Cong., 2d Sess., p. 10 (Oct. 6, 1970).) The OSH Act tasks OSHA with promulgating rules that will create safe places of employment, notwithstanding the many varied employment relationships that might exist at a worksite.

Subsequent congressional action has also recognized OSHA's authority to impose responsibilities on employers to protect employees who are not their own. For example, Congress directed OSHA to develop a chemical process safety standard (the PSM Standard) requiring employers to "ensure contractors and contract employees are provided appropriate information and training" and to "train and educate employees and contractors in emergency response" (Pub. L. 101–549, Title III, Sec. 304, Nov. 15, 1990, 104 Stat. 2576 (reprinted at 29 U.S.C. 655 Note)). This is a clear ratification of the Agency's authority to require employers to protect the employees of others. Congress also approved of the Agency's authority when it relied on the provisions of OSHA's Hazard Communication Standard in promulgating the Emergency Planning and Community Right-to-Know Act

(EPCRA), 42 U.S.C. 11001–11050. The Hazard Communication Standard requires, in part, that manufacturers and importers of hazardous chemicals provide information for the benefit of downstream employees.⁶² (See 29 CFR 1910.1200; see also *Martin v. American Cyanamid Co.*, 5 F.3d 140, 141 (6th Cir. 1993) (noting that the Hazard Communication Standard requires "that a manufacturer of hazardous chemicals inform not only its own employees of the dangers posed by the chemicals, but downstream employers and employees as well".) Congress incorporated provisions of the Hazard Communication Standard in EPCRA as a basis for triggering obligations on owners or operators of facilities producing hazardous chemicals to provide local governments with information needed for emergency response. Had Congress not approved of the multiemployer provisions in the Hazard Communication Standard, it would not have approved of it as a basis for obligations in EPCRA.

Furthermore, OSHA has consistently interpreted the OSH Act as authorizing it to impose multiemployer obligations in its standards. In addition to the Hazard Communication Standard and the PSM Standard already noted, OSHA included multiemployer provisions in its standard for powered platforms, which requires that a building owner inform employers that the building installation has been inspected and is safe to use. (See 29 CFR 1910.66(c)(3).) OSHA also has imposed multiemployer obligations in construction standards. For example, OSHA exercised its OSH Act authority to promulgate provisions in the Asbestos Standard for the construction industry that require building owners to communicate the presence of asbestos or presumed asbestos-containing materials to certain employers with employees who may be exposed to such materials. (See 29 CFR 1926.1101(k).) In OSHA's Steel-Erection Standard, the Agency imposed duties on controlling contractors to ensure that site conditions are safe for steel erection. (See 29 CFR 1926.752(c).) More recently, OSHA promulgated rules requiring controlling entities and utilities to take steps to protect other employers' employees during crane operations. (See 29 CFR 1926.1402(c), 1926.1402(e), 1926.1407(e), 1926.1408(c), and 1926.1424(b).)

Finally, OSHA's authority to impose these provisions is confirmed by the

⁶⁰ As explained later in this section of the preamble, the overall sharing of information that will occur in accordance with the final host-contractor provisions will help protect the employees of both host employers and contract employers.

⁶¹ This language is in marked contrast to the language of Section 5(a)(1) of the OSH Act (known as the "general duty clause"), which requires each employer to "furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees" (29 U.S.C. 654(a)(1)). (See *Brennan v. OSHRC*, 513 F.2d 1032, 1037–38 (2d Cir. 1975).)

⁶² As a rationale for those provisions, OSHA explained that chemical manufacturers and importers are in the best position to develop, disseminate, and obtain information about their products. (See 48 FR 53280, 53322, Nov. 25, 1983.)

decisions of numerous courts of appeals and the Review Commission. For example, the Third Circuit upheld the information-sharing requirements in the Asbestos Standard for the construction industry, noting: “We are not convinced that the Secretary is powerless to regulate in this [way], especially given the findings she has made regarding the importance of building owners in the discovery and communication of asbestos hazards.” *Secretary of Labor v. Trinity Indus., Inc. (Trinity)*, 504 F.3d 397, 402 (3d Cir. 2007). (See also *Universal Constr. Co. v. OSHRC*, 182 F.3d 726, 728 (10th Cir. 1999) (following decisions from Second, Sixth, Seventh, Eighth, and Ninth Circuits holding that an employer’s duties and OSHA standards may extend beyond an employer’s own employees).)

EEI asserted that § 1910.12(a) precludes host-contractor requirements in subpart V, commenting:

Section 1910.12(a), standing alone, precludes OSHA from requiring an employer covered by the final Part 1926 rule to take any responsibility for the safety of another employer’s employees, certainly insofar as the final standard purports to regulate “construction.” [Ex. 0227].

OSHA disagrees with EEI. Paragraph (a) of § 1910.12 provides:

The standards prescribed in part 1926 of this chapter are adopted as occupational safety and health standards under section 6 of the Act and shall apply, according to the provisions thereof, to every employment and place of employment of every employee engaged in construction work. Each employer shall protect the employment and places of employment of each of his employees engaged in construction work by complying with the appropriate standards prescribed in this paragraph.

Paragraph (a) of § 1910.12 has no bearing on the host-contractor requirements in the final rule because the Agency clearly intends to assign specific responsibilities to host employers and contract employers, and the final regulatory text plainly reflects that intent. (See *Trinity*, 504 F.3d at 402 (rejecting argument premised on § 1910.12(a) where “the regulation at issue . . . specifically applie[d] to building owners”).) Moreover, the Eighth Circuit and the Review Commission have squarely rejected EEI’s argument. In *Solis v. Summit Contractors, Inc. (Summit Contractors)*, the Eighth Circuit concluded that § 1910.12(a) is “unambiguous” in that it does not preclude OSHA from citing an employer when only employees of other employers are exposed to the hazard in question (558 F.3d 815, 825 (8th Cir. 2009)). The Review Commission similarly held that § 1910.12(a) does not

prevent OSHA from citing a controlling employer that does not have exposed employees (*Summit Contractors, Inc.*, 23 BNA OSHC 1196 (No. 05–0839, Aug. 19, 2010)). Both the Eighth Circuit and the Review Commission emphasized the language in § 1910.12(a) establishing a duty on the part of employers to protect “places of employment” as well as employees. (See, for example, *Summit Contractors*, 558 F.3d at 824.) The first sentence in § 1910.12(a) makes the construction standards applicable to every employment and to every “place of employment” of every construction employee, and the second sentence, by providing that each employer must protect “places of employment,” does not negate the broad reach of the first sentence.

Moreover, the history of § 1910.12(a) reveals that the purpose of this provision is to extend, not limit, the Agency’s authority. Indeed, § 1910.12(a) is located in a subpart entitled “Adoption and Extension of Established Federal Standards,” which was established to extend OSHA’s authority through adoption of the Construction Safety Act’s standards. (See 29 CFR 1910.11(a) (“The provisions of this subpart . . . adopt[,] and extend the applicability of, established Federal standards . . . with respect to every employer, employee, and employment covered by the Act.”).) Thus, neither the language nor the context of § 1910.12(a) suggest a conflict with the information-sharing requirements in this final rule.

Some commenters asserted that the proposed host-contractor provisions inappropriately expanded or conflicted with OSHA’s existing Multi-Employer Citation Policy (CPL 02–00–124 (Dec. 10, 1999)). (See, for example, Exs. 0162, 0167, 0170, 0207, 0237.)

These comments reflect a misunderstanding of both the proposal and the multiemployer citation policy. The host-contractor provisions do not rely on, or modify, the Agency’s multiemployer enforcement policy. (See *Trinity*, 504 F.3d at 402 (distinguishing an enforcement action under the multiemployer provisions of the Asbestos Standard for construction from cases in which the Agency invoked the multiemployer citation policy).) Rather, the multiemployer citation policy and the host-contractor provisions represent separate exercises of OSHA’s statutory authority to protect places of employment. The host-contractor provisions and the multiemployer enforcement policy operate in different, yet entirely consistent, ways to permit the Agency to fulfill its statutory mission.

OSHA’s multiemployer citation policy simply recognizes the existing responsibilities of different employers at multiemployer worksites under the Act and OSHA standards. For example, employers have a duty not to create hazardous conditions that violate OSHA standards, regardless whether it is their own employees or another employer’s that they endanger. (Employers who do so are referred to as “creating employers.”) And employers have a duty to protect their own employees from violative conditions, even if created by another employer. Such “exposing employers” must take reasonable steps to correct the hazards or otherwise protect their workers. Similarly, “controlling employers,” that is, employers with general supervisory authority over safety and health at a worksite, by virtue of that authority, have certain responsibilities to prevent and detect violations affecting employees at the workplace.

When OSHA promulgates new safety and health standards, it does so against this background principle that employers share responsibility for working conditions, and thus for OSHA compliance, at multiemployer worksites. Therefore, when the Agency issues a new safety or health standard, it is with the intention that creating, exposing, and controlling employers at multiemployer worksites will exercise their respective responsibilities to ensure that affected employees are protected as required by the standard.

In some situations, however, the general background principles reflected in the multiemployer policy will not be sufficient to ensure the safety of workplaces; in those instances, OSHA may find it necessary to impose additional or more specific obligations on particular employers to protect workers. The host-contractor provisions in this final rule, as well as similar information-sharing provisions in the Hazard Communication Standard, the PSM Standard, and the Asbestos Standard for construction, are examples of the Agency regulating in this manner. In this rulemaking, OSHA determined that the final host-contractor provisions are necessary, in addition to the general background responsibilities employers have, to ensure the safety of affected employees. Not all utilities (or host employers) will have sufficient authority over, or relationships with, contractor worksites to qualify as controlling employers under the multiemployer citation policy. In addition, the final rule prescribes with specificity the information-sharing responsibilities of hosts and contractors. The specific information-sharing

requirements in the host-contractor provisions are necessary to ensure that critical information sharing and coordination take place at all workplaces where employees perform work covered by the final rule.

Some commenters argued that the host-contractor provisions could create employer-employee relationships between host employers and contractor employees. (See, for example, Exs. 0173, 0178.) For instance, the Farmers Rural Electric Cooperative Corporation commented:

It is up to the contractor and the employees of that firm to perform this work, under their supervision and direction, using their work practices and safety rules. Should we as hosts begin to direct their work, provide supervision of that work, oversee their safety practices, the IRS would then say they are our employees and are entitled to benefits. [Ex. 0173]

Also, some commenters suggested, more generally, that the host-contractor provisions could expand the potential legal liability of the respective employers. (See, for example, Exs. 0168, 0187, 0220, 0226.) A few commenters argued that in these ways the proposed host-contractor provisions went so far as to violate the OSH Act. For example, the National Association of Home Builders commented:

[W]e also believe that OSHA's multi-employer language in the proposed rule in Subpart V impermissibly expands the common law liability of host/general contractors in violation [of Section 4(b)(4)] of the OSH Act. [Ex. 0168].

OSHA concludes that, under any of the potentially applicable legal tests for an employment relationship, the final host-contractor provisions are unlikely to result in one employer exercising the type or degree of control over the employees of another employer that would create an employer-employee relationship when one otherwise would not have existed. (See, for example, *Nationwide Mutual Ins. Co v. Darden*, 503 U.S. 318 (1992) (common-law test for determining who is an "employee"); *Antenor v. D&S Farms*, 88 F.3d 925 (11th Cir. 1996) (factors relevant to determining whether two employers are "joint employers" of an individual employee for purposes of the Fair Labor Standards Act); *Weber v. C.I.R.*, 60 F.3d 1104 (4th Cir. 1995) (test for determining whether there is an employment relationship for income tax purposes).)

OSHA also disagrees with the commenters' claim about Section 4(b)(4) of the OSH Act. That provision states:

Nothing in [the OSH] Act shall be construed to . . . in any manner affect any

workmen's compensation law or to enlarge or diminish or affect in any other manner the common law or statutory rights, duties, or liabilities of employers and employees under any law with respect to injuries, diseases, or death of employees arising out of, or in the course of, employment. [29 U.S.C. 653(b)(4)]

This provision serves two purposes: First, it establishes that the OSH Act does not create a private right of action. (See, for example, *Crane v. Conoco, Inc.*, 41 F.3d 547 (9th Cir. 1994).) Second, it makes clear that the duties and liabilities imposed under the OSH Act do not displace the duties and liabilities that exist under State tort and workers' compensation schemes. (See, for example, *Frohlick Crane Serv., Inc. v. OSHRC*, 521 F.2d 628 (10th Cir. 1975).)

OSHA acknowledges that State courts are free to permit the use of OSHA regulations, including these final host-contractor provisions, as evidence of a standard of care in a negligence action. (See, for example, *Knight v. Burns, Kirkley & Williams Constr. Co.*, 331 So.2d 651 (Ala. 1976).) However, it does not follow that regulations used in that fashion are invalid under Section 4(b)(4) on the ground that they expand employers' common-law liabilities, a result that would limit the Secretary's rulemaking authority to issuing regulations that codify duties already owed by employers at common law. Such a result would be inconsistent with Congressional intent in promulgating the OSH Act, and no court has ever invalidated an OSHA regulation on the ground that it violates Section 4(b)(4). Indeed, courts have squarely rejected the argument that Section 4(b)(4) precludes multiemployer enforcement practices. For example, in *Summit*, the Eighth Circuit concluded that OSHA's multiemployer citation policy did not violate Section 4(b)(4), explaining that even though it could "increas[e] an employer's liability at common law[.]" the policy "neither creates a private cause of action nor preempts state law" (558 F.3d at 829). (See also *Steelworkers*, 647 F.2d at 1234-36.)

OSHA decided to adopt the proposed host-contractor provisions, with some substantial modifications (described later in this section of the preamble), in the final rule. Before addressing each specific provision, however, OSHA must first address the scope of these requirements.

The proposal defined a "host employer" as "[a]n employer who operates and maintains an electric power transmission or distribution installation covered by subpart V of this Part and who hires a contract employer to perform work on that installation."

This definition included electric utilities and other employers that operate and maintain electric power transmission or distribution installations. However, it did not include employers that own, but do not operate and maintain, such installations. The Agency believed that entities that do not operate or maintain these installations would generally not have the expertise necessary to work safely on transmission or distribution lines and equipment and would have little hazard-related knowledge to pass on to contractors. In addition, the employees of such entities would have little if any exposure to hazards created by a contract employer. The Agency invited comments on whether excluding such employers from the host-contractor provisions would unduly jeopardize employee safety and whether any of the host-contractor provisions could reasonably be applied to such employers.

Some commenters, such as Energy United EMC (Ex. 0219), supported the proposed exclusion of owners that do not operate or maintain installations. Ohio Rural Electric Cooperatives commented: "If an employer only owns but does not actually operate its own lines or equipment then that employer would certainly not be able to pass on any useful information to a contractor" (Ex. 0186).

IBEW took the position that "[e]xcluding such employers from any host-contract employer provisions, in general, should not jeopardize employee safety," but questioned whether those entities may make "decisions on how the system will be operated, such as switching procedures and load transfer, that . . . could have a direct impact on worker safety" (Ex. 0230). The union went on to suggest that "[w]hatever entity has the responsibility and/or decision making power as to how the system is operated should be included in the proposed provisions" (*id.*).

Others commented that the host-contractor provisions should apply to all system owners. Ms. Susan O'Connor of Siemens Power Generation commented, for example, that excluding owners that do not perform operations or maintenance could jeopardize employee safety "in situations where host employers might use this provision as a loophole to avoid regulation" (Ex. 0163). Ms. O'Connor suggested that a utility could "eliminate [its] qualified maintenance department and outsource . . . maintenance to avoid dealing with this regulation" (*id.*). MYR Group also "believe[d] that the protections afforded to contractors through the host employer obligations should apply

regardless of whether the host actually operates the installation" (Ex. 0162). MYR thought that "[s]erious and inequitable problems could arise from failure to apply the proposed rule requirements on host employers that own but do not operate their electric utility installations" (*id.*).

OSHA considered the record and concludes that the host employer should be the employer that is in the best position to have information on the design, operation, and condition of an electric power generation, transmission, or distribution system. Based on this principle, OSHA decided that an employer that controls how the system is operated, such as switching procedures and load transfer, should not be excluded from the host-contractor provisions. Depending on the type of work practices used, such operational control could have a direct impact on worker safety. For example, an employer that controls the operation of an electric power generation, transmission, or distribution system could institute new switching procedures without informing contractors or coordinating the new procedures with contractors (Ex. 0230). In addition, because an employer, to fall within the proposed definition of "host employer," needed to operate and maintain the installation *and* hire the contractor, it would have been possible under the proposal to have scenarios in which there was no host employer, such as if one employer owned the installation (and hired the contractor) and a different employer operated or maintained the installation. This result could have undermined the information-sharing requirements altogether.

The Agency is revising the definition of "host employer" to include employers that operate installations or control procedures for operation of installations without regard to whether the employer owns the installation. In addition, OSHA is deleting the reference to "maintenance" in the final definition of "host employer" because the Agency believes that an employer that only maintains an electric power generation, transmission, or distribution system is unlikely to have knowledge of the design, operation, and condition of the installation; employers that perform such maintenance may be contractors hired by an electric utility. (See, for example, Tr. 403, 1200–1201.) Maintenance contractors will need information from the employer that operates or controls the operation of the installation, as would any other contractor. The final rule states that an employer that operates, or that controls

the operating procedures for, an electric power generation, transmission, or distribution installation on which a contract employer is performing work covered by subpart V is a host employer. A note to the definition of "host employer" provides that OSHA will treat the electric utility or the owner of the installation as the host employer if it operates or controls operating procedures for the installation. If the electric utility or installation owner neither operates nor controls operating procedures for the installation, OSHA will treat the employer that the utility or owner has contracted with to operate or control the operating procedures for the installation as the host employer. In no case will there be more than one host employer. (See the definition of "host employer" in final § 1926.968.)

The revised definition incorporates IBEW's recommendation that the Agency focus on the entity that has control over the system. OSHA believes any such entity is likely to have critical safety-related information about the system. In addition, the revised language renders Ms. O'Connor's comment moot; the revised language ensures that an entity that is in a position to have information that affects the safety of contractor employees will be identified as a host employer under the final rule.⁶³ Note that OSHA has added electric power generation installations to the installations covered by the definition of "host employer" in subpart V for consistency with the definition of this term in § 1910.269.

In addition, the definition in the final rule removes the criterion that the host employer be the entity that hires the contractor. The record indicates that various entities hire contractors to work on electric power generation, transmission, and distribution installations. For example, utility owners hire contractors to perform maintenance (Ex. 0186; Tr. 403). In addition, some contractors subcontract some of their work (Tr. 315–316, 1380–1381). Subcontractors will be treated as "contract employers" under the final rule even though the host does not hire them directly.⁶⁴ The standard's information-exchange requirements hinge on the need to exchange information between the entity that

⁶³ The definition of host employer in the final rule also removes any confusion over whether a holding company that owns a utility company's outstanding stock, which is a common practice, or the electric utility itself "owns" the installation.

⁶⁴ As explained later in this section of the preamble, "contract employer" is defined as: "An employer, other than a host employer, that performs work covered by subpart V of this part under contract."

operates or controls operating procedures for the system and entities that are performing maintenance or construction work on the system. The type of contractual relationship that exists between the host employer and contract employers does not change the need for this information exchange. OSHA realizes that the final rule will require some employers to exchange information with entities with which they have no direct contractual relationship. These employers can either exchange information directly with each other or can arrange to handle their information exchange through contacts with entities that *do* have contractual relationships with the other employer. For example, an electric utility transmitting information to an employer under contract to perform work on the installation could instruct (or contract for) that contractor to share the same information with any subcontractors hired to perform work under the contract. Ultimately, however, it is the host employer's responsibility to ensure that whatever procedures it uses are adequate to get the required information to all "contract employers" working on the installation. Paragraph (c)(3) of final § 1926.950 (discussed later in this section of the preamble) requires host employers and contract employers to coordinate their work rules and procedures; part of this coordination involves establishing appropriate procedures for exchanging information in accordance with the host-contractor provisions.

The other issue involving coverage under the host-contractor provisions pertains to line-clearance tree trimming. OSHA proposed to exclude from the host-contractor requirements work done by line-clearance tree trimmers who are not qualified employees. As discussed earlier in this section of the preamble, line-clearance tree-trimming work is covered by § 1910.269. Paragraph (a)(1)(i)(E)(2) of existing § 1910.269 lists the paragraphs of that section that apply to work performed by line-clearance tree trimmers who are not qualified employees, and OSHA did not propose to add the host-contractor provisions to that list.

By not proposing to modify existing § 1910.269(a)(1)(i)(E)(2), OSHA would not have applied the host-contractor provisions to line-clearance tree-trimming operations performed by unqualified employees. However, as long as qualified employees are using electrical protective equipment, these employees would be permitted to come much closer to energized parts than unqualified employees. The Agency believed that qualified employees

performing line-clearance tree-trimming work in proximity to energized lines and equipment face hazards similar to contract power line workers and should receive similar protection.⁶⁵

OSHA requested comments on whether its proposed approach for dealing with line-clearance tree-trimming work under the host-contractor provisions unduly jeopardized employee safety and whether any of the host-contractor provisions could reasonably be applied to tree-trimming work performed by line-clearance tree trimmers who are unqualified employees. Many commenters supported OSHA's proposal. (See, for example, Exs. 0126, 0174, 0177, 0200, 0201, 0213, 0219, 0227.) For instance, EEI agreed "that line clearance tree-trimming contractors should be excluded from the requirement," explaining: "Host utilities are usually not familiar with the hazards associated with trimming trees and routinely rely on the expertise of the line clearance tree-trimming contractors to perform that work in a manner which ensures the safety of their employees" (Ex. 0227). These comments were echoed by ULCC, which "commended" OSHA's proposal to exclude work done by line-clearance tree trimmers who "do not work on or touch electric supply lines" from the host-contractor provisions (Ex. 0174). ULCC urged the Agency to maintain this exclusion in the final rule, commenting:

[T]he wisdom of the exclusion is manifest: for, the rationale of the proposed "host-contractor" provisions . . . is to apply the utilities' expertise to utility contractors performing utilities' typical work—in effect, to force down utilities' safety expertise onto their *electric-work contractors* in order to raise the safety experience rate of those contractors to the better safety rate of the utilities who employ them. Such policy-driver for applying "host-contractor" to utility contractors performing electric utility (i.e. lineman) "qualified" work, simply is inapplicable to line clearance work: for, the utilities hire line clearance contractors because line clearance contractors are arborists who are specialists in vegetation management—precisely skills which the utilities contract out because they typically do not have that expertise in tree growth, tree trimming techniques, tree rigging, tree removal, vegetation management, etc. In short, utilities simply do not have the institutional expertise of line clearance tree knowledge to develop and direct line clearance safety practices of line clearance contractors via "host-contractor" provisions.

⁶⁵ For a full discussion of why § 1910.269 applies different requirements to line-clearance tree-trimming operations depending on whether they are performed by qualified or unqualified employees, see the preamble to the 1994 § 1910.269 final rule (59 FR 4336).

. . . So, the "force-down" premise of "host-contractor" simply does not apply to line clearance. [*Id.*; emphasis included in original.]

Duke Energy commented that "[t]here should be no expectation that host employers provide information on tree-trimming hazards to line-clearance tree trimming contractors," suggesting that "[a]pplying the host-contract employer provisions [in the context of line-clearance tree trimming] will be very difficult" (Ex. 0201).

Some commenters, however, advised against the proposed exclusion and argued that all line-clearance tree trimmers should be covered by the host-contractor provisions. (See, for example, Exs. 0162, 0186, 0230, 0234.) IBEW, for instance, commented:

Line-clearance tree-trimming work could, in some instances, be affected by the host employer's operation of the system. Lockout/Tagout procedures during service restoration are one example where contractor employee safety could be jeopardized if line-clearance tree-trimming contractors are excluded from all provisions of the proposed host-contract employer provisions. At a minimum, information regarding circuit conditions, changes in conditions, and lockout/tagout applications should be communicated by the host employer to the contractor employer. [Ex. 0230]

The Ohio Rural Electrical Cooperatives agreed, also suggesting that all line-clearance tree trimmers be covered by the host-contractor requirements. That organization explained that tree trimmers "might not need as much information as a line contractor but they still need to know for sure which lines are energized, which are on single-shot protection, etc." (Ex. 0186). Mr. Wilson Yancey of Quanta Services noted that "[w]hether an employee is qualified or not, hazards will exist that are unique to the host employer" (Ex. 0234). He believed that the proposal to leave some line-clearance tree trimmers out of the host-contractor requirements was "not well-founded and might unduly jeopardize employee safety" (*id.*).

The Agency recognizes that line-clearance tree trimmers do not face exactly the same hazards as line workers. However, the record indicates that host employers have information that line-clearance tree trimmers need so that they can perform their work safely (Ex. 0505; Tr. 642–643, 686–688, 775). For example, Mr. Mark Foster of Lucas Tree Experts testified that line workers will generally inform tree crews that a line is about to be reenergized (Tr. 642–643). In addition, ULCC's posthearing brief indicated that "line clearance tree trimmers necessarily

must rely upon information from utility representatives that the line has been deenergized, isolated and grounded when those procedures are appropriate" and that the "safety of line clearance tree trimmers would be enhanced by . . . utilities being required, by OSHA standard, to give [certain] information to line clearance tree trimmers" (Ex. 0502).

Not only do line-clearance tree trimmers need information from utilities, but line-clearance tree trimming contractors often have important safety information for utilities, for example, information they discover in the course of work about hazardous conditions that could affect utility employees. Such conditions can include downed power lines, transformer problems, and insulator and pole issues (Tr. 665, 689–690, 787–788).

Upon considering the record, it has become apparent to OSHA that: (1) There is a need for information exchange between host employers and tree-trimming contractors and (2) the host-contractor provisions should apply to all line-clearance tree trimming. Therefore, the Agency added § 1910.269(a)(3) to the list of paragraphs denoted in final § 1910.269(a)(1)(i)(E)(2) to cover line-clearance tree-trimming operations performed by line-clearance tree trimmers who are not qualified employees.

