

(9) When mining is in progress, tests for methane will be made with a hand-held methane detector at least every 10 minutes from the time mining with the continuous mining machine is within 30 feet of the well until the well is intersected and immediately prior to mining through or the resumption of mining after a well is intersected. When mining with longwall mining equipment, the tests for methane will be made at least every 10 minutes when the longwall face is within 10 feet of the well.

(10) When using continuous mining methods, the working place will be free from accumulations of coal dust and coal spillages, and rock dust will be placed on the roof and rib to within 20 feet of the face when mining through the well.

(11) When the wellbore is intersected, all equipment will be deenergized and the place thoroughly examined and determined safe before mining is resumed. Any well casing will be removed and no open flame will be permitted in the area until adequate ventilation has been established around the wellbore.

(12) After a well has been intersected and the working place determined safe, mining will continue in the well at a sufficient distance to permit adequate ventilation around the area of the wellbore.

(13) No person will be permitted in the area of the mining-through operation, in the last open crosscut except those actually engaged in the operation, company personnel, representatives of the miners, MSHA personnel and personnel from the appropriate State agency.

(14) The mining-through operation will be under the direct supervision of a certified official. Instructions concerning the mining-through operation will be issued only by the certified official in charge.

The petitioner asserts that the proposed alternative method will provide the same measure of protection as that afforded by the existing standard.

Sheila McConnell,

Acting Director, Office of Standards, Regulations and Variances.