As noted earlier, some commenters maintained that utilities hire contractors for their expertise and knowledge about particular hazards and rely on those contractors to use that expertise to protect their (that is, the contractors') own employees. (See, for example, Exs. 0127, 0172, 0173, 0177, 0200, 0207, 0227.) For instance, Mr. Frank Brockman with Farmers Rural Electric Cooperatives Corporation stated, "We, as host employers, hire contractors to do specific jobs, often that we do not have the knowledge, expertise, equipment or manpower to accomplish." He maintained that "[c]ontractors are responsible for their employees' safety" (Ex. 0173). SBA commented that "the host is usually not present at these worksites and often does not possess expertise in the type of work being performed" and noted that "many of the SERs questioned whether the host-contractor provisions are appropriate for the electric power industry at all" (Ex. 0207).

Some comments specifically addressed the issue of whether line-clearance tree trimming firms should be covered by the host-contractor provisions. For example, Consumers Energy stated, "Host utilities are usually not familiar with the hazards associated with trimming trees and routinely rely

on the expertise of the line clearance tree-trimming contractors to perform that work in a manner which ensures the safety of their employees” (Ex. 0177). In addition, TCIA stated:

OSHA makes the correct assertion that the utility must have a shared expertise with the contractor in order to specify its safety standards for the contractor to follow. In stark contrast, utilities typically contract line clearance tree trimming because of their *lack of expertise* in that subject. [Ex. 0200; emphasis included in original]

OSHA recognizes that contractors may have specific expertise that host employers do not have. However, the Agency does not believe that this is a valid reason not to require the type of information exchange required by the final rule. As noted earlier, electric utilities have information about their systems that the contractors do not have. The Agency also believes that contractors, especially those hired for expertise in a particular area, have information about hazardous conditions related to their work that host employers do not have (for example, the dangers posed to the host employer’s employees from chippers and falling tree limbs). In addition, when one employer’s activities may endanger another employer’s employees, the Agency believes that it is essential for the two employers to coordinate their activities to ensure that all employees are adequately protected. For example, as noted later in this section of the preamble, it is important for an electrical contractor to coordinate procedures for deenergizing and grounding lines and equipment with the host employer. Similarly, it is important for line-clearance tree trimming firms to coordinate their work with host employers and to inform host employers of hazardous conditions posed by the tree-trimming work to ensure that the host employers’ employees are not exposed to tree-trimming hazards about which those employees have received no training.

OSHA proposed to define “contract employer” as “[a]n employer who performs work covered by subpart V of this part for a host employer.” OSHA did not receive any significant comment on this definition. However, OSHA is revising the definition to include any “work covered by subpart V of this part under contract” rather than just work “for a host contractor.” This revision correlates the definition of “contract employer” with the revised definition of “host employer,” which no longer provides that an employer must “hire” another employer to be a host employer. This revision makes it clear that an employer performing subpart V work

under contract is covered as a “contract employer” by the host-contractor provisions in final paragraph (c) regardless of whether the entity for which the work is being performed is the “host employer” or another “contract employer.” Contract employers under the final rule may include painting contractors, line-construction contractors, electrical contractors, and any other contractors working on the construction of electric power transmission and distribution lines. (For final § 1910.269, contract employers will also include contractors working on covered electric power generation installations, such as boiler-maintenance contractors, conveyor-servicing contractors, and electrical contractors.) The definition of “contract employer” does not include contractors that might be present at a jobsite where some work performed is covered by subpart V, but that are not performing covered work.

Paragraph (c) of final § 1926.950 contains requirements for the transfer of information between host employers and contract employers. In the proposal, OSHA entitled this paragraph “Contractors.” After considering the comments received, the Agency concludes that the proposed title does not reflect the true scope of the paragraph’s provisions. The title at final § 1926.950(c) is being changed to “Information transfer” to more appropriately describe the requirements contained in the paragraph.⁶⁶ In addition, the final rule does not include proposed § 1926.950(c)(1)(ii), which would have required host employers to report observed contract-employer-related violations of this section to the contract employer. Consequently, OSHA renumbered proposed paragraph (c)(1)(i) (and subordinate paragraphs (c)(1)(i)(A) and (c)(1)(i)(B)) as final paragraph (c)(1) (and subordinate paragraphs (c)(1)(i) through (c)(1)(iv)).

Proposed paragraph (c)(1)(i) required host employers to provide certain information to contract employers. Paragraph (c)(1)(i)(A), as proposed, required host employers to provide contractors with information about “[k]nown hazards that are covered by this section, that are related to the contract employer’s work, and that might not be recognized by the contract

employer or its employees.” The purpose of this provision was to ensure that contractors could take measures to protect their employees from hazards posed by hosts’ workplaces. Although this proposed provision would not require hosts to inform contract employers of hazards that contract employees are expected to recognize, such as hazards posed by an overhead power line, the proposal provided that hosts inform contract employers of hazards known to the hosts that might not be recognized by the contractors. For example, if a host employer knew that a particular manhole on its system was subject to periodic contamination from a nearby fuel tank, the host was to share this information with the contractor.

OSHA received considerable feedback on this proposed requirement. (See, for example, Exs. 0146, 0159, 0160, 0167, 0175, 0178, 0186, 0201, 0227, 0234, 0480, 0505; Tr. 1333–1334.) Some commenters agreed with the proposal to require host employers to inform contractors of known hazards. (See, for example, Exs. 0167, 0169, 0234; Tr. 1333–1334.) For example, the Iowa Association of Electric Cooperatives commented that its members supported proposed paragraph (c)(1)(i)(A), explaining that “[i]t is . . . common practice for Iowa’s cooperatives to inform their contract employers of hazards that are related to the contract employer’s work that might not be recognized by the contract employer or its employees” (Ex. 0167).

However, most of the comments on this provision objected to the proposed language. The most common complaint was that the proposed language was too broad or vague. (See, for example, Exs. 0146, 0175, 0178, 0201, 0227.) For instance, EEI commented:

This proposal is impermissibly vague because it fails to provide adequate notice of what would constitute compliance. *See, e.g., Ga. Pac. Corp., v. OSHRC*, 25 F.3d 999 (11th Cir. 1994). For example, what are hazards “that are covered by this section?” Considering that the proposed standards incorporate the requirements of many standards other than those addressed in the proposal, would host employers be required to inform contractors of known hazards addressed by all potentially applicable standards? Even if the term is confined to the standards under consideration here, this is a vastly overbroad requirement.

Next, what is the test for determining the hazards that are “related” to the contractor’s work? Further, on what objective basis is a host employer to determine which hazards might not be recognized by the contract employer or its employees? Does this mean that the host must be sufficiently familiar with the training of a specialty contractors’ employees to allow an intelligent assessment

⁶⁶The title of this provision is “Information transfer.” However, throughout the rulemaking, the Agency and the regulated community referred to the provision as the “host-contractor provision,” as the provision contains information-transfer requirements for host employers and contract employers. OSHA, therefore, uses the terms “information-transfer provision” and “host-contractor provision” interchangeably when referring to this provision.

of what hazards those employees “might” or “might not” recognize? What will be the penalty for mis-evaluating these possibilities, if made in good faith?

Indeed, what are “hazards” for purposes of this rule? Are they limited to conditions and practices that pose a significant risk of injury to employees, and would the likelihood of occurrence and degree of gravity make a difference? Similarly, what are “known” hazards? Are they hazards that the host employer actually knows of, or are they hazards that a host employer should have known through the exercise of reasonable diligence? Does actual knowledge for this purpose mean knowledge of any hazard that can be discerned by searching a company’s records—a daunting test for an electric utility that may have decades of records related to work on transmission and distribution facilities that cover literally thousands of square miles—or is a more realistic test to be applied? If so, what is it? [Ex. 0227]

Mr. James Shill with ElectriCities similarly commented that the proposed provision would ‘require ElectriCities’ members to take into account every section of the OSHA standards, as well as others incorporated by reference, and make a ‘guess’ as to all of the potential hazards a contractor may be unable or unwilling to ‘recognize’ (Ex. 0178). Ms. Salud Layton with the Virginia, Maryland & Delaware Association of Electric Cooperatives argued that “[t]he phrase ‘might not be recognized by the contract employer or its employees’ is too broad” and suggested that the proposed paragraph be revised to “specifically state the items that must be provided by the host employer to the contract employer” (Ex. 0175).

Some commenters proposed new language for this provision. (See, for example, Exs. 0201, 0227, 0505.) For instance, EEI suggested:

[T]he final rules should be limited to requiring that a host employer notify a contractor of a hazard where: (1) The host employer has actual knowledge: (a) That the hazard is present, and (b) that the contractors’ employees are likely to encounter the hazard in performing the work for which the contractor is engaged; (2) given its known expertise, the contractor cannot reasonably be expected to recognize the hazard; and (3) for this purpose, the “hazard” is a condition or practice that poses a significant risk of death or serious physical harm to the contractor’s employees. The standard should also make clear that the host employer is not obligated to evaluate each job assigned to a contractor to determine whether such hazards are presented. [Ex. 0227]

IBEW, although generally supporting this and the other proposed host-contractor requirements, also suggested changes to paragraph (c)(1)(i)(A). The union proposed:

The host employer shall inform the contract employer of . . . existing or

reasonably anticipated hazards covered by this subsection (i) of which the host employer is aware, (ii) that are related to the contract employer’s work, and (iii) that are sufficiently unique to the host employer’s operations or premises that the contract employer or its employees would not, through the exercise of reasonable care, be expected to recognize. [Ex. 0505]

Mr. Donald Hartley with IBEW explained:

It is important . . . to require the host employer to disclose hazardous conditions that it knows actually exist and that it reasonably anticipates may exist. The point here is to include hazards that may exist intermittently: for example, switching surges or environmental conditions or only under certain circumstances that, when they occur, affect the workplace safety.

Second, the focus of the information disclosure should be on information that is sufficiently unique to the host’s workplace or operations that the contract employer cannot be expected to know without the input from the host employer. A contractor may be unable to identify hazards not only because it lacks the technical expertise, but for the very basic reason that it is unfamiliar with the unique features of the host’s operation or workplace environment. Again, environmental conditions or specific operating procedures are examples of this.

Finally, we believe that host employers should be required to disclose any hazards that threaten contractor employees with any illness or injury, not just death or the most serious of physical harm. [Tr. 879–880]

OSHA considered the comments on proposed paragraph (c)(1)(i)(A) and continues to believe that the final rule should include a requirement for host employers to convey certain information to contractors that will bear on the contractor’s ability to ensure the safety of its employees. Much of the opposition to this provision was to the specific language in the proposal, not to the general principle that utilities have safety-related information that should be shared with contractors.

OSHA is sensitive to the concerns of commenters who noted that the proposed language was overbroad or unclear. Therefore, OSHA revised the final rule to more clearly define the information host employers must provide to contractors. The Agency is linking the information-transfer requirements, in part, to the requirement in final § 1926.950(d) for determining existing conditions. (Paragraph (d), discussed later in this section of the preamble, is essentially the same as existing § 1910.269(a)(3).) In the final rule, § 1926.950(d) requires a determination of the existing characteristics and conditions of electric lines and equipment related to the safety of the work. The examples of “existing conditions” that were listed in

proposed paragraph (d) have been separately numbered in final paragraph (d). The first five items of information listed in final paragraph (d) are “characteristics” of the electric power installation. The remaining three items of information listed in final paragraph (d) are “conditions” at those installations. Therefore, paragraphs (c)(1)(i) and (c)(1)(ii) of the host-contractor provisions in the final rule refer to (and require the sharing of) information about the characteristics and conditions specifically listed in final paragraph (d) that are related to the safety of the work to be performed.

Contract employers may request from the host employer information they need to protect their employees, in addition to the information that host employers must provide under final paragraphs (c)(1)(i) through (c)(1)(iii).⁶⁷ Thus, final paragraph (c)(1)(iv) requires host employers to provide contractors with information about the design or operation of the host employer’s installation that is known by the host employer, that the contract employer requests, and that is related to the protection of the contract employer’s employees.

As already noted, OSHA decided to adopt language in paragraphs (c)(1)(i) and (c)(1)(ii) in the final rule that more clearly specifies the information that host employers must provide to contractors and does so by using language that is familiar to employers complying with existing § 1910.269.⁶⁸ Paragraph (d), discussed later in this section of the preamble, lists specific characteristics and conditions of electric lines and equipment that must be determined before work on or near electric lines or equipment is started when these characteristics and conditions are related to the safety of the work to be performed. These characteristics and conditions include the nominal voltages of lines and

⁶⁷ Final paragraph (c)(1)(iii), discussed later in this section of the preamble, requires host employers to provide contractors with information about the design and operation of the host employer’s installation that the contract employer needs to make the assessments required by subpart V.

⁶⁸ It should be noted that, in revising the language of this provision in the final rule, OSHA did not conclude that the proposed language was overbroad or too vague. Similar language is used in other OSHA standards, including the standard for process safety management of highly hazardous chemicals (see § 1910.119(h)(2)(ii)). The Agency believes that employers subject to that rule are successfully complying with it. However, OSHA is revising the language of this provision in Subpart V because it resolves rulemaking participants’ concerns about the proposed provision in a manner that adequately protects employees and is more consistent with existing requirements for electric power generation, transmission, and distribution work in § 1910.269.

equipment, maximum switching transient voltages, the presence and condition of protective grounds and equipment grounding conductors, and the condition of poles. Host employers are the parties that possess much of this information, and it would be difficult in many cases (and impossible in others) for contract employers to determine these conditions and comply with paragraph (d) without getting the necessary information from the host employer.

For example, an electrical contractor might be able to make a reasonable estimate of the nominal voltage on a line through examination of the equipment. However, having the host employer provide that information to the contractor eliminates guesswork and the hazards associated with inaccurate estimates.

Similarly, contractors will usually be unable to determine the maximum switching transient overvoltages on a power line without information from the host employer. The maximum per-unit transient overvoltage determines the minimum approach distance for workers to maintain from exposed, energized parts (see the discussion of this issue under the summary and explanation of final § 1926.960(c)(1) later in this section of the preamble). Without this information from the host, a contractor might not adhere to the proper minimum approach distance and, as a result, a power line worker might come too close to the power line and be at risk of serious injury from electric shock and burns.

Paragraph (c)(1)(i) of the final rule provides that, before work begins, the host employer must inform the contractor of the characteristics of the host employer's installation that are related to the safety of the work to be performed and are listed in paragraphs (d)(1) through (d)(5). These characteristics are: the nominal voltages of lines and equipment, the maximum switching-transient voltages, the presence of hazardous induced voltages, the presence of protective grounds and equipment grounding conductors, and the locations of circuits and equipment, including electric supply and communication lines and fire-protective signaling circuits.⁶⁹ OSHA presumes that host employers have this information because they typically need

it for the design and operation of an electric power generation, transmission, or distribution system. A note to final paragraph (c)(1)(i) explains that in an unusual case in which the host employer does not have this information in existing records, it must obtain the information for purposes of complying with paragraph (c)(1)(i).

Paragraph (c)(1)(ii) of the final rule requires that, before work begins, the host employer inform the contract employer of the conditions of the host employer's installation that are related to the safety of the work to be performed, that are listed in final paragraphs (d)(6) through (d)(8), and that are known to the host employer. These conditions are: the condition of protective grounds and equipment grounding conductors, the condition of poles, and environmental conditions relating to safety. Final paragraph (c)(1)(ii) only requires host employers to provide known information to contractors. Host employers gain information on the condition of their electric power generation, transmission, and distribution systems through normal preventive-maintenance inspections; and, if host employers find conditions listed in final paragraphs (d)(6) through (d)(8) and related to the safety of work to be performed by a contractor during such inspections, the host employer must pass that information to the contract employer under final paragraph (c)(1)(ii). For example, if a utility conducts a wood-pole inspection program and finds several poles that are structurally unsound and that need replacement, this information must be imparted to a contractor whose work involves the affected poles. However, this paragraph only requires the host employer to provide information that the host can obtain from existing records through the exercise of reasonable diligence; this provision does not require host employers to conduct inspections to identify these conditions. To make this clear in the final rule, OSHA included a note following paragraph (c)(1)(ii) clarifying that, for the purposes of that paragraph, the host employer does not have to inspect of worksite conditions or otherwise get information that it cannot obtain through a reasonably diligent search of its existing records.

OSHA believes that the revised language in paragraphs (c)(1)(i) and (c)(1)(ii) of the final rule addresses the concerns expressed by commenters, such as ElectricCities and EEI, about the clarity and scope of proposed paragraph (c)(1)(i)(A). The provision no longer requires host employers to determine whether a hazard exists or whether

contractors might be expected to recognize particular hazards.

Under final paragraph (c)(1)(iv), before work begins, a host employer must provide additional information about the design or operation of the installation, but only if that information (1) is known by the host employer, (2) is requested by the contract employer, and (3) is related to the protection of the contract employer's employees. A note to final paragraph (c)(1)(iv) clarifies that, for purposes of complying with that paragraph, the host employer is not required to make inspections or otherwise get information that it cannot obtain through a reasonably diligent search of its existing records.

IBEW commented that, "[i]n addition to the information about 'existing conditions' needed to perform the hazard analysis, there may be other information unique to the host's operations or premises that the contractor employer needs to ensure the safety of its employees" (Ex. 0505). The union identified "schedules of other crews that may be working on the same circuits or equipment, anticipated operational changes, and the potential impact of unique localized climatic, environmental or geological conditions" as examples of such information (*id.*). Details about the scheduling of outages is another example of information a contractor might need to obtain from the host employer before employees start work.

OSHA is not explicitly requiring host employers to provide this other type of information to contractors. The Agency believes that, although information such as the scheduling of crews may prove useful in some situations, it is not always essential to ensure the safety of employees. When a contractor needs this information to protect its employees, the contractor may request this type of information under final paragraph (c)(1)(iv). In addition, OSHA believes that host employers and contract employers will exchange this type of information in their efforts to comply with other provisions in final paragraph (c). For example, when host and contractor crews will be working together or on the same circuit, OSHA intends for both employers to exchange crew-scheduling information when necessary to comply with final paragraph (c)(3) (discussed later in this section of the preamble), which requires the contract employer and the host employer to coordinate their work rules and procedures to ensure that employees are protected as required by subpart V.

As a general matter, OSHA does not believe that the information host

⁶⁹ In final § 1926.950(d)(5), OSHA changed the proposed term "power . . . lines" to "electric supply . . . lines." The two terms are synonymous, and the final rule defines "electric supply lines" in § 1926.968. Note that lines that employees encounter are either electric supply lines, communication lines, or control lines, such as those on fire-protective signaling circuits.

employers must share with contract employers under final paragraph (c)(1)(iv) is likely to contain proprietary information or trade secrets. OSHA recognizes, however, that an unusual case could arise presenting issues related to trade secrets. In any such case, OSHA expects that the host employer will find a way to provide the necessary information to the contract employer without divulging trade secrets or will share the information with the contract employer pursuant to an appropriate confidentiality agreement.

Southern Company expressed concern that contractors and their employees might rely on the information provided by the utility in lieu of doing a thorough job briefing as required by final § 1926.952 (Ex. 0212). Final § 1926.950(c)(1)(i), which requires host

employers to provide information to contractors, does not replace the contract employer's basic responsibility to conduct the job briefing required by final § 1926.952. The briefing will impart information, including relevant information a contractor obtains from a host employer, to the employees doing the work. The requirements in final §§ 1926.950(c)(1) and (d) and 1926.952 work in combination to ensure that the employees performing the work are provided with sufficient information to perform that work safely.

Proposed paragraph (c)(1)(i)(B) required host employers to provide contract employers with information about the installation that the contract employer would need to make the assessments required elsewhere in Subpart V. EEI inquired as to who (the host or contract employer) would be

responsible for deciding what assessments the contractor must make and whether the host would have to survey contractor work areas to identify hazards that need assessment (Ex. 0227).

The language in final paragraph (c)(1)(iii) states explicitly that, before work begins, the host employer must provide information that the *contract employer* needs to perform the assessments. In addition, the language from the proposal has been modified in the final rule to limit the information the host employer must provide to “[i]nformation about the design and operation of the host employer’s installation.” Table 2 shows the assessments that are implicitly or explicitly required by final subpart V and lists information that the Agency anticipates contractors will need to perform the required assessments.

TABLE 2—ASSESSMENTS REQUIRED BY SUBPART V

Provision	Assessment required	Type of information to be provided under § 1926.950(c)(1)(iii)
§ 1926.953(a)	Whether an enclosed space must be entered as a permit-required confined space.	Whether an enclosed space contains hazards, other than electrical and atmospheric hazards, that could endanger the life of an entrant or could interfere with escape from the space.
§ 1926.953(m)	Whether forced air ventilation has been maintained long enough that a safe atmosphere exists.	The size of the enclosed space.
§ 1926.960(c)(1)(i)	What is the appropriate minimum approach distance for the work to be performed.	What the operating conditions are for the value of the maximum transient overvoltage provided to the contract employer. ¹
§ 1926.960(g)(1)	Whether employees are exposed to hazards from flames or electric arcs.	Information on electric equipment, such as safety information provided by manufacturers, that relates to the required hazard assessment.
§ 1926.960(g)(2)	What is the estimated incident energy from an electric arc.	The electrical parameters needed to calculate incident energy, such as maximum fault current, bus spacings, and clearing times.
§ 1926.960(k)	Whether devices are designed to open or close circuits under load conditions.	Load current for, and the opening and closing ratings of, devices used to open and close circuits under load.
§§ 1926.961 and 1926.967(h).	What are the known sources of electric energy (including known sources of backfeed) supplying electric circuits.	All known sources of electric energy, including known sources of backfeed.
§ 1926.962(d)(1)(i)	Whether protective grounds have adequate current-carrying capacity.	The maximum fault current and clearing time for the circuit.
§ 1926.962(g)	Whether there is a possibility of hazardous transfer of potential should a fault occur.	Potential rise on remote grounds under fault conditions.
§ 1926.964(a)(2)	Whether overhead structures such as poles and towers are capable of sustaining stresses imposed by the work.	The design strength of the pole or structure.

¹ Includes information on conditions that must be in place for the maximum transient overvoltage to be valid, such as whether circuit reclosing devices are disabled.

In specific cases, contractors may need information that is somewhat different from that described in Table 2. OSHA expects that contractors will inform host employers if they need additional information, and that information must be provided to the extent the host employer is required to provide it by final paragraph (c)(1)(iii). In addition, the Agency does not expect host employers to provide contractors

with information in the table if the contractor informs the host that the information is not needed.

EEI questioned whether the proposed provision was limited to information actually known by the host employer (Ex. 0227). OSHA expects that the host employer will usually have, in existing records, information about the design and operation of its installation that the contract employer will need to make

required assessments. OSHA presumes that host employers know their electric power generation, transmission, or distribution installations and know their systems’ nominal system and operating voltages, available fault currents, relay protection schemes, anticipated relay clearing times, and switching schedules. As IBEW noted, this is information “that the host employer should have for basic operational purposes and that is

generally solely in the host's possession" (Ex. 0505). In addition, electric utilities will also need to have this information to perform their own required assessments when their employees are performing work on the utilities' installations. However, the record also indicates that, in some unusual circumstances, electric utilities do not have basic information about their system readily available. (See Mr. Brian Erga's testimony regarding a nuclear power plant that did not know its available fault current, Tr. 1241–1242.) In such cases, the final rule requires the host employer to ascertain the information and provide it to its contractor so that the contractor can conduct the required assessments. A note to final paragraph (c)(1)(iii) clarifies that, in any situation in which the host does not have such information in existing records, it must obtain the information and provide it to the contract employer to comply with paragraph (c)(1)(iii).⁷⁰

Mr. Steven Theis of MYR Group recommended that the final rule require hosts and contractors to perform joint hazard analyses (Tr. 1334).

The final rule neither requires nor prohibits such joint assessments. Even if employers do not conduct a joint hazard analysis, the information exchange required by final paragraph (c)(1) of the final rule will be part of a two-way conversation between host employers and contract employers. As discussed later in this section of the preamble, final paragraph (c)(3) requires hosts and contractors to coordinate their work rules and procedures to ensure that employees are protected as required by subpart V. To comply with the final rule, the contractor, as part of this effort, must communicate with the host about the information the contractor needs about the host's installation.

OSHA notes that final paragraph (c)(1) does not require the host employer to report any information to the contract employer in writing; the Agency will deem it sufficient for the host employer to provide the necessary information, through any appropriate mechanism (for example, a phone call or an email), to an authorized agent of the contractor.

⁷⁰The preamble to the proposal indicated that proposed paragraph (c)(1)(i) would not require host employers to provide "unknown information" to contractors (70 FR 34840). It should be noted, however, that OSHA presumes that host employers "know" the information that must be shared under final paragraphs (c)(1)(i) and (c)(1)(iii) because it relates to the design and operation of the installation, which are aspects of an electric power generation, transmission, or distribution system that are under the exclusive purview of the host employer.

Proposed paragraph (c)(1)(ii) would have required the host employer to report observed contract-employer-related violations of subpart V to contract employers. OSHA included this provision in the proposal because the Agency believed that host employers occasionally observe contractor employees performing work under the contract and that it was important for the host employer to inform the contract employer of observed violations so that the contractor could correct them and prevent them from occurring in the future.

OSHA received many comments on this proposed requirement. (See, for example, Exs. 0128, 0152, 0160, 0167, 0169, 0170, 0171, 0178, 0183, 0186, 0201, 0222, 0227, 0235, 0505; Tr. 880–882.) IBEW supported the need for a reporting requirement, explaining:

[T]he point is that if in performing its usual functions the host observes contract employees exposed to hazards, it must report those observations to their contract employer. This requirement is particularly important in the electrical industry where contract employees are potentially exposed to extremely serious hazards.

If the host employer who knows the worksite's hazards and the potential for harm sees a contract employee exposed to those conditions the host knows to be hazardous, it is unconscionable for the host to walk away. The host must report that information to the contract employer so the contract employer can take the steps necessary to eliminate the unsafe condition, and the contract employer must report back what action it actually took . . . [Tr. 881].

Many commenters objected to the proposed reporting requirement, however. (See, for example, Exs. 0128, 0152, 0167, 0170, 0178, 0183, 0186, 0222, 0227.) Some expressed concerns about putting host employers in an enforcement role and requiring them to make determinations about whether an OSHA violation exists. (See, for example, Exs. 0128, 0152, 0170, 0178, 0183, 0222, 0227.) For instance, EEI commented:

The proposal would require a host employer to report observed contract-employer-related *violations of the standard* to the contract employer.

* * * * *

Typically, utility employees and managers are not trained "in the requirements of" OSHA standards." [sic] Rather . . . they are trained in the requirements of their own employer's safety rules. . . . There simply are no requirements that any employee know what OSHA standards require—only that behavior and work practices be in compliance with standards. Employees are entitled, however, to assume that if they comply with their employer's safety rules, they will comply with OSHA standards. . . . Indeed, among EEI members, the

requirements of safety rules often exceed the minimum requirements of OSHA standards.

Clearly, the proposed requirement would create confusion. Utility representatives may believe they are seeing OSHA violations, but in fact may observe that contractors are not performing as the utility's internal safety rules require. [T]he proposal would effectively place utility personnel in the role of surrogate Compliance Officers. They are not trained or qualified to perform such a function. [Ex. 0227; emphasis included in original]

Mr. Alan Blackmon with the Blue Ridge Electric Cooperative suggested that, "[b]y requiring the [host] employer to report on the violation of a federal rule, the proposal in a sense deputizes the employer as an OSHA inspector, a role for which employers have no training and no experience" (Ex. 0183). Mr. Chris Tampio of the National Association of Manufacturers argued that, by requiring hosts to report observed violations, OSHA "would inappropriately force a host employer to make a legal determination as to whether the contractor has committed a violation of the OSH Act" (Ex. 0222).

EEI was also concerned that host employers would be cited for failing to report violations that were present, but not recognized by, the host's employees, commenting:

The proposal provides no guidance as to the kinds of observation that would trigger a notification requirement. For example, [utilities commonly] engage inspectors . . . to observe contractors' performance. In other situations, this is performed by a utility's own foremen or supervisors. Such inspections often are aimed at assuring that the work is performed accurately and in timely fashion, and observation of safety performance, while important, may not be the main or only focus. If a utility inspector is found to have had the opportunity to observe a contractor's violative behavior but did not understand or appreciate what he saw and failed to report it, would the host be cited? [Ex. 0227]

Similarly, Duke Energy commented: "Host employers may have a variety of employees observing contract operations for reasons unrelated to safety. They may be observing contract operations for quality, schedule, productivity, or cost purposes. A host employee may 'observe' a condition, but not recognize it as a violation of this OSHA regulation" (Ex. 0201).

Some commenters presumed that the proposal required host employers to either actively monitor contractors or take measures to ensure that reported hazards were abated. (See, for example, Exs. 0187, 0225, 0235, 0238, 0504.) For instance, Mr. James Strange with American Public Power Association (APPA) commented that municipal

utilities “do not have the personnel to shadow contractors on each utility job site to assure that they are working according to OSHA rules” (Ex. 0238). In addition, several commenters argued that the proposal would create an adversarial relationship between hosts and contractors. (See, for example, Exs. 0169, 0171, 0183.) Mr. Wilson Yancey expressed this argument as follows:

[T]he proposed requirements might create an unduly adversarial relationship between the parties. For instance, the host employer seeking to fulfill its perceived duties under the regulations would thrust the host employer into the role of an investigator and rule-enforcer, rather than a business partner seeking to achieve a common goal of employee safety. [Ex. 0169]

After considering the comments received on this issue, OSHA decided not to include proposed paragraph (c)(1)(ii) in the final rule. First, the host employer, as defined in the final rule, may not be in position to recognize, or even observe, hazardous conditions created by contract employers. OSHA based the proposed rule on the premise that the host employer would hire the contract employer and would perform some maintenance on the system. As noted earlier, in the final rule, the Agency adopted a definition of “host employer” that is designed to capture the employer in the best position to provide information about the electric power generation, transmission, or distribution installation on which the contract employer is working. The definition of “host employer” in the final rule does not require the host employer to maintain the installation or to be the entity that hired the contractor. A host employer that does not perform maintenance work on the system would be unlikely to recognize hazardous conditions created by contractors. In addition, a host employer that does not hire the contract employer usually would not find itself in a position to observe the contractor’s employees working.⁷¹

Second, in some circumstances, the host employer will also be a controlling employer under OSHA’s multiemployer citation policy. A controlling employer

has an underlying duty to exercise reasonable care to prevent and detect violations endangering contractor employees at the worksite. (See CPL 02–00–124; see also OSHA’s discussion of the multiemployer citation policy earlier in this section of the preamble.) This is a broader obligation than the one OSHA proposed for host employers in proposed paragraph (c)(1)(ii); therefore, the proposed requirement is not necessary with respect to hosts that are controlling employers. (Whether a host employer is a controlling employer depends on whether it has general supervisory authority over the worksite, including the power to correct, or require others to correct, safety and health violations.⁷²) Indeed, the Agency is concerned that including the proposed reporting requirement in the final rule would lead host employers to believe they could fulfill their obligations as controlling employers just by complying with the more limited requirement in the standard.

Although OSHA is not including proposed paragraph (c)(1)(ii) in the final rule, the Agency expects that, in many situations, liability and practical considerations will drive host employers that are not controlling employers to notify the contractor if they observe hazardous conditions involving the contractor’s employees. Unsafe conditions created by contractors can pose hazards to employees of the host employer and to the public and can create additional obligations for host employers to protect their employees (for example, through OSHA standards and the general duty clause) and the public (for example, through liability concerns) from those hazards. For instance, a host employer that observes a contractor bypassing safety rules when installing a new line will likely have concerns about the quality of the contractor’s work and about the effect of the contractor’s unsafe practices on the installation and on public safety. These concerns will form a strong incentive for the host employer to report the hazardous conditions to the contractor.

Although the Agency concluded, based on the current rulemaking record, that the reporting requirement in proposed paragraph (c)(1)(ii) is neither necessary nor appropriate for this final rule, the Agency will continue to monitor this issue and evaluate whether regulatory requirements like the one in proposed paragraph (c)(1)(ii) are necessary to ensure the safety of

employees under subpart V or other OSHA standards.

Proposed paragraph (c)(2)(iii)(C) would have required the contract employer to advise the host employer of measures taken to correct, and prevent from recurring, violations reported by the host employer under proposed paragraph (c)(1)(ii). In light of the Agency’s decision not to adopt proposed paragraph (c)(1)(ii), proposed paragraph (c)(2)(iii)(C) is no longer meaningful and is not incorporated in the final rule.

In addition to proposing the requirement for hosts to report observed contract-employer-related violations, OSHA requested comments on the related, but distinct, issue of whether it should require host employers to take appropriate measures to enforce contractual safety requirements or review the contracts of contractors who fail to correct violations.⁷³

IBEW was the only commenter that supported such requirements, explaining:

The host employer should regularly review the safety performance of a contractor while operating on its site. The host employer should take necessary action to ensure contractual obligations are being met. The rule should require the host employer to initiate further action if the review finds non compliance. [Ex. 0230]

Rulemaking participants agreed that host employers regularly adopt contracts that specify safety standards to which contractors must adhere and that include provisions for enforcing those requirements. (See, for example, Exs. 0163, 0175, 0213, 0405; Tr. 1386–1387.) Also, some commenters recognized a general need for hosts to evaluate the safety performance of contractors. (See, for example, Exs. 0167, 0175, 0184, 0213, 0219.) However, none of these rulemaking participants supported the adoption of OSHA requirements related to the enforcement, review, or awarding of contracts.

For example, Ms. Susan O’Connor with Siemens Power Generation explained:

While host employers often [require and enforce compliance with OSHA standards], in practice it would be burdensome [on] the host employer to require them, at the risk of OSHA sanctions, to enforce contract provisions as a regulatory matter. Indeed, establishing this as a regulatory standard could operate as a disincentive for host employers to establish sound health and safety contractual terms with contractors,

⁷³ Contracts between electric utilities and their contractors often contain provisions requiring contractors to meet OSHA standards and other provisions addressing noncompliance with the terms of the contract. (See, for example, Ex. 0175.)

⁷¹ For example, a generation plant owner could contract with a company to operate, but not maintain, the plant. If the plant owner neither operates nor controls operating procedures for the installation, the company it contracts with to operate the plant is the host employer under the final rule. The plant owner could hire a different company to perform maintenance in the substation in the generation plant. Because the host employer in this scenario does not perform maintenance, it is likely that the host employer will not have any employees qualified to enter the substation, and, thus, will not observe the maintenance contractor’s employees.

⁷² Such control can be established by contract or by the exercise of control in practice.

particularly terms which go beyond regulatory requirements. . . . In addition, OSHA regulations are promulgated and undergo public review; Host Employer requirements do not go through such a regulatory review process and therefore must not be held on par with OSHA regulations. Host employers have a right to establish site safety requirements that are more stringent than the law requires; however, they should have the right to deal with contractors who do not comply individually and in their own manner. But they must currently do this against the backdrop of specific OSHA standards, and the OSHA Multi-employer Workplace policy. Siemens sees no reason to change this.

* * * * *

OSHA should not prescribe how contractors are selected or prescribe how contractors must be evaluated for purposes of contracting work or terminating work. It is up to the discretion of the party contracting for the services to make those determinations. Host employers should have the discretion to choose, to dismiss, or continue utilizing contractors. Given the already comprehensive and pervasive nature of health and safety regulation through OSHA and the states, as well as considerations of tort law, the effects of the marketplace will weed out contractors that are repeatedly substandard from a safety standpoint, as well as those that are chronically poor perform[ers] from a quality, delivery, or other standpoint. Contractors should be answerable to the host employe[r] for business matters, and the agency for regulatory matters. These lines should not be blurred by attempting to make the host employer responsible for both. As a practical matter, it would be impossible for OSHA . . . to come up with minimum requirements for every contract activity, to establish an "acceptable" versus "unacceptable" contractor. [Ex. 0163]

Duke Energy commented:

The only safety performance that OSHA has authority to regulate is compliance with OSHA rules. Worker Compensation Insurance Carriers and others review safety performance. There is no need for OSHA to impose additional requirements. Each host employer is faced with a unique set of available contractors, each with its own safety record. Some may excel in one area and perform poorly in another. Some host employers may have such a limited pool of available contractors that requiring some pre-determined level of contractor safety performance would eliminate all contractors. Other goals, such as employing minority firms may cause hosts to work with poor performers to improve their performance, rather than eliminating the minority contractor with the poor record. OSHA should not interfere in decisions such as these. [Ex. 0201]

In light of the comments received, OSHA decided not to adopt provisions requiring host employers to enforce contractual safety requirements, to review the contracts of contractors who fail to correct violations or hazards, or to evaluate the safety performance of

contractors. As discussed previously, the host employer might not be the entity that hired the contract employer, in which case the host employer would not be in position to enforce contract requirements or be involved in awarding contracts to the contract employer. In addition, as Ms. O'Connor pointed out, and as noted earlier in this section of the preamble, host employers that have supervisory authority over a contractor's worksite are subject to a background statutory obligation, as set forth in OSHA's multiemployer citation policy, to exercise reasonable care to detect and prevent violations affecting contractor employees. Moreover, for the reasons stated previously, OSHA believes that, even in the absence of a specific requirement in subpart V, host employers that are not controlling employers have strong incentives to take measures to ensure safe contractor performance. In addition, the Agency believes that contractors with poor safety performance are likely to have similarly poor records with respect to the quality of their work, making it less likely that host employers will hire them. Therefore, the final rule does not contain provisions related to the enforcement, review, or awarding of contracts.

Paragraph (c)(2) of final § 1926.950 addresses the responsibilities of the contract employer. Final paragraph (c)(2)(i) requires the contract employer to ensure that each of its employees is instructed in any hazardous conditions relevant to the employee's work of which the contractor is aware as a result of information communicated to the contractor by the host employer as required by final paragraph (c)(1). This paragraph ensures that information on hazards the employees might face is conveyed to those employees. The information provided by the host employer under paragraph (c)(1) is essential to the safety of employees performing the work, especially because it may include information related to hazardous conditions that the contract employees might not identify or recognize.

Proposed paragraph (c)(2)(i) was worded differently from the final rule; the proposed paragraph required contractors to instruct their employees in hazards communicated by the host employer. OSHA received no comments on this proposed provision. However, changes were made to this paragraph in the final rule to mirror the changes made to paragraph (c)(1) (described earlier). In the final rule, the Agency did not include the note to proposed paragraph (c)(2)(i) because OSHA believes that the note was confusing.

The proposed note suggested that the instruction required under paragraph (c)(2)(i) was not part of the training required under § 1926.950(b). The contractors' employees will already be trained in many of the hazards that are related to the information the contractor receives from the host, and the final rule does not require employers to duplicate this training. Contractors will need to supplement an employee's training only when that employee will be exposed to a hazard or will follow safety-related work practices with respect to which he or she has not already been trained.

Paragraph (c)(2)(ii), as proposed, required the contract employer to ensure that its employees followed the work practices required by subpart V, as well as safety-related work rules imposed by the host employer. In proposing this provision, OSHA explained that a host employer's safety-related work rules are almost certain to impact the safety and health of the contractor's employees (70 FR 34840). For example, electric utilities typically require contractors to follow the utilities' procedures for deenergizing electric circuits. If the contract employer's employees do not follow these procedures, a circuit the contractor's employees are working on might not be properly deenergized, endangering the contractor's employees, or a circuit the contractor was not working on might become reenergized, endangering any host employer's employees that might be working on that circuit.

OSHA invited comments on whether requiring a contractor to follow a host employer's safety-related work rules could make work more hazardous. A few commenters supported proposed paragraph (c)(2)(ii). (See, for example, Exs. 0164, 0213.) For instance, Mr. Tommy Lucas of TVA commented:

The proposed requirement is supported. Regardless whether this requirement is carried forward, we will require contractors to follow certain host-employer safety rules contractually, such as the lockout/tagout (LOTO) procedure. Failure to follow the LOTO procedure could result in host or contractor employees being seriously injured. [Ex. 0213]

In contrast, the vast majority of rulemaking participants opposed the proposed provision. (See, for example, Exs. 0156, 0161, 0162, 0168, 0183, 0201, 0202, 0212, 0220, 0222, 0227, 0233, 0237, 0501; Tr. 1323, 1333.) These commenters gave several reasons for objecting to this proposed requirement:

- It could result in the implementation of inadequately safe work rules, such as when the contractor has more protective work rules than the

host (see, for example, Ex. 0161) or when the host's work rules may be based on its own employees' working conditions that are less hazardous than the working conditions to which contractor employees will be exposed (see, for example, Ex. 0233).

- It could cause contract employees to be confused about proper work methods if rules change from contract to contract (see, for example, Ex. 0227).

- It would result in contractual requirements becoming enforceable OSHA standards in a way that constitutes an illegal delegation of OSHA's rulemaking authority, thereby circumventing proper rulemaking procedures (see, for example, Ex. 0237).

- It would place OSHA in the position of having to interpret and enforce third-party contracts (see, for example, Ex. 0233).

- It could increase disaster-response time (Ex. 0233).

- It would increase costs and administrative burdens on contract employers (see, for example, Ex. 0162).

- It could result in contractors having to follow host employer work rules that are not directly linked to employee safety, for example, in a situation in which the host's rules approve only one vendor for safety equipment when equivalent, equally protective, equipment is available from other vendors (Ex. 0162).

For instance, Mr. Steven Theis with MYR Group commented:

MYR Group believes that requiring a contractor to follow a host's safety rules would create hazards. Contractors are required by the standard to have appropriate work rules and policies for compliance. Requiring them to follow another employer's policies—which they are unfamiliar with and untrained on—would either result in accidents or add undue and unnecessary time for retraining and familiarization with the policies when the contractor has its own policy. . . . Indeed, MYR Group has experienced situations where host employers impose work rules that do not significantly affect employee safety and may even create an unsafe situation. [H]ost work rules can specify chain of command requirements that do not align with contractor management structure or responsibility and thus following host requirements could result in loss or miscommunication of safety information or safe work directives. Accordingly, MYR Group respectfully submits that the requirement to follow host employer work rules should be deleted. [Ex. 0162]

Mr. Terry Williams with the Electric Cooperatives of South Carolina agreed and provided an example of how following a host employer's safety rules could jeopardize worker safety:

The proposal ignores the fact that contractors have developed their own rules

that are appropriate for the work they do. They train on these rules and operate according to them all the time. Requiring contractors . . . to work to the rules of others could easily result in the contractor working less safely.

Consider the following actual situation: an electric utility that is primarily a 12kV system, with some 34.5kV. The utility uses its own crews for the 12kV work, and uses a qualified contractor for the 34.5kV work, as the need arises. The utility's safety rules specify use of Class 2 gloves, sleeves and cover up for all work, as that is all their line crews need. For the 34.5 kV work, the contractor should use Class 4 equipment, yet OSHA's proposal could justify use of Class 2, with unsafe results.

OSHA should retract this proposal and allow host employers to require contractors to work to appropriate safety rules. [Ex. 0202]

EEI made similar comments in its posthearing brief:

[T]he standard would require contractors to utilize different safe procedures depending upon the owner involved. For example, an electric line contractor could be required to observe a "ground-to-ground" rubber glove requirement while working for one electric utility, but not while working for another utility nearby (Tr. 110–11). The confusion and consequent increased risk to employees from such requirements is obvious, not to mention the cost of training for employees and supervisors alike. [Ex. 0501]

As to the legal arguments, Susan Howe with the Society of the Plastics Industry suggested that "OSHA's incorporation" of the host employer's rules "into the OSHA standards which are the subject of this rulemaking would violate the rulemaking provisions of the Occupational Safety and Health Act, the Administrative Procedures Act, and the Federal Register Act" (Ex. 0170). The National Association of Manufacturers similarly stated, with reference to this provision: "OSHA has never had the authority to incorporate the provisions of millions of private contracts into OSHA standards, nor to delegate its rulemaking authority to private entities" (Ex. 0222). EEI also commented that the proposed requirement "effectively would place each host employer in the position of promulgating safety and health standards for contractors' employees, and therefore would constitute an unconstitutional delegation of legislative power" (Ex. 0227).

OSHA does not believe that the proposed provision would cause the practical problems identified by rulemaking participants. There is evidence in the record that, as IBEW stated, "contractors . . . routinely adapt their work rules and safety practices to accommodate the demands of particular jobs and the requirements of specific

hosts" (Ex. 0505). The union explained this statement as follows:

There are circumstances related to contractors performing work on utility properties that would require the contractors to work under the host employer's safety related work rules to ensure both the contractor employees and the host employer employees are provided a safe work environment. In fact, many collective bargaining agreements require this. [Ex. 0230]

Mr. Brian Erga with ESCI noted that some utilities have such unique systems that contractors have no choice but to follow the host's rules (Tr. 1271–1272). Several witnesses stated that contractors routinely follow a host employer's lockout-tagout requirements (Tr. 314, 984, 1299–1301). There is evidence that some host employers require contractors to follow NFPA 70E (Ex. 0460), to follow the host's fall protection requirement for working from aerial lifts (Tr. 391), and to use particular types of flame-resistant clothing (Tr. 1346). In addition, the proposal did not require contractors to follow all of the host employer's safety rules, only rules the host imposes on contractors, which the contractors are required to follow anyway. The Agency also does not believe that proposed paragraph (c)(2)(ii) would result in undue confusion from work rules that vary from one employer to another. The record indicates that contractors are already required to institute different work rules because of contractual or other requirements imposed by host employers, such as following the host employers' lockout-tagout procedures (Tr. 314), using particular live-line work methods (Tr. 320), and using particular forms of fall protection (Tr. 643–644).

On the other hand, the record establishes that hosts sometimes impose rules that do not meet OSHA requirements (Tr. 1366⁷⁴) or that may be less safe than the contractor's rules (Tr. 1365–1366⁷⁵). These are outcomes that OSHA did not envision in proposing paragraph (c)(2)(ii). Considering these potential risks, and the commenters' overwhelming opposition to this proposed provision, the Agency decided not to include proposed paragraph (c)(2)(ii) in the final rule.

OSHA concludes, however, that some coordination of work rules between

⁷⁴ Some host employers "don't believe in equipotential work zone," which is required by existing § 1910.269(n)(3), or want trucks barricaded, instead of having them grounded, as required by existing § 1910.269(p)(4)(iii)(C).

⁷⁵ One host employer requires contractor employees to wear rubber insulating gloves while working with live-line tools on transmission lines, which may cause the gloves to fail.

hosts and contractors is necessary, particularly with respect to deenergizing lines and equipment (Ex. 0505) and grounding procedures (Tr. 1271–1272). According to IBEW:

[What is important] is not that one party's rules take precedence over the others. Instead, what is important is that the parties operating on an electrical system coordinate procedures to ensure that all of the employees can perform safely. There are two sets of circumstances in which this kind of coordination is an issue: Where employees actually work together and when the manner in which one group of employees performs has an impact on the safety of another group of employees. [Ex. 0505]

Other rulemaking participants similarly supported a requirement for coordination between host employers and contract employers to assure the protection of host employees and contract employees. (See, for example, Exs. 0128, 0235, 0237.) Therefore, the Agency is adopting a new paragraph in the final rule, § 1926.950(c)(3), entitled "Joint host- and contract-employer responsibilities," which reads as follows:

The contract employer and the host employer shall coordinate their work rules and procedures so that each employee of the contract employer and the host employer is protected as required by this subpart.

This new provision provides host employers and contract employers more flexibility than the proposal to select appropriate work rules and procedures for each task or project, while ensuring that workers are not at risk of harm due to a lack of coordination between employers.

Under the new provision, each employer has independent responsibility for complying with the final rule. In addition, the Agency stresses that a contract employer must comply with the final rule even though a host employer may try to impose work rules that would cause the contract employer to violate OSHA's rules.

Accordingly, a contract employer is not relieved of its duty to comply with the final rule by following a work rule imposed by the host employer. For example, a contract employer must comply with final § 1926.962(c), which prescribes rules for equipotential grounding, even if the host employer has its own noncompliant grounding procedures. Paragraph (c)(3) of final § 1926.950 requires host employers and contract employers to confer in an effort to select work rules and procedures that comply with final § 1926.962(c).

Final paragraphs (c)(2)(ii) and (c)(2)(iii) (proposed as part of paragraph (c)(2)(iii)) require the contract employer to advise the host employer of unique

hazardous conditions posed by the contract employer's work⁷⁶ and any unanticipated hazardous conditions found, while the contractor's employees were working, that the host employer did not mention. Final paragraphs (c)(2)(ii) and (c)(2)(iii) enable the host employer to take necessary measures to protect its employees from hazards of which the host employer would not be aware. These requirements will protect the host employer's employees: when they are working near the contractor's employees (for example, during storm situations (Tr. 315, 392, 1379–1380); during outages on transmission lines (Tr. 1380) and in plants (Tr. 985); while working in the same substation (Tr. 313–314, 559); and when the host employer's employees work on the same equipment after the contract employer departs (such as, when contractors are working on equipment in the field that the host employer does not regularly inspect) (Tr. 877–878)). The Utility Workers Union supported these proposed requirements, commenting: "Requiring the sharing of information of hazards found or created by the contractor is . . . insurance that all employees, host and contractor, are in a safer working environment" (Ex. 0197). OSHA notes that proposed paragraph (c)(2)(iii)(B) (now paragraph (c)(2)(iii)) required contractors to report any unanticipated "hazards" not mentioned by the host; however, in the final rule, the phrase "hazardous conditions" replaces the word "hazards" throughout paragraph (c). In addition, the Agency anticipates that contract employers will inform host employers of any information provided by the host that is at odds with actual conditions at the worksite, consistent with paragraph (c)(3), which specifies that host employers and contract employers coordinate their work rules and procedures so that each employee is protected as required by subpart V.

Some commenters believed that proposed paragraph (c)(2)(iii) (now paragraphs (c)(2)(ii) and (c)(2)(iii)) needed clarification. For example, the Associated General Contractors of America (AGC) commented that proposed paragraph (c)(2)(iii) was vague and did not provide guidance on the timeframes or format of required information transfers (Ex. 0160).

OSHA does not agree that final paragraphs (c)(2)(ii) or (c)(2)(iii) are vague or unclear. These provisions simply require that contractors provide

⁷⁶ For the purposes of final paragraph (c)(2)(ii), "unique hazardous conditions presented by the contract employer's work" means hazardous conditions that the work poses to which employees at the worksite are not already exposed.

information to host employers, which reciprocates the requirements under final paragraph (c)(1) that host employers provide contractors with information. The Agency deliberately omitted, in the proposed and final rules, any requirement for a formal or written report; the final rule simply requires contractors to advise the host employer, which allows contract employers maximum flexibility in complying with the final requirements. The Agency will deem it sufficient for the contract employer to provide the necessary information, through any appropriate mechanism (for example, a phone call or an email), to an authorized agent of the host employer.

The purpose of final paragraph (c)(2)(ii) is to enable host employers to protect their own employees from hazardous conditions presented by the contractor's work. Thus, the information addressed by paragraph (c)(2)(ii) needs to be provided to the host employer soon enough so that the host employer can take any necessary action before its employees are exposed to a hazardous condition. To address AGC's concern that the proposed paragraph did not provide guidance on the timeframe of the required information transfer, OSHA added language to paragraph (c)(2)(ii) in the final rule to indicate that this information must be provided "[b]efore work begins."

The final rule also includes, in paragraph (c)(2)(iii), a 2-working day timeframe in which the contractor must advise the host employer of information described in that paragraph. OSHA believes that this timeframe will give the contract employer sufficient time to provide the required information. The final rule does not specifically require hosts to take any direct action in response to information provided by contractors, although the Agency anticipates that host employers will use this information to protect their employees and comply with the OSH Act.

Frequently, the conditions present at a jobsite can expose workers to unexpected hazards. For example, the grounding system available at an outdoor site may be damaged by weather or vehicular traffic, or communications cables in the vicinity could reduce the approach distance to an unacceptable level. To protect employees from such adverse situations, conditions affecting safety that are present in the work area should be known so that appropriate action can be taken. Paragraph (d) of § 1926.950 addresses this problem by requiring safety-related characteristics and conditions existing in the work area to

be determined before employees start working in the area. The language for proposed paragraph (d) was based on language in current § 1926.950(b)(1) and was the same as existing § 1910.269(a)(3). A similar requirement can be found in ANSI/IEEE C2–2002, Rule 420D.⁷⁷ As noted earlier, OSHA revised the language in the final rule to clarify that the paragraph addresses installation characteristics, as well as work-area conditions, and to separately number the examples listed in the provision.

OSHA received only a few of comments on proposed paragraph (d). EEI objected to this provision, commenting:

EEI recognizes that the regulatory text of proposed paragraph 1926.950(d) is the same as in existing 1910.269(a)(3). Also, the preamble accompanying the current proposal is essentially the same as in the final 1910.269. There are certain aspects of the current proposal, however, that are troublesome. . . .

* * * * *

It is susceptible of being applied in a manner that effectively requires an employer to examine every imaginable condition on a jobsite, lest it be held accountable if some obscure, unexpected condition later is involved in causing an accident.

* * * * *

[I]f the standard is not applied reasonably, the result could be a significant burden for line crews, as time is taken not to miss a single detail, however obscure, lest the crew be second-guessed for having missed observing some condition if something later goes wrong. In the final rule, OSHA needs to address this issue. Rather than state that there is an unqualified obligation to “determine” existing conditions relating to the safety of the work, the obligation should be modified to require a “reasonable effort to determine” the reasonably anticipated hazards. [Ex. 0227]

EEI noted, as an example of “some obscure, unexpected condition . . . involved in causing an accident,” an energized static line that caused the electrocution of an apprentice line worker (*id.*):

In that case, the contractor was performing maintenance work on a high-voltage transmission tower. The host utility was shown to have been aware that what appeared to be a grounded static line atop one side of the tower was in fact energized at 4,000 volts. The utility did not inform the contractor of this information, however, and the contractor’s foremen on the ground and on the tower did not notice that there was an insulator separating the line and tower, thus indicating that the line could be energized. [*Id.*]

EEI stated that the contractor was cited, under existing § 1910.269(a)(3), “for failing to ascertain existing conditions, *i.e.*, the energized condition of the static line, before beginning work” (*id.*).

OSHA considered this comment and decided not to adopt EEI’s recommended change to proposed § 1926.950(d). First, OSHA does not believe that obscure and unexpected conditions often lead to accidents, as EEI seems to argue. EEI’s example, in which an apprentice power line worker was electrocuted by an energized static line, is a case in point (*id.*). An employer exercising reasonable diligence can be expected to determine that a static line is energized. In the case described by EEI, the electric utility that owned the line was aware that the line was energized, and the line itself was installed on insulators (*id.*). Thus, the energized condition of the static wire was neither obscure nor unexpected.

Second, EEI appears confused about the purpose of this provision. Paragraph (d) of final § 1926.950 requires employers to determine, before work is started on or near electric lines or equipment, existing installation characteristics and work-area conditions related to the safety of the work to be performed. The requirement also includes examples of such characteristics and conditions.

Characteristics of the installation, such as the nominal voltage on lines, maximum switching transient overvoltages, and the presence of grounds and equipment grounding conductors, are parameters of the system. This is information the employer already has, either through direct knowledge or by the transfer of information from the host employer to the contract employer.⁷⁸ Thus, this aspect of final paragraph (d) does not place any burden, much less an unreasonable one, on line crews.

Conditions of the installation, including the condition of protective grounds and equipment grounding conductors, the condition of poles, and environmental conditions relating to safety, are worksite conditions. In some cases, the employer already will have information on the condition of the installation, such as information on the condition of poles from pole-inspection programs or on the condition of electric equipment from equipment manufacturers. In the usual case,

⁷⁸ The employer may not have knowledge of the exact locations of customer-owned backup generators; however, the location of possible sources of backfeed from such customer-owned equipment can readily be determined by looking for connections to customers’ wiring in circuit diagrams or during an inspection at the worksite.

however, the conditions addressed by paragraph (d) of the final rule will be determined by employees through an inspection at the worksite. This inspection need not be overly detailed, but it does need to be thorough rather than cursory. The standard does not require crews to determine “every imaginable condition,” as EEI suggests. Rather, the inspection must be designed to uncover the conditions specifically noted in this paragraph as well as any other conditions of electric lines and equipment that are related to the safety of the work to be performed and that can be discovered through the exercise of reasonable diligence by employees with the training required by § 1926.950(b) of the final rule.

Employers are required by § 1926.952(a)(1) of the final rule to provide information on such worksite-specific conditions and the characteristics of the installation to the employee-in-charge. With this information, the employer then will determine the current conditions of the installation through an examination by employees at the worksite. Employer-supplied information, as well as information gathered at the worksite, must be used in the job briefing required by § 1926.952 of the final rule. (See the discussion of § 1926.952 later in this section of the preamble.) The characteristics and conditions found as a result of compliance with final § 1926.950(d) could affect the application of various Subpart V requirements. For example, the voltage on equipment will determine the minimum approach distances required under final § 1926.960(c)(1). Similarly, the presence or absence of an equipment grounding conductor will affect the work practices required under final § 1926.960(j). If conditions are found to which no specific subpart V provision applies, then the employee would need to be trained, as required by final § 1926.950(b)(1)(ii), to use appropriate safe work practices.

Employers need not take measurements on a routine basis to make the determinations required by final § 1926.950(d). For example, knowledge of the maximum transient voltage level is necessary to perform many routine transmission and distribution line jobs safely. However, no measurement of this maximum level is necessary to make the requisite determination. Employers can make the determination by conducting an analysis of the electric circuit, or they can assume the default maximum transient overvoltages discussed under the summary and explanation of final § 1926.960(c)(1), later in this section of

⁷⁷ The 2012 NESC contains an equivalent requirement in Rule 420D.

the preamble. Similarly, employers can make determinations about the presence of hazardous induced voltages, as well as the presence and condition of grounds, without taking measurements.

It may be necessary for employers to make measurements when there is doubt about the condition of a ground or the level of induced or transient voltage if the employer is relying on one of these conditions to meet other requirements in the standard. For example, an engineering analysis of a particular installation might demonstrate that the voltage induced on a deenergized line is considerable, but should not be dangerous. However, a measurement of the voltage may be required if the employer is using this analysis as a basis for claiming that the provisions of final § 1926.964(b)(4) on hazardous induced voltage do not apply. In another example, further investigation is required when an equipment ground is found to be of questionable reliability, unless the equipment is treated as energized under final § 1926.960(j).

EEI was concerned about this discussion of engineering analysis in the preamble to the proposed rule (70 FR 34841), commenting:

This [discussion] is unrealistic: engineering analyses are not made in the field in transmission and distribution work. [Ex. 0227]

OSHA agrees with EEI that engineering analyses are not made in the field. Under this provision of the final rule, employers would conduct any engineering analyses required by this provision off site and supply the requisite information to the employees performing the work.

Section 1926.951, Medical services and first aid

Section 1926.951 sets requirements for medical services and first aid. Paragraph (a) of § 1926.951 emphasizes that the requirements of § 1926.50 apply. (See § 1926.950(a)(2).) Existing § 1926.50 includes provisions for available medical personnel, first-aid training and supplies, and facilities for drenching or flushing of the eyes and body in the event of exposure to corrosive materials.

Mr. Daniel Shipp with the International Safety Equipment Association (ISEA) recommended that the reference in § 1926.50, Appendix A, to ANSI Z308.1–1978, *Minimum Requirements for Industrial Unit-Type First-aid Kits*, be updated to the 2003 edition (Ex. 0211). OSHA did not propose any changes to § 1926.50, nor was that section a subject of this

rulemaking. Thus, the Agency is not adopting Mr. Shipp's suggestion. It should be noted, however, that Appendix A to § 1926.50 is not mandatory. The Agency encourages employers to examine the recommendations in the latest edition of the consensus standard, which is ANSI/ISEA Z308.1–2009, when reviewing the guidance in Appendix A to § 1926.50.

Mr. Stephen Sandherr with AGC was concerned that the requirements proposed in § 1926.951 conflicted with the requirements in § 1926.50 and maintained that such a conflict would hinder a contractor's ability to implement safety (Ex. 0160).

OSHA reexamined the requirements in proposed § 1926.951 and found that the requirements for first-aid supplies in proposed paragraphs (b)(2) and (b)(3) in that section conflicted with similar requirements in § 1926.50. Proposed paragraph (b)(2) would have required weatherproof containers if the supplies could be exposed to the weather, whereas existing § 1926.50(d)(2) requires that the contents of first-aid kits be placed in weatherproof containers, with individual sealed packages for each type of item. Further, proposed paragraph (b)(3) would have required that first-aid kits be inspected frequently enough to ensure that expended items are replaced, but not less than once per year. By contrast, existing § 1926.50(d)(2) requires that first-aid kits "be checked by the employer before being sent out on each job and at least weekly on each job to ensure that the expended items are replaced."

As noted earlier, final § 1926.951(a), which requires that employers comply with existing § 1926.50, was adopted without change from the proposal. The Agency is not including proposed paragraphs (b)(2) and (b)(3) in the final rule because these provisions were less restrictive than the requirements of § 1926.50. Including them in the final rule would compromise OSHA's efforts to enforce § 1926.50 on jobsites covered by Subpart V. OSHA notes that the remaining provisions in § 1926.951 apply in addition to those in § 1926.50.

Final § 1926.951(b) supplements § 1926.50 by requiring cardiopulmonary resuscitation (CPR) to help resuscitate electric shock victims.⁷⁹ OSHA

⁷⁹ In discussing these remaining provisions in this preamble, OSHA generally uses the term "CPR training" to describe the first-aid training required by the provisions. OSHA does not mean to imply by this language that the final provisions do not require first-aid training other than CPR. In fact, as explained later in the preamble, the final rule defines "first-aid training" as training in the initial care, including CPR, performed by a person who is not a medical practitioner, of a sick or injured person until definitive medical treatment can be

concludes that the requirements for CPR training in the final rule are supported by the record. This training is required by existing § 1910.269(b)(1), and work under subpart V poses the same electric-shock hazards and requires the same protection against those hazards. As discussed in the summary and explanation for § 1926.953(h), the final rule defines "first-aid training" to include CPR training. Therefore, in final § 1926.951(b), OSHA replaced the proposed phrase "persons trained in first aid including cardiopulmonary resuscitation (CPR)" with "persons with first-aid training." The Agency stresses that CPR training is required by this and other provisions in the final rule for first-aid training.

Electric shock is a serious and ever-present hazard to electric power transmission and distribution workers because of the work they perform on or with energized lines and equipment. CPR is necessary to revive an employee rendered unconscious by an electric shock. As OSHA concluded in the 1994 § 1910.269 rulemaking, CPR must be started within 4 minutes to be effective in reviving an employee whose heart has gone into fibrillation (59 FR 4344–4347; see also 269–Ex. 3–21).

To protect employees performing work on, or associated with, exposed lines or equipment energized at 50 volts or more, OSHA proposed to require that employees with training in first aid including CPR be available to render assistance in an emergency.

OSHA chose 50 volts as a widely recognized threshold for hazardous electric shock.⁸⁰ In this regard, several OSHA and national consensus standards recognize this 50-volt threshold. For example, OSHA's general industry and construction electrical standards require guarding live parts energized at 50 volts or more (§§ 1910.303(g)(2)(i) and 1926.403(i)(2)(i)); the general industry electrical standard also requires that electric circuits be deenergized generally starting at 50 volts (§ 1910.333(a)(1)). Similarly, NFPA's *Standard for Electrical Safety in the Workplace* (NFPA 70E–2004) and the National Electrical Safety Code (ANSI/IEEE C2–2002) impose electrical safety requirements starting at 50 volts (Exs. 0134, 0077, respectively). (See, for example, Section 400.16 of NFPA 70E–

administered. OSHA is emphasizing "CPR training" in its preamble discussion because that type of first aid is particularly beneficial to workers who are injured by an electric shock.

⁸⁰ Although it is theoretically possible to sustain a life-threatening shock below this voltage, it is considered extremely unlikely. (See, for example, Ex. 0428.)

2004, which requires guarding of live parts of electric equipment operating at more than 50 volts, and Rule 441A2 of ANSI/IEEE C2–2002,⁸¹ which prohibits employees from contacting live parts energized at 51 to 300 volts unless certain precautions are taken.)

Many electric shock victims suffer ventricular fibrillation (59 FR 4344–4347; 269–Ex. 3–21). Ventricular fibrillation is an abnormal, chaotic heart rhythm that prevents the heart from pumping blood and, if unchecked, leads to death (*id.*). Someone must defibrillate a victim of ventricular fibrillation quickly to allow a normal heart rhythm to resume (*id.*). The sooner defibrillation is started, the better the victim's chances of survival (*id.*). If defibrillation is provided within the first 5 minutes of the onset of ventricular fibrillation, the odds are about 50 percent that the victim will recover (*id.*). However, with each passing minute, the chance of successful resuscitation is reduced by 7 to 10 percent (*id.*). After 10 minutes, there is very little chance of successful rescue (*id.*). Paragraph (b) of the final rule requires CPR training to ensure that electric shock victims survive long enough for defibrillation to be efficacious. The employer may rely on emergency responders to provide defibrillation.

In the preamble to the proposal, OSHA requested public comment on whether the standard should require the employer to provide automated external defibrillators (AEDs) and, if so, where they should be required. AEDs are widely available devices that enable CPR-trained individuals to perform defibrillation.

Many rulemaking participants recommended that OSHA not adopt a requirement for AEDs. (See, for example, Exs. 0125, 0162, 0167, 0169, 0171, 0173, 0174, 0177, 0200, 0225, 0227; Tr. 635–636, 762–763.) Some commenters argued that there were no injuries for which AEDs would prove beneficial. (See, for example, Exs. 0174, 0200; Tr. 635–636, 762–763.) In this regard, Mr. Steven Semler, commenting on behalf of ULCC, stated:

[W]hen tragic electric contact accidents do, albeit rarely, occur with respect to line clearance tree trimmers, they tend to involve catastrophic accidental direct contact with high voltage electric supply lines which inherently pass massive amounts of electricity through the victim which irreversibly damages cardiac conductivity altogether—as to which AED's cannot, nor even purport to, rectify It is, of course, a misnomer that AED's can restart a heart which is stopped from electrical contact or

any other reason. The stoppage is known as “asystole” for which an AED is programmed to *not* shock the patient because AED's cannot start a stopped heart—for instance, one whose stoppage is due to destruction of the heart's electrical path, or due to irreversible brain damage, respiratory muscle paralysis, tissue burn, or due to electrical contact which serves to destroy the ability to breathe.

Rather, AED's use is limited solely to cases of cardiac fibrillation—cases of the heart beating in quivering fashion so as to cease effective pumping capacity (and also to rarer situations of ventricular tachycardia where the heart beats very fast). But, as a trauma specialist physician has observed, ventricular fibrillation is a rare occurrence in high voltage electrical contacts, as to which rescue breathing and CPR (currently required) are remedial pending arrival of medical help. [Footnote: Richard F. Edlic, MD, “Burns, Electrical, www.emedicine.com/plastic/topic491.htm (7/12/05) . . .]

Given that the unfortunate nature of line clearance tree trimmers cardiac events due to electric contact tend to be catastrophic because of accidental non compliance with the OSHA minimum distance separation from electric supply lines separation requirement, the cardiac events which unfortunately have happened to line clearance tree trimmers have tended to catastrophic, tending to involve cardiac and brain damage of such severity that AED's are not designed to, and cannot, perform a useful purpose. [Ex. 0174; emphasis included in original]

Furthermore, TCIA presented polling data to show that their members have not experienced any occupational incidents for which AED use would have been appropriate to treat the victim (Exs. 0200, 0419).

On the other hand, several rulemaking participants pointed out that AEDs have saved lives (Exs. 0213, 0230). TVA, which has deployed AEDs in both fixed work locations, such as generation plants, and in field service-centers, reported two successful uses of AEDs in a 17-month period (Ex. 0213). IBEW commented that “AED units have proven to be effective in the utility industry. More than one ‘save’ has occurred” (Ex. 0230). Testifying on behalf of IBEW, Mr. James Tomaseski stated, “[B]ased on what the experts tell you about the need to have AEDs in certain environments, [electric utility work] is [at the] top of the list. We have an aging workforce. The possibilities of sudden cardiac arrest to occur to people in this industry is very high” (Tr. 964).

The Agency concludes that employees performing work covered by subpart V and § 1910.269 are exposed to electric shocks for which defibrillation is needed as part of the emergency medical response to such injuries. The Agency bases this conclusion on the evidence in both this record, as well as

the record supporting its decision in the 1994 § 1910.269 rulemaking to require first-aid training, including CPR training, for work covered by that standard. OSHA found in its 1994 § 1910.269 rulemaking that line-clearance tree trimmers were exposed to electric-shock hazards for which CPR would be efficacious (59 FR 4344–4347), and the National Arborist Association (TCIA's predecessor) pointed out that low-voltage electric shock can result from indirect contact with higher voltage sources (269-Ex. 58, 59 FR 4345). OSHA's inspection data amply demonstrate that indirect contacts, such as contacting a power line through a tree branch, do occur in work covered by § 1910.269 and Subpart V (Ex. 0400). Half of the ten line-clearance tree-trimmer electrocutions described in these data resulted from indirect contacts. The experience of TVA and IBEW reinforces the Agency's conclusion that employees performing work covered by Subpart V and § 1910.269 are exposed to electric shocks for which defibrillation is needed as part of the emergency medical response.

Many rulemaking participants argued that work covered by Subpart V would subject AEDs to environmental and other conditions for which the devices are not, or may not be, designed, including:

- Extreme heat (see, for example, Exs. 0169, 0171, 0173, 0177, 0227),
- Extreme cold (see, for example, Exs. 0169, 0171, 0173, 0177, 0227),
- Vibration or jarring (see, for example, Exs. 0169, 0173, 0175),
- Dust (see, for example, Exs. 0169, 0171, 0173, 0175), and
- Humidity and moisture (see, for example, Exs. 0169, 0171, 0173).

For instance, Mr. Wilson Yancey with Quanta Services commented that the conditions to which AEDs would be exposed could “quickly degrade the performance of the equipment and require frequent inspection and maintenance” (Ex. 0169). Ms. Salud Layton with the Virginia, Maryland & Delaware Association of Electric Cooperatives commented, “Most field experience with AED's has been at either fixed sites or carried by ambulances in padded bins/cases inside of heated and cooled ambulance bodies. This is not what the AED's would be exposed to on a utility vehicle” (Ex. 0175). Mr. Thomas Taylor with Consumers Energy noted that manufacturers' instructions tightly control AEDs' storage requirements, explaining:

⁸¹ The 2012 NESC contains a similar requirement in Rule 441A2.

[L]ine truck storage conditions would prohibit the AED from functioning properly and therefore provide no tangible safety benefit to employees. In this regard, the manufacturer instructions for preventing electrode damage states: “Store electrodes in a cool, dry location (15 to 35 degree Celsius or 59 to 95 degrees Fahrenheit)”. The instruction also states: “[I]t is important that when the AED is stored with the battery installed, temperature exposure should not fall below 0 degrees Celsius (32 degrees Fahrenheit) or exceed 50 degrees Celsius (122 degrees Fahrenheit). If the AED is stored outside this temperature range, the auto tests may erroneously detect a problem and the AED may not operate properly.” [Ex. 0177]

OSHA decided not to include a requirement for AEDs in the final rule because the Agency believes that there is insufficient evidence in the record that AEDs exposed to the environmental extremes typical of work covered by Subpart V and § 1910.269 would function properly when an incident occurs. There is no evidence in the record that AEDs are adversely affected by dust, vibration, or humidity; however, it is clear that line work in many areas of the country would subject AEDs to temperatures above and below their designed operating range of 0 to 50 degrees Celsius. For example, Mr. Frank Owen Brockman with the Farmers Rural Electric Cooperatives testified that temperatures in Kentucky can get as cold as -34 degrees Celsius and as high as 44 degrees Celsius (Tr. 1283). Although the record indicates that the highest of these temperatures is within the operating range of AEDs, OSHA believes that it is likely that the interior of trucks would be significantly hotter than the 50-degree Celsius recommended maximum. Accordingly, there is insufficient evidence in the record for the Agency to determine whether AEDs will work properly in these temperature extremes during use, even if they are stored in temperature-controlled environments as mentioned by some rulemaking participants (see, for example, Ex. 0186; Tr. 965–966).⁸²

As explained previously, the Agency stresses that defibrillation is a necessary part of the response to electric shock

⁸² Some rulemaking participants gave other reasons why OSHA should not require AEDs, including: Costs of acquiring the devices (see, for example, Exs. 0162, 0169, 0173, 0174, 0200, 0227), varying State requirements related to AEDs, such as requirements that they be prescribed by a physician (see, for example, Exs. 0125, 0149, 0227), conflicts with requirements of other Federal agencies, such as the Food and Drug Administration (see, for example, Exs. 0177, 0227), and OSHA’s failure to meet all its regulatory burdens, such as burdens imposed by the Small Business Regulatory Enforcement Fairness Act (Ex. 0170). Because OSHA decided not to require AEDs for the reason given in this section of the preamble, it need not consider these other issues.

incidents that occur during work covered by the final rule. OSHA is not adopting a rule requiring AEDs because the record is insufficient for the Agency to conclude that these devices will be effective in the conditions under which they would be used. OSHA encourages employers to purchase and deploy AEDs in areas where they could be useful and efficacious. This action likely will save lives and provide the Agency with useful information on the use of AEDs under a wide range of conditions.

Proposed paragraph (b)(1) would have required CPR training for field crews of two or more employees, in which case a minimum of two trained persons would generally have been required (proposed paragraph (b)(1)(i)), and for fixed worksites, in which case enough trained persons to provide assistance within 4 minutes would generally have been required (proposed paragraph (b)(1)(ii)). Proposed paragraph (b)(1)(i) provided that employers could train all employees in first aid including CPR within 3 months of being hired as an alternative to having two trained persons on every field crew. If the employer chose this alternative for field work, then only one trained person would have been required for each crew. In practice, crews with more than one employee would normally have two or more CPR-trained employees on the crew, since all employees who worked for an employer more than 3 months would receive CPR training. However, employers who rely on seasonal labor (for example, employees hired only in the summer months), or those with heavy turnover, might have some two-person crews with only one CPR-trained employee. Because the Agency was concerned that those new employees might be most at risk of injury, OSHA requested comment on whether allowing employers the option of training all their employees in CPR if they are trained within 3 months of being hired is sufficiently protective. The Agency also requested comment on how this provision could be revised to minimize the burden on employers, while providing adequate protection for employees.

Several commenters shared OSHA’s concern with the 3-month delay in CPR training. (See, for example, Exs. 0126, 0187, 0213, 0230) Mr. Rob Land with the Association of Missouri Electric Cooperatives commented that this option was too hazardous because of “the hazards that linemen face and the distinct possibility that [emergency medical services] may be delayed due to remoteness and distances involved” (Ex. 0187). TVA opposed the option because the “3[]months when a two-person

crew would have only one CPR trained member . . . reduce[s] the level of safety provided” (Ex. 0213). IBEW presented its reasons for opposing the 3-month option, and its recommendation for revising the rule, as follows:

Allowing employers the option of training all their employees in CPR if they are trained within 3 months of being hired may not work in all situations. Many utilities engaged in field work have implemented the use of 2-person crews. It is not uncommon for the 2-person crew to perform rubber gloving work on all distribution voltage ranges. It is also not uncommon for a utility to assign a new-hire (less than 3 months of service) as the second person on the 2-person crew. In these work scenarios, the second person would have to be trained in CPR. Waiting 3 months to complete this training would not [be] proper.

* * * * *

The only revision that is necessary is to make it clear that under certain circumstances, new-hires may need to be trained in CPR well before the 3 month window. Manning of crews, especially in the construction industry, cannot always be accomplished using CPR certification as a factor. All employees need to receive the training and the 3 months gives enough flexibility when appropriate[.] [Ex. 0230; emphasis included in original]

Other rulemaking participants supported the provision as proposed. (See, for example, Exs. 0155, 0162, 0174, 0200; Tr. 633–635, 764–765.) Some of them argued that the provision, which was taken from existing § 1910.269(b)(1)(i), has worked well. (See, for example, Exs. 0155, 0200; Tr. 764.) The tree care industry stated that the line-clearance tree trimming industry did not use seasonal labor and argued that the 3-month delay in training new employees in CPR was justified on the basis of high turnover in that industry (Exs. 0174, 0200; Tr. 633–635, 764–765). For example, testifying on behalf of ULCC, Mr. Mark Foster stated:

[T]he current standard reflects a clearly considered balance made by OSHA at the time of adoption of the current standard to allow a three-month phase-in period for CPR compliance for new hires. That policy judgment rests on the fact that there was then an 81 percent turnover rate among line clearance tree trimming employees such that many would not last in employment beyond the initial training period and that that would be very difficult to field crews if new hires had first had to be sent for CPR training.

While the turnover ratio has improved somewhat, it is still staggering[ly] high, [presenting] the same considerations that led to the adoption of the phase-in period in the initial standard. [Tr. 633–634]

In its comment, ULCC indicated that the annual turnover rate in the line-

clearance tree trimming industry is 53 to 75 percent (Ex. 0174).

OSHA decided to restrict the exception permitting a 3-month delay in training employees in first aid, including CPR, to line-clearance tree trimming. The Agency agrees that turnover in the line-clearance tree trimming industry remains high, which was the underlying reason for OSHA's original adoption of the 3-month delay in training for newly hired employees in the 1994 § 1910.269 rulemaking (59 FR 4346–4347). However, as noted by Mr. Land, the provision as proposed leaves employees exposed to hazards when a new employee who has not yet been trained in CPR is the second person in a two-worker crew (Ex. 0187). IBEW also recognized the need to have both employees trained in CPR in many circumstances (Ex. 0230). Finally, turnover rates for the electric utility and power line contractor industries are not nearly as high as that for the tree trimming industry. OSHA estimates that the turnover rates among employees performing electric power generation, transmission, and distribution work ranges from 11 to 16 percent in the construction industries and 3 percent in the generation and utility industries (see Section VI, Final Economic Analysis and Regulatory Flexibility Analysis, later in the preamble). These turnover rates are significantly lower than the turnover rate indicated by ULCC for the line-clearance tree trimming industry.

Because this exception in the final rule applies only to line-clearance tree trimming, which is addressed only in § 1910.269, the Agency is not adopting it in final § 1926.951(b)(1).⁸³ The corresponding provision in § 1910.269(b)(1)(i) retains the exception providing for a 3-month delay in first-aid training, including CPR, but only for line-clearance tree-trimming work.

These changes will continue to permit employers in the line-clearance tree trimming industry to delay training in first aid, including CPR, to new employees for a reasonable time.

Finally, OSHA notes that it remains concerned that some employees in the line-clearance tree trimming industry might encounter an unnecessary delay in being treated in an emergency. The Agency does not believe that it is reasonable to *unnecessarily* staff crews so that some crews had only one CPR-trained worker, while other crews had

three or four. Although the Agency is not addressing this concern in the final rule, OSHA expects employers to staff each tree trimming crew with as many employees trained in first aid as possible, including CPR, to assist in emergencies.

Mr. Steven Theis of MYR Group requested that OSHA provide a similar 3-month grace period for refresher training (Ex. 0162).⁸⁴

OSHA rejects this request. As stated, OSHA is adopting the 3-month delay in CPR training because of the high turnover in the tree trimming industry. There is no evidence in the record that this rationale also applies to refresher training. The Agency expects employers to plan for their employees' training needs and to schedule training in accordance with the standard.

Mr. Paul Hamer, a member of the NFPA 70E Technical Committee on Electrical Safety in the Workplace, recommended that OSHA require first-aid training, including CPR training, for all qualified employees who work on electric circuits of 50 volts or more. He also recommended deleting the 4-minute maximum response time for fixed work locations (Ex. 0228). He argued that the sooner a victim receives CPR, the less cell damage will occur. On the other hand, the American Forest & Paper Association recommended that the 4-minute requirement should be deleted because "no one could ensure ([that is], guarantee) survival of the victim for any particular length of time or that defibrillation would be successful" (Ex. 0237).

OSHA rejects these recommendations. OSHA considered requiring all employees to receive first-aid training, including CPR training, when the Agency developed existing § 1910.269. In lieu of such a requirement, OSHA decided that the best approach was to require a 4-minute maximum response time for fixed work locations and to require at least two trained persons for field work involving crews of two or more employees (existing § 1910.269(b)). OSHA supplemented these provisions with a requirement that two employees be present for work exposing an employee to contact with exposed live parts energized at more

than 600 volts (existing § 1910.269(l)(1)).⁸⁵ This approach continues to be the best one, as it ensures that persons trained in first aid, including CPR, will be available to employees most at risk of electrocution. The Agency further notes that Mr. Hamer's approach does not address employees working alone in fixed work locations. In these cases, it would still take time for someone to discover the injury, which also would delay first-aid treatment, including CPR.

Two rulemaking participants commented that proposed paragraphs (b)(1)(i) and (b)(1)(ii) were vague (Exs. 0175, 0180). They did not understand the difference between "field work" and "fixed work locations" (*id.*). For example, Ms. Salud Layton with the Virginia, Maryland & Delaware Association of Electric Cooperatives questioned whether the requirements for fixed work locations applied to work at unmanned substations (Ex. 0175). OSHA does not consider an unmanned location to be a fixed work location, as there are normally no employees present. In determining whether to apply paragraph (b)(1) or (b)(2), the Agency would treat an unmanned substation no differently than a manhole or utility pole in the field.

As explained previously in this section of the preamble, OSHA decided not to include proposed paragraphs (b)(2) or (b)(3) in the final rule. The corresponding provisions in existing § 1910.269(b)(2) and (b)(3) are being retained, however. The Agency did not propose to revise these existing requirements and received no comments alleging inconsistencies between existing § 1910.269(b) and § 1910.151, OSHA's general industry standard addressing medical services and first aid.

Section 1926.952, Job Briefing

In § 1926.952, OSHA is requiring that employers ensure that employees conduct a job briefing before each job. This section, which has no counterpart in existing subpart V, is based largely on existing § 1910.269(c).

Most of the work covered by this final rule requires planning to ensure employee safety (as well as to protect equipment and the general public). Typically, electric power transmission and distribution work exposes employees to the hazards of exposed conductors energized at thousands of volts. If the work is not thoroughly

⁸³ Final § 1926.951(b) uses the term "trained persons," rather than "trained employees," because the individuals with the training do not necessarily need to be employees. For instance, the "trained persons" required by the rule could be self-employed individuals working with a crew of employees.

⁸⁴ Although paragraph (b)(1) in the final rule does not address refresher first-aid training, final § 1926.950(b)(4)(iii) contains a general requirement that employees receive additional training when they must employ safety-related work practices (such as administering first aid) that are not normally used during their regular work duties. A note following § 1926.950(b)(4)(iii) indicates that the Agency would consider tasks performed less often than once per year to require retraining. See the discussion of that requirement earlier in this section of the preamble.

⁸⁵ The issue of whether the requirement for two employees should apply to voltages of 600 volts or less is discussed under the summary and explanation of final § 1926.960(b)(3), later in this section of the preamble.

planned ahead of time, the possibility of human error that could harm employees increases greatly. To avoid problems, the task sequence is prescribed before work is started. For example, before climbing a pole, the employee must determine if the pole is capable of remaining in place and if minimum approach distances are sufficient, and he or she must determine what tools will be needed and what procedure should be used for performing the job. Without job planning, the worker may not know or recognize the minimum approach-distance requirements or may have to re-climb the pole to retrieve a forgotten tool or perform an overlooked task, thereby increasing employee exposure to the hazards of falling and contact with energized lines.

Employers performing electric power generation, transmission, and distribution work use job briefings to plan the work and communicate the job plan to employees. If the job is planned, but the plan is not discussed with the workers, an employee may perform his or her duties out of order or may not coordinate activities with the rest of the crew, thereby endangering the entire crew. Therefore, OSHA is requiring a job briefing before work is started.

Commenters agreed that job briefings are an important part of electric power work. (See, for example, Exs. 0162, 0173, 0184, 0213, 0241; Tr. 1335.) For instance, Mr. John Masarick of the Independent Electrical Contractors considered job briefings to be “one of the most critical steps for safety on any task” (Ex. 0241). Also, Mr. Stephen Frost of the Mid-Columbia Utilities Safety Alliance voiced his organization’s support for job briefings:

We strongly agree that the job briefing requirement should be written into § 1926.952. Good communications on the job is paramount to safety, and too often workers either choose not to communicate or don’t have the skills to communicate their ideas. The job briefing requirement makes it the personal responsibility of every crew member to understand all aspects of the job. The time it takes to do a thorough job briefing is usually 5 to 15 minutes. This is time well-spent to eliminate the possibility of an accident due to workers not knowing or controlling hazards in the work area. [Ex. 0184]

OSHA’s experience in enforcing § 1910.269(c), however, shows that some employers are placing the entire burden of compliance with the job briefing requirement on the employee in charge of the work. Therefore, OSHA proposed to include a provision in Subpart V requiring the employer to provide the employee in charge of a job with available information necessary to

perform the job safely. This requirement, which is not in existing § 1910.269(c), was in proposed § 1926.952(a)(1). OSHA proposed to add the same requirement to § 1910.269(c). A note following the proposed paragraph indicated that the information provided by the employer was intended to supplement the training requirements proposed in § 1926.950(b) and was likely to be more general than the job briefing provided by the employee in charge. This note also clarified that information covering all jobs for a day could be disseminated at the beginning of the day.

Many commenters recognized the need for the employer to provide certain information to the employee in charge about conditions to which an employee would be exposed. (See, for example, Exs. 0125, 0127, 0186, 0197, 0200, 0219, 0230.) For instance, Mr. Anthony Ahern with Ohio Rural Electric Cooperatives commented:

The person in charge does need to be given more information than is usually given him/her. They need to know things like the status of the system where they will be working. What are the breaker configurations/settings. Is reclosing enabled or disabled. What is the available fault current at their work site. Are there any other crews working in the area whose work could impact them. For the most part most of this information is of a general type and a company could probably develop a simple form that would be fairly easy to fill out and attach to the usual work orders. This could also be used to document that this information was given and could be used to document the job briefing (tailgate) that the person in charge is required to give the rest of the crew. [Ex. 0186]

Mr. James Junga, the Safety Director of Local 223 of the Utility Workers Union of America (UWUA), also commented on the need for the employer to supply information about the work:

Requiring the employer to provide adequate information to the employee in charge of a crew is the best way of ensuring that all available information is given to the crew leader. Then and only then the crew leader will be able to brief the crew. Without this requirement a crew leader will be left on his/her own to figure out what the crew is to do. [Ex. 0197]

Some rulemaking participants described the types of information that should be provided to employees. (See, for example, Exs. 0186, 0219; Tr. 402–403, 1373.) Commenters stated that employees in charge need to be provided with the available fault current (Ex. 0186; Tr. 1373), circuit breaker settings, including whether reclosing is enabled (Ex. 0186), whether there are other crews that could affect their work (Ex. 0186), detailed maps and staking sheets (Ex. 0219), and relevant

information from outage reports by customers (Tr. 402–403).

Other rulemaking participants addressed when there was a need for the employer to provide information about a job. Mr. Allan Oracion with EnergyUnited EMC maintained: “When a job is not routine, special or large-scale, the employer needs to share any special information with the employee in charge. When the employee in charge is working at a distant location, radio or telephone can be used to communicate information” (Ex. 0219). Mr. Donald Hartley with IBEW stated that the employer needs to provide information “when a contractor’s crew performs its first tasks on a host employer’s worksite or when the job assignment involves hazards or conditions the crew has not yet encountered” (Tr. 887).

However, many commenters argued that the provision as proposed was inappropriate. (See, for example, Exs. 0125, 0127, 0128, 0163, 0177, 0178, 0200, 0201 0226.) Many argued that the proposed provision was too broad. (See, for example, Exs. 0125, 0127, 0200, 0226.) For instance, Ms. Cynthia Mills of TCIA stated, “We are uncomfortable with the open-ended and subjective nature of the [proposed language], even though we believe it is intended to convey anything ‘known to the employer, but unusual,’ associated with the work assignment” (Ex. 0200).

Some commenters argued that it was the responsibility of the employee in charge to survey the site and determine all hazards associated with the work. (See, for example, Exs. 0163, 0177, 0178, 0201.) Consumers Energy’s submission typified these comments:

The computer-generated job assignment will contain information related to the location, circuit, and task to be accomplished but no information related to unique hazards of the assignment. It is critical that the employees on the job site survey the site and identify all hazards upon arrival at the site. Removing that responsibility from them would create a false sense of security and a less than desirable knowledge of the hazards present. Safety manuals and written procedures provide general information on hazards that are typically expected in transmission and distribution work. It is the responsibility of the employee in charge to survey the site and identify all hazards upon arrival at the site. [Ex. 0177]

After carefully considering the evidence in the record, OSHA concludes that job briefings are important for ensuring the safety of employees performing work covered by the final rule and that the employer needs to provide adequate information to employees in charge so that a complete job briefing can be conducted. However, OSHA also decided to address

the concerns of commenters that the proposed rule was overly broad or open ended. To this end, OSHA decided to require the employer to provide the employee in charge of the job with all available information that relates to the determination of existing characteristics and conditions required by § 1926.950(d). Thus, final § 1926.952(a)(1) requires the employer, in assigning an employee or a group of employees to perform a job, to provide the employee in charge of the job with all available information that relates to the determination of existing characteristics and conditions required by § 1926.950(d).

The Agency notes that final paragraph (a)(1) requires the employer to provide the employee in charge with two types of available information, as noted in § 1926.950(d): (1) Available information on the characteristics of electric lines and equipment, and (2) available information on the conditions of the installation. The Agency also notes that, because § 1926.950(d) limits the determination of characteristics and conditions only to characteristics and conditions that relate to the safety of the work to be performed, this same limitation extends to information that must be provided under final § 1926.952(a)(1). As such, information on the characteristics of electric lines and equipment that must be provided under the final rule (including, for instance, the nominal voltage of lines and equipment, the maximum switching transient voltages, and the presence of hazardous induced voltage) is critical to the selection of proper safety-related work practices and protective equipment.⁸⁶ For example, for an employee to select the minimum approach distance required by final § 1926.960(c)(1), he or she needs to know, at a minimum, the nominal voltage on the energized parts. Depending on the employer's established minimum approach distances, the employee also may need to know the maximum transient overvoltage at the worksite. Similarly, an employee needs to know the employer's estimate of incident energy for electric equipment so that he or she can select protective equipment with an appropriate arc rating as required by final § 1926.960(g)(5).

Information on the conditions of the installation that must be provided under the final rule (including, for instance, the condition of protective grounds and

equipment grounding conductors, the condition of poles, and environmental conditions relative to safety) also is critical because that information can facilitate the employees' assessment of conditions at the worksite and enable the employees to take appropriate protective measures. For example, an employer may know of defects in a wood pole on which employees are to work because it has a pole-inspection program or has received reports that the pole had defects. Information on such defects can help employees ascertain whether the pole is safe to climb as required by § 1926.964(a)(2). Likewise, information from an employee or a customer that electric equipment is making arcing noises periodically can affect the assessment of whether the employee is exposed to hazards from flames or electric arcs as required by § 1926.960(g)(1).

Thus, the type of information that the employer must provide under the final rule ensures that employees in charge are provided with information relevant to selecting appropriate work practices and protective equipment as required by the final rule. Moreover, because final § 1926.952(a)(1) links the information that the employer must provide the employee in charge to the determination required by § 1926.950(d), final § 1926.952(a)(1) is neither overly broad nor open ended.

The final rule also is narrowly tailored because it limits the information the employer must provide to information that is available to the employer. Under the rule, the question of whether information is available to the employer varies depending on the type of information at issue. First, OSHA presumes that information related to the characteristics of electric lines and equipment is available to the employer. Second, OSHA will deem information on the condition of the installation to be available to the employer only when the information is known by the employer or can be obtained by the employer from existing records through the exercise of reasonable diligence. OSHA does not expect employers to make inspections of worksite conditions to determine the conditions of the installation. The Agency believes that, in most instances, employees will gather additional information about worksite conditions after they reach the worksite. It is nevertheless important that employers provide employees with available information to aid the employees' assessment of worksite conditions and as a secondary precaution in case employees at the site fail to observe a

particular condition related to their safety.

Paragraph (a)(1) of 1926.952 applies fully to contractors. Contractors will obtain much or all of the information that they need to comply with § 1926.952(a)(1)—especially information about the characteristics of electric lines and equipment—through the operation of the host-contractor provision in § 1926.950(c).

Several commenters maintained that, in proposing this provision, OSHA did not account for the way work is currently assigned to employees. (See, for example, Exs. 0128, 0163, 0177, 0178, 0201.) For instance, Mr. James Shill of Electricities noted that small towns often assign work through a town manager who has insufficient knowledge of the electrical system to provide the required information (Ex. 0178). Further, Mr. James Gartland of Duke Energy described how the process commonly used to assign work to employees at many utilities was at odds with the proposal:

Requiring a representative of the employer (a manager or supervisor) to provide employees with information necessary to perform a job safely for every job is inconsistent with the use of technology in work management and scheduling. Today's utility workers drive vehicles equipped with computers with wireless communications. They receive job assignments throughout the day from the computer. There frequently is no direct supervisor-employee interface to discuss specific work assignments. The computer-generated job assignment will contain information related to the location, circuit, and task to be accomplished but no information related to unique hazards of this assignment. . . .

It is also inconsistent with industry practices to expect a supervisor/manager to conduct a pre-job briefing at the beginning of the day as mentioned in the Note [to proposed § 1926.952(a)(1)]. Many utilities have employees who report directly to work locations where their supervisor/manager is not present. They are expected to do a pre-job briefing and to assess hazards on their own. There is no company manager/supervisor at the work location to do that assessment. [Ex. 0201]

Some of these commenters also recommended that the Agency make it clear (1) that the rule does not require a face-to-face exchange of information and (2) that the exchange can be provided through work orders or in conjunction with training, safety manuals, and written procedures. (See, for example, Exs. 0177, 0201.)

OSHA appreciates these commenters' concerns and therefore changed the heading for paragraph (a)(1) to read "Information provided by the employer" to help clarify that a separate briefing or face-to-face discussion

⁸⁶ In fact, these are the types of information that commenters argued employers should provide. (See, for example, Exs. 0186, 0219; Tr. 402–403, 1373.)

between the employer and the employee in charge is not required. The Agency recognizes that assignments are made through a wide range of mechanisms that do not always provide for face-to-face contact between the employer and the employees performing the work. The rule does not require such contact. The employer is free to use any mechanism that provides the required information before the employees begin their assignment. For example, information could be provided through radio communication with the employee in charge, through a written work order, or through a computer-generated assignment conveyed electronically. Some of this information may be provided through training, in a safety manual, or through written work procedures. However, the Agency will deem such information as meeting paragraph (a)(1) only if it effectively communicates the information about the particular job in question to the employee in charge and if employers respond to these employees' questions about this information as it relates to the particular job in question.

Some commenters suggested that OSHA add certain explicit language to the requirement. (See, for example, Exs. 0125, 0127, 0149, 0169, 0171.) For instance, several commenters recommended revising the rule to read: "In assigning an employee or group of employees to perform a job, the employer shall provide the employee in charge of the job with any additional information known by the employee's supervisor that could affect the safety of the job before the start of the work" (Exs. 0125, 0127, 0149). Other commenters recommended that OSHA clarify that the employer need only provide the information once for work lasting long periods of time (Exs. 0169, 0171).

OSHA rejects these recommended approaches. First, the key issue is whether the information is available to the employer, not whether the supervisor has knowledge of the required information. Second, the final rule requires the employer to provide required information in connection with each job. As stated, the information must be communicated to the employee in charge in an effective manner. Whether a prior communication constitutes an effective communication depends on several factors, such as, but not limited to: The time between the prior communication and the job at hand; the manner in which the prior communication was made; the extent to which the prior job and the present job are similar; and whether any additional

or different information needs to be provided with respect to the present job.

OSHA is not including in the final rule the note following proposed paragraph (a)(1). This note was to clarify the meaning of the phrase "available information necessary to perform the job safely." The final rule does not contain that phrase, and OSHA concludes that the note is no longer necessary.

Paragraph (a)(2), which is being adopted without substantive change from the proposal, requires the employee in charge of the job to conduct a job briefing. This provision comes from existing § 1910.269(c).

In the 2005 notice extending the comment period on the proposal, OSHA requested comments on whether the standard should include a requirement to document the job briefing. Comments addressing this issue recommended that the Agency not include such a requirement in the final rule because it would add to employers' paperwork burden without a significant increase in safety. (See, for example, Exs. 0201, 0212.) Considering the lack of record support for such a provision, OSHA is not adopting a requirement to document job briefings in the final rule.

Paragraph (b), which is being adopted without substantive change from the proposal, requires the briefing by the employee in charge to cover: Hazards and work procedures involved, special precautions, energy-source controls, and requirements for personal protective equipment. This requirement also comes from existing § 1910.269(c).

Under final paragraph (c)(1), the employee in charge must conduct at least one briefing before the start of each shift. Only one briefing in a shift is needed if all the jobs to be performed are repetitive or similar. Additional briefings must be conducted pursuant to final paragraph (c)(2) for work involving significant changes in routine that might affect the safety of the employees. For example, if the first two jobs of the day involve working on a deenergized line and the third job involves working on energized lines with live-line tools, separate briefings must be conducted for each type of job. It should be noted that additional job briefings provided under paragraph (c)(2) are separate from the job briefing provided at the start of the shift; these briefings may not be combined. Paragraphs (c)(1) and (c)(2), which duplicate existing § 1910.269(c)(1), have been adopted without substantive change from the proposal.

For routine work, under final paragraph (d)(1), the required briefing need only consist of a concise discussion outlining the tasks to be

performed and how to perform them safely. However, if the work is complicated or particularly hazardous or if the employees may not be able to recognize and avoid the hazards involved, then a more thorough discussion is required by paragraph (d)(2). OSHA included a note following this paragraph to clarify that, regardless of how short the discussion is, the briefing must still address all the topics listed in paragraph (b).

OSHA received several comments on proposed paragraphs (d)(1) and (d)(2). These commenters expressed concern that the proposed provisions were vague and provided insufficient guidance on the conditions requiring more detailed job briefings. (See, for example, Exs. 0162, 0175, 0213.) For instance, MYR Group maintained that the proposal did not sufficiently distinguish between work that is "routine" and work that is "complicated" (Ex. 0162; Tr. 1335), and TVA asked the Agency to define "complicated or particularly hazardous" (Ex. 0213).

With final paragraphs (d)(1) and (d)(2), which were taken from existing § 1910.269(c)(2), OSHA recognizes that employees are familiar with the tasks and hazards involved in routine work. However, it is important to take the time to carefully discuss unusual work situations that may pose additional or different hazards to workers. (See also the discussion of § 1926.950(b)(4) earlier in this section of the preamble.) The Agency believes that it is important for the briefing to be as detailed as necessary for the hazards and work practices involved. MYR Group noted that "the general requirement for short discussions could . . . be applied differently depending on the skill and qualification of the employees involved in the work rather than the work itself" (Ex. 0162). This comment interprets the requirement correctly, and the Agency believes that the language in final § 1926.952(d)(1) and (d)(2), which duplicates existing § 1910.269(c)(2), appropriately conveys this meaning. Accordingly, a more detailed discussion is required "[i]f the employee cannot be expected to recognize and avoid the hazards involved in the job." In addition, the Agency has received no formal interpretation requests related to existing § 1910.269(c)(2). Thus, OSHA concludes that the vast majority of employers understand this provision, and the Agency is adopting § 1926.952(d) without change from the proposal.

OSHA recognizes the importance of job planning for all employees. Although employees working alone cannot participate in formal job

briefings, the Agency believes that an employee who works alone needs to plan his or her tasks as carefully and extensively as an employee who works as part of a team. OSHA is aware of several fatalities involving lone employees who could have benefited from better job planning, or perhaps a briefing with the supervisor, before the job started (Ex. 0400). In one such incident, a power line worker working alone was repairing a broken guy. Standing on the ground, the employee had the anchor in place and grabbed the dangling guy to attach it to the anchor. The guy contacted a 7200-volt overhead power line that had not been guarded or insulated. Had the employee properly planned the job, he would have seen that the guy was close to the power line and could have avoided the contact (*id.*).⁸⁷ Therefore, paragraph (e), which OSHA took from existing § 1910.269(c)(3), provides that employees working alone do not need to conduct job briefings, but the employer must ensure that that the tasks are planned as if a briefing were required. This provision is being adopted in the final rule without change from the proposal.

4. Section 1926.953, Enclosed Spaces

Section 1926.953 contains requirements for entry into, and work in, enclosed spaces. An “enclosed space” is defined in final § 1926.968 as a working space, such as a manhole, vault, tunnel, or shaft, that has a limited means of egress or entry, that is designed for periodic employee entry under normal operating conditions, and that, under normal conditions, does not contain a hazardous atmosphere, but may contain a hazardous atmosphere under abnormal conditions. The hazards posed by enclosed spaces consist of (1) limited access and egress, (2) possible lack of oxygen, (3) possible presence of flammable gases, and (4) possible presence of limited amounts of toxic chemicals. The potential atmospheric hazards are caused by an enclosed space’s lack of adequate ventilation and can normally be controlled through the use of continuous forced-air ventilation alone. Practices to control these hazards are widely recognized and are currently in use in electric, telecommunications, and other underground utility industries. Such practices include testing for the presence of flammable gases and vapors, testing for oxygen deficiency, ventilation of the enclosed space, controls on the use of open

flames, and the use of an attendant outside the space. These practices already are required by existing § 1910.269(e) for the maintenance of electric power generation, transmission, and distribution installations, and OSHA took the requirements adopted in final § 1926.953 from existing § 1910.269(e).

Paragraph (a) of final § 1926.953, which is being adopted without substantive change from the proposal, sets the scope of the section’s provisions. Accordingly, this section applies only to the types of enclosed spaces that are routinely entered by employees engaged in electric power transmission and distribution work and that are unique to underground utility work. Work in these spaces is part of the day-to-day activities performed by some of the employees protected by this final rule. Enclosed spaces covered by this section include, but are not limited to, manholes and vaults that provide employees access to electric power transmission and distribution equipment.

There are several types of spaces that are not covered by final § 1926.953 (or the corresponding general industry provisions in final § 1910.269(e)). If maintenance work is being performed in confined spaces, it may be covered by OSHA’s general industry permit-required confined space (permit-space) standard at § 1910.146; this standard applies to all of general industry, including industries engaged in electric power generation, transmission, and distribution work.

In § 1910.146(b), the permit-space standard defines “confined space” and “permit-required confined space.” A confined space is a space that: (1) Is large enough and so configured that an employee can bodily enter and perform assigned work; and (2) Has limited or restricted means for entry or exit (for example, tanks, vessels, silos, storage bins, hoppers, vaults, and pits are spaces that may have limited means of entry); and (3) Is not designed for continuous employee occupancy. A permit-required confined space (permit space) is a confined space that has one or more of the following characteristics: (1) Contains or has a potential to contain a hazardous atmosphere; (2) Contains a material that has the potential for engulfing an entrant; (3) Has an internal configuration such that an entrant could be trapped or asphyxiated by inwardly converging walls or by a floor which slopes downward and tapers to a smaller cross-section; or (4) Contains any other recognized serious safety or health hazard.

Section 1926.953 of the final rule applies to “enclosed spaces.” By definition, an enclosed space is a permit-required confined space under § 1926.146. An enclosed space meets the definition of a confined space—it is large enough for an employee to enter; it has a limited means of access or egress; and it is designed for periodic, rather than continuous, employee occupancy under normal operating conditions. An enclosed space also meets the definition of a permit space—while it is not expected to contain a hazardous atmosphere, it has the potential to contain one. OSHA also notes that the definition of permit space in the general industry permit-space standard is broader than the definition of enclosed space in § 1926.968. For instance, if a space contains a hazardous atmosphere under normal conditions, that space is a permit space under § 1910.146, but it is not an enclosed space under final § 1910.269 or Subpart V.

Paragraph (b)(6) of § 1926.21 specifies training requirements for employees who enter “confined or enclosed spaces” as defined in § 1926.21(b)(6)(ii).

When § 1926.21(b)(6) applies, it requires employers to: (1) Instruct their employees about confined-space hazards, the necessary precautions to be taken, and protective and emergency equipment required; and (2) comply with any specific regulations that apply to work in dangerous or potentially dangerous areas. An enclosed space under § 1926.953 also is a confined or enclosed space under § 1926.21(b)(6). However, the definition of confined or enclosed space in § 1926.21(b)(6) (like the definition of permit space in the general industry permit-space standard) is broader than the definition of enclosed space in § 1926.968.⁸⁸

Paragraph (b)(6) of § 1926.21 applies to enclosed spaces covered by final § 1926.953 because employers covered under subpart V are not exempt from complying with other applicable provisions in Part 1926 (see § 1926.950(a)(2)). Section 1926.953 is, therefore, different from final § 1910.269(e), which “applies to routine entry into enclosed spaces in lieu of the permit-space entry requirements contained in paragraphs (d) through (k) of § 1910.146.” OSHA concludes, however, that an employer that is compliant with § 1926.953 is considered as being in compliance with existing § 1926.21(b)(6) for entry into enclosed

⁸⁸ Under § 1926.21(b)(6)(ii), a confined or enclosed space is any space having a limited means of egress, which is subject to the accumulation of toxic or flammable contaminants or has an oxygen deficient atmosphere.

⁸⁷ This accident can be viewed at: http://www.osha.gov/pls/imis/accidentsearch.accident_detail?id=909119.

spaces covered by final § 1926.953. Therefore, for all practical purposes, § 1926.953 applies to routine entry into enclosed spaces in lieu of the requirements contained in § 1926.21(b)(6). OSHA is not including the “in lieu of” language in final § 1926.953 because OSHA recently proposed a new standard for confined-space entry during construction work (72 FR 67352, Nov. 28, 2007). OSHA intends to revise § 1926.953 to include appropriate “in lieu of” language when it promulgates the new standard.

Under final § 1926.953(a), entry into an enclosed space to perform construction work covered by Subpart V must meet the permit-space entry requirements of paragraphs (d) through (k) of the general industry permit-space standard at § 1910.146 when the precautions taken under §§ 1926.953 and 1926.965 are insufficient to eliminate hazards in the enclosed space that endanger the life of an entrant or could interfere with escape from the space. This requirement ensures that employees working in enclosed spaces will be afforded protection in circumstances in which the Subpart V provisions are insufficiently protective.⁸⁹

Some employers may prefer to comply with § 1910.146 instead of § 1926.953 for entry into enclosed spaces covered by Subpart V. Because the provisions of § 1910.146 protect employees entering enclosed spaces at least as effectively as § 1926.953, OSHA will accept compliance with § 1910.146 as meeting the enclosed-space entry requirements of § 1926.953. OSHA included a note to this effect immediately following final § 1926.953(o). The Agency is adopting the note as proposed.

MYR Group opposed applying the general industry standard for permit spaces to construction work. The company argued that subpart V should not incorporate “standard requirements that have already been rejected for construction work” and recommended that the Agency develop requirements specific “to electrical construction work or through the proposed and pending

separate confined space standard for construction” (Ex. 0162).

OSHA disagrees with this comment. The Agency developed the enclosed-space provisions in existing § 1910.269 to protect employees during routine entry into enclosed spaces. As discussed in detail previously, OSHA concluded that the requirements for work on electric power generation, transmission, and distribution installations should generally be the same regardless of whether the work is covered by final § 1910.269 or subpart V. (See the summary and explanation for final § 1926.950(a)(1), earlier in this section of the preamble.) For the purpose of routine entry into these spaces, OSHA concludes that it is appropriate for employers to follow the same rules with respect to both construction and general industry work.

OSHA also is applying the general industry permit-space standard to work in enclosed spaces when the hazards remaining in the enclosed space endanger the life of an entrant or could interfere with escape from the space after an employer takes the precautions required by §§ 1926.953 and 1926.965. This action is necessary because, as OSHA noted in the proposed construction standard for confined spaces, “the existing construction standard for confined and enclosed spaces at 29 CFR 1926.21(b)(6) does not adequately protect construction employees in confined spaces from atmospheric, mechanical, and other hazards” (72 FR 67354). OSHA notes, however, that the references to the general industry standard in final § 1926.953 are included as a placeholder pending the promulgation of the confined spaces in construction standard. OSHA intends to change these references to refer to the construction standard when it promulgates that standard.

Paragraph (a) in final § 1926.953 provides that § 1926.953 does not apply to vented vaults under certain conditions. Permanent ventilation in vented vaults prevents a hazardous atmosphere from accumulating. However, the intake or exhaust of a vented vault could be clogged, limiting the flow of air through the vaults. The employee in such cases would be exposed to the same hazards presented by unvented vaults. Additionally, mechanical ventilation for a vault so equipped may fail to operate. To ensure that the employee is protected from the hazards posed by lack of proper ventilation, the final rule exempts vented vaults only if the employer determines that the ventilation is operating to protect employees. This

determination must ensure that ventilation openings are clear and that any permanently installed mechanical ventilating equipment is in proper working order.

Section 1926.953 also does not apply to spaces not designed for periodic entry by employees during normal operating conditions, such as spaces that require energy sources to be isolated or fluids to be drained before an employee can safely enter. These types of spaces include, but are not limited to, boilers, fuel tanks, coal bunkers, and transformer and circuit breaker cases. As explained in the preamble to the 1994 § 1910.269 final rule, the measures required in existing § 1910.269(e) (and, by implication, final § 1926.953) are not adequate to protect employees from the various hazards posed by these types of permit-entry confined spaces (59 FR 4364–4367).

MYR Group commented that subpart V’s definition of “enclosed space” was “overly narrow and unclear” because “there is no specific basis for creation of such a broad definition solely for electrical work” (Ex. 0162).

OSHA disagrees with this comment. The Agency derived the definition from the definition of “enclosed space” in existing § 1910.269(x). As explained in the preamble to the 1994 § 1910.269 final rule, OSHA narrowly tailored the definition of “enclosed space” to the protective measures required by existing § 1910.269(e) (59 FR 4364–4367). A broader definition would involve permit spaces presenting hazards against which final § 1926.953 would not offer protection. Therefore, OSHA is adopting the definition of “enclosed space” as proposed. However, OSHA is not adopting the proposed note in final § 1926.968.⁹⁰ The proposed note, which appears in existing § 1910.269(x), describes types of spaces that are enclosed, but that do not meet the definition of “enclosed space,” and explains that such spaces meet the definition of permit spaces in § 1910.146 and that entries into those spaces must conform to that standard. Although the types of spaces described in the proposed note do not meet the definition of “enclosed space” in either the general industry or construction standard, § 1910.146 does not apply to confined-space entry during construction work. Consequently, the final rule does not include the note to the definition of “enclosed space” in final § 1926.968. OSHA intends to revise § 1926.968 to include an appropriate note to the definition of “enclosed

⁸⁹ Section 1926.953 thus functions similarly to corresponding provisions in § 1910.146. An employer need not follow the permit-entry requirements of § 1910.146 for spaces where the hazards have been completely eliminated, or for limited situations in which OSHA permits the use of alternative procedures (§ 1910.146(c)(5) and (c)(7)). The spaces for which alternative procedures may be used are similar to “enclosed spaces,” as defined in this final rule, and the alternative procedures themselves are similar to the procedures contained in final § 1926.953 (§ 1910.146(c)(5); 58 FR 4462, 4486–4489, Jan. 14, 1993).

⁹⁰ OSHA is not removing the existing note to that definition from final § 1910.269(x).

space” when it promulgates the new standard for confined-space entry during construction work.

Paragraph (b), which is being adopted without substantive change from the proposal, contains the general requirement that employers ensure the use of safe work practices for entry into, and work in, enclosed spaces and for rescue of employees from such spaces. These safe work practices ensure that employees are protected against hazards in the enclosed space and include, among others, the practices specified in paragraphs (e) through (o).

Paragraph (c), which is being adopted without substantive change from the proposal, requires each employee who enters enclosed spaces, or who serves as an attendant, to be trained in the hazards associated with enclosed-space entry and in enclosed-space entry and rescue procedures. This training must ensure that employees are trained to work safely in enclosed spaces and that they will be knowledgeable of the rescue procedures in the event that an emergency arises within the space.

Paragraph (d), which is being adopted without change from the proposal, requires that the employer provide equipment that will assure the prompt and safe rescue of employees from the enclosed space. This requirement is necessary to ensure that employees who are injured in enclosed spaces will be retrieved from the spaces. The equipment must enable a rescuer to remove an injured employee from the enclosed space quickly and without injury to the rescuer or further harm to the injured employee. A harness, lifeline, and self-supporting winch can normally be used for this purpose.

Mr. Leo Muckerheide with Safety Consulting Services recommended that, because of the risk of arc hazards, OSHA should explicitly require nonconductive and flame-resistance-rated rescue equipment that meets ASTM F887, *Standard Specifications for Personal Climbing Equipment* (Ex. 0180). He argued that the general industry confined space standard does not protect against arc-flash and electric-shock hazards and contrasted proposed paragraph (d) with provisions in proposed § 1926.960 that do require protection from these hazards (*id.*).

OSHA rejects this recommendation. First, work in enclosed spaces does not always pose arc-flash or electric-shock hazards. Sometimes, employees enter spaces to take readings or perform inspections; during these activities these hazards are unlikely to be present,⁹¹ or

⁹¹ It is possible under certain circumstances that employees taking readings or performing inspection

there may be no energized electric equipment present.

Second, addressing arc-flash and electric-shock hazards in § 1926.953 would be unnecessarily duplicative, as these hazards are more appropriately addressed in § 1926.960, which applies to work on or near exposed live parts. When work is performed within reaching distance of exposed energized parts of equipment, final § 1926.960(f) requires the employer to ensure that each employee removes, or renders nonconductive, all exposed conductive articles, unless such articles do not increase the hazards associated with contact with the energized parts. This provision covers conductive articles on harnesses. Paragraph (c)(1)(iii) of final § 1926.960 requires the employer to ensure that employees do not take conductive objects, such as conductive lifelines, closer to energized parts than the employer's established minimum approach distances, unless the live parts or conductive objects are insulated.⁹² Because, in a rescue situation, the attendant would not have control over how close the lifeline got to exposed energized parts, any lifeline would have to be insulated, or the live parts would have to be insulated, to protect the attendant and the entrant against electric shock. Paragraph (g)(1) of final § 1926.960 requires the employer to assess the workplace to determine if each employee is exposed to hazards from flames or electric arcs. This assessment can guide the selection of rescue equipment that can effect safe rescue when employees are exposed to these hazards. If there is a risk that an electric arc could occur in an enclosed space, then the rescue equipment must be capable of withstanding that hazardous condition.

Some conditions within an enclosed space, such as high temperature and high pressure, make it hazardous to remove a cover from the space. For example, if high pressure is present within the space, the cover could be blown off in the process of removing it. Paragraph (e), which is being adopted without substantive change from the proposal, protects against these hazards by requiring a determination of whether it is safe to remove the cover. This determination must include checking for the presence of any atmospheric pressure or temperature differences

activities could be exposed to arc-flash hazards. See the discussion of arc-flash hazard assessment under the summary and explanation for final § 1926.960(g)(1), later in this section of the preamble.

⁹² There is a third exception associated with live-line barehand work, which is generally inapplicable in enclosed spaces.

(generally between the inside and outside of the enclosed space) and evaluating whether there might be a hazardous atmosphere in the space. Furthermore, any condition making it unsafe for employees to remove the cover must be eliminated (that is, reduced to the extent that it is no longer unsafe) before the cover is removed. A note following paragraph (e) clarifies that this determination may consist of checking the conditions that might foreseeably be inside the enclosed space. For example, the cover could be checked to see if it is hot and, if it is fastened in place, it could be loosened gradually to release any residual pressure. The note also clarifies that, to evaluate whether there might be a hazardous atmosphere in the space, an evaluation needs to be made of whether conditions at the site could cause a hazardous atmosphere to accumulate in the space.

Paragraph (f), which is being adopted without substantive change from the proposal, requires that, when covers are removed, openings to enclosed spaces be promptly guarded to protect employees from falling into the space and to protect employees in the enclosed space from being injured by objects entering the space. The guard could be a railing, a temporary cover, or any other barrier that provides the required protection.

Paragraph (g), which is being adopted without substantive change from the proposal, prohibits employees from entering enclosed spaces that contain a hazardous atmosphere unless the entry conforms to the general industry permit-space standard at § 1910.146. Accordingly, if an entry is to be made while a hazardous atmosphere is present in the enclosed space, the entry must conform to the general industry permit-required confined spaces standard at § 1910.146.⁹³ Once the hazardous atmosphere is removed (for example, by ventilating the enclosed space), employees may enter the enclosed space following the provisions in § 1926.953.

The use of the term “entry” in this paragraph of § 1926.953 is consistent with the use of that term in § 1910.146, and OSHA proposed to include the § 1910.146 definition of “entry” in Subpart V. Two commenters objected to the proposed definition of “entry” on the basis that the definition would

⁹³ As stated previously, the references to the general industry standard in final § 1926.953 are included as a placeholder pending the promulgation of the confined spaces in construction standard. OSHA intends to change these references to refer to the construction standard when it promulgates that standard.

prevent them from hanging a tag in the chimney of a manhole with a fault (Exs. 0157, 0227). Consolidated Edison Company of New York (ConEd) described their opposition to the proposed definition of “entry” as follows:

In order to comply with § 1910.269(t)(7)(i), Con Edison utilizes an identification system for structures that have cable and joint abnormalities. This system requires the identifying crew to hang a tag (in our nomenclature, a D-Fault tag) in the chimney of the manhole. This red tag is a clear indication to any other personnel who may attempt to enter the structure that the entry should not be made. This tagging system is an integral part of our compliance method and of protecting our employees. If OSHA adds the definition as proposed, it will prevent us from breaking the plane of the opening and hence prevent us from hanging the tag. This process will reduce, not increase the safety of our employees and as such will have the opposite effect from what OSHA is trying to accomplish. [Ex. 0157]

EEI recommended instead that “that the Agency grant electric utilities an [exemption from] the definition for [§ 1910.269](t)(7) Protection against faults, to allow utilities to properly comply” (Ex. 0227).

OSHA rejects ConEd’s recommendation. Paragraph (g) of final § 1926.953 does not preclude employers from hanging tags in the chimney of a manhole with a fault. To the contrary, the rule permits entry into an enclosed space that contains a hazardous atmosphere if entry conforms to the general industry permit-space standard. Moreover, if there is no hazardous atmosphere in the space, employees may enter when the entry conforms to § 1926.953. OSHA concludes that the proposed definition is, therefore, appropriate as it applies to final § 1926.953 and the corresponding requirements in final § 1910.269(e).

OSHA also rejects EEI’s recommendation, because it is unnecessary. The definition of “entry,” as proposed and adopted, applies only to the use of that term in final §§ 1910.269(e) and 1926.953. The definition does not apply to final § 1910.269(t)(7)(i) or § 1926.965(h)(1). (See the summary and explanation for final § 1926.965(h)(1) for the response to ConEd’s and EEI’s concerns that this provision, and its counterpart in § 1910.269(t)(7)(i), would preclude an employer from hanging a tag in the chimney of a manhole or vault to indicate the presence of a faulted cable.)

Paragraph (h), which has been adopted with clarifying revisions from the proposal, requires an attendant with first-aid training, including CPR, to be immediately available outside the

enclosed space to provide assistance when a hazard exists because of traffic patterns in the area of the opening used for entry.⁹⁴ This paragraph does not prohibit the attendant from performing other duties outside the enclosed space, as long as those duties do not distract the attendant from monitoring employees who are in the enclosed space (entrants) and ensuring that it is safe to enter and exit the space. This paragraph has two purposes: To protect the entrant from hazards involving traffic patterns while the entrant is entering or exiting the space and to provide assistance in an emergency.

Mr. Frank Brockman with Farmers Rural Electric Cooperative Corporation noted that attendants should never be allowed to enter manholes or confined spaces (Ex. 0173).

The final rule, like the proposal, requires the attendant to remain immediately available outside the enclosed space during the entire entry. If the attendant were permitted to enter the enclosed space during entry, he or she might not be able to assist the entrant. For example, if traffic-pattern hazards are present in the area of the opening to the enclosed space and if the attendant enters the space, then both the attendant and the workers he or she is protecting would be vulnerable upon leaving the enclosed space because no one would be present to minimize or control the traffic-pattern hazards. Therefore, the final rule specifies that the attendant must remain outside the enclosed space during the entire entry process. It should be noted that the rescue equipment required by paragraph (d) will enable the entrant to rescue the entrant from the space before administering any necessary first aid.

Mr. Lee Marchessault of Workplace Safety Solutions recommended that paragraph (h) require the attendant to be trained in CPR, in addition to first-aid training (Ex. 0196; Tr. 575). He noted that the electrical hazards in the space, as well as other hazards, might present a need for CPR (Tr. 598).

OSHA is clarifying paragraph (h) in the final rule. The proposed rule required training in first aid, including CPR, so that the attendant could provide emergency assistance in case of injury. This is the type of training required by § 1926.951(b). However, the reference to § 1926.951(b)(1) in the proposal likely caused Mr. Marchessault to misinterpret

⁹⁴ Typically, workers direct traffic away from the work area using traffic control devices, as required by § 1926.967(g). When the resultant traffic patterns (that is, the flow of traffic) could bring vehicles close to the enclosed space entrance (for example, when the work reduces the number of traffic lanes), the employer must provide an attendant.

the requirement. Therefore, the Agency included a definition of “first-aid training” in § 1926.968 in the final rule. That definition states that first-aid training is training in the initial care, including cardiopulmonary resuscitation (which includes chest compressions, rescue breathing, and, as appropriate, other heart and lung resuscitation techniques), performed by a person who is not a medical practitioner, of a sick or injured person until definitive medical treatment can be administered. The definition clarifies that, wherever first-aid training is required by the final rule, CPR training must be included.⁹⁵ OSHA also dropped the proposed cross-reference to § 1926.951(b)(1), as it is no longer necessary.

Mr. Anthony Ahern with the Ohio Rural Electric Cooperatives recommended that an attendant always be available for enclosed-space operations, not just when traffic-pattern hazards exist (Ex. 0186).

OSHA is not adopting this recommendation. By definition, an enclosed space contains a hazardous atmosphere only under abnormal conditions. The Agency previously concluded that these spaces do not present the type of atmospheric hazards that warrant the presence of an attendant after the employer takes precautions such as those required by § 1926.953. (See, for example, 58 FR 4485–4488.) In addition, as provided in final § 1926.953(a), when a hazardous atmosphere is present after the employer takes the precautions required by this section, paragraphs (d) through (k) of OSHA’s general industry permit-space standard, § 1910.146, which do require attendants, apply. Therefore, the Agency concluded that, when paragraph (h) applies, the only hazards (other than electrical) that necessitate the presence of an attendant while work is being performed in an enclosed space are traffic-pattern hazards in the area of the opening used for entering and exiting the enclosed space. OSHA notes that even if no traffic-pattern hazards are present, an attendant is required under § 1926.965(d) of the final rule while work is being performed in a manhole or vault containing energized electric equipment. A note to this effect follows final § 1926.953(h).

Mr. Leo Muckerheide with Safety Consulting Services commented that the purpose of proposed paragraph (h) was confusing because the purpose of the requirement as stated in the first

⁹⁵ The definition also clarifies that CPR training includes resuscitation techniques both for the heart and for the lungs.

sentence—that is, protecting entrants from traffic-pattern hazards—differs from the attendant's duties as noted in the second sentence—monitoring employees within the space. He recommended that OSHA revise the second sentence of that paragraph as follows:

That person is not precluded from performing other duties outside the enclosed space if these duties do not distract the attendant from monitoring the traffic patterns outside the enclosed space. [Ex. 0180]

OSHA rejects Mr. Muckerheide's recommended language. Part of the attendant's duty to monitor employees in the space is to warn entrants preparing to exit an enclosed space about hazards involving traffic patterns. If the attendant is watching traffic patterns instead of monitoring the entrant, the entrant might not receive warnings about that traffic before exiting the space. When the entrant is ready to exit the space, the attendant can then monitor or direct traffic and let the entrant know when it is safe to exit the space. On the other hand, OSHA agrees with Mr. Muckerheide that the duties of the attendant may not be clear from the language of the provision as proposed. Therefore, OSHA revised the language in final paragraph (h) to make it clear that ensuring that it is safe to enter and exit an enclosed space is part of the attendant's duties.

Paragraph (i), which is being adopted without change from the proposal, requires that test instruments used to monitor atmospheres in enclosed spaces have a minimum accuracy of ± 10 percent and be kept in calibration. This provision will ensure that test measurements are accurate so that hazardous conditions will be detected when they arise. The accuracy of instruments used for testing the atmosphere of these spaces is important for employee safety, and calibration is critical to test-instrument accuracy. As noted in the preamble to the proposal and to the 1994 § 1910.269 final rule, OSHA considers ± 10 percent to be the minimum accuracy needed to detect hazardous conditions reliably (70 FR 34849, 59 FR 4369).

Two commenters objected to the proposed requirements (Exs. 0128, 0227). EEI recommended that the standard only require “that test instruments be kept in calibration using the recommendations set forth by the specific manufacturer” and not address accuracy (Ex. 0227). Mr. Mark Spence of Dow Chemical Company argued that OSHA did not demonstrate that the provision was necessary or that calibration has been a problem (Ex.

0128). He stated that the general industry permit-space standard did not contain such a requirement, but only requires that the atmospheres in spaces be monitored (*id.*).

OSHA rejects the recommendations from these two commenters. Mr. Spence is incorrect. The permit-space standard requires test equipment to be calibrated. As mentioned previously, § 1910.146(c)(5) contains requirements for alternative procedures for permit spaces that are analogous to the enclosed-space requirements contained in § 1926.953 of the final rule. Paragraph (c)(5)(ii)(C) of § 1910.146 requires atmospheric testing using a calibrated test instrument. Paragraph (d) of § 1910.146, which contains requirements for permit-required confined-space programs, specifies, at paragraph (d)(4)(i), that employers maintain “[t]esting and monitoring equipment needed to comply with paragraph (d)(5).” As OSHA concluded in the preamble to the general industry permit-space final rule, if test equipment “is properly selected, calibrated, and maintained . . . , the testing and monitoring needs for entry and work in permit-required confined spaces can be effectively met” (58 FR 4498). Thus, the use of inaccurate or uncalibrated test instruments does not meet the permit-space standard.

OSHA rejects EEI's recommendation that the standard not address accuracy. The Agency concluded in the 1994 § 1910.269 rulemaking that the requirement for test instruments to be accurate within ± 10 percent was reasonably necessary for the protection of employees (59 FR 4369). OSHA continues to believe that the accuracy of instruments used for testing the atmosphere of these spaces is important, and EEI offered no evidence to the contrary.

OSHA also rejects EEI's assertion that equipment calibrated to manufacturers' specification is an adequate substitute for test equipment accuracy. Calibration and accuracy are not synonymous. A calibrated test instrument is one that has been compared to a standard reference source for the substance (oxygen, or a toxic or flammable gas) to be measured. Accuracy is a measure of the precision with which the substance can be measured. An oxygen meter, for example, with an accuracy of ± 20 percent could give a reading as much as 20 percent above or below the actual oxygen content even when it is properly calibrated. It is evident that this calibrated instrument would not meet the final rule's minimum accuracy requirement of ± 10 percent.

Several commenters recommended that OSHA include in the final rule specific requirements on how to keep instruments calibrated. (See, for example, Exs. 0196, 0211, 0227.) For instance, ISEA recommended that OSHA refer employers and employees to the Agency's Safety and Health Information Bulletin “Verification of Calibration for Direct-Reading Portable Gas Monitors” (SHIB 05–04–2004) for information on this topic (Ex. 0211).⁹⁶ As noted earlier, EEI recommended that test instruments be calibrated in accordance with manufacturers' instructions (Ex. 0227). Another commenter, Mr. Lee Marchessault with Workplace Safety Solutions agreed that the standard should require calibration in accordance with manufacturers' instructions because test instruments “may go out of calibration 2 hours after being calibrated” (Ex. 0196).

OSHA is not adopting these recommendations. The Agency decided to adopt a performance-based approach for this requirement to provide compliance flexibility. OSHA considers a test instrument to be “kept in calibration,” as required by paragraph (i), when the employer follows the manufacturers' calibration instructions or other reasonable guidelines for the calibration of the instrument involved. The Agency anticipates that most employers will follow manufacturers' instructions. However, these instructions might not be available if the manufacturer has gone out of business. In addition, there are other sources of information on proper calibration methods. As mentioned earlier, ISEA noted one appropriate source of information that can be used instead, although the Agency decided against including a reference to that publication in the final rule.

Mr. Kevin Taylor with the Lyondell Chemical Company asked for clarification of the requirement that test instruments have a minimum accuracy of ± 10 percent (Ex. 0218). He inquired whether that level of accuracy was needed for each measured gas or whether the accuracy measurement was based on total detection of gases.

OSHA clarifies that the accuracy required by the final rule pertains to each gas being measured. Moreover, the accuracy of the instrument must be determined based on the threshold quantities that would make the atmosphere within the space hazardous (as per the definition of “hazardous atmosphere” in § 1926.968). For

⁹⁶ This document is available on the OSHA Web site at: <http://www.osha.gov/dts/shib/shib050404.pdf>.

example, a particular enclosed space could potentially contain hazardous levels of methane, carbon dioxide, and carbon monoxide, as well as insufficient levels of oxygen. The instrument or instruments used to test the space in this example must be accurate to within ± 10 percent of: (1) A 0.5-percent concentration of methane (which is 10 percent of its lower flammable limit),⁹⁷ (2) the permissible exposure limits (PELs) contained in Subpart D for both carbon dioxide and carbon monoxide (9,000 and 55 mg/m³, respectively), and (3) atmospheric concentrations of oxygen at 19.5 percent. It is important for the test instrument to be accurate near the threshold because those are the critical values for determining whether or not a space is hazardous.

As noted earlier, because of the lack of adequate ventilation, enclosed spaces can accumulate hazardous concentrations of flammable gases and vapors, or an oxygen deficient atmosphere could develop. It is important to keep concentrations of oxygen and flammable gases and vapors at safe levels; otherwise, an explosion could occur while employees are in the space, or an oxygen deficiency could lead to suffocation of an employee. Toward these ends, paragraphs (j) through (o) of the final rule address the testing of the atmosphere in the space and ventilation of the space. OSHA notes that the specific testing requirements in paragraphs (j), (k), and (o) must be met irrespective of the results of the employer's evaluation performed under paragraph (e). The evaluation performed under paragraph (e) serves only to ensure that it is safe to remove the cover and will not determine whether an enclosed space contains a hazardous atmosphere. The testing required by paragraphs (j), (k), and (o) will ensure, as required by paragraph (g), that employees not enter an enclosed space while it contains a hazardous atmosphere unless they follow the requirements of the general industry permit-space standard.

Paragraph (j), which is being adopted without substantive change from the proposal, requires that, before an employee enters an enclosed space, the atmosphere in the space be tested for oxygen deficiency and that the testing be done with a direct-reading meter or similar instrument capable of collecting and immediately analyzing data samples without the need for off-site evaluation. Continuous forced air-ventilation is permitted as an alternative to testing. However, procedures for such

ventilation must ensure that employees are not exposed to the hazards posed by oxygen deficiency.⁹⁸ (See also paragraph (m) for additional requirements relating to ventilation of the space.)

Paragraph (k), which is being adopted without change from the proposal, requires that, before employees enter an enclosed space, the internal atmosphere of the space be tested for flammable gases and vapors. If the results of the test indicate the presence of a hazardous atmosphere, employees may not enter under the procedures specified by § 1926.953. (See § 1926.953(g).) So that the results are accurate and relevant to the atmosphere in the space at the time of employee entry, testing must be performed with a direct-reading meter, or similar instrument, capable of collecting and immediately analyzing data samples without the need for off-site evaluation. The flammability test required by this paragraph must be performed after oxygen testing and ventilation required by paragraph (j) demonstrate that the enclosed space has sufficient oxygen for an accurate flammability test.

If flammable gases or vapors are detected or if an oxygen deficiency is found, paragraph (l), which is being adopted without substantive change from the proposal, requires the employer to provide forced-air ventilation to maintain safe levels of oxygen and to prevent a hazardous concentration of flammable gases or vapors from accumulating. As an alternative to ventilation, an employer may use a continuous monitoring system that ensures that no hazardous atmosphere develops and no increase in flammable gas or vapor concentrations above safe levels occur if flammable gases or vapors are detected at safe levels. The language in the final rule clarifies that the monitoring must ensure that concentrations of flammable gases and vapors do not increase above safe levels (as opposed to not increasing at all). The definition of hazardous atmosphere contains guidelines for determining whether the concentration of a substance is at a hazardous level. OSHA is including a note to this effect after paragraph (l). An identical note appears after paragraph (o). OSHA changed the title of this paragraph in the final rule to "Ventilation, and monitoring for flammable gases or

vapors" to accurately reflect the contents of the paragraph.

Paragraph (m), which is being adopted without substantive change from the proposal, contains specific requirements for the ventilation of enclosed spaces. When forced-air ventilation is used, it must begin before entry is made and must be maintained long enough for the employer to be able to demonstrate that a safe atmosphere exists before employees are allowed to enter the space. To accomplish this, the ventilation must be maintained long enough to purge the atmosphere within the space of hazardous levels of flammable gases and vapors and to supply an adequate concentration of oxygen.

OSHA decided not to specify a minimum number of air changes before employee entry into the enclosed space is permitted. Instead, the Agency places the burden on the employer to ensure that the atmosphere is safe before such entry. The employer can discharge this duty either by testing to determine the safety of the atmosphere in the space or by a thorough evaluation of the air flow required to make the atmosphere safe. In this way, the safety of employees working in enclosed spaces will not be dependent on speculation by a supervisor or an employee.⁹⁹

Paragraph (m) also requires the air provided by the ventilating equipment to be directed at the immediate area within the enclosed space where employees are at work. The forced-air ventilation must be maintained the entire time the employees are present within the space. These provisions ensure that a hazardous atmosphere does not reoccur where employees are working.

NIOSH recommended that "the atmosphere in a confined space be tested before entry and monitored continuously while workers are in the confined space to determine if the atmosphere has changed due to the work being performed" (Ex. 0130). NIOSH identified its publication "Worker Deaths in Confined Spaces: A Summary of NIOSH Surveillance and Investigative Findings," Publication No. 94-103, as evidence of the need for continuous monitoring (*id.*).

As explained earlier in this section of the preamble, the final rule requires the atmosphere in enclosed spaces to be tested before entry. OSHA concludes, however, that continuous monitoring of enclosed spaces is unnecessary. By

⁹⁸ The definition of "hazardous atmosphere" determines what concentrations of oxygen are considered hazardous. (See § 1926.968.) Paragraph (g) of final § 1926.953 prohibits entry into an enclosed space while a hazardous atmosphere is present.

⁹⁹ This discussion, which also appeared in the preamble to the proposal, responds to one commenter's request for clarification of how the employer could demonstrate that the atmosphere in the enclosed space is safe (Ex. 0186).

⁹⁷ The lower flammable limit for methane is 5 percent, and 10 percent of that value is 0.5 percent.

definition, enclosed spaces contain a hazardous atmosphere only under abnormal conditions. Thus, enclosed spaces almost never contain the types of conditions that will cause a hazardous atmosphere to reoccur after employers implement the precautions required by § 1926.953 (such as forced-air ventilation). If these precautions are not sufficient to keep the atmosphere in the space safe, then the space would not qualify for entry under § 1926.953, and entry could only proceed under the general industry permit-required confined space standard, as specified by paragraph (a) of that section. Therefore, OSHA has not adopted NIOSH's recommendation in the final rule.

Two commenters noted that proposed paragraph (m) might be impossible to implement under certain conditions and recommended that the final rule recognize these conditions (Exs. 0128, 0224). One of these commenters, Dow Chemical Company, noted that it is not always possible to test atmospheric conditions before entry into an enclosed space (Ex. 0128). The other commenter, the Alabama Rural Electric Association of Cooperatives, maintained that it was not always feasible to use forced-air ventilation because of space constraints (Ex. 0224).

OSHA concludes that no changes to paragraph (m) are necessary. The final rule, as with the proposal, recognizes that the enclosed-space procedures might not adequately protect employees in some circumstances. Paragraph (a) of the final rule requires that employers follow the general industry permit-space standard at § 1910.146 whenever the precautions required by final §§ 1926.953 and 1926.965 are insufficient to adequately control the hazards posed by the space. These conditions include any conditions that make complying with those two sections in this final rule infeasible. Therefore, OSHA is including paragraph (m) in the final rule as proposed.

To ensure that the air supplied by the ventilating equipment provides a safe atmosphere, paragraph (n), which is being adopted without substantive change from the proposal, requires the air supply to be from a clean source and prohibits it from increasing the hazards in the enclosed space. For example, the final rule prohibits positioning the air intake for ventilating equipment near the exhaust from a gasoline or diesel engine because doing so would contaminate the atmosphere in the enclosed space.

The use of open flames in enclosed spaces is safe only when flammable gases or vapors are not present in hazardous quantities. For this reason,

final paragraph (o), which is being adopted without change from the proposal, requires additional testing for flammable gases and vapors if open flames are to be used in enclosed spaces. The tests must be performed immediately before the open-flame device is used and at least once per hour while the device is in use. More frequent testing is required if conditions indicate the need for it. Examples of such conditions include the presence of volatile flammable liquids in the enclosed space and a history of hazardous quantities of flammable vapors or gases in such a space.

5. Section 1926.954, Personal protective equipment

Final § 1926.954 contains requirements for personal protective equipment (PPE). Paragraph (a), which is being adopted without change from the proposal, clarifies that PPE used by employees during work covered by Subpart V must meet Subpart E of Part 1926.

Mr. Daniel Shipp with ISEA recommended that OSHA update the national consensus standards incorporated by reference in Subpart E (Ex. 0211). He pointed out, for example, that § 1926.100, which covers head protection, incorporates two outdated ANSI standards, namely ANSI Z89.1–1969, *Safety Requirements for Industrial Head Protection*, and ANSI Z89.2–1971, *Industrial Protective Helmets for Electrical Workers* (*id.*).

Updating the national consensus standards incorporated by reference in Subpart E is beyond the scope of this rulemaking, so OSHA is not adopting Mr. Shipp's recommendation in this final rule. However, on June 22, 2012, OSHA published a direct final rule updating its head protection standard in Subpart E (77 FR 37587–37600).¹⁰⁰ On November 16, 2012, OSHA published a notice confirming the effective date of the direct final rule (77 FR 68684; effective date—September 20, 2012). That rulemaking action updates the national consensus standard for head protection incorporated in Subpart E of the construction standards as recommended by Mr. Shipp.

The preamble to the proposal noted that OSHA had separately proposed regulatory language for the general PPE standards to clarify that employers are

generally responsible for the cost of PPE (70 FR 34868–34869; 64 FR 15402, Mar. 31, 1999). OSHA published the final rule on employer payment for PPE on November 15, 2007 (72 FR 64342). The final rule on employer payment for PPE requires employers to pay for the PPE used to comply with OSHA standards, with a few exceptions. The exceptions include: (1) Everyday clothing, such as long-sleeve shirts, long pants, street shoes, and normal work boots; and (2) ordinary clothing, skin creams, or other items, used solely for protection from weather, such as winter coats, jackets, gloves, parkas, rubber boots, hats, raincoats, ordinary sunglasses, and sunscreen. (See §§ 1910.132(h) and 1926.95(d).)

Employers must pay for fall protection equipment and other PPE used by employees in compliance with this final rule to the extent required by § 1926.95(d), the general construction rule regarding payment for PPE, or § 1910.132(h), the general rule regarding payment for PPE in general industry. (See 72 FR 64369 (explaining that the general PPE-payment provisions “apply to all OSHA standards requiring PPE”)); see also the March 16, 2009, letter of interpretation to Mr. William Mattiford¹⁰¹ (employers must pay for body belts, positioning straps, and pole- and tree-climbing equipment in accordance with § 1910.132(h)) and the May 1, 2008, letter to Mr. Gil Niedenthal¹⁰² (employers must pay for body belts and pole climbers in accordance with § 1910.132(h)).)

OSHA included a note to final § 1926.954(a) to indicate that § 1926.95(d) sets employer payment obligations for the PPE required by subpart V, including, but not limited to, the fall protection equipment required by final § 1926.954(b), the electrical protective equipment required by final § 1926.960(c), and the flame-resistant and arc-rated clothing and other protective equipment required by final § 1926.960(g). (See the summary and explanation for § 1926.960(g), later in this section of the preamble, for a discussion of the issue of employer payment for flame-resistant and arc-rated clothing.)

Paragraph (b) of the final rule sets requirements for personal fall protection systems. Subpart M of part 1926, which sets requirements for fall protection for

¹⁰⁰ OSHA also updated its consensus standards for general industry and maritime on September 9, 2009 (74 FR 46350). The Agency again updated the general industry and maritime standards with the June 22, 2012, direct final rule because OSHA published the proposal for the 2009 final rule before ANSI updated its head-protection standard that year.

¹⁰¹ The letter of interpretation to Mr. Mattiford is available at http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=27014.

¹⁰² The letter of interpretation to Mr. Niedenthal is available at http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=27091.

construction, contains provisions covering two types of personal fall protection systems: Personal fall arrest systems, addressed in § 1926.502(d), and positioning device systems, addressed in § 1926.502(e). Subpart M defines a “personal fall arrest system” as a system used to arrest an employee in a fall from a working level. It consists of an anchorage, connectors, and body harness and may include a lanyard, deceleration device, lifeline, or suitable combinations of these. (See § 1926.500(b).) Personal fall arrest systems are designed to safely arrest the fall of an employee working on a horizontal or vertical surface.

Subpart M defines a “positioning device system” as a body belt or body harness system rigged to allow an employee to be supported on an elevated vertical surface, such as a wall, and work with both hands free while leaning. (See § 1926.500(b).)

Positioning device systems are designed to support an employee working on a vertical surface so that the employee can work with both hands without falling. Proposed Subpart V contained requirements for “work positioning equipment,” which is equivalent to “positioning device system” as that term is defined in subpart M. (See the summary and explanation for final § 1926.954(b)(2), later in this section of the preamble.)

A third form of personal fall protection system, which is not specifically addressed in Subpart M, is a tethering, restraint, or travel-restricting system. OSHA’s steel erection standard in Subpart R of Part 1926 contains requirements for “fall restraint systems,” which it defines as a fall protection system that prevents the user from falling any distance. The system consists of either a body belt or body harness, along with an anchorage, connectors and other necessary equipment. The other components typically include a lanyard, and may also include a lifeline and other devices. (See § 1926.751.¹⁰³)

Fall restraint, tethering, and travel-restricting equipment are all designed to prevent employees from falling, in some cases by restraining an employee’s access to unprotected edges (restraint, tethering, and travel-restricting equipment) and in other cases by holding the employee in place to prevent falling (restraint equipment).

IBEW recommended that the fall protection provisions in proposed

¹⁰³ The term “fall restraint system” as defined in § 1926.751 is a broad term that includes travel-restricting equipment, tethering systems, and other systems that prevent an employee from falling any distance.

paragraph (b), and in its general industry counterpart, proposed § 1910.269(g)(2), contain a reference to IEEE Std 1307, *Standard for Fall Protection for Utility Work* (Ex. 0230; Tr. 904–905, 983–984). The union noted that this is the only consensus standard addressing specific fall protection issues for the utility industry (Ex. 0230).

OSHA agrees that this consensus standard provides useful information to help employers comply with some provisions of the final rule and added the IEEE standard to the list of reference documents in Appendix G to subpart V and Appendix G to § 1910.269.¹⁰⁴ The Agency is not, however, referencing IEEE Std 1307 in § 1926.954 of the final rule. OSHA made substantial changes to the fall protection requirements in the final rule, and the IEEE standard does not reflect all of the final rule’s requirements. For example, on and after April 1, 2015, final

§ 1926.954(b)(3)(iii)(C) generally does not permit qualified employees to climb poles, towers, or similar structures without fall protection. (See the summary and explanation for final § 1926.954(b)(3)(iii), later in this section of the preamble.) In contrast, section 6.2.1 of IEEE Std 1307–2004 permits qualified climbers to climb poles, towers, and similar structures without fall protection (Ex. 0427).¹⁰⁵

Proposed paragraph (b)(1) provided that personal fall arrest systems had to meet the requirements of Subpart M of Part 1926. Existing § 1910.269(g)(2)(i) already contains a similar requirement. A note following proposed paragraph (b)(1) indicated that this provision would apply to all personal fall arrest systems used in work covered by subpart V. OSHA is not including this note in the final rule as it is unnecessary.

OSHA received a number of comments about proposed paragraph (b)(1). (See, for example, Exs. 0128, 0180, 0211, 0219, 0227, 0230.) Some of these comments generally supported the proposal, noting that there are no situations in which work covered by Subpart V would necessitate different requirements for fall arrest equipment than those already found in Subpart M. (See, for example, Exs. 0219, 0227, 0230.) Mr. Mark Spence with Dow

¹⁰⁴ See the discussion of the appendices to the final rule, later in this section of the preamble. As explained in the appendices, the referenced national consensus standards, including IEEE Std 1307, contain detailed specifications that employers may follow in complying with the more performance-oriented requirements of OSHA’s final rule. However, compliance with IEEE Std 1307 is not a substitute for compliance with § 1926.954(b).

¹⁰⁵ IEEE Std 1307–2004 is the most recent edition of that consensus standard.

Chemical Company supported the incorporation of subpart M in both subpart V and § 1910.269, but noted OSHA’s plan to revise the general industry fall protection standard. He recommended that § 1910.269 and subpart V eventually be revised to refer to the updated general industry fall protection provisions:

The existing general industry standard [§ 1910.269] requires personal fall arrest equipment to meet the requirements of the construction industry fall protection standards, 29 CFR Part 1926, Subpart M. Both § 1910.269 and Subpart M were promulgated in 1994, whereas the general industry fall protection standards date back to 1971 (and are based on earlier requirements). To take advantage of the updated fall protection requirements in the construction standards, OSHA chose to make them applicable to work under this general industry standard. [Footnote omitted.]

* * * * *

Dow sees no current option for OSHA other than continuing to refer to Subpart M, supplementing it as appropriate with new provisions, as OSHA has done here. However, Dow urges OSHA to proceed expeditiously with the issuance of . . . new general industry fall protection . . . standards. Once . . . new [general industry fall protection standards are] published as a final rule, OSHA should revise both [Subpart V and § 1910.269] to refer to the new [provisions]. [Ex. 0126]

On May 24, 2010, OSHA proposed to revise the general industry walking-working surfaces standards and the personal protective equipment standards (75 FR 28862). The proposal included a new standard for personal fall protection systems, § 1910.140, which would increase consistency between construction, maritime, and general industry standards. When that rulemaking is finalized, OSHA will consider whether the cross-references in subpart V and § 1910.269 should be changed as recommended by Mr. Spence.

Two commenters noted that subpart M does not address arc-flash resistance for fall arrest equipment and recommended that OSHA require this equipment to pass arc-flash tests (Exs. 0180, 0211). Mr. Daniel Shipp of ISEA supported arc-flash testing as follows:

We believe that workers in electric power transmission and distribution have special requirements different from those in general construction activities. These special requirements are recognized as hazards associated with exposure to high-voltage electric current. The hazard of exposure to energized electrical sources often occurs at height[s] where personal fall arrest systems are required. The hazard of electric arc flash has been addressed in the ASTM F887–04 [*Standard Specifications for Personal Climbing Equipment*] for full body harnesses used in fall arrest.

We support the inclusion of electric arc-flash resistance requirements, referenced in ASTM F887-04, to be extended to [include] fall arrest PPE, especially full body harnesses and shock absorbing lanyards that are worn together as part of a complete fall arrest system. These components would be exposed to potentially damaging thermal shock in the event of an arc flash. The damage to lanyards not designed to withstand a high-voltage arc flash can be quite severe, reducing strength to levels below the factor of safety necessary to assure arrest of a fall. Tests have been performed by the Kinetics high energy laboratory on high-tensile webbing, such as that used in fall protection PPE products. Testing at exposure levels of 40 cal/cm², in accordance with the procedures in ASTM F1958/F1958M-99 [*Standard Test Method for Determining the Ignitability of Non-flame-Resistance Materials for Clothing by Electric Arc Exposure Method Using Mannequins*], demonstrated ignition and melting of the webbing sufficient to reduce webbing strength by greater than 30 percent.

One common example of this hazard involves employees tied off in bucket trucks working in close proximity to high-voltage power lines. The fall arrest harness and lanyard are typically exposed above the edge of the bucket where contact with electric arc flash is possible. In the event of an incident, including a fall by ejection out of the bucket, the strength of fall arrest components could be severely compromised if they were exposed to a high-voltage electric arc flash. [Ex. 0211]

Mr. Leo Muckerheide of Safety Consulting Services similarly recommended that harnesses and lanyards used by employees working on or near energized circuits meet ASTM F887-04, because that consensus standard provides performance criteria for arc resistance (Ex. 0180).

OSHA recognizes that employees performing work covered by subpart V and § 1910.269 are sometimes exposed to hazards posed by electric arcs. In fact, final §§ 1910.269(l)(8) and 1926.960(g) are designed to protect employees from electric arcs. In addition, the Agency already recognized the need for work-positioning equipment to be capable of passing a flammability test to ensure that the equipment does not fail if an electric arc occurs. (See final §§ 1910.269(g)(2)(iii)(G)(5) and 1926.954(b)(2)(vii)(E).) On the other hand, in work covered by subpart V or § 1910.269, personal fall arrest equipment has broader application than work-positioning equipment, with work-positioning equipment being used primarily on support structures for overhead power lines. Several applications for personal fall arrest equipment involve work that does not pose electric-arc hazards, especially in electric power generation work covered by § 1910.269. For example, an employee working on a cooling tower or

atop a dam at an electric power generation plant would not normally be exposed to these hazards. Consequently, OSHA decided not to include a general requirement for all fall arrest equipment used under the final rule to be capable of passing an electric-arc test.

However, OSHA agrees that electric arcs can damage personal fall arrest equipment as readily as work-positioning equipment. The testing to which the commenters referred, and which is the basis of the test data found in the record, demonstrates that harnesses subjected to an electric arc can fail a drop test (Ex. 0432). The Agency concludes from these test data that personal fall arrest equipment worn by an employee who is exposed to an electric arc could fail if it is not designed to withstand the heat energy involved. OSHA also agrees with the commenters that employees working on or near energized circuits are exposed to electric arcs when the circuit parts are exposed (Ex. 0180). Accordingly, OSHA adopted a requirement in the final rule that fall arrest equipment used by employees exposed to hazards from flames or electric arcs be capable of passing a drop test after exposure to an electric arc¹⁰⁶ with a heat energy of 40±5 cal/cm². This requirement matches the electric arc performance required of fall arrest equipment by ASTM F887-04 (Ex. 0055). The provision appears in final paragraph (b)(1)(ii).

Paragraph (g)(1) of § 1926.960 in the final rule requires employers to identify employees exposed to the hazards of flames or electric arcs. When these employees are using personal fall arrest equipment, that equipment also would be exposed to flame or electric-arc hazards, and the final rule requires this fall arrest equipment to be capable of passing a drop test equivalent to the test specified in paragraph (b)(2)(xii) (discussed later in this section of the preamble) after exposure to an electric arc with a heat energy of 40±5 cal/cm². Harnesses and shock-absorbing lanyards meeting ASTM F887-12^{e1} 107 will be deemed to comply with this provision.

OSHA received a substantial number of comments addressing fall protection

¹⁰⁶ The electric arc test required by this paragraph is a test exposing the equipment to an electric arc with a specified incident heat energy. ASTM F887-12^{e1} includes an electric-arc test method that involves positioning the fall arrest equipment in front of two vertically mounted electrodes. The electric arc forms between the electrodes.

¹⁰⁷ The final rule is based on the edition of the consensus standard that is in the record, ASTM F887-04, *Standard Specifications for Personal Climbing Equipment* (Ex. 0055). OSHA reviewed the most recent edition of this standard, ASTM F887-12^{e1}, and found that equipment meeting that standard will also comply with final § 1926.954(b)(1)(ii).

requirements for employees working in aerial lifts. Existing fall protection requirements to protect employees in aerial lifts performing work, including line-clearance tree-trimming work, covered by Subpart V or § 1910.269 are found in several standards. In construction, the construction aerial lift standard (§ 1926.453) and subpart M apply. For maintenance and operation work, the general industry aerial lift standard (§ 1910.67) and existing § 1910.269(g)(2) (incorporating subpart M of the construction standards) apply. Currently, line-clearance tree-trimming work is typically governed by the fall protection requirements in § 1910.269 and, depending on the type of work performed, falls under either the general industry or construction aerial lift standard.

Paragraph (b)(2)(v) of § 1926.453 in the construction standard for aerial lifts requires an employee working from an aerial lift to wear a body belt with a lanyard attached to the boom or basket. However, the introductory text to § 1926.502(d) in subpart M provides that “body belts are not acceptable as part of a personal fall arrest system.” The hazards of using a body belt as part of a fall arrest system are described in the preamble to the Subpart M final rule (59 FR 40672, 40702-40703, Aug. 9, 1994) and later in this section of the preamble. In short, since the fall-arrest forces are more concentrated for a body belt compared to a body harness, the risk of injury in a fall is much greater with a body belt. In addition, an employee can fall out of a body belt in a fall. Lastly, an employee faces an unacceptable risk of further injury while suspended in a body belt awaiting rescue.

Given the potential discrepancy between the aerial lift standard’s requirement for body belts and the subpart M limitation on the use of body belts in fall arrest systems, a note following § 1926.453(b)(2)(v) explains that § 1926.502(d) provides that body belts are not acceptable as part of a personal fall arrest system. The use of a body belt in a tethering system or in a restraint system is acceptable and is regulated under § 1926.502(e).

Like the aerial lift standard in construction, the general industry aerial lift standard at § 1910.67(c)(2)(v) requires an employee working from an aerial lift to wear a body belt with a lanyard attached to the boom or basket. Even though existing § 1910.269(g)(2)(i) requires fall arrest equipment to meet subpart M of part 1926, which prohibits the use of body belts in personal fall arrest systems, the Agency previously decided that employers could use body belts and lanyards configured as fall

arrest systems to protect employees doing work covered by § 1910.269 in aerial lifts.

OSHA explained in the preamble to the proposal that this rulemaking would prohibit the use of body belts in personal fall arrest systems for all work covered by § 1910.269 and subpart V, including work done from aerial lifts (70 FR 34850). The tree trimming industry criticized OSHA's proposed application of the Subpart M prohibition on body belts in personal fall arrest systems on the basis that it left line-clearance tree trimming employers with two (in the industry's view, undesirable) options—providing either (1) a personal fall arrest system with a body harness, or (2) a positioning system that, under proposed § 1926.954(b)(3)(iv) (or proposed § 1910.269(g)(2)(iii)(D)), is rigged to prevent free falls of more than 0.6 meters (2 feet). (See, for example, Exs. 0174, 0200, 0502, 0503; Tr. 611–619, 756–760.)

The tree trimming industry is mistaken about the compliance options available to its employers. The 0.6-meter free-fall limit applies only to work-positioning equipment, which may not be used in aerial lifts. As noted previously, under § 1926.500(b) of subpart M, “positioning device system” is defined as “a body belt or body harness system rigged to allow an employee to be supported on an elevated vertical surface, such as a wall, and work with both hands free while leaning.” Positioning device systems are *not* permitted to be used from a horizontal surface, such as the platform or bucket of an aerial lift.¹⁰⁸

Although employees in aerial lifts cannot use work-positioning equipment, they can use restraint systems. As noted previously, a restraint system is a method of fall protection that prevents the worker from falling, for example, by preventing the employee from reaching an unprotected edge. Body belts are permissible in restraint systems. If an employer has an employee use a fall restraint system, it must ensure that the lanyard and anchor are arranged so that the employee is not exposed to falling

any distance.¹⁰⁹ In addition, for a restraint system to work, the anchorage must be strong enough to prevent the worker from moving past the point where the system is fully extended, including an appropriate safety factor. In a November 2, 1995, letter of interpretation to Mr. Dennis Gilmore, OSHA suggested that, at a minimum, a fall restraint system have the capacity to withstand at least 13.3 kilonewtons (3,000 pounds) or twice the maximum expected force that is needed to restrain the employee from exposure to the fall hazard.¹¹⁰ The Agency recommended that, in determining this force, employers should consider site-specific factors such as the force generated by an employee (including his or her tools, equipment and materials) walking, slipping, tripping, leaning, or sliding along the work surface.¹¹¹ With respect to work in aerial lifts, to the extent that the bucket or platform can become separated from the boom as noted by several commenters (see, for example, Tr. 614–615, 700), the restraint system would need to be anchored to the boom.

The proposed rule gave line-clearance tree trimming employers two options for employees in aerial lifts: (1) Use a personal fall arrest system with a harness; or (2) use a fall restraint system with a body belt or a harness. With respect to the first option, the tree trimming industry argued that personal fall arrest systems with body harnesses pose two hazards unique to line-clearance tree trimmers: (1) An electrocution hazard in the event of a fall into a power line and (2) a hazard associated with a harness' being pulled into a chipper. (See, for example, Exs. 0174, 0200, 0502, 0503; Tr. 616–617, 757–758.) Testifying on behalf of ULCC, Mr. Andrew Salvatore explained these arguments as follows:

It is to be noted that this full body harness as one of the options is potentially problematic though for line clearance tree trimmers. [D]ue to the unique way that line clearance tree trimmers work, this is for two reasons.

Reason 1: Linemen work next to energized conductors at arm's height. So if they fall

from the aerial lift, they fall below the wire suspended in the air. But because . . . line clearance tree trimmers uniquely work from aerial lifts routinely positioned . . . or traveling above the wires if they were to fall from the bucket, they would likely fall onto the wire below when using the six-foot lanyard and full body harness, facing certain death by electrocution.

Reason 2: Some line clearance tree trimming companies have their tree trimmers help feed brush into the truck's wood chippers. This is a concern among many line clearance tree trimming safety professionals in that the harness's appendage straps . . . can get caught on the brush being fed into the chipper and drag the operator into the chipper. Additionally the donning and doffing of a full body harness may predispose the aerial lif[t] operator to take [an] unacceptable risk of aiding a coworker chipping brush on the ground or conversely removing the harness and not putting it back on when returning [aloft] in the lift. [Tr. 616–617]

In their posthearing comments, ULCC and TCIA expanded on this testimony. These organizations acknowledged that power line workers also work above power lines, but maintained that there are still significant differences that make it more dangerous to use personal fall arrest equipment with harnesses for line-clearance tree trimming work (Exs. 0502, 0503). First, ULCC and TCIA argued that, unlike line-clearance tree trimmers, line workers take measures to protect themselves from contact with power lines below the aerial lift bucket. For example, TCIA commented:

Through questioning of IBEW Panelists Jim Tomaseski and Don Hartley (Hearing Transcript, pages 1016–1019), we discovered that it is the lineman's typical practice to insulate wires underneath the person in an elevated work position in an aerial lift when there is the possibility of the worker coming within (including falling within) the minimum approach distance. Obviously, it effectively frees the lineman from concern of their fall protection allowing them to drop into the conductor(s). [I]nsulating the line is infeasible or impractical for our crews since they do not possess the tools or expertise to implement it. [Ex. 0503]

Second, ULCC asserted that line workers perform significantly less work above power lines than line-clearance tree trimmers, explaining:

Linemen usually work *at* the height of the electric line; their work from above the line is atypical—we estimate that less than 20% of linemen work is from above the line. Thus, the amount of linemen work [conducted] from above an electric line is di minimis [*sic*]. [Ex. 0502; emphasis included in original]

First, with respect to fall arrest equipment, OSHA does not consider body harnesses to pose greater hazards to line-clearance tree trimmers than

¹⁰⁸ See, for example, the following OSHA letters of interpretation:

May 11, 2001, to Mr. Jessie L. Simmons (http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=24360);

August 14, 2000, to Mr. Charles E. Hill (http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=24110); and

April 20, 1998, to Mr. Jonathan Hemenway Glazier (http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=22569).

¹⁰⁹ See, for example, the August 14, 2000, letter of interpretation to Mr. Charles E. Hill (http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=24110).

¹¹⁰ This letter of interpretation is available at (http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=22006).

¹¹¹ See also the following letters of interpretation:

November 8, 2002, to Mr. Jeff Baum (http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=24576); and

November 2, 1995, to Mr. Mike Amen (http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=21999).

body belts. The hazard to a worker from being pulled into a chipper is easily dismissed. OSHA acknowledges that there are serious hazards associated with operating chippers, including the hazard that workers could be caught by the chipper feed mechanism. NIOSH published an article warning of hazards associated with the operation of chippers (see NIOSH Publication No. 99-145, "Hazard ID 8—Injury Associated with Working Near or Operating Wood Chippers;" Ex. 0481), and that publication provides recommendations to protect workers against being caught in the feed mechanism.¹¹² These recommendations include: (1) Having workers wear close-fitting clothing and gloves, (2) having workers wear trousers without cuffs, and (3) ensuring that employees tuck in their clothing. Consistent with these recommendations, OSHA expects that any hazards associated with using a chipper while wearing a harness can be avoided by requiring employees to remove their harnesses before working with the chipper. The tree trimming industry commented that employees might not want to take off their harnesses before feeding brush into chippers. (See, for example, Ex. 0502; Tr. 616–617.) OSHA does not find that argument persuasive. Employers can avoid this concern altogether by having these workers perform other ground-based work, such as moving the cut tree branches near the chipper, while ground workers, who are not wearing harnesses, feed the branches into the chippers.

Second, OSHA does not consider the risk of falling into a power line to be as serious as the tree care industry portrays. If an employee falls from an aerial lift while using a personal fall arrest system with a harness, contact with a power line, though possible, is not certain. Sometimes the employee will not be working over the line. In other situations, the line will be on one side of the aerial lift bucket, but the employee will fall out on the other side where no conductors are present. In addition, the line may be far enough away that the employee does not reach it during the fall. In any event, the hazards associated with an employee falling into a power line can be reduced—or even removed altogether—by using a shorter lanyard as suggested by some rulemaking participants. (See, for example, Ex. 0505; Tr. 694–695.) In this regard, IBEW noted: "If . . . the normal lanyard length [for a fall arrest system] of 5 to 6 feet is too long, the lanyard can be shortened to 3 or 4 feet,

thereby eliminating the anticipated problems" (Ex. 0505). Noting that the attachment point on a harness will be farther from the anchorage on the boom than is the attachment point on a body belt, ULCC claimed that a 0.9-meter (3-foot) lanyard was unworkable with a body harness (Ex. 0502). OSHA is not suggesting that a 0.9-meter lanyard with a body harness is feasible, only that a lanyard shorter than 1.8 meters (6 feet) could be used to reduce the risk of contact with a power line. A retractable lanyard could be used to keep the length of the lanyard as short as possible, thereby reducing the risk even further.

Finally, the tree trimming associations' attempt to portray the hazards of falling into power lines as unique to their industry is flawed. The evidence is clear from the comments of employees who perform line work that power line workers also work above power lines and can fall into them. (See, for example, Ex. 0505; Tr. 971.) In addition, ULCC's attempt to distinguish line-clearance tree trimming work from power line work on the grounds that power line workers insulate the conductors above which they are working is unpersuasive. Like line-clearance tree trimmers, power line workers often work above energized power lines that have not been insulated. The final rule does not require insulation on conductors for a power line worker maintaining the minimum approach distance. In addition, insulating the lines is not always possible. According to § 1926.97(c)(2)(i) and Table E-4 of the final rule, the highest maximum use voltage for rubber insulating equipment, such as rubber insulating line hose or blankets, is 36 kilovolts. The maximum use voltage for plastic guard equipment is 72.5 kilovolts (Ex. 0073). Insulation is not available above those voltages.

TClA argued that insulating power lines is not feasible or practical for line-clearance tree trimming crews (Ex. 0503). OSHA is not persuaded by this argument. To the extent that it is the practice of line workers to insulate conductors beneath them, OSHA concludes that this practice also represents a feasible means of protecting line-clearance tree trimmers from the hazard of falling into the line. The comment that line-clearance tree trimmers are not currently being trained in this practice is not relevant to whether it is feasible. If necessary, a line-clearance tree trimming employer could have the electric utility install the insulation or train line-clearance tree trimmers so that they are qualified to install insulation. In any event, the final rule does not require insulation for line-

clearance tree trimmers; the final rule at § 1910.269(r)(1)(iii) simply requires them to maintain the minimum approach distance from power lines. The use of insulation would simply be one way for line-clearance tree trimming employers to address their concern about employees falling into power lines while using personal fall arrest systems.

The tree trimming industry did not submit any comments directly addressing the use of restraint systems, which is the second compliance option available to line-clearance tree trimming employers. Instead, as a result of the industry's misunderstanding regarding the applicability of the 0.6-meter (2-foot) free-fall distance for work-positioning systems (described earlier), it simply argued that it would be impossible or unsafe for employees working from an aerial lift to use a 0.6-meter lanyard with a body belt for their work. (See, for example, Exs. 0174, 0200, 0419, 0502, 0503; Tr. 613–615, 756.)

Mr. Andrew Salvatore, representing ULCC, testified as follows:

[W]e can't do line clearance tree trimming with a lanyard of two foot [*sic*] or less. There are three reasons for this.

Reason No. 1: Line clearance tree trimmers need to be able to reach from the four corners of an aerial lift bucket to do their work because [of the need] to maintain a minimum approach distance from energized wires different from linemen who can work right next to the wires. We can't get to the four corners of the bucket with a two-foot or shorter lanyard, typically anchored . . . outside of the bucket on the boom. This prevents us from reaching outside of the bucket with our tools or extending from the bucket. . . .

Reason 2: The two-foot limitation is also unworkable because we usually work from [an] aerial lift positioned above energized conductors, reaching down to the tree branches below adjacent to conductors using insulated pole tools. This is different from linemen who typically position their lift buckets right next to the wire at arm's length. We lack the range of movement within the bucket necessary to reach over the bucket and down to the worksite because we would be restrained to the side of the bucket closest to the anchor. Relocation of an anchor is not [an] easy fix because the anchor is required to withstand a 5,000 pounds of force and typically can't be installed on the bucket . . . because [of] the lack of [a] strong enough anchoring point and because if the bucket breaks off in a catastrophic incident the worker goes down with the anchor attached to the bucket [rather than] being suspended by the lanyard attached to the boom.

The Third Reason: Our people may be potentially yanked out of the bucket into precisely the fall that is sought to be avoided by the proposal because line clearance tree trimmers routinely rotate and articulate their lift buckets in ways that would exceed the distance of a short lanyard. . . . [This

¹¹² This document is available at <http://www.cdc.gov/niosh/docs/99-145>.

exposes] the worker to being yanked out of the bucket by the short lanyard when the range of articulation of the bucket exceeds the short length of the lanyard. [Tr. 613–615]

To address these problems, the tree care industry recommended that OSHA permit the use of a 0.9-meter (3-foot) shock-absorbing lanyard with a body belt. (See, for example, Exs. 0174, 0200, 0502, 0503; Tr. 615–616, 759–760.) The industry proposed a 408-kilogram (900-pound) limitation on fall arrest forces, presumably to remove hazards associated with concentrated fall arrest forces in falls into body belts (*id.*).

As noted earlier, the tree care industry misinterpreted its compliance options under the proposed rule. For work from an aerial lift, there are only two options: (1) Fall arrest equipment and (2) a fall restraint system. Restraint systems do not permit any free fall. An acceptable restraint system for an aerial lift would prevent an employee from falling out of the lift and from being catapulted from the lift (for example, if the vehicle supporting the aerial lift was struck by a vehicle or if a large tree section struck the boom). Body belts are permitted as part of a restraint system; however, a system rigged to allow an employee to free fall even 0.6 meters (2 feet) would not be acceptable as a restraint system. The system proposed by the tree care industry, namely a body belt connected to a 0.9-meter (3-foot) lanyard attached to an anchorage on the boom of an aerial lift, would not prevent the employee from falling out of or being catapulted from an aerial lift. Therefore, it would not be acceptable as a restraint system.

Moreover, with a body belt instead of a harness, the system proposed by the tree care industry would not be an acceptable fall arrest system. Even if it provides sufficient protection to employees against concentrated fall arrest forces, it does not address the other two significant hazards associated with falling into body belts, that is, falling out of the body belt and sustaining further injury during suspension.¹¹³

¹¹³ Paragraph (d)(16) of § 1926.502 requires a personal fall arrest system to be rigged so that the employee cannot free fall more than 6 feet (1.8 meters) nor contact any lower level. The Agency notes that the lanyard may need to be shorter than the maximum free-fall distance. This is the case for aerial lift work. The anchorage point on the boom of an aerial lift may be below the attachment point on the body belt or harness. As a result, the employee could free fall a distance equal to twice the length of the lanyard if he or she is ejected or catapulted from the aerial lift, as can happen when a vehicle strikes the aerial lift truck or a falling object, such as a tree branch, strikes the boom. This is not an unlikely event as several accidents in the record demonstrate (Ex. 0003; these three accidents can be viewed at http://www.osha.gov/pls/imis/accidentsearch.accident_detail?id=14507743&

The tree care industry asserted that OSHA has not demonstrated that using body belts in personal fall arrest systems in aerial lifts poses hazards to line-clearance tree trimmers. (See, for example, Exs. 0174, 0200, 0502, 0503; Tr. 613, 758–759.) TCIA made this point as follows:

The only fall protection issue arising in aerial lifts is failure to use *any* form of fall protection—an unsafe and non-compliant behavior that the industry must strive to eliminate. Similarly, if operators in the past have worn body belts incorrectly, causing the equipment to not deliver the level of protection it should have, then there is a behavioral issue to address in training.

It is our industry's experience that workers are not being injured by virtue of using body belts . . . and that non-compliance with PPE use requirements is directly proportional to how hard or uncomfortable the PPE is to use. [Ex. 0200; emphasis included in original]

ULCC had similar comments:

Preliminarily, there is NO showing in the subject notice of rule making that . . . allowing a body belt and lanyard for fall protection from aerial devices . . . creates a risk which merits modification of existing practice. It is our industry's experience that line clearance tree trimmers are *not* being injured by virtue of using body belts (OSHA cites no evidence, nor contrary evidence of any such bucket fall hazard or hazard from body belt lanyards over two feet long in line clearance tree trimming), and that lack of compliance with PPE use requirements is directly proportional to how hard or uncomfortable the PPE is to use. Between 1984 and 2002, there were 34 OSHA-recorded fatalities in Tree Trimming (SIC 0783) involving aerial device operators and falls. The details of these accidents illustrate where the greatest problems lie:

- 23 of 34 fatalities were caused by catastrophic mechanical failures of some part of the aerial device that slammed the victim to the ground from considerable height. Fall protection, or lack of it, was not a factor in these fatalities.
- 5 of 34 fatalities were caused by a tree or limb striking the aerial lift boom, again causing failure of the aerial device. Again, fall protection was not a factor.
- 6 of 34 fatalities were caused by *unsecured* falls from the aerial device, and probably would have been prevented by the use of *any* means of fall protection.

At a recent meeting of the Tree Care Industry Association Safety Committee (a tree care industry trade association), with the safety directors of 20 of the largest tree care companies representing well over 60,000 tree care employees present, a survey was taken as to whether these companies had any experience with aerial lift operators being injured from secured falls out of buckets. *None did. For them, the more profound problem was the operator who disobeyed company policy and failed to wear any fall*

id=953869&id=14333157). Thus, the tree industry's recommended lanyard length could result in a free fall of 1.8 meters (6 feet).

protection. [Ex. 0174; emphasis included in original]

In its posthearing comments, ULCC further argued that the one accident OSHA described, in which an employee slipped out of a body belt, occurred to a line worker, not a line-clearance tree trimmer, and that this single accident “is statistically insignificant, insufficiently documented on the record, and in no way probative of any problem of line clearance tree trimmers falling from aerial lifts” (Ex. 0502). ULCC further suggested that OSHA's proposal ignored the suspension-trauma risk associated with full body harnesses (Exs. 0481, 0502). (OSHA describes the hazards related to prolonged suspension in fall protection equipment later in this section of the preamble.)

OSHA rejects these assertions. OSHA closely examined issues related to the use of body belts in arresting falls in its Subpart M rulemaking (59 FR 40702–40703). In that rulemaking, the Agency concluded that “evidence in the record clearly demonstrates that employees who fall while wearing a body belt are not afforded the level of protection they would be if the fall occurred while the employee was wearing a full body harness” (59 FR 40703). In addition, the Agency pointed to “evidence of injuries resulting from the use of body belts” in fall arrest systems (*id.*). Also, as mentioned by ULCC, there is evidence in this rulemaking of an incident in which an employee, working from an aerial lift while wearing a body belt in a fall arrest system, slipped from the belt in a fall (Ex. 0003¹¹⁴). Contrary to the tree care industry's suggestion, OSHA need not show that injuries are presently occurring to line-clearance tree trimmers because of falls into body belts; it is sufficient that the Agency found that tree trimming employees are exposed to a significant risk of injury under the existing standard and that the final rule will substantially reduce that risk. (See Section II.D, Significant Risk and Reduction in Risk, earlier in this preamble, for OSHA's response to the argument that the Agency is required to demonstrate a significant risk for each of the hazards addressed by this rulemaking.) ULCC's own analysis confirms that line-clearance tree trimmers are exposed to fall hazards (Ex. 0174). Nearly 18 percent of falls from aerial lifts were of the type that, if the employee had been wearing a body belt in a personal fall arrest system, he or she would have been exposed to the serious hazards, described earlier, that

¹¹⁴ The description of this accident is available at: http://www.osha.gov/pls/imis/accidentsearch.accident_detail?id=170155857.

are associated with using body belts in fall arrest systems (*id.*).

The Agency acknowledges the suspension risk from body harnesses identified by ULCC. When an employee is suspended in a body belt or harness, a number of adverse medical effects can occur, including upper or lower extremity numbness; abdominal, shoulder, or groin pain; respiratory distress; nausea; dizziness; and arrhythmias (Ex. 0088). At least one of the adverse effects, orthostatic incompetence, can lead to death (Ex. 0481). It is because of these hazards that § 1926.502(d)(20) in Subpart M requires the employer to provide for prompt rescue of employees in the event of a fall or to assure that employees are able to rescue themselves. In any event, the hazards associated with prolonged suspension in a body belt are substantially more severe than the hazards associated with suspension in a harness. In 1985, the U.S. Technical Advisory Group on Personal Equipment for Protection Against Falling stated, in comments on another OSHA rulemaking: “The length of time which a fallen person can tolerate suspension in a body belt is measured in a very few minutes under the most favorable conditions” (Ex. 0084). In addition, a 1984 U.S. Air Force literature review recounted one study that found that “two subjects evaluated in . . . waist belt[s] with shoulder straps tolerated suspension for 1 min 21 sec and 3 min” (Ex. 0088).¹¹⁵ That same study showed that subjects suspended in full body harnesses could tolerate suspension for approximately 20 to 30 minutes (*id.*).

The tree care industry commented that, to the extent injuries are occurring, they are caused by the failure of employees to use any fall protection, rather than by the use of body belts. (See, for example, Exs. 0174, 0200.) This argument supports, rather than undermines, a requirement for harnesses in personal fall arrest systems. To the extent better enforcement of fall protection requirements by employers is a critical component of protecting employees in aerial lifts, harnesses are preferable to body belts. It is not always possible to detect from the ground whether an employee is wearing a body belt, but it is relatively easy to determine if an employee is wearing a body harness (Tr. 972–973). If employees initially resist the use of body harnesses, as suggested by some commenters (see, for example, Exs.

0174, 0200, 0219), employers must be proactive in communicating the need for, and ensuring the use of, the required equipment.

The Agency concludes that the use of a 0.9-meter shock-absorbing lanyard with a body belt, as proposed by the tree trimming industry, is not an adequate substitute for the use of a harness in a fall arrest system. OSHA has not been persuaded to abandon its finding in the Subpart M rulemaking that body belts present unacceptable risks in fall arrest situations and should be prohibited as components of fall arrest equipment. OSHA is adopting in the final rule the requirement proposed in paragraph (b)(1) that personal fall arrest equipment meet Subpart M of Part 1926. This provision appears in final § 1926.954(b)(1)(i).

ULCC noted what it perceived as an implied, but unstated, revision in the proposal to the provisions contained in the general industry aerial lift standard (§ 1910.67(c)(2)(v)) requiring employees working in aerial lifts to use body belts and lanyards. (See, for example, Ex. 0174.)

In the preamble to the proposal, OSHA explained that it was relying on the provisions in the aerial lift standards to establish the employer’s duty to provide fall protection for employees, but that Subpart M would govern the criteria fall arrest equipment must meet (70 FR 34850). In other words, for work covered by this rule, body belts would not be permitted in personal fall arrest systems. The ULCC commented: “OSHA’s suggestion that [the aerial lift standard] describes only the ‘duty’ to use fall protection rather than the kind of fall protection, respectfully, is a makeweight” (Ex. 0502).

In light of ULCC’s comments, the Agency is concerned that some employers reading the final rule may mistakenly assume that the body belts required by §§ 1910.67(c)(2)(v) and 1926.453(b)(2)(v) remain acceptable for use in personal fall arrest systems. In addition, the Agency wants to make it clear in the final rule that work-positioning equipment is unacceptable from the horizontal working surface of an aerial lift. Employees working from aerial lifts covered by the final rule must be protected using either a fall restraint system or a personal fall arrest system. Therefore, OSHA is adding a provision in final §§ 1910.269(g)(2)(iv)(C)(1) and 1926.954(b)(3)(iii)(A) providing that employees working from aerial lifts be protected with a fall restraint system or a personal fall arrest system and that the provisions of the aerial lift standards requiring the use of body belts and lanyards do not apply. This provision

clearly states the requirement contained in the proposal. As a consequence of this change, the final rule does not include the text in Note 1 to proposed § 1910.269(g)(2)(iii)(C) and Note 1 to proposed § 1926.954(b)(3)(iii) referring to fall protection for aerial lifts or referencing the general industry and construction standards on aerial lifts. (The corresponding notes in the final rule are Note 1 to § 1910.269(g)(2)(iv)(C)(2) and (g)(2)(iv)(C)(3) and Note 1 to § 1926.954(b)(3)(iii)(B) and (b)(3)(iii)(C).)

OSHA is adopting revised requirements for work-positioning equipment in § 1926.954(b)(2).¹¹⁶ Section 1926.959 of existing Subpart V contains requirements for body belts, safety straps,¹¹⁷ and lanyards.¹¹⁸ This equipment was traditionally used as both work-positioning equipment and fall arrest equipment in the maintenance and construction of electric power transmission and distribution installations. However, fall arrest equipment and work-positioning equipment present significant differences in the way they are used and in the forces they place on an employee’s body. With fall arrest equipment, an employee has freedom of movement within an area restricted by the length of the lanyard or other device connecting the employee to the anchorage. In contrast, and as explained earlier, work-positioning equipment is used on a vertical surface to support an employee in position while he or she works. The employee “leans” into this equipment so that he or she can work with both hands free. If a fall occurs while an employee is wearing fall arrest equipment, the employee will free fall up to 1.8 meters (6 feet) before the slack is removed and the equipment begins to arrest the fall. In this case, the fall arrest forces can be high, and they need to be spread over a relatively large area of the

¹¹⁶ In § 1910.269(g)(2)(ii), OSHA proposed to require body belts and positioning straps for work positioning to meet § 1926.954(b)(2). The final rule duplicates the requirements of § 1926.954(b)(2) in § 1910.269(g)(2)(iii) rather than referencing them.

¹¹⁷ “Safety straps” is an older, deprecated term for “positioning straps.”

¹¹⁸ Existing § 1926.500(a)(3)(iii) states that additional performance requirements for personal climbing equipment, lineman’s body belts, safety straps, and lanyards are provided in subpart V. OSHA is revising the language in this provision to make it consistent with the terms used in final Subpart V. Furthermore, because the Agency is adopting, in subpart V, an additional requirement for fall arrest equipment used by employees exposed to electric arcs (as described earlier in this section of the preamble), OSHA is adding fall arrest equipment to the list of equipment in § 1926.500(a)(3)(iii). As revised, § 1926.500(a)(3)(iii) states that additional performance requirements for fall arrest and work-positioning equipment are provided in Subpart V.

¹¹⁵ Hearon, B.F., Brinkley, J.W., “Fall Arrest and Post-Fall Suspension: Literature Review and Directions for Further Research,” AFAMRL–TR–84–021, April 1984.

body to avoid injury to the employee. Additionally, the velocity at which an employee falls can reach up to 6.1 meters per second (20 feet per second). Work-positioning equipment is normally used to prevent a fall from occurring in the first place. If the employee slips and if the work-positioning equipment is anchored, the employee will only fall a short distance (no more than 0.6 meters (2 feet) under paragraph (b)(3)(iv) of final § 1926.954). This distance limits the forces on the employee and the maximum velocity of a fall. Additionally, because of the way the equipment is used, the employee should not be free falling. Instead, the work-positioning equipment will be exerting some force on the employee to stop the fall, thereby further limiting the maximum force and velocity. As long as the employee is working on a vertical surface, the chance of an employee using work-positioning equipment falling out of, or being suspended at the waist in, a body belt is extremely low.

In the final rule, OSHA is applying requirements to personal fall arrest systems that differ from the requirements that apply to work-positioning equipment. As discussed previously, personal fall arrest systems must meet subpart M of part 1926, as required by paragraph (b)(1)(i), supplemented by the requirement in final paragraph (b)(1)(ii) that the equipment withstand exposure to electric arcs. Work-positioning equipment must meet the requirements contained in paragraph (b)(2) of the final rule. Employers engaged in electric power transmission and distribution work may use the same equipment for fall arrest and for work positioning provided the equipment meets both sets of requirements. In fact, as noted in the preamble to the proposal, several manufacturers market combination body harness-body belt equipment, which can be used as fall arrest systems by employees working on horizontal surfaces or as work-positioning systems supporting employees working on vertical surfaces (70 FR 34850).

Paragraph (b)(2) of the final rule is based on existing § 1926.959 and ASTM F887-04, *Standard Specifications for Personal Climbing Equipment*, which was the latest edition of the national consensus standard applicable to work-positioning equipment when OSHA developed the proposed rule (Ex. 0055). Although OSHA is adopting requirements derived from the ASTM standard, the final rule is written in performance-oriented terms. Detailed specifications contained in the ASTM standard, which do not directly impact the safety of employees, were not

included in the final rule. The Agency believes that this approach will retain the protection for employees afforded by the ASTM standard, while giving employers flexibility in meeting the OSHA standard and accommodating future changes in the ASTM standard without needing to change the OSHA standard. This is similar to the approach OSHA took in final § 1926.97, discussed previously.

While the ASTM standard does not cover lanyards, paragraph (b)(2), as proposed, would have applied many of the requirements based on the ASTM standard to lanyards. Existing § 1926.959 imposes the same basic requirements on lanyards.

OSHA requested comment on whether any of the proposed requirements for work-positioning equipment should not be applicable to lanyards. Some commenters supported the Agency's proposal. (See, for example, Exs. 0211, 0230.) For instance, IBEW stated:

[L]anyards used for fall protection for electric power transmission and distribution work [already] meet the requirements of ASTM F887-04. Therefore these requirements, as proposed, should be applicable to lanyards used for work positioning equipment. [Ex. 0230]

However, Buckingham Manufacturing Company, a manufacturer of work-positioning equipment used by line workers, opposed the application of some of the proposed requirements for work-positioning equipment to lanyards:
